Abstract

General Chemistry I: Chemical bond and molecular structure, chemical thermodynamics, chemical equilibrium.

In the course "Chemistry I," the competencies of process understanding, system understanding, modeling, concept development and data analysis & interpretation are taught, applied and examined.

Objective

Introduction to general and inorganic chemistry. Basics of the composition and the change of the material world. Introduction to the thermodynamically controlled physico-chemical processes. Macroscopic phenomena and their explanation through atomic and molecular properties. Using the theories to solve qualitatively and quantitatively chemical and ecologically relevant problems.

Content

1. Stoichiometry
   - Amount of substance and mass. Composition of chemical compounds. Reaction equation. Ideal gas law.
2. Atoms
4. Basics of chemical thermodynamics
   - System and surroundings. Description of state and change of state of chemical systems.
5. First law of thermodynamics
6. Second law of thermodynamics
   - Entropy. Change of entropy in chemical systems and universe. Reaction entropy.
7. Gibbs energy and chemical potential.
8. Chemical equilibrium
9. Acids and bases
10. Solution and precipitation.

Lecture notes

Online-Skript mit durchgerechneten Beispielen.

401-0251-00L | Mathematics I | O | 6 credits | 4V+2U | A. Cannas da Silva |

Abstract

This course covers mathematical concepts and techniques necessary to model, solve and discuss scientific problems - notably through ordinary differential equations.

Objective

Mathematics is of ever increasing importance to the Natural Sciences and Engineering. The key is the so-called mathematical modelling cycle, i.e. the translation of problems from outside of mathematics into mathematics, the study of the mathematical problems (often with the help of high level mathematical software packages) and the interpretation of the results in the original environment.

The goal of Mathematics I and it is to provide the mathematical foundations relevant for this paradigm. Differential equations are by far the most important tool for modelling and are therefore a main focus of both of these courses.
This introductory lecture in ecology covers basic ecological concepts and the most important levels of complexity in ecological research.

**1. Single-Variable Calculus:**
review of differentiation, linearisation, Taylor polynomials, maxima and minima, antiderivative, fundamental theorem of calculus, integration methods, improper integrals.

**2. Linear Algebra and Complex Numbers:**
systems of linear equations, Gaussian-Jordan elimination, matrices, determinants, eigenvalues and eigenvectors, cartesian and polar forms for complex numbers, complex powers, complex roots, fundamental theorem of algebra.

**3. Ordinary Differential Equations:**
separable ordinary differential equations (ODEs), integration by substitution, 1st and 2nd order linear ODEs, homogeneous systems of linear ODEs with constant coefficients, introduction to 2-dimensional dynamical systems.

**Literature**
- Bretscher, O.: Linear Algebra with Applications (Pearson Prentice Hall).

**Prerequisites / notice**
Prerequisites: familiarity with the basic notions from Calculus, in particular those of function and derivative.

---

**551-0001-00L General Biology I**

**Abstract**
Organismic biology to teach the basic principles of classical and molecular genetics, evolutionary biology and phylogeny. First in a series of two lectures given over two semesters for students of agricultural and food sciences, as well as of environmental sciences.

**Objective**
The understanding of some basic principles of biology (inheritance, evolution and phylogeny) and an overview of the diversity of life.

**Content**
The first semester focuses on the organismal biology aspects of genetics, evolution and diversity of life in the Campbell chapters 12-34.

**Lecture notes**
no script

**Literature**

**Prerequisites / notice**
The lecture is the first in a series of two lectures given over two semesters for students with biology as a basic subject.

---

**701-0243-01L Biology III: Essentials of Ecology**

**Abstract**
This introductory lecture in ecology covers basic ecological concepts and the most important levels of complexity in ecological research. Ecological concepts are exemplified by using aquatic and terrestrial systems; corresponding methodological approaches are demonstrated. Threats to biodiversity and the appropriate management are discussed.

**Objective**
The objective of this lecture is to teach basic ecological concepts and the different levels of complexity in ecological research. The students should learn ecological concepts at these different levels in the context of concrete examples from terrestrial and aquatic ecology. Corresponding methods for studying the systems will be presented. A further aim of the lecture is that students achieve an understanding of biodiversity, why it is threatened and how it can be managed.

**Content**
- Biodiversity: variation, threats and conservation
- Influence of environmental factors on organisms; adaptation to environmental conditions
- Population dynamics: causes, description, prediction and regulation
- Interactions between species (competition, coexistence, predation, parasitism, food webs)
- Ecological communities: structure, stability, succession
- Ecosystems: compartments, material and energy flows

**Lecture notes**
Documents, lecture slides, exercises and relevant literature are available in Moodle. The documents for the next lecture will be available on Friday morning at the latest.

**Literature**

**Competencies**
Subject-specific Competencies: Concepts and Theories assessed
- Techniques and Technologies fostered

Method-specific Competencies: Analytical Competencies assessed
- Decision-making fostered
- Problem-solving fostered

Social Competencies: Communication fostered
- Cooperation and Teamwork fostered
- Sensitivity to Diversity fostered

Personal Competencies: Adaptable and Flexibility fostered
- Creative Thinking fostered
- Critical Thinking fostered
- Self-awareness and Self-reflection fostered
- Self-direction and Self-management fostered

---

**701-0027-00L Environmental Systems I**

**Abstract**
The lecture provides a science-based exploration of environmental aspects from three research fields: earth, climate, and health sciences.
The students are able to explain important properties of the three environmental systems, to discuss critical drivers, trends and conflicts of their use, and to compare potential solutions.

The students are able to apply economic analysis confidently and independently. This is achieved through participation in exercises, class discussions and reading material from current media. By the end of the course, students will be asked to apply these concepts to issues in their own field of study and to current issues in society. This goal will be achieved through participation in exercises, class discussions and reading material from current media. By the end of the course, students should be able to apply economic analysis confidently and independently.

Not for students belonging to D-MTEC!

This course introduces basic economic concepts and theories. Beginning with microeconomics, the course starts with the topics of supply and demand, markets, and behavioral economics before moving on to the key macroeconomic concepts of national accounts, the labor market, trade, and monetary policy.

After successful completion of the course you will be able to:

- Describe the basic micro- and macroeconomic problems and theories.
- Introduce economic reasoning appropriately to a given topic.
- Evaluate economic measures.

Households, firms, supply and demand: How are household preferences and consumption patterns formed? How does a household react to price changes? How are goods prices formed? At what prices are companies willing to offer goods? How do we make economic decisions?

Markets: What is "perfect competition" and how does a competitive market work? Are monopolies always a bad thing? How can the state influence the market?

Market failure: What happens when prices give wrong signals?

Labour market: How do supply and demand work in the labour market? What influences unemployment?

National accounts: How big is the Swiss economy?

Foreign trade: Why do countries trade with each other? What are the consequences for the domestic market?

Money and inflation: What exactly is money? How does money creation work and what happens when there is too much (or too little) money on the market?

Students will be asked to apply these concepts to issues in their own field of study and to current issues in society. This goal will be achieved through participation in exercises, class discussions and reading material from current media. By the end of the course, students should be able to apply economic analysis confidently and independently.

Students learn to apply selected concepts and tools from computer science for working on interdisciplinary projects. The following topics are covered: modeling and simulations, managing data with lists, tables and relational databases, introduction to programming. The students learn to...

| 401-0624-00L | Mathematics IV: Statistics | O    | 4 credits | 2V+1U | N. Meinshausen |
| **Abstract** | Introduction to basic methods and fundamental concepts of statistics and probability theory for practitioners in natural sciences. The concepts will be illustrated with some real data examples and applied using the statistical software R. |
| **Objective** | Capacity to learn from data; good practice when dealing with data and recognizing possible fraud in statistics; basic knowledge about the laws of randomness and stochastic thinking (thinking in probabilities); application of simple methods in inferential statistics (e.g., several hypothesis tests will be introduced), i.a. also using the statistical software R. The lecture will be held in German. |
| **Content** | Einführung in die Wahrscheinlichkeitsrechnung (Grundregeln, Zufallsvariablen, diskrete und stetige Verteilungen, Ausblick auf Grenzwertsätze), Beschreibende Statistik (einschliesslich grafische Methoden). Methoden der Analytischen Statistik: Schätzungen, Tests (einschliesslich Binomialtest, t-Test, Vorzeichentest, F-Test, Wilcoxon-Test), Vertrauensintervalle, Vorhersageintervalle, Korrelation, einfache und multiple lineare Regression. Einführung in die statistische Programmiersprache R. |
| **Lecture notes** | Ausführliches Skript zur Vorlesung ist erhältlich. |
| **Literature** | Stahel, W.: Statistische Datenanalyse. Vieweg, 5. Auflage 2008 (als ergänzende Lektüre)  
| **Prerequisites / notice** | The Übungen (ca. die Hälfte der Kontaktstunden; einschliesslich Computerübungen) sind ein wichtiger Bestandteil der Lehrveranstaltung. |
| **Voraussetzungen** | Mathematik I, II |

---

Some parts of the lecture will be taught in English.
Subject-specific Competencies

Teaching of basic knowledge in microbiology with main focus on Microbial Cell Structure and Function, Molecular Genetics, Microbial Growth, Metabolic Diversity, Phylogeny and Taxonomy, Prokaryotic Diversity, Human-Microbe Interactions, Biotechnology.

Abstract

Vermittlung von betriebswirtschaftlichen Grundlagenwissen und Analyse- und Planungsinstrumenten mit Anwendung auf Unternehmen der Agrar- und Ernährungswirtschaft

Objective

Teilnehmer des Kurses sollen am Ende der Vorlesung i) grundlegende Entscheide strukturieren und analysieren können, ii) Entscheidungen unter Unsicherheit und Risikomanagement anwenden zu können, iii) verschiedene Werkzeuge zur unternehmerischen Entscheidungsunterstützung anwenden können und iv) die Spezifika von Unternehmen in der Agrar- und Ernährungswirtschaft kennen.

Content

Die Vorlesung geht auf folgende Inhalte, mit spezifischen Anwendungen im Agrar- und Ernährungssektors ein:

- Grundlagen und Ziele unternehmerischen Entscheids
- Kosten und Leistungsrechnung
- Produktionstheorie
- Produktionsprogrammplanung
- Investitionsplanung und Finanzierung
- Entscheidungen unter Unsicherheit und Risikomanagement

752-6003-00L Introduction to Nutritional Science

Abstract

This course introduces basic concepts of micro- and macronutrient nutrition. Micronutrients studied include fat-soluble and water-soluble vitamins, minerals and trace elements. Macronutrients include proteins, fat and carbohydrates.

Objective

The course is divided into two parts: Micronutrients and macronutrients. The micronutrient part includes fat-soluble vitamins, water-soluble vitamins, minerals and trace elements. The macronutrient part introduces basic nutritional aspects of proteins, fats, carbohydrates and energy metabolism. The nutrients are described in relation to digestion, absorption and metabolism. Special aspects of homeostasis and homeostasis are emphasized.

Content

Teaching of basic knowledge in microbiology with main focus on Microbial Cell Structure and Function, Molecular Genetics, Microbial Growth, Metabolic Diversity, Phylogeny and Taxonomy, Prokaryotic Diversity, Human-Microbe Interactions, Biotechnology.

Lecture notes

There is no script. Powerpoint presentations will be made available.

**Abstract**
Important concepts from population, quantitative and molecular genetics are introduced and applied to plant and animal populations.

**Objective**
- work with genetic polymorphisms and explain mechanisms underlying allele frequency changes in natural and experimental populations;
- determine factors affecting the selection intensity
- explain the difference between genotypic and phenotypic values
- quantify the expected genetic gain per time unit
- explain important molecular methods to determine genetic polymorphisms;
- map traits in plant and animal populations using molecular marker information;
- integrate different concepts from population, molecular and quantitative genetics and explain their importance for applications in genetics in agricultural sciences.

**Content**
- Molecular genetics (15%)
  - DNA sequence variation
  - Marker & genotyping technologies (SSRs, AFLPs, SNPs, KASP, GBS, RADseq, AmpSeq, Chip Technologies)
- Population genetics (30%)
  - Allele- and genotype frequencies in populations
  - Hardy-Weinberg equilibrium
  - Genetic drift, differentiation of populations
  - Fitness, selection
  - Inbreeding, relationship, effective population size
- Quantitative genetics (40%)
  - Recombination, crossing over, linkage analysis, genetic mapping
  - QTL mapping
  - Forms of selection and selection differential
  - Heritability
  - Quantification of expected genetic gain
  - Genotypic value, allele substitution effect, breeding value
- Integrative genetics (15%)
  - Genome-wide association mapping
  - Estimation of genomic breeding values

**Lecture notes**
Slides and exercises will be provided in advance of each class via Moodle.

### Agricultural Economics

#### Introduction to Microeconomics

**GESS (Science in Perspective):**

This course is only for students enrolled in a Bachelor’s degree programme.

Students enrolled in a Master’s degree programme may attend “Principles of Microeconomics” (LE 363-0503-00L) instead.

Note for D-MAVT students: If you have already successfully completed “Principles of Microeconomics” (LE 363-0503-00L), then you will not be permitted to attend it again.

**Abstract**
The course introduces basic principles, problems and approaches of microeconomics. It describes economic decisions of households and firms, and their coordination through perfectly competitive markets.

**Objective**
Students acquire a deeper understanding of basic microeconomic models.

They acquire the ability to apply these models in the interpretation of real world economic contexts.

Students acquire a reflective and contextual knowledge on how societies use scarce resources to produce goods and services and distribute them among themselves.
Content
- Market, budget constraint, preferences, utility function, utility maximisation, demand, technology, profit function, cost minimisation, cost functions, perfect competition, information and communication technologies

Lecture notes
- Course material in e-learning environment https://moodle-app2.let.ethz.ch/auth/shibboleth/login.php

Literature

Prerequisites / notice
- This course "Einführung in die Mikroökonomie" (363-1109-00L) is intended for Bachelor students and LE 363-0503-00 "Principles of Microeconomics" for Master students.

Competencies
- Subject-specific Competencies: Concepts and Theories, Techniques and Technologies, Analytical Competencies, Decision-making, Media and Digital Technologies, Problem-solving, Project Management
- Social Competencies: Communication, Negotiation
- Personal Competencies: Adaptability and Flexibility, Critical Thinking, Integrity and Work Ethics, Self-awareness and Self-reflection, Self-direction and Self-management

Course material in e-learning environment https://moodle-app2.let.ethz.ch/auth/shibboleth/login.php

This course "Einführung in die Mikroökonomie" (363-1109-00L) is intended for Bachelor students and LE 363-0503-00 "Principles of Microeconomics" for Master students.
Objective
A successful completion of the course will enable a thorough understanding of the basic questions and methods of resource and environmental economics and the ability to solve typical problems using appropriate tools consisting of concise verbal explanations, diagrams or mathematical expressions. Concrete goals are first of all the acquisition of knowledge about the main questions of resource and environmental economics and about the foundation of the theory with different normative concepts in terms of efficiency and fairness. Secondly, students should be able to deal with environmental externalities and internalisation through appropriate policies or private negotiations, including knowledge of the available policy instruments and their relative strengths and weaknesses. Thirdly, the course will allow for in-depth economic analysis of renewable and non-renewable resources, including the role of stock constraints, regeneration functions, market power, property rights and the impact of technology. A fourth objective is to successfully use the well-known tool of cost-benefit analysis for environmental policy problems, which requires knowledge of the benefits of an improved natural environment. The last two objectives of the course are the acquisition of sufficient knowledge about the economics of sustainability and the application of environmental economic theory and policy at international level, e.g. to the problem of climate change.

Content
The course covers all the interactions between the economy and the natural environment. It introduces and explains basic welfare concepts and market failure; external effects, public goods, and environmental policy; the measurement of externalities and contingent valuation; the economics of non-renewable resources, renewable resources, cost-benefit analysis, sustainability concepts; international aspects of resource and environmental problems; selected examples and case studies. After a general introduction to resource and environmental economics, highlighting its importance and the main issues, the course explains the normative basis, utilitarianism, and fairness according to different principles. Pollution externalities are a deep core topic of the lecture. We explain the governmental internalisation of externalities as well as the private internalisation of externalities (Coase theorem). Furthermore, the issues of free rider problems and public goods, efficient levels of pollution, tax vs. permits, and command and control instruments add to a thorough analysis of environmental policy. Turning to resource supply, the lecture first looks at empirical data on non-renewable natural resources and then develops the optimal price development (Hotelling-rule). It deals with the effects of explorations, new technologies, and market power. When treating the renewable resources, we look at biological growth functions, optimal harvesting of renewable resources, and the overuse of open-access resources. A next topic is cost-benefit analysis with the environment, requiring measuring environmental benefits and measuring costs. In the chapter on sustainability, the course covers concepts of sustainability, conflicts with optimality, and indicators of sustainability. In a final chapter, we consider international environmental problems and in particular climate change and climate policy.

### Course Details

#### 751-3401-00L Plant Nutrition I

**Objective**

The aim of these lecture is to present the processes controlling the uptake and transport of nutrients by the plant, the assimilation of nutrients in the plant, the effect of nutrients on crop yield and quality, the role of the soil as a source of nutrients for crops, and the basic principles of fertilization of different crop types using mineral and organic fertilizers.

**Content**

A general introduction explains the needs of appropriately managing nutrients in plant production. Afterwards, we will study the physiology of plant nutrition (nutrient uptake by roots; nutrient transports in the plant; physiological roles of nutrients in the plant). Then the role of nutrients for yield formation and their effects on crop quality is dealt with. Finally, the bases of crop fertilization are taught (availability of nutrient in soil; N, P and K fertilization; different types of fertilizers).

**Lecture notes**

The slides will be distributed online.

**Literature**

### 751-4108-00L Startup for Smart Sustainable Farming

**Objective**

During the course, the students generate their own ideas. They explore e.g., which technologies provide possibilities for a more sustainable agriculture. They simulate the creation of a startups company in a team.

**Prerequisites**

- Maximum number of students: 16 (four teams will be formed)
- All students interested should come to the first lecture (25th September). There, details of this year's format will be explained. In case students are then still interested to visit the class, they have to write a motivational letter of max. 100 words and send it via email to Achim.walter@usys.ethz.ch until (25.9.). Participants will be selected according to the following criteria:
  1.) Convincing motivational letter
  2 a) Agricultural science students of the BSc program, 5. Semester
  2 b) Students of other semesters or study programs, who will be selected with a view to forming four interdisciplinary and diverse teams. The definitive acceptance to the course will be communicated to students by (27.9.). The definitive inscription will subsequently been done by the study secretariate.

**Abstract**

Agriculture needs to become more sustainable via innovative approaches. This course allows students to explore in group work, how this could be realized. There are short impulse talks on ‘Smart Farming’ given by experts on technology, sustainability and entrepreneurship. Most importantly, students elaborate the first steps to create a startup company in this field.

751-4504-00L
Course description: Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems.

Week 1
The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrotrophs, disease cycles and pathogen life cycles.

Week 2
Nematode attack strategies and types of damage. Viral pathogens, classification, reproduction and transmission, attack strategies and types of damage. Examples TMV, BYDV. Bacterial pathogens and phytoplasmas, classification, reproduction and transmission.

Week 3
Bacterial attack strategies and symptoms. Example bacterial diseases: fire blight, Agrobacterium crown gall, soft rots. Fungal and oomycete pathogens, classification, growth and reproduction, sexual and asexual spores, transmission.

Week 4
Fungal and oomycete disease cycles, disease cycles, infection processes, colonization, phytoalexins and mycotoxins. Attack strategies of fungal necroctrophs and biotrophs. Symptoms and signs of fungal infection. Example fungal diseases: potato late blight.

Week 5
Example fungal diseases: wheat stem rust, grape powdery mildew, wheat septoria tritici blotch. Plant defense mechanisms, host range and non-host resistance, Passive structural and chemical defenses, preformed chemical defenses. Active structural defense, histological and cellular (papillae).

Week 6
Active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytoalexins and disease resistance. Pisatin and pisatin demethylase. Local and systemic acquired resistance (LAR, SAR), induced systemic resistance (ISR), signal molecules, defense activators (Bion). Pathogen effects on food quality. Positive and negative transformations.

Week 7

Week 8
Epidemiology: Disease pyramid, environmental effects on epidemic development, plant effects on development of epidemics, including resistance, physiology, density, uniformity.

Week 9
Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity. Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies, ELISA.

Week 10
Molecular detection and diagnosis of pathogens: PCR, rDNA and loop-mediated isothermal amplification. Strategies for minimizing disease risks: calculating disease thresholds, disease forecasting systems.

Week 11

Week 12

Week 13
Cultural control methods: fertilizers, crop rotations.

Week 14
Open lecture.

751-5003-00L
Lecture notes
Detailed lecture notes (~160 pages) will be available for purchase at the cost of reproduction at the start of the semester.

Subject-specific Competencies

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 11 of 2684
Abstract
This class conveys current topics and methods of agroecological and food systems research through selected case studies from ongoing research of the Sustainable Agroecosystems group. Students will be encouraged to develop critical thinking competencies, through individual and group work, on major agricultural and food system challenges and paths towards agricultural and food system transformation.

Objective
(1) Systematically analyse and discuss case studies from ongoing agroecological and food system research.
(2) Learn and experiment on methods for field and laboratory investigations in agroecology.
(3) Engage with positive and empowering frameworks that motivate critical reflection and action on the types of transformative responses needed to adapt and thrive within agricultural and food systems.
(4) Reflect critically on agricultural and food system transformation tools and methods from the perspective a food system stakeholder.
(5) Identify and describe institutions in the context of sustainable agricultural development (for Bachelor and Master thesis and internships).

Content
The course will address a wide range of agricultural and food system challenges (e.g. food security, climate crisis, soil degradation, etc.) in both temperate and tropical contexts. In class we will address topics like building food system resilience through innovative measures, improving soil fertility management or understanding the effects of agroforestry systems.

Case studies from the on-going research in the Sustainable Agroecosystems Group (sae.ethz.ch) will be presented, covering different scales (e.g. food value-chains, farm dynamics and soil management).

The class is complemented by practical group work conducted with the CSA Meh Als Gmues in Zürich on Measuring and monitoring Agroecological performance.

Students will gain an overview on institutions and actors’ roles in the field of sustainable agricultural development. Throughout the group work, students will learn to engage directly with various stakeholders, monitor agroecological transition and communicate their research to a wider audience. Ultimately, this class should provide an overview on methods, tools, innovations and platforms that support a sustainable food transformation.

Literature

Prerequisites / notice
Prior participation in the lecture Nachhaltige Agrarökosysteme I (Sustainable Agroecosystems I) 751-5000-00G (spring term) recommended.

751-4201-00L Horticulture W+ 2 credits 2V C. Carlen, A. Bühmann, A. NÄf, T. Schönberg, T. Verdenal

Abstract
The importance and specificities of the different horticultural crops are shown in this course in the autumn semester. It deals with fruit growing (8 h), berry production (4 h), vegetables (6 h) and viticulture (6 h).

Objective
You are able to describe the production systems of the horticultural crops fruits, berries, vegetables and viticulture (yield formation and physiology, cultivation methods, main varieties, quality factors).

You are able to assess the importance of new conditions (climate, politics, trade) for the production of horticultural crops and identify options for action for production.

Content
The importance and specificities of the different horticultural crops are shown in this course in the autumn semester. It deals with fruit growing (8 h), berry production (4 h), vegetable growing (6 h) and viticulture (6 h).

Under the responsibility of Agroscope representatives, basic knowledge of production systems (yield formation and physiology, cultivation methods, main varieties, quality) of these horticultural crops, which are important in Switzerland, is imparted.

Lecture notes
Delivered during the lectures by the different teachers, Moodle upload.

Literature
Not needed; maybe specific literature is specified by the different teachers.

Prerequisites / notice
Language and script: German or French, maybe selected parts in English.

751-6101-00L
Anatomy and Physiology of Humans and Animals I
0
2 credits
2V
S. E. Ulbrich, A.-K. Hankele, F. Trepp

Abstract
Imparts a basic understanding of physiology and anatomy in man and domestic animals, focusing on the interrelations between morphology and function of the organism, in particular of domestic animals. This is fostered by discussing all subjects from a functional point of view.

The lecture consists of two consecutive parts.

Objective
The overall goal of this course is to enable students to understand basic functions of the vertebrate organism and to comprehend pathophysiological correlations.

Lecture notes
Handouts are provided by each lecturer separately.

Literature
The lecturers will recommend additional literature at the beginning of the course.

Data: 06.08.2024 12:40 Autumn Semester 2024 Page 12 of 2684
### 751-7501-00L Introduction to Housing and Behaviour of Farm Animals

**Abstract**
The overall goal of this course is to provide general knowledge about the behaviour, housing and welfare of domestic animals.

**Objective**
Students will:
- Understand the basis of animal behaviour of farm animals
- Acquire knowledge of housing systems and management of domestic animals

**Content**

**Performance Assessment**: 1 final written examination (100% of grade)

**751-7101-00L Applied Animal Nutrition**

**W+ 2 credits 2G S. Müller, G. Bee, F. Leiber, M. Rombach, F. Sutter**

**Abstract**
The basics of planning of feeding and formulation of diets incl. the implications on nutrient cycles and balances are taught. In the part dealing with ruminants, forage-based diets and the application of feed formulation programs are central and exercised on-farm. With pigs and poultry, the basics of energy and nutrient requirements are deepened through practical examples.

**Objective**
The students are able, based on the knowledge they obtain in this course, to deal with problems in the nutrition of ruminants, pigs and poultry on farm.

**Content**

- Programmteil Wiederkäuer: Einführung in die Winterfütterungsplanung für Milchkühe, Betriebsbesuch (Erfassung aller notwendigen Daten inkl. Futterprobenentnahme für eine konkrete Planung auf einem Praxisbetrieb), Besonderheiten der Milchviehfütterung (Laktationsverlauf, Jahreszeit, etc.); Einführung in den LBL-Fütterungsplan, Möglichkeiten der Futterbeurteilung und -bewertung mit praktischer Beurteilung der gesammelten Proben, Berechnungen und Besprechung Fütterungsplan, Aufstellung der Mineralstoffbilanz, Vorführung von PC-Software zur Fütterungsplanung Vorstellen und diskutieren des Fütterungsplanes auf dem Praxisbetrieb durch die Gruppe.

- Programmteil Nicht-Wiederkäuer: Der Energie- und spezifische Nährstoffbedarf beim Schwein und Geflügel; Besonderheiten der Fütterung in den verschiedenen Produktionsphasen; Fütterungsempfehlungen und -hinweise. Rationengestaltung und -Rezeptoptimierung für Mischfuttermittel anhand verschiedener Beispiele; Einsatzgrenzen von Futtermittel; technologische Futterbearbeitung.

**Lecture notes**
Handouts in German language will be provided by each lecturer on the Moodle platform when starting his part of the lecture.

**Literature**
The Dozierenden geben in der Lehrveranstaltung die relevante Literatur bekannt.

**Prerequisites / notice**
Blockkurs in Halbtagesform; eingeschlossen sind Betriebsbesuche. Fach mit benoteter Semesterleistung.

**751-7103-00L Animal Feed and Feeding of Ruminants**

**W+ 2 credits 2V M. A. Boessinger, M. Rombach**

**Abstract**
The knowledge of the nutrition of ruminants and of the feeds used is deepened. Particular emphasis is put on the variety of home-grown feeds, their production and conservation and their application in the nutrition of dairy cows, cattle and small ruminants. Finally, information on specific problems of animal nutrition is communicated.
Objective
Purchase of basic skills in agricultural livestock nutrition.

Content

Lecture notes
Script is available in German language and will be provided by each lecturer when starting his part the lecture.

Literature
Eine Literaturliste ist im Skript enthalten.

Prerequisites / notice
Fach mit benoteter Prüfung am Ende der Lehrveranstaltung.

Objective
Zusammen mit nervaler Kontrolle, spielen Hormone und Zytokine als Signalmediatoren eine besondere Rolle bei der Regulation der Homöostase von Körperfunktionen (Flüssigkeits-, Temperatur-, Energie-Homöostase). Insbesondere im Zusammenhang mit pathologischen Konstellationen (Fieber, Stress, metabolische Imbalance, Schmerz) wird diese komplexe Funktion verständlich.

Objective

Objective
Students will get an introduction to the scientific work with data covering all steps from data import from Excel via statistical analyses to producing correct scientific graphical output. Exercises with the software R/RStudio will provide hands-on opportunities to get acquainted with data analysis and presentation in adequate graphs.

Objective
This lecture with exercises gives an introduction to the scientific work with data, starting with data acquisition and ending with statistical analyses as they are often required for a bachelor thesis (descriptive statistics, linear regression, simple analyses of variance etc.). Using open-source R/RStudio software will be the primary focus via a hands-on approach. An imporant aspect will be to learn which graphical representation of data are best suited for the task (how can data be presented clearly and still scientifically correct?)
Content
Tentative Programme:
- Introduction
- Introduction to ‘R’
- Data import and graphical presentation
- Correct and problematic graphical data displays
- Statistical distribution and confidence intervals
- Statistical tests - Repetition and hands-on applications
- Correlation analysis
- Linear regressions
- Analysis of Variance

Last week of semester: examination (Leistungskontrolle)

Lecture notes
German and English

Prerequisites / notice
Theoretical background in ensemble statistics from the mandatory course in the 4th semester; students should have cleared the examination of that fundamental course to be able to follow

751-1010-00L Introduction to Scientific Methods Part II: Scientific Writing
3 credits 4G

Abstract
Die Studierenden kennen die Grundlagen und die Konventionen des wissenschaftlichen Schreibens in den Naturwissenschaften, können wissenschaftliche Literatur suchen und verwalten sowie wissenschaftliche Publikationen analysieren. Sie setzen das Gelernte beim Schreiben eines eigenen Textes um.

Objective
Die Studierenden kennen die Grundlagen und die Konventionen des wissenschaftlichen Schreibens in den Naturwissenschaften. Sie setzen das Gelernte beim Schreiben eines kritischen Literaturberichtes zu einem agrarwissenschaftlichen Thema ihrer Wahl um. Die Lehrveranstaltung bereitet die Studierenden auf weitere schriftliche Arbeiten im Studium der Agrarwissenschaften vor, beispielsweise auf die Bachelor-Arbeit.

Lecture notes
Es wird ein Skript abgegeben.

Prerequisites / notice
Die Note für die LV Wissenschaftliches Arbeiten (Teil I: Grundlagen (WiA) und Teil II: Wissenschaftliches Schreiben (WiSch)) setzt sich aus den Leistungen der Lehrveranstaltungen im 4. und 5. Semester zusammen. Die Note für WiSch (5. Sem.) zählt zu 80% zur Gesamtnote.

751-0206-00L Applied Laboratory Techniques in Agricultural Sciences
3 credits 3P

Abstract
Die Lehrveranstaltung ist zweiteilig aus einem Laborpraktikum und einem angewandten Methodentraining aufgebaut. Im Laborpraktikum werden an 6 Kurstagen die wichtigsten Techniken der Molekularbiologie gelehrt. Das folgende Methodentraining findet an 5 Kurstagen im Block in einer der beteiligten Forschungsgruppen statt, um die wichtigsten Methoden aus dem jeweiligen Fachgebiet praxisnah anzuwenden.

Objective
- Aneignung von guter Laborpraxis (Sicherheit, Effizienz, Qualität und Dokumentation)
- Erlernen der wichtigsten Labor- und Feldmethoden in den Agrarwissenschaften sowie deren korrekte und sichere Anwendung
- Vertiefenes Verständnis von molekularen, physiologischen und biochemischen Prozessen in aktuellen agrarwissenschaftlichen Themenbereichen
- Aneignung von Kompetenzen für zukünftige Bachelor-, Master-, und Doktorarbeiten
- Kritische Beurteilung der angewandten Methoden für verantwortungsvolle Forschung
The electives listed are recommended.

However, electives can be chosen from the complete course offer of the ETH Zurich and University of Zurich.

| 751-0401-00L| Optimization of Agricultural Production Systems          | W    | 3    | 2G    | R. Huber  |
| Abstract    | Introduction in to optimization of agricultural production systems with linear and non-linear programming models. Students will be able to a) solve linear and non-linear optimization problems in the context of agricultural production; b) properly interpret the results; and c) critically discuss the economic implications. |
| Objective   | The course is an application of Operations Research (OR). First, the theory and application of linear programming (LP) is presented. Students will learn the underlying principles (Optimization, Duality, Simplex) and solve exercises in the context of agricultural production. In the second part of the course, the foundation of non-linear programming (NLP) is introduced (Lagrangian, Kuhn-Tucker) and illustrated with various examples. |

| 363-0537-00L| Resource and Environmental Economics                        | W    | 3    | 2G    | A. Miftakhova, A. Minabutdinov |
| Abstract    | Relationship between economy and environment, market failures, external effects and public goods, contingent valuation, internalisation of externalities, economics of non-renewable resources, economics of renewable resources, environmental cost-benefit analysis, sustainability economics, and international resource and environmental problems. |
| Objective   | A successful completion of the course will enable a thorough understanding of the basic questions and methods of resource and environmental economics and the ability to solve typical problems using appropriate tools consisting of concise verbal explanations, diagrams or mathematical expressions. Concrete goals are first of all the acquisition of knowledge about the main questions of resource and environmental economics and about the foundation of the theory with different normative concepts in terms of efficiency and fairness. Secondly, students should be able to deal with environmental externalities and internalisation through appropriate policies or private negotiations, including knowledge of the available policy instruments and their relative strengths and weaknesses. Thirdly, the course will allow for in-depth economic analysis of renewable and non-renewable resources, including the role of stock constraints, regeneration functions, market power, property rights and the impact of technology. A fourth objective is to successfully use the well-known tool of cost-benefit analysis for environmental policy problems, which requires knowledge of the benefits of an improved natural environment. The last two objectives of the course are the acquisition of sufficient knowledge about the economics of sustainability and the application of environmental economic theory and policy at international level, e.g. to the problem of climate change. |
### Content

The course covers all the interactions between the economy and the natural environment. It introduces and explains basic welfare concepts and market failure; external effects, public goods, and environmental policy; the measurement of externalities and contingent valuation; the economics of non-renewable resources, renewable resources, cost-benefit-analysis, sustainability concepts; international aspects of resource and environmental problems; selected examples and case studies. After a general introduction to resource and environmental economics, highlighting its importance and the main issues, the course explains the normative basis, utilitarianism, and fairness according to different principles. Pollution externalities are a deep core topic of the lecture. We explain the governmental internalisation of externalities as well as the private internalisation of externalities (Coase theorem). Furthermore, the issues of free rider problems and public goods, efficient levels of pollution, tax vs. permits, and command and control instruments add to a thorough analysis of environmental policy. Turning to resource supply, the lecture first looks at empirical data on non-renewable natural resources and then develops the optimal price development (Hotelling-rule). It deals with the effects of explorations, new technologies, and market power. When treating the renewable resources, we look at biological growth functions, optimal harvesting of renewable resources, and the overuse of open-access resources. A next topic is cost-benefit analysis with the environment, requiring measuring environmental benefits and measuring costs. In the chapter on sustainability, the course covers concepts of sustainability, conflicts with optimality, and indicators of sustainability. In a final chapter, we consider international environmental problems and in particular climate change and climate policy.

### Objective

- Students will be able to,
  - explain the decision-making processes underlying the purchasing process
  - describe the factors that have an influence on consumer behavior
  - develop strategies to influence purchasing behavior

### Abstract

- All students interested should come to the first lecture (23.9.). There, details of this year’s format will be explained. In case students are then still interested to visit the class, they have to write a motivational letter of max. 100 words and send it via email to achim.walter@usys.ethz.ch until (25.9.). Participants will be selected according to the following criteria:
  1.) Convincing motivational letter
  2 a) Agricultural science students of the BSc program, 5. Semester
  2 b) Students of other semesters or study programs, who will be selected with a view to forming four interdisciplinary and diverse teams. The definitive acceptance to the course will be communicated to students by (27.9.). The definitive inscription will subsequently been done by the study secretariate.

- All students interested should come to the first lecture (25th September). There, details of this year’s format will be explained. In case students are still interested to visit the class, they have to write a motivational letter of max. 100 words and send it via email to Achim.Walter@usys.ethz.ch until (27th September). Participants will be selected according to the following criteria:
  1.) Convincing motivational letter
  2 a) Agricultural science students of the BSc program, 5. Semester
  2 b) Students of other semesters or study programs, who will be selected with a view to forming four interdisciplinary and diverse teams. The definitive acceptance to the course will be communicated to students by (29th September). The definitive inscription will subsequently been done by the study secretariate.

### Prerequisites / notice

- Maximum number of students: 16 (four teams will be formed)

- During the course, the students generate their own ideas. They explore e.g., which technologies provide possibilities for a more sustainable agriculture. They simulate the creation of a startup company in this field.
Plant Pathology I

**Abstract**
Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems.

**Objective**
Students will understand: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies.

**Course description**
Course: Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems.

**Lecture Notes**
Detailed lecture notes (~160 pages) will be available for purchase at the cost of reproduction at the start of the semester.
Abstract
This class conveys current topics and methods of agroecological and food systems research through selected case studies from ongoing research of the Sustainable Agroecosystems group. Students will be encouraged to develop critical thinking competencies, through individual and group work, on major agricultural and food system challenges and paths towards agricultural and food system transformation.

Objective
(1) Systematically analyse and discuss case studies from ongoing agroecological and food system research.
(2) Learn and experiment on methods for field and laboratory investigations in agroecology.
(3) Engage with positive and empowering frameworks that motivate critical reflection and action on the types of transformative responses needed to adapt and thrive within agricultural and food systems.
(4) Reflect critically on agricultural and food system transformation tools and methods from the perspective a food system stakeholder.
(5) Identify and describe institutions in the context of sustainable agricultural development (for Bachelor and Master thesis and internships).

Content
The course will address a wide range of agricultural and food system challenges (e.g. food security, climate crisis, soil degradation, etc.) in both temperate and tropical contexts. In class we will address topics like building food system resilience through innovative measures, improving soil fertility management or understanding the effects of agroforestry systems. Case studies from the on-going research in the Sustainable Agroecosystems Group (see.ethz.ch) will be presented, covering different scales (e.g. food value-chains, farm dynamics and soil management).

The class is complemented by practical group work conducted with the CSA Meh Als Gnuus in Zürich on Measuring and monitoring Agroecological performance.

Literature

Prerequisites / notice
Prior participation in the lecture Nachhaltige Agrarökosysteme I (Sustainable Agroecosystems I) 751-5000-00G (spring term) recommended.

Competencies
Subject-specific Competencies
- Concepts and Theories: assessed
- Analytical Competencies: assessed
- Decision-making: fostered
- Problem-solving: assessed
- Project Management: fostered

Method-specific Competencies
- Communication: fostered
- Cooperation and Teamwork: assessed
- Self-presentation and Social Influence: fostered
- Sensitivity to Diversity: fostered
- Adaptability and Flexibility: fostered
- Creative Thinking: assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: fostered
- Self-awareness and Self-reflection: fostered
- Self-direction and Self-management: fostered

Social Competencies

Personal Competencies

751-7101-00L Applied Animal Nutrition

Abstract
The basics of planning of feeding and formulation of diets incl. the implications on nutrient cycles and balances are taught. In the part dealing with ruminants, forage-based diets and the application of feed formulation programs are central and exercised on-farm. With pigs and poultry, the basics of energy and nutrient requirements are deepened through practical examples.

Objective
The students are able, based on the knowledge they obtain in this course, to deal with problems in the nutrition of ruminants, pigs and poultry on farm.

Content
- Blockkurs in Halbtagesform; eingeschlossen sind Betriebsbesuche. Fach mit benoteter Semesterleistung.
- Programmteil Nicht-Wiederkäuer: Der Energie- und spezifische Nährstoffbedarf beim Schwein und Geflügel; Besonderheiten der Fütterung in den verschiedenen Produktionsphasen; Fütterungsempfehlungen und Hinweise. Rationengestaltung und Rezeptoptimierung für Mischtierfutter, Futteraufbau, Technologische Futterbearbeitung.

Lecture notes
Handouts in German language will be provided by each lecturer on the Moodle platform when starting his part of the lecture.

Literature
Handouts in German language will be provided by each lecturer on the Moodle platform when starting his part of the lecture.

Competencies
Social Competencies

- Cooperation and Teamwork:

Cooperation and Teamwork: fostered

751-7103-00L Animal Feed and Feeding of Ruminants

Abstract
The knowledge of the nutrition of ruminants and of the feeds used is deepened. Particular emphasis is put on the variety of home-grown feeds, their production and conservation and their application in the nutrition of dairy cows, cattle and small ruminants. Finally, information on specific problems of animal nutrition is communicated.

Objective
Purchase of basic skills in agricultural livestock nutrition.

Content

Lecture notes
Script is available in German language and will be provided by each lecturer when starting his part of the lecture.

Literature
Eine Literaturliste ist im Skript enthalten.

Prerequisites / notice
Fach mit benoteter Prüfung am Ende der Lehrveranstaltung.

**Abstract**
Zusammen mit nervaler Kontrolle, spielen Hormone und Zytokine als Signalmediatoren eine besondere Rolle bei der Regulation der Homöostase von Körperfunktionen (Flüssigkeits-, Temperatur-, Energie-Homöostase). Insbesondere im Zusammenhang mit pathologischen Konstellationen (Fieber, Stress, metabolische Imbalance, Schmerzen) wird diese komplexe Funktion verständlich.

**Objective**

**Content**
- Thermoregulation (Fieber)
- Flüssigkeits-Homöostase (Durchfall)
- Calciumregulation (Milchfieber)
- Energiehomöostase (Ketose)
- Schmerz (zootechnische Eingriffe)
- Stress (allostatische Last, Epigenetik)

**Abstract**
Agroecology is a discipline, an agricultural practice, and a political-social movement. Students will attend public lectures by experts from different fields and will reflect on agroecology and its principles. Moreover, students will expand their knowledge with case studies and discuss about the role of agroecology to support sustainable agriculture and food systems.

**Objective**
Students know the thirteen principles of the High-Level Panel of Experts (HLPE) of the Committee on World Food Security as well as the ten elements of agroecology suggested by FAO and can critically reflect on the important properties as well as benefits and trade-offs of agroecological systems and approaches.

Students will be able to transfer their disciplinary and interdisciplinary knowledge about the thirteen principles as guiding principles for policymakers, practitioners, and other stakeholders across the food system in planning, managing, and evaluating agroecological transformation. Students are part of small groups focusing on selected principles of the HLPE. During the course, students discuss the potential and limitations of agroecology and learn about scientific contributions to agroecology. Students form an opinion on the role of agroecology, reflect and argue on the different facets and develop recommendations for real-world applications of agroecology in supporting a transition towards sustainable food systems.

**Content**
The course is designed as a combination of public lectures/webinars on "Agroecology and the Transformation to Sustainable Food Systems" delivered by national and international experts and scientists as well as sessions in which students reflect on the topics addressed in the lecture series in a group work format. The public lectures bring different perspectives to the discussion and are intended as inputs for the students' sessions. In the student sessions, the student groups deepen their knowledge of the 13 principles of agroecology proposed by the High-Level Panel of Experts (HLPE) of the Committee on World Food Security. They identify "unknowns" and link to other closely related principles. The groups also work out the perspective of a chosen stakeholder. Finally, the groups will take part in a scientific discussion representing their stakeholder perspective. All groups will synthesize their discussions in a short report.

**Lecture notes**
Handouts will be available on the webpage of the course.
Prerequisites / notice
This course is based on fundamental knowledge about plant ecophysiology, soil science, biogeochemistry, crop and forage science, and ecology in general. The course will be taught in English. The course is only offered in fall.

Students apply the insights, abilities and skills they have acquired within the context of an educational institution. They observe 10 lessons fostered assessed - Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching. Teaching Internship Including Examination Lessons assessed Mentored Work Subject Didactics Agricultural Science - Students learn more about the potential and challenges of pupils. They get to know the early stages of knowledge as well as the development of pre-concepts of students in their subject area. The seminar with a phase of cooperation consists of three phases: In the block seminar, pre-concepts are discussed in their own subject as well as theoretical inputs from developmental and cognitive psychology. During the cooperation phase, a teaching task defined by the primary and secondary school teachers is actively undertaken in a class. Finally, a final report is written, which contains a description of the students’ level of knowledge. This seminar is only suitable for students who can adapt flexibly to the needs of pupils from lower class levels. **Abstract**

Students apply the insights, abilities and skills they have acquired within the context of an educational institution. They observe 10 lessons and teach 20 lessons independently. Two of them are as assessed as Examination Lessons.

**Objective**

- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics for their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They learn the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils’ work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

**Content**

The lengths and assignments of the internship are determined by the primary and secondary school teachers. The preparation of the teaching lessons is done by the students, following the didactic plan. The taught lessons are examined by the primary and secondary school teachers.

- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

**Abstract**

In the mentored work on their subject specialisation, students link high-school and university aspects of the subject, thus strengthening their teaching competence with regard to curriculum decisions and the future development of the tuition. They compile texts under supervision that are directly comprehensible to the targeted readers - generally specialist-subject teachers at high-school level.
Objective
The aim is for the students
- to familiarise themselves with a new topic by obtaining material and studying the sources, so that they can selectively extend their specialist competence in this way.
- to independently develop a text on the topic, with special focus on its mathematical comprehensibility in respect of the level of knowledge of the targeted readership.
- To try out different options for specialist further training in their profession.

**Abstract**
The course provides the scientific basis of the central aspects of reproduction and nutrition physiology of ruminants, and of the implications for animal health, product quality, and breeding programs. Means of knowledge transfer include interdisciplinary approaches, disciplinary parts, web-based learning and self-study.

**Objective**
At the end of the course the students are able to apply, by a comprehensive understanding of the underlying mechanisms, their knowledge in various fields of ruminant science. They will be able to develop and recommend best strategies for breeding programs, feed formulation, improving forage quality, and increasing animal health. They will be trained to carry out interdisciplinary and disciplinary research at the highest level.

**Content**
Fields (contact hours)
- Introduction: 2 h
- Special topics: 20 h
  - Rumen Anatomy
  - Hohenheim Gas Test
  - Calf health
  - Reproduction Techniques
  - Fertility in Cows
  - Disciplinary topics: 32 h
  - Ruminal Digestion: 8 h
  - Ruminant Nutrition Physiology: 12 h
  - Reproduction in Ruminants: 8 h
  - Lectures held by the students: 4 h

In summary
- Contact hours: 58 h
- Self-study within semester: 30 h (especially preparation for the interdisciplinary courses and the own lecture)
- Self-study in semester break: 32 h
Total: 120 h

**Lecture notes**
Documentations, links and other materials will be provided at the start of the course

**Literature**
Information on books and other references will be communicated during the course.

**Prerequisites / notice**
The specialty of this course is that for the first time the animal science disciplines are unified. This is realised with a particular emphasis on interdisciplinary special topics and new forms of teaching. At the same time the essential basics in the central fields are communicated.

Conditions for successful participation: Background on animal science from the Bachelor is desired. In order to attend the Minor in Ruminant Science without any animal science background, a realistic self-assessment concerning the need for additional self-study is recommended (e.g. by choosing an appropriate bachelor course which then may be counted as 'optional courses' in the master). These efforts depend on the extent to which animal science courses have already been attended in the bachelor.

The control of performance will consist of:
- an own short lecture
- a final oral examination with focus on comprehension of the fundamental linkages rather than of specific details

</tbody>
</table>

**Abstract**
This forum is a platform for the critical reflection of relevant topics of livestock in the frame of the world food system comprising issues from basic knowledge to acceptance in society. The exchange is operated by scientific writing and presentation.

**Objective**
In the Forum "Livestock in the World Food System", a topic of significance for livestock agriculture is selected by the students and subsequently dealt with from various angles (from scientific basis to production systems, environmental aspects and to the acceptance by society). The students learn to present a scientific subject in writing and orally to an audience and to defend the presentation in a discussion. Further, feedback is intended to improve the presentation style. Furthermore, the review process of a scientific paper will be demonstrated and applied.

**Content**
The Forum "Livestock in the World Food System" will take place in blocks of 2 hours each. Once the general topic has been selected, it comprises two parts:

**Part 1**
Aspect 1 - Oral presentation: The students form small groups and are lecturers.
Aspect 2 - chairperson: There are moderators which are chosen from outside of the presenting groups and they will lead the discussion and the remaining students and the lecturer are the audience and ask questions.
Aspect 3 - feedback: At the beginning, students form teams of 2, which are not in the same group, to give each other feedback on their presentation style.

**Part 2**
Aspect 1 - Scientific writing: Preparation of a critical review of a chosen publication and individual exchange with the lecturer.
Aspect 2 - Defense: There will be a discussion in small groups on several dates to discuss the chosen publication in detail and the observations during the process.

Introductions to both presentation forms will be given by the lecturer.

**Lecture notes**
no scriptum

**Prerequisites / notice**
Requirements for allocation of the two credit points:
- oral talk with sufficient handout
- delivery of the scientific writing in sufficient quality
- active participation during all presentations (in case of absence there will be additional tasks)
- feedback on the presentation style of a student
### Political Ecology of Food and Agriculture

**Number of participants limited to 25.**

All students who register will be on the waiting list. A motivational application is required until 6 September:

- presenting yourself and your studies
- stating what topic in the field of Political Ecology that you are interested in
- suggesting one paper to enrich the literature list for the course

The selected students will be notified until 9 September.

Questions regarding the application to

johanna.jacobi@usys.ethz.ch.

**Abstract**

In this seminar, students are introduced to the multi-disciplinary field of political ecology to investigate human-environment relationships in food and agricultural systems.

**Objective**

- Being able to provide an overview of the multi-disciplinary field of political ecology for investigating the relationships of humans to our environment
- Learn to identify how power and interest influence social-ecological systems and to distinguish symptoms from systemic root causes
- Become enabled to analyse complex and sometimes distant human-ecology relationships choosing from a broad range of methods

**Content**

We will review common narratives in agri-food systems informed by a range of different theories and assisted by different analytical tools. For this purpose, we will start from different concepts of nature, power and interests, explore different ontologies and epistemologies through a set of topics such as hunger, obesity, agrobiodiversity and seeds, forests and deforestation, climate change and food production. Students will explain one concept in each course to the groups and practice their argumentative and writing skills in a final essay, applying the acquired tools to a topic of their choice. While specific inputs from external lecturers broaden our perspective, enough time for critical discussion and reflection will be granted.

**Lecture notes**

20.9.2024 Introduction to political ecology
27.9.2024 Ontologies and epistemologies
4.10.2024 Green revolution, industrial agriculture, and agroecology
11.10.2024 Don't blame the rain: Water management in agriculture
18.10.2024 Climate justice and food systems
25.10.2024 Conservation: Protecting what from what?
1.11.2024 Deforestation: Root causes and alternatives
8.11.2024 Pandemics, syndemics and the food system
15.11.2024 Technology and the politics of knowledge
22.11.2024 Land-sharing, land-sparing
29.11.2024 Feminist (political) agroecology
6.12.2024 Food: Commons or commodity?
13.12.2024 Alternatives to sustainable development
20.12.2024 Final session (The Hunger Banquet)

**Literature**

Literaturelist provided on Moodle when the course starts.

### Endocrinology and Biology of Reproduction

**Abstract**

Endokrinologie und Reproduktionsbiologie der Säugetiere und des Menschen (Anatomie, Morphologie, Physiologie, Regelmechanismen) Die Systematik der Reproduktionshormone und der Hormonrezeptoren wird erläutert, die Wirkungsmechanismen (Bildung; orale Bioverfügbarkeit; Elimination) erklärt. Mit diesen Grundlagen wird das Verständnis der Regulation der Fortpflanzung umfassend erörtert.

**Objective**

Die Studierenden erlangen das grundlegende theoretische Verständnis und Fachwissen zur Endokrinologie der Reproduktion und zur weiblichen und männlichen Reproduktionsbiologie. Sie können darüber hinaus pathologische Situationen (Fortpflanzungsstörungen) und deren vielfältige Ursachen in den physiologischen Kontext einordnen.

Bioactive Feed Compounds and Enriched Food

Abstract
The course provides students with basic knowledge of the connection between plant secondary metabolites and their active roles in feed and food. It offers insights into active compounds in feed or their natural-identical equivalents and the resulting quality of animal-derived food, reporting practical examples.

Objective
The course aims to provide students with foundational knowledge of plant secondary metabolites and their roles in animal feed and food quality. Through an in-depth exploration of the structure and mechanisms of action of these compounds, students will gain insights into their practical applications in animal nutrition and the production of added-value or enriched food products.

Content
The course provides an overview of various types of bioactive components contained in both food and feedstuffs, including fatty acids and secondary plant metabolites such as polyphenols, terpenoids, carotenoids and saponins.

Subject-specific Competencies
- Distribution of bioactive compounds
- Sources of active compounds for animal feed
- Main mechanism of actions at animal or human levels
- Added value and enriched food products
- Advantages and disadvantages

Literature
Information about books and other references will be communicated during the course.

Bioactive Feed Compounds and Enriched Food

701-7310-00L

Breeding and Conservation of Animal Genetic Resources

Abstract
Animal genetic resources refer to the genetic and species diversity of livestock. Only a few production breeds have been further developed through breeding, while local breeds have no longer been able to survive in this competition. Without the support of endangered breeds and the sustainable breeding of productive breeds, many regionally typical breeds are threatened with extinction.

Objective
At the end of the course, students are able to assess the importance and problems of small ruminant breeding and husbandry in Switzerland and neighbouring countries. They know the most important breeding objectives and are able to assess them in terms of production and sustainable development in small ruminants and cattle.

Learning objectives part 2:
- The second part gives an overview of the distribution, endangerment and conservation of breed diversity of farm animals in Switzerland and internationally. The theory is illustrated with numerous examples and the knowledge is deepened in exercises.
- The students:
  - have an overview of the national and international distribution of animal genetic resources and are familiar with the database DAD-IS (Domestic Animal Diversity Information System).
  - can name the national and international efforts to conserve agricultural livestock breeds.
  - know how to describe genetic diversity.
  - can point out what is important in the management of small populations.
  - can describe different conservation measures, especially in situ and ex situ conservation.
  - can describe current national and international conservation programmes for different livestock breeds.
Prerequisites / notice
Examination:
Examination Part 1: Graded written examination (1 hour) on the material covered.
Examination Part 2: Graded semester performance completed during the block course.
Parts 1 and 2 contribute equally to the final grade.

751-6305-00L Livestock Breeding and Genomics W 3 credits 3G P. von Rohr
This course will be offered for the last time in autumn 2024.

Abstract
Swiss routine breeding value estimation/genetic evaluation systems of cattle, pig, sheep and goats are presented with methods and evaluated traits. Examples will be demonstrated using the statistical software R.

Objective
The students know the theoretical and practical application of breeding value estimation in Switzerland for cattle, pig, sheep and goats. The students are able to interpret estimated breeding values.

Content
- basic principles of genetic evaluations
- Swiss routine breeding value estimation/genetic evaluation systems of cattle, pig, sheep and goats
- methods and evaluated traits
- applied genetic evaluation in pigs (data, methods, traits)
- applied genetic evaluation in sheep and goats (data, methods, traits)

Lecture notes
Course notes in the form of a monograph, copies of the slides and solutions to the exercise questions are available.

Literature
To be announced in the lectures.

<td>Experimental Design and Applied Statistics in Agroecosystem Science</td>
<td>W</td>
<td>3</td>
<td>2G</td>
<td>A. Hund, C. Grieder, R. Kölliker</td>
</tr>
</tbody>
</table>

Abstract
Different experimental designs will be discussed and various statistical tools will be applied to research questions in agroecosystem sciences. Statistical methods range from simple analysis of variance to mixed-models and multivariate statistics. Surveys and manipulative field and laboratory experiments are addressed and students learn to analyse data using a hands-on approach.

Objective
Students will know various statistical analyses and their application to science problems in their study area as well as a wide range of experimental design options used in environmental and agricultural sciences. They will practice to use statistical software packages (R), understand pros and cons of various designs and statistics, and be able to statistically evaluate their own results as well as those of published studies.

Content
The course program uses a learning-by-doing approach ("hands-on minds-on"). The topics are introduced as short lectures, but most of the work is done on the computer using different packages of R – a software for statistical computing and graphics. In addition to contact hours exercises must be finalized and handed in for grading. The credit points will be given based on successful assessments of selected exercises.

The tentative schedule contains the following topics:
- Introduction to experimental design and applied statistics in R
- Data handling and data exploration with tidyverse
- Designs of field and growth chamber experiments
- Design creation with DiGGer
- Fitting linear mixed-effects models with lme4
- Marginal means estimation and post-hoc tests with emmeans
- Nonlinear regression fits
- Statistical learning techniques
- Principle component analysis, canonical correspondence analysis (CCA), cluster analysis
- Random forest

This course does not provide the mathematical background that students are expected to bring along when signing up to this course. Alternatively, students can consider some aspects of this course as a first exposure to solutions in experimental design and applied statistics and then deepen their understanding in follow-up statistical courses.

Lecture notes
Handouts will be available (in English)

Literature
A selection of suggested additional literature, especially for German speaking students will be presented in the introductory lecture.

Prerequisites / notice
This course is based on the course Mathematik IV: Statistik, passed in the 2nd year and the Bachelor's course "Wissenschaftliche Datenauswertung und Datenpräsentation" (751-0441-00L)

Competencies
- Subject-specific Competencies
  - Concepts and Theories

751-6003-00L Training Course in Research Groups (Large) W 6 credits 13P S. M. Bernal Ulloa, S. Neuenenschwander, M. Niu, H. Pausch, M. Saenz de Juano Ribes, S. E. Ulbrich

Abstract
The students will learn the conceptual and methodological background of research in the animal science groups of the Institute of Plant, Animal and Agroecosystem Science. In addition to teaching the theoretical background, the major aim of the course is to integrate the students into the research groups (on job training) and, hence, to focus on the practical application of the knowledge.
Objective
- Introduction into the conceptual and methodological basis of research
- Integration of the students into the research groups (on job training)
- Application of the gained knowledge

Content
The students will be integrated into the research groups day-to-day work and will thus deal with all aspects of scientific work. This comprises the planning (conceptually and logistically), execution (data collection, laboratory analyses) and evaluation (statistics, data presentation) of experiments as well as the basics of scientific writing (aim: later publication, Master thesis). The research topics and the range of methodologies vary between the animal science research groups in the Institute of Plant, Animal and Agroecosystem Sciences.

Lecture notes
None

Literature
Specific readings after enlisting in a particular research group.

Prerequisites / notice
The number of training slots in the various groups is limited. It is therefore highly recommended to contact the group leaders early enough (first come first serve).

The full integration in a research group often means to work on weekends. The total time budget is equivalent to about 180 hours. Active participation in group meetings (discussion, presentation) and short written reports about the work conducted are required for the 6 credit points. There are no grades, it is only pass or fail.

751-6003-00L Forum: Livestock in the World Food System W+ 2 credits 2S

S. Meese

Abstract
This forum is a platform for the critical reflection of relevant topics of livestock in the frame of the world food system comprising issues from basic knowledge to acceptance in society. The exchange is operated by scientific writing and presentation.

Objective
In the Forum "Livestock in the World Food System", a topic of significance for livestock agriculture is selected by the students and subsequently dealt with from various angles (from scientific basis to production systems, environmental aspects and to the acceptance by society).

The students learn to present a scientific subject in writing and orally to an audience and to defend the presentation in a discussion. Further, feedback is intended to improve the presentation style. Furthermore, the review process of a scientific paper will be demonstrated and applied.
Content

The Forum "Livestock in the World Food System" will take place in blocks of 2 hours each. Once the general topic has been selected, it comprises two parts:

Part 1
Aspect 1 - Oral presentation: The students form small groups and are lecturers.
Aspect 2 - chairperson: There are moderators which are chosen from outside of the presenting groups and they will lead the discussion and the remaining students and the lecturer are the audience and ask questions.
Aspect 3 - feedback: At the beginning, students form teams of 2, which are not in the same group, to give each other feedback on their presentation style.

Part 2.
Aspect 1 - Scientific writing: Preparation of a critical review of a chosen publication and individual exchange with the lecturer.
Aspect 2 - Defense: There will be a discussion in small groups on several dates to discuss the chosen publication in detail and the observations during the process.

Introductions to both presentation forms will be given by the lecturer.

751-5201-10L Tropical Cropping Systems, Soils and Livelihoods (with Excursion) W+ 5 credits 10G J. Six, K. Benabderrazik

IMPORTANT: Students who enroll for this course are strongly recommended to verify with lecturers from other courses whether their absence of two weeks may affect their performance in the respective courses.

Abstract
This course guides students in analyzing and comprehending tropical agroecosystems and food systems. Students gain practical knowledge of field methods, diagnostic tools and survey methods for tropical soils and agroecosystems. An integral part of the course is the two-week field project in the Mount Kenya Region, which is co-organized with the University of Embu (Kenya)

Objective
(1) Overview of the major land use systems in Tropical agroecosystems in several contexts Africa
(2) Interdisciplinary analysis of agricultural production systems
(3) Knowledge on methods to assess agroecological performance of a tropical agroecosystems
(4) Hands-on training on the use of field methods, diagnostic tools and survey methods.
(5) Gain practical knowledge on how to assess to climate resilience and farming systems.
(6) Collaboration in international students and stakeholders

Content
This course guides students in analyzing and comprehending tropical agroecosystems. Students of ETH Zürch will work together with the students from Embu University (Kenya) in an interdisciplinary and intercultural team. Students will focus on the Agroecological performance and climate resilience of diverse farming systems in the Mount Kenya Region.

From October 28th to November 11th, The students will take part in a field course in the Mount Kenya Region. Students will then gain practical knowledge on field, meeting several stakeholders of the agricultural and food systems and conducting various assessments related to climate resilience and farming systems.

Prerequisites / notice
We would require the students enrolled to the class to send a short cover letter (1-page max.) by September 18rd 2023, justifying your motivation to enroll to this class. A selection of 20 students will be done on the basis of the letters.

</table>
| Objective    | The educational objectives cover thematic, methodic as well as social and personal competencies:  
Thematic/methodic competencies:  
- Deepening of scientific knowledge in plant breeding  
- Critical evaluation of current challenges and new concepts in plant breeding  
- Promotion of collaboration and Master thesis projects with practical plant breeders  
Social/personal competencies:  
- Independent literature research to get familiar with the selected topic  
- Critical evaluation and consolidation of the acquired knowledge in an interdisciplinary team  
- Establishment of a scientific presentation in an interdisciplinary team  
- Presentation and discussion of the teamwork outcome  
- Establishing contacts and strengthening the network to national and international plant breeders and scientist |
| Content      | Interesting topics related to plant breeding will be selected in close collaboration with the working group for plant breeding of the Swiss Society of Agronomy (SSA). |
| Lecture notes| None |
| Literature   | Peer-reviewed research articles, selected according to the topic. |
| Prerequisites / notice | Participation in the BSc course 'Pflanzenzüchtung' is strongly recommended, a completed course in 'Molecular Plant Breeding' is advantageous. |
| Competencies | Subject-specific Competencies: Concepts and Theories assessed, Techniques and Technologies assessed, Analytical Competencies assessed, Decision-making assessed, Media and Digital Technologies assessed, Problem-solving assessed, Project Management assessed, Communication assessed, Cooperation and Teamwork assessed, Customer Orientation assessed, Leadership and Responsibility fostered, Self-presentation and Social Influence fostered, Sensitivity to Diversity assessed, Negotiation assessed |
|             | Method-specific Competencies: Analytical Competences assessed, Decision-making assessed, Media and Digital Technologies assessed, Problem-solving assessed, Project Management assessed |
|             | Social Competencies: Communication assessed, Cooperation and Teamwork assessed, Customer Orientation assessed, Leadership and Responsibility fostered, Self-presentation and Social Influence fostered, Sensitivity to Diversity assessed, Negotiation assessed |
|             | Personal Competencies: Adaptability and Flexibility fostered, Creative Thinking assessed, Critical Thinking assessed, Integrity and Work Ethics assessed, Self-awareness and Self-reflection assessed, Self-direction and Self-management fostered |

<tr>
<td>Abstract</td>
<td>This is an introductory class on insect ecology. During the course you will learn about insect interactions with, and adaptations to, their environment and other organisms, and the importance of insect roles in our ecosystems. This course includes in-person lectures, small group discussions and outside readings.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>The aim of the course is for you to be able to describe examples of insect interactions and evaluate their impact on broader ecosystems. Important topics include: insect-plant interactions, chemical ecology, predator-prey interactions, vectors of disease, social insects, mutual and parasitic interactions, and examining insect ecology in an evolutionary context.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Lecture notes</td>

<tr>
<td>Abstract</td>
<td>The course focuses on alien organisms in agriculture as well as the scientific assessment and regulatory management of their effects on the environment and agricultural production.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>Students will understand the consequences arising from the unintentional or deliberate introduction of alien organisms into agricultural systems. They will be able to understand the concept of environmental risk assessment and be able to evaluate risk management options.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>Alien organisms in agriculture is a topic that receives an increasing awareness among farmers, agricultural scientists, regulators and the general public. Students of this course will learn about the nature of alien organisms such as invasive species, biocontrol organisms and genetically modified organisms. With a particular focus to understanding plants and their interactions we will look at the potential threats the novel organisms pose, the benefits they provide and how both of these effects can be scientifically assessed. Students will learn how the topic of alien organisms in agriculture is intrinsically tied to policy making and regulation and get to know current examples and future challenges in research. In the last part of the course students will be able to apply the acquired knowledge in a practical exercise (case study).</td>
<td></td>
<td></td>
<td></td>

**Concepts and Theories**

**Biogeochemistry and Sustainable Management**

T-3 3 credits 2G I. Feigenwinter, N. Buchmann, K.-M. Kohonen

**Abstract**

This course focuses on the interactions between ecology, biogeochemistry and management of agro- and forest ecosystems, thus, coupled human-environmental systems. Students learn how human impacts on ecosystems via management or global change are mainly driven by effects on biogeochemical cycles and thus ecosystem functioning, but also about feedback mechanisms of terrestrial ecosystems.

**Objective**

Students will analyse and understand the complex and interacting processes of ecology, biogeochemistry and management of agroecosystems. They will use their theoretical knowledge in two flipped classroom exercises, but also set up a small weather station and program a data logger to collect meteorological variables, analyze large meteorological and flux data sets, and evaluate the impacts of weather events and management practices on the ecosystem greenhouse gas exchange. Thus, students will expand their computational competences. Moreover, students will be able to coordinate and work successfully in small (interdisciplinary) teams.

**Content**

Students will gain profound knowledge about biogeochemical cycles and greenhouse gas fluxes in managed grassland and/or cropland ecosystems as well as expand their computational competences. Responses of agroecosystems to the environment, i.e., to climate and weather events, but also to management will be studied. Two flipped class-room exercises include the assessment of an ecosystem disturbance and the experimental design of an own study. Dataloggers will be programmed, and a small weather station will be set up. Different meteorological and greenhouse gas flux data will be analysed (using R) and assessed in terms of production, greenhouse gas budgets, and carbon sequestration. Thus, students will learn how to collect, analyse and interpret data about the complex interactions of a coupled human-environmental system.

Students will work in groups (3-4 persons per group) with data from a small weather station (dedicated to the course), as well as data from the long-term measurement network Swiss FluxNet and from global databases. Data from the intensively managed grassland site Chamau will be used to investigate the biosphere-atmosphere exchange of CO₂, H₂O, N₂O and CH₄. Functional relationships will be identified, greenhouse gas budgets will be calculated for different time periods and in relation to management over the course of a year.

**Lecture notes**

Handouts will be available in moodle.

**Prerequisites / notice**

Prerequisites: Attendance of introductory courses in plant ecophysiology, ecology, and grassland or forest sciences. Knowledge of data analyses in R and statistics. Course will be taught in English.

**Chemical Nature of Nutrients and their Availability to Plants: The Case of Phosphorus**

T-3 3 credits 2G E. Frossard

**Abstract**

The CNNAP course teaches the mechanistic relationships between nutrient speciation in fertilizer and nutrient uptake by plants using phosphorus as an example. The course involves theoretical aspects of nutrient cycling, laboratory work, data analysis and presentation, and the use of advanced methods in plant nutrition studies.

At the end of the CNNAP course, participants will obtain a mechanistic understanding of why and how the speciation of phosphorus in fertilizer can affect its release to the soil solution and subsequent uptake by plants. Students will be able to use this information for the development of fertilization schemes that maximize the nutrient uptake and fertilizer efficiency of crops or pastures. During the course, participants will become familiar with the use of radioisotopes and nuclear magnetic resonance as approaches to measure nutrient availability and forms, respectively and they will know the limits of these techniques. Students will also have the opportunity to improve their laboratory, presentation, discussion and writing skills.

**Lecture notes**

Documents will be distributed during the lecture.

**Literature**

Documents will be distributed during the lecture.

**Prerequisites / notice**

The CNNAP lecture will take place at the ETH experimental station in Eschikon Lindau every second year. The next course will be organized in autumn 2024. The CNNAP course will take place if and only if 8 or more students are registered one week before the start. See the location of the station at: http://www.plantnutrition.ethz.ch/the-group/how-to-find-us.html

We strongly advise students who are planning to be absent for more than one week during the semester NOT to visit this course. Students should have visited the plant nutrition lectures in the 3rd and 6th semesters and the lecture pedosphere in the 3rd semester of the agricultural study program of the ETH. If students do not have visited these courses they will have to acquire the necessary information by themselves as this knowledge is indispensable for the CNNAP course.

As the CNNAP course does not take place in autumn 2023, we recommend students interested in integrated assessment of nutrient cycling in soil plant systems to visit the 8th semester lecture 751-3404-00L (Nutrient Fluxes in Soil-Plant Systems: The Case of Nitrogen) organized in spring 2024 by Oberson et al.
Stable Isotope Ecology of Terrestrial Ecosystems

Abstract
This course provides an overview about the applicability of stable isotopes (carbon 13C, nitrogen 15N, oxygen 18O and hydrogen 2H) to process-oriented ecological research. Topics focus on stable isotopes as indicators for the origin of pools and fluxes, partitioning of composite fluxes as well as to trace and integrate processes. In addition, students carry out a small project during lab sessions.

Objective
Students will be familiar with basic and advanced applications of stable isotopes in studies on plants, soils, water and trace gases, know the relevant approaches, concepts and recent results in stable isotope ecology, know how to combine classical and modern techniques to solve ecophysiological or ecological problems, learn to design, carry out and interpret a small IsoProject, practice to search and analyze literature as well as to give an oral presentation.

Content
The analyses of stable isotopes often provide insights into ecophysiological and ecological processes that otherwise would not be available with classical methods only. Stable isotopes proved useful to determine origin of pools and fluxes in ecosystems, to partition composite fluxes and to integrate processes spatially and temporally.

This course will provide an introduction to the applicability of stable isotopes to ecological research questions. Topics will focus on carbon (13C), nitrogen (15N), oxygen (18O) and hydrogen (2H) at natural isotope abundance and tracer levels. Lectures will be supplemented by intensive laboratory sessions, short presentations by students and computer exercises.

Lecture notes
Handouts will be available on the webpage of the course.

Literature
Will be discussed in class.

Prerequisites / notice
This course is based on fundamental knowledge about plant ecophysiology, soil science, and ecology in general. Course will be taught in English.

Seminar in Plant Sciences

Number Title Type ECTS Hours Lecturers
751-5115-00L Current Aspects of Nutrient Cycle in Agro-Ecosystems W+ 2 credits 1S E. Frossard, A. Oberson Dräyer

Abstract
The seminar concerns current aspects and research related to nutrient cycles in agro-ecosystems. The theme of the next seminar is “Integrated Nutrient Management to maximize nutrient use efficiency in productive agricultural systems: Insights from long-term field experiments”.

Objective
Analyze publications and/or data records on long-term field experiments regarding their content on integrated nutrient management and derive the nutrient use efficiency; link this information, write it up in a report and present the results in an oral presentation; work in a group; ask questions and contribute to the discussion following the oral presentations; link the information to answer overarching questions and recommendations; expand the knowledge on nutrient cycles and nutrient management in the agro-ecosystem; learn about the importance of long-term field experiment to answer questions on the sustainability of agricultural systems.

Content
The seminar concerns current aspects and research related to nutrient cycles in agro-ecosystems. The theme of the next seminar is “Integrated Nutrient Management to maximize nutrient use efficiency in productive agricultural systems: Insights from long-term field experiments”. The students will analyze and connect the results published (or from data records) for selected field experiments in a group work. They will present their analysis in a report and in an oral presentation. The seminar is composed by presentations of experts and of the students. The presentations will be synthesized during a final discussion.

751-4003-01L Current Topics in Grassland Sciences (autumn)

W+ 2 credits 2S N. Buchmann

Abstract
Research results in agro- and forest ecosystem sciences will be presented by experienced researchers as well as by doctoral and graduate students. Citation classics as well as recent research results will be discussed. Topics will range from plant ecophysiology, biodiversity and biogeochemistry to management aspects in agro- and forest ecosystems.

Objective
Students will be able to understand and evaluate experimental design and data interpretation of on-going studies, be able to critically analyze published research results, practice to present and discuss results in the public, and gain a broad knowledge of recent research and current topics in agro- and forest ecosystem sciences.

Content
Research results in agro- and forest ecosystem sciences will be presented by experienced researchers as well as by doctoral and graduate students. Citation classics as well as recent research results will be discussed. Topics will range from plant ecophysiology, biodiversity and biogeochemistry to management aspects in agro- and forest ecosystems.

Lecture notes

751-2105-00L Political Ecology of Food and Agriculture

W+ 3 credits 2G J. Jacobi

Abstract
In this seminar, students are introduced to the multi-disciplinary field of political ecology to investigate human-environment relationships in food and agricultural systems.

Objective
- Being able to provide an overview of the multi-disciplinary field of political ecology for investigating the relationships of humans to our environment
- Learn to identify how power and interest influence social-ecological systems and to distinguish symptoms from systemic root causes

Content
We will review common narratives in agri-food systems informed by a range of different theories and assisted by different analytical tools. For this purpose, we will start from different concepts of nature, power and interests, explore different ontologies and epistemologies through a set of topics such as hunger, obesity, agrobiodiversity and seeds, forests and deforestation, climate change and food production. Students will explain one concept in each course to the groups and practice their argumentative and writing skills in a final essay, applying the acquired tools to a topic of their choice. While specific inputs from external lecturers broaden our perspective, enough time for critical discussion and reflection will be granted.

Lecture notes
20.9.2024 Introduction to political ecology

<td>Experimental Design and Applied Statistics in Agroecosystem Science</td>
<td>O</td>
<td>3 credits</td>
<td>2G</td>
<td>A. Hund, C. Grieder, R. Kolliker</td>
</tr>
</tbody>
</table>

**Abstract**

Different experimental designs will be discussed and various statistical tools will be applied to research questions in agroecosystem sciences. Statistical methods range from simple analysis of variance to mixed-models and multivariate statistics. Surveys and manipulative field and laboratory experiments are addressed and students learn to analyse data using a hands-on approach.

**Objective**

Students will know various statistical analyses and their application to science problems in their study area as well as a wide range of experimental design options used in environmental and agricultural sciences. They will practice to use statistical software packages (R), understand pros and cons of various designs and statistics, and be able to statistically evaluate their own results as well as those of published studies.

**Content**

The course program uses a learning-by-doing approach (“hands-on minds-on”). The topics are introduced as short lectures, but most of the work is done on the computer using different packages of R – a software for statistical computing and graphics. In addition to contact hours exercises must be finalized and handed in for grading. The credit points will be given based on successful assessments of selected exercises.

The tentative schedule contains the following topics:
- Introduction to experimental design and applied statistics in R
- Data handling and data exploration with tidyverse
- Designs of field and growth chamber experiments theory
- Design creation with DiGGer
- Fitting linear mixed-effects models with lme4
- Marginal means estimation and post-hoc tests with emmeans
- Nonlinear regression fits
- Statistical learning techniques
- Principle component analysis, canonical correspondence analysis (CCA), cluster analysis
- Random forest

This course does not provide the mathematical background that students are expected to bring along when signing up to this course. Alternatively, students can consider some aspects of this course as a first exposure to solutions in experimental design and applied statistics and then deepen their understanding in follow-up statistical courses.

**Lecture notes**

Handouts will be available (in English)

**Literature**

A selection of suggested additional literature, especially for German speaking students will be presented in the introductory lecture.

**Prerequisites / notice**

This course is based on the course Mathematik IV: Statistik, passed in the 2nd year and the Bachelor's course “Wissenschaftliche Datenauswertung und Datenpräsentation” (751-0441-00L)

**Competencies**

| Subject-specific Competencies | Concepts and Theories | assessed

**Title**

Tropical Cropping Systems, Soils and Livelihoods (with Excursion)

**W+** 5 credits 10G J. Six, K. Benabderrazik

**Abstract**

This course guides students in analyzing and comprehending tropical agroecosystems and food systems. Students gain practical knowledge of field methods, diagnostic tools and survey methods for tropical soils and agroecosystems. An integral part of the course is the two-week field project in the Mount Kenya Region, which is co-organized with the University of Embu (Kenya)

**Objective**

1. Overview of the major land use systems in Tropical agroecosystems in several contexts Africa
2. Interdisciplinary analysis of agricultural production systems
3. Knowledge on methods to assess agroecological performance of a tropical agroecosystems
4. Hands-on training on the use of field methods, diagnostic tools and survey methods.
5. Gain practical knowledge on how to assess to climate resilience and farming systems.
6. Collaboration in international students and stakeholders

**Content**

This course guides students in analyzing and comprehending tropical agroecosystems. Students of ETH Zürich will work together with the students from Embu University (Kenya) in an interdisciplinary and intercultural team. Students will focus on the Agroecological performance and climate resilience of diverse farming systems in the Mount Kenya Region.

From October 28th to November 11th, The students will take part in a field course in the Mount Kenya Region. Students will then gain practical knowledge on field, meeting several stakeholders of the agricultural and food systems and conducting various assessments related to climate resilience and farming systems.

**Prerequisites / notice**

We would require the students enrolled to the class to send a short cover letter (1-page max.) by September 18rd 2023, justifying your motivation to enroll to this class. A selection of 20 students will be done on the basis of the letters.

</table>
The course consists of two blocks: First, students will learn the basics of how to design, implement and interpret agricultural policy evaluations. In this block, the conceptual embedding, the design and methodological tools as well as case studies are presented. Secondly, the science-policy interface of policy evaluations (econometrics, modelling etc.). They make hands-on experiences of methodological challenges. 4) They can critically assess their theoretical and empirical knowledge to Swiss case studies.

Students can transfer their methodological knowledge from other agricultural economics courses to the context of agricultural policy evaluations. 2) They know the basics of how to design and implement a policy evaluation study. 3) They understand and apply the principles of scientific based evaluations of agricultural policies.

Corporative Sustainability is the flagship course of the Group for Sustainability and Technology at D- MTEC. In this course, students learn about key concepts in corporate sustainability and develop skills to implement them in the real world. The course prepares students for making well-informed sustainability decisions in their future careers.

For part of the course, students work in groups to complete a set of graded assignments designed to guide them into a deep dive on a selected corporate sustainability challenge. Please note that full participation in this part is essential, so make sure you are available. Furthermore, these group assignments count towards the overall grade for the course.

For further details on the course structure etc. visit the following link: http://www.sustec.ethz.ch/teaching/lectures/corporate-sustainability.html

The course addresses environmental policies, focusing on new steering approaches, which are generally summarized as environmental governance. The course also provides students with tools to analyze environmental policy processes and assesses the key features of environmental governance by examining various practical environmental policy examples.
Objective
To understand how an environmental problem may (not) become a policy and explain political processes, using basic concepts and techniques from political science.

To analyze the evolution as well as the key elements of environmental governance.

To be able to identify the main challenges and opportunities for environmental governance and to critically discuss them with reference to various practical policy examples.

Content
Improvements in environmental quality and sustainable management of natural resources cannot be achieved through technical solutions alone. The quality of the environment and the achievement of sustainable development strongly depend on human behavior and specifically the human uses of nature. To influence human behavior, we rely on public policies and other societal rules, which aim to steer the way humans use natural resources and their effects on the environment. Such steering can take place through government intervention alone. However, this often also involves governance, which includes the interplay between governmental and non-governmental actors, the use of diverse tools such as emission standards or financial incentives to steer actors’ behavior and can occur at the local, regional, national or international level.

In this course, we will address both the practical aspects of as well as the scientific debate on environmental governance. The course gives future environmental experts a strong basis to position themselves in the governance debate, which does not preclude government but rather involves a spectrum from government to governance.

Key questions that this course seeks to answer: What are the core characteristics of environmental challenges from a policy perspective? What are key elements of ‘environmental governance’ and how legitimate and effective are these approaches in addressing persistent environmental challenges?

Furthermore, we encourage the development of soft skills by engaging students in activities such as moderating discussions in class, presenting own proposals, giving regular peer feedback, as well as critically reflecting on various relevant publications in the environmental governance domain.

Lecture notes
Lecture slides, a script and additional course material will be provided on Moodle.

Prerequisites / notice
A detailed course schedule will be made available at the beginning of the semester.
During the lecture we will work with Moodle. We ask that all students register themselves on this platform before the lecture.

We recommend that students have (a) three-years BSc education of a (technical) university; (b) successfully completed Bachelor introductory course to environmental policy (Entwicklungen nationaler Umweltpolitik (or equivalent)) and (c) familiarity with key issues in environmental policy and some fundamental knowledge of one social science or humanities discipline (political science, economics, sociology, history, philosophy, psychology).

Development and International Policy

Number Title Type ECTS Hours Lecturers
751-2103-00L Socioeconomics of Agriculture W+ 2 credits 2V S. Mann

Abstract
The main part of this lecture will examine constellations where hierarchies, markets or cooperation have been observed and described in the agricultural sector. On a more aggregated level, different agricultural systems will be evaluated in terms of main socioeconomic parameters like social capital or perceptions.

Objective
Students should be able to describe the dynamics of hierarchies, markets and cooperation in an agricultural context.

Content
Introduction to Sociology
Introduction to Socioeconomics
Agricultural Administration: Path dependencies and efficiency issues
Power in the Chain
The farming family
Occupational Choices
Market segregation
The issue of meat demand
Common Resource Management in Alpine Farming
Agricultural Cooperatives
Societal perceptions of agriculture
Perceptions of farming from within
Varieties of agricultural systems and policies

Lecture notes

Literature
see script

Prerequisites / notice
Basic economic knowledge is expected.
International Development Cooperation

**851-0626-01L**

**International Development Cooperation**

*Does not take place this semester.*

**W+** 2 credits 2V  I. Günther

- **Abstract**: The course gives economic and empirical foundations for a sound understanding of the instruments, prospects and limitations of international development aid.
- **Objective**: Students have a theoretically and empirically sound understanding of the prospects and limitations of international development aid. Students are able to critically discuss the various aid instruments of bi- and multilateral donors and NGOs.
- **Content**: Introduction to the Determinants of Underdevelopment; History of Aid; Aid and Development: Theories and Empirics; Political Economy of Aid; Experience and Impact of Aid; New Instruments of Aid: e.g. Micro-Finance, Budget-Support; Fair-Trade.
- **Literature**: Reading materials and book abstracts will be uploaded to a course website.

International Environmental Politics

**860-0023-00L**

**International Environmental Politics**

*Particularly suitable for students of D-ITET, D-USYS.*

**W+** 3 credits 2V  T. Bernauer

- **Abstract**: This course deals with how and why international problem-solving efforts (cooperation) in environmental politics emerge and evolve, and under what circumstances such efforts are effective. Based on concepts, theories, and methods of political economy, political science, and public policy, various examples of international environmental policy-making are examined.
- **Objective**: The objectives in this course are to (1) gain an overview of important questions in international environmental politics from a social sciences viewpoint; (2) learn to identify interesting/innovative questions in this policy area and how to address them in a conceptually and methodologically meaningful and insightful way; (3) gain an overview of important global and regional environmental problems and how they are or could be solved.
- **Content**: This course deals with how and why international problem-solving efforts (cooperation) in environmental politics emerge and evolve, and under what circumstances such efforts are effective. Based on concepts, theories, and methods of political economy, political science, and public policy, various examples of international environmental policy-making are examined; for example international efforts to reduce air pollution, manage international water resources, mitigate and adapt to global warming, protect the stratospheric ozone layer, address biodiversity challenges, deal with plastic waste, and prevent pollution of the oceans.
- **Lecture notes**: Reading materials and slides will be available via Moodle.
- **Literature**: Reading materials and slides will be available via Moodle.
- **Prerequisites / notice**: The course is open to all ETH students and visiting students from other universities. Participation does not require previous coursework in the social sciences or environmental policy. Most meetings in this course will take place on campus (ETH Main Building, HG F.3). There will be no live-streaming, and the course is not in hybrid (on-campus plus online) format. However, the lecture will be recorded (slides and voice, no video) and the recordings will be made available via the Moodle platform for this course a few days after the respective lecture for students who are unable to attend in person. All electronic correspondence will take place via the ETH mystudies system and Moodle, so please make sure you are properly registered there with a functioning email address/account.

**Competencies**

- **Subject-specific Competencies**
  - Concepts and Theories: assessed
  - Techniques and Technologies: assessed
- **Method-specific Competencies**
  - Analytical Competencies: assessed
- **Social Competencies**
  - Cooperation and Teamwork: assessed
- **Personal Competencies**
  - Critical Thinking: assessed

Credits and Exam

After passing a written test at the end of the course (requirement; grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test). Visiting students (e.g., from the University of Zurich, exchange students) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory. Students who obtain a grade of < 4.0 for the test will have a second chance (see table below). Students who did not participate in the test on 16 December 2024 will not have access to the repeat test unless they submit compelling and documented (e.g., medical, other exam in parallel at ETH) reasons for why they are/were unable to participate in the first test. The test covers all contents of the lectures and the reading assignments. No separate registration for the exam is required, registration for the course as such covers everything. The exam will take place on campus, most likely in HG F.3. That is, you must be present in person at ETH Zurich on the exam date/time.

**Political Ecology of Food and Agriculture**

**751-2105-00L**

**Political Ecology of Food and Agriculture**

*W+* 3 credits 2G  J. Jacobi

- **Abstract**: In this seminar, students are introduced to the multi-disciplinary field of political ecology to investigate human-environment relationships in food and agricultural systems.
- **Objective**: - Being able to provide an overview of the multi-disciplinary field of political ecology for investigating the relationships of humans to our environment
  - Learn to identify how power and interest influence social-ecological systems and to distinguish symptoms from systemic root causes
  - Become enabled to analyse complex and sometimes distant human-ecology relationships choosing from a broad range of methods
- **Content**: We will review common narratives in agri-food systems informed by a range of different theories and assisted by different analytical tools. For this purpose, we will start from different concepts of nature, power and interests, explore different ontologies and epistemologies through a set of topics such as hunger, obesity, agrobiodiversity and seeds, forests and deforestation, climate change and food production.

**Prerequisites / notice**

- **Competencies**
  - Subject-specific Competencies
    - Concepts and Theories: assessed
  - Method-specific Competencies
    - Analytical Competencies: assessed
  - Personal Competencies
    - Creative Thinking: assessed
    - Critical Thinking: assessed

**Literature**

- Articles and book abstracts will be uploaded to a course website.

**Credits and Exam**

- **Students who obtain a grade of < 4.0 for the test will have a second chance (see table below). Students who did not participate in the test on 16 December 2024 will not have access to the repeat test unless they submit compelling and documented (e.g., medical, other exam in parallel at ETH) reasons for why they are/were unable to participate in the first test. The test covers all contents of the lectures and the reading assignments. No separate registration for the exam is required, registration for the course as such covers everything. The exam will take place on campus, most likely in HG F.3. That is, you must be present in person at ETH Zurich on the exam date/time.**
Methodology Competences

Methods in Agricultural Economics

<table>

<td>3 credits</td>
<td>2G</td>
<td>S. Tillmanns</td>
</tr>
<tr>
<td>Abstract</td>
<td>In this class, students learn how to understand and conduct empirical research. It will enable them to manage a business based on evidence-based decision-making. The class includes assignments related to the lecture content.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>The general objective of the course is to enable students to understand the basic principles of empirical studies. After successfully passing the class, they will be able to formulate research questions, design empirical studies, and analyze data by using basic statistical approaches.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>Data has become an important resource in today's business environment, which can be used to make better management decisions. However, evidence-based decision-making comes along with challenges and requires a basic understanding of statistical approaches. Therefore, this class introduces problems and key concepts of empirical research, which might be qualitative or quantitative in nature. Concerning qualitative research, students learn how to conduct and evaluate interviews. In the area of quantitative research, they learn how to apply measurement and scaling methods and conduct experiments. In addition, basic statistical analyses like a variance analysis and how to conduct it in a standard statistical software package like SPSS or R are also part of the lecture. The lessons learned from the lecture will empower students to critically assess the quality and outcomes of studies published in the media and scientific journals, which might form a basis of their managerial decision-making. We recommend the lecture also to students without basic statistical skills, who plan to attend more advanced lectures in the field of artificial intelligence such as Marketing Analytics. The lecture will be taught in presence. There will be individual assignments that students have to solve throughout the lecture. In addition to that, there will be some non-mandatory online exercises as an additional opportunity to prepare for the exam.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Literature</td>
<td>Literature and readings will be announced. For a basic understanding we recommend the Handbook of Good Research by Jürgen Brock and Florian von Wangenheim.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Prerequisites / notice</td>
<td>The course includes out-of-class assignments to give students some hands-on experience in conducting empirical research in management. Projects will focus on one particular aspect of empirical research, like the formulation of a research question or the design of a study. Assignments will be graded and need to be turned in on time as they will be shown and discussed in class. Class participation is encouraged and can greatly improve students' learning. In this spirit, students are expected to attend class regularly and come to class prepared.</td>

<td>363-0585-00L</td>
<td>Intermediate Econometrics</td>
<td>W+</td>
<td>3 credits</td>
<td>2V</td>
<td>S. Stefanova</td>
</tr>
<tr>
<td>Abstract</td>
<td>The aim of the course is to discuss different econometric models and their empirical applications. We will cover cross-sectional linear and non-linear regression models, models for estimating treatment effects, and linear panel data models.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>By the end of the course, students should understand the different existing approaches, their applicability, and their advantages and disadvantages. They should be able to read and understand regression output tables. Additionally, students will be able to apply the estimation approaches in practice using STATA.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
The lectures will consist of both theoretical and practical components. In the theoretical part, we will discuss each estimation approach in detail. The lecture will present the assumptions, derivations, as well as the advantages and disadvantages of the estimation approach.

In the empirical part, we will look at simulation results using artificial data. Furthermore, we will investigate a particular research question using STATA.

The course will tentatively cover the following subjects:
- review of ordinary least squares (OLS) estimation
- instrumental variable estimation and two-stage least squares estimation
- seemingly unrelated regression models
- simultaneous equation models
- maximum likelihood estimation
- binary response models
- count data models
- censored and truncated regression models
- sample selection models
- treatment effect models
- static linear panel data models (random effects and fixed effects estimation)

For the theoretical portions of the lectures, we will prepare slides for in-class discussion. The format of the course is in-person. Slides will be distributed electronically before each lecture.

Problem sets will also be made available after every lecture. These problem sets will not be collected or graded, but students can use them in order to prepare for the final exam. Solutions will be made available in the following lecture.

While there is no required textbook for the course, we draw from the following texts, which are also recommend for the preparation of the exam:
- Angrist, J.D. and Jörn-Steffen Pischke: Mostly Harmless Econometrics.

Prerequisites / notice

Prior basic knowledge of matrix algebra and probability theory is strongly recommended.

751-0423-00L Risk Analysis and Risk Management in Agriculture

Objective

- to develop a better understanding of decision making under uncertainty and risk;
- to gain hands-on experience in risk analysis and management using R;
- to gain experience in different approaches to analyze risky decisions;
- to develop an understanding for different sources of risk in agricultural production;
- to understand the crucial role of subjective perceptions and preferences for risk management decisions;
- to get an overview on risk management in the agricultural sector, with a particular focus on insurance solutions;
- to get insights in the role of big data and machine learning for agricultural risk management.

Content

- Quantification and measurement of risk
- Risk preferences, Expected Utility Theory, Cumulative Prospect Theory
- Production and input use decisions under risk
- Portfolio Theory and Farm Diversification
- Forwards, Futures, Crop Insurance
- Weather Index Insurance and Satellite Imagery
- Big data and machine learning for agricultural risk management
- Empirical Applications using R

Lecture notes

Handouts will be distributed in the lecture and available on the moodle.

Prerequisites / notice

knowledge of basic concepts of probability theory and microeconomics
Concepts and Theories

Introduction to basic techniques and problems in mathematical optimization, and their applications to a variety of problems in engineering.

Methods covered in this course include:
- Linear programming (simplex method, duality theory, shadow prices, ...).
- Basic combinatorial optimization problems (spanning trees, shortest paths, network flows, ...).
- Modelling with mathematical optimization: applications of mathematical programming in engineering.

Successful participant of the course is able to:
- apply formal concepts to model economic growth and competition
- analyze macroeconomic models of business cycles, supply and demand
- identify critical conditions for stability and dynamic transitions
- formalize and solve one- and two-dimensional nonlinear models
- understand the importance of different modeling approaches
- apply formal concepts to model economic growth and competition
- system dynamics rooted general system theory and cybernetics, and nonlinear dynamics using applied mathematics.

The goal of the course is to obtain a good understanding of some of the most fundamental mathematical optimization techniques used to solve linear programs and basic combinatorial optimization problems. The students will also practice applying the learned models to problems in engineering.

We practice how to solve nonlinear models formally and numerically and how to interpret the results.

Weekly self-study tasks are used to apply the concepts introduced in the lectures. We practice how to solve nonlinear models formally and numerically and how to interpret the results.

The lecture slides are provided as handouts - including notes and literature sources - to registered students only. All material is to be found on the Moodle platform. More details during the first lecture.

Students should be familiar with nonlinear differential equations and should have basic programming skills. All necessary details to solve nonlinear models will be provided in the course. The course will not build on mathematical proofs, optimization, statistics, efficient numerical computation and other specialized skills.

By applying the developed simulation model, students gain insights into food system issues. They also learn to recognize the benefits and pitfalls of dynamic simulation, both from a theoretical and an applied perspective.

The lecture slides are provided as handouts - including notes and literature sources - to registered students only. All material is to be found on the Moodle platform. More details during the first lecture.

Students can develop, analyze and extend a dynamic simulation model and interpret its results.

We focus on two sources of complexity: (a) nonlinear dynamics, which is captured in this course, “Economic Dynamics and Complexity” and (b) collective interactions, which is captured in the course “Agent-Based Modeling of Economic Systems” (in Spring).

Information on the Moodle platform. More details during the first lecture.
Information about relevant literature will be given in the lecture.

This course is meant for students who did not already attend the course "Mathematical Optimization", which is a more advance lecture covering similar topics. Compared to "Mathematical Optimization", this course has a stronger focus on modeling and applications.

**Principles of Macroeconomics**  
**W 3 credits 2V**  
**J.-E. Sturm**

**Abstract**  
This course examines the behaviour of macroeconomic variables, such as gross domestic product, unemployment and inflation rates. It tries to answer questions like: How can we explain fluctuations of national economic activity? What can economic policy do against unemployment and inflation?

**Objective**  
This lecture will introduce the fundamentals of macroeconomic theory and explain their relevance to every-day economic problems. This course helps you understand the world in which you live. There are many questions about the macroeconomy that might spark your curiosity. Why are living standards so meagre in many African countries? Why do some countries have high rates of inflation while others have stable prices? Why have some European countries adopted a common currency? These are just a few of the questions that this course will help you answer.

Furthermore, this course will give you a better understanding of the potential and limits of economic policy. As a voter, you help choose the policies that guide the allocation of society's resources. When deciding which policies to support, you may find yourself asking various questions about economics. What are the burdens associated with alternative forms of taxation? What are the effects of free trade with other countries? How does the government budget deficit affect the economy? These and similar questions are always on the minds of policy makers.

**Content**  
This course helps you understand the world in which you live. There are many questions about the macroeconomy that might spark your curiosity. What are the burdens associated with alternative forms of taxation? What are the effects of free trade with other countries? How does the government budget deficit affect the economy? These and similar questions are always on the minds of policy makers.

**Lecture notes**  
The course Moodle page contains announcements, course information and lecture slides.

**Literature**  

This book can also be used for the course ‘363-0503-00L Principles of Microeconomics’ (Filippini).

Besides this textbook, the slides, lecture notes and problem sets will cover the content of the lecture and the exam questions.

**Risk and Insurance Economics**  
**W 3 credits 2G**  
**H. Schernberg**

**Abstract**  
The course covers the economics of risk and insurance, in particular the following topics will be discussed:

2) individual decision making under risk  
3) models of insurance demand, risk sharing, insurance supply  
4) information issues in insurance markets  
5) advanced topics in microeconomics and behavioral economics  
5) the macroeconomic role of insurers and insurance regulation

**Objective**  
The course introduces students to basic microeconomic models of risk attitudes and highlight the role insurance can – or cannot – play for individuals facing risks.

**Content**  
Everyday, we take decisions involving risks. These decisions are driven by our perception of and our appetite for risk. Insurance plays a significant role in people's risk-management strategies. In the first part of this lecture, we discuss a normative decision concept, Expected Utility theory, and compare it with empirically observed behaviour.

Students then learn about the rationale for individuals to purchase insurance, and for companies to offer it. We derive the optimal level of insurance demand and discuss how it depends on our model's underlying assumptions.

We then discuss the consequences of information asymmetries in insurance markets and the consequences for insurance supply.

Finally, we discuss refinements in decision theory that help account for observed behaviours that don't fit with the basic models of microeconomic theory. For example, we'll explore how behavioural economics can be leveraged by the insurance industry.

**Further readings:**  

References will be given on a topic-by-topic basis during the course.
363-1137-00L Applied Econometrics in Environmental and Energy Economics

Does not take place this semester.

It is highly recommended to take 363-0570-00L Principles of Econometrics first.

Abstract
The course introduces the most common empirical methods for the analysis of issues in environmental, energy, and resource economics. The course includes computer laboratory sessions, and covers the following broad topics: demand models, discrete choice models, empirical methods in policy evaluation, field- and quasi-experiments.

Objective
At the end of the course, the students will be able to: understand the most common empirical methodologies used in environmental, energy, and resource economics; understand the problems the methodologies learnt in class aims to address; appreciate the importance of causal inference in empirical economics; read and understand the research papers in the literature; apply the empirical methods learnt in class using the software R.

Content
The course introduces students to empirical statistical methods that have wide application in environmental, energy, and resource economics. The first block introduces field experiments and instrumental variables, and their characteristic. At the end of each block there will be a computer laboratory class in which the student will learn to apply the methodologies learnt in class using the statistical open-source software R. Throughout the course, the students will have the chance to work on actual data used for analysis in economics papers.

Prerequisites / notice
It is highly recommended to take 363-0570-00L Principles of Econometrics first.

IMPORTANT: Students who enroll for this course are strongly recommended to verify with lecturers from other courses whether their absence of two weeks may affect their performance in the respective courses.

Abstract
This course guides students in analyzing and comprehending tropical agroecosystems and food systems. Students gain practical knowledge of field methods, diagnostic tools and survey methods for tropical soils and agroecosystems. An integral part of the course is the two-week field project in the Mount Kenya Region, which is co-organized with the University of Embu (Kenya).

Objective
(1) Overview of the major land use systems in Tropical agroecosystems in several contexts Africa
(2) Interdisciplinary analysis of agricultural production systems
(3) Knowledge on methods to assess agroecological performance of a tropical agroecosystems
(4) Hands-on training on the use of field methods, diagnostic tools and survey methods.
(5) Gain practical knowledge on how to assess to climate resilience and farming systems.
(6) Collaboration in international students and stakeholders

Content
This course guides students in analyzing and comprehending tropical agroecosystems. Students of ETH Zürich will work together with the students from Embu University (Kenya) in an interdisciplinary and intercultural team. Students will focus on the Agroecological performance and climate resilience of diverse farming systems in the Mount Kenya Region.

From October 28th to November 11th, students will take part in a field course in the Mount Kenya Region. Students will then gain practical knowledge on field, meeting several stakeholders of the agricultural and food systems and conducting various assessments related to climate resilience and farming systems.

Prerequisites / notice
We would require the students enrolled to the class to send a short cover letter (1-page max.) by September 18rd 2023, justifying your motivation to enroll to this class. A selection of 20 students will be done on the basis of the letters.
### Professional Internship

</tbody>
</table>

**Abstract**

Students primarily work on a defined task or internship project in a professional environment within the field of Agricultural Sciences. By doing so, they apply the subject-specific, method-specific, social, and personal competencies acquired during their studies in their daily work and further develop and deepen them. Additionally, they reflect upon and present their internship experiences.

**Objective**

The students will set their own learning and working goals, and reflect on learning and work performance within the framework of their internship provider.

**Content**

- a preparatory phase, which includes an information event, the attendance of Agro Day II as well as seeking a suitable internship position.
- the placement period, preferably in the 3rd semester of the master's programme, but necessarily before the master's thesis, lasting at least 16 weeks. During placement period, additional written assignments will be completed.
- a follow-up phase, which includes presenting a "1-minute presentation" and discussing a poster on Agro-Day II.

**Prerequisites / notice**

Der Praktikumsaufenthalt wird in der Regel im dritten Master-Semester, in jedem Fall vor Beginn der Master-Arbeit absolviert. Er kann erst absolviert werden, wenn

- die Bachelor-Arbeit im Studiensekretariat abgegeben wurde;
- eine Einschreibung ins Master-Studium Agrarwissenschaften erfolgt ist;
- allfällige Zulassungsauflagen erfüllt sind.

Falls in einem Semester nur die Lehrveranstaltung Berufspraktikum belegt wird, kann man sich in ein Urlaub einschreiben. Genaue Informationen finden sich im Moodle Kurs.

</tbody>
</table>

**Abstract**

In this course, students get an overview of agricultural policy evaluations and their societal and political relevance. They learn to understand and apply the principles of scientific based evaluations of agricultural policies.

**Objective**

The course has four major learning objectives: 1) Students know the conceptual background of evaluations and can relate concepts in agricultural economics to the evaluation of policies. 2) They know the basics of how to design and implement a policy evaluation study. 3) Students can transfer their methodological knowledge from other agricultural economics courses to the context of agricultural policy evaluations (econometrics, modelling etc.). They make hands-on experiences of methodological challenges. 4) They can critically assess the science-policy interface of policy evaluations.

**Content**

The course consists of two blocks: First, students will learn the basics of how to design, implement and interpret agricultural policy evaluations. In this block, the conceptual embedding, the design and methodological tools as well as case studies are presented. Secondly, the students make hands-on experience using econometric and modelling tools in the context of agricultural policy evaluations. They apply their theoretical and empirical knowledge to Swiss case studies.

Data: 06.08.2024 12:40 Autumn Semester 2024 Page 47 of 2684
Objective

- to develop a better understanding of decision making under uncertainty and risk;
- gain hands-on experience in risk analysis and management using R
- to gain experience in different approaches to analyze risky decisions;
- to develop an understanding for different sources of risk in agricultural production;
- to understand the crucial role of subjective perceptions and preferences for risk management decisions;
- to get an overview on risk management in the agricultural sector, with a particular focus on insurance solutions
- to get insights in the role of big data and machine learning for agricultural risk management

Content

- Quantification and measurement of risk
- Risk preferences, Expected Utility Theory, Cumulative Prospect Theory
- Production and input use decisions under risk
- Portfolio Theory and Farm Diversification
- Forwards, Futures, Crop Insurance
- Weather Index Insurance and Satellite Imagery
- Big data and machine learning for agricultural risk management
- Empirical Applications using R

Lecture notes

Handouts will be distributed in the lecture and available on the moodle.

Empirical Methods in Management

W+ 2 credits
2G 2S
S. Tillmanns

Abstract

In this class, students learn how to understand and conduct empirical research. It will enable them to manage a business based on evidence-based decision-making. The class includes assignments related to the lecture content.

Objective

The general objective of the course is to enable students to understand the basic principles of empirical studies. After successfully passing the class, they will be able to formulate research questions, design empirical studies, and analyze data by using basic statistical approaches.

Content

Data has become an important resource in today’s business environment, which can be used to make better management decisions. However, evidence-based decision-making comes along with challenges and requires a basic understanding of statistical approaches. Therefore, this class introduces problems and key concepts of empirical research, which might be qualitative or quantitative in its nature. Concerning qualitative research, students learn how to conduct and evaluate interviews. In the area of quantitative research, they learn how to apply measurement and scaling methods and conduct experiments. In addition, basic statistical analyses like a variance analysis and how to conduct it in a standard statistical software package like SPSS or R are also part of the lecture. The lessons learned from the lecture will empower students to critically assess the quality and outcomes of studies published in the media and scientific journals, which might form a basis of their managerial decision-making. We recommend the lecture also to students without basic statistical skills, who plan to attend more advanced lectures in the field of artificial intelligence such as Marketing Analytics.

The lecture will be taught in presence. There will be individual assignments that students have to solve throughout the lecture. In addition to that, there will be some non-mandatory online exercises as an additional opportunity to prepare for the exam.

Literature

Literature and readings will be announced. For a basic understanding we recommend the Handbook of Good Research by Jürgen Brock and Florian von Wangenheim.

Prerequisites / notice

The course includes out-of-class assignments to give students some hands-on experience in conducting empirical research in management. Projects will focus on one particular aspect of empirical research, like the formulation of a research question or the design of a study. Assignments will be graded and need to be turned-in on time as they will be shown and discussed in class. Class participation is encouraged and can greatly improve students’ learning. In this spirit, students are expected to attend class regularly and come to class prepared.

Competencies

International Development Cooperation

W+ 2 credits
2V 2S
I. Günther

Abstract

Does not take place this semester.

Objective

Students have a theoretically and empirically sound understanding of the prospects and limitations of international development aid.

Content

Introduction to the Determinants of Underdevelopment: History of Aid; Aid and Development: Theories and Empirics; Political Economy of Aid; Experience and Impact of Aid; New Instruments of Aid; e.g. Micro-Finance, Budget-Support, Fair-Trade.

Literature

Articles and book abstracts will be uploaded to a course website.

Animal Sciences

Number  Title  Type  ECTS  Hours  Lecturers
751-6001-00L  Forum: Livestock in the World Food System  W+  2 credits  2S  S. Meese

Abstract

This forum is a platform for the critical reflection of relevant topics of livestock in the frame of the world food system comprising issues from basic knowledge to acceptance in society. The exchange is operated by scientific writing and presentation.
In the Forum "Livestock in the World Food System", a topic of significance for livestock agriculture is selected by the students and subsequently dealt with from various angles (from scientific basis to production systems, environmental aspects and to the acceptance by society). The students learn to present a scientific subject in writing and orally to an audience and to defend the presentation in a discussion. Further, feedback is fostered to improve the presentation style. Furthermore, the review process of a scientific paper will be demonstrated and applied.

The Forum "Livestock in the World Food System" will take place in blocks of 2 hours each. Once the general topic has been selected, it comprises two parts:

Part 1
Aspect 1 - Oral presentation: The students form small groups and are lecturers. Aspect 2 - chairperson: There are moderating which are chosen from outside of the presenting groups and they will lead the discussion and the remaining students and the lecturer are the audience and ask questions. Aspect 3 - feedback: At the beginning, students form teams of 2, which are not in the same group, to give each other feedback on their presentation style.

Part 2.
Aspect 1 - Scientific writing: Preparation of a critical review of a chosen publication and individual exchange with the lecturer. Aspect 2 - Defense: There will be a discussion in small groups on several dates to discuss the chosen publication in detail and the observations during the process.

Introductions to both presentation forms will be given by the lecturer.

- oral talk with sufficient handout
- delivery of the scientific writing in sufficient quality
- active participation during all presentations (in case of absence there will be additional tasks)
- feedback on the presentation style of a student

The course provides the scientific basis of the central aspects of reproduction and nutrition physiology of ruminants, and of the implications for animal health, product quality, and breeding programs. Means of knowledge transfer include interdisciplinary approaches, disciplinary parts, web-based learning and self-study.

At the end of the course the students are able to apply, by a comprehensive understanding of the underlying mechanisms, their knowledge in various fields of ruminant science. They will be able to develop and recommend best strategies for breeding programs, feed formulation, improving forage quality, and increasing animal health. They will be trained to carry out interdisciplinary and disciplinary research at the highest level.

The students learn to present a scientific subject in writing and orally to an audience and to defend the presentation in a discussion. At the same time the essential basics in the central fields are communicated.

The specialty of this course is that for the first time the animal science disciplines are unified. This is realised with a particular emphasis on interdisciplinary special topics and new forms of teaching. At the same time the essential basics in the central fields are communicated.

For successful participation: Background on animal science from the Bachelor is desired. In order to attend the Minor in Ruminant Science without any animal science background, a realistic self-assessment concerning the need for additional self-study is recommended (e.g. by choosing an appropriate bachelor course which then may be counted as 'optional courses' in the master). These efforts depend on the extent to which animal science courses have already been attended in the bachelor.

The control of performance will consist of:
- an own short lecture
- a final oral examination with focus on comprehension of the fundamental linkages rather than of specific details

Lecture notes
no scriptum

Requirements for allocation of the two credit points:

- feedback on the presentation style of a student
- active participation during all presentations (in case of absence there will be additional tasks)
- oral talk with sufficient handout
- delivery of the scientific writing in sufficient quality

Competencies

4 credits

751-6501-00L  Ruminant Science  W+  4 credits  4G  M. Niu, M. Terranova, U. Witschi

Abstract
The course provides the scientific basis of the central aspects of reproduction and nutrition physiology of ruminants, and of the implications for animal health, product quality, and breeding programs. Means of knowledge transfer include interdisciplinary approaches, disciplinary parts, web-based learning and self-study.

Objective
At the end of the course the students are able to apply, by a comprehensive understanding of the underlying mechanisms, their knowledge in various fields of ruminant science. They will be able to develop and recommend best strategies for breeding programs, feed formulation, improving forage quality, and increasing animal health. They will be trained to carry out interdisciplinary and disciplinary research at the highest level.

Content
Fields (contact hours)
- Introduction: 2 h
- Special topics: 20 h
  - Rumen Anatomy
  - Hohenheim Gas Test
  - Calf health
  - Reproduction Techniques
  - Fertility in Cows
- Disciplinary topics: 32 h
  - Ruminal Digestion: 8 h
  - Ruminant Nutrition Physiology: 12 h
  - Reproduction in Ruminants: 8 h
  - Lectures held by the students: 4 h

In summary
- Contact hours: 58 h
- Self-study within semester: 30 h (especially preparation for the interdisciplinary courses and the own lecture)
- Self-study in semester break: 32 h
Total: 120 h

Lecture notes
Documentations, links and other materials will be provided at the start of the course

Literature
Information on books and other references will be communicated during the course.

Prerequisites / notice
The specialty of this course is that for the first time the animal science disciplines are unified. This is realised with a particular emphasis on interdisciplinary special topics and new forms of teaching. At the same time the essential basics in the central fields are communicated.

Conditions for successful participation: Background on animal science from the Bachelor is desired. In order to attend the Minor in Ruminant Science without any animal science background, a realistic self-assessment concerning the need for additional self-study is recommended (e.g. by choosing an appropriate bachelor course which then may be counted as 'optional courses' in the master). These efforts depend on the extent to which animal science courses have already been attended in the bachelor.

The control of performance will consist of:
- an own short lecture
- a final oral examination with focus on comprehension of the fundamental linkages rather than of specific details
Crop- and Grassland Science

Number Title Type ECTS Hours Lecturers
751-4104-00L Alternative Crops W 2 credits 2V A. Walter, K. Berger Büter

Abstract
Few crops dominate the crop rotations worldwide. Following the goal of an increased agricultural biodiversity, species such as buckwheat but also medicinal plants might become more important in future. The biology, physiology, stress tolerance and central aspects of the value-added chain of the above-mentioned and of other alternative crops will be depicted.

Objective
During this course, students learn to assess the potential of different minor or alternative crops compared to the dominant major crops based on their biological and agronomical features. Each student will assess and present a specific alternative crop of his or her choice based on information from scientific articles and Wikipedia. Wikipedia-entries will be generated.

Competencies
Subject-specific Competencies

751-3603-00L Current Challenges in Plant Breeding W 2 credits 2G B. Studer, A. Hund, R. Kölliker

Abstract
The seminar 'Current Challenges in Plant Breeding' aims to bring together national and international experts in plant breeding to discuss current activities, latest achievements and future prospective of a selected topic/area in plant breeding.

Objective
The educational objectives cover thematic, methodic as well as social and personal competencies:
- Thematic/methodic competencies:
  - Deepening of scientific knowledge in plant breeding
  - Critical evaluation of current challenges and new concepts in plant breeding
  - Promotion of collaboration and Master thesis projects with practical plant breeders
- Social/personal competencies:
  - Independent literature research to get familiar with the selected topic
  - Critical evaluation and consolidation of the acquired knowledge in an interdisciplinary team
  - Establishment of a scientific presentation in an interdisciplinary team
  - Presentation and discussion of the teamwork outcome
  - Establishing contacts and strengthening the network to national and international plant breeders and scientist

Content
Interesting topics related to plant breeding will be selected in close collaboration with the working group for plant breeding of the Swiss Society of Agronomy (SSA).

Lecture notes
None

Literature
Peer-reviewed research articles, selected according to the topic.

Prerequisites / notice
Participation in the BSc course 'Pflanzenzüchtung' is strongly recommended, a completed course in 'Molecular Plant Breeding' is advantageous.

Data: 06.08.2024 12:40 Autumn Semester 2024 Page 50 of 2684
Agroecosystems play a major role in all landscapes, either for production purposes, ecological areas or for recreation. The human impact has been assessed, N. Buchmann, K. I. Feigenwinter

### Alien Organisms in Agriculture

**W 2 credits 2G J. Collatz, M. Meissle**

**Abstract**

The course focuses on alien organisms in agriculture as well as the scientific assessment and regulatory management of their effects on the environment and agricultural production.

**Objective**

Students will understand the consequences arising from the unintentional or deliberate introduction of alien organisms into agricultural systems. They will be able to understand the concepts of environmental risk assessment and be able to evaluate risk management options. Novel organisms pose, the benefits they provide and how both of these effects can be scientifically assessed. Students will learn how the topic of alien organisms in agriculture is intrinsically tied to policy making and regulation and get to know current examples and future challenges in research. In the last part of the course students will be able to apply the acquired knowledge in a practical exercise (case study).

**Content**

Alien organisms in agriculture is a topic that receives an increasing awareness among farmers, agricultural scientists, regulators and the general public. Students of this course will learn about the nature of alien organisms such as invasive species, biocontrol organisms and genetically modified organisms. With a particular focus on arthropods, plants and their interactions we will look at the potential threats the novel organisms pose, the benefits they provide and how both of these effects can be scientifically assessed. Students will learn how the topic of alien organisms in agriculture is intrinsically tied to policy making and regulation and get to know current examples and future challenges in research. In the last part of the course students will be able to apply the acquired knowledge in a practical exercise (case study).

**Lecture notes**

Material will be distributed during the course.

**Prerequisites / notice**

A part of the course will take place in flipped classroom mode, i.e. some lectures will be available as podcasts.

### Biogeochemistry and Sustainable Management

**W 3 credits 2G I. Feigenwinter, N. Buchmann, K.- M. Kohonen**

**Abstract**

This course focuses on the interactions between ecology, biogeochemistry and management of agro- and forest ecosystems, thus, coupled human-environmental systems. Students learn how human impacts on ecosystems via management or global change are mainly driven by effects on biogeochemical cycles and thus ecosystem functioning, but also about feedback mechanisms of terrestrial ecosystems.

**Objective**

Students will analyse and understand the complex and interacting processes of ecology, biogeochemistry and management of agroecosystems. They will use their theoretical knowledge in two flipped classroom exercises, but also set up a small weather station and program a data logger to collect meteorological variables, analyze large meteorological and flux data sets, and evaluate the impacts of weather events and management practices on the ecosystem greenhouse gas exchange. Thus, students will expand their computational competences. Moreover, students will be able to coordinate and work successfully in small (interdisciplinary) teams.

**Content**

Agroecosystems play a major role in all landscapes, either for production purposes, ecological areas or for recreation. The human impact of any management on the environment is mainly driven by effects on biogeochemical cycles. Effects of global change impacts will also act via biogeochemistry at the soil-biosphere-atmosphere-interface. Thus, ecosystem functioning, i.e., the interactions between ecology, biogeochemistry and management of terrestrial systems, is the science topic for this course.

Students will gain profound knowledge about biogeochemical cycles and greenhouse gas fluxes in managed grassland and/or cropland ecosystems as well as expand their computational competences. Responses of agroecosystems to the environment, i.e., to climate and weather events, but also to management will be studied. Two flipped class-room exercises include the assessment of an ecosystem disturbance and the experimental design of an own study. Data loggers will be programmed, and a small weather station will be set up. Different meteorological and greenhouse gas flux data will be analysed (using R) and assessed in terms of production, greenhouse gas budgets, and carbon sequestration. Thus, students will learn how to collect, analyse and interpret data about the complex interactions of a coupled human-environmental system.

Students will work in groups (3-4 persons per group) with data from a small weather station (dedicated to the course), as well as data from the long-term measurement network Swiss FluxNet and from global databases. Data from the intensively managed grassland site Chamau will be used to investigate the biosphere-atmosphere exchange of CO2, H2O, N2O and CH4. Functional relationships will be identified, greenhouse gas budgets will be calculated for different time periods and in relation to management over the course of a year.

**Lecture notes**

Handouts will be available in moodle.

**Prerequisites / notice**

Prerequisites: Attendance of introductory courses in plant ecophysiology, ecology, and grassland or forest sciences. Knowledge of data analyses in R and statistics. Course will be taught in English.
The seminar concerns current aspects and research related to nutrient cycles in agro-ecosystems. The theme of the next seminar is "Integrated Nutrient Management to maximize nutrient use efficiency in productive agricultural systems: Insights from long-term field experiments".

The students will learn and train preparation skills for microscopy, acquire knowledge of selected diseases (identification, biology of pathogen, epidemiology and systematics) and understand the corresponding integrated control measures practiced in Swiss agriculture.

Research results in agro- and forest ecosystem sciences will be presented by experienced researchers as well as by doctoral and graduate students. Citation classics as well as recent research results will be discussed. Topics will range from plant ecophysiology, biodiversity and biogeochemistry to management aspects in agro- and forest ecosystems.

Students will be able to understand and evaluate experimental design and data interpretation of ongoing studies, be able to critically analyze published research results, practice to present and discuss results in the public, and gain a broad knowledge of recent research and current topics in agro- and forest ecosystem sciences.

The seminar is composed by presentations of experts and of the students. The presentations will be synthesized during a final discussion.

Objective

Analyze publications and/or data records on long-term field experiments regarding their content on integrated nutrient management and derive the nutrient use efficiency; link this information, write it up in a report and present the results in an oral presentation; work in a group; ask questions and contribute to the discussion following the oral presentations; link the information to answer overarching questions and recommendations; expand the knowledge on nutrient cycles and nutrient management in the agro-ecosystem; learn about the importance of long-term field experiment to answer questions on the sustainability of agricultural systems.

Content

The seminar concerns current aspects and research related to nutrient cycles in agro-ecosystems. The theme of the next seminar is "Integrated Nutrient Management to maximize nutrient use efficiency in productive agricultural systems: Insights from long-term field experiments". The students will analyze and connect the results published (or from data records) for selected field experiments in a group work. They will present their analysis in a report and in an oral presentation. The seminar is composed by presentations of experts and of the students. The presentations will be synthesized during a final discussion.

Lecture notes
none

Prerequisites / notice
Prerequisites: Basic knowledge of plant ecophysiology, terrestrial ecology and management of agro- and forest ecosystems. Course will be taught in English.

751-4506-00L Plant Pathology III W 2 credits 2G M. Maurhofer Brinolphi

Abstract
Identification based on host, symptoms and micro-morphology, completed with life cycles and related control measures of the most important fungal diseases and their causal pathogens of annual and perennial crops with agricultural significance.

Objective
The students will learn and train preparation skills for microscopy, acquire knowledge of selected diseases (identification, biology of pathogen, epidemiology and systematics) and understand the corresponding integrated control measures practiced in Swiss agriculture.

Content
A script will be used on annual and perennial crops and their most important diseases. It will be updated stepwise

Lecture notes

Prerequisites / notice
The course will be in German (spec. nomenclature)

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 53 of 2684
Abstract
The course provides the second part an introduction to the statistical software R for scientists. Topics are data generation and selection, graphical functions, important statistical functions, types of objects, models, programming and writing functions.

Note: This part builds on "Using R.. (Part I)", but can be taken independently if the basics of R are already known.

Objective
The students will be able to use the software R efficiently for data analysis, graphics and simple programming

Content
The course provides the second part of an introduction to the statistical software R (https://www.r-project.org/) for scientists. R is free software that contains a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

Part II of the course builds on part I and covers the following additional topics:
- Elements of the R language: control structures (if, else, loops), lists, overview of R objects, attributes of R objects;
- More on R functions;
- Applying functions to elements of vectors, matrices and lists;
- Object oriented programming with R: classes and methods;
- Tailoring R: options
- Extending basic R: packages

Lecture notes
The course focuses on practical work at the computer. We will make use of the graphical user interface RStudio: www.rstudio.org

Prerequisites / notice
Basic knowledge of R equivalent to "Using R .. (part 1)" (* 401-6215-00L *) is a prerequisite for this course.

The course resources will be provided via the Moodle web learning platform. As from FS 2019, subscribing via Mystudies should "automatically" make you a student participant of the Moodle course of this lecture, which is at

https://moodle-app2.let.ethz.ch/course/view.php?id=20848

Introduction to Agricultural Robotics

W+ 3 credits 2G  S. Mintchev

Abstract
Autonomous robots are quickly becoming a key player in the transition to precision agriculture. In this course, students will learn theoretical and practical aspects of robotics. Lectures will introduce how robots operate and analyse their application to precision agriculture. In hands-on laboratories, students will apply concepts learned in class on educational robots to simulate a weeding task.

Objective
After the course, students will be able to critically examine and select appropriate robotic solutions for agricultural applications. The learning objectives of the course are: (i) illustrate the principle of operation of the main components of a robotic system, (ii) analyse how the different robotic components are integrated and contribute to the functioning of a robotic system, and (iii) solve problems in the field of agriculture using robotic principles.

Content
Robots are becoming a key technology in the transition to smart farming and in supporting the agricultural needs of the 21st century. For example, robots enable site-specific fertilization, automated weeding, or livestock herding.

The course gives an overview of robotic systems, beginning with their fundamental components (e.g., sensors, actuators, locomotion strategies) and gradually scaling up to the system level, illustrating the concepts of perception, robot control, obstacle avoidance and navigation. Exercises performed with an educational robot (Thymio) will complement the theoretical lectures providing a hands-on practical experience of the challenges of using these machines.

During the course, students will gradually apply the theoretical and practical knowledge they are learning. To this end, students will work in teams to develop a robotic solution for an agricultural task of their choice. Students will learn to translate the task into meaningful requirements for a robotic system and critically select the most appropriate components to achieve the required robotic functions. Students will periodically present and discuss the development of this "robot design" exercise during presentations and in a journal report.

Lecture notes
Copies of the slides and exercises will be provided on the course Moodle page.

Literature

Prerequisites / notice
No mandatory prerequisites, but it is preferable that students have a basic knowledge of computer programming.

Class size limitation to 30 students.
Competencies

Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: fostered
- Problem-solving: assessed
- Project Management: fostered

Social Competencies
- Communication: assessed
- Cooperation and Teamwork: assessed
- Leadership and Responsibility: fostered
- Self-presentation and Social Influence: fostered
- Sensitivity to Diversity: fostered
- Negotiation: fostered

Personal Competencies
- Adaptability and Flexibility: assessed
- Creative Thinking: assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: fostered
- Self-presentation and Social Influence: fostered
- Self-direction and Self-management: fostered

701-0951-00L  GIST - Introduction into Geoinformation Science and Technology  W+  5 credits  2V+3P  M. A. M. Niederhuber

Abstract
Theoretical basics and fundamental concepts of Geographic Information Science are imparted and subsequently further elaborated with the software ArcGIS.

Objective
Students are able to
- elucidate the theoretical and conceptional foundations of geographic information systems (GIS)
- independently perform normal GIS work using commercial software and practical examples

Content
The course covers the following topics:
- What is GIS? What are spatial data?
- The representation of reality by means of spatial data models: vector, raster, TIN
- The four phases of data modelling: Spatial, conceptual, logical and physical model
- Possibilities of data collection
- Transition of reference frame
- Spatial Analysis I: query and manipulation of vector data
- Spatial Analysis II: operators and functions with raster data
- Digital elevation models and derived products
- Process modelling with vector and raster data
- Presentation possibilities of spatial data

One Friday is reserved for a field trip or guest speaker;

Literature

Prerequisites / notice
Aufgrund der Grösse des verfügbaren EDV-Schulungsraumes ist die Teilnehmerzahl auf 50 Studierende beschränkt! Für die Übungen werden die Studierenden auf zwei, max. drei Zeitfenster aufgeteilt. Pro Zeitfenster können maximal 25 Studierende betreut werden.

Competencies

651-4031-00L  Geographic Information Systems  W+  3 credits  4G  A. Baltensweiler, M. Fraefel Kocher

Abstract
Introduction to the fundamental concepts and data processing capabilities of Geographic Information Systems (GIS). Practical application of geospatial data management and analysis functions based on a selected geoscience project.

Objective
Students can
- explain the basic principles of GIS
- solve a complex, real-world GIS problem in the field of Earth Science
- apply the principles of data modelling and geoprocessing with ArcGIS Pro: data design and modelling, data acquisition, data integration of different data types (including LiDAR data), spatial analysis of vector and raster data, special functions for digital terrain modelling and hydrology, map production and 3D visualisation.

Content
Theoretical introduction to the concepts, spatial data types and spatial data handling functions of Geographic Information Systems (GIS). Application of data modeling principles and geoprocessing capabilities using ArcGISPro: data design and modeling, data acquisition, data acquisition and integration, spatial analysis of vector and raster data, particular functions for digital terrain modeling and hydrology, map generation and 3D-visualisation.

Lecture notes
Lecture Script: Introduction to Geographic Information Systems, Tutorial: Introduction to ArcGIS Pro. All lecture materials are provided digitally.

Literature

Environmental Systems Data Science: Machine Learning

701-3003-00L

Abstract

Students are introduced to advanced data science where environmental data are analyzed using state of the art machine learning methods. Starting from known statistical approaches, they learn the principle of more advanced machine learning methods with practical application. The course enables students to plan their own data science project in their specialization and to apply machine learning methods.

Objective

The students are able to:
- select an appropriate model related to a research question and dataset
- describe the steps from data preparation to running and evaluating models
- prepare data for running machine learning with dependent and independent variable
- build and validate regressions and neural network models
- understand convolution and deep learning models
- access online resources to keep up with the latest data science methodology and deepen their understanding

Content

- The data science workflow
- Data preparation for running and validating machine learning models
- Get to know machine learning approaches including regression, random forest and neural network
- Model complexity and hyperparameters
- Model parameterization and loss
- Model evaluations and uncertainty
- Deep learning with convolutions

Literature

Building on existing data science resources

Prerequisites / notice

Math IV, VI (Statistics); R, Python; ESDS I

Chemical Nature of Nutrients and their Availability to Plants: The Case of Phosphorus

751-3405-00L

Abstract

The CNNAP course discusses the mechanistic relationships between nutrient speciation in fertilizer and nutrient uptake by plants using phosphorus as an example. The course involves theoretical aspects of nutrient cycling, laboratory work, data analysis and presentation, and the use of advanced methods in plant nutrition studies.

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 56 of 2684
At the end of the CNNAP course, participants will obtain a mechanistic understanding of why and how the speciation of phosphorus in fertilizer can affect its release to the soil solution and subsequent uptake by plants. Students will be able to use this information for the development of fertilization schemes that maximize the nutrient uptake and fertilizer efficiency of crops or pastures. During the course, participants will become familiar with the use of radiotopes and nuclear magnetic resonance as approaches to measure nutrient availability and forms, respectively and they will know the limits of these techniques. Students will also have the opportunity to improve their laboratory, presentation, discussion and writing skills.

The analyses of stable isotopes often provide insights into ecophysiological and ecological processes that otherwise would not be available.

The CNNAP course will take place if and only if 8 or more students are registered one week before the start. As the CNNAP course does not take place in autumn 2023, we recommend students interested in integrated assessment of nutrient cycling in soil plant systems to visit the 8th semester lecture 751-3404-00L (Nutrient Fluxes in Soil-Plant Systems: The Case of Nitrogen) organized in spring 2024 by Oberson et al.

This course will provide an introduction to the applicability of stable isotopes to ecological research questions. Topics will focus on carbon (13C), nitrogen (15N), oxygen (18O) and hydrogen (2H) at natural isotope abundance and tracer levels. Lectures will be supplemented by selected examples.

The course "Soil and Water Chemistry" teaches, applies and examines the competences process understanding, systems understanding, speciation, bioavailability, mobility) of nutrients and pollutants. During the course, students will become familiar with the use of radioisotopes and nuclear magnetic resonance as approaches to measure nutrient availability and forms, respectively and they will know the limits of these techniques. Students will also have the opportunity to improve their laboratory, presentation, discussion and writing skills.

This course covers chemical and biogeochemical processes in soils and water and their influence on the behavior and cycling of nutrients and pollutants in terrestrial and aquatic systems. Approaches for quantitative modeling of the processes are introduced and applied in selected examples.
The lecture courses Pedosphere and Hydrosphere are highly recommended.

**Subject-specific Competencies**
- Concepts and Theories assessed
- Techniques and Technologies assessed

**Method-specific Competencies**
- Analytical Competencies assessed
- Problem-solving assessed

**Social Competencies**
- Communication fostered

**Personal Competencies**
- Critical Thinking fostered

**Environmental Soil Physics/Vadose Zone Hydrology**

**W 3 credits 2V+1U**

**A. Carminati, P. U. Lehmann Grunder**

**Abstract**
The course provides theoretical and practical foundations for understanding and characterizing physical soil properties and processes and their relevance for terrestrial ecosystems, plant growth, hydrological processes and atmospheric-land gas exchange, across all relevant scales.

**Objective**

Students are able to:
- Characterize the different soils based on their key textural and structural properties.
- Simulate and predict soil water retention and flow under varying environmental conditions and understand the key driving forces (capillarity, gravity, friction) and related water properties (surface tension and viscosity).
- Predict soil hydraulic properties for varying soil textural classes.
- Predict solute transport in soils for varying environmental conditions.
- Predict energy balance and temperature dynamics in soils.
- Predict conditions for plant water stress
- Estimate the impact of soil properties on the hydrological cycle and on plant growth.

**Content**

**INTRODUCTION**
- Week 1 (September 18)
  - Presentation of the role of soil physics in environmental sciences and terrestrial ecosystems: soils in the water cycle; soils and vegetation; soils and solute transport. Survey on students' interests and expectations. Presentation of course structure and learning objectives.

**BASIC SOIL PROPERTIES**
- Week 2 (September 25) and Week 3 (October 02)
  - soil texture, particle size distribution, soil structure, soil surface area, porosity and bulk density
  - Pore scale consideration (water in a single pore), pore sizes and shapes; surface tension; Young-Laplace equation; capillary rise; contact angle
  - Friction and laminar flow; Hagen-Poiseuille's law; Washburn equation; numerical lab (REPORT 1)

**SOIL HYDRAULIC PROPERTIES**
- Week (4 October 09) and Week 5 (October 16)
  - Soil water content and soil water potential - The energy state of soil water; total water potential and its components; volumetric and gravimetric water contents; field capacity and wilting point
  - Soil water characteristics and pore size distribution
  - Saturated water flow in soils - Laminar flow in tubes (Poiseuille's Law); Darcy's Law, conditions and states of flow; permeability and hydraulic conductivity, measurement and theoretical concepts; effective conductivity; unsaturated hydraulic conductivity; Buckingham law.
  - Unsaturated water flow in soils - Unsaturated hydraulic conductivity models and applications

**TOOLBOX – MEASUREMENTS AND MODELING**
- Week 6 (October 23) and Week 7 (October 30)
  - Measuring soil hydraulic properties, fitting and interpretation; Lab tour - demonstration of soil physical methods; lecture on HYPROP method; report on HYPROP data (REPORT 2)
  - Modelling unsaturated water flow based on Richards equation - Using Hydrus1D for simulation of unsaturated flow; simulating HYPROP measurements (REPORT 3)

**SOIL IN THE WATER CYCLE**
- Week 8 (November 06) – Week 9 (November 13)
  - Water infiltration - steady state solutions for infiltration; approximate solutions to infiltration (Green-Ampt, Philip); infiltration rate and ponding; outlook to preferential flow
  - Water evaporation - Energy balance and land atmosphere interactions - potential and actual evaporation, evaporation stages;

**SOIL PLANT INTERACTIONS**
- Week 10 (November 20) Week 11 (November 27)
  - Root water uptake and transpiration – Theory and mechanisms controlling root water uptake; hydraulic properties of rhizosphere; plant and stomatal conductance.
  - Modelling root water uptake and transpiration; analytical approaches and modeling using Hydrus (REPORT 4)

**SOLUTE TRANSPORT**
- Week 12 (December 04) Week 13 (December 11)
  - Transport mechanisms of solutes in porous media; breakthrough curves; convection-dispersion equation; solutions for pulse and step solute application
  - Transport of reactive substances, preferential flow, simulations with Hydrus

**CLOSURE**
- Week 14 (December 18)
  - Summary, course synthesis, connections between the different topics, questions, exam preparation

**Literature**

Supplemental textbook (not mandatory) - Introduction to Environmental Soil Physics, by: D. Hillel
Water limitation is a primary constraint on plant growth and terrestrial fluxes worldwide. In this course, the principles of water flow in soil and plants are discussed, with particular attention on the effect of drought on root water uptake, transpiration and plant growth. Strategies of plants to tolerate drought are discussed in relation to both agricultural and ecological implications.

Objective

The students are able to: explain and compare systematically the drivers of water stress to plants; to solve the equations of water flow in soil and plants and to calculate plant water status for varying soil and climatic conditions and plant traits; to critically review and present one research question in soil-plant water relations; to openly debate on the current trends in soil and plant water research and climate change ecology.

Content

Part 1 - Lectures
Week 1: Introduction.
Week 2: Soil water relations; Principles of soil water retention and soil water flow; Soil hydraulic properties.
Week 3: Root water uptake; soil hydraulic constraints on transpiration
Week 4: Rhizosphere processes and properties; root-soil contact; root hairs; mycorrhiza; rhizodeposition.
Week 5: Water flow in roots and xylem; root anatomy, architecture and plasticity; cavitation.
Week 6: Transpiration; Vapor Pressure Deficit; Photosynthesis; Stomatal regulation.
Week 7: Soil-plant-atmospheric continuum; Below- and above-ground feedbacks; Soil and atmospheric drivers of transpiration losses.

Part 2 - Seminar
Week 8: Plant response to drought and consequences for agriculture and forests. Open questions and introduction to seminar topics.
Week 9: Class work - preparation of the presentations/Debate
Week 10: Class work - preparation of the presentations/Debate
Week 11: Seminar/Debate (presentations)
Week 12: Seminar/Debate (presentations)
Week 13: Seminar/Debate (presentations)
Week 14: Feedback, Summary, Conclusion

| 752-2307-00L | Nutritional Aspects of Food Composition and Processing | W    | 3    | 2V    | B. E. Baumer, J. M. Sych |
| Abstract     | Lecture type course with an interdisciplinary approach for the evaluation of nutritional aspects of changes in food composition due to processing. |
| Objective    | Students should be able to... |
|              | - describe and compare the major concepts /criteria used for the evaluation of the nutritional quality of food  
- apply these criteria when assessing the effects of selected processing technologies on nutritional quality.  
- evaluate recent formulation strategies aimed to achieve additional physiological benefits for targeted population groups (i.e. functional foods), |
| Content      | The course gives inputs on compositional changes in food due to processing (with focus on thermal/chilling, enzymatic, chemical, separation and emerging technologies) or new formulation strategies. New approaches for evaluating these changes (e.g. nutritional profiles) and how these are communicated to consumers are also discussed. |
| Lecture notes| There is no script. Powerpoint presentations and relevant scientific articles will be available on-line for students. A selection of recommended readings will be given at the beginning of the course. |
| Prerequisites/notice | The course is open to Master and MAS students in food and science and nutrition or related. Basic knowledge of food chemistry and nutrition is expected, as well as an understanding of food processing. |
| Competencies | Subject-specific Competencies                      |      |      |       |                        |

|             | Critical Thinking                                 |      |      |       | assessed               |

| 751-7310-00L | Bioactive Feed Compounds and Enriched Food Products | W    | 2    | 2V    | M. Niu, to be announced |
| Abstract     | The course provides students with basic knowledge of the connection between plant secondary metabolites and their active roles in feed and food. It offers insights into active compounds in feed or their natural-identical equivalents and the resulting quality of animal-derived food, reporting practical examples. |
| Objective    | The course aims to provide students with foundational knowledge of plant secondary metabolites and their roles in animal feed and food quality. Through an in-depth exploration of the structure and mechanisms of action of these compounds, students will gain insights into their practical applications in animal nutrition and the production of added-value or enriched food products. |
| Content      | The course provides an overview of various types of bioactive components contained in both food and feedstuffs, including fatty acids and secondary plant metabolites such as polyphenols, terpenoids, carotenoids and saponins. |

Subjects covered:
- Distribution of bioactive compounds
- Sources of active compounds for animal feed
- Main mechanism of actions at animal or human levels
- Added value and enriched food products
- Advantages and disadvantages
### Sustainable Agricultural Development

**Number of participants limited to 25.**

All students who register will be on the waiting list. A motivational application is required until 6 September:
- presenting yourself and your studies
- stating what topic in the field of Political Ecology that you are interested in
- suggesting one paper to enrich the literature list for the course

The selected students will be notified until 9 September.

Questions regarding the application to johanna.jacobi@usys.ethz.ch.

- Being able to provide an overview of the multi-disciplinary field of political ecology for investigating the relationships of humans to our environment
- Learn to identify how power and interest influence social-ecological systems and to distinguish symptoms from systemic root causes
- Become enabled to analyse complex and sometimes distant human-ecology relationships choosing from a broad range of methods

We will review common narratives in agri-food systems informed by a range of different theories and assisted by different analytical tools. For this purpose, we will start from different concepts of nature, power and interests, explore different ontologies and epistemologies through a set of topics such as hunger, obesity, agrobiodiversity and seeds, forests and deforestation, climate change and food production. Students will explain one concept in each course to the groups and practice their argumentative and writing skills in a final essay, applying the acquired tools to a topic of their choice. While specific inputs from external lecturers broaden our perspective, enough time for critical discussion and reflection will be granted.

- 20.12.2024 Final session (The Hunger Banquet)

#### Literature

- Literature list provided on Moodle when the course starts.
This class conveys current topics and methods of agroecological and food systems research through selected case studies from ongoing research of the Sustainable Agroecosystems group. Students will be encouraged to develop critical thinking competencies, through individual and group work, on major agricultural and food system challenges and paths towards agricultural and food system transformation.

Objective
(1) Systematically analyse and discuss case studies from ongoing agroecological and food system research.
(2) Learn and experiment on methods for field and laboratory investigations in agroecology.
(3) Engage with positive and empowering frameworks that motivate critical reflection and action on the types of transformative responses needed to adapt and thrive within agricultural and food systems.
(4) Reflect critically on agricultural and food system transformation tools and methods from the perspective a food system stakeholder.
(5) Identify and describe institutions in the context of sustainable agricultural development (for Bachelor and Master thesis and internships).

Content
The course will address a wide range of agricultural and food system challenges (e.g. food security, climate crisis, soil degradation, etc.) in both temperate and tropical contexts. In class we will address topics like building food system resilience through innovative measures, improving soil fertility management or understanding the effects of agroforestry systems. Case studies from the on-going research in the Sustainable Agroecosystems Group (sae.ethz.ch) will be presented, covering different scales (e.g. food value-chains, farm dynamics and soil management).

The class is complemented by practical group work conducted with the CSA Meh Als Gmues in Zürich on Measuring and monitoring Agroecological performance.

Students will gain an overview on institutions and actors’ roles in the field of sustainable agricultural development. Throughout the group work, students will learn to engage directly with various stakeholders, monitor agroecological transition and communicate their research to a wider audience. Ultimately, this class should provide an overview on methods, tools, innovations and platforms that support a sustainable food transformation.

Literature

Prerequisites / notice
Prior participation in the lecture Nachhaltige Agrarökosysteme I (Sustainable Agroecosystems I) 751-5000-00G (spring term) recommended.

Competencies
751-5003-00L Sustainable Agroecosystems II
- Subject-specific Competencies: Concepts and Theories assessed
- Method-specific Competencies: Analytical Competencies fostered
- Social Competencies: Cooperation and Teamwork fostered
- Personal Competencies: Adaptability and Flexibility analyzed

851-0626-01L International Development Cooperation
- Subject-specific Competencies: Concepts and Theories assessed
- Method-specific Competencies: Analytical Competencies assessed
- Social Competencies: Communication fostered
- Personal Competencies: Adaptability and Flexibility fostered

751-6001-00L Forum: Livestock in the World Food System
- Subject-specific Competencies: Concepts and Theories assessed
- Method-specific Competencies: Analytical Competencies fostered
- Social Competencies: Cooperation and Teamwork fostered
- Personal Competencies: Adaptable and Flexibility fostered

Competencies
- Subject-specific Competencies: Concepts and Theories assessed
- Method-specific Competencies: Analytical Competencies fostered
- Social Competencies: Cooperation and Teamwork fostered
- Personal Competencies: Good Communication, Adaptable and Flexibility fostered

Objective
The course gives economic and empirical foundations for a sound understanding of the instruments, prospects and limitations of international development aid.

Students have a theoretically and empirically sound understanding of the prospects and limitations of international development aid.

Students are able to critically discuss the various aid instruments of bi- and multilateral donors and NGOs.

The students learn to present a scientific subject in writing and orally to an audience and to defend the presentation in a discussion.

Further, feedback is intended to improve the presentation style. Furthermore, the review process of a scientific paper will be demonstrated and applied.

This forum is a platform for the critical reflection of relevant topics of livestock in the frame of the world food system comprising issues from basic knowledge to acceptance in society. The exchange is operated by scientific writing and presentation.

In the Forum "Livestock in the World Food System", a topic of significance for livestock agriculture is selected by the students and subsequently dealt with from various angles (from scientific basis to production systems, environmental aspects and to the acceptance by society).

Further, feedback is intended to improve the presentation style. Furthermore, the review process of a scientific paper will be demonstrated and applied.

Literature
Articles and book abstracts will be uploaded to a course website.
The Forum “Livestock in the World Food System” will take place in blocks of 2 hours each. Once the general topic has been selected, it comprises two parts:

Part 1
Aspect 1 - Oral presentation: The students form small groups and are lecturers,
Aspect 2 - chairperson: There are moderators which are chosen from outside of the presenting groups and they will lead the discussion and the remaining students and the lecturer are the audience and ask questions.
Aspect 3 - feedback: At the beginning, students form teams of 2, which are not in the same group, to give each other feedback on their presentation style.

Part 2.
Aspect 1 - Scientific writing: Preparation of a critical review of a chosen publication and individual exchange with the lecturer.
Aspect 2 - Defense: There will be a discussion in small groups on several dates to discuss the chosen publication in detail and the observations during the process.

Introductions to both presentation forms will be given by the lecturer.

Requirements for allocation of the two credit points:
- oral talk with sufficient handout
- delivery of the scientific writing in sufficient quality
- active participation during all presentations (in case of absence there will be additional tasks)
- feedback on the presentation style of a student

Competencies

751-5201-10L Tropical Cropping Systems, Soils and Livelihoods (with Excursion)

W+ 5 credits 10G J. Six, K. Benabderrazik

IMPORTANT: Students who enroll for this course are strongly recommended to verify with lecturers from other courses whether their absence of two weeks may affect their performance in the respective courses.

Abstract
This course guides students in analyzing and comprehending tropical agroecosystems and food systems. Students gain practical knowledge of field methods, diagnostic tools and survey methods for tropical soils and agroecosystems. An integral part of the course is the two-week field project in the Mount Kenya Region, which is co-organized with the University of Embu (Kenya)

Objective
(1) Overview of the major land use systems in Tropical agroecosystems in several contexts Africa
(2) Interdisciplinary analysis of agricultural production systems
(3) Knowledge on methods to assess agroecological performance of a tropical agroecosystems
(4) Hands-on training on the use of field methods, diagnostic tools and survey methods.
(5) Gain practical knowledge on how to assess to climate resilience and farming systems.
(6) Collaboration in international students and stakeholders

Content
This course guides students in analyzing and comprehending tropical agroecosystems. Students of ETH Zürch will work together with the students from Embu University (Kenya) in an interdisciplinary and intercultural team. Students will focus on the Agroecological performance and climate resilience of diverse farming systems in the Mount Kenya Region.

From October 28th to November 11th, The students will take part in a field course in the Mount Kenya Region. Students will then gain practical knowledge on field, meeting several stakeholders of the agricultural and food systems and conducting various assessments related to climate resilience and farming systems.

Prerequisites / notice
We would require the students enrolled to the class to send a short cover letter (1-page max.) by September 18rd 2023, justifying your motivation to enroll to this class. A selection of 20 students will be done on the basis of the letters.

751-2107-00L Agrarian and Environmental Values: Tensions, W+ 5 credits 3G M. Chapman, J. Jacobi

Autumn Semester 2024
Synergies, Practices and Policies

Limited to 20 students.

Abstract

In politics, society, and science, it can seem that the values and practices of agricultural production and environmental protection are in conflict. This tension is often described as “protection versus use” of natural resources. We will explore ways to move beyond the apparent conflict. We will apply this learning to field trips and transdisciplinary projects.

Objective

Students are able to:
- Define different kinds and categories of values.
- Relate value concepts to their own studies, life, and experiences through reflective journaling.
- Infer the underlying values in a text or policy about agri-environmental topics.
- Collaboratively develop a transdisciplinary project for an agri-environmental case study from the field trips.

Content

The course consists of interactive seminars alongside field trips to farms that have found innovative solutions to balancing protection and production.

Seminars will cover topics such as the relationship between values and behavior and how people perceive value trade-offs. We will also discuss environmental ethics, environmental valuation and its critiques, the interplay of facts and values in agri-environmental decision-making, cultural ecosystem services, and relational values.

This class requires active participation. Learning is based on in-class activities, group work, and field trips.

Literature

Literature will draw from political ecology, value theory and environmental values, as well as case studies and primary texts, such as the following (not all will be required reading; we will read 1 or 2 papers or book chapters each week).

- Environmental Values, by O'Neill, Holland and Light, 2008
- IPBES Values Assessment 2023
The students are able to critically examine and select appropriate robotic solutions for agricultural applications.

Robots are becoming a key technology in the transition to smart farming and in supporting the agricultural needs of the 21st century. For example, robots enable site-specific fertilization, automated weeding, or livestock herding.

The course gives an overview of robotic systems, beginning with their fundamental components (e.g., sensors, actuators, locomotion strategies) and gradually scaling up to the system level, illustrating the concepts of perception, robot control, obstacle avoidance and navigation. Exercises performed with an educational robot (Thymio) will complement the theoretical lectures providing a hands-on practical experience of the challenges of using these machines.

During the course, students will gradually apply the theoretical and practical knowledge they are learning. To this end, students will work in teams to develop a robotic solution for an agricultural task of their choice. Students will periodically present and discuss the development of this “robot design” exercise during presentations and in a journal report.

Copies of the slides and exercises will be provided on the course Moodle page.

No mandatory prerequisites, but it is preferable that students have a basic knowledge of computer programming.

Class size limitation to 30 students.
The Master thesis is an independent scientific work. Normally the subject is selected among the topics of the core subject. It is written

751-5005-00L Agroecology W+ 2 credits 2G N. Buchmann, S. Keller, M. Sonneveld

Abstract
Agroecology is a discipline, an agricultural practice, and a political-social movement. Students will attend public lectures by experts from different fields and will reflect on agroecology and its principles. Moreover, students will expand their knowledge with case studies and discuss about the role of agroecology to support sustainable agriculture and food systems.

Objective
Students know the thirteen principles of the High-Level Panel of Experts (HLPE) of the Committee on World Food Security as well as the ten elements of agroecology suggested by FAO and can critically reflect on the important properties as well as benefits and trade-offs of agroecological systems and approaches.

Students will be able to transfer their disciplinary and interdisciplinary knowledge about the thirteen principles as guiding principles for policymakers, practitioners, and other stakeholders across the food system in planning, managing, and evaluating agroecological transformation. Students are part of small groups focusing on selected principles of the HLPE. During the course, students discuss the potential and limitations of agroecology and learn about scientific contributions to agroecology. Students form an opinion on the role of agroecology, reflect and argue on the different facets and develop recommendations for real-world applications of agroecology in supporting a transition towards sustainable food systems.

Content
The course is designed as a combination of public lectures/webinars on "Agroecology and the Transformation to Sustainable Food Systems" delivered by national and international experts and scientists as well as sessions in which students reflect on the topics addressed in the lecture series in a group work format. The public lectures bring different perspectives to the discussion and are intended as inputs for the students' sessions. In the student sessions, the student groups deepen their knowledge of the 13 principles of agroecology proposed by the High-Level Panel of Experts (HLPE) of the Committee on World Food Security. They identify "unknowns" and link to other closely related principles. The groups also work out the perspective of a chosen stakeholder. Finally, the groups will take part in a scientific discussion representing their stakeholder perspective. All groups will synthesize their discussions in a short report.

Lecture notes
Handouts will be available on the webpage of the course.

Literature
Report of HLPE on agroecology:

Prerequisites / notice
This course is based on fundamental knowledge about plant ecophysiology, soil science, biogeochemistry, crop and forage science, and ecology in general. The course will be taught in English. The course is only offered in fall.

Introduction to Crop and Forage Production

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
This course provides an introduction into crop and forage sciences - with a focus on sustainable management methods in Switzerland and Europe.

Objective
The students know the basic processes and management methods of arable and forage production in Switzerland and Central Europe. They know the most relevant arable crops. Students can assess the influence of environmental factors and management not only on individual plants, but also on meadow and pasture plant communities and on their yields. They understand the relevance of crop rotation measures and can make recommendations for the establishment of land management methods. The students are familiar with sustainable, climate-friendly and biodiversity-conserving or biodiversity-enhancing management measures and understand the value of species-rich vegetation for the provision of ecosystem services.

Content
The lecture is divided into two parts, i.e., Arable Crop and Forage Production, supervised by different lecturers.

The part 'Arable Crop Production' deals with the most relevant arable crops and with basic steps of arable field management such as soil tillage, sowing and plant protection. Effects on soil structure, different tillage measures for different crops as well as differences in the intensity of intervention in comparison of conventional and soil-conserving tillage (e.g. no-till) are explained. The most important differences between conventional, integrated and organic production are addressed. Special emphasis is placed on the establishment of crop rotations taking into account the farm context.

In the part 'Forage Production', important plant functional groups and representative plant species as well as different types of grassland systems, i.e., most important mixtures as well as natural plant communities in Central Europe are presented (ward assessment). Based on the ecophysiology of individual plants, the reactions of plant stands to changing environmental conditions are elaborated. Different types of management are presented (e.g. fertilisation, grazing, cutting) and their effects on stand composition and yields are discussed. Feedback mechanisms between environment and grassland systems are addressed. The role of biodiversity is addressed.

Lecture notes
Available on moodle

Animal Breeding

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Abstract
Introduction to basics of animal breeding. Importance of animal production. Species of livestock and their products, performance recording, functional traits, genetic diversity, breeding goals. Qualitative and quantitative traits. Basic knowledge of breeding methods: genetic and environmental variation, heritability, genetic correlation, estimation of breeding values, selection, mating systems.

Objective
Show the importance of animal production for Swiss and international agriculture. Name the livestock species, their products, systematic classification and breeding and production goals. Describe methods to measure animal performance (performance recording) and functional traits. Define the most important parameters and methods in animal breeding.

Content
Domestication, history of animal breeding.
Definition, models of animal production, species of livestock, numbers, distribution.
Genetic polymorphisms and their applications in animal breeding.
Genetic diversity, breeds, production and breeding goals.
Traits: performance, functional.
Performance recording, herd replacement.
Qualitative (monogenic) and qualitative (polygenic) traits, Mendelian genetics, quantitative genetics.
Genetic and environmental variation, heritability, genetic correlation, selection, selection response.

Lecture notes
Transparencies and single chapters of textbook are made available on homepage.

<tr>
<td>Objective</td>
<td>This series of lectures should enable students to comprehend architecture in its social context.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>Sociology I deals with the macro-sociological point of view, and investigates the relation between social developments and the production of the built environment. In the first part central aspects of social change are examined, in particular the transition from Fordism to Neoliberalism and the interlinked processes of globalization and regionalization. The second part deals with historical and current forms of urbanization. Among other aspects, it focuses on the changed significance of the urban-rural contradiction, the processes of suburbanization, periurbanization, and planetary urbanization; the formation of global cities and metropolitan regions; the development of new urban configurations in centres (gentrification) and in urban peripheries (edge city, exopolis, new urban intensity). In the third part these general processes are illustrated by typical models of urbanization: Manchester, Chicago, Los Angeles, Paris and Zürich.</td>

Content

Building history I covers the period from classical Greek antiquity to medieval architecture. The principal topics include construction issues such as Greek megalithic building, Roman mortar-and-rubble construction, and vaulting.

Within the Vitruvian and Albertian triad of firmitas, utilitas and venustas, we focus on the first two topics, whereas the last topic (deciphering the "meaning" of architecture) stands at the heart of the "architectural history" lectures. The present lecture contributes essentially to deepening knowledge about historic constructions, an indispensable precondition for building within existing fabric.

- buildings of Greek antiquity as examples of construction with huge stone blocks
- Roman buildings as examples of building with small materials, strict functional disposition, and evolution of the art of vaulting
- late antique and early Christian buildings: discovering interior space, developing new paradigms for religious architecture, construction of wide-span roofs
- early and high medieval construction, continuing antique traditions, revival of dressed stone and vaulting
- small buildings, notably rural housing
- the medieval monastery

Lecture notes

Please keep a tight record of manuscript notes yourself. PDFs of lecture slides will be online before each lecture. Lecture notes for exam preparation are provided and should be used in conjunction with the pictures from the lecture slides.

Literature

The exam will be held at the end of the first year. It is a computer-based multiple choice test. It calls for precise knowledge of the examples presented in the lecture, including the specifics of the architecture and construction of the buildings. Terminology is in German.

Prerequisites / notice

Due to professor Holzer's sabbatical, this lecture will be given by Dr. Jasmin Schäfer, in Fall Term 2024. However, the contents will be identical to the lecture delivered by professor Holzer in the Fall Term of 2023. This includes the topics, slides, lecture notes. Professor Holzer's lecture of Fall Term 2023 is available as a recording on video.ethz.ch. The lecture of Dr. Schäfer in Fall Term 2024 will NOT be recorded. Please refer to the recording of Fall Term 2023 under video.ethz.ch.

You may either listen to the fall 2023 recordings, to Dr. Schäfer's live lecture, or to both, to be prepared for the spring term of 2025 and the exam.

Abstract

Introduction and overview of the history and theory of architecture from the Renaissance to the nineteenth century. The course covers the chronology and key works, protagonists and discourses of early modern European architecture.

Fundamentals for the History and Theory of Architecture I-II provide a practical introduction to the methods and instruments of the history of art and architecture.

Objective

1. Acquiring basic knowledge of the history and theory of architecture during the early modern period, of its key protagonists and discourses and of the methods and instruments of architectural research.
2. Identifying the main architectural issues and debates of the period and recognising the places and architectural works covered in the course.
3. Acquiring the tools to develop a historically informed reading of the built environment, recognising debates, styles, ideas and problems which drive and inform architectural production.
4. Developing the tools to draw on historical, theoretical and critical research to the benefit to one's own architectural culture.

Content

The course History and Theory of Architecture I-II offers a chronological and thematic overview of the architecture and architectural theory produced in Europe from the 15th to the 19th centuries. Thematic lectures about key questions at play during the period will be combined with in-depth analysis of historical buildings, texts and iconographies.

Themes will cover the emergence and development of Vitruvian design theory and practice up to the 19th century and related issues such as the emergence of the architect; the development of original design practices and of divergent theories of architectural composition and design; the media of architectural design and practice (drawings, models, building materials); patterns and media of dissemination and influence (books, imagery, micro-architecture); building types (the palazzo and the villa); questions of beauty and ornament; questions of patronage (e.g., the Roman papacy) and the formation of religious and political symbolism through architecture; the relation of buildings to the city (e.g., the development of European capitals); attitudes towards history (origin myths, historicism); the question of the monument.

The exercises Fundamentals of the History and Theory of Architecture I-II aim to explore and develop basic methods and strategies to research the history of art and architecture. They consist of four parts, each developed under one of the four gta Chairs and each dealing with a particular area of study in the field of architecture and art history.

(1) The historiography of architecture (M. Delbeke)
(2) Architectural media (L. Stalder)
(3) Architecture and art (P. Ursprung)
(4) Urbanism and the Commons (T. Avermaete)
Course scripts, PowerPoints and lecture recordings for History and Theory of Architecture I-II will be available to download from the course page. Printed copies of the course scripts will also be available for purchase.

For the course History and Theory of Architecture I-II students will rely on assisted self-study to acquire basic knowledge of the history of architecture in Europe.

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 73 of 2684
Architecture is no longer conceivable without information technology. The planning, construction, operation, and ultimately the nature of buildings are increasingly influenced by digital technology. The digital is omnipresent both in the work of architects and in our built environment itself.

The courses Computational Design 1 and 2 offer an introduction to the character, challenges, and possibilities of digital technology in architectural design. The lectures will discuss the topics of digital building models and data, computational geometry, digital fabrication, machine intelligence, and mixed reality.

In this course, students will practice digital modeling processes and related techniques. The spectrum of exercises includes manual modeling, visual programming, and programming code within CAD software. Students learn to read, understand and adapt this code. In addition, the courses will provide insights into the nature and handling of different digital media formats, from real-time rendering to mixed reality.

Topics discussed within the lectures:
- CAD - background, and developments
- On the nature of digital models and data
- Architectural geometry
- Computational geometry
- Parametric and generative creation of models
- Computer-aided analysis and optimization of models
- Artificial intelligence and architectural models
- Materialization of digital models
- Mixed reality

Course Structure
The course consists of theoretical lectures, practical tutorials introducing technical concepts, and exercises supported by tutors. Participants can find updated and detailed information on Moodle, which is the learning platform for the course.
## Competencies

### Art in Space and Time I

**Abstract**
Attendance in the lecture and exercise "Art in Space and Time I" and in the course "Introduction to Free and Perspective Drawing". Submission of artistic exercise works. The semester grade results from participation in the lecture and exercise "Art in Space and Time I" as well as the "Introduction to Free and Perspective Drawing", and the submission of artistic exercise works.

**Objective**
Students engage in experimental concepts in the arts as well as free and perspective drawing. In addition to acquiring extended artistic thought processes and practices, they each develop their own artistic exercise works.

**Content**
"Art in Space and Time" encompasses diverse and multi-disciplinary research fields, ranging from urban anthropology to artistic practices: film, sculpture, sound, writing, digital arts, and performance. These fields include and intersect with language, political discourses, and investigations of the human environment. Concrete theoretical as well as speculative, practical procedures are being tested to open up new horizons of perception and to reflect on them.

<td>J. Pauli</td>
</tr>
</tbody>
</table>

*Abstract*
The course Structural Design III complements the courses Structural Design I and II by introducing building materials and construction techniques.

**Objective**
After a successful conclusion of the course, students will be able to:

1. Understand the structural behaviour of a building and of its main components
2. Conceive and control design parameters as part of the design process
3. Design structural systems in compliance with diverse performance criteria including architectural, structural, constructive, and environmental aspects altogether.
4. Design structural systems consistent with the material used
5. Dimension structural elements using different building materials
6. Develop construction details in compliance to a specific static scheme
Content

The course presents a holistic approach to the design of structures by integrating static equilibrium, learned in previous semesters, with considerations regarding materials and construction techniques.

The course explores the relationship between architecture and structure by introducing and discussing design parameters and their implications with respect to different performance criteria. In addition to those related to statics, performance criteria also include aspects related to use of material and energy resources, which is directly connected to questions of environmental footprint.

The objective of the course is to show that structural design tasks must consider a number of aspects belonging to different disciplines simultaneously. This results in a level of complexity that very rarely can be reduced to a univocal “right” answer. Critical thinking and technical knowledge must support each other. The course aims at giving the tools for developing these skills.

After a brief review of the key aspects taught in Structural Design I and II, the course Structural Design III will examine different load-bearing elements, how they relate to each other, and their possible relationships with the architectural space.

Starting from 2D spanning structures, a series of 5 lectures will illustrate the functioning of the main load-bearing elements of multistory buildings by means of graphic statics as well as analytical methods.

Implications at the level of structural performance, spatial performance, material use, and environmental footprint will be thoroughly discussed throughout the entire course by analyzing buildings of exemplary quality.

The content of the lectures will be strengthened through 5 exercise sessions during which students will apply the knowledge gained during the lectures and refine their design skills through dedicated design exercises under the supervision of a tutoring team.

Literature

"The art of structures, Introduction to the functioning of structures in architecture”

"Faustformel Tragwerksentwurf”
(Philippe Block, Christoph Gengangel, Stefan Peters, DVA Deutsche Verlags-Anstalt 2013, ISBN: 978-3-421-03904-0)

"Form and Forces: Designing Efficient, Expressive Structures”

Prerequisites / notice

To take part in this course, it is recommended to first complete the courses Structural Design I and II or to have knowledge of graphic statics.

052-0805-00L History and Theory of Architecture III 2 credits 2V L. Stalder, A. Kalpakci

Abstract

This two-semester course is an introduction to the history of architecture from the Second Industrial Revolution in the 1850s to the Oil Crisis in the 1970s in Europe. Students will be able to identify the “things”—technical objects and ensembles—that transformed architecture, and to relate them to the technical, scientific, and cultural concerns that introduced them as key features of modernity.

Objective

To introduce students to the history and theory of architecture, the course has three objectives.

First, students will be able to identify the “things” that transformed architecture in modernity, and the crucial events, buildings, theories, and actors that characterize their history.

Second, students will be able to describe how these “things” operated at different scales, focusing less on the formal level, and naming instead the different forms of expertise that constituted them historically, as well as the processes within which they were embedded.

Third, students will be able to reflect on a series of apparatuses, devices, and building parts that are in fact micro-architectures which have often been neglected, despite their pivotal role in shaping the daily lives of modern societies.

Content

The course proposes a new approach to the study of the history and theory of architecture in Europe during modernity. It focuses less on single architects or their buildings, and more on those “things” that have brought profound transformations in the built environment and daily life over the last 200 years, such as the revolving door, the clock, and the curtain.

The notion of “thing” includes both the concrete building parts and the concerns associated with them, such as material performance, social synchronization, and individual expression. To understand buildings as assemblages of “things,” therefore, does not mean to diminish their significance, but on the contrary to add reality to them, to understand them in terms of the complex, historically situated, and diverse concerns within which they were designed.

Each lecture introduces one “thing” through a genealogy that shaped it, from patents and scientific discoveries and technological advancement, to cinema, the visual arts, and literature. A set of renowned projects as well as lesser-known buildings from all around Europe offers a variety of case studies to describe these “things,” to understand how they operated in relation with one another, and to identify the theories and tactics that architects mobilized to make sense of them.

052-0635-00L Computational Design III O 2 credits 2G F. Gramazio, H. Hassan, M. Kohler, L. Wiedemeier

Title of this course before HS22: "Mathematical Thinking and Programming III".

Abstract
This class builds on the digital literacy foundations taught in the previous year and expands the acquired competence in the use of computers in design. At the core stands the question of how to use digital architectural design methods in a creative, purposeful and self-confident manner.

Objective
The course consists of lectures and exercises. The lectures convey an insight into strategies for the implementation of algorithmic techniques in architectural design by presenting and discussing the research and the build work of the professorship. This pragmatic view on the computational design process helps demystifying algorithmic techniques and developing a critical understanding for their potentials in the architectural praxis. Programming is an extension of traditional design tools. While this powerful cultural technique allows us to handle complexity in a previously unknown way, the question of its meaning, relevance and potential needs to be negotiated on a context specific base for every single project. In order to be able to do this, we shall develop a conceptual understanding for the methods as well as familiarity with the practice of programming. While the works discussed in the lectures sharpen the conceptual understanding, the tutored exercises will train the programming practice. In these sessions, we will implement simplified yet powerful versions of the discussed projects by using Rhinoceros 3D as a modeler and Grasshopper as a visual programming interface, both environments that have been introduced in the previous semesters. Up-to-date and detailed information on the lectures and exercises is announced on MOODLE, which will serve as the teaching platform for this course.

The specific learning goals are:
- To develop a critical awareness for the potentials of algorithmic design methods.
- To learn to deploy parametric design strategies.
- To become familiar with the practice of visual programming.
- To understand the concepts and potentials of digital fabrication.

052-0801-00L Global History of Urban Design I O 2 credits 2G T. Avermaete

This course focuses on the history of the design of cities, as well as on the ideas, processes and actors that engender and lead their development and transformation. The history of urban design will be approached as a cross-cultural field of knowledge that integrates scientific, economic and technical innovation as well as social and cultural advances.

Objective
The lectures deal mainly with the definition of urban design as an independent discipline, which maintains connections with other disciplines (politics, sociology, geography) that are concerned with the transformation of the city. The aim is to make students conversant with the multiple theories, concepts and approaches of urban design as they were articulated throughout time in a variety of cultural contexts, thus offering a theoretical framework for students' future design work.

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 78 of 2684
In the first semester the genesis of the objects of study, the city, urban culture and urban design, are introduced and situated within their intellectual, cultural and political contexts:

01: The History and Theory of the City as Project
02: Of Rituals, Water and Mud: The Urban Revolution in Mesopotamia and the Indus
03: The Idea of the Polis: Rome, Greece and Beyond
04: The Long Middle Ages and their Counterparts: From the Towns of Tuscany to Delhi
05: Between Ideal and Laboratory: Of Middle Eastern Grids and European Renaissance Principles
06: Of Absolutism and Enlightenment: Baroque, Defense and Colonization
07: The City of Labor: Company Towns as Cross-Cultural Phenomena
08: Garden Cities of Tomorrow: From the Global North to the Global South and Back Again
09: Civilized Wilderness and City Beautiful: The Park Movement of Olmsted and The Urban Plans of Burnham
10: The Extension of the European City: From the Viennese Ringstrasse to Amsterdam Zuid

Prior to each lecture a chapter of the reader (Skript) will be made available through the webpage of the Chair. These chapters will provide an introduction to the lecture, the basic visual references of each lecture, key dates and events, as well as references to the compulsory and additional reading.

There are three books that will function as main reference literature throughout the course:

These books will be reserved for consultation in the ETH Baubibliothek, and will not be available for individual loans.

Students are required to familiarize themselves with the conventions of architectural drawing (reading and analyzing plans at various scales).

- Literacy
- Analytical Competencies
- Social Competencies
- Method-specific Competencies
- Personal Competencies

Prerequisites / notice

A list of further recommended literature will be found within each chapter of the reader (Skript).

The lecture series translates urban knowledge into operational tools, extracted from cities where we are building a catalog of change, analyzing what design solutions cities have been developing informally incrementally over time, why, and how. We look at the people, institutions, culture behind the design and make concepts behind these tools visible. Students get first-hand information from cities where the chair as a team has researched, worked, or constructed projects over the last year, allowing competent, practical insight about the people and topics that make these places unique. Students will be able to use and expand an alternative repertoire of experiences and evidence-based design tools, go to the conceptual core of them, and understand how and to what extent they can be relevant in other places. Urban Storied is the basic practice of architecture and urban design. It introduces a repertoire of urban design instruments to the students to use, test, and start their designs.

Students are introduced to a narrative of ‘Urban Stories’ through a series of three tools driven by social, governance, and environmental transformations in today’s urbanization processes. Each lecture explores one city’s spatial and organizational ingenuity born out of a particular place’s realities, allowing students to transfer these inventions into a catalog of conceptual tools.

- Analytical Competencies
- Decision-making
- Sensitivity to Diversity
- Creativity Thinking
- Critical Thinking
- Negotiation

This lecture series will introduce urban knowledge and the way it has introduced urban models and operational modes within different concrete realities, therefore shaping cities. The lecture series translates urban knowledge into operational tools, extracted from cities where they have been tested and become exemplary samples, most relevant for understanding how the urban landscape has taken shape. The tools are clustered in twelve thematic clusters and three tool scales for better comparability and cross-reflection.

The Tool case studies are compiled into a global urbanization toolbox, which we use as typological models to read the city and critically reflect upon it. The presented contents are meant to serve as inspiration for positioning in future professional life and provide instruments for future design decisions.

In an interview with a local designer, we measure our insights against the most pressing design topics in cities today, including inclusion, affordable housing, provision of public spaces, and infrastructure for all.
The Landscape Architecture I and II lecture series looks at the design of nature from the first cultural landscapes to today’s complex cultural landscape formations. The lecture series not only analyzes the results of anthropogenic nature design, but also discusses its various causes, contexts and consequences.

<tr>
<td></td>
<td>The two-semester course offers an introduction to the history of modern and contemporary art and architecture since ca. 1970. Motivated by questions of the current discourse, central topics and exemplary works of art and architecture are discussed. Concepts such as &quot;labor&quot;, &quot;economy&quot;, &quot;experience&quot;, &quot;research&quot;, &quot;nature&quot;, &quot;diversity&quot; or &quot;surface&quot; are used to focus on specific historical developments and connections. Art and architecture is considered as a field of cultural change as well as an indicator of social, economic, and political conflicts which in turn helps to understand historical dynamics.</td>

---

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 80 of 2684
Students learn about historical developments and their topicality and learn "from history". Design contexts are presented on the basis of examples. Students develop a basis for ways of thinking and action for current landscape architectural challenges.

The lectures in the fall semester course "History and Theory of Gardens and Landscape Architecture" provide an overview of the cultural history of nature, the landscape, and the garden from its origins to the present day. An in-depth understanding of change as well as the design strategies and characteristics of the most important epochs and their current relevance will be discussed.

Lectures: The lectures in the landscape architecture courses provide an overview of methods and methods for the efficient and sustainable design of buildings. Interactions of energy, GHG emissions and climate with architectural and urban design will be investigated.

Handouts and a bibliography will be provided.
Objective
The lecture series does not provide instructions or recipes on general constructive topics. The description of distinctive, spatial experiences and the constructive measures used to achieve them, is rather intended to sharpen the students' awareness, for their own design work and to show countless possibilities of how an architectural, spatial idea can be understood and further developed through its material, its construction method and its supporting structure.

Content
The buildings, which are described and explained in the lectures, differ fundamentally from each other in their time of origin, their urban context, as well as their geographical location and could hardly be more different in their scale and their use. These buildings are not a typical expression of their time and location, instead they are an expression of an individual creation and likewise use the constructive possibilities of their time and their environment in a distinctive way. Accordingly, each lecture is dedicated to a different architect.

In addition, isolated current examples from professional practice will be shown. These lectures on new buildings, some of them unfinished, are given by an architect directly involved on site, in English, and partly online.

23.09.24 Der filmische Raum
30.09.24 Vilanova Artigas
14.10.24 André Bloc
28.10.24 Modell und Wirklichkeit
11.11.24 Kenzuo Shinozha
25.11.24 Le Corbusier

Lecture notes
The script is a comprehensive collection of material that allows students to form their own ideas about the case studies shown, independent of the lecture. Most of the photographs were taken on study trips and show the buildings under discussion with unpublished material. The extensive collection of photographs is supplemented with drawings, plans, site photographs, and historical photographs from books and archives. The script will be made available in digital form at the end of the year to students enrolled in the lecture series.

Prerequisites / notice
Mobility students or students from other departments who only want to take the exam on the material from the last semester (Construction V or VI) are asked to contact the chair in advance.

Architectural Design
Architectural Design (3. Semester)

Number | Title | Type | ECTS | Hours | Lecturers
---|---|---|---|---|---

Abstract
Focusing on the theme of Shelter, the semester begins with a field trip to Rome, where we will visit and study selected historical examples. Through this analysis we will develop a typological understanding of architecture, addressing questions of space, structure and tectonics. The second half of the semester will be dedicated to the design of an ideal shelter located in the Roman countryside.

Objective
Design Studio "Architectural Design III":
Master the analysis of historical case studies through experimental drawings. Foster a multifaceted interpretation of architectural principles and characteristics, while developing an environmentally aware approach to design, and addressing climate issues on a typological level. Cultivate an understanding of the topic in relation to contemporary issues. Learning to address aspects related to form and tectonics within the design of a new building.

Lecture "Construction III":
Introducing students into different design and making approaches to find a path towards their personal approach on designing and making.
Design Studio "Architectural Design III":
In times of climate crisis and strong social transformation we find ourselves dwelling on unsettling questions: am I still safe in my place? Will there be room for everyone in the future? What is the minimum necessary to live? What does it take to foster an idea of community that is gradually disappearing? Within the discipline of architecture, such doubts and fears can be translated into fundamental design questions: how do we protect our living space from increasingly harsh and unpredictable climatic events? How do we design resilient and durable structures? How to make the best use of the limited available resources? All these questions take us back to the roots of architecture, to the complex relationship between nature and civilization, to the human need of finding refuge in and from nature: Shelter.

But what is Shelter? Not just a protection from natural elements, a shelter also identifies the place of collective refuge in our society, a place of community and hospitality. This social value in turn influences the architectural form: be it inn or church, hut or temple, cave or hangar, the Shelter is as much primary dwelling as cultural place. The Shelter is Architecture.

With these questions in mind, we will dedicate the coming studio in the series of Ideal Architecture to the development of a contemporary understating of Shelter, taking into consideration its connotation as both intimate and collective space, and its socio-cultural value: The Ideal Shelter - 7 new Types. Starting from historical examples, we will develop the basic architectural knowledge needed to tackle this challenging task in theory and practice. Primary questions of space, structure and tectonics, as well as the fundamental issues of proportion, form and meaning will be at the center of our design debate.

We will begin the design process for a new contemporary shelter with a field trip to Rome. We will visit, analyze and critically reflect on 7 shelters from different time periods. This will be followed by a visit to 7 sites outside of Rome. Here in the ideal (-ized) landscape of the Roman Campagna, the Ideal Shelter will find its place. As a studio we will collectively develop a representation where multi-layered drawings and models, as well as the handling of historical references, will form the methodological basis for the design, which will primarily focus on typological, tectonic, and formal aspects.

Lecture "Construction III":
The overall topic of the lecture series is "Construction – Elements of Architecture". The lecture series gives the students an insight into different construction and design methods. The lectures are held by four different professorships in a block of 5 lectures in a row and showcasing their individual approach on design and architecture in general.

Abstract
Lecture "Construction III":
The overall topic of the lecture series is "Construction – Elements of Architecture". The lecture series gives the students an insight into different construction and design methods. The lectures are held by four different professorships in a block of 5 lectures in a row and showcasing their individual approach on design and architecture in general.

Objective
In the 2nd Year curriculum, three courses are related in design theory and design practice: "Konstruktion III" is design theory. "Konstruktion BUK III" is construction theory. "Architectural Design III" integrates the theories from the different courses including with them to apply architectural design in real-world problems.

Architectural Design III: House Behaviorology in Switzerland (M.Kajima)

Typology and Research (4 weeks)
Each individual student
• is able to understand different housing typologies within their historical context. (2)
• is able to understand the principles of housing design, including topics such as Typology, Program, Usage, Privacy, Commonality, Material and Climate. (2)
• is able to independently gather information on a self-chosen topic (3)
• is able to analyze a case study house based on an individually formed question or individual interest. (4)
• is able to represent their analysis in a drawing and a short text. (3)

Structure and Space (4 weeks)
Each individual student
• is able to design a small-scale housing complex according to the above-mentioned principles. (3)
• is able to design spaces for privacy and for community. (3)
• is able to adapt a housing design to the needs of specific inhabitants with partially special needs, such as families and elderly. (3)
• is able to apply the principles of structural design to their housing design. (3)
• is able to critically evaluate a design and improve it. (5+6)
• is able to represent a design through floor plans, sections and elevations as well as with physical models (3)

Improving Design + Details and Construction (5 weeks)
Each individual student
• is able to detail a small-scale housing complex. (3)
• is able to understand the principles of construction. (2)
• is able to gather examples and evaluate them in accordance with their design (5)
• is able to evaluate and chose materials and construction in accordance with their design idea (5).
• Is able draw a section of their design in scale 1:50 with all necessary details. (3)

Cognitive scale
(1) Remember
(2) Understand
(3) Apply
(4) Analyze
(5) Evaluate
(6) Create
https://ethz.ch/content/dam/ethz/main/eth-zurich/education/lehrentwicklung/files_DE/Vorlage_LernzieleFormulierenDe.pdf

Grading Criteria:
The submissions will be graded before each review. Each submission is graded according to the following criteria:
• Completeness and punctuality of submission
• Research method, the ability to find and analyze information
• Implementation of the concept of Architectural Behaviorology within the design
• Choice of Typology, Design and Expression of the project, in connection with the concept of Architectural Behaviorology
• Structural design, construction details and choice of materials in accordance with the design idea and the method of Architectural Behaviorology
• Visualization, the ability to communicate a design effectively with compelling drawings, models and text.

The final grade consists of the following partial grades:
• Mid review 1 submission (individual work): 30%
• Mid Review 2 submission (individual work): 30%
• Final Review submission (individual work): 30%
• "Construction III" submission (individual work): 10%

Lecture "Construction III":
Introducing students into different design and making approaches to find a path towards their personal approach on designing and making. Last day of lecture, students must bring construction drawing by a A5 sketchbook given at first lecture by design studio to submit the result of understanding of lectures. The presentation will be a large exhibition participated by all 2nd year students to share as exhibition by all 2nd year students. The result will be integrated in the grading of design studio.

Architectural Design III: Material and Light (R.Boltshauser)

W 14 credits 2V+14U R. Boltshauser, E. Christ, J. De Vylder, C. Gantenbein, M. Kaijima, D. Mettler, D. Studer

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

Students who do not wish to change the design class don't have to participate in the internal enrolment.

Project grading at semester end is based on the list of enrolments on 30.10.2024, 24:00 h (valuation date) only.

This is also the ultimate deadline to unsubscribe or enroll for the studio.

Abstract

In the autumn semester, we will approach the phenomenon of space through fundamental experiences with regenerative materials and «Nordic Light» to design a cultural centre on Louis Kahn's home island of Saaremaa in Estonia.

In the spring semester, we work on the redensification of an industrial wasteland in Brunnen (CH) and focus on the themes of structure and place.

Objective

Semester topic "Design III":
• Addressing dense, sustainable, circular, simple building
• Development of a broad theoretical basic
• Holistic design of spatial atmospheres in the interplay of concept, context, construction, climate, sustainability and materiality
• Research and development of architectural themes resulting from energy and climatic considerations
• Practical work with models, plans and visualization programs as part of the design process

Lecture "Construction III":
Introducing students into different design and making approaches to find a path towards their personal approach on designing and making.

Content

Semester topic "Architectural Design III":

(…)

Lecture "Construction III":
The overall topic of the lecture series is "Construction – Elements of Architecture". The lecture series gives the students an insight into different construction and design methods. The lectures are held by four different professorships in a block of 5 lectures in a row and showcasing their individual approach on design and architecture in general.

Lecture notes

The students will receive a reader at the beginning of the semester.

Please register [www.mystudies.ethz.ch](http://www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see [http://www.einschreibung.arch.ethz.ch/design.php](http://www.einschreibung.arch.ethz.ch/design.php)). Students who do not wish to change the design class must not enrol.

Project grading at semester end is based on the list of enrolments on 30.10.2024 (valuation date) only.

This is the ultimate deadline to unsubscribe or enroll for the studio.

### Abstract

Do we live a house?  
Or do we house a life?  
How. Do. We. Live.  
Do we know HOW we live? Do we know enough about HOW we live? HOW do things around us shape the way we live? HOW do we live the things around us? WHAT are the conditions around us? WHAT makes our habits? HOW do habits change conditions?
Objective

With sets of questions, we will question
HOW TO house a life?
HOW TO cook?
HOW TO bath?
HOW TO rest?
HOW TO move?
HOW TO eat?
HOW TO plant?
HOW TO clean?

Combined with
WHAT IS
WHAT IS wood?
WHAT IS steel?
WHAT IS stone?
WHAT IS ceramic?
WHAT IS glass?
WHAT IS earth?
WHAT IS concrete?

Lined out with
WHERE IS
WHERE IS the window?
WHERE IS the stool?
WHERE IS the tree?
WHERE IS the stove?
WHERE IS the sink?
WHERE IS the lamp?
WHERE IS the door?

And never without
WHAT ABOUT
WHAT ABOUT the norm and the normative?
WHAT ABOUT the size and the scale?
WHAT ABOUT the place and the space?
WHAT ABOUT the individual and the common?
WHAT ABOUT the culture and the society?
WHAT ABOUT the weather and the atmosphere?
WHAT ABOUT the speed and the urge?

These sets of questions will guide us through the semester and form SETTINGS, SCENOGRAFI ES and SEQUENCES.

Is the way we cook defining the space or is our space changing the way we cook? Is taking a bath a matter of physical cleaning or might it also be a matter mental health?
Do we sleep to rest or is the bedroom also a place to read, to play, to meet? Can space be more than circulation? What do you store, where do you hide? What is an office at home? What is work at all?

Content

0 + 3 + 13

This studio will be organized in 0 + 3 + 13 movements. Movement 0, 1, 2 and 3 will last 3 weeks. Movement 13 will last 1 week.

During Movement 0, students will question, travel, draw, and collect from the activities of Universum Carousel Journey.

Movements 1, 2 and 3, students will work in groups of 3. These 3 students become a practice. The practice will be assigned a set of 2x HOW TO and 1x WHILST; that they will freely combine with 1x WHAT IS, 1x WHERE IS and 1x WHAT ABOUT. They will work in the form of settings, scenographies and sequences for 3 weeks.

In the next movement group members and assigned sets of questions change again. Each movement will be another group constellation of students. We study 3 times a combination of questions. All together we will by that collect an endless series of configurations of topics.

The Movement 13, will be an individual movement of questioning, connecting M0, M1, M2 and M3 all together into sets of questions that will be presented in the last week as a ground for a collective discussion.

Abstract

RETHINKING LANDSCAPE STRUCTURES

The semester explores new ways of dealing with infrastructure projects and exemplary climate adaptations of the Swiss cultural landscape.

Objective

DESIGNING LANDSCAPES AND PROCESSES

The primary goal of the studio is to project landscapes. This entails the constant oscillation between territorial relationships and local actions - between landscape space and place.

THINKING IN SYSTEMS

Due to the dynamics of their constituent elements such as soil, water and vegetation, landscapes change their dimensions and character with cycles and time. Designing landscape consequently means thinking in and designing systems and processes.

DEVELOPMENT OF A LANDSCAPE VOCABULARY

‘Reading’ a landscape, its space-defining elements – like water, topography and vegetation – and the processes and forces that shape them is as much a focus of teaching as designing. Thus, an intensive examination of our understanding of landscape and our relationship to nature goes hand-in-hand with the semester.

METHOD TO DESIGN FROM AND WITH PROCESSES

Because of the complexity of territory and task, the iterative design method is followed, oscillating between designing and analyzing, and between large and small scales. Developing an attitude, crystallizing the specific themes, and choosing the appropriate design tools are as much a part of the work process as designing the transformation processes.

Content

PROTOTYPICAL CASE STUDIES ON THE CLIMATE ADAPTATION OF THE SWISS LANDSCAPE

Based on specific issues such as landslide risks or planned tunnel projects, new innovative ways of dealing with natural events and infrastructure projects are designed - always in search of multi-layered added value for people, flora and fauna.

Parallel to the landscape design, the students get to know landscape architecture as one of the instruments with which today’s questions can be answered. Because these increasingly demand different answers - systemic thinking, designing processes, accepting change and a differentiated landscape vocabulary are prerequisites for this.

Prerequisites / notice

Integrated Discipline: Landscape and Urban Studies (LUS)
Competencies

### Subject-specific Competencies

Architectural Design V-IX: Voluptas S2E5 – Pathfinder (Charbonnet/Heiz)

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

Project grading at semester end is based on the list of enrolments on 30.10.2024 (valuation date) only. This is the ultimate deadline to unsubscribe or enroll for the studio.

Abstract
"Italian may be "such children" but their tar-babies are not physical pain or coldness; they want an absence of history, they want to start fresh. When they designed those big palaces in Rome they must have known all along about hope and death, but they were so graceful they made it look easy."

Objective
METHODOLOGY
1. Conduct a survey based on the objective observation of Rome; Driven by the choice of an Agent, map out a singular path within the city; Consider the subjectivity of experience and extrapolate multiple storylines.
2. Develop a project addressing a specific problematic: formulate a critical comment onto a contemporary condition; Intensify the experience to reveal further potentials.
3. Elaborate an argumentative discourse, supported by a curated selection of multidisciplinary sources.

INCENTIVES
Drafting & Mounting
Conceptual & Critical Thinking
Argumentation & Rhetoric
Narration & Storytelling
Scenography & Atmosphere
Expression & Composition

SKILLS
Researching Contemporary Concepts & Curating multidisciplinary Sources; Articulating a discursive Argument; Mastering Visual Literacy & Storytelling, Image Mounting & Composing, Architectural Drafting & Projecting.

Content
PATHFINDER 3 is dedicated to the timeless city of Rome: its intricate history, morphology, mythology… all canonical spatial perimeters as suggested by Lefebvre: political, sociological, anthropological, economical, temporal."

Our interest will focus both on the banal and the sublime, on habits, routines, and calendar rites as well as on individual and social rhythms setting the pace for society. As the ordinary interweaves thousands of beats, repetitive tunes and syncopated breaks, there can be no territory without its temporalities, may it be that of urbanisation, of experience, or of dreams.

The critical consideration of these paragons, further endowed with the lure of fiction, shall initiate alternate (hi)stories and cityscapes.

The design studio will be carried out in collaboration with the Faculty of Game Design of the Zurich University of the Arts (ZHdK). Together we will draft, mount, design, discuss, play... confront our perspectives onto contemporaneity and ultimately imagine audacious yet playful architectural and territorial fictions.

A series of lectures by experts from a variety of fields will enrich our investigations.

**Architectural Design V-IX: Topic (GD N. Cristelo Dias / M. Nägeli)**

*W 14 credits 16U C. Kerez, N. M. Cristelo Dias, M. Nägeli*

*Please register [here](http://www.einschreibung.arch.ethz.ch/design.php).*

*Project grading at semester end is based on the list of enrolments on 30.10.2024 (valuation date) only. This is the ultimate deadline to unsubscribe or enroll for the studio.*

### Abstract

The semester will focus on space as the language of architecture. Real-life constraints, requirements and disciplines will found the basis for the research in the form of fast-pace design exercise.

### Objective

folgt

### Content

folgt

### Prerequisites / notice

Individual and group work

Abstract

The Japan Studio assignment is to design a tearoom as an extension of the cafe on the Hönggerberg campus and to assemble the structure using construction waste. Students will be challenged to reinterpret Japanese wooden architecture, which established a sophisticated circular economy, in the context of contemporary Switzerland, and to create a new architectural philosophy and technology.

Objective

The studio is divided into three phases. The competencies to be acquired in each phase are as follows.

1st Phase: Building Elements Study (4 weeks)
- understanding of basic principles of building construction
- creation method by reinterpreting existing building elements
- craftsmanship skills in working with building elements

2nd Phase: Designing 'Tearoom' (4 weeks)
- ability to read the context of the surroundings
- planning ability to mediate conflicting demands
- conceptual ability to find an extraordinary space in an everyday space
- ability to design a distinctive form with an intimate space

3rd Phase: Building 'Tearoom' using Construction Waste (5 weeks)
- execution design ability from the perspective of construction
- understanding of basic materials and processing methods with construction waste
- ability to select appropriate materials, details, and processing methods
- ingenuity in construction, such as jigs for processing and assembly
- teamwork ability

Content

Outline:

The Japan Studio was established to exchange architectural culture between Japan and Switzerland in a contemporary context to look for new architectural answers to the sustainability issues that have rapidly become common world problems. In the Fall 2023 semester, a practical design studio will be conducted spanning architectural design and construction. The task is to design a tea room as an annex of the Alumni Lounge at the Hönggerberg campus, and to assemble the designed building (or parts of it) using construction waste materials, referring to the Japanese architecture in the early modern period. Because Japan was under a national isolation system in the early modern period, a sophisticated circular economy was established. The architecture then had been developed as a technological system that allowed for the reuse of materials as a matter of course. In addition, the influence of Zen culture led to the development of design techniques, such as "borrowed scenery" that harmonized and sublimated the surrounding scenery with the architectural space.

Such architectural thinking unique to early modern Japan must be helpful for modern architecture, which faces significant challenges such as the finite nature of resources and the chaos of urban landscapes. Students will challenge themselves to reinterpret the ideas of Japanese architecture developmentally in the context of contemporary Switzerland, and to create the germ of a new architectural philosophy and technology that will be required in the coming age.

Site and Building to Be Designed:

The site is located around the Alumni Lounge of the Hönggerberg campus, where we will design a tea room / Lounge furniture as an extension to the cafe. We want it to be a special and intimate place to spend special time with friends or guests invited to the university. The design will consist of tea spaces of no more than 10 square meters deployed inside and outside of the cafe. The tea room will be realised, in cooperation with the operators of the Alumni Lounge.

Studio Configuration:

Japan Studio consists of three phases. Students will develop comprehensive architectural skills spanning history, design, and construction through these phases.

1st Phase: Building Elements Study (4 weeks)
In the first phase, students will learn about demolished buildings that provide waste materials to be reused, and will be trained to open up the characteristics of the waste materials to new architectural possibilities. Specifically, students will research the history and industrial background of the demolished building (Huber Pavilions), as well as create a full-scale portion of a building element using the waste materials.

2nd Phase: Designing 'Tearoom' (4 weeks)
In the second phase, students will learn about Japanese tearooms and spatial design, and design a "new tearoom" as an extension to a small café on the ETH premises. While learning about the design concepts of "having a small but rich world", "feeling enclosed and connected", and "finding resources in a limited environment", all of which are common to tearoom architecture, students will observe the issues and potential attractions of the target site and how to find resources in a limited environment through the design of small architectural interventions. Final deliverables will include a presentation to the cafe operators.

3rd Phase: Building 'Tearoom' using Construction Waste (5 weeks)
In the third phase, students will produce the designed tearoom at 1/1 scale through group work and learn about the characteristics of basic materials such as wood, metal, and resin, as well as processing and joining methods. Students will be using dry construction methods that do not use adhesives, using details that will not wear off during assembly and dismantling. In order to realize the conceived space, technical invention from both form and material is required.

Lecture notes

Each student will receive a printed reader, containing the basic information about the course, such as schedule, syllabus and other important information, as well as examples and references for the design task, and readings to support the theoretical framework of the course.
Abstract
This studio works on the idea that a substantial understanding of today’s technology (internet of things, big data, machine intelligence ...) changes the perspective to architectural theory and will result in different architectural designs and building constructions.

Objective
1) Identification and understanding of the challenges of today's technologies;
2) techniques of working within the plenty of the internet;
3) a methodology to design digital architectures;
4) understanding of the shift from hard building construction to soft building applications, and
5) an understanding of the importance of becoming a literate digital persona in order to be an architect today.

Content
METEORA #09
will use artificial intelligence to write a text to explicate a precise position in today's world, to create a spectrum of images to reflect this world and design an architectural artefact which brings things into adequate proportions

Prerequisites / notice
Individual work only

Architectural Design V-IX: Topic (L.Hovestadt)
W 14 credits 16U
L. Hovestadt, J. Orozco Esquivel

W 14 credits 16U
F. Gramazio, M. Kohler
Abstract

In the Immersive Studio we design in virtual space and assess the current project status regularly from a first-person perspective. We work with the CAD software Rhinoceros and create our designs directly in 3D. Consistent work on the model ensures that the immersive experience of the project using virtual reality glasses is possible at any time and without additional effort.

Objective

We will not create orthogonal representations of the project. We generate plans and sections using horizontal and vertical sectional planes directly on the 3D model. This allows us to efficiently and interactively present the abstractions necessary for understanding the spatial relationships.

- We learn to develop and discover our designs with the help of virtual reality
- We learn to design with the parametric design tool Grasshopper in Rhino
- We learn what influence our design decisions (geometry, materialization) have on the room acoustics
- We present our designs in an interactive way

Content

Immersion:

We are used to designing architecture from a supposedly objective perspective. With immersive technologies, we overcome this distance, expand our perception and immerse ourselves directly in the space to be designed. In doing so, we develop a different understanding of space by designing architecture and its construction digitally and moving around in it at the same time.

In the Immersive Studio, we will get to know contemporary digital design methods and use them in a creative, sensitive and meaningful way. We will critically reflect on the potential of these technologies beyond pure efficiency thinking and develop an independent and emancipated attitude towards them.

We will achieve this by consistently developing our designs using digital 3D models. We will generate and edit these models both manually and algorithmically and parametrically. We will regularly walk through the designs in virtual space, evaluate them spatially and discuss them.

Aspects of materialization, fabrication and sustainability will have a decisive influence on the discussion of the architectural design.

Program:

This semester, we are designing a multi-purpose space that allows for a variety of usage scenarios through targeted spatial transformations. The chosen site is located on Letten, opposite the EWZ and close to various cultural institutions. The space to be designed should be able to accommodate various cultural uses, such as workshops, concerts, readings, exhibitions or others. In addition to the use of VR/AR to visually check the spatial impact of our design decisions, we will simulate the acoustic effect of the different spatial conditions in real time to obtain an audiovisual impression of the space.

Prerequisites / notice

To deepen the subject of acoustics, we recommend taking the following courses by Achilleas Xydis:

052-0655-24 G Architectural Acoustics, Thu, 15:45-18:30, HIT F 22
052-1205-24 L Seminarweek

The official language in our studio is German. Table critiques can also take place in English. Lectures and project meetings can also be held in English depending on our guests.

We do not presume any prior knowledge of Rhinoceros or Grasshopper. We will introduce the necessary methods and will rehearse them together.

Individual and group work, including 5 or more weeks of group work.

Introduction: Tuesday, Sept. 17th 2024, HIL C40.1
Concept discussion: Wednesday, Oct. 16th 2024
Intermediate discussion: Wednesday, Nov. 22nd 2024
Presentation discussion: Wednesday, Dec. 4th 2024
Final crits: will be announced soon

CHF 100.-- per student (estimated costs, excluding possible seminar week costs)

Abstract

The Architecture and Care design studio will address the spaces where human reproduction takes place. Gendered constructs around reproduction have been and still are central practices to the ways we structure social realities. Architecture and space have historically contributed to promoting and perpetuating sexist social models around reproductive labour and its associated care practices.
RAISING CRITICAL ARCHITECTURAL POSITIONS
Formulating clear and precise questions, using abstract ideas to interpret information, considering diverse points of view, reaching well-reasoned conclusions, and testing alternative outcomes. Performing qualitative and quantitative architectural research and translating it into an architectural language. Gathering, assessing, recording, and comparatively evaluating relevant information and performance in order to support conclusions.

DESIGNING SOCIAL IMPACT
Designing responding to territories of care and their characteristics, including urban context and historical fabric, soil, topography, ecology, climate, economy... Using formal, organisational, social, and environmental principles and informing two- and three-dimensional design. Understanding construction systems and their coherent formalisation. Considering the environmental impact and the reuse of the design.

COMMUNICATING ARCHITECTURAL PROJECTS
Writing, performing, and speaking effectively about an architectural design, using representational media appropriate for both the profession and for a wider audience. Making clear architectural drawings and constructing props at different scales that illustrate and communicate an architectural research and design technically, experientially, and aesthetically.

In this design course, we will imagine architectures that support alternative reproduction practices at different stages, from fertility treatments to upbringing. Speculating with new programmes and institutions, we will design collective spaces that promote and visualise shared forms of reproductive care. In the present context, the division between productive and reproductive labour, the spaces it takes place in, and the bodies that carry it out, are once again being reshaped. The limits of the domestic are blurring, the home is no longer necessarily a space for care; instead, it is a transient, productive, and networked space. On the other hand, public and collective spaces can shelter former domestic activities and become spaces for care through different bodies (human and non-human), technologies, and strategies at multiple scales.

Addressing architecture from the urban to the body, the course aims to develop a comprehensive understanding of the relationship between design and reproduction in Switzerland. We will understand dependency as a positive kin, and propose programmes and spaces that support sharing reproductive labour in transversal ways. This realignment can contribute to generating new forms of balance, ones in which we stop “caring for” and start “caring with” as a form of interdependence. We will look at the body – its spaces, contexts and rituals – in conjunction with an architectural and aesthetic proposal at multiple scales. The students will be asked to design avoiding former forms of spatial oppression and exploitation and, instead, explore the paths of otherness, wildness, diversity, complexity, and the impractical. The final objective is to propose institutions providing inclusive spaces for reproductive futures based on collective kinship.

In Switzerland, official data shows that nowadays the burdens of child-rearing still predominantly fall upon women, with 70 percent expressing concerns that having a child will impact on their careers. There are a myriad of reasons for the country’s declining birth rates – for instance a stronger focus on women’s careers, challenging socio-economic conditions, and the availability of contraception – and architecture is one of them: urbanisation leading to smaller living spaces and the dispersion of support networks, the scarcity of nearby public care facilities, and the lack of adequate spaces for shared forms of care beyond the domestic sphere of the nuclear family. Public relief, despite being remarkably generous in comparison to other countries, is still insufficient: fertility treatments like IVF are not covered by insurance – while three percent of children born were conceived in vitro – child care costs are only partially subsidised, etc. Unsurprisingly, people who can become pregnant are having less and less children and, if so, much later in their life. In this context, what can the role of architecture be?

In this design course, we will imagine architectures that support alternative reproduction practices at different stages, from fertility treatments to upbringing. Speculating with new programmes and institutions, we will design collective spaces that promote and visualise shared forms of reproductive care. In the present context, the division between productive and reproductive labour, the spaces it takes place in, and the bodies that carry it out, are once again being reshaped. The limits of the domestic are blurring, the home is no longer necessarily a space for care; instead, it is a transient, productive, and networked space. On the other hand, public and collective spaces can shelter former domestic activities and become spaces for care through different bodies (human and non-human), technologies, and strategies at multiple scales.

CAAD Theory: Epic Encounters - Telling Stories from the Vectorial World

W 2 credits 2G L. Hovestadt

Abstract

The ubiquity of neural nets calls on architects to explore the vectorial world they index. After introducing participants to basic concepts of coding and machine learning, this course invites them to inventively explore hidden connections among vectorized digital objects.

Objective

- Familiarizing participants with Wolfram Mathematica as an agile coding laboratory and theoretical ideas related to the digital/vectorial world.
- Inviting participants to work with pre-and self-trained machine learning models to play among millions of digital objects.
- Supporting participants in strengthening their storytelling and presentation skills across different media.

Content

- The first phase of the course, CODING, offers entry points to coding literacy as well as related theoretical literature without attempting exhaustive coverage: using Wolfram Mathematica, participants will get familiar with functional programming, including importing and exporting data, organizing it into data structures, writing simple functions and encoding and decoding digital objects into and from vectors.
- In the second phase, INVENTING, participants are given access to a multi-modal corpus, an inventory containing millions of digital objects pertaining to different media – scans, sounds, samples and sentences – and a series of bespoke functions in Wolfram Mathematica. Aided by machine-learning algorithms, participants will join characteristic collections of digital objects into a story a character might tell. These collections can be based on authors, inviting participants to further engage with theoretical ideas. In the third phase, STAGING, participants will focus on bringing these stories to life through a deliverable in their chosen format, accompanied by weekly tutorials.

Questions about both application in construction and expression should be answered. Which reused materials and elements are suitable for what and how are they assembled? What new aesthetics can be created and how can they be conveyed? The aim is to prepare the young generation of architects for the constructive use of reused materials. Using theoretical exercises and practical examples, an attitude towards building with existing things and its challenges and opportunities should be developed.

Phase 1: Inputs and lectures give students insight into the topic of circular building. Necessities, opportunities as well as challenges and limitations of the practice are discussed together. We get an overview of processes from the organization of a component platform to non-linear planning within the architectural offices.

Phase 2: In experimental exercises (groups of two to three), details on a scale of 1:5:1:10 are constructed from the collected material. The focus is on the choice of materials for the specific location and on joining the individual elements. It is examined how one can react to a given situation with limited resources. Against the background of a new aesthetic, various forms of representation are also being examined.

052-0559-24L  
**Analog Photography**  
W 2 credits 2S R. Barba

**Abstract**  
Practice-oriented seminar on the topic of analog & artistic photography

**Objective**  
Instructed by Nicolas Rolle, the seminar serves as an introduction to analog experimentation in the creative process of artistic practice. By analyzing the motifs and ways of thinking of photographers, the aim is to develop a basic approach to the medium of photography and to expand practical work in the darkroom through theoretical questions about the medium.

**Content**  
Theoretical and practical introductions form the core of the targeted exploration of the photographic apparatus. Students are encouraged to gather their own experiences in analog experiments and to explore the urban space and their surroundings with the camera. With an artistic work developed over the semester, the expanded concept of photography will be sharpened and brought to an individual expression.

**Prerequisites / notice**  
Lecturer approval required for all students. Please send a letter of motivation (max. 300 words) to rolle@arch.ethz.ch by 05.09.2024. The number of participants is limited to 20. The course will be held in German in the Fall Semester 2024.

**Competencies**  
- Subject-specific Competencies
  - Concepts and Theories  
  - Techniques and Technologies

- Method-specific Competencies
  - Analytical Competencies
  - Decision-making
  - Media and Digital Technologies
  - Problem-solving

- Social Competencies
  - Communication
  - Cooperation and Teamwork
  - Self-presentation and Social Influence
  - Sensitivity to Diversity

- Personal Competencies
  - Adaptability and Flexibility
  - Creative Thinking
  - Critical Thinking

Participants pay CHF 25.00 for the materials required in the course.

052-0579-24L  
**Understanding Light**  
W 2 credits 2S R. Barba, P. Anantha Murthy

**Abstract**  
The seminar explores light from the perspectives of Physics and Art, opening up new dimensions for collaboration across disciplines by tackling questions such as: What is the origin and nature of light? How does it travel through space and time? How can it be made productive in an artistic sense and what, in turn, can artistic methodologies contribute to experimenting and thinking about light?

**Objective**  
- Learn about the properties of light: intensities, phases, colors, and interactions with matter
- Exploring optical effects: reflection, refraction, dispersion
- Learn to plan and carry out an art project based on research inputs from other sciences
- Enhancing conceptual and interdisciplinary thinking in unusual set-ups
- Learn how to cope with unforeseen results and make random events productive for the successful implementation of a project
- Fostering communication and presentation skills

**Content**  
In this course, we will set a performative frame for experimentation and exploration.

Coupled with experiments in the Dep. of Physics, students will be introduced to concepts such as the origin of light and color, and the interpretation of the optical world that surrounds us to understand what actually gives rise to the effects we see everyday—from butterfly wings and autumn colors to the appearance of buildings and cities. In addition, we will perform practical experiments with basic optical components like lenses, mirrors, and prisms, in order to understand how they can be used to capture images. Inputs by guest lecturers (e.g. on light in photography, anthropology or urban landscapes) are planned. Students will be asked to present related topics.

At the end of the semester, the artistic experiments will be presented.

**Prerequisites / notice**  
Max. number of participants: 15

Please send a short motivation letter (max. 300 words) to artnspaceandtime@arch.ethz.ch by 05 September 2024.

Unveiling Habitats

W 2 credits 2S F. Gradin, M. Conen

Objective
– Knowledge of relevant topics and discourses in the growing transdisciplinary field of architecture and biodiversity
– Definition of personal levels and fields of action to promote cohabitation and biodiversity as an architect
– Critical and reflective analysis of various existing examples
– Analysing and developing relevant parameters based on a case study

Content
Biodiversity forms the indispensable basis of our lives. However, in Switzerland, its quality, quantity and connectivity are rapidly declining. The country is particularly hard hit by climate change. Almost half of all habitats and more than a third of all species are threatened (Biodiversity in Switzerland analysis report, FOEN 2023). Urban areas play a central role in this context. The built environment in Switzerland has almost doubled since the 1970s, putting enormous pressure on ecosystems.

In this context: how can integrative construction projects of the future be designed with a high ecological quality and a high quality of life - both for humans and other living beings? In this seminar, we will look at the notions, issues and actors involved in questions of biodiversity in the urban area of the city of Zurich from an architectural perspective. Theory and practice in the field of architecture and biodiversity will be linked through a variety of guest contributions from experts and on the basis of a case study and several field trips. The individual research and findings are summarized in the form of a visual project documentation and will be presented at a final event.

Planning Strategies for Complex Buildings Using the
Example of Health Facilities

W 2 credits 2S T. Guthknecht

Objective
The objective is that the students engage in a debate of a differentiated functional planning as a basis for complex buildings which are to be explored and discussed in order to create ecologically rich and networked living spaces of high-quality.

On the basis of a given scope of themes the students carry out research aiming for possible improvements for example in health facility planning. The scope of subjects is announced at the beginning of each semester.

Content
Complex buildings such as health care buildings are subject to constant change. In a new hospital building 60% of the diagnostic and treatment areas are subject to building changes within the first 10 years of operation. Architecture has to develop concepts which accommodate this level of dynamics into the building structure in a better way.

In the coming years this need for adaptability is going to be challenges even further by the even more reducing health care resources. The costs incurred (public transport tickets) will not be covered.

In this context: how can integrative construction projects of the future be designed with a high ecological quality and a high quality of life - both for humans and other living beings? In this seminar, we will look at the notions, issues and actors involved in questions of biodiversity in the urban area of the city of Zurich from an architectural perspective. Theory and practice in the field of architecture and biodiversity will be linked through a variety of guest contributions from experts and on the basis of a case study and several field trips. The individual research and findings are summarized in the form of a visual project documentation and will be presented at a final event.

Re-Imagine: architectures of transformation

W 1 credit 1V T. Rapelli, L. Crignola

Abstract
The shift from ‘Ersatzneubau’ as the status quo to an intelligent approach to our existing building stock has just begun. This transition demands new roles, new knowledge, and new ways of action. The course examines, through lectures and discussions with guests, the fields of action that open up for architects to actively shape a changing building culture.

Data: 06.08.2024 12:40 Autumn Semester 2024 Page 105 of 2684
Objective - Develop an awareness of the field of action of one's own profession to help shape a sustainable building culture
- Understand and analyze complex and multifaceted mechanisms in the construction process, especially in the transformation processes of existing buildings
- Investigate and discuss relevant case studies, practices, and processes
- Question common practices and formulate alternative approaches

Content

There is a sense of new beginnings in architecture. Over the past two decades, efforts in sustainable construction have primarily focused on (replacement) new buildings that consume as little energy as possible in operation. Recently, the issue of embodied energy has gained more attention: in Switzerland, there is an increasing willingness to preserve not only monuments but also "everyday" buildings from demolition and to redesign them for continued use and a new life cycle. Although the practice of replacement construction still constitutes a large part of overall construction activity, a path is slowly opening towards a building culture that seeks the ongoing redesign of existing buildings instead of the tabula rasa and "clean solutions" of past decades.

This shift from a demolition culture to a transformation culture requires a new set of skills from architects. The times of standard solutions and pre-drawn construction detail catalogs are over. Transformation projects require imagination, technical skill, and a profound understanding of our building stock. We will explore the changing role of architects in this new building culture through discussions with local experts and pioneers who have demonstrated exemplary approaches in their practice and made significant contributions to the transformation. Each week, we will examine a specific step in the transformation process of a building, from strategic planning to construction. This will provide a detailed understanding of the tools and competencies that practicing architects need to learn, the contributions we can make as individuals to the transformation, and the opportunities a changing building culture can offer us.

Each session will include an introduction to the topic with practical examples, followed by guest presentations sharing their experiences, expertise, and case studies. The inputs will be discussed in plenary at the end of each lesson.

Competencies

Subject-specific Competencies

Prerequisites / notice

Enrollment in agreement with the lecturer only: kiryk@arch.ethz.ch

Abstract

This course explores the concept of "Hybrid Reality," blending digital and physical spaces using VR technologies. Students will learn to digitize spaces, create immersive environments, and design interactive exhibitions.

Objective

The goal is to digitize an existing space and use it in virtual reality as a context for further design. During the course, AI tools will be utilized to enhance the photogrammetry 3D scanning process. In the first part of the course, we learn the tools; then we work on architectural VR projects, either in groups or individually. Throughout the course, we will examine VR workflows to create immersive and interactive architectural spaces. At the end of the course, we will present the works in a VR exhibition. Each student receives an Oculus Quest VR headset to work with at home throughout the semester.

Content

Fusions of digital-analog relationships have accompanied us since the very beginning of the digitalization era. The rapidly growing impact of digital technologies on our life necessitates constant adaptation. The course introduces the term "Hybrid Reality," which represents the coexistence of physical and digital spaces. Using state-of-the-art VR technologies, the methodology focuses on immersive, real-time, 1:1 scale space creation, exploring corporeal design, and reinventing conventional methods. Students will learn to digitize physical spaces, create hybrid reality environments, and design interactive exhibitions.

The course "360 – Reality to Virtuality" is interconnected with "3D Scanning and Freeform Modeling". You must register for both courses: "360 – Reality to Virtuality" and "3D-Modeling" (2x 2 ETCS).

Classroom teaching as 4h block + self-teaching and research at home.

Max. number of participants 15 students.

A 200 CHF deposit will be charged for the VR Headset. It will be refunded upon the return of the headset on the last day of the course.

If you already have an Oculus Quest 2, you do not need to pay any deposit and can work on your own device.

Please send a short application email (max 150 words) to Adam Kiryk: kiryk@arch.ethz.ch

Competencies

Method-specific Competencies
- Media and Digital Technologies
- Creative Thinking

Personal Competencies
- fostering
The seminar focuses on drawing exercises that build on one another, with which the students can try out a wide variety of forms of drawing. The drawing exercises start as a free game with simple shapes and objects and are continued step by step. The practice rounds are introduced by picture examples and video clips. Here we compare drawings from fine arts, film/video, cartoons, theatre, architecture, etc. These examples convey the special features of different materials and milieus and give concrete impulses for our practice. The main drawing tools used are charcoal, pencil and ink. All participants work together in the hall, alternately at the table, wall and floor on variable paper formats.

The results are uploaded to a drawing blog at the end of each lecture and discussed over the following week.

If a credit is sought, the following is required to pass the elective:
The drawings must be uploaded to the drawing blog on the respective practice day. Attendance and submission is required for at least 8 practice days. The submissions on the blog must contain the category of your name and that of the respective lecture title. You will receive further information on this at the beginning of the elective course.

The goal of the course is to introduce digital technologies and facilitate common architectural workflows by skipping the time-consuming processes of 3D modeling. The HYTAC Elective Course offers the opportunity to explore alternative ways to approach Point Cloud and 3D Printing in a simple way. The students will learn the basic principles and workflows behind photogrammetry, 3d-modeling and 3D-printing, to produce digital and physical (3d-printed) models.

The course includes:
- Introduction to photogrammetry and 3D printing through lectures and tutorials.
- Generation of a digital twin of the selected site through photogrammetry and production of a physical model (3D printed).
- Use of Blender. Basic skills can be acquired during the course.

In case of questions regarding the course, please visit our website: https://hytac.arch.ethz.ch/courses/elective-2/ or contact us directly via email (hytac@arch.ethz.ch).

construction II

D. Studer

Abstract
The elective subject "New focal points of construction" investigates on the basis of contemporary architecture the complex interaction of construction elements. The comparative analysis of built constructions serves as a basis for further development of future constructions. These semester will focus on building with new timber constructions.

Objective
Target of the course is the understanding of the impacts of material, technology and construction to the architectural education of constructive points. The focus lies on the present state of technology and the current challenge of building. The conjunction to current constructive methods and basic conditions enables a critical evaluation of the constructive Status Quo within the contemporary producing architecture as well as a perspective to new constructive education.

Content
Course:
1. Introduction of current level of technique
2. Colloquium with guests of producing and processing companies.
3. Visit of construction site and factory

Excercise:
Analysis and presentation in group of two of a building.

Prerequisites / notice
The definitive registration takes place after attending the introductory event.

W 3 credits 2A Supervisors

052-0561-24L Territories of Play - Spoilsport
W 2 credits 2S F. Neto Moura Veiga

Abstract
SPOILSPORT will expand Voluptas' research on Play and Architecture. It will test Playfulness as critical design tool for deconstructing rule-making mechanisms and surpassing them. Students will play a typological design game based on collaborative competition: together defining criteria for success, competing towards answers to these criteria, and again collaborating in choosing the best answers.

Lecture notes
Semester reader will be made available as a download for registered participants.

Literature
Required readings and recommended screenings will be made available as a download for registered participants.

Prerequisites / notice
Recommended for students with a strong interest in critical design thinking, typological politics, and constructive criticism.

The course will be online.

**052-0557-24L** BUK Construction Lab

**Objective**

Understand the complex relationships between material, detail and built artifact. New artistic methods are designed, analyzed and applied from a deeper understanding of innovative building materials.

**Content**

Phase 1: The analysis of innovative building materials aims at their application in construction thanks to experimental construction methods.

Phase 2: Derived, independent drafts (group work) for case studies are developed from the newly conceived construction methods. During the semester, the students gradually approach the real scale and check the interactions on the construction concept.

Phase 3: The focus is on realization. A suitable project is selected from the second phase and further developed together. The detailed planning questions the previous decisions. Finally, the construction is materialized and checked by building case study 1/1.

**Prerequisites / notice**

Places are limited and visiting the introductory lecture is mandatory.

**Autumn Semester 2024**  
**Page 109 of 2684**
This seminar deals with writings by Walter Benjamin. On the one hand, his most famous and influential essays and fragments on critique, history and experience will be read and discussed, and on the other, a special focus will be placed on his thinking on architectural themes.

Benjamin: Experience, History, Architecture

Number Title Type ECTS Hours Lecturers

Abstract

‘Sites-and-services’ was an important housing paradigm that was mobilized in the context of development aid to provide cost-efficient housing for the global poor. As these were essentially unfinished projects that relied on their future inhabitants to complete their dwellings, in this seminar we discuss what we can learn from the histories of such atypical housing projects. Inhabitants have drastically expanded and transformed the initial minimal design to complete their dwellings, in this seminar we not only intend to dig up the histories of such projects, but also to discuss what we can learn from the histories of such atypical housing projects.

Objective

By focusing on the history of sites-and-services projects, this seminar course aims to develop, on the one hand, a historical understanding of urban design in the postcolonial context of development aid, and, on the other, a theoretical understanding of the centrality of the act of inhabitation to architecture and its history.

Upon completion of the course, students will have:
1. acquired a general knowledge of the role of architecture and urban planning in the historical context of development aid, the main actors involved, and strategies adopted
2. acquired an in-depth knowledge on the specific housing paradigm of ‘sites-and-services’
3. developed a critical attitude in engaging with the history of postcolonial urban design
4. developed a theoretical understanding of the act of inhabitation as central to architecture and its history
5. developed a reflective attitude on the modes of writing architectural history and the role of inhabitation in it
6. strengthened their analytical skills by engaging in text- and project-based discussions, their collaborative skills through team-based project analyses, and their communication skills through presenting the outcomes of their work to their peers.

Content

The City Lived: ‘Sites-and-Services’

In our seminar series ‘The City Lived’ we focus on the history of urban design, with a particular emphasis on the lived experiences in the city. This semester’s seminar will focus on ‘sites-and-services’, an important housing paradigm that was mobilized in the context of development aid to provide cost-efficient housing for the global poor.

This housing strategy consisted of providing ‘sites’ – plots of land to construct dwellings on – in combination with a set of ‘services’, ranging from infrastructural features, such as sewerage and waste disposal, to market-based interventions that aimed to make cheap building material more easily accessible, or financial loan schemes that offered inhabitants the means to invest in their homes. It often operated on a large scale, and targeted thousands of households in a single project. For several decades from the 1970s, it was heavily endorsed by major actors such as the World Bank and the United Nations as a cost-efficient way to meet the most basic housing needs of a high number of people, whilst simultaneously offering authorities the means to direct the enormous growth of spontaneous settlements in the urban peripheries as part of their broader urban development plans. As such, these sites-and-services schemes have left a major imprint on many cities in the Global South. Despite this impact, however, their histories are not well documented.

Whereas sites-and-services were promoted as a cost-efficient solution to ‘the housing problem’ of the global urban poor, the housing paradigm attracted severe criticism from its inception. One line of critique considered such programs as formalizing the state’s disinvestment in its poorest citizens, symptomatic of neoliberal policies that erode structures of state support, while another line of critique considered them as instruments of a globalizing debt economy, incorporating the global poor in an expanding, profit-oriented capitalist market.

Beyond its praise and criticism, in this seminar course we study sites-and-services projects in the first place as material artefacts: as man- and woman-made built environments that have shaped the lives of thousands of people, whose history for that very reason deserves to be studied.

In doing so, we will discuss two broader themes. On the one hand, sites-and-services projects allow us to problematize the notion of housing expertise and how it was mobilized in the Global South. Therefore, we will discuss them against the background of housing policy in the Global South more generally. Which housing paradigms were relied upon in the context of the Global South? And what were the logics underlying them? On the other hand, since these were essentially unfinished projects that relied on their future inhabitants to complete their dwellings, in this seminar we not only intend to dig up the histories of such projects, but also to discuss what we can learn from the histories of such atypical housing projects. Inhabitants have drastically expanded and transformed the initial minimal design to complete their dwellings, in this seminar we not only intend to dig up the histories of such projects, but also to discuss what we can learn from the histories of such atypical housing projects. Inhabitants have drastically expanded and transformed the initial minimal design to complete their dwellings. How do we write the history of ‘unfinished’ projects? How do we acknowledge the act of appropriation and inhabitation as an integral part of such projects?
In this seminar we will, on the one hand, deal with the central strategies in the context of the climate crisis and get to know them by reading key theoretical texts. On the other hand, we will analyze concrete architectural case studies from Europe and Japan on this basis and thus examine these as well as the theoretical strategies for their potentials.

Climate change confronts architecture with a series of new and complex challenges that are reflected in a specific vocabulary. Terms like sufficiency, circularity or cohabitation are shaping the debates around this crisis or are standing for possible ways out of it. At the same time, the immediate nature of the situation forces us to critically question or revise common standards in the built practice - without having established new reliabilities in advance. Instead, a wide variety of isolated, sometimes contradictory strategies are being pursued simultaneously: Replacing fossil building materials with ecological ones, striving for "less" or a "different" way of building, low-tech and high-tech approaches, simple or multi-layered constructions. Theoretical and practical perspectives seem to be little connected so far.

In this seminar we will, on the one hand, deal with the central concepts and strategies of the current debates and get to know and question them by reading key theoretical texts. On the other hand, we will analyze relevant case studies from Europe and Japan on this basis and thus examine both the theoretical strategies and the concrete projects for their potentials.

By combining theoretical foundations and practice-based approaches, we thus aim to develop a deeper understanding of theoretically grounded ecological architecture while capturing and questioning the methods of current practice from a variety of perspectives.

**Architecture and Photography**  
**W** 2 credits  **2S**  
**T. Wootton**

**Abstract**  
Representation of architecture is inextricably linked to photography since the mid 19th century. As buildings are commonly discussed on the basis of images, understanding their technical origin is key to reading and making them. By teaching students how to use a 4x5" view camera, the artist and photographer Tobias Wootton will introduce different techniques of 'thinking through the lens'.

**Objective**  
Knowledge of architectural photography

**Content**  
History, theory and practice of photography in relation to architecture

**Prerequisites / notice**  
This course runs on a bi-weekly schedule in two separate groups limited to 15 students each and is taught in English.

**Special Questions in History of Art and Architecture:**  
**W** 2 credits  **2S**

**Architecture in the Expanded Field**  
*Does not take place this semester.*

**Abstract**  
This seminar will explore contemporary architecture through the lens of its ever expanding field, taking as a starting point the view that we "both do and do not know" what architecture is. Together we will discuss texts, visit workspaces and have conversations with practitioners who work at the interfaces of architecture, art and other disciplines.

**Objective**  
Adapting our course title from Rosalind Krauss's prominent essay on sculpture (1979) but not strictly following its argument, we will pay special attention to ways that architecture intersects with art (and other disciplines), whether through direct collaboration, cross-referencing, role-swapping, or the engagement of parallel topics or methods.

**Content**  
This course aims to sharpen critical reading and thinking skills. Students should come away clearer about their position on the contemporary contours and potentials of architecture.

**Literature**  
Literature will be provided at the start of the semester.

**Prerequisites / notice**  
Due to the guest talks and visits planned, individual sessions might take place at times or locations different from the regular time-table. The adapted schedule will be communicated during the first meeting.

**PhD Teaching: Drawing Things Together: Drawings Beyond Disegno**  
**W** 2 credits  **2S**

**Abstract**  
This seminar will study the material, cultural, and social parameters that conditioned drawing practices in Europe from the 15th through 19th centuries. We will examine drawings firsthand, and compile critical perspectives to grasp the varied roles drawings performed in artistic and architectural practices as well as the production of knowledge, and the constitution of power structures.

**Objective**  
The course aims to sharpen the historical awareness of the media conditions of architectural design. It does so by highlighting the practice of hand drawing in the face of today's digital imaging devices and through a critical engagement with the material, cultural, and social conditions and implications of the allegedly neutral blank page. This exploration also involves a methodological reflection of historical research. We will delve into in-depth reading of texts from various scientific fields and disciplinary perspectives. This will require the preparation of one text per session, which will be moderated alternately by one or two assigned students. This reading component will be complemented by visits to drawing collections and study rooms, to familiarize ourselves with the historical materials.

Data: 06.08.2024 12:40  
Autumn Semester 2024  
Page 112 of 2684
“Architects do not make buildings; they make drawings of buildings.” Robin Evans reminds us of a fact so obvious that it is easy to forget. Even easier to forget is that, for centuries and until only recently, this meant drawing by hand. Materially standing in for the Vasarian paradigm of disegno, drawings have been positioned at the processual and conceptual base of the Western definition of art. Art and architectural history have consequently rendered them a privileged medium in the comprehension of artistic production—with the graphic marks left by the artist’s hand regarded as the most immediate access to the mental disposition constituting a work of art. This reflects a discursive prevalence of artistic individuality, authorship, and autonomy in the endeavor to make sense of the history of art and architecture.

This course departs from this influential paradigm and shifts the focus to the material, cultural, and social parameters that conditioned drawing practices in the early modern period. We will consider the act of drawing less an externalization of an individual mind than a cultural technique, just as we will consider drawings less the traces of a creative process than social objects. Drawings can be read as tacit notations of discourses and practices, as tools of collaboration and exchange, as sites of the production of knowledge as much as of institutional centralization and social power. This entails refraining from any attempt at a systematic or conclusive history or theory of drawings in favor of gathering various theoretical observations and critical perspectives, combining thoughts, approaches, and questions from such diverse fields as art history, history of science, cultural studies, and media theory. The texts we will subject to an in-depth reading in assigned sessions, therefore, range from classical pieces of architectural history to contemporary contributions of critical theory. The reading sessions will be complemented by on-site visits to study rooms and drawing collections to enable firsthand engagement with the historic materials themselves.

How can we think of utopias in the dystopian times we live in? Are all utopian visions devoid of reformist agency, as historians have pointedly warned us? What is the role of architectural history in navigating these questions? This course critically interrogates the concept of utopia in its historical and spatial dimensions, through a combination of lectures, readings, and in-class discussion. Such “utopias of the rear-guard” will be the focus of our course. Bringing together archival material and secondary sources, we will explore the spatial articulation of feminist, decolonial, spiritual, and other collectivist sites of resistance. Although the gravity of this theme is heightened by the exigencies of our present, the emphasis of the class will be on pre- and early modern examples, with particular attention paid to the socio-political structures of the Enlightenment.

Students will learn how to approach primary / archival and secondary sources and will be given a curated selection of readings to support their understanding of key concepts, such as utopia, identity, colonialism, etc. They will be given the opportunity to research their own case studies, curate material, and present on it at the end of the semester in a symposium format. Most importantly, they will learn methodologies to engage with the architectural form and the built environment critically, as well as to approach early modern episodes through contemporary lenses, in a historically responsible way.

Architecture’s historical failure to breathe life into reformist, utopian dreams can feel disempowering, especially in light of current escalating ecological, political, and cultural challenges. If, however, the clean slate worlds envisioned by architectural avant-gardes have traditionally failed to materialize into a more equitable future, there is still a lot to learn from practitioners, theorists, and communities who devoted their efforts to resist disenfranchisement, and to reclaim and restore the equity of their present.

Students will learn how to approach primary / archival and secondary sources and will be given a curated selection of readings to support their understanding of key concepts, such as utopia, identity, colonialism, etc. They will be given the opportunity to research their own case studies, curate material, and present on it at the end of the semester in a symposium format. Most importantly, they will learn methodologies to engage with the architectural form and the built environment critically, as well as to approach early modern episodes through contemporary lenses, in a historically responsible way.

Attendance, participation, and collaboration are key, as most of the work will take place in the classroom, which too, will be approached as a form of a radicalized, “concrete utopia” of our present.

Literature
All material will be offered in English to the students through the online portal of the course.
052-0843-24L  History of Art and Architecture: Class Matters - in Architecture, Art and Design

Abstract
Class matters – in Architecture, Art and Design
The subject of this seminar is the relationship between architecture and social class.

Objective
The participants gain familiarity with the analysis terms of historical cultural sociology and can apply them to questions of architecture and urban research.

Content
Class matters – in architecture, art and design
The subject of this seminar is the relationship between architecture and social class. Our inherited class reference determines our social architecture: how we relate to each other in a historically grown, hierarchically structured space, how we perceive the built world, how we intervene in it in a creative way and how we judge sensuality and beauty, all of this is strongly pre-structured and yet leaves nothing to be desired leeway open. We can't help what class we're born into, but we can understand, mediate—and maybe even change—the social reflexes and unconscious beliefs that arise out of this coincidence. This seminar offers a sociological, historical and aesthetic basis for this.

• On the basis of theoretical texts, a number of questions are discussed: How is the racialization of the working class manifested in the history of cultural production? How are economic discrimination and privilege in the field of the arts related to normative gender categories? How do we make the big analytic terms our own when we write about class and architecture to connect with others?
• Exercises on graphical representations of social strata. What is a spatial perspective considering the creativity of class habits? How can we present the fragments of our perception, determined by class origin, as a whole without leveling or even condemning individual positions? How do we deal with the naturalized power of imagery's common sense when representing class issues in architecture?
• Personal engagement with autobiographical photo material regarding the manifestation of the habitual, inherited lifestyle of a certain milieu or a certain class faction - or regarding the manifestation of the break with this heritage. Approaching the answer to the question: What makes the difference - between a narcissistic and an objectified architectural view of social space?

052-0845-24L  Reflection on Exhibition and Art Practice Now. Colonial Influence? Focus on the Graphic Arts Collect

Abstract
In autumn 2024, two exhibitions take place in Zurich focusing on Switzerland and its colonial interdependencies. In the seminar, this topic will be addressed using the Graphische Sammlung ETH Zürich as an example. The students will research a selection of works from the collection, read specialized texts and discuss the jointly visited exhibitions.

Objective
Students learn about the history of the collection and work on individual works of the Graphische Sammlung ETH Zürich with a possibly colonial influence – whether in terms of provenance, titles or pictorial content. At the same time, students read and contextualize selected specialized texts on decolonization. During the two exhibition visits (Landesmuseum Zürich: kolonial – Globale Verflechtungen der Schweiz / exhibition space extract at ETH Zürich: Koloniale Spuren – Sammlungen im Kontext), participants will familiarize themselves with various forms of presentation and ways of communicating the topic.

Content
It has long been known that although Switzerland itself was not a colonial power, it nevertheless has complex colonial ties. This will be the subject of two different exhibitions in Zurich in autumn 2024 and will also be the topic of a seminar focusing on a collection of ETH Zurich: Graphische Sammlung ETH Zürich. In addition to reading specialized texts and visiting the exhibitions at Landesmuseum (ikolonial – Globale Verflechtungen der Schweiz) as well as at extract at ETH Zurich (Koloniale Spuren – Sammlungen im Kontext), the focus will be on analyzing individual works from the collection. Are there titles, pictorial contents or provenances that need to be critically questioned? If so, how should they be dealt with? What possibilities are conceivable with regard to the cataloging and presentation of colonial works?

And finally, what new insights can be gained by taking a different look at one's own collection, its history, and its art collection? Through theoretical reflection and practical work with specific case studies, students will familiarize the topic from two different angles.

Literature
The compulsory texts will be available at the beginning of the seminar.

Prerequisites / notice
The seminar is limited to 20 people. There will be a waiting list.

Please note:
Several meetings will take place at Graphische Sammlung ETH Zürich in the main building or in museums in Zurich. Time for travel before and after the meetings is therefore necessary.

052-0851-24L  Exploring Internationalism: How to work for UNESCO?

Abstract
This seminar explores the different actors working for UNESCO and the role of bureaucracy and international relations in their work. We will focus on the 1970s project on "Traditional Forms of Architecture", the collaboration with the International Union of Architects on an international information network in architecture, and the 1983 Bangkok workshop on "Training of Barefoot Architects".

Objective
The goal of this seminar is to develop an understanding of how international organisations such as UNESCO work internally and how they try to act in the world. In addition to academic argumentation and writing, the seminar will provide basic skills in working with archival material and analysing printed material from the 1970s and 1980s. The final assignment will be a short academic paper on one of the three case studies.
Content

This is not a seminar on how to get a job at UNESCO. Rather, we will explore who works for UNESCO, what they do in the field of architecture, and the role of bureaucracy and international relations in their work.

The United Nations Educational, Scientific and Cultural Organisation (UNESCO) is an international organisation that coordinates a wide range of activities related to architecture. These include the preservation of historical monuments and the establishment of a universal cultural heritage, initiatives for school construction projects, the commissioning of manuals and the implementation of training programmes. In this seminar, we will focus on three case studies to disentangle the UNESCO apparatus.

The first section will look at the UNESCO project on “Traditional Forms of Architecture” in the 1970s, led by Wolf Tochttermann, Acting Director of UNESCO’s Human Settlements and Socio-Cultural Environment Division. Through contacts with a variety of architects and academics around the world, he collected and commissioned studies on what he called “architecture without architects”, particularly in countries where development projects threatened to transform the existing built environment. We will look at published articles, audio-visual material and documents from the UNESCO archives to understand how these studies were produced (negotiations, contracts, payment) and used (publications, exhibitions, etc.) by UNESCO.

The second part will focus on the cooperation between UNESCO and the International Union of Architects (UIA), exemplified by the joint project ARKISYST, “an international information network in architecture”. Sponsored by the Spanish government and coordinated by the architect Donald Conway, the possibility of establishing a global exchange of information on architecture and urban planning was intensively studied but never implemented. This case study allows us to question notions of international standardisation, global participation and open access.

The third section of the seminar will examine the UNESCO Workshop on “Training of Barefoot Architects” in Bangkok, 30 May–4 June 1983, which was organised by the UNESCO Regional Office for Education in Asia and the Pacific. The aim of this analysis is to explore the different perspectives of the various actors involved in this workshop, including the architect Yona Friedman. The UNESCO archives provide a valuable source of information on the criticism of the approach and attitude of the “foreign expert” by local architects.

063-0861-24L Integrated Discipline HS24 in the Field of History and Theory of Architecture (GTA)

Enrolling in this course is only possible on agreement with the lecturer and if you attend a design course (V-IX) at the same time.

Abstract

Works in the integrated discipline art and architectural history evolve in close connection with projects in design. Textual and creative works are possible. The length of the text or the extent of the creative project will be decided upon individually. Interested students are asked to develop a (textual or diagrammatic) concept sketch explaining the content and the form.

Objective

We expect that students pursue their examination of the design process independently and in an original manner or that they develop a related theme from the perspective of the history of art and architecture. The work should be part of the design process and interact with it formally and in regard to content.

Content

The School of (Sub)Curating asks, discusses, plays with and ventures into the question of how to visualise art and knowledge in space. It teaches you a history of curating and challenges you to become active in figuring out spatial forms of presentation for artworks, books, magazines, films, sounds and more. With guest artists, curators and researchers.

Interested students are asked to develop a (textual or diagrammatic) concept sketch explaining the content and the form.
The seminar is a close cooperation with the Chair of Prof. Dr. Tom Avermaete.

Selected examples of historic architecture, urban planning and architectural theory will be analyzed with help of groundbreaking texts from the new interdisciplinary field of "Animal Studies". The focal point is the question, which roles and which spaces were and are given or denied to animals in our built environment.

"Why look at animals?" is the title of an article from 1980 by British writer and art critic John Berger. In this fundamental text Berger looks into the spiritual and cultural relation of humans towards animals. In this course, this text and some more recent texts form the starting point to examine the cohabitation of "nonhuman animals" and "human animals". Examples include structures which have been built with often high architectonic ambitions for certain species of animals, like stables, riding houses, pigeon towers, zoos and different typologies of agricultural buildings from different regions and epochs.

Throughout the course, students will develop a high degree of independent thinking, the ability to read texts critically and apply the results on historic and contemporary examples, be it the built environment, a text or an art project. Via individual presentations students learn to process complex content verbally and visually and answer questions. This school several important skills like abstraction of content, conveyance of content, visualization, reaction to unforeseen questions et. al. With the joint close reading students will further exercise the analytical skills whereas the final discussion will train the discursive skills and show how to synthesize differing positions.

The seminar is organized in three modules:

I Building for animals

The first module will focus on buildings (or environments) designed to accommodate animals (and often to accommodate the proximity of "non human animals" and "human animals"). Examples include structures which have been built with often high architectonic ambitions for certain species of animals, like stables, riding houses, pigeon towers, zoos and different typologies of agricultural buildings from different regions and epochs.

(Examples: Riding house of William Cavendish in Bolsover Castle 1660ies, Hameau de la Reine, toy farm for Marie Antoinette, Versailles, 1785-1788; Pigeon towers in Iran; Hugo Häring, Gut Garkau, 1922; next phase for the expansion of Zoo Zürich, Tessiner Houses, etc.)

II Animal city

The second module focuses on the city as a shared space for humans and animals. Until the beginning of the 20th century, masses of animals were kept within the confines of big cities. It came with its own challenges, so called "cultural followers" and "pests", which made a strong impact on building, zoning, and developing the city. Zoonoses were and still are a serious thread today, influencing urban planning.

(Examples: Johann Bernhard Fischer von Erlach, Imperial riding school and stables in Vienna; Animals in "Georgian" London; Union Stock Yards, Chicago, ab 1865; Pest and rats, Urban Foxes, Raccoons in Berlin et. al.)

III Architectural and animal theories

The final module focuses on recent discourses of human-animal-relations in philosophy, biology and literary studies, leading to the new field of more or less radical "animal studies" or "human-non human animal studies" emerging within the last two decades. In this part of the course the renewed focus on questions of cohabitation in a global perspective is studied through contemporary texts and art/architectural projects with a strong political message. These objects and projects are taken as a starting point for a discussion on the future role of architecture and urban planning in fostering biodiversity.

Thomas Ameroth-Williams, City of Beasts. How animals shaped Georgian London, Manchester University Press, 2019

PhD Teaching II: Miss Manners: Gender, Etiquette, and Architecture

Abstract
This seminar draws architectural history’s attention to textual sources from advice literature that formulate the normative and gendered standards of interior design, decoration and homemaking. Through a critical examination of advice ranging from Ottoman adab books to Western etiquette manuals, we will examine the various regimes and expressions of gender embedded in the skin of architecture.

Objective
How do we comply, condone, distort, or resist gender roles in our manners and social conduct? And how does this performance inform our spatial imagination? This seminar broadens the scope of what can be considered as source material for architectural history and theory by reading a set of historical and contemporary texts against the grain. Over the course of the semester, students will become familiar with vocabularies pertaining to gender, sex, and sexuality that are referenced in the narrative strategies of advice manuals and examine how these influence aspects of architectural discourse. In addition to this historical inquiry, they will independently explore texts, cases, or designs from the intersection of race, class, and gender, and discuss the materiality of sex within imaginary and/or real space configurations.

Content
For centuries, advice literature has extensively examined the codes of propriety, or decorum, and ordered both the plot and the stage of domestic living provided by its rules about hosting, dining, decorating, or designing the private sphere. Although these manuals stood somewhere between fact and fiction, they always conveyed to their readers the performative nature of a home. From Italian books of courtiers (Alberti, 1434; Castiglione, 1528) to Ottoman adab manuals (Mustafa Ali, 1599; Mithat, 1894) to modern experts of etiquette publishing in newspapers and the read-write pages of the web (Gentlewoman, 2021; Judith Martin, 2023), this pervasive literature reflected norms and normative behaviors and still continues to feed into the exclusive designs of residential architecture. This seminar will draw the attention of architects to this extensive but also thorny collection of writings, which is replete with arguments about class, race, and gender. The seminar is composed of three modules that arrange the main sources in a chronological and thematic manner. Subsequently, there is a workshop dedicated to the final assignment, during which students reflect on a selected text, case, or design of their choice.

PhD Teaching III: Archival Laziness at the Ethnographic Museum Zurich

Abstract
What happens if we think about the archive through our bodies? Can we see archives as fragments of personal encounters instead of an impersonal all-encompassing institutional authority? The course critically approaches museum institutions, archives and the politics of value in the postcolonial and centres the body and its contingencies to think towards the museum and archive of the future.

Objective
I can safely say that the taken-for-grantedness of the emotionally contained subject is a residue of Euro-centerism in critical thinking. The separation of our body and mind, the distinction between material and emotional being is a style of thought; and Dipesh Chakrabarty in “ Provincializing Europe” has showed us that this style of thought was born in a certain place (Europe) and in a certain time (Modernity). In an attempt to blur such binaries and offer personal ambiguities instead of modern precision, the course attempts to look at the politics of the archive and its relationship to bodies. The course introduces decolonial, postcolonial, queer, and feminist theories, and attempts to reduce the archival premise from its modern totality and suspend in a state of partiality.

Content
There are two type of bodies which will be discussed in the course, the body(s) of the person who contributed to build the archive by means of collection by travel, research, and scientific enquiries. The other body is our own body(s) as architecture students, artists, researchers who access these archives to make sense of the historical and contemporary. We will think about the body and its aspects of hunger, thirst, desire, ego, fear etc and look at the museum collection and archive through these fundamental bodily aspects. The course departs from laziness of the body as a vector upon which museum collections and archives are built. The notion of laziness comes from the colonial myth of the lazy native. We will look at certain case studies of objects from the archives from the Ethnographic Museum of Zurich in order to understand our own position. We are exposed to the notion of social lives of objects.

052-0723-24L | Sociology: Henri Lefebvre and the Theory of the Production of Space - Theory Seminar | W | 2 credits | 2S | C. Schmid

**Abstract**
This theory seminar discusses the new book on Henri Lefebvre by Christian Schmid. We will read and discuss a chapter of this book every week.

**Objective**
Participants will be expected to engage actively in:
- reading, debating and discussing a scholarly text

The goals of this course include:
- acquiring new skills in reading and applying a theoretical text
- strengthening ability to read, present and debate academic texts
- getting familiar with one of the most important theories on space and the urban in social sciences

**Content**
On the occasion of the publication of the forthcoming book 'Henri Lefebvre and the Theory of the Production of Space' by Christian Schmid, we are organising a special seminar in the autumn semester 2022 in which we will read and discuss the book together.

The book will be published by Verso in November 2022, and offers an encompassing, systematic, and accessible introduction to Lefebvre's theory of space and the urban. We will provide pre-print copies of the individual chapters to the seminar participants.

**Lecture notes**
On the book:
Henri Lefebvre developed an extraordinarily and far-reaching spatio-temporal theory of society that is today widely applied in humanities and social sciences, particularly in urban studies, human geography, sociology, cultural anthropology, political sciences, political philosophy, literature, cultural studies and the arts, and also in architecture, urban design and planning. This book provides the first systematic reconstruction of Lefebvre's theory of the production of space. While many receptions represent Lefebvre's work as a collection of inspiring but disparate thoughts and reflections, this book starts from the thesis of coherence, assuming that this work is distinguished by a continuity of concepts and categories that are connected in a consistent way. It reveals the epistemological context of this theory in French philosophy and in the German dialectic (Hegel, Marx, and Nietzsche), and explores the historical development of the core concepts. It illuminates Lefebvre's understanding of everyday life, the right to the city, the thesis of the complete urbanization of society, and the intrinsic relationship between space and the state. It explains the famous double triad of the production of space: perceived, conceived and lived space – and spatial practice, representation of space and spaces of representation. And it develops a dialectical matrix of a theory of society, which is based on the core categories of spatio-temporal dimensions, levels, and configurations of social reality. It also gives an overview on the different Lefebvre receptions and discusses a wide range of applications of his concepts in various research fields.

For further information see: https://www.versobooks.com/books/4089-henri-lefebvre-and-the-theory-of-the-production-of-space

**Prerequisites / notice**
The course will be held in English. Participants must be able to read and speak English.

In order to make the seminar open to a wider audience, we are organising it hybrid – over Zoom and in-person. Places are limited. Please send a short application expressing your interest in the seminar to bathla@arch.ethz.ch

052-0717-24L | Territory of the City: Turin | W | 2 credits | 2G | to be announced

**Abstract**
The elective deals with current transformation processes of metropolitan landscapes in Europe and introduces landscape architecture design on a territorial scale. On the basis of cartographic analysis and field trips, students will develop concrete strategies for the urban landscape of the Città Metropolitana di Torino.

**Objective**
The elective introduces to the subject and complexity of the urbanized landscape and teaches the critical engagement with the challenges and potentials of current tendencies in Landscape Architecture. On the basis of a concrete study area, students examine the large-scale processes of reuse, reform and reinterpretation of metropolitan landscapes in Europe and develop new approaches and strategies on various scales. They become familiar with GIS as an analytical tool, model building as a design methodology and the representation of landscape through plans. They develop a project based on the perception of place, knowledge of landscape-architectonic typologies and conception of public space. The design process is accompanied by workshops, lectures, excursions, critiques and a workbook.

Data: 06.08.2024 12:40
Autumn Semester 2024
Page 118 of 2684

Prerequisites / notice

The participation in the course is subject to the following three conditions: 1) The course is limited to 12 students. The restriction follows the time of the inscription according to the first-come-first-served-principle. 2) A two-days trip to Turin is mandatory for all students, which will take place on the weekend of October 8-9. 3) The contribution to expenses will be max. 250.- CHF per student. In case of short-notice cancellation, these costs will be charged to the student.

Lecture notes

A workbook with texts and background information is available for purchase (CHF 20.-). A digital version is also available for free.

052-0725-24L ACTION! On the Filmed City: Video Games 2 credits W 2U H. Klumpner, C. E. Papanicolaou

Abstract

In the 1970s and 80s, rudimentary video games emerged as entertainment for the middle classes. 40 years later and more ubiquitous than ever before, they are now more than that: an alternative mode of experiencing reality.

Objective

Through a combination of practical exercises in video and audio techniques in parallel with the study of seminal observation-driven texts, this course aims to equip students with the basic tools and core principles to create short but complex experiments reflecting on urban space. This semester, the focus falls on the topic of video games, asking students to think about how filmmaking and digital animation skills may be used to tap into the multi-faceted possibilities presented by contemporary video gaming.

Content

Using widely available recording tools and editing software, students will turn their fieldwork into short video or audio works of about 3-5 minutes.

Literature

Seminal texts include:

- ‘Mirror Images: Cinematic and Sensory Ethnography for Landscape and Urban Studies (Papanicolaou)
- ‘Cross-Cultural Filmmaking’ (Barbash, Castaing-Taylor)
- ‘Acoustic Territories’ (LaBelle)
- ‘Space Time Play: Computer Games, Architecture and Urbanism: The Next Level’ (Davidson)
- ‘The Semiotics of Architecture in Video Games’ (Aroni)
- ‘Documentary’s Expanded Fields: New Media and the Twenty-first-century Documentary’ (Kim)

063-0761-24L Integrated Discipline HS4 in the Field of Landscape and Urban Studies (LUS) 3 credits W 2A Supervisors

Abstract

Enrolling in this course is only possible on agreement with the lecturer and if you attend a design course (V-IX) at the same time.

Objective

Design concepts ranging from architectural objects to urban planning are developed together with the discipline of landscape architecture. Depending on the task at hand different themes are investigated. The goal of the integrated discipline is to develop design solutions of a specific topic in landscape architecture, which have to be incorporated into the overall design submission.

Content

Students gain an insight into the integrated disciplines of design in architecture together with landscape architecture. Depending on the task at hand different themes are investigated. The goal of the integrated discipline is to develop design solutions of a specific topic in landscape architecture, which have to be incorporated into the overall design submission.

052-0713-24L Serendipity: Züriberg Section 2 credits W 2G

Abstract

Does not take place this semester.
The city of Zurich is well known. Not only is it continuously surveyed by official bodies in maps or plans, it has also served as a test case for the development of new methods and technologies in the field of geographic information systems (GIS) and remote sensing.

This is the question that the teaching and research project Schnitt durch Zürich (Section through Zurich) has been investigating by the Chair of Laurent Stalder. As an Addition to the existing work, this course will create a section of the Uetliberg. In the course of methodical refinement 3D laser scanning and point cloud modeling methods, developed at the Chair of Christophe Girard, are used to digitally model the topography and vegetation as well as pathways and buildings. Following the data collection the materials will be transferred to common CAD Software and reproduced in a section. Students will use scanners to scan the slopes and forests of the Uetliberg in fieldwork and get introduced to the workflow from scan to CAD drawing. This should give a tool for a better understanding of the existing context in future projects and thus broaden the students' methodological scope.

A bibliography will be made available to inscribed students prior the start of the semester.

Fostered

The elective course *Global Housing Issues, Challenges and Strategies: Reconstruction After Conflicts & Natural Disasters* gives architecture students the opportunity to further develop their perception of space through a site-specific approach in the field of landscape architecture. The students will learn to use 3D point cloud technology and other spatial sensing technologies in order to analyze complex urban landscape and develop new ways of editing and representing these intertwined spaces.

The layout of the city of Zurich is well known. Not only is it continuously surveyed by official bodies in maps or plans, it has also served as a test case for the development of new methods and technologies in the field of geographic information systems (GIS) and remote sensing.

This is the question that the teaching and research project Schnitt durch Zürich (Section through Zurich) has been investigating by the Chair of Laurent Stalder. As an Addition to the existing work, this course will create a section of the Uetliberg. In the course of methodical refinement 3D laser scanning and point cloud modeling methods, developed at the Chair of Christophe Girard, are used to digitally model the topography and vegetation as well as pathways and buildings. Following the data collection the materials will be transferred to common CAD Software and reproduced in a section. Students will use scanners to scan the slopes and forests of the Uetliberg in fieldwork and get introduced to the workflow from scan to CAD drawing. This should give a tool for a better understanding of the existing context in future projects and thus broaden the students' methodological scope.

A bibliography will be made available to inscribed students prior the start of the semester.
Students will document and analyze a case-study site to reveal its topological potentials and sensory qualities. This understanding will be gained through point cloud modeling and audiovisual composition. In particular, we will develop a new, comprehensive sectional model of a topologically interesting site situation.

Students will become acquainted to working with point cloud models produced with laser-scanning. Through a series of steps, they will learn how a laser-scanning survey is conducted, how the raw data is processed, how point cloud models are assembled, what qualities these models can provide to analyze, explore and represent space as an audiovisual experience.

Collected samples from the field will be assembled and built into an interactive application in the «Landscape Visualization and Modelling Lab». All software required is open source and can also be installed on private laptops, facilitating work from home if necessary.

Lecture notes
Literature will be provided during the course.

Prerequisites / notice
- The course is limited to 20 students (based on available computer stations)
- Students will work in groups of 2
- The lectures will be held in English, assistance in English and German
- The enrolment will be prioritized by the time of inscription and balanced between departments

My Garden's Boundaries are the Horizon: A Case Study of Queer Gardens

W 2 credits 2S C. Baumann

Abstract
This course aims to raise awareness about the necessity to look at architectural history through a non-normative lens. The participants will be invited to explore the topic of queer gardens via the review of exemplary case studies. We will discuss how the shape of those gardens have been influenced by their owner's personality and argue if such spaces share a common denominator.

Objective
Participants will conduct an analysis of case studies through the means of archival and iconographical research. They will also redraw the gardens in plans and sections in order to understand the specificity of those spaces. They will be invited to sharpen their critical thinking and debate the topic of queer gardens: Can one define the spatial criteria of such a typology? Does such a genre even exist? The outcome of this weekly elective course will be a presentation of the selected garden along with pictures, plans, section, a brief descriptive text and a bibliography list.

Content
"My garden's boundaries are the horizon" (1) is one of the first sentence used by Derek Jarman, the late English artist, filmmaker and gay rights activist in the book Modern Nature to describe his small garden located in Dungeness, south Kent. The diary depicts Jarman's artist life, his ordeal dealing with AIDS as well as his love for gardening. The word garden comes from the etymology "to guard" and is by definition an enclosed outdoor space. What a contradiction then to describe a garden, as Jarman's does, by the absence of its limits! Dungeness has emerged over time as an exemplary reference of queer garden, but does such a typology even exists? And if it does, what are its characteristics?

"Growing up queer means experiencing the destabilising absence of broad and accessible queer history". (2) Architecture as well as landscape architecture are far from exempt from this reality and there are little stories about queer landscapes to be found in the textbooks. In order to bridge this knowledge gap, we will study the gardens of openly queer personalities of the 20th and 21st century. The case studies will include, but not limited to, the followings:

- Casa Azul, Frida Kahlo, Mexico
- Dungeness, Derek Jarman, United Kingdom
- Majorelle Garden, Yves Saint-Laurent and Pierre Bergé, Morocco
- Sissinghurst, Vita Sackville-West, United Kingdom
- Temple de l'Amitié, Natalie Clifford Barney, Paris
- Villa Gamberaia, Florence Blood and Princess Ghyka, Italy

(1) Modern Nature, The Journals of Derek Jarman, Derek Jarman, Paperback, 2018
(2) Queer spaces, an Atlas of LGBTQ+ Places and Stories, Adam Nathaniel Furman and Joshua Mardell (Eds), Routledge, 2022

Literature
A bibliography specifically focused on queer spaces will be given at the beginning of the semester.

Prerequisites / notice
The assessment will be based on the following criteria: quality of the research, critical thinking, participation in the group discussions, and quality of the final presentation.

The number of participants is limited to 20. A short letter of motivation via mail is expected for application.
151-8015-00L  Moisture Transport in Porous Media  W  3 credits  2G  J. Carmeliet, A. Kubilay, A. Rubin, D. A. Strebel

Abstract
Moisture transport and related degradation processes in porous materials
Theory of moisture transport in porous materials
Experimental determination of moisture transport properties
Exercises on moisture transport properties determination:
Selected topics
Liquid transport in cracked porous media, Drying of porous media, microclimate in urban street canyons.

Objective
1. Introduction
   Moisture damage: problem statement, durability
   Applications: building materials, soil science, geoscience

   2. Moisture transport: theory and application
   Description of moisture transport
   Determination of moisture transport properties
   Exercises on moisture transport properties

   3. Special topics
   Liquid transport in cracked materials, Drying of porous materials, Microclimate in urban street canyons

Lecture notes
Handouts, supporting material and exercises are provided online via Moodle.

Literature
All material is provided online via Moodle.

101-0577-00L  An Introduction to Sustainable Development in the Built Environment  W  3 credits  2G  G. Habert, E. Zea Escamilla

Abstract
In 2015, the UN Conference in Paris shaped future world objectives to tackle climate change.
This decarbonization strategy is additional to Sustainable Development goals formulated the same year by the UN general assembly.

What does that mean for the built environment?
This course provides an introduction to the notion of sustainable development when applied to our built environment
At the end of the semester, the students have an understanding of the term of sustainable development, its history, the current political and scientific discourses and its relevance for our built environment.

In order to address current challenges of climate change mitigation and resource depletion, students will learn a holistic approach of sustainable development. Ecological, economical and social constraints will be presented and students will learn about methods for argumentation and tools for assessment (i.e. life cycle assessment).

For this purpose an overview of sustainable development is presented with an introduction to the history of sustainability and its today definition as well as the role of cities, urbanisation and material resources (i.e. energy, construction material) in social economic and environment aspects.

The course aims to promote an integral view and understanding of sustainability and describing different spheres (social/cultural, ecological, economical, and institutional) that influence our built environment.

Students will acquire critical knowledge and understand the role of involved stakeholders, their motivations and constraints, learn how to evaluate challenges, identify deficits and define strategies to promote a more sustainable construction.

After the course students should be able to define the relevance of specific local, regional or territorial aspects to achieve coherent and applicable solutions toward sustainable development.

The course offers an environmental, socio-economic and socio-technical perspective focussing on buildings, cities and their transition to resilience with sustainable development. Students will learn on theory and application of current scientific pathways towards sustainable development.

The following topics give an overview of the themes that are to be worked on during the lecture.

- Overview on the history and emergence of sustainable development
- Overview on the current understanding and definition of sustainable development and beyond

Methods
- Method 1: Life cycle assessment (planning, construction, operation/use, deconstruction)
- Method 2: Life Cycle Costing
- Method 3: Labels and certification
- Method 4: Material Flow Analysis

Main issues:
- Operation energy at building, urban and national scale
- Mobility and density questions
- Embodied energy for developing and developed world

- Synthesis: Transition to sustainable development

Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies
- Problem-solving

Social Competencies
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation

Personal Competencies
- Adaptability and Flexibility
- Critical Thinking
- Self-awareness and Self-reflection

A list of the basic literature will be offered on a specific online platform, that could be used by all students attending the lectures.

The recordings of the lectures are available on the MAP under the link https://map.arch.ethz.ch (book symbol at the top right).

Introductory event: Participation in the introductory event is a prerequisite for this course!

Enrolment is only possible in agreement with the lecturer (eglin@arch.ethz.ch).

Visits to construction sites and interdisciplinary lectures on the topics of communication, complexity, landscape and investment are the main focus of the workshop. In addition, the term process is to be depicted by means of visits to manufacturers of construction components.

The main focus of the diploma elective subject is in showing the building process by means of current examples of urban design with architectural relevance. The Chair views itself as the facilitator between those involved in construction and students. Active participation is a prerequisite.

The number of participants is limited and enrolment is only possible in agreement with the chair!

C 052-0622-24L CAAD Practice: Favela is City  W  2 credits  2G  V. Gomes Natividade

Favelas – the Brazilian version of informal cities – are no longer exceptions but the massive mode of urban production in the XXI Century. They are informal by nature - if you call it ‘informality’, the ambiguity between instant stability and constant change.
Objective

1. To gain insight into informal urbanism and the prominent urban phenomenon of favelas, their inherent informality, dynamic nature, and the interplay between stability and change.
2. To develop the ability to decode the intricate fabric of favelas, to read the interrelationships between various elements, resources, and the nuanced rhythms of signals, noises, and uncertainties that define their urban landscapes.
3. To gain familiarity with AI algorithms as tools for exploring and interpreting favelas, employ images and textual analysis to uncover urban themes and issues these informal settlements embody.
4. To develop critical thinking skills, encouraging a deeper exploration of the underlying social, economic, and cultural factors at play.
5. To gain broader insights and generalisations from the study of favelas, to identify overarching principles that can contribute to the discourse on urbanism and informal settlements.
6. To enhance design fluency, effectively communicating complex ideas and interpretations through images and words, refining the ability to conceptualise and share favela ideas.
7. To develop the ethical dimensions of studying and representing informal urban environments.

Content

Students will learn and engage with various modes of engagement with favelas using visual and written forms, becoming familiar with AI techniques and strategies to tackle both. By the end of the semester, students should have broadened their understanding of impoverished urban areas of the South and a clearer perspective on urban trends and opportunities in those areas. Using texts and images will develop competencies to be more effective visual communicators, understanding how to generate and manipulate images and text to express their ideas confidently, clearly, and precisely. Throughout the semester, students will write around 1000 to 2000 words and create self-organising maps using internet-sourced images guided by provided algorithms. Self-organising maps (SOMs) are an artificial neural network that helps visualise and group complex data by finding patterns and similarities, making it easier to understand and analyse large sets of information. Thus, a significant portion is dedicated to the data’s curation, editing, and publishing of the final assignment: a speculative exhibition that includes a poster and catalogue with a curator’s readings of favelas.

Prerequisites / notice

No previous knowledge is required for joining this course.

052-0639-24L Climate Responsive Architecture with Hive

Abstract

This Online course provides an introduction to climate-responsive design using the Hive tool and how to apply it in early building design stages. Hive allows architecture and building science students to understand the relation between architectural design, climate, comfort and energy. Hive is a plugin for the 3D modeling environment Rhino and its visual programming interface Grasshopper.

Objective

- Recall general principles of climate responsive design and examples of it.
- Utilize 3D building geometries to conduct simplified energy demand and supply simulations.
- Observe relevant physical principles and interactions between climate, energy, and geometry.
- Implement passive and active concepts for Climate Responsive Design.
- Apply Hive for building design analysis and integrate it into own designs or in design courses.
- Identify and harness synergies and trade-offs between climate, energy and architectural design aspects.

Content

The course can be frequented individually, or as a prerequisite for other courses such as the master course Climate and Energy Systems 3 or architectural design studios.

Modules:
- 1. Course overview.
- 2. Introduction to climate responsive design.
- 3. Introduction to Rhino, Grasshopper and HIVE.
- 4. Early solar analyses.
- 7. Real-world Applications and Examples.

Prerequisites / notice

This is a blended-learning self-paced ONLINE COURSE that can be started at any time.

A working Rhino 6 or 7 license is necessary.

052-0641-24L Digital Lexicon

Abstract

The seminar focuses on the etymology and use of terms. It engages students to interrogate words and notions in order to understand the historical and theoretical implications related to the digital. The seminar aims to be a collective and shared work through the edition of a common lexicon.

Objective

Enlarge a background of historical knowledge and architectural culture. Develop a critical reflexion on tools and methods of digital design. Foster writing and synthesis skills and organize a collective publication.

Content

Is digital design a tool, a language, a content, a style, a dogma? In the last four decades the digital turn had a radical impact in the field of architecture from the conception to the fabrication stage, through different ways of representing and simulating space. Despite its recent history and a substantial rapid evolution, digital design is also naturally in continuity with previous techniques of craftsmanship and traditional design.

Digital, computer, analog, virtual, artificial intelligence, smart technology, virtual reality, parametric design, rendering, modelization, auralization: to only name some of the most widely employed terms. The proposed seminar focuses on the theoretical definition of a recent although already dense and evolving vocabulary related to digital design. Building on the etymology of chosen terms and borrowing from a selected bibliography, we will edit a collective lexicon tackling the historical roots and theoretical implications of our everyday language employed in relation to the digital.
Future Cities Laboratory Indicia 03: Actions and Evidence for Future Settlements

Abstract
The course is organised based on research conducted at the Future Cities Laboratory (FCL) and its recent publication, Indicia 03. It introduces the background and motivations behind FCL’s focus on cities, highlighting the challenges urban areas face and approaches FCL employs to address them. The course aims to facilitate interdisciplinary knowledge exchange and critical thinking across domains.

Objective
We expect students to achieve the following objectives at the end of the course:
* Be familiar with key concepts in urbanisation, city systems, and their academic study.
* Learn about the main research results of FCL regarding sustainable urban development in an interdisciplinary format.
* Critically analyse diverse urban issues and debates, formulate and evaluate research questions related to urban phenomena.

Content
FCL Global helps shape sustainable cities and settlement systems through science, by design, in place, and over time. Cities are highly complex systems with interconnections between their social, economic, natural, and built environments. Many different academic fields address urban questions, spanning a wide range of disciplines and urban sectors, including urban planning, architecture, civil engineering, economics, public policy, sociology, geography, public health, and environmental sciences. Tackling the grand challenges that cities face today requires multidisciplinary teams that can work together, considering the complexity of urban systems and both local and global contexts. FCL’s research covers multiple disciplines and scales, from the individual citizens to larger communities and from small villages to megacities and offers important insights into the development of future settlements worldwide. The course will draw from Indicia 03, published in 2022, as well as ongoing research projects and recent findings.

The course will be delivered through a blend of lectures and moderated discussions.

Lecture weeks will provide background and context on diverse urban topics including:
* Urban systems theory, modelling, and simulation
* Cities, urbanisation, and current challenges
* Society and space
* Cities and complexity
* Socio-spatial differentiation and urban disparities

Dialogue weeks will consist of 4-6 weeks of moderated discussions with invited guest speakers from FCL, presenting their work and engaging in dialogues on topics such as:
* Design Liveable Density
* Powering the City
* Resource Efficient Urban Intensification
* Sustainable and Innovative Materials in Urban Construction
* Reducing the Impact of Cities on Non-Urban Land
* Adaptive Mobility, Land-Use, and Infrastructure
* User-Centred Design in Cities
* Blue-Green Infrastructures

Prerequisites / notice
This elective course is organised with a focus on FCL Global research contents. We provide digital copies of the Indicia 03 for the students attending the course. The format of the course is physical (at ETH Hönggerberg) and virtual. It will be open to all researchers and students in FCL Global, D-Arch and D-Baug.
## Content

The course examines room acoustics and its applications in architecture and design. It introduces physiological and psychoacoustics by exploring audible space impressions in daily life and our ability to perceive and localise sounds. It provides the theoretical background on how sound propagates in space and interacts with surfaces by looking closely into reflection, absorption, and diffusion. It demonstrates basic mathematical and physics concepts such as decibels and reverberation time through practical examples and hands-on exercises. The course examines how headphones and loudspeaker systems made electroacoustics and their application in room acoustics simulation and auralisation, a tool for acoustic design in architecture. It provides the software and hardware tools to measure and analyse the acoustics of existing spaces. It demonstrates acoustic simulation tools for designing and predicting the acoustics of digitally designed spaces.

Lectures by guest speakers round up the content and broaden the focus outside the box. Finally, the course concludes with a short semester thesis, allowing students to apply their acquired knowledge to a small design project.

### Lecture notes

The course format is a 1-hour lecture and a 2-hour hands-on exercise session. Lecture notes are provided every week through the course's website. Lecture notes are provided every week through the course's website. The course takes place in the Immersive Design Laboratory (IDL) at HIT F22.

### Literature

Literature will be provided during the course. Slides and other materials will be provided during the course. Literature will be provided during the course.

### Prerequisites

- **063-0669-00 Coding Architecture I, or equivalent programming fluency in Python and Grasshopper**
- **063-0670-00 Coding Architecture II, or equivalent programming fluency in Python and Grasshopper**
- **101-0531-00L Digital Creativity for Circular Construction**

## Competencies

### Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

### Method-specific Competencies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management

### Social Competencies
- Communication
- Cooperation and Teamwork

### Personal Competencies
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

## Methods and Tools

The course consists of lectures providing a theoretical background followed by hands-on practical sessions with coding exercises in Python and Grasshopper. In parallel, the students will work in small groups on a semester project, in which they apply the presented data-exploration and inverse design methods to a design task of their choice. Building upon the provided framework (in Grasshopper and Python), students will generate custom datasets and train project-specific models, and then use them for concept-phase design exploration.

### Course format

- **063-0661-24L Integrated Discipline HS24 in the Field of Technology in Architecture (ITA)**
  - **W** 3 credits 2A
  - **Supervisors**

### Prerequisites / notice

- Enrolling in this course is only possible on agreement with the lecturer and if you attend a design course (V-IX) at the same time.

### Objective

Understanding of the importance of the ITA disciplines for architectural design and integration of structural thinking into the design process.

### Content

This elective course presents machine-learning methods for data-driven design exploration in architectural design, and how to leverage them in combination with the parametric modelling paradigm. The students learn how to harness parametric models for data exploration and how to augment the design process with project-specific generative deep learning models. They acquire basic understanding of the underlying methods and can implement them in their design tasks in architecture, urban planning, engineering etc.

### Literature

Literature will be provided during the course. Literature will be provided during the course. Literature will be provided during the course.

### Prerequisites

- **063-0669-00 Coding Architecture I, or equivalent programming fluency in Python and Grasshopper**
- **063-0670-00 Coding Architecture II, or equivalent programming fluency in Python and Grasshopper**
- **101-0531-00L Digital Creativity for Circular Construction**

## Assessments

All students who register go on a waiting list until 11.09.2024. To register:

1. Enrol before 05.09.2024
2. Send a short motivation letter (max. 300 words) and a
The course is about digital innovation towards a circular economy in the built environment. How can we bring together two worlds that are often too distinct: low-impact construction and digital innovation? Bringing digital tools already used in other sectors into the construction sector, students will learn about circular construction (e.g., reuse of materials) through hands-on learning practices.

Objective

In the fall semester 2024 we will focus on applying artificial intelligence (AI) and extended reality (XR) to the circular design workflow and the generation of circular design concepts.

The course will be taught at the Kunsthalle Zurich as part of an exhibition. By the end of this course, students will be able to use augmented computational design enabling circular construction, with a view to environmental implications. They will be able to assess the challenges and opportunities of low-carbon, circular construction and evaluate possible solutions using digital technologies to enable a circular built environment (more specifically, with reused building materials). To achieve this, they need to be able to do the following:

1. Apply circular principles using recovered building materials.
2. Compare different digital technologies applied in circular construction (e.g., LiDAR scanning, drone imagery, photogrammetry, computational design, AI, computer vision, XR, LCA tools etc.).
3. Understand the potential and limitations of AI for circular construction, e.g., use machine learning to detect and digitize materials (computer vision) or to support creativity in the early design phases of circular construction (generative AI).
4. Communicate the importance and urgency of circular construction.
5. Assess the environmental impact implications of their design and technology decisions through a preliminary Life Cycle Assessment (LCA).

Content

Students will receive an introduction to circular principles by experts from the building industry and visit of (de-)construction sites where circular construction is exemplified. They will explore how to use digital technologies such as LiDAR scanning, photogrammetry, scan-to-BIM, computer vision, computational design, digital fabrication, blockchain technology and learn about the design implications using reclaimed building materials. This course is meant as an overview/introduction of many digital technologies that could be useful for circularity and gives the tools to students to further study the technologies they are most interested in on their own. Creativity in writing, filmmaking, design, construction, etc. is expected from the students. This course will give the tools to students to learn more on LCA if they wish to deepen their knowledge further.

Lecture notes

Language: English

Courses are on Tuesday afternoons in Kunsthalle or a room at ETH, but also require out-of-the-semester work and significant homework and site visits outside of class hours.

Literature

Prerequisites / notice

Interest in Digitalisation and Construction. Flexibility: This is a hands-on course, where students explore digital technologies and opportunities/challenges of reuse. Flexibility (e.g. adapting to unforeseen circumstances), responsibility (e.g. arriving on time for safety briefing), and spontaneity (e.g. finding innovative solutions) is expected from the students to adapt to the contingencies from demolition and construction sites with reused materials. The course is mandatory for MIBS students. If you are a first year MIBS student, please do not apply, you are automatically accepted. All other students from other departments should apply. Please only register for the course if you really intend to participate on all course dates (see course catalog). Please only register for the course if you are willing to send us a letter of motivation and really intend to participate; otherwise, you will deprive someone else of a place. All non-MIBS students who register go onto a waiting list until 11.09.2024 and up to 25 of them will be selected by the lecturer.

Collaborators: Kunsthalle Zürich, ETH AI Center, Design++

To register:

1. Enroll before 05.09.2024.
2. Send a short letter of motivation (max. 300 words) and a 1-page CV to cea-course@ibi.baug.ethz.ch by 05.09.2024.

**Abstract**

The formal framework needs to be discussed with the staff members.

**Objective**

A study in building research and preservation of building heritage with a clear topic.

**Content**

In addition to theory, heritage conservation also plays an important practical role in the current building revolution. In order to make the diverse possibilities in architecture visible, this course develops new strategies for communicating the discipline of monument preservation for an exhibition on this topic at S AM in 2025.

**Prerequisites / notice**

The course addresses primarily students of the MAS ETH in Denkmalpflege und Konstruktionsgeschichte and the CAS ETH in Future Heritage.

**Abstract**

Complex constructions that are difficult to maintain and industrial manufacturing processes decrease the lifespan of objects not only in product design but also in architecture. Repairability is becoming less of a concern – replacement seems to be the norm. We need to rethink the way we build, starting already with the planning phase.

**Objective**

In this course, we combine traditional topics of preservation with concepts of repair and FAB initiatives to raise awareness for sustainable thinking and action. Students will learn both traditional and digital methods as well as the basic building and material criteria for repair. The objective is not only the hands-on repair of a building part but especially to learn about the concepts of heritage preservation.

**Content**

This semester the elective (2KP) is offered in combination with a design studio (14KP) and an integrated design-build seminar week (2KP) in Davos on the Schatzalp. This course can only be taken in conjunction with 652-0923-24 U Architectural Design V-IX: Heritage-Led Teaching Project (GD A. Beer / D. Merz) and an integrated Design-Build seminar week. Please note: Registration for the elective is open until 18.09.2024. Please wait for enrolment and assignment of design studio.

Abstract
Surveying and measuring technologies in historical building archaeology. Case studies on building archaeology.

Objective
Basic understanding of different surveying methods and first practical contacts with technical surveys instruments. Understanding of the procedures and aims of building archaeology.

Content
From folding rule to laser scanner: surveying techniques and their possible applications.

The elective subject "Building Surveying and Building Archaeology" covers surveying and measurement methods ranging from simple hand measurements and tachymetry to laser scanning, terrestrial and drone-based photogrammetry (structure from motion) and other non-invasive assessment methods such as thermal imaging. The different methods and technologies will be presented on the basis of current or completed research projects and their practical applications will be discussed. Internal and external guest speakers will report on their latest research projects in the field of building research and construction history. In the course of the elective, students will also have the opportunity to try out the methods themselves and integrate them into a small concluding project of their own.

The course is composed of theoretical and practical parts in and outside the classroom.

Literature
Will be announced in the course for the individual lectures.

Abstract
The seminar week is obligatory for students of all semesters. There are many and varied study contents.

Objective
The students will be enabled to discuss narrowly formulated factual questions in small groups and in direct contact with the professors.

assessed

When we talk about meaning in architecture we often begin with the architect, the patron or any number of contingencies which shaped a character. It is also a category of architectural discourse, developed in the 18th century when architects and theorists were seeking new ways to talk about and judge buildings, pushing architectural discourse beyond Vitruvian categories to which it had been tied for centuries before.

This course is a reading class in which the architectural category of 'caractère' or character - a key concept in the 18th century - will be examined by a close reading of several key texts, from the late 1700s up until today. Independent reading and vivid discussion in class make up this course's character.

Deepen basic knowledge, improve ability to critically read and analyze texts of architectural theory, and understand shifts in architectural thinking.

'Caractère' or character is not only a quality applied to human beings. It is also a category of architectural discourse, developed in the 18th century when architects and theorists were seeking new ways to talk about and judge buildings, pushing architectural discourse beyond Vitruvian categories to which it had been tied for centuries before.

This reading class will closely examine key texts that discuss the phenomenon of a building's 'character' from the 1700s up until today. The weekly assigned texts (in the original French, English or German) will be read at home and then discussed in class. Independent reading and vivid participation in class are a fundamental prerequisite. In addition, there will be weekly written assignments, which will all be graded. A final written assignment at the end of the semester will be graded as well. To pass the course, students will have to read each assigned text, and hand in all written assignments on time.

History and Theory in Architecture IX: Earthworks: Art, Architecture, Ground

Abstract
The current trend of architecture towards the ground and its materiality, the fascination for quarries, minerals, geology and the subterranean raises questions. How can one locate the phenomenon within the theoretical and historical discourse?

Objective
Increase knowledge of contemporary and historical discourse on architecture, art and the ground. The lecture will focus on various case studies of contemporary architecture and relate these phenomena to models of historiography and theory, and to earlier works of art and architecture. Which is the relation to the discussion of the Anthropocene? How does it affect perceptions of temporality and space? Which are the connections to earlier movements such as Land Art? How does it resonate with notions of infrastructure, extraction, and forms of power?

063-0805-24L History and Theory in Architecture IX: 1990s Theories that Inspired Architecture

Abstract
This course examines a variety of theories – lightness, whiteness, the diagram, public fear, feminism – from other disciplines that entered the architectural debate in the 1990s and have since inspired architects to produce different architectural designs.

Objective
Upon completion of the course, the students will have:

1. recognised the multidisciplinary character of architectural discourse, and the potential for architectural design to interrogate theories from other disciplines
2. acquired in-depth knowledge of a number of theories from other disciplines that have been crucial in shaping current architectural discourse
3. cultivated an understanding that theories are subject to interpretation and reinterpretation over time
4. developed the ability to identify, analyse and interpret positions taken within architectural discussions and architects' contributions to other disciplines, and acquired the skills to position themselves vis-a-vis theories that have been developed outside the realm of architecture
Content

This course will take some of the most provocative thematic issues of the 26 editions of the journal ANY: Architecture New York (1993–2000) as a starting point for discussing non-architectural theories that inspired architects.

In 1990, the architects Peter Eisenman, Arata Isozaki, and Ignasi de Solà-Morales, along with the editor Cynthia Davidson, founded the non-profit Anyone Corporation with the goal of stimulating theoretical discourse through cross-disciplinary discussion. The Anyone Corporation began with a series of ten cross-cultural and multidisciplinary conferences, The Any Conferences (1991–2000), which provided a unique forum for architects in the 1990s to discuss architecture from interdisciplinary perspectives while physically spending three days together, fostering constructive feedback. ANY: Architecture New York was a journal launched in 1993 to widen the impact of The Any Conferences and incorporate more young voices around the field of architecture discussed by people from outside the field of architecture. As such, the ANY magazine was a critical part of the entire Anyone Project; an activating force that aimed to expand and build on the annual conferences with something that occurred 'in-between' the yearly conferences.

This course seeks to make architectural students aware of the interdisciplinary character of architecture and ask what we can learn from discussing architecture from multiple disciplinary viewpoints by tackling ANY magazine’s forward-looking themes such as feminism, virtual space, public fear, the mechanical in the electronic era, lightness, and whiteness, topics all highly relevant today. We will examine various cultural and disciplinary perspectives that have been taken on these theories, as well as the fact that they were not immutable but rather developed over time as a result of various interpretations and (mis)translations.

More broadly, the goal of this course is to help close the gap between currently available architectural histories – which are primarily centred on architects – and the complex, multidisciplinary reality of the built environment.

063-0863-24L Intersectional Histories: How Architectures Were Also Made W 2 credits 2G A. Hultzsch

Autumn Semester 2024
From a ‘cottage’ in Chile, a ‘tea equipage’ in London, a ‘veranda’ in Mumbai, to a ‘cathedral’ in Strasbourg, this course presents global entanglements of built spaces while asking who we listen to when forming our understanding of architectural histories. By combining intersectional history with reception history, we ask: how and by whom were architectures also made?

This course encourages students to critically reflect on the relevance and critical importance of historical research for the present and the future. By completing this course, students will:

- develop an understanding of history as a living practice that shapes our present and future,
- deepen knowledge about local and global entanglements of buildings and objects,
- learn about concepts such as intersectional feminism, coloniality and decolonization,
- become familiar with historiographic methods such as the global microhistory or collaborative reading,
- improve both analytical and speculative writing skills.

This course introduces students to intersectional history – how accounts of the past are shaped by intersecting privileges and marginalizations – as well as reception history – how the meaning of architecture is and has been shaped also by those who dwell in it and use it. It draws heavily on the research of the ERC-funded group WoWA – Women Writing Architecture. It will focus, as the project, on the 18th and 19th centuries, complicating European histories within colonial contexts, especially linking to Latin America and the Indian subcontinent. However, it will also reach beyond this time frame to bring in a wider context – up to the Renaissance and into the 20th century.

Through a set of lectures which are interspersed with exercises over the semester, students will engage with a diverse set of primary sources – texts, objects, sites – to actively re-think and re-read the past of the built environment. Lectures will present both theories and concepts such as intersectional feminism, critical race theory, (de- and post-) colonialism and coloniality, as well as showcase global microhistories of texts, objects, and sites that materialise the approach of intersectional histories. We reflect on what constitutes architecture – or architectures – from the point of view of the user, critic, and dweller. In several structured exercises, students will analyse an object, site, or text on both a micro and global scale, producing their own global microhistories over the semester. They will receive feedback and their work process and outcome will be graded.

This lecture series deals with the history of the production of buildings. This history draws heavily on pictorial and archival sources, but the lecture will always establish the link to traces observable on site. In that sense, the lecture is an introduction to the wide topic of “building archeology”. Among others, we will cover the following topics:

- construction materials, tools and tooling of construction elements
- material flow and economic boundary conditions of the construction site
- construction site technology and construction machinery (scaffolding, cranes, etc.)
- history of building production

The autumn semester is primarily dedicated to building with stone: from quarrying to dressing and lifting. We consider tools, construction site technology such as scaffolding, centring and other temporary works, cranes. We study all types of stone constructions, from foundations to walls to vaults, from concrete-like rubble stone through small dressed stone to huge monoliths.

The spring term lecture, conversely, is mostly dedicated to timber construction and to the evolution of structural concepts over time.

Autumn Semester 2024

Fall 2023 (video.ethz.ch) and to have a look at the slides from 2023. Both will provide all information necessary to pass the exam.

This lecture will NOT be given by Prof. Holzer in the fall term 2024 (sabbatical). Rather, students are asked to listen to the recordings from fall 2023 (video.ethz.ch) and to have a look at the slides from 2023. Both will provide all information necessary to pass the exam.

However, there will be biweekly lecture-hall events during which topics from last year’s lecture will be considered, questions answered, and some additional illustrative examples presented. This will include presentations by PhD students reporting from their ongoing research projects.
### Case Studies Construction History and Building Preservation

**063-0903-24L**

**W** 4 credits 2G S. Holzer

**Abstract**

Acquiring in-depth knowledge of construction history and building archeology by means of detailed study of selected historic monuments. The course will start with a multi-part classroom introduction, followed by field studies in small groups.

**Objective**

The participants will gain in-depth knowledge on the methodology of building archeology by means of the documentation and interpretation of real historic structures in on-site studies.

**Content**

We study historic constructions in German-speaking Switzerland (individual small groups, objects within 2 hrs public transport reach from ETH Hoenggberg). Each group will be assigned an individual tutor (PhD student) who will be present on-site, on individual appointment.

We will survey, document and analyze a historic construction, with particular attention to production traces, constructive detail and laod-carrying system.

We will start with introductory classroom lectures and on-site teaching during the first third of the semester. This will be followed by individual investigations on site. The progress will be pinpointed in three critiques:

1) on site, with individual tutor
2) at institute, with professor and institute members
3) final delivery, at institute, with professor and all institute members

The detailed schedule of the case studies can be found here:

Each enrolment obliges the student to visit all compulsory dates during the entire semester without interruption.

**Lecture notes**

Detailed instructions on on-site investigations, as well as manuscripts on the background, will be provided. It is mandatory to read them in due time!

**Literature**

Will be announced during the introductory lectures

This class will NOT take place in fall term 2024, due to prof. Holzer's sabbatical.

**Prerequisites / notice**

This class will NOT take place this semester. Each enrolment requires an uninterrupted visit throughout the semester. Cancellation (incl. deletion of enrolment) is permitted until x.x.2024.

---

### Future Monuments

**063-0911-24L**

**W** 2 credits 2V S. Langenberg

**Abstract**

Heritage conservation is dedicated to the preservation and protection of historical buildings. In this lecture, students will learn about the theoretical positions on historic monuments and the basics of preservation in practice.

---

Objective

In addition to active participation in the discussions, students will be asked to engage with a topic or object of their own choice in order to be able to develop and comprehensibly justify their own positions within the context of preservation. Our goal here is to foster students’ communication skills and the culture of discussion.

Content

The responsible reconstruction and further development of the existing building stock requires knowledge and an understanding of the theoretical positions conservation and the basics of preservation in practice. The core course of spring semester 2024 conveys this knowledge to students with the help of selected writings and discusses them in the context of various guest lectures.

**Abstract**
This lecture series sets up an agenda for widening the disciplinary field of architecture and urbanism from their focus on the city, or the urban in the narrow sense, to wider territorial scales, which correspond to the increasing scales of contemporary urbanisation. It discusses the concepts of territory and urbanisation, and their implications for the work of architects and urbanists.

**Objective**
The course will enable students to critically discuss concepts of territory and urbanisation. It will invite students to revisit the history of architects’ work engaging with the problematic of urbanising territories and territorial organisation. The goal is to motivate and equip students to engage with territory in the present day and age, by setting out our contemporary urban agenda.

The lectures are animated by a series of visual and conceptual exercises, usually on A4 sheets of paper. All original student contributions will be collected and bound together, creating a unique book-object.

**Content**
The lecture series consists of 7 core lectures delivered by professor Milica Topalović, and 4 curated guest lectures highlighting a selected theme.

This fall, within the theme MY WEATHER, we will trace the uneven impacts of the environmental crises on the ground, and reflect on the entanglements of weather, atmosphere, and climate with the constructed environments and ecologies.

Our Common Territories: An Outlook
MILICA TOPALOVIĆ
While architects, planners, and urban designers have engaged with the city, the analysis of urbanising territories 'beyond the city' have been a blind spot. This lecture series attempts to close this gap by discussing with researchers who will present methods, experiences and findings from a great variety of territories of extended urbanisation.

The grading will be based on the attendance record and the three graded exercises.

063-0701-24L Methods of Urban Research: Extended Urbanisation

Abstract
While architects, planners, and urban designers have engaged with the city, the analysis of urbanising territories 'beyond the city' have been a blind spot. This lecture series attempts to close this gap by discussing with researchers who will present methods, experiences and findings from a great variety of territories of extended urbanisation.

Objective
The lecture series ‘Methods of Urban Research: Extended Urbanisation’ presents the methodology of sociological analysis of territories of extended urbanisation. These territories, which have traditionally been beyond the sensorium of architecture and urban design professions, provide important terrains for urban practice. The lecture series will bring together researchers that have been part of a long-standing research project on territories of extended urbanisation. They will present a kaleidoscopic overview of the diverse methods and insights into international research on urbanisation processes in large metropolises and territories characterized by extended urbanisation. Most of the presented case studies are published in the brand new book ‘Extended Urbanisation: Tracing Planetary Struggles’. Semester performance will be assessed on the basis of a written group assignment on extended urbanization (approximately 10 pages, in groups of four). For the assignment - describe and analyse an example of extended urbanization in a geography of your choice. The example may be from Switzerland or from any other region of the planet. Based on scientific literature and other data, conduct a critical analysis of the chosen case study, and discuss the consequences of urbanization of this area for its people and the environment. Develop a possible urban strategy for alternative inclusive development. Summarize your findings through a A3-sized poster.

Introduction: Christian Schmid

European Aspects of Spatial Development

W 3 credits 2G A. Peric Momcilovic

Abstract
Following the insight into historical perspective and contemporary models of governance and planning, the course focuses on the international dimension of spatial planning in Europe. This includes a discussion of how European spatial policy is made and by whom, how planners can participate in such process and how they can address transnational challenges of spatial development cooperatively.

Objective
Keeping the general aim of exploring the European dimension of spatial planning in mind, the specific course learning objectives are as follows:
- to interpret the history of spatial planning at the transnational scale
- to understand and explain the content of the European spatial policy agenda
- to describe and analyse the role of territorial cooperation in making European spatial development patterns and planning procedures
- to discuss the changing role of planners and evaluate the ways of their engagement in European spatial policy-making

Content
- European spatial policy agenda: introduction and basic directives
- governance models
- planning models; collaborative planning model (main concepts & critics)
- post-positivist approach to spatial planning
- transnational spatial planning in Europe; questioning the European spatial planning; spatial development trends in Europe
- EU as a political system: EU institutions & non-EU actors
- planning families in Europe; the European spatial planning agenda
- spatial planning strategies and programmes on territorial cooperation
- the notion of planning culture and planning system; planning cultures in Europe
- basic characteristics of planning systems in Europe
- the relevance of European transnational cooperation for spatial planning
- European transnational initiatives

Lecture notes
The documents for the lecture will be provided at the moodle.

Literature
Obligatory literature:

Recommended literature:
- Governance models:
  - Planning models:
- EU as a political context:
- Territorial cooperation in Europe:
- Planning families and cultures:
- Planning systems in Europe:
Prerequisites / notice

Only for master students, otherwise a special permission by the lecturer is required.

Abstract
Urban physics: wind, wind comfort, pollutant dispersion, natural ventilation, driving rain, heat islands, climate change and weather conditions, urban acoustics and energy use in the urban context.

Objective
- Basic knowledge of the global climate and the local microclimate around buildings
- Impact of urban environment on wind, ventilation, rain, pollutants, acoustics and energy, and their relation to comfort, durability, air quality and energy demand
- Application of urban physics concepts in urban design
- Climate Change. The Global Picture: global energy balance, global climate models, the IPCC process. Towards regional climate scenarios: role of spatial resolution, overview of approaches, hydrostatic RCMs, cloud-resolving RCMs
- Urban micro climate and comfort: urban heat island effect, wind flow and radiation in the built environment, convective heat transport modelling, heat balance and ventilation of urban spaces - impact of morphology, outdoor wind comfort, outdoor thermal comfort
- Urban energy and urban design. Energy performance of building quarters and cities, decentralized urban energy production and storage technologies, district heating networks, optimization of energy consumption at district level, effect of the micro climate, urban heat islands, and climate change on the energy performance of buildings and building blocks.
- Wind driving rain (WDR): WDR phenomena, WDR experimental and modeling, wind blocking effect, applications and moisture durability
- Pollutant dispersion. pollutant cycle : emission, transport and deposition, air quality
- Urban acoustics. noise propagation through the urban environment, meteorological effects, urban acoustic modeling, noise reduction measures, urban vegetation
- Practical exercise on climatic data collection and analyze

Content
Lectures, tutorials and exercises will focus on:
- Advanced Grasshopper usage as a continuation of Computational Design III-IV course.
- Build up basic proficiency in programming using Python.
- Programming using Python within the design environment.
- Applications in architecture and digital fabrication.
- Familiarity with Grasshopper visual programming is expected.
- Course starts from the basics of programming, but moves quickly into advanced topics.

Lecture notes
The course lectures and material are provided online via Moodle.

Prerequisites / notice
For MIBS Master students 151-8011-00L Building Physics Theory & Application is a pre-requisit for this course or instructor permission. For others no prior knowledge is required.

063-0669-00L Coding Architecture I

Abstract
"Coding Architecture I-II" is a programming class for architects with particular focus on demystifying technology - both software and hardware - and exploring the programmability of our world through powerful methods of digital, computational, and algorithmic design. This course welcomes students from all backgrounds, as no prior coding experience is required.

Objective
1. Understand essential concepts in programming and algorithmic thinking.
2. Understand and apply powerful methods of digital, computational and algorithmic design.
3. Apply digital technologies to design processes.
4. Ability to understand a problem and create a solution in algorithmic terms.
5. Ability to produce and implement novel and useful ideas.
6. Materialize ideas into the physical world.

Content
Lectures, tutorials and exercises will focus on:
* Advanced Grasshopper usage as a continuation of Computational Design III-IV course.
* Build up basic proficiency in programming using Python.
* Programming using Python within the design environment.
* Applications in architecture and digital fabrication.
* Familiarity with Grasshopper visual programming is expected.
* Course starts from the basics of programming, but moves quickly into advanced topics.
The course "Architektur und Tragwerk" represents an opportunity for architecture students to develop a design project in which load-bearing structures and architectural space support and enhance each other as inherent parts of the same design process.

### Content
The design process of the diploma subject is characterized by the integral nature of its processes and the integral nature of its content. The economic considerations within this process are also an important aspect of the design process. The main focus of the diploma subject is the design and construction process of buildings. Alongside determining basic principles, case studies play an important role in teaching. The economic factors of building construction are examined and the specific decision process is simulated. The case studies in the lectures as well as the processing of individual topics within the framework of elective work permit and require students active participation.

### Prerequisites / notice
ITA Pool - information event on the courses offered at the institute ITA: Wednesday 7th September 2022, 10-11 h:
Room: HB Open Space 2 (HIB E52) or online. Zoom link: https://ethz.zoom.us/j/6884810727

Your presence on the first course day is obligatory!

Further information: http://www.bauprozess.arch.ethz.ch/education/MSc/BauprozessOekonomie.html
Upon successful completion of the subject semester, students will be able to identify concepts and relevant design parameters for zero-emission building design, which integrates aspects of energy, materials, technology, human behavior, and comfort into architectural design and seeks synergetic design solutions.

The goal of the semester is to demonstrate the relationships between building systems and architecture and to find ways to manifest building systems in design.

Students begin with a research and mapping phase in which they first investigate various building systems for zero-emission building design. They then map the building systems with architectural parameters for successful interaction between the two and create a catalog of their findings.

After the research and mapping phase, students design a small building in which they explore how to maximize the interactions between the building systems and the architectural parameters. Finally, students attempt to quantify their design solutions using low-threshold modeling, simulation, and optimization tools such as Rhino/Grasshopper or Hive. To assess and discuss their concepts not only numerically but also architecturally and aesthetically, students also find appropriate forms of visualization.

Students document the process and results both numerically and architecturally, which are then discussed with a final jury.

All materials (lectures, tools, examples) are available on the A/S Knowledge Platform: https://moodle-app2.let.ethz.ch/course/view.php?id=11917

A student can only register once for a "Fachsemester" during the Master studies!

The application deadline for this "Fachsemester" is 4.9.2024, 8 p.m. You will receive a message about acceptance or rejection for the subject semester by 5.9.2024, 2 p.m. at the latest. Students who have been rejected have the opportunity to choose a design class (enrollment ends on 5.9.2024, at 6 p.m.).

**Abstract**

In this subject semester, we explore the topic of zero-emission building design, which integrates aspects of energy, materials, technology, human behavior, and comfort into architectural design and seeks synergetic design solutions.

**Objective**

Upon successful completion of the subject semester, students will be able to identify concepts and relevant design parameters for zero-emission building design and develop integrated architectural design strategies. They will know how to select and use appropriate simulation and analysis tools to qualify and quantify their design solutions and will be able to visualize their concepts with both technical schematics and architectural drawings and visualizations.

**Content**

The subject semester kicks off with an introduction to the use and exploitation of building systems for the design of zero-emission buildings. The goal of the semester is to demonstrate the relationships between building systems and architecture and to find ways to manifest building systems in design.

Students begin with a research and mapping phase in which they first investigate various building systems for zero-emission building design. They then map the building systems with architectural parameters for successful interaction between the two and create a catalog of their findings.

After the research and mapping phase, students design a small building in which they explore how to maximize the interactions between the building systems and the architectural parameters. Finally, students attempt to quantify their design solutions using low-threshold modeling, simulation, and optimization tools such as Rhino/Grasshopper or Hive. To assess and discuss their concepts not only numerically but also architecturally and aesthetically, students also find appropriate forms of visualization.

Students document the process and results both numerically and architecturally, which are then discussed with a final jury.

**Abstract**

This Research Studio focuses on the entanglements of the architectural and urban histories of Switzerland and the history of global colonialism. Through architecture-specific research methods, it investigates how centuries of colonialism have historically influenced the aesthetic, construction and craft cultures of Swiss cities, and explores ways to engage with these contested legacies today.

**Objective**

The Research Studio has two main objectives:

1. **Archeology of Swiss Coloniality.**
   - First, students will develop an ‘archeology’ of the historical entanglements of Swiss industry with global colonialism. In this part, the studio work is understood as an archaeological venture, digging up traces of the past. Students will systematically probe the built environment of Switzerland for traces and influences of global colonialism and its aftermath. The result will be a catalogue of colonial entanglements, illustrating how they are inscribed into architectural and urban figures and how they continue to impact the urban fabric of Switzerland and its industry.
   - In a second step, students will attempt to ‘process’ the enduring impact of Swiss Coloniality. Based on the ‘Archeology,’ students will explore the inherent logics of global colonialism in relation to Swiss industry as it impacts the present. The central idea is to avoid considering the past as a closed chapter, but as an ongoing process and condition of coloniality that still structures our present and future, which needs acknowledgement and dialogue. Students will be asked, using the tools of the architect, to explore strategies to represent these entanglements and suggest openings for repair where needed.

Based on these main objectives, this course will:

- offer students an overview of the most important historical and contemporary contributions to debates on postcolonial and decolonial theory and the entanglement of Switzerland’s industry with global colonialism;
- equip students to reflect critically upon the manifestations of Swiss Coloniality in the built environment with the help of both theoretical and historical perspectives;
- make students aware that the production of the city is not a neutral given but is always shaped by cultural values, assumptions, and expectations, which impact the everyday environment and, as such, condition inhabitants and users;
- help students to position themselves within current debates on cities, urban development, and urban life in relation to broader challenges such as sustainability and social inequality.

**Content**

Swiss Coloniality

Cities have never been isolated entities and have always existed by grace of the myriad connections with their hinterland. Throughout the past centuries, and especially since the 15th century onwards, these connections have become increasingly far-reaching across the globe, and the history of urban development in areas such as Europe has been intricately entwined with conditions and realities elsewhere. As such, urban history cannot be seen as entirely separate from global colonialism and its aftermath. While designing and constructing the architecture of the city, architects, urban designers, builders, and inhabitants also inevitably take part in the wider ecologies of material and immaterial flows that are shaped by and contribute to a global system of inequality. Not uncoincidentally, the metropole – a key term of science practices, etc. So, despite being a country without colonies, what if we consider Switzerland and its position in the world from the perspective of the colonial metropole? What would be the specific architectural and urban dimension of this figure of Metropole Switzerland?

While Switzerland never had colonies of its own, it was nevertheless in many ways involved in and contributed to the history of global colonialism: by taking part in the economy sustained by colonialism, by financing and securing slave trade, by contributing to race-based science practices, etc. While Switzerland never had colonies of its own, it was nevertheless in many ways involved in and contributed to the history of global colonialism: by taking part in the economy sustained by colonialism, by financing and securing slave trade, by contributing to race-based science practices, etc. So, despite being a country without colonies, what if we consider Switzerland and its position in the world from the perspective of the colonial metropole? What would be the specific architectural and urban dimension of this figure of Metropole Switzerland?

In raising such questions, in this Research Studio, we aim to focus on the entanglements of the architectural and urban histories of Switzerland and the history of global colonialism.

Starting to answer such questions requires a widened understanding of colonialism and its impact, which has been grasped with the notion of coloniality in recent debates. While colonialism refers to the historically specific phenomenon of one area of the world colonizing another, settling on foreign land, extracting its resources, and violently disciplining its inhabitants, the term coloniality refers to the more long-lasting processes and indirect effects that are the result of centuries of colonialism, and that mark a landscape of global inequality, even after the ‘official’ reign of colonialism has ended. In this sense, the disparity between the so-called ‘Global North’ and ‘Global South’, and the way in which a country such as Switzerland is still profiting from an advantageous position in this globally unequal world, can be considered the result of centuries of colonialism, and to be still part of a condition of coloniality. As this condition is a two-sided and mutually inflictive phenomenon, to unravel the knot of Swiss coloniality, we not only aim to investigate how Switzerland was implicated in activities abroad but also, conversely, how these activities have impacted Switzerland. While in the fields of political, social and economic history, a revisionist effort is underway to reconsider/correct the image of Switzerland as a neutral country without colonies, in the field of architecture and urban history, however, we are yet to unravel the impact of this entanglement on the built environment, and, more widely, on the aesthetic, material and craft cultures of Swiss cities.
Our aim is to increase the knowledge and sensitivity of architecture students toward the history of art and architecture, to make their voices heard and to develop new teaching formats for the history and theory of architecture. Students will learn to take position in a field, they will practice argumentation and increase their skills in writing and presenting.

The overarching hypothesis of this Research Studio is that historical and theoretical research can profit profoundly from the use of the tools and knowledge of architects. On the one hand, the spatial, formal, material, and constructive knowledge gained throughout architectural studies will guide the historical research in the archives, in the library, and/or in the city itself and will allow students to articulate specifically architectural interpretations of the materials they find. On the other hand, the Studio explicitly asks students to employ specific architectural tools such as drawing, writing and model-making to explore the historical and theoretical realities that are being investigated. By actively reflecting on the composition of a varied set of analytical and interpretative drawings, texts, and models, students will probe the capacity of these media to act as tools for historical and theoretical research.

Within the general theme of Swiss Coloniality, students will be guided to identify their own subtheme, which will require exploring their own specific research methodologies. These architecture-specific methodologies will be strategically chosen to discuss specific aspects of society: political, economic, social, cultural, or otherwise. Thus, conforming these ‘autonomous’ and ‘heteronomous’ dimensions of architecture, a new understanding of the city and our built environment is developed that allows us to answer (some of) the research questions mentioned previously.

Research process

Students will be guided through three phases with different emphases: Definitions, Logics and Reinterpretations of Swiss Coloniality. The first phase, Definitions, is focused on developing an understanding of what the notion of Swiss Coloniality can entail and how it relates specifically to industry and the production of the city. This phase will allow students to become familiar with the historical and current entanglements of Switzerland with global colonialism. Based on this hypothesis, students will position themselves in relation to Swiss Coloniality, its history and its enduring impact. The position statement can take the form of a written text, architectural drawings and/or models and will be presented in the form of a student-curated studio exhibition and an online adaptation of it.

The second phase, Logics, is about understanding and demonstrating the inner workings and mechanisms of Swiss Coloniality. Each of the students will focus on one specific case – a material, a site, an actor, a practice, etc. – and will examine it closely through targeted archival and library research, as well as through drawing, writing, and model-making.

In the third phase, Reinterpretations, students will formulate and investigate a hypothesis regarding the entanglements of Swiss industry with global colonialism. Based on this hypothesis, students will position themselves in relation to Swiss Coloniality, its history and its enduring impact. The position statement can take the form of a written text, architectural drawings and/or models and will be presented in the form of a student-curated studio exhibition and an online adaptation of it.

Enrollment will not take place through the D-ARCH website. To enroll for this Fachsemester please send an e-mail to sebastian.loosen@tga.arch.ethz.ch by Wednesday 6 September 2023, 8PM. If necessary, available places will be allocated firstly conform the A-B-C-studio priority system, and secondly, randomly. You will receive a confirmation by Thursday 7 September 2023, 12AM (noon). In case of over-applications, students who are not selected have the opportunity to choose a regular design studio through the D-ARCH website (enrollment ends on September 7th, at 6 p.m.).

The Research Studio is self-dependent work and tutoring takes place on Tuesdays and Wednesdays.

Further course information on https://avermaete.arch.ethz.ch/researchstudio

Abstract

In slang, “peace out” means “goodbye”. It also relates to the word “peace” which is, today, rarely used and hard to focus on. This double-meaning is the entry point for our Fachsemester. Can peace, in our present time, only be imagined as something that is over or yet to come? Are art or architecture peaceful as such? Does something like violent art or architecture exist?

Objective

Our aim is to increase the knowledge and sensitivity of architecture students toward the history of art and architecture, to make their voices heard and to develop new teaching formats for the history and theory of architecture. Students will learn to take position in a field, they will practice argumentation and increase their skills in writing and presenting.
In slang, “peace out” means “goodbye”. It also relates to the word “peace” which is, today, rarely used and hard to focus on. This double-meaning is the entry point for our Fachsemester. Can peace, in our present time, only be imagined as something that is over or yet to come? Are art or architecture peaceful as such? Does something like violent art or architecture exist? Starting with a visit to the almost forgotten Paxmal, a monument for peace initiated exactly 100 years ago by Karl Bickel high over Walensee, we will dive into the history of pacifism and look backwards, forward and to the present.

The Fachsemester in HS 2024 will deal with issues of ethics and esthetics in the largest sense. The syllabus will contain articles and book chapters on philosophy, performance, political science, poetry and history. Students are invited to develop their own texts in relation to the overall topic.

Our aim is to increase the facility of students for understanding spatial, political and historical interrelations. We support students to develop their skills in writing and reading, to make their voices heard, and to experiment, together with the teaching group, with new educational forms for the history and theory of art and architecture.

The group will meet on Wednesdays 10-13 at Kunsthalle Zürich and Thursdays 10-13 in our office.

Start: Wednesday, 18 September 2024.

Lecture notes
A Syllabus with source material for the lecture session will be provided.

Competencies
Subject-specific Competencies
- Concepts and Theories assessed
- Techniques and Technologies assessed
- Analytical Competencies fostered
- Decision-making fostered

- Self-awareness and Self-reflection assessed
- Self-direction and Self-management fostered

063-0857-24L Subject Semester HS24 (Fachsemester) in the Field of History and Theory in Architecture (gta) M. Delbeke

W 14 credits 29A

Does not take place this semester.
A student can only register once for a "Fachsemester" during the Master studies!

The application deadline for this "Fachsemester" is 4.9.2024, 8 p.m. You will receive a message about acceptance or rejection for the subject semester by 5.9.2024, 2 p.m. at the latest. Students who have been rejected have the opportunity to choose a design class (enrollment ends on 5.9.2024, at 6 p.m.).

Abstract
A History Research Studio fostering in-depth research where each student will propose and then develop their own individual project.

Objective
The course will be organised in weekly meetings. We will begin with talks by researchers at Chair Delbeke, but we will mostly focus on discussing your findings and work, sharpening your tools of analysis and fostering the development of each project. Rather than individual ‘desk crits’, we will discuss each project collectively, in a round table, to enable mutual feedback and a more collective exchange of ideas. As each project develops, there will also be individual feedback sessions.

This Research Studio will teach you to be both historically and critically competent. By combining different historiographical approaches, you will develop the skills to articulate research questions, carry out appropriate primary and secondary study and you will be trained in academic research and writing.

Content
Delbeke Fachsemester: What do buildings mean?

Meaning in architecture is often a more fraught question than in painting or literature. Architecture’s non-figurative nature may not appear as easy to read as the iconography of a painting or the narrative of a novel, but buildings do mean things and this meaning is inflected through audience and time. At its creation, occupation, or even violent destruction, architecture can embody all sorts of specific identifiable meanings, for definable even antagonistic groups.

We are interested in meaning in architecture in the widest possible sense. This Fachsemester is a place where you can pursue your own research interests. You come to us with a topic and we will help you develop it from initial idea, through focused research, ending with a carefully edited essay which you will deliver as a lecture at the end of the course. Weekly discussions will be focused on your research and how you can most quickly develop your own expertise. Complimentary talks will be given by members of Chair Delbeke where they will explain how they have conducted their own research from initial idea to published paper.
A student can only register once for a "Fachsemester" during the Master studies!

Places for this "Fachsemester" are limited. If you are interested in taking part, please send us an email with a 300-word motivation letter including an initial topic proposal to: professur.delbeke@gta.arch.ethz.ch

If you already have a specific case study in mind, please describe what this is. If not, you can describe a general idea or area of interest and we will help you find a more specific object of study during the course.

Proposals are open but might include: decoding the iconography of a particular building, historically and ideologically placing the ideas of a particular architect, studying a performance and its architectural setting, explaining the significance of a building during a specific political event, or reconstructing how the ideas of a particular group or class shaped a particular building or architectural type.

Our sole stipulation is that most or at least part of your work will focus on the period before 1900.

Deadline for applications is Wednesday September 6, 8 p.m. You will receive a message about acceptance or rejection for the subject semester by Thursday, September 7, 2 p.m. at the latest. Students who have been rejected have the opportunity to choose a design class (enrollment ends on September 7, at 6 p.m.).

Feel free to get in touch with us over summer if you would like to discuss your proposal in advance.

Focus Work

Realization in the respective fields of the institutes. Definition of topics by professors, in consultation with the students. The content may also refer to an elective course.

Field of Historic Building Research and Conservation

Definition of topics by professors, in consultation with the students (student's proposal / content of an elective course).

Field of Design and Architecture

Definition of topics by professors, in consultation with the students (student's proposal / content of an elective course).
In-depth work is carried out in the respective subject areas of the institute. The professors determine the topics in consultation with the students. The content of the in-depth work can also relate to the content of an elective course.

The performance assessment comprises either a purely written work with a subsequent oral examination or a creative, technical or graphic work, including a description, with a subsequent oral examination. At least in the case of one in-depth thesis, the performance assessment must take the form of a purely written work with a subsequent oral examination (Regulations Paragraph 2 Letter a). In formal terms, the written work must meet the criteria of an academic paper. In addition to the creative, manual or drawing part, it includes a written description of the question, the methodology and the possible gain in knowledge of the work.

The students take the oral examination with the professor with whom they have discussed the topic of the in-depth thesis.

The written or creative, manual or drawing work and the oral examination are each assessed individually. These two assessments are offset against each other and result in the overall grade for the in-depth work. Paragraph 7 remains reserved.

The oral examination can only be taken if the written work or the creative, technical or graphic work is sufficient.

A thesis is passed if the overall grade is at least 4. It is considered not passed if the overall grade is below 4; if the written or creative, technical or graphic work is unsatisfactory and therefore the oral examination cannot be taken; in such a case, the failure will be noted with the term "dropout".

An in-depth thesis that has not been passed cannot be repeated. In order to acquire the required CP, a further in-depth work must be carried out and the performance must be assessed with an overall grade of at least 4. The number of attempts is limited (see regulations).

If more than one "in-depth study" course unit is not passed, the course is considered to have been definitively failed, which leads to exclusion from the course.

The creative, craft or drawing in-depth work is publicly exhibited. Purely written in-depth theses are made publicly available.

The topic is determined in consultation with the chosen professor.

**Abstract**

Indentation work of the Institute ITA of which the content can also refer to an elective subject. The topic is determined in consultation with the chosen professor.

**Objective**

Development of skills and competences in a special area/sub-area of architectural theory or practice.

**Content**

In-depth work is carried out in the respective subject areas of the institute. The professors determine the topics in consultation with the students. The content of the in-depth work can also relate to the content of an elective course.

The performance assessment comprises either a purely written work with a subsequent oral examination or a creative, technical or graphic work, including a description, with a subsequent oral examination.

At least in the case of one in-depth thesis, the performance assessment must take the form of a purely written work with a subsequent oral examination (Regulations Paragraph 2 Letter a). In formal terms, the written work must meet the criteria of an academic paper. In addition to the creative, manual or drawing part, it includes a written description of the question, the methodology and the possible gain in knowledge of the work.

The students take the oral examination with the professor with whom they have discussed the topic of the in-depth thesis.

The written or creative, manual or drawing work and the oral examination are each assessed individually. These two assessments are offset against each other and result in the overall grade for the in-depth work. Paragraph 7 remains reserved.

The oral examination can only be taken if the written work or the creative, technical or graphic work is sufficient.

A thesis is passed if the overall grade is at least 4.

It is considered not passed if the overall grade is below 4; if the written or creative, technical or graphic work is unsatisfactory and therefore the oral examination cannot be taken; in such a case, the failure will be noted with the term “dropout”.

An in-depth thesis that has not been passed cannot be repeated. In order to acquire the required CP, a further in-depth work must be carried out and the performance must be assessed with an overall grade of at least 4. The number of attempts is limited (see regulations).

If more than one “in-depth study” course unit is not passed, the course is considered to have been definitively failed, which leads to exclusion from the course.

The creative, craft or drawing in-depth work is publicly exhibited. Purely written in-depth theses are made publicly available.

The subjects can be proposed by the students.

In consultation with the professors of architecture, the fixed topics are binding (see Art. 29 Reg. 201 MSc Architecture).

### Master's Thesis

Only students who fulfill the following criteria are allowed to begin with their master thesis:

- successful completion of the bachelor programme;
- fulfilling of any additional requirements necessary to gain admission to the master programme.

Ultimate deadline to unsubscribe or enroll for the Master Thesis is 23.10.2024. Deleting a reservation after this date is prohibited.
Abstract
The master’s thesis is the completion of the Master’s degree.

Objective
It shows the students’ ability to work independently and is a proof of the successful completion of their studies.

Prerequisites / notice
The Master’s thesis is supervised by a design professor D-ARCH. The students can choose one of the topics presented by the D-ARCH or - after approval by the head of the work - a free, self-chosen topic. Further details are regulated in Articles 31-38.

Abstract
This course covers the chemical and physical processes controlling the composition of the troposphere and stratosphere and introduces the relevant fundamentals for processes in the gas phase, in aerosols and clouds. These concepts are explored in the context of key environmental issues, such as urban air pollution, stratospheric ozone depletion, and air quality connections to climate change.

Objective
At the end of this course, students are able to:
1. describe the structure of the atmosphere and list atmospheric components and their main properties
2. define and describe the chemical and physical processes in the stratosphere and troposphere, follow reaction mechanisms, and apply rate laws
3. describe the physical and chemical principles of air pollution and summarize the most important legislative measures
4. discuss the local, regional, and global aspects of interactions between air quality, ecosystem health, and climate

Content
- Origin and properties of the atmosphere: composition (gases and aerosols), atmospheric structure, UV radiation, transport timescales
- Kinetics of gas phase reactions: rate laws, mechanisms of bimolecular and termolecular reactions.
- Stratospheric chemistry: Chapman cycle, catalytic ozone destruction cycles, polar ozone hole, Montreal protocol
- Tropospheric chemistry: oxidizing capacity of the troposphere and the role of OH, oxidation and global budgets of CO and CH4, role of NOx, and the global tropospheric O3 budget
- Surface ozone chemistry: HOx-NOx cycle, role of VOCs, O3 isopleth, ozone production efficiency
- Aerosols: primary and secondary sources, composition, quantities and measures, connections to climate
- Multiphase chemistry: solubility of gases, Raoult’s Law and hygroscopicity, kinetics of gas to particle transfer, N2O5 chemistry, aqueous phase sulfur chemistry, secondary organic aerosol formation
- Air quality: role of planetary boundary layer, deposition processes, summer- versus winter-smog, environmental problems, legislation, long-term trends
- Global aspects: air quality - climate interactions

Lecture notes
Lecture materials (slides) are provided continuously during the semester, at least 2 days before each lecture. Annotations and corrections are provided at the latest within the same week.

Prerequisites / notice
Attendance of the lecture "Atmosphäre" LV 701-0023-00L or equivalent knowledge is a pre-requisite, and basic courses in physics and chemistry are expected.

On Mondays (upon agreement) a tutorial is offered. This allows the students to discuss unresolved issues from the lecture or to discuss the problems of the exercise series and their solution. Participation is recommended.

Competencies
Subject-specific Competencies: Concepts and Theories assessed
Method-specific Competencies: Analytical Competencies assessed
Problem-solving assessed
Personal Competencies: Creative Thinking fostered
Critical Thinking assessed

Data: 06.08.2024 12:40
Autumn Semester 2024 Page 149 of 2684
Satellite observations; analysis of vertical soundings; geostrophic and thermal wind; cyclones at mid-latitude; global circulation; north-atlantic oscillation; atmospheric blocking situations; Eulerian and Lagrangian perspective; Potential Vorticity; Alpine dynamics (storms, orographic wind); planetary boundary layer; water isotopes.

The students are able to:
- explain basic measurement and analysis techniques that are relevant in atmospheric dynamics.
- to explain the basic dynamics of the global circulation and of synoptic- and meso-scale flow features.
- to explain how mountains influence the atmospheric flow on different scales.
- to discuss the mathematical basics of atmospheric dynamics, based on selected atmospheric flow phenomena.

Satellite observations; analysis of vertical soundings; geostrophic and thermal wind; cyclones at mid-latitude; global circulation; north-atlantic oscillation; atmospheric blocking situations; Eulerian and Lagrangian perspective; Potential Vorticity; Alpine dynamics (storms, orographic wind); planetary boundary layer; water vapour transport in the atmosphere; water isotopes.

Content

The course starts with introducing selected concepts of thermodynamics for atmospheric processes: The students learn the concept of the thermodynamic equilibrium and derive the Clausius-Clayperon equation from the first law of thermodynamics. This equation is central for the phase transitions in clouds.

Students also learn to use thermodynamic charts (tephigrams) and to identify cloud base, cloud top, available convective energy in radiosonde ascents. Atmospheric mixing processes are introduced as a basis for fog formation. The concept of an air parcel is used to understand convection.

Aerosol particles are introduced in terms of their physical properties and their role in cloud formation based on Köhler theory. Thereafter cloud microphysical processes including ice nucleation are discussed.

With these basics, the different forms of precipitation (convective vs. stratiform) are discussed and how they can be identified in radar images. Students will also learn under which conditions severe convective storms (especially supercells with tornados) can form.

The concepts are applied to understand and judge the validity of different proposed artificial weather modification ideas.

We offer a lab tour, in which we demonstrate how some of the processes discussed in the lectures are measured with instruments.

pdf-files of the revised book will be provided on moodle on a chapter-by-chapter basis.

There is a additional tutorial right after each lecture to give you the chance to ask further questions and discuss the exercises. The participation is recommended but voluntary.

**Abstract**

This seminar is designed for PhD students and PostDoc researchers involved in inter- or transdisciplinary research. It addresses and discusses challenges of this kind of research using scientific literature presenting case studies, concepts, theories, methods and by testing practical tools. It concludes with a 10-step approach to make participants’ research projects more societally relevant.

**Objective**

Participants know specific challenges of inter- and transdisciplinary research and can address them by applying practical tools. They can tackle questions like: how to integrate knowledge from different disciplines, how to engage with societal actors, or how to secure broader impact of research. They learn to critically reflect their own research project in its societal context and on their role as scientists.

**Content**

The seminar covers the following topics:
1. Theories and concepts of inter- and transdisciplinary research
2. The specific challenges of inter- and transdisciplinary research
3. Collaborating between different disciplines
4. Engaging with stakeholders
5. 10 steps to make participants’ research projects more societally relevant

Throughout the whole course, scientific literature will be read and discussed as well as practical tools explored in class to address concrete challenges.

**Literature**

Literature will be made available to the participants.

The following open access article builds a core element of the course:

Further, this collection of tools will be used:

https://naturalsciences.ch/topics/co-producing_knowledge
https://www.shapetoolkit.eu

**Prerequisites**

Participation in the course requires participants to be working on their own research project.

**Dates** (Wednesdays, 8h15-12h00)

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 151 of 2684
Abstract
In this seminar, the process of writing a scientific proposal will be introduced. The essential elements of a proposal, including the peer review process, will be outlined and class exercises will train scientific writing skills. Knowledge exchange between class participants is promoted through the preparation of a master thesis proposal and evaluation of each other's work.

Objective
Training scientific writing skills.

701-1211-02L Master's Seminar: Atmosphere and Climate 2

Abstract
In this seminar, scientific project management is introduced and applied to the master projects. The course concludes with a presentation of all projects including an overview of the scientific content and a discussion of project management techniques related to the master thesis.

Objective
Apply scientific project management techniques to your master project, practice the presentation of scientific results and how to chair other students' presentations and lead the discussion.

Content

701-1213-00L Introduction Course to Master Studies Atmosphere and Climate

Abstract
New master students are introduced to the atmospheric and climate research field through keynotes given by the programme's professors. In several self-assessment and networking workshops they get to know each other and obtain general information and guidance about the organisation of the MSc programme.

Objective
The aims of this course are i) to welcome all students to the master programme and to ETH, ii) to acquaint students with the faculty teaching in the field of atmospheric and climate science at ETH and at the University of Bern, iii) that the students get to know each other and iv) to assess needs and discuss options for training and eduction of soft-skills during the Master program and to give an overview of the study options in general.

Only students who fulfill the following criteria are allowed to begin with their master thesis:

a. successful completion of the bachelor programme;
b. fulfilling of any additional requirements necessary to gain admission to the master programme.

The master thesis is supervised by a professor of the D-EAPS or of the Institute for Atmosphere and Climate (IAC, D-USYS), a professor who teaches in the module subjects or a senior scientist who is on the list of "competent leaders of master theses" of the D-EAPS or of the D-USYS (associated with the IAC).

Abstract
The master programme will be completed by a master thesis on a topic selected from the subject range of the chosen major programme.

Objective
Students are to prove their skills in working autonomously on a scientific project.

Course Units for Additional Admission Requirements
The courses below are only available for MSc students with additional admission requirements.
Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Introduction of the most important components of the climate systems and their interactions.

Objective
Students have a basic understanding of the global energy balance, radiation budget, boundary layer, atmosphere, ocean, biosphere, land-surface coupling, cryosphere, carbon cycle, climate variability, climate of the past and anthropogenic climate change, and they are able to apply this to solve simple quantitative problems and answer qualitative questions.

Lecture notes
Copies of the slides are provided in electronic form.

Literature
A comprehensive list of references is provided in the class. Two books are particularly recommended:

Prerequisites / notice
Teaching: Reto Knutti, several keynotes to special topics by other professors
Course taught in German, slides in English

---

701-0471-AAL
Atmospheric Chemistry
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
This is a self-study course targeted at Master students who did not follow the bachelor course "atmospheric chemistry" or equivalent, providing a general introduction into atmospheric chemistry. It introduces the relevant fundamental concepts, which are explored in the context of key environmental issues, such as air pollution, stratospheric ozone depletion, and connections to climate change.

Objective
At the end of this course, students are able to:
1. describe the structure of the atmosphere and list atmospheric components and their main properties
2. define and describe the chemical and physical processes in the stratosphere and troposphere, follow reaction mechanisms, and apply rate laws
3. describe the physical and chemical principles of air pollution and summarize the most important legislative measures
4. discuss the local, regional, and global aspects of interactions between air quality, ecosystem health, and climate

Content
- Origin and properties of the atmosphere: composition (gases and aerosols), atmospheric structure, UV radiation, transport timescales
- Kinetics of gas phase reactions: rate laws, mechanisms of bimolecular and termolecular reactions.
- Stratospheric chemistry: Chapman cycle, catalytic ozone destruction cycles, polar ozone hole, Montreal protocol
- Tropospheric chemistry: oxidizing capacity of the troposphere and the role of OH, oxidation and global budgets of CO and CH4, role of NOx, and the global tropospheric O3 budget
- Surface ozone chemistry: HOx-NOx cycle, role of VOCs, O3 isopleth, ozone production efficiency
- Aerosols: primary and secondary sources, composition, quantities and measures, connections to climate
- Multiphase chemistry: solubility of gases, Raoult’s Law and hygroscopicity, kinetics of gas to particle transfer, N2O5 chemistry, aqueous phase sulfur chemistry, secondary organic aerosol formation
- Air quality: role of planetary boundary layer, deposition processes, summer- versus winter-smog, environmental problems, legislation, long-term trends
- Global aspects: air quality - climate interactions

Lecture notes
The slides, notes and exercises of the preceding edition of the bachelor course 701-0471-01L Atmospheric Chemistry will be provided.

Prerequisites / notice
Basic courses in chemistry and physics are expected

Competencies
Subject-specific Competencies
Concepts and Theories: assessed
Techniques and Technologies: fostered

Method-specific Competencies
Analytical Competencies: assessed
Problem-solving: assessed

Personal Competencies
Adaptability and Flexibility: fostered
Creative Thinking: assessed
Integrity and Work Ethics: fostered

701-0475-AAL
Atmospheric Physics
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
This course is a self-study course for MSc students, who like to learn something about Atmospheric Physics but for cannot follow the course Atmosphärenphysik, because that is taught in German. However, the slides and the textbook of the course Atmosphärenphysik, and they form the basis also for this course.

Objective
See entry under LV 701-0475-00L Atmosphärenphysik

Content
See entry under LV 701-0475-00L Atmosphärenphysik

Lecture notes
Powerpoint slides and script from LV 701-0475-00L Atmosphärenphysik will be made available

Literature

pdf-files of the revised book will be provided as well.

Abstract
The students learn about the dynamical features of the Earth's atmosphere. They interpret satellite imagery and learn about basic concepts in dynamical meteorology. The global circulation is briefly discussed, before introducing the Eulerian and the Lagrangian perspective, which are used to study air streams in extratropical cyclones and to investigate basic aspects in mountain meteorology.

Objective
The students are able to
- explain basic measurement and analysis techniques that are relevant in atmospheric dynamics
- to discuss the mathematical basics of atmospheric dynamics, based on selected atmospheric flow phenomena
- to explain the basic dynamics of the global circulation and of synoptic- and meso-scale flow features
- to explain how mountains influence the atmospheric flow on different scales
- basic understanding of the role of moist adiabatic processes for weather systems and why stable water isotopes are useful in this context

Content
Satellite observations; analysis of vertical soundings; geostrophic and thermal wind; cyclones at mid-latitude; global circulation; north-atlantic oscillation; atmospheric blocking situations; Eulerian and Lagrangian perspective; potential vorticity; Alpine dynamics (storms, orographic wind); planetary boundary layer

701-0106-AAL
Mathematics V: Applied Deepening of Mathematics I - III
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.
Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Selected mathematical topics are presented for later use in more specialised lectures. Part of the topics were already discussed in the lectures Mathematics I-III. Here, they should be shortly recapitulated and most importantly applied to practical problems. If necessary, new mathematical concepts and methods will be introduced in order to solve challenging and inspiring problems from practice.

Objective
The aim of this lecture is to prepare the students for the more specialised lectures. They should become more familiar with the mathematical background, the mathematical concepts and most of all with their application and interpretation.

Content
Practical examples from the following areas will be discussed: ordinary differential equations; eigenvalue problems from linear algebra; systems of linear and nonlinear differential equations; partial differential equations (diffusion, transport, waves).

701-0071-AAL
Mathematics III: Systems Analysis
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.
Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
The objective of the systems analysis course is to deepen and illustrate the mathematical concepts on the basis of a series of very concrete examples. Topics covered include: linear box models with one or several variables, non-linear box models with one or several variables, time-discrete models, and continuous models in time and space.

Objective
Learning and applying of concepts (models) and quantitative methods to address concrete problems of environmental relevance.
Understanding and applying the systems-analytic approach, i.e., Recognizing the core of the problem - simplification - quantitative approach - prediction.

Content
Introduction to principles of models; one-dimensional linear box models; multi-dimensional linear box models; nonlinear box models; models in space and time

Lecture notes
Teaching material: book (see literature).

Data: 06.08.2024 12:40 Autumn Semester 2024 Page 155 of 2684
Deepening the understanding of knowledge formation and learning processes of primary and secondary students from a cognitive and educational science perspective aims to familiarize students with forms of social cognition in humans, as well as the neural systems that support social cognition. Students learn more about the potential and challenges of pupils. They get to know the early stages of knowledge as well as the development of pre-concepts of students in their subject area. The seminar with a phase of cooperation consists of three phases: In the block seminar, pre-concepts are discussed in their own subject as well as theoretical inputs from developmental and cognitive psychology. During the cooperation phase, a teaching task defined by the primary and secondary school teachers is actively undertaken in a class. Finally, a final report is written, which contains a description of the students' level of knowledge. This seminar is only suitable for students who can adapt flexibly to the needs of pupils from lower class levels.

---

### 376-1309-00L Disorders of Social Cognition

**Enrolment possible with matriculation in**
- Master HST
- Teaching Diploma or Teaching Certificate

---

**Abstract**

In this seminar, we consider how the human brain processes social information. The approach focuses on exploring the neural bases of social cognition in healthy individuals, as well as providing case studies from atypical populations, whose pathologies are typified by dysfunction in social information processing, such as autism spectrum disorder and schizophrenia.

**Objective**

- To develop effective scientific communication skills in oral and written formats.

**Content**

This seminar will consider how the human brain understands and organizes social behaviour. The approach will focus on exploring the neural bases of social cognition in healthy individuals, as well as providing case studies from atypical populations, whose pathologies are typified by dysfunction in social information processing. Examples of such pathologies include autism spectrum disorder, schizophrenia, and attention deficit hyperactivity disorder. By examining healthy and atypical populations, this module will highlight how disorders of social cognition can inform the understanding of healthy brain function, as well as how understanding healthy brain function can inform disorders of social cognition.

---

### 871-0226-00L Effective Use of Visualisations for Learning

**Successful completion of the lecture "871-0240-00L Human Learning (EW1)"**

**Abstract**

**Objective**

Seminar participants learn how to examine visualizations for their pedagogical impact. They will learn how to assess when it is worth using visualizations, how many visualizations should be offered, and how they can be embedded in teaching materials to avoid misconceptions and promote learning.

**Content**

Visualizations are an integral part of STEM subjects. Visualizations can make learning content intuitively accessible. However, visualizations can also create misconceptions. For example, ball-and-stick models in chemistry can create the misconception that chemical bonds consist of static connections. In order to avoid such misconceptions, the seminar teaches effective instructional methods with visualizations. The seminar builds on theories from EW1. Practical exercises with various visualization methods (e.g. images, graphs, animations, simulations, interactive diagrams) will help seminar participants to create effective learning materials with visualizations for their own discipline.

Abstract
This course looks into scientific theories and also empirical studies on human learning and relates them to the school.

Objective
Anyone wishing to be a successful teacher must first of all understand the learning process. Against this background, theories and findings on the way humans process information and on human behaviour are prepared in such a manner that they can be used for planning and conducting lessons. Students additionally gain an understanding of what is going on in learning and behavioural research so that teachers are put in a position where they can further educate themselves in the field of research into teaching and learning.

Content

Thematische Schwerpunkte:
Lernen als Verhaltensänderung und als Informationsverarbeitung; Das menschliche Gedächtnis unter besonderer Berücksichtigung der Verarbeitung symbolischer Information; Lernen als Wissenskonstruktion und Kompetenzerwerb unter besonderer Berücksichtigung des Wissenstransfers; Lernen durch Instruktion und Erklärungen; Die Rolle von Emotion und Motivation beim Lernen; Interindividuelle Unterschiede in der Lernfähigkeit und ihre Ursachen; Intelligenztheorien, Geschlechtsunterschiede beim Lernen

Lernformen:

Lecture notes
Folien werden zur Verfügung gestellt.

Literature

Prerequisites / notice
This lecture is only apt for students who intend to enrol in the programs "Lehrdiplom" or "Didaktisches Zertifikat". It is about learning in childhood and adolescence.

871-0238-01L | Support and Diagnosis of Knowledge Acquisition Processes (EW3) | O    | 3    | 3S    | C. M. Thurn, S. Daguati

Abstract
In this seminar students learn advanced techniques to support and to diagnose knowledge acquisition processes in school.

Objective
The main goals are:
1. You have a deep understanding about the cognitive mechanisms of knowledge acquisition.
2. You have a basic understanding about psychological test theory and can appropriately administer tests.
3. You know various techniques of formative assessment and can apply these to uncover students’ misconceptions.

871-0242-01L | Coping with Psychosocial Demands of Teaching (EW4) | O    | 3    | 3S    | S. Maurer, P. Caprez, I. Sargenti

Abstract
This lecture is only apt for students who intend to enrol in the programs "Lehrdiplom" or "Didaktisches Zertifikat". It is about learning in childhood and adolescence.

Objective
The main goals are:
1. You have a basic understanding about the social mechanisms of knowledge acquisition.
2. You have a basic understanding about social psychological test theory and can appropriately administer tests.
3. You know various techniques of formative assessment and can apply these to uncover students’ misconceptions.
Abstract
Students learn and practice techniques and skills for coping with psychosocial demands of teaching.

Objective
Students possess theoretical knowledge and practical competences to be able to cope with the psychosocial demands of teaching.
(1) They know the basic rules of negotiation and conflict management (e.g., mediation) and can apply them in the school context (e.g., in conversations with parents).
(2) They can apply diverse techniques of classroom management (e.g., prevention of disciplinary problems in the classroom) and know relevant authorities for further information (e.g., legal conditions; crisis intervention).
(3) They know stress coping strategies to prevent burnout (e.g., psychosocial support) and are familiar with relevant institutions.

Content
Major themes:
- counseling and counseling techniques
- conflict management and mediation
- classroom management
- supporting students in a psychological crisis
- preventing stress and burnout

Forms of learning
Theoretical foundations will be taught in workshops which contain different means of activation and interaction such as group work, panel discussions, and individual work. Subsequently, this knowledge will be transferred and applied in different school-relevant situations by means of role plays, discussing cases and video sequences, as well as reflections of practical experiences.

Lecture notes
Slides of the lecturer’s presentations, supplementary materials, and materials for further reading are made available on Moodle.

Literature
Verschiedenen Grundlagen- und Anwendungstexte werden den Studierenden zur Verfügung gestellt.

Prerequisites / notice
Der erfolgreiche Abschluss von EW1 und EW2 stellt eine wünschenswerte, jedoch nicht obligatorische Voraussetzung dar.

Using Outdoor Education  ■  W  1 credit  1S  R. Schumacher, P. Faller

Abstract
In this seminar, future teachers will be trained to prepare and conduct excursions to out-of-school learning venues. For this purpose, excursions are offered at the Swiss Federal Institute for Forest, Snow and Landscape Research (WSL) in Birmensdorf.

Objective
Future teachers will learn to prepare and conduct excursions to out-of-school learning venues.

Content
Excursions at the Swiss Federal Institute for Forest, Snow and Landscape Research (WSL) in Birmensdorf:
- Dendrochronology: What annual rings tell
- Photosynthesis/Climate change: The tracks in the forest
- Forest Soil: The soil in the focus of the climate

Supervising and Assessing Matura Theses  ■  W  1 credit  1V  J. Maue

Prerequisites: successful participation in 871-0240-00L "Human Learning (EW1)"

Abstract
This course prepares prospective teachers to supervising and assessing scientific projects at upper secondary school level, particularly Matura theses in STEM subjects at Gymnasium.

Objective
1. Assessing the adequacy of Matura thesis topics and defining the scope of a project.
2. Determining and promoting a successful work process.
3. Devising and applying criteria for assessing process, product and presentation of a Matura thesis.

Prerequisites / notice
Focus on STEM subjects (biology, chemistry, computer science, mathematics, and physics) with no explicit discussion of geography or physical education.

Formation of Knowledge in STEM Fields in Primary and Secondary School  ■

Adresses to students enrolled either in Teaching Diploma* (TD) or Teaching Certificate (TC) (excluding Teaching Diploma Sport).

This course unit can only be enrolled after successful participation in the course 871-0240-00L "Human Learning (EW1)"

Abstract
Course promotes exchange between student teachers and elementary school teachers in STEM teaching with 3 parts: 1) block seminar (ca. 16 h), 2) collaboration with elementary school teacher in a class (ca. 34 h, with approx. 50% spent in the elementary or middle school class and ca. 50% for preparation), and 3) final report (ca. 10 h). Registration implies participation in all 3 parts.

Objective
Students learn more about the potential and challenges of pupils. They get to know the early stages of knowledge as well as the development of pre-concepts of students in their subject area. The seminar with a phase of cooperation consists of three phases: In the block seminar, pre-concepts are discussed in their own subject as well as theoretical inputs from developmental and cognitive psychology. During the cooperation phase, a teaching task defined by the primary and secondary school teachers is actively undertaken in a class. Finally, a final report is written, which contains a description of the students' level of knowledge. This seminar is only suitable for students who can adapt flexibly to the needs of pupils from lower class levels.

Prerequisites / notice
https://www.minterlink.ch/student

Competencies
- Subject-specific Competencies
  - Concepts and Theories: assessed
  - Analytical Competencies: assessed
  - Communication: assessed
  - Cooperation and Teamwork: assessed
  - Leadership and Responsibility: assessed
  - Sensitivity to Diversity: assessed

- Social Competencies
  - Adaptability and Flexibility: assessed
  - Creative Thinking: assessed
  - Critical Thinking: assessed
  - Self-awareness and Self-reflection: assessed

Disorders of Social Cognition  ■

Enrolment possible with matriculation in "Master HST"
- Teaching Diploma or Teaching Certificate ---

This course unit can only be enrolled after successful participation in, or during enrolment in the course "Human Learning (EW 1)"

!!! Teaching Diploma Sports: allocation of the ECTS only possible in the category "Educational Science" !!!

Abstract
In this seminar, we consider how the human brain processes social Information. The approach focuses on exploring the neural bases of social cognition in healthy individuals, as well as providing case studies of dysfunction in social information processing, such as autism spectrum disorder and schizophrenia.
Objective
- To familiarise students with forms of social cognition in humans, as well as the neural systems that support social cognition.
- To critically evaluate theories and data relating to Social Cognition and Social Neuroscience.
- To relate how knowledge of typical brain function can inform our understanding of individuals who process social information differently, and vice versa.
- To develop effective scientific communication skills in oral and written formats.

Content
This seminar will consider how the human brain understands and organises social behaviour. The approach will focus on exploring the neural bases of social cognition in healthy individuals, as well as providing case studies from atypical populations, whose pathologies are typified by dysfunction in social information processing. Examples of such pathologies include autism spectrum disorder, schizophrenia and attention deficit hyperactivity disorder. By examining healthy and atypical populations, this module will highlight how disorders of social cognition can inform the understanding of healthy brain function, as well as how understanding healthy brain function can inform disorders of social cognition.

871-0226-00L Effective Use of Visualisations for Learning

Objective
Successful completion of the lecture "871-0240-00L Human Learning (EW1)"

Abstract

Content
Seminar participants learn how to examine visualizations for their pedagogical impact. They will learn how to assess when it is worth using visualizations, how many visualizations should be offered, and how they can be embedded in teaching materials to avoid misconceptions and promote learning.

Competencies
Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: assessed
- Media and Digital Technologies: assessed
- Problem-solving: assessed
- Project Management: fostered

Social Competencies
- Communication: fostered
- Cooperation and Teamwork: fostered
- Self-presentation and Social Influence: assessed
- Sensitivity to Diversity: fostered

Personal Competencies
- Adaptability and Flexibility: fostered
- Creative Thinking: fostered
- Critical Thinking: fostered
- Integrity and Work Ethics: fostered
- Self-awareness and Self-reflection: fostered
- Self-direction and Self-management: fostered

Abstract
Enrolment only possible with Teaching Diploma matriculation.

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: 090LLB1 (ATTENTION: Students of Sport Teaching Diploma enroll in course 090LLB1S) Simultaneous enrolment in course "Lernende an der Berufsmaturitätsschule unterstützen und begleiten" (UZH Module Code: 090LLB2) is compulsory.

Mind the enrolment deadlines at UZH: https://www.uzh.ch/cmsssl/en/studies/application/deadline s.html (*Registering for studies at more than one university, Teaching Diplom*, Philosophische Fakultät)

Objective
- Students will be able to select subject content in their lessons based on vocational pedagogy, implement vocational pedagogical requirements for lesson design, incorporate interdisciplinary and cross-curricular approaches.
- Students are familiar with various forms and procedures of performance assessment and feedback as well as lesson design. They are able to implement them, taking into account the different contexts in which young people live and work.
- Students are familiar with the content and significance of basic principles such as the vocational baccalaureate ordinance or school curricula and concepts such as sustainability, lifelong learning or error culture. They can use these aspects for school and teaching development and work cooperatively within the college.

871-0237-02L Support and Accompany Learners at the Federal Vocational Baccalaureate School (UZH)

Objective
Successful completion of the lecture "871-0240-00L Human Learning (EW1)"
In this course, pedagogical processes are analyzed and learning and socialization processes are discussed using concrete case studies from teaching at vocational schools and vocational baccalaureate schools. The focus is on the supporting and encouraging role of the teacher and the consideration of the individual life and professional situations of the trainees in their heterogeneity.

**Abstract**
In this course, pedagogical processes are analyzed and learning and socialization processes are discussed using concrete case studies from teaching at vocational schools and vocational baccalaureate schools. The focus is on the supporting and encouraging role of the teacher and the consideration of the individual life and professional situations of the trainees in their heterogeneity.

**Objective**
- Students are familiar with a variety of approaches in the areas of individual support, internal differentiation, learning and problem-solving skills as well as constructive error and criticism culture. They are able to use them to promote learning.
- Students are aware of age- and development-typical problems of learners in education, can address them appropriately and involve counseling services and legal representation of young people appropriately.
- Students are able to relate their instructions to the students’ learning experiences in professional practice and to their various life and work contexts, and to incorporate them as a starting point for school-based and lifelong learning processes.
- Students can describe and explain the experience and behaviour of adolescents at school and the world of work from different perspectives.

**871-0226-00L** Effective Use of Visualisations for Learning

Successful completion of the lecture "871-0240-00L Human Learning (EW 1)"

**Abstract**

**Objective**
Seminar participants learn how to examine visualizations for their pedagogical impact. They will learn how to assess when it is worth using visualizations, how many visualizations should be offered, and how they can be embedded in teaching materials to avoid misconceptions and promote learning.

**Content**
Visualizations are an integral part of STEM subjects. Visualizations can make learning content intuitively accessible. However, visualizations can also create misconceptions. For example, ball-and-stick models in chemistry can create the misconception that chemical bonds consist of static connections. In order to avoid such misconceptions, the seminar teaches effective instructional methods with visualizations. The seminar builds on theories from EW1. Practical exercises with various visualization methods (e.g. images, graphs, animations, simulations, interactive diagrams) will help seminar participants to create effective learning materials with visualizations for their own discipline.

| 101-0700-00L | Programming for Engineers | O  | 4 credits | 2V+2U | B. Sudret, N. Lüthen |
| **Abstract** | This course is a hands-on introduction to programming with Matlab and Python, oriented at the needs of civil engineers. The course is held in a novel format comprising self-paced tutorials, a project consisting of implementing an engineering application including graphical user interface, and individual meetings with teaching assistants to demonstrate understanding and progress. | | | | |
| **Objective** | Students recognize the usefulness and power of computer tools in civil engineering, and are prepared to independently use Matlab or Python for solving relevant engineering problems. | | | | |
| | • Students are able to explain basic computer science concepts in simple terms. | | | | |
| | • Students are able to understand and explain the functionality of existing code. | | | | |
| | • Students are able to analyse a simple civil engineering problem in order to partition it into logical blocks and devise an algorithm to systematically solve the problem. | | | | |
| | • Students are able to implement simple imperative algorithms in Matlab and Python and explain the functionalities of their code. They are able to extend existing code with new functionalities. | | | | |
| | • Students are able to validate, test and debug their own code as well as existing code. | | | | |
| | • Students are able to explain the basics of object-oriented and interactive programming and are able to extend existing skeleton code to create simple graphical user interfaces. | | | | |

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 164 of 2684
The course is structured into six modules. The first five are using Matlab, while the last introduces Python.

1. Getting to know Matlab: Matlab as a calculator; variables and arrays
2. Programming basics I: iterating and branching
3. Programming basics II: input and output, functions, visualization
4. Introduction to scientific programming: implementing simple algorithms from numerics, statistics and discrete math; validation, testing and debugging
5. From structures to objects to GUI: basics of object-oriented programming, introduction to interactive programming and graphical user interfaces (GUI)

6. Introduction to programming with Python

Lecture notes
A script will be provided. The students will discover the topics of each module through E.Tutorials that they will follow at their own pace online.

Literature
Additional book (not mandatory):
Introduction to Civil Law

Complex numbers.
Mathematics as a tool to solve engineering problems. Mathematical formulation of technical and scientific problems.

There are 'Lecture Notes' (in German) for this course.

---

**851-0703-03L**  
Private Construction Law  
W  
2 credits  
T. Ender, E. Rüegg

**Abstract**
This class introduces to practice-relevant basics of construction and real estate law.

**Objective**
As future construction practitioners, students are able to recognise legal problems independently and in good time in their daily work and to initiate the right measures.

**Content**
Introduction (most important sources of construction and real estate law), SIA (Swiss Society of Engineers and Architects) Design Engineering Services Contract, SIA-Norm 118 (SIA General Terms and Conditions for Construction Services), liability of designers/civil engineers, construction insurance, property law for civil engineers, sale of land, contaminated sites, statutory mortgage for contractors, public procurement, litigation in construction and real estate, the civil engineer as expert, What else to know ...

**Lecture notes**
There are 'Lecture Notes' (in German) for this course.

---

**851-0709-00L**  
Introduction to Civil Law  
W  
2 credits  
H. Peter

**Abstract**
The course Private Law focuses on the Swiss Code of Obligations (contracts, torts) and on Property Law (ownership and easements). In addition, the course will provide a short overview of Civil Procedure and Enforcement.

**Objective**
Teaching of the principles of law, particularly private law. Introduction to law.

**Content**
Le cours de droit civil porte notamment sur le droit des obligations (droit des contrats et responsabilité civile) et sur les droits réels (propriété, gages et servitudes). De plus, il est donné un bref aperçu du droit de la procédure et de l'exécution forcée.

**Literature**
Editions officielles récentes des lois fédérales, en langue française (Code civil et Code des obligations) ou italienne (Codice civile e Codice delle obbligazioni), disponibles auprès de la plupart des librairies.

Sont indispensables:
- le Code civil et le Code des obligations;
- Sont conseillés:
  - Nef, Urs Ch., "Le droit des obligations à l'usage des ingénieurs et des architectes, trad. Bovay, J., éd. Payot, Lausanne
  - Boillon, J.-P.: Manuel de droit, éd Slatkine, Genève

**Prerequisites / notice**
Remarques
- Le cours de droit civil et le cours de droit public (2e sem.) sont l'équivalent des cours "Recht I" et "Recht II" en langue allemande et des exercices y relatifs.
- Les examens peuvent se faire en français ou en italien.
- Examens au 1er propédeutique; convient pour travail de semestre.
- Con riassunti in italiano. E possibile sostenere l’esame in italiano.

**Abstract**

We will model and solve scientific problems with partial differential equations. Differential equations which are important in applications will be classified and solved. Elliptic, parabolic and hyperbolic differential equations will be treated. The following mathematical tools will be introduced: Laplace and Fourier transforms, Fourier series, separation of variables, methods of characteristics.

**Objective**

Learning to model scientific problems using partial differential equations and developing a good command of the mathematical methods that can be applied to them. Knowing the formulation of important problems in science and engineering with a view toward civil engineering (when possible). Understanding the properties of the different types of partial differential equations arising in science and in engineering.

**Content**

- Classification of partial differential equations
- Study of the Heat equation general diffusion/parabolic problems using the following tools as an introduction to Fourier Series.
- Systematic treatment of the complex and real Fourier Series
- Study of the wave equation and general hyperbolic problems using Fourier Series, D'Alembert solution and the method of characteristics.
- Laplace transform and its uses to differential equations
- Study of the Laplace equation and general elliptic problems using similar tools and generalizations of Fourier series.
- Application of Laplace transform for beam theory will be discussed.

**Lecture notes**

Time permitting, we will introduce the Fourier transform.

**Literature**

- Large part of the material follows certain chapters of the following two books quite closely:

The course material is taken from the following sources:

- Stanley J. Farlow - Partial Differential Equations for Scientists and Engineers

**Prerequisites / notice**

Analysis I and II, insbesondere, gewöhnliche Differentialgleichungen.

**Abstract**

This course gives an overview of important concepts in classical dynamics, thermodynamics, electromagnetism, quantum physics, atomic physics, and special relativity. Emphasis is placed on demonstrating key phenomena using experiments, and in developing skills for quantitative problem solving.

**Objective**

The goal of this course is to make students able to explain and apply the basic principles and methodology of physics to problems of interest in modern science and engineering. An important component of this is learning how to solve new, complex problems by breaking them down into parts and applying simplifications. A secondary goal is to provide to students an overview of important subjects in both classical and modern physics.

**Content**

- Electrodynamics, Thermodynamics, Quantum physics, Waves and Oscillations, special relativity

**Lecture notes**

Lecture notes and exercise sheets will be distributed via Moodle

**Literature**

101-0203-01L  Hydraulics I  O  5 credits  3V+1U  R. Stocker
Abstract  The course teaches the basics of hydromechanics, relevant for civil and environmental engineers.
Objective  In the course “Hydraulics I”, the competency of process understanding is taught, applied and examined. Furthermore system understanding and measurement methods are taught.
Content  Properties of water, hydrostatics, stability of floating bodies, continuity, Euler equation of motion, Navier-Stokes equations, similarity, Bernoulli principle, momentum equation for finite volumes, potential flows, ideal fluids vs. real fluids, boundary layer, pipe flow, open channel flow, flow measurements, demonstration experiments in the lecture hall
Lecture notes  Script and collection of previous problems
Literature  Bollrich, Technische Hydromechanik 1, Verlag Bauwesen, Berlin

101-0113-00L  Theory of Structures I  O  5 credits  3V+2U  B. Sudret
Abstract  Introduction to structural mechanics, statically determinate beams and frame structures, trusses, stresses and deformations, statically indeterminate beams and frame structures (force method)
Objective  - Understanding the response of elastic beam and frame structures
- Ability to correctly apply the equilibrium conditions
- Understanding the basics of continuum mechanics
- Computation of stresses and deformations of elastic structures
- Ability to apply the force (flexibility) method for statically indeterminate structures
Content  - Equilibrium, reactions, static determinacy
- Internal forces (normal and shear forces, moments)
- Arches and cables
- Elastic trusses
- Influence lines
- Basics of continuum mechanics
- Stresses in elastic beams
- Deformations in Euler-Bernoulli and Timoshenko beams
- Energy theorems
- Statically indeterminate systems (Force method)
Lecture notes  Bruno Sudret, “Einführung in die Baustatik” (2021)
Literature  * Bruno Sudret, “Baustatik - Eine Einführung”, Springer Vieweg

151-0503-00L  Mechanics III  O  6 credits  4V+2U  D. Kochmann
Abstract  Dynamics of particles, rigid bodies, and deformable bodies: Motion of a single particle, motion of systems of particles, 2D and 3D motion of rigid bodies, vibrations, waves.
Objective  This course enables students to apply the concepts and laws governing the kinematics and kinetics of particles, rigid bodies, and elastic bodies in order to identify, formulate, and solve dynamical engineering problems. Specifically, students will be able to describe, analyze, and predict the motion of particles and bodies in space over time and to relate their motion to the applied forces for applications in (not only) mechanical and civil engineering.
Content

Students of mechanical and civil engineering learn the fundamental concepts of the dynamics of mechanical systems. By studying the motion of a single particle, systems of particles, of rigid bodies, and of deformable bodies, we introduce essential concepts such as kinematics, kinetics, work and energy, equations of motion, and forces and torques. Further topics include the stability of equilibria and vibrations as well as an introduction to the dynamics of deformable bodies and waves in elastic rods. Throughout the course, application-oriented examples help students acquire a proficient background in engineering dynamics, further to learn and embrace problem-solving techniques for dynamical engineering problems, gain cross-disciplinary expertise (by linking concepts from, among others, mechanics, mathematics, and physics), and prepare students for advanced courses and work on engineering applications. The detailed syllabus includes:

1. Motion of a single particle: kinematics (trajectory, velocity, acceleration), forces and torques, constraints, active and reaction forces, balance of linear and angular momentum, work-energy balance, conservative systems, equations of motion.
2. Motion of systems of particles: internal and external forces, balance of linear and angular momentum, work-energy balance, rigid systems of particles, particle collisions, mass accretion/loss.
3. Motion of rigid bodies in 2D and 3D: kinematics (angular velocity, velocity and acceleration transfer, instantaneous center and axis of rotation), balance of linear and angular momentum, work-energy balance, angular momentum transport, inertial vs. moving reference frames, apparent forces, Euler equations.
5. Introduction to waves and vibrations of elastic bodies: local form of linear momentum balance, waves in slender elastic rods.

Lecture notes

Lecture notes (a complete scriptum) is available on Moodle. Students are encouraged to take their own notes during class.

Literature

Lecture notes (a complete scriptum) is available on Moodle. Further reading materials are suggested but not required for this class.

Prerequisites / notice

For students in the bachelor's degree programme in mechanical engineering:

Precondition for this course unit are passed first year examination blocks A and B.

All course materials (including lecture notes, exercise problems, etc.) are available on Moodle.

Competencies

Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: assessed
- Media and Digital Technologies: fostered
- Problem-solving: assessed

Social Competencies
- Communication: fostered
- Cooperation and Teamwork: fostered
- Sensitivity to Diversity: fostered

Personal Competencies
- Adaptability and Flexibility: fostered
- Creative Thinking: fostered
- Critical Thinking: assessed
- Self-awareness and Self-reflection: fostered
- Self-direction and Self-management: fostered

Abstract

Objective

Die Studierenden erlernen in den Vorlesungen und in auf diese abgestimmten Laborübungen theoretische und praktische Kompetenzen für den werkstoffgerechten Einsatz und bewussten Umgang mit Baustoffen als wertvolle Ressourcen.
Content

Der Jahreskurs gliedert sich in 8 Module, die auf 2 Semester verteilt sind. Module umfassen Vorlesungen und dazugehörige Labore:

HS:

Modul 1: Physikalisches Verhalten von Materialien und ihre Charakterisierung:
L (3-4): Labore zu Bauphysik, zu Finite Elemente Methoden, bewertete Hausübung zu LCA und zur Analyse wissenschaftlicher Daten.

Modul 2: Zementöse Baustoffe:
L (3): Labore zu Betonmethodologie, Mineralische Bindemittel, Stein als Baumaterial, Mauerwerk und Mikrostruktur unterschiedlicher Baustoffe.

Modul 3: Amorphe Werkstoffe:

Modul 4: Digitale Fabrikation:
V (2): Methoden der digitalen Fabrikation und additiven Fertigung.
E (1): Exkursion Emersive Design Lab / HIB

FS:

Modul 5: Metalle und Korrosion:
L (3): Labore zu metallischen Werkstoffen, Dauerhaftigkeit von Stahlbetonbauten, detektieren und orten der Korrosion und digitaler Fabrikation.

Modul 6: Holz und Holzwerkstoffe:
L (2): Labore zu Holzmechanischen auf Makro- und Mikroskopischer Ebene.

Modul 7: Baustoffe im Computer:
V (3): Grundlagen der Materialsimulation, Mikromechanismen und Fallstudien zu Materialsimulationen für Baustoffe

Modul 8: Repetitorien:

Examination Block 3

Number Title Type ECTS Hours Lecturers
101-0315-00L Geotechnical Engineering O 5 credits 4G A. Puzrin

Abstract
The course explores the fundamental principles of Geomechanics and Geotechnical Engineering, with the following objectives:
- Recognition of the basic consequences of the ground construction;
- Understanding of the important fundamental concepts of Soil mechanics and Geotechnical Engineering;
- Independent analysis of the basic geotechnical problems.

Objective
The course explores the fundamental principles of Geomechanics and Geotechnical Engineering, with the following objectives:
- Recognition of the basic consequences of the ground construction;
- Understanding of the important fundamental concepts of Soil mechanics and Geotechnical Engineering;
- Independent analysis of the basic geotechnical problems.

Content
Overview of stability problems; Bearing capacity of shallow and deep foundations; Soil-foundation interaction; Analysis and design of shallow and deep foundations; Earth pressure on retaining structures; Analysis and design of retaining walls; Excavations: dewatering, analysis and design; Soil improvement; Safety considerations.

Lecture notes
Examples Exercises

Literature
Students will expand the knowledge acquired during "Steel Structures I" and learn how to apply these skills to the design of more complex structures. Slides, in English, are made available some days before each lecture.

Fostered
textbooks

- J.-P. Lebet, M. Hirt: Steel Bridges, Conceptual and Structural Design of Steel and Steel-Concrete Composite Bridges, EPFL Press

**Subject-specific Competencies**

- Public Transport and Railways
- Communication
- Lecture notes and slides. Worked Examples with summary of theory. Design aids and formula collections. Videos of lectures.

**Method-specific Competencies**

- Students will expand the knowledge acquired during "Steel Structures I" and learn how to apply these skills to the design of more complex structures. They will acquire the fundamental background for the phenomena of plate buckling and fatigue and learn how to apply it to practical design tasks. In addition, students will learn to appreciate the importance of questions of detailing, fabrication, erection and cost calculation for the effective design of steel and composite structures.

After completion of the year-long course in Steel Structures I+II, students will have at their disposal a wide and detailed set of skills concerning the modern practice for steel and composite structures design and have a deep understanding of its theoretical & scientific background. The examples of scientific and standardisation work provided in the lectures give the students the opportunity to learn about the most current developments and see how these are used to shape the future practice in the structural engineering field.

The lecture Steel Structures II complements the knowledge acquired in part I by providing students with additional theoretical and practical knowledge.

Content overview:

- Structural forms, analysis techniques and modelling of multi-storey buildings and bridges.
- Structural analysis (deformations, internal forces, stresses and strains) in steel-concrete composite girders considering the effects of creep, shrinkage and shear deformations.
- Elastic and plastic longitudinal shear transfer mechanisms and effects
- Plate buckling of unstiffened and stiffened panels
- Fatigue resistance and safe life assessment: phenomenon and design approaches
- Special topics of steel connection design
- Detailing, drafting, fabrication and erection, cost determination in constructional steelwork

**Literature**

- J.-P. Lebet, M. Hirt: Steel Bridges, Conceptual and Structural Design of Steel and Steel-Concrete Composite Bridges, EPFL Press
- Stahlbaukalender (various editions), Ernst & Sohn, Berlin
- References material books are provided in German and English (list disseminated at lecture), plus Skript Bahninfrastruktur; System- und Netzplanung

101-0135-01L 3 credits 2G F. Corman

**Abstract**

Fundamentals of public and collective transport, in its different forms. Categorization of performance dimensions of public transport systems, and their implications to their design and operations.

**Objective**

Teaches the basic principles of public transport network and topology design, to understand the main characteristics and differences of public transport networks, based on buses, railways, or other technologies.

Teaches students to recognize the interactions between the infrastructure design and the production processes, and various performance criteria based on various perspective and stakeholders.

At the end of this course, students can critically analyze existing networks of public transport, their design and use; consider and substantiate different choices of technologies to suitable cases; optimize the use of resources in public transport.

**Content**

Infrastructure: Planning processes and decision levels in network development and infrastructure planning, planning of topologies; tracks and roadways, station infrastructures; Fundamentals of the infrastructure design for lines; track geometries; switches and crossings

Vehicles: Classification, design and suitability for different goals

Network design: design dilemmas, conceptual models for passenger transport on long distance, urban regional transport.

Operations: Passenger/Supply requirements for line operations; timetabling, measures of realized operations, capacity

Lecture notes

Slides, in English, are made available some days before each lecture.

Literature

Reference material books are provided in German and English (list disseminated at lecture), plus Skript Bahninfrastruktur; System- und Netzplanung
Analytical Competencies

• Systems Engineering is a way of thinking that helps engineer sustainable systems, i.e., ones that meet the needs of stakeholders in the short, medium and long term.

• This course provides an overview of the main principles of Systems Engineering, and includes an introduction to the use of operations research methods in the determination of optimal systems.

2G

The lectures are structured as follows:

O

11. How sensitivity analysis is conducted using linear programming.

12. How to use operations research to solve problems that consist of discrete values, as well as how to exploit the structure of networks to find optimal solutions to network problems.

13. How to set up and solve problems when there are multiple objectives.

The objective of this course is to ensure the best possible decision making when engineering sustainable systems, i.e., ones that meet the needs of stakeholders in the short, medium and long term. In this course, you will learn the main principles of Systems Engineering that can help you from the first idea that a system may not meet expectations, to the quantitative and qualitative evaluation of possible system modifications. Additionally, the course includes an introduction to the use of operations research methods in the determination of optimal solutions in complex systems.

More specifically upon completion of the course, you will have gained insight into:

1. Introduction – An introduction to System Engineering, a way of thinking that helps to engineer sustainable systems, i.e. ones that meet the needs of stakeholders in the short, medium and long terms. A high-level overview of the main principles of System Engineering. The expectations of your efforts throughout the semester.

2. Situation analysis – How to structure the large amount of information that is often associated with attempting to modify complex systems.

3. Goals and constraints – How to set goals and constraints to identify the best solutions as clearly as possible.

4. Generation of possible solutions – How to generate possible solutions to problems, considering multiple stakeholders.

5. The principles of net-benefit maximization and a series of methods that range from qualitative and approximate to quantitative and exact, including pairwise comparison, elimination, weighting, and expected value.

6. The idea behind the supply and demand curves and revealed preference methods.

7. The concept of equivalence, including the time value of money, interest, life times and terminal values.

8. The relationship between net-benefit and the benefit-cost ratio. How incremental cost benefit analysis can be used to determine the maximum net benefit. Internal rates of return.

9. How to consider multiple possible futures and use simple rules to help pick optimal solutions and to determine the value of more information.

10. Once quantitative analysis is used it becomes possible to use operations research methods to analyse large numbers of possible solutions. Linear programming and the simplex method.

11. How sensitivity analysis is conducted using linear programming.

12. How to use operations research to solve problems that consist of discrete values, as well as how to exploit the structure of networks to find optimal solutions to network problems.

13. How to set up and solve problems when there are multiple objectives.

The course uses a combination of qualitative and quantitative approaches.

Lecture notes

• The lecture materials consist of a script, the slides, example calculations in Excel, Moodle quizzes, and exercises.

• The lecture materials will be distributed via Moodle before each lecture.

Literature

Appropriate literature in addition to the lecture materials will be handed out when required via Moodle.
The course introduces the students to engineering hydrology. It covers first physical hydrology, that is the description and the measurement of hydrological processes (precipitation, interception, evapotranspiration, runoff, erosion, and snow), and it introduces then the basic mathematical models of the single processes and of the rainfall-runoff transformation, thereby including flood analysis.

Prerequisites / notice
Knowledge of statistics is a prerequisite. The required theoretical background, which is needed for understanding part of the lectures and performing part of the assignments, may be summarised as follows:
- Elementary data processing: hydrological measurements and data, data visualisation (graphical representation and numerical parameters).
- Frequency analysis: hydrological data as random variables, return period, frequency factor, probability paper, probability distribution fitting, parametric and non-parametric tests, parameter estimation.

102-0293-00L Hydrology

Lecture notes
The lecture notes as well as the lecture presentations and handouts may be downloaded from the website of the Chair of Hydrology and Water Resources Management.

Literature

Prerequisites / notice

Abstract:
A structure to be designed serves as a mean to practice the holistic approach of conceptual design by working in parallel and iteratively on different levels of detailing. Both, requirements and scope of action, are identified by the students and serve as basis for a solution. The task group organizes itself to solve complex tasks.

Objective:
The project work conceptual design conveys a first insight into the holistic approach to cope with typical tasks of civil engineering and introduces professional techniques of civil engineering to students. A further aim is to consolidate the knowledge gained so far in bachelor courses, to link different domains and to fill gaps with respect to work techniques. The students analyse the inventory, formulate design requirements and boundary conditions, elaborate approaches and proposals for solutions, dimension some exemplary structural elements, practise detailing and document their work by different media.

Content:
Topics:
- Basics of graphic representation, Acceptance of service, Analysis of third-party documents, site survey, Conceptual design, service criteria agreement, technical specification, connections, strcutural analyesy, Quantitites and costs, Models

Methodology:
- Excursion with mission, lectures, autonomous work, role playing, presentations, deliveries, final presentation, exhibition.

Abstract:
The Bachelor Programme concludes with the Bachelor Thesis. This project is supervised by a professor. Writing up the Bachelor Thesis encourages students to show independence and to produce scientifically structured work and to apply engineering working methods.

Objective:
- The contents base upon the fundamentals of the Bachelor Programme. Students can choose from different subjects and tasks. The thesis consists of both a written report and an oral presentation.

**Abstract**
This course is designed to lay down the foundation of the different concepts, techniques, and tools for successful project management of construction projects.

**Objective**
The goal is that at the end of this course students should have a good understanding of the different project management knowledge areas, the phases required for successful project management, and the role of a project manager. To demonstrate this, students will work in groups in different case studies to apply the concepts, tools and techniques presented in the class.

Two 3 to 4 hours sessions towards the end of the lecture series will introduce a practical project to allow the teams to demonstrate the tools and techniques learned during the semester.
The course will have a final quiz that will be graded.

The course will be supported by several external lecturers from the construction industry and demonstrations of real-life case studies.

**Content**
The main content of the course is summarized in the following topics:

- Introduction, project and organization structures
- Project scheduling
- Resource management
- Risk management
- Project estimating and budgeting
- Project financing and Public-Private Partnerships (PPP)
- Construction Process management and controlling
- Sustainability management
- Reporting and Communication
- Interpersonal skills and leadership in Construction projects
- Advanced Topics in Construction Project management (BIM / 5D planning, Ki)
- Project Evaluation and Closure

**Lecture notes**
The slides for the class will be available for download from Moodle at least one day before each class. Copies of all necessary documents will be distributed at appropriate times.

**Literature**
Relevant readings will be recommended throughout the course (and made available to the students via Moodle).

**Prerequisites / notice**
The students will be randomly assigned to teams. Students will be graded as a team based on the final Project proposal with the in-class oral presentation as well as a final exam (50% exam and 50% project). Homework will not be graded but your final report and presentation will consist mostly of your homework assignments consolidated and put in a report and presentation format.

**Abstract**
Principles of heat and mass transport, hygro-thermal performance, durability of the building envelope and interaction with indoor and outdoor climates, applications.

**Objective**
The students will acquire in the following fields:
- Indoor and outdoor climate and driving forces.
- Hygrothermal properties of building materials.
- Building envelope solutions and their construction.
- Hygrothermal performance and durability.

**Content**
Principles of heat and mass transport, hygro-thermal performance, durability of the building envelope and interaction with indoor and outdoor climates, applications.

**Lecture notes**
Handouts, supporting material and exercises are provided online via Moodle.

**Prerequisites / notice**
Priority will be given to students in Integrated Building Systems Master (MIBS).

Design and Building Process MIBS is a brief manual for prospective architects and engineers covering the competences and the responsibilities of all involved parties through the design and building process. Lectures on six compact aspects gaining importance in an increasingly specialised, complex and international surrounding.

Participants will come to understand how they can best navigate the design and building process, especially in relation to understanding their profession, gaining a thorough knowledge of rules and regulations, as well as understanding how involved parties’ minds work. They will also have the opportunity to investigate ways in which they can relate to, understand, and best respond to their clients’ wants and needs. Finally, course participants will come to appreciate the various tools and instruments, which are available to them when implementing their projects. The course will guide the participants, bringing the individual pieces of knowledge into a superordinate relationship.

Design and Building Process MIBS is a brief manual for prospective architects and engineers covering the competencies and the responsibilities of involved parties through the design and building process. Three compact chapters regarding the established building culture are gaining importance in an increasingly specialised, complex and international surrounding. Lectures on the topics of competence, organisation, agility, monitoring, interest, and the environment will guide the participants, bringing the individual pieces of knowledge into a superordinate relationship. The course introduces the key figures, depicts the criteria of the project and highlights the proved services of the consultants. In addition to discussing the basics, the terminologies and the tendencies, the lecture units will refer to the studios as well as the practice: Teaching-based workshops will compliment and deepen the understanding of the three selected aspects of profession, methodology, and environment. The course is presented as a moderated seminar to allow students the opportunity for individual input: active collaboration between the students and their tutor therefore required.

Public Transport Design and Operations

This course aims at analyzing, designing, improving public transport systems, as part of the overall transport system. Public transport is a key driver for making our cities more livable, clean and accessible, providing safe, and sustainable travel options for millions of people around the globe. Proper planning of public transport system also ensures that the system is competitive in terms of speed and cost. Public transport is a crucial asset, whose social, economic and environmental benefits extend beyond those who use it regularly; it reduces the amount of cars and road infrastructure in cities; reduces injuries and fatalities associated to car accidents, and gives transport accessibility to very large demographic groups.

Goal of the class is to understand the main characteristics and differences of public transport networks. Their various performance criteria based on various perspective and stakeholders. The most relevant decision making problems in a planning tactical and operational point of view

At the end of this course, students can critically analyze existing networks of public transport, their design and use; consider and substantiate possible improvements to existing networks of public transport and the management of those networks; optimize the use of resources in public transport.

General structure:
general introduction of transport, modes, technologies,
system design and line planning for different situations,
mathematical models for design and line planning
timetabling and tactical planning, and related mathematical approaches
operations, and quantitative support to operational problems,
evaluation of public transport systems.

Basics for line transport systems and networks
Passenger/Supply requirements for line operations
Objectives of system and network planning, from different perspectives and users, design dilemmas
Conceptual concepts for passenger transport: long-distance, urban transport, regional, local transport
Planning process, from demand evaluation to line planning to timetables to operations
Matching demand and modes
Line planning techniques
Timetabling principles
Allocation of resources
Management of operations
Measures of realized operations
Improvements of existing services

Lecture notes
Lecture slides are provided.
The objective of this course is to provide an overview of the infrastructure management process. The high-level process can be used as a starting point to ensure that infrastructure management is done professionally, efficiently and effectively. This process can be used to help improve the specific infrastructure management processes in the organisations.

More specifically upon completion of the course, students had their first experience with
- defining the service to be provided by infrastructure,
- developing and evaluating asset strategies, and converting them into programs / project portfolios
- establishing a monitoring program for an infrastructure system, and
- establishing basic rules and principles to ensure an infrastructure management organisation is running well.

Infrastructure management is the process that ensures infrastructure provides desired service over time. This course provides an overview of the process and insight into some of the most important parts, i.e., defining service, justifying interventions, monitoring the infrastructure system, and ensuring a well-functioning infrastructure management organisation.

The weekly lectures are structured as follows:
1. Introduction: An introduction to infrastructure management and the project.
2. Service: Determination of what service you are trying to provide with an infrastructure network is important in justifying the interventions you think are required and ensuring that investment decisions are aligned throughout an infrastructure management organisation. This lecture introduces the concept of serve and connects it to measurable indicators.
3. Help session 1: This session provides time for your group to ask questions as you define the service you want your infrastructure network to provide.
4. Presentation 1: 4 groups will present their ideas on how they want their networks to provide service.
5. Interventions: Justifying the interventions you want to execute to ensure you continue to provide the defined service requires you to model deterioration, determining economically justifiable strategies and explain which interventions will be postponed if you can't do all you would like. This lecture is focused on explaining the main principles behind each of these concepts.
6. Help session 2: This session provides time for your group to ask questions as you justify the interventions you want to execute on your infrastructure network over time and explain what you will postpone if you can't do all of them.
7. Presentation 2: 4 groups will present how they have justified interventions and how they have selected the ones they would like to postpone if required.
8. Monitoring: To ensure you the infrastructure network is providing what you expect you need to monitor its performance and how projects are being done. This lecture is focused on the principles to ensure a monitoring system is set up that ensure that the infrastructure system is providing the expected service.
9. Help session 3: This session provides time for your group to ask questions on how to establish the monitoring systems for your infrastructure networks.
10. Presentation 3: 4 groups will present how they intended to monitor their systems and projects.
11. Organisation: Managing infrastructure only works well with great teams of people with great processes. This lecture focuses on the principles of ensuring a well-functioning organisation and well-functioning processes.
12. Help session 4: This session provides time for your group to ask questions on how to ensure well-functioning organisations and well-functioning processes.
13. Presentation 4: 4 groups will present how they intended to ensure well-functioning organisations and well-functioning processes.

- The lecture materials consist of handouts and the slides.
- The lecture materials will be distributed via Moodle by the beginning of each lecture.
- The questions to be discussed in the discussion session will be distributed by the end of the day on the Monday before the discussion session.
Literature
Appropriate literature will be handed out when required via Moodle.

Prerequisites / notice
This course has no prerequisites.

101-0577-00L An Introduction to Sustainable Development in the Built Environment

Abstract
In 2015, the UN Conference in Paris shaped future world objectives to tackle climate change. This decarbonization strategy is additional to Sustainable Development goals formulated the same year by the UN general assembly.

Objective
At the end of the semester, the students have an understanding of the term of sustainable development, its history, the current political and scientific discourses and its relevance for our built environment.

In order to address current challenges of climate change mitigation and resource depletion, students will learn a holistic approach of sustainable development. Ecological, economical and social constraints will be presented and students will learn about methods for argumentation and tools for assessment (i.e. life cycle assessment).

For this purpose an overview of sustainable development is presented with an introduction to the history of sustainability and its today definition as well as the role of cities, urbanisation and material resources (i.e. energy, construction material) in social economic and environmental aspects.

The course aims to promote an integral view and understanding of sustainability and describing different spheres (social/cultural, ecological, economical, and institutional) that influence our built environment.

Students will acquire critical knowledge and understand the role of involved stakeholders, their motivations and constraints, learn how to evaluate challenges, identify deficits and define strategies to promote a more sustainable construction.

After the course students should be able to define the relevance of specific local, regional or territorial aspects to achieve coherent and applicable solutions toward sustainable development.

The course offers an environmental, socio-economic and socio-technical perspective focussing on buildings, cities and their transition to resilience with sustainable development. Students will learn on theory and application of current scientific pathways towards sustainable development.

Content
The following topics give an overview of the themes that are to be worked on during the lecture.

- Overview on the history and emergence of sustainable development
- Overview on the current understanding and definition of sustainable development and beyond

Methods
- Method 1: Life cycle assessment (planning, construction, operation/use, deconstruction)
- Method 2: Life Cycle Costing
- Method 3: Labels and certification
- Method 4: Material Flow Analysis

Main issues:
- Operation energy at building, urban and national scale
- Mobility and density questions
- Embodied energy for developing and developed world

- Synthesis: Transition to sustainable development

Lecture notes
All relevant information will be online available before the lectures. For each lecture slides of the lecture will be provided.

Literature
A list of the basic literature will be offered on a specific online platform, that could be used by all students attending the lectures.

Abstract
Basic aspects of design and analysis of underground structures. Conventional tunnel construction methods. Auxiliary measures (ground improvement and drainage, forepoling, face reinforcement). Numerical analysis methods.

Objective
Basic aspects of design and analysis of underground structures. Conventional tunnel construction methods. Auxiliary measures (ground improvement and drainage, forepoling, face reinforcement). Numerical analysis methods.

Content
Numerical analysis methods in tunnelling. Conventional excavation methods (full face, top heading and bench, side drift method, ...) Auxiliary measures:
- Injections
- Jet grouting
- Ground freezing
- Drainage
- Forepoling
- Face reinforcement

Prerequisites / notice
This course will continue to be offered in German up to and including HS24.

Competencies

Subject-specific Competencies
Concepts and Theories assessed
Techniques and Technologies fostered

Method-specific Competencies
Analytical Competencies assessed
Decision-making assessed

Theoretical and Experimental Soil Mechanics

Prerequisites: Mechanics I, II and III.

The number of participants is limited to 60 due to the existing laboratory equipment! Students with major in Geotechnical Engineering have priority. Registrations will be accepted in the order they are received.

Abstract
Overview of soil behaviour
Explanation of typical applications: reality, modelling, lab tests with transfer of results to practical examples
Consolidation theory and typical applications
Triaxial tests: consolidation & shear, drained & undrained response
Plasticity theory & Critical State Soil Mechanics, Cam Clay
Application of plasticity theory
Introduction to physical modelling

Objective
(1) Extend knowledge of theoretical approaches that can be used to describe soil behaviour.
(2) Offer the opportunity to perform hands on element tests required for constitutive model calibration.
(3) Enable students to select an appropriate constitutive model and calibrate it using element test performed in the lab.
(4) Enable students to carry out FE analyses for realistic geotechnical applications.

Content
Overview of soil behaviour
Discussion of general gaps between basic theory and soil response
Stress paths in practice & in laboratory tests
Explanation of typical applications: reality, modelling, laboratory tests with transfer of results to the practical examples
Consolidation theory for incremental and continuous loading oedometer tests and typical applications in practice
Triaxial & direct shear tests: consolidation & shear, drained & undrained response
Plasticity theory & Critical State Soil Mechanics, Cam Clay
Application of plasticity theory
Introduction to physical modelling with emphasis on centrifuge modelling

Prerequisites / notice
Pre-requisites: Fundamental knowledge of solid and soil mechanics.

The theoretical part of the course will be covered by problem-based lectures. The experimental part will be covered by hands-on element tests performed by the students in the laboratory. These experimental results will be instrumental in the calibration of advanced soil constitutive models. The connection between the experimental and theoretical parts of the course will be facilitated by means of numerical investigations (i.e, FE analyses), including the selection and calibration of relevant constitutive models. The numerical investigations shall be documented by the students in a final report.

Laboratory equipment will be available for 60 students. Students registered for the Geotechnics Specialty in Masters will be given priority as follows: (1) 2nd year students; (2) 1st year students, (3) doctoral students taking the class for their qualifying exam; Further students will be admitted on a first-come-first-served basis.

Design and Construction in Geotechnical Engineering

Abstract
This lecture deals with the practical application of the knowledge gained in the fundamental lectures from the Bachelor degree. The basics of planning and design of geotechnical structures will be taught for the main topics geotechnical engineers are faced to in practice.

Objective
Transfer of the fundamental knowledge taught in the Bachelor degree to practical application.
Ability to plan and design geotechnical structures based on the state of the art.

Content
Introduction to Swisscode SIA
Foundations and settlements
Pile foundations
Excavations
Slopes
Soil nailing
Reinforced geosystems
Ground improvement
River levees

Lecture notes
Script in the form of chapters and powerpoint overheads with web support (moodle-app2.let.ethz.ch)
Exercises

Literature
Relevant literature will be stated during the lectures

Prerequisites / notice
Pre-condition: Successful examinations (pass) in the geotechnical studies (soil mechanics and ground engineering, each 5 credits) in the Bachelor degree of Civil Engineering (ETH), or equivalent for new students.
The lecture contains at least one presentation from practice.

Competencies
Subject-specific Competencies

101-0369-00L Forensic Geotechnical Engineering W 3 credits 2G A. Puzrin
Prequisites: successful participation in "Geotechnical Engineering" (101-0315-00L) or an equivalent course.

Abstract
In this course selected famous geotechnical failures are investigated with the following purpose: (a) to deepen understanding of the geotechnical risks and possible solutions; (b) to practice design and analysis methods; (c) to learn the techniques for investigation of failures; (d) to learn the techniques for mitigation of the failure damage.

Objective
In this course selected famous geotechnical failures are investigated with the following purpose: (a) to deepen understanding of the geotechnical risks and possible solutions; (b) to practice design and analysis methods; (c) to learn the techniques for investigation of failures; (d) to learn the techniques for mitigation of the failure damage.

Content
Failure due to the loading history
Failure due to excessive settlements
Failure due to the leaning instability
Bearing capacity failure
Excavation failure
Failure in the creeping landslides
Failure evolution in submarine landslides
Construction in the landslide influence zone
Delayed failure in snow avalanches

Lecture notes
Lecture notes
Exercises

Literature

Prerequisites / notice
The course is given in the first MSc semester.
Prerequisite: Basic knowledge in Geotechnical Engineering (Course content of "Grundbau" or similar lecture).
Granular Mechanics

This course aims to provide a basic understanding of the mechanics and rheology of granular matter. It includes fundamental concepts as well as recent progress in research with main focus on related engineering and natural hazards applications. Small experiments are performed in class to illustrate important processes and state-of-the-art numerical modeling tools are introduced and used.

After this class, the students should know how to describe inter-particle interactions at the grain scale, the statics of granular materials, the transition towards fluid states through classical frictional plastic laws and the rheology of granular flows. Furthermore, the students should know the basics of the Discrete Element Method (DEM), its advantage and limitations and should be able to use a commercial software for different types of application.

This course covers grain-scale interactions, statics and rheology of granular materials based on a mix between classical lectures, on-board developments, presentation of small experiments, analytical and numerical exercises. We present the domains of application of granular mechanics through examples taken from the industry or research. In addition, the Discrete Element Method (DEM) together with state-of-the-art contact models will be presented and used to simulate standard tests such as the granular column collapse, shear flows but also more complex industrial or geophysical problems. Calibration of model parameters based on laboratory experiments will be discussed. The course will not cover aspects related to granular gasses and kinetic theory.

Lecture slides and lecture notes will be provided on Moodle.

1. Granular Media: Between Fluid and Solid by Bruno Andreotti, Olivier Pouliquen, and Yoël Forterre
2. Particulate Discrete Element Modelling: A Geomechanics Perspective by Catherine O'Sullivan

Basic knowledge of physics, mechanics and soil mechanics is required.

This course focuses on the axial, shear, bending and torsion load-deformation response of continuous elastic prismatic structural elements such as rods, beams, shear walls, frames, arches, cables and rings, and structures that contain such elements. Additional special topics may be addressed time-permitting.

After passing this course students will be able to:
1. Explain the equilibrium of continuous structural elements.
2. Formulate mechanical models of continuous prismatic structural elements.
3. Analyze the axial, shear, bending and torsion load-deformation response of prismatic structural elements and structures assembled using these elements.
4. Determine the state of forces and deformations in rods, beams, frame structures, arches, cables and rings under combined mechanical and thermal loading.
5. Use the theory of continuous structures to design structures and understand the basis for structural design code provisions.

This is the third course in the ETH series on theory of structures. Building on the material covered in previous courses, this course focuses on the axial, shear, bending and torsion load-deformation response of continuous elastic prismatic structural elements such as rods, beams, shear walls, frames, arches, cables and rings, and structures assembled using such elements. Additional special topics, such as the behavior of inelastic prismatic structural elements or the behavior of planar structural elements and structures may be addressed if time permits. The course provides the theoretical background and engineering guidelines for practical structural analysis of modern structures.

Electronic copies of the learning material will be managed using Moodle. The learning material includes the lecture presentations, additional reading, and exercise problems and solutions. Lectures are streamed live and recorded on the ETH Video Portal.

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 181 of 2684
Literature

Prerequisites / notice
Working knowledge of theory of structures, as covered in ETH course Theory of Structures I (Baustatik I) and Theory of Structures II (Baustatik II), and ability to solve ordinary differential equations. Basic knowledge of structural design of reinforced concrete, steel or wood structures. Familiarity with structural analysis computer software and computer tools such as Python, Matlab, Mathematica, Mathcad or Excel.

Self-awareness and Self-reflection assessed
Self-direction and Self-management assessed

Prerequisites / notice
Students are assumed to be proficient in the material taught in the following courses offered in the BSc in Civil Engineering at ETH Zurich (or have acquired equivalent knowledge elsewhere):
- Theory of structures I+II
- Structural Concrete I+II (incl. prestressed concrete)

101-0127-00L Advanced Structural Concrete O 4 credits 2G L. Gebhard, S. Häfliger

Abstract
This course supplements the courses Structural Concrete I and II regarding the analysis and dimensioning of reinforced and prestressed concrete structures. It focuses on limit analysis methods for walls, beams, slabs and shells, particularly regarding their applicability to the safety assessment of existing structures and their computer-aided implementation.

Objective
Within this course, the students are able to:
- deepen their understanding of structural concrete models and apply them to general design problems, including the assessment of existing structures.
- enhance their knowledge about the load-deformation response of reinforced and prestressed concrete structures.
- identify and assess the limits of applicability of limit analysis methods.
- recognise the assumptions of models suitable for computer-aided structural design and use in a critical way structural concrete design software.
- evaluate the long-term behaviour and the behaviour under fire conditions of concrete structures.
- assess the behaviour of fibre reinforced concrete structures.

Content
Fundamentals (structural analysis, theorems of limit analysis, applicability of limit analysis methods); walls and beams (stress fields and strut-and-tie models, compatibility and deformation capacity, membrane elements with yield conditions and load-deformation behaviour, computer-aided structural design); slabs (equilibrium solutions, yield conditions, shear and punching shear, sustainability); long term effects; steel fibre reinforced concrete (mechanical behaviour, applications); fire behaviour.

Literature

101-0137-00L Steel Structures III: Advanced Steel and Composite Structures O 4 credits 2G A. Taras

Abstract
Expand the theoretical background and practical knowledge in the design of steel and composite structures. Special composite construction and detailing; partial connection, serviceability. Fire design. Cold-formed steel design. Crane girders; masts; tanks & silos. Structural glazing and lightweight cable-supported structures.
Objectives: Engineers are confronted every day to decision making under limited amount of information and uncertain conditions. When designing new structures, students will be able to:

- Structural reliability aims at quantifying the probability of failure of systems due to uncertainties in their design, manufacturing and environmental conditions. Risk analysis combines this information with the consequences of failure in view of optimal decision making. The course presents the underlying probabilistic modelling and computational methods for reliability and risk assessment.

- The course also includes a tutorial using the UQLab software dedicated to real world structural reliability analysis.

- The course also includes a tutorial using the UQLab software dedicated to real world structural reliability analysis.

- Steel Structures III provides in-depth theoretical background and practical knowledge on advanced design topics in steel and composite structures. The focus of the course lies on design tasks and solutions in modern, multi-storey, steel-framed buildings driven by architectural needs, as well as on certain special fields of application of steel structures. The course discusses the use and design of long-span slim-floor girders and ultra-slimmer composite columns, or the use of glazing and cable structures as principal load-carrying components. The design of steel structures subjected to elevated temperatures (fire conditions) is treated, as well as special topics of design for serviceability. In addition, fundamental concepts of the design of cold-formed steel framed structures are discussed. Finally, the course will give an overview on the design of specialty steel structures, such as crane girders, masts and storage tanks.

- The examples of scientific and standardisation work provided in the lectures give the students the opportunity to learn about some current developments and see how these are used to shape the future practice in the structural engineering field.

| Objective   | After successful completion of this course the students will be able to:  
1. Explain the dynamic equilibrium of structures under dynamic loading.  
2. Use second-order differential equations to theoretically and numerically model the dynamic equilibrium of structural systems.  
4. Compute the dynamic response of structural system to harmonic, periodic, pulse, and impulse excitation using time-history and response-spectrum methods.  
5. Use dynamics of structures to identify the basis for structural design code provisions related to dynamic loading. |
| Content     | This is a course on structural dynamics, an extension of structural analysis for loads that induce significant inertial forces and vibratory response of structures. Dynamic responses of elastic and inelastic single-degree-of-freedom and multiple-degree-of-freedom structural systems subjected to harmonic, periodic, pulse, and impulse excitation are discussed. Theoretical background and engineering guidelines for practical solutions to vibration problems in flexible structures caused by humans, machinery, wind or explosions are presented. |
| Lecture notes | The class will be taught mainly on the blackboard. Accompanying electronic material will be uploaded to ILIAS and available through myStudies. |

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 183 of 2684
Fibre Reinforced Polymer (FRP) composites are increasingly being used in civil infrastructure applications, such as reinforcing rods, tendons and FRP profiles as well as wraps for seismic upgrading of columns and repair of deteriorated structures. The objective of this course is on one hand to provide new generation of engineering students with an overall awareness of the application and design of FRP reinforcing materials for internal and external strengthening (repair) of reinforced concrete structures. The FRP strengthening of other structures such as metallic and timber will also be shortly discussed. On the other hand the course will provide guidance to students seeking additional information on the topic. Many practical cases will be presented analysed and discussed. An ongoing structural health monitoring of these new materials is necessary to ensure that the structures are performing as planned, and that the safety and integrity of structures is not compromised. The course outlines some of the primary considerations to keep in mind when designing and utilizing structural health monitoring technologies. During the course, students will have the opportunity to design FRP strengthened concrete beams and columns, apply the FRP by themselves, and finally test their samples up to failure.

1) Design advanced FRP composites for your structures,
2) To consult owners and clients with necessary testing and SHM techniques for FRP structures,
3) Continue your education as a phd student in this field.

101-0617-02L Computational Science Investigation for Material Mechanics

Abstract
Introduction to computational sciences with focus on numerical modeling of the mechanics of materials. Simulation of material damage, fracture and failure with various material models.

Objective
Learning from mistakes and failures is as old as the engineering discipline. Understanding why things went wrong is essential for improvement, but often impossible without the help of numerical modelling. Real world problems are often highly nonlinear, dependent on multiple physical fields, involve fundamental material behavior far from equilibrium and reversibility, and can only be understood by addressing different relevant scales.

In this course, we will use real-life cases to learn how to deal with such problems. Starting from the problem description with governing equations, you will learn how to tackle non-linear and multi-field problems using numerical simulations. A particular focus will be on fracture. We will investigate the conditions and mechanisms that lead to material failure and analyze the contributions of plastic behavior, size effects, randomness in the underlying material micro-structure, and various other non-linear material behavior. You will learn various approaches to model the mechanics of complex heterogeneous materials and to implement your model in Python code to run numerical simulations.

Content
1 Introduction to (numeric) forensic engineering
2 The nature of engineering problems (governing equations)
3 Numerical recipes for dealing with non-linear problems
4 Multi-field problems (HTM)
5 Creep and relaxation
6 On the nature of failure - Physics of damage and fracture
7 Cracks and growth in structures (LEFM and beyond)
8 Damage and fracture in heterogeneous materials
9 Mechanics of fatigue
10 Student - Project presentation

Lecture notes
Will be provided during the lecture via moodle.

101-0427-01L Public Transport Design and Operations

Abstract
This course aims at analyzing, designing, improving public transport systems, as part of the overall transport system.

Objective
Public transport is a key driver for making our cities more livable, clean and accessible, providing safe, and sustainable travel options for millions of people around the globe. Proper planning of public transport system also ensures that the system is competitive in terms of speed and cost. Public transport is a crucial asset, whose social, economic and environmental benefits extend beyond those who use it regularly; it reduces the amount of cars and road infrastructure in cities; reduces injuries and fatalities associated to car accidents; and gives transport accessibility to very large demographic groups.

Goal of the class is to understand the main characteristics and differences of public transport networks. Their various performance criteria based on various perspective and stakeholders. The most relevant decision making problems in a planning tactical and operational point of view

At the end of this course, students can critically analyze existing networks of public transport, their design and use; consider and substantiate possible improvements to existing networks of public transport and the management of those networks; optimize the use of resources in public transport.

General structure:
general introduction of transport, modes, technologies, system design and line planning for different situations, mathematical models for design and line planning timetabling and tactical planning, and related mathematical approaches operations, and quantitative support to operational problems, evaluation of public transport systems.
Content
Basics for line transport systems and networks
Passenger/Supply requirements for line operations
Objectives of system and network planning, from different perspectives and users, design dilemmas
Conceptual concepts for passenger transport: long-distance, urban transport, regional, local transport
Planning process, from demand evaluation to line planning to timetables to operations
Matching demand and modes
Line planning techniques
Timetabling principles
Allocation of resources
Management of operations
Measures of realized operations
Improvements of existing services

Lecture notes
Lecture slides are provided.

Abstract
Fundamentals of traffic flow theory and control.

Objective
The objective of this course is to fully understand the fundamentals of traffic flow theory in order to effectively manage traffic operations. By the end of this course students should be able to apply basic techniques to model different aspects of urban and inter-urban traffic performance, including congestion.

Content
Introduction to fundamentals of traffic flow theory and control. Includes understanding of traffic data collection and processing techniques, as well as data analysis, traffic modeling, and methodologies for traffic control.

Lecture notes
The lecture notes and additional handouts will be provided during the lectures.

Prerequisites / notice
Verkehr III - Road Transport Systems 6th Sem. BSc (101-0415-00L)
Special permission from the instructor can be requested if the student has not taken Verkehr III

Abstract
The course provides the necessary knowledge to develop models supporting and also evaluating the solution of given planning problems. The course is composed of a lecture part, providing the theoretical knowledge, and an applied part in which students develop their own models in order to evaluate a transport project/ policy by means of cost-benefit analysis.

Objective
- Knowledge and understanding of statistical methods and algorithms commonly used in transport planning
- Comprehend the reasoning and capabilities of transport models
- Ability to independently develop a transport model able to solve / answer planning problem
- Getting familiar with cost-benefit analysis as a decision-making supporting tool
The course provides the necessary knowledge to develop models supporting the solution of given planning problems and also introduces cost-benefit analysis as a decision-making tool. Examples of such planning problems are the estimation of traffic volumes, prediction of estimated utilization of new public transport lines, and evaluation of effects (e.g. change in emissions of a city) triggered by building new infrastructure and changes to operational regulations.

To cope with that, the problem is divided into sub-problems, which are solved using various statistical models (e.g. regression, discrete choice analysis) and algorithms (e.g. iterative proportional fitting, shortest path algorithms, method of successive averages).

The course is composed of a lecture part, providing the theoretical knowledge, and an applied part in which students develop their own models in order to evaluate a transport project/ policy by means of cost-benefit analysis. Interim lab session take place regularly to guide and support students with the applied part of the course.

The exercises provide a framework for practical application of the learned theoretical concepts of spatial planning to real-life situations.

You as students will:
... assess present and future core challenges of spatial planning and development.
... discuss the role of spatial planning and development in shaping our living environment.
... differentiate the levels, scales and tasks of spatial planning instruments and processes.
... reflect on theoretical concepts and practical examples of decision-making of spatial tasks.
... identify and apply spatially relevant principles and systems for action-oriented planning and decision-making.
... acquire theoretical, methodological, practical know-how to examine, clarify, and solve tasks on spatial development
... reflect on theoretical concepts and practical examples of decision-making of spatial tasks.
... acquire theoretical, methodological, practical know-how to examine, clarify, and solve tasks on spatial development
... evaluate the potential of new public transport lines, and the effects of building new infrastructure.
... examine and analyze the impact of changes to operational regulations.

The lecture series introduces necessary key concepts and covers the following main topics:
- Drivers of spatial development, inward development, core tasks and current challenges for (spatial) planners.
- Interplay of formal and informal planning instruments across scales and actors.
- Differentiation urban typologies, their characteristics and challenges.
- Types of spatial analysis and key figures.
- Planning approaches and the (political) steering of spatial development.
- Types of processes and participation in spatial development.
- Approaches for planning complex urban situations.
- Concepts for sustainable development.

The course focuses on both theoretical concepts and practice-oriented approaches to gain knowledge and be equipped to address current issues in spatial planning and development. This is mirrored in the course’s structure made of both of lectures and exercises.

You as students will:

### 151-0227-00L Basics of Air Transport (Aviation I)

**W 4 credits 3G P. Wild**

**Abstract**

In general the course explains the main principles of air transport and elaborates on simple interdisciplinary topics. Working on broad 14 different topics like aerodynamics, manufacturers, airport operations, business aviation, business models etc. the students get a good overview in air transportation. The program is taught in English and we provide 11 different experts/lecturers.

**Objective**

The goal is to understand and explain basics, principles and contexts of the broader air transport industry. Further, we provide the tools for starting a career in the air transport industry. The knowledge may also be used for other modes of transport. Ideal foundation for Aviation II - Management of Air Transport.

**Content**

Weekly: 1h independent preparation; 2h lectures and 1 h training with an expert in the respective field

Concept: This course will be taught as Aviation I. A subsequent course - Aviation II - covers the "Management of Air Transport".

Content: Transport as part of the overall transportation scheme; Aerodynamics; Aircraft (A/C) Designs & Structures; A/C Operations; Aviation Law; Maintenance & Manufacturers; Airport Operations & Planning; Aviation Security; ATC & Airspace; Air Freight; General Aviation; Business Jet Operations; Business models within Airline Industry; Military Aviation.

Technical visit: This course includes a guided tour at Zurich Airport and Dubendorf Airfield (baggage sorting system, apron, Tower & Radar Simulator at Skyguide Dubendorf).

**Literature**

Literature will be provided by the lecturers, respectively there will be additional Information upon registration (normally available in Moodle)

**Prerequisites / notice**

The lecture is planned as class teaching.

### 227-0523-00L Railway Systems I

**W 6 credits 4G M. Meyer**

**Abstract**

Basic characteristics of railway vehicles and their interfaces with the railway infrastructure:
- Transportation tasks and vehicle types
- Running dynamics
- Mechanical part of rail vehicles
- Brakes
- Traction chain and auxiliary supply
- Railway power supply
- Signalling systems
- Standards
- Availability and safety
- Traffic control and maintenance

**Objective**

- Overview of the technical characteristics of railway systems
- Understanding tasks and opportunities of engineers working in an environment which has strong economical and political boundaries
- Insight into the activities of the railway vehicle industry and railway operators in Switzerland
- Motivation of young engineers to start a career in the railway industry or with railway operators
Infrastructure management is the process that ensures infrastructure provides desired service over time. This course provides an overview.

The objective of this course is to provide an overview of the infrastructure management process. The high-level process can be used as a functioning processes. Principles of ensuring a well function organisation and well-functioning processes.

The weekly lectures are structured as follows:

1. Introduction: An introduction to infrastructure management and the project.
2. Service: Determination of what service you are trying to provide with an infrastructure network is important in justifying the interventions you think are required and ensuring that investment decisions are aligned throughout an infrastructure management organisation. This lecture introduces the concept of serve and connects it to measurable indicators.
3. Help session 1: This session provides time for your group to ask questions as you define the service you want your infrastructure network to provide.
4. Presentation 1: 4 groups will present their ideas on how they want their networks to provide service.
5. Interventions: Justifying the interventions you want to execute to ensure you continue to provide the defined service requires you to model deterioration, determining economically justifiable strategies and explain which interventions will be postponed if you can’t do all you would like. This lecture is focused on explaining the main principles behind each of these concepts.
6. Help session 2: This session provides time for your group to ask questions as you justify the interventions you want to execute on your infrastructure network over time and explain what you will postpone if you cannot do all of them.
7. Presentation 2: 4 groups will present how they have justified interventions and how they have selected the ones they would like to postpone if required.
8. Monitoring: To ensure you the infrastructure network is providing what you expect you need to monitor its performance and how projects are being done. This lecture is focused on the principles of ensuring a well functioning organisation and well-functioning processes.
9. Help session 3: This session provides time for your group to ask questions on how to establish the monitoring systems for your infrastructure networks.
10. Presentation 3: 4 groups will present how they intended to monitor their systems and projects.
11. Organisation: Managing infrastructure only works well with great teams of people with great processes. This lecture focuses on the principles of ensuring a well functioning organisation and well-functioning processes.
12. Help session 4: This session provides time for your group to ask questions on how to ensure well-functioning organisations and well-functioning processes.
13. Presentation 4: 4 groups will present how they intended to ensure well-functioning organisations and well-functioning processes.

Content: 6 credits

1. Einführung: Geschichte und Struktur des Bahnsystems
2. Fahrdynamik
3. Vollbahnfahrzeuge:
   3.1 Mechanik: Kasten, Drehgestelle, Lauftechnik, Adhäsion
   3.2 Bremsen
   3.3 Traktionsantriebssysteme
   3.4 Hilfsbetriebe und Komfortanlagen
   3.5 Steuerung und Regelung
4. Betrieb:
   4.1 Interoperabilität, Normen und Zulassung
   4.2 RAMS, LCC
   4.3 Anwendungsbeispiele

Voraussichtlich ein oder zwei Gastreferate

Geplante Exkursionen:
- Betriebszentrale SBB, Zürich Flughafen
- Reparatur und Unterhalt, SBB Zürich Altstetten
- Fahrzeugfertigung, Stadler Bussnang

Lecture notes: Abgabe der Unterlagen (gegen eine Schutzgebühr) zu Beginn des Semesters. Rechtzeitig eingeschriebene Teilnehmer können die Unterlagen auf Wunsch und gegen eine Zusatzgebühr auch in Farbe beziehen.

Prerequisites / notice: Dozent: Dr. Markus Meyer, Erkmatik GmbH
The main objective of this course is to provide students with some basic tools to analyze the fundamental economic forces at play in urban systems and transportation. It focuses on the formation and development of urban systems, and as such deserve our attention.

In general, this class focuses on the latest research developments in urban and regional economics, though it does not require prior knowledge in this field. It pays particular attention to economic approaches, which are based on theoretical frameworks with strong micro-foundations and allow for precise policy recommendations.

In the third part, I combine the previous two parts and analyze the interaction between urban systems and transportation. Thereby, the main focus is to understand the economic mechanisms that can lead to a general equilibrium of all actors involved. However, as the study of the historical development of urban systems and transport networks provides interesting insights, I will discuss how their interaction in the past shapes today’s economic geography.

Finally, I broaden the scope of the course and explore related topics. There will be a particular emphasis on the relation between urban systems and fiscal federalism as well as environmental policies. Both aspects are important determinants of the contemporary developments of urban systems, and as such deserve our attention.

In general, this class focuses on the latest research developments in urban and regional economics, though it does not require prior knowledge in this field. It pays particular attention to economic approaches, which are based on theoretical frameworks with strong micro-foundations and allow for precise policy recommendations.
In the course Numerical Hydraulics the basics of numerical modelling of flows are presented. The lecture addresses the fundamentals of river engineering to quantitatively describe the flow of water, transport of sediment and wood, respectively.

At the end of the course, the students will be able to:
- determine the interaction between flow (discharge), sediment transport, wood transport and the resulting channel evolution.
- apply different calculation approaches and methods to tackle river engineering problems and tasks such as the discharge capacity of a river, scour estimation, or sediment budget of a river.
- recall and describe the fundamentals of transport processes in rivers.
- identify and describe the fundamentals of transport processes in rivers, as well as the methods to determine and calculate the river discharge, or sampling methods to characterize the bed material. In addition, the transport processes of sediment (bedload and suspended load) and wood in rivers will be examined, including the principles of incipient motion, and initiation of erosion or deposition processes.

The first part of the lecture introduces the fundamentals of river engineering, such as methods to determine and calculate the river discharge, or sampling methods to characterize the bed material. In addition, the transport processes of sediment (bedload and suspended load) and wood in rivers will be examined, including the principles of incipient motion, and initiation of erosion or deposition processes.

In the second part of the lecture, the methods will be explained to quantify the bed load budget and the morphological changes (erosion, deposition) in river systems. Specifically, natural channel formation processes, different bed forms and plan forms of rivers (straight, meandering, braided) are examined.

The last part of the lecture focuses on the design of river engineering structures, including examples from an ongoing flood and river rehabilitation project at the Alpine Rhine in Austria and Switzerland.

Short practical exercises (voluntary) will be offered throughout the semester to improve the application of the learned subjects.

**101-0267-01L**

**Numerical Hydraulics**

**Objective**

In the course Numerical Hydraulics the basics of numerical modelling of flows are presented.

**Content**

The basic equations are derived from first principles. Possible simplifications relevant for practical problems are shown and their applicability is discussed. Using the example of non-steady state pipe flow numerical methods such as the method of characteristics and finite difference methods are introduced. The finite volume method as well as the method of characteristics are used for the solution of the shallow water equations. Special aspects such as wave propagation and turbulence modelling are also treated.

All methods discussed are applied praticially in exercises. This is done using programs in MATLAB which partially are programmed by the students themselves. Further, some generally available softwares such as BASEMENT for non-steady shallow water flows are used.

**Lecture notes**

Slides from the lectures and programs used can be downloaded.

**Literature**

Given in lecture

**Competencies**

- Concepts and Theories
- Techniques and Technologies
- Analytical Competencies
- Decision-making
- Problem-solving
- Adaptable and Flexible
- Creative Thinking
- Critical Thinking
- Self-direction and Self-management

**Prerequisites / notice**

Information: Because Hydraulic Engineering II is strongly based on Hydraulic Engineering (Wasserbau, 101-0206-00L) it is strongly recommended to have taken this course (101-0206-00L) or a similar one previously.

**101-0258-00L**

**River Engineering**

**Abstract**

The lecture addresses the fundamentals of river engineering to quantitatively describe the flow of water, transport of sediment and wood, and morphological changes such as erosion and deposition processes associated with river structures. In addition, design guidelines for river engineering structures are introduced.

**Objective**

At the end of the course, the students will be able to:

- recall and describe the fundamentals of transport processes in rivers,
- apply different calculation approaches and methods to tackle river engineering problems and tasks such as the discharge capacity of a river, scour estimation, or sediment budget of a river,
- design and dimension river engineering works needed to influence the processes in watercourses, and
- determine the interaction between flow (discharge), sediment transport, wood transport and the resulting channel evolution.

**Content**

The first part of the lecture introduces the fundamentals of river engineering, such as methods to determine and calculate the river discharge, or sampling methods to characterize the bed material. In addition, the transport processes of sediment (bedload and suspended load) and wood in rivers will be examined, including the principles of incipient motion, and initiation of erosion or deposition processes.

In the second part of the lecture, the methods will be explained to quantify the bed load budget and the morphological changes (erosion, deposition) in river systems. Specifically, natural channel formation processes, different bed forms and plan forms of rivers (straight, meandering, braided) are examined.

The last part of the lecture focuses on the design of river engineering structures, including examples from an ongoing flood and river rehabilitation project at the Alpine Rhine in Austria and Switzerland.

**Lecture notes**

Lecture slides can be downloaded via Moodle.

**Prerequisites / notice**

2. River Mechanics; Pierre Y. Julien

**Recommended lectures:**

Hydrology (102-0239-AAL), Hydraulics I (101-0203-01L), and Hydraulic Engineering (101-0206-00L).

Short practical exercises (voluntary) will be offered throughout the semester to improve the application of the learned subjects.
The main aim of the course is to provide practical training with watershed models for environmental engineers. The course is built on examples from scientific studies. A comprehensive exercise block builds on the lectures with a series of 4 practical tasks to be conducted during the semester in group work. Exercise hours during the week focus on explanation of the tasks. The course is evaluated 50% by performance in the graded exercises and 50% by a semester-end oral examination (30 mins) on watershed modelling concepts.

When quantitative assessment of physical processes governing natural and engineered systems relies on numerically solving differential equations, fast and accurate solutions require performant algorithms leveraging parallel hardware. The goal of this course is to offer a practical approach to solve systems of differential equations in parallel on GPUs using the Julia language. Julia combines high-level language conciseness to low-level language performance which enables efficient code development. The course will be taught in a hands-on fashion, putting emphasis on you writing code and completing exercises; lecturing will be kept at a minimum. In a final project you will solve a solid mechanics or fluid dynamics problem of your interest, such as the shallow water equation, the shallow ice equation, acoustic wave propagation, nonlinear diffusion, viscous flow, elastic deformation, viscous or elastic poromechanics, frictional heating, and more. Your Julia GPU application will be hosted on a git-platform and implement modern software development practices.

Part 1 - Exploring a modern parallel computing ecosystem
- Learn the basics of the Julia language;
- Learn how to solve diffusion, wave propagation and advection processes;
- Implement efficient iterative algorithms;
- Get started with software development tools: git, version control.

Part 2 - Developing your own parallel algorithms on GPUs
- Implement wave propagation and porous convection;
- Apply spatial and temporal discretisation (finite-differences, various time-stepper);
- Understand the practical challenges of parallel computing: GPUs, multi-core CPUs;
- Learn about main simulation performance limiters;
- Implement software development tooling: unit tests, continuous integration (CI).

Part 3 - Multi-GPU computing projects
- Understand the practical challenges of distributed parallel computing on multi-GPUs;
- Implement shared (on CPU and GPU) and distributed memory parallelisation (multi-GPUs/CPUs);
- Automatise the software tooling using remote runners.

The course covers GIS use in watershed analysis, models types from conceptual to physically-based, parameter calibration and model validation, and analysis of uncertainty. The course combines theory (lectures) with a series of practical tasks (exercises).

102-0468-10L Watershed Modelling

WWASS

W 6 credits 4G P. Molnar, A. Costa, S. Sinclair

Abstract
Watershed Modelling is a practical course on numerical water balance models for a range of catchment-scale water resource applications. The course covers GIS use in watershed analysis, models types from conceptual to physically-based, parameter calibration and model validation, and analysis of uncertainty. The course combines theory (lectures) with a series of practical tasks (exercises).

Objective
The main aim of the course is to provide practical training with watershed models for environmental engineers. The course is built on examples from scientific studies. A comprehensive exercise block builds on the lectures with a series of 4 practical tasks to be conducted during the semester in group work. Exercise hours during the week focus on explanation of the tasks. The course is evaluated 50% by performance in the graded exercises and 50% by a semester-end oral examination (30 mins) on watershed modelling concepts.

Content
The first part (A) of the course is on watershed properties analysed from DEMs, and on global sources of hydrological data for modelling applications. Here students learn about GIS applications (ArcGIS, Q-GIS) in hydrology - flow direction routines, catchment morphometry, extracting river networks, and defining hydrological response units. In the second part (B) of the course on conceptual watershed models students build their own simple bucket model (Matlab, Python), they learn about performance measures in modelling, how to calibrate the parameters and how to validate models, about methods to simulate stochastic climate to drive models, uncertainty analysis. The third part (C) of the course is focussed on physically-based model components. Here students learn about components for soil water fluxes and evapotranspiration, they practice with a fully-distributed physically-based model Topkapi-ETH, and learn about other similar models at larger scales. They apply Topkapi-ETH to an alpine catchment and study simulated discharge, snow, soil moisture and evapotranspiration spatial patterns.

Lecture notes
There is no textbook. Learning materials consist of (a) video-recording of lectures; (b) lecture presentations; and (c) exercise task documents that allow independent work.

Literature
Literature consist of collections from standard hydrological textbooks and research papers, collected by the instructors on the course moodle page.

Prerequisites / notice
Basic Hydrology in Bachelor Studies (engineering, environmental sciences, earth sciences). Basic knowledge of Matlab (Python), ArcGIS (Q-GIS).

101-0250-00L Solving Partial Differential Equations in Parallel on GPUs

W 4 credits 3G I. Utkin, S. Omlin, L. Räss, M. Werder

Abstract
This course aims to cover state-of-the-art methods in modern parallel computing on Graphics Processing Unit (GPU), supercomputing and high-performance computing. The main aim of the course is to provide practical training with watershed models for environmental engineers. The course is built on examples from scientific studies. A comprehensive exercise block builds on the lectures with a series of 4 practical tasks to be conducted during the semester in group work. Exercise hours during the week focus on explanation of the tasks. The course is evaluated 50% by performance in the graded exercises and 50% by a semester-end oral examination (30 mins) on watershed modelling concepts.

Objective
When quantitative assessment of physical processes governing natural and engineered systems relies on numerically solving differential equations, fast and accurate solutions require performant algorithms leveraging parallel hardware. The goal of this course is to offer a practical approach to solve systems of differential equations in parallel on GPUs using the Julia language. Julia combines high-level language conciseness to low-level language performance which enables efficient code development. The course will be taught in a hands-on fashion, putting emphasis on you writing code and completing exercises; lecturing will be kept at a minimum. In a final project you will solve a solid mechanics or fluid dynamics problem of your interest, such as the shallow water equation, the shallow ice equation, acoustic wave propagation, nonlinear diffusion, viscous flow, elastic deformation, viscous or elastic poromechanics, frictional heating, and more. Your Julia GPU application will be hosted on a git-platform and implement modern software development practices.

Content
Part 1 - Discovering a modern parallel computing ecosystem
- Learn the basics of the Julia language;
- Learn how to solve diffusion, wave propagation and advection processes;
- Implement efficient iterative algorithms;
- Get started with software development tools: git, version control.

Part 2 - Developing your own parallel algorithms on GPUs
- Implement wave propagation and porous convection;
- Apply spatial and temporal discretisation (finite-differences, various time-stepper);
- Understand the practical challenges of parallel computing: GPUs, multi-core CPUs;
- Learn about main simulation performance limiters;
- Implement software development tooling: unit tests, continuous integration (CI).

Part 3 - Multi-GPU computing projects
- Understand the practical challenges of distributed parallel computing on multi-GPUs;
- Implement shared (on CPU and GPU) and distributed memory parallelisation (multi-GPUs/CPUs);
- Automatise the software tooling using remote runners.

Final projects
- Apply your new skills in a final project;
- Implement advanced physical processes (solid and fluid dynamic - elastic and viscous solutions).
Lecture notes
Digital lecture notes, interactive Julia notebooks, online material.

Literature
Links to relevant literature will be provided during classes.

Prerequisites / notice
Completed BSc studies. Interest in and basic knowledge of numerics, applied mathematics, and physics/engineering sciences. Basic programming skills (in e.g. Matlab, Python, Julia); advanced programming skills are a plus.

Abstract
Opportunities and limitations of concrete technology, Commodities and leading edge specialties.

Objective
Advanced education in concrete technology for civil engineers who are designing, specifying and executing concrete structures.

Content
- concrete components
- concrete properties
- concrete mix design
- production, transport, casting
- demoulding, curing and additional protective measures
- durability
- standards
- chemical admixtures
- alternative binders
- specialty concretes such as: self compacting concrete, fiber reinforced concrete, fast setting concrete
- the role of sustainability in concrete technology
- new research in digital fabrication with concrete

Abstract
Moisture transport and related degradation processes in porous materials Theory of moisture transport in porous materials Experimental determination of moisture transport properties Exercises on moisture transport properties determination: Selected topics Liquid transport in cracked porous media, Drying of porous media, microclimate in urban street canyons.

Objective
- Basic knowledge of moisture transport and related degradation processes in porous materials
- Knowledge of experimental determination of moisture transport properties
- Application of knowledge to moisture transport in cracked materials, drying of porous materials and microclimate in urban street canyons

Content
1. Introduction
Moisture damage: problem statement, durability
Applications: building materials, soil science, geoscience

2. Moisture transport: theory and application
Description of moisture transport Determination of moisture transport properties Exercises on moisture transport properties

3. Special topics
Liquid transport in cracked materials, Drying of porous materials, Microclimate in urban street canyons

Lecture notes
Handouts, supporting material and exercises are provided online via Moodle.

Literature
All material is provided online via Moodle.
### Advances in Building Materials

**Abstract**
The course on Advances in Building Materials provides an introductory overview of the needs and future of materials science in the building sector. Focus topics concern sustainability, durability, thermal insulation, coatings, sealants, adhesives, flame retardancy and the future perspective and developments of concrete and wood with regard to smart material development and ecological concerns.

**Objective**
In this course, the students will gain a broad overview of the use of materials in the building sector, with a particular focus on concrete and wood. Current limitations and in particular sustainability related challenges will be detailed with the objective of laying the grounds to discuss future developments anticipated in this field.

**Content**
The following topics are covered:
1. Material selection
2. Materials and sustainability 1
3. Materials and sustainability 2
4. Recyclability
5. Material science of wood durability
6. Material science of concrete durability
7. Foams in construction and thermal insulation
8. Sealants and adhesives in construction
9. Coatings
10. Flame retardants
11. Future of wood – 1
12. Future of wood – 2
13. Future of concrete – 1
14. Future of concrete – 2

**Lecture notes**
Handouts will be provided for each lecture.

### Computational Science Investigation for Material Mechanics

**Abstract**
Introduction to computational sciences with focus on numerical modeling of the mechanics of materials. Simulation of material damage, fracture and failure with various material models.

**Objective**
Learning from mistakes and failures is as old as the engineering discipline. Understanding why things went wrong is essential for improvement, but often impossible without the help of numerical modelling. Real world problems are often highly nonlinear, dependent on multiple physical fields, involve fundamental material behavior far from equilibrium and reversibility, and can often only be understood by addressing different relevant scales.

In this course, we will use real-life cases to learn how to deal with such problems. Starting from the problem description with governing equations, you will learn how to tackle non-linear and multi-field problems using numerical simulations. A particular focus will be on fracture. We will investigate the conditions and mechanisms that lead to material failure and analyze the contributions of plastic behavior, size effects, randomness in the underlying material micro-structure, and various other non-linear material behavior. You will learn various approaches to model the mechanics of complex heterogeneous materials and to implement your model in Python code to run numerical simulations.

**Content**
1. Introduction to (numeric) forensic engineering
2. The nature of engineering problems (governing equations)
3. Numerical recipes for dealing with non-linear problems
4. Multi-field problems (HTM)
5. Creep and relaxation
6. On the nature of failure - Physics of damage and fracture
7. Cracks and growth in structures (LEFM and beyond)
8. Damage and fracture in heterogeneous materials
9. Mechanics of fatigue
10. Student -Project presentation

**Lecture notes**
Will be provided during the lecture via moodle.

**Literature**
Will be provided during the lecture.

### Mechanics of Composite Materials

**Abstract**
This course for civil engineers lays the grounds in the specialization Materials and Mechanics and complements the second introductory course of the specialization on Numerical Mechanics of Materials. The course also addresses master students in Materials Science and other study programs interested in deepening their understanding of application-relevant properties of engineering materials and sustainability related challenges.

The following topics are covered:
1. Material selection
2. Materials and sustainability 1
3. Materials and sustainability 2
4. Recyclability
5. Material science of wood durability
6. Material science of concrete durability
7. Foams in construction and thermal insulation
8. Sealants and adhesives in construction
9. Coatings
10. Flame retardants
11. Future of wood – 1
12. Future of wood – 2
13. Future of concrete – 1
14. Future of concrete – 2

**Lecture notes**
Handouts will be provided for each lecture.

The objective is to introduce the basic concept of composite materials and provide a thorough understanding of the mechanical response of such materials and structures particularly made from fiber reinforced polymer composites, including elastic behavior, failure, fracture and damage analysis as well as structural design aspects. The ultimate goal is to provide the necessary skills to address the design and analysis of modern lightweight composite structures.

Content

The course is addressing following topics:
- Introduction
- Elastic anisotropy
- Micromechanics & Homogenization
- Classical Laminate Theory (CLT)
- Strength, failure and damage analysis
- Thin ply composite shells & effects of material non-linearity
- Analysis and design of composite structures

Lecture notes

Script, handouts, exercises and additional material are available in PDF-format on the moodle page of the lecture.

Literature

The lecture material is covered by a script/lecture notes compiled by CMASLab and further literature is referenced therein.

Abstract

Currently, Life Cycle Assessment (LCA) is applied as an ex-post design evaluation of buildings, but rarely used to improve the building during the design process. The aim of this course is to apply LCA during the design of buildings by means of a digital, parametric tool. The necessary fundamentals of the LCA method will be taught following a lecture on demands approach.

Objective

The course will follow two main objectives and a third optional objective, depending on the design projects the students choose. At the end of the course, the students will:
1. Know the methodology of LCA
2. Be able to apply LCA in the design process to assess and improve the environmental performance of their projects
3. Be able to use the parametric LCA tool and link it to additional performance assessment tools for a holistic optimisation

Content

The course will be structured into two parts, each making up about half of the semester.

Part I: Exercises with lectures on demand

The first six individual courses will follow the "lectures on demand" approach. Small "hands-on" exercises focusing on one specific aspect will be given out and the necessary background knowledge will be provided in the form of short input lectures when questions arise. The following topics will be discussed during the first part:
1) LCA basic introduction
2) System boundaries, functional unit, end of life
3) Carbon budget and LCA benchmarks
4) BIM-LCA, available calculation tools and databases
5) Integrated analysis of environmental and cost assessment
6) Bio-based carbon storage

Part II: Project-based learning

In the second part, the students will work on their individual project in groups of three. For the design task, the students will bring their own project and work on improving it. The projects can be chosen depending on the students background and range from buildings to infrastructure projects. Intermediate presentations will ensure the continuous work and make sure all groups are on the same level and learn from each other. During this part, the following hands-on tutorials will be given:
1) Introduction to Rhinoceos 6 and 7
2) Introduction to grasshopper
3) Integrated assessment tools (ladybug tools)
4) Introduction to in-house grasshopper plugin for LCA analysis

Lecture notes

As the course follows a lecture on demand approach, the lecture slides will be provided after each course.

Literature

A list of the basic literature will be offered on a specific online platform, that could be used by all students attending the lectures.

Prerequisites / notice

The students are expected to work out of class as well. The course time will be used by the teachers to answer project-specific questions. The lecture series will be conducted in English and is aimed at students of master's programs, particularly in civil engineering and MIBS. No lecture will be given during Seminar week.
An Introduction to Sustainable Development in the Built Environment

Abstract

In 2015, the UN Conference in Paris shaped future world objectives to tackle climate change. This decarbonization strategy is additional to Sustainable Development goals formulated the same year by the UN general assembly. What does that mean for the built environment? This course provides an introduction to the notion of sustainable development when applied to our built environment.

Objective

At the end of the semester, the students have an understanding of the term of sustainable development, its history, the current political and scientific discourses and its relevance for our built environment.

In order to address current challenges of climate change mitigation and resource depletion, students will learn a holistic approach of sustainable development. Ecological, economical and social constraints will be presented and students will learn about methods for argumentation and tools for assessment (i.e. life cycle assessment).

For this purpose an overview of sustainable development is presented with an introduction to the history of sustainability and its today definition as well as the role of cities, urbanisation and material resources (i.e. energy, construction material) in social economic and environmental aspects.

The course aims to promote an integral view and understanding of sustainability and describing different spheres (social/cultural, ecological, economical, and institutional) that influence our built environment.

Students will acquire critical knowledge and understand the role of involved stakeholders, their motivations and constraints, learn how to evaluate challenges, identify deficits and define strategies to promote a more sustainable construction.

After the course students should be able to define the relevance of specific local, regional or territorial aspects to achieve coherent and applicable solutions toward sustainable development.

The course offers an environmental, socio-economic and socio-technical perspective focussing on buildings, cities and their transition to resilience with sustainable development. Students will learn on theory and application of current scientific pathways towards sustainable development.

Content

The following topics give an overview of the themes that are to be worked on during the lecture.

- Overview on the history and emergence of sustainable development
- Overview on the current understanding and definition of sustainable development and beyond

Methods

- Method 1: Life cycle assessment (planning, construction, operation/use, deconstruction)
- Method 2: Life Cycle Costing
- Method 3: Labels and certification
- Method 4: Material Flow Analysis

Main issues:
- Operation energy at building, urban and national scale
- Mobility and density questions
- Embodied energy for developing and developed world
- Synthesis: Transition to sustainable development

Lecture notes

All relevant information will be online available before the lectures. For each lecture slides of the lecture will be provided.

Literature

A list of the basic literature will be offered on a specific online platform, that could be used by all students attending the lectures.
Objective

Special focus on regenerative materials: earth, bio-based and reuse
The students will acquire knowledge in the following fields:
Fundamentals of material performance
Introduction to durability problems of building facades

Content

Materials for the building envelope:
- Overview of structural materials and systems: concrete, steel, stone, earth, wood and bamboo
- Insulating materials (bio-based vs conventional)

Assessment of materials and components behaviour and performance
Degradation risks connected to insulation and post-insulation
Aspects of sustainability and durability

Special focus on comfort, moisture transfer and building physics with hygroscopic materials will be done.

Comprehensiveness

Students will receive an introduction to circular principles by experts from the building industry and visit of (de-)construction sites where circular construction is exemplified. They will explore how to use digital technologies such as LiDAR scanning, photogrammetry, scan-to-BIM, computer vision, computational design, digital fabrication, blockchain technology and learn about the design implications using reclaimed building materials. This course is meant as an overview/introduction of many digital technologies that could be useful for circular construction and evaluate possible solutions using digital technologies to enable a circular built environment (more specifically, with reused building materials). To achieve this, they need to be able to do the following:

1. Apply circular principles using recovered building materials.
2. Compare different digital technologies applied in circular construction (e.g., LiDAR scanning, drone imagery, photogrammetry, computational design, AI, computer vision, XR, LCA tools etc.)
3. Understand the potential and limitations of AI for circular construction, e.g. use machine learning to detect and digitize materials (computer vision) or to support creativity in the early design phases of circular construction (generative AI).
4. Communicate the importance and urgency of circular construction.
5. Assess the environmental impact implications of their design and technology decisions through a preliminary Life Cycle Assessment (LCA).

Language: English

Courses are on Tuesday afternoons in Kunsthalle or a room at ETH, but also require out-of-the-semester work and significant homework and site visits outside of class hours.

Data: 06.08.2024 12:40 Autumn Semester 2024 Page 197 of 2684
Literature

Prerequisites / notice
Interest in Digitalisation and Construction. Flexibility: This is a hands-on course, where students explore digital technologies and opportunities/challenges of reuse. Flexibility (e.g., adapting to unforeseen circumstances), responsibility (e.g., arriving on time for safety briefing), and spontaneity (e.g., finding innovative solutions) is expected from the students to adapt to the contingencies from demolition and construction sites with reused materials. The course is mandatory for MIBS students. If you are a first year MIBS student, please do not apply, you are automatically accepted. All other students from other departments should apply. Please only register for the course if you really intend to participate on all course dates (see course schedule). Please only register for the course if you are willing to send us a letter of motivation and really intend to participate; otherwise, you will deprive someone else of a place. All non-MIBS students who register go onto a waiting list until 11.09.2024 and up to 25 of them will be selected by the lecturer.

To register:
1. Enroll before 05.09.2024.
2. Send a short letter of motivation (max. 300 words) and a 1-page CV to cea-course@ibi.baug.ethz.ch by 05.09.2024.

- Problem-solving

Objective
Lecture: Explain the concepts underlying radioactive waste management practices. Exercises: Conceptual solutions of complex problems based upon discussion of current tunnel cases with particularly demanding problems.

Content
Waste Disposal
The practice of landflling, remediation of polluted sites and the disposal of radioactive waste are based on the same concepts of environmental protection. Understanding the contaminants behaviour and how to reduce their release to the environment is the key to remediating polluted sites and designing multi-barrier systems.

On successful completion of this course students will be able to
- Assess the risk to the environment from landfills, contaminated sites and radioactive waste repositories in terms of the fate and transport of contaminants.
- Describe the technologies available to minimise environmental contamination.
- Describe the principles of dealing with polluted sites and propose and evaluate appropriate remediation techniques.
- Explain the concepts underlying radioactive waste management practices.

This lecture course consists of lectures with exercises and case studies.

- An overview of the principles of environmental protection in waste management and how this is applied in legislation.
- An overview of the chemistry underlying the release and transport of contaminants from the landfill/treated contaminated material/radioactive waste repository focusing on processes controlling mobility of heavy metals and organic compounds.
- Introduction to contaminant transport in porous adsorbing media.
- Design and function of engineered barriers. Clay as a barrier.
- Polluted site remediation: Site investigation, assessment, and remediation technologies.
- Concepts and safety in radioactive waste management.
- Role of the geological and engineered barriers and radionuclide transport in geological media.

According to the bibliography in the submitted documents.

Students should be able to recognise basic structural and material-related connections in traffic route engineering as well as be able to design pavements. This includes knowledge of the interrelation of local conditions such as soil properties, climate, water, as well as the mechanical behaviour of the selected construction materials and the quality of the design models involved.

This knowledge is conveyed through lectures, practical demonstrations, moderated exercises and assignments (to be completed independently).

Historical Development of Masonry Construction

The Method of Finite Elements II is a continuation of Method of Finite Elements I. Here, we explore the theoretical and numerical implementation concepts for the finite element analysis beyond the linear elastic behavior. This course aims to offer students with the skills to perform nonlinear FEM simulations using coding in Python.

The concepts are introduced via theory, numerical examples, demonstrators and computer labs in Python (starting Fall 2021).

Upon completion of the course, the participants will be able to:
- Recognize when linear elastic analysis is insufficient
- Solve nonlinear dynamics problems, which form the core for limit state calculations (e.g. ultimate capacity, failure) of structures
- Numerically simulate fracture; a dominant failure phenomenon for structural systems.

See the class webpage for more information:

The course slides serve as Script. These are openly available on: http://www.chatzi.ibk.ethz.ch/education/method-of-finite-elements-ii.html
Seismic Design of Structures II

This course completes the series of courses on dynamic analysis and seismic design of structures at ETHZ. Building on the material assessed in Seismic Design of Structures I (101-0188-00 G) and in the primary target group (majoring in Structural Engineering and/or doing project-based coursework for other majors).

Abstract
In this course the students will learn how to do performance-based seismic design of building structures. This is a project-based course. The students will, in parallel, acquire the basis knowledge about the seismic behavior and non-linear response modeling of structures, and apply this knowledge in a project focused on design of a new building.

Objective
After successfully completing this course, the students will be able to:
1. Model and explain the seismic behavior of new structures with moment frame, braced frame and shear wall structural systems.
2. Evaluate the performance of new structures under earthquake loading using modern risk-informed performance assessment methods and analysis tools.
3. Use the knowledge of nonlinear dynamic response of structures to interpret the design code provisions and apply it in seismic design of structural systems.
4. Successfully design such systems to achieve the performance objectives stipulated by the design codes.

Content
This course completes the series of courses on dynamic analysis and seismic design of structures at ETHZ. Building on the material covered in Structural Dynamics and Seismic Design of Structures I, the following advanced topics will be covered in this course: 1) behavior and non-linear response modeling of structural systems under earthquake excitation; 2) displacement-based inelastic design of new building structures; 3) seismic design of moment frame, braced frame and shear wall structures. These topics will be discussed from the standpoint of risk-informed performance-based seismic design.

Lecture notes
Moodle is used to manage the course learning material. These include the lecture presentations, additional reading, exercise problems and solutions, example models of structures in OpenSees system for earthquake engineering simulation, and example designs.

Literature

Earthquake Engineering: From Engineering Seismology to Performance-Based Engineering, Borzorgnia, Y. and Bertero, V. Eds., CRC Press, 2004

Prerequisites

- A good knowledge of Python is necessary for attending this course.
- 101-0158-01 Method of Finite Elements I (FS)

Number of participants limited to 18. All students go on a waiting list. Final registration based on an application letter (information given in the first lecture). Priority will be given to students who completed Seismic Design of Structures I (101-0188-00 G) and are in the primary target group (majoring in Structural Engineering and/or doing project-based coursework for other majors).

Prerequisites / notice
- Earthquake Engineering: From Engineering Seismology to Performance-Based Engineering, Borzorgnia, Y. and Bertero, V. Eds., CRC Press, 2004

Useful (optional) Reading:

Literature
Course Slides (Script): http://www.chatzi.ibk.ethz.ch/education/method-of-finite-elements-ii.html

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 201 of 2684
There is no single textbook for this course. However, most of the lectures are based on parts of the following books:

- Dynamics of Structures, Theory and Applications to Earthquake Engineering, 4th edition, Anil Chopra, Prentice Hall, 2017
- Mechanics of rubber bearings for seismic and vibration isolation, James M. Kelly and Dimitrios Konstantinidis, John Wiley & Sons, 2011

After successfully completing this course the students will be able to:

1. Understand the mechanics of and design isolator bearings.
2. Understand the dynamics of and design an isolated structure.
3. Design approaches and code requirements
4. Behavior of rubber isolators under shear and compression
5. Behavior of rubber isolators under bending
6. Buckling and stability of rubber isolators
7. Code provisions for seismically isolated buildings

There is no single textbook for this course. However, most of the lectures are based on parts of the following books:

- Dynamics of Structures, Theory and Applications to Earthquake Engineering, 4th edition, Anil Chopra, Prentice Hall, 2017
- Mechanics of rubber bearings for seismic and vibration isolation, James M. Kelly and Dimitrios Konstantinidis, John Wiley & Sons, 2011

After a successful completion of the course, students will be able to:

1. Critically evaluate structural design concepts based on their impact and implications beyond the sole structural performance
2. Identify the most relevant design parameters and performance criteria for a given design task and select adequate tools to effectively integrate them as part of the design process
3. Develop structural systems in compliance with structural, spatial, and environmental design aspects simultaneously

The goal of the course is to introduce students to Structural Design. The course fosters the development of a design thinking that emerges from the coexistence of a number of design parameters and performance criteria related to force flow, construction technologies, material use, and spatial qualities.

The goal of the course is to introduce students to Structural Design. The course fosters the development of a design thinking that emerges from the coexistence of a number of design parameters and performance criteria related to force flow, construction technologies, material use, and spatial qualities. Students will learn about diverse tools that allow for controlling such a complex blend of parameters and criteria at the interface between different disciplines such as structural engineering and architecture. These tools will include physical models, graphical methods, and digital tools. After a series of lectures and workshops, students will work on a design exercise that represents the core of the entire course. The design exercise is an opportunity to deal with an open-ended task that does not admit a univocal answer. In fact, besides structural performance, design options will be discussed and evaluated through a set of criteria including spatial qualities, constructability, and environmental footprint.
This course introduces civil engineering students to structural glass design and related façade engineering aspects. It aims to provide the students with the knowledge required in engineering offices to design glass elements but at the same time, the necessary fundamentals for later performing research in this field. To achieve this, the course includes lectures, design exercises and a design project.

Lectures:
- Production methods and properties of the material glass and glass products and their structurally relevant properties (annealed glass, thermally tempered glass, chemically tempered glass, laminated glass, insulating glass, curved glass);
- Connection principles and types for glass elements (mechanical fixing, adhesive bonding);
- Requirements and functions for transparent facades.

Design exercises:
- The principles and methods presented in the lectures are practiced with the students in design exercises. Hand calculation methods and their limitations as well as the software for structural glass design SJ Mepla are used for out-of-plane loaded glass elements. For in-plane loaded glass elements, the specifics of numerical calculation procedures are exemplified with the software ABAQUS.
- Select suitable supporting systems (post-and-beam façade, curtain wall, etc.) and connections (point fixings, brackets, etc.) for the glass elements and structurally design them.
- Apply selected approaches for the structural design of in-plane loaded glass elements;
- Select suitable supporting systems (post-and-beam façade, curtain wall, etc.) and connections (point fixings, brackets, etc.) for the glass elements and structurally design them.

Lecture notes
- Recommended and supplementary literature:

Prerequisites / notice
- Prior knowledge of structural analysis, especially steel structures is necessary. Prior basic knowledge on the method of finite elements is recommended.
Abstract
This course will present methods of scientific machine and deep learning (ML / DL) for applications in design and construction. After providing proper background on ML and the scientific ML (SciML) track, several applications of SciML together with their computational implementation during the design and construction process of the built environment are examined.

Objective
This course aims to provide a graduate-level introduction to machine learning, with a particular focus on scientific machine learning for applications in the design and construction phases of projects from architecture and civil engineering.

Upon completion of the course, the students will be able to:
1. Understand main ML background theory and methods.
2. Assess a problem and apply ML and DL in a computational framework accordingly.
3. Incorporate scientific domain knowledge in the SciML process.
4. Define, plan, conduct and present a SciML project.

Content
The course will include theory and algorithms for SciML, programming assignments, as well as a final project assessment.

The topics to be covered are:
2. Incorporation of Domain Knowledge into ML and DL.
4. ML training, validation and testing pipelines for academic and research projects.

A comprehensive series of computer/lab exercises and in-class demonstrations will take place, providing a "hands-on" feel for the course topics.

Lecture notes
The course script is composed by lecture slides, which are available online and will be continuously updated throughout the duration of the course.

101-0138-11L Bridge Design: Project Competition W 4 credits 2S W. Kaufmann

Abstract
This module offers the possibility to apply the fundamentals of the course Bridge Design in a conceptual design project. The scenario is set as a design competition: The students (group of two) will get a basic documentation (service criteria agreement, plans, digital terrain model, geotechnical report, photo documentation, etc.) and will develop a conceptual design suitable for the given site.

Objective
At the end of the course, students will have developed a convincing bridge design that satisfies following criteria:
_ Consideration of governing boundary conditions and constraints.
_ Conception of an efficient structural system with an adequate aesthetic expression considering the environment.
_ Definition of the relevant actions and decisive load cases.
_ Proof of feasibility by dimensioning the main structural elements.
_ Schematic overview of construction processes.
_ Appropriate presentation and visualisation of the proposed bridge design.

Content
The module is built up as follows:
0. Presentation of problem statement / project. (1st week of semester)
1. Introduction to design tools & working methods.
2. Working on project (milestones):
   _ a. Define requirements and boundary conditions.
   _ b. Study of references and possible concepts
   _ c. Choice of best variant
   _ d. Structural modelling & calculations
   _ e. Plans & visualisation
3. Presentation of your work in a mid-term and a final critique.
4. Submission

Prerequisites / notice
101-0138-00L Bridge Design or an equivalent attestation of knowledge in bridge design.

</tr>
</tbody>
</table>
In this course, the students will first learn some microscopic modelling and simulation concepts, and then complete a traffic-engineering project with microscopic traffic simulator Aimsun.

Microscopic modelling and simulation concepts will include:
1) Car following models
2) Lane change models
3) Calibration and validation methodology
Specific tasks for the project will include:
1) Building a model with the simulator Aimsun in order to replicate and analyze the traffic conditions measured/observed.
2) Calibrating and validating the simulation model.
3) Redesigning/Extending the model to improve the traffic performance through Aimsun and with/without programming in Python or C++.

The course will be based on a project that each group of students will build (design, calibrate, analyze and present) across the semester. A mid-term and final presentation of the work will be asked from each group of students. It consists of weekly 2-hour lectures. The students work in pairs on a project that completes in the end of the semester. The modelling software used is Aimsun and lectures (theory and hands on experience) are taking place in a computer room.

The course Road Transport Systems (Verkehr III), or simultaneously taking the course Traffic Engineering is encouraged. Previous experience with Aimsun/Python/C++ is helpful but not mandatory.

The lecture notes and additional handouts will be provided before the lectures.

According to the bibliography in the submitted documents, students should be able to recognize basic structural and material-related connections in traffic route engineering as well as be able to:
- partition the structural behaviour of pavement materials, such as concrete and asphalt, into subassemblies such as base, subbase, subgrade, and pavement; and
- design pavements. This includes knowledge of the interrelation of local conditions such as soil properties, climate, water, as well as the mechanical behaviour of the selected construction materials and the quality of the design models involved.

This knowledge is conveyed through lectures, practical demonstrations, moderated exercises and assignments (to be completed independently).

Geotechnical Engineering in Transportation and Pavement Design

**Competencies**

Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

Method-specific Competencies
- Analytical Competencies: assessed
- Media and Digital Technologies: fostered
- Problem-solving: fostered

Social Competencies
- Cooperation and Teamwork: assessed

Personal Competencies
- Critical Thinking: assessed

**Abstract**

This lecture deals with the geotechnical aspects in transportation, introduces pavement design and familiarises students with the behaviour of the various materials used in traffic route engineering. The lecture focuses on roads, however, many of the basic geotechnical principles are also transferable to other modes of transport.

**Objective**

Students should be able to recognize basic structural and material-related connections in traffic route engineering as well as be able to design pavements. This includes knowledge of the interrelation of local conditions such as soil properties, climate, water, as well as the mechanical behaviour of the selected construction materials and the quality of the design models involved.

**Content**

The content of the lecture is divided into the parts “geotechnical fundamentals in transportation”, “construction technology and materials” and “pavement design”. In the first part, soil stabilization, artificial compaction, testing of soils as well as the effects of frost are discussed for traffic route engineering. Thereafter, knowledge of the building materials and construction methods used in transportation is imparted with reference to European and national standards. After conveying some introductory concepts on the structural behaviour of asphalt, different design methods and models for pavements are subsequently examined.

This knowledge is conveyed through lectures, practical demonstrations, moderated exercises and assignments (to be completed independently).

**Lecture notes**

Slides, exercise and homework sheets, handouts

**Literature**

According to the bibliography in the submitted documents

**Prerequisites / notice**

Basic knowledge in “soil mechanics”.

**Abstract**

Railway technology; interaction between track and vehicles; stress; track construction including features of railway bridges and tunnels; starting up; track diagnostics and forecast; track maintenance and related methods

The lecture gives a deeper insight into railway technology, the interaction between track and vehicles as well as in construction and dimensioning of the track. Methods for starting up and the diagnosis of the state of the track and its forecast are shown. State-of-the-art maintenance strategies and technologies are presented.
1 - Railway technology
Track, power supply / catenaries, information technology, safety / interlockings / dispatching

2 - Interaction
Interaction between track and vehicles, vehicle dynamics

3 - Railway Track
Stress; track construction including special features of railway bridges and tunnels

4 - Starting up
Goals, methods, procedures

5 - Diagnostics, maintenance strategies
Track diagnostics and forecast

6 - Track maintenance
Maintenance strategies, fundamentals of track maintenance and related methods

Lecture notes
The slides will be made available.

Literature
A list with related technical literature will be handed out.

101-0491-10L Basics of Java and Best Practices for Scientific Computing

Abstract
This course provides an introduction to programming in Java, version control, and cloud computing.

Objective
At the end of the course, the students should
- Have acquired object-oriented programming skills with a focus on Java.
- Have an understanding of version control using git
- Have learned to deploy java applications on servers

Content
This course provides an introduction to object-oriented programming with Java. Four topics are covered:
- Basics of Java (objects, classes, interfaces, abstract classes, static classes, static methods,...)
- Injection (traditional vs. Guice)
- Code versioning
- Java application deployment on servers

Literature
Intro to Java Programming, Comprehensive Version (10th Edition) by Y. Daniel Liang

101-0249-00L Hydraulic Engineering III

Prerequisites: 101-0247-01L Hydraulic Engineering II or equivalent course.

Abstract
The lecture focuses on selected topics in hydraulic engineering, water management and aquatic ecology relating to hydropower and flood protection projects.

Objective
The overarching goal of the course is to broaden and enhance knowledge on special aspects in hydraulic engineering and its links to aquatic ecology and to understand the procedures and the planning sequence of large-scale projects.

Content
Selected topics in hydraulic engineering will be focused on, e.g. dam safety, materials in dam construction, possible problems at reservoirs like hazards from impulse waves and dam breaching, the hydraulics of spillways and intake structures at dams and weirs and the link between hydropower and ecology. Another focus will be put on typical approaches and procedures in the planning process of large-scale hydraulic engineering projects at the national and international level.

Lecture notes
Lecture handouts will be available online. Parts of the lectures will also be covered by a manuscript that will be available in electronic form.

Lecture notes / notice
External speakers will be involved to present current topics and projects in Switzerland and abroad.

101-0289-00L Applied Glaciology

Abstract
Autumn Semester 2024
Abstract
The course transmits fundamental knowledge for treating applied glaciological problems. Topics include climate-glacier interactions, glacier ice flow, glacier hydrology, ice avalanches, and lake ice.

Objective
The objectives of the courses are to:
- learn about fundamental glaciological processes, including glacier mass balance, ice dynamics, and glacier-related hazards;
- apply the above knowledge to some case studies inspired by contract-works performed at ETH's Glaciology section;
- generate the own computer code to solve the above case studies, and interpret the results;
- understand, both in class and in the field, the practical relevance of glaciology, with a focus on the Swiss applications.

Content
The course will develop along the following outline:
- How glaciology became a scientific discipline
- Glacier mechanics and ice flow
- Gravitational glacier instabilities
- Glacier hydrology and glacier lake outbursts
- Lake ice and ice bearing capacity
- Field excursion to Jungfraujoch
- Discussion of the exercises performed during the semester

Lecture notes
Digital lecture handouts will be distributed prior to each class.

Literature
Links to relevant literature will be provided during the classes.

Prerequisites / notice
Completed BSc studies. Basic knowledge in computer scripting in any language (e.g. Python, R, Julia, Matlab, IDL, ...) will be advantageous for solving the exercises. The exercises will be performed in groups. A minimal level of fitness is required for the field excursion.

Competencies

101-1249-00L  Hydraulics of Engineering Structures  W  3 credits  2G  I. Albayrak, F. Evers

Abstract
Hydraulic fundamentals are applied to hydraulic structures for wastewater, flood protection and hydropower. Typical case studies from engineering practice are further described.

Objective
Understanding and quantification of fundamental hydraulic processes with particular focus on hydraulic structures for wastewater, flood protection and hydropower.

In the course "Hydraulics of Engineering Structures", the competencies of process understanding, system understanding and measurement methods are taught, applied and examined. The competencies modeling, concept development and data analysis & interpretation are taught and data analysis & interpretation is applied in addition.

Content
1. Introduction & Basic equations
2. Losses in flow & Maximum discharge
3. Uniform flow & Critical flow
4. Hydraulic jump & Stilling basin
5. Backwater curves
6. Weirs & End overfall
7. Sidewer & Side channel
8. Bottom opening, Venturi & Culverts, Restrictors, Inverted siphons
9. Fall manholes & Vortex drop
10. Supercritical flow & Special manholes
11. Aerated flows & Low level outlets
12. Hydraulics of sediment bypass tunnels
13. Vegetated flows - Introduction & Application
14. Summary

Lecture notes
Text books

### Transport Processes in Torrents

**W 3 credits 2V I. Schalko**

**Abstract**

This course focuses on the various transport processes in torrents. This includes discharge, bedload, debris flow, and large wood. Differences between transport processes in rivers versus torrents will be discussed. Special focus will be put on the (1) analysis of the interaction between the transport processes (cascading processes) and the (2) design of countermeasures.

**Objective**

At the end of the course, the students will be able to:

(1) Describe the different transport processes in torrents, such as flow discharge or bedload transport,
(2) discuss how cascading processes affect the resulting natural hazard, and
(3) derive solutions for a sustainable hazard management.

**Content**

The first part of the lecture introduces the different transport processes in torrents such as discharge, bedload, debris flow, and large wood. This will include methods to determine and calculate the discharge, characterize debris flow, and quantify wood load.

In the second part of the lecture, special focus will be put on the cascading effects (what happens if multiple transport processes occur at once) and their implications on the resulting natural hazards.

The last part of the lecture focuses on the design of countermeasures such as check dams and will include examples from selected catchments in Switzerland.

Lecture notes

Lecture slides can be downloaded via Moodle.

</tr>
</tbody>
</table>

**Abstract**

The course offers an overview of relevant practical issues and present technological challenges for glass and natural stones in constructions. Students gain a good knowledge of the basics of glasses and natural stones, their potential as engineering materials and learn to apply them in the design of civil engineering constructions and to evaluate concepts.
Objective

Glass is increasingly used in constructions to ease the construction process, as functional insulation barrier, even for structural applications of impressive size. While everyone has experienced the innovation potential of glass in the last decade, products from natural stone suffer from an unjustified traditional image that often originates from a lack of understanding of the material and its combination with other materials. Culturally important structures often are made from natural stone and their conservation demands an understanding of their deterioration mechanisms, the concepts of which can be applied to other civil engineering materials. Designers and engineers need the knowledge to reconcile materials and system behavior with the entire processing, handling, integration and life time in mind.

In this module students are provided with a broad fundamental as well as practice-oriented education on glass and natural stone in civil engineering applications. Present and future construction and building concepts demand for such materials with optimized properties. Based on the fundamentals from the Bachelor course in materials by the end of this module, you should be able to:

-recognize and choose specific applications from the broad overview you were provided with,
-relate processing technologies to typical products and building applications and recognize (and explain typical damage related to wrong material choice or application,
-explain the nature of glassy and crystalline materials and interpret their physical behavior against this background,
-explain the major deterioration mechanisms in natural stone and how this relates to durability,
-analyze material combinations and appraise their application in future products as well as integration in existing constructions,
-summary with appropriate guidance publications on a related topic in an oral presentation and short report.

Content

Lecture 1: An introduction to science and engineering of glass and natural stone in construction (FW/TW)

Lecture 2: Glass chemistry including historical development of glass composition, use of raw materials, melts, chemical stability and corrosion. (FW)

Lecture 3: Geology and mineralogy of stones used in construction. Formation processes, chemistry, crystal structure. (TW)

Lecture 4: Microscopic models for glassy materials. Physics of vitrification. From microscopic physical models to thermodynamics, rheology and mechanics of glassy materials. (FW)

Lecture 5: Stone properties and behavior: microstructure, density, porosity, mechanical properties (TW)

Lecture 6: Glass physics: Optical properties (transmission, reflection, emission, refraction, polarization and birefringence, testing methods); Mechanical properties (density, thermal, mechanical, electric properties, glass testing) (FW)

Lecture 7: Stone properties and durability: transport, moisture and thermal cycling (TW)

Lecture 8: Forming and processing of glass: (plate and molded glass, drawing, slumping, profiling etc.; Processing: Cutting, mechanical processing, tempering, gluing, bending, laminating of glass Surface treatments: coating, sputtering, enamelizing, printing, etching, chemical pre-stressing.) (FW)

Lecture 9: Durability: Salt crystallization, freezing, biodeterioration (TW)

Lecture 10: Glass products for civil engineering applications: (Molded glasses, fiber glass, foam glass, plate glass); construction glass (insulation glass, structural glass, protective glass, intelligent glass, codes); (FW)

Lecture 11: Conservation: Consolidation, cleaning, and other treatments (TW).

Lecture 12: Glass in constructions. (modelling, application and regulation, typical damage in glass) (FW)

Lecture 13: Student presentations; exam questions (FW/TW)

Lab1: Durability of natural stone (FW/TW)

Lab2: Fracture of glass (FW/TW)

Will be handed out in the lectures

Literature

Werkstoffe II script (download via the IFB homepage). Rest will be handed out in the lectures

Prerequisites / notice

Werkstoffe I/II of the bachelor studies or equivalent introductory materials lecture.

101-0659-01L Durability and Maintenance of Reinforced Concrete W 4 credits 2V U. Angst, Z. Zhang

Abstract

We look at the durability of reinforced concrete structures, covering common deterioration processes such as reinforcement corrosion, frost damage, ASR, etc. The course spans the range from fundamental mechanisms to aspects of engineering practice. New methods and materials for preventative measures, condition assessment and repair techniques are treated. Examples from real cases are shown.
Objective

After this course you will have profound understanding about:

- the different mechanisms of deterioration of concrete structures, in particular reinforcement corrosion
- the relevant parameters affecting durability of reinforced concrete (cover depth, concrete quality, moisture, etc.)

Furthermore, you will know:

- current engineering approaches for durability design (according to standards) and their limitations
- refined models for enhanced durability design and service life predictions
- preventive measures to improve durability (e.g. stainless steel reinforcement, concrete surface coatings, etc.)
- the particular durability challenges with post-tensioned structures and ways to overcome them (electrically isolated tendons)
- methods for inspection and condition assessment of existing, ageing structures (including non-destructive techniques and monitoring with sensors)
- repair methods for deteriorated concrete structures such as conventional repair and electrochemical methods (in particular cathodic protection)
- possible future problems for durability that may arise with modern materials and construction technologies

Content

- Socio-economic challenges related to ageing infrastructures
- Degradation mechanisms for concrete: sulphate attack, ASR, frost attack.
- Inspection and condition assessment: Chloride analyses, carbonation depth, etc. Non-destructive tests, particularly potential mapping to detect corrosion. New developments (for example, monitoring with sensors).
- Stainless steel as reinforcing steel for concrete: Different types of stainless steels. Coupling with black reinforcing steel. Examples of application. Life-cycle-costs.
- Modern materials and construction technologies: Discussion of expected implications for the durability of structures today and in the future.

Excursion:

- We generally try to organize a site-visit (depending on availability of construction sites). Presumably, we will visit an installation site of cathodic protection on a concrete structure in the Zurich area.

Lecture notes

The course is based on the book

Slides of the lectures will be distributed in advance

Special handouts and reprints for particular topics will be distributed

The course is based on the book

Slides of the lectures will be distributed in advance

Special handouts and reprints for particular topics will be distributed

Form of teaching:

The course is a lecture that contains frequent discussion and interaction between students and lecturer. You will see and work on many examples from engineering practice, both during the lectures and in the form of exercises to be solved at home.

Report:

Each student will work on a small case study and deliver a report during the semester. The report will be graded.

Excursion:

We generally try to organize a site-visit (depending on availability of construction sites). Presumably, we will visit an installation site of cathodic protection on a concrete structure in the Zurich area.

101-0689-00L Shrinkage and Cracking of Concrete: Mechanisms and Impact on Durability

Concrete is generally viewed as a durable construction material. However, the long-term performance of a concrete structure can be greatly compromised by early-age cracking. This course will explain how shrinkage of concrete leads to cracking and how control of shrinkage allows increasing the expected durability of a concrete structure.
This course will begin with a brief introduction about hydration and microstructure development in cement paste and concrete. The students will learn the main causes of cracking at early ages, namely plastic, drying, thermal and autogenous shrinkage, with special emphasis on the driving mechanisms. The importance of concrete curing, especially in the first few days after casting, will be stressed and explained. Building on the knowledge of the driving forces of shrinkage, the way of action of shrinkage-reducing admixtures will be clarified and different applications illustrated. As an extension of external curing, the students will become familiar with internal water curing by means of saturated lightweight aggregates and superabsorbent polymers.

Most concrete members are restrained by adjacent structures. When shrinkage is restrained, cracks may develop. The students will learn how to apply different criteria for assessing concrete cracking and how to retrieve the mechanical properties of the concrete, especially stiffness and creep, which are needed for the calculations of self-induced stresses and risk of cracking.

In addition to macroscopic cracks, microcracking may occur in the cement paste due to inner restraint offered by the aggregates. Both macroscopic cracks and diffuse microcracking within a concrete may facilitate the ingress of harmful substances (e.g. chloride and sulfate ions) into the concrete; these may react with the concrete or with the reinforcement and create further deterioration. The students will acquire an understanding of the mechanisms of transport through cracked concrete, with special focus on experimental evidence and on techniques able to visualize the transport process and follow it in time.

As a final outcome of the course, the students will be able to estimate the impact of cracking on the expected durability of concrete structures and to implement different types of measures to reduce the extent of cracking.

Advances in concrete technology over the past decades have led to the practical use of concrete with a low water to binder ratio and with different types of mineral and organic admixtures. Another recent development is self-compacting concrete, which avoids concrete vibration and reduces labor during placing. Unfortunately, these concretes are especially prone to cracking at early ages, unless special precautions are taken. Proper curing becomes in this case the key to achieve better performance in various environmental and load conditions.

Specific topics covered by the course:
- Hydration and microstructure development
- Plastic shrinkage
- Development of mechanical properties
- Thermal deformation
- Autogenous deformation
- Drying shrinkage
- Creep and relaxation
- Curing
- Shrinkage-reducing admixtures
- Internal curing: saturated lightweight aggregates and superabsorbent polymers
- Fracture and microcracking
- Transport in cracked concrete
- Impact of cracking on concrete durability
- Self-healing of cracks

Lecture notes
For each lecture, lecture notes will be provided. In addition, one or two research papers for each lecture will be indicated as supportive information.

Prerequisites /
A basic knowledge of concrete technology is preferable.

Literature
Copies of one to two research papers relevant to the topic of each lecture will be provided to the students as supportive information.

101-0637-10L Wood Structure and Function
3 credits
2G
I. Burgert, G. von Arx

Abstract
The course Wood structure and function conveys basic knowledge on the microstructure of softwoods and hardwoods as well as general and species-specific relationships between growth processes, wood properties and wood function in the living tree.

Objective
Learning a basic understanding of the anatomy of wood and the related impact of endogenous and exogenous factors. The students can learn how to distinguish common central European wood species at the macroscopic and microscopic level. A deeper insight will be given by wood identification exercises for softwood species. Further, the students will gain insight into the relationships between tree growth and wood properties with a specific focus on the wood function in the living tree.

Content
In an introduction to wood anatomy, the general structural features of softwoods and hardwoods will be explained and factors of diversity and variability will be discussed. A specific focus is placed on common central European tree species with relevance in the wood sector, which will be studied in macro- and microstructural investigations. In the following, relationships between wood structure, properties and function in the living tree will be in the focus of the lectures. Topics covered are water transport, trends in wood anatomy within trees, environmental impact on wood anatomy, wood defects and their causes, tools to study wood properties over time, secondary changes in wood, and tree biomechanics.

101-0519-00L Method of Finite Elements II
3 credits
2G
E. Chatzi, K. Tatsis

Abstract
The Method of Finite Elements II is a continuation of Method of Finite Elements I. Here, we explore the theoretical and numerical implementation concepts for the finite element analysis beyond the linear elastic behavior. This course aims to offer students with the skills to perform nonlinear FEM simulations using coding in Python.

*This course offers no introduction to commercial software.
Objective

This class overviews advanced topics of the Method of Finite Elements, beyond linear elasticity. Such phenomena are particularly linked to excessive loading effects and energy dissipation mechanisms. Their understanding is necessary for reliably computing structural capacity.

In this course, instead of blindly using generic structural analysis software, we offer an explicit understanding of what goes on behind the curtains, by explaining the algorithms that are used in such software.

The course specifically covers the treatment of the following phenomena:
- Material Nonlinearity (Plasticity)
- Geometric Nonlinearity (Large Displacement Problems)
- Nonlinear Dynamics
- Fracture Mechanics

The concepts are introduced via theory, numerical examples, demonstrators and computer labs in Python (starting Fall 2021).

Upon completion of the course, the participants will be able to:
- Recognize when linear elastic analysis is insufficient
- Solve nonlinear dynamics problems, which form the core for limit state calculations (e.g. ultimate capacity, failure) of structures
- Numerically simulate fracture; a dominant failure phenomenon for structural systems.

See the class webpage for more information:

101-0187-00L  Structural Reliability and Risk Analysis  W  3 credits  2G  S. Marelli

Abstract
Structural reliability aims at quantifying the probability of failure of systems due to uncertainties in their design, manufacturing and environmental conditions. Risk analysis combines this information with the consequences of failure in view of optimal decision making. The course presents the underlying probabilistic modelling and computational methods for reliability and risk assessment.

Objective
The goal of this course is to provide the students with a thorough understanding of the key concepts behind structural reliability and risk analysis. After this course the students will have refreshed their knowledge of probability theory and statistics to model uncertainties in view of engineering applications. They will be able to analyze the reliability of a structure and use risk assessment methods for decision making under uncertain conditions. They will be aware of the state-of-the-art computational methods and software in this field.

Content
Engineers are confronted every day to decision making under limited amount of information and uncertain conditions. When designing new structures and systems, the design codes such as SIA or Euro-codes usually provide a framework that guarantees safety and reliability. However the level of safety is not quantified explicitly, which does not allow the analyst to properly choose between design variants and evaluate a total cost in case of failure. In contrast, the framework of risk analysis allows one to incorporate the uncertainty in decision making.

The first part of the course is a reminder on probability theory that is used as a main tool for reliability and risk analysis. Classical concepts such as random variables and vectors, dependence and correlation are recalled. Basic statistical inference methods used for building a probabilistic model from the available data, e.g. the maximum likelihood method, are presented.

The second part is related to structural reliability analysis, i.e. methods that allow one to compute probabilities of failure of a given system with respect to prescribed criteria. The framework of reliability analysis is first set up. Reliability indices are introduced together with the first order-second moment method (FOSM) and the first order reliability method (FORM). Methods based on Monte Carlo simulation are then reviewed and illustrated through various examples. By-products of reliability analysis such as sensitivity measures and partial safety coefficients are derived and their links to structural design codes is shown. The reliability of structural systems is also introduced as well as the methods used to reassess existing structures based on new information.

The third part of the course addresses risk assessment methods. Techniques for the identification of hazard scenarios and their representation by fault trees and event trees are described. Risk is defined with respect to the concept of expected utility in the framework of decision making. Elements of Bayesian decision making, i.e. pre-, post and pre-post risk assessment methods are presented.

Literature

S. Marelli, R. Schöbi, B. Sudret, UQLab user manual - Structural reliability (rare events estimation), Report UQLab-V0.92-107.
The course provides the necessary knowledge to develop models supporting the solution of given planning problems and also introduces cost-benefit analysis as a decision-making tool. Examples of such planning problems are the estimation of traffic volumes, prediction of estimated utilization of new public transport lines, and evaluation of effects (e.g., change in emissions of a city) triggered by building new infrastructure and changes to operational regulations.

To cope with that, the problem is divided into sub-problems, which are solved using various statistical models (e.g. regression, discrete choice analysis) and algorithms (e.g. iterative proportional fitting, shortest path algorithms, method of successive averages).

The course is composed of a lecture part, providing the theoretical knowledge, and an applied part in which students develop their own models in order to evaluate a transport project/ policy by means of cost-benefit analysis. Interim lab session take place regularly to guide and support students with the applied part of the course.

At the end of the course, the students should:

1. have an understanding of agent-based modeling
2. have an understanding of MATSim
3. have practical experience of using MATSim to perform transportation studies

This course provides an introduction to agent-based models for transportation policy analysis. Four essential topics are covered:

1) Introduction of agent-based modeling and its comparison to the traditional state of practice modeling
2) Introduction of MATSim, an open-source agent-based model, developed at ETH Zurich and TU Berlin, and its various parts
3) Setting up an agent-based model simulation, where different statistical methods used in the process will be introduced and explained.
4) Conducting a transport policy study. The case study will be performed in groups and will include a paper-like report.

During the course, outside lecturers will give several lectures on using MATSim in practice (i.e., SBB).

There are no strict preconditions regarding which lectures the students should have previously attended. However, experience with at least one high-level programming language (Java, R, Python, or other) is recommended.

For those without object-oriented programming experience, a crash course 101-0491-10 Basics of Java and Best Practices for Scientific Computing before the start of HS is recommended.

In the course Numerical Hydraulics the basics of numerical modelling of flows are presented.

The basic equations are derived from first principles. Possible simplifications relevant for practical problems are shown and their applicability is discussed. Using the example of non-steady state pipe flow numerical methods such as the method of characteristics and finite difference methods are introduced. The finite volume method as well as the method of characteristics are used for the solution of the shallow water equations. Special aspects such as wave propagation and turbulence modelling are also treated.

All methods discussed are applied practically in exercises. This is done using programs in MATLAB which partially are programmed by the students themselves. Further, some generally available softwares such as BASEMENT for non-steady shallow water flows are used.
The Method of Finite Elements II is a continuation of Method of Finite Elements I. Here, we explore the theoretical and numerical implementation concepts for the finite element analysis beyond the linear elastic behavior. This course aims to offer students with the skills to perform nonlinear FEM simulations using coding in Python.

Upon completion of the course, the participants will be able to:
- Recognize when linear elastic analysis is insufficient
- Solve nonlinear dynamics problems, which form the core for limit state calculations (e.g. ultimate capacity, failure) of structures
- Numerically simulate fracture; a dominant failure phenomenon for structural systems.

Upon completion of the course, the participants will be able to:
- Fracture Mechanics
- Nonlinear Dynamics
- Material Nonlinearity (Plasticity)
- Nonlinear Dynamics
- Fracture Mechanics

The concepts are introduced via theory, numerical examples, demonstrators and computer labs in Python (starting Fall 2021).

The course specifically covers the treatment of the following phenomena:
- Material Nonlinearity (Plasticity)
- Geometric Nonlinearity (Large Displacement Problems)
- Nonlinear Dynamics
- Fracture Mechanics

Abstract
Introduction to computational sciences with focus on numerical modeling of the mechanics of materials. Simulation of material damage, fracture and failure with various material models.

Learning from mistakes and failures is as old as the engineering discipline. Understanding why things went wrong is essential for improvement, but often impossible without the help of numerical modelling. Real world problems are often highly nonlinear, dependent on multiple physical fields, involve fundamental material behavior far from equilibrium and reversibility, and can often only be understood by addressing different relevant scales.

In this course, we will use real-life cases to learn how to deal with such problems. Starting from the problem description with governing equations, you will learn how to tackle non-linear and multi-field problems using numerical simulations. A particular focus will be on fracture. We will investigate the conditions and mechanisms that lead to material failure and analyze the contributions of plastic behavior, size effects, randomness in the underlying material micro-structure, and various other non-linear material behavior. You will learn various approaches to model the mechanics of complex heterogeneous materials and to implement your model in Python code to run numerical simulations.

Content
1 Introduction to (numeric) forensic engineering
2 The nature of engineering problems (governing equations)
3 Numerical recipes for dealing with non-linear problems
4 Multi-field problems (HTM)
5 Creep and relaxation
6 On the nature of failure - Physics of damage and fracture
7 Cracks and growth in structures (LEFM and beyond)
8 Damage and fracture in heterogeneous materials
9 Mechanics of fatigue
10 Student -Project presentation

Lecture notes
Will be provided during the lecture via moodle.

Literature
Will be provided during the lecture.
### 101-0250-00L Solving Partial Differential Equations in Parallel on GPUs

**Abstract**
This course aims to cover state-of-the-art methods in modern parallel computing on Graphics Processing Unit (GPU), supercomputing and code development with applications to natural sciences and engineering.

**Objective**
When quantitative assessment of physical processes governing natural and engineered systems relies on numerically solving differential equations, fast and accurate solutions require performant algorithms leveraging parallel hardware. The goal of this course is to offer a practical approach to solve systems of differential equations in parallel on GPUs using the Julia language. Julia combines high-level language conciseness to low-level language performance which enables efficient code development.

The course will be taught in a hands-on fashion, putting emphasis on you writing code and completing exercises; lecturing will be kept at a minimum. In a final project you will solve a solid mechanics or fluid dynamics problem of your interest, such as the shallow water equation, the shallow ice equation, acoustic wave propagation, nonlinear diffusion, viscous flow, elastic deformation, viscous or elastic poromechanics, frictional heating, and more. Your Julia GPU application will be hosted on a git-platform and implement modern software development practices.

**Content**

- **Part 1 - Discovering a modern parallel computing ecosystem**
  - Learn the basics of the Julia language;
  - Learn how to solve diffusion, wave propagation and advection processes;
  - Implement efficient iterative algorithms;
  - Get started with software development tools: git, version control.

- **Part 2 - Developing your own parallel algorithms on GPUs**
  - Implement wave propagation and porous convection;
  - Apply spatial and temporal discretisation (finite-differences, various time-stepper);
  - Understand the practical challenges of parallel computing: GPUs, multi-core CPUs;
  - Learn about main simulation performance limiters;
  - Implement software development tooling: unit tests, continuous integration (CI).

- **Part 3 - Multi-GPU computing projects**
  - Understand the practical challenges of distributed parallel computing on multi-GPUs;
  - Implement shared (on CPU and GPU) and distributed memory parallelisation (multi-GPUs/CPUs);
  - Automate the software tooling using remote runners.

**Final projects**
- Apply your new skills in a final project;
- Implement advanced physical processes (solid and fluid dynamic - elastic and viscous solutions).

**Lecture notes**
Digital lecture notes, interactive Julia notebooks, online material.

**Literature**
Links to relevant literature will be provided during classes.

**Prerequisites / notice**
Completed BSc studies. Interest in and basic knowledge of numerics, applied mathematics, and physics/engineering sciences. Basic programming skills (in e.g. Matlab, Python, Julia); advanced programming skills are a plus.

**Competencies**

- **Subject-specific Competencies**
  - Concepts and Theories: assessed
  - Techniques and Technologies: assessed

- **Method-specific Competencies**
  - Analytical Competencies: fostered
  - Decision-making: fostered
  - Media and Digital Technologies: assessed
  - Problem-solving: assessed
  - Project Management: assessed

- **Social Competencies**
  - Communication: fostered
  - Cooperation and Teamwork: fostered
  - Sensitivity to Diversity: fostered

- **Personal Competencies**
  - Creative Thinking: assessed
  - Critical Thinking: assessed
  - Integrity and Work Ethics: fostered
  - Self-awareness and Self-reflection: fostered
  - Self-direction and Self-management: assessed

### 101-0139-00L Scientific Machine and Deep Learning for Design and Construction

**Abstract**
This course will present methods of scientific machine and deep learning (ML / DL) for applications in design and construction. After providing proper background on ML and the scientific ML (SciML) track, several applications of SciML together with their computational implementation during the design and construction process of the built environment are examined.

**Objective**
This course aims to provide a graduate-level introduction to machine learning, with a particular focus on scientific machine learning for applications in the design and construction phases of projects from architecture and civil engineering.

Upon completion of the course, the students will be able to:
1. Understand main ML background theory and methods.
2. Assess a problem and apply ML and DL in a computational framework accordingly.
3. Incorporate scientific domain knowledge in the SciML process.
4. Define, plan, conduct and present a SciML project.
The course will include theory and algorithms for SciML, programming assignments, as well as a final project assessment.

The topics to be covered are:
2. Incorporation of Domain Knowledge into ML and DL.
4. ML training, validation and testing pipelines for academic and research projects.

A comprehensive series of computer/lab exercises and in-class demonstrations will take place, providing a "hands-on" feel for the course topics.

The course will include theory and algorithms for SciML, programming assignments, as well as a final project assessment.

The course script is composed by lecture slides, which are available online and will be continuously updated throughout the duration of the course.

This course introduces civil engineering students to structural glass design and related façade engineering aspects. It aims to provide the students the knowledge required in engineering offices to design glass elements but at the same time, the necessary fundamentals for later performing research in this field. To achieve this, the course includes lectures, design exercises and a design project.

The lectures will cover the following contents:
- Production methods and properties of the material glass and glass products and their structurally relevant properties (annealed glass, thermally tempered glass, chemically tempered glass, laminated glass, insulating glass, curved glass);
- Connection principles and types for glass elements (mechanical fixing, adhesive bonding);
- Requirements for glass elements depending on the application area (vertical glazing, overhead glazing, walk-on glazing, barrier glazing);
- Structural design of glass elements based on standards and research results (out-of-plane loaded glass elements and in-plane loaded glass elements);
- Typologies and design of structural systems for transparent façades;
- Requirements and functions for transparent façades.

The principles and methods presented in the lectures are practiced with the students in design exercises. Hand calculation methods and their limitations as well as the software for structural glass design SJ Mepla are used for out-of-plane loaded glass elements. For in-plane loaded glass elements, the specifics of numerical calculation procedures are exemplified with the software Abaqus.

The topics to be covered are:
2. Incorporation of Domain Knowledge into ML and DL.
4. ML training, validation and testing pipelines for academic and research projects.

A comprehensive series of computer/lab exercises and in-class demonstrations will take place, providing a "hands-on" feel for the course topics.

The course script is composed by lecture slides, which are available online and will be continuously updated throughout the duration of the course.

This course introduces civil engineering students to structural glass design and related façade engineering aspects. It aims to provide the students the knowledge required in engineering offices to design glass elements but at the same time, the necessary fundamentals for later performing research in this field. To achieve this, the course includes lectures, design exercises and a design project.

Lectures:
The lectures will cover the following contents:
- Production methods and properties of the material glass and glass products and their structurally relevant properties (annealed glass, thermally tempered glass, chemically tempered glass, laminated glass, insulating glass, curved glass);
- Connection principles and types for glass elements (mechanical fixing, adhesive bonding);
- Requirements for glass elements depending on the application area (vertical glazing, overhead glazing, walk-on glazing, barrier glazing);
- Structural design of glass elements based on standards and research results (out-of-plane loaded glass elements and in-plane loaded glass elements);
- Typologies and design of structural systems for transparent façades;
- Requirements and functions for transparent façades.

Design exercises:
The principles and methods presented in the lectures are practiced with the students in design exercises. Hand calculation methods and their limitations as well as the software for structural glass design SJ Mepla are used for out-of-plane loaded glass elements. For in-plane loaded glass elements, the specifics of numerical calculation procedures are exemplified with the software Abaqus.

Lecture notes
The lectures are based on lecture slides and handouts.

Literature
Recommended and supplementary literature:

Prior knowledge of structural analysis, especially steel structures is necessary. Prior basic knowledge on the method of finite elements is recommended.
Creative Thinking

Watershed Modelling is a practical course on numerical water balance models for a range of catchment-scale water resource applications. The course is designed to provide training in the use of watershed models for environmental engineers. The course is built on literature consist of collections from standard hydrological textbooks and research papers, collected by the instructors on the course.

The main aim of the course is to provide practical training with watershed models for environmental engineers. The course is based on the simulation model Topkapi-ETH and alternative scenarios regarding the infrastructure, simulation of in-vehicle technologies and vehicle-to-everything (V2X) communication.

Simulations will be implemented in Aimsun software. The students will be asked to understand, analyze, interpret and present traffic properties. Simulation of alternative scenarios over the same network will be performed. Finally, students will be asked to design, implement, analyze and present a novel proposal, which will be compared with the base scenario.

Upon completion of the course, the students will:

- Understand the basic models used in microsimulation software (car-following, lane change, gap acceptance, give ways, on/off-ramps, etc.).
- Design a road transport network inside the simulation software.
- Understand the basics behind modeling traffic demand and supply, vehicle dynamics, performance indicators for evaluation and network design for a realistic road transport network.
- Understand how to design a complete study, implement and validate it for planning purposes, e.g. creating a new road infrastructure.
- Make valid and concrete engineering proposals based on the simulation model and alternative scenarios.

In this course, the students will first learn some microscopic modelling and simulation concepts, and then complete a traffic-engineering project with microscopic traffic simulator Aimsun.

Microscopic modelling and simulation concepts will include:

1) Car following models
2) Lane change models
3) Calibration and validation methodology

Specific tasks for the project will include:

1) Building a model with the simulator Aimsun in order to replicate and analyze the traffic conditions measured/observed.
2) Calibrating and validating the simulation model.
3) Redesigning/extended the model to improve the traffic performance through Aimsun and with/without programming in Python or C++.

The course will be based on a project that each group of students will build (design, calibrate, analyze and presentation) across the semester. A mid-term of the project will be asked from each group of students. It consists of weekly 2-hour lectures. The students work in pairs on a group project that completes in the end of the semester. The modelling software used is Aimsun and lectures (theory and hands on experience) are taking place in a computer room.

The course Road Transport Systems (Verkehr III), or simultaneously taking the course Traffic Engineering is encouraged. Previous experience with Aimsun/Python/C++ is helpful but not mandatory.

Specific tasks for the project will include:

1) Building a model with the simulator Aimsun in order to replicate and analyze the traffic conditions measured/observed.
2) Car following models
3) Calibration and validation methodology
4) Lane change models

Throughout the semester, along with theoretical concepts, the students will build the base scenario (design, calibration and validation) and will present alternative scenarios regarding the network design, simulation of in-vehicle technologies and vehicle-to-everything (V2X) communication. Simulations will be implemented in Aimsun software. The students will be asked to understand, analyze, interpret and present traffic properties. Simulation of alternative scenarios over the same network will be performed. Finally, students will be asked to design, implement, analyze and present a novel proposal, which will be compared with the base scenario.

Upon completion of the course, the students will:

- Understand the basic models used in microsimulation software (car-following, lane change, gap acceptance, give ways, on/off-ramps, etc.).
- Design a road transport network inside the simulation software.
- Understand the basics behind modeling traffic demand and supply, vehicle dynamics, performance indicators for evaluation and network design for a realistic road transport network.
- Understand how to design a complete study, implement and validate it for planning purposes, e.g. creating a new road infrastructure.
- Make valid and concrete engineering proposals based on the simulation model and alternative scenarios.

In this course, the students will first learn some microscopic modelling and simulation concepts, and then complete a traffic-engineering project with microscopic traffic simulator Aimsun.

101-0491-10L Basics of Java and Best Practices for Scientific Computing  W  1 credit  1U  M. Balac

Abstract

This course provides an introduction to programming in Java, version control, and cloud computing.

Objective

At the end of the course, the students should
● Have acquired object-oriented programming skills with a focus on Java.
● Have an understanding of version control using git
● Have learned to deploy java applications on servers

Content

This course provides an introduction to object-oriented programming with Java. Four topics are covered:
● Basics of Java (objects, classes, interfaces, abstract classes, static classes, static methods,...)
● Injection (traditional vs. Guice)
● Code versioning
● Java application deployment on servers

Literature

Intro to Java Programming, Comprehensive Version (10th Edition) by Y. Daniel Liang

401-0647-00L Introduction to Mathematical Optimization  W  5 credits  2V+1U  D. Adjishvili

Abstract

Introduction to basic techniques and problems in mathematical optimization, and their applications to a variety of problems in engineering.

Objective

The goal of the course is to obtain a good understanding of some of the most fundamental mathematical optimization techniques used to solve linear programs and basic combinatorial optimization problems. The students will also practice applying the learned models to problems in engineering.

Content

Topics covered in this course include:
- Linear programming (simplex method, duality theory, shadow prices, ...).
- Basic combinatorial optimization problems (spanning trees, shortest paths, network flows, ...).
- Modelling with mathematical optimization: applications of mathematical programming in engineering.

Literature

Information about relevant literature will be given in the lecture.

Prerequisites /

This course is meant for students who did not already attend the course "Mathematical Optimization", which is a more advance course covering similar topics. Compared to "Mathematical Optimization", this course has a stronger focus on modeling and applications.

101-0307-00L Design and Construction in Geotechnical Engineering  W  4 credits  3G  I. Anastasopoulos, K. Kassas, A. Marin, L. Sakellariadis

Abstract

This lecture deals with the practical application of the knowledge gained in the fundamental lectures from the Bachelor degree. The basics of planning and design of geotechnical structures will be taught for the main topics geotechnical engineers are faced to in practice.

Objective

Transfer of the fundamental knowledge taught in the Bachelor degree to practical application. Ability to plan and design geotechnical structures based on the state of the art.

Content

Introduction to Swisscode SIA
Foundations and settlements
Pile foundations
Excavations
Slopes
Soil nailing
Reinforced geosystems
Ground improvement
River levees

Lecture notes

Script in the form of chapters and powerpoint overheads with web support (moodle-app2.let.ethz.ch)

Exercises

Literature

Relevant literature will be stated during the lectures

Prerequisites /

Pre-condition: Successful examinations (pass) in the geotechnical studies (soil mechanics and ground engineering, each 5 credits) in the Bachelor degree of Civil Engineering (ETH), or equivalent for new students.

The lecture contains at least one presentation from practice.
Practice-oriented introduction to BIM working methods for civil engineers. Advantageous applications compared to 2D/3D, especially for digital construction and parametric modelling.

In this course students will see what the BIM method entails for a civil engineer and learn how to create a parametric model yourself incl. associated steel, precast concrete, in-situ concrete, reinforcement and masonry parts based on a practical example. Students will also learn how to automatically create formwork plans, parts lists and data for digital prefabrication and construction sites. They will thus acquire the necessary basis for their future work as engineers and how their work interacts with draughtsmen, designers and master builders in a digital working environment.

- Parametric modelling of steel, precast concrete, in-situ concrete, reinforcements and masonry
- Parametric modelling of connections and joints
- Defining and evaluating concreting stages
- Semi-automatic creation of formwork plans according to sia standards
- Automatic export of all necessary models and data for BIM2Field
- Insight into BIM2Field applications "Stake out from model" and "Lay reinforcement based on model".

Available eLearning content
PowerPoint slides

Basic knowledge of physics, mechanics and soil mechanics is required.

This course aims to provide a basic understanding of the mechanics and rheology of granular matter. It includes fundamental concepts as well as recent progress in research with main focus on related engineering and natural hazards applications. Small experiments are performed in class to illustrate important processes and state-of-the-art numerical modeling tools are introduced and used.

Granular materials have the ability to sustain stresses like a solid of flow like a fluid depending on the applied solicitation and boundary conditions. This course targets civil, geotechnical and mechanical engineering students, who are interested in discovering the fascinating and sometimes surprising world of granular media, the second most used material in industry and in learning novel modeling approaches. After this class, the students should know how to describe inter-particle interactions at the grain scale, the statics of granular materials, the transition towards fluid states through classical frictional plastic laws and the rheology of granular flows. Furthermore, the students should know the basics of the Discrete Element Method (DEM), its advantage and limitations and should be able to use a commercial software for different types of application.

This course covers grain-scale interactions, statics and rheology of granular materials based on a mix between classical lectures, on-board developments, presentation of small experiments, analytical and numerical exercises. We present the domains of application of granular mechanics through examples taken from the industry or research. In addition, the Discrete Element Method (DEM) together with state-of-the-art contact models will be presented and used to simulate standard tests such as the granular column collapse, shear flows but also more complex industrial or geophysical problems. Calibration of model parameters based on laboratory experiments will be discussed. The course will not cover aspects related to granular gasses and kinetic theory.

Lecture slides and lecture notes will be provided on Moodle.

Books:
1. Granular Media: Between Fluid and Solid by Bruno Andreotti, Olivier Pouliquen, and Yoël Forterre
2. Particulate Discrete Element Modelling: A Geomechanics Perspective by Catherine O’Sullivan

Basic knowledge of physics, mechanics and soil mechanics is required.
Adaptability and Flexibility

This module offers the possibility to apply the fundamentals of the course Bridge Design in a conceptual design project. The scenario is set... Language: English

W assessed

At the end of the course, students will have developed a convincing bridge design that satisfies following criteria:

fostered

To achieve this, they need to be able to do the following:

1. Apply circular principles using recovered building materials.
2. Compare different digital technologies applied in circular construction (e.g., LiDAR scanning, drone imagery, photogrammetry, computational design, AI, computer vision, XR, LCA tools etc.)
3. Understand the potential and limitations of AI for circular construction, e.g. use machine learning to detect and digitize materials (computer vision) or to support creativity in the early design phases of circular construction (generative AI).
4. Communicate the importance and urgency of circular construction.
5. Assess the environmental impact implications of their design and technology decisions through a preliminary Life Cycle Assessment (LCA).

Content

The module is built up as follows:

0. Presentation of problem statement / project (1st week of semester)
1. Introduction to design tools & working methods.
2. Working on project (milestones):
   a. Define requirements and boundary conditions.
   b. Study of references and possible concepts
   c. Choice of best variant
   d. Structural modelling & calculations
   e. Plans & visualisation
3. Presentation of your work in a mid-term and a final critique.
4. Submission

Prerequisites / notice

101-0138-00L Bridge Design or an equivalent attestation of knowledge in bridge design.

Digital Creativity for Circular Construction

W 8 credits 7.5P C. De Wolf

All students who register go on a waiting list until 11.09.2024. To register:

1. Enroll before 05.09.2024
2. Send a short motivation letter (max. 300 words) and a 1-page CV to cea-course@ibi.baug.ethz.ch by 05.09.2024
3. MIBS students: This course is mandatory and there is no need to send your application documents

Please only register for the course if you really intend to participate on all course dates (see course catalog), otherwise, you will deprive someone else of a place.

Abstract

The course is about digital innovation towards a circular economy in the built environment. How can we bring together two worlds that are often too distinct: low-impact construction and digital innovation? Bringing digital tools already used in other sectors into the construction sector, students will learn about circular construction (e.g., reuse of materials) through hands-on learning practices.

Objective

In the fall semester 2024 we will focus on applying artificial intelligence (AI) and extended reality (XR) to the circular design workflow and. The course will be taught at the Kunsthalle Zurich as part of an exhibition.

By the end of this course, students will be able to use augmented computational design enabling circular construction, with a view to environmental implications. They will be able to assess the challenges and opportunities of low-carbon, circular construction and evaluate possible solutions using digital technologies to enable a circular built environment (more specifically, with reused building materials). To achieve this, they need to be able to do the following:

1. Apply circular principles using recovered building materials.
2. Compare different digital technologies applied in circular construction (e.g., LiDAR scanning, drone imagery, photogrammetry, computational design, AI, computer vision, XR, LCA tools etc.)
3. Understand the potential and limitations of AI for circular construction, e.g. use machine learning to detect and digitize materials (computer vision) or to support creativity in the early design phases of circular construction (generative AI).
4. Communicate the importance and urgency of circular construction.
5. Assess the environmental impact implications of their design and technology decisions through a preliminary Life Cycle Assessment (LCA).

Content

Students will receive an introduction to circular principles by experts from the building industry and visit of (de-)construction sites where circular construction is exemplified. They will explore how to use digital technologies such as LiDAR scanning, photogrammetry, scan-to-BIM, computer vision, computational design, digital fabrication, blockchain technology and learn about the design implications using reclaimed building materials. This course is meant as an overview/introduction of many digital technologies that could be useful for circularity and gives the tools to students to further study the technologies they are most interested in on their own. Creativity in writing, filmmaking, design, construction, etc. is expected from the students. This course will give the tools to students to learn more on LCA if they wish to deepen their knowledge further.

Lecture notes

Language: English

Courses are on Tuesday afternoons in Kunsthalle or a room at ETH, but also require out-of-the-semester work and significant homework and site visits outside of class hours.
Currently, Life Cycle Assessment (LCA) is applied as an ex-post design evaluation of buildings, but rarely used to improve the building. The overarching goal of the course is to broaden and enhance knowledge on special aspects in hydraulic engineering and its links to aquatic ecology and to understand the procedures and the planning sequence of large-scale projects.

Abstract

The lecture focuses on selected topics in hydraulic engineering, water management and aquatic ecology relating to hydropower and flood protection projects.

Objective

The overarching goal of the course is to broaden and enhance knowledge on special aspects in hydraulic engineering and its links to aquatic ecology and to understand the procedures and the planning sequence of large-scale projects.

Content

Selected topics in hydraulic engineering will be focused on, e.g. dam safety, materials in dam construction, possible problems at reservoirs like hazards from impulse waves and dam breaching, the hydraulics of spillways and intake structures at dams and weirs and the link between hydropower and ecology. Another focus will be put on typical approaches and procedures in the planning process of large-scale hydraulic engineering projects at the national and international level.

Lecture notes

Lecture handouts will be available online. Parts of the lectures will also be covered by a manuscript that will be available in electronic form. Lecture notes will be specified in the lecture and in a written manuscript.

Prerequisites / notice

Prerequisites: 101-0247-01L Hydraulic Engineering II or equivalent course.

Lecture

Hydraulic Engineering III

101-0249-00L

Type: W

ECTS: 3

Hours: 2S

Lecturers: R. Boes

Prerequisites

1. Enroll before 05.09.2024.
2. Send a short letter of motivation (max. 300 words) and a 1-page CV to cea-course@ibi.baug.ethz.ch by 05.09.2024.

Collaborators: Kunsthalle Zürich, ETH AI Center, Design++

Abstract

Currently, Life Cycle Assessment (LCA) is applied as an ex-post design evaluation of buildings, but rarely used to improve the building during the design process. The aim of this course is to apply LCA during the design of buildings by means of a digital, parametric tool. The necessary fundamentals of the LCA method will be taught following a lecture on demands approach.
Objective
The course will follow two main objectives and a third optional objective, depending on the design projects the students' choose. At the end of the course, the students will:
1. Know the methodology of LCA
2. Be able to apply LCA in the design process to assess and improve the environmental performance of their projects
3. Be able to use the parametric LCA tool and link it to additional performance assessment tools for a holistic optimisation

Content
The course will be structured into two parts, each making up about half of the semester.

Part I: Exercises with lectures on demand
The first six individual courses will follow the “lectures on demand” approach. Small “hands-on” exercises focusing on one specific aspect will be given out and the necessary background knowledge will be provided in the form of short input lectures when questions arise. The following topics will be discussed during the first part:
1) LCA basic introduction
2) System boundaries, functional unit, end of life
3) Decision-making
4) Media and Digital Technologies
5) Integrated analysis of environmental and cost assessment
6) BIM-LCA, available calculation tools and databases

Part II: Project-based learning
In the second part, the students will work on their individual project in groups of three. For the design task, the students will bring their own project and work on improving it. The projects can be chosen depending on the students background and range from buildings to infrastructure projects. Intermediate presentations will ensure the continuous work and make sure all groups are on the same level and learn from each other. During this part, the following hands-on tutorials will be given:
1) Introduction to Rhinoceros 6 and 7
2) Introduction to grasshopper
3) Integrated assessment tools (ladybug tools)
4) Introduction to in-house grasshopper plugin for LCA analysis

Prerequisites
Prerequisite: BSc course “Tunnelling”, MSc courses “Tunnelling I” and “Tunnelling II”.

Lecture notes
As the course follows a lecture on demand approach, the lecture slides will be provided after each course.

Literature
A list of the basic literature will be offered on a specific online platform, that could be used by all students attending the lectures.

Prerequisites / notice
The students are expected to work out of class as well. The course time will be used by the teachers to answer project-specific questions.

The lecture series will be conducted in English and is aimed at students of master’s programs, particularly in civil engineering and MIBS. No lecture will be given during Seminar week.

Abstract
This course will present methods of scientific machine and deep learning (ML / DL) for applications in design and construction. After providing proper background on ML and the scientific ML (SciML) track, several applications of SciML together with their computational implementation during the design and construction process of the built environment are examined.
Objective

This course aims to provide a graduate-level introduction to machine learning, with a particular focus on scientific machine learning for applications in the design and construction phases of projects from architecture and civil engineering.

Upon completion of the course, the students will be able to:
1. Understand main ML background theory and methods.
2. Assess a problem and apply ML and DL in a computational framework accordingly.
3. Incorporate scientific domain knowledge in the SciML process.
4. Define, plan, conduct and present a SciML project.

Content

The course will include theory and algorithms for SciML, programming assignments, as well as a final project assessment.

The topics to be covered are:
2. Incorporation of Domain Knowledge into ML and DL.
4. ML training, validation and testing pipelines for academic and research projects.

A comprehensive series of computer/lab exercises and in-class demonstrations will take place, providing a "hands-on" feel for the course topics.

Lecture notes

The course script is composed by lecture slides, which are available online and will be continuously updated throughout the duration of the course.

Theoretical and Experimental Soil Mechanics ■

The number of participants is limited to 60 due to the existing laboratory equipment! Students with major in Geotechnical Engineering have priority. Registrations will be accepted in the order they are received.

Abstract

Overview of soil behaviour
Explanation of typical applications: reality, modelling, lab tests with transfer of results to practical examples
Consolidation theory and typical applications
Triaxial tests: consolidation & shear, drained & undrained response
Plasticity theory & Critical State Soil Mechanics, Cam Clay
Application of plasticity theory
Introduction to physical modelling

Objective

(1) Extend knowledge of theoretical approaches that can be used to describe soil behaviour.
(2) Offer the opportunity to perform hands on element tests required for constitutive model calibration.
(3) Enable students to select an appropriate constitutive model and calibrate it using element test performed in the lab.
(4) Enable students to carry out FE analyses for realistic geotechnical applications.

Content

Overview of soil behaviour
Discussion of general gaps between basic theory and soil response
Stress paths in practice & in laboratory tests
Explanation of typical applications: reality, modelling, laboratory tests with transfer of results to the practical examples
Consolidation theory for incremental and continuous loading oedometer tests and typical applications in practice
Triaxial & direct shear tests: consolidation & shear, drained & undrained response
Plasticity theory & Critical State Soil Mechanics, Cam Clay
Application of plasticity theory
Introduction to physical modelling with emphasis on centrifuge modelling

Lecture notes

Printed script with web support
Exercises

Literature

https://moodle-app2.let.ethz.ch/

Prerequisites /

Pre-requisites: Fundamental knowledge of solid and soil mechanics.

The theoretical part of the course will be covered by problem-based lectures.

The experimental part will be covered by hands-on element tests performed by the students in the laboratory. These experimental results will be instrumental in the calibration of advanced soil constitutive models.

The connection between the experimental and theoretical parts of the course will be facilitated by means of numerical investigations (i.e, FE analyses), including the selection and calibration of relevant constitutive models. The numerical investigations shall be documented by the students in a final report.

Laboratory equipment will be available for 60 students. Students registered for the Geotechnics Specialty in Masters will be given priority as follows: (1) 2nd year students; (2) 1st year students, (3) doctoral students taking the class for their qualifying exam; Further students will be admitted on a first-come-first-served basis.
### Structural Glass Design and Facade Engineering

**W** 3 credits  
**V**. A. Silvestru

#### Abstract
The course gives an introduction to structural glass design and related façade engineering aspects. It will focus on the properties of the material glass and glass products, as well as on the structural design of glass elements and their supporting systems and connections.

#### Objective
After successful completion of the course, students will be able to:
- Understand and apply the fundamentals of the material glass and glass products, the basic principles for using glass as a load-carrying building material for structural applications and the types of connections used for glass elements;
- Recognize requirements for glass elements depending on their application area and chose the appropriate glass products and assemblies accordingly;
- Structurally design out-of-plane loaded glass elements based on available standards, both by hand calculations and specific software applications;
- Apply selected approaches for the structural design of in-plane loaded glass elements;
- Select suitable supporting systems (post-and-beam façade, curtain wall, etc.) and connections (point fixings, brackets, etc.) for the glass elements and structurally design them.

#### Content
This course introduces civil engineering students to structural glass design and related façade engineering aspects. It aims to provide the students the knowledge required in engineering offices to design glass elements but at the same time, the necessary fundamentals for later performing research in this field. To achieve this, the course includes lectures, design exercises and a design project.

#### Lectures:
The lectures will cover the following contents:
- Production methods and properties of the material glass and glass products and their structurally relevant properties (annealed glass, thermally tempered glass, chemically tempered glass, laminated glass, insulating glass, curved glass);
- Connection principles and types for glass elements (mechanical fixing, adhesive bonding);
- Requirements for glass elements depending on the application area (vertical glazing, overhead glazing, walk-on glazing, barrier glazing);
- Structural design of glass elements based on standards and research results (out-of-plane loaded glass elements and in-plane loaded glass elements);
- Typologies and design of structural systems for transparent façades;
- Requirements and functions for transparent facades.

#### Design exercises:
The principles and methods presented in the lectures are practiced with the students in design exercises. Hand calculation methods and their limitations as well as the software for structural glass design SJ Mepla are used for out-of-plane loaded glass elements. For in-plane loaded glass elements, the specifics of numerical calculation procedures are exemplified with the software Abaqus.

#### Design project:
The students will consolidate the knowledge gained in the theory-lectures and in the design exercises by working on a small design task (e.g. a glass canopy, a glass façade, a glass pavilion) in the form of a group work (ideally groups of 2-3 students). Within this task, the students will: conceptually design the structure and selected connection details; identify requirements for the glass elements and define their assembly; structurally design selected glass components, their support systems and their connections. The students will work on the design task in the second half of the semester and will get feedback on their progress in weekly review sessions. At the end of the semester, the groups will submit a project report and give an oral presentation of their projects.

#### Lecture notes
The lectures are based on lecture slides and handouts.

#### Literature
Recommended and supplementary literature:

#### Prerequisites / notice
Prior knowledge of structural analysis, especially steel structures is necessary. Prior basic knowledge on the method of finite elements is recommended.

#### 101-0250-00L Solving Partial Differential Equations in Parallel on GPUs

**W** 4 credits  
**I**. Utkin, S. Omlin, L. Räss, M. Werder

#### Abstract
This course aims to cover state-of-the-art methods in modern parallel computing on Graphics Processing Unit (GPU), supercomputing and code development with applications to natural sciences and engineering.

#### Objective
When quantitative assessment of physical processes governing natural and engineered systems relies on numerically solving differential equations, fast and accurate solutions require performant algorithms leveraging parallel hardware. The goal of this course is to offer a practical approach to solve systems of differential equations in parallel on GPUs using the Julia language. Julia combines high-level language conciseness to low-level language performance which enables efficient code development.

The course will be taught in a hands-on fashion, putting emphasis on you writing code and completing exercises; lecturing will be kept at a minimum. In a final project you will solve a solid mechanics or fluid dynamics problem of your interest, such as the shallow water equation, the shallow ice equation, acoustic wave propagation, nonlinear diffusion, viscous flow, elastic deformation, viscous or elastic poromechanics, frictional heating, and more. Your Julia GPU application will be hosted on a git-platform and implement modern software development practices.
We look at the durability of reinforced concrete structures, covering common deterioration processes such as reinforcement corrosion, frost damage, ASR, etc. The course spans the range from fundamental mechanisms to aspects of engineering practice. New methods and materials for preventative measures, condition assessment and repair techniques are treated. Examples from real cases are shown.

Furthermore, you will know:
- current engineering approaches for durability design (according to standards) and their limitations
- refined models for enhanced durability design and service life predictions
- preventive measures to improve durability (e.g. stainless steel reinforcement, concrete surface coatings, etc.)
- the particular durability challenges with post-tensioned structures and ways to overcome them (electrically isolated tendons)
- methods for inspection and condition assessment of existing, ageing structures (including non-destructive techniques and monitoring with sensors)
- repair methods for deteriorated concrete structures such as conventional repair and electrochemical methods (in particular cathodic protection)
- possible future problems for durability that may arise with modern materials and construction technologies
- socio-economic challenges related to ageing infrastructures
- degradation mechanisms for concrete: sulphate attack, ASR, frost attack.
- Inspection and condition assessment: Chloride analyses, carbonation depth, etc. Non-destructive tests, particularly potential mapping to detect corrosion. New developments (for example, monitoring with sensors).
- Stainless steel as reinforcing steel for concrete: Different types of stainless steels. Coupling with black reinforcing steel. Examples of application. Life-cycle-costs.
- Modern materials and construction technologies: Discussion of expected implications for the durability of structures today and in the future.

Excursion:
- We generally try to organize a site-visit (depending on availability of construction sites). Presumably, we will visit an installation site of cathodic protection on a concrete structure in the Zurich area.

The course is based on the book

Slides of the lectures will be distributed in advance

Special handouts and reprints for particular topics will be distributed
The course is based on the book

Slides of the lectures will be distributed in advance

Special handouts and reprints for particular topics will be distributed

Form of teaching:
The course is a lecture that contains frequent discussion and interaction between students and lecturer. You will see and work on many examples from engineering practice, both during the lectures and in the form of exercises to be solved at home.

Report:
Each student will work on a small case study and deliver a report during the semester. The report will be graded.

Excursion:
We generally try to organize a site-visit (depending on availability of construction sites). Presumably, we will visit an installation site of cathodic protection on a concrete structure in the Zurich area.

101-0677-00L Concrete Technology

Abstract
Opportunities and limitations of concrete technology. Commodities and leading edge specialties.

Objective
Advanced education in concrete technology for civil engineers who are designing, specifying and executing concrete structures.

Content
Based on the lecture 'Werkstoffe' students receive deep concrete technology training. Comprehensive knowledge of the most important properties of conventional concrete and the current areas of research in concrete technology will be presented. The course covers various topics, including:

- concrete components
- concrete properties
- concrete mix design
- production, transport, casting
- demoulding, curing and additional protective measures
- durability
- standards
- chemical admixtures
- alternative binders
- specialty concretes such as: self compacting concrete, fiber reinforced concrete, fast setting concrete
- the role of sustainability in concrete technology
- new research in digital fabrication with concrete

Lecture notes
Slides provided for download.

101-0427-01L Public Transport Design and Operations

Abstract
This course aims at analyzing, designing, improving public transport systems, as part of the overall transport system.
Objective

Public transport is a key driver for making our cities more livable, clean and accessible, providing safe, and sustainable travel options for millions of people around the globe. Proper planning of public transport system also ensures that the system is competitive in terms of speed and cost. Public transport is a crucial asset, whose social, economic and environmental benefits extend beyond those who use it regularly; it reduces the amount of cars and road infrastructure in cities; reduces injuries and fatalities associated to car accidents, and gives transport accessibility to very large demographic groups.

Goal of the class is to understand the main characteristics and differences of public transport networks. Their various performance criteria based on various perspective and stakeholders. The most relevant decision making problems in a planning tactical and operational point of view

At the end of this course, students can critically analyze existing networks of public transport, their design and use; consider and substantiate possible improvements to existing networks of public transport and the management of those networks; optimize the use of resources in public transport.

General structure:
general introduction of transport, modes, technologies, system design and line planning for different situations, mathematical models for design and line planning, timetabling and tactical planning, and related mathematical approaches operations, and quantitative support to operational problems, evaluation of public transport systems.

Content

Basics for line transport systems and networks 
Passenger/Supply requirements for line operations
Objectives of system and network planning, from different perspectives and users, design dilemmas
Conceptual concepts for passenger transport: long-distance, urban transport, regional, local transport
Planning process, from demand evaluation to line planning to timetables to operations
Matching demand and modes 
Line planning techniques
Timetabling principles

Allocation of resources 
Management of operations
Measures of realized operations
Improvements of existing services

Lecture notes

Lecture slides are provided.

101-0492-00L Microscopic Modelling and Simulation of Traffic Operations W 3 credits 2G M. Makridis

Abstract
The course introduces basics of microscopic modelling and simulation of traffic operations, including model design and development, calibration, validation, data analysis, identification of strategies for improving traffic flow performance, and evaluation of such strategies. The aim is to provide the fundamentals for building a realistic traffic-engineering project from beginning to end.
Objective

The objective of this course is to conduct a realistic traffic engineering project from beginning to end. The students will first familiarize themselves with microscopic traffic models. Students will work in groups on a project that includes a base scenario on a real traffic network. Throughout the semester, along with theoretical concepts, the students will build the base scenario (design, calibration and validation) and will develop alternative scenarios regarding modification on the infrastructure, simulation of in-vehicle technologies and vehicle-to-everything (V2X) communication.

Simulations will be implemented in Aimsun software. The students will be asked to understand, analyze, interpret and present traffic properties. Evaluation of alternative scenarios over the same network will be performed. Finally, students will be asked to design, implement, analyze and present a novel proposal, which will be compared with the base scenario.

Upon completion of the course, the students will:
- Understand the basic models used in microsimulation software (car-following, lane changing, gap acceptance, give ways, on/off-ramps, etc.).
- Design a road transport network inside the simulation software.
- Understand the basics behind modeling traffic demand and supply, vehicle dynamics, performance indicators for evaluation and network design for a realistic road transport network.
- Understand how to design a complete study, implement and validate it for planning purposes, e.g. creating a new road infrastructure.
- Make valid and concrete engineering proposals based on the simulation model and alternative scenarios.

Content

In this course, the students will first learn some microscopic modelling and simulation concepts, and then complete a traffic-engineering project with microscopic traffic simulator Aimsun.

Microscopic modelling and simulation concepts will include:
1) Car following models
2) Lane change models
3) Calibration and validation methodology

Specific tasks for the project will include:
1) Building a model with the simulator Aimsun in order to replicate and analyze the traffic conditions measured/observed.
2) Calibrating and validating the simulation model.
3) Redesigning/extend the model to improve the traffic performance through Aimsun and with/without programming in Python or C++.

The course will be based on a project that each group of students will build (design, calibrate, analyze and present) across the semester. A mid-term and final presentation of the work will be asked from each group of students. It consists of weekly 2-hour lectures. The students work in pairs on a group project that completes in the end of the semester. The modelling software used is Aimsun and lectures (theory and hands on experience) are taking place in a computer room.

The course Road Transport Systems (Verkehr III), or simultaneously taking the course Traffic Engineering is encouraged. Previous experience with Aimsun/Python/C++ is helpful but not mandatory.

Lecture notes

The lecture notes and additional handouts will be provided before the lectures.

Literature

Additional literature recommendations will be provided at the lectures.

Prerequisites / notice

Students need to know some basic road transport concepts. The course Road Transport Systems (Verkehr III), or simultaneously taking the course Traffic Engineering is encouraged. Previous experience with Aimsun is helpful but not mandatory.

101-0527-10L Materials and Constructions

W 4 credits 2G G. Habert, M. Posani

Abstract

Building materials with a special focus on regenerative materials: earth, bio-based and reuse.

Looking at material sourcing, properties and performance, as well as how they are integrated in the buildings (building envelope and detailing).

Choice of material is done out of sustainability concern.

Comfort, moisture transfer and building physics with hygroscopic materials.

Objective

Special focus on regenerative materials: earth, bio-based and reuse

The students will acquire knowledge in the following fields:
- Fundamentals of material performance
- Introduction to durability problems of building facades

Materials for the building envelope:
- Overview of structural materials and systems: concrete, steel, stone, earth, wood and bamboo
- Insulating materials (bio-based vs conventional)

Assessment of materials and components behaviour and performance

Degradation risks connected to insulation and post-insulation

Aspects of sustainability and durability

Content

Special focus on comfort, moisture transfer and building physics with hygroscopic materials will be done.

Introduction

Sustainable cement and concrete
- Earth construction
- Stone
- Steel
- Bamboo
- Timber construction
- Building physic and conventional insulation
- Bio-based insulation and degradation risks with insulation
- Hygrothermal properties of building materials and dynamic numerical simulations
- Efficiency and sustainability of modern window glazing

Course will have general lectures
+ hands on lab @home experiments
+ group project for implementation of regenerative materials.

### Objective

After a successful completion of the course, students will be able to:
1. Critically evaluate structural design concepts based on their impact and implications beyond the sole structural performance.
2. Identify the most relevant design parameters and performance criteria for a given design task and select adequate tools to effectively integrate them as part of the design process.
3. Develop structural systems in compliance with structural, spatial, and environmental design aspects simultaneously.

### Abstract

The goal of the course is to introduce students to Structural Design. The course fosters the development of a design thinking that emerges from the coexistence of a number of design parameters and performance criteria related to force flow, construction technologies, material use, and spatial qualities.

### Content

- The basic equations are derived from first principles. Possible simplifications relevant for practical problems are shown and their applicability is discussed.
- The finite difference methods are introduced. The finite volume method as well as the method of characteristics are used for the solution of the shallow water equations. Special aspects such as wave propagation and turbulence modelling are also treated.
- All methods discussed are applied practically in exercises. This is done using programs in MATLAB which partially are programmed by the students themselves. Further, some generally available softwares such as BASEMENT for non-steady shallow water flows are used.

### Objective

Practice-oriented introduction to BIM working methods for civil engineers.

### Content

- Parametric modelling of steel, precast concrete, in-situ concrete, reinforcements and masonry
- Parametric modelling of connections and joints
- Defining and evaluating concreting stages
- Semi-automatic creation of formwork plans according to sia standards
- Automatic export of all necessary models and data for BIM2Field
- Insight into BIM2Field applications "Stake out from model" and "Lay reinforcement based on model".

### Abstract

The goal of the course is to introduce students to Structural Design. The course fosters the development of a design thinking that emerges from the coexistence of a number of design parameters and performance criteria related to force flow, construction technologies, material use, and spatial qualities.

### Objective

After a successful completion of the course, students will be able to:
1. Critically evaluate structural design concepts based on their impact and implications beyond the sole structural performance.
2. Identify the most relevant design parameters and performance criteria for a given design task and select adequate tools to effectively integrate them as part of the design process.
3. Develop structural systems in compliance with structural, spatial, and environmental design aspects simultaneously.

### Content

The goal of the course is to introduce students to Structural Design. The course fosters the development of a design thinking that emerges from the coexistence of a number of design parameters and performance criteria related to force flow, construction technologies, material use, and spatial qualities. Students will learn about diverse tools that allow for controlling such a complex blend of parameters and criteria at the interface between different disciplines such as structural engineering and architecture. These tools will include physical models, graphical methods, and digital tools. After a series of lectures and workshops, students will work on a design exercise that represents the core of the entire course. The design exercise is an opportunity to deal with an open-ended task that does not admit a univocal answer. In fact, besides structural performance, design options will be discussed and evaluated through a set of criteria including spatial qualities, constructability, and environmental footprint.

### Abstract

In the course Numerical Hydraulics the basics of numerical modelling of flows are presented.

### Objective

The goal of the course is to develop the understanding of the students for numerical simulation of flows to an extent that they can later use commercial software in a responsible and critical way.

### Content

The basic equations are derived from first principles. Possible simplifications relevant for practical problems are shown and their applicability is discussed. Using the example of non-steady state pipe flow numerical methods such as the method of characteristics and finite difference methods are introduced. The finite volume method as well as the method of characteristics are used for the solution of the shallow water equations. Special aspects such as wave propagation and turbulence modelling are also treated.

All methods discussed are applied practically in exercises. This is done using programs in MATLAB which partially are programmed by the students themselves. Further, some generally available softwares such as BASEMENT for non-steady shallow water flows are used.

### Abstract

Advantageous applications compared to 2D/3D, especially for digital construction and parametric modelling.

### Objective

In this course students will see what the BIM method entails for a civil engineer and learn how to create a parametric model yourself incl. associated steel, precast concrete, in-situ concrete, reinforcement and masonry parts based on a practical example. Students will also learn how to automatically create formwork plans, parts lists and data for digital prefabrication and construction sites. They will thus acquire the necessary basis for their future work as engineers and how their work interacts with draughtsmen, designers and master builders in a digital working environment.

### Content

- Parametric modelling of steel, precast concrete, in-situ concrete, reinforcements and masonry
- Parametric modelling of connections and joints
- Defining and evaluating concreting stages

PowerPoint slides
This course aims to provide a basic understanding of the mechanics and rheology of granular matter. It includes fundamental concepts as assessed.

This course covers grain-scale interactions, statics and rheology of granular materials based on a mix between classical lectures, on-board developments, presentation of small experiments, analytical and numerical exercises. We present the domains of application of granular mechanics through examples taken from the industry or research. In addition, the Discrete Element Method (DEM) together with state-of-the-art contact models will be presented and used to simulate standard tests such as the granular column collapse, shear flows but also more complex industrial or geophysical problems. Calibration of model parameters based on laboratory experiments will be discussed. The course will not cover aspects related to granular gasses and kinetic theory.

1. Granular Media: Between Fluid and Solid by Bruno Andreotti, Olivier Pouliquen, and Yoël Forterre
2. Particulate Discrete Element Modelling: A Geomechanics Perspective by Catherine O’Sullivan
101-0138-00L Bridge Design: Project Competition

Objective
At the end of the course, students will have developed a convincing bridge design that satisfies following criteria:

1. Apply circular principles using recovered building materials.
2. Compare different digital technologies applied in circular construction (e.g., LiDAR scanning, drone imagery, photogrammetry, computational design, AI, computer vision, XR, LCA tools etc.)
3. Understand the potential and limitations of AI for circular construction, e.g. use machine learning to detect and digitize materials (computer vision) or to support creativity in the early design phases of circular construction (generative AI).
4. Communicate the importance and urgency of circular construction.
5. Assess the environmental impact implications of their design and technology decisions through a preliminary Life Cycle Assessment (LCA).

Content
The module is built up as follows:

0. Presentation of problem statement / project. (1st week of semester)
1. Introduction to design tools & working methods.
2. Working on project (milestones):
   a. Define requirements and boundary conditions.
   b. Study of references and possible concepts
   c. Choice of best variant
   d. Structural modelling & calculations
   e. Plans & visualisation
3. Presentation of your work in a mid-term and a final critique.
4. Submission

Prerequisites / notice
101-0138-00L Bridge Design or an equivalent attestation of knowledge in bridge design.

The Master Programme concludes with the Master Thesis, which has to be done in one of the chosen specialisations and has to be ECTS 20 credits. The topics of the Master Thesis are published by the professors. The Topic can be set also in consultation between the student and the professor.

Collaborators: Kunsthalle Zürich, ETH AI Center, Design++

Prerequisites / notice
Interest in Digitalisation and Construction. Flexibility: This is a hands-on course, where students explore digital technologies and opportunities/challenges of reuse. Flexibility (e.g. adapting to unforeseen circumstances), responsibility (e.g. arriving on time for safety briefing), and spontaneity (e.g. finding innovative solutions) is expected from the students to adapt to the contingencies from demolition and construction sites with reused materials. The course is mandatory for MIBS students. If you are a first year MIBS student, please do not apply, you are automatically accepted. All other students from other departments should apply. Please only register for the course if you really intend to participate on all course dates (see course catalog). Please only register for the course if you are willing to send us a letter of motivation and really intend to participate; otherwise, you will deprive someone else of a place. All non-MIBS students who register go onto a waiting list until 11.09.2024 and up to 25 of them will be selected by the lecturer.

To register:
1. Enroll before 05.09.2024.
2. Send a short letter of motivation (max. 300 words) and a 1-page CV to cea-course@ibi.baug.ethz.ch by 05.09.2024.

Only students who fulfill the following criteria are allowed to begin with their master thesis:
a. successful completion of the bachelor programme;
b. fulfilling of any additional requirements necessary to gain admission to the master programme.

Abstract
The Master Programme concludes with the Master Thesis, which has to be done in one of the chosen specialisations and has to be completed within 18 weeks. The Master Thesis is supervised by a professor and shall attest the students ability to work independently and to produce scientifically structured work.

Objective
To work independently and to produce a scientifically structured work.

Content
The topics of the Master Thesis are published by the professors. The Topic can be set also in consultation between the student and the professor.
gain admission to the master programme.

Abstract
The Master Programme concludes with the Master Thesis, which has to be done in one of the chosen Majors and has to be completed within 16 weeks. The Master Thesis is supervised by a professor and shall attest the students ability to work independently and to produce scientifically structured work.

Objective
To work independently and to produce a scientifically structured work.

Abstract
This course is an introduction to urban and regional economics. It focuses on the formation and development of urban systems, and highlight how transport infrastructure investments can affect the location, size and composition of such systems.

Objective
The main objective of this course is to provide students with some basic tools to analyze the fundamental economic forces at play in urban systems (i.e., agglomeration and congestion forces), and the role of transport networks in shaping the structure of these systems. Why do urban areas grow or decline? How do transport networks affect the location of individuals and firms? Does the location of a firm determine its productivity? Can transport infrastructure investments reduce economic disparities? These are some of the questions that students should be able to answer after having completed the course.

Content
The course is organized in four parts. I start with the key observation that economic activity (both in terms of population density and productivity) is unevenly distributed in space. For instance, the share of the population living in urban centers is increasing globally, from 16% in 1900 and 50% in 2000 to about 68% by the year 2050 (UN, World Economic Prospects, 2014). The goal of the first part is then to understand the economic forces at play behind these trends, looking at the effects within and across urban areas. I will also discuss how natural or man-made geographical characteristics (e.g., rivers, mountains, borders, etc.) affect the development of such urban systems.

In the second part, I discuss the planning and pricing of transport networks, moving from simple local models to more complex transport models at a global scale. The key aspects include: the first and second best road pricing, the public provision of transport networks and the demographic effects of transport networks.

In the third part, I combine the previous two parts and analyze the interaction between urban systems and transportation. Thereby, the main focus is to understand the economic mechanisms that can lead to a general equilibrium of all actors involved. However, as the study of the historical development of urban systems and transport networks provides interesting insights, I will discuss how their interaction in the past shapes today's economic geography.

Finally, I broaden the scope of the course and explore related topics. There will be a particular emphasis on the relation between urban systems and fiscal federalism as well as environmental policies. Both aspects are important determinants of the contemporary developments of urban systems, and as such deserve our attention.

In general, this class focuses on the latest research developments in urban and regional economics, though it does not require prior knowledge in this field. It pays particular attention to economic approaches, which are based on theoretical frameworks with strong micro-foundations and allow for precise policy recommendations.

052-0707-00L Urban Design III

Abstract
Students are introduced to a narrative of ‘Urban Stories’ through a series of three tools driven by social, governance, and environmental transformations in today’s urbanization processes. Each lecture explores one city’s spatial and organizational ingenuity born out of a particular place’s realities, allowing students to transfer these inventions into a catalog of conceptual tools.

Objective
How can students of architecture become active agents of change? What does it take to go beyond a building's scale, making design-relevant decisions to the city rather than a single client? How can we design in cities with a lack of land, tax base, risk, and resilience, understanding that Zurich is the exception and these other cities are the rule? How can we discover, set rather than follow trends and understand existing urban phenomena activating them in a design process? The lecture series produces a growing catalog of operational urban tools across the globe, considering Governance, Social, and Environmental realities. Instead of limited binary comparing of cities, we are building a catalog of change, analyzing what design solutions cities have been developing informally incrementally over time, why, and how. How do transport networks affect the location of individuals and firms? Does the location of a firm determine its productivity? Can transport infrastructure investments reduce economic disparities? These are some of the questions that students should be able to answer after having completed the course.

Lecture notes
Course slides will be made available to students prior to each class.

F. T. Salva Rocha Franco

H. Klumpner.
Urban form cannot be reduced to physical space. Cities result from social construction, under the influence of technologies, ecology, culture, the impact of experts, and accidents. Urban un-concluded processes respond to political interests, economic pressure, cultural inclinations, along with the imagination of architects and urbanists and the informal powers at work in complex adaptive systems. Current urban phenomena are the result of urban evolution. The facts stored in urban environments include contributions from its entire lifecycle, visible in the physical environment, and non-physical aspects. This imaginary city exists along with its potentials and problems and with the conflicts that have evolved. Knowledge and understanding, along with a critical observation of the actions and policies, are necessary to understand the diversity and instability present in the contemporary city and understand how urban form evolved to its current state.

How did cities develop into the cities we live in now? Urban plans, instruments, visions, political decisions, economic reasonings, cultural inputs, and social organization have been used to operate in urban settlements in specific moments of change. We have chosen cities that exemplify how these instruments have been implemented and how they have shaped urban environments. We transcribe these instruments into urban operational tools that we have recognized and collected within existing tested cases in contemporary cities across the globe.

This lecture series will introduce urban knowledge and the way it has introduced urban models and operational modes within different concrete realities, therefore shaping cities. The lecture series translates urban knowledge into operational tools, extracted from cities where they have been tested and become exemplary samples, most relevant for understanding how the urban landscape has taken shape. The tools are clustered in twelve thematic clusters and three tool scales for better comparability and cross-reflection.

The Tool case studies are compiled into a global urbanization toolbox, which we use as typological models to read the city and critically reflect upon it. The presented contents are meant to serve as inspiration for positioning in future professional life and provide instruments for future design decisions.

In an interview with a local designer, we measure our insights against the most pressing design topics in cities today, including inclusion, affordable housing, provision of public spaces, and infrastructure for all.

**Lecture notes**

The learning material, available via https://moodle-app2.let.ethz.ch/ is comprised of:
- Toolbox ‘Reader’ with an introduction to the lecture course and tool summaries
- Weekly exercise tasks
- Infographics with basic information of each city
- Quiz question for each tool
- Additional reading material
- Interviews with experts
- Archive of lecture recordings
- Reading material will be provided throughout the semester.

**101-0186-01L BIM, Parametric Modeling and Digital Construction for Civil Engineers**

**Abstract**

Practice-oriented introduction to BIM working methods for civil engineers.

Advantageous applications compared to 2D/3D, especially for digital construction and parametric modelling.

**Objective**

In this course students will see what the BIM method entails for a civil engineer and learn how to create a parametric model yourself incl. associated steel, precast concrete, in-situ concrete, reinforcement and masonry parts based on a practical example. Students will also learn how to automatically create formwork plans, parts lists and data for digital prefabrication and construction sites. They will thus acquire the necessary basis for their future work as engineers and how their work interacts with draughtsmen, designers and master builders in a digital working environment.

**Content**

- Parametric modelling of steel, precast concrete, in-situ concrete, reinforcements and masonry
- Parametric modelling of connections and joints
- Defining and evaluating concreting stages
- Semi-automatic creation of formwork plans according to sia standards
- Automatic export of all necessary models and data for BIM2Field
- Insight into BIM2Field applications "Stake out from model" and "Lay reinforcement based on model".

**Lecture notes**

Available eLearning content

PowerPoint slides

**Prerequisites / notice**

Basic knowledge of construction detailing in steel and concrete, as taught in the BSc courses for steel and concrete structures, is of advantage.

**052-0715-24L Topology**

**Abstract**

The elective course "Topology" in the Autumn Semester 2023 builds on a long standing specialization in the spatial exploration of the landscape. We will embark the participants on a terrain that we shape through our own thoughts and actions, adopting different perceptual perspectives, supported by examples from art, literature, technology and history.

**Objective**

This elective course gives architecture students the opportunity to further develop their perception of space through a site-specific approach in the field of landscape architecture. The students will learn to use 3D point cloud technology and other spatial sensing technologies in order to analyze complex urban landscape and develop new ways of editing and representing these intertwined spaces.

**Content**

Students will document and analyze a case-study site to reveal its topological potentials and sensory qualities. This understanding will be gained through point cloud modeling and audiovisual composition. In particular, we will develop a new, comprehensive sectional model of a topologically interesting site situation.

Students will become acquainted to working with point cloud models produced with laser-scanning. Through a series of steps, they will learn how a laser-scanning survey is conducted, how the raw data is processed, how point cloud models are assembled, what qualities these models can provide to analyze, explore, and represent space as an audiovisual experience. Collected samples from the field will be assembled and built into an interactive application in the «Landscape Visualization and Modelling Lab». All software required is open source and can also be installed on private laptops, facilitating work from home if necessary.

**Lecture notes**

Literature will be provided during the course.

**Prerequisites / notice**

- The course is limited to 20 students (based on available computer stations)
- Students will work in groups of 2
- The lectures will be held in English, assistance in English and German
- The enrolment will be prioritized by the time of inscription and balanced between departments

Abstract
Discussion of syntheses, structures, and general reactivity of coordination compounds of the transition metals (as well as the lanthanides and actinides). Introduction of methods of characterization and physicochemical properties of coordination compounds.

Objective
The students will learn and understand the methodological basics of binding theory in complexes of transition metals. They will be able to explain the structure, chemical bonding, spectroscopic properties as well as general strategies for the synthesis of complexes of transition metals. In this context, students will master the basics of group theory and its application.

Content
This course consists of the following parts, which introduce the students to the chemistry of transition metals as well as lanthanides and actinides: 1) General definitions and terms in coordination chemistry; 2) Coordination numbers and structures; 3) Ligand types; 4) The chemical bond in coordination compounds part A: Crystal field theory and ligand field theory; 5) The chemical bond in coordination compounds part B: Qualitative MO theory; 6) Reactivity and reaction mechanisms of coordination compounds; 7) Group theory and character tables; 8) vibrational spectroscopy; 9) electronic excitation.

Lecture notes
A (commented) collection of slides and a script will be made available via Moodle.

### 529-0422-00L Physical Chemistry II: Chemical Reaction Kinetics

**Objective**

**Content**
Fundamental concepts: rate laws, elementary reactions and composite reactions, molecularity, reaction order. Experimental methods in reaction kinetics up to new developments in femtosecond kinetics. Simple chemical reaction rate theories: temperature dependence of the rate constant and Arrhenius equation, collision theory, reaction cross-section, transition state theory. Reaction mechanisms and complex kinetic systems, approximation techniques, chain reactions, explosions and detonations. Homogeneous catalysis and enzyme kinetics.

**Lecture notes**
Will be provided.

**Prerequisites / notice**
- Introduction to Chemical Reaction Kinetics

**Literature**

**Examination Block II**

**Abstract**
This course will build upon the basic knowledge of structure and reactivity of organic molecules gained in AC/OCI and AC/OCII. The module aims to provide a wide understanding of the occurrence, synthesis, properties, and reactivity of carbonyl compounds.

**Objective**
The goal of this course is the acquisition of a basic repertoire of synthetic methods including important reactions of aldehydes, ketones, carboxylic acids, and carboxylic acid derivatives. Particular emphasis is placed on the understanding of reaction mechanisms and the correlation between structure and reactivity. A deeper understanding of the concepts presented during the lecture is reached by solving the problems handed out each time and discussed one week later in the exercise class.
Content

Lecture notes
The lecture slides, problem sets, and additional documents are provided online. Link: https://wennemers.ethz.ch/education.html

Literature

402-0043-00L

Abstract
Introduction to the concepts and tools in physics with the help of demonstration experiments: mechanics of point-like and ridged bodies, periodic motion and mechanical waves.

Objective
The concepts and tools in physics, as well as the methods of an experimental science are taught. The student should learn to identify, communicate and solve physical problems in his/her own field of science.

Content
Mechanics (motion, Newton's laws, work and energy, conservation of momentum, rotation, gravitation, fluids)
Periodic Motion and Waves (periodic motion, mechanical waves, acoustics).

Lecture notes
The lecture follows the book “Physics” by Paul A. Tipler.

Literature

Analytical Chemistry I

Abstract
Introduction into the most important spectroscopic methods and their applications to gain structural information.

Objective
Knowledge about the necessary theoretical background of spectroscopic methods and their practical applications.

Content
Application oriented basics of organic and inorganic instrumental analysis and of the empirical employment of structure elucidation methods:
- Mass spectrometry; Ionization methods, mass separation, isotope signals, rules of fragmentation, rearrangements.
- NMR spectroscopy: Experimental basics, chemical shift, spin-spin coupling.
- IR spectroscopy: Revisiting topics like harmonic oscillator, normal vibrations, coupled oscillating systems (in accordance to the basics of the related lecture in physical chemistry); sample preparation, acquisition techniques, laws of Lambert and Beer, interpretation of IR spectra; Raman spectroscopy.

Lecture notes
Script will be for the production price

Literature
- M. Hesse, M. Meier, B. Zeeh, Spektroskopische Methoden in der organischen Chemie, 5, überarbeitete Auflage, Thieme, Stuttgart, 1995

Prerequisites / notice
Exercises are integrated in the lectures. In addition, attendance in the lecture 529-0289-00 "Instrumental analysis of organic compounds" (4th semester) is recommended.

Abstract
The synthesis and reactivity of organic molecules plays a crucial role in chemical biology, particularly for the interrogation of biological pathways and phenomena. This course will cover advanced topics in the design and synthesis of organic molecules for applications in biochemistry and chemical biology, with particular emphasis on the mechanistic understanding of these reactions and processes.

Objective
After the completion of this lecture, the students will have an understanding of organic chemistry commonly employed in the field of chemical biology, be able to apply these concepts to the design and synthesis of tools for probing biological pathways, and explain the underlying reaction mechanisms of selective reactions.

Content
The course will discuss past and recent advances in the synthesis of biomolecules, organic chemistry for applications in chemical biology, and the mechanism of relevant reactions. Topics will include chemical ligations, bioorthogonal reactions, photoaffinity probes, photopharmacology, activity based probes, targeted protein degraders, chemical probes for metabolites, fluorescent dyes and imaging, caged biomolecules, conditional activation, site-specific protein modification, and metabolic engineering.

Lecture notes
Lecture notes and other material relevant for the course will be available online under https://bode.ethz.ch/education.html.

Literature
Relevant research articles and review papers will be available in the course and course material.

Prerequisites / notice
This is an advanced organic chemistry course. Prior knowledge of organic synthesis, reactions, and mechanisms is required. Familiarity with biochemistry and biology is recommended.
In the general chemistry practical course students are introduced to the work in chemistry laboratory. During the course they become familiar with common chemistry glassware and related equipment as well as learn basic experimental procedures, such as distillation, recrystallization, purification, digestion etc. Upon the measurements of pH, conductivity, and potential in the course of reactions, students establish the understanding of the chemical equilibrium concept.

Students work with various classes of inorganic compounds and types of chemical reactions, e.g. acid-base, redox, precipitation. They also obtain first experience with the synthesis of metal complexes as well as learn basics of qualitative analysis of an unknown substance.

### Competencies

- Self-direction and Self-management: fostered

### 529-0016-00L BCB III: Organic Chemistry

**Abstract**

Laboratory course in Organic Chemistry for students of "Biochemistry - Chemical Biology"

**Objective**

Introduction into basic techniques used in the organic laboratory. Understanding organic reactions through experiments.

**Content**

- Part I: Basic operations such as the isolation, purification, and characterization of organic compounds: distillation, extraction, chromatography, crystallization, IR (UV/1H-NMR)-spectroscopy for the identification of the constitution of organic compounds.

- Part II: Organic reactions: preparative chemistry. From simple, one-step to multi-step syntheses. The syntheses include classic Organic Chemistry as well as methods widely used in a Chemical Biology context.

**Lecture notes**

see [https://bode.ethz.ch/education/bcb-iii/bcb-iii-lab-course.html](https://bode.ethz.ch/education/bcb-iii/bcb-iii-lab-course.html)

**Number of participants limited to 6.**

The enrolment is done by the D-BIOL study administration.

**Abstract**

The focus of this laboratory course is on current research topics related to metabolic engineering and the general understanding of metabolism, particularly in relation to one carbon metabolism. Projects will be carried out in small teams.

**Objective**

The course aims at introducing technologies to investigate bacterial metabolism and key principles of metabolic engineering. The main focus of this block course is on practical work and will familiarize participants with complementary approaches, in particular genetic, biochemical and analytical techniques including metabolomics. Results will be presented by students in scientific presentations. Another goal is to learn how to write a scientific report.
The course and will include topics such as pathway elucidation & engineering and related ongoing research projects in the lab. Experimental work applied during the course will comprise methods such as cloning work & transformation, growth determination, enzyme activity assays, liquid-chromatography mass-spectrometry and dynamic labeling experiments.

Experimental work applied during the course will comprise methods such as cloning work & transformation, growth determination, enzyme activity assays, liquid-chromatography mass-spectrometry and dynamic labeling experiments.

Lecture notes

551-1421-00L The Mechanisms of Natural Transformation in Competent Gram-Negative Bacteria

Number of participants limited to 5.

The enrolment is done by the D-BIOL study administration.

Abstract

Students will carry out defined research projects related to the current research topics of the Hospenthal group. The topics will include protein expression of pilins and/or other competence proteins from Gram-negative bacteria, protein purification using affinity chromatography, crystallisation experiments and analysis of assembled pil by electron microscopy.

Objective

The course should enable students to understand concepts of protein expression, purification and the characterisation of biomolecular interactions. In addition, students will learn some basic principles of X-ray crystallography and electron microscopy.

Content

The students will be tutored in their experimental work by an experienced doctoral student. The course will also include a short lecture delivered by M. Hospenthal, providing the theoretical background for the experimental work. Throughout the course, students will receive exercises that further help to explain the theory of the practical work, as well as literature research tasks.

Participation in the following Hospenthal lab projects will be possible:

- Purification, biophysical characterisation and structure determination of pilins
- Purification, biophysical characterisation and structure determination of proteins and protein complexes involved in natural transformation.

Experimental work on this project involves:

- Cloning and mutagenesis
- Recombinant or endogenous protein production in E. coli or Legionella
- Protein purification by affinity chromatography (other chromatographic purification techniques will also be discussed)
- Protein crystallisation and crystal optimisation
- Visualisation of bacterial pil by electron microscopy (negative stain or cryo electron microscopy)
- DNA binding experiments
- Enzymatic activity measurements
- In silico structural analyses using PyMOL and Chimera

Literature

Any required reading of literature will be discussed at the beginning of the course.

Prerequisites / notice

There are no special requirements for this course.

551-0345-00L Mechanisms of Bacterial Pathogenesis

Number of participants limited to 15.

The enrolment is done by the D-BIOL study administration.

Abstract

Research laboratory class in small groups. Research projects on current topics in cellular microbiology and bacterial pathogenesis are assigned to each student.

Objective

Introduction to a current topic in cellular microbiology, molecular genetics of a bacterial pathogen or its interaction with the host's microbiome. Experimental work in the research lab and introduction to the current lab techniques. This includes contributions to the analysis of animal experiment. You will work with the current research literature in bacterial pathogenesis and write a research protocol. Requirement for obtaining the credit points: oral presentation of the research project, a short written exam and evaluation of the research protocol.

Content

Research projects on the model pathogen Salmonella.

Lecture notes

none.

Literature

Literature will be selected with reference to the assigned research project.

Autumn Semester 2024
### Competencies

#### Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

#### Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: fostered
- Media and Digital Technologies: assessed
- Problem-solving: assessed
- Project Management: assessed

#### Social Competencies
- Communication: assessed
- Cooperation and Teamwork: assessed
- Leadership and Responsibility: fostered
- Self-presentation and Social Influence: fostered
- Sensitivity to Diversity: fostered

#### Personal Competencies
- Adaptability and Flexibility: fostered
- Creative Thinking: assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: fostered
- Self-awareness and Self-reflection: assessed
- Self-direction and Self-management: assessed

#### Literature
- The recommended literature, including reviews and primary research articles, will be provided during the course.

#### Prerequisites / notice
- The course will be taught in English. All general lectures will be held at ETH Hoenggerberg. Students will be divided into small groups to carry out experiments at ETH or at the Paul Scherrer Institute. Travel to the Paul Scherrer Institute will be by public transportation.

### Course Information
- **Code**: 551-0351-00L
- **Title**: Membrane Biology
- **Number of participants limited to 12.**
- **Enrolment**: done by the D-BIOL study administration.
- **Number of credits**: 6
- **Lecturer**: V. Korkhov, U. Kutay, S. C. Zeeman

## Abstract
The course will introduce the students to the key concepts in membrane biology and will allow them to be involved in laboratory projects related to that broad field. The course will consist of lectures, literature discussions, and practical laboratory work in small groups. Results of the practical projects will be presented during the poster session at the end of the course.

## Objective
The aim of the course is to expose the students to a wide range of modern research areas encompassed by the field of membrane biology.

## Content
Students will be engaged in research projects aimed at understanding the biological membranes at the molecular, organelar and cellular levels. Students will design and perform experiments, evaluate experimental results, analyze the current scientific literature and understand the relevance of their work in the context of the current state of the membrane biology field.

## Lecture notes
- No script

## Literature
- Descriptions of the possible projects including individual reading suggestions will be handed out beforehand.
551-1609-00L  Single Molecule Biophysics Studies of the Microtubule Cytoskeleton

Number of participants limited to 5.
The enrolment is done by the D-BIOL study administration.

Abstract
This laboratory course has a focus on current research topics in our laboratory related to microtubule nucleation and dynamics and its investigation using in vitro reconstitutions and single molecule biophysics. Projects will be conducted in small groups.

Objective
The course aims to introduce technologies to investigate cytoskeletal processes and regulation using in vitro reconstitutions and single molecule biophysics methods. The main focus of this block course is on practical work and will familiarize participants with complementary approaches, in particular protein purification and biophysical techniques including single molecule fluorescence imaging using Total Internal Reflection Fluorescence Microscopy (TIRFM) and subsequent image analysis methods. Results will be presented by students in scientific presentations. Another goal is to learn how to write a scientific report.

Content
The course will include topics such as microtubule polymerization dynamics and related ongoing research projects in the lab. Experimental work applied during the course will comprise methods such as cloning work & transformation, protein purification, single molecule fluorescence imaging using Total Internal Reflection Fluorescence Microscopy (TIRFM), and single molecule image analysis.

529-0044-00L  Genetic Code Expansion for Studying Posttranslational Modifications

Enrolment limited to max 8 students. The enrolment is done by the D-BIOL study administration.

Abstract
In this block course we will prepare proteins bearing site-specifically installed post-translational modifications using genetic code expansion. The impact of the post-translational modifications on enzymatic activity and protein-protein interactions will be studied.

Objective
Students will learn basic techniques for genetic code expansion. They will learn how to synthesize non-canonical amino acids (ncAAs), manipulate plasmids through cloning techniques to introduce an amber codon at a user defined site in a gene of interest, express and purify recombinant proteins bearing site-specific ncAAs using state-of-the-art chromatographic techniques, characterize the target protein using mass spectrometry and analyze the properties of the target protein regarding enzymatic activity and protein-protein interactions using biophysical techniques.

After the course, participants should be able to apply the gained skills in future chemical and molecular biology lab courses and projects.

Individual reports describing the experiments and obtained results must be prepared by the end of the course. At the end of the course, each team (consisting of two participants each) will present their results in an oral presentation.
**Content**

During this block course, the participants will study the impact of different post-translational modifications (PTMs) on protein function using genetic code expansion.

The participants will work in teams of two, first will synthesize different ncAAs mimicking PTMs, such as acetylated lysine, butyryllysine etc.). These ncAAs will be incorporated into target proteins using orthogonal aminoacyl tRNA synthetase / tRNA pairs, which direct the site-specific incorporation in response to an in frame introduced amber stop codon (amber suppression). Therefore, the participants will introduce the amber stop codon at different positions in the gene of interest using standard molecular cloning techniques. After recombinant expression of the target protein, the participants will isolate the ncAA-bearing target proteins using different chromatography techniques using a FPLC system. After characterization of the PTM-bearing protein using mass spectrometry, the participants will study the impact of the PTM on enzymatic activity and protein-protein interactions using biophysical techniques.

**Lecture notes**

All the required theoretical and experimental informations can be found in the provided script. Details will be discussed in class. Relevant research papers will be recommended for reading during the seminars.

**Prerequisites / notice**

This laboratory block course is designed for 3 weeks, 3.5 days. Students should have basic practical knowledge in organic synthesis, molecular cloning, protein expression and purification (participants must have attended the practical course BCB-IV prior to this block course). The maximum number of participants is currently limited to 8. Interested applicants may contact Dr. M. Fottner for further information. Commitment for attendance of entire course is necessary. The course cannot be interrupted by individual absences once started.

**Number of participants limited to 12.

The enrollment is done by the D-BIOL study administration.

**Abstract**

During the block course in the fall semester, we will carry out biological-chemical enzyme evolution experiments using molecular genetic modification technologies and in vivo selection in recombinant bacterial strains. The class with its very dense program consists of the practical course itself and an integrated series of seminar/lecture sessions.

**Objective**

All technologies used for the experiments will be explained to the students in theory and in practice with the goal that they will be able to independently apply them for the course project and in future research endeavors. After the course, an individual report about the results obtained has to be prepared.

**Content**

The class deals with a specifically designed and genuine research project. We intend to carry out biological-chemical enzyme evolution experiments using molecular genetic modification technologies and in vivo selection in recombinant bacterial strains. By working in parallel, teams of 2 participants each will generate a variety of different variants of a chorismate mutase. Individual enzyme catalysts will be purified and subsequently characterized using several different spectroscopic methods. The detailed chemical-physical analyses include determination of the enzymes' kinetic parameters, their molecular mass, and the integrity of the protein structure. The results obtained from the individual evolution experiments will be compared and discussed at the end of the class in a final seminar. We expect that during this lab course we will not only generate novel enzymes, but also gain new mechanistic insights into the investigated catalysts.

**Lecture notes**

A script will be distributed to the participants on the first day of the course.

**Literature**

General literature to "Directed Evolution" and chorismate mutases, e.g.:

Further literature will be indicated in the distributed script.

**Prerequisites / notice**

This laboratory block course is designed for 3 weeks, 3.5 days. **551-1147-00L Bioactive Natural Products from Bacteria**

**Number of participants limited to 8.

The enrollment is done by the D-BIOL study administration.

**Abstract**

Lab course. In small groups projects of relevance to current research questions in the field of bacterial natural product biosynthesis are addressed.

**Objective**

Introduction to relevant subjects of the secondary metabolism of bacteria. Training in practical work in a research laboratory. Scientific writing in form of a research report.

**Content**

Research project on bacteria that produce bioactive natural products (e.g., Streptomyces, Cyanobacteria, uncultivated bacteria). The techniques used will depend on the project, e.g. PCR, cloning, natural product analysis, precursor feeding studies, enzyme expression and analysis.
### Microbial Community Genomics

**Number of participants limited to 10.**

**Prerequisites:** Participants should bring their own laptop computer. Basic knowledge in [R], Python and/or UNIX is required.

*The enrolment is done by the D-BIOL study administration.*

**Objective**

We provide training in the use of computational methods to address molecular, genetic, ecological and/or evolutionary questions by analyzing DNA sequencing data from microbial communities. The course includes lectures, tutorials, and the development of a research project at the intersection between microbiology and bioinformatics.

**Prerequisites / notice**

Participants should bring their own laptop computer. Basic knowledge in [R], Python and/or UNIX is required.

### Polymer Physics Methods for Unstructured Biomolecules

**Enrollment limited to 12 students. Enrollment is done by the D-BIOL study administration.**

**Objective**

Expansion of competences for the experimental and analytical treatment and structural characterization of partially and completely unstructured biomacromolecules as well as their interactions and self-organization.

**Content**

Part I: Molecular interactions, concepts of polymer physics, spectroscopic methods; Part II: Polymer types in biology - proteins, DNA/RNA, polysaccharides, lipids; Part III: Molecular modeling and determination of conformational ensembles.

**Lecture notes**

Script for part I of the course in HS2024; slides for all three parts

### Characterization of the Aggregation Landscape of Peptide Amyloids and their Chemical Templating

**Enrollment is done by the D-BIOL study administration.**

**Objective**

During the block course, each student will learn how to handle aggregation-prone peptides, characterize their aggregation state and structure as well as assay their ability to template their own chemical synthesis.

**Content**

The course is divided between lectures practical work in the lab. The lectures will introduce the general topic of amyloids and in particular their potential role in the origin of molecular complexity, as well as cover the theory and the practice behind the tools that are used to characterize peptide amyloids. The practical work in the lab will allow the students to gain hands-on experience working on a novel peptide that has yet to be characterized. Since the course consists of genuine research we also hope that new discoveries will be made that will provide insights into the role that amyloids may have played in the origin of life.

**Lecture notes**

A script will be distributed to the participants on the first day of the course.

### RNA-Biology

**Number of participants limited to 12.**

*The enrolment is done by the D-BIOL study*

---

---
Abstract
Introduction to the diversity of current RNA-research at all levels from structural biology to systems biology using mainly model systems like S. cerevisiae (yeast), mammalian cells.

Objective
The students will obtain an overview about the diversity of current RNA-research. They will learn to design experiments and use techniques necessary to analyze different aspects of RNA biology. Through lectures and literature seminars, they will learn about the burning questions of RNA research and discuss approaches to address these questions experimentally. In practical lab projects the students will work in one of the participating laboratories. Finally, they will learn how to present and discuss their data in an appropriate manner. Student assessment is a graded semester performance based on individual performance in the laboratory, the written exam and the poster presentation.

Literature
Documentation and recommended literature will be provided at the beginning and during the course.

Prerequisites / notice
The course will be taught in English.

551-1417-00L In Vivo Cryo-EM Analysis of Dynein Motor Proteins

Number of participants limited to 5.

Abstract
Motor proteins convert chemical energy into mechanical motion. In this block course, we study dynein motor proteins in cilia. Dynein causes conformational change upon ATP hydrolysis and finally generate ciliary bending motion. Participants will analyze cryo-EM data of cilia and visualize in vivo 3D structure of dynein to learn how motor proteins function in the cell.

Objective
The goal of this course is to familiar with structural biology techniques of cryo-electron tomography and single particle cryo-EM studies on motor proteins. The main focus is 3D image analysis of cryo-EM datasets acquired by highest-end microscopes. Participants will learn structure-function relationship at various scales: how the conformational change of motor proteins causes mechanical force and generates cellular motility.

Content
Motor proteins, such as dynein, myosin and kinesin, hydrolyze ATP to ADP and phosphate to convert chemical energy to mechanical motion. Their function is essential for intracellular transport, muscle contraction and other cellular motility as well as cell division. Motor proteins have been major targets of biophysical studies. There exist questions from atomic to tissue levels – how ATP hydrolysis causes conformational change of motor proteins; how their motion is regulated by calcium, phosphorylation and other factors; how motions of multiple motor proteins are coordinated to generate cellular motility. Structural biology has been playing central roles to answer these questions. X-ray crystallography and single particle cryo-EM address structural analysis at atomic resolution and try to reveal molecular mechanism of conformational change. Cryo-electron tomography analyzes localization and 3D structure of motor proteins in the cell to explain how motions of molecular motors happen in the context of cellular environment and are integrated into cellular motion. In this course, we study dyneins in cilia. Cilia are force-generating organelles, made by nine microtubules and thousands of dyneins. Dynein hydrolyzes ATP and undergoes conformational change, generating linear motion with respect to the microtubule. As a whole system, cilia integrate motions of these dyneins and orchestrate beating motion. To explain ciliary motion at molecular level, we need to know dynein conformational change in the cellular context. Cryo-electron tomography is recently developed technique to study molecular structures in vivo and therefore a suitable method to study dynein in cilia. Recently spatial resolution of these cryo-EM techniques was dramatically improved, driven by development of new types of detectors and electron optics. The participants of this course will learn a program to analyze cryo-electron tomography and single particle cryo-EM data, acquired by highest-end electron microscopes and detectors in ETH and other places, and reconstruct 3D structure (tomogram) of cilia from various organisms (from green algae to human). They will further learn a program to study molecular structures from these tomograms (called subtomogram averaging) and apply it to reconstruct high-resolution 3D structure of dyneins, microtubules and regulatory proteins. This practical course is therefore mainly computational, but we will also provide students a chance to analyze cryo-electron tomography and single particle cryo-EM data, acquired by highest-end electron microscopes and detectors in ETH.

Lecture notes
Scripts will be distributed during the course.

Literature
An overview is given in the following review articles. Further literature will be indicated during the course.

Adaptability and Flexibility fostered

Current literature references will be provided during the lectures.

Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and fostered

Lecture notes will be made available online.

Subject-specific Competencies assessed

Comprehensive knowledge about the analytical methods introduced in this course and their practical applications.

Content

Advanced class covering the state of the research in bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Lecture notes

Updated handouts will be provided during the class.

Literature

Current literature references will be provided during the lectures.

Prerequisites / notice

The lecture "Grundlagen der Biologie II: Mikrobiologie" is the basis for this advanced lecture.

Modern Mass Spectrometry, Hyphenated Methods, and Chemometrics

Abstract

Modern mass spectrometry, hyphenated analytical methods, speciation, chemometrics.

Objective

Comprehensive knowledge about the analytical methods introduced in this course and their practical applications.

Content

Hyphenation of separation with identification methods such as GC-MS, LC-MS, GC-IR, LC-IR, LC-NMR etc.; importance of speciation. Modern mass spectrometry: time-of-flight, orbitrap and ion cyclotron resonance mass spectrometry, ICP-MS. Soft ionization methods, desorption methods, spray methods. Mass spectrometry imaging. Use of statistical and computer-assisted methods for processing analytical data (chemometrics).

Lecture notes

Lecture notes will be made available online.

Literature

Information about relevant literature will be available in the lecture & in the lecture notes.

Prerequisites / notice

Exercises are an integral part of the lecture.

Prerequisites:

529-0051-00 “Analytische Chemie I (3. Semester)”

529-0058-00 “Analytische Chemie II (4. Semester)” (or equivalent)

Competencies

Subject-specific Competencies

Concepts and Theories assessed

Self-direction and Self-management fostered

Inorganic Chemistry III: Organometallic Chemistry and Homogeneous Catalysis

Abstract

Fundamental aspects of the organometallic chemistry of the transition elements. Mechanistic homogeneous catalysis including oxidative additions, reductive eliminations and insertion reactions, Catalytic hydrogenation, carbylation, C-C bond-forming and related reactions.

Objective

Towards an understanding of the fundamental coordination-chemical and mechanistic aspects of transition-metal chemistry relevant to homogeneous catalysis.

Content

Fundamental aspects of the organometallic chemistry of the transition elements. Mechanistic homogeneous catalysis including oxidative additions, reductive eliminations and insertion reactions, Catalytic hydrogenation, carbylation, C-C bond-forming and related reactions.

Cellular Biochemistry (Part I)

Abstract

Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

Objective

The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterization of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry. The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.
Content
Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.
Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

Lecture notes
Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

Literature
Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

Prerequisites / notice
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

Abstract
Students will study bioinformatic concepts in the areas of metagenomics, genomics, transcriptomics, proteomics, biological networks and biostatistics. Through integrated lectures, practical hands-on exercises and project work, students will also be trained in analytical and programming skills to meet the emerging increase in data-driven knowledge generation in biology in the 21st century.

Objective
Students will have an advanced understanding of the underlying concepts behind modern bioinformatic analyses at genome, metageneome and proteome-wide scales. They will be familiar with the most common data types, where to access them, and how to analytically work with them to address contemporary questions in the field of biology.

Prerequisites / notice
Course participants have already acquired basic programming skills in UNIX, Python and R.

Abstract
Methods of Asymmetric Synthesis

Objective
Understanding of the basic principles of diastereoselective synthesis

Content
Conformational analysis: acyclic and cyclic systems; Diastereoselective sigmatropic rearrangements; Diastereoselective Carbonyl addition reactions: Cram- and Felkin-Anh models, carbonyl Lewis acid interactions, chelate controlled reactions; chemistry of enolates, selective formation; asymmetric enolate alkylation; aldol reactions, allyl- and crotyl-metal chemistry; cyclisations, Baldwin rules; Diastereoselective olefin functionalization: hydroboration, dihydroxylation, epoxidation.

Abstract

Objective

The aim of the course is to learn how to design polymerization reactors and bioreactors to produce polymers and proteins with the specific product qualities that are required by different applications in chemical, pharmaceutical and food industry. This activity includes the post-treatment of polymer latexes, the downstream processing of proteins and the analysis of their colloidal behavior.

Content

We will cover the fundamental processes and the operation units involved in the production of polymeric materials and proteins. In particular, the following topics are discussed: Overview on the different polymerization processes, Kinetics of free-radical polymerization and use of population balance models. Production of polymers with controlled characteristics in terms of molecular weight distribution. Kinetics and control of emulsion polymerization. Surfactants and colloidal stability. Aggregation kinetics and aggregate structure in conditions of diffusion and reaction limited aggregation. Modeling and design of colloid aggregation processes. Physico-chemical characterization of proteins and description of enzymatic reactions. Operation units in bioprocessing: upstream, reactor design and downstream. Industrial production of therapeutic proteins. Characterization and engineering of protein aggregation. Protein aggregation in biology and in biotechnology as functional materials.

Lecture notes

Scripts are available on the web page of the Arosio-group: http://www.arosiogroup.ethz.ch/education.html

Additional handout of slides will be provided during the lectures.

Literature

529-0243-01L Transition Metal Catalysis: From Mechanisms to Applications

Abstract

Detailed discussion of selected modern transition metal catalyzed reactions from a synthetic and mechanistic viewpoint

Objective

Understanding and critical evaluation of current research in transition metal catalysis. Design of mechanistic experiments to elucidate reaction mechanisms. Synthetic relevance of transition metal catalysis. Students will also learn about writing an original research proposal during a workshop.

Content

Detailed discussion of selected modern transition metal catalyzed reactions from a synthetic and mechanistic viewpoint. Synthetic applications of these reactions. Introduction and application of tools for the elucidation of mechanisms. Selected examples of topics include: C-H activation, C-O activation, C-C activation, redox active ligands, main group redox catalysis, bimetallic catalysis.

Lecture notes

Lecture slides will be provided online. A Handout summarizing important concepts in organometallic and physical organic chemistry will also be provided. Useful references and handouts will also be provided during the workshop.

Literature

Slides will be uploaded 1-2 days before each lecture on http://morandi.ethz.ch/education.html

Compensatory Courses

Prerequisites / notice

Required level: Courses in organic and physical chemistry (kinetics in particular) of the first and second year as well as ACI and III

Prerequisites: Either 535-0830-00L Pharmaceutical Immunology I or 551-0317-00L Immunology I must have been taken.
In this course, various topics related to the development, GMP production and application of therapeutic proteins will be discussed.

**Objective**

Students know and understand:
- basic mechanisms and regulation of the immune response
- the pathogenic mechanisms of the most important immune-mediated disorders
- the concepts of vaccination and cancer immunotherapy
- the most frequently used expression systems for the production of therapeutic proteins
- the use of protein engineering tools for modifying different features of therapeutic proteins
- the mechanism of action of selected therapeutic proteins and their application
- basic concepts in the GMP production of therapeutic proteins

**Content**

The course consists of two parts:

In the first part, students will complete their training in Pharmaceutical Immunology. This part particularly focuses on the pathogenic mechanisms of immune-mediated diseases, vaccination and cancer immunotherapy. Deepened knowledge of immunology will be relevant for understanding the mechanism of action of many therapeutic proteins, as well as for understanding one major concern related to the use of protein-based drugs, namely, immunogenicity.

The second part focuses on topics related to the development and application of therapeutic proteins, such as protein expression, protein engineering, reducing immunogenicity, and GMP production of therapeutic proteins. Furthermore, selected examples of approved therapeutic proteins will be discussed.

**Literature**

- Janeway's Immunobiology, by Kenneth Murphy (9th or 10th Edition)
- Lecture Handouts
- Paper References provided in the Scripts
- EMEA Dossier for Humira

**Prerequisites / notice**

Prerequisites: Either 535-0830-00L Pharmaceutical Immunology I or 551-0317-00L Immunology I
Students will study bioinformatic concepts in the areas of metagenomics, genomics, transcriptomics, proteomics, biological networks and biostatistics. Through integrated lectures, practical hands-on exercises and project work, students will also be trained in analytical and programming skills to meet the emerging increase in data-driven knowledge generation in biology in the 21st century.

Students will have an advanced understanding of the underlying concepts behind modern bioinformatic analyses at genome, metagenome and proteome-wide scales. They will be familiar with the most common data types, where to access them, and how to analytically work with them to address contemporary questions in the field of biology.

Students bring their own computer with keyboard, internet access (browser) and software to connect to the ETH network via VPN.

Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

Concepts and modern genetics, Information for UZH students: Enrolment to this course unit only possible at ETH. No enrolment to module BIC348 at UZH.
Please mind the ETH enrolment deadlines for UZH students: https://www.ethz.ch/en/studies/non-degree-courses/special-students-university-of-zurich.html

Abstract
Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Objective
This course focuses on the concepts of classical and modern genetics and genomics.

Content
The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Lecture notes
Scripts and additional material will be provided during the semester.

551-0317-00L Immunology I W 3 credits 2V M. Kopf, A. Oxenius

Abstract
Introduction into structural and functional aspects of the immune system. Basic knowledge of the mechanisms and the regulation of an immune response.

Objective
Introduction into structural and functional aspects of the immune system. Basic knowledge of the mechanisms and the regulation of an immune response.

Content
- Introduction and historical background
- Innate and adaptive immunity, Cells and organs of the immune system
  - B cells and antibodies
  - Generation of diversity
  - Antigen presentation and Major Histoincompatibility (MHC) antigens
  - Thymus and T cell selection
  - Autoimmunity
  - Cytotoxic T cells and NK cells
  - Th1 and Th2 cells, regulatory T cells
  - Allergies
  - Hypersensitivities
- Vaccines, immune-therapeutic interventions

Lecture notes
Electronic access to the documentation will be provided. The link can be found at "Lernmaterialien"

Literature
- Kuby, Immunology, 9th edition, Freeman + Co., New York, 2020

Prerequisites / notice
For D-BIOL students Immunology I (WS) and Immunology II (SS) will be examined as one learning entity in a "Sessionsprüfung". All other students write separate exams for Immunology I and Immunology II. All exams (combined exam Immunology I and II, individual exams) are offered in each exam session.

Abstract
The lecture conveys the fundamental concepts underlying multicellularity with an emphasis on the molecular basis of multicellular biological systems and their functional integration into coherent wholes. The structural and functional specialization in multicellular organisms will be discussed by highlighting common and specific functions in fungi, plants, and animals (including humans).

Objective
1. Students can describe advantages and challenges associated with being multicellular and outline independent solutions that organisms have developed to cope with the challenges of complex multicellularity.

2. Students can explain how the internal and external structures of fungi, plants and animals function to support survival, growth, behavior, and reproduction.

3. Students can explain the basic pathways and mechanisms of cellular communication regulating cellular behavior (cell adhesion, metabolism, proliferation, reproduction, development).

4. Students can describe how a single cell develops from one cell into many, each with different specialized functions.

Data: 06.08.2024 12:40 Autumn Semester 2024 Page 258 of 2684
Content
The lecture introduces the structural and functional specialization in fungi, plants and animals, including humans. After providing an overview on the diversity of eukaryotic organisms, the lecture will discuss how fungi, plants, animals and humans have evolved structures and strategies to cope with the challenges of multicellularity. The molecular basis underlying communication, coordination and differentiation will be conveyed and complemented by key aspects of reproduction, metabolism development, and regeneration. Topics include form and function of fungi and plants, human anatomy and physiology, metabolism, cell signaling, adhesion, stem cells, regeneration, reproduction, and development.

Literature
Campbell “Biology”, 11th Edition

Prerequisites / notice
Some lecture are held in English.

551-1005-00L Bioanalytics

Abstract
The course will introduce students to a selected set of laboratory techniques that are foundational to modern biological research.

Objective
For each of the techniques covered in the course, the students will be able to explain:

a) the physical, chemical and biological principles underlying the technique,
b) the requirements for the sample,
c) the type of raw data collected by the technique,
d) the assumptions and auxiliary information used in the interpretation of the data and
e) how these data can be used to answer a given biological question.

By the end of the course the students will be able to select the appropriate experimental technique to answer a given biological problem and will be able to discuss the advantages and limitations of individual techniques as well as how different techniques can be combined to gain a more complete understanding of a given biological questions.

Content
The course will be based on a combination of lectures, self-study elements and exercises.

The focus will be on the following experimental techniques:

- DNA sequencing
- chromatography
- mass-spectrometry
- UV/Vis and fluorescence spectrometry
- light microscopy
- electron microscopy
- X-ray crystallography
- NMR spectroscopy

Lecture notes
The course is supported by a Moodle page that gives access to all supporting materials necessary for the course.

529-0004-01L Classical Simulation of (Bio)Molecular Systems

Abstract
Molecular models, classical force fields, configuration sampling, molecular dynamics simulation, boundary conditions, electrostatic interactions, analysis of trajectories, free-energy calculations, structure refinement, applications in chemistry and biology. Exercises: hands-on computer exercises for learning progressively how to perform an analyze classical simulations (using the package GROMOS).

Objective
Introduction to classical (atomistic) computer simulation of (bio)molecular systems, development of skills to carry out and interpret these simulations.

Content
Molecular models, classical force fields, configuration sampling, molecular dynamics simulation, boundary conditions, electrostatic interactions, analysis of trajectories, free-energy calculations, structure refinement, applications in chemistry and biology. Exercises: hands-on computer exercises for learning progressively how to perform an analyze classical simulations (using the package GROMOS).

Lecture notes
The powerpoint slides of the lectures will be made available weekly on the website in pdf format (on the day preceding each lecture).

Literature
See: www.csms.ethz.ch/education/CSBMS

Prerequisites / notice
Since the exercises on the computer do convey and test essentially different skills than those being conveyed during the lectures and tested at the oral exam, the results of the exercises are taken into account when evaluating the results of the exam (learning component, possible bonus of up to 0.25 points on the exam mark).

For more information about the lecture: www.csms.ethz.ch/education/CSBMS
Concepts and Theories

Analytical Strategy

W 6 credits 3G
R. Zenobi, S. Giannoukos, D. Günther

Abstract
Problem-oriented development of analytical strategies and solutions.

Objective
Ability to create solutions for particular analytical problems.

Content
Individual development of strategies for the optimal application of chemical, biochemical, and physico-chemical methods in analytical chemistry solving predefined problems. Experts from industry and administration present particular problems in their field of activity. Principles of sampling. Design and application of microanalytical systems.

Lecture notes
Copies of problem sets and solutions will be distributed free of charge

Biochemical and Polymer Reaction Engineering

529-0615-01L

W 6 credits 3G
P. Arosio, P. Fleckenstein

Abstract

Objective
The aim of the course is to learn how to design polymerization reactors and bioreactors to produce polymers and proteins with the specific product qualities that are required by different applications in chemical, pharmaceutical and food industry. This activity includes the post-treatment of polymer latexes, the downstream processing of proteins and the analysis of their colloidal behavior.

Content
We will cover the fundamental processes and the operation units involved in the production of polymeric materials and proteins. In particular, the following topics are discussed: Overview on the different polymerization processes. Kinetics of free-radical polymerization and use of population balance models. Production of polymers with controlled characteristics in terms of molecular weight distribution. Kinetics and control of emulsion polymerization. Surfactants and colloidal stability. Aggregation kinetics and aggregate structure in conditions of diffusion and reaction limited aggregation. Modeling and design of colloid aggregation processes. Physico-chemical characterization of proteins and description of enzymatic reactions. Operation units in bioprocessing: upstream, reactor design and downstream. Industrial production of therapeutic proteins. Characterization and engineering of protein aggregation. Protein aggregation in biology and in biotechnology as functional materials.

Lecture notes
Additional handout of slides will be provided during the lectures.

Cell Biophysics

227-0939-00L

W 6 credits 4G
T. Zambelli

Abstract
Applying two fundamental principles of thermodynamics (entropy maximization and Gibbs energy minimization), an analytical model is derived for a variety of biological phenomena at the molecular as well as cellular level, and critically compared with the corresponding experimental data in the literature.

Objective
Engineering uses the laws of physics to predict the behavior of a system. Biological systems are so diverse and complex prompting the question whether we can apply unifying concepts of theoretical physics coping with the multiplicity of life’s mechanisms.

Objective of this course is to show that biological phenomena despite their variety can be analytically described using only two principles from statistical mechanics: maximization of the entropy and minimization of the Gibbs free energy.

Starting point of the course is the probability theory, which enables to derive step-by-step the two pillars of thermodynamics from the perspective of statistical mechanics; the maximization of entropy according to the Boltzmann's law as well as the minimization of the Gibbs free energy. Then, an assortment of biological phenomena at the molecular and cellular level (e.g. cytoskeletal polymerization, action potential, photosynthesis, gene regulation, morphogen patterning) will be examined at the light of these two principles with the aim to derive a quantitative expression describing their behavior. Each analytical model is finally validated by comparing it with the corresponding experimental results from the literature.

By the end of the course, students will also learn to critically evaluate the concepts of making an assumption and making an approximation.
Content

- Basics of theory of probability
- Boltzmann's law
- Entropy maximization and Gibbs free energy minimization
- Ligand-receptor: two-state systems and the MWC model
- Random walks, diffusion, crowding
- Electrostatics for salty solutions
- Elasticity: fibers and membranes
- Molecular motors
- Action potential: Hodgkin-Huxley model
- Photosynthesis and vision
- Gene regulation
- Development: Turing patterns

Theory and corresponding exercises are merged together during the classes.

Lecture notes

No lecture notes because the two proposed textbooks are more than exhaustive!

I am willingly available Mondays 17.00 o'clock - 18.00 in my office GLC F12.2 for whatever discussion about the lessons and the exercises.

!!! I am using OneNote. All lectures will be broadcast via ZOOM, while corresponding videos of the previous years (lectures and exercises) are available in Moodle !!!

Literature

As further deepening:

Prerequisites / notice

Participants need a good command of
- differentiation and integration of a function with one or more variables (basics of Analysis),
- Newton's and Coulomb's laws (basics of Mechanics and Electrostatics).

Notions of vectors in 2D and 3D are beneficial.

Organic Chemistry III: Introduction to Asymmetric Synthesis

Methods of Asymmetric Synthesis

Understanding of the basic principles of diastereoselective synthesis

Conformational analysis: acyclic and cyclic systems; Diastereoselective sigmatropic rearrangements; Diastereoselective Carbonyl addition reactions: Cram- and Felkin-Anh models, carbonyl Lewis acid interactions, chelate controlled reactions; chemistry of enolates, selective formation; asymmetric enolate alkylation; aldol reactions, allyl- and crotyl-metal chemistry; cyclisations, Baldwin rules; Diastereoselective olefin functionalization: hydroboration, dihydroxylation, epoxidation.

**327-0312-00L** **Materials Synthesis I - Polymers**

**Abstract**
The course teaches the basics and terminology of polymer synthesis. To synthesize various polymeric materials, different polymerization techniques are required. This course will introduce representative polymerization methodologies and will discuss how they operate in order to yield materials with enhanced polymeric characteristics.

**Objective**
1) The students will be able to recognize different polymer types and associate them with their chemical structure and properties (i.e. rubber elasticity, glass transition temperature, etc.)
2) The students will become familiar with various synthetic methods to produce polymers of different architectures and topologies
3) The students will be exposed to different characterization methods (e.g. size exclusion chromatography, mass-spectrometry, nuclear magnetic resonance) that are necessary to confirm the successful synthesis and structure of a polymer
4) The students will understand the mechanism of selected polymerization methodologies
5) The students will be introduced to state-of-the-art polymer synthesis and recent literature examples will be critically discussed

**Content**
conventional chain growth polymerization, living chain growth polymerization, step growth polymerization, polymeric architectures, molecular weight determination methods, polymer properties, polymerization mechanisms, polymer characterization methods

**Lecture notes**
Lecture slides with references to further literature will be available on Moodle

**Literature**
- J. M. G. Cowie "Polymers: Chemistry and Physics of Modern Materials"
- L. Mandelkern, "An Introduction to Macromolecules"
- M. Fussenegger, "Polymers: Chemistry and Physics of Modern Materials"

**636-0108-00L** **Biological Engineering and Biotechnology**

**Abstract**
Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

**Objective**

**Lecture notes**
Lecture slides with references to further literature will be available on Moodle

**529-0233-01L** **Organic Synthesis: Methods and Strategies**

**Abstract**
The complex relation between structural analysis, methods leading to desired transformations, and insight into reaction mechanisms is exemplified. Relations between retrosynthetic analysis of target structures, synthetic methods and their combination in a synthetic strategy.

**Objective**
Extension and deepening of the knowledge in organic synthesis and the principles of structure and reactivity.

**Content**

**Prerequisites / notice**
OC I-IV
Inorganic Chemistry III: Organometallic Chemistry and Assessing Transition Metal Catalysis: From Mechanisms to Applications

The students should obtain an understanding of these processes, which are at work during gene expression.

Adaptability and Flexibility

The students should get familiar with the wide array of roles, which non-coding RNAs play in cellular functions.

551-1407-00L  RNA Biology Lecture Series I: Transcription & Processing & Translation

W  4 credits  2V

F. Allain, N. Ban, S. Jonas, U. Kutay, further lecturers

Abstract
This course covers aspects of RNA biology related to gene expression at the posttranscriptional level. These include RNA transcription, processing, alternative splicing, editing, export and translation.

Objective
The students should get familiar with the wide array of roles, which non-coding RNAs play in cellular functions.

Content
Transcription & 3'end formation; splicing, alternative splicing, RNA editing; the ribosome & translation, translation regulation, RNP biogenesis & nuclear export, mRNA surveillance & mRNA turnover; signal transduction & RNA.

Prerequisites / notice
Basic knowledge of cell and molecular biology.

529-0132-00L  Inorganic Chemistry III: Organometallic Chemistry and Assessing Homogeneous Catalysis

W  4 credits  3G

M. Bezdek, C. Copéret

Abstract
Fundamental aspects of the organometallic chemistry of the transition elements. Mechanistic homogeneous catalysis including oxidative additions, reductive eliminations and insertion reactions. Catalytic hydrogenation, carbylonylation, C-C bond-forming and related reactions.

Objective
Towards an understanding of the fundamental coordination-chemical and mechanistic aspects of transition-metal chemistry relevant to homogeneous catalysis.

Content
Fundamental aspects of the organometallic chemistry of the transition elements. Mechanistic homogeneous catalysis including oxidative additions, reductive eliminations and insertion reactions. Catalytic hydrogenation, carbylonylation, C-C bond-forming and related reactions.

551-1409-00L  RNA Biology Lecture Series II: Non-Coding RNAs: Biology and Therapeutics

W  4 credits  2V

J. Hall, M. Stoffel, further lecturers

Abstract
This course covers aspects of RNA biology related to the functions of non-coding RNAs as well as their use as drugs to treat diseases.

Objective
The students should get familiar with the wide array of roles, which non-coding RNAs play in cellular functions.

Content
Micro RNAs; computational approaches to miRNAs; micro RNA function in metabolism; viruses and viral RNAs; ncRNA-mediated genome regulation; epigenetic programming of genome remodelling in ciliates; telomerase and telomeres; tRNA biology. http://www.nccr-rna-and-disease.ch/tiki-index.php?page=LectureSeries

Prerequisites / notice
Basic knowledge of cell and molecular biology.

529-0243-01L  Transition Metal Catalysis: From Mechanisms to Assessing Applications

W  6 credits  3G

B. Morandi

Abstract
Detailed discussion of selected modern transition metal catalyzed reactions from a synthetic and mechanistic viewpoint

Objective
Understanding and critical evaluation of current research in transition metal catalysis. Design of mechanistic experiments to elucidate reaction mechanisms. Synthetic relevance of transition metal catalysis. Students will also learn about writing an original research proposal during a workshop.

Content
Detailed discussion of selected modern transition metal catalyzed reactions from a synthetic and mechanistic viewpoint. Synthetic applications of these reactions. Introduction and application of tools for the elucidation of mechanisms. Selected examples of topics include: C-H activation, C-O activation, C-C activation, reductively active ligands, main group reduct catalysts, bimetallic catalysis.

Lecture notes
Lecture slides will be provided online. A Handout summarizing important concepts in organometallic and physical organic chemistry will also be provided. Useful references and handouts will also be provided during the workshop.

The following textbooks can provide useful support for the course:

Prerequisites / notice
Required level: Courses in organic and physical chemistry (kinetics in particular) of the first and second year as well as ACI and III

376-1581-00L Cancer: Fundamentals, Origin and Therapy Z 2 credits 2G H. Nägeli

Abstract

Objective

Students are able to describe selected chemicals, biological and molecular processes that occur in cells spontaneously or after physical or chemical exposure and resulting in a tumor. They are able to list important cancer-inducing agents and explain the respective mechanism of action. They have knowledge of significant risk factors for cancer diseases. They are confronted with the basics of toxicology and they can explain the principle of the most common therapeutic strategies.

Content

The lecture deals with problems of tumor epidemiology (causes, mortality, incidence). Cancer is delineated as a multi-step process. Classes of chemical compounds that induce cancer are discussed as well as the reactive metabolites that may be built from. Covalent binding to DNA is discussed and different types of mutations resulting thereof. A selection of proto-oncogenes and tumor suppressor genes is presented. Their function will be discussed as well as the changes which are found in these genes in tumor cells, starting from single nucleotide exchanges up to large deletions.

The reason for genetic predisposition to cancer will be discussed as well as cancer relevant aspects of cell cycle regulation. The role of tumor microenvironments and phenomena like angiogenesis and metastasis are presented as well as the mechanisms that protect the genome from mutagenic damage. Further subjects address old and new strategies of cancer treatment. Personalised cancer treatment.

Lecture notes

Handouts with reproductions of all presented transparencies will be distributed.

Additional information is given during the lecture

Prerequisites / notice

The lecture requires an active participation of the students. All students will participate in individual or group work focussing on specific subject of the lecture. Students will have ample time for preparation during lecture time.

401-5640-00L ZüKoSt: Seminar on Applied Statistics Z Dr. 0 credits 1K M. Kalisch, F. Balabdaoui, A. Bandeira, Y. Chen, R. Furrer, L. Held, T. Hothorn, L. Meier

Data: 06.08.2024 12:40 Autumn Semester 2024 Page 266 of 2684
Advice for analyzing data by statistical methods.

There will be about 3 talks on how statistical methods are applied in practice.

Student-led presentations, guests and discussions on current themes in ecology, evolution and population biology.

Contact: beratung@stat.math.ethz.ch, Tel. 044 632 2223. See also http://stat.ethz.ch/consulting

Requirements: Knowledge of the basic concepts of statistics is desirable.

Seminars by invited speakers covering selected microbiology themes.

Students gain competences in presenting their work orally, leading discussions about current topics in ecology and evolution, interacting with colleagues from various subdisciplines, and engaging in critical dialogue about ongoing research projects.

For information, location and details: https://pe.ethz.ch/education/zis.html

About 3 talks on applied statistics.

See how statistical methods are applied in practice.

This is no lecture. There is no exam and no credit points will be awarded. The current program can be found on the web: http://stat.ethz.ch/events/zukost

Course language is English or German and may depend on the speaker.

Concepts and Theories fostered
Techniques and Technologies fostered
Decision-making fostered
Problem-solving fostered
Creative Thinking fostered
Critical Thinking fostered

The course is a literature seminar or "journal club". Each Friday a student, or a member of the Suter Lab in the Institute of Molecular Health Sciences, will present a paper from the recent literature.

The course introduces you to recent developments in the fields of cellular and molecular neurobiology. It also supports you to develop your skills in critically reading the scientific literature. You should be able to grasp what the authors wanted to learn i.e. their goals, why the authors chose the experimental approach they used, the strengths and weaknesses of the experiments and the data presented, and how the work fits into the wider literature in the field. You will present one paper yourself, which provides you with practice in public speaking.

You will present one paper yourself. Give an introduction to the field of the paper, then show and comment on the main results (all the papers we present are available online, so you can show original figures with a beamer). Finish with a summary of the main points and a discussion of their significance.

Current Immunological Research in Zurich

R. Spörri, C. Halin Winter, W.-D. Hardt, M. Kopf, S. R. Leibundgut, A. Oxenius, University lecturers

This monthly meeting is a platform for Zurich-based immunology research groups to present and discuss their ongoing research projects. At each meeting three PhD students or Postdocs from the participating research groups present an ongoing research project in a 30 min seminar followed by a plenary discussion.

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 267 of 2684
551-1106-00L Progress Reports in Microbiology and Immunology

Objective
The aim of this monthly meeting is to provide further education for master and doctoral students as well as Postdocs in diverse topics of immunology and to give an insight in the related research. Furthermore, this platform fosters the establishment of science- and technology-based interactions between the participating research groups.

Content
Presentation and discussion of current research projects carried out by various immunology-oriented research groups in Zurich.

Lecture notes
none

551-2029-00L Sustainable Plant Systems (Seminar)

Objective
Future society has to feed nine billion people, therefore agriculture and food, waste and resource management have to go hand in hand toward the use of less resources and acceptance of the limits of Planetary Boundaries. The focus of the seminar will be:

(1) Agroecological systems. Can we transform the impact of agricultural in Switzerland and beyond?
(2) Food system transformation. How can local sustainable food systems be built and scaled through policy strategies, food environments and consumer habits.

Future society to feed nine billion people, therefore agriculture and food, waste and resource management have to go hand in hand toward the use of less resources and acceptance of the limits of Planetary Boundaries.

1K A. D. Gossert

551-0120-00L Plant Biology Colloquium (Autumn Semester)

Objective
Current topics in Molecular Plant Biology presented by internal and external speakers from academia.

Content

551-1615-00L NMR Methods for Studies of Biological Macromolecules

Objective
In this seminar series, topics relevant to solution state NMR with biological macromolecules are treated. Each semester a different aspect of biomolecular NMR is discussed in depth. The course is tailored to advanced students (PhD students and postdocs) who have experience with applications of NMR spectroscopy. Each participant presents a selected topic in form of a seminar. The students will actively participate in the course which is held in the form of a seminar. Individual students will prepare particular topics of the course based on literature references and present the material in form of a seminar to their fellow students. In short, the students learn to actively participate in discussions and to prepare a presentation of a scientific topic which was mostly unknown to them before.

551-1713-00L Current Topics in Molecular Health Sciences

Z 0 credits 2S I. Zanini, further lecturers

Abstract
This course is a seminar series on current research topics within the Institute of Molecular Health Sciences.

Objective
The course introduces the participants to recent developments in the fields of molecular health sciences.

Prerequisites / notice
Approval of the responsible lecturer necessary for participation.

402-0368-07L Lecture Series: Space Research and Exploration

Z Dr 1 credit 2V S. P. Quanz

Abstract
Lecture Series about selected topics of space research and exploration consisting of individual talks given by different leading experts from academia and industry.

Objective
- Attending students will experience the interdisciplinarity of space research and exploration spanning physics, engineering, geosciences, biology and more.
- get familiar with the Swiss space research and industry landscape.
- enhance their communication skills by broadening their research horizon.
- have the opportunity for direct learning by posing questions to experts.

Content
The field of space research and exploration is intrinsically interdisciplinary. Cutting edge space activities are dominated by an interplay between the scientifically desirable and the technologically possible. The ‘Lecture Series: Space Research and Exploration’ aims to shed light on key questions engaged by leading scientists and engineers today. It consists of weekly lectures, given by different speakers with vast experience in their respective field (e.g., Human Spaceflight, System Engineering of Spacecraft, Space Life Sciences, Space-based astrophysics). Subsequent to the talk, the student will have the opportunity to deepen their understanding by asking questions to the presenter in a moderated Q&A.

Confirmed speakers will be announced by the start of the semester (see lecture from last year for previous speakers).

<td>The lecture introduces biology as an interdisciplinary science. Links to physics and chemistry will manifest as biological processes that operate within the laws of thermodynamics and are rooted in elements, molecules and chemical reactions. The transition from geochemistry to biochemistry is discussed and considered in relation to the origin of life. Evolutionary principles are introduced and resulting processes are used as a guiding principle. Unifying concepts in biology are presented, including the structure and function of cellular macromolecules and the ways in which hereditary information is encoded, decoded and replicated. Central principles of universal energy conversion are looked at, starting from redox processes and focusing on bacteria and archaea. Finally, biological processes are put into an ecosystems perspective.</td>

Abstract
Introduction to the concepts and tools in physics with the help of demonstration experiments: mechanics and elements of quantum mechanics

Objective
Students know and understand the basic ideas of the scientific description of nature. They understand the fundamental concepts and laws of mechanics and they are able to apply them in practical problems. They know the concepts of quantization and quantum numbers.

Content
1. Description of Motion
2. The laws of Newton
3. Work and energy
4. Collision problems
5. Wave properties of particles
6. The atomic structure of matter

401-0291-00L | Mathematics I | O    | 6 credits | 4V+2U | E. W. Farkas |

Abstract
Mathematics I/II is an introduction to one- and multidimensional calculus and linear algebra emphasizing on applications.

Objective
Students understand mathematics as a language for modeling and as a tool for solving practical problems in natural sciences.
Students can analyze models, describe solutions qualitatively or calculate them explicitly if need be. They can solve examples as well as their practical applications manually and using computer algebra systems.
Content

## Eindimensionale diskrete Entwicklungen ##
- linear, exponentiell, begrenzt, logistisch
- Fixpunkte, diskrete Veränderungsraten
- Folgen und Grenzwerte

## Funktionen in einer Variablen ##
- Reproduktion, Fixpunkte
- Periodizität
- Stetigkeit

## Differentialrechnung (I) ##
- Veränderungsrate-geschwindigkeit
- Differentialquotient und Ableitungsfunktion
- Anwendungen der Ableitungsfunktion

## Integralrechnung (I) ##
- Stammfunktionen
- Integrationstechniken

## Gewöhnliche Differentialgleichungen (I) ##
- Qualitative Beschreibung an Beispielen:
  - Beschränkt, Logistisch, Gompertz
  - Stationäre Lösungen
  - Lineare DGL 1. Ordnung
  - Trennung der Variablen

## Lineare Algebra ##
- Erste Arithmetische Aspekte
- Matrizenrechnung
- Eigenwerte / -vektoren
- Quadratische LGS und Determinante

Lecture notes
In Ergänzung zu den Vorlesungskapiteln der Lehrveranstaltungen fassen wir wichtige Sachverhalte, Formeln und weitere Ausführungen jeweils in einem Vademecum zusammen.

Dabei gilt:

* Die Skripte ersetzen nicht die Vorlesung und/oder die Übungen!
* Ohne den Besuch der Lehrveranstaltungen verlieren die Ausführungen ihren Mehrwert.
* Details entwickeln wir in den Vorlesungen und den Übungen, um die hier bestehenden Lücken zu schliessen.
* Prüfungsrelevant ist, was wir in der Vorlesung und in den Übungen behandeln.

Laboratory Course General Chemistry (for Biology and Pharmacy)

Information about the practical course will be given on the first day.

Register in myStudies as early as possible, because the fire protection courses take place separately before the internship starts.

Abstract
Introduction to the practical work in a chemistry laboratory. The most important manipulations and techniques are treated, as well as the most fundamental chemical reaction types.

Objective
- Knowledge of the basic chemical laboratory methods
- Basic knowledge of the scientific approach in experimenting
- Observation and interpretation of chemical processes
- Keeping of a reliable laboratory journal

Content
- Simple chemical working techniques/methods
- Separation techniques
- Physical measurements: mass, volume, pH
- Ionic solids (salts)
- Acid/base chemistry, buffers
- Redox reactions
- Metal complexes
- Titration methods and quantitative spectrometry
- Introduction to qualitative analysis

Prerequisites / notice
This practical course causes costs for materials and chemicals. The costs are charged to the students at the end of semester.

By enrolling in this lab course, students confirm that they will thoroughly study and follow all safety information and instructions and that they have an accident insurance valid for Switzerland for the entire duration of the semester.

Abstract
The lecture conveys the fundamental concepts underlying multicellularity with an emphasis on the molecular basis of multicellular biological systems and their functional integration into coherent wholes. The structural and functional specialization in multicellular organisms will be discussed by highlighting common and specific functions in fungi, plants, and animals (including humans).

Objective
1. Students can describe advantages and challenges associated with being multicellular and outline independent solutions that organisms have developed to cope with the challenges of complex multicellularity.
2. Students can explain how the internal and external structures of fungi, plants, and animals function to support survival, growth, behavior, and reproduction.
3. Students can explain the basic pathways and mechanisms of cellular communication regulating cellular behavior (cell adhesion, metabolism, proliferation, reproduction, development).
4. Students can describe how a single cell develops from one cell into many, each with different specialized functions.

Content
The lecture introduces the structural and functional specialization in fungi, plants, and animals, including humans. After providing an overview on the diversity of eukaryotic organisms, the lecture will discuss how fungi, plants, animals, and humans have evolved structures and strategies to cope with the challenges of multicellularity. The molecular basis underlying communication, coordination and differentiation will be conveyed and complemented by key aspects of reproduction, metabolism development, and regeneration. Topics include form and function of fungi and plants, human anatomy and physiology, metabolism, cell signaling, adhesion, stem cells, regeneration, reproduction, and development.

Bioanalytics

Abstract
The course will introduce students to a selected set of laboratory techniques that are foundational to modern biological research.

Objective
For each of the techniques covered in the course, the students will be able to explain:

a) the physical, chemical and biological principles underlying the technique,
b) the requirements for the sample,
c) the type of raw data collected by the technique,
d) the assumptions and auxiliary information used in the interpretation of the data and
e) how these data can be used to answer a given biological question.

By the end of the course the students will be able to select the appropriate experimental technique to answer a given biological problem and will be able to discuss the advantages and limitations of individual techniques as well as how different techniques can be combined to gain a more complete understanding of a given biological questions.

Content
The course will be based on a combination of lectures, self-study elements and exercises.

The focus will be on the following experimental techniques:
- DNA sequencing
- chromatography
- mass-spectrometry
- UV/Vis and fluorescence spectrometry
- light microscopy
- electron microscopy
- X-ray crystallography
- NMR spectroscopy

Lecture notes
The course is supported by a Moodle page that gives access to all supporting materials necessary for the course.

Foundations of Computer Science

Abstract
This course provides selected computer science concepts for interdisciplinary projects.

Objective
Students learn to...

- encode a problem into a program, test the program, and correct errors.
- understand and improve existing code.
- deal with the complexity of real data.
- store data in a suitable data structure.
- query databases and understand and evaluate the corresponding database model.
- implement models from the natural sciences as a simulation.
- run random experiments and interpret the results.
- explain and apply standard algorithms and evaluate their efficiency.

Content
1. Variables, data types
2. Control structures, logic
3. Sequential data types, search- and sort algorithms, sequence analysis
4. Functions, modules, simulation and animation
5. Manage data with a relational database
6. Matrices, random experiments, cellular automata

Lecture notes
All materials for the lecture are available at www.gdi.ethz.ch

Literature

Prerequisites / notice
This course is based on application-oriented learning. The students spend most of their time working through projects with data from natural science and discussing their results with teaching assistants. To learn the computer science basics there are electronic tutorials available.

Abstract
Vertiefung von Statistikmethoden. Nach dem detaillierten Fundament aus Statistik I liegt nun der Fokus auf konzeptioneller Breite und konkreter Problemlösungsfähigkeit mit der Statistiksoftware R.

Objective

529-0015-00L  Physical Chemistry  O  3 credits  2V+1U  G. Jeschke, D. Klose

Abstract
Thermodynamic foundations of phase equilibria, intermolecular interactions, and molecular self-assembly; kinetics of chemical reactions and transport processes

Objective
This course teaches physical-chemical foundations of important processes in living cells and organisms as well as of working techniques in biochemistry and molecular biology. Students learn:

1. Evaluation of chemical equilibria based on chemical potential
2. Interpretation of phase diagrams
3. Which interactions between molecules are important in living cells
4. Why molecules self-organize into aggregates
5. Which physical-chemical basics determine behavior of biomembranes
6. What determines the rate of chemical reactions, in particular also of enzymatically catalyzed reactions
7. What determines the transport rate of matter and heat

Content
chemical potential, prediction of the direction of processes, phase equilibria, phase rule, phase diagrams of pure substances, colligative properties, osmosis, dialysis, surface tension, intermolecular interactions, hydrophobic effect, hydrophilic effect and denaturation, amphiphiles, basics of self-association, micelles, packing parameter, double layers, vesicles, membranes, elementary reactions, parallel reactions, consecutive reactions, Eyring theory, enzyme kinetics, diffusion, heat conduction, active transport

Lecture notes
A lecture script is provided

Literature
In addition to the lecture script, the following two books can be used to gain deeper understanding
Jacob Israelachvili, Intermolecular and Surface Forces, Academic Press, 1992

529-0229-00L  Practical Course Organic Chemistry (for Students of Biology and Pharmaceutical Sciences)  O  8 credits  1P  C. Thiligen

Abstract
Analytical part: basic operations for the separation of mixtures of organic compounds (recrystallization, distillation, extraction, chromatography)
Synthetic part (main part): at least 8 synthetic steps (one- or two-step syntheses).

Objective
Learn the basic techniques for the preparation and purification of organic compounds.
Learn to take accurate notes of the experiments and to write reports.
Deepen the understanding of reaction mechanisms.

Content
Analytical part: basic operations for the separation of mixtures of organic compounds (recrystallization, distillation, extraction, chromatography).
Synthetic part (main part): at least 8 synthesis steps (one- to two-step preparations) from the following classes of reactions: 1. nucleophilic substitution at C(sp3), 2. elimination or electrophilic addition to a C=C bond, 3. electrophilic aromatic substitution, 4. reduction of an aldehyde/ketone, 5. Grignard reaction, 6. heterocyclization with imine/enamine formation, 7. synthesis of a carboxylic acid derivative by acyl group transfer, 8. aldol, Claisen, Mannich, Michael reaction or Robinson anellation.

Lecture notes
Introduction to database searches (Reaxys, SciFinder).
Written documents are distributed via Moodle course.
Prerequisites / notice
The basic reactions of Organic Chemistry and their mechanisms should be known and the corresponding exam have been passed (cf. course 529-1012-00L Organic Chemistry II for Students of Biology, Pharmaceutical Sciences, and Health Sci. and Tech.).

The prerequisite for passing is the ETH security exam.

By enrolling in this lab course, students confirm that they have thoroughly studied all safety information and will follow all instructions.

Third Year Courses
Concept Courses
Number | Title | Type | ECTS | Hours | Lecturers
---|---|---|---|---|---
701-2413-00L | Evolutionary Genetics | W | 6 credits | 4V | T. Städler, A. Widmer, S. Fior, M. Fischer, J. Stapley

Abstract
The concept course 'Evolutionary Genetics' consists of two lectures that jointly provide an introduction to the fields of population and quantitative genetics (emphasis on basic concepts) and ecological genetics (more emphasis on evolutionary and ecological processes of adaptation and speciation).

Objective
The aim of the course is to provide students with a solid introduction to the fields of population genetics, quantitative genetics, and ecological genetics. The concepts and research methods developed in these fields have undergone profound transformations; they are of fundamental importance in our understanding of evolutionary processes, both past and present. Students should gain an appreciation for the concepts, methods and explanatory power of evolutionary genetics.

Content
Population genetics - Types and sources of genetic variation; randomly mating populations and the Hardy-Weinberg equilibrium; effects of inbreeding; natural selection; random genetic drift and effective population size; gene flow and hierarchical population structure; molecular population genetics: neutral theory of molecular evolution and basics of coalescent theory.

Quantitative genetics - Continuous variation; measurement of quantitative characters; genes, environments and their interactions; measuring their influence; response to selection; inbreeding and crossbreeding, effects on fitness; Fisher’s fundamental theorem.

Ecological Genetics - Concepts and methods for the study of genetic variation and its role in adaptation, reproductive isolation, hybridization and speciation.

Molecular and Structural Biology I: Protein Structure and Function
D-BIOL students are obliged to take part I and part II (next semester) as a two-semester course.

Abstract
Biophysics of protein folding, membrane proteins and biophysics of membranes, enzymatic catalysis, catalytic RNA and RNAi, current topics in protein biophysics and structural biology.

Objective
Understanding of structure-function relationships in proteins and in protein folding, detailed understanding of biophysics and physical methods as well as modern methods for protein purification and microanalysis.

Lecture notes
Scripts on the individual topics can be found under http://www.mol.biol.ethz.ch/teaching.

Basics:
- Creighton, T.E., Proteins, Freeman, (1993)
- Fersht, A., Enzyme, Structure and Mechanism in Protein Science (1999), Freeman.

Current topics: References will be given during the lectures.

Concepts in Modern Genetics
Enrolment to this course unit only possible at ETH. No enrolment to module BIO348 at UZH.

Please mind the ETH enrolment deadlines for UZH students: https://www.ethz.ch/en/studies/non-degree-courses/special-students.html

Lecture notes
Scripts on the individual topics can be found under http://www.mol.biol.ethz.ch/teaching.

Basics:
- Creighton, T.E., Proteins, Freeman, (1993)
- Fersht, A., Enzyme, Structure and Mechanism in Protein Science (1999), Freeman.

Current topics: References will be given during the lectures.
The advanced course introduces students to plants through a concept-based discussion of developmental processes that integrates physiology and biochemistry with genetics, molecular biology, and cell biology. The course follows the life of the plant, starting with the seed, progressing through germination to the seedling and mature plant, and ending with reproduction and senescence.

The goal of "Molecular Life of Plants" is to train students in integrative approaches to understand the function of plants in a developmental context. While the course focuses on plants, the training integrative approaches will also be useful for other organisms.

The course "Molecular Life of Plants" will cover the following topics:

- Seed structure and physiology, their dormancy and germination.
- Seedling establishment and early development.
- Structure and Function of Meristems, including stem cells.
- Plant organ development (leaves, roots, flowers etc.).
- Plant reproduction.
- The plant vasculature for long-distance transport and other specialized tissues.
- Sensing and responding to the abiotic environment.
- Plant-microbe interactions; beneficial friends or pathogenic foes?
- Polyploidy; the benefits, problems and solutions to of multiple genomes.
- Photosynthesis and carbon partitioning.
- Photosynthesis and the evolution of C4 metabolism.
- Starch biosynthesis and degradation.
- Chloroplast development and chlorophyll biosynthesis.
- Senescence mechanisms in plants.
- General principles of RNA silencing.
- Chloroplast-based RNA silencing.
- Antiviral RNA silencing.
- RNA silencing & defense against non-viral pathogens.
- RNA silencing movement and amplification.

The lecture "Grundlagen der Biologie II: Mikrobiologie" is the basis for this advanced lecture.

This lecture will start with a broad overview of bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

The new course "Molecular Life of Plants" reflects the rapid advances that are occurring in the field of experimental plant biology as well as the changing interests of students being trained in this discipline. Contemporary plant biology courses emphasize a traditional approach to experimental plant biology by discussing discrete topics that are removed from the context of the plant life cycle. The course will take an integrative approach that focuses on developmental concepts. Whereas traditional plant physiology courses were based on research carried out on intact plants or plant organs and were often based on phenomenological observations, current research in plant biology emphasizes work at the cellular, subcellular and molecular levels.

The course "Molecular Life of Plants" will cover the following topics:

- Structure and Function of Meristems, including stem cells.
- Seedling establishment and early development.
- Seed structure and physiology, their dormancy and germination.
- Sensing and responding to the abiotic environment.
- Plant-microbe interactions; beneficial friends or pathogenic foes?
- Polyploidy; the benefits, problems and solutions to of multiple genomes.
- Photosynthesis and carbon partitioning.
- Photosynthesis and the evolution of C4 metabolism.
- Starch biosynthesis and degradation.
- Chloroplast development and chlorophyll biosynthesis.
- Senescence mechanisms in plants.
- General principles of RNA silencing.
- Chloroplast-based RNA silencing.
- Antiviral RNA silencing.
- RNA silencing & defense against non-viral pathogens.
- RNA silencing movement and amplification.

The new course "Molecular Life of Plants" will cover the following topics:

- Seed structure and physiology, their dormancy and germination.
- Seedling establishment and early development.
- Structure and Function of Meristems, including stem cells.
- Plant organ development (leaves, roots, flowers etc.).
- Plant reproduction.
- The plant vasculature for long-distance transport and other specialized tissues.
- Sensing and responding to the abiotic environment.
- Plant-microbe interactions; beneficial friends or pathogenic foes?
- Polyploidy; the benefits, problems and solutions to of multiple genomes.

The lecture "Grundlagen der Biologie II: Mikrobiologie" is the basis for this advanced lecture.
Abstract

Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

Objective

The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Content

Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

Lecture notes

Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

Literature

Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

Prerequisites / notice

To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

551-0317-00L Immunology I

Abstract

Introduction into structural and functional aspects of the immune system. Basic knowledge of the mechanisms and the regulation of an immune response.

Objective

Introduction into structural and functional aspects of the immune system. Basic knowledge of the mechanisms and the regulation of an immune response.

Content

- Introduction and historical background
- Innate and adaptive immunity. Cells and organs of the immune system
- B cells and antibodies
- Generation of diversity
- Antigen presentation and Major Histoincompatibility (MHC) antigens
- Thymus and T cell selection
- Autoimmunity
- Cytotoxic T cells and NK cells
- Th1 and Th2 cells, regulatory T cells
- Allergies
- Hypersensitivities
- Vaccines, immune-therapeutic interventions

Lecture notes

Electronic access to the documentation will be provided. The link can be found at "Lernmaterialien"

Literature

- Kuby, Immunology, 9th edition, Freemen + Co., New York, 2020

Prerequisites / notice

For D-BIOL students Immunology I (WS) and Immunology II (SS) will be examined as one learning entity in a "Sessionsprüfung". All other students write separate exams for Immunology I and Immunology II. All exams (combined exam Immunology I and II, individual exams) are offered in each exam session.

551-1299-00L Bioinformatics

Abstract

Students will study bioinformatic concepts in the areas of metagenomics, genomics, transcriptomics, proteomics, biological networks and biostatistics. Through integrated lectures, practical hands-on exercises and project work, students will also be trained in analytical and programming skills to meet the emerging increase in data-driven knowledge generation in biology in the 21st century.

Objective

Students will have an advanced understanding of the underlying concepts behind modern bioinformatic analyses at genome, metagenome and proteome-wide scales. They will be familiar with the most common data types, where to access them, and how to analytically work with them to address contemporary questions in the field of biology.

Prerequisites / notice

Course participants have already acquired basic programming skills in UNIX, Python and R.

Students bring their own computer with keyboard, internet access (browser) and software to connect to the ETH network via VPN.
The course aims at introducing technologies to investigate bacterial metabolism and key principles of metabolic engineering. The main assessed fostered

### Nucleic Acids and Carbohydrates

**Title**

Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNA; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines

**Objective**

Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNA; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines

**Abstract**

The focus of this laboratory course is on current research topics related to metabolic engineering and the general understanding of metabolism, particularly in relation to one carbon metabolism. Projects will be carried out in small teams.

**Objective**

The course aims at introducing technologies to investigate bacterial metabolism and key principles of metabolic engineering. The main focus of this block course is on practical work and will familiarize participants with complementary approaches, in particular genetic, biochemical and analytical techniques including metabolomics. Results will be presented by students in scientific presentations. Another goal is to learn how to write a scientific report.

**Content**

The course and will include topics such as pathway elucidation & engineering and related ongoing research projects in the lab. Experimental work applied during the course will comprise methods such as cloning work & transformation, growth determination, enzyme activity assays, liquid-chromatography mass-spectrometry and dynamic labeling experiments.

**Lecture notes**

None

**Literature**

Will be provided at the beginning of the course.
The enrolment is done by the D-BIOL study administration.

Abstract
Students will carry out defined research projects related to the current research topics of the Hospenthal group. The topics will include protein expression of pilins and/or other competence proteins from Gram-negative bacteria, protein purification using affinity chromatography, crystallisation experiments and analysis of assembled pil as well as electron microscopy.

Objective
The course should enable students to understand concepts of protein expression, purification and the characterisation of biomolecular interactions. In addition, students will learn some basic principles of X-ray crystallography and electron microscopy.

Content
The students will be tutored in their experimental work by an experienced doctoral student. The course will also include a short lecture delivered by M. Hospenthal, providing the theoretical background for the experimental work. Throughout the course, students will receive exercises that further help to explain the theory of the practical work, as well as literature research tasks.

Participation in the following Hospenthal lab projects will be possible:
- Purification, biophysical characterisation and structure determination of pilins
- Purification, biophysical characterisation and structure determination of proteins and protein complexes involved in natural transformation.

Experimental work on this project involves:
- Cloning and mutagenesis
- Recombinant or endogenous protein production in E. coli or Legionella
- Protein purification by affinity chromatography (other chromatographic purification techniques will also be discussed)
- Protein crystallisation and crystal optimisation
- Visualisation of bacterial pil as well as electron microscopy (negative stain or cryo electron microscopy)
- DNA binding experiments
- Enzymatic activity measurements
- In silico structural analyses using PyMOL and Chimera

Literature
Any required reading of literature will be discussed at the beginning of the course.

Prerequisites / Literature
There are no special requirements for this course.

551-0337-00L Cell Biology of the Nucleus

W 6 credits 7P
R. Kroschewski, Y. Barral, M. Jagannathan, S. Jessberger, K. Weis

Abstract
Introduction to the organizational principles of the nucleus using budding yeast, drosophila and vertebrate cells as model systems.

Objective
The aim of our course is to introduce the students to the organizational principles of the nucleus using budding yeast, drosophila and vertebrate cells as model systems. Emphasis is given to:
- Establishment of nuclear identity and nuclear-cytoplasmic communication
- Reorganization of the nucleus in aging
- Animal cells during the generation of cell diversity and neuronal differentiation

By the end of the course, based on lectures, literature reading and practical lab work, the students will be able to formulate open questions concerning the function of the nucleus. Thus, the students will know about the mechanisms and consequences of nuclear-cytoplasmic compartmentalization, DNA clustering in the nucleus and cytoplasm during cell divisions and aging.

Content
During this block-course, the students will:
- learn how organelles establish and maintain identity with a focus on the nucleus
- discover the evolutionary and functional plasticity of the nucleus
- design, apply, evaluate and compare experimental strategies

Students - in groups of 2 or max. 3 - will be integrated into a research project connected to the subject of the course, within one of the participating research groups.

Lecture notes
About 1 week before course start you will be invited to express your preference for a practical lab project on the course moodle site. Optional papers linked to the projects shall support you in that choice. They can also serve as framework orientation for the practical parts of this block course.

Literature
Documentation and recommended literature (review articles) will be provided during the course.

6 credits
Title Protein Analysis by Mass Spectrometry
Research laboratory class in small groups. Research projects on current topics in cellular microbiology and bacterial pathogenesis are fostered.

Cancer Progression: Mechanisms, Targets and Therapeutic Approaches
Number of participants limited to 15.
The enrolment is done by the D-BIOL study administration.

Abstract
This course will consider the pathogenetic landscape of cancer and its progression to metastasis, explore how abnormalities of cellular information management cause cancer and demonstrate how the integrated application of modern profiling technologies, mouse cancer models and human pathology provides a foundation for developing individualized cancer therapeutics.

Objective
Insights into and overview about the genetic and metabolic alterations that underlie different cancer types, the complex cancer cell circuits governing tumor development, progression, and metastasis. Understanding of modern approaches used in contemporary basic and translational cancer research and sophisticated strategies to control individual cancers and combat drug resistance. The course is closely linked to ongoing research projects in the lab to provide the participants with direct insights into current experimental approaches and strategies. Student assessment is a graded performance based on individual performance in the laboratory, a written report of their data and a presentation of a recent paper published in a top ranking international peer reviewed journal that relates to cancer.

551-0345-00L Mechanisms of Bacterial Pathogenesis W 6 credits 7P W.-D. Hardt, B. Nguyen

Number of participants limited to 15.
The enrolment is done by the D-BIOL study administration.

Abstract
Research laboratory class in small groups. Research projects on current topics in cellular microbiology and bacterial pathogenesis are assigned to each student.

Objective
Introduction to a current topic in cellular microbiology, molecular genetics of a bacterial pathogen or its interaction with the host's microbiome. Experimental work in the research lab and introduction to the current lab techniques. This includes contributions to the analysis of animal experiment. You will work with the current research literature in bacterial pathogenesis and write a research protocol. Requirement for obtaining the credit points: oral presentation of the research project, a short written exam and evaluation of the research protocol.

Content
Research projects on the model pathogen Salmonella.

Lecture notes
none.

Adaptability and Flexibility

Objectives

Knowledge of the fungi of forest and its ecological significance. Knowing of current methodological research approaches. Self-reliant and deepened activities of selected topics of fungi from forests.

Content

Introduction of the biological and ecological basics of fungi in forests. Focusing on mycorrhizal, saprobic, and pathogenic fungi and their functional relevance in the forest ecosystems. To get to know current methodological research approaches on the basis of selected examples with practical works in forest and lab as well as excursions and lectures.

Prerequisites

Unterlagen zum Kurs werden abgegeben.

Literature

Communication

6 credits

Students will be engaged in research projects aimed at understanding the biological membranes at the molecular, organellar and cellular levels. Students will design and perform experiments, evaluate experimental results, analyze the current scientific literature and understand the relevance of their work in the context of the current state of the membrane biology field.

Introduction of the key concepts in membrane biology and will allow them to be involved in laboratory projects related to that broad field. The course will consist of lectures, literature discussions, and practical laboratory work in small groups. Results of the practical projects will be presented during the poster session at the end of the course.

The aim of the course is to expose the students to a wide range of modern research areas encompassed by the field of membrane biology.

The enrolment is done by the D-BIOL study administration.

Number of participants limited to 12.

The enrolment is done by the D-BIOL study administration.

The recommended literature, including reviews and primary research articles, will be provided during the course

The course will be taught in English. All general lectures will be held at ETH Hoenggerberg. Students will be divided into small groups to carry out experiments at ETH or at the Paul Scherrer Institute. Travel to the Paul Scherrer Institute will be by public transportation.

The enrolment is done by the D-BIOL study administration.

Number of participants limited to 7.

Methods for analyzing animal genomes are increasingly becoming important for applications in human health and biotechnology suggesting that the experience will be useful to develop relevant expertise for a broad range of functions. Students will have the opportunity to advance their knowledge in programming by focusing on algorithms for genome and gene sequence analysis. A major goal of the course will be to lead the student to an independent and empowered attitude towards computational problems. For reaching this goal the students will work on an implementation of a solution for a set real-world problem in genome and sequence analysis under guided supervision.

The enrolment is done by the D-BIOL study administration.

Number of participants limited to 10.

Methods for analyzing animal genomes are increasingly becoming important for applications in human health and biotechnology suggesting that the experience will be useful to develop relevant expertise for a broad range of functions. Methods for analyzing animal genomes are increasingly becoming important for applications in human health and biotechnology suggesting that the experience will be useful to develop relevant expertise for a broad range of functions. Students will have the opportunity to advance their knowledge in programming by focusing on algorithms for genome and gene sequence analysis. A major goal of the course will be to lead the student to an independent and empowered attitude towards computational problems. For reaching this goal the students will work on an implementation of a solution for a set real-world problem in genome and sequence analysis under guided supervision.
The course will consist of a series of lectures, assignments for implementing elementary tasks in Python, project development and discussion workshops, and 3 and a half week of practical work implementing a Python script as a solution to a real world problem associated with sequence analysis. At the end of the course students will explain their solutions and demonstrate the functionality of their implementations, which will then be discussed and commented on by the group. It is expected that students will be able to apply the knowledge to improve on concrete problems.

Prerequisites / notice
- It is recommended to bring your own computer with a Python installation to the course
- simple computers can be provided
- Programming basics with Python

Competencies

- Self-direction and Self-management

551-0359-00L Plant Biochemistry

Objective
Students are able to independently apply and record current molecular biology methods on plants, critically evaluate and communicate the results, understand the larger context of their research project and develop ideas for further experiments.

Content
Projects are newly designed each year and announced a few days before the course starts. Possible projects include the cell biology of starch granule formation (using fluorescence and electron microscopy and protein-protein interaction studies) or RNA metabolism in chloroplasts (using import assays and RNA detection).

Lecture notes
No script

Literature
Descriptions of the possible projects including individual reading suggestions will be handed out beforehand.

551-1609-00L Single Molecule Biophysics Studies of the Microtubule Cytoskeleton

Objective
This laboratory course has a focus on current research topics in our laboratory related to microtubule nucleation and dynamics and its investigation using in vitro reconstitutions and single molecule biophysics. Projects will be conducted in small groups.

Content
The course aims to introduce technologies to investigate cytoskeletal processes and regulation using in vitro reconstitutions and single molecule biophysics methods. The main focus of this block course is on practical work and will familiarize participants with complementary approaches, in particular protein purification and biophysical techniques including single molecule fluorescence imaging using Total Internal Reflection Fluorescence Microscopy (TIRFM) and subsequent image analysis methods. Results will be presented by students in scientific presentations. Another goal is to learn how to write a scientific report.
The course will include topics such as microtubule polymerization dynamics and related ongoing research projects in the lab. Experimental work applied during the course will comprise methods such as cloning work & transformation, protein purification, single molecule fluorescence imaging using Total Internal Reflection Fluorescence Microscopy (TIRFM), and single molecule image analysis.

During the block course in the fall semester, we will carry out biological-chemical enzyme evolution experiments using molecular genetic mutation technologies and in vivo selection in recombinant bacterial strains. The class with its very dense program consists of the practical laboratory work, the seminar/lecture sessions, and the lab course. We will not only generate novel enzymes, but also gain new mechanistic insights into the investigated catalysts. The participants will study the impact of the PTM on enzymatic activity and protein-protein interactions using biophysical techniques.

Students will learn basic techniques for genetic code expansion. They will learn how to synthesize non-canonical amino acids (ncAAs), manipulate plasmids through cloning techniques to introduce an amber codon at a user defined site in a gene of interest, express and purify recombinant proteins bearing site-specific ncAAs using state-of-the-art chromatographic techniques, characterize the target protein using mass spectrometry and analyze the properties of the target protein regarding enzymatic activity and protein-protein interactions using biophysical techniques.

After the course, participants should be able to apply the gained skills in future chemical and molecular biology lab courses and projects. Individual reports describing the experiments and obtained results must be prepared by the end of the course. At the end of the course, each team (consisting of two participants each) will present their results in an oral presentation. The participants will work in teams of two, will first synthesize different ncAAs mimicking PTMs, such as acetylated lysine derivatives (e.g. acetylyysine, butrylyysine etc.). These ncAAs will be incorporated into target proteins using orthogonal aminoacyt tRNA synthetase / trNA pairs, which direct the site-specific incorporation in response to an in frame introduced amber stop codon (amber suppression). Therefore, the participants will introduce the amber stop codon at different positions in the gene of interest using standard molecular cloning techniques. After recombinant expression of the target protein, the participants will isolate the ncAA-bearing target proteins using different chromatography techniques using a FPLC system. After characterization of the PTM-bearing protein using mass spectrometry, the participants will study the impact of the PTM on enzymatic activity and protein-protein interactions using biophysical techniques.

Lecture notes: All the required theoretical and experimental informations can be found in the provided script. Details will be discussed in class. Relevant research papers will be recommended for reading during the seminars.

Prerequisites / notice: This laboratory block course is designed for 3 weeks, 3.5 days. Students should have basic practical knowledge in organic synthesis, molecular cloning, protein expression and purification (participants must have attended the practical course BCB-IV prior to this block course). The maximum number of participants is currently limited to 8. Interested applicants may contact Dr. M. Fottner for further information. Commitment for attendance of entire course is necessary. The course cannot be interrupted by individual absences once started.

Data: 06.08.2024 12:40 Autumn Semester 2024 Page 284 of 2684
The students will obtain an overview about the current topics of research in insulin signaling and how it impacts on growth, metabolism and diabetes. They will learn about the open questions of insulin signaling research and discuss approaches to address these questions experimentally. In practical lab projects the students will perform physiological in vivo studies as well as biochemical experiments. Finally, they will learn how to present and discuss their data. Student assessment is a graded semester performance based on individual performance in the laboratory, a written exam and the lab data presentation.

Further literature will be indicated in the distributed script.

Abstract
Teaching of basic experimental knowledge for detection and identification of microorganisms in food. Practical experiments were accompanied by theoretical introductions. Students become acquainted with classical and state-of-the-art molecular techniques for the rapid detection of foodborne pathogens and experiments in dependence on current research topics of the Laboratory of Food Microbiology.

Objective

Fachliche Lernziele
Die Studierenden
- setzen im Studium erworbenes und im Rahmen der Lehrveranstaltung neu erarbeitetes Wissen ein, um zu beurteilen, welche Mikroorganismen in welchen Lebensmitteln relevant sind.
- können entscheiden, welche Verfahren zum Nachweis welcher Mikroorganismen geeignet sind.

Überfachliche Lernziele
Die Studierenden
- evaluiieren und bewerten ihre Ergebnisse vor dem Hintergrund der verwendeten Methoden.
- dokumentieren ihre Tätigkeiten in einem Laborjournal in übersichtlicher Form und diskutieren die erhaltenen Ergebnisse kritisch.
- präsentieren die erhaltenen in mündlicher Form verständlich und nachvollziehbar.

Content
Teaching of basic experimental knowledge for detection and identification of foodborne pathogens by applying state-of-the-art techniques as well as modern molecular techniques for the rapid identification of relevant foodborne pathogens.

Lecture notes
Handouts were provided at the start of the course

Literature
- Krämer: "Lebensmittel-Mikrobiologie" (Ulmer; UTB)

551-1119-00L Microbial Community Genomics W 6 credits 7P S. Sunagawa
Number of participants limited to 10.
Prerequisites: Participants should bring their own laptop computer. Basic knowledge in [R], Python and/or UNIX is required.
The enrolment is done by the D-BIOL study administration.

Abstract
We provide training in the use of computational methods to address molecular, genetic, ecological and/or evolutionary questions by analyzing DNA sequencing data from microbial communities. The course includes lectures, tutorials, and the development of a research project at the intersection between microbiology and bioinformatics.

Objective
Students will learn concepts and methods for analyzing complex 'omics' datasets and applying them in individual projects. To facilitate learning, the course includes lectures on functional genomics, metagenomics and microbiology, along with practical sessions on scientific programming to analyze and visualize biological data. Additionally, students will learn how to plan, execute, report on, and present a scientific project.

Prerequisites / notice
Participants should bring their own laptop computer. Basic knowledge in [R], Python and/or UNIX is required.

551-1147-00L Bioactive Natural Products from Bacteria W 6 credits 7P J. Piel
Number of participants limited to 8.
The enrolment is done by the D-BIOL study administration.

Abstract
Lab course. In small groups projects of relevance to current research questions in the field of bacterial natural product biosynthesis are addressed.

Objective
Introduction to relevant subjects of the secondary metabolism of bacteria. Training in practical work in a research laboratory. Scientific writing in form of a research report.

Content
Research project on bacteria that produce bioactive natural products (e.g., Streptomycetes, Cyanobacteria, uncultivated bacteria). The techniques used will depend on the project, e.g., PCR, cloning, natural product analysis, precursor feeding studies, enzyme expression and analysis.

Lecture notes
none.

Data: 06.08.2024 12:40 Autumn Semester 2024 Page 286 of 2684
**Title**: Introduction to Ecology  
**W** 6 credits  **7P** O. Y. Martin

**Number of participants limited to 15.** The enrolment is done by the D-BIOL study administration.

**Abstract**  
This module is designed as an introduction to Ecology. Students will be introduced to fundamental ecological concepts and theories, and will learn how to apply these concepts to real-world ecological problems. The module will cover a broad range of topics, including the structure and function of ecosystems, the role of humans in shaping the environment, and the impact of climate change on ecological systems. Through a combination of lectures, discussions, and hands-on exercises, students will develop the skills necessary to analyze and interpret ecological data, and to think critically about ecological issues.

**Objective**  
Students will be able to:
- Understand and apply ecological concepts and theories to real-world problems.
- Analyze and interpret ecological data using statistical and computational tools.
- Develop critical thinking skills to evaluate ecological arguments and data.
- Communicate ecological information effectively to both scientific and non-scientific audiences.

**Content**  
- Understanding ecological systems: Structure and function of ecosystems.
- Human impacts on the environment: Human activities and their effects on ecological systems.
- Climate change and ecological systems: Causes and effects of climate change on ecological systems.
- Analytical and computational skills: Introduction to statistical and computational tools for ecological data analysis.

**Literature**  

**Competencies**  
- Subject-specific Competencies: Concepts and Theories, Techniques and Technologies.
- Social Competencies: Cooperation and Teamwork.
- Personal Competencies: Creative Thinking, Critical Thinking, Self-awareness and Self-reflection, Self-direction and Self-management.

---

**Title**: Polymer Physics Methods for Unstructured Biomolecules  
**W** 6 credits  **7G** M. Yulikov, L. Galazzo, G. Jeschke

**Number of participants limited to 12 students.** Enrollment is done by the D-BIOL study administration.

**Abstract**  
This module is designed to introduce students to the methods used to study unstructured biomolecules, such as proteins and nucleic acids. Students will learn about the principles and techniques used to characterize the structure and dynamics of these molecules, and will have the opportunity to apply these techniques in practical exercises. Through a combination of lectures, discussions, and hands-on exercises, students will develop the skills necessary to analyze and interpret data from these methods.

**Objective**  
Students will be able to:
- Understand and apply the methods used to study unstructured biomolecules.
- Analyze and interpret data from these methods.
- Develop critical thinking skills to evaluate scientific arguments and data.
- Communicate scientific information effectively to both scientific and non-scientific audiences.

**Content**  
- Introduction to the methods used to study unstructured biomolecules.
- Practical exercises using these methods.

**Literature**  
- Oxford Press 2003; Große Auswahl an Fachbüchern und Forschungsartikeln

**Competencies**  
- Subject-specific Competencies: Concepts and Theories, Techniques and Technologies.

**Note:** Will be provided for each of the projects at the beginning of the course.
This course aims at the understanding of the cellular and molecular mechanisms underlying tissue repair processes in response to different insults. The focus will be on repair of the skin and the liver. In addition, we will highlight the parallels and differences between tissue repair and cancer. Experimental approaches include biochemical studies, molecular and cellular studies using cultured cell lines and primary cells, as well as analysis of murine and human tissues.

The course combines practical work with lectures, discussions, project preparations and presentations.

Students will acquire the skills to cultivate bacteria, plunge-freeze samples for cryotomography, collect data using an electron cryomicroscope, process raw data, analyze tomograms, perform subtomogram averaging, model structures of interest, and generate movies for visualization. The key method and its application in bacterial cell biology will be introduced by lectures.

The enrolment is done by the D-BIOL study administration. Number of participants limited to 15.

Lecture notes
Hand-outs will be distributed.

Literature

No text book for ferns

Prerequisites / notice
Students have to present a poster on a special topic.

Grade according to poster presentation and contributions during the course.

551-1309-00L RNA-Biology
Number of participants limited to 12.
The enrolment is done by the D-BIOL study administration.

Abstract
Introduction to the diversity of current RNA-research at all levels from structural biology to systems biology using mainly model systems like S. cerevisiae (yeast), mammalian cells.

Objective
The students will obtain an overview about the diversity of current RNA-research. They will learn to design experiments and use techniques necessary to analyze different aspects of RNA biology. Through lectures and literature seminars, they will learn about the burning questions of RNA research and discuss approaches to address these questions experimentally. In practical lab projects the students will work in one of the participating laboratories. Finally, they will learn how to present and discuss their data in an appropriate manner. Student assessment is a graded semester performance based on individual performance in the laboratory, the written exam and the poster presentation.

Literature
Documentation and recommended literature will be provided at the beginning and during the course.

The course will be taught in English.

551-1511-00L Parallels Between Tissue Repair and Cancer
Number of participants limited to 20.
The enrolment is done by the D-BIOL study administration.

Abstract
This course aims at the understanding of the cellular and molecular mechanisms underlying tissue repair processes in response to different insults. The focus will be on repair of the skin and the liver. In addition, we will highlight the parallels and differences between tissue repair and cancer.

Objective
To learn the cellular and molecular principles underlying tissue repair processes, in particular in the skin and in the liver, and the parallels and differences to cancer. To learn modern technologies in Molecular and Cellular Biology as well as Histology and to use these technologies to study questions related to mechanisms underlying tissue repair and cancer.

Content
This course aims at the understanding of the cellular and molecular mechanisms underlying tissue repair processes in response to different insults. The focus will be on repair of the skin and the liver. In addition, we will highlight the parallels and differences between tissue repair and cancer. 551-1403-00L Imaging Bacterial Cells in a Native State by Electron Cryotomography
Number of participants limited to 15.
The enrolment is done by the D-BIOL study administration.

Abstract
The goal is to acquire the techniques to image bacteria by electron cryotomography, resolving their structure in a native state, in 3D, and to macromolecular resolution. In a small group, students will perform wet lab experiments, data collection with state-of-the-art equipment, data processing and analyses. The key method and its application in bacterial cell biology will be introduced by lectures.

Objective
Students will acquire the skills to cultivate bacteria, plunge-freeze samples for cryotomography, collect data using an electron cryomicroscope, process raw data, analyze tomograms, perform subtomogram averaging, model structures of interest, and generate movies for visualization. https://www.mol.biol.ethz.ch/groups/pilhofer_group/

551-1417-00L In Vivo Cryo-EM Analysis of Dynein Motor Proteins
Number of participants limited to 5.
The enrolment is done by the D-BIOL study administration.

Abstract
Motor proteins convert chemical energy into mechanical motion. In this block course, we study dynein motor proteins in cilia. Dynein causes conformational change upon ATP hydrolysis and finally generate ciliary bending motion. Participants will analyze cryo-EM data of cilia and visualize in vivo 3D structure of dynein to learn how motor proteins function in the cell.

Objective
The goal of this course is to be familiar with structural biology techniques of cryo-electron tomography and single particle cryo-EM studies on motor proteins. The main focus is 3D image analysis of cryo-EM datasets acquired by highest-end microscopes. Participants will learn structure-function relationship at various scales: how the conformational change of motor proteins causes mechanical force and generates cellular motility.
Content

Motor proteins, such as dynein, myosin and kinesin, hydrolyze ATP to ADP and phosphate to convert chemical energy to mechanical motion. Their function is essential for intracellular transport, muscle contraction and other cellular motility as well as cell division. Motor proteins have been major targets of biophysical studies. There exist questions from atomic to tissue levels – how ATP hydrolysis causes conformational change of motor proteins; how their motion is regulated by calcium, phosphorylation and other factors; how motions of multiple motor proteins are coordinated to generate cellular motility. Structural biology has been playing central roles to answer these questions. X-ray crystallography and single particle cryo-EM address structural analysis at atomic resolution and try to reveal molecular mechanism of conformational change. Cryo-electron tomography analyze localization and 3D structure of motor proteins in the cell to explain how motions of molecular motors happen in the context of cellular environment and are integrated into cellular motion.

In this course, we study dyneins in cilia. Cilia are force-generating organelles, made by multiple microtubules and thousands of dynein molecules. Dynein hydrolyzes ATP and undergoes conformational change, generating linear motion with respect to the microtubule. As a whole system, cilia integrate motions of these dyneins and orchestrate beating motion. To explain ciliary motion at molecular level, we need to know dynein conformational change in the cellular context. Cryo-electron tomography is recently developed technique to study molecular structures in vivo and therefore a suitable method to study dynein in cilia. Recently spatial resolution of these cryo-EM techniques was dramatically improved, driven by development of new types of detectors and electron optics. The participants of this course will learn a program to analyze cryo-electron tomography and single particle cryo-EM data, acquired by highest-end electron microscopes and detectors in ETH and other places, and reconstruct 3D structure (tomogram) of cilia from various organisms (from green algae to human). They will further learn a program to study molecular structures from these tomograms (called subtomogram averaging) and apply it to reconstruct high-resolution 3D structure of dyneins, microtubules and regulatory proteins. This practical course is therefore mainly computational, but we will also provide students a chance of cilia preparation from green algae, cryo-EM data collection using an electron microscope in PSI and site-visit of highest-end electron microscope facility in ETH.

Lecture notes

Scripts will be distributed during the course.

Literature

An overview is given in the following review articles. Further literature will be indicated during the course.

529-0019-00L Characterization of the Aggregation Landscape of Peptide Amyloids and their Chemical Templating

The enrolment is done by the D-BIOL study administration.

Number of participants limited to 6.

Abstract

Short peptide amyloids are models for their more complex protein counterparts in the study of disease-related and functional aggregation as well as being interesting in their own right as molecules that may have played a role in the origin of life. This block course will allow the students to study novel peptides in order to characterize their aggregation landscape and also to assess the ability o

Objective

During the block course, each student will learn how to handle aggregation-prone peptides, characterize their aggregation state and structure as well as assay their ability to template their own chemical synthesis.

Content

The course is divided between lectures practical work in the lab. The lectures will introduce the general topic of amyloids and in particular their potential role in the origin of molecular complexity, as well as cover the theory and the practice behind the tools that are used to characterize peptide amyloids. The practical work in the lab will allow the students to gain hands-on experience working on a novel peptide that has yet to be characterized. Since the course consists of genuine research we also hope that new discoveries will be made that will provide insights into the role that amyloids may have in the origin of life.

Lecture notes

A script will be distributed to the participants on the first day of the course.

Literature

Further literature will be indicated in the distributed script.

Abstract

This course combines Limnology (the study of inland waters in its broad sense) with ecological and evolutionary concepts. It deals with rivers, groundwater and lakes. This course contains a lecture part, an experimental part, two determination courses (aquatic invertebrates and algae) as well as excursions.

Objective

During this course you will get an overview of the world's typical continental aquatic ecosystems. After this course you will be able to understand how aquatic organisms have adapted to their habitat, and how the interactions (e.g. food web) between organisms work. During the experimental part of this course you will learn the principles of doing research to observe interrelations in aquatic ecosystems. You will measure and interpret biological and physical data (e.g. during experiments, field work) and present the collected knowledge scientifically.

After this course you will know the most important aquatic species groups (macroinvertebrates, microinvertebrates and freshwater algae) in Switzerland and the most important identification traits.

Content

The course contains a lecture part, an experimental part, two determination courses (aquatic invertebrates and algae) and field excursions.

Lecture:

The lecture part covers ecology and evolution of aquatic organisms in lentic and lotic waters. Topics include: Adaptations, distribution patterns, biotic interactions, and conceptual paradigms in freshwater ecosystems; important aspects regarding ecosystem metabolism and habitat properties of freshwaters; applied case studies and experiments testing ecological and evolutionary processes in freshwaters.

Practical part:

The practical part includes an excursion to Greifensee and a 3-day-exursion to the river Glatt in Niederuzwil, where you independently perform small research projects.

Additionally, you will perform small groups in an independent research experiment in a research group at Eawag.

The taxonomic part will cover macroinvertebrates (e.g. crustacean, aquatic insects), microinvertebrates and algae. The goal is to get to know the most common aquatic taxa in Switzerland, to identify them with commonly used identification literature, and to get an idea how these organisms are used in research and practice. (Language: German, translation of the most important things during the course possible)

Lecture notes

Course notes and power point presentations provided during the course.

Prerequisites / notice

The maximal participating number of biology students is 16.

The course includes a field trip to Greifensee (21.09.2023) and a 3-day-exursion to the river Glatt in Niederuzwil from 27.09. to 29.09.2023.
Laboratory Course Organic Chemistry II

- Admittance is limited and depends on the availability of hosting research labs.
- Interested students are asked to contact Prof. C. Thilgen (thilgen@org.chem.ethz.ch) before the end of the preceding semester for further details.
- In case of admittance, the actual enrolment needs to be done via the D-BIOL study administration.

Abstract
An organic-synthetic sub-project of the current research of a group from the Laboratory of Organic Chemistry is carried out under the guidance of doctoral students.

Objective
Learn to plan and carry out challenging multistep syntheses making use of modern methods; reach a deeper understanding of organic reactions through experimental work; develop an organic-synthetic research project; take accurate notes, write a publication style report, and present the obtained results in a seminar.

Content
An organic-synthetic sub-project of the current research of a group from the Laboratory of Organic Chemistry is carried out under the guidance of doctoral students.

Lecture notes
No course notes.

Literature
No set textbooks. Literature will be indicated or provided by the supervising tutors.

Prerequisites
Course prerequisites: Accomplished laboratory course Organic Chemistry I (529-0229-00 or 529-0016-00) and passed session exams Organic Chemistry I (529-0221-00 or 529-1011-00) / Organic Chemistry II (529-0222-00 or 529-1012-00). The number of participants per course is limited to 4.

</tbody>
</table>

- Admittance is limited and depends on the availability of hosting research labs.
- Interested students are asked to contact Prof. C. Thilgen (thilgen@org.chem.ethz.ch) before the end of the preceding semester for further details.
- In case of admittance, the actual enrolment needs to be done via the D-BIOL study administration.

Abstract
An organic-synthetic sub-project of the current research of a group from the Laboratory of Organic Chemistry is carried out under the guidance of doctoral students.

Objective
Learn to plan and carry out challenging multistep syntheses making use of modern methods; reach a deeper understanding of organic reactions through experimental work; develop an organic-synthetic research project; take accurate notes, write a publication style report, and present the obtained results in a seminar.

Content
An organic-synthetic sub-project of the current research of a group from the Laboratory of Organic Chemistry is carried out under the guidance of doctoral students.

Lecture notes
No course notes.
Literature
No set textbooks. Literature will be indicated or provided by the supervising tutors.

Prerequisites / notice
Course prerequisites: Accomplished laboratory course Organic Chemistry I (529-0229-00 or 529-0016-00) and passed session exams Organic Chemistry I (529-0221-00 or 529-1011-00) / Organic Chemistry II (529-0222-00 or 529-1012-00). The number of participants per course is limited to 4.

Abstract
This course aims to provide students with a comprehensive overview of mammalian developmental biology and stem cell systems both on the theoretical as well as the experimental level. Centering the course on genetic and genomic methods engages the students in contemporary research and prepares for future studies in the course of semester and master projects.

Objective
- Understanding mammalian development
- Introduction to stem cells systems
- Working with cultured cells
- Translational aspects of mammalian cell biology

Content
The course will consist of a series of lectures, assay assignments, project development and discussion workshops, and 2 and a half week of lab work with different mammalian cell systems embedded in real life research projects. At the end of the course students will take an exam consisting of questions on the topic of the lectures and workshops. It is expected that students will be able to apply the knowledge to concrete problems.

--- | --- | --- | --- | --- | ---
551-0961-00L | Mentored Work Subject Didactics Biology A | O | 2 credits | 4A | P. Faller, H. Stocker

**Abstract**

In their mentored work on subject didactics, students put into practice the contents of the subject-didactics lectures. Under supervision, they compile tuition materials enabling effective learning and/or analyse and reflect on certain topics from a subject-based and pedagogical perspective.

**Objective**

- to be able to familiarise themselves with a tuition topic by consulting different sources, acquiring materials and reflecting on the relevance of the topic and the access they have selected to this topic from a specialist, subject-didactics, pedagogical, and potentially social perspective.

- to prove that they can independently compile a tuition sequence and develop it to deployment.

**Content**

Thematic Schwerpunkte

Die Gegenstände der mentorierten Arbeit in Fachdidaktik stammen in der Regel aus dem gymnasialen Unterricht.

Lernformen

**Lecture notes**

Eine kurze Anleitung zur mentorierten Arbeit in Fachdidaktik wird zur Verfügung gestellt.

**Literature**

Die Literatur ist themenspezifisch. Die Studierenden beschaffen sie sich in der Regel selber (siehe Lernziele). In besonderen Fällen wird sie vom Betreuer zur Verfügung gestellt.

**Prerequisites / notice**

Beginn nach Absprache jederzeit möglich, jedoch erst nach Abschluss der Fachdidaktik I und II und nach Erfüllung allfälliger fachwissenschaftlicher Anforderungen.

Professional Training
Important: You can only enrol in the courses of this category if you have not more than 12 CP left for possible additional requirements.
Students conduct a series of "classical" biological school experiments and therefore gain practice and experience in this area.

Professional Exercises in Biology

On the basis of a specified topic, the candidate shows that they are in a position
- to develop and conduct teaching that is conducive to learning at high school level, substantiating it in terms of the subject-matter and from the didactic angle
- to analyze the tuition they have given with regard to its strengths and weaknesses, and outline improvements.

Simultaneous enrolment in "Examination Lesson II Biology" (551-0969-02L) is compulsory.

In the context of an examination lesson conducted and graded at a high school, the candidates provide evidence of the subject-matter-based and didactic skills they have acquired in the course of their training.

On the basis of a specified topic, the candidate shows that they are in a position
- to develop and conduct teaching that is conducive to learning at high school level, substantiating it in terms of the subject-matter and from the didactic angle
- to analyze the tuition they have given with regard to its strengths and weaknesses, and outline improvements.

Simultaneous enrolment in "Examination Lesson I Biology" (551-0969-00L) is compulsory.

Simultaneous enrolment in "Examination Lesson II Biology" (551-0969-01L) is compulsory.

Simultaneous enrolment in "Examination Lesson I Biology" (551-0969-01L) is compulsory.

Implementation of Subject Didactics I and II with the focus on conducting biological experiments in schools. This includes finding, testing and further developing suitable protocols for different subject areas of school biology. Working out how to didactically embed the experiments in lessons.

Students can perform, off the cuff, 12 school experiments (which they have tested themselves), from the different subject areas, and conduct these correctly in technical terms. They can incorporate these experiments in their tuition in a didactically meaningful manner.

By contrast to the Subject Specialisation 1 and 2 course units, these are "basic tests" and do not involve the implementation of current research topics. The students' compilations are available in a data archive.

2. Die Studierenden führen alle ausgearbeiteten Experimente selber durch.

Hand out of course material.

Der Teil biologische Experimente findet im Rahmen von 7 Halbtagen statt.

Students learn to
- engage with current biological research and its relevance to society
- carefully select content for high school
- make meaningful and correct didactic reductions
- compose activating and motivating learning arrangements
- put prepared lessons into practice
- reflect on their role as a teacher.

Content
Students can choose from three options:

Seminar paper:
Writing a textbook chapter on a current topic in biological research (focus on content).

Innovative lesson:
Planning and implementation of biology lessons with special consideration of activating forms of learning (focus on didactics).

The results will be presented and discussed in a seminar.

Prerequisites / notice
The module "Innovative Biology Teaching at High School" is an integral part of the Specialized Biology Course with an Educational Focus. Before taking this module, at least one of the two lectures should have been completed.

The Specialized Biology Course with an Educational Focus can be acknowledged, in agreement with the advisor of the respective elective major, as one of the two obligatory research projects. In such a case, additional 3 CP must be obtained in another course.

551-0973-00L Specialized Biology Course with an Educational Focus: Evolution

Objective
After successful completion of the module, students should be able
- to retrieve in-depth knowledge of biology with a special focus on evolution and to impart this to others.
- to analyse controversial topics and to give factual explanations for these.
- prepare teaching units suitably tailored to the recipients, with complex learning matter on a high professional level.

Content
Selected biological topics, with a special focus on evolution, are dealt with under consideration of the special needs of persons involved in teaching.

The module comprises lectures, a book club, and a project assignment.

Lecture notes
Teaching materials are available online on Moodle.

Literature
Literature and references are posted online on Moodle.

Prerequisites / notice
The Specialized Biology Course with an Educational Focus consists of three modules (4 CP each). In the fall semester, the focus of the lecture is on evolution. The lecture of the spring semester deals with biological concepts. The sequence of assignment is free. In addition, the module "Innovative Biology Teaching at High School" has to be completed.

Performance is assessed during the course of the entire module. Active participation in the course is required.

The Specialized Biology Course with an Educational Focus can be acknowledged, in agreement with the advisor of the respective elective major, as one of the two obligatory research projects. In such a case, additional 3 CP must be obtained in another course.

In case of overbooking of the course, students enrolled in the Teaching Diploma in Biology will have priority.

573-0917-00L The lecture takes place if a minimum of 12 students register for it.

Text:

Transdisciplinary Research: Challenges of Interdisciplinarity and Stakeholder Engagement

The lecture takes place if a minimum of 12 students register for it.

Abstract
This seminar is designed for PhD students and PostDoc researchers involved in inter- or transdisciplinary research. It addresses and discusses challenges of this kind of research using scientific literature presenting case studies, concepts, theories, methods and by testing practical tools. It concludes with a 10-step approach to make participants' research projects more societally relevant.
Participants know specific challenges of inter- and transdisciplinary research and can address them by applying practical tools. They can tackle questions like: how to integrate knowledge from different disciplines, how to engage with societal actors, or how to secure broader impact of research. They learn to critically reflect their own research project in its societal context and on their role as scientists.

### Content

The seminar covers the following topics:
1. Theories and concepts of inter- and transdisciplinary research
2. The specific challenges of inter- and transdisciplinary research
3. Collaborating between different disciplines
4. Engaging with stakeholders
5. Ten steps to make participants' research projects more societally relevant

Throughout the whole course, scientific literature will be read and discussed as well as practical tools explored in class to address concrete challenges.

### Literature

Literature will be made available to the participants.

Further, this collection of tools will be used:
- https://naturalsciences.ch/topics/co-producing_knowledge
- https://www.shapeidtoolkit.eu

### Prerequisites / notice

Participation in the course requires participants to be working on their own research project.

### Dates (Wednesdays, 8h15-12h00)

701-1651-00L **Environmental Governance**

| Objective | To understand how an environmental problem may (not) become a policy and explain political processes, using basic concepts and techniques from political science.
| Content | Improvements in environmental quality and sustainable management of natural resources cannot be achieved through technical solutions alone. The quality of the environment and the achievement of sustainable development strongly depend on human behavior and specifically the human uses of nature. To influence human behavior, we rely on public policies and other societal rules, which aim to steer the way humans use natural resources and their effects on the environment. Such steering can take place through government intervention alone. However, this often also involves governance, which includes the interplay between governmental and non-governmental actors, the use of diverse tools such as emission standards or financial incentives to steer actors' behavior and can occur at the local, regional, national or international level.

In this course, we will address both the practical aspects of as well as the scientific debate on environmental governance. The course gives future environmental experts a strong basis to position themselves in the governance debate, which does not preclude government but rather involves a spectrum from government to governance.

Key questions that this course seeks to answer: What are the core characteristics of environmental challenges from a policy perspective? What are key elements of 'environmental governance' and how legitimate and effective are these approaches in addressing persistent environmental challenges?

Furthermore, we encourage the development of soft skills by engaging students in activities such as moderating discussions in class, presenting own proposals, giving regular peer feedback, as well as critically reflecting on various relevant publications in the environmental governance domain.

Lecture slides, a script and additional course material will be provided on Moodle.

**Prerequisites / notice**

None mentioned in the text.

**Lecture notes**

A detailed course schedule will be made available at the beginning of the semester.

During the lecture we will work with Moodle. We ask that all students register themselves on this platform before the lecture.

We recommend that students have (a) three-years BSc education of a (technical) university; (b) successfully completed Bachelor introductory course to environmental policy (Entwicklungen nationaler Umweltpolitik (or equivalent)) and (c) familiarity with key issues in environmental policy and some fundamental knowledge of one social science or humanities discipline (political science, economics, sociology, history, psychology, philosophy)
This course deals with how and why international problem-solving efforts (cooperation) in environmental politics emerge and evolve, and the various examples of international environmental policy-making are examined. For example, international efforts to reduce air pollution, manage international water resources, mitigate and adapt to global warming, protect the stratospheric ozone layer, address biodiversity challenges, deal with plastic waste, and prevent pollution of the oceans.

Excursions at the Swiss Federal Institute for Forest, Snow and Landscape Research (WSL) in Birmensdorf:
- Dendrochronology: What annual rings tell
- Photosynthesis/Climate change: The tracks in the forest
- Forest Soil: The soil in the focus of the climate

Credits and Exam
After passing a written test at the end of the course (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test). Visiting students (e.g., from the University of Zurich, exchange students) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory.

The course is open to all ETH students and visiting students from other universities. Participation does not require previous coursework in the social sciences or environmental policy. Most meetings in this course will take place on campus (ETH Main Building, HG F.3). There will be no live-streaming, and the course is not in hybrid (on-campus plus online) format. However, the lecture will be recorded (slides and voice, no video) and the recordings will be made available via the Moodle platform for this course a few days after the respective lecture for students who are unable to attend in person. All electronic correspondence will take place via the ETH mystudies system and Moodle, so please make sure you are properly registered there with a functioning email address/account.

Presence
Students who obtain a grade of < 4.0 for the test will have a second chance (see table below). Students who did not participate in the test on 16 December 2024 will not have access to the repeat test unless they submit compelling and documented (e.g., medical, other exam in exchange students) reasons for why they were unable to participate in the first test. The test covers all contents of the lectures and the reading assignments. No separate registration for the exam is required; registration for the course as such covers everything. The exam will take place on campus, most likely in HG F3. That is, you must be present in person at ETH Zurich on the exam date/time.

Future teachers will learn to prepare and conduct excursions to out-of-school learning venues. For this purpose, excursions are offered at the Swiss Federal Institute for Forest, Snow and Landscape Research (WSL) in Birmensdorf.

Enrolment only possible with matriculation in Teaching Diploma Biology and Geography.

The objectives in this course are to (1) gain an overview of important questions in international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions in this policy area and how to address them in a conceptually and methodologically meaningful and insightful way; (3) gain an overview of important global and regional environmental problems and how they are or could be solved.

In this seminar, future teachers will be trained to prepare and conduct excursions to out-of-school learning venues. For this purpose, excursions are offered at the Swiss Federal Institute for Forest, Snow and Landscape Research (WSL) in Birmensdorf.
Objective

Students can describe advantages and challenges associated with being multicellular and outline independent solutions that organisms have developed to cope with the challenges of complex multicellularity.

Content

Humanphysiologie I (HS)

- «Kern-Konzepte» in der Physiologie
  1. Struktur und Funktion
  2. Energietransfer, -speicherung und -nutzung
  3. Informationsfluss, -speicherung und -nutzung
  4. Homöostase
  5. Evolution
  Allgemeine Endokrinologie und endokrines System
  Allgemeine Neurophysiologie und Neuroanatomie
  Die chemischen Sinne, Geschmack und Geruch
  Ernährung und Verdauung
  Leber und Stoffwechsel
  Energiehomöostase
  Flüssigkeitshomöostase und Niere
  Reproduktion, Entwicklung und Altern

Humanphysiologie II (FS)

- Sinnesphysiologie
- Muskelsystem
- Neuronale Kontrolle von Haltung und Bewegung
- Höhere zentralnervöse Hirnfunktionen
- Atmung und Lunge
- Herz und Kreislauf
- Blut
- Immunologie
- Thermoregulation/Fieber
- Stress

752-4001-00L Microbiology

Some parts of the lecture will be taught in English.

Abstract

Teaching of basic knowledge in microbiology with main focus on Microbial Cell Structure and Function, Molecular Genetics, Microbial Growth, Metabolic Diversity, Phylogeny and Taxonomy, Prokaryotic Diversity, Human-Microbe Interactions, Biotechnology.

Objective

Teaching of basic knowledge in microbiology.

Content

Lecture notes

Wird von den jeweiligen Dozenten ausgegeben.

Literature

Die Behandlung der Themen erfolgt auf der Basis des Lehrbuchs Brock, Biology of Microorganisms.

551-0127-01L Plants and Fungi

The lecture conveys the fundamental concepts underlying multicellularity with an emphasis on the molecular basis of multicellular biological systems and their functional integration into coherent wholes. The structural and functional specialization in multicellular organisms will be discussed by highlighting common and specific functions in fungi and plants.

Objective

1. Students can describe advantages and challenges associated with being multicellular and outline independent solutions that organisms have developed to cope with the challenges of complex multicellularity.
2. Students can explain how the internal and external structures of fungi and plants function to support survival, growth, behavior, and reproduction.
3. Students can explain the basic pathways and mechanisms of cellular communication regulating cellular behavior (cell adhesion, metabolism, proliferation, reproduction, development).
4. Students can describe how a single cell develops from one cell into many, each with different specialized functions.

Content

The lecture introduces the structural and functional specialization in fungi and plants. After providing an overview on the diversity of eukaryotic organisms, the lecture will discuss how fungi and plants have evolved structures and strategies to cope with the challenges of multicellularity. The molecular basis underlying communication, coordination and differentiation will be conveyed and complemented by key aspects of reproduction, metabolism development, and regeneration. Topics include form and function of fungi and plants, metabolism, cell signaling, adhesion, stem cells, regeneration, reproduction, and development.

Literature

Campbell "Biology", 11th Edition

Prerequisites / notice

Some lecture are held in English.
Introduction to Ecology

Number of participants limited to 15. The enrolment is done by the D-BIOL study administration.

ATTENTION: Students of the biology teaching diploma, please contact Dr. O. Martin until 01.08.2024.

abstract

Objective
Studierende vertiefen ihr Wissen zu ökologischen Themen konkret anhand von:
- Vorlesungen zu Grundlagen der Ökologie
- Planen und Durchführen von Experimenten (z.B. Verhaltensökologie mit Insekten)
- Literaturdiskussionen
- Einblicke in aktuelle ökologische Forschungsarbeiten im Raum Zürich (z.B. Gastvorträge, Laborbesuche)
- Besprechung der Möglichkeiten zum Einsatz von Ökologie im theoretischen und praktischen Unterricht
- Exkursionen & Führungen

Content
- Einleitung: evolutionäre Hintergrund der Ökologie / Ökologie in Forschung und Praxis
- Umweltbedingungen & Ressourcen: Abiotische Umweltbedingungen & Verfügbarkeit von Ressourcen / Klima & Biome der Erde
- Individuen & Populationen: Geburt, Tod & Wanderungen / Interspezifische Konkurrenz / Prädation, Weidegang & Parasiten / Molekulare & evolutionäre Ökologie
- Lebensgemeinschaften und Ökosysteme: Von Populationen zu Lebensgemeinschaften / Muster des Artenreichtums / Energie- & Stofffluss durch Ökosysteme
- Angewandte Aspekte der Ökologie: Globale biogeochemische Kreisläufe & ihre Veränderung durch den Menschen / Naturschutzbiologie / Ökologie des Menschen: Bevölkerungswachstum, Krankheiten & Nahrungsversorgung

Lecture notes
Kursunterlagen werden via Moodle verfügbar sein.

Abstract
Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

Objective
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Content
Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

Lecture notes
Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

Literature
Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

Prerequisites / notice
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

Abstract
During this Masters level seminar style course, students will explore current research topics in cellular biochemistry focused on the structure, function and regulation of selected cell components, and the consequences of dysregulation for pathologies.

Objective
Students will work with experts toward a critical analysis of cutting-edge research in the domain of cellular biochemistry, with emphasis on normal cellular processes and the consequences of their dysregulation. At the end of the course, students will be able to evaluate, critically discuss and write about scientific articles in the research area of cellular biochemistry, and they will identify open testable research questions.

Content
Guided by an expert in the field, students will engage in classical round-table style discussions of current literature with frontal presentations. Guided by a faculty expert, students develop domain knowledge of the research area associated with a primary paper, and alternate as discussion leaders to present the research topic. By the end of the semester, students will formulate their ideas about open testable research questions that extend from the published work.

Literature
The literature will be provided during the course.

Prerequisites / notice
The course will be taught in English.

Abstract
Biophysics of protein folding, membrane proteins and biophysics of membranes, enzymatic catalysis, catalytic RNA and RNAi, current topics in protein biophysics and structural biology.

Objective
Understanding of structure-function relationships in proteins and in protein folding, detailed understanding of biophysics and physical methods as well as modern methods for protein purification and microanalytically.

Lecture notes
Scripts on the individual topics can be found under http://www.mol.biol.ethz.ch/teaching.
Biology has witnessed an unprecedented increase in experimental data and, correspondingly, an increased need for computational methods. This course focuses on the concepts of classical and modern genetics and genomics. The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics. For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

For modern biology at the level of single cells, a new type of data has been generated in the form of DNA sequences. These data allow for the investigation of biological networks with increasing detail. These include (i) graph theoretical approaches for revealing large-scale network organization, (ii) probabilistic (Bayesian) network representations, (iii) structural network analysis based on reaction stoichiometries, (iv) qualitative methods for dynamic modeling and simulation (Boolean and piece-wise linear approaches), (v) mechanistic modeling using ordinary differential equations (ODEs) and finally (vi) stochastic simulation methods.
Abstract
This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning "good practice" that can be applied in every student's own projects and daily work life. A special focus will be laid in the use of the statistical software package R for regression analysis.

Objective
The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.

Content
The course starts with the basics of linear modeling, and then proceeds to parameter estimation, tests, confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, multicollinearity problems and model interpretation, as well as general modeling strategies.

The last third of the course is dedicated to an introduction to generalized linear models: this includes the generalized additive model, logistic regression for binary response variables, binomial regression for grouped data and poisson regression for count data.

Lecture notes
A script will be available.

Faraway (2006): Extending the Linear Model with R
Draper & Smith (1998): Applied Regression Analysis
Fox (2006): Applied Regression Analysis and GLMs
Montgomery et al. (2006): Introduction to Linear Regression Analysis

Prerequisites / notice
The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L “Applied Statistical Regression” and 401-3622-00L “Statistical Modelling” are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

Abstract
Modern mass spectrometry, hyphenated analytical methods, speciation, chemometrics.

Objective
Comprehensive knowledge about the analytical methods introduced in this course and their practical applications.

Content
Hyphenation of separation with identification methods such as GC-MS, LC-MS, GC-IR, LC-IR, LC-NMR etc.; importance of speciation. Modern mass spectrometry: time-of-flight, orbitrap and ion cyclotron resonance mass spectrometry, ICP-MS. Soft ionization methods, desorption methods, spray methods. Mass spectrometry imaging. Use of statistical and computer-assisted methods for processing analytical data (chemometrics).

Lecture notes
Lecture notes will be made available online.

Literature
Information about relevant literature will be available in the lecture & in the lecture notes.

Prerequisites / notice
Exercises are an integral part of the lecture. Prerequisites:
529-0051-00 "Analytische Chemie I (3. Semester)"
529-0058-00 "Analytische Chemie II (4. Semester)"
(or equivalent)
RNA Biology Lecture Series II: Non-Coding RNAs:

Abstract

This course covers aspects of RNA biology related to the functions of non-coding RNAs as well as their use as drugs to treat diseases. Micro RNAs; computational approaches to miRNAs; micro RNA function in metabolism; viruses and viral RNAs; nucleic acid-based drugs; ncRNA-mediated genome regulation; epigenetic programming of genome remodelling in ciliates; telomerase and telomeres; tRNA biology. http://www.nccr-rna-and-disease.ch/tiki-index.php?page=LectureSeries

Prerequisites / notice

Basic knowledge of cell and molecular biology.

636-0108-00L Biological Engineering and Biotechnology

Objective

By the end of the course, students will also learn to critically evaluate the concepts of making an assumption and making an approximation.

Abstract

Engineering uses the laws of physics to predict the behavior of a system. Biological systems are so diverse and complex prompting the question whether we can apply unifying concepts of theoretical physics coping with the multiplicity of life’s mechanisms. Starting point of the course is the probability theory, which enables to derive step-by-step the two pillars of thermodynamics from the perspective of statistical mechanics: the maximization of entropy according to the Boltzmann’s law as well as the minimization of the Gibbs free energy. Then, an assortment of biological phenomena at the molecular and cellular level (e.g. cytoskeletal polymerization, action potential, photosynthesis, gene regulation, morphogen patterning) will be examined at the light of these two principles with the aim to derive a quantitative expression describing their behavior. Each analytical model is finally validated by comparing it with the corresponding experimental results from the literature.

Notice

Does not take place this semester.

Prerequisites / notice

Basic knowledge of cell and molecular biology.

227-0939-00L Cell Biophysics

Abstract

Applying two fundamental principles of thermodynamics (entropy maximization and Gibbs energy minimization), an analytical model is derived for a variety of biological phenomena at the molecular as well as cellular level, and critically compared with the corresponding experimental data in the literature.

Objective

By the end of the course, students will also learn to critically evaluate the concepts of making an assumption and making an approximation.
Content

- Basics of theory of probability
- Boltzmann's law
- Entropy maximization and Gibbs free energy minimization
- Ligand-receptor: two-state systems and the MWC model
- Random walks, diffusion, crowding
- Electrostatics for salty solutions
- Elasticity: fibers and membranes
- Molecular motors
- Action potential: Hodgkin-Huxley model
- Photosynthesis and vision
- Gene regulation
- Development: Turing patterns

Theory and corresponding exercises are merged together during the classes.

Lecture notes

No lecture notes because the two proposed textbooks are more than exhaustive!

I am willingly available Mondays 17.00 o'clock - 18.00 in my office GLC F12.2 for whatever discussion about the lessons and the exercises.

I am using OneNote. All lectures will be broadcast via ZOOM, while corresponding videos of the previous years (lectures and exercises) are available in Moodle!!!

Literature

As further deepening:

Prerequisites / notice

Participants need a good command of
- differentiation and integration of a function with one or more variables (basics of Analysis),
- Newton's and Coulomb's laws (basics of Mechanics and Electrostatics).

Notions of vectors in 2D and 3D are beneficial.

551-0357-00L Cellular Matters: Properties, Functions and Applications of Biomolecular Condensates

The number of participants is limited to 30 and will only take place with a minimum of 6 participants.

At the beginning of the course, student groups will be formed and assigned to the milestone papers. To facilitate this, students must confirm their registration by the beginning of the 3rd week of semester.

Abstract

This Master level course delves into the emerging field of biomolecular condensates - membrane-less organelles in cells. Using interdisciplinary concepts from biology, chemistry, biophysics, and soft matter, we will explore the biological properties of these condensates, their functions in health and disease, and their potential as new biomimetic materials for various applications.
In the last decade, a novel type of cell compartments called biomolecular condensates have been discovered. This discovery is radically changing our understanding of the cell, its organization, and dynamics. The emerging picture is that the cytoplasm and nucleoplasm are highly complex fluids that can (meta)stably segregate into membrane-less compartments, similarly to emulsions.

This interdisciplinary course encompasses milestone works and cutting-edge research questions in the young field of biomolecular condensates, including their properties, functions, and applications. The course begins with a lecture series that introduces the topic of condensates to an interdisciplinary audience and provides a theoretical foundation for understanding current research questions in the field. The lectures provide a base for student presentations of recent publications in the field, and for research seminars given by course lecturers, who are all active researchers with diverse expertise. Through this exciting interdisciplinary understanding of biomolecular condensates, bridging biology, chemistry, biophysics, and soft matter.

Students will not only learn how to critically read and evaluate scientific literature but will also gain valuable experience in giving scientific presentations to an interdisciplinary audience. Each presentation will require an introduction, critical analysis of the results, and a discussion of their significance, allowing student to substantiate their statements with a critical mindset that considers the pros and cons of chosen approaches and methods, as well as any limitations or possible follow-up experiments. This process will enable student to ask relevant queries and actively participate in class discussions, further enhancing their scientific skills.

In preparing the presentations, the students will have the unique opportunity to interact closely with each other and with the lecturers, who are all internationally well-established experts, and receive guidance in selectin a topic for the final presentation and supporting literature.

The topic of biomolecular condensates goes beyond the boundaries of traditional disciplines and requires a multi-disciplinary approach that leverages and cross-fertilizes biology, physical chemistry, biophysics, and soft matter. This course will explore the properties, functions, and potential applications of biomolecular condensates, including their role in neurodegenerative diseases such as Alzheimer's and Parkinson's, as well as their use as smart biomimetic materials.

This course is divided into two parts. The first part will introduce the basic concepts essentially the study of biomolecular condensates and phase separation. Topics include: fundamental units and scales in soft matter, phase transitions in biology, biopolymers and molecular self-assembly, introduction to active matter. This will establish a foundation for the second part, which will explore milestone works and current research in the field of biomolecular condensates. Each lecture of this second part will consist of:

1) a short literature seminar, where student groups will present and discuss a milestone paper assigned in advance and
2) a research seminar, where one of the course lecturers will present their own state-of-the-art research in the field, building upon the milestone literature.

At the beginning of the course, student groups will be formed and assigned to the milestone papers. To facilitate this, students must confirm their registration by the beginning of the 3rd week of semester.

Lecture slides and some scripts will be provided.

No compulsory textbooks. Literature will be provided during the course.

529-0733-02L Chemical Biology and Synthetic Biochemistry 6 credits K. Lang, M. Fottner

Overview of modern chemical biology and synthetic biochemistry techniques, focussed on protein modification and labeling and on methods to endow proteins with novel functionalities.

After taking this course, students should be capable of the following: A) Recall different possibilities for modifying proteins in vitro and in vivo and their applications in a biological context. B) Understand the chemical and biochemical consequences of modifications and assess the different reaction possibilities in the context of in vivo - in vitro, C) Critically analyze and assess current chemical biology articles D) Question the approaches learned and apply them to new biological problems.

advanced genetic code expansion methods (amber suppression, orthogonal ribosomes, unnatural base pairs, genome engineering and genome editing)

directed evolution and protein engineering

chemical biology of ubiquitin and targeted protein degradation

A script will not be handed out. Handouts to the lecture will be provided through moodle.

Citations from the original literature relevant to the individual lectures will be assigned during the lectures.

Knowledge provided in the bachelor lectures 'Nucleic Acids and Carbohydrates' and 'Proteins and Lipids' is assumed for this lecture.

**551-0317-00L Immunology I**

**Abstract**
Introduction into structural and functional aspects of the immune system. Basic knowledge of the mechanisms and the regulation of an immune response.

**Objective**
Introduction into structural and functional aspects of the immune system. Basic knowledge of the mechanisms and the regulation of an immune response.

**Content**
- Introduction and historical background
- Innate and adaptive immunity, Cells and organs of the immune system
- B cells and antibodies
- Generation of diversity
- Antigen presentation and Major Histoincompatibility (MHC) antigens
- Thymus and T cell selection
- Autoimmunity
- Cytotoxic T cells and NK cells
- Th1 and Th2 cells, regulatory T cells
- Allergies
- Hypersensitivities
- Vaccines, immune-therapeutic interventions

**Lecture notes**
Electronic access to the documentation will be provided. The link can be found at "Lernmaterialien" in the Moodle server.

**Literature**
- Kuby, Immunology, 9th edition, Freeman + Co., New York, 2020

**Prerequisites**
For D-BIOL students Immunology I (WS) and Immunology II (SS) will be examined as one learning entity in a "Sessionsprüfung". All other students write separate exams for Immunology I and Immunology II. All exams (combined exam Immunology I and II, individual exams) are offered in each exam session.

**Competencies**
- Subject-specific Competencies
  - Concepts and Theories
  - Techniques and Technologies
- Method-specific Competencies
  - Analytical Competencies
  - Decision-making
  - Problem-solving
- Social Competencies
  - Communication

**529-0731-00L Nucleic Acids and Carbohydrates**

**Note for BSc Biology students:** Only one of the two concept courses 529-0731-00 Nucleic Acids and Carbohydrates (autumn semester) or 529-0732-00 Proteins and Lipids (spring semester) can be counted for the Bachelor's degree.

**Abstract**
Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines

**Objective**
Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines

**Content**
Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines

**Lecture notes**
No script; illustrations from the original literature relevant to the individual lectures will be provided weekly (typically as handouts downloadable from the Moodle server).

**Literature**
Mainly based on original literature, a detailed list will be distributed during the lecture

<td>1G</td>
<td>R. Taylor</td>
</tr>
</tbody>
</table>

**Abstract**
This short course is designed to accompany MSc students in writing their first reports in English, providing input on scientific writing in English as well as feedback on drafts sections of the report.

**Objective**
Students will learn to:
- Plan, draft, structure, and edit scientific reports
- Produce reader-friendly sentences
- Establish a clear and logical flow between sentences and paragraphs
- Select formal vocabulary and use it in a generally accurate and correct manner
- Choose and use generally suitable grammatical structures, punctuation, and identify areas in which further development is needed
Content

The course covers the process of writing reports in biology, helping students to focus on the language and communicative aspects of these reports. Topics covered include structuring sentences, paragraphs, and longer sections (introductions, methods, etc.); presenting and integrating non-textual elements such as graphs and tables; reviewing common grammar problems for advanced writers in English; and editing drafts and proofs. Sessions will consist of a mix of specialist input, group and pair work, and editing sessions.

Students who attend this course will turn in three sections of a report (approx. 500 words each) for feedback, revising these texts for a final portfolio that is graded.

Prerequisites / notice

Participants should be at a stage in their research where they can already start drafting parts of the report.

Transition Metal Catalysis: From Mechanisms to Applications

W 6 credits 3G B. Morandi

Abstract
Detailed discussion of selected modern transition metal catalyzed reactions from a synthetic and mechanistic viewpoint

Objective
Understanding and critical evaluation of current research in transition metal catalysis. Design of mechanistic experiments to elucidate reaction mechanisms. Synthetic relevance of transition metal catalysis. Students will also learn about writing an original research proposal during a workshop.

Content
Detailed discussion of selected modern transition metal catalyzed reactions from a synthetic and mechanistic viewpoint. Synthetic applications of these reactions. Introduction and application of tools for the elucidation of mechanisms. Selected examples of topics include: C-H activation, C-O activation, C-C activation, redox active ligands, main group redox catalysis, bimetallic catalysis.

Lecture notes
Lecture slides will be provided online. A Handout summarizing important concepts in organometallic and physical organic chemistry will also be provided. Useful references and handouts will also be provided during the workshop.

Literature
Primary literature and review articles will be cited during the course.

The following textbooks can provide useful support for the course:

Modern Mass Spectrometry, Hyphenated Methods, and Chemometrics

W 6 credits 3G R. Zenobi, B. Hattendorf, P. Sinués Martinez-Lozano

Abstract
Modern mass spectrometry, hyphenated analytical methods, speciation, chemometrics.

Objective
Comprehensive knowledge about the analytical methods introduced in this course and their practical applications.

Content
Hyphenation of separation with identification methods such as GC-MS, LC-MS, GC-IR, LC-IR, LC-NMR etc.; importance of speciation. Modern mass spectrometry: time-of-flight, orbitrap and ion cyclotron resonance mass spectrometry, ICP-MS. Soft ionization methods, desorption methods, spray methods. Mass spectrometry imaging. Use of statistical and computer-assisted methods for processing analytical data (chemometrics).

Lecture notes
Lecture notes will be made available online.

Literature
Information about relevant literature will be available in the lecture & in the lecture notes.

Prerequisites
Exercises are an integral part of the lecture.

Prerequisites:
- 529-0051-00 "Analytische Chemie I (3. Semester)"
- 529-0058-00 "Analytische Chemie II (4. Semester)"
(or equivalent)
This course covers aspects of RNA biology related to the functions of non-coding RNAs as well as their use as drugs to treat diseases. Fostered approaches will be discussed in the context of ncRNA-mediated genome regulation; epigenetic programming of genome remodelling in ciliates; telomerase and telomeres; tRNA biology.

### Competencies

- Self-awareness and Self-reflection
- Self-direction and Self-management

### Literature

### Prerequisites

Basic knowledge of cell and molecular biology.

### Objective

Knowledge of the synthesis, properties and function of peptides in chemistry and biology.

### Content

Advanced peptide synthesis, conformational properties, combinatorial chemistry, therapeutic peptides, peptide based materials, peptides in nanobiotechnology, peptides in asymmetric catalysis.

### Lecture notes

Citations from the original literature relevant to the individual lectures will be assigned weekly.

### Data: 06.08.2024 12:40

Autumn Semester 2024

Page 311 of 2684
Abstract
Applying two fundamental principles of thermodynamics (entropy maximization and Gibbs energy minimization), an analytical model is derived for a variety of biological phenomena at the molecular as well as cellular level, and critically compared with the corresponding experimental data in the literature.

Objective
Engineering uses the laws of physics to predict the behavior of a system. Biological systems are so diverse and complex prompting the question whether we can apply unifying concepts of theoretical physics coping with the multiplicity of life’s mechanisms.

Objective of this course is to show that biological phenomena despite their variety can be analytically described using only two principles from statistical mechanics: maximization of the entropy and minimization of the Gibbs free energy.

Starting point of the course is the probability theory, which enables to derive step-by-step the two pillars of thermodynamics from the perspective of statistical mechanics: the maximization of entropy according to the Boltzmann’s law as well as the minimization of the Gibbs free energy. Then, an assortment of biological phenomena at the molecular and cellular level (e.g. cytoskeletal polymerization, action potential, photosynthesis, gene regulation, morphogen patterning) will be examined at the light of these two principles with the aim to derive a quantitative expression describing their behavior. Each analytical model is finally validated by comparing it with the corresponding experimental results from the literature.

By the end of the course, students will also learn to critically evaluate the concepts of making an assumption and making an approximation.

Content
• Basics of theory of probability
• Boltzmann’s law
• Entropy maximization and Gibbs free energy minimization
• Ligand-receptor: two-state systems and the MWC model
• Random walks, diffusion, crowding
• Electrostatics for salty solutions
• Elasticity: fibers and membranes
• Molecular motors
• Action potential: Hodgkin-Huxley model
• Photosynthesis and vision
• Gene regulation
• Development: Turing patterns

Theory and corresponding exercises are merged together during the classes.

Lecture notes
No lecture notes because the two proposed textbooks are more than exhaustive!

I am willingly available Mondays 17.00 o’clock - 18.00 in my office GLC F12.2 for whatever discussion about the lessons and the exercises.

!!! I am using OneNote. All lectures will be broadcast via ZOOM, while corresponding videos of the previous years (lectures and exercises) are available in Moodle !!!

Literature

As further deepening:

Prerequisites / notice
Participants need a good command of
• differentiation and integration of a function with one or more variables (basics of Analysis),
• Newton's and Coulomb's laws (basics of Mechanics and Electrostatics).

Notions of vectors in 2D and 3D are beneficial.
### Competencies

#### Subject-specific Competencies

### 551-0357-00L Cellular Matters: Properties, Functions and Applications of Biomolecular Condensates

<table>
<thead>
<tr>
<th>W</th>
<th>4 credits</th>
<th>2S</th>
</tr>
</thead>
</table>

**Objective**

In the last decade, a novel type of cell compartments called biomolecular condensates have been discovered. This discovery is radically changing our understanding of the cell, its organization, and dynamics. The emerging picture is that the cytoplasm and nucleoplasm are highly complex fluids that can (meta)stably segregate into membrane-less compartments, similar to emulsions.

This interdisciplinary course encompasses milestone works and cutting-edge research questions in the young field of biomolecular condensates, including their properties, functions, and applications. The course begins with a lecture series that introduces the topic of condensates to an interdisciplinary audience and provides a theoretical foundation for understanding current research questions in the field. The lectures provide a base for student presentations of recent publications in the field, and for research seminars given by course lecturers, who are all active researchers with diverse expertise. Through this exciting interdisciplinary understanding of biomolecular condensates, bridging biology, chemistry, biophysics, and soft matter, students will not only learn how to critically read and evaluate scientific literature but will also gain valuable experience in giving scientific presentations to an interdisciplinary audience. Each presentation will require an introduction, critical analysis of the results, and a discussion of their significance, allowing student to substantiate their statements with a critical mindset that considers the pros and cons of chosen approaches and methods, as well as any limitations or possible follow-up experiments. This process will enable student to ask relevant querions and actively participate in class discussions, further enhancing their scientific skills.

Students will have the unique opportunity to interact closely with each other and with the lecturers, who are all internationally well-established experts, and receive guidance in selectin a topic for the final presentaton and supporting literature. In preparing the presentations, the students will have the unique opportunity to interact closely with each other and with the lecturers, who are all internationally well-established experts, and receive guidance in selecting a topic for the final presentation and supporting literature.

**Content**

The topic of biomolecular condensates goes beyond the boundaries of traditional disciplines and requires a multi-disciplinary approach that leverages and cross-fertilizes biology, physical chemistry, biophysics, and soft matter. This course will explore the properties, functions and potential applications of biomolecular condensates, including their role in neurodegenerative diseases such as Alzheimer's and Parkinson's, as well as their use as smart biomimetic materials.

This course is divided into two parts. The fist part will introduce the basic concepts essential to the study of biomolecular condensates and phase separation. Topics include: fundamental units and scales in soft matter, phase transitions in biology, biopolymers and molecular self-assembly, introduction to active matter. This will establish a foundation for the second part, which will explore milestone works and current research in the field of biomolecular condensates. Each lecture of this second part will consist of:

1) a short literature seminar, where student groups will present and discuss a milestone paper assigned in advance and
2) a research seminar, where one of the course lecturers will present their own state-of-the-art research in the field, building upon the milestone literature.

At the beginning of the course, student groups will be formed and assigned to the milestone papers. To facilitate this, students must confirm their registration by the beginning of the 3rd week of semester.

**Lecture notes**

Lecture slides and some scripts will be provided.

**Literature**

No compulsory textbooks. Literature will be provided during the course.
Abstract
Overview of modern chemical biology and synthetic biochemistry techniques, focussed on protein modification and labeling and on methods to endow proteins with novel functionalities.

Objective
After taking this course, students should be capable of the following: A) Recall different possibilities for modifying proteins in vitro and in vivo and their applications in a biological context, B) Understand the chemical and biochemical consequences of modifications and assess the different reaction possibilities in the context of in vivo - in vitro, C) Critically analyze and assess current chemical biology articles D) Question the approaches learned and apply them to new biological problems.

Content
- principles of protein labeling and protein modification (fluorescent proteins, enzyme-mediated labeling, bioorthogonal chemistries)
- advanced genetic code expansion methods (amber suppression, orthogonal ribosomes, unnatural base pairs, genome engineering and genome editing)
- directed evolution and protein engineering
- chemical biology of ubiquitin and targeted protein degradation

Lecture notes
A script will not be handed out. Handouts to the lecture will be provided through moodle.

Literature
Citations from the original literature relevant to the individual lectures will be assigned during the lectures.

Prerequisites / notice
Knowledge provided in the bachelor lectures 'Nucleic Acids and Carbohydrates' and 'Proteins and Lipids' is assumed for this lecture.

551-0319-00L  Cellular Biochemistry (Part I)  W 3 credits  2V  U. Kutay, F. Allain, T. Kleele, I. Zemp

Abstract
Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

Objective
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry. The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Content
Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

Lecture notes
Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

Literature
Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

Prerequisites / notice
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

Competencies
Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Assessed

551-1299-00L  Bioinformatics  W 6 credits  4G  S. Sunagawa, P. Beltrao, V. Boeva, A. Kahles, C. von Mering, N. Zamboni

Abstract
Students will study bioinformatic concepts in the areas of metagenomics, genomics, transcriptomics, proteomics, biological networks and biostatistics. Through integrated lectures, practical hands-on exercises and project work, students will also be trained in analytical and programming skills to meet the emerging increase in data-driven knowledge generation in biology in the 21st century.

Objective
Students will have an advanced understanding of the underlying concepts behind modern bioinformatic analyses at genome, metagenome and proteome-wide scales. They will be familiar with the most common data types, where to access them, and how to analytically work with them to address contemporary questions in the field of biology.

Prerequisites / notice
Course participants have already acquired basic programming skills in UNIX, Python and R.

Competencies
Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Abstract
Information for UZH students: Enrolment to this course unit only possible at ETH. No enrolment to module BICO348 at UZH.

Please mind the ETH enrolment deadlines for UZH students: https://www.ethz.ch/en/studies/non-degree-courses/special-students-university-of-zurich.html

Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Objective
This course focuses on the concepts of classical and modern genetics and genomics.

Content
The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Lecture notes
Scripts and additional material will be provided during the semester.

<td>R. Taylor</td>
</tr>
</tbody>
</table>

#### Abstract
This short course is designed to accompany MSc students in writing their first reports in English, providing input on scientific writing in English as well as feedback on drafts sections of the report.

#### Objective
Students will learn to:
- Plan, draft, structure, and edit scientific reports
- Produce reader-friendly sentences
- Establish a clear and logical flow between sentences and paragraphs
- Select formal vocabulary and use it in a generally accurate and correct manner
- Choose and use generally suitable grammatical structures, punctuation, and identify areas in which further development is needed

#### Content
The course covers the process of writing reports in biology, helping students to focus on the language and communicative aspects of these reports. Topics covered include structuring sentences, paragraphs, and longer sections (introductions, methods, etc.); presenting and integrating non-textual elements such as graphs and tables; reviewing common grammar problems for advanced writers in English; and editing drafts and proofs. Sessions will consist of a mix of specialist input, group and pair work, and editing sessions.

#### Prerequisites / notice
Students who attend this course will turn in three sections of a report (approx. 500 words each) for feedback, revising these texts for a final portfolio that is graded.

### Major in Microbiology and Immunology

#### Abstract
Advanced lecture class providing a broad overview on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

#### Objective
This concept class will be based on common concepts and introduce to the enormous diversity among bacteria and archaea. It will cover the current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

#### Content
Advanced class covering the state of the research in bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

#### Lecture notes
Updated handouts will be provided during the class.

#### Literature
Current literature references will be provided during the lectures.

#### Prerequisites / notice
English
The lecture "Grundlagen der Biologie II: Mikrobiologie" is the basis for this advanced lecture.

#### Abstract
Introduction into structural and functional aspects of the immune system.

#### Objective
Basic knowledge of the mechanisms and the regulation of an immune response.

#### Content
- Introduction and historical background
- Basic knowledge of the mechanisms and the regulation of an immune response.
- Innate and adaptive immunity
- Cells and organs of the immune system
- Generation of diversity
- Antigen presentation and Major Histocompatibility (MHC) antigens
- Thymus and T cell selection
- Autoimmunity
- Cytotoxic T cells and NK cells
- Th1 and Th2 cells, regulatory T cells
- Allergies
- Hypersensitivities
- Vaccines, immune-therapeutic interventions

#### Lecture notes
Electronic access to the documentation will be provided. The link can be found at "Lernmaterialien"

</tr>
</tbody>
</table>

**Abstract**
- This course provides a detailed understanding of
- Development of T and B cells
- The dynamics of an immune response during acute and chronic infection
- Immunopathogenesis
- Modern vaccination strategies

**Objective**
Obtain a detailed understanding of
- Development, activation, and differentiation of different types of T cells and their effectormechanisms during immune responses,
- Recognition of pathogenic microorganisms by the host cells and molecular events thereafter,
- Events and signals for maturation of naive B cells to antibody producing plasma cells and memory B cells.
- Optimization of B cell responses by intelligent design of new vaccines

**Content**
- Development and selection of CD4 and CD8 T cells, natural killer T cells (NKT), and regulatory T cells (Treg)
- NK T cells and responses to lipid antigens
- Differentiation, characterization, and function of CD4 T cell subsets such as Th1, Th2, and Th17
- Overview of cytokines and their effecter function
- Co-stimulation (signals 1-3)
- Dendritic cells
- Evolution of the "Danger" concept
- Cells expressing Pattern Recognition Receptors and their downstream signals
- T cell function and dysfunction in acute and chronic viral infections

<td>W</td>
<td>2</td>
<td>1S</td>
<td>U. Suter</td>
</tr>
</tbody>
</table>

**Abstract**
Does not take place this semester.

**Objective**
The course is a literature seminar or "journal club". Each Friday a student, or a member of the Suter Lab in the Institute of Molecular Health Sciences, will present a paper from the recent literature.

**Content**
You will present one paper yourself. Give an introduction to the field of the paper, then show and comment on the main results (all the papers we present are available online, so you can show original figures with a beamer). Finish with a summary of the main points and a discussion of their significance.

You are expected to take part in the discussion and to ask questions. To prepare for this you should read all the papers beforehand (they will be announced a week in advance of the presentation).

**Lecture notes**
Presentations will be made available after the seminars.

**Prerequisites / notice**
You must attend at least 80% of the journal clubs, and give a presentation of your own. At the end of the semester there will be a 30 minute oral exam on the material presented during the semester. The grade will be based on the exam (45%), your presentation (45%), and a contribution based on your active participation in discussion of other presentations (10%).

**Abstract**
Weekly seminar about cutting edge topics in immunology and infection biology. Internationally renowned experts present their current research followed by an open discussion.
Objective: Weekly seminar about cutting edge topics in immunology and infection biology. Internationally renowned experts present their current research followed by an open discussion. The aim of this course is to confront students with current research topics and with scientific presentation. The course offers the opportunity to gain in depth knowledge about diverse topics which are often only briefly touched in the concept courses and to engage in discussion with experts in the field.

Content: Immunology and infection biology. The specific topics are variable and depend each semester on the list of invited experts.

Lecture notes: Current research data (often not yet published) are presented in this seminar series. There is no script and we are not allowed to record or distribute the contents of the seminars. Thus, the ability of students to extract the most relevant points of each seminar is promoted, which is an important skill for the future attendance of scientific meetings.

Literature: Often parts of the presented seminars have already been published by the respective speakers and the respective primary research can be retrieved from scientific journals.

551-1153-00L Systems Biology of Metabolism

Number of participants limited to 15.

Abstract: Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.

Objective: Develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology.

Content: The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics. For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

Lecture notes: Script and original publications will be supplied during the course.

Prerequisites: Script and original publications will be supplied during the course.

Literature: Literaturunterlagen werden vor Beginn des Kurses auf folgender website zugänglich sein: https://moodle-app2.let.ethz.ch/course/view.php?id=15568

551-1171-00L Immunology: From Milestones to Current Topics

Abstract: Milestones in Immunology: on old concepts and modern experiments

Objective: The course will cover the current grand topics in immunology: B cells, innate immunity, antigen presentation, tumor immunity, T cells, myeloid cells and stromal cells. For each topic two or four hours will be allocated. Historical milestone papers will be presented by the tutor/lecturer providing an overview on the development of the theoretical framework and critical technological advances. The students will re-read the historical milestone papers and contribute to the discussion. In the second part of the lecture, students will present recent high impact research papers that have emerged from the landmark achievements of the previously discussed milestone concepts.

Content: Milestones and current topics of innate immunity, antigen presentation, B cells, thymus and T cells, cytotoxic T cells, NK cells, stromal cells, CNS immunity and tumor immunology.

Lecture notes: Original and review articles will be distributed by the respective lecturer.

Literature: Literaturunterlagen werden vor Beginn des Kurses auf folgender website zugänglich sein: https://moodle-app2.let.ethz.ch/course/view.php?id=15568

551-1303-00L Current Research Topics in Cellular Biochemistry

Abstract: During this Masters level seminar style course, students will explore current research topics in cellular biochemistry focused on the structure, function and regulation of selected cell components, and the consequences of dysregulation for pathologies.

Objective: Students will work with experts toward a critical analysis of cutting-edge research in the domain of cellular biochemistry, with emphasis on normal cellular processes and the consequences of their dysregulation. At the end of the course, students will be able to evaluate, critically discuss and write about scientific articles in the research area of cellular biochemistry, and they will identify open testable research questions.
Guided by an expert in the field, students will engage in classical round-table style discussions of current literature with frontal presentations. Guided by a faculty expert, students develop domain knowledge of the research area associated with a primary paper, and alternate as discussion leaders to present the research topic. By the end of the semester, students will formulate their ideas about open testable research questions that extend from the published work.

**Literature**
The literature will be provided during the course.

**Prerequisites / notice**
The course will be taught in English.

**Lecture notes**
Electronic copies of the presentation slides (PDF) and additional material will be made available for download to registered students.

**Prerequisites / notice**
Lectures (2 hours) will be held as a single session of approximately 60+ minutes (10:15 until approx. 11:15 h), without a break !

**Abstract**
The course offers detailed information on selected foodborne pathogens and toxin producing organisms; the focus lies on relevant molecular biological aspects of pathogenicity and virulence, as well as on the occurrence and survival of these organisms in foods.

**Objective**
Detailed and current status of research and insights into the molecular basis of foodborne diseases, with focus on interactions of the microorganism or the toxins they produce with the human system. Understanding the relationship between specific types of food and the associated pathogens and microbial risks. Another focus lies on the currently available methods and techniques useful for the various purposes, i.e., detection, differentiation (typing), and antimicrobial agents.

**Content**
Molecular biology of infectious foodborne pathogens (Listeria, E. coli, Campylobacter, Salmonella, etc) and toxin-producing organisms (Bacillus, Clostridium, Staphylococcus). How and under which conditions will toxins and virulence factors be produced, and how do they work? How is the interaction between the human host and the microbial pathogen? What are the roles of food and the environment? What can be done to interfere with the potential risks? Which methods are best suited for what approach? Last, but not least, the role of bacteriophages in microbial pathogenicity will be highlighted, in addition to various applications of bacteriophage for both diagnostics and antimicrobial intervention.

**Abstract**
Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems.

**Objective**
Students will understand: 1) how pathogens attack plants; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems as a basis for implementing disease management strategies in agroecosystems.
Lecture Topics and Tentative Schedule

Week 1
- The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrotrophs, disease cycles and pathogen life cycles.

Week 2
- Nematode attack strategies and types of damage. Viral pathogens, classification, reproduction and transmission, attack strategies and types of damage. Examples TMV, BYDV. Bacterial pathogens and phytoplasmas, classification, reproduction and transmission.

Week 3
- Bacterial attack strategies and symptoms. Example bacterial diseases: fire blight, Agrobacterium crown gall, soft rots. Fungal and oomycete pathogens, classification, growth and reproduction, sexual and asexual spores, transmission.

Week 4
- Fungal and oomycete life cycles, disease cycles, infection processes, colonization, pythotoxins and mycotoxins. Attack strategies of fungal necrotrophs and biotrophs. Symptoms and signs of fungal infection. Example fungal diseases: potato late blight.

Week 5
- Example fungal diseases: wheat stem rust, grape powdery mildew, wheat septoria tritici blotch. Plant defense mechanisms, host range and non-host resistance. Passive structural and chemical defenses, preformed chemical defenses. Active structural defense, histological and cellular (papillae).

Week 6
- Active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytoalexins and disease resistance. Pisiatin and pisiatin demethylase. Local and systemic acquired resistance (LAR, SAR), induced systemic resistance (ISR), signal molecules, defense activators (Bion). Pathogen effects on food quality. Positive and negative transformations.

Week 7

Week 8
- Epidemiology: Disease pyramid, environmental effects on epidemic development, plant effects on development of epidemics, including resistance, physiology, density, uniformity.

Week 9
- Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity. Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies, ELISA.

Week 10
- Molecular detection and diagnosis of pathogens: PCR, rDNA and loop-mediated isothermal amplification. Strategies for minimizing disease risks: calculating disease thresholds, disease forecasting systems.

Week 11

Week 12
- Physical control methods. Cultural control methods: avoidance, tillage practices, crop sanitation.

Week 13
- Cultural control methods: fertilizers, crop rotations.

Week 14
- Open lecture.

Lecture notes
- Detailed lecture notes (~160 pages) will be available for purchase at the cost of reproduction at the start of the semester.

Competencies
- Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Content
- Course description: Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies.

Lecture slides will be available on moodle.

The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:
* Yang, Z. 2006. Computational Molecular Evolution.
* Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.
Analytical Competencies fostered assessed

Applied Bioinformatics: Microbiomes fostered assessed

This course explores infectious disease from both the host and pathogen perspective. Through short lectures, reading and active discussion, students will identify areas where evolutionary thinking can improve our understanding of infectious diseases and, ultimately, our ability to treat them effectively.

Students will learn to (i) identify evolutionary explanations for the origins and characteristics of infectious diseases in a range of organisms and (ii) evaluate ways of integrating evolutionary thinking into improved strategies for treating infections of humans and animals. This will incorporate principles that apply across any host-pathogen interaction, as well as system-specific mechanistic information, with particular emphasis on bacteria and viruses.

We will cover several topics where evolutionary thinking is relevant to understanding or treating infectious diseases. This includes: (i) determinants of pathogen host range and virulence, (ii) dynamics of host-parasite coevolution, (iii) pathogen adaptation to evade or suppress immune responses, (iv) antimicrobial resistance, (v) evolution-proof medicine. For each topic there will be a short (< 20 minutes) introductory lecture, before students independently research the primary literature and develop discussion points and questions, followed by interactive discussion in class.

The focus is on primary literature, but for some parts the following text books provide good background information:

- Schmid Hempel 2011 Evolutionary Parasitology
- Stearns & Medzhitov 2016 Evolutionary Medicine
- personal Competencies
- Social Competencies
- Critical Thinking
- Problem-solving
- Decision-making
- Communication
- Cooperation and Teamwork
- Creative Thinking
- Critical Thinking

701-1703-00L Evolutionary Medicine for Infectious Diseases W 3 credits 2G A. Hall

Abstract

This course explores infectious disease from both the host and pathogen perspective. Through short lectures, reading and active discussion, students will identify areas where evolutionary thinking can improve our understanding of infectious diseases and, ultimately, our ability to treat them effectively.

Objective

Students will learn to (i) identify evolutionary explanations for the origins and characteristics of infectious diseases in a range of organisms and (ii) evaluate ways of integrating evolutionary thinking into improved strategies for treating infections of humans and animals. This will incorporate principles that apply across any host-pathogen interaction, as well as system-specific mechanistic information, with particular emphasis on bacteria and viruses.

Content

We will cover several topics where evolutionary thinking is relevant to understanding or treating infectious diseases. This includes: (i) determinants of pathogen host range and virulence, (ii) dynamics of host-parasite coevolution, (iii) pathogen adaptation to evade or suppress immune responses, (iv) antimicrobial resistance, (v) evolution-proof medicine. For each topic there will be a short (< 20 minutes) introductory lecture, before students independently research the primary literature and develop discussion points and questions, followed by interactive discussion in class.

Literature

The focus is on primary literature, but for some parts the following text books provide good background information:

- Schmid Hempel 2011 Evolutionary Parasitology
- Stearns & Medzhitov 2016 Evolutionary Medicine

Prerequisites / notice

A basic understanding of evolutionary biology, microbiology or parasitology will be advantageous but is not essential.

This lecture is the first part of a one-year course. It offers insights into the fundamentals and applications of Food Microbiology. Contents include basic microbiology of the different bacteria, yeasts and molds present in foods, as well as the occurrence and control of foodborne pathogens and spoilage organisms.

1. History of Food Microbiology
1.1. Short synopsis of foodborne microorganisms
1.2. Spoilage of Foods
1.3. Foodborne Disease
1.4. Food Preservation
1.5. VIP's of Food Microbiology
2. Overview of Microorganisms in Foods
2.1 Origin of foodborne Microorganisms
2.2. Bacteria
2.3. Yeasts
2.4. Molds
3. Microbial Spoilage of Foods
3.1. Intrinsic and Extrinsic Parameters
3.2. Meats, Seafoods, Eggs
3.3. Milk and Milk Products
3.4. Vegetable and Fruit Products
3.5. Miscellaneous (baked goods, nuts, spices, ready-to-eat products)
3.6. Drinks and Canned Foods
4. Foodborne Disease
4.1. Significance and Transmission of Foodborne pathogens
4.2. Staphylococcus aureus
4.3. Gram-positive Sporeformers (Bacillus & Clostridium)
4.4. Listeria monocytogenes
4.5. Salmonella, Shigella, Escherichia coli
4.6. Vibrio, Yersinia, Campylobacter
4.7. Brucella, Mycobacterium
4.8. Parasites
4.9. Viruses and Bacteriophages
4.10. Mycotoxins
4.11. Bioactive Amines
4.12. Miscellaneous (Antibiotic-resistant Bacteria, Biofilms)

Electronic copies of the presentation slides (PDF) and additional material will be made available for download.

Recommendations will be given in the first lecture.

Subject-specific Competencies assessed

The concept course ‘Evolutionary Genetics’ consists of two lectures that jointly provide an introduction to the fields of population and quantitative genetics (emphasis on basic concepts) and ecological genetics (more emphasis on evolutionary and ecological processes of adaptation and speciation).

The aim of the course is to provide students with a solid introduction to the fields of population genetics, quantitative genetics, and ecological genetics. The concepts and research methods developed in these fields have undergone profound transformations; they are of fundamental importance in our understanding of evolutionary processes, both past and present. Students should gain an appreciation for the concepts, methods and explanatory power of evolutionary genetics.

Population genetics - Types and sources of genetic variation; randomly mating populations and the Hardy-Weinberg equilibrium; effects of inbreeding; natural selection; random genetic drift and effective population size; gene flow and hierarchical population structure; molecular population genetics; neutral theory of molecular evolution and basics of coalescent theory.

Quantitative genetics - Continuous variation; measurement of quant. characters; genes, environments and their interactions; measuring their influence; response to selection; inbreeding and crossbreeding, effects on fitness; Fisher’s fundamental theorem.

Ecological Genetics - Concepts and methods for the study of genetic variation and its role in adaptation, reproductive isolation, hybridization and speciation.

Handouts

Concepts and Theories assessed

The advanced course introduces students to plants through a concept-based discussion of developmental processes that integrates physiology and biochemistry with genetics, molecular biology, and cell biology. The course follows the life of the plant, starting with the seed, progressing through germination to the seedling and mature plant, and ending with reproduction and senescence.

The new course "Molecular Life of Plants" reflects the rapid advances that are occurring in the field of experimental plant biology as well as the changing interests of students being trained in this discipline. Contemporary plant biology courses emphasize a traditional approach to experimental plant biology by discussing discrete topics that are removed from the context of the plant life cycle. The course will take an integrative approach that focuses on developmental concepts. Whereas traditional plant physiology courses were based on research carried out on intact plants or plant organs and were often based on phenomenological observations, current research in plant biology emphasizes work at the cellular, subcellular and molecular levels.

The goal of "Molecular Life of Plants" is to train students in integrative approaches to understand the function of plants in a developmental context. While the course focuses on plants, the training integrative approaches will also be useful for other organisms.

The course "Molecular Life of Plants" will cover the following topics:

1. Seed structure and physiology, their dormancy and germination.
2. Seedling establishment and early development.
3. Structure and Function of Meristems, including stem cells.
4. Plant organ development (leaves, roots, flowers etc.).
5. Plant reproduction.
6. The plant vasculature for long-distance transport and other specialized tissues.
7. Sensing and responding to the abiotic environment.
8. Plant-microbe interactions; beneficial friends or pathogenic foes?
9. Polyploidy; the benefits, problems and solutions to of multiple genomes.
12. Starch biosynthesis and degradation.
13. Chloroplast development and chlorophyll biosynthesis.
14. Senescence mechanisms in plants.
15. General principles of RNA silencing.
18. Antiviral RNA silencing.
19. RNA silencing & defense against non-viral pathogens.
20. RNA silencing movement and amplification.

### 551-0307-00L Molecular and Structural Biology I: Protein Structure and Function

- **W 3 credits**
- **2V**
- R. Glockshuber, K. Locher, E. Weber-Ban

Enrolment to this course unit only possible at ETH. No enrolment to module BIO348 at UZH.

Please mind the ETH enrolment deadlines for UZH students: https://www.ethz.ch/en/studies/non-degree-courses/special-students/university-of-zurich.html

Abstract

- Biophysics of protein folding, membrane proteins and biophysics of membranes, enzymatic catalysis, catalytic RNA and RNAi, current topics in protein biophysics and structural biology.

Lecture notes

- Basics:
  - Creighton, T.E., Proteins, Freeman, (1993)
  - Fersht, A., Enzyme, Structure and Mechanism in Protein Science (1999), Freeman.

Current topics: References will be given during the lectures.

### 551-0309-00L Concepts in Modern Genetics

- **W 6 credits**
- **4V**
- Y. Barral, A. Hajnal, O. Voinnet

Information for UZH students: Enrolment to this course unit only possible at ETH. No enrolment to module BIO348 at UZH.

Please mind the ETH enrolment deadlines for UZH students: https://www.ethz.ch/en/studies/non-degree-courses/special-students/university-of-zurich.html

Abstract

- Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Lecture notes

- Scripts and additional material will be provided during the semester.
### 551-0319-00L Cellular Biochemistry (Part I)

#### Abstract
Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function, and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

#### Objective
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

#### Content
Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

#### Literature
Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

#### Prerequisites / notice
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

### 551-1299-00L Bioinformatics

#### Abstract
Students will study bioinformatic concepts in the areas of metagenomics, genomics, transcriptomics, proteomics, biological networks and biostatistics. Through integrated lectures, practical hands-on exercises and project work, students will also be trained in analytical and programming skills to meet the emerging increase in data-driven knowledge generation in biology in the 21st century.

#### Objective
Students will have an advanced understanding of the underlying concepts behind modern bioinformatic analyses at genome, metagenome and proteome-wide scales. They will be familiar with the most common data types, where to access them, and how to analytically work with them to address contemporary questions in the field of biology.

#### Prerequisites / notice
Course participants have already acquired basic programming skills in UNIX, Python and R.

### 529-0731-00L Nucleic Acids and Carbohydrates

Note for BSc Biology students: Only one of the two concept courses 529-0731-00 Nucleic Acids and Carbohydrates (autumn semester) or 529-0732-00 Proteins and Lipids (spring semester) can be counted for the Bachelor's degree.

#### Abstract
Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines.

#### Objective
Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines.

#### Content
Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

Students will learn to:

- Plan, draft, structure, and edit scientific reports
- Produce reader-friendly sentences
- Establish a clear and logical flow between sentences and paragraphs
- Select formal vocabulary and use it in a generally accurate and correct manner
- Choose and use generally suitable grammatical structures, punctuation, and identify areas in which further development is needed

Content

The course covers the process of writing reports in biology, helping students to focus on the language and communicative aspects of these reports. Topics covered include structuring sentences, paragraphs, and longer sections (introductions, methods, etc.); presenting and integrating non-textual elements such as graphs and tables; reviewing common grammar problems for advanced writers in English; and editing drafts and proofs. Sessions will consist of a mix of specialist input, group and pair work, and editing sessions.

Prerequisites / notice

Students who attend this course will turn in three sections of a report (approx. 500 words each) for feedback, revising these texts for a final portfolio that is graded.

Participants should be at a stage in their research where they can already start drafting parts of the report.

Major in Molecular and Structural Biology

Compulsory Concept Courses

Number Title Type ECTS Hours Lecturers
551-0307-00L Molecular and Structural Biology I: Protein Structure and Function O 3 credits 2V R. Glockshuber, K. Locher, E. Weber-Ban

Abstract

Biophysics of protein folding, membrane proteins and biophysics of membranes, enzymatic catalysis, catalytic RNA and RNA, current topics in protein biophysics and structural biology.

Objective

Understanding of structure-function relationships in proteins and in protein folding, detailed understanding of biophysics and physical methods as well as modern methods for protein purification and microanalytics.

Lecture notes

Scripts on the individual topics can be found under http://www.mol.biol.ethz.ch/teaching.

Literature

- Creighton, T.E., Proteins, Freeman, (1993)
- Fersht, A., Enzyme, Structure and Mechanism in Protein Science (1999), Freeman.

Current topics: References will be given during the lectures.

Elective Compulsory Concept Courses

See D-BIOL Master Studies Guide

Number Title Type ECTS Hours Lecturers
551-0319-00L Cellular Biochemistry (Part I) W 3 credits 2V U. Kutay, F. Allain, T. Kleele, I. Zemp

Abstract

Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

Objective

The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Content

- Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.
- Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

Lecture notes

Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

Literature

Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

Prerequisites / notice

To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

ECTS: 6 credits
University lecturers

Introduction into current research strategies in protein science.

Abstract
Introduction into current research strategies in protein science.

Objective
To understand current research strategies in protein science.

Content
Proteins have become an object of intense study in modern science, ranging from their use as therapeutics to elucidating their structure and function in the cell. Moreover, it is now possible to engineer and evolve tailor-made proteins, opening up many new areas of science. This course will attempt to cover the frontiers and remaining challenges, emphasizing the biochemical foundations of the various approaches.

Lecture notes
Slides and references will be available on OLAT server.

Literature
PDFs will be available on OLAT server.

Prerequisites / notice
Solid knowledge in biochemistry strongly recommended

Number 551-1153-00L

551-1401-00L Advanced Protein Engineering (University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: BCH420

Restricted to max. 10 students from ETH

Mind the enrolment deadlines at UZH:
https://www.uzh.ch/cmsssl/en/studies/application/deadline.s.html

Abstract
Introduction into current research strategies in protein science.

Objective
To understand current research strategies in protein science.

Content
Proteins have become an object of intense study in modern science, ranging from their use as therapeutics to elucidating their structure and function in the cell. Moreover, it is now possible to engineer and evolve tailor-made proteins, opening up many new areas of science. This course will attempt to cover the frontiers and remaining challenges, emphasizing the biochemical foundations of the various approaches.

Lecture notes
Slides and references will be available on OLAT server.

Literature
https://www.olat.uzh.ch/olat/auth/repo/go?rid=600670219

Prerequisites / notice
Solid knowledge in biochemistry strongly recommended

Number 551-1153-00L

551-1153-00L Systems Biology of Metabolism

Number of participants limited to 15.

Abstract
Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.

Objective
Develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology.

Content
The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics. For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

Lecture notes
Script and original publications will be supplied during the course.

Literature
https://www.olat.uzh.ch/olat/auth/repo/go?rid=600670219

Prerequisites / notice
The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.

Number 529-0004-01L

529-0004-01L Classical Simulation of (Bio)Molecular Systems

Abstract
Molecular models, classical force fields, configuration sampling, molecular dynamics simulation, boundary conditions, electrostatic interactions, analysis of trajectories, free-energy calculations, structure refinement, applications in chemistry and biology. Exercises: hands-on computer exercises for learning progressively how to perform an analyze classical simulations (using the package GROMOS).

Objective
Introduction to classical (atomistic) computer simulation of (bio)molecular systems, development of skills to carry out and interpret these simulations.

Content
Molecular models, classical force fields, configuration sampling, molecular dynamics simulation, boundary conditions, electrostatic interactions, analysis of trajectories, free-energy calculations, structure refinement, applications in chemistry and biology. Exercises: hands-on computer exercises for learning progressively how to perform an analyze classical simulations (using the package GROMOS).

Lecture notes
The powerpoint slides of the lectures will be made available weekly on the website in pdf format (on the day preceding each lecture).

Literature
See: www.csms.ethz.ch/education/CSBMS

Prerequisites / notice
Since the exercises on the computer do convey and test essentially different skills than those being conveyed during the lectures and tested at the oral exam, the results of the exercises are taken into account when evaluating the results of the exam (learning component, possible bonus of up to 0.25 points on the exam mark).

For more information about the lecture: www.csms.ethz.ch/education/CSBMS
### 401-0649-00L Applied Statistical Regression

**Abstract**
This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning "good practice" that can be applied in every student's own projects and daily work life. A special focus will be laid in the use of the statistical software package R for regression analysis.

**Objective**
The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.

**Content**
The course starts with the basics of linear modeling, and then proceeds to parameter estimation, tests, confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, multicollinearity problems and model interpretation, as well as general modeling strategies.

The last third of the course is dedicated to an introduction to generalized linear models: this includes the generalized additive model, logistic regression for binary response variables, binomial regression for grouped data and poisson regression for count data.

**Lecture notes**
A script will be available.

**Literature**
- Faraway (2005): Linear Models with R
- Faraway (2006): Extending the Linear Model with R
- Draper & Smith (1998): Applied Regression Analysis
- Fox (2008): Applied Regression Analysis and GLMs
- Montgomery et al. (2006): Introduction to Linear Regression Analysis

**Prerequisites / notice**
The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

### 401-06215-00L Using R for Data Analysis and Graphics (Part I)

**Abstract**
The course provides the first part an introduction to the statistical/graphical/data science software R (https://www.r-project.org/) for scientists. Topics covered are data generation and selection, graphical and basic statistical functions, creating simple functions, basic types of objects.

**Objective**
The students will be able to use the software R for simple data analysis and graphics.

**Content**
The course provides the first part of an introduction to the statistical software R for scientists. R is free software that contains a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

Part I of the course covers the following topics:
- What is R?
- R Basics: reading and writing data from/to files, creating vectors & matrices, selecting elements of dataframes, vectors and matrices, arithmetics;
- Types of data: numeric, character, logical and categorical data, missing values;
- Simple (statistical) functions: summary, mean, var, etc., simple statistical tests;
- Writing simple functions;
- Introduction to graphics: scatter-, boxplots and other high-level plotting functions, embellishing plots by title, axis labels, etc., adding elements (lines, points) to existing plots.

The course focuses on practical work at the computer with R. We will make use of the graphical user interface RStudio: www.rstudio.org

**Lecture notes**
An Introduction to R. http://stat.ethz.ch/CRAN/doc/contrib/Lam-IntroductionToR_LHL.pdf

**Prerequisites / notice**
The course resources will be provided via the Moodle web learning platform.

Note: Part I of UsingR is complemented and extended by Part II, which is offered during the second part of the semester and which can be taken independently from Part I.

**529-0041-00L Modern Mass Spectrometry, Hyphenated Methods, and Chemometrics**

**W 6 credits 3G**

**R. Zenobi, B. Hattendorf, P. Sinués Martinez-Lozano**

**Abstract**
Modern mass spectrometry, hyphenated analytical methods, speciation, chemometrics.

**Objective**
Comprehensive knowledge about the analytical methods introduced in this course and their practical applications.

**Content**
Hyphenation of separation with identification methods such as GC-MS, LC-MS, GC-IR, LC-IR, LC-NMR etc.; importance of speciation. Modern mass spectrometry: time-of-flight, orbitrap and ion cyclotron resonance mass spectrometry, ICP-MS. Soft ionization methods, desorption methods, spray methods. Mass spectrometry imaging.

Use of statistical and computer-assisted methods for processing analytical data (chemometrics).

**Lecture notes**
Lecture notes will be made available online.

**Literature**
Information about relevant literature will be available in the lecture & in the lecture notes.

Exercises are an integral part of the lecture.

Prerequisites:
- 529-0051-00 "Analytische Chemie I (3. Semester)"
- 529-0058-00 "Analytische Chemie II (4. Semester)"

(or equivalent)

**551-1407-00L RNA Biology Lecture Series I: Transcription & Processing & Translation**

**W 4 credits 2V**

**F. Allain, N. Ban, S. Jonas, U. Kutay, further lecturers**

**Abstract**
This course covers aspects of RNA biology related to gene expression at the posttranscriptional level. These include RNA transcription, processing, alternative splicing, editing, export and translation.

**Objective**
The students should obtain an understanding of these processes, which are at work during gene expression.

**Content**
Transcription & 3'end formation; splicing, alternative splicing, RNA editing; the ribosome & translation, translation regulation, RNP biogenesis & nuclear export, mRNA surveillance & mRNA turnover; signal transduction & RNA.

**Prerequisites / Notice**
Basic knowledge of cell and molecular biology.

**551-1409-00L RNA Biology Lecture Series II: Non-Coding RNAs: Biology and Therapeutics**

**W 4 credits 2V**

**J. Hall, M. Stoffel, further lecturers**

**Does not take place this semester.**

**Abstract**
This course covers aspects of RNA biology related to the functions of non-coding RNAs as well as their use as drugs to treat diseases.

**Objective**
The students should obtain an understanding of these processes, which are at work during gene expression.

**Content**
Micro RNAs; computational approaches to miRNAs; micro RNA function in metabolism; viruses and viral RNAs; nucleic acid-based drugs; ncRNA-mediated genome regulation; epigenetic programming of genome remodelling in ciliates; telomerase and telomeres; tRNA biology.

**Prerequisites / Notice**
Basic knowledge of cell and molecular biology.

**227-0939-00L Cell Biophysics**

**W 6 credits 4G**

**T. Zambelli**

**Abstract**
Applying two fundamental principles of thermodynamics (entrainment maximization and Gibbs energy minimization), an analytical model is derived for a variety of biological phenomena at the molecular as well as cellular level, and critically compared with the corresponding experimental data in the literature.
Objective
Engineering uses the laws of physics to predict the behavior of a system. Biological systems are so diverse and complex prompting the question whether we can apply unifying concepts of theoretical physics coping with the multiplicity of life’s mechanisms.

Objective of this course is to show that biological phenomena despite their variety can be analytically described using only two principles from statistical mechanics: maximization of the entropy and minimization of the Gibbs free energy.

Starting point of the course is the probability theory, which enables to derive step-by-step the two pillars of thermodynamics from the perspective of statistical mechanics: the maximization of entropy according to the Boltzmann’s law as well as the minimization of the Gibbs free energy. Then, an assortment of biological phenomena at the molecular and cellular level (e.g. cytoskeletal polymerization, action potential, photosynthesis, gene regulation, morphogen patterning) will be examined at the light of these two principles with the aim to derive a quantitative expression describing their behavior. Each analytical model is finally validated by comparing it with the corresponding experimental results from the literature.

By the end of the course, students will also learn to critically evaluate the concepts of making an assumption and making an approximation.

Content
• Basics of theory of probability
• Boltzmann’s law
• Entropy maximization and Gibbs free energy minimization
• Ligand-receptor: two-state systems and the MWC model
• Random walks, diffusion, crowding
• Electrostatics for salty solutions
• Elasticity: fibers and membranes
• Molecular motors
• Action potential: Hodgkin-Huxley model
• Photosynthesis and vision
• Gene regulation
• Development: Turing patterns

Theory and corresponding exercises are merged together during the classes.

Lecture notes
No lecture notes because the two proposed textbooks are more than exhaustive!

I am willingly available Mondays 17.00 o’clock - 18.00 in my office GLC F12.2 for whatever discussion about the lessons and the exercises.

!!! I am using OneNote. All lectures will be broadcast via ZOOM, while corresponding videos of the previous years (lectures and exercises) are available in Moodle !!!

Literature

As further deepening:

Prerequisites / notice
Participants need a good command of
• differentiation and integration of a function with one or more variables (basics of Analysis),
• Newton’s and Coulomb’s laws (basics of Mechanics and Electrostatics).

Notions of vectors in 2D and 3D are beneficial.

529-0733-02L Chemical Biology and Synthetic Biochemistry W 6 credits 3G K. Lang, M. Fottner

Abstract
Overview of modern chemical biology and synthetic biochemistry techniques, focussed on protein modification and labeling and on methods to endow proteins with novel functionalities.

Objective
After taking this course, students should be capable of the following: A) Recall different possibilities for modifying proteins in vitro and in vivo and their applications in a biological context, B) Understand the chemical and biochemical consequences of modifications and assess the different reaction possibilities in the context of in vivo - in vitro, C) Critically analyze and assess current chemical biology articles D) Question the approaches learned and apply them to new biological problems.
principles of protein labeling and protein modification (fluorescent proteins, enzyme-mediated labeling, bioorthogonal chemistries)

advanced genetic code expansion methods (amber suppression, orthogonal ribosomes, unnatural base pairs, genome engineering and genome editing)

directed evolution and protein engineering

chemical biology of ubiquitin and targeted protein degradation

Lecture notes
A script will not be handed out. Handouts to the lecture will be provided through moodle.

Citations from the original literature relevant to the individual lectures will be assigned during the lectures.

Knowledge provided in the bachelor lectures ‘Nucleic Acids and Carbohydrates’ and ‘Proteins and Lipids’ is assumed for this lecture.

Abstract
This short course is designed to accompany MSc students in writing their first reports in English, providing input on scientific writing in English as well as feedback on drafts sections of the report.

Objective
Students will learn to:
- Plan, draft, structure, and edit scientific reports
- Produce reader-friendly sentences
- Establish a clear and logical flow between sentences and paragraphs
- Select formal vocabulary and use it in a generally accurate and correct manner
- Choose and use generally suitable grammatical structures, punctuation, and identify areas in which further development is needed

Content
The course covers the process of writing reports in biology, helping students to focus on the language and communicative aspects of these reports. Topics covered include structuring sentences, paragraphs, and longer sections (introductions, methods, etc.); presenting and integrating non-textual elements such as graphs and tables; reviewing common grammar problems for advanced writers in English; and editing drafts and proofs. Sessions will consist of a mix of specialist input, group and pair work, and editing sessions.

Prerequisites / notice
Students who attend this course will turn in three sections of a report (approx. 500 words each) for feedback, revising these texts for a final portfolio that is graded.

Abstract
Students will study bioinformatic concepts in the areas of metagenomics, genomics, transcriptomics, proteomics, biological networks and biostatistics. Through integrated lectures, practical hands-on exercises and project work, students will also be trained in analytical and programming skills to meet the emerging increase in data-driven knowledge generation in biology in the 21st century.

Objective
Students will have an advanced understanding of the underlying concepts behind modern bioinformatic analyses at genome, metagenome and proteome-wide scales. They will be familiar with the most common data types, where to access them, and how to analytically work with them to address contemporary questions in the field of biology.

Prerequisites / notice
Course participants have already acquired basic programming skills in UNIX, Python and R.

Students bring their own computer with keyboard, internet access (browser) and software to connect to the ETH network via VPN.

### 551-0319-00L Cellular Biochemistry (Part I)

| Objective | The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry. The students will be able to describe the structural and functional details of individual cell components, and to explain the regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer. |
| Content | Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes. Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression. |
| Lecture notes | Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch) |
| Literature | Recommended supplementary literature (review articles and selected primary literature) will be provided during the course. |
| Prerequisites / notice | To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English. |

### 551-0309-00L Concepts in Modern Genetics

| Objective | This course focuses on the concepts of classical and modern genetics and genomics. The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference. |
| Content | Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference. |
| Lecture notes | Scripts and additional material will be provided during the semester. |

### 551-0317-00L Immunology I

| Objective | Introduction into structural and functional aspects of the immune system. Basic knowledge of the mechanisms and the regulation of an immune response. |

### Literature

- Enrolment to the course unit only possible at ETH. No enrolment to module BIO348 at UZH.
- Please mind the ETH enrolment deadlines for UZH students: https://www.ethz.ch/en/studies/non-degree-courses/special-students-university-of-zurich.html
- Enrolment to this course unit only possible at ETH. No enrolment to module BIO348 at UZH.
- Introduction and historical background
- Innate and adaptive immunity, Cells and organs of the immune system
- B cells and antibodies
- Generation of diversity
- Antigen presentation and Major Histoincompatibility (MHC) antigens
- Thymus and T cell selection
- Autoimmunity
- Cytotoxic T cells and NK cells
- Th1 and Th2 cells, regulatory T cells
- Allergies
- Hypersensitivities
- Vaccines, immune-therapeutic interventions

- Kuby, Immunology, 9th edition, Freeman + Co., New York, 2020

Electronic access to the documentation will be provided. The link can be found at "Lernmaterialien"

During this Masters level seminar style course, students will explore current research topics in cellular biochemistry focused on the normal cellular processes and the consequences of their dysregulation. At the end of the course, students will be able to evaluate, critically discuss and write about scientific articles in the research area of cellular biochemistry, and they will identify open testable research questions.

The literature will be provided during the course.

For D-BIOL students Immunology I (WS) and Immunology II (SS) will be examined as one learning entity in a “Sessionsprüfung”. All other students write separate exams for Immunology I and Immunology II. All exams (combined exam Immunology I and II, individual exams) are offered in each exam session.

| 551-1303-00L    | Current Research Topics in Cellular Biochemistry             | W    | 4    | 2S    | T. Kleeele, V. Korkhov, G. Neurohr, V. Panse, M. Peter, A. E. Smith, F. van Drogen |
| Abstract        | During this Masters level seminar style course, students will explore current research topics in cellular biochemistry focused on the structure, function and regulation of selected cell components, and the consequences of dysregulation for pathologies. |
| Objective       | Students will work with experts toward a critical analysis of cutting-edge research in the domain of cellular biochemistry, with emphasis on normal cellular processes and the consequences of their dysregulation. At the end of the course, students will be able to evaluate, critically discuss and write about scientific articles in the research area of cellular biochemistry, and they will identify open testable research questions. |
| Content         | Guided by an expert in the field, students will engage in classical round-table style discussions of current literature with frontal presentations. Guided by a faculty expert, students develop domain knowledge of the research area associated with a primary paper, and alternate as discussion leaders to present the research topic. By the end of the semester, students will formulate their ideas about open testable research questions that extend from the published work. |
| Literature      | The literature will be provided during the course.            |

| 376-1305-00L    | Development of the Nervous System (University of Zurich)     | W    | 3    | 2V    | University lecturers |
| No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student. |
The lecture will cover molecular and cellular processes underlying the development of the nervous system (neurogenesis, cell death, cell migration and differentiation, axon guidance and synapse formation). The importance of these processes in the context of developmental diseases is discussed.

On successful completion of the module the student should be able to:
- relate structure and function of the nervous system to its development - apply principles of molecular, cellular, and developmental biology to the development of the nervous system
- identify key steps in development underlying neurological syndromes and diseases

The lecture will cover molecular and cellular processes underlying the development of the nervous system. After an introduction to structure and function of the nervous system, we will discuss neurogenesis, cell death, cell migration and differentiation, axon guidance and synapse formation. The importance of these processes in the context of developmental diseases will be discussed.

The lecture will cover molecular and cellular processes underlying the development of the nervous system. After an introduction to structure and function of the nervous system, we will discuss neurogenesis, cell death, cell migration and differentiation, axon guidance and synapse formation. The importance of these processes in the context of developmental diseases will be discussed.

The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on OLAT.

This course explores infectious disease from both the host and pathogen perspective. Through short lectures, reading and active discussion, students will identify areas where evolutionary thinking can improve our understanding of infectious diseases and, ultimately, our ability to treat them effectively.

Students will learn to (i) identify evolutionary explanations for the origins and characteristics of infectious diseases in a range of organisms and (ii) evaluate ways of integrating evolutionary thinking into improved strategies for treating infections of humans and animals. This will incorporate principles that apply across any host-pathogen interaction, as well as system-specific mechanistic information, with particular emphasis on bacteria and viruses.

We will cover several topics where evolutionary thinking is relevant to understanding or treating infectious diseases. This includes: (i) determinants of pathogen host range and virulence, (ii) dynamics of host-parasite coevolution, (iii) pathogen adaptation to evade or suppress immune responses, (iv) antimicrobial resistance, (v) evolution-proof medicine. For each topic there will be a short (< 20 minutes) introductory lecture, before students independently research the primary literature and develop discussion points and questions, followed by interactive discussion in class.

The focus is on primary literature, but for some parts the following text books provide good background information:

- Schmid Hempel 2011 Evolutionary Parasitology
- Stearns & Medzhitov 2016 Evolutionary Medicine
- Mind the enrolment deadlines at UZH: https://www.uzh.ch/cmsssl/en/studies/application/deadline.html

The evolution of the various body-plans is investigated by means of comparison of developmentally essential control genes of molecularly analysed model organisms.

By the end of this module, each student should be able to:
- recognize the universal principles underlying the development of different animal body plans.
- explain how the genes encoding the molecular toolkit have evolved to create animal diversity.
- relate changes in gene structure or function to evolutionary changes in animal development.

Key skills:
- By the end of this module, each student should be able to:
  - present and discuss a relevant evolutionary topic in an oral presentation
  - select and integrate key concepts in animal evolution from primary literature
  - participate in discussions on topics presented by others

551-0571-00L From DNA to Diversity: the Evolution of Multicellular Organisms (University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: BIO336

Mind the enrolment deadlines at UZH: https://www.uzh.ch/cmsssl/en/studies/application/deadline.html

551-0223-00L Immunology III
This course provides a detailed understanding of:
- development of T and B cells
- the dynamics of an immune response during acute and chronic infection
- mechanisms of immunopathology
- modern vaccination strategies

Key experimental results will be shown to help understanding how immunological textbook knowledge has evolved.

Objectives:
Obtain a detailed understanding of:
- the development, activation, and differentiation of different types of T cells and their effectormechanisms during immune responses,
- Recognition of pathogenic microorganisms by the host cells and molecular events thereafter,
- events and signals for maturation of naive B cells to antibody producing plasma cells and memory B cells.
- Optimization of B cell responses by intelligent design of new vaccines

Content:
- Development and selection of CD4 and CD8 T cells, natural killer T cells (NKT), and regulatory T cells (Treg)
- NK T cells and responses to lipid antigens
- Differentiation, characterization, and function of CD4 T cell subsets such as Th1, Th2, and Th17
- Overview of cytokines and their effector function
- Co-stimulation (signals 1-3)
- Dendritic cells
- Evolution of the "Danger" concept
- Cells expressing Pattern Recognition Receptors and their downstream signals
- T cell function and dysfunction in acute and chronic viral infections

Literature:
Documents of the lectures are available for download at:
https://moodle-app2.let.ethz.ch/course/view.php?id=2581&noticeid=1

Prerequisites:
Immunology I and II recommended but not compulsory

752-4009-00L Molecular Biology of Foodborne Pathogens

Abstract
The course offers detailed information on selected foodborne pathogens and toxin producing organisms; the focus lies on relevant molecular biological aspects of pathogenicity and virulence, as well as on the occurrence and survival of these organisms in foods.

Objective
Detailed and current status of research and insights into the molecular basis of foodborne diseases, with focus on interactions of the microorganism or the toxins they produce with the human system. Understanding the relationship between specific types of food and the associated pathogens and microbial risks. Another focus lies on the currently available methods and techniques useful for the various purposes, i.e., detection, differentiation (typing), and antimicrobial agents.

Content
Molecular biology of infectious foodborne pathogens (Listeria, E. coli, Campylobacter, Salmonella, etc) and toxin-producing organisms (Bacillus, Clostridium, Staphylococcus). How and under which conditions will toxins and virulence factors be produced, and how do they work? What is the interaction between the human host and the microbial pathogen? What are the roles of food and the environment? What can be done to interfere with the potential risks? Which methods are best suited for what approach? Last, but not least, the role of bacteriophages in microbial pathogenicity will be highlighted, in addition to various applications of bacteriophage for both diagnostics and antimicrobial intervention.

Lecture notes
Electronic copies of the presentation slides (PDF) and additional material will be made available for download to registered students.

Literature
Recommendations will be given in the first lecture

Prerequisites / notice
Lectures (2 hours) will be held as a single session of approximately 60+ minutes (10:15 until approx. 11:15 h), without a break!

Competencies
- Subject-specific Competencies
  - Concepts and Theories
  - Techniques and Technologies

376-1305-01L Molecular Neurophysiology: From Molecules to Systems

Information for UZH students:
Enrolment to this course unit only possible at ETH.
Please mind the ETH enrolment deadlines for UZH

W. von der Behrens, J. Winterer

G. Schratt, R. Fiore, further lecturers
RNA Biology Lecture Series II: Non-Coding RNAs:
The course covers the physiology of nerve cells, from the single cell through the neuronal network to the systemic level. The focus is on molecular and cellular mechanisms – synaptic transmission, signal transduction, gene expression, synaptic plasticity.

Objective
Based on an understanding of molecular and cellular mechanisms, the aim is to provide a deepened insight into neurophysiological processes underlying complex brain functions – learning/memory, sleep, sensory.

Content
First, basic molecular and cellular mechanisms in nerve cells (excitability, neurotransmission, signal transduction, gene expression, synaptic plasticity) are introduced. Afterwards, their significance for selected neurophysiological processes (learning/memory, sleep, sensory) will be illuminated.

Literature
The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on Moodle.

Competencies

Concepts and Theories
Method-specific Competencies
Analytical Competencies

551-1407-00L
RNA Biology Lecture Series I: Transcription & Processing & Translation

Abstract
This course covers aspects of RNA biology related to gene expression at the posttranscriptional level. These include RNA transcription, processing, alternative splicing, editing, export and translation.

Objective
The students should obtain an understanding of these processes, which are at work during gene expression.

Content
Transcription & 3’end formation; splicing, alternative splicing, RNA editing; the ribosome & translation, translation regulation, RNP biogenesis & nuclear export, mRNA surveillance & mRNA turnover; signal transduction & RNA.

Prerequisites / notice
Basic knowledge of cell and molecular biology.

551-1409-00L
RNA Biology Lecture Series II: Non-Coding RNAs:

Abstract
This course covers aspects of RNA biology related to the functions of non-coding RNAs as well as their use as drugs to treat diseases.

Objective
The students should get familiar with the wide array of roles, which non-coding RNAs play in cellular functions.

Content
Micro RNAs; computational approaches to miRNAs; micro RNA function in metabolism; viruses and viral RNAs; nucleic acid-based drugs; ncRNA-mediated genome regulation; epigenetic programming of genome remodelling in ciliates; telomerase and telomeres; tRNA biology.

Prerequisites / notice
Basic knowledge of cell and molecular biology.

551-1153-00L
Systems Biology of Metabolism

Abstract
Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.

Objective
Develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology.

Content
The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics. For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

Lecture notes
Script and original publications will be supplied during the course.

Prerequisites / notice
Basic knowledge of cell and molecular biology.

376-0300-00L
Essentials in Translational Science

Abstract
Translational science is a cross disciplinary scientific research that is motivated by the need for practical applications that help people (e.g. Medicines). The course should help to clarify basics of translational science, illustrate successful applications and enable students to integrate key features into their future projects.

Objective
After completing this course, students will be able to understand: Principles of translational science including medical device development, intellectual property, regulatory environment and project management

Content
What is translational science and what is it not including?
How to identify need?
How to choose the appropriate research type and methodology
How to measure success?
How are medical devices developed?
How to handle IP in the development process?
How does the regulatory environment impact innovation?
How to manage complex development projects?
Positive and negative examples will be illustrated by distinguished guest speakers.

Literature
Principles of Biomedical Sciences and Industry
Translating Ideas into Treatments https://doi.org/10.1002/9783527824014

The course covers the process of writing reports in biology, helping students to focus on the language and communicative aspects of these reports. Topics covered include structuring sentences, paragraphs, and longer sections (introductions, methods, etc.); presenting and integrating non-textual elements such as graphs and tables; reviewing common grammar problems for advanced writers in English; and editing drafts and proofs. Sessions will consist of a mix of specialist input, group and pair work, and editing sessions.

Students who attend this course will turn in three sections of a report (approx. 500 words each) for feedback, revising these texts for a final portfolio that is graded.

Prerequisites / Notice
Participants should be at a stage in their research where they can already start drafting parts of the report.

Elective Major: Molecular Plant Biology

Compulsory Concept Courses

Abstract
The advanced course introduces students to plants through a concept-based discussion of developmental processes that integrates physiology and biochemistry with genetics, molecular biology, and cell biology. The course follows the life of the plant, starting with the seed, progressing through germination to the seedling and mature plant, and ending with reproduction and senescence.

Objective
The new course "Molecular Life of Plants" reflects the rapid advances that are occurring in the field of experimental plant biology as well as the changing interests of students being trained in this discipline. Contemporary plant biology courses emphasize a traditional approach to experimental plant biology by discussing discrete topics that are removed from the context of the plant life cycle. The course will take an integrative approach that focuses on developmental concepts. Whereas traditional plant physiology courses were based on research carried out on intact plants or plant organs and were often based on phenomenological observations, current research in plant biology emphasizes work at the cellular, subcellular and molecular levels.

The goal of "Molecular Life of Plants" is to train students in integrative approaches to understand the function of plants in a developmental context. While the course focuses on plants, the training integrative approaches will also be useful for other organisms.

Content
The course "Molecular Life of Plants" will cover the following topics:
- Seed structure and physiology, their dormancy and germination.
- Seedling establishment and early development.
- Structure and function of meristems, including stem cells.
- Plant organ development (leaves, roots, flowers etc.).
- Plant reproduction.
- The plant vasculature for long-distance transport and other specialized tissues.
- Sensing and responding to the abiotic environment.
- Plant-microbe interactions; beneficial friends or pathogenic foes?
- Polyploidy; the benefits, problems and solutions to multiple genomes.
- Photosynthesis and carbon partitioning.
- Photosynthesis and the evolution of C4 metabolism.
- Starch biosynthesis and degradation.
- Chloroplast development and chlorophyll biosynthesis.
- Senescence mechanisms in plants.
- General principles of RNA silencing.
- MicroRNAs: discovery, general principle and modes of action at the cellular and system levels.
- Chromatin-based RNA silencing.
- Antiviral RNA silencing.
- RNA silencing & defense against non-viral pathogens.
- RNA silencing movement and amplification.

#### 551-0313-00L Microbiology (Part I)

**Abstract**
Advanced lecture class providing a broad overview on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

**Objective**
This concept class will be based on common concepts and introduce to the enormous diversity among bacteria and archaea. It will cover advanced class covering the state of the research in bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

**Content**
Updated handouts will be provided during the class.

**Literature**
Current literature references will be provided during the lectures.

**Prequisites / notice**
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

#### 551-0319-00L Cellular Biochemistry (Part I)

**Abstract**
Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

**Objective**
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular explanation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry. The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

**Content**
Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

**Literature**
Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

**Prequisites / notice**
To attend this course the students must have a solid basic knowledge in biochemistry, molecular biology and genetics.

**Competencies**

#### 701-2413-00L Evolutionary Genetics

**Abstract**
The concept course 'Evolutionary Genetics' consists of two lectures that jointly provide an introduction to the fields of population and quantitative genetics (emphasis on basic concepts) and ecological genetics (more emphasis on evolutionary and ecological processes of adaptation and speciation).

**Objective**
The aim of the course is to provide students with a solid introduction to the fields of population genetics, quantitative genetics, and ecological genetics. The concepts and research methods developed in these fields have undergone profound transformations; they are of fundamental importance in our understanding of evolutionary processes, both past and present. Students should gain an appreciation for the concepts, methods and explanatory power of evolutionary genetics.

**Content**
Population genetics - Types and sources of genetic variation; randomly mating populations and the Hardy-Weinberg equilibrium; effects of inbreeding, natural selection; random genetic drift and effective population size; gene flow and hierarchical population structure; molecular population genetics: neutral theory of molecular evolution and basics of coalescent theory.

**Techniques and Technologies**
Quantitative genetics - Continuous variation; measurement of quant. characters; genes, environments and their interactions; measuring their influence; response to selection; inbreeding and crossingbreeding, effects on fitness; Fisher's fundamental theorem.

**Literature**

#### 529-0731-00L Nucleic Acids and Carbohydrates

**Abstract**
Structure, function and chemistry of nucleic acids and carbohydrates, DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymers and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines.

**Notice**
For BSc Biology students: Only one of the two concept courses 529-0731-00 Nucleic Acids and Carbohydrates (autumn semester) or 529-0732-00 Proteins and Lipids (spring semester) can be counted for the Bachelor's degree.

Data: 06.08.2024 12:40
Autumn Semester 2024
Page 339 of 2684
Objective

Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines

Content

Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines

Lecture notes

No script; illustrations from the original literature relevant to the individual lectures will be provided weekly (typically as handouts downloadable from the Moodle server).

Literature

Mainly based on original literature, a detailed list will be distributed during the lecture

551-1299-00L Bioinformatics

W 6 credits 4G Sunagawa, S., Beltrao, P., Boeva, A., Kahles, C., von Mering, N., Zamboni

Abstract

Students will study bioinformatic concepts in the areas of metagenomics, genomics, transcriptomics, proteomics, biological networks and biostatistics. Through integrated lectures, practical hands-on exercises and project work, students will also be trained in analytical and programming skills to meet the emerging increase in data-driven knowledge generation in biology in the 21st century.

Objective

Students will have an advanced understanding of the underlying concepts behind modern bioinformatic analyses at genome, metagenome and proteome-wide scales. They will be familiar with the most common data types, where to access them, and how to analytically work with them to address contemporary questions in the field of biology.

Prerequisites / notice

Course participants have already acquired basic programming skills in UNIX, Python and R.

| 551-1153-00L | Systems Biology of Metabolism Number of participants limited to 15. | W | 4    | 2V | S. Sunagawa, N. Zamboni |
| Abstract | Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts. | | | |
| Objective | Develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology. | | | |
| Content | The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics. For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics. | | | |
| Lecture notes | Script and original publications will be supplied during the course. | | | |
| Prerequisites / notice | The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry. | | | |

| 751-4504-00L | Plant Pathology I | W | 2    | 2G | B. McDonald |
| | | | | |
Abstract
Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems.

Objective
Students will understand: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems as a basis for implementing disease management strategies in agroecosystems.

Content
Course description: Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies.

Lecture Topics and Tentative Schedule
Week 1
The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrofrrophs, disease cycles and pathogen life cycles.

Week 2
Nematode attack strategies and types of damage. Viral pathogens, classification, reproduction and transmission, attack strategies and types of damage. Examples TMV, BYDV. Bacterial pathogens and phytoplasmas, classification, reproduction and transmission.

Week 3
Bacterial attack strategies and symptoms. Example bacterial diseases: fire blight, Agrobacterium crown gall, soft rots. Fungal and oomycete pathogens, classification, growth and reproduction, sexual and asexual spores, transmission.

Week 4
Fungal and oomycete life cycles, disease cycles, infection processes, colonization, phytotoxins and mycotoxins. Attack strategies of fungal necrofrrophs and biotrophs. Symptoms and signs of fungal infection. Example fungal diseases: potato late blight.

Week 5
Example fungal diseases: wheat stem rust, grape powdery mildew, wheat septoria triticí blotch. Plant defense mechanisms, host range and non-host resistance. Passive structural and chemical defenses, preformed chemical defenses. Active structural defense, histological and cellular (papillae).

Week 6
Active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytoalexins and disease resistance. Pisatin and pisatin demethylase. Local and systemic acquired resistance (LAR, SAR), induced systemic resistance (ISR), signal molecules, defense activators (Bion). Pathogen effects on food quality. Positive and negative transformations.

Week 7

Week 8
Epidemiology: Disease pyramid, environmental effects on epidemic development, plant effects on development of epidemics, including resistance, physiology, density, uniformity.

Week 9
Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity. Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies, ELISA.

Week 10
Molecular detection and diagnosis of pathogens: PCR, rDNA and loop-mediated isothermal amplification. Strategies for minimizing disease risks: calculating disease thresholds, disease forecasting systems.

Week 11

Week 12

Week 13
Cultural control methods: fertilizers, crop rotations.

Week 14
Open lecture.

Lecture Notes
Detailed lecture notes (~160 pages) will be available for purchase at the cost of reproduction at the start of the semester.

Competencies
Subject-specific Competencies
Concepts and Theories
Techniques and Technologies

551-1407-00L
RNA Biology Lecture Series I: Transcription & Processing & Translation
W 4 credits 2V F. Allain, U. Kutay, further lecturers

Abstract
This course covers aspects of RNA biology related to gene expression at the posttranscriptional level. These include RNA transcription, processing, alternative splicing, editing, export and translation.

Objective
The students should obtain an understanding of these processes, which are at work during gene expression.

Content
Transcription & 3'end formation; splicing, alternative splicing, RNA editing; the ribosome & translation, translation regulation, RNP biogenesis & nuclear export, mRNA surveillance & mRNA turnover; signal transduction & RNA.

551-1409-00L
RNA Biology Lecture Series II: Non-Coding RNAs: Biology and Therapeutics
W 4 credits 2V J. Hall, M. Stoffel, further lecturers

Abstract
This course covers aspects of RNA biology related to the functions of non-coding RNAs as well as their use as drugs to treat diseases. The students should get familiar with the wide array of roles, which non-coding RNAs play in cellular functions.

Objective
Micro RNAs: computational approaches to miRNAs; micro RNA function in metabolism; viruses and viral RNAs: nucleic acid-based drugs; ncRNA-mediated genome regulation; epigenetic programming of genome remodelling in ciliates; telomerase and telomeres; RNA biology.

Prerequisites / notice
Basic knowledge of cell and molecular biology.

529-0733-02L
Chemical Biology and Synthetic Biochemistry
W 6 credits 3G K. Lang, M. Fottner

Abstract
Overview of modern chemical biology and synthetic biochemistry techniques, focussed on protein modification and labeling and on methods to endow proteins with novel functionalities.
Objective
After taking this course, students should be capable of the following: A) Recall different possibilities for modifying proteins in vitro and in vivo and their applications in a biological context, B) Understand the chemical and biochemical consequences of modifications and assess the different reaction possibilities in the context of in vivo - in vitro, C) Critically analyze and assess current chemical biology articles D) Question the approaches learned and apply them to new biological problems.

Content
principles of protein labeling and protein modification (fluorescent proteins, enzyme-mediated labeling, bioorthogonal chemistries)
advanced gene code expansion methods (amber suppression, orthogonal ribosomes, unnatural base pairs, genome engineering and genome editing)
directed evolution and protein engineering

chemical biology of ubiquitin and targeted protein degradation

Lecture notes
A script will not be handed out. Handouts to the lecture will be provided through moodle.

Literature
Citations from the original literature relevant to the individual lectures will be assigned during the lectures.

Prerequisites / notice
Knowledge provided in the bachelor lectures 'Nucleic Acids and Carbohydrates' and 'Proteins and Lipids' is assumed for this lecture.

636-0017-00L Computational Biology  W  6 credits  3G+2A  T. Vaughan, C. Magnus, T. Stadler

Abstract
The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Computational algorithms extracting biological information from genetic sequence data are discussed, and statistical tools to understand this information in detail are introduced.

Objective
Attendees will learn which information is contained in genetic sequencing data and how to extract information from this data using computational tools. The main concepts introduced are:
* stochastic models in molecular evolution
* phylogenetic & phylodynamic inference
* maximum likelihood and Bayesian statistics

Attendees will apply these concepts to a number of applications yielding biological insight into:
* epidemiology
* pathogen evolution
* macroevolution of species

Content
The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods for direct alignment analysis using approaches such as BLAST and GWAS. Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. Lastly, we introduce the field of phylodynamics, the aim of which is to understand and quantify population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

Lecture notes
Lecture slides will be available on moodle.

Literature
The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:
* Yang, Z. 2006. Computational Molecular Evolution.
* Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.

Prerequisites / notice
Basic knowledge in linear algebra, analysis, and statistics will be helpful. Programming in R will be required for the project work (compulsory continuous performance assessments). In case you do not have any previous experience with R, we strongly recommend to get familiar with R prior to the semester start. For the D-BSSE students, we highly recommend the voluntary course „Introduction to Programming“, which takes place in Basel before the start of the semester.

401-6215-00L Using R for Data Analysis and Graphics (Part I)  W  1.5 credits  1G  A. Hauser

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 342 of 2684
The course provides the first part an introduction to the statistical/graphical/data science software R (https://www.r-project.org/) for scientists. Topics covered are data generation and selection, graphical and basic statistical functions, creating simple functions, basic types of objects.

### Objective
The students will be able to use the software R for simple data analysis and graphics.

### Content
- What is R?
- R Basics: reading and writing data from/to files, creating vectors & matrices, selecting elements of dataframes, vectors and matrices, arithmetics;
- Types of data: numeric, character, logical and categorical data, missing values;
- Simple (statistical) functions: summary, mean, var, etc., simple statistical tests;
- Writing simple functions;
- Introduction to graphics: scatter,- boxplots and other high-level plotting functions, embellishing plots by title, axis labels, etc., adding elements (lines, points) to existing plots.

The course focuses on practical work at the computer with R. We will make use of the graphical user interface RStudio: https://rstudio.org

### Lecture notes
An Introduction to R: http://stat.ethz.ch/Rcran/doc/contrib/Lam-IntroductionToR_LHL.pdf

### Prerequisites / notice
The course resources will be provided via the Moodle web learning platform. Subscribing via Mystudies "automatically" makes you a student participant of the Moodle course of this lecture, which is at https://moodle-app2.let.ethz.ch/course/view.php?id=20847

### Competencies
#### Subject-specific Competencies

#### Social Competencies
- Cooperation and Teamwork fostered

#### Personal Competencies
- Creative Thinking assessed

### 401-06217-00L Using R for Data Analysis and Graphics (Part II) W 1.5 credits 1G M. Mächler

**Abstract**
The course provides the second part an introduction to the statistical software R for scientists. Topics are data generation and selection, graphical programming, important statistical functions, types of objects, models, programming and writing functions.

**Objective**
The students will be able to use the software R efficiently for data analysis, graphics and simple programming

The course focuses on practical work at the computer with R. We will make use of the graphical user interface RStudio: https://rstudio.org

**Lecture notes**
An Introduction to R. http://stat.ethz.ch/Rcran/doc/contrib/Lam-IntroductionToR_LHL.pdf

**Prerequisites / notice**
Basic knowledge of R equivalent to "Using R... (Part I)" (= 401-6215-00L) is a prerequisite for this course.

**Competencies**
#### Subject-specific Competencies
- Concepts and Theories assessed
- Techniques and Technologies assessed

#### Method-specific Competencies
- Analytical Competencies assessed
- Decision-making fostered
- Media and Digital Technologies assessed
- Problem-solving assessed

#### Social Competencies
- Communication fostered

#### Personal Competencies
- Cooperation and Teamwork fostered
- Adaptable and Flexible assessed
- Critical Thinking fostered
- Self-direction and Self-management fostered

### 401-0649-00L Applied Statistical Regression W 5 credits 2V+1U M. Dettling

**Abstract**
This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning "good practice" that can be applied in every student's own projects and daily work life. A special focus will be laid in the use of the statistical software package R for regression analysis.

**Objective**
The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.
Content

The course starts with the basics of linear modeling, and then proceeds to parameter estimation, tests, confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, multicollinearity problems and model interpretation, as well as general modeling strategies.

The last third of the course is dedicated to an introduction to generalized linear models: this includes the generalized additive model, logistic regression for binary response variables, binomial regression for grouped data and poisson regression for count data.

Lecture notes

A script will be available.

Literature

Faraway (2005): Linear Models with R
Faraway (2006): Extending the Linear Model with R
Draper & Smith (1998): Applied Regression Analysis
Fox (2008): Applied Regression Analysis and GLMs
Montgomery et al. (2006): Introduction to Linear Regression Analysis

Prerequisites / notice

The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L “Applied Statistical Regression” and 401-3622-00L “Statistical Modelling” are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

751-4104-00L Alternative Crops

Number Title Type ECTS Hours Lecturers
551-0575-00L Writing Scientific Reports for MSc Biology W 2 credits 2V A. Walter, K. Berger Büter

Abstract

This short course is designed to accompany MSc students in writing their first reports in English, providing input on scientific writing in English as well as feedback on drafts sections of the report.

Objective

Students will learn to:
- Plan, draft, structure, and edit scientific reports
- Produce reader-friendly sentences
- Establish a clear and logical flow between sentences and paragraphs
- Select formal vocabulary and use it in a generally accurate and correct manner
- Choose and use generally suitable grammatical structures, punctuation, and identify areas in which further development is needed

Content

The course covers the process of writing reports in biology, helping students to focus on the language and communicative aspects of these reports. Topics covered include structuring sentences, paragraphs, and longer sections (introductions, methods, etc.); presenting and integrating non-textual elements such as graphs and tables; reviewing common grammar problems for advanced writers in English; and editing drafts and proofs. Sessions will consist of a mix of specialist input, group and pair work, and editing sessions.

Students who attend this course will turn in three sections of a report (approx. 500 words each) for feedback, revising these texts for a final portfolio that is graded.
The concept course 'Evolutionary Genetics' consists of two lectures that jointly provide an introduction to the fields of population and quantitative genetics (emphasis on basic concepts) and ecological genetics (more emphasis on evolutionary and ecological processes of adaptation and speciation).

**Objective**
The aim of the course is to provide students with a solid introduction to the fields of population genetics, quantitative genetics, and ecological genetics. The concepts and research methods developed in these fields have undergone profound transformations; they are of fundamental importance in our understanding of evolutionary processes, both past and present. Students should gain an appreciation for the concepts, methods and explanatory power of evolutionary genetics.

**Content**
Population genetics - Types and sources of genetic variation; randomly mating populations and the Hardy-Weinberg equilibrium; effects of inbreeding; natural selection; random genetic drift and effective population size; gene flow and hierarchical population structure; molecular population genetics: neutral theory of molecular evolution and basics of coalescent theory.

Quantitative genetics - Continuous variation; measurement of quant. characters; genes, environments and their interactions; measuring their influence; response to selection; inbreeding and crossbreeding, effects on fitness; Fisher's fundamental theorem.

Ecological Genetics - Concepts and methods for the study of genetic variation and its role in adaptation, reproductive isolation, hybridization and speciation.

**Abstract**
In this research seminar we will critically discuss recent publications on current topics in Ecological Genetics.

**Objective**
It is our aim that participants gain insight into current research topics and approaches in Ecological Genetics and learn to critically assess and appreciate scientific publications in this field.

**Lecture notes**
None

**Literature**
Selected required readings (peer reviewed literature). Optional recommended readings with additional information.

**Competencies**
- **Subject-specific Competencies**
  - Concepts and Theories
  - Communication
  - Cooperation and Teamwork
- **Personal Competencies**
  - Critical Thinking

**Prerequisites / notice**
Active and regular participation in the discussions, together with the presentation of a scientific paper are required to successfully pass this course.

It is strongly recommended that participants have in advance successfully participated in the course Evolutionary Genetics (701-2413-00) or Ecological Genetics (701-1413-01).

---

**Abstract**
This is an introductory class on insect ecology. During the course you will learn about insect interactions with, and adaptations to, their environment and other organisms, and the importance of insect roles in our ecosystems. This course includes in-person lectures, small group discussions and outside readings.

**Objective**
The aim of the course is for you to be able to describe examples of insect interactions and evaluate their impact on broader ecosystems. Important topics include: insect-plant interactions, chemical ecology, predator-prey interactions, vectors of disease, social insects, mutual and parasitic interactions, and examining insect ecology in an evolutionary context.

**Lecture notes**
Provided to students through Moodle

**Literature**
Selected required readings (peer reviewed literature). Optional recommended readings with additional information.

This course provides the ecological systems’ knowledge needed to question applied solutions to current environmental issues. Our central aim is to balance participants’ respect for complexity with a sense of possibility by providing examples from the vast solution space offered by ecological systems, such as e.g. green infrastructure to manage water.

At the end of the course...
- ...you know how to structure your inquiry and how to proceed the analysis when faced with a complex environmental issue. You can formulate the relevant questions, find answers (supported by discussions, input from the lecturers and the literature), and you are able to present your conclusions clearly and cautiously.
- ...you understand the complexity of interactions and structures in ecosystems. You know how ecosystem processes, functions and services interact and feed back across multiple spatio-temporal scales (in general, plus in depth case examples).
- ...you understand that biodiversity and the interaction between organisms are an integral part of ecosystems. You are aware that the link between biodiversity and process/function/service is rarely fully understood. You know how to honestly deal with this lack of understanding and can nevertheless find, critically analyse and communicate solutions.
- ...you understand the importance of ecosystem services for society.
- ...you have an overview of the methods of ecosystem research and have a deeper insight into some of them, e.g. ecosystem observation, manipulation and modelling.
- ...you have reflected on ecology as a young discipline at the heart of significant applied questions.

This course provides the ecological systems’ knowledge needed to question applied sustainability solutions. We will critically assess the complexity of current environmental issues, illustrating basic ecological concepts and principles. Our central aim is to balance participants’ respect for complexity with a sense of possibility by providing examples from the vast solution space offered by ecological systems, such as e.g. green infrastructure to manage water.

The course is structured around four larger topical areas: (1) Integrated Water Management -- Green infrastructure (land management options) as an alternative to engineered solutions (e.g. large reservoirs) in flood and drought management; (2) Fire dynamics, the water cycle and biodiversity -- The surprising dynamics of species life cycles and populations in arid landscapes; (3) Rewilding, e.g. re-introducing apex predators (e.g. wolves), or large ungulates (e.g. bisons) in protected areas -- A nature conservation trend with counterintuitive effects; (4) Coupling of aquatic and terrestrial systems: carbon, nitrogen and phosphorus transfers of global importance on landscape scale.

Case descriptions, commented glossary and a list of literature and further resources per case.
### Concepts and Theories

The course combines elements of a classic lecture, group discussions and problem based learning. It is helpful, but not essential to be familiar with the "seven stages" method (see e.g. course 701-0352-00L "Analysis and Assessment of Environmental Sustainability" by Christian Pohl et al.).

Abstract

Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Concepts and Theories

Objective

Students will understand: 1) how pathogens attack plants; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems as a basis for implementing disease management strategies in agroecosystems.

Content

Course description: Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies.

Lecture Topics and Tentative Schedule

Week 1  The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrotrophs, disease cycles and pathogen life cycles.

Week 2  Nematode attack strategies and types of damage. Viral pathogens, classification, reproduction and transmission, attack strategies and types of damage. Examples TMV, BYDV. Bacterial pathogens and phytoplasmas, classification, reproduction and transmission.

Week 3  Bacterial attack strategies and symptoms. Example bacterial diseases: fire blight, Agrobacterium crown gall, soft rots. Fungal and oomycete pathogens, classification, growth and reproduction, sexual and asexual spores, transmission.

Week 4  Fungal and oomycete life cycles, disease cycles, infection processes, colonization, phytoxins and mycotoxins. Attack strategies of fungal necrotrophs and biotrophs. Symptoms and signs of fungal infection. Example fungal diseases: potato late blight.

Week 5  Example fungal diseases: wheat stem rust, grape powdery mildew, wheat septoria tritici blotch. Plant defense mechanisms, host range and non-host resistance. Passive structural and chemical defenses, preformed chemical defenses. Active structural defense, histological and cellular (papillae).

Week 6  Active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytoalexins and disease resistance. Pisatin and pisatin demethylase. Local and systemic acquired resistance (LAR, SAR), induced systemic resistance (ISR), signal molecules, defense activators (Bion). Pathogen effects on food quality. Positive and negative transformations.

Week 8  Epidemiology: Disease pyramid, environmental effects on epidemic development, plant effects on development of epidemics, including resistance, physiology, density, uniformity.

Week 9  Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity. Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies, ELISA.

Week 10  Molecular detection and diagnosis of pathogens: PCR, rDNA and loop-mediated isothermal amplification. Strategies for minimizing disease risks: calculating disease thresholds, disease forecasting systems.

Week 12  Physical control methods. Cultural control methods: avoidance, tillage practices, crop sanitation.

Week 13  Cultural control methods: fertilizers, crop rotations.

Week 14  Open lecture.

Competencies

Subject-specific Competencies  Concepts and Theories  Techniques and Technologies

636-0017-00L Computational Biology 6 credits  3Gi2A  T. Vaughan, C. Magnus, T. Stadler

Abstract

The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Attendees will learn which information is contained in genetic sequencing data and how to extract information from this data using computational tools. The main concepts introduced are:

- stochastic models in molecular evolution
- phylogenetic & phylogenetic inference
- maximum likelihood and Bayesian statistics
- epidemiology
- pathogen evolution
- macroevolution of species

Objective

Attendees will apply these concepts to a number of applications yielding biological insight into:

- computational tools: fertilizers, crop rotations.

Content

The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods for direct alignment analysis using approaches such as BLAST and GWAS. Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. Lastly, we introduce the field of phylodynamics, the aim of which is to understand and quantify population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

Lecture notes

Lecture slides will be available on moodle.
The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:

* Yang, Z. 2006. Computational Molecular Evolution.
* Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.

Prerequisites / notice

Basic knowledge in linear algebra, analysis, and statistics will be helpful. Programming in R will be required for the project work (compulsory continuous performance assessments). In case you do not have any previous experience with R, we strongly recommend to get familiar with R prior to the semester start. For the D-BSSE students, we highly recommend the voluntary course „Introduction to Programming“, which takes place in Basel before the start of the semester.

Competencies

Subject-specific Competencies

- Concepts and Theories: assessed

701-1471-00L Ecological Parasitology

W 3 credits 1V+1P F. Feijen, J. Jokela, C. Vorburger

Abstract

Does not take place this semester.

The course will not take place fall semester 2024.

Course focuses on the ecology and evolution of macroparasites and their hosts. Through lectures and practical work, students learn about diversity and natural history of parasites, adaptations of parasites, ecology of host-parasite interactions, applied parasitology, and human macroparasites in the modern world.

Objective

1. Identify common macroparasites in invertebrates.
2. Understand ecological and evolutionary processes in host-parasite interactions.
3. Conduct parasitological research

Content

Lectures:
1. Diversity and natural history of parasites (i.e. systematic groups and life-cycles).
2. Adaptations of parasites (e.g. evolution of life-cycles, host manipulation).
3. Ecology of host-parasite interactions (e.g. parasite communities, effects of environmental changes).
4. Ecology and evolution of parasitoids and their applications in biocontrol
5. Human macroparasites (schistosomiasis, malaria).

Practical exercises:
1. Examination of parasites in molluscs (identification and examination of host exploitation strategies).
2. Examination of parasites in amphipods (identification and examination of effects on hosts).
3. Examination of parasitoids of aphids.

Competencies

- Concepts and Theories: assessed
- Techniques and Technologies: assessed

Method-specific Competencies

- Analytical Competencies: assessed
- Decision-making: assessed
- Media and Digital Technologies: assessed
- Problem-solving: assessed
- Project Management: assessed

Social Competencies

- Communication: assessed
- Cooperation and Teamwork: assessed
- Leadership and Responsibility: fostered
- Self-presentation and Social Influence: fostered
- Sensitivity to Diversity: fostered
- Negotiation: fostered

Personal Competencies

- Adaptability and Flexibility: fostered
- Creative Thinking: assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: fostered
- Self-awareness and Self-reflection: fostered
- Self-direction and Self-management: assessed

701-1703-00L Evolutionary Medicine for Infectious Diseases

W 3 credits 2G A. Hall

Abstract

This course explores infectious disease from both the host and pathogen perspective. Through short lectures, reading and active discussion, students will identify areas where evolutionary thinking can improve our understanding of infectious diseases and, ultimately, our ability to treat them effectively.

Objective

Students will learn to (i) identify evolutionary explanations for the origins and characteristics of infectious diseases in a range of organisms and (ii) evaluate ways of integrating evolutionary thinking into improved strategies for treating infections of humans and animals. This will incorporate principles that apply across any host-pathogen interaction, as well as system-specific mechanistic information, with particular emphasis on bacteria and viruses.

Content

We will cover several topics where evolutionary thinking is relevant to understanding or treating infectious diseases. This includes: (i) determinants of pathogen host range and virulence, (ii) dynamics of host-parasite coevolution, (iii) pathogen adaptation to evade or suppress immune responses, (iv) antimicrobial resistance, (v) evolution-proof medicine. For each topic there will be a short (~20 minutes) introductory lecture, before students independently research the primary literature and develop discussion points and questions, followed by interactive discussion in class.

Literature

The focus is on primary literature, but for some parts the following text books provide good background information:

- Schmid Hempel 2011 Evolutionary Parasitology
- Stearns & Medzhitov 2016 Evolutionary Medicine

Prerequisites / notice

A basic understanding of evolutionary biology, microbiology or parasitology will be advantageous but is not essential.

**636-0009-00L**  
**Evolutionary Dynamics**  
W 6 credits 2V+1U+2A N. Beerenwinkel

**Abstract**  
Evolutionary dynamics is concerned with the mathematical principles according to which life has evolved. This course offers an introduction to mathematical modeling of evolution, including deterministic and stochastic models, with an emphasis on tumor evolution.

**Objective**  
The goal of this course is to understand and to appreciate mathematical models and computational methods that provide insight into the evolutionary process in general and tumor evolution in particular. Students should analyze and evaluate models and their application critically and be able to design new models.

**Content**  
Evolution is the one theory that encompasses all of biology. It provides a single, unifying concept to understand the living systems that we observe today. We will introduce several types of mathematical models of evolution to describe gene frequency changes over time in the context of different biological systems, focusing on sexual populations. Viruses and cancer cells provide the most prominent examples of such systems and they are at the same time of great biomedical interest. The course will cover some classical mathematical population genetics and population dynamics, and also introduce several new approaches. This is reflected in a diverse set of mathematical concepts which make their appearance throughout the course, all of which are introduced from scratch. Topics covered include the quasispecies equation, evolution of HIV, evolutionary game theory, evolutionary stability, evolutionary graph theory, tumor evolution, stochastic tunneling, genetic progression of cancer, diffusion theory, fitness landscapes, branching processes, and evolutionary escape.

**Lecture notes**  
No.

**Literature**  

**Prerequisites / notice**  
Prerequisites: Basic mathematics (linear algebra, calculus, probability)

**701-0328-00L**  
**Advanced Ecological Processes**  
W 4 credits 2V J. Hille Ris Lambers

**Abstract**  
This course presents a broad overview of the key processes structuring ecological populations and communities, with a particular focus on understanding and managing global change impacts.

**Objective**  
In this course, students will develop an integrated knowledge of how ecological theory can help us understand and manage ecological responses to global change. Specifically, the course goals are to:

- Introduce students to the major ecological processes that together shape the composition and abundance of species within ecological communities.
- Provide insight to students on the ecological impacts of anthropogenic change, and how an understanding of ecological processes can help us predict these ecological impacts and design conservation / restoration actions to mitigate their negative impacts.
- Teach students to critically summarize and analyze primary ecological literature, understanding how ecological studies contribute to our knowledge, how to critically evaluate their strengths and weaknesses, and practice designing follow up studies.

**LEARNING OBJECTIVES**  
The learning objectives follow from the course goals. After attending this course, students should be able to:

- Describe key processes affecting the size of populations and abundance of species within ecological communities.
- Critically evaluate evidence and conclusions presented in primary ecological literature based on your understanding of these ecological processes.
- Apply knowledge of ecological processes to make predictions about the major responses of ecological communities to anthropogenic perturbations.

**Content**  
We will explore how ecological theories can provide insight into the effects of anthropogenic change as well as guide management to undo undesired impacts. Collectively, this requires us to focus on classic problems in ecology (for examples, competitive coexistence, top-down impacts of predators, diversity-ecosystem function relationships, the role of dispersal in spread).

The course is taught in a flipped format. Generally (with the exception of a few weeks), there will be online materials for students to watch or read during the first hour of class (lecture videos, readings), and the class will meet in person for the second half of class. The in person portions of the class will have students participate in activities to learn the content, including paper discussions, groupwork, and presentations. Students are also required to submit a written assignment.

**Lecture notes**  
All course materials (videos, lecture notes, primary literature) will be provided on the course moodle.

**752-5500-00L**  
**Applied Bioinformatics: Microbiomes**  
W 5 credits 2V+2U N. Bokulich, A. Lavrinienko, M. Ziemski

**Abstract**  
Learn to apply practical bioinformatics/computational skills for analysis of microbiomes in foods and human health! Students will apply basic programming skills for scientific computing and bioinformatics, and learn and discuss the importance of microbiomes to foods and human health, through recognition and comparison of ecological theory, methodology, and experimental design across systems.
Objective

Learn to apply bioinformatics and computational methods for analysis of microbiome next-generation sequencing data. A secondary goal is to critically examine the relevance of microbiomes to food quality, safety, and human health, through application of theory and appropriate experimental design. Students completing this course will thus be able to both apply appropriate methodology to study microbiomes (or other high-dimensional data) in different systems, as well as evaluate and interpret bioinformatics results.

Content

1. Introduction to microbiomes and microbial bioinformatics toolkit. Python, Pandas, Jupyter, GitHub, visualization libraries for Python.
3. Microbial diversity, function, and ecology. Molecular ecology; diversity metrics, ordination methods.

This course requires extensive engagement in learning outside of the classroom (using online resources and practical exercises), with a focus on active learning in the classroom.

Prerequisites / notice
No specific pre-requisites, but students should have some familiarity with microbiology, molecular biology, programming (Python), bioinformatics, and statistics.

Students will bring and work on their own laptop computers.

All software used in the course is free and open-source.

Objective: This short course is designed to accompany MSc students in writing their first reports in English, providing input on scientific writing in English as well as feedback on drafts sections of the report.

Content: The course covers the process of writing reports in biology, helping students to focus on the language and communicative aspects of these reports. Topics covered include structuring sentences, paragraphs, and longer sections (introductions, methods, etc.); presenting and integrating non-textual elements such as graphs and tables; reviewing common grammar problems for advanced writers in English; and editing drafts and proofs. Sessions will consist of a mix of specialist input, group and pair work, and editing sessions.

Prerequisites / notice: Students who attend this course will turn in three sections of a report (approx. 500 words each) for feedback, revising these texts for a final portfolio that is graded.

</tbody>
</table>

Objective: Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

Content: The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

Techniques and Technologies

- Choose and use generally suitable grammatical structures, punctuation, and identify areas in which further development is needed
- Select formal vocabulary and use it in a generally accurate and correct manner
- Establish a clear and logical flow between sentences and paragraphs
- Produce reader-friendly sentences

Social Competencies
- Communication
- Cooperation and Teamwork

Personal Competencies

Elective Compulsory Master Courses I: Computation

Number Title Type ECTS Hours Lecturers
636-0007-00L Computational Systems Biology W 6 credits 3V+2U J. Stelling

Abstract
Study of fundamental concepts, models and computational methods for the analysis of complex biological networks. Topics: Systems approaches in biology, biology and reaction network fundamentals, modeling and simulation approaches (topological, probabilistic, stoichiometric, qualitative, linear / nonlinear ODEs, stochastic), and systems analysis (complexity reduction, stability, identification).

Objective
The aim of this course is to provide an introductory overview of mathematical and computational methods for the modeling, simulation and analysis of biological networks.
Content

Biology has witnessed an unprecedented increase in experimental data and, correspondingly, an increased need for computational methods to analyze this data. The explosion of sequenced genomes, and subsequently, of bioinformatics methods for the storage, analysis and comparison of genetic sequences provides a prominent example. Recently, however, an additional area of research, captured by the label "Systems Biology", focuses on how networks, which are more than the mere sum of their parts' properties, establish biological functions. This is essentially a task of reverse engineering. The aim of this course is to provide an introductory overview of corresponding computational methods for the modeling, simulation and analysis of biological networks.

We will start with an introduction into the basic units, functions and design principles that are relevant for biology at the level of individual cells. Making extensive use of example systems, the course will then focus on methods and algorithms that allow for the investigation of biological networks with increasing detail. These include (i) graph theoretical approaches for revealing large-scale network organization, (ii) probabilistic (Bayesian) network representations, (iii) structural network analysis based on reaction stoichiometries, (iv) qualitative methods for dynamic modeling and simulation (Boolean and piece-wise linear approaches), (v) mechanistic modeling using ordinary differential equations (ODEs) and finally (vi) stochastic simulation methods.

Lecture notes

http://www.csb.ethz.ch/education/lectures.html

636-0706-00L Spatio-Temporal Modelling in Biology W 4 credits 3G D. Iber

Abstract

This course focuses on modeling spatio-temporal problems in biology, in particular on the cell and tissue level. The main focus is on mechanisms and concepts, but mathematical and numerical techniques are introduced as required. Biological examples discussed in the course provide an introduction to key concepts in developmental biology.

Objective

Students will learn state-of-the-art approaches to modelling spatial effects in dynamical biological systems. The course provides an introduction to dynamical system, and covers the mathematical analysis of pattern formation in growing, developing systems, as well as the description of mechanical effects at the cell and tissue level. The course also provides an introduction to image-based modelling, i.e. the use of microscopy data for model development and testing. The course covers classic as well as current approaches and exposes students to open problems in the field. In this way, the course seeks to prepare students to conduct research in the field. The course prepares students for research in developmental biology, as well as for applications in tissue engineering, and for biomedical research.

Content

1. Introduction to Modelling in Biology
2. Bioimage Analysis
3. Morphogen Gradients
4. Precision & Robustness of Patternning
5. Mathematical Description of Growing Biological Systems
6. Travelling Waves & Wave Pinning
7. Turing Patterns
8. Chemotaxis
9. Epithelial Organisation
10. Tissue Simulation Frameworks
11. Tissue Mechanics & Fluid Dynamics
12. Growth Control
13. Image-Based Modelling
14. Summary

Lecture notes

All lecture material will be made available online via Moodle.

Literature

The lecture course is not based on any textbook. The following textbooks are related to some of its content. The textbooks may be of interest for further reading, but are not necessary to follow the course:

Murray, Mathematical Biology, Springer
Forogics and Newman, Biological Physics of the Developing Embryo, CUP
Keener and Sneyd, Mathematical Physiology, Springer
Fall et al, Computational Cell Biology, Springer
Szallasi et al, System Modeling in Cellular Biology, MIT Press
Wolkenhauer, Systems Biology
Kreyszig, Engineering Mathematics, Wiley

Prerequisites / notice

The course is self-contained. The course assumes no background in biology but a good foundation regarding mathematical and computational techniques.

Autumn Semester 2024

ECTS: 4

Number

551-1153-00L

Title

Systems Biology of Metabolism

Number of participants limited to 15.

Abstract

Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.

Objective

Develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology.

Content

The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics. For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolomic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

Lecture notes

Script and original publications will be supplied during the course.

Prerequisites / notice

From DNA to Diversity: the Evolution of Multicellular Organisms (University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: BIO336

Mind the enrolment deadlines at UZH: https://www.uzh.ch/cmsssl/en/studies/application/deadline.html

Abstract

The evolution of the various body-plans is investigated by means of comparison of developmentally essential control genes of molecularly analysed model organisms.
Objective
By the end of this module, each student should be able to
- recognize the universal principles underlying the development of
different animal body plans.
- explain how the genes encoding the molecular toolkit have evolved
to create animal diversity.
- relate changes in gene structure or function to evolutionary
changes in animal development.

Key skills:
By the end of this module, each student should be able to
- present and discuss a relevant evolutionary topic in an oral
presentation
- select and integrate key concepts in animal evolution from
primary literature
- participate in discussions on topics presented by others

Objective of this course is to show that biological phenomena despite their variety can be analytically described using only two principles from statistical mechanics: maximization of the entropy and minimization of the Gibbs free energy.

Starting point of the course is the probability theory, which enables to derive step-by-step the two pillars of thermodynamics from the perspective of statistical mechanics: the maximization of entropy according to the Boltzmann's law as well as the minimization of the Gibbs free energy. Then, an assortment of biological phenomena at the molecular and cellular level (e.g. cytoskeletal polymerization, action potential, photosynthesis, gene regulation, morphogen patterning) will be examined at the light of these two principles with the aim to derive a quantitative expression describing their behavior. Each analytical model is finally validated by comparing it with the corresponding experimental results from the literature.

By the end of the course, students will also learn to critically evaluate the concepts of making an assumption and making an approximation.

Content
- Basics of theory of probability
- Boltzmann's law
- Entropy maximization and Gibbs free energy minimization
- Ligand-receptor: two-state systems and the MWC model
- Random walks, diffusion, crowding
- Electrostatics for salty solutions
- Elasticity: fibers and membranes
- Molecular motors
- Action potential: Hodgkin-Huxley model
- Photosynthesis and vision
- Gene regulation
- Development: Turing patterns

Lecture notes
No lecture notes because the two proposed textbooks are more than exhaustive!

I am willingly available Mondays 17.00 o'clock - 18.00 in my office GLC F12.2 for whatever discussion about the lessons and the exercises.

!!! I am using OneNote. All lectures will be broadcast via ZOOM, while corresponding videos of the previous years (lectures and exercises) are available in Moodle !!!
Literature

As further deepening:

Prerequisites / notice

Participants need a good command of
- differentiation and integration of a function with one or more variables (basics of Analysis),
- Newton's and Coulomb's laws (basics of Mechanics and Electrostatics).

Notions of vectors in 2D and 3D are beneficial.

Abstract

This short course is designed to accompany MSc students in writing their first reports in English, providing input on scientific writing in English as well as feedback on drafts sections of the report.

Objective

Students will learn to:
- Plan, draft, structure, and edit scientific reports
- Produce reader-friendly sentences
- Establish a clear and logical flow between sentences and paragraphs
- Select formal vocabulary and use it in a generally accurate and correct manner
- Choose and use generally suitable grammatical structures, punctuation, and identify areas in which further development is needed

Content

The course covers the process of writing reports in biology, helping students to focus on the language and communicative aspects of these reports. Topics covered include structuring sentences, paragraphs, and longer sections (introductions, methods, etc.); presenting and integrating non-textual elements such as graphs and tables; reviewing common grammar problems for advanced writers in English; and editing drafts and proofs. Sessions will consist of a mix of specialist input, group and pair work, and editing sessions.

Students who attend this course will turn in three sections of a report (approx. 500 words each) for feedback, revising these texts for a final portfolio that is graded.

Prerequisites / notice

Participants should be at a stage in their research where they can already start drafting parts of the report.

**Abstract**

- Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

**Objective**

- The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

**Content**

- Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes. Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

**Lecture notes**

- Scripts and additional material will be provided during the semester.

**Competencies**

- Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

**Abstract**

- Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

**Objective**

- This course focuses on the concepts of classical and modern genetics and genomics.

**Content**

- The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

**Lecture notes**

- Scripts and additional material will be provided during the semester.
Objective
Introduction into structural and functional aspects of the immune system.

Basic knowledge of the mechanisms and the regulation of an immune response.

Content
- Introduction and historical background
- Innate and adaptive immunity, Cells and organs of the immune system
- B cells and antibodies
- Generation of diversity
- Antigen presentation and Major Histoincompatibility (MHC) antigens
- Thymus and T cell selection
- Autoimmunity
- Cytotoxic T cells and NK cells
- Th1 and Th2 cells, regulatory T cells
- Allergies
- Hypersensitivities
- Vaccines, immune-therapeutic interventions

Lecture notes
Electronic access to the documentation will be provided. The link can be found at “Lernmaterialien”

Literature
- Kuby, Immunology, 9th edition, Freeman + Co., New York, 2020

Prerequisites / notice
For D-BIOL students Immunology I (WS) and Immunology II (SS) will be examined as one learning entity in a “Sessionsprüfung”. All other students write separate exams for Immunology I and Immunology II. All exams (combined exam Immunology I and II, individual exams) are offered in each exam session.

551-1299-00L Bioinformatics W 6 credits 4G S. Sunagawa, P. Beltrao, V. Boeva, A. Kahles, C. von Mering, N. Zamboni

Abstract
Students will study bioinformatic concepts in the areas of metagenomics, genomics, transcriptomics, proteomics, biological networks and biostatistics. Through integrated lectures, practical hands-on exercises and project work, students will also be trained in analytical and programming skills to meet the emerging increase in data-driven knowledge generation in biology in the 21st century.

Objective
Students will have an advanced understanding of the underlying concepts behind modern bioinformatic analyses at genome, metagenome and proteome-wide scales. They will be familiar with the most common data types, where to access them, and how to analytically work with them to address contemporary questions in the field of biology.

Prerequisites / notice
Course participants have already acquired basic programming skills in UNIX, Python and R.

<td>U. Suter</td>
</tr>
</tbody>
</table>

Abstract
The course is a literature seminar or "journal club". Each Friday a student, or a member of the Suter Lab in the Institute of Molecular Health Sciences, will present a paper from the recent literature.

Objective
The course introduces you to recent developments in the fields of cellular and molecular neurobiology. It also supports you to develop your skills in critically reading the scientific literature. You should be able to grasp what the authors wanted to learn i.e. their goals, why the authors chose the experimental approach they used, the strengths and weaknesses of the experiments and the data presented, and how the work fits into the wider literature in the field. You will present one paper yourself, which provides you with practice in public speaking.

Content
You will present one paper yourself. Give an introduction to the field of the paper, then show and comment on the main results (all the papers we present are available online, so you can show original figures with a beamer). Finish with a summary of the main points and a discussion of their significance.
You are expected to take part in the discussion and to ask questions. To prepare for this you should read all the papers beforehand (they will be announced a week in advance of the presentation).

Lecture notes
Presentations will be made available after the seminars.

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 358 of 2684
Prerequisites / notice
You must attend at least 80% of the journal clubs, and give a presentation of your own. At the end of the semester there will be a 30 minute oral exam on the material presented during the semester. The grade will be based on the exam (45%), your presentation (45%), and a contribution based on your active participation in discussion of other presentations (10%).

551-0571-00L From DNA to Diversity: the Evolution of Multicellular Organisms (University of Zurich)
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.
UZH Module Code: BIO336
Mind the enrolment deadlines at UZH: https://www.uzh.ch/cmsssl/en/studies/application/deadlines.html

Abstract
The evolution of the various body-plans is investigated by means of comparison of developmentally essential control genes of molecularly analysed model organisms.

Objective
By the end of this module, each student should be able to
- recognize the universal principles underlying the development of different animal body plans.
- explain how the genes encoding the molecular toolkit have evolved to create animal diversity.
- relate changes in gene structure or function to evolutionary changes in animal development.

Key skills:
By the end of this module, each student should be able to
- present and discuss a relevant evolutionary topic in an oral presentation
- select and integrate key concepts in animal evolution from primary literature
- participate in discussions on topics presented by others

551-1117-00L Cutting Edge Topics: Immunology and Infection Biology

Information for UZH students:
Enrolment to this course unit only possible at ETH. No enrolment to module BIO636 at UZH.

Please mind the ETH enrolment deadlines for UZH students: https://www.ethz.ch/en/studies/non-degree-courses/special-students-special-students-university-of-zurich.html

Abstract
Weekly seminar about cutting edge topics in immunology and infection biology. Internationally renowned experts present their current research followed by an open discussion.

Objective
Weekly seminar about cutting edge topics in immunology and infection biology. Internationally renowned experts present their current research followed by an open discussion.
The aim of this course is to confront students with current research topics and with scientific presentation. The course offers the opportunity to gain in depth knowledge about diverse topics which are often only briefly touched in the concept courses and to engage in discussion with experts in the field.

Content
Immunology and infection biology.
The specific topics are variable and depend each semester on the list of invited experts.

Lecture notes
Current research data (often not yet published) are presented in this seminar series. There is no script and we are not allowed to record or distribute the contents of the seminars. Thus, the ability of students to extract the most relevant points of each seminar is promoted, which is an important skill for the future attendance of scientific meetings.

Literature
Often parts of the presented seminars have already been published by the respective speakers and the respective primary research can be retrieved from scientific journals.

551-1153-00L Systems Biology of Metabolism

Abstract
Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.

Objective
Develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology.

551-1153-00L Systems Biology of Metabolism

Abstract
Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.

Objective
Develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology.
The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics. For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolite networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

Lecture notes

Script and original publications will be supplied during the course.

The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.

Abstract

Milestones in Immunology: on old concepts and modern experiments

Objective

The course will cover the current grand topics in immunology: B cells, innate immunity, antigen presentation, tumor immunity, T cells, myeloid cells and stromal cells. For each topic two or four hours will be allocated. Historical milestone papers will be presented by the tutor/lecturer providing an overview on the development of the theoretical framework and critical technological advances. The students will read the historical milestone papers and contribute to the discussion. In the second part of the lecture, students will present recent high impact research papers that have emerged from the landmark achievements of the previously discussed milestone concepts.

Content

Milestones and current topics of innate immunity, antigen presentatino, B cells, thymus and T cells, cytotoxic T cells, NK cells, stromal cells, CNS immunity and tumor immunology.

Literature

Lecturer/student presentations according to the schedule. The literature will be provided during the course.

Lecture notes

Original and review articles will be distributed by the respective lecturer.

Prerequisites / notice

Basic knowledge of cell and molecular biology.

Competencies

Subject-specific Competencies

Concepts and Theories

Techniques and Technologies

Method-specific Competencies

Analytical Competencies

Social Competencies

Communication

Personal Competencies

Self-presentation and Social Influence

Self-awareness and Self-reflection

Self-direction and Self-management

Literature

551-1407-00L RNA Biology Lecture Series I: Transcription & Processing & Translation W 4 credits 2V F. Allain, N. Ban, S. Jonas, U. Kutay, further lecturers

Abstract

This course covers aspects of RNA biology related to gene expression at the posttranscriptional level. These include RNA transcription, processing, alternative splicing, editing, export and translation.

Objective

The students should obtain an understanding of these processes, which are at work during gene expression.

Content

Transcription & 3'end formation ; splicing, alternative splicing, RNA editing; the ribosome & translation, translation regulation, RNP biogenesis & nuclear export, mRNA surveillance & mRNA turnover; signal transduction & RNA.

Prerequisites / notice

Basic knowledge of cell and molecular biology.

551-1409-00L RNA Biology Lecture Series II: Non-Coding RNAs: Biology and Therapeutics W 4 credits 2V J. Hall, M. Stoffel, further lecturers

Abstract

Does not take place this semester.

Objective

This course covers aspects of RNA biology related to the functions of non-coding RNAs as well as their use as drugs to treat diseases.

Content

Micro RNAs; computational approaches to miRNAs; micro RNA function in metabolism; viruses and viral RNAs; nucleic acid-based drugs; rRNA-mediated genome regulation; epigenetic programming of genome remodelling in ciliates; telomerase and telomerases; TRNA biology.

Prerequisites / notice

Basic knowledge of cell and molecular biology.

551-2023-00L Immunology III W 4 credits 2V M. Kopf, S. B. Freigang, S. R. Leibundgut, F. Mar, A. Oxenius, C. Schneider, E. Slack, R. Spörri, further lecturers

Abstract

The course provides an in-depth look at current research topics in the field of immunology.
Abstract

This course provides a detailed understanding of
- development of T and B cells
- the dynamics of a immune response during acute and chronic infection
- mechanisms of immunopathology
- modern vaccination strategies

Key experimental results will be shown to help understanding how immunological text book knowledge has evolved.

Objective

Obtain a detailed understanding of
- the development, activation, and differentiation of different types of T cells and their effectormechanisms during immune responses,
- Recognition of pathogenic microorganisms by the host cells and molecular events thereafter,
- events and signals for maturation of naive B cells to antibody producing plasma cells and memory B cells.
- Optimization of B cell responses by intelligent design of new vaccines

Content

- Development and selection of CD4 and CD8 T cells, natural killer T cells (NKT), and regulatory T cells (Treg)
- NK T cells and responses to lipid antigens
- Overview of cytokines and their effector function
- Co-stimulation (signals 1-3)
- Dendritic cells
- Evolution of the "Danger" concept
- Cells expressing Pattern Recognition Receptors and their downstream signals
- T cell function and dysfunction in acute and chronic viral infections

Literature

Documents of the lectures are available for download at:
https://moodle-app2.let.ethz.ch/course/view.php?id=2581&notifyeditingon=1

Prerequisites / notice

Immunology I and II recommended but not compulsory

227-0939-00L Cell Biophysics W 6 credits 4G T. Zambelli

Abstract

Applying two fundamental principles of thermodynamics (entropy maximization and Gibbs energy minimization), an analytical model is derived for a variety of biological phenomena at the molecular as well as cellular level, and critically compared with the corresponding experimental data in the literature.

Objective

Engineering uses the laws of physics to predict the behavior of a system. Biological systems are so diverse and complex prompting the question whether we can apply unifying concepts of theoretical physics coping with the multiplicity of life's mechanisms.

Objective of this course is to show that biological phenomena despite their variety can be analytically described using only two principles from statistical mechanics: maximization of the entropy and minimization of the Gibbs free energy.

Starting point of the course is the probability theory, which enables to derive step-by-step the two pillars of thermodynamics from the perspective of statistical mechanics: the maximization of entropy according to the Boltzmann’s law as well as the minimization of the Gibbs free energy. Then, an assortment of biological phenomena at the molecular and cellular level (e.g. cytoskeletal polymerization, action potential, photosynthesis, gene regulation, morphogen patterning) will be examined at the light of these two principles with the aim to derive a quantitative expression describing their behavior. Each analytical model is finally validated by comparing it with the corresponding experimental results from the literature.

By the end of the course, students will also learn to critically evaluate the concepts of making an assumption and making an approximation.

Content

- Basics of theory of probability
- Boltzmann's law
- Entropy maximization and Gibbs free energy minimization
- Ligand-receptor: two-state systems and the MWC model
- Random walks, diffusion, crowding
- Electrostatics for salty solutions
- Elasticity: fibers and membranes
- Molecular motors
- Action potential: Hodgkin-Huxley model
- Photosynthesis and vision
- Gene regulation
- Development: Turing patterns

Theory and corresponding exercises are merged together during the classes.

Lecture notes

No lecture notes because the two proposed textbooks are more than exhaustive!

I am willingly available Mondays 17.00 o'clock - 18.00 in my office GLC F12.2 for whatever discussion about the lessons and the exercises.

!!! I am using OneNote. All lectures will be broadcast via ZOOM, while corresponding videos of the previous years (lectures and exercises) are available in Moodle !!!

Literature

As further deepening:

Prerequisites / notice

Participants need a good command of
- differentiation and integration of a function with one or more variables (basics of Analysis),
- Newton’s and Coulomb's laws (basics of Mechanics and Electrostatics).

Notions of vectors in 2D and 3D are beneficial.
376-1305-01L Molecular Neurophysiology: From Molecules to Systems

W 3 credits 2V G. Schratt, R. Fiore, W. von der Behrens, J. Winterer

Abstract
The course covers the physiology of nerve cells, from the single cell through the neuronal network to the systemic level. The focus is on molecular and cellular mechanisms – synaptic transmission, signal transduction, gene expression, synaptic plasticity.

Objective
Based on an understanding of molecular and cellular mechanisms, the aim is to provide a deepened insight into neurophysiological processes underlying complex brain functions – learning/memory, sleep, sensory.

Content
First, basic molecular and cellular mechanisms in nerve cells (excitability, neurotransmission, signal transduction, gene expression, synaptic plasticity) are introduced. Afterwards, their significance for selected neurophysiological processes (learning/memory, sleep, sensory) will be illuminated.

Literature
The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on Moodle.

Competencies
Subject-specific Competencies
Concepts and Theories assessed
Techniques and Technologies fostered

Method-specific Competencies
Analytical Competencies assessed
Decision-making assessed
Media and Digital Technologies fostered
Problem-solving assessed
Project Management assessed

Social Competencies

Adaptability and Flexibility assessed
Creative Thinking assessed
Critical Thinking assessed
Integrity and Work Ethics assessed
Self-awareness and Self-reflection assessed
Self-direction and Self-management assessed

376-1305-00L Development of the Nervous System (University of Zurich)

W 3 credits 2V University lecturers

Abstract
The lecture will cover molecular and cellular processes underlying the development of the nervous system (neurogenesis, cell death, cell migration and differentiation, axon guidance and synapse formation). The importance of these processes in the context of developmental diseases is discussed.

Objective
On successful completion of the module the student should be able to
- relate structure and function of the nervous system to its development - apply principles of molecular, cellular, and developmental biology to the development of the nervous system
- identify key steps in development underlying neurological syndromes and diseases

Key skills
On successful completion of the module the student should be able to
- interpret and critically evaluate original research reports
- apply knowledge and relate experimental approaches from molecular, cellular and developmental biology to the developing nervous system.

Content
The lecture will cover molecular and cellular processes underlying the development of the nervous system. After an introduction to structure and function of the nervous system, we will discuss neurogenesis, cell death, cell migration and differentiation, axon guidance and synapse formation. The importance of these processes in the context of developmental diseases will be discussed.

Lecture notes
Must be downloaded from OLAT: https://www.olat.uzh.ch/olat/dmz/as BIO344

Literature
The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on OLAT.

Prerequisites / notice
BIO142 Developmental Biology, BIO143 Neurobiology

529-0733-02L Chemical Biology and Synthetic Biochemistry

W 6 credits 3G K. Lang, M. Fottner

Abstract
Overview of modern chemical biology and synthetic biochemistry techniques, focussed on protein modification and labeling and on methods to endow proteins with novel functionalities.
Objective
After taking this course, students should be capable of the following: A) Recall different possibilities for modifying proteins in vitro and in vivo and their applications in a biological context, B) Understand the chemical and biochemical consequences of modifications and assess the different reaction possibilities in the context of in vivo, - in vitro, C) Critically analyze and assess current chemical biology articles D) Question the approaches learned and apply them to new biological problems.

Content
principles of protein labeling and protein modification (fluorescent proteins, enzyme-mediated labeling, bioorthogonal chemistries)
advanced genetic code expansion methods (amber suppression, orthogonal ribosomes, unnatural base pairs, genome engineering and genome editing)
directed evolution and protein engineering
chemical biology of ubiquitin and targeted protein degradation

Lecture notes
A script will not be handed out. Handouts to the lecture will be provided through moodle.

Literature
Citations from the original literature relevant to the individual lectures will be assigned during the lectures.

Prerequisites / notice
Knowledge provided in the bachelor lectures 'Nucleic Acids and Carbohydrates' and 'Proteins and Lipids' is assumed for this lecture.

Competencies

Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management

Social Competencies
- Communication
- Cooperation and Teamwork
- Customer Orientation
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation

Personal Competencies
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

Recommended Master Courses

- **551-0575-00L** Writing Scientific Reports for MSc Biology
  - **Type**: W
  - **ECTS**: 2 credits
  - **Hours**: 1G
  - **Lecturers**: R. Taylor

  **Abstract**
  This short course is designed to accompany MSc students in writing their first reports in English, providing input on scientific writing in English as well as feedback on drafts sections of the report.

  **Objective**
  Students will learn to:
  - Plan, draft, structure, and edit scientific reports
  - Produce reader-friendly sentences
  - Establish a clear and logical flow between sentences and paragraphs
  - Select formal vocabulary and use it in a generally accurate and correct manner
  - Choose and use generally suitable grammatical structures, punctuation, and identify areas in which further development is needed

  **Content**
  The course covers the process of writing reports in biology, helping students to focus on the language and communicative aspects of these reports. Topics covered include structuring sentences, paragraphs, and longer sections (introductions, methods, etc.); presenting and integrating non-textual elements such as graphs and tables; reviewing common grammar problems for advanced writers in English; and editing drafts and proofs. Sessions will consist of a mix of specialist input, group and pair work, and editing sessions.

  Students who attend this course will turn in three sections of a report (approx. 500 words each) for feedback, revising these texts for a final portfolio that is graded.

  **Prerequisites / notice**
  Participants should be at a stage in their research where they can already start drafting parts of the report.

- **551-0309-00L** Concepts in Modern Genetics
  - **Type**: W
  - **ECTS**: 6 credits
  - **Hours**: 4V
  - **Lecturers**: Y. Barral, A. Hajnal, O. Voinnet, University lecturers

  **Abstract**
  Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

  **Objective**
  This course focuses on the concepts of classical and modern genetics and genomics.

Elective Major: Molecular Health Sciences

Elective Compulsory Concept Courses

See D-BIOL Master Studies Guide
The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Scripts and additional material will be provided during the semester.

</table>
Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

The course will be taught in English.

Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

The literature will be provided during the course.

For additional information, please consult the following online resource: https://www.uzh.ch/cmsssl/en/studies/application/deadline.shtml

By the end of this module, each student should be able to:

- recognize the universal principles underlying the development of different animal body plans.
- explain how the genes encoding the molecular toolkit have evolved to create animal diversity.
- relate changes in gene structure or function to evolutionary changes in animal development.
- present and discuss a relevant evolutionary topic in an oral presentation.
- select and integrate key concepts in animal evolution from primary literature.
- participate in discussions on topics presented by others.

Key skills:

- relate changes in gene structure or function to evolutionary changes in animal development.
- explain how the genes encoding the molecular toolkit have evolved to create animal diversity.
- present and discuss a relevant evolutionary topic in an oral presentation.
- select and integrate key concepts in animal evolution from primary literature.
- participate in discussions on topics presented by others.

From DNA to Diversity: the Evolution of Multicellular Organisms (University of Zurich) No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: BIO336

Mind the enrolment deadlines at UZH: https://www.uzh.ch/cmsssl/en/studies/application/deadline.shtml

By the end of this module, each student should be able to:

- discuss and write about scientific articles in the research area of cellular biochemistry, and they will identify open testable research questions.
- explain how the genes encoding the molecular toolkit have evolved to create animal diversity.
- relate changes in gene structure or function to evolutionary changes in animal development.
- present and discuss a relevant evolutionary topic in an oral presentation.
- select and integrate key concepts in animal evolution from primary literature.
- participate in discussions on topics presented by others.

Current Research Topics in Cellular Biochemistry

During this Masters level seminar style course, students will explore current research topics in cellular biochemistry focused on the structure, function and regulation of selected cell components, and the consequences of dysregulation for pathologies.

Students will work with experts toward a critical analysis of cutting-edge research in the domain of cellular biochemistry, with emphasis on normal cellular processes and the consequences of their dysregulation. At the end of the course, students will be able to evaluate, critically discuss and write about scientific articles in the research area of cellular biochemistry, and they will identify open testable research questions.

Guided by experts in the field, students will engage in classical round-table style discussions of current literature with frontal presentations. Guided by a faculty expert, students develop domain knowledge of the research area associated with a primary paper, and alternate as discussion leaders to present the research topic. By the end of the semester, students will formulate their ideas about open testable research questions that extend from the published work.

The literature will be provided during the course.

The course will be taught in English.

For additional information, please consult the following online resource: https://www.uzh.ch/cmsssl/en/studies/application/deadline.shtml

By the end of this module, each student should be able to:

Abstract
Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.

Objective
Develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology.

Content
The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics. For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

Lecture notes
Script and original publications will be supplied during the course.

Prerequisites / notice
The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.

551-1177-00L Immunology: From Milestones to Current Topics

Abstract
Milestones in Immunology: on old concepts and modern experiments

Objective
The course will cover the current grand topics in immunology: B cells, innate immunity, antigen presentation, tumor immunity, T cells, myeloid cells and stromal cells. For each topic two or four hours will be allocated. Historical milestone papers will be presented by the tutor/lecturer providing an overview on the development of the theoretical framework and critical technological advances. The students will read the historical milestone papers and contribute to the discussion. In the second part of the lecture, students will present recent high impact research papers that have emerged from the landmark achievements of the previously discussed milestone concepts.

Content
Milestones and current topics of innate immunity, antigen presentation, B cells, thymus and T cells, cytotoxic T cells, NK cells, stromal cells, CNS immunity and tumor immunology.

Lecture notes
Original and review articles will be distributed by the respective lecturer.

752-4009-00L Molecular Biology of Foodborne Pathogens

Abstract
The course offers detailed information on selected foodborne pathogens and toxin producing organisms; the focus lies on relevant molecular biological aspects of pathogenicity and virulence, as well as on the occurrence and survival of these organisms in foods.

Objective
Detailed and current status of research and insights into the molecular basis of foodborne diseases, with focus on interactions of the microorganism or the toxins they produce with the human system. Understanding the relationship between specific types of food and the associated pathogens and microbial risks. Another focus lies on the currently available methods and techniques useful for the various purposes, i.e., detection, differentiation (typing), and antimicrobial agents.

Content
Molecular biology of infectious foodborne pathogens (Listeria, E. coli, Campylobacter, Salmonella, etc) and toxin-producing organisms (Bacillus, Clostridium, Staphylococcus). How and under which conditions will toxins and virulence factors be produced, and how do they work? How is the interaction between the human host and the microbial pathogen? What are the roles of food and the environment? What can be done to interfere with the potential risks? Which methods are best suited for what approach? Last, but not least, the role of bacteriophages in microbial pathogenicity will be highlighted, in addition to various applications of bacteriophage for both diagnostics and antimicrobial intervention.

Lecture notes
Electronic copies of the presentation slides (PDF) and additional material will be made available for download to registered students.

Literature
Recommendations will be given in the first lecture

Prerequisites / notice
Lectures (2 hours) will be held as a single session of approximately 60+ minutes (10:15 until approx. 11:15 h), without a break !

Comptencies
Subject-specific Competencies
Concepts and Theories assessed
Techniques and Technologies assessed
Method-specific Competencies
Analytical Competencies assessed
Decision-making fostered
Problem-solving assessed
Social Competencies
Communication fostered
Personal Competencies
Creative Thinking fostered
Critical Thinking fostered

376-0300-00L Essentials in Translational Science

Abstract
Translational science is a cross disciplinary scientific research that is motivated by the need for practical applications that help people (e.g. Medicines). The course should help to clarify basics of translational science, illustrate successful applications and enable students to integrate key features into their future projects.

Objective
After completing this course, students will be able to understand:
Principles of translational science including medical device development, intellectual property, regulatory environment and project management
Students should be able to apply this knowledge in drug development programs in Pharma, Biotech or their own spin-off.

Content
What is translational science and what is it not Including:
- How to handle IP in the development process?
- How do the regulatory environment impact innovation?
- How to manage complex development projects?
- Positive and negative examples will be illustrated by distinguished guest speakers.
This course explores infectious disease from both the host and pathogen perspective. Through short lectures, reading and active discussion, students will identify areas where evolutionary thinking can improve our understanding of infectious diseases and, ultimately, our ability to treat them effectively.

Students will learn to (i) identify evolutionary explanations for the origins and characteristics of infectious diseases in a range of organisms and (ii) evaluate ways of integrating evolutionary thinking into improved strategies for treating infections of humans and animals. This will incorporate principles that apply across any host-pathogen interaction, as well as system-specific mechanistic information, with particular emphasis on bacteria and viruses.

We will cover several topics where evolutionary thinking is relevant to understanding or treating infectious diseases. This includes: (i) determinants of pathogen host range and virulence, (ii) dynamics of host-parasite coevolution, (iii) pathogen adaptation to evade or suppress immune responses, (iv) antimicrobial resistance, (v) evolution-proof medicine. For each topic there will be a short (< 20 minutes) introductory lecture, before students independently research the primary literature and develop discussion points and questions, followed by interactive discussion in class.

The focus is on primary literature, but for some parts the following text books provide good background information:

- Schmid Hempel 2011 Evolutionary Parasitology
- Streams & Medzhitov 2016 Evolutionary Medicine
- A. Hall
- M. Fussenegger

Competencies:

- Subject-specific Competencies: Concepts and Theories
- Method-specific Competencies: Analytical Competencies
- Social Competencies: Communication
- Personal Competencies: Adaptability and Flexibility

Literature:

Prerequisites / notice:

- A basic understanding of evolutionary biology, microbiology or parasitology will be advantageous but is not essential.

636-0108-00L  Biological Engineering and Biotechnology

Abstract: Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

Objective: Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

Lecture notes: Handout during the course.

551-1407-00L  RNA Biology Lecture Series I: Transcription & Processing & Translation

Abstract: This course covers aspects of RNA biology related to gene expression at the posttranscriptional level. These include RNA transcription, processing, alternative splicing, editing, export and translation.

Objective: The students should obtain an understanding of these processes, which are at work during gene expression.

Content: Transcripton & 3'end formation; splicing, alternative splicing, RNA editing; the ribosome & translation, translation regulation, RNP biogenesis & nuclear export, mRNA surveillance & mRNA turnover; signal transduction & RNA.

Prerequisites / notice:

- Basic knowledge of cell and molecular biology.

551-1409-00L  RNA Biology Lecture Series II: Non-Coding RNAs: Biology and Therapeutics

Abstract:

- Does not take place this semester.
This course covers aspects of RNA biology related to the functions of non-coding RNAs as well as their use as drugs to treat diseases. The students should get familiar with the wide array of roles, which non-coding RNAs play in cellular functions.

**Abstract**

Micro RNAs; computational approaches to miRNAs; micro RNA function in metabolism; viruses and viral RNAs; nucleic acid-based drugs; ncRNA-mediated genome regulation; epigenetic programming of genome remodelling in ciliates; telomerase and telomeres; tRNA biology.

**Content**

This course provides a detailed understanding of
- development of T and B cells
- the dynamics of a immune response during acute and chronic infection
- mechanisms of immunopathology
- modern vaccination strategies

Key experimental results will be shown to help understanding how immunological text book knowledge has evolved.

**Objective**

The lecture will cover molecular and cellular processes underlying the development of the nervous system. After an introduction to structure and function of the nervous system, we will discuss neurogenesis, cell death, cell migration and differentiation, axon guidance and synapse formation. The importance of these processes in the context of developmental diseases will be discussed.

**Content**

First, basic molecular and cellular mechanisms in nerve cells (excitability, neurotransmission, signal transduction, gene expression, synaptic plasticity) are introduced. Afterwards, their significance for selected neurophysiological processes (learning/memory, sleep, sensory) will be illuminated.

**Competencies**

- apply knowledge and relate experimental approaches from molecular, cellular and developmental biology to the developing nervous system.
- apply principles of molecular, cellular, and developmental biology to the nervous system.
- interpret and critically evaluate original research reports
- identify key steps in development underlying neurological syndromes and diseases

**Literature**

The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on OLAT.

**Prerequisites / notice**

Basic knowledge of cell and molecular biology.

---

This is a list of courses with their details.
Content
- Development and selection of CD4 and CD8 T cells, natural killer T cells (NKT), and regulatory T cells (Treg)
- NK T cells and responses to lipid antigens
- Differentiation, characterization, and function of CD4 T cell subsets such as Th1, Th2, and Th17
- Overview of cytokines and their effector function
- Co-stimulation (signals 1-3)
- Dendritic cells
- Evolution of the "Danger" concept
- Cells expressing Pattern Recognition Receptors and their downstream signals
- T cell function and dysfunction in acute and chronic viral infections

Literature
Documents of the lectures are available for download at:
https://moodle-app2.let.ethz.ch/course/view.php?id=2581&notifyeditingon=1

Prerequisites / notice
Immunology I and II recommended but not compulsory

</tr>
</tbody>
</table>

Abstract
This short course is designed to accompany MSc students in writing their first reports in English, providing input on scientific writing in English as well as feedback on drafts sections of the report.

Objective
Students will learn to:
- Plan, draft, structure, and edit scientific reports
- Produce reader-friendly sentences
- Establish a clear and logical flow between sentences and paragraphs
- Select formal vocabulary and use it in a generally accurate and correct manner
- Choose and use generally suitable grammatical structures, punctuation, and identify areas in which further development is needed

Content
The course covers the process of writing reports in biology, helping students to focus on the language and communicative aspects of these reports. Topics covered include structuring sentences, paragraphs, and longer sections (introductions, methods, etc.); presenting and integrating non-textual elements such as graphs and tables; reviewing common grammar problems for advanced writers in English; and editing drafts and proofs. Sessions will consist of a mix of specialist input, group and pair work, and editing sessions.

Prerequisites / notice
Participants should be at a stage in their research where they can already start drafting parts of the report.

Only students who fulfill the following criteria are allowed to begin with their master thesis:
(a) successful completion of the bachelor programme;
(b) fulfilling of any additional requirements necessary to gain admission to the master programme;
(c) have acquired at least 30 credits in the category "research projects".

Abstract
The Master research will be carried out on a theme in the chosen subject area and must be completed with a written report (Thesis) within six months.

Master's Examination
For the Master examination a student must provide proof of general knowledge in the elective major field. Starting with a discussion based on the Master's thesis further experiments and experimental strategies should be discussed in order to test the general understanding.

</tbody>
</table>
Objective
Beside electronics nanodevices, D-ITET is pushing its research in the fields of NMR (MRI), electrochemistry, bioelectronics, nano-optics, and quantum information, which are all rationalized in terms of quantum mechanics.

Starting from the axioms of quantum mechanics, we will derive the fascinating theory describing spin and qubits, electron transitions and transfer, photons and LASER: quantum mechanics is different because it mocks our daily Euclidean intuition!

In this way, students will work out a robust quantum mechanics (theoretical!) basis which will help them in their advanced studies of the following masters: EIT (batteries), Biomedical Engineering (NMR, bioelectronics), Quantum Engineering, Micro- and Nanosystems.

IMPORTANT: "qubits" from the point of view of NMR (and NOT from that of quantum computing!).

Content
- Lagrangian and Hamiltonian: Symmetries and Poisson Brackets
- Postulates of QM: Hilbert Spaces and Operators
- Heisenberg’s Matrix Mechanics: Hamiltonian and Time Evolution Operator
- Density Operator
- Spin: Qubits, Bloch Equations, and NMR
- Entanglement
- Symmetries and Corresponding Operators
- Schrödinger's Wave Mechanics: Electrons in a Periodic Potential and Energy Bands
- Harmonic Oscillator: Creation and Annihilation Operators
- Identical Particles: Bosons and Fermions
- Quantization of the Electromagnetic Field: Photons, Absorption and Emission, LASER
- Electron Transfer: Marcus Theory via Born-Oppenheimer, Franck-Condon, Landau-Zener

Lecture notes
No lecture notes because the proposed textbooks together with the provided supplementary material are more than exhaustive!

!!! I am using OneNote. All lectures and exercises will be broadcast via ZOOM, while corresponding videos of the previous years are available in Moodle !!!

Literature

Supplementary material will be uploaded in Moodle.

---

+ (as rigorous and profound presentation of the mathematical framework) G. Dell'Antonio, "Lectures on the Mathematics of Quantum Mechanics I", 2015, Springer

+ (as account of those formidable years) G. Gamow, "Thirty Years that Shook Physics", 1985, Dover Publications Inc.

Prerequisites / notice
The course has been intentionally conceived to be self-consistent with respect to QM for those master students not having encountered it in their track yet. Therefore, a presumably large overlapping has to be expected with a (welcome!) QM introduction course like the D-ITET "Physics II".

A solid base of Analysis I & II as well as of Linear Algebra is really helpful.

227-0385-10L Biomedical Imaging W 6 credits 5G S. Kozerke, K. P. Prüssmann

Abstract
Introduction to diagnostic medical imaging based on electromagnetic and acoustic fields including X-ray planar and tomographic imaging, radio-tracer based nuclear imaging techniques, magnetic resonance imaging and ultrasound-based procedures.

Objective
Upon completion of the course students are able to:

- Explain the physical and mathematical foundations of diagnostic medical imaging systems
- Characterize system performance based on signal-to-noise ratio, contrast-to-noise ratio and transfer function
- Design a basic diagnostic imaging system chain including data acquisition and data reconstruction
- Identify advantages and limitations of different imaging methods in relation to medical diagnostic applications

Data: 06.08.2024 12:40 Autumn Semester 2024 Page 372 of 2684
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The focus is on learning the basic vocabulary of biomedical engineering and getting familiar with concepts that govern common medical instruments and the most important organs from an engineering point of view.

Objective
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The course provides an overview of the various topics of the different tracks of the biomedical engineering master course and helps orienting the students in selecting their specialized classes and project locations. It also serves as an introduction to the field for students of the ITET, MAVT, HEST and other bachelor programs.

In addition, the most recent achievements and trends of the field of biomedical engineering are also outlined.

Content
- History of BME and the role of biomedical engineers. Ethical issues related to BME.
- Biomedical sensors both wearable and also biochemical sensors.
- Biomedical electronics: Nernst equation, Donnan equilibrium, equivalent circuits of biological membranes and bioelectronic devices.
- Bioinformatics: genomic and proteomic tools, databases and basic calculations.
- Equations describing basic reactions and enzyme kinetics.
- Medical optics: Optical components and systems used in hospitals.
- Basic concepts of tissue engineering and organ printing.
- Biomaterials and their medical applications.
- Function of the heart and the circulatory system.
- Transport and exchange of substances in the human body, compartment modeling.
- The respiratory system.
- Bioimaging.
- Orthopedic biomechanics.
- Lectures (2h), discussion of practical exercises (1h) and homework exercises.

Lecture notes
Introduction to Biomedical Engineering by Enderle, Banchard, and Bronzino

AND

Prerequisites / notice
No specific requirements, BUT ITET, MAVT, PHYS students will have to learn a lot of new words related to biochemistry, biology and medicine, while HEST and BIOL students will have to grasp basic engineering concepts (circuits, equations, etc.).
Competencies

Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

227-0393-10L Bioelectronics and Biosensors W 6 credits 2V+2U J. Vörös, M. F. Yanik

Abstract
The course introduces bioelectricity and the sensing concepts that enable obtaining information about neurons and their networks. The sources of electrical fields and currents in the context of biological systems are discussed. The fundamental concepts and challenges of measuring bioelectric signals and the basic concepts to record optogenetically modified organisms are introduced.

Objective
During this course the students will:
- learn the basic concepts in bioelectronics including the sources of bioelectric signals and the methods to measure them
- be able to solve typical problems in bioelectronics
- learn about the remaining challenges in this field

Content
Lecture topics:

1. Introduction

Sources of bioelectric signals
2. Membrane and Transport
3-4. Action potential and Hodgkin-Huxley

Measuring bioelectric signals
5. Detection and Noise
6. Measuring currents in solutions, nanopore sensing and patch clamp pipettes
7. Measuring potentials in solution and core conductance model
8. Measuring electronic signals with wearable electronics, ECG, EEG
9. Measuring mechanical signals with bioelectronics

In vivo stimulation and recording
10. Functional electric stimulation
11. In vivo electrophysiology

Optical recording and control of neurons (optogenetics)
12. Measuring neurons optically, fundamentals of optical microscopy
13. Fluorescent probes and scanning microscopy, optogenetics, in vivo microscopy
14. Measuring biochemical signals

Lecture notes
A detailed script is provided to each lecture including the exercises and their solutions.

Literature
Plonsey and Barr, Bioelectricity: An Analytical Approach (Third edition)

Prerequisites / notice
The course requires an open attitude to the interdisciplinary approach of bioelectronics. In addition, it requires undergraduate entry-level familiarity with electric & magnetic fields/forces, resistors, capacitors, electric circuits, differential equations, calculus, probability calculus, Fourier transformation & frequency domain, lenses / light propagation / refractive index, pressure, diffusion AND basic knowledge of biology and chemistry (e.g. understanding the concepts of concentration, valence, reactants-products, etc.).
Learning in Deep Artificial and Biological Neuronal Networks

Abstract

Deep-Learning (DL) a brain-inspired weak form of AI allows training of large artificial neuronal networks (ANNs) that, like humans, can learn real-world tasks such as recognizing objects in images. However, DL is far from being understood and investigating learning in biological networks might serve again as a compelling inspiration to think differently about state-of-the-art ANN training methods.

Objective

The main goal of this lecture is to provide a comprehensive overview into the learning principles neuronal networks as well as to introduce a diverse skill set (e.g., simulating a spiking neuronal network) that is required to understand learning in large, hierarchical neuronal networks. To achieve this the lectures and exercises will merge ideas, concepts and methods from machine learning and neuroscience. These will include training basic ANNs, simulating spiking neuronal networks as well as being able to read and understand the main ideas presented in today’s neuroscience papers.

After this course students will be able to:
- read and understand the main ideas and methods that are presented in today's neuroscience papers
- explain the basic ideas and concepts of plasticity in the mammalian brain
- implement alternative ANN learning algorithms to 'error backpropagation' in order to train deep neuronal networks.
- use a diverse set of ANN regularization methods to improve learning
- simulate spiking neuronal networks that learn simple (e.g. digit classification) tasks in a supervised manner.

Content

Deep-learning a brain-inspired weak form of AI allows training of large artificial neuronal networks (ANNs) that, like humans, can learn real-world tasks such as recognizing objects in images. The origins of deep hierarchical learning can be traced back to early neuroscience research by Hubel and Wiesel in the 1960s, who first described the neuronal processing of visual inputs in the mammalian neocortex. Similar to their neocortical counterparts ANNs seem to learn by interpreting and structuring the data provided by the external world.

However, while on specific tasks such as playing (video) games deep ANNs outperform humans (Minh et al, 2015, Silver et al., 2018), ANNs are still not performing on par when it comes to recognizing actions in movie data and their ability to act as generalizable problem solvers is still far behind of what the human brain seems to achieve effortlessly. Moreover, biological neuronal networks can learn far more effectively with fewer training examples, they achieve a much higher performance in recognizing complex patterns in time series data (e.g. recognizing actions in movies), they dynamically adapt to new tasks without losing performance and they achieve unmatched performance to detect and integrate out-of-domain data examples (data they have not been trained with). In other words, many of the big challenges and unknowns that have emerged in the field of deep learning over the last years are already mastered exceptionally well by biological neuronal networks in our brain. On the other hand, many facets of typical ANN design and training algorithms seem biologically implausible, such as the non-local weight updates, discrete processing of time, and scalar communication between neurons. Recent evidence suggests that learning in biological systems is the result of the complex interplay of diverse error feedback signaling processes acting at multiple scales, ranging from single synapses to entire networks.

Lecture notes

The lecture slides will be provided as a PDF after each lecture.

Prerequisites / notice

This advanced level lecture requires some basic background in machine/deep learning. Thus, students are expected to have a basic mathematical foundation, including linear algebra, multivariate calculus, and probability. The course is not to be meant as an extended tutorial of how to train deep networks in PyTorch or Tensorflow, although these tools used.

The participation in the course is subject to the following conditions:

1) The number of participants is limited to 120 students (MSc and PhDs).

2) Students must have taken the exam in Deep Learning (263-3210-00L) or have acquired equivalent knowledge.

Neuromorphic Engineering I

Registration in this class requires the permission of the instructors. Class size will be limited to available lab spots. Preference is given to students that require this class as part of their major.

Information for UZH students:
Enrollment to this course unit only possible at ETH. No enrolment to module INI404 at UZH.
Please mind the ETH enrolment deadlines for UZH students: https://ethz.ch/en/studies/non-degree-courses/special-students-university-of-zurich.html

Abstract

This course covers analog circuits with emphasis on neuromorphic engineering: MOS transistors in CMOS technology, static circuits, dynamic circuits, systems (silicon neuron, silicon retina, silicon cochlea) with an introduction to multi-chip systems. The lectures are accompanied by weekly laboratory sessions.

Objective

Understanding of the characteristics of neuromorphic circuit elements.
Understanding computation by neurons and neuronal circuits is one of the great challenges of science. Many different disciplines can contribute their tools and concepts to solving mysteries of neural computation. The goal of this introductory course is to introduce the monocolures of physics, maths, computer science, engineering, biology, psychology, and even philosophy and history, to discover the enchantments and challenges that we all face in taking on this major 21st century problem and how each discipline can contribute to discovering solutions.

Connections to computer science and artificial intelligence are discussed, but the main focus of the course is on establishing the biological basis of computations in neurons.

**Abstract**

The course provides an introduction to the functional properties of neurons. Particularly the description of membrane electrical properties (action potentials, channels), neuronal anatomy, synaptic structures, and neuronal networks. Models of computation, learning, and behavior will be explained. Some artificial systems (robot, chip) are presented.

**Objective**

Understanding computation by neurons and neuronal circuits is one of the great challenges of science. Many different disciplines can contribute their tools and concepts to solving mysteries of neural computation. The goal of this introductory course is to introduce the monocolures of physics, maths, computer science, engineering, biology, psychology, and even philosophy and history, to discover the enchantments and challenges that we all face in taking on this major 21st century problem and how each discipline can contribute to discovering solutions.

**Content**

This course considers the structure and function of biological neural networks at different levels. The function of neural networks lies fundamentally in their wiring and in the electro-chemical properties of nerve cell membranes. Thus, the biological structure of the nerve cell needs to be understood if biologically-realistic models are to be constructed. These simpler models are used to estimate the electrical current flow through dendritic cables and explore how a more complex geometry of neurons influences this current flow. The active properties of nerves are studied to understand both sensory transduction and the generation and transmission of nerve impulses along axons. The concept of local neuronal circuits arises in the context of the rules governing the formation of nerve connections and topographic projections within the nervous system. Communication between neurons in the network can be thought of as information flow across synapses, which can be modified by experience. We need an understanding of the action of inhibitory and excitatory neurotransmitters and neuromodulators, so that the dynamics and logic of synapses can be interpreted. Finally, simple neural architectures of feedforward and recurrent networks are discussed in the context of co-ordination, control, and integration of sensory and motor information.

**Literature**

Handouts and references therin.

**Handouts and references therin.**

(available online via ETH library)

Handouts and references therin.

**Prerequisites**

The course is highly recommended for those who intend to take the spring semester course ‘Neuromorphic Engineering II’, that teaches the conception, simulation, and physical layout of such circuits with chip design tools.

**Prerequisites: Background in basics of semiconductor physics helpful, but not required.**
The lecture series is motivated by an overview covering the skin of the crystals, roughness analysis, contact angle measurements, protein absorption/activity and monocyte behaviour.

As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting, oxide and organic surfaces are introduced.

The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure’s shapes, which are based on the strain relieving mechanisms and kinetic growth processes.

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. Recently, ellipsometry has been introduced to on-line monitor film thickness, and roughness with sub-nanometer precision. These characterisation techniques are vital for optimising the preparation of medical implants.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.

X-rays are more and more often used to characterise the human tissues down to the nanometer level. The combination of highly intense beams only some micrometers in diameter with scanning enables spatially resolved measurements and the determination of tissue’s anisotropies of biopsies.

### Recommended Elective Courses

These courses are particularly recommended for the Bioelectronics track. Please consult your track advisor if you wish to select other subjects.

Introduction to Photonics

W  4 credits  2V+2U  R. Quidant, J. Ortega Arroyo

Abstract
This course introduces students to the main concepts of optics and photonics. Specifically, we will describe the laws obeyed by optical waves and discuss how to use them to manipulate light.

Objective
Photonics, the science of light, has become ubiquitous in our lives. Control and manipulation of light is what enables us to interact with the screen of our smart devices and exchange large amounts of complex information. Photonics has also taken a preponderant role in cutting-edge science, allowing for instance to image nanospecimens, detect diseases or sense very tiny forces. The purpose of this course is three-fold: (i) We first aim to provide the fundamentals of photonics, establishing a solid basis for more specialised courses. (ii) Beyond theoretical concepts, our intention is to have students develop an intuition on how to manipulate light in practise. (iii) Finally, the course highlights how the taught concepts apply to modern research as well as to everyday life technologies (LCD screens, polarisation sun glasses, anti-reflection coating etc...). Content, including videos of laboratory experiments, has been designed to be approachable by students from a diverse set of science and engineering backgrounds.

Content

I- BASICS OF WAVE THEORY
1) General concepts
2) Differential wave equation
3) Wavefront
4) Plane waves and Fourier decomposition of optical fields
5) Spherical waves and Huygens-Fresnel principle

II- ELECTROMAGNETIC WAVES
1) Maxwell equations
2) Wave equation for EM waves
3) Dielectric permittivity
4) Refractive index
5) Nonlinear optics
6) Polarisation and polarisation control

III- PROPAGATION OF LIGHT
1) Waves at an interface
2) The Fresnel coefficients
3) Total internal reflection
4) Evanescent waves
5) Dispersion diagram

IV- INTERFERENCES
1) General considerations
2) Temporal and spatial coherence
3) The Young double slit experiment
4) Diffraction gratings
5) The Michelson interferometer
6) Multi-wave interference
7) Antireflecting coating and interference filters
8) Optical holography

V- LIGHT MANIPULATION
1) Optical waveguides
2) Photonic crystals
3) Metamaterials and metasurfaces
4) Optical cavities

VI- OPTICAL FORCES AND OPTICAL TWEEZERS
1) History of optical forces
2) Theory of optical trapping
3) Atom cooling
4) Optomechanics
5) Applications of optical tweezers

VII- INTRODUCTION TO OPTICAL MICROSCOPY
1) Basic concepts
2) Direct and Fourier imaging
3) Image formation
4) Fluorescence microscopy
5) Scattering-based microscopy
6) Digital holography
7) Computational imaging
### 151-0941-00L Molecular Sensors: From Fundamentals to Health and Environmental Applications

**Note:** Previous course title until HS23 "Molecular Health Sensors and Devices."

**Abstract**

Molecular sensors are used in everyday life in health care, environmental monitoring, food safety, space and other fields. Sources of molecular information, its transport and fundamental concepts of molecular sensing will be discussed. In the scope of group projects, the acquired knowledge will be applied and deepened in case studies.

**Objective**

After the course, the students will:

- know the requirements and merits of molecular sensors for health, environmental and other emerging applications (e.g. space)
- understand transport phenomena of molecular information & surface interactions and how to quantitatively describe these
- understand fundamental sensing concepts for the detection and quantification of molecular analytes
- know concepts of signal processing
- be capable to apply the learnt knowledge to conceive and engineer sensor concepts and systems
- know how to investigate sensor-related literature and present scientific data

This course consists of a theoretical and a project-based learning block. In the first 10 semester weeks, theoretical knowledge will be provided through lectures and deepened in corresponding exercises. In the last 4 weeks, the students will apply the learned concepts through group projects to investigate case studies. The outcome will be present.

**Content**

Transport of Molecular Information; Surface Interactions; Sensor Fundamentals; Chemoresistive Sensing; Electrochemical Sensing; Mass-sensitive; Capacitive Sensing; Signal Processing; Medical Requirements for Molecular Sensing

**Lecture notes**

Hand-outs will be provided to each lecture including the exercises and their solutions.

### 227-1033-00L Neuromorphic Engineering I

**Registration in this course requires the permission of the instructors. Class size will be limited to available lab spots. Preference is given to students that require this class as part of their major.**

**Information for UZH students:**

Enrolment to this course unit only possible at ETH. No enrolment to module INI404 at UZH.

Please mind the ETH enrolment deadlines for UZH students: https://ethz.ch/en/studies/non-degree-courses/special-students/special-students-university-of-zurich.html

**Abstract**

This course covers analog circuits with emphasis on neuromorphic engineering: MOS transistors in CMOS technology, static circuits, dynamic circuits, systems (silicon neuron, silicon retina, silicon cochlea) with an introduction to multi-chip systems. The lectures are accompanied by weekly laboratory sessions.

**Objective**

Understanding of the characteristics of neuromorphic circuit elements.

**Content**

Neuromorphic circuits are inspired by the organizing principles of biological neural circuits. Their computational primitives are based on physics of semiconductor devices. Neuromorphic architectures often rely on collective computation in parallel networks. Adaptation, learning and memory are implemented locally within the individual computational elements. Transistors are often operated in weak inversion (below threshold), where they exhibit exponential I-V characteristics and low currents. These properties lead to the feasibility of high-density, low-power implementations of functions that are computationally intensive in other paradigms. Application domains of neuromorphic circuits include silicon retinas and cochleas for machine vision and audition, real-time emulations of networks of biological neurons, and the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS transistor, phototransducers, static circuits (differential pair, current mirror, transconductance amplifiers, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silicon neuron, silicon retina and cochlea) and an introduction to multi-chip systems that communicate events analogous to spikes. The lectures are accompanied by weekly laboratory sessions on the characterization of neuromorphic circuits, from elementary devices to systems.

**Literature**

S.-C. Liu et al.: Analog VLSI Circuits and Principles; various publications.
Prerequisites / notice

Particular: The course is highly recommended for those who intend to take the spring semester course 'Neuromorphic Engineering II', that teaches the conception, simulation, and physical layout of such circuits with chip design tools.

Prerequisites: Background in basics of semiconductor physics helpful, but not required.

227-1051-00L Systems Neuroscience (University of Zurich) W 6 credits 2V+1U D. Kiper

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: INI415

Mind the enrolment deadlines at UZH: https://www.uzh.ch/cms/sez/en/studies/application/deadlines.html

Abstract

This course focuses on basic aspects of central nervous system physiology, including perception, motor control and cognitive functions.

Objective

To understand the basic concepts underlying perceptual, motor and cognitive functions.

Content

Main emphasis sensory systems, with complements on motor and cognitive functions.

Lecture notes

None

"Principles of Neural Science", Kandel, Schwartz, and Jessel  

Prerequisites / notice

227-0384-00L Ultrasound Fundamentals and Applications in Biology and Medicine W and X 4 credits 3G X. L. Dean Ben

Previously (up to spring 2020) offered as Ultrasound Fundamentals, Imaging, and Medical Applications

Abstract

Ultrasound waves are non-ionizing and thus provide a safe means to interrogate and treat biological tissues. Advantages such as real-time operation, low cost, and portability have led to ultrasound systems becoming standard tools in hospitals and research laboratories. Applications in biology and medicine include ultrasound and optoacoustic imaging, thermal therapy, or pulse stimulation.

Objective

The objective of the course is that students are able to understand how to use ultrasound in biology and medicine and generalize this knowledge to applications in other fields.

Content

The course will cover the basic physics of ultrasound (acoustic waves at frequencies higher than the audible range) in biological tissues as well as the instrumentation required to generate and detect these waves. Imaging methods will extensively be described in the course. Specifically, standard and ultra-fast ultrasound imaging approaches will be covered along with new optoacoustic and transmission ultrasound imaging methods. The course will also describe mathematical modelling approaches and numerical methods as well as signal and image processing tools applicable in ultrasound-based imaging. Other topics include ultrasound sensors, laser ultrasound, therapeutic effects, or biomedical applications and contrast agents. The course will conclude with current and future research directions in the field of ultrasound in biomedicine.

Lecture notes

The lecture slides will be made available to the students.

Lecture notes

Basic knowledge in physics. Basic programming skills, preferably in Matlab.

Prerequisites / notice

227-0166-00L Analog Integrated Circuits W 6 credits 4G T. Jang

Abstract

This course provides a foundation in analog integrated circuit design based on bipolar and CMOS technologies.

Objective

Integrated circuits are responsible for much of the progress in electronics in the last 50 years, particularly the revolutions in the Information and Communications Technologies we witnessed in recent years. Analog integrated circuits play a crucial part in the highly integrated systems that power the popular electronic devices we use daily. Understanding their design is beneficial to both future designers and users of such systems.

Content

The basic elements, design issues and techniques for analog integrated circuits will be taught in this course.

Review of bipolar and MOS devices and their small-signal equivalent circuit models; Building blocks in analog circuits such as current sources, active load, current mirrors, supply independent biasing etc; Amplifiers: differential amplifiers, cascode amplifier, high gain structures, output stages, gain bandwidth product of op-amps; stability; comparators; second-order effects in analog circuits such as mismatch, noise and offset; data converters; frequency synthesizers; switched capacitors.

The exercise sessions aim to reinforce the lecture material by well guided step-by-step design tasks. The circuit simulator SPECTRE is used to facilitate the tasks. There is also an experimental session on op-amp measurements.

Lecture notes

Handouts of presented slides. No script but an accompanying textbook is recommended.

Literature

Prerequisites / notice

227-0447-00L Image Analysis and Computer Vision W 6 credits 3V+1U E. Konukoglu, E. Erdil, F. Yu

Abstract

Objective

Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

Content

This course aims at offering a self-contained account of computer vision and its underlying concepts, including the recent use of deep learning.

The first part starts with an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First the interaction of light with matter is considered. The most important hardware components such as cameras and illumination sources are also discussed. The course then turns to image discretization, necessary to process images by computer.

The next part describes necessary pre-processing steps, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and 3D shape as two important examples. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed. A major part at the end is devoted to deep learning and AI-based approaches to image analysis. Its main focus is on object recognition, but also other examples of image processing using deep neural nets are given.

Lecture notes

Course material Script, computer demonstrations, exercises and problem solutions

Prerequisites / notice

227-0468-00L Analog Signal Processing and Filtering W 6 credits 2V+2U H. Schmid

Suitable for Master Students as well as Doctoral Students.

227-0447-00L Image Analysis and Computer Vision 6 credits

227-1051-00L Systems Neuroscience (University of Zurich) 6 credits

227-0166-00L Analog Integrated Circuits 6 credits

227-0384-00L Ultrasound Fundamentals and Applications in Biology and Medicine 4 credits
This lecture provides a wide overview over analog filters (continuous-time and discrete-time), signal-processing systems, and sigma-delta conversion, and gives examples with sensor interfaces and class-D audio drivers. All systems and circuits are treated using a signal-flow view. The lecture is suitable for both analog and digital designers.

The learning goal is that the students can apply signal-flow graphs and can understand the signal flow in such circuits and systems (including non-ideal effects) well enough to gain an understanding of further circuits and systems by themselves.

At the beginning, signal-flow graphs in general and driving-point signal-flow graphs in particular are introduced. We will use them during the whole term to analyze circuits on a system level (analog continuous-time, analog discrete-time, mixed-signal and digital) and understand how signals propagate through them. The theory and CMOS implementation of active Filters is then discussed in detail using the example of Gm-C filters and active-RC filters. The ideal and nonideal behaviour of opamps, current conveyors, and inductor simulators follows. The link to the practical design of circuits and systems is done with an overview over different quality measures and figures of merit used in scientific literature and datasheets. Finally, an introduction to discrete-time and mixed-domain filters and circuits is given, including sensor read-out amplifiers, correlated double sampling, and chopping, and an introduction to sigma-delta A/D and D/A conversion on a system level.

This lecture does not go down to the details of transistor implementations. The lecture "227-0166-00L Analog Integrated Circuits" complements this lecture very well in that respect.

The base for these lectures are lecture notes and two or three published scientific papers. From these papers we will together develop the technical content.

Details: https://people.ee.ethz.ch/~haschmid/asfwiki/

The graph methods are also supported with teaching videos: https://tube.switch.ch/channels/d206c96c?order=episodes, and a Python-based open-source tool to manipulate graphs is available on https://github.com/hanspi42/signalflowgrapher

Some material is protected by password; students from ETHZ who are interested can write to haschmid@ethz.ch to ask for the password even if they do not attend the lecture.

Prerequisites / notice

Knowledge of the Laplace transform and z transform and their interpretation (transfer functions, poles and zeros, bode diagrams, stability criteria ...) and of the main properties of linear systems is necessary.

227-0621-00L Emerging Memory Technologies

Abstract

This course focuses on the current state and prospects of memory technologies, emerging beyond the silicon transistor era. We explore resistive PCM and RRAM, magnetic MRAM and ferroelectric FRAM memories, covering physics, device aspects and the latest research in the field. Through interactive lectures and laboratory sessions, students gain up-to-date knowledge and compare emerging memory techs. Decades of research have yielded several efficient memory device working principles, including phase-change of the structure (PCM), materials conversion (OxRAM), ion diffusion (CBRAM), magnetic properties (STT-MRAM, MTJ), and ferroelectricity (FRAM, FeFET). Currently, these memory technologies are transitioning from research to industry, and are predicted to have at least niche applications in the ever-growing hardware market. Some technologies, such as PCM, may even eventually surpass silicon-based flash memory, providing better performance and unique features.

In this course, students will learn about the leading contenders for post-silicon storage-class and main memory technologies. Students will have the opportunity to compare emerging memory technologies with state-of-the-art SSD Flash, DRAM, and SRAM, as well as evaluate their potential. Through critical thinking discussions, students will acquire important skills for assessing the strengths and limitations of these emerging technologies.

Students will have the opportunity to compare emerging memory technologies with state-of-the-art SSD Flash, DRAM, and SRAM, as well as evaluate their potential. Through critical thinking discussions, students will acquire important skills for assessing the strengths and limitations of these emerging technologies.

Objective

The course is organized as a series of lectures, focusing on selected memory technologies. This class also includes practical laboratory sessions for the PCM research topics. Students will spend 2 hours per week in the class or laboratory and additional 2-3 hours per week to prepare for the exam.

Content

Students will have the opportunity to compare emerging memory technologies with state-of-the-art SSD Flash, DRAM, and SRAM, as well as evaluate their potential. Through critical thinking discussions, students will acquire important skills for assessing the strengths and limitations of these emerging technologies.

Literature

Lecture notes will be made available on the website.

Autumn Semester 2024

Page 381 of 2684
Fostered 2V+2A

Engineering uses the laws of physics to predict the behavior of a system. Biological systems are so diverse and complex prompting the need for interdisciplinary communication, need identification and product development. The engineering students will be fostered to communicate with medical doctors to identify needs, develop early-stage solution concepts together with the medical students, and critically compare the derived solutions with the corresponding experimental data in the literature.

The main goal of this course is to demonstrate the differences in communication between the fields of medicine and engineering. Since such differences become most evident during actual collaborative work, the course is based on a project in physiology, medical or clinical research that combines medicine and engineering.

For the engineering students, the specific aims of the course are to:
- Identify and precisely define a clinical need;
- Acquire a working understanding of the investigated system;
- Identify the engineering challenges in the project and communicate them to the medical students;
- Develop and implement, together with the medical students, solution strategies for the identified challenges;
- Present the solution concept to a cross-disciplinary audience; Preliminary need and solution validation;
- Present the solution concept to a cross-disciplinary audience.

Objective

Content

After a general introduction to interdisciplinary communication, need identification and product development, the engineering students will team up with medical students to 1) identify a clinically relevant need, 2) develop early-stage solution concepts to it, and 3) critically compare them with the corresponding experimental data in the literature.

The objective of this course is to show that biological phenomena despite their variety can be analytically described using only two principles from statistical mechanics: maximization of the entropy and minimization of the Gibbs free energy.

Starting point of the course is the probability theory, which enables to derive step-by-step the two pillars of thermodynamics from the perspective of statistical mechanics: the maximization of entropy according to the Boltzmann’s law as well as the minimization of the Gibbs free energy. Then, an assortment of biological phenomena at the molecular and cellular level (e.g. cytoskeletal polymerization, action potential, photosynthesis, gene regulation, morphogen patterning) will be examined at the light of these two principles with the aim to derive a quantitative expression describing their behavior. Each analytical model is finally validated by comparing it with the corresponding experimental results from the literature.

By the end of the course, students will also learn to critically evaluate the concepts of making an assumption and making an approximation.

Theory and corresponding exercises are merged together during the classes.
Lecture notes

No lecture notes because the two proposed textbooks are more than exhaustive!

I am willingly available Mondays 17.00 o'clock - 18.00 in my office GLC F12.2 for whatever discussion about the lessons and the exercises.

!!! I am using OneNote. All lectures will be broadcast via ZOOM, while corresponding videos of the previous years (lectures and exercises) are available in Moodle !!!

Literature

As further deepening:

Prerequisites / notice

Participants need a good command of
• differentiation and integration of a function with one or more variables (basics of Analysis),
• Newton's and Coulomb's laws (basics of Mechanics and Electrostatics).

Notions of vectors in 2D and 3D are beneficial.

Competencies

227-0976-00L Computational Psychiatry & Computational Psychosomatics

W 2 credits 4S K. Stephan

Abstract

This seminar deals with the development of clinically relevant computational tools and/or their application to psychiatry and psychosomatics. It is complementary to the annual Computational Psychiatry Course and serves to build bridges between computational scientists and clinicians. It is designed to foster in-depth exchange, with ample time for discussion.

Objective

Understanding strengths and weaknesses of current trends in the development of clinically relevant computational tools and their application to problems in psychiatry and psychosomtics.

Content

This seminar deals with the development of computational tools (e.g. generative models, machine learning) and/or their application to psychiatry and psychosomatics. The seminar includes (i) presentations by computational scientists and clinicians, (ii) group discussion with focus on methodology and clinical utility, (iii) self-study based on literature provided by presenters.

Literature

Literature for additional self-study of the topics presented in this seminar will be provided by the presenters and will be available online at https://www.tnu.ethz.ch/en/teaching

Prerequisites / notice

Participants are expected to be familiar with general principles of statistics (including Bayesian statistics) and have successfully completed the course “Computational Psychiatry” (Course number 227-0971-00L).

227-2037-00L Physical Modelling and Simulation

W 6 credits 4G J. Smajic

Abstract

This module consists of (a) an introduction to fundamental equations of electromagnetics, mechanics and heat transfer, (b) a detailed overview of numerical methods for field simulations, and (c) practical examples solved in form of small projects.

Objective

Basic knowledge of the fundamental equations and effects of electromagnetics, mechanics, and heat transfer. Knowledge of the main concepts of numerical methods for physical modelling and simulation. Ability (a) to develop own simple field simulation programs, (b) to select an appropriate field solver for a given problem, (c) to perform field simulations, (d) to evaluate the obtained results, and (e) to interactively improve the models until sufficiently accurate results are obtained.
The module begins with an introduction to the fundamental equations and effects of electromagnetics, mechanics, and heat transfer. After the introduction follows a detailed overview of the available numerical methods for solving electromagnetic, thermal and mechanical boundary value problems. This part of the course contains a general introduction into numerical methods, differential and integral forms, linear equation systems, Finite Difference Method (FDM), Boundary Element Method (BEM), Method of Moments (MoM), Multiple Multipole Program (MMP) and Finite Element Method (FEM). The theoretical part of the course finishes with a presentation of multiphysics simulations through several practical examples of HF-engineering such as coupled electromagnetic-mechanical and electromagnetic-thermal analysis of MEMS.

In the second part of the course the students will work in small groups on practical simulation problems. For solving practical problems the students can develop and use own simulation programs or chose an appropriate commercial field solver for their specific problem. This practical simulation work of the students is supervised by the lecturers.

### 263-3210-00L Deep Learning

**W** 8 credits 3V+2U+2A T. Hofmann

**Abstract**

Deep learning is an area within machine learning that deals with algorithms and models that automatically induce multi-level data representations.

**Objective**

In recent years, deep learning and deep networks have significantly improved the state-of-the-art in many application domains such as computer vision, speech recognition, and natural language processing. This class will cover the mathematical foundations of deep learning and provide insights into model design, training, and validation. The main objective is a profound understanding of why these methods work and how. There will also be a rich set of hands-on tasks and practical projects to familiarize students with this emerging technology.

**Prerequisites / notice**

This is an advanced level course that requires some basic background in machine learning. More importantly, students are expected to have a very solid mathematical foundation, including linear algebra, multivariate calculus, and probability. The course will make heavy use of mathematics and is not (!) meant to be an extended tutorial of how to train deep networks with tools like Torch or Tensorflow, although that may be a side benefit.

The participation in the course is subject to the following condition:

- Students must have taken the exam in Advanced Machine Learning (252-0535-00) or have acquired equivalent knowledge, see exhaustive list below:
  
  Advanced Machine Learning

### 263-5702-00L Seminar on Digital Humans

**W** 2 credits 2S M. Gross, B. Solenthaler, O. Sorkine Hornung, S. Tang, R. Wampfler

**Abstract**

This seminar covers advanced topic in digital humans with a focus on the latest research results. Topics include estimating human pose and motion from images, human motion synthesis, learning-based human avatar creation, learning neural implicit representations for humans, modeling, animations, artificial intelligence for digital characters, and others. A collection of research papers is selected.

**Objective**

The goal is to get an overview of actual research topics in the field of digital humans and to improve presentation and critical analysis skills.

**Content**

This seminar covers advanced topics in digital humans including both seminal research papers as well as the latest research results. A collection of research papers are selected covering topics such as estimating human pose and motion from images, human motion synthesis, learning-based human avatar creation, learning neural implicit representations for humans, modeling, animations, artificial intelligence for digital characters, and others. Each student presents one paper to the class and leads a discussion about the paper. All students read the papers and participate in the discussion.

### 263-5902-00L Computer Vision

**W** 8 credits 3V+1U+3A M. Pollefeys, S. Tang, F. Yu

**Abstract**

The goal of this course is to provide students with a good understanding of computer vision and image analysis techniques. The main concepts and techniques will be studied in depth and practical algorithms and approaches will be discussed and explored through the exercises.

**Objective**

The objectives of this course are:

1. To introduce the fundamental problems of computer vision.
2. To introduce the main concepts and techniques used to solve those.
3. To enable participants to implement solutions for reasonably complex problems.
4. To enable participants to make sense of the computer vision literature.

**Content**

Camera models and calibration, invariant features, Multiple-view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition

**Prerequisites / notice**

It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts before taking this course.

### 376-1103-00L Frontiers in Nanotechnology

**W** 4 credits 4V V. Vogel, further lecturers

**Abstract**

Many disciplines are meeting at the nanoscale, from physics, chemistry to engineering, from the life sciences to medicine. The course will prepare students to communicate more effectively across disciplinary boundaries, and will provide them with deep insights into the various frontiers.
Objective

Building upon advanced technologies to create, visualize, analyze and manipulate nano-structures, as well as to probe their nano-chemistry, nano-mechanics and other properties within manmade and living systems, many exciting discoveries are currently made. They change the way we do science and result in so many new technologies.

The goal of the course is to give Master and Graduate students from all interested departments an overview of what nanotechnology is all about, from analytical techniques to nanosystems, from physics to biology. Students will start to appreciate the extent to which scientific communities are meeting at the nanoscale. They will learn about the specific challenges and what is currently sizzling in the respective fields, and learn the vocabulary that is necessary to communicate effectively across departmental boundaries.

Each lecturer will first give an overview of the state-of-the art in his/her field, and then describe the research highlights in his/her own research group. While preparing their Final Projects and discussing them in front of the class, the students will deepen their understanding of how to apply a range of new technologies to solve specific scientific problems and technical challenges. Exposure to the different frontiers will also improve their ability to conduct effective nanoscale research, recognize the broader significance of their work and to start collaborations.

Content

Starting with the fabrication and analysis of nanoparticles and nanostructured materials that enable a variety of scientific and technical applications, we will transition to discussing biological nanosystems, how they work and what bioinspired engineering principles can be derived, to finally discussing biomedical applications and potential health risk issues. Scientific aspects as well as the many of the emerging technologies will be covered that start impacting so many aspects of our lives. This includes new phenomena in physics, advanced materials, novel technologies and new methods to address major medical challenges.

Lecture notes

All the enrolled students will get access to a password protected website where they can find pdf files of the lecture notes, and typically 1-2 journal articles per lecture that cover selected topics.

376-1176-00L Wearable and Mobile Technologies of the Future - Focus on Sports and Health

Objective 1:
Acquire knowledge about wearable and unobtrusive technologies and skills to process data acquired using wearable technologies.

Objective 2:
Provide students with hands-on experience using various wearable technologies, including textile-based stretchable sensors, electromyography (EMG), electroencephalogram (EEG) and electrocardiogram (ECG).

Content

The course consists of the following modules:

Module 0: Fundamentals
This module briefly reviews time-frequency domains, transforms and filtering.

Module 1: Movement.
This module provides the scientific background needed to understand the principles that current technologies investigating movement rely on. It provides an overview of wearable technologies for monitoring overall body movement as well as for tracking motion parameters (e.g. gait, running, posture). Technologies such as inertial measurement units, electromyography, optical motion capture systems, and others are covered. The latest updates on wearable-related (e.g., textile-based) technologies are also introduced. Students are involved in labs/assignments to put into practice the knowledge and skills acquired during this module.

Module 2: Brain.
This module briefly introduces brain functions and provides an overview of related wearable technologies. Topics covered may include electroencephalograms, transcranial magnetic stimulation, and galvanic vestibular stimulation. Data processing techniques such as common spatial patterns, principal component analysis, and linear discriminant analysis are introduced. Students are given a practical assignment to put into practice the knowledge and skills acquired during this module.

Module 3: Cardiac.
This module focuses on wearable technologies for monitoring cardiac health. The module starts by providing information on cardiac physiology and introduces wearable technologies for the heart. Topics such as electrocardiography, photoplethysmography, light sensing, and contactless physiology monitoring are introduced. Data analysis techniques for cardiac data including heart-rate variability, Poincare plots, and wavelet transforms are discussed. Students will be given an assignment to put into practice the knowledge and skills acquired during this module.

Prerequisites / notice

- Students should be proficient in programming (any language).
- Note: assignments will be in Python. Students are expected to learn Python on their own if not experienced with this programming language.
- Course prerequisites:
  - For Biomedical Engineering Master's: none
  - For ITET Master's: none
  - For D-NAVY Master's: none
  - For D-HEST Master's and PhD students:
    - If BSc in electrical/mechanical engineering or computer science: none
    - If any other BSc program: 376-0022-00L (Imaging and Computing in Medicine) or 376-1983-00L (Foundations of Data Science)

Abstract
Rehabilitation Engng is the application of science and technology to ameliorate the handicaps of individuals with disabilities to reintegrate them into society. The goal is to present classical and new rehabilitation engineering principles applied to compensate or enhance motor, sensory, and cognitive deficits. Focus is on the restoration and treatment of the human sensory and vegetative system.

Objective
Provide knowledge on the anatomy and physiology of the human sensory system, related dysfunctions and pathologies, and how rehabilitation engineering can provide sensory restoration and substitution.

This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.

Content
Introduction, problem definition, overview
Rehabilitation of visual function
- Anatomy and physiology of the visual sense
- Technical aids (glasses, sensor substitution)
- Retina and cortex implants
Rehabilitation of hearing function
- Anatomy and physiology of the auditory sense
- Hearing aids
- Cochlea Implants
Rehabilitation and use of kinesthetic and tactile function
- Anatomy and physiology of the kinesthetic and tactile sense
- Tactile/haptic displays for motion therapy (incl. electrical stimulation)
- Role of displays in motor learning
Rehabilitation of vestibular function
- Anatomy and physiology of the vestibular sense
- Rehabilitation strategies and devices (e.g. BrainPort)
Rehabilitation of vegetative Functions
- Cardiac Pacemaker
- Phrenic stimulation, artificial breathing aids
- Bladder stimulation, artificial sphincter
Brain stimulation and recording
- Deep brain stimulation for patients with Parkinson, epilepsy, depression
- Brain-Computer Interfaces

VideoTact, ForeThought Development, LLC. http://my.execpc.com/?dwysocki/videotac.html
This course is an introduction to techniques in micro/nanotechnology and to microfluidics. It reviews how many familiar devices are built and can be used for research and biomedical applications. Transistors for DNA sequencing, beamers for patterning proteins, hard-disk technology for biosensing and microfluidics for point-of-care diagnostics are just a few examples of the covered topics.

The main objective of the course is to introduce micro/nanotechnology and microfluidics to students having any technical background. The course is multi-disciplinary and covers a broad range of techniques. For each lecture, a brief historical perspective is given to illustrate by whom and how the techniques were invented.

The course should familiarize the students with the techniques used in micro/nanotechnology, cleanroom microfabrication, and show them how micro/nanotechnology pervades throughout life sciences. Microfluidics will be emphasized due to their increasing importance in research and for medical applications.

The second objective is to have life sciences students less intimidated by micro/nanotechnology and make them able to link instruments and techniques to specific problems that they might have in their projects/studies. This will also help students getting access to the ETHZ/IBM Nanotech Center infrastructure if needed.

In terms of technical content, the lectures will cover:
- an overview of the microelectronic industry, Moore’s law, field-effect transistors, next-generation DNA sequencing
- liquid crystal displays, organic light emitting diodes, electrophoretic displays, micromirrors and beamers, photopatterning of proteins and cells, optogenetics, and flexible displays and electronics
- hard disk drives and the giant magnetoresistance effect, magnetic nanoparticles, photonics, magnetic sensing and optical biosensing
- cleanroom techniques and instruments, from design to microfabrication of simple devices and microfluidics, examples of DNA microarrays
- the principles of microfluidics, microfluidic functions and fabrication, from microfluidics for research to point-of-care diagnostics, and the (infamous) history of Theranos, as well as some discussions on diagnostics for COVID, R0, and (im)precision of diagnostic devices and why it matters
- 2 x 45 min will be covered by Yuksel Temiz, a master of Arduino programming and do-it-yourself electronics, who will present how to make $20 electronic components that are synergistic to microfluidic devices and that can be controlled using a smartphone

We will investigate the theoretical concepts behind microfluidic device operation, the methods of microfluidic device manufacture and the application of microfluidic architectures to important problems faced in modern day chemical and biological analysis.

A central component of this course is a research project. This will allow students to develop a practical understanding of the benefits of miniaturization in chemical and biological experimentation. Projects will be performed in groups of between four and six students and will include both experimental and simulation aspects. Each group, under the guidance of a mentor, will plan and execute a novel research project. The results of this activity will be disseminated through an ‘academic-style’ research article and a ‘conference-style’ oral presentation. Course grades will be evaluated through both a written exam and the project grade.
Specific topics covered in the course include, but are not limited to:

1. Theoretical Concepts
   Scaling laws, features of thermal/mass transport, diffusion, basic description of fluid flow in small volumes, microfluidic mixing strategies.

2. Microfluidic Device Manufacture
   Basic principles of conventional lithography of rigid materials, 'soft' lithography, polymer machining (injection molding, hot embossing, and 3D-printing).

3. Electrokinetics
   Principles of electrophoresis, electroosmosis, high performance capillary electrophoresis, electrokinetic scaling laws, chip-based electrophoresis and isoelectric focusing.

4. Mass Transfer Phenomena
   Key features of mass transport in microfluidic systems, diffusive transport, diffusion-convection, Péclet number, Taylor-Aris diffusion, chaotic mixing and Damköhler numbers.

5. Heat Transfer Phenomena
   Key features of thermal transport in microfluidic systems, conduction, convection, heat transfer by convection in internal flows, heat transfer processes in microfluidic devices.

6. Microfluidic Systems for Materials Synthesis
   Microfluidic reactors for the controlled synthesis of colloidal nanomaterials, advanced automation for bespoke materials discovery & characterization.

7. Point-of-Care Diagnostics
   Microscale tools for diagnostics, challenges associated with point-of-care (PoC) diagnostic testing, requirements for PoC devices, common PoC device formats, applications of PoC diagnostics in the developing world.

8. Microscale DNA Amplification
   Amplification and analysis of nucleic acids using batch, continuous flow and droplet-based microfluidic reactors.

9. Small volume Molecular Detection
   Spectroscopic approaches for analyte detection in small volumes with a particular focus on single molecule detection.

10. Droplets and Segmented Flows
   Formation, manipulation and use of liquid/liquid segmented flows in chemical and biological experimentation.

Lecture notes

Lecture handouts, background literature, problem sheets and notes will be provided electronically through the course Moodle site.

Literature

There is no set text for the course. All relevant literature will be provided electronically through the course Moodle site.

Objective

- Identify advantages and limitations of different imaging methods in relation to medical diagnostic applications

- Explain the physical and mathematical foundations of diagnostic medical imaging systems

- Characterize system performance based on signal-to-noise ratio, contrast-to-noise ratio and transfer function

- Design a basic diagnostic imaging system chain including data acquisition and data reconstruction

- Upon completion of the course students are able to:

- Signal theory and processing (foundations, transforms, filtering, signal-to-noise ratio)
- X-rays (production, tissue interaction, contrast, modular transfer function)
- X-rays (resolution, detection, digital subtraction angiography, Radon transform)
- X-rays (filtered back-projection, spiral computed tomography, image quality, dose)
- Nuclear imaging (radioactive tracer, collimation, point spread function, SPECT/PET)
- Nuclear imaging (detection principles, image reconstruction, kinetic modelling)
- Magnetic Resonance (magnetic moment, spin transitions, excitation, relaxation, detection)
- Magnetic Resonance (plane wave encoding, Fourier reconstruction, pulse sequences)
- Magnetic Resonance (contrast mechanisms, gradient- and spin-echo, applications)
- Ultrasound (mechanical wave generation, propagation in tissue, reflection, transmission)
- Ultrasound (spatial and temporal resolution, phased arrays)
- Ultrasound (Doppler shift, implementations, applications)
- Summary, example exam questions

- Communication assessed

- Cooperation and Teamwork assessed

- Adaptable and Flexibility fostered

- Critical Thinking assessed

- Integrity and Work Ethics fostered

- Self-direction and Self-management fostered

**Abstract**

Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The focus is on learning the basic vocabulary of biomedical engineering and getting familiar with concepts that govern common medical instruments and the most important organs from an engineering point of view.

**Objective**

Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The course provides an overview of the various topics of the different tracks of the biomedical engineering master course and helps orienting the students in selecting their specialized classes and project locations. It also serves as an introduction to the field for students of the ITET, MAVT, HEST and other bachelor programs. In addition, the most recent achievements and trends of the field of biomedical engineering are also outlined.

**Content**

- History of BME and the role of biomedical engineers. Ethical issues related to BME.
- Biomedical sensors both wearable and also biochemical sensors.
- Bioelectronics: Nernst equation, Donnan equilibrium, equivalent circuits of biological membranes and bioelectronic devices.
- Equations describing basic reactions and enzyme kinetics.
- Medical optics: Optical components and systems used in hospitals.
- Basic concepts of tissue engineering and organ printing.
- Biomaterials and their medical applications.
- Function of the heart and the circulatory system.
- Transport and exchange of substances in the human body, compartment modeling.
- The respiratory system.
- Bioimaging.
- Orthopedic biomechanics.
- Lectures (2h), discussion of practical exercises (1h) and homework exercises.

**Lecture notes**

- Introduction to Biomedical Engineering by Enderle, Banchard, and Bronzino

**Prerequisites / notice**

- No specific requirements, BUT ITET, MAVT, PHYS students will have to learn a lot of new words related to biochemistry, biology and medicine, while HEST and BIOL students will have to grasp basic engineering concepts (circuits, equations, etc.).

**Competencies**

<table>

- Integrity and Work Ethics fostered

- Self-awareness and Self-reflection fostered

- Self-direction and Self-management fostered

**Abstract**

**Objective**

Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.
Content
This course aims at offering a self-contained account of computer vision and its underlying concepts, including the recent use of deep learning.

The first part starts with an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First the interaction of light with matter is considered. The most important hardware components such as cameras and illumination sources are also discussed. The course then turns to image discretization, necessary to process images by computer. The next part describes necessary pre-processing steps, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and 3D shape as two important examples. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed. A major part at the end is devoted to deep learning and AI-based approaches to image analysis. Its main focus is on object recognition, but also other examples of image processing using deep neural nets are given.

Lecture notes
Course material script, computer demonstrations, exercises and problem solutions

Prerequisites / notice
Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Python and Linux.

The course language is English.

227-0965-00L Micro and Nano-Tomography of Biological Tissues

Objective
Introduction to the basic concepts of X-ray tomographic imaging, image analysis and data quantification at the micro and nano scale with particular emphasis on biological applications.

Content
Synchrotron-based X-ray micro- and nano-tomography is today a powerful technique for non-destructive, high-resolution investigations of a broad range of materials. The high-brilliance and high-coherence of third generation synchrotron radiation facilities allow quantitative, three-dimensional imaging at the micro and nanometer scale and extend the traditional absorption imaging technique to edge-enhanced and phase-sensitive measurements, which are particularly suited for investigating biological samples.

The course includes a general introduction to the principles of tomographic imaging from image formation to image reconstruction. It provides the physical and engineering basics to understand how imaging beamlines at synchrotron facilities work, looks into the recently developed phase contrast methods, and explores the first applications of X-ray nano-tomographic experiments.

The course finally provides the necessary background to understand the quantitative evaluation of tomographic data, from basic image analysis to complex morphometrical computations and 3D visualization, keeping the focus on biomedical applications.

Lecture notes
Will be indicated during the lecture.

Literature
Available online

IMPORTANT: "qubits" from the point of view of NMR (and NOT from that of quantum computing!!!).

Recommended Elective Courses
These courses are particularly recommended for the Bioimaging track. Please consult your track advisor if you wish to select other subjects.

Number Title Type ECTS Hours Lecturers
227-0311-00L Qubits, Electrons, Photons W 6 credits 3V+2U T. Zambelli

Abstract
In-depth analysis of the quantum mechanics origin of nuclear magnetic resonance (qubits, two-level systems), of LASER (quantization of the electromagnetic field, photons), and of electron transfer (from electrochemistry to photosynthesis).

Objective
Beside electronics nanodevices, D-ITET is pushing its research in the fields of NMR (MRI), electrochemistry, bioelectronics, nano-optics, and quantum information, which are all rationalized in terms of quantum mechanics.

Starting from the axioms of quantum mechanics, we will derive the fascinating theory describing spin and qubits, electron transitions and transfer, photons and LASER: quantum mechanics is different because it mocks our daily Euclidean intuition!

In this way, students will work out a robust quantum mechanics (theoretical!!!) basis which will help them in their advanced studies of the following masters: EEIT (batteries), Biomedical Engineering (NMR, bioelectronics), Quantum Engineering, Micro- and Nanosystems.

Content
- Lagrangian and Hamiltonian: Symmetries and Poisson Brackets
- Postulates of QM: Hilbert Spaces and Operators
- Heisenberg’s Matrix Mechanics: Hamiltonian and Time Evolution Operator
- Density Operator
- Spin: Qubits, Bloch Equations, and NMR
- Entanglement
- Symmetries and Corresponding Operators
- Schrödinger’s Wave Mechanics: Electrons in a Periodic Potential and Energy Bands
- Harmonic Oscillator: Creation and Annihilation Operators
- Identical Particles: Bosons and Fermions
- Quantization of the Electromagnetic Field: Photons, Absorption and Emission, LASER
- Electron Transfer: Marcus Theory via Born-Oppenheimer, Franck-Condon, Landau-Zener

Lecture notes
No lecture notes because the proposed textbooks together with the provided supplementary material are more than exhaustive!

Literature

Supplementary material will be uploaded in Moodle.

Data: 06.08.2024 12:40 Autumn Semester 2024 Page 391 of 2684
The main goal of this lecture is to provide a comprehensive overview into the learning principles neuronal networks as well as to introduce computational neuroimaging. The lecture slides will be provided as a PDF after each lecture.

Deep-Learning (DL) a brain-inspired weak for of AI allows training of large artificial neuronal networks (ANNs) that, like humans, can learn real-world tasks such as recognizing objects in images. However, DL is far from being understood and investigating learning in biological networks might serve again as a compelling inspiration to think differently about state-of-the-art ANN training methods.

The main goal of this lecture is to provide a comprehensive overview into the learning principles neuronal networks as well as to introduce a diverse skill set (e.g. simulating a spiking neuronal network) that is required to understand learning in large, hierarchical neuronal networks. To achieve this the lectures and exercises will merge ideas, concepts and methods from machine learning and neuroscience. These will include training basic ANNs, simulating spiking neuronal networks as well as being able to read and understand the main ideas presented in today’s neuroscience papers.

After this course students will be able to:
- read and understand the main ideas and methods that are presented in today's neuroscience papers
- explain the basic ideas and concepts of plasticity in the mammalian brain
- implement alternative ANN learning algorithms to 'error backpropagation' in order to train deep neuronal networks.
- use a diverse set of ANN regularisation methods to improve learning
- simulate spiking neuronal networks that learn simple (e.g. digit classification) tasks in a supervised manner.

227-0421-00L Learning in Deep Artificial and Biological Neuronal Networks

Abstract
Deep-learning a brain-inspired weak form of AI allows training of large artificial neuronal networks (ANNs) that, like humans, can learn real-world tasks such as recognizing objects in images. However, DL is far from being understood and investigating learning in biological networks might serve again as a compelling inspiration to think differently about state-of-the-art ANN training methods.

Objective
The main goal of the lecture is to provide a comprehensive overview into the learning principles neuronal networks as well as to introduce a diverse skill set (e.g. simulating a spiking neuronal network) that is required to understand learning in large, hierarchical neuronal networks. To achieve this the lectures and exercises will merge ideas, concepts and methods from machine learning and neuroscience. These will include training basic ANNs, simulating spiking neuronal networks as well as being able to read and understand the main ideas presented in today’s neuroscience papers.

Content
Deep-learning a brain-inspired weak form of AI allows training of large artificial neuronal networks (ANNs) that, like humans, can learn real-world tasks such as recognizing objects in images. The origins of deep hierarchical learning can be traced back to early neuroscience research by Hubel and Wiesel in the 1960s, who first described the neuronal processing of visual inputs in the mammalian neocortex. Similar to their neocortical counterparts ANNs seem to learn by interpreting and structuring the data provided by the external world.

However, while on specific tasks such as playing (video) games deep ANNs outperform humans (Minh et al., 2015, Silver et al., 2018), ANNs are still not performing on par when it comes to recognizing actions in movie data and their ability to act as generalizable problem solvers is still far behind of what the human brain seems to achieve effortlessly. Moreover, biological neuronal networks can learn far more effectively with fewer training examples, they achieve a much higher performance in recognizing complex patterns in time series data (e.g. recognizing actions in movies), they dynamically adapt to new tasks without losing performance and they achieve unmatched performance to detect and integrate out-of-domain data examples (data they have not been trained with). In other words, many of the big challenges and unknowns that have emerged in the field of deep learning over the last years are already mastered exceptionally well by biological neuronal networks in our brain. On the other hand, many facets of typical ANN design and training algorithms seem biologically implausible, such as the non-local weight updates, discrete processing of time, and scalar communication between neurons. Recent evidence suggests that learning in biological systems is the result of the complex interplay of diverse error feedback signaling processes acting at multiple scales, ranging from single synapses to entire networks.

Lecture notes
The lecture slides will be provided as a PDF after each lecture.

Prerequisites / notice
This advanced level lecture requires some basic background in machine/deep learning. Thus, students are expected to have a basic mathematical foundation, including linear algebra, multivariate calculus, and probability. The course is not to be meant as an extended tutorial for deep networks in PyTorch or Tensorflow, although these tools are used.

The participation in the course is subject to the following conditions:

1) The number of participants is limited to 120 students (MSc and PhDs).

2) Students must have taken the exam in Deep Learning (263-3210-00L) or have acquired equivalent knowledge.

227-0967-00L Computational Neuroimaging Clinic

Abstract
This seminar teaches problem solving skills for computational neuroimaging, based on analyses of neuroimaging and behavioural data. It deals with a wide variety of real-life problems that are brought to this meeting from the neuroimaging community at Zurich, e.g. mass-univariate and multivariate analyses of fMRI/EEG data, or generative models of fMRI, EEG, or behavioural data.

Objective
1. Consolidation of theoretical knowledge (obtained in the following courses: 'Methods & models for fMRI data analysis', 'Translational Neuromodeling', 'Computational Psychiatry') in the setting of concrete research questions.

Content

This course covers analog circuits with emphasis on neuromorphic engineering: MOS transistors in CMOS technology, static circuits, and neuromorphic circuits include silicon retinas and cochleas for machine vision and audition, real-time emulations of networks of biological neurons, and high-density, low-power implementations of functions that are computationally intensive in other paradigms. Application domains of neuromorphic circuits include silicon retinas and cochleas for machine vision and audition, real-time emulations of networks of biological neurons, and the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS transistor, phototransducers), static circuits (differential pair, current mirror, transconductance amplifiers, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silicon neuron, silicon retina and cochlea) and an introduction to multi-chip systems that communicate events analogous to spikes. The lectures are accompanied by weekly laboratory sessions. Neuronal circuits are inspired by the organizing principles of biological neural circuits. Their computational primitives are based on the physics of semiconductor devices. Neuromorphic architectures often rely on collective computation in parallel networks. Adaptation, learning and memory are implemented locally within the individual computational elements. Transistors are often operated in weak inversion (below threshold), where they exhibit exponential I-V characteristics and low currents. These properties lead to the feasibility of high-density, low-power implementations of functions that are computationally intensive in other paradigms. Application domains of neuromorphic circuits include silicon retinas and cochleas for machine vision and audition, real-time emulations of networks of biological neurons, and the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS transistor, phototransducers), static circuits (differential pair, current mirror, transconductance amplifiers, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silicon neuron, silicon retina and cochlea) and an introduction to multi-chip systems that communicate events analogous to spikes. The lectures are accompanied by weekly laboratory sessions.

**Abstract**

This course teaches methods and models for fMRI data analysis, covering all aspects of statistical parametric mapping (SPM), incl. preprocessing, the general linear model, statistical inference, multiple comparison corrections, and event-related designs, and Dynamic Causal Modelling (DCM), a Bayesian framework for identification of nonlinear neuronal systems from neurophysiological data.

**Content**

This course teaches state-of-the-art methods and models for fMRI data analysis in lectures and exercises. It covers all aspects of statistical parametric mapping (SPM), incl. preprocessing, the general linear model, frequentist and Bayesian inference, multiple comparison corrections, and event-related designs, and Dynamic Causal Modelling (DCM), a Bayesian framework for identification of nonlinear neuronal systems from neurophysiological data. A particular emphasis of the course will be on methodological questions arising in the context of clinical studies in psychiatry and neurology. Practical exercises serve to consolidate the skills taught in lectures.

**Abstract**

This six-day course teaches state-of-the-art methods in computational psychiatry. It covers various computational models of cognition (e.g., learning and decision-making) and brain physiology (e.g., effective connectivity) of relevance for psychiatric disorders. The course not only provides theoretical background, but also demonstrates open source software in application to concrete examples. Furthermore, practical exercises provide in-depth exposure to different software packages. Please see http://www.translationalneuromodeling.org/cpcourse/ for details.

**Abstract**

The course provides an introduction to the fundamental properties of neurons. Particularly the description of membrane electrical properties (action potentials, channels), neuronal anatomy, synaptic structures, and neuronal networks. Simple models of computation, learning, and behavior will be explained. Some artificial systems (robot, chip) are presented.
Subject-specific Competencies

This module consists of (a) an introduction to fundamental equations of electromagnetics, mechanics and heat transfer, (b) a detailed overview of numerical methods for field simulations, and (c) practical examples solved in form of small projects.

Content

This course considers the structure and function of biological neural networks at different levels. The function of neural networks lies fundamentally in their wiring and in the electro-chemical properties of nerve cell membranes. Thus, the biological structure of the nerve cell needs to be understood if biologically-realistic models are to be constructed. These simpler models are used to estimate the electrical current flow through dendritic cables and explore how a more complex geometry of neurons influences this current flow. The active properties of neurons are studied to understand both sensory transduction and the generation and transmission of nerve impulses along axons. The concept of local neuronal circuits arises in the context of the rules governing the formation of nerve connections and topographic projections within the nervous system. Communication between neurons in the network can be thought of as information flow across synapses, which can be modified by experience. We need an understanding of the action of inhibitory and excitatory neurotransmitters and neuromodulators, so that the dynamics and logic of synapses can be interpreted. Finally, simple neural architectures of feedforward and recurrent networks are discussed in the context of co-ordination, control, and integration of sensory and motor information.

Connections to computer science and artificial intelligence are discussed, but the main focus of the course is on establishing the biological basis of computations in neurons.

Prerequisites:

Fundamentals of calculus and linear algebra, basic concepts of algorithms and data structures, programming skills in C++, and the Visual Computing course are recommended.

Computation by neurons and neuronal circuits is one of the great challenges of science. Many different disciplines can contribute their tools and concepts to solving mysteries of neural computation. The goal of this introductory course is to introduce the monocultures of physics, maths, computer science, engineering, biology, psychology, and even philosophy and history, to discover the enchantments and challenges that we all face in taking on this major 21st century problem and how each discipline can contribute to discovering solutions.

This module of the course covers fundamental and advanced concepts of modern computer graphics. Students will learn the fundamentals of digital scene representations, advanced physically-based light transport algorithms for generating photo-realistic images from these scene representations, and inverse rendering methods for recovering digital scene representations from captured images. At the end of the course, the students will be able to build a rendering system based on path-tracing algorithms. The students will learn the principles of physically-based rendering and computer graphics. In addition, the course is intended to stimulate the student's curiosity to explore the field of computer graphics in subsequent classes or on their own.

Students can develop and use own simulation programs or chose an appropriate commercial field solver for their specific problem. This practical simulation work of the students is supervised by the lecturers.

The course lectures will conclude with an overview of image-based capture and rendering methods. Topics covered will include geometry reconstruction, material acquisition, differentiable rendering, and image-based rendering.

The course focuses on the development of a rendering system based on path tracing algorithms. Subsequently, we will introduce relevant concepts from Monte Carlo integration and develop path-tracing algorithms to solve these equations by simulating light transport for direct and global illumination due to hard surfaces and participating media, such as fog, smoke, and translucent objects. Moreover, we will present techniques for significantly improving path-tracing efficiency, including importance sampling, multiple importance sampling, stratified sampling, denoising, and acceleration data structures.

The course will conclude with an overview of image-based capture and rendering methods. Topics covered will include geometry reconstruction, material acquisition, differentiable rendering, and image-based rendering.

The course will cover the fundamentals of digital scene representations, advanced physically-based light transport algorithms for generating photo-realistic images from these scene representations, and inverse rendering methods for recovering digital scene representations from captured images.

Next, we will mathematically formulate the physics of light transport and appearance modeling. Subsequently, we will introduce relevant concepts from Monte Carlo integration and develop path-tracing algorithms to solve these equations by simulating light transport for direct and global illumination due to hard surfaces and participating media, such as fog, smoke, and translucent objects. Moreover, we will present techniques for significantly improving path-tracing efficiency, including importance sampling, multiple importance sampling, stratified sampling, denoising, and acceleration data structures.

The course will conclude with an overview of image-based capture and rendering methods. Topics covered will include geometry reconstruction, material acquisition, differentiable rendering, and image-based rendering.
The lecture series is motivated by an overview covering the skin of the crystals, roughness analysis, contact angle measurements, protein absorption/activity and monocyte behaviour.

As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting, oxide and organic surfaces are introduced.

The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical way. The evolution of the surface morphology is characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure's shapes, which are based on the strain relieving mechanisms and kinetic growth processes.

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. Recently, ellipsometry has been introduced to on-line monitor film thickness, and roughness with sub-nanometer precision. These characterisation techniques are vital for optimising the preparation of medical implants.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.

X-rays are more and more often used to characterise the human tissues down to the nanometer level. The combination of highly intense beams only some micrometers in diameter with scanning enables spatially resolved measurements and the determination of tissue's anisotropies of biopsies.

Preparatory courses: Please mind the ETH enrolment deadlines for UZH students: https://www.ethz.ch/en/studies/non-degree-courses-special-students/special-students-university-of-zurich.html

Enrolment to this course unit only possible at ETH Zurich.

Please mind the ETH enrolment deadlines for UZH students: https://www.ethz.ch/en/studies/non-degree-courses-special-students-university-of-zurich.html

Participants are expected to be familiar with general principles of statistics (including Bayesian statistics) and have successfully completed the course "Computational Psychiatry" (Course number 227-0971-00L).

Objective

Physiology and Anatomy for Biomedical Engineers I

Students will be able to identify and enumerate important anatomical structures to describe basic physiological processes of the human body to use a 3d animation database/software to use 'anatomical language' to retrieve anatomical structures to understand basic medical terminology to understand basic principles and structure of the human body in consideration of the clinical relevance and the medical terminology used in medical work and research.

Content

- The Human Body: nomenclature, orientations, tissues
- Musculoskeletalsystem, Muscle contraction
- Blood vessels, Heart, Circulation
- Blood, Immune system
- Respiratory system
- Acid-Base Homeostasis

**Abstract**

Introduction to diagnostic medical imaging based on electromagnetic and acoustic fields including X-ray planar and tomographic imaging, radio-tracer based nuclear imaging techniques, magnetic resonance imaging and ultrasound-based procedures.

**Objective**

Upon completion of the course students are able to:

- Explain the physical and mathematical foundations of diagnostic medical imaging systems
- Characterize system performance based on signal-to-noise ratio, contrast-to-noise ratio and transfer function
- Design a basic diagnostic imaging system chain including data acquisition and data reconstruction
- Identify advantages and limitations of different imaging methods in relation to medical diagnostic applications

**Content**

- Introduction (intro, overview, history)
- Signal theory and processing (foundations, transforms, filtering, signal-to-noise ratio)
- X-rays (production, tissue interaction, contrast, transfer function)
- X-rays (resolution, detection, digital subtraction angiography, Radon transform)
- X-rays (filtered back-projection, spiral computed tomography, image quality, dose)
- Nuclear imaging (radioactive tracer, colimation, point spread function, SPECT/PET)
- Nuclear imaging (detection principles, image reconstruction, kinetic modelling)
- Magnetic Resonance (magnetic moment, spin transitions, excitation, relaxation, detection)
- Magnetic Resonance (plane wave encoding, Fourier reconstruction, pulse sequences)
- Magnetic Resonance (contrast mechanisms, gradient- and spin-echo, applications)
- Ultrasound (mechanical wave generation, propagation in tissue, reflection, transmission)
- Ultrasound (spatial and temporal resolution, phased arrays)
- Ultrasound (Doppler shift, implementations, applications)
- Summary, example exam questions

**227-0386-00L Biomedical Engineering**

**Abstract**

Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The focus is on learning the basic vocabulary of biomedical engineering and getting familiar with concepts that govern common medical instruments and the most important organs from an engineering point of view.

**Objective**

Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The course provides an overview of the various topics of the different tracks of the biomedical engineering master course and helps orienting the students in selecting their specialized classes and project locations. It also serves as an introduction to the field for students of the ITET, MAVT, HEST and other bachelor programs.

In addition, the most recent achievements and trends of the field of biomedical engineering are also outlined.
Content

History of BME and the role of biomedical engineers. Ethical issues related to BME.
Biomedical sensors both wearable and also biochemical sensors.
Bioelectronics: Nernst equation, Donnan equilibrium, equivalent circuits of biological membranes and bioelectronic devices.
Bioinformatics: genomic and proteomic tools, databases and basic calculations.
Equations describing basic reactions and enzyme kinetics.
Medical optics: Optical components and systems used in hospitals.
Basic concepts of tissue engineering and organ printing.
Biomaterials and their medical applications.
Function of the heart and the circulatory system.
Transport and exchange of substances in the human body, compartment modeling.
The respiratory system.
Bioimaging.
Orthopedic biomechanics.
Lectures (2h), discussion of practical exercises (1h) and homework exercises.

Lecture notes

Introduction to Biomedical Engineering
by Enderle, Banchard, and Bronzino

Prerequisites / notice

No specific requirements, BUT
ITEF, MAVT, PHYS students will have to learn a lot of new words related to biochemistry, biology and medicine, while
HEST and BIOL students will have to grasp basic engineering concepts (circuits, equations, etc.).

Competencies

Subject-specific Competencies
Concepts and Theories assessed
Techniques and Technologies assessed
Method-specific Competencies
Analytical Competencies assessed
Decision-making assessed
Media and Digital Technologies fostered
Problem-solving fostered
Social Competencies
Communication fostered
Cooperation and Teamwork fostered
Customer Orientation fostered
Leadership and Responsibility fostered
Self-presentation and Social Influence fostered
Sensitivity to Diversity fostered
Negotiation fostered
Personal Competencies
Adaptability and Flexibility fostered
Creative Thinking fostered
Critical Thinking fostered
Integrity and Work Ethics fostered
Self-awareness and Self-reflection fostered
Self-direction and Self-management fostered

Abstract

Image Analysis and Computer Vision
W 6 credits 3V+1U E. Konukoglu, E. Erdil, F. Yu

Objective

Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

Content

This course aims at offering a self-contained account of computer vision and its underlying concepts, including the recent use of deep learning.

The first part starts with an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First the interaction of light with matter is considered. The most important hardware components such as cameras and illumination sources are also discussed. The course then turns to image discretization, necessary to process images by computer.

The next part describes necessary pre-processing steps, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and 3D shape as two important examples. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed. A major part at the end is devoted to deep learning and AI-based approaches to image analysis. Its main focus is on object recognition, but also other examples of image processing using deep neural nets are given.

Lecture notes

Course material Script, computer demonstrations, exercises and problem solutions

Prerequisites / notice

Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Python and Linux.

Micro and Nano-Tomography of Biological Tissues
W 4 credits 3G M. Stampanoni, F. Marone Welford

Abstract

The lecture introduces the physical and technical know-how of X-ray tomographic microscopy. Several X-ray imaging techniques (absorption-, phase- and darkfield contrast) will be discussed and their use in daily research, in particular biology, is presented. The course discusses the aspects of quantitative evaluation of tomographic data sets like segmentation, morphometry and statistics.

Objective

Introduction to the basic concepts of X-ray tomographic imaging, image analysis and data quantification at the micro and nano scale with particular emphasis on biological applications.
Synopsis: Multiscale Bone Biomechanics

This course includes an introduction to study design, measurement techniques, signal processing, as well as musculoskeletal modeling with regards to human movement and its clinical applications.

Objective

The learning objectives include:

1. advanced knowledge of the state-of-the-art in multiscale bone biomechanics;
2. basic understanding of the biological principles governing bone in health, disease and treatment from molecules, to cells, tissue and up to the organ;
3. good understanding of the prevalent biomechanical testing and imaging techniques on the various levels of bone hierarchy;
4. practical implementation of state-of-the-art multiscale simulation techniques;
5. improved programming skills through the use of python;
6. hands on experience in designing solutions for clinical and industrial problems;
7. encouragement of critical thinking and creating an environment for independent and self-directed studying.

Content

Bone is one of the most investigated biological materials due to its primary function of providing skeletal stability. Bone is susceptible to different local stimuli including mechanical forces and has great capabilities in adapting its mechanical properties to the changes in its environment. Nevertheless, aging or hormonal changes can make bone lose its ability to remodel appropriately, with loss of strength and increased fracture risk as a result, leading to devastating diseases such as osteoporosis.

To better understand the biomechanical function of bone, one has to understand the hierarchical organization of this fascinating material down from the molecules, to cells, tissue and up to the organ. Multiscale imaging and simulation allow to link these different levels of hierarchy. Incorporating systems biology approaches, not only biomechanical strength of the material can be assessed but also the mechanobiological response of the bone triggered by loading and injury in scenarios relevant for personalized health. Watching cells working together to build and repair bone in a coordinated fashion is a spectacular, which will need dynamic image content and deep discussions in the lecture room to probe the imagination of the individual student interested in the topic. Lastly, state-of-the-art developments in tissue engineering and regeneration, 3D bioprinting and bio-manufacturing and organoid technology will be highlighted towards personalized health.

For the seminar, concepts of video lectures will be used in a flipped classroom setup, where students can study the basic biology, engineering, and mathematical concepts in video tutorials online (TORQUES). All videos and animations will be incorporated in Moodle and PolyBook allowing studying and interactive course participation online. It is anticipated that the students need to prepare 2x45 minutes for the study of the actual lecture material. The course is structured as a seminar in three parts of 45 minutes with video lectures and a flipped classroom setup. In the first part (TORQUES: Tiny, Open-with-Restrictions courses focused on QUality and Effectiveness), students study the basic concepts in short, interactive video lectures on the online learning platform Moodle. Students are able to pose questions at the end of each video lecture or the Moodle forum that will be addressed in the second part of the lectures using a flipped classroom concept. For the flipped classroom, the lecturers may prepare additional teaching material to answer the posted questions (Q&A).

Following the Q&A, the students will have to form small groups to try to solve such problems and to present their solutions for advanced multiscale investigation of bone ranging from basic science to clinical application. Towards the end of the semester, students will have to present self-selected publications associated with the different topics of the lecture identified through PubMed or the Web of Science.
### Recommended Elective Courses

These courses are particularly recommended for the Biomechanics track. Please consult your track advisor if you wish to select other subjects.

**Abstract**
The lecture deals with constitutive models that are relevant for the design and analysis of components and structures. These include anisotropic linear elasticity, linear viscoelasticity, plasticity and viscoplasticity. The basic concepts of homogenization and laminate theory are introduced. Theoretical models are complemented by examples of engineering applications and experiments.

**Objective**
After successful completion of the course students are able to:
- explain basic theories for solving continuum mechanics problems
- proficiently apply these theories by solving application-related academic examples
- relate the theories and examples to real engineering applications and challenges
- distinguish between different mechanical behaviors of materials
- systematically select appropriate constitutive theories suitable to analyze and model these materials

**Content**
Anisotropic Elasticity, Linear Elastic and Linear Viscous Material Behavior, Viscoelasticity, Micro-Macro Modelling, Laminate Theory, Plasticity, Viscoplasticity, Examples of Engineering Applications, Comparison with Experiments

**Abstract**
Microrobotics is an interdisciplinary field that combines aspects of robotics, micro and nanotechnology, biomedical engineering, and materials science. The aim of this course is to expose students to the fundamentals of this emerging field. Throughout the course, the students apply these concepts in assignments. The course concludes with an end-of-semester examination.

**Objective**
The objective of this course is to expose students to the fundamental aspects of the emerging field of microrobotics. This includes a focus on physical laws that predominate at the microscale, technologies for fabricating small devices, bio-inspired design, and applications of the field.

**Content**
Main topics of the course include:
- Scaling laws at micro/nano scales
- Electrostatics
- Electromagnetism
- Low Reynolds number flows
- Observation tools
- Materials and fabrication methods
- Applications of biomedical microrobots

**Lecture notes**
The powerpoint slides presented in the lectures will be made available as pdf files. Several readings will also be made available electronically.

**Prerequisites / notice**
The lecture will be taught in English.

**Abstract**
Project-oriented learning on how to develop technological solutions to address unmet clinical needs.
The goal is to get an overview of actual research topics in the field of digital humans and to improve presentation and critical analysis skills.

The course will cover the basic physics of ultrasound (acoustic waves at frequencies higher than the audible range) in biological tissues as well as the instrumentation required to generate and detect these waves. Imaging methods will extensively be described in the course. Specifically, standard and ultra-fast ultrasound imaging approaches will be covered along with new optoacoustic and transmission ultrasound imaging methods. The course will also describe mathematical modelling approaches and numerical methods as well as signal and image processing tools applicable in ultrasound-based imaging. Other topics include ultrasound sensors, laser ultrasound, therapeutic effects, or biomedical applications and contrast agents. The course will conclude with current and future research directions in the field of ultrasound in biomedicine.

The deadline for deregistering expires at the end of the third week of the semester. Students who are still registered after that date, but do not attend the seminar, will officially fail the seminar.

This course covers advanced topics in digital humans including both seminal research papers as well as the latest research results. A collection of research papers are selected covering topics such as estimating human pose and motion from images, human motion synthesis, learning-based human avatar creation, learning neural implicit representations for digital characters, and others. Each student presents one paper to the class and leads a discussion about the paper. All students read the papers and participate in the discussion.

This seminar covers advanced topics in digital humans with a focus on the latest research results. Topics include estimating human pose and motion from images, human motion synthesis, learning-based human avatar creation, learning neural implicit representations for digital characters, and others. Each student presents one paper to the class and leads a discussion about the paper. All students read the papers and participate in the discussion.

Many disciplines are meeting at the nanoscale, from physics, chemistry to engineering, from the life sciences to medicine. The course aims to prepare you for typical engineering challenges in the real-world where - in addition to the development of an elegant solution - interdisciplinary team work and effective communication play a key role.
Objective

Building upon advanced technologies to create, visualize, analyze and manipulate nano-structures, as well as to probe their nano-chemistry, nano-mechanics and other properties within manmade and living systems, many exciting discoveries are currently made. They change the way we do science and result in so many new technologies.

The goal of the course is to give Master and Graduate students from all interested departments an overview of what nanotechnology is all about, from analytical techniques to nanosystems, from physics to biology. Students will start to appreciate the extent to which scientific communities are meeting at the nanoscale. They will learn about the specific challenges and what is currently sizzling in the respective fields, and learn the vocabulary that is necessary to communicate effectively across departmental boundaries.

Each lecturer will first give an overview of the state-of-the art in his/her field, and then describe the research highlights in his/her own research group. While preparing their Final Projects and discussing them in front of the class, the students will deepen their understanding of how to apply a range of new technologies to solve specific scientific problems and technical challenges. Exposure to the different frontiers will also improve their ability to conduct effective nanoscale research, recognize the broader significance of their work and to start collaborations.

Content

Starting with the fabrication and analysis of nanoparticles and nanostructured materials that enable a variety of scientific and technical applications, we will transition to discussing biological nanosystems, how they work and what bioinspired engineering principles can be derived, to finally discussing biomedical applications and potential health risk issues. Scientific aspects as well as the many of the emerging technologies will be covered that start impacting so many aspects of our lives. This includes new phenomena in physics, advanced materials, novel technologies and new methods to address major medical challenges.

Lecture notes

All the enrolled students will get access to a password protected website where they can find pdf files of the lecture notes, and typically 1-2 journal articles per lecture that cover selected topics.

376-1176-00L Wearable and Mobile Technologies of the Future - Focus on Sports and Health

W 4 credits 3G C. Menon, C. Ahmadizadeh, C. Otesteanu

Abstract

The course introduces concepts about wearable and unobtrusive technologies for sport and health data collection. Tools for analysing this data and evaluating the performance of these systems are introduced. Topics such as monitoring movement and muscle activation, mental focus, stress, and heart health are covered.

Objective

Objective 1: Acquire knowledge about wearable and unobtrusive technologies and skills to process data acquired using wearable technologies.

Objective 2: Provide students with hands-on experience using various wearable technologies, including textile-based stretchable sensors, electromyography (EMG), electroencephalogram (EEG) and electrocardiogram (ECG).

Content

The course consists of the following modules:

Module 0: Fundamentals
This module briefly reviews time-frequency domains, transforms and filtering.

Module 1: Movement.
This module provides the scientific background needed to understand the principles that current technologies investigating movement rely on. It provides an overview of wearable technologies for monitoring overall body movement as well as for tracking motion parameters (e.g. gait, running, posture). Technologies such as inertial measurement units, electromyography, optical motion capture systems, and others are covered. The latest updates on wearable-related (e.g., textile-based) technologies are also introduced. Students are involved in labs/assignments to put into practice the knowledge and skills acquired during this module.

Module 2: Brain.
This module briefly introduces brain functions and provides an overview of related wearable technologies. Topics covered may include electroencephalograms, transcranial magnetic stimulation, and galvanic vestibular stimulation. Data processing techniques such as wavelet transforms are discussed. Students will be given an assignment to put into practice the knowledge and skills acquired during this module.

Module 3: Cardiac.
This module focuses on wearable technologies for monitoring cardiac health. The module starts by providing information on cardiac physiology and introduces wearable technologies for the heart. Topics such as electrocardiography, photoplethysmography, light sensing, and contactless physiology monitoring are introduced. Data analysis techniques for cardiac data including heart-rate variability, Poincare plots, and wavelet transforms are discussed. Students will be given an assignment to put into practice the knowledge and skills acquired during this module.

Prerequisites / notice

- Students should be proficient in programming (any language).
- Note: assignments will be in Python. Students are expected to learn Python on their own if not experienced with this programming language.
- Course prerequisites:
  - For Biomedical Engineering Master’s: none
  - For ITET Master’s: none
  - For D-NAVY Master’s: none
  - For D-HEST Master’s and PhD students:
    - If BSc in electrical/mechanical engineering or computer science: none
    - If any other BSc program: 376-0022-00L (Imaging and Computing in Medicine) or 376-1983-00L (Foundations of Data Science)

376-1219-00L Rehabilitation Engineering II: Rehabilitation of Sensory and Vegetative Functions

W 3 credits 2V R. Rienner, O. Lambercy
Abstract
Rehabilitation Engng is the application of science and technology to ameliorate the handicaps of individuals with disabilities to reintegrate them into society. The goal is to present classical and new rehabilitation engineering principles applied to compensate or enhance motor, sensory, and cognitive deficits. Focus is on the restoration and treatment of the human sensory and vegetative system.

Objective
Provide knowledge on the anatomy and physiology of the human sensory system, related dysfunctions and pathologies, and how rehabilitation engineering can provide sensory restoration and substitution.

Content
Introduction, problem definition, overview
Rehabilitation of visual function
- Anatomy and physiology of the visual sense
- Technical aids (glasses, sensor substitution)
- Retina and cortex implants
Rehabilitation of hearing function
- Anatomy and physiology of the auditory sense
- Hearing aids
- Cochlea Implants
Rehabilitation and use of kinesthetic and tactile function
- Anatomy and physiology of the kinesthetic and tactile sense
- Tactile/haptic displays for motion therapy (incl. electrical stimulation)
- Role of displays in motor learning
Rehabilitation of vestibular function
- Anatomy and physiology of the vestibular sense
- Rehabilitation strategies and devices (e.g. BrainPort)
Rehabilitation of vegetative Functions
- Cardiac Pacemaker
- Phrenic stimulation, artificial breathing aids
- Bladder stimulation, artificial sphincter
Brain stimulation and recording
- Deep brain stimulation for patients with Parkinson, epilepsy, depression
- Brain-Computer Interfaces

Literature
Introductory Books:

Selected Journal Articles and Web Links:
VideoTact, ForeThought Development, LLC. http://my.execpc.com/?dwysocki/videotac.html
The main objective of the course is to introduce micro/nanotechnology and microfluidics to students having any technical background. The course is multi-disciplinary and covers a broad range of techniques. For each lecture, a brief historical perspective is given to illustrate by whom and how the techniques were invented.

The course should familiarize the students with the techniques used in micro/nanotechnology, cleanroom microfabrication, and show them how micro/nanotechnology pervades throughout life sciences. Microfluidics will be emphasized due to their increasing importance in research and for medical applications.

The second objective is to have life sciences students less intimidated by micro/nanotechnology and make them able to link instruments and techniques to specific problems that they might have in their projects/studies. This will also help students getting access to the ETHZ/IBM Nanotech Center infrastructure if needed.
Introduction into natural and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the assessed Wassermann, M. Rottmar, M. Zenobi-Wong.

Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, E. Wehrle fostered.

Biocompatible Materials

Subject-specific Competencies

Mostly formal lectures (2 × 45 min), with few specific guest lectures on topics of particular relevance. For example, an introduction to cleanroom and micro/nanotechnology instruments and 3D printing will be provided. Last 3 weeks would be dedicated to the presentation and evaluation of projects by students (2 to 3 students per team). For this, about 12 recent technologies are listed and each team picks a technology and makes a short report and presentation describing how it works, its strengths and weaknesses, and describes what problem it solves.

In terms of technical content, the lectures will cover:
- an overview of the microelectronic industry, Moore’s law, field-effect transistors, next-generation DNA sequencing
- liquid crystal displays, organic light emitting diodes, electrophoretic displays, micromirrors and beamers, photopatterning of proteins and cells, optogenetics, and flexible displays and electronics
- hard disk drives and the giant magnetostrictance effect, magnetic nanoparticles, photonics, magnetic sensing and optical biosensing
- cleanroom techniques and instruments, from design to microfabrication of simple devices and microfluidics, examples of DNA microarrays
- the principles of microfluidics, microfluidic functionality and fabrication, microfluidics for research to point-of-care diagnostics, and the (infamous) history of Theranos, as well as some discussions on diagnostics for COVID, R0, and (im)precision of diagnostic devices and why it matters

4. Introduction to different material classes in use for medical applications.

Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed. A link between academic research and industrial entrepreneurship is demonstrated by external guest speakers, who present their current research topics.

376-1714-00L

Bone Biology: Basics, Research and Clinics

W 4 credits 3V

E. Wehrle, G. A. Kuhn, to be announced.

Objectives

After completing the Bone Biology course, students will be able to:
1. Remember and apply basics in bone biology and disease
2. Remember clinical features and surgical approaches
3. Select adequate research methods and approaches
4. Evaluate publications on topics presented in the lecture

Content

The course provides an overview of bone biology including cellular mechanism, metabolism and mechanoregulation. The acquired knowledge is applied to clinically-relevant topics such as skeletal development, osteoporosis and fracture healing. For each topic, we will share examples from our research and clinical experience combined with interactive sessions. Two site visits will provide insight into translational aspects concerning implant design and surgical application.
Competencies

Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: fostered

Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: fostered
- Media and Digital Technologies: fostered
- Problem-solving: fostered
- Project Management: fostered

Social Competencies
- Communication: fostered
- Cooperation and Teamwork: assessed
- Leadership and Responsibility: fostered
- Self-presentation and Social Influence: fostered
- Sensitivity to Diversity: fostered

Personal Competencies
- Adaptability and Flexibility: fostered
- Critical Thinking: assessed
- Integrity and Work Ethics: assessed
- Self-presentation and Self-reflection: fostered
- Self-direction and Self-management: fostered

Application of MATLAB in the Human Movement Sciences

376-1720-00L

W 2 credits 2G to be announced

Abstract
Students will learn to import, process and graphically present experimental data using the MATLAB computing environment. Both the data and the methods of analysis will be typical for experiments in Human Movement Science (i.e. kinematics, kinetics and electromyography).

Objective
Students will acquire the ability to independently load, plot, and process kinematic, kinetic and electromyographical data using the MATLAB computing environment.

Content
- Drawbacks of Excel; Possibilities in MATLAB;
- Import of several data formats;
- Plot of one and more signals;
- Removing of an offset and filtering of data based on self-written functions;
- Normalisation and parametrisation of data;
- Reliability; Interpolation, Differentiation and Integration in MATLAB.

Literature
During the lecture, several electronically available MATLAB introductions are indicated. Course-specific scripts will be provided by the lecturer.

Prerequisites / notice
A Laptop with MATLAB installed (v2009 or higher) and wireless internet access is mandatory. Two students can share a laptop if necessary. A MATLAB student version can be obtained at Stud-IDES for free.

Colloquium in Biomechanics

376-1974-00L

W 2 credits 2K

Abstract
Current topics in biomechanics presented by speakers from academia and industry.

Objective
Getting insight into actual areas and problems of biomechanics.

Biomechanics of Sports Injuries and Rehabilitation

376-2017-00L

W 3 credits 2V

Objective
This lectures introduces the basic principles of injury mechanics and rehabilitation focussing on sports injuries.

Content
- Within the scope of this lecture you will learn the basic principles of trauma biomechanics. Based on examples from sports, you will get to know different mechanisms that can possibly result in injury. Investigating the background and cause of injury should allow you to assess the injury risk for sports activities. Furthermore you should be able to develop measures to prevent such injury.

Lecture notes
Handouts will be made available.

Literature

Prerequisites / notice
A course work is required. The mark of this course work contributes to the final credits for this lecture. Details will be given during the first lecture.

Physics in Medical Research: From Atoms to Cells

402-0674-00L

W 6 credits 2V+1U

Abstract
- Scanning probe and diffraction techniques allow studying activated atomic processes during early stages of epitaxial growth.
- Quantitative descriptive, rate equation analysis, mean-field nucleation and scaling theories are applied on systems ranging from simple metallic to complex organic materials. The knowledge is expanded to optical and electronic properties as well as to proteins and cells.

Data: 06.08.2024 12:40
Autumn Semester 2024
Page 405 of 2684
Objective

The lecture series is motivated by an overview covering the skin of the crystals, roughness analysis, contact angle measurements, protein absorption/activity and monocyte behaviour.

As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting, oxido and organic surfaces are introduced.

The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure's shapes, which are based on the strain relieving mechanisms and kinetic growth processes.

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. Recently, ellipsometry has been introduced to on-line monitor film thickness, and roughness with sub-nanometer precision. These characterisation techniques are vital for optimising the preparation of medical implants.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.

X rays are more and more often used to characterise the human tissues down to the nanometer level. The combination of highly intense beams only some micrometers in diameter with scanning enables spatially resolved measurements and the determination of tissue’s anisotropies of biopsies.

465-0953-00L Biostatistics W 4 credits 2V+1U B. Sick

Objective

- know the commonly used methods in biostatistics
- perform simple data analysis with R

**Abstract**
In-depth analysis of the quantum mechanics origin of nuclear magnetic resonance (qubits, two-level systems), of LASER (quantization of the electromagnetic field, photons), and of electron transfer (from electrochemistry to photosynthesis).

**Objective**

Starting from the axioms of quantum mechanics, we will derive the fascinating theory describing spin and qubits, electron transitions and transfer, photons and LASER: quantum mechanics is different because it mocks our daily Euclidean intuition!

In this way, students will work out a robust quantum mechanics (theoretical!!!) basis which will help them in their advanced studies of the following masters: EEIT (batteries), Biomedical Engineering (NMR, bioelectronics), Quantum Engineering, Micro- and Nanosystems.

**IMPORTANT:** "qubits" from the point of view of NMR (and NOT from that of quantum computing!).

**Content**
- Lagrangian and Hamiltonian: Symmetries and Poisson Brackets
- Postulates of QM: Hilbert Spaces and Operators
- Heisenberg’s Matrix Mechanics: Hamiltonian and Time Evolution Operator
- Density Operator
- Spin: Qubits, Bloch Equations, and NMR
- Entanglement
- Symmetries and Corresponding Operators
- Schrödinger's Wave Mechanics: Electrons in a Periodic Potential and Energy Bands
- Harmonic Oscillator: Creation and Annihilation Operators
- Identical Particles: Bosons and Fermions
- Quantization of the Electromagnetic Field: Photons, Absorption and Emission, LASER
- Electron Transfer: Marcus Theory via Born-Oppenheimer, Franck-Condon, Landau-Zener

**Lecture notes**
No lecture notes because the proposed textbooks together with the provided supplementary material are more than exhaustive!

!!! I am using OneNote. All lectures and exercises will be broadcast via ZOOM, while corresponding videos of the previous years are available in Moodle!!!

**Literature**

Supplementary material will be uploaded in Moodle.

227-0385-10L Biomedical Imaging W 6 credits 5G S. Kozerke, K. P. Prüssmann

**Abstract**
Introduction to diagnostic medical imaging based on electromagnetic and acoustic fields including X-ray planar and tomographic imaging, radio-tracer based nuclear imaging techniques, magnetic resonance imaging and ultrasound-based procedures.
Upon completion of the course students are able to:

- Explain the physical and mathematical foundations of diagnostic medical imaging systems
- Characterize system performance based on signal-to-noise ratio, contrast-to-noise ratio and transfer function
- Design a basic diagnostic imaging system chain including data acquisition and data reconstruction
- Identify advantages and limitations of different imaging methods in relation to medical diagnostic applications

### Content

- **Introduction (intro, overview, history)**
- **Signal theory and processing (foundations, transforms, filtering, signal-to-noise ratio)**
- **X-rays (production, tissue interaction, contrast, modular transfer function)**
- **X-rays (resolution, detection, digital subtraction angiography, Radon transform)**
- **X-rays (filtered back-projection, spiral computed tomography, image quality, dose)**
- **Nuclear imaging (radioactive tracer, collimation, point spread function, SPECT/PET)**
- **Nuclear imaging (detection principles, image reconstruction, kinetic modelling)**
- **Magnetic Resonance (magnetic moment, spin transitions, excitation, relaxation, detection)**
- **Magnetic Resonance (plane wave encoding, Fourier reconstruction, pulse sequences)**
- **Magnetic Resonance (contrast mechanisms, gradient- and spin-echo, applications)**
- **Ultrasound (mechanical wave generation, propagation in tissue, reflection, transmission)**
- **Ultrasound (spatial and temporal resolution, phased arrays)**
- **Ultrasound (Doppler shift, implementations, applications)**
- **Summary, example exam questions**

**227-0943-00L Radiobiology**

**Objective**

The purpose of this course is to impart basic knowledge in radiobiology in order to handle ionizing radiation and to provide a basis for predicting the radiation risk.

**Abstract**

By the end of this course the participants will be able to:

- Interpret the 6 Rs of radiation oncology in the context of the hallmarks of cancer
- Understand factors which underpin the differing radiosensitivities of different tumors
- Follow rational strategies for combined treatment modalities of ionizing radiation with targeted and immunological agents
- Understand different treatment responses of the tumor and the normal tissue to differential clinical-related parameters of radiotherapy (dose rate, LET etc.).

**Content**

Einführung in die Strahlenbiologie ionisierender Strahlen: Allgemeine Grundlagen und Begriffsbestimmungen; Mechanismen der biologischen Strahlenwirkung; Strahlenwirkung auf Zellen, Gewebe und Organe; Modifikation der biologischen Strahlenwirkung; Strahlenzytogenetik: Chromosomenveränderungen, DNA-Defekte, Reparaturprozesse; Molekularer Strahlenbiologie: Bedeutung inter- und intrazellulärer Signalübermittlungsprozesse, Strahlen-induzierter Zelltod, Zellzyklus-Checkpoints; Radioimmunologie, Strahlenrisiko: Strahlensynrome, Krebsinduktion, Mutationsauslösung, pränatale Strahlenwirkung; Strahlenbiologische Grundlagen des Strahlenschutzes; Nutzen-Risiko-Abwägungen bei der medizinischen Strahlenanwendung; Prädiktive strahlenbiologische Methoden zur Optimierung der therapeutischen Strahlenanwendung.

**Lecture notes**

**402-0341-00L Medical Physics I**

**Objective**

Introduction to the fundamentals of medical radiation physics. Functional chain due to radiation exposure from the primary physical effect to the radiobiological and medically manifest secondary effects. Dosimetric concepts of radiation protection in medicine. Mode of action of radiation sources used in medicine and its illustration by means of Monte Carlo simulations.

**Content**

Understanding the functional chain from primary physical effects of ionizing radiation to clinical radiation effects. Dealing with dose as a quantitative measure of medical exposure. Getting familiar with methods to generate ionizing radiation in medicine and learn how they are applied for medical purposes. Eventually, the lecture aims to show the students that medical physics is a fascinating and evolving discipline where physics can directly be used for the benefits of patients and the society.

**Abstract**

The lecture is covering the basic principles of ionizing radiation and its physical and biological effects. The physical interactions of photons as well as of charged particles will be reviewed and their consequences for medical applications will be discussed. The concept of Monte Carlo simulation will be introduced in the exercises and will help the student to understand the characteristics of ionizing radiation in simple and complex situations. Fundamentals in dosimetry will be provided in order to understand the physical and biological effects of ionizing radiation. Deterministic as well as stochastic knowledge about radiation protection will be provided. In the second part of the lecture series, we will cover the generation of ionizing radiation. By this means, the x-ray tube, the clinical linear accelerator, and different radioactive sources in radiology, radiotherapy and nuclear medicine will be addressed. Applications in radiology, nuclear medicine and radiotherapy will be described with a special focus on the physics underlying these applications.

**Lecture notes**

A script will be provided.
Radiotherapy is one of the main treatment options against cancer. Today, more than 50% of cancer patients receive radiation as part of their treatment. Modern radiotherapy is a highly technology driven field. Research and development in medical physics has improved the precision of radiotherapy substantially. Using intensity-modulated radiotherapy (IMRT), radiation can be delivered precisely to tumors while minimizing radiation exposure of healthy organs surrounding the tumor. Thereby, medical physics has provided radiation oncologists with new curative treatment approaches where previously only palliative treatments were possible. This lecture will provide a detailed introduction to radiotherapy treatment planning and will consist of three blocks:

1. The first part of the course considers the physical interactions of radiation in tissue. The physical interactions give rise to dose calculation algorithms, which are used to calculate the absorbed radiation dose based on a CT scan of the patient.
2. The second part considers the mathematical aspects of treatment planning. Mathematical optimization techniques are introduced, which are used in intensity-modulated radiotherapy to determine the external radiation fields that optimally irradiate the tumor while minimizing radiation dose to healthy organs.
3. The third part deals with additional aspects of central importance for radiotherapy planning. This includes biomedical imaging techniques for treatment planning and target delineation as well as image registration algorithms.

The lectures are followed by computational exercises where students implement the main components of a radiotherapy treatment planning system in two dimensions in Matlab.
Prerequisites / notice
Basic programming skills in Matlab (or willingness to learn) are needed for the exercises. Basic knowledge of calculus is needed, approximately corresponding to the 3rd year of a bachelor degree in physics, mathematics, computer science, engineering or comparable discipline.

Other Elective Courses
These courses may be suitable for the Medical Physics track. Please consult your track advisor.

<td>This course aims at offering a self-contained account of computer vision and its underlying concepts, including the recent use of deep learning. The first part starts with an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First the interaction of light with matter is considered. The most important hardware components such as cameras and illumination sources are also discussed. The course then turns to image discretization, necessary to process images by computer. The next part describes necessary pre-processing steps, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and 3D shape as two important examples. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed. A major part at the end is devoted to deep learning and AI-based approaches to image analysis. Its main focus is on object recognition, but also other examples of image processing using deep neural nets are given.</td>

| 227-0965-00L | Micro and Nano-Tomography of Biological Tissues         | W    | 4    | 3G    | M. Stampanoni, F. Marone Welford |
|             | Abstract                                                |      |      |       |                            |
|             | The lecture introduces the physical and technical know-how of X-ray tomographic microscopy. Several X-ray imaging techniques (absorption-, phase- and darkfield contrast) will be discussed and their use in daily research, in particular biology, is presented. The course discusses the aspects of quantitative evaluation of tomographic data sets like segmentation, morphometry and statistics. |      |      |       |                            |
|             | Objective                                               |      |      |       |                            |
|             | Introduction to the basic concepts of X-ray tomographic imaging, image analysis and data quantification at the micro and nano scale with particular emphasis on biological applications |      |      |       |                            |
|             | Content                                                 |      |      |       |                            |
|             | Synchrontron-based X-ray micro- and nano-tomography is today a powerful technique for non-destructive, high-resolution investigations of a broad range of materials. The high-brilliance and high-coherence of third generation synchrontron radiation facilities allow quantitative, three-dimensional imaging at the micro and nanometer scale and extend the traditional absorption imaging technique to edge-enhanced and phase-sensitive measurements, which are particularly suited for investigating biological samples. |      |      |       |                            |
|             | The lecture includes a general introduction to the principles of tomographic imaging from image formation to image reconstruction. It provides the physical and engineering basics to understand how imaging beamlines at synchrontron facilities work, looks into the recently developed phase contrast methods, and explores the first applications of X-ray nano-tomographic experiments. The course finally provides the necessary background to understand the quantitative evaluation of tomographic data, from basic image analysis to complex morphometrical computations and 3D visualization, keeping the focus on biomedical applications. |      |      |       |                            |

</table>
Building upon advanced technologies to create, visualize, analyze and manipulate nano-structures, as well as to probe their nano-chemistry, nano-mechanics and other properties within manmade and living systems, many exciting discoveries are currently made. They change the way we do science and result in so many new technologies.

The goal of the course is to give Master and Graduate students from all interested departments an overview of what nanotechnology is all about, from analytical techniques to nanosystems, from physics to biology. Students will start to appreciate the extent to which scientific communities are meeting at the nanoscale. They will learn about the specific challenges and what is currently sizzling in the respective fields, and learn the vocabulary that is necessary to communicate effectively across departmental boundaries.

Each lecturer will first give an overview of the state-of-the art in his/her field, and then describe the research highlights in his/her own research group. While preparing their Final Projects and discussing them in front of the class, the students will deepen their understanding of how to apply a range of new technologies to solve specific scientific problems and technical challenges. Exposure to the different frontiers will also improve their ability to conduct effective nanoscale research, recognize the broader significance of their work and to start collaborations.

Starting with the fabrication and analysis of nanoparticles and nanostructured materials that enable a variety of scientific and technical applications, we will transition to discussing biological nanosystems, how they work and what bioinspired engineering principles can be derived. We will also briefly discuss biomedical applications and potential health risk issues. Scientific aspects as well as the many of the emerging technologies will be covered that start impacting so many aspects of our lives. This includes new phenomena in physics, advanced materials, novel technologies and new methods to address major medical challenges.

All the enrolled students will get access to a password protected website where they can find pdf files of the lecture notes, and typically 1-2 journal articles per lecture that cover selected topics.
**Adaptability and Flexibility**

**W. Herrmann**

Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

**Objective**

- know the commonly used methods in biostatistics

Abstract

In-depth analysis of the quantum mechanics origin of nuclear magnetic resonance (qubits, two-level systems), of LASER (quantization of the electromagnetic field, photons), and of electron transfer (from electrochemistry to photosynthesis).

Objective

Beside electronics nanodevices, D-ITET is pushing its research in the fields of NMR (MRI), electrochemistry, bioelectronics, nano-optics, and quantum information, which are all rationalized in terms of quantum mechanics.

Starting from the axioms of quantum mechanics, we will derive the fascinating theory describing spin and qubits, electron transitions and transfer, photons and LASER: quantum mechanics is different because it mocks our daily Euclidean intuition!

In this way, students will work out a robust quantum mechanics (theoretical!!!) basis which will help them in their advanced studies of the following masters: EEIT (batteries), Biomedical Engineering (NMR, bioelectronics), Quantum Engineering, Micro- and Nanosystems.

IMPORTANT: "qubits" from the point of view of NMR (and NOT from that of quantum computing!).

Content

- Lagrangian and Hamiltonian: Symmetries and Poisson Brackets
- Postulates of QM: Hilbert Spaces and Operators
- Heisenberg’s Matrix Mechanics: Hamiltonian and Time Evolution Operator
- Density Operator
- Spin: Qubits, Bloch Equations, and NMR
- Entanglement
- Symmetries and Corresponding Operators
- Schrödinger's Wave Mechanics: Electrons in a Periodic Potential and Energy Bands
- Harmonic Oscillator: Creation and Annihilation Operators
- Identical Particles: Bosons and Fermions
- Quantization of the Electromagnetic Field: Photons, Absorption and Emission, LASER
- Electron Transfer; Marcus Theory via Born-Oppenheimer, Franck-Condon, Landau-Zener

227-0385-10L Biomedical Imaging

W 6 credits 5G S. Kozerke, K. P. Prüssmann

Abstract

Introduction to diagnostic medical imaging based on electromagnetic and acoustic fields including X-ray planar and tomographic imaging, radio-tracer based nuclear imaging techniques, magnetic resonance imaging and ultrasound-based procedures.

Objective

Upon completion of the course students are able to:

- Explain the physical and mathematical foundations of diagnostic medical imaging systems
- Characterize system performance based on signal-to-noise ratio, contrast-to-noise ratio and transfer function
- Design a basic diagnostic imaging system chain including data acquisition and data reconstruction
- Identify advantages and limitations of different imaging methods in relation to medical diagnostic applications
Abstract
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The focus is on learning the basic vocabulary of biomedical engineering and getting familiar with concepts that govern common medical instruments and the most important organs from an engineering point of view.

Objective
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The course provides an overview of the various topics of the different tracks of the biomedical engineering master course and helps orienting the students in selecting their specialized classes and project locations. It also serves as an introduction to the field for students of the ITET, MAVT, HEST and other bachelor programs.

In addition, the most recent achievements and trends of the field of biomedical engineering are also outlined.

Content
- History of BME and the role of biomedical engineers. Ethical issues related to BME.
- Biomedical sensors both wearable and also biochemical sensors.
- Bioelectronics: Nernst equation, Donnan equilibrium, equivalent circuits of biological membranes and bioelectronic devices.
- Bioinformatics: genomic and proteomic tools, databases and basic calculations.
- Equations describing basic reactions and enzyme kinetics.
- Medical optics: Optical components and systems used in hospitals.
- Function of the heart and the circulatory system.
- Transport and exchange of substances in the human body, compartment modeling.
- The respiratory system.
- Bioimaging.
- Orthopedic biomechanics.

Lecture notes
Introduction to Biomedical Engineering by Enderle, Banchard, and Bronzino

AND

Prerequisites / notice
No specific requirements, BUT ITET, MAVT, PHY/S students will have to learn a lot of new words related to biochemistry, biology and medicine, while HEST and BIOL students will have to grasp basic engineering concepts (circuits, equations, etc.).
**Bioelectronics and Biosensors**

**W** 6 credits  2V+2U  J. Vörös, M. F. Yanik

**Abstract**
The course introduces bioelectricity and the sensing concepts that enable obtaining information about neurons and their networks. The sources of electrical fields and currents in the context of biological systems are discussed. The fundamental concepts and challenges of measuring bioelectronic signals and the basic concepts to record optogenetically modified organisms are introduced.

**Objective**
During this course the students will:
- learn the basic concepts in bioelectronics including the sources of bioelectronic signals and the methods to measure them
- be able to solve typical problems in bioelectronics
- learn about the remaining challenges in this field

**Content**

1. **Introduction**
2. **Membrane and Transport**
3-4. Action potential and Hodgkin-Huxley
5. Detection and Noise
6. Measuring currents in solutions, nanopore sensing and patch clamp pipettes
7. Measuring potentials in solution and core conductance model
8. Measuring electronic signals with wearable electronics, ECG, EEG
9. Measuring mechanical signals with bioelectronics

In vivo stimulation and recording
10. Functional electric stimulation
11. In vivo electrophysiology
12. Optical recording and control of neurons (optogenetics)
13. Measuring neurons optically, fundamentals of optical microscopy
14. Measuring biochemical signals

**Lecture notes**
A detailed script is provided to each lecture including the exercises and their solutions.

**Literature**
Plonsey and Barr, Bioelectricity: A Quantitative Approach (Third edition)

**Prerequisites / notice**
The course requires an open attitude to the interdisciplinary approach of bioelectronics. In addition, it requires undergraduate entry-level familiarity with electric & magnetic fields/forces, resistors, capacitors, electric circuits, differential equations, calculus, probability calculus, Fourier transformation & frequency domain, lenses / light propagation / refractive index, pressure, diffusion AND basic knowledge of biology and chemistry (e.g. understanding the concepts of concentration, valence, reactants-products, etc.).
The lecture introduces the physical and technical know-how of X-ray tomographic microscopy. Several X-ray imaging techniques (absorption-, phase- and darkfield contrast) will be discussed and their use in daily research, in particular biology, is presented. The course discusses the aspects of quantitative evaluation of tomographic data sets like segmentation, morphometry and statistics. Synchrotron-based X-ray micro- and nano-tomography is today a powerful technique for non-destructive, high-resolution investigations of a broad range of materials. The high-brilliance and high-coherence of third generation synchrotron radiation facilities allow quantitative, three-dimensional imaging at the micro and nanometer scale and extend the traditional absorption imaging technique to edge-enhanced and phase-sensitive measurements, which are particularly suited for investigating biological samples.

The lecture includes a general introduction to the principles of tomographic imaging from image formation to image reconstruction. It provides the physical and engineering basics to understand how imaging beamlines at synchrotron facilities work, looks into the recently developed phase contrast methods, and explores the first applications of X-ray nano-tomographic experiments. The course finally provides the necessary background to understand the quantitative evaluation of tomographic data, from basic image analysis to complex morphometrical computations and 3D visualization, keeping the focus on biomedical applications.

A maximum of 12 medical degree students and 12 (biomedical) engineering degree students can be admitted, their number should be equal.

Cross-disciplinary collaboration between engineers and medical doctors is indispensable for innovation in health care. This course brings together engineering students from ETH Zurich and medical students from the University of Zurich to experience the rewards and challenges of such interdisciplinary work in a project based learning environment.

The main goal of this course is to demonstrate the differences in communication between the fields of medicine and engineering. Since such differences become most evident during actual collaborative work, the course is based on a project in physiology, medical or clinical research that combines medicine and engineering.

For the engineering students, the specific aims of the course are to:
- Identify and precisely define a clinical need;
- Acquire a working understanding of the investigated system;
- Identify the engineering challenges in the project and communicate them to the medical students;
- Develop and implement, together with the medical students, solution strategies for the identified challenges;
- Present the solution concept to a cross-disciplinary audience; Preliminary need and solution validation;

Surfaces and Interfaces I: Fundamentals, Analytics and Applications

Extended course starting HS23. Old title: Surfaces, Interfaces and their Applications I. Students who obtained credit points for the old course cannot retake it.

Abstract
This course teaches the basics of surface and interface science and technology, including surface modifications and forces. It covers various analytical techniques to study surface and interface properties, and explores phenomena of applied relevance like friction, lubrication, phoresis, and wetting where surfaces play a crucial role.

Objective
- Students are able to
  - describe the physical and chemical properties of surfaces and interfaces.
  - analyze and compare analytical tools for surfaces.
  - choose and combine appropriate surface-analytical approaches for solving problems connected to applications.
  - understand and explain the importance of surfaces and interfaces in a broad range of phenomena and applications.

Content
- Introduction to surfaces and interfaces
- Structure of surfaces over different length scales: from macroscopic roughness to atomic structure
- Surface modifications
- Adsorption and adsorption models
- Surface forces
- Basic physical concepts
- Thermodynamics of surfaces and interfaces
- Measurement of intermolecular and surface forces
- Dynamics and history effects
- Surface analytics: X-ray Photocorrelation Spectroscopy (XPS) – principles and modern developments
- Surface analytics: Secondary Ion Mass Spectroscopy (SIMS) and IR Spectroscopy – Principles and examples
- Atomic Force Microscopy (AFM): Principles and modes of operation
- Tribology: Adhesion, Friction and Lubrication
- Contact mechanics
- Micro and macroscale friction
- Boundary lubrication
- Wetting
- Contact angles
- Phoretic phenomena
- Electric double layer and electrophoresis
- Electro-osmosis
- Other types of phoresis
- Case studies

Biomineralization
W 2 credits 2V K.-H. Ernst

Abstract
The course addresses undergraduate and graduate students interested in getting introduced into the basic concepts of biomineralization.

Objective
The course aims to introduce the basic concepts of biomineralization and the underlying principles, such as supersaturation, nucleation and growth of minerals, the interaction of biomolecules with mineral surfaces, and cell biology of inorganic materials creation. An important part of this class is the independent study and the presentation of original literature from the field.
Biominerallization is a multidisciplinary field. Topics dealing with biology, molecular and cell biology, solid state physics, mineralogy, crystallography, organic and physical chemistry, biochemistry, dentistry, oceanography, geology, etc. are addressed. The course covers definition and general concepts of biominerallization (BM) types of biominerals and their function crystal nucleation and growth biological induction of BM control of crystal morphology, habit, shape and orientation by organisms strategies of compartmentalization the interface between biomolecules (peptides, polysaccharides) and the mineral phase experimental methods for studying BM phenomena inter-, intra-, extra- and epicellular BM organic templates and matrices for BM structure of bone, teeth (vertebrates and invertebrates) and mollusk shells calcification silification in diatoms, radiolarians and plants calcium and iron storage impact of BM on lithosphere and atmosphere evolution taxonomy of organisms.

1. Introduction and overview
2. Biominerals and their functions
3. Chemical control of biominerallization
4. Control of morphology Organic templates and additives
5. Modern methods of investigation of BM
6. BM in matrices bone and nacre
7. Vertebrate teeth
8. Invertebrate teeth
9. BM within vesicles calcite of coccoliths
10. Silica
11. Iron storage and mineralization

Lecture notes
Script with more than 600 pages with many illustrations will be distributed free of charge.

Abstract

Objective

Content

Lecture notes

Prerequisites

Competencies

Techniques and Technologies

assessed

assessed
Drugs, ophthalmic devices, novel trends in transdermal and nasal drug delivery and 3D printing of drug delivery systems.

The course covers the following topics: drug targeting and delivery principles, macromolecular drug carriers, liposomes, micelles, micro/nanoparticles, gels and implants, administration of vaccines, targeting at the gastrointestinal level, synthetic carriers for nucleic acid drugs, ophthalmic devices, novel trends in transdermal and nasal drug delivery and 3D printing of drug delivery systems.

The students dispose of an overview on current principles and systems for the controlled delivery and targeting of drugs. The focus of the course lies on developing a capacity to understand the involved technologies and methods, as well as an appreciation of the chances and constraints of their therapeutic usage, with prime attention on anticancer drugs, therapeutic peptides, proteins, nucleic acids and vaccines.

The students gain an overview on current principles, methodologies and systems for controlled delivery and targeting of drugs. This enables the students to understand and evaluate the field in terms of scientific criteria.

Further references will be provided in the course.
### Competencies

#### Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

#### Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: assessed
- Media and Digital Technologies: fostered
- Problem-solving: assessed
- Project Management: fostered

#### Social Competencies
- Communication: assessed
- Cooperation and Teamwork: assessed
- Leadership and Responsibility: fostered
- Self-presentation and Social Influence: fostered
- Sensitivity to Diversity: fostered
- Negotiation: fostered

#### Personal Competencies
- Adaptability and Flexibility: assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: fostered
- Leadership and Responsibility: fostered
- Negotiation: fostered
- Self-awareness and Self-reflection: fostered

### Abstract

This course provides a detailed understanding of:
- development of T and B cells
- the dynamics of a immune response during acute and chronic infection
- mechanisms of immunopathology
- modern vaccination strategies

Key experimental results will be shown to help understanding how immunological textbook knowledge has evolved.

### Objective

Obtain a detailed understanding of:
- the development, activation, and differentiation of different types of T cells and their effector mechanisms during immune responses,
- Recognition of pathogenic microorganisms by the host cells and molecular events thereafter,
- events and signals for maturation of naive B cells to antibody producing plasma cells and memory B cells.
- Optimization of B cell responses by intelligent design of new vaccines

### Content
- Development and selection of CD4 and CD8 T cells, natural killer T cells (NKT), and regulatory T cells (Treg)
- NK T cells and responses to lipid antigens
- Differentiation, characterization, and function of CD4 T cell subsets such as Th1, Th2, and Th17
- Overview of cytokines and their effector function
- Co-stimulation (signals 1-3)
- Dendritic cells
- Evolution of the "Danger" concept
- Cells expressing Pattern Recognition Receptors and their downstream signals
- T cell function and dysfunction in acute and chronic viral infections

### Literature

Documents of the lectures are available for download at:
https://moodle-app2.let.ethz.ch/course/view.php?id=2581&notifyeditingon=1

### Prerequisites / notice

Immunology I and II recommended but not compulsory

### Other Elective Courses

These courses may be suitable for the Molecular Bioengineering track. Please consult your track advisor.

Immunology I and II recommended but not compulsory

#### Number Title
- 227-0399-10L Physiology and Anatomy for Biomedical Engineers I

#### Abstract

Students will be able to identify and enumerate important anatomical structures
to describe basic physiological processes of the human body
to use a 3D animation database/software
to retrieve anatomical structures
to understand basic medical terminology

#### Objective

To understand basic principles and structure of the human body in consideration of the clinical relevance and the medical terminology used in medical work and research.

**Abstract**
This four-hour course covers the basics of writing and presenting scientific work. The focus lies on the structure and the main elements of a scientific text. Formatting guidelines, citation rules, good practice of scientific writing and hints to convince the audience are part of the course.

**Objective**
- You can write scientific texts using the correct structure
- You can convincingly present scientific work
- You can differentiate the scientific style from novels and news
- You can adhere to citation rules and scientific integrity

**Content**
The block course covers the following topics:
- Structure of Scientific Texts
- Structure of Scientific Presentations
- Formatting of Scientific Elements (figures, equations, tables)
- Citation Rules and Scientific Integrity

**Literature**
Scientific Integrity, see https://ethz.ch/en/research/ethics-and-animal-welfare/research-integrity.html

**Prerequisites / Notice**
You should be writing either a bachelor/semester/master thesis or a scientific publication in the immediate future.

The main objective of the 12-week internship (full-time) is to expose master's students to the industrial work environment. During this period, students have the opportunity to be involved in on-going projects at the host institution.

Abstract

The fifteen-weeks (full-time) research project can be done at a research or non-research institution in Switzerland or abroad, but not in a pure industry setting. The project can be done alone or in groups of students, and it is finished with a report and/or prototype. The project must be finished before the start of the Master project.

Objective

Research Project (24 credits)

Must be completed before the start of the master's thesis

Abstract

The aim of the long research project is to perform a larger (exploratory) scientific study or a larger development project in a team. The duration of this project is at least four months (full-time) and it is finished with a report and/or prototype.

Objective

Research Project (18 credits)

Must be completed before the start of the master's thesis

Abstract

The ten-weeks (full-time) research project can be done at a research or non-research institution in Switzerland or abroad, but not in a pure industry setting. The project can be done alone or in groups of students, and it is finished with a report and/or prototype. The project must be finished before the start of the Master project.

Objective

Research Project (12 credits)

Must be completed before the start of the master's thesis

Abstract

The five-weeks (full-time) short research project can be done at a research or non-research institution in Switzerland or abroad, but not in a pure industry setting. The project can be done alone or in groups of students, and it is finished with a report and/or prototype. The project must be finished before the start of the Master project.

Objective

也只有在满足所有条件后，项目才能成功完成。

<td>This course will be a mix of lecture sessions, hands-on computational data analysis using public datasets and seminars discussing own results in the context of the published studies. In the lectures we will introduce current Next-Generation Sequencing technologies and their application to address basically all facets of modern biology and biomedical research. We will cover the major sample processing methods used for investigating functional genomic aspects like transcriptome and chromatin profiling, review recent advances in (cancer) genome sequencing and give an overview of public big data sequencing projects (ENCODE, GTEX, TCGA, ...). For the computational data analysis we will focus on differential gene expression profiling (RNA-seq) experiments that have been selected from fascinating published biological studies. Data analysis based on R will follow a detailed tutorial describing all required steps of sequence read processing and will be conducted in small groups to enable every student hands-on experience.</td>
</tr>

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 424 of 2684
The course Methods in Cell Analysis and Laboratory Automation introduces students to high-end cell analysis and sample preparation methods. It consists of five units, each lasting 2 days (total 10 days):

1. **Microscopy**: Murphy and Davidson, Fundamentals of Light Microscopy and Electronic Imaging, John Wiley & Sons, 2012
2. **Light microscopy**: Learn how to build a microscope and understand the underlying physical principles.
3. **Image Analysis**: Introduction to the fundamentals of image analysis.
4. **Laboratory Automation**: Introduction to the basics of automated liquid handling and lab robotics.
5. **Practical Training**: Each student will be assigned to an individual topic of the course and will have to prepare a presentation on it.

**Lecture notes**
You will find further information on the practical course and the equipment at: https://www.bsse.ethz.ch/scf/ https://www.bsse.ethz.ch/lauf/

**Literature**
- Microscopy: Murphy and Davidson, Fundamentals of Light Microscopy and Electronic Imaging, John Wiley & Sons, 2012
- Flow Cytometry: Shapiro, Practical Flow Cytometry, John Wiley & Sons, 2005
- Light microscopy: Learn how to use a modern automated wide-field fluorescence microscope.
- Image analysis: Introduction to the fundamentals of image analysis software Fiji/ImageJ.
- Use Fiji/ImageJ to analyze the images acquired during the microscopy exercise.

**Prerequisites / notice**
The following knowledge is required for the course:
- Basic laboratory methods
- Basic physics of optics (properties of light, refraction, lenses, fluorescence)
- Basic biology of cells (cell anatomy and physiology)

**Lab Course: Microsystems and Microfluidics in Biology**
This practical course is an introduction to microsystems technology and microfluidics for the life sciences. It includes basic concepts of microsystem design, fabrication, and assembly into an experimental setup. Biological applications include a variety of measurements of cellular and tissue signals and subsequent analysis.

**Objective**
The students are introduced to the basic principles of microsystems technology. They get acquainted with practical scientific work and learn the entire workflow of (a) understanding the theoretical concept, (b) planning the experiment, (c) engineering of the needed device, (d) execution of the experiment and data acquisition, (e) data evaluation and analysis, and (f) reporting and discussion of the results.

**Content**
The practical course will consist of a set of 4 experiments.

**Lecture notes**
Notes and guidelines will be provided at the beginning of the course.

**Literature**

**Prerequisites / notice**
The practical course will consist of a set of 4 experiments. For each experiment, the student will be required to:
- Understand the theoretical concept behind the experiment
- Plan the experiment
- Engineer the devices
- Execute the experiments and acquire data
- Evaluate and analyze the data
- Report and discuss the results
A good quality of the final report will be expected and be an important criterion.

**Number** 636-0201-00L
**Title** Lab Course: Methods in Cell Analysis and Laboratory Automation
**ECTS** 3 credits
**Hours** 6P
**Lecturers** T. Horn

**Objective**
To understand the technical and physical principles of light microscopes and flow cytometers.

**Content**
The practical course will have five units at 2 days each (total 10 days):

1. **Flow Cytometry**: a. Introduction to Flow Cytometry
   b. Practical demonstration on flow cytometry analyzers and flow cytometry cell sorters
   c. Flow cytometry sample preparation
   d. Learn how to use flow cytometry equipment to analyze and sort fluorescence-labeled cells

2. **Light microscopy**: a. Learn how to build a microscope and understand the underlying physical principles
   b. Learn how to use a modern automated wide-field fluorescence microscope.
   c. Use this microscope to automatically acquire images of a cell culture assay to analyze the dose-dependent effect of a drug treatment.

3. **Image Analysis**: a. Introduction to the fundamentals of image analysis
   b. Learn the basics of the image analysis software Fiji/ImageJ
   c. Use Fiji/ImageJ to analyze the images acquired during the microscopy exercise

4. **Laboratory Automation**: a. Introduction to the basics of automated liquid handling and lab robotics
   b. See examples on using lab automation for plasmid library generation and cell cultivation
   c. Learn how to program and execute a basic pipetting workflow including liquid handling and labware transfers on Tecan and Hamilton robotic systems.

5. **Presentations**
   a. Each student will be assigned to an individual topic of the course and will have to prepare a presentation on it.
   b. Presentations and discussion in form of a Colloquium.

**Lecture notes**
You will find further information on the practical course and the equipment at: https://www.bsse.ethz.ch/scf

**Literature**

- Evaluate and analyze the data
- Report and discuss the results
A good quality of the final report will be expected and be an important criterion.
Students are introduced to the basics of microtechnology, cleanroom, semiconductor and silicon process technologies. They will get to know the different fabrication methods for various microdevices and systems.

- Fundamentals of semiconductors and band model
- Fundamentals of devices: transistor and diode.
- Silicon processing and fabrication steps
- Silicon crystal structure and manufacturing
- Thermal oxidation
- Doping via diffusion and ion implantation
- Photolithography
- Thin film deposition: dielectrics and metals
- Wet etching & bulk micromachining
- Dry etching & surface micromachining
- Microtechnological processing and fabrication sequence
- Optional: Packaging

The lab course is open for MSc Biotechnology students only.

Abstract
Students will learn the foundations of monoseptic working practice and create and screen microbial libraries for identification of strains expressing different fluorescent protein (XFP) levels.

Objective
Students will learn the foundations of monoseptic working practice and create and screen microbial libraries for identification of strains expressing different fluorescent protein (XFP) levels.

Content
Block A: Handling and preparation of microbial libraries
D1: Introduction to microbiological cultures and monoseptic working techniques.
D2: Plasmid-based expression systems and variation of XFP synthesis levels via site-directed RBS mutagenesis.
Block B: Library screening
D3: In vivo screening for XFP expression levels.
D4: Analysis of XFP levels via SDS-PAGE analysis. RBS-sequencing.
Block C: Hit recovery and validation
D5: In silico analysis of RBS variants.
D6: Cellular XFP content for selected variants at different culture conditions.
Block D: Data analysis and presentation
D7: Protein expression analysis. Q&A for reports and presentations.
D8: Final presentations and wrap-up.

Lecture notes
Material will be provided during the course.

Literature
(3) Salis HM. "The ribosome binding site calculator." Methods Enzymol. 2011
(6) Pirt JS. "Principles of microbe and cell cultivation." Blackwell Scientific Publications 1975

Advanced Courses
Students need to acquire a minimum of 22 ECTS in this category (MSc Biotechnology Study Programme Regulations 2021). The list of advanced courses is a closed list, no other course can be added to this category.

Abstract
Students are introduced to the basics of microtechnology, cleanroom, semiconductor and silicon process technologies. They will get to know the fabrication of mostly silicon-based microdevices and systems and all related microfabrication processes.

Objective
Students are introduced to the basics of microtechnology, cleanroom, semiconductor and silicon process technologies. They will get to know the different fabrication methods for various microdevices and systems.

Content
Introduction to microtechnology, semiconductors, and micro electro mechanical systems (MEMS)

- Fundamentals of semiconductors and band model
- Fundamentals of devices: transistor and diode.
- Silicon processing and fabrication steps
- Silicon crystal structure and manufacturing
- Thermal oxidation
- Doping via diffusion and ion implantation
- Photolithography
- Thin film deposition: dielectrics and metals

Lecture notes
Handouts in English

Literature

Prerequisites / notice
Fundamentals in physics and physicochemistry (orbital models etc.) are required, a repetitorium of fundamental physics and quantum theory at the semester beginning can be offered.

The information on the web can be updated until the beginning of the semester.
636-0104-00L Biophysical Methods W 4 credits 3G D. J. Müller

Abstract
Students will be imparted knowledge in basic and advanced biophysical methods applied to problems in molecular biotechnology. The course is fundamental to applying the methods in their daily and advanced research routines. The students will learn the physical basis of the methods as well as their limitations and possibilities to address existing and future topics in molecular biotechnology.

Objective
Gain of interdisciplinary competence in experimental and theoretical research, which qualifies for academic scientific work (master's or doctoral thesis) as well as for research in a biotechnology or a pharmaceutical company. The module is of general use in courses focused on modern biomolecular technologies, systems biology and systems engineering.

Content
The students will learn basic and advanced knowledge in applying biophysical methods to address problems and overcome challenges in biotechnology, cell biology and life sciences in general. The biological and physical possibilities and limitations of the methods will be discussed and critically evaluated. By the end of the course the students will have assimilated knowledge on a portfolio of biophysical tools widening their research capabilities and aptitude.

The biophysical methods to be taught will include:
- Light microscopy; Resolution limit of light microscopy, fluorescence, GFP, fluorescence microscopy, DIC, phase contrast, difference between wide-field and confocal microscopy
- Superr Resolution optical microscopy; STED, PALM, STORM, other variations
- Electron microscopy; Scanning electron microscopy, transmission electron microscopy, electron tomography, cryo-electron microscopy, single particle analysis and averaging, tomography, sectioning, negative stain
- X-ray, electron and neutron diffraction
- MRI Imaging
- Scanning tunneling microscopy and atomic force microscopy
- Patch clamp technologies: Principles of patch clamp analysis and application. Various patch clamp approaches used in research and industry
- Surface plasmon resonance-based biosensors
- Molecular pore-based sensors and sequencing devices
- Mechanical molecular and cellular assembly devices
- Optical and magnetic tweezers
- CD spectroscopy
- Optogenetics
- Molecular dynamics simulations

Lecture notes
Hand out will be given to students at lecture.

Literature
Methods in Molecular Biophysics (5th edition), Serdyuk et al., Cambridge University Press

Prerequisites / notice
The module is composed of 3 SWS (3 hours/week); 2-hour lecture, 1-hour seminar. For the seminar, students will prepare oral presentations on specific in-depth subjects with/under the guidance of the teacher.

636-0108-00L Biological Engineering and Biotechnology W 4 credits 3V M. Fussenegger

Abstract
Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

Objective
Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

Content

Lecture notes
Handout during the course.

636-0107-00L Biotechnology of Enzymes W 4 credits 3G S. Panke, A. Bunzel

Abstract
This course covers the role of enzymes in biotechnology, from discovery via engineering to applications in a variety of fields from food to the pharmaceutical industry.

Objective
Students will learn to identify opportunities for utilizing enzymes in biotechnology and develop basic and advanced enzyme engineering skills, informed by the latest research and techniques.

Content
This course offers an in-depth exploration of the use and engineering of enzymes in biotechnology, spanning fundamental enzymology, enzyme engineering, and applied biocatalysis. Topics will include (1) thermodynamic, kinetic, and mechanistic principles of enzyme catalysis, (2) the generation and engineering of enzymes through technologies such as protein design and directed evolution, (3) industrially applied biocatalysis, and (4) future challenges for biocatalysis.

Lecture notes
Notes will be provided in the form of handouts.

Literature
The course will use selected parts of textbooks, original scientific publications, and reviews, which will be shared during the lecture.

Competencies
Subject-specific Competencies
Concepts and Theories assessed

Method-specific Competencies

Social Competencies
Cooperation and Teamwork assessed

Personal Competencies
Self-direction and Self-management assessed

636-0550-00L Biomolecular Nanotechnology W 4 credits 2V+1U M. Nash

Abstract
Biomolecular nanotechnology is a broad field that focuses on the study and science of biological materials including DNA, RNA and proteins at length scales below 10 nm. This is a broad overview of the topic with a focus on current research themes.

Objective
The objective is to familiarise the students with a broad range of topics related to biotechnology, nanotechnology, and biophysics with a focus on current research and reading of scientific literature.

Content
Introduction to biomacromolecules; Measurement techniques for characterisation of biomacromolecules; Fundamentals of molecular recognition; Recombinant DNA; Protein engineering; Directed evolution; Protein folding; Polymers; Elastin-like polypeptides; Intelligent materials; Spatially localized hydrogels; Mechanical properties of proteins and macromolecules; Single-molecule force spectroscopy
We will use different diseases to discuss how to potentially model, diagnose or heal them by stem cell based therapies. This will be used as a guiding framework to discuss relevant concepts and technologies in cell and molecular biology, engineering, imaging, bioinformatics, tissue engineering, that are required to manipulate stem cells for therapeutic application.

Topics will include:
- Embryonic and adult stem cells and their niches
- Induced stem cells by directed reprogramming
- Relevant basic cell biology and developmental biology
- Relevant molecular biology
- Cell culture systems
- Cell fates and their molecular control by transcription factors and signalling pathways
- Cell reprogramming
- Disease modelling
- Tissue engineering
- Bioimaging, Bioinformatics
- Single cell technologies

**Literature**

Representative literature:

1. Alberts, Molecular Biology (Ch.2 Cellular chemistry).
2. Ratner, Biomaterials Science (Ch. 2.3, 2.4 Polymers & hydrogels).
3. Walsh, Protein Biochemistry, (Ch. 2, Protein Structure).

Biochemical Reaction Modelling

**636-0118-00L Introduction to Dynamical Systems with Applications to Biology**

Does not take place this semester.

**Content**

A dynamical view of the world: the importance of nonlinearity; solutions of differential equations; solving equations on the computer; the phase plane; fixed points and stability; linear stability analysis; classifications of linear systems; Liapunov functions and nonlinear stability; cycles and oscillations; bifurcations and bifurcation diagrams. Many biological examples will be used through the course to demonstrate the concepts.

**Literature**

Prerequisites / notice

Prerequisites: Calculus; a first course in differential equations; basic linear algebra (eigenvalues and eigenvectors), Matlab programming.
Microtechnology fostered

Students are introduced to the basics of microtechnology, cleanroom, semiconductor and silicon process technologies. They will get to know the fabrication of mostly silicon-based microdevices and systems.

**Objective**

Students are introduced to the basics of microtechnology, cleanroom, semiconductor and silicon process technologies. They will get to know the different fabrication methods for various microdevices and systems.

Stem cells are central in tissue regeneration and repair, and hold great potential for therapy. We will discuss the role of stem cells in health and disease, and possibilities to manipulate their behavior for therapeutic application. Basic molecular and cell biology, engineering and novel technologies relevant for stem cell research and therapy will be discussed.

Understanding of current knowledge, and lack thereof, in stem cell biology, regenerative medicine and required technologies. Theoretical preparation for practical laboratory experimentation with stem cells.
Content

We will use different diseases to discuss how to potentially model, diagnose or heal them by stem cell based therapies. Electives

The electives list in the ETH course catalogue is an open list, and the courses listed in the ETH course catalogue provide just examples for possible elective courses, e.g. a selection of eligible courses. Students are expected to look for relevant courses in the ETH and University of Basel course catalogue and ask their mentor for approval. Courses from the advanced course category may also be taken as electives.

We particularly recommend browsing the University of Basel course catalogue for elective courses of relevant master's degree programs (using the filter "programme structure" on the course catalogue website), such as for example: Biomedical Engineering, Chemistry, Drug Sciences, Epidemiology, Infection Biology, Molecular Biology, Nanosciences.

Number | Title | Type | ECTS | Hours | Lecturers
--- | --- | --- | --- | --- | ---
636-0015-00L | An Introduction to Probability Theory and Stochastic Processes with Applications to Biology | W | 4 credits | 3G |

Abstract

Biology is becoming increasingly quantitative and mathematical modeling is now an integral part of biological research. In many biological processes, ranging from gene-expression to evolution, randomness plays an important role that can only be understood using stochastic models. This course will provide the students with a theoretical foundation for developing such stochastic models and analyzing them.

Objective

The aim of this course is to introduce certain topics in Probability Theory and Stochastic Processes that have been specifically selected with an eye on biological applications. This course will teach students the tools and techniques for modeling and analyzing random phenomena. Throughout the course, several biological applications will be discussed and students will be encouraged to do additional reading based on their research interests.

Content

1. The mathematical representation of random phenomena. The probability space, properties of the probability measure, Independence of events, Conditional probability and Bayes formula, applications to parameter inference.
3. Convergence of Random Variables: Modes of convergence, Laws of large numbers, the central limit theorem, the law of the iterated logarithm, Applications to the analysis of cell population data.

Literature

Prerequisites / notice

The course will involve a healthy balance between mathematical rigor (theorem proving) and biological applications. Students are expected to have a good grasp of Linear Algebra and Multivariable Calculus. Basic knowledge of set theory will also be needed. Students should be prepared for abstract reasoning.

</table>

Abstract

The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Computational algorithms extracting biological information from genetic sequence data are discussed, and statistical tools to understand this information in detail are introduced.
Objective
Attendees will learn which information is contained in genetic sequencing data and how to extract information from this data using computational tools. The main concepts introduced are:
- stochastic models in molecular evolution
- phylogenetic & phylodynamic inference
- maximum likelihood and Bayesian statistics

Attendees will apply these concepts to a number of applications yielding biological insight into:
- epidemiology
- pathogen evolution
- macroevolution of species

Content
The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods for direct alignment analysis using approaches such as BLAST and GWAS. Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. Lastly, we introduce the field of phylodynamics, the aim of which is to understand and quantify population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

Lecture notes
Lecture slides will be available on moodle.

Literature
The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:
- Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.

Prerequisites / notice
Basic knowledge in linear algebra, analysis, and statistics will be helpful. Programming in R will be required for the project work (compulsory continuous performance assessments). In case you do not have any previous experience with R, we strongly recommend to get familiar with R prior to the semester start. For the D-BSSE students, we highly recommend the voluntary course „Introduction to Programming“, which takes place in Basel before the start of the semester.

Competencies

636-0511-00L Developmental Neuroscience (University of Basel) 
W 2 credits 2V 
Does not take place this semester. 
The course must be registered for directly at Uni Basel. 
Uni Basel course number: 14467-01 
Mind the enrolment deadlines at Uni Basel: 
https://www.unibas.ch/en/Studies/Mobility/Mobility-Switzerland/Students-Registering-From-Other-Swiss-Universities.html

Abstract
Development of cerebral cortex, hippocampus, motor system, olfactory system, visual system, auditory system, somatosensory system, navigation and memory systems, developmental disorders (autism, stem cells in the developing, adult and diseased brain.

636-0515-00L Molecular Medicine I (University of Basel) 
W 2 credits 2V 
The course must be registered for directly at Uni Basel. 
Uni Basel course number: 22831-01 
Mind the enrolment deadlines at Uni Basel: 
https://www.unibas.ch/en/Studies/Mobility/Mobility-Switzerland/Students-Registering-From-Other-Swiss-Universities.html

Abstract
This lecture series will introduce biologists to the mechanisms that cause human diseases. Emphasis will be on the genetic and environmental factors that lead to diseases, and how this knowledge can be used to develop diagnostic and therapeutic procedures.

636-0706-00L Spatio-Temporal Modelling in Biology 
W 4 credits 3G D. Iber

Abstract
This course focuses on modeling spatio-temporal problems in biology, in particular on the cell and tissue level. The main focus is on mechanisms and concepts, but mathematical and numerical techniques are introduced as required. Biological examples discussed in the course provide an introduction to key concepts in developmental biology.

Objective
Students will learn state-of-the-art approaches to modelling spatial effects in dynamical biological systems. The course provides an introduction to dynamical system, and covers the mathematical analysis of pattern formation in growing, developing systems, as well as the description of mechanical effects at the cell and tissue level. The course also provides an introduction to image-based modelling, i.e. the use of microscopy data for model development and testing. The course covers classic as well as current approaches and exposes students to open problems in the field. In this way, the course seeks to prepare students to conduct research in the field. The course prepares students for research in developmental biology, as well as for applications in tissue engineering, and for biomedical research.

Content
1. Introduction to Modelling in Biology
2. Bioimage Analysis
3. Morphogen Gradients
4. Precision & Robustness of Patterning
5. Mathematical Description of Growing Biological Systems
6. Travelling Waves & Wave Pinning
7. Turing Patterns
8. Chemotaxis
9. Epithelial Organisation
10. Tissue Simulation Frameworks
11. Tissue Mechanics & Fluid Dynamics
12. Growth Control
13. Image-Based Modelling
14. Summary

Lecture notes
All lecture material will be made available online via Moodle.

Data: 06.08.2024 12:40 Autumn Semester 2024 Page 432 of 2684
To acquire the statistical understanding to design an appropriate analysis and the practical skills to implement the analysis in R and present

Available on course website (Moodle)

The lecture course is not based on any textbook. The following textbooks are related to some of its content. The textbooks may be of

Chemical Biology (University of Basel)

Introduction to Statistics and R

The modern tools of chemical biology will be discussed and contextualized with a discussion of practical applications with those tools.

Introduction to Programming

This course offers a practical introduction to the fundamentals of data analysis and R

Data analysis is fundamental for arriving at scientific conclusions and testing different hypotheses. This course offers a hands-on introduction to statistical analyses including: exploratory data analysis, testing differences in populations, p-values, power calculations, multiple testing, confounding, linear regression, maximum likelihood, model selection, and logistic regression; along with the fundamentals of R programming including markdown and data handling with the tidyverse.

Lecture notes

Lecture slides will be available

Prerequisites / notice

Access to Rstudio with some markdown and tidyverse packages installed.

Introduction to Statistics and R

W 6 credits 3G+2A J. Kuipers

This course offers a practical introduction to the fundamentals of data analysis and R

To acquire the statistical understanding to design an appropriate analysis and the practical skills to implement the analysis in R and present the results.

Data analysis is fundamental for arriving at scientific conclusions and testing different hypotheses. This course offers a hands-on introduction to statistical analyses including: exploratory data analysis, testing differences in populations, p-values, power calculations, multiple testing, confounding, linear regression, maximum likelihood, model selection, and logistic regression; along with the fundamentals of R programming including markdown and data handling with the tidyverse.

Lecture notes

Lecture slides will be available

Prerequisites / notice

Access to Rstudio with some markdown and tidyverse packages installed.

Introduction to Programming

Z 0 credits 1G A. Gupta, T. Vaughan

This is a voluntary programming course “before” the start of the semester, open for students of the MSc Biotechnology master's programme only. Lecture dates: 2-13 September 2004.

The course must be registered for directly at Uni Basel.

Introduction to Programming provides an overview of the basic programming blocks needed to translate a problem, stated in textual form, into an algorithm that solves such problem. The course provides an introduction to the MATLAB programming language and covers Bash scripting and other programming languages such as R and Python.

The goal of this course is to give students, who have no prior programming background, a solid introduction to algorithm development and its successive implementation in a programming language. For students with previously acquired programming skills, the course will serve as a reinforcement of key aspects of structured programming in addition to providing a well-rounded introduction to MATLAB, R and Python.

Metals in Biology (University of Basel) ■

The course must be registered for directly at Uni Basel.

Uni Basel course number: 58301-01

Mind the enrolment deadlines at Uni Basel:

https://www.unibas.ch/en/Studies/Mobility/Mobility-Switzerland/Students-Registering-From-Other-Swiss-Universities.html

Basics of protein structure

Metal cofactors and their interactions with proteins

Analysis of key metalloenzymes including: Hydrolyses, Oxynogenase, Oxidasen, Hydrogenasen, Nitrogenase, Redox-proteins, Oxygen evolving complex, Photosystem II, Metal trafficking in cells, Metal homeostasis, DNA-binding proteins, Biomimetic chemistry, Artificial Metalloenzymes etc.

Metals in medicine

Objective

Identify key features of metalloenzymes and enzyme mimics

Deduce and draw reasonable reaction mechanisms catalyzed by metalloenzymes

Understand the role of metalloenzymes in solving energy-related grand challenges

Design functional enzyme mimics

Critically analyze the structure and function of metalloproteins

Chemical Biology (University of Basel) ■

The course must be registered for directly at Uni Basel.

Uni Basel course number: 27412-01

Mind the enrolment deadlines at Uni Basel:

https://www.unibas.ch/en/Studies/Mobility/Mobility-Switzerland/Students-Registering-From-Other-Swiss-Universities.html

The modern tools of chemical biology will be discussed and contextualized with a discussion of practical applications with those tools.

Supramolecular Chemistry (University of Basel) ■

W 3 credits 2V K. Tiefenbacher

Supramolecular Chemistry is another approach to study biological systems, where non-covalent interactions play a dominant role. The course will provide an overview of supramolecular chemistry, with a focus on the design and application of supramolecular architectures and their role in biological systems.

Abstract  
This course provides an introduction to supramolecular chemistry. Prior knowledge in supramolecular chemistry is not a prerequisite for this course.

Objective  
After this course, the student is expected to understand and be able to apply the basics of supramolecular chemistry: host-guest interactions, host design, self-assembly and simple enzyme mimetics.

Content  
This course provides an introduction to supramolecular chemistry. Prior knowledge in supramolecular chemistry is not a prerequisite for this course. We will first cover the basic concepts of supramolecular chemistry: non-covalent interactions, host-guest chemistry, binding constant determination and binding strength. Subsequently, we will take a closer look at how to bind different species: cations, anions and neutral organic molecules. Towards the end of the semester, we will cover self-assembly processes and applications of supramolecular structures as simple enzyme mimetics.

Lecture notes  
The lecture slides are provided online via ADAM. No additional literature is required. If additional information is desired, the book "Supramolecular Chemistry" by Jonathan W. Steed and Jerry L. Atwood (John Wiley & Sons) is recommended.

636-0554-00L  
Modelling and Simulation in Drug Development  
W  2 credits  3V  H.-M. Kaltenbach

Abstract  
This course introduces how Modelling and Simulation (=mathematical modelling) is applied today for the development of novel drugs in the pharmaceutical industry. Background lectures are combined with hands-on exercises on real-world examples.

Objective  
The goal of this course is to provide students with a general understanding of drug development and pharmacology and how Modelling and Simulation is used to develop new drugs. Together with the application, the course will provide the background in the statistical methodologies used to model multivariate and time-dependent data with several levels of statistical variability.

Content  
Understanding the pharmacology, pharmacokinetics and pharmacodynamics (PK/PD) of novel drugs is key for a successful drug development process. Modelling and Simulation of these data is at the core to gain this understanding. Focusing on the application using real world examples, this course will introduce the statistical methodologies that have been developed to describe complex biological and pharmacological data with several levels of statistical variability. The course will cover the basics of drug development and pharmacology with a focus on the principles of drug absorption, distribution, metabolism and excretion (ADME) and drug pharmacokinetics and pharmacodynamics (PK/PD). The different drug formats (small molecules, biologics, cell-based therapies, gene therapies and oligonucleotide formats) and their pharmacological properties will be introduced. The translation from animal to human to inform first-in human dose selections will be discussed. The methodology part will cover compartmental PK/PD modelling, the practical aspects of numerical solutions of ordinary differential equation (ODEs) and the theory on non-linear mixed effects (NLME) modelling, which has become the de-facto standard methodology in the pharmaceutical industry. Practical problems of Modelling and Simulations will be discussed including parameter identifiability, model development and model evaluation and the application (or not) of the Occam's Razor. The course will focus on hands-on exercises using contemporary real-world examples from the pharmaceutical industry and provide necessary theoretical and methodological background in accompanying lectures.

Prerequisites / notice  
Basics of dynamic systems (e.g., BSSE courses by Iber or Kamnah, or CSB course by Stelling)  
Basics of statistics and R (e.g., BSSE courses by Kuipers or Kaltenbach)

Module 2 focuses on cultural change, innovation, disruption or evolution? In this last model, we learn to question and discover what the 17 Sustainable Goals mean for our industry.

As a final module, new business models are discussed and explored. Examples will be used to explore patterns and interfaces and to analyse what is needed today and in the future for a successful and sustainable development of the sector. How can innovative ideas move us forward? What can we learn from design thinking? Why is it important for people to have useful and understandable measurable values? How do the 17 Sustainable Goals influence our industry?

We will analyse the topic on the basis of two concrete examples, familiarise ourselves with them and observe their further development as a result.

Building and breaking off is understood as an energy and material flow.

Scripts, documents, studies, dates and addresses are stored on the server of the program.

Key words: construction and real estate market, micro and macro environment

The structure and nomenclature of the interventions in the stock are presented and models for the registration and calculation of the structural interventions are presented. It focuses specifically on ongoing maintenance, the periodic repair and planning of renewal cycles, as well as on structural interventions and value-enhancing measures. Based on the study II, the learning content is applied and various options for action in dealing with the building stock are evaluated.

The term paper is offered in spring semester only.

The CAS AMaP module is fully customisable, building on the expertise of technical specialist professionals and aims at:

- Eligible for credits and recommended
- Recommended, not eligible for credits

CAS AMaP participants are offered a MaP professor as a mentor together with whom they design their study plan along an individually-specified focus area in ‘Advanced Materials and Processes’. Building on the individual expertise, interests and needs of the participants, the customised CAS AMaP module consists of the elements (i) research project, (ii) courses and lectures, (iii) knowledge transfer.

Depending on individual interests and needs of the technical specialist professionals, the CAS AMaP module consists of the elements:

I. conducting a research project in the mentor’s group, addressing fundamental, development or applied problems, considering theoretical and/or experimental aspects,
II. individual schedule of courses and lectures with state-of-the-art knowledge, and
III. sharing of know-how in, e.g. seminars and interactive formats, thereby enhancing bidirectional knowledge transfer.

Abstract: The block course focuses on shallow groundwater wells and ground heat exchangers, but also expands the spectrum to include geothermal energy and geostorage potential in Switzerland. The contributions address, among other things, the question of how, with increased use of geothermal resources, conflicts of use due to the growing number of uses can be dealt with.

Objective: The aim of the course is for participants to be able to describe the basic processes of geothermal use and to understand the regulatory framework. They will be able to assess the mutual influence of the uses and know possibilities to take these into account in strategic planning.

The Module Geo-Constructions runs over two semesters (FS and HS) and is offered every three years.

Takes place in FS23 + HS23

Abstract: The course focuses on the characterization of rock as a basis for describing rock mass behaviour with the help of hazard scenarios that are used in the planning and construction of underground excavations.

Objective: Participants learn the geological, geomechanical and hydrogeological factors necessary for the assessment and are able to estimate the influence of geological conditions on underground excavations.

ECTS European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
Applied Statistical Regression I

**Abstract**
Simple and multiple regression models, with emphasis on practical aspects and interpretation of results, analysis of residuals and model selection.

**Objective**

Applied Analysis of Variance and Experimental Design I

**Abstract**
Principles of experimental design, one-way analysis of variance, contrasts and multiple comparisons, multi-factor designs and analysis of variance, complete block designs, Latin square designs.

**Objective**
Participants will be able to plan and analyze efficient experiments in the fields of natural sciences. They will gain practical experience by using the software R.

**Literature**

**Competencies**

Applied Statistical Regression II

**Abstract**
Random effects and mixed effects models, split-plot designs, incomplete block designs, two-series factorials and fractional designs, power.

**Objective**
Understanding the concept and flexibility of generalized linear models and correct interpretation of the corresponding model outputs.

**Literature**

**Competencies**

Further Courses

**Applied Statistical Regression II**

**Abstract**
Does not take place this semester.

**Objective**
Understanding the concept and flexibility of generalized linear models and correct interpretation of the corresponding model outputs.

**Literature**

**Competencies**

**Repealed Measures**

**Abstract**

**Objective**
Participants will gain the ability of recognizing repeated measures and to analyze them adequately. They will know how to deal with pseudoreplicates.

**Nonparametric Regression**

**Abstract**
This course focusses on nonparametric estimation of probability densities and regression functions. These recent methods allow modelling without restrictive assumptions such as 'linear function'. These smoothing methods require a weight function and a smoothing parameter. Focus is on one dimension, higher dimensions and samples of curves are treated briefly. Exercises at the computer.

**Objective**
Understanding of the choice of weight function and of the smoothing parameter, also done automatically.
### Competencies

**Method-specific Competencies**
- Concepts and Theories: assessed
- Analytical Competencies: assessed
- Media and Digital Technologies: assessed
- Problem-solving: assessed

**Personal Competencies**
- Creative Thinking: assessed

**447-6233-00L Spatial Statistics**  
W 1 credit 1G M. Nussbaum

**Abstract**
In many research fields, spatially referenced data are collected. When analysing such data the focus is either on exploring their structure (dependence on explanatory variables, autocorrelation) and/or on spatial prediction. The course provides an introduction to geostatistical methods that are useful for such purposes.

**Objective**
The course will provide an overview of the basic concepts and stochastic models that are commonly used to model geostatistical data sets. In addition, the participants will learn a number of geostatistical techniques and acquire some familiarity with software that is useful for analysing spatial data.

**Content**
After an introductory discussion of the types of problems and the kind of data that arise in environmental research, an introduction into linear geostatistics (models: stationary random processes, modelling large-scale spatial patterns by regression, modelling autocorrelation by variogram; kriging: mean-square prediction of spatial data) will be taught. The lectures will be complemented by data analyses that the participants have to do themselves.

**Lecture notes**
Slides, descriptions of the problems for the data analyses and worked-out solutions to them will be provided.

**Literature**

**447-6255-00L Analysis of High-Dimensional Data**  
W 1 credit 1G N. Städler

**Abstract**
Block course on analysis of high-dimensional data with a focus on prediction and feature assessment.

**Objective**
The goal of this course is to gain a good understanding of the concepts discussed during the lecture and to apply the new methods on real data examples using the software "R". The topics covered in the lecture are:

**Part 1:** Linear regression in the high-dimensional context; Overfitting, prediction and the bias-variance tradeoff; Model selection; Ridge and Lasso regularization

**Part 2:** Logistic regression and regularization; Classification based on decision trees, Random Forest and AdaBoost; Multiple testing; P-value adjustment and variance shrinkage

**Content**
Course on Analysis of High-Dimensional Data with focus on Prediction and Feature Assessment.

**Part 1:** Linear regression in the high-dimensional context; Overfitting, prediction and the bias-variance tradeoff; Model selection; Ridge and Lasso regularization

**Part 2:** Logistic regression and regularization; Classification based on decision trees, Random Forest and AdaBoost; Multiple testing; P-value adjustment and variance shrinkage

**Lecture notes**
The block course is based on lecture notes (https://bookdown.org/staedler_n/highdimstats/).

**Literature**

**Prerequisites / notice**
The exercises are done exclusively with the (free, open source) software "R" (http://www.r-project.org). A final exam will also happen at the computers, using R (and your brains!).

### Abstract
**Applied Bayesian Statistics**
Introduction to Bayesian statistics: basics of inference, computation with MCMC, linear model, logistic regression, Bayesian hierarchical models. Focus on applications and hands-on programming.

**Objective**
- understand the basics of Bayesian inference
- use R packages to run MCMC algorithms
- fit and understand Bayesian linear models
- introduction to hierarchical Bayesian models

**Content**
We will learn how to describe business/scientific problems as probabilistic models, apply Bayes rules to draw inference from data, and use the probabilistic programming language STAN to obtain samples from posterior distributions.

**Literature**
"Bayes Rules! An Introduction to Applied Bayesian Modeling", Alicia A. Johnson, Miles Q. Ott, Mine Dogucu - CRC Press 2022

### Prerequisites / notice
- introductory statistics
- applied regression
- R

### Competencies
**Subject-specific Competencies**
- Concepts and Theories (assessed)
- Techniques and Technologies (assessed)

**Method-specific Competencies**
- Analytical Competencies (assessed)
- Decision-making (assessed)
- Media and Digital Technologies (fostered)
- Problem-solving (assessed)

**Social Competencies**
- Communication (fostered)
- Cooperation and Teamwork (fostered)
- Customer Orientation (fostered)
- Leadership and Responsibility (fostered)
- Self-presentation and Social Influence (fostered)
- Sensitivity to Diversity (fostered)

**Personal Competencies**
