Competencies

Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: assessed
- Media and Digital Technologies: fostered
- Problem-solving: assessed

Personal Competencies
- Creative Thinking: assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: fostered
Content
- Direct Methods for linear systems of equations
- Least Squares Techniques
- Data Interpolation and Fitting
- Filtering Algorithms
- Approximation of Functions
- Numerical Quadrature
- Iterative Methods for non-linear systems of equations

Lecture notes
Lecture materials (PDF documents and codes) will be made available to participants.

Literature

M. Hanke-Bourgeois "Grundlagen der Numerischen Mathematik und des wissenschaftlichen Rechnens", BG Teubner, 2002

P. Deuflhard and A. Hohmann, "Numerische Mathematik I", DeGruyter, 2002

Prerequisites / notice
Solid knowledge about fundamental concepts and techniques from linear algebra & calculus as taught in the first year of science and engineering curricula.

The course will be accompanied by programming exercises in C++ relying on the template library EIGEN. Familiarity with C++, object oriented and generic programming is an advantage. Participants of the course are expected to learn C++ by themselves.

401-0674-AAL
Numerical Methods for Partial Differential Equations
10 credits
21R
not available

Abstract
Derivation, properties, and implementation of fundamental numerical methods for a few key partial differential equations: convection-diffusion, heat equation, wave equation, conservation laws. Implementation in C++ based on a finite element library.

Objective
Main skills to be acquired in this course:
- Ability to implement fundamental numerical methods for the solution of partial differential equations efficiently.
- Ability to modify and adapt numerical algorithms guided by awareness of their mathematical foundations.
- Ability to select and assess numerical methods in light of the predictions of theory
- Ability to identify features of a PDE (= partial differential equation) based model that are relevant for the selection and performance of a numerical algorithm.
- Ability to understand research publications on theoretical and practical aspects of numerical methods for partial differential equations.
- Skills in the efficient implementation of finite element methods on unstructured meshes.

This course is neither a course on the mathematical foundations and numerical analysis of methods nor an course that merely teaches recipes and how to apply software packages.
1 Case Study: A Two-point Boundary Value Problem [optional]
1.1 Introduction
1.2 A model problem
1.3 Variational approach
1.4 Simplified model
1.5 Discretization
1.5.1 Galerkin discretization
1.5.2 Collocation [optional]
1.5.3 Finite differences
1.6 Convergence
2 Second-order Scalar Elliptic Boundary Value Problems
2.1 Equilibrium models
2.1.1 Taut membrane
2.1.2 Electrostatic fields
2.1.3 Quadratic minimization problems
2.2 Sobolev spaces
2.3 Variational formulations
2.4 Equilibrium models: Boundary value problems
3 Finite Element Methods (FEM)
3.1 Galerkin discretization
3.2 Case study: Triangular linear FEM in two dimensions
3.3 Building blocks of general FEM
3.4 Lagrangian FEM
3.4.1 Simplicial Lagrangian FEM
3.4.2 Tensor-product Lagrangian FEM
3.5 Implementation of FEM in C++
3.5.1 Mesh file format (Gmsh)
3.5.2 Mesh data structures (DUNE)
3.5.3 Assembly
3.5.4 Local computations and quadrature
3.5.5 Incorporation of essential boundary conditions
3.6 Parametric finite elements
3.6.1 Affine equivalence
3.6.2 Example: Quadrilateral Lagrangian finite elements
3.6.3 Transformation techniques
3.6.4 Boundary approximation
3.7 Linearization [optional]
4 Finite Differences (FD) and Finite Volume Methods (FV) [optional]
4.1 Finite differences
4.2 Finite volume methods (FVM)
5 Convergence and Accuracy
5.1 Galerkin error estimates
5.2 Empirical Convergence of FEM
5.3 Finite element error estimates
5.4 Elliptic regularity theory
5.5 Variational crimes
5.6 Duality techniques [optional]
5.7 Discrete maximum principle [optional]
6 2nd-Order Linear Evolution Problems
6.1 Parabolic initial-boundary value problems
6.1.1 Heat equation
6.1.2 Spatial variational formulation
6.1.3 Method of lines
6.1.4 Timestepping
6.1.5 Convergence
6.2 Wave equations [optional]
6.2.1 Vibrating membrane
6.2.2 Wave propagation
6.2.3 Method of lines
6.2.4 Timestepping
6.2.5 CFL-condition
7 Convection-Diffusion Problems [optional]
7.1 Heat conduction in a fluid
7.1.1 Modelling fluid flow
7.1.2 Heat convection and diffusion
7.1.3 Incompressible fluids
7.1.4 Transient heat conduction
7.2 Stationary convection-diffusion problems
7.2.1 Singular perturbation
7.2.2 Upwinding
7.3 Transient convection-diffusion BVP
7.3.1 Method of lines
7.3.2 Transport equation
7.3.3 Lagrangian split-step method
7.3.4 Semi-Lagrangian method
8 Numerical Methods for Conservation Laws
8.1 Conservation laws: Examples
8.2 Scalar conservation laws in 1D
8.3 Conservative finite volume discretization
8.3.1 Semi-discrete conservation form
8.3.2 Discrete conservation property
8.3.3 Numerical flux functions
8.3.4 Mollene schemes
8.4 Timestepping
8.4.1 Linear stability
8.4.2 CFL-condition
8.4.3 Convergence
8.5 Higher order conservative schemes [optional]
8.5.1 Slope limiting
8.5.2 MUSCL scheme
8.6. FV-schemes for systems of conservation laws [optional]

“optional” indicates that the corresponding topic might be skipped depending on the progress of the course.

Lecture notes
The lecture will be taught in flipped classroom format:
- Video tutorials for all thematic units will be published online.
- Solution of homework problems will partly be covered by video tutorials.
- Lecture documents and tablet notes accompanying the videos will be made available to the audience as PDF.

Literature
Chapters of the following books provide supplementary reading (detailed references in course material):

However, study of supplementary literature is not important for following the course.

Prerequisites / notice
Mastery of basic calculus and linear algebra is taken for granted.
Familiarity with fundamental numerical methods (solution methods for linear systems of equations, interpolation, approximation, numerical quadrature, numerical integration of ODEs) is essential.

Important: Coding skills and experience in C++ are essential.

Homework assignments involve substantial coding, partly based on a C++ finite element library. The written examination will be computer based and will comprise coding tasks.

**Abstract**

This course is a hands-on introduction to self-driving cars using the Duckietown platform.

**Objective**

- Each student is given a mobile wheeled robot and throughout the class must configure and program.
- The objective of the class is to give the student a pragmatic view of what it takes to design and operate a fleet of self-driving cars or any other large robotic systems.

**Content**

- Perception, planning, modeling, and control, leveraging primarily on vision data.

**Lecture notes**

Lecture notes, primarily in the form of slides and tutorials, will be accessible from Moodle.

**Literature**

Course notes will be provided in an electronic form. These are some books that can be used to provide background information or consulted as references:

1. Siegwart, Nourbakhsh, Scaramuzza - Introduction to autonomous mobile robots;
2. Norvig, Russell - Artificial Intelligence, a modern approach.
3. Peter Corke - Robotics Vision and Control
4. Oussama Khatib, Bruno Siciliano - Handbook of Robotics

**Prerequisites / notice**

- Students should have taken a basic course in probability theory, computer vision, and control systems, and should be familiar and comfortable with programming (Python), Linux, and Git utilization.

In introduction to ROS will be given, but it's strongly advised that students have prior exposure to and experience with ROS to effectively navigate through the homework assignments and the final project.

A shared space will be available to work with the robots.

It's advised students will have ~5 square meters of free space at their place to work with their assigned robot.

**Competencies**

**Abstract**

Planning safe and efficient motions for robots in complex environments, often shared with humans and other robots, is a difficult problem combining discrete and continuous mathematics, as well as probabilistic, game-theoretic, and ethical/regulatory aspects. This course will cover the algorithmic foundations of motion planning, with an eye to real-world implementation issues.

**Objective**

The students will learn how to design and implement state-of-the-art algorithms for planning the motion of robots executing challenging tasks in complex environments.

**Content**

**Lecture notes**

Course notes and other education material will be provided for free in an electronic form.

**Literature**

- There is no required textbook, but an excellent reference is Steve LaValle’s book on “Planning Algorithms.”

**Prerequisites / notice**

- Students should have taken basic courses in optimization, control systems, probability theory, and should be familiar with modern programming languages and practices (e.g., Python, and/or C/C++). Previous exposure to robotic systems is a definite advantage.

**Competencies**

- Subject-specific Competencies
  - Concepts and Theories
  - Techniques and Technologies
- Method-specific Competencies
  - Decision-making
  - Problem-solving

**Abstract**

Model predictive control (MPC) has established itself as a powerful control technique for complex systems under state and input constraints. This course discusses the theory and application of recent advanced MPC concepts, focusing on system uncertainties and safety, as well as data-driven formulations and learning-based control.

**Objective**

Design, implement and analyze advanced MPC formulations for robust and stochastic uncertainty descriptions, in particular with data-driven formulations.

**Content**

- Topics include:
  - Nominal MPC for uncertain systems (nominal robustness)
  - Robust MPC
  - Stochastic MPC
  - Review of regression methods
  - Set-membership Identification and robust data-driven MPC
  - Bayesian regression and stochastic data-driven MPC
  - MPC as safety filter for reinforcement learning
Lecture notes will be provided.

Prerequisites / notice
Basic courses in control, advanced course in optimal control, basic MPC course (e.g. 151-0660-00L Model Predictive Control in Spring Semester) strongly recommended.
Background in linear algebra and stochastic systems recommended.

151-0509-00L Acoustics in Fluid Media: From Robotics to Additive Manufacturing

W 4 credits 3G  D. Ahmed

Abstract
The course will provide you with the fundamentals of the new and exciting field of ultrasound-based microrobots to treat various diseases. Furthermore, we will explore how ultrasound can be used in additive manufacturing for tissue constructs and robotics.

Objective
The course is designed to equip students with skills in the design and development of ultrasound-based manipulation devices and microrobots for applications in medicine and additive manufacturing.

Content
Linear and nonlinear acoustics, foundations of fluid and solid mechanics and piezoelectricity, Gorkov potential, numerical modelling, acoustic streaming, applications from ultrasonic microrobotics to surface acoustic wave devices

Lecture notes

Literature

151-0532-00L Nonlinear Dynamics and Chaos I

W 4 credits 4G  G. Haller

Abstract
Basic facts about nonlinear systems; stability and near-equilibrium dynamics; bifurcations; dynamical systems on the plane; non-autonomous dynamical systems; chaotic dynamics.

Objective
This course is intended for Masters and Ph.D. students in engineering sciences, physics and applied mathematics who are interested in the behavior of nonlinear dynamical systems. It offers an introduction to the qualitative study of nonlinear physical phenomena modeled by differential equations or discrete maps. We discuss applications in classical mechanics, electrical engineering, fluid mechanics, and biology. A more advanced Part II of this class is offered every other year.

Content
(1) Basic facts about nonlinear systems: Existence, uniqueness, and dependence on initial data.
(2) Near equilibrium dynamics: Linear and Lyapunov stability
(3) Bifurcations of equilibria: Center manifolds, normal forms, and elementary bifurcations
(4) Nonlinear dynamical systems on the plane: Phase plane techniques, limit sets, and limit cycles.
(5) Time-dependent dynamical systems: Floquet theory, Poincare maps, averaging methods, resonance

Lecture notes
The class lecture notes will be posted electronically after each lecture. Students should not rely on these but prepare their own notes during the lecture.

Prerequisites / notice
- Prerequisites: Analysis, linear algebra and a basic course in differential equations.

151-0563-01L Dynamic Programming and Optimal Control

W 4 credits 2V+1U  R. D’Andrea

Abstract
Introduction to Dynamic Programming and Optimal Control.

Objective
Covers the fundamental concepts of Dynamic Programming & Optimal Control.

Content
Dynamic Programming Algorithm; Deterministic Systems and Shortest Path Problems; Infinite Horizon Problems, Bellman Equation; Deterministic Continuous-Time Optimal Control.

Literature

Prerequisites / notice
Requirements: Knowledge of advanced calculus, introductory probability theory, and matrix-vector algebra.

151-0593-00L Embedded Control Systems

W 4 credits 6G  C. Onder, M. Schmid Daners

Abstract
This course provides a comprehensive overview of embedded control systems. The concepts introduced are implemented and verified on a microprocessor-controlled haptic device.

Objective
Familiarize students with main architectural principles and concepts of embedded control systems.
An embedded system is a microprocessor used as a component in another piece of technology, such as cell phones or automobiles. In this intensive two-week block course the students are presented with the principles of embedded digital control systems using a haptic device as an example for a mechatronic system. A haptic interface allows for a human to interact with a computer through the sense of touch.

Subjects covered in lectures and practical lab exercises include:
- The application of C-programming on a microprocessor
- Digital I/O and serial communication
- Quadrature decoding for wheel position sensing
- Queued analog-to-digital conversion to interface with the analog world
- Pulse width modulation
- Timer interrupts to create sampling time intervals
- System dynamics and virtual worlds with haptic feedback
- Introduction to rapid prototyping

Lecture notes
Lecture notes, lab instructions, supplemental material

Prerequisites / notice
Prerequisite courses are Control Systems I and Informatics I.

This course is restricted to 33 students due to limited lab infrastructure. Interested students please contact Marianne Schmid Daners (E-Mail: mariischm@ethz.ch)

After your reservation has been confirmed please register online at www.mystudies.ethz.ch.

Detailed information can be found on the course website http://www.idsc.ethz.ch/education/lectures/embedded-control-systems.html

151-0604-00L Microrobotics

Abstract
Microrobotics is an interdisciplinary field that combines aspects of robotics, micro and nanotechnology, biomedical engineering, and materials science. The aim of this course is to expose students to the fundamentals of this emerging field. Throughout the course, the students apply these concepts in assignments. The course concludes with an end-of-semester examination.

Objective
The objective of this course is to expose students to the fundamental aspects of the emerging field of microrobotics. This includes a focus on physical laws that predominate at the microscale, technologies for fabricating small devices, bio-inspired design, and applications of the field.

Content
Main topics of the course include:
- Scaling laws at micro/nano scales
- Electrostatics
- Electromagnetism
- Low Reynolds number flows
- Observation tools
- Materials and fabrication methods
- Applications of biomedical microrobots

Lecture notes
The powerpoint slides presented in the lectures will be made available as pdf files. Several readings will also be made available electronically.

Prerequisites / notice
The lecture will be taught in English.

151-0615-00L Real-World Robotics - A Hands-On Project Class

Abstract
During this course, the students will develop an articulated robotic hand to solve a real-world robotic challenge: the robot must autonomously grasp and place objects. The students will learn the key theoretical concepts required to model, manufacture, control, and test their robot, alongside developing machine learning, programming, hardware, and engineering skills through the hands-on project.

Objective
Learning Objective 1: High-Level System Design
System and product design combined with requirement generation and verification are essential for this robotics project. The students will apply previously acquired system design knowledge and methods to a hands-on challenge.

Learning Objective 2: Robot Design and Simulation
Students will gain experience implementing and simulating robotic systems using modern design, modeling, and simulation techniques such as CAD and Isaac Gym. These techniques are essential in any design process to understand the expected system behavior. This requires thoroughly understanding the system’s kinematics, dynamics, material, actuation principle, and physical limitations. Students will learn the theory and limitations behind modeling and simulation software.

Learning Objective 3: Robot Fabrication
Students will learn to use the previously designed CAD models for successful robot fabrication. Additionally, the iterative nature of the process will allow them to develop their critical thinking skills in assessing the limitations of their design as well as possible sources for improvements. Building the robot will equip students with essential skills for using robots in the real world.

Learning Objective 4: Control, Integration, and Testing
Students can directly apply the knowledge acquired in their control courses. They will gain theoretical knowledge on how to model and develop intelligent control algorithms. Perception methods and state-of-the-art machine-learning techniques will be taught. They will gain experience testing their robots’ performance in both hard- and software to enhance their design and suggest future improvements.

Learning Objective 5: Robot production
Students will learn to choose between state-of-the-art industrial production processes to manufacture a soft robot by understanding their limitations and requirements. They will also learn how to optimize the robot design to account for a specific production process.
During this course, the students will be divided into teams and each group will independently develop an articulated robotic arm to solve a real-world robotic challenge, which will take place at the end of the course. The students will learn the key theoretical concepts required to model, manufacture, control and test a soft robot, along with developing the programming, hardware and engineering skills through hands-on workshops.

This course is composed of tutorials, which will be available on the course website where the lecturer will provide all the necessary theoretical input, focus talks where robotic experts will present a particular aspect of the manipulator in detail, and workshops where the students will have the possibility to hands-on learn how to implement the solutions required to solve their challenge. Finally, there will be time slots to autonomously work on the manufacturing and development of the team's robot and an online forum will be available to help the students throughout the entire course.

This course is divided into six parts:

Part 1: Challenge introduction
- Identify the functional requirements necessary for the final challenge
- Evaluate the existing manipulator designs to optimize them for the specific task

Part 2: Robot Design
- Develop a CAD model based on the high-level system design.
- Integrate motors, pneumatics components, and other required materials in the design

Part 3: Robot Fabrication
- Come up with a fabrication method and plan using the presented fabrication skills.
- Fabricate the robot and its actuators based on the CAD model.
- Evaluate, modify, and enhance the fabrication approach.

Part 4: Soft Robot Simulation
- Simulate the soft manipulator through a simulation framework
- Optimize the simulation parameters to reflect the experimental setup

Part 5: Control, Integration, and Testing
- Formulate the dynamic skills needed for real-life application.
- Develop traditional and learning-based control algorithms and test them in simulation.
- Integrate controller design into the fabricated robot.
- Build, test, fail, and repeat until the soft robot works as desired in simple tasks.
- Upgrade and validate the robot for performance in real-world conditions and verify requirements.

Part 6: Product development
- Propose a manufacturing process to bring the robot from a prototype to the final product
- Optimize the robot for production

Lecture notes
All class materials, including slides, video tutorials, and supporting literature, can be found on the class webpage (https://rwr.ethz.ch) and Moodle, supported by discussion and Q&A forums. Focus talks, Q&A sessions, and workshops will happen on Mondays between 14:00 and 16:00.

Literature

Prerequisites / notice
Students are expected to have attended introductory courses in dynamics, control systems, and robotics.

Registration for this course is limited due to the amount of resources needed to make this course happen. For this reason, it is required to apply through the following module: https://forms.gle/pnMHTCdZwgdawb519

The graded semester performance consists of the final team performance in the class challenge, a final team presentation and report, weekly Moodle quizzes, and attendance at the focus talks and workshops.

151-0632-00L Vision Algorithms for Mobile Robotics (University of Zurich)
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.
UZH Module Code: DINF2039

Mind the enrolment deadlines at UZH:
For a robot to be autonomous, it has to perceive and understand the world around it. This course introduces you to the key computer vision algorithms used in mobile robotics, such as feature extraction, structure from motion, dense reconstruction, tracking, image retrieval, event-based vision, and visual-inertial odometry (the algorithms behind Hololens, Oculus Quest, and the NASA Mars rovers).

Learn the fundamental computer vision algorithms used in mobile robotics, in particular: filtering, feature extraction, structure from motion, multiple view geometry, dense reconstruction, tracking, image retrieval, event-based vision, and visual-inertial odometry and Simultaneous Localization And Mapping (SLAM) (the algorithms behind Hololens, Facebook-Oculus Quest, and the NASA Mars rovers).

Each lecture will be followed by a lab session where you will learn to implement a building block of a visual odometry algorithm in Matlab. By the end of the course, you will integrate all these building blocks into a working visual odometry algorithm.

Lecture slides will be made available on the course official website: http://rpg.ifi.uzh.ch/teaching.html

Applied Category Theory is an exciting multidisciplinary field of research which harnesses the mathematical language of category theory for applications across a broad range of disciplines. This course is a gentle introduction to the theory, emphasizing applications in engineering and the “compositional approach” to systems analysis, co-design, and computation.

Note: If you are interested in taking UZH courses, you must register as an incoming mobility student at UZH. For details, see as follows:

UZH course enrollment for ETH student at University of Zurich (UZH) > Mobility within Switzerland – Incoming > Module Mobility: The easiest way to take individual modules/courses to supplement your studies at your home university is with module mobility. This option is not available to students who have dropped out of their home university or have been definitively excluded or banned from the relevant program > Application and Deadlines: Applications are submitted via the UZH application portal (https://www.uzh.ch/cmsssl/en/studies/application/chmobilityin.html)

ATTENTION: When you book the course at UZH, you are automatically registered for the exam at UZH and you can unregister until the October deadline. After registering for the course, you as an ETH student need to check out your **UZH email account** to receive the related information from the lecturer.
Objective

1) Learn basic concepts from algebra and category theory, together with ways to make use of these concepts for engineering applications.

2) Become familiar with case studies of applied category theory, for instance involving dynamical systems, databases, and complex system co-design (e.g. in the context of autonomous vehicles).

3) Be able to recognize compositional structures in concrete scenarios at different levels of abstraction.

4) Understand the "compositional way of thinking" as an approach to systems analysis, co-design, and computation.

Content

Review of basic algebraic structures [sets, relations, (semi)groups, monoids, actions, order theory]

Gentle introduction to category theory [series and parallel composition, feedback, actions, functors, universal properties]

Many simple applied examples illustrating concepts along the way. Extended examples from dynamical systems, databases, and systems co-design in engineering.

Homework will consist of 1) basic exercises to check one’s understanding of core concepts, and 2) a choice between either A) coding exercises (in python) to learn how to implement concepts in software or B) further theory exercises to deepen mathematical understanding.

Homework will be graded on a schedule that allows some flexibility, and it will constitute 100% of the grade (no exam).

Lecture notes

Slides and a (work-in-progress) textbook for the course will be provided (A. Censi, J. Lorand, G. Zardini, "Applied Compositional Thinking for Engineers").

For many further resources, see also https://applied-compositional-thinking.engineering/

227-0102-00L Discrete Event Systems W 6 credits 4G L. Vanbever, L. Josipovic, B. Keller, R. Wattenhofer

Abstract

Introduction to discrete event systems. We start out by studying popular models of discrete event systems. Then we analyze discrete event systems from an average-case and from a worst-case perspective, and study verification. Topics include: Automata and Languages, Specification Models, Stochastic Discrete Event Systems, Worst-Case Event Systems, Verification, Petri Nets.

Objective

Over the past few decades the rapid evolution of computing, communication, and information technologies has brought about the proliferation of new dynamic systems. A significant part of activity in these systems is governed by operational rules designed by humans. The dynamics of these systems are characterized by asynchronous occurrences of discrete events, some controlled (e.g. hitting a keyboard key, sending a message), some not (e.g. spontaneous failure, packet loss).

The mathematical arsenal centered around differential equations that has been employed in systems engineering to model and study processes governed by the laws of nature is often inadequate or inappropriate for discrete event systems. The challenge is to develop new modeling frameworks, analysis techniques, design tools, testing methods, and optimization processes for this new generation of systems.

In this lecture we give an introduction to discrete event systems. We start out the course by exploring the limits of what is computable and what is not. In doing so, we will consider three distinct models of computation which are often used to model discrete event systems: finite automata, push-down automata and Turing machines (ranked in terms of expressiveness power). In the second part of the course we analyze discrete event systems. We first examine discrete event systems from an average-case perspective: we model discrete events as stochastic processes, and then apply continuous time markov chains and queueing theory for an understanding of the typical behavior of a system. Then we analyze discrete event systems from a worst-case perspective using the theory of online algorithms and adversarial queueing. In the last part of the course we introduce methods that allow to formally verify certain properties of Finite Automata and Petri Nets. These are some typical analysis questions we will look at: Do two given systems behave the same? Does a given system behave as intended? Does the system eventually enter a dangerous state?

Content

1. Regular Languages
2. Non-Regular Languages
3. Markov Chains
4. Stochastic Discrete Event Systems
5. Worst-Case Event Systems
6. Verification of Finite Automata
7. Petri Nets

Lecture notes

Available at https://disco.ethz.ch/courses/des/
An embedded system is a combination of hardware and software, either fixed in function or programmable, that is designed for a specific application scenario or for a specific task within a larger system. They are part of industrial machines such as agricultural and manufacturing equipment, automotive systems, medical equipment, household appliances, sensor networks, and the Internet of Things.

Understanding the specific requirements and problems that arise in embedded system applications.

Understanding the hardware structure of a microcontroller and an embedded system; memory architecture and memory map, internal and external peripherals, low-power and low-energy design as well as instruction sets and computational accelerators.

Understanding the firmware structure of a microcontroller and an embedded system; low-level instruction set, hardware-software interfaces, communication between components, embedded real-time operating systems, real-time scheduling, shared resources, low-power and low-energy programming as well as computational accelerators.

Using formal models and methods for designing and optimizing embedded systems.

Gaining experience with practical applications of the C programming language, embedded real-time operating systems, and debug functionalities of the associated design environment to design, implement, and verify embedded firmware.

Through project-based activities, students will gain substantial experience in applying the C programming language in the context of embedded systems. Projects will involve developing and implementing firmware, utilizing embedded real-time operating systems, and exploring the debugging functionalities within design environments. This hands-on approach aims to bridge the gap between theoretical knowledge and practical application, allowing students to experience the full lifecycle of embedded system development from design to implementation and verification.

This lecture focuses on the design of embedded systems using formal models and methods. Besides the theoretical lecture, the course contains laboratory sessions where students transfer the learned theoretical aspects into praxis by programming a microcontroller and interfacing it with sensors and actuators. Students will be exposed to a commercial microcontroller, and the development board extend with a custom-designed embedded systems educational platform.

Specifically, the following topics will be covered in the course: hardware and software structures of embedded systems, low-level instruction set, memory architecture and memory map, peripherals, hardware-software interfaces, communication between components, firmware design methodologies, firmware design using the C programming language, embedded real-time operating systems, real-time scheduling, shared resources, low-power, and low-energy designs well as computational accelerators.

Lecture material, publications, exercise sheets, and laboratory documentation will be available on the course's Moodle page.
The course is intended to provide a comprehensive overview of the theory of linear dynamical systems, stability analysis, and their use in control and estimation. The focus is on the mathematics behind the physical properties of these systems and on understanding and constructing proofs of properties of linear control systems.

Objective

Students should be able to apply the fundamental results in linear system theory to analyze and control linear dynamical systems.

Content

- Proof techniques and practices.
- Linear spaces, normed linear spaces and Hilbert spaces.
- Ordinary differential equations, existence and uniqueness of solutions.
- Continuous and discrete-time, time-varying linear systems. Time domain solutions. Time invariant systems treated as a special case.
- Controllability and observability, duality. Time invariant systems treated as a special case.
- Stability and stabilization, observers, state and output feedback, separation principle.

Lecture notes

Available on the course Moodle platform.

Prerequisites / notice

Sufficient mathematical maturity, in particular in linear algebra, analysis.

Competencies

- Subject-specific Competencies
  - Concepts and Theories: assessed
  - Techniques and Technologies: assessed

227-0225-00L Linear System Theory

Abstract

The class is intended to provide a comprehensive overview of the theory of linear dynamical systems, stability analysis, and their use in control and estimation. The focus is on the mathematics behind the physical properties of these systems and on understanding and constructing proofs of properties of linear control systems.

Objective

Students should be able to apply the fundamental results in linear system theory to analyze and control linear dynamical systems.

Content

- Proof techniques and practices.
- Linear spaces, normed linear spaces and Hilbert spaces.
- Ordinary differential equations, existence and uniqueness of solutions.
- Continuous and discrete-time, time-varying linear systems. Time domain solutions. Time invariant systems treated as a special case.
- Controllability and observability, duality. Time invariant systems treated as a special case.
- Stability and stabilization, observers, state and output feedback, separation principle.

227-0224-00L Power Electronic Systems I

Abstract

Basics of the switching behavior, gate drive and snubber circuits of power semiconductors are discussed. Soft-switching and resonant DC/DC converters are analyzed in detail and high frequency loss mechanisms of magnetic components are explained. Space vector modulation of three-phase inverters is introduced and the main power components are designed for typical industry applications.

Objective

Detailed understanding of the principle of operation and modulation of advanced power electronics converter systems, especially of zero voltage switching and zero current switching non-isolated and isolated DC/DC converter systems and three-phase voltage DC link inverter systems. Furthermore, the course should convey knowledge on the switching frequency related losses of power semiconductors and inductive power components and introduce the concept of space vector calculus which provides a basis for the comprehensive discussion of three-phase PWM converters systems in the lecture Power Electronic Systems II.

Content

Basics of the switching behavior and gate drive circuits of power semiconductor devices and auxiliary circuits for minimizing the switching losses are explained. Furthermore, zero voltage switching, zero current switching, and resonant DC/DC converters are discussed in detail; the operating behavior of isolated full-bridge DC/DC converters is detailed for different secondary side rectifier topologies; high frequency loss mechanisms of magnetic components of converter circuits are explained and approximate calculation methods are presented; the concept of space vector calculus for analyzing three-phase systems is introduced; finally, phase-oriented and space vector modulation of three-phase inverter systems are discussed related to voltage DC link inverter systems and the design of the main power components based on analytical calculations is explained.

Lecture notes

Lecture notes and associated exercises including correct answers.

Prerequisites / notice

Prerequisites: Introductory course on power electronics is recommended.

227-0447-00L Image Analysis and Computer Vision

Abstract

Objective

Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

Content

This course aims at offering a self-contained account of computer vision and its underlying concepts, including the recent use of deep learning.

The first part starts with an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First the interaction of light with matter is considered. The most important hardware components such as cameras and illumination sources are also discussed. The course then turns to image discretization, necessary to process images by computer.

The next part describes necessary pre-processing steps, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and 3D shape as two important examples. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed. A major part at the end is devoted to deep learning and AI-based approaches to image analysis. Its main focus is on object recognition, but also other examples of image processing using deep neural nets are given.

Lecture notes

Course material Script, computer demonstrations, exercises and problem solutions.

Prerequisites / notice

Prerequisites:
- Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Python and Linux.
- The course language is English.

227-0526-00L Power System Analysis

Abstract

Sufficient mathematical maturity, in particular in linear algebra, analysis.

Objective

- Controllability and observability, duality. Time invariant systems treated as a special case.
- Stability and stabilization, observers, state and output feedback, separation principle.

Content

- Proof techniques and practices.
- Linear spaces, normed linear spaces and Hilbert spaces.
- Ordinary differential equations, existence and uniqueness of solutions.
- Continuous and discrete-time, time-varying linear systems. Time domain solutions. Time invariant systems treated as a special case.

Lecture notes

Lecture notes and associated exercises including correct answers.

Prerequisites / notice

Prerequisites: C programming, circuit theory, digital logic, binary number representations.

Competencies

- Subject-specific Competencies
  - Concepts and Theories: assessed
  - Techniques and Technologies: assessed
The goal of this course is understanding the stationary dependencies in electrical power systems. The course includes the development of stationary models of the electrical network, their mathematical representation and special characteristics and solution methods of large linear and non-linear systems of equations related to electrical power grids. Approaches such as the Newton-Raphson algorithm applied to power flow equations, superposition technique for short-circuit analysis and symmetrical components are discussed as well as power flow computation techniques for distribution grids and state estimation.

Objective

The goal of this course is understanding the stationary dependencies in electrical power systems and the application of analysis tools in normal but also in faulty state.

Content

The course includes the development of stationary models of the electrical network, their mathematical representation and special characteristics and solution methods of large linear and non-linear systems of equations related to electrical power networks. Approaches such as the Newton-Raphson algorithm applied to power flow equations, superposition technique for short-circuit analysis and symmetrical components are discussed as well as power flow computation techniques for distribution grids and state estimation.

Computer Vision and Artificial Intelligence for Autonomous Driving

Up until FS2022 offered as Deep Learning for Autonomous Driving

Abstract

This course introduces the core computer vision techniques and algorithms that autonomous cars use to perceive the semantics and geometry of their driving environment, localize themselves in it, and predict its dynamic evolution. Emphasis is placed on techniques tailored for real-world settings, such as multi-modal fusion, domain-adaptive and outlier-aware architectures, and multi-agent methods.

Objective

Students will learn about the fundamentals of autonomous cars and of the computer vision models and methods these cars use to analyze their environment and navigate themselves in it. Students will be presented with state-of-the-art representations and algorithms for semantic, geometric and temporal visual reasoning in automated driving and will gain hands-on experience in developing computer vision algorithms and architectures for solving such tasks.

After completing this course, students will be able to:

1. understand the operating principles of visual sensors in autonomous cars
2. differentiate between the core architectural paradigms and components of modern visual perception models and describe their logic and the role of their parameters
3. systematically categorize the main visual tasks related to automated driving and understand the primary representations and algorithms which are used for solving them
4. critically analyze and evaluate current research in the area of computer vision for autonomous cars
5. practically reproduce state-of-the-art computer vision methods in automated driving
6. independently develop new models for visual perception

Content

The content of the lectures consists in the following topics:

1. Fundamentals
   (a) Fundamentals of autonomous cars and their visual sensors
   (b) Fundamental computer vision architectures and algorithms for autonomous cars

2. Semantic perception
   (a) Semantic segmentation
   (b) Object detection
   (c) Instance segmentation and panoptic segmentation

3. Geometric perception and localization
   (a) Depth estimation
   (b) 3D reconstruction
   (c) Visual localization
   (d) Unimodal visual/lidar 3D object detection

4. Robust perception: multi-modal, multi-domain and multi-agent methods
   (a) Multi-modal 2D and 3D object detection
   (b) Visual grounding and verbo-visual fusion
   (c) Domain-adaptive and outlier-aware semantic perception
   (d) Vehicle-to-vehicle communication for perception

5. Temporal perception
   (a) Multiple object tracking
   (b) Motion prediction

The practical projects involve implementing complex computer vision architectures and algorithms and applying them to real-world, multi-modal driving datasets. In particular, students will develop models and algorithms for:

1. Semantic segmentation and depth estimation
2. Sensor calibration for multi-modal 3D driving datasets
3. 3D object detection using lidars

Lecture notes

Lecture slides are provided in PDF format.

Prerequisites / notice

Students are expected to have a solid basic knowledge of linear algebra, multivariate calculus, and probability theory, and a basic background in computer vision and machine learning. All practical projects will require solid background in programming and will be based on Python and libraries of it such as PyTorch.

**Abstract**

Theory and techniques for the identification of dynamic models from experimentally obtained system input-output data.

**Objective**

To provide a series of practical techniques for the development of dynamical models from experimental data, with the emphasis being on the development of models suitable for feedback control design purposes. To provide sufficient theory to enable the practitioner to understand the trade-offs between model accuracy, data quality and data quantity.

**Content**

- Introduction to modeling: Black-box and grey-box models; Parametric and non-parametric models; ARX, ARMAX (etc.) models.
- Predictive, open-loop, black-box identification methods. Time and frequency domain methods. Subspace identification methods.
- Optimal experimental design, Cramer-Rao bounds, input signal design.
- Parametric identification methods. On-line and batch approaches.

**Literature**

**Prerequisites / notice**

Control systems (227-0216-00L) or equivalent.

</table>

**Abstract**

Introduction to industrial automation systems with application to the process industry, power generation as well as discrete manufacturing.

**Objective**

General understanding of industrial automation systems in different industries. Purpose, architecture, technologies, application examples, current and future trends.

**Content**

- Introduction to process automation: system architecture, data handling, communication (fieldbuses), process visualization, and engineering. Differences and characteristics of discrete and process industries.
- Analysis and design of open loop control problems: discrete automata, finite state machines, decision tables, and petri-nets. Practical analysis and design of closed-loop control for the process industry.
- Automation Engineering: Application programming in IEC 61131-3 (ladder diagrams, function blocks, sequence control, structured text); PLC programming and simulation, process visualization and operation; engineering integration from sensors, cabling, topology design, function, visualization, diagnosis, to documentation; Industry standards (e.g. OPC, Profibus); Ergonomic design, safety (IEC61508) and availability, supervision and diagnosis.
- Extensive practical examples from different process industries, power generation, gas compressor control, and automotive manufacturing.

**Literature**

- Slides will be available as .PDF documents, see "Learning materials" (for registered students only)
- References will be given at the end of individual lectures.

**Prerequisites / notice**

Practical exercises will illustrate some topics, e.g. some control software coding using industry standard programming tools based on IEC61131-3.

**Competencies**

- Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

**Abstract**

Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

**Objective**

Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and the difference between modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real world data.

**Content**

The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

**Topics covered in the lecture include:**

- Fundamentals:
  - What is data?
  - Bayesian Learning
  - Computational learning theory
- Supervised learning:
  - Ensembles: Bagging and Boosting
  - Max Margin methods
  - Neural networks
- Unsupervised learning:
  - Dimensionality reduction techniques
  - Clustering
  - Mixture Models
  - Non-parametric density estimation
  - Learning Dynamical Systems

**Literature**

Prerequisites / notice

The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments. Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

252-3110-00L Human Computer Interaction W 8 credits 3V+2U+2A C. Holz

Abstract

The course provides an introduction to the field of human-computer interaction and focuses on role of the user in system design. Methods used to analyze the user experience will be introduced to show how they inform the design of new interfaces, systems, and technologies. Emerging methods and tools in computational interaction and optimization for UI design will also be introduced.

Objective

The goal of the course is for students to understand the principles of user-centered design and be able to apply these in practice. Another goal is to understand the basic notions of Computational Design in a HCI context.

Content

The course will introduce students to several methods of analysing the user experience, showing how these can be used at different stages of system development from requirements analysis through to usability testing.

Students will get experience of designing and carrying out user studies as well as analysing results. The course will also cover the basic principles of interaction design. Practical exercises related to touch and gesture-based interaction will be used to reinforce the concepts introduced in the lecture. To get students to further think beyond traditional system design, we will discuss issues related to ambient information and awareness.

252-5051-00L Advanced Topics in Machine Learning W 2 credits 2S R. Cotterell, M. El-Assady, N. He, F. Yang

Abstract

In this seminar, recent papers of the pattern recognition and machine learning literature are presented and discussed. Possible topics cover statistical models in computer vision, graphical models and machine learning.

Objective

The seminar "Advanced Topics in Machine Learning" familiarizes students with recent developments in pattern recognition and machine learning. Original articles have to be presented and critically reviewed. The students will learn how to structure a scientific presentation in English which covers the key ideas of a scientific paper. An important goal of the seminar presentation is to summarize the essential ideas of the paper in sufficient depth while omitting details which are not essential for the understanding of the work. The presentation style will play an important role and should reach the level of professional scientific presentations.

Content

The seminar will cover a number of recent papers which have emerged as important contributions to the pattern recognition and machine learning literature. The topics will vary from year to year to year but are centered on methodological issues in machine learning like new learning algorithms, ensemble methods or new statistical models for machine learning applications. Frequently, papers are selected from computer vision or bioinformatics - two fields, which relies more and more on machine learning methodology and statistical models.

Literature

The papers will be presented in the first session of the seminar.

252-5701-00L Seminar in Advanced Topics in Vision W 2 credits 2S M. Pollefeys, S. Tang

Abstract

This seminar covers advanced topics in computer vision, such as 3D reconstruction, image understanding, object detection, people tracking, motion prediction, and other related topics. Each time the course is offered, a collection of research papers is selected and each student presents one paper to the class and leads a discussion about the paper and related topics.

Objective

The goal is to get an in-depth understanding of actual problems and research topics in the field of computer vision as well as improve presentations and critical analysis skills.

Content

This seminar covers advanced topics in computer vision by reading and presenting classic and state-of-the-art papers. Each time the course is offered, a collection of research papers are selected covering topics such as 3D reconstruction, image understanding, object detection, people tracking, motion prediction and others. Each student presents one paper to the class and leads a discussion about the paper and related topics. All students read the papers and participate in the discussion.

Individual research papers are selected each term.

263-5210-00L Probabilistic Artificial Intelligence W 8 credits 3V+2U+2A A. Krause

Abstract

This course introduces core modeling techniques and algorithms from machine learning, optimization and control for reasoning and decision making under uncertainty, and study applications in areas such as robotics.
The objectives of this course are:

- To introduce the fundamentals of computer vision.
- To introduce the main concepts and techniques used to solve those.
- To enable participants to implement solutions for reasonably complex problems.
- To be able to critically analyze and assess current research in this area.

The course introduces latest mixed reality technology and provides introductory elements for a number of related fields including:

- Introduction to Mixed Reality / Augmented Reality / Virtual Reality
- Introduction to 3D Computer Graphics, 3D Computer Vision. This will take place in the form of short lectures, followed by student presentations discussing the current state-of-the-art. The main focus of this course is to introduce students on mixed reality topics, where small groups of students will work on a particular project with the goal to design, develop and deploy a mixed reality application. The project topics are flexible and can reach from proof-of-concept vision/graphics/HMI research, to apps that support teaching with interactive augmented reality, or game development. The default platform will be Microsoft HoloLens in combination with C# and Unity3D - other platforms are also possible to use, such as tablets and phones.

Prerequisites include:

- Good programming skills (C# / C++ / Java etc.)
- Computer graphics/vision experience: Students should have taken, at a minimum, Visual Computing. Higher level courses are recommended, such as Introduction to Computer Graphics, 3D Vision, Computer Vision.

The goal of this course is to provide students with a good understanding of computer vision and image analysis techniques. The main concepts and techniques will be studied in depth and practical algorithms and approaches will be discussed and explored through the exercises.

Objective

The goals of this course are:

1. To introduce the main concepts and techniques used to solve those.
2. To enable participants to implement solutions for reasonably complex problems.
3. To be able to critically analyze and assess current research in this area.

The material covered in the course “Introduction to Machine Learning” is considered as a prerequisite.

Prerequisites

Solid basic knowledge in statistics, algorithms and programming.

The goal of this course is an introduction and hands-on experience on latest mixed reality technology at the cross-section of 3D computer graphics and vision, human machine interaction, as well as gaming technology.

Objective

After attending this course, students will:

1. Understand the foundations of 3D graphics, Computer Vision, and Human-Machine Interaction
2. Have a clear understanding on how to build mixed reality apps
3. Have a good overview on state-of-the-art Mixed Reality
4. Be able to critically analyze and assess current research in this area.

Content

The course introduces latest mixed reality technology and provides introductory elements for a number of related fields including:

- Introduction to Mixed Reality / Augmented Reality / Virtual Reality
- Introduction to 3D Computer Graphics, 3D Computer Vision. This will take place in the form of short lectures, followed by student presentations discussing the current state-of-the-art. The main focus of this course is to introduce students on mixed reality topics, where small groups of students will work on a particular project with the goal to design, develop and deploy a mixed reality application. The project topics are flexible and can reach from proof-of-concept vision/graphics/HMI research, to apps that support teaching with interactive augmented reality, or game development. The default platform will be Microsoft HoloLens in combination with C# and Unity3D - other platforms are also possible to use, such as tablets and phones.

Prerequisites

- Good programming skills (C# / C++ / Java etc.)
- Computer graphics/vision experience: Students should have taken, at a minimum, Visual Computing. Higher level courses are recommended, such as Introduction to Computer Graphics, 3D Vision, Computer Vision.

This course focuses on the emerging, interdisciplinary field of physical human-robot interaction, bringing together themes from robotics, real-time control, human factors, haptics, virtual environments, interaction design and other fields to enable the development of human-oriented robotic systems.

Objective

The objective of this course is to give an introduction to the fundamentals of physical human robot interaction, through lectures on the underlying theoretical/mechatronics aspects and application fields, in combination with a hands-on lab tutorial. The course will guide students through the design and evaluation process of such systems.

By the end of this course, you should understand the critical elements in human-robot interactions - both in terms of engineering and human factors - and use these to evaluate and de- sign safe and efficient assistive and rehabilitative robotic systems. Specifically, you should be able to:

1) identify critical human factors in physical human-robot interaction and use these to derive design requirements;
2) compare and select mechatronic components that optimally fulfill the defined design requirements;
3) derive a model of the device dynamics to guide and optimize the selection and integration of selected components into a functional system;
4) design control hardware and software and implement and test human-interactive control strategies on the physical setup;
5) characterize and optimize such systems using both engineering and psychophysical evaluation metrics;
6) investigate and optimize one aspect of the physical setup and convey and defend the gained insights in a technical presentation.
Content

This course provides an introduction to fundamental aspects of physical human-robot interaction. After an overview of human haptic, visual and auditory sensing, neurophysiology and psychophysics, principles of human-robot interaction systems (kinematics, mechanical transmissions, robot sensors and actuators used in these systems) will be introduced. Throughout the course, students will gain knowledge of interaction control strategies including impedance/admittance and force control, haptic rendering basics and issues in device design for humans such as transparency and stability analysis, safety hardware and procedures. The course is organized into lectures that aim to bring students up to speed with the basics of these systems, readings on classical and current topics in physical human-robot interaction, laboratory sessions and lab visits.

Students will attend periodic laboratory sessions where they will implement the theoretical aspects learned during the lectures. Here the salient features of haptic device design will be identified and theoretical and experimental procedures will be used in a haptic system based on the haptic paddle (https://relab.ethz.ch/downloads/open-hardware/haptic-paddle.html), by creating simple dynamic haptic virtual environments and understanding the performance limitations and causes of instabilities (direct/virtual coupling, friction, damping, time delays, sampling rate, sensor quantization, etc.) during rendering of different mechanical properties.

Lecture notes

Will be distributed on Moodle before the lectures.

636-0007-00L Computational Systems Biology

W 6 credits
3V+2U  J. Stelling

Abstract

Study of fundamental concepts, models and computational methods for the analysis of complex biological networks. Topics: Systems approaches in biology, biology and reaction network fundamentals, modeling and simulation approaches (topological, probabilistic, stoichiometric, qualitative, linear / nonlinear ODEs, stochastic), and systems analysis (complexity reduction, stability, identification).

Objective

The aim of this course is to provide an introductory overview of mathematical and computational methods for the modeling, simulation and analysis of biological networks.

The Master's Thesis must be approved in advance by the tutor and is supervised by a professor of ETH Zurich or an adjunct faculty of RSC.

Abstract
Master's programs are concluded by the master's thesis. The thesis is aimed at enhancing the student's capability to work independently toward the solution of a theoretical or applied problem. The subject of the master's thesis, as well as the project plan and roadmap, are proposed by the tutor and further elaborated with the student.

Objective
The thesis is aimed at enhancing the student's capability to work independently toward the solution of a theoretical or applied problem.

ECTS
European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
Analytical Competencies

Course materials will be available on Moodle.

E. K. Smith, S. Gomm assessed

fostered

Hours

ECTS

The goals of this class are:

Concepts and Theories

Students should gain the skill to perform policy analyses independently. To this end, students will be enabled to understand a policy problem and the rationale for policy intervention; to select appropriate impact categories and methods to address a policy problem through policy analysis; to assess policy alternatives, using various ex-ante policy analysis methods; and to communicate the results of the analysis.

Policy Analysis

The course Policy Analysis 1 will introduce important concepts and methods for ex-ante policy analysis. It will mostly focus on the policy process (vis-à-vis the policy process). We will primarily discuss quantitative methods. The course will contain several practical assignments in which students have to apply the concepts and methods studied.

Principles of Microeconomics

The course introduces basic principles, problems and approaches of microeconomics. This provides the students with reflective and contextual knowledge on how societies use scarce resources to produce goods and services and ensure a (fair) distribution.

Course 860-0004-00L

Concepts, Theories, and Methods for Public Policy Analysis

ISTP-PhD students please register via the Study Administration.

Course 860-0034-00L

Opinion Research, Survey and Field Experiments

Priority for Science, Technology, and Policy MSc and PhD students.

Introduction to public opinion surveys. We start with the theoretical foundations of the formation of (public) opinion formation and ideology, then turn to the practical lessons of developing and implementing own surveys with a focus on causal inference via survey experiments. Finally, we give practical insights into the analysis of (complex) survey data.

Course 860-0005-00L

Colloquium Science, Technology, and Policy (HS)

The series is open to the public. The lectures start at 12:15 and last 30 minutes, followed by an open discussion of 30 minutes.

Course 860-0031-00L

Policy Analysis

Does not take place this semester.

Course 363-0503-00L

Principles of Microeconomics

The course introduces basic principles, problems and approaches of microeconomics. This provides the students with reflective and contextual knowledge on how societies use scarce resources to produce goods and services and ensure a (fair) distribution.
The learning objectives of the course are:

1. Students must be able to discuss basic principles, problems and approaches in microeconomics.
2. Students can analyse and explain simple economic principles in a market using supply and demand graphs.
3. Students can contrast different market structures and describe firm and consumer behavior.
4. Students can identify market failures such as externalities related to market activities and illustrate how these affect the economy as a whole.
5. Students can also recognize behavioral failures within a market and discuss basic concepts related to behavioral economics.
6. Students can apply simple mathematical concepts on economic problems.

Topics covered by the course are:
- Supply and demand
- Consumer demand: neoclassical and behavioral perspective
- Cost of production: neoclassical and behavioral perspective
- Welfare economics, deadweight losses
- Governmental policies
- Market failures, common resources and public goods
- Public sector, tax system
- Market forms (competitive, monopolistic, monopolistic competitive, oligopolistic)
- International trade

Lecture notes
Lecture notes, exercises and reference material can be downloaded from Moodle.

Literature

For students taking only the course 'Principles of Microeconomics' there is a shorter version of the same book:

Complementary:

363-0565-00L Principles of Macroeconomics

Objective
This course examines the behaviour of macroeconomic variables, such as gross domestic product, unemployment and inflation rates. It tries to answer questions like: How can we explain fluctuations of national economic activity? What can economic policy do against unemployment and inflation?

Content
This course introduces students to the necessary fundamentals of statistics, and its application, to understand policy. Theoretically the course will provide a survey of foundational concepts and techniques in statistics and mathematics. The applied part of the course will focus on implementing these techniques in R, as well as the practical skills required to develop their own data based research projects.

By doing so, students will gain a familiarity with foundational concepts and techniques in statistics, and be able to apply these to new problems. Students will also develop the requisite skills to be able to independently conduct a variety of tasks in R, such as data cleaning, visualisation and analysis. Finally, students will be able to produce summaries of statistical analyses that non-specialists can understand.

860-0041-00L Data Analysis for Public Policy Research

Objective
This course covers the necessary fundamentals for the use of statistics to understand policy. Theoretically the course will provide a survey of foundational concepts and techniques in statistics and mathematics. The applied part of the course will focus on implementing these techniques in R, as well as the practical skills required to develop their own data based research projects.

Content
The resources on our planet are finite. The discipline of microeconomics therefore deals with the question of how society can use scarce resources to produce goods and services and ensure a 'fair' distribution. In particular, microeconomics deals with the behaviour of consumers and firms in different market forms. Economic considerations and discussions are not part of classical engineering and science study programme. Thus, the goal of the lecture "Principles of Microeconomics" is to teach students how economic thinking and argumentation works. The course should help the students to look at the contents of their own studies from a different perspective and to be able to critically reflect on economic problems discussed in the society.

Topics covered by the course are:
- Supply and demand
- Consumer demand: neoclassical and behavioral perspective
- Cost of production: neoclassical and behavioral perspective
- Welfare economics, deadweight losses
- Governmental policies
- Market failures, common resources and public goods
- Public sector, tax system
- Market forms (competitive, monopolistic, monopolistic competitive, oligopolistic)
- International trade

Lecture notes
Lecture notes, exercises and reference material can be downloaded from Moodle.

Literature

For students taking only the course 'Principles of Microeconomics' there is a shorter version of the same book:

Complementary:
This course helps you understand the world in which you live. There are many questions about the macroeconomy that might spark your curiosity. Why are living standards so meagre in many African countries? Why do some countries have high rates of inflation while others have stable prices? Why have some European countries adopted a common currency? These are just a few of the questions that this course will help you answer.

Furthermore, this course will give you a better understanding of the potential and limits of economic policy. As a voter, you help choose the policies that guide the allocation of society’s resources. When deciding which policies to support, you may find yourself asking various questions about economics. What are the burdens associated with alternative forms of taxation? What are the effects of free trade with other countries? How does the government budget deficit affect the economy? These and similar questions are always on the minds of policy makers.

This book can also be used for the course ‘363-0503-00L Principles of Microeconomics’ (Filippini).

Besides this textbook, the slides, lecture notes and problem sets will cover the content of the lecture and the exam questions.

Lecture notes
The course Moodle page contains announcements, course information and lecture slides.

Literature

This book can also be used for the course ‘363-0503-00L Principles of Microeconomics’ (Filippini).
The course is organized in four parts. I start with the key observation that economic activity (both in terms of population density and
natural or man-made geographical characteristics (e.g., rivers, mountains, borders, etc.) affect the development of such urban systems.

In the second part, I discuss the planning and pricing of transport networks, moving from simple local models to more complex transport
models at a global scale. The key aspects include: the first and second best road pricing, the public provision of transport networks and the
demographic effects of transport networks.

In the third part, I combine the previous two parts and analyze the interaction between urban systems and transportation. Thereby, the
main focus is to understand the economic mechanisms that can lead to a general equilibrium of all actors involved. However, as the study
of the historical development of urban systems and transport networks provides interesting insights, I will discuss how natural or man-made geographical characteristics (e.g., rivers, mountains, borders, etc.) affect the development of such urban systems.

Finally, I broaden the scope of the course and explore related topics. There will be a particular emphasis on the relation between urban
systems and fiscal federalism as well as environmental policies. Both aspects are important determinants of the contemporary
developments of urban systems, and as such deserve our attention.

In general, this class focuses on the latest research developments in urban and regional economics, though it does not require prior
knowledge in this field. It pays particular attention to economic approaches, which are based on theoretical frameworks with strong micro-
foundations and allow for precise policy recommendations.
The weekly lectures are structured as follows:

1. **Introduction:** An introduction to infrastructure management and the project.
2. **Service:** Determination of what service you are trying to provide with an infrastructure network is important in justifying the interventions you think are required and ensuring that investment decisions are aligned throughout an infrastructure management organisation. This lecture introduces the concept of serve and connects it to measurable indicators.
3. **Help session 1:** This session provides time for your group to ask questions as you define the service you want your infrastructure network to provide.
4. **Presentation 1:** 4 groups will present their ideas on how they want their networks to provide service.
5. **Interventions:** Justifying the interventions you want to execute to ensure you continue to provide the defined service requires you to model deterioration, determining economically justifiable strategies and explain which interventions will be postponed if you can't do all you would like. This lecture is focused on explaining the main principles behind each of these concepts.
6. **Help session 2:** This session provides time for your group to ask questions as you justify the interventions you want to execute on your infrastructure network over time and explain what you will postpone if you cannot do all of them.
7. **Presentation 2:** 4 groups will present how they have justified interventions and how they have selected the ones they would like to postpone if required.
8. **Monitoring:** To ensure you the infrastructure network is providing what you expect you need to monitor its performance and how projects are being done. This lecture is focused on the principles to ensure a monitoring system is set up that ensure that the infrastructure system is providing the expected service.
9. **Help session 3:** This session provides time for your group to ask questions on how to establish the monitoring systems for your infrastructure networks.
10. **Presentation 3:** 4 groups will present how they intended to monitor their systems and projects.
11. **Organisation:** Managing infrastructure only works well with great teams of people with great processes. This lecture focuses on the principles of ensuring a well function organisation and well-functioning processes.
12. **Help session 4:** This session provides time for your group to ask questions on how to ensure well-functioning organisations and well-functioning processes.
13. **Presentation 4:** 4 groups will present how they intended to ensure well-functioning organisations and well-functioning processes.

**Lecture notes**
- The lecture materials consist of handouts and the slides.
- The lecture materials will be distributed via Moodle by the beginning of each lecture.
- The questions to be discussed in the discussion session will be distributed by the end of the day on the Monday before the discussion session.

**Literature**
- Appropriate literature will be handed out when required via Moodle.

**Prerequisites / notice**
- This course has no prerequisites.

**103-0347-01L Landscape Planning and Environmental Systems (GIS W)**

**Abstract**
The course content of the lecture Landscape Planning and Environmental Systems (103-0347-00 V) will be illustrated in practical GIS exercises (e.g. habitat modelling, land use change, ecosystem services, connectivity).

**Objective**
- Practical application of theory from the lectures
- Quantitative assessment and evaluation of landscape characteristics
- Learning useful applications of GIS for landscape planning
- Developing landscape planning measures for practical case studies

**Content**
- Applications of GIS in landscape planning
- Landscape analysis
- Landscape structural metrics
- Modelling habitats and land use change
- Calculating urban ecosystem services
- Ecological connectivity

**Lecture notes**
- A script and presentation slides for each exercise will be provided on Moodle.

**Literature**
- Will be named in the lecture.

**Prerequisites / notice**
- Basic GIS skills are strongly recommended.
103-0347-00L  
Landscape Planning and Environmental Systems  
W 3 credits  2V  A. Grêt-Regamey

Abstract  
In the course, students learn about methods for the identification and measurement of landscape characteristics, as well as measures and policies for landscape planning. Landscape planning is put into the context of environmental systems (soil, water, air, climate, flora and fauna) and discussed with regard to socio-political questions of the future.

Objective  
The aims of this course are:  
1) To illustrate the concept of landscape planning, the economic relevance of landscape and nature in the context of the environmental systems (soil, water, air, climate, flora and fauna).  
2) To show landscape planning as an integral information system for the coordination of different instruments by illustrating the aims, methods, instruments and their functions in landscape planning.  
3) To show the importance of ecosystem services.  
4) To learn basics about nature and landscape: Analysis and assessment of the complex interactions between landscape elements, effects of current and future land use (ecosystem goods and services, landscape functions).  
5) To identify and measure the characteristics of landscape.  
6) Learn how to use spatial data in landscape planning.

Content  
In this course, the following topics are discussed:  
- Definition of the concept of landscape  
- Relevance of landscape planning  
- Landscape metrics  
- Landscape change  
- Methods, instruments and aims of landscape planning (policy)  
- Socio-political questions of the future  
- Environmental systems, ecological connectivity  
- Ecosystem services  
- Urban landscape services  
- Practice of landscape planning  
- Use of GIS in landscape planning

Lecture notes  
No script. The documentation, consisting of presentation slides are partly handed out and are provided for download on Moodle.

Prerequisites / notice  
The contents of the course will be illustrated in the associated course 103-0347-01 U (Landscape Planning and Environmental Systems (GIS Exercises)) or in Project LAND within the Experimental and Computer Lab (for Environmental Engineers). A combination of courses is recommended.
Objective
Public transport is a key driver for making our cities more livable, clean and accessible, providing safe, and sustainable travel options for millions of people around the globe. Proper planning of public transport system also ensures that the system is competitive in terms of speed and cost. Public transport is a crucial asset, whose social, economic and environmental benefits extend beyond those who use it regularly; it reduces the amount of cars and road infrastructure in cities; reduces injuries and fatalities associated to car accidents, and gives transport accessibility to very large demographic groups.

Goal of the class is to understand the main characteristics and differences of public transport networks. Their various performance criteria based on various perspective and stakeholders. The most relevant decision making problems in a planning tactical and operational point of view
At the end of this course, students can critically analyze existing networks of public transport, their design and use; consider and substantiate possible improvements to existing networks of public transport and the management of those networks; optimize the use of resources in public transport.

General structure:
general introduction of transport, modes, technologies, system design and line planning for different situations, mathematical models for design and line planning, timetabling and tactical planning, and related mathematical approaches operations, and quantitative support to operational problems, evaluation of public transport systems.

Content
Basics for line transport systems and networks
Passenger/Supply requirements for line operations
Objectives of system and network planning, from different perspectives and users, design dilemmas
Conceptual concepts for passenger transport: long-distance, urban transport, regional, local transport

Planning process, from demand evaluation to line planning to timetables to operations
Matching demand and modes
Line planning techniques
Timetabling principles
Allocation of resources
Management of operations
Measures of realized operations
Improvements of existing services

Lecture notes
Lecture slides are provided.

Spatial Planning and Development W 3 credits 2G D. Kaufmann, A. Kuitenbrouwer
Only for master students, otherwise a special permission by the lecturer is required.

Abstract
The course deals with theoretical, methodological and practical foundations around the understanding and production of urban space. It discusses theoretical planning frameworks, and tasks of spatial planning at various scales, addresses current and future challenges of spatial development and reviews approaches for a sustainable development in Switzerland and beyond.
The overall aim of the course is to raise students’ awareness and curiosity about the aspects that guide and shape our environment. Through lectures, readings, discussions, and exercises, the course seeks to achieve this goal by accumulating crucial notions from both theoretical and practice-based examples, and applying such knowledge into tasks of spatial planning.

At the end of this course, students should feel empowered to critically engage with the teaching topic from a variety of approaches. By taking up the lecture, the students should be able to to analyse, interpret and reflect complex cross-scale tasks of spatial development and transformation, and to use their theoretical, methodical and professional knowledge to tackle them.

You as students will...
... assess present and future core challenges of spatial planning and development.
... discuss the role of spatial planning and development in shaping our living environment.
... differentiate the levels, scales and tasks of spatial planning instruments and processes.
... reflect on theoretical concepts and practical examples of decision-making of spatial tasks.
... identify and apply spatially relevant principles and systems for action-oriented planning and decision-making.
... acquire theoretical, methodological, practical know-how to examine, clarify, and solve tasks on spatial development

The course focuses on both theoretical concepts and practice-oriented approaches to gain knowledge and be equipped to address current issues in spatial planning and development. This is mirrored in the course’s structure made of both of lectures and exercises.

The lecture series introduces necessary key concepts and covers the following main topics:
- Drivers of spatial development, inward development, core tasks and current challenges for (spatial) planners.
- Interplay of formal and informal planning instruments across scales and actors.
- Differentiation urban typologies, their characteristics and challenges
- Types of spatial analysis and key figures
- Planning approaches and the (political) steering of spatial development.
- Types of processes and participation in spatial development.
- Approaches for planning complex urban situations
- Concepts for sustainable development

The exercises provide a framework for practical application of the learned theoretical concepts of spatial planning to real-life situations.

A course will be set up on Moodle for the provision of lectures and documents, to upload group deliverables and to ask questions in a discussion Forum. All documents provided are exclusively available for use within this course.

You as students will...
... acquire theoretical, methodological, practical know-how to examine, clarify, and solve tasks on spatial development

Spatial development as a discipline deals with the development, (trans)formation, and arrangement of our urban environment. We simultaneously perceive and contribute to its transformation, making space the result of manifold intended and unintended changes. To mediate between different demands, interests and interventions of multiple actors, a forward-looking, evidence-based, and action-oriented planning is necessary. As guidance for future action, (spatial) planning has to be committed to the sustainable handling as well as just allocation of resources, in particular of the non-replicable resource land.

The exercises provide a framework for practical application of the learned theoretical concepts of spatial planning to real-life situations.

The lecture series introduces necessary key concepts and covers the following main topics:
- Drivers of spatial development, inward development, core tasks and current challenges for (spatial) planners.

052-0707-00L Urban Design III W 2 credits 2V H. Klumpner.
F. T. Salva Rocha Franco

Students are introduced to a narrative of ‘Urban Stories’ through a series of three tools driven by social, governance, and environmental transformations in today's urbanization processes. Each lecture explores one city’s spatial and organizational ingenuity born out of a particular place’s realities, allowing students to transfer these inventions into a catalog of conceptual tools.

How can students of architecture become active agents of change? What does it take to go beyond a building’s scale, making design-relevant decisions to the city rather than a single client? How can we design in cities with a lack of land, tax base, risk, and resilience, understanding that Zurich is the exception and these other cities are the rule? How can we discover, set rather than follow trends and understand existing urban phenomena activating them in a design process? The lecture series produces a growing catalog of operational urban tools across the globe, considering Governance, Social, and Environmental realities. Instead of limited binary comparing of cities, we are building a catalog of change, analyzing what design solutions cities have been developing informally incrementally over time, why, and how. We look at the people, institutions, culture behind the design and make concepts behind these tools visible. Students get first-hand information from cities where the chair as a Team has researched, worked, or constructed projects over the last year, allowing competent, practical insight about the people and topics that make these places unique. Students will be able to use and expand an alternative repertoire of experiences and evidence-based design tools, go to the conceptual core of them, and understand how and to what extent they can be relevant in other places. Urban Stories is the basic practice of architecture and urban design. It introduces a repertoire of urban design instruments to the students to use, test, and start their designs.
Urban form cannot be reduced to physical space. Cities result from social construction, under the influence of technologies, ecology, culture, the impact of experts, and accidents. Urban un-concluded processes respond to political interests, economic pressure, cultural inclinations, along with the imagination of architects and urbanists and the informal powers at work in complex adaptive systems. Current urban phenomena are the result of urban evolution. The facts stored in urban environments include contributions from its entire lifecycle, visible in the physical environment, and non-physical aspects. This imaginary city exists along with its potentials and problems and with the conflicts that have evolved. Knowledge and understanding, along with a critical observation of the actions and policies, are necessary to understand the diversity and instability present in the contemporary city and understand how urban form evolved to its current state.

How did cities develop into the cities we live in now? Urban plans, instruments, visions, political decisions, economic reasonings, cultural inputs, and social organization have been used to operate in urban settlements in specific moments of change. We have chosen cities that exemplify how these instruments have been implemented and how they have shaped urban environments. We transcribe these instruments into urban operational tools that we have recognized and collected within existing tested cases in contemporary cities across the globe.

This lecture series will introduce urban knowledge and the way it has introduced urban models and operational modes within different concrete realities, therefore shaping cities. The lecture series translates urban knowledge into operational tools, extracted from cities where they have been successfully implemented and proven most relevant for understanding how the urban landscape has taken shape. The tools are clustered in twelve thematic clusters and three tool scales for better comparability and cross-reflection.

The Tool case studies are compiled into a global urbanization toolbox, which we use as typological models to read the city and critically react upon it. The presented contents are meant to serve as inspiration for positioning in future professional life and provide instruments for future design decisions.

In an interview with a local designer, we measure our insights against the most pressing design topics in cities today, including inclusion, affordable housing, provision of public spaces, and infrastructure for all.

Title
This mechanical engineering course focuses on the technical aspects of wind turbines; non-technical issues are not within the scope of this course. The course is tailored for students studying for B-ARCH and M-ARCH degrees. As an alternative to obtaining D-GESS credit, architecture students can obtain course credit in "Vertiefungsfach" or "Wahlfach".

Objective
The objective of this course is to introduce the students to the fundamentals, technologies, modern day application, and economics of wind energy. The course aims to teach students how to evaluate a design project from the perspective of the end user. The concept of evidence-based design is introduced through a series of case studies. Students are given a theoretical background in space syntax and spatial cognition, with a view to applying this knowledge during the design process. The course covers a range of methods including visibility analysis, network analysis, conducting real-world observations, and virtual reality for architectural design. Students apply these methods to a case study of their choice, which can be at building or urban scale. For students taking a B-ARCH or M-ARCH degree, this can be a completed or ongoing design studio project. The course gives students the chance to implement the methods iteratively and explore how best to address the needs of the eventual end-user during the design process.

The course is tailored for students studying for B-ARCH and M-ARCH degrees. As an alternative to obtaining D-GESS credit, architecture students can obtain course credit in "Vertiefungsfach" or "Wahlfach".

Evaluating Architectural Design
Particularly suitable for students of D-ARCH.

- Toolbox 'Reader' with an introduction to the lecture course and tool summaries
- Weekly exercise tasks
- Infographics with basic information of each city
- Quiz question for each tool
- Additional reading material
- Interviews with experts
- Archive of lecture recordings
- Reading material will be provided throughout the semester.

Evaluating Architectural Design

851-0252-08L Evidence-Based Design: Methods and Tools for Evaluating Architectural Design

W 3 credits 2S C. Häscher, M. Gath Morad, L. Narvaez Zertuche, C. Veddeler, to be announced

Objective
The course aims to teach students how to evaluate a design project from the perspective of the end user. The concept of evidence-based design is introduced through a series of case studies. Students are given a theoretical background in space syntax and spatial cognition, with a view to applying this knowledge during the design process. The course covers a range of methods including visibility analysis, network analysis, conducting real-world observations, and virtual reality for architectural design. Students apply these methods to a case study of their choice, which can be at building or urban scale. For students taking a B-ARCH or M-ARCH degree, this can be a completed or ongoing design studio project. The course gives students the chance to implement the methods iteratively and explore how best to address the needs of the eventual end-user during the design process.

The course is tailored for students studying for B-ARCH and M-ARCH degrees. As an alternative to obtaining D-GESS credit, architecture students can obtain course credit in "Vertiefungsfach" or "Wahlfach".

Urban Systems and Transportation
W 3 credits 2G
M. Köthenbürger, G. Loumeau

Abstract
This course is an introduction to urban and regional economics. It focuses on the formation and development of urban systems, and highlight how transport infrastructure investments can affect the location, size and composition of such systems.

Objective
The main objective of this course is to provide students with some basic tools to analyze the fundamental economic forces at play in urban systems (i.e., agglomeration and congestion forces), and the role of transport networks in shaping the structure of these systems. Why do urban areas grow or decline? How do transport networks affect the location of individuals and firms? Does the location of a firm determine its productivity? Can transport infrastructure investments reduce economic disparities? These are some of the questions that students should be able to answer after having completed the course.

Content
The course is organized in four parts. I start with the key observation that economic activity (both in terms of population density and productivity) is unevenly distributed in space. For instance, the share of the population living in urban centers is increasing globally, from 16% in 1900 and 50% in 2000 to about 68% by the year 2050 (UN, World Economic Prospects, 2014). The goal of the first part is then to understand the economic forces at play behind these trends, looking at the effects within and across urban areas. I will also discuss how natural or man-made geographical characteristics (e.g., rivers, mountains, borders, etc.) affect the development of such urban systems.

In the second part, I discuss the planning and pricing of transport networks, moving from simple local models to more complex transport models at a global scale. The key aspects include: the first and second best road pricing, the public provision of transport networks and the demographic effects of transport networks.

In the third part, I combine the previous two parts and analyze the interaction between urban systems and transportation. Thereby, the main focus is to understand the economic mechanisms that can lead to a general equilibrium of all actors involved. However, as the study of the historical development of urban systems and transport networks provides interesting insights, I will discuss how their interaction in the past shapes today’s economic geography.

Finally, I broaden the scope of the course and explore related topics. There will be a particular emphasis on the relation between urban systems and fiscal federalism as well as environmental policies. Both aspects are important determinants of the contemporary developments of urban systems, and as such deserve our attention.

In general, this class focuses on the latest research developments in urban and regional economics, though it does not require prior knowledge in this field. It pays particular attention to economic approaches, which are based on theoretical frameworks with strong microfoundations and allow for precise policy recommendations.

Lecture notes Course slides will be made available to students prior to each class.
Literature Course slides will be made available to students.

Nuclear Energy Conversion
W 4 credits 2V+1U
A. Manera
### Energy Conversion (151-1633-00L)

**Energy Conversion**

This course provides students an introduction to thermodynamics and energy conversion. Students shall gain basic understanding of energy and energy interactions as well as their link to energy conversion technologies.

#### Content

1. Thermodynamic systems, states and state variables
2. Properties of substances: Water, air and ideal gas
3. Energy conservation in closed and open systems: work, internal energy, heat and enthalpy
4. Second law of thermodynamics and entropy
5. Energy analysis of steam power cycles
6. Energy analysis of gas power cycles
7. Refrigeration and heat pump cycles
8. Nonideal gas equation of state and Joule-Thomson effect
9. Maximal work and exergy
10. Mixtures
11. Chemical reactions and combustion systems; chemical and phase equilibrium

#### Lecture notes

Lecture slides and supplementary documentation will be available online.

#### Literature

#### Prerequisites / notice

This course is intended for students outside of D-MAVT.

### Engine Systems (151-0567-00L)

**Engine Systems**

Introduction to current and future engine systems and their control systems

#### Objective

Introduction to methods of control and optimization of dynamic systems. Application to real engines. Understand the structure and behavior of drive train systems and their quantitative descriptions.

#### Content

Physical description and mathematical models of components and subsystems (mixture formation, load control, supercharging, emissions, drive train components, etc.)

#### Lecture notes

Introduction to Modeling and Control of Internal Combustion Engine Systems

Guzzella Lino, Onder Christopher H.

ISBN: 978-3-642-10774-0

---

**Abstract**

Physical fundamentals of the fission reaction and the sustainable chain reaction, thermal design, construction, function and operation of nuclear reactors and power plants, light water reactors and other reactor types, conversion and breeding

**Objective**

Students get an overview on energy conversion in nuclear power plants, on construction and function of the most important types of nuclear reactors with special emphasis to light water reactors. They obtain the mathematical/physical basis for quantitative assessments concerning most relevant aspects of design, dynamic behaviour as well as material and energy flows.

**Content**

Nuclear physics of fission and chain reaction. Thermodynamics of nuclear reactors. Design of the reactor core. Introduction into the dynamic behaviour of nuclear reactors. Overview on types of nuclear reactors, difference between thermal reactors and fast breeders. Construction and operation of nuclear power plants with pressurized and boiling water reactors, role and function of the most important safety systems, special features of the energy conversion. Development tendencies of reactor technology.

**Lecture notes**

Hand-outs will be distributed. Additional literature and information on the website of the lab: https://www.ethz.ch/content/specialinterest/mavt/energy/technology/lab-of-nuclear-energy-systems/en/studium/teaching-materials/151-0163-00l-nuclear-energy-conversion.html

**Literature**

R. L. Murray: Nuclear Energy (Sixth Edition), An Introduction to the Concepts, Systems, and Applications of Nuclear Processes, Elsevier
Combined homework and testbench exercise (air-to-fuel-ratio control or idle-speed control) in groups

**227-0122-00L**  Introduction to Electric Power Transmission: System & Technology

**Abstract**
Introduction to theory and technology of electric power transmission systems.

**Objective**
At the end of this course, the student will be able to: describe the structure of electric power systems, name the most important components and describe what they are needed for, apply models for transformers and overhead power lines, explain the technology of lines, know about electrical safety, calculate electric withstand strength of gas gaps, stationary power flows and other basic parameters in simple power systems.

**Content**
Structure of electric power systems, transformer and power line models, analysis of and power flow calculation in basic systems, technology and principle of electric power systems.

**Lecture notes**
Lecture script in English, exercises and sample solutions.

**Abstract**
Deep learning is an area within machine learning that deals with algorithms and models that automatically induce multi-level data representations.

**Objective**
In recent years, deep learning and deep networks have significantly improved the state-of-the-art in many application domains such as computer vision, speech recognition, and natural language processing. This class will cover the mathematical foundations of deep learning and provide insights into model design, training, and validation. The main objective is a profound understanding of why these methods work and how. There will also be a rich set of hands-on tasks and practical projects to familiarize students with this emerging technology.

**Prerequisites / notice**
This is an advanced level course that requires some basic background in machine learning. More importantly, students are expected to have a very solid mathematical foundation, including linear algebra, multivariate calculus, and probability. The course will make heavy use of mathematics and is not (!) meant to be an extended tutorial of how to train deep networks with tools like Torch or Tensorflow, although that may be a side benefit.

The participation in the course is subject to the following condition:
- Students must have taken the exam in Advanced Machine Learning (252-0535-00) or have acquired equivalent knowledge, see exhaustive list below:

  - Advanced Machine Learning
    https://ml2.inf.ethz.ch/courses/aml/

  - Computational Intelligence Lab
    http://da.inf.ethz.ch/teaching/2019/CIL/

  - Introduction to Machine Learning

**252-1414-00L**  System Security

**Abstract**
The first part of the course covers general security concepts and hardware-based support for security.
In the second part, the focus is on system design and methodologies for building secure systems.

**Objective**
In this lecture, students learn about the security requirements and capabilities that are expected from modern hardware, operating systems, and other software environments. An overview of available technologies, algorithms and standards is given, with which these requirements can be met.
The first part of the lecture covers hardware-based security concepts. Topics include the concept of physical and software-based side channel attacks on hardware resources, architectural support for security (e.g., memory management and permissions, disk encryption), and trusted execution environments (Intel SGX, ARM TrustZone, AMD SEV, and RISC-V Keystone).

In the second part, the focus is on system design and methodologies for building secure systems. Topics include: common software faults (e.g., buffer overflows, etc.), bug-detection, writing secure software (design, architecture, QA, testing), compiler-supported security (e.g., control-flow integrity), and language-supported security (e.g., memory safety).

Along the lectures, model cases will be elaborated and evaluated in the exercises.

### Abstract

Some of today’s most damaging attacks on computer systems involve exploitation of network infrastructure, either as the target of attack or as a vehicle to attack end systems. This course provides an in-depth study of network attack techniques and methods to defend against them.

### Objective

- Students are familiar with fundamental network-security concepts.
- Students can implement network-security protocols based on cryptographic libraries.
- Students have an in-depth understanding of a range of important state-of-the-art security technologies.
- Students can identify and assess vulnerabilities in software systems and network protocols.
- Students can assess current threats that Internet services and network devices face, and can evaluate appropriate countermeasures.
- Students have an in-depth understanding of a range of important state-of-the-art security technologies.
- Students can implement network-security protocols based on cryptographic libraries.

### Content

- The course will cover topics spanning four broad themes with a focus on the first two themes:
  1. network defense mechanisms such as public-key infrastructures, TLS, VPNs, anonymous-communication systems, secure routing protocols, secure DNS systems, and network intrusion-detection systems;
  2. network attacks such as hijacking, spoofing, denial-of-service (DoS), and distributed denial-of-service (DDoS) attacks;
  3. analysis and inference topics such as traffic monitoring and network forensics; and
  4. new technologies related to next-generation networks.

### Prerequisites / notice

This course is accompanied by practical machine learning projects. Students are expected to be familiar with a general-purpose or network programming language such as C/C++, Go, Python, or Rust.

### Abstract

Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

### Objective

Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real world data.
The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:

**Fundamentals:**
- What is data?
- Bayesian Learning
- Computational learning theory

**Supervised learning:**
- Ensembles: Bagging and Boosting
- Max Margin methods
- Neural networks

**Unsupervised learning:**
- Dimensionality reduction techniques
- Clustering
- Mixture Models
- Non-parametric density estimation
- Learning Dynamical Systems

Lecture notes
No lecture notes, but slides will be made available on the course webpage.

Literature

Prerequisites / notice
The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments. Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

263-2400-00L
Reliable and Trustworthy Artificial Intelligence
W 6 credits 2V+2U+1A M. Vechev

Abstract
Creating reliable, secure, robust, and fair machine learning models is a core challenge in artificial intelligence and one of fundamental importance. The goal of the course is to teach both the mathematical foundations of this new and emerging area as well as to introduce students to the latest and most exciting research in the space.

Objective
Upon completion of the course, the students should have mastered the underlying methods and be able to apply them to a variety of engineering and research problems. To facilitate deeper understanding, the course includes a group coding project where students will build a system based on the learned material.

Content
The course is split into 4 parts:

**Robustness of Machine Learning**
- Adversarial attacks and defenses on deep learning models.
- Certified training of deep neural networks (combining symbolic and continuous methods).

**Privacy of Machine Learning**
- Threat models (e.g., stealing data, poisoning, membership inference, etc.).
- Attacking federated machine learning (across vision, natural language and tabular data).
- Differential privacy for defending machine learning.
- AI Regulations and checking model compliance.

**Fairness of Machine Learning**
- Introduction to fairness (motivation, definitions).
- Enforcing individual fairness (for both vision and tabular data).
- Enforcing group fairness (e.g., demographic parity, equalized odds).

**Robustness, Privacy and Fairness of Foundation Models**
- We discuss all previous topics, as well as programmability, in the context of latest foundation models (e.g., LLMs).

Prerequisites / notice
While not a formal requirement, the course assumes familiarity with basics of machine learning (especially linear algebra, gradient descent, and neural networks as well as basic probability theory). These topics are usually covered in "Intro to ML" classes at most institutions (e.g., "Introduction to Machine Learning" at ETH).

The coding project will utilize Python and PyTorch. Thus some programming experience in Python is expected. Students without prior knowledge of PyTorch are expected to acquire it early in the course by solving exercise sheets.

**Abstract**
The course will cover the implementation aspects of data management systems using relational database engines as a starting point to cover the basic concepts of efficient data processing and then expanding those concepts to modern implementations in data centers and the cloud.

**Objective**
The goal of the course is to convey the fundamental aspects of efficient data management from a systems implementation perspective: storage, access, organization, indexing, consistency, concurrency, transactions, distribution, query compilation vs interpretation, data representations, etc. Using conventional relational engines as a starting point, the course will aim at providing an in depth coverage of the latest technologies used in data centers and the cloud to implement large scale data processing in various forms.

**Content**
The course will first cover fundamental concepts in data management: storage, locality, query optimization, declarative interfaces, concurrency control and recovery, buffer managers, management of the memory hierarchy, presenting them in a system independent manner. The course will place an special emphasis on understating these basic principles as they are key to understanding what problems existing systems try to address. It will then proceed to explore their implementation in modern relational engines supporting SQL to then expand the range of systems used in the cloud: key value stores, geo-replication, query as a service, serverless, large scale analytics engines, etc.

**Literature**
The main source of information for the course will be articles and research papers describing the architecture of the systems discussed. The list of papers will be provided at the beginning of the course.

**Prerequisites / notice**
The course requires to have completed the Data Modeling and Data Bases course at the Bachelor level as it assumes knowledge of databases and SQL.

**Course Code** | Computer Vision | W | 8 credits | 3V+1U+3A | M. Pollefeys, S. Tang, F. Yu

**Abstract**
The goal of this course is to provide students with a good understanding of computer vision and image analysis techniques. The main concepts and techniques will be studied in depth and practical algorithms and approaches will be discussed and explored through the exercises.

**Objective**
The objectives of this course are:
1. To introduce the fundamental problems of computer vision.
2. To introduce the main concepts and techniques used to solve those.
3. To enable participants to implement solutions for reasonably complex problems.
4. To enable participants to make sense of the computer vision literature.

**Content**
camera models and calibration, invariant features, Multiple-view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition

**Prerequisites / notice**
It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts before taking this course.

<table>

**Abstract**
This course presents topics in natural language processing with an emphasis on modern techniques, primarily focusing on statistical and deep learning approaches. The course provides an overview of the primary areas of research in language processing as well as a detailed exploration of the models and techniques used both in research and in commercial natural language systems.

**Objective**
The objective of the course is to learn the basic concepts in the statistical processing of natural languages. The course will be project-oriented so that the students can also gain hands-on experience with state-of-the-art tools and techniques.

**Content**
This course presents an introduction to general topics and techniques used in natural language processing today, primarily focusing on examples when CS method or bioinformatics/statistical technique has lead to an instrumentation, technique or drug approved for clinical practice use.

**Objective**
Throughout the course, students will read and analyze recent publications that demonstrate successful applications and sometimes failures in medicine. Promising research applications will also be discussed. The publications will cover a wide range of topics, including drug discovery, image analysis, prognostic models, and learning healthcare.

**Literature**
Lectures will make use of textbooks such as the one by Jurafsky and Martin where appropriate, but will also make use of original research and survey papers.

</table>

**Abstract**
The deadline for deregistering expires at the end of the second week of the summer. Students who are still registered after that date, but do not attend the seminar, will officially fail the seminar.

**Objective**
This seminar course is designed to provide students with an opportunity to review and critically evaluate recent publications in medical field focusing on examples when CS method or bioinformatics/statistical technique has lead to an instrumentation, technique or drug approved for clinical practice use.
The course will be structured as half lecture content and half seminar content. Lectures will review state of the medical practice prior to the discovery, obstacles in moving the field forward, and the need for improvement. Lecture will be followed by the seminar part where students will take turns presenting the assigned publications and leading the discussions. Students’ presentations will focus on the main findings, and specific steps taken to translate the finding into clinical practice.

Publications will include examples of:
- specific CS/bioinformatics/statistics applications that has been brought to “bedside” – has been approved by European Medicines Agency / Food and Drug Administration (USA) for clinical use or are widely used in medical research;
- examples of failures of how a discovery did not translate into an endproduct and why;
- current active research areas.

Covered topics will include some of the following:
- Drug discovery: Computer-aided drug discovery has become an integral part of the drug development process, enabling researchers to design and screen large libraries of molecules in silico (i.e., using computer simulations) before synthesizing and testing them in the lab. This has led to the discovery of new drug candidates for a wide range of diseases, including cancer, Alzheimer’s disease, and HIV/AIDS.
- Genomics: Advances in computational genomics have enabled researchers to analyze and interpret large-scale genomic data, including DNA sequencing data, to identify disease-causing mutations, genetic risk factors, and drug targets. Examples of the development of personalized medicine, where treatments are tailored to an individual’s genetic makeup. Examples when drug target identified by genetics has led to approved treatment.
- Imaging: Computer vision and image processing techniques have revolutionized medical imaging, enabling researchers to extract quantitative information from medical images that were previously inaccessible. This has led to the development of new diagnostic and prognostic tools for a wide range of diseases, including cancer, cardiovascular disease, and neurological disorders.
- Real-world data applications: emulation of clinical trials using electronic health records data.
- Large language models: Generating clinical trial protocols using large language models. Natural Language Processing for information extraction and interpretation.
- Learning healthcare systems: Advances in data analytics and information technology have enabled the development of learning healthcare systems, which use real-time data from electronic health records, medical devices, and other sources to improve patient outcomes and reduce healthcare costs. This has the potential to transform the way healthcare is delivered, making it more personalized, efficient, and effective.

In addition to the presentations, students will also be required to write critical reviews of the assigned publications throughout the course. The reviews will be evaluated based on the students’ ability to identify the strengths and weaknesses of the publications and to provide insightful and constructive feedback.

Prerequisites / notice
The course is intended for advanced undergraduate and graduate students with a background in computer science, bioinformatics, or a related field and interest in applying their skills to medical research.

This course assumes a working knowledge of R/Python and intermediate statistical analysis, including linear, logistic, survival regressions or ability and interest to learn them outside of the class.

| 376-1103-00L | **Frontiers in Nanotechnology** | W    | 4    | 4V    | V. Vogel, further lecturers |
| Abstract  | Many disciplines are meeting at the nanoscale, from physics, chemistry to engineering, from the life sciences to medicine. The course will prepare students to communicate more effectively across disciplinary boundaries, and will provide them with deep insights into the various frontiers. |
| Objective | Building upon advanced technologies to create, visualize, analyze and manipulate nano-structures, as well as to probe their nano-chemistry, nano-mechanics and other properties within mammade and living systems, many exciting discoveries are currently made. They change the way we do science and result in so many new technologies. |
| The goal of the course is to give Master and Graduate students from all interested departments an overview of what nanotechnology is all about, from analytical techniques to nanosystems, from physics to biology. Students will start to appreciate the extent to which scientific communities are meeting at the nanoscale. They will learn about the specific challenges and what is currently sizzling in the respective fields, and learn the vocabulary that is necessary to communicate effectively across departmental boundaries. |
| Each lecturer will first give an overview of the state-of-the-art in his/her field, and then describe the research highlights in his/her own research group. While preparing their Final Projects and discussing them in front of the class, the students will deepen their understanding of how to apply a range of new technologies to solve specific scientific problems and technical challenges. Exposure to the different frontiers will also improve their ability to conduct effective nanoscale research, recognize the broader significance of their work and to start collaborations. |
Starting with the fabrication and analysis of nanoparticles and nanostructured materials that enable a variety of scientific and technical applications, we will transition to discussing biological nanosystems, how they work and what bioinspired engineering principles can be derived, to finally discussing biomedical applications and potential health risk issues. Scientific aspects as well as the many of the emerging technologies will be covered that start impacting so many aspects of our lives. This includes new phenomena in physics, advanced materials, novel technologies and new methods to address major medical challenges.

**376-1714-00L Biocompatible Materials**

- **Abstract**: Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.

- **Objective**: The course covers the following topics:
  1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
  2. The concept of biocompatibility.
  3. Introduction into methodology used in biomaterials research and application.
  4. Introduction to different material classes in use for medical applications.

- **Content**: Introduction into natural and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering, drug delivery and for medical devices are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated. Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed.

A link between academic research and industrial entrepreneurship is demonstrated by external guest speakers, who present their current research topics.

- **Lecture notes**: Handouts are deposited online (moodle).

- **Literature**:

(available online via ETH library)

**376-0300-00L Essentials in Translational Science**

- **Abstract**: Translational science is a cross disciplinary scientific research that is motivated by the need for practical applications that help people (e.g. Medicines). The course should help to clarify basics of translational science, illustrate successful applications and enable students to integrate key features into their future projects.

- **Objective**: After completing this course, students will be able to understand:
  - Principles of translational science including medical device development, intellectual property, regulatory environment and project management
  - Students should be able to apply this knowledge in drug development programs in Pharma, Biotech or their own spin-off.

- **Content**: What is translational science and what is it not including:
  - How to identify need?
  - How to choose the appropriate research type and methodology
  - How to measure success?
  - How are medical devices developed?
  - How to handle IP in the development process?
  - How does the regulatory environment impact innovation?
  - How to manage complex development projects?
  - Positive and negative examples will be illustrated by distinguished guest speakers.

- **Literature**: Principles of Biomedical Sciences and Industry

- **Prerequisites / notice**: Translating Ideas into Treatments

**752-6105-00L Epidemiology and Prevention**

- **Abstract**: The module Epidemiology and Prevention describes the process of scientific discovery from the detection of a disease and its causes, to the development and evaluation of preventive and treatment interventions and to improved population health.

- **Objective**: The overall goal of the course is to introduce students to epidemiological thinking and methods, which are critical pillars for medical and public health research. Students will also become aware on how epidemiological facts are used in prevention, practice and politics.
We will use different diseases to discuss how to potentially model, diagnose or heal them by stem cell based therapies. This will be used as an assessed E. Giannouli.

Handouts are provided to students in the classroom.

**Subject-specific Competencies**

The module Epidemiology and prevention follows an overall framework that describes the course of scientific discovery from the detection of a disease to the development of prevention and treatment interventions and their evaluation in clinical trials and real world settings. We will discuss study designs in the context of existing knowledge and the type of evidence needed to advance knowledge. Examples from nutrition, chronic and infectious diseases will be used in order to show the underlying concepts and methods.

Abstract
In the course, students learn about methods for the identification and measurement of landscape characteristics, as well as measures and policies for landscape planning. Landscape planning is put into the context of environmental systems (soil, water, air, climate, flora and fauna) and discussed with regard to socio-political questions of the future.

Objective
The aims of this course are:
1) To illustrate the concept of landscape planning, the economic relevance of landscape and nature in the context of the environmental systems (soil, water, air, climate, flora and fauna).
2) To show landscape planning as an integral information system for the coordination of different instruments by illustrating the aims, methods, instruments and their functions in landscape planning.
3) To show the importance of ecosystem services.
4) To learn basics about nature and landscape: Analysis and assessment of the complex interactions between landscape elements, effects of current and future land use (ecosystem goods and services, landscape functions).
5) To identify and measure the characteristics of landscape.
6) Learn how to use spatial data in landscape planning.

Content
In this course, the following topics are discussed:
- Definition of the concept of landscape
- Relevance of landscape planning
- Landscape metrics
- Landscape change
- Methods, instruments and aims of landscape planning (policy)
- Socio-political questions of the future
- Environmental systems, ecological connectivity
- Ecosystem services
- Urban landscape services
- Practice of landscape planning
- Use of GIS in landscape planning

Lecture notes
No script. The documentation, consisting of presentation slides are partly handed out and are provided for download on Moodle.

Prerequisites / notice
The contents of the course will be illustrated in the associated course 103-0347-01 U (Landscape Planning and Environmental Systems (GIS Exercises)) or in Project LAND within the Experimental and Computer Lab (for Environmental Engineers). A combination of courses is recommended.

651-4057-00L Climate History and Palaeoclimatology W 4 credits 2G H. Stoll, I. Hernández Almeida
Abstract
Climate history and paleoclimatology explores how the major features of the earth's climate system have varied in the past, and the driving forces and feedbacks for these changes. The major topics include the earth's CO2 concentration and mean temperature, the size and stability of ice sheets and sea level, the amount and distribution of precipitation, and the ocean heat transport.

Objective
The student will be able to describe the natural factors lead to variations in the earth's mean temperature, the growth and retreat of ice sheets, and variations in ocean and atmospheric circulation patterns, including feedback processes. Students will be able to interpret evidence of past climate changes from the main climate indicators or proxies recovered in geological records. Students will be able to use data from climate proxies to test if a given hypothesized mechanism for the climate change is supported or refuted. Students will be able to compare the magnitudes and rates of past changes in the carbon cycle, ice sheets, hydrological cycle, and ocean circulation, with predictions for climate changes over the next century to millennia.

Content
The course spans 5 thematic modules:

1. Cyclic variation in the earth's orbit and the rise and demise of ice sheets. Ice sheets and sea level - What do expansionist glaciers want? What is the natural range of variation in the earth's ice sheets and the consequent effect on sea level? How do cyclic variations in the earth's orbit affect the size of ice sheets under modern climate and under past warmer climates? What conditions the mean size and stability or fragility of the large polar ice caps and is their evidence that they have dynamic behavior? What rates and magnitudes of sea level change have accompanied past ice sheet variations? How stable or fragile is the ocean heat conveyor, past and present?
2. Feedbacks on climate cycles from CO2 and methane. What drives CO2 and methane variations over glacial cycles? What are the feedbacks with ocean circulation and the terrestrial biosphere?
3. Atmospheric circulation and variations in the earth's hydrological cycle - How variable are the earth's precipitation regimes? How large are the orbital scale variations in global monsoon systems?
4. Century-scale droughts and civil catastrophes. Will mean climate change El Nino frequency and intensity? What factors drive change in mid and high-latitude precipitation systems? Is there evidence that changes in water availability have played a role in the rise, demise, or dispersion of past civilizations?
5. How sensitive is Earth's long term climate to CO2 and cloud feedbacks? What regulates atmospheric CO2 over long tectonic timescales of millions to tens of millions of years?

The weekly two hour lecture periods will feature lecture on these themes interspersed with short interactive tasks to apply new knowledge. Over the semester, student teams will each present in class one debate based on two scientific articles of contrasting interpretations. With flexible scheduling, students will participate in a laboratory activity to generate a new paleoclimate record from stalagmites. Student teams will be supported by an individual tutorial meeting to assist in debate preparation and another to assist in the interpretation of the lab activity data.

Competencies
Subject-specific Competencies

Abstract
The course introduces basic concepts and applications of dynamic vegetation models at various temporal and spatial scales. Different modeling approaches and underlying principles are presented and critically discussed during the lectures. In the integrated exercise parts, students work in a number of small projects with some of the introduced models to gain practical experience.

Objective
Students will
- be enabled to understand, assess and evaluate the fundamental properties of dynamic systems using vegetation models as case studies
- obtain an overview of dynamic modelling techniques and their applications from the individual plant to the global level
- understand the basic assumptions of the various model types, which dictate the applicability and limitations of the respective model
- be enabled to work with such model types on their own
- appreciate the methodological basis for impact assessments of future climate change and other environmental changes on ecosystems.

Content
Models of individuals
- Deriving single-plant models from inventory measurements
- Plant models based on 'first principles'

Models at the stand scale
- Simple approaches: matrix models
- Competition for light and other resources as central mechanisms
- Individual-based stand models: distance-dependent and distance-independent
- Theoretical models

Models at the landscape scale
- Simple approaches: cellular automata
- Dispersal and disturbances (windthrow, fire, bark beetles) as key mechanisms
- Landscape models

Global models
- Sacrificing local detail to attain global coverage: processes and entities
- Dynamic Global Vegetation Models (DGVMs)
- DGVMs as components of Earth System Models

Lecture notes
Handouts will be available in the course and for download

Literature
Will be indicated at the beginning of the course

Prerequisites
- Ideally basic experiences in modelling and systems analysis
- Basic knowledge of programming, ideally in R
- Good knowledge of general ecology, ideally of vegetation dynamics and forest systems

Abstract
Climate change mitigation and carbon dioxide removal can only be kept within reasonable bounds when CO2 emissions are drastically reduced. In this course, we will discuss a portfolio of options involving the alteration of natural carbon sinks and carbon sequestration. The course includes introductory lectures, presentations from guest speakers from industry and the public sector, and final presentations by the students.

Objective
The goal of this course is to investigate, as a group, a particular set of carbon mitigation/sequestration options and to evaluate their potential, their cost, and their consequences.
Content
From the large number of carbon sequestration/mitigation options, a few options will be selected and then investigated in detail by the students. The results of this research will then be presented to the other students, the involved faculty, and discussed in detail by the whole group.

Lecture notes
None

Literature
Will be identified based on the chosen topic.

Prerequisites / notice
Exam: No final exam. Pass/No-Pass is assigned based on the quality of the presentation and ensuing discussion.

103-0347-01L Landscape Planning and Environmental Systems (GIS Exercises)
Abstract
The course content of the lecture Landscape Planning and Environmental Systems (103-0347-00 V) will be illustrated in practical GIS exercises (e.g. habitat modelling, land use change, ecosystem services, connectivity).

Objective
- Practical application of theory from the lectures
- Quantitative assessment and evaluation of landscape characteristics
- Learning useful applications of GIS for landscape planning
- Developing landscape planning measures for practical case studies

Content
- Applications of GIS in landscape planning
- Landscape analysis
- Landscape structural metrics
- Modelling habitats and land use change
- Calculating urban ecosystem services
- Ecological connectivity

Lecture notes
A script and presentation slides for each exercise will be provided on Moodle.

Literature
Will be named in the lecture.

Prerequisites / notice
Basic GIS skills are strongly recommended.

701-1257-00L European Climate Change
Abstract
The lecture provides an overview of climate change in Europe, from a physical and atmospheric science perspective. It covers the following topics:
- observational datasets, observation and detection of climate change;
- underlying physical processes and feedbacks;
- numerical and statistical approaches;
- currently available projections.

Objective
At the end of this course, participants should:
- understand the key physical processes shaping climate change in Europe;
- know about the methodologies used in climate change studies, encompassing observational, numerical, as well as statistical approaches;
- be familiar with relevant observational and modeling data sets;
- be able to tackle simple climate change questions using available data sets.
### Content

- global context
- observational data sets, analysis of climate trends and climate variability in Europe
- global and regional climate modeling
- statistical downscaling
- key aspects of European climate change: intensification of the water cycle, Polar and Mediterranean amplification, changes in extreme events, changes in hydrology and snow cover, topographic effects
- projections of European and Alpine climate change

### Lecture notes

Slides and lecture notes will be made available at [http://www.iac.ethz.ch/edu/courses/master/electives/european-climate-change.html](http://www.iac.ethz.ch/edu/courses/master/electives/european-climate-change.html)

### Prerequisites / notice

Participants should have a background in natural sciences, and have attended introductory lectures in atmospheric sciences or meteorology.

### 751-5201-10L Tropical Cropping Systems, Soils and Livelihoods (with Excursion)

**W 5 credits 10G J. Six, K. Benabderrazik**

**Abstract**

This course guides students in analyzing and comprehending tropical agroecosystems and food systems. Students gain practical knowledge of field methods, diagnostic tools and survey methods for tropical soils and agroecosystems. An integral part of the course is the two-week field project in the Mount Kenya Region, which is co-organized with the University of Embu (Kenya).

**Objective**

1. Overview of the major land use systems in Tropical agroecosystems in several contexts Africa
2. Interdisciplinary analysis of agricultural production systems
3. Knowledge on methods to assess agroecological performance of a tropical agroecosystems
4. Hands-on training on the use of field methods, diagnostic tools and survey methods.
5. Gain practical knowledge on how to assess to climate resilience and farming systems.
6. Collaboration in international students and stakeholders

**Content**

This course guides students in analyzing and comprehending tropical agroecosystems. Students of ETH Zürch will work together with the students from Embu University (Kenya) in an interdisciplinary and intercultural team. Students will focus on the Agroecological performance and climate resilience of diverse farming systems in the Mount Kenya Region.

From October 28th to November 11th, The students will take part in a field course in the Mount Kenya Region. Students will then gain practical knowledge on field, meeting several stakeholders of the agricultural and food systems and conducting various assessments related to climate resilience and farming systems.

**Prerequisites / notice**

We would require the students enrolled to the class to send a short cover letter (1-page max.) by September 18rd 2023, justifying your motivation to enroll to this class. A selection of 20 students will be done on the basis of the letters.

**Competencies**

- **Subject-specific Competencies**
  - Concepts and Theories
  - Techniques and Technologies
- **Method-specific Competencies**
  - Analytical Competencies
  - Decision-making
  - Problem-solving
  - Project Management
- **Social Competencies**
  - Communication
  - Cooperation and Teamwork
  - Leadership and Responsibility
  - Self-presentation and Social Influence
  - Sensitivity to Diversity
  - Negotiation
- **Personal Competencies**
  - Adaptability and Flexibility
  - Critical Thinking
  - Integrity and Work Ethics
  - Self-awareness and Self-reflection
  - Self-direction and Self-management

### 651-4037-00L Mineral Resources I

**W 3 credits 2G C. Chelle-Michou, L. Tavazzani**

**Abstract**

Can be chosen as an elective course within the Bachelor.

Prospective MSc-Students attending the module "Mineral Resources" should attend Mineral Resources I and II in the first year of their MSc studies.

**Objective**

Understanding the fundamental processes of hydrothermal, magmatic and supergene ore formation, recognising and interpreting mineralised rocks in geological context

**Content**

(a) Principles of hydrothermal ore formation: base metal deposits in sedimentary basins. Practical classification of sample suites by genetic ore deposit types

(b) Introduction to orthomagmatic ore formation. Chromite, Ni-Cu sulphides and PGE in layered mafic intrusions. Distribution coefficients between silicate and sulphide melts. Carbonatites and pegmatite deposits.

(c) Introduction to supergene residual deposits with emphasis on Ni laterites and bauxites

**Lecture notes**

Notes handed out during lectures

**Literature**

Extensive literature list distributed in course

**Prerequisites / notice**

2 contact hours per lecture / week including lectures, exercises and practical study of samples, and small literature-based student presentations. Supplementary contact for sample practicals and exercises as required. Credits and mark based on participation in course (exercises, 50%) and 1h30 written exam in the last lecture of the semester (50%).
### Competencies

#### Subject-specific Competencies

#### Prerequisites:
- Good mathematical skills, basic programming skills, elementary probability and statistics.

#### Abstract
This course introduces mathematical and computational models to study techno-socio-economic systems and the process of scientific research. Students develop a significant project to tackle techno-socio-economic challenges in application domains of complex systems. They are expected to implement a model and communicating their results through a seminar thesis and a short oral presentation.

#### Objective
The students are expected to know a programming language and environment (Python, Java or Matlab) as a tool to solve various scientific problems. The use of a high-level programming environment makes it possible to quickly find numerical solutions to a wide range of scientific problems. Students will learn to take advantage of a rich set of tools to present their results numerically and graphically.

The students should be able to implement simulation models and document their skills through a seminar thesis and finally give a short oral presentation.

#### Content
Students are expected to implement themselves models of various social processes and systems, including agent-based models, complex networks models, decision making, group dynamics, human crowds, or game-theoretical models.

Credit points are finally earned for the implementation of a mathematical or empirical model from the complexity science literature and the documentation in a seminar thesis.

#### Lecture notes
The lecture slides will be presented on the course web page after each lecture.

#### Literature
- Agent-Based Modeling
  https://link.springer.com/chapter/10.1007/978-3-642-24004-1_2

- The hidden geometry of complex, network-driven contagion phenomena (relevant for modeling pandemic spread)
  https://science.sciencemag.org/content/342/6164/1337

Further literature will be recommended in the lectures.

#### Prerequisites / notice
- The number of participants is limited to the size of the available computer teaching room. The source code related to the seminar thesis should be well enough documented.
- Good programming skills and a good understanding of probability & statistics and calculus are expected.
- Students need to present a new subject, for which they have not earned any credit points before.
- Good scientific practices, in particular citation and quotation rules, must be properly complied with.
- Chatham House rules apply to this course. Materials may not be shared without previous written permission.
Transport Planning Methods

The course provides the necessary knowledge to develop models supporting and also evaluating the solution of given planning problems. The course is composed of a lecture part, providing the theoretical knowledge, and an applied part in which students develop their own models in order to evaluate a transport project/policy by means of cost-benefit analysis.

The course is composed of a lecture part, providing the theoretical knowledge, and an applied part in which students develop their own models in order to evaluate a transport project/policy by means of cost-benefit analysis. Interim lab session take place regularly to guide and support students with the applied part of the course.

Prerequisites / notice

Students can enroll in this unit exclusively in combination with another (companion) course to complete the Case Study requirements in the MSc ISTP. The unit allows students to carry out case studies on specific policy issues based on their individual preferences. The companion course should have a policy focus or deal with a policy relevant issue and can be taken either in parallel or prior to the Case Study Research Paper per unit. The instructor of the companion course should be able and willing to also serve as the supervisor of the associated case study paper. After successfully completing the companion course and the research paper, the student office will assign both courses to the category case studies.

Lecturers

Lecturers

- Knowledge and understanding of statistical methods and algorithms commonly used in transport planning
- Comprehend the reasoning and capabilities of transport models
- Ability to independently develop a transport model able to solve/answer planning problem
- Getting familiar with cost-benefit analysis as a decision-making supporting tool

To cope with that, the problem is divided into sub-problems, which are solved using various statistical models (e.g. regression, discrete choice analysis) and algorithms (e.g. iterative proportional fitting, shortest path algorithms, method of successive averages).

Case Study Research Paper in Science, Technology and Policy 1

In the case study research paper, students apply skills and knowledge acquired in the social sciences courses of the ISTP curriculum to address a particular societal challenge.

Based on what they have learned, or are learning, in the companion course, and the skills and knowledge acquired in the social sciences courses of the ISTP curriculum, students identify a particular policy challenge to be addressed. Coached by the instructor of the companion course, or in exceptional cases by another ISTP professor, the develop and implement their research idea, according to the ISTP guidelines to this end. The result should be a research paper of around 4'000 words (all inclusive, except appendices) that will be graded by the supervisor on the 1-6 scale, based on a grading scheme for this purpose.

Students can enroll in this unit exclusively in combination with another (companion) course to complete the Case Study requirements in the MSc ISTP. This course introduces students to the data science tools that may provide the first building blocks for a robot judge. While building a fostered, S. Hanger-Kopp

Building a Robot Judge: Data Science for Decision-Making

This course explores the automation of decisions in the legal system. We delve into the machine learning tools needed to predict judge decision-making and ask whether techniques in model explanation and algorithmic fairness are sufficient to address the potential risks.

Objective

This course introduces students to the data science tools that may provide the first building blocks for a robot judge. While building a working robot judge might be far off in the future, some of the building blocks are already here, and we will put them to work.

Content

Data science technologies have the potential to improve legal decisions by making them more efficient and consistent. On the other hand, there are serious risks that automated systems could replicate or amplify existing legal biases and rigidities. Given the stakes, these technologies force us to think carefully about notions of fairness and justice and how they should be applied.

The focus is on legal prediction problems. Given the evidence and briefs in this case, how will a judge probably decide? How likely is a criminal defendant to commit another crime? How much additional revenue will this new tax law collect? Students will investigate and implement the relevant machine learning tools for making these types of predictions, including regression, classification, and deep neural networks models.

We then use these predictions to better understand the operation of the legal system. Under what conditions do judges tend to make errors? Against which types of defendants do parole boards exhibit bias? Which jurisdictions have the most tax loopholes? Students will be introduced to emerging applied research in this vein. In a seminar paper, students (individually or in groups) will conceive and implement an applied data-science research project.

Climate Policy

This course provides an in-depth analysis both of the theoretical underpinnings to different approaches to climate policy at the international and national levels, and how these different approaches have played out in practice. Students will learn how legislative frameworks have developed over the last 25 years, and also be able to appraise those frameworks critically.

Objective

The goal is to give students a glimpse into the enormous complexity of this policy area, an understanding of some of the many debates that are currently raging (of which the debate about whether climate change is actually real is probably the least complicated or interesting). We want to give students the ability to evaluate policy arguments made by politicians, experts, and academics with a critical eye, informed by a knowledge of history, an understanding of the theoretical underpinnings, and the results of empirical testing of different strategies. A student taking this course ought to be able to step into an NGO or government agency involved in climate policy analysis or political advocacy, and immediately be able to make an informed and creative contribution. Moreover, by experiencing the depth of this policy area, students should appreciate the complexity inherent in all policy areas.

Content

Climate change is one of the defining challenges of our time, touching all aspects of the environment and of society. There is broad recognition (although with some dissent) that governments ought to do something about it: making sure that emissions of greenhouse gases (GHGs) stop within the next 20 to 30 years; helping people to adapt to the consequences of the climate change to which we have already committed ourselves; and, most controversially, perhaps taking measures to actively remove GHG's from the atmosphere, or to alter the radiation balance of the Earth through solar engineering.

It’s a complicated set of problems, especially the first of these, known as mitigation. Fundamentally this is because it means doing something that humanity has never really tried before at a planetary scale: deliberately altering the ways we produce, convert, and consume energy, which is at the heart of modern society. Modern society – the entire anthropocene – grew up on fossil fuels, and the huge benefits they offered in terms of energy that was inexpensive, easy to transport and store, and very dense in terms of its energy content per unit mass or volume. How to manage a society of over 7 billion people, at anything like today’s living standards, without the benefits of that energy, is a question for which there is no easy answer. There are also other challenges outside of energy. How do we build houses, office buildings, and infrastructure networks without cement, a substance that releases large amounts of CO2 as it hardens? How do we reverse the pace of deforestation, particularly in developing countries? How do we eliminate the GHG emissions from agriculture: the methane from cows' bellies and rice paddies, together with the chemicals that enter the atmosphere from the application of fertilizer?

These are all tough questions at a technical level, but even tougher when you consider that governments typically need to employ indirect methods to get these things to happen. Arguably a government could simply pass a law banning all fossil fuels. But politically this is simply unrealistic, at least while so many people depend on fossil fuels in their daily lives. What is to be done? For this, one needs to turn to various ideas about how government can and should influence society. On the one hand are ideas suggesting that government ought to play a very limited role, relative to private actors, and should step in only to correct "market failures," with interventions designed specifically to focus around that failure. On the other hand are ideas suggesting that government (meaning all of us, working together through a democratic process) is the appropriate decision-making body for core decisions on where society can and should go. These issues come to the fore in climate policy discussions and debates.

Literature

There will be reading assignments for select classes. All of these will be posted in PDF format on a course Moodle. In addition, there will be one book and one report to be read over the course of the semester. They are:

- Ministry of the Future, by Kim Stanley Robinson

History and Theory of Urban Design (Avermaete)

Does not take place this semester.
A student can only register once for a "Fachsemester" during the Master studies!

The application deadline for this "Fachsemester" 4.9.2024, 8 p.m. You will receive a message about acceptance or rejection for the subject semester by 5.9.2024, 2 p.m. at the latest. Students who have been rejected have the opportunity to choose a design class (enrollment ends on 5.9.2024, at 6 p.m.).

Abstract
This Research Studio focuses on the entanglements of the architectural and urban histories of Switzerland and the history of global colonialism. Through architecture-specific research methods, it investigates how centuries of colonialism have historically influenced the aesthetic, construction and craft cultures of Swiss cities, and explores ways to engage with these contested legacies today.

Objective
The Research Studio has two main objectives:

1. Archaeology of Swiss Coloniality.

First, students will develop an ‘archaeology’ of the historical entanglements of Swiss industry with global colonialism. In this part, the studio work is understood as an archaeological venture, digging up traces of the past. Students will systematically probe the built environment of Switzerland for traces and influences of global colonialism and its aftermath. The result will be a catalogue of colonial entanglements, illustrating how they are inscribed into architectural and urban figures and how they continue to impact the urban fabric of Switzerland and its industry.

2. Processing Swiss Coloniality.

In a second step, students will attempt to ‘process’ the enduring impact of Swiss Coloniality. Based on the ‘Archaeology,’ students will explore the inherent logics of global colonialism in relation to Swiss industry as it impacts the present. The central idea is to avoid considering the past as a closed chapter, but as an ongoing process and condition of coloniality that still structures our present and future, which needs acknowledgement and dialogue. Students will be asked, using the tools of the architect, to explore strategies to represent these entanglements and suggest openings for repair where needed.

Based on these main objectives, this course will:
- offer students an overview of the most important historical and contemporary contributions to debates on postcolonial and decolonial theory and the entanglement of Switzerland’s industry with global colonialism;
- equip students critically to reflect on the manifestations of Swiss Coloniality in the built environment with the help of both theoretical and historical perspectives;
- make students aware that the production of the city is not a neutral given but is always shaped by cultural values, assumptions, and expectations, which impact the everyday environment and, as such, condition inhabitants and users;
- help students to position themselves within current debates on cities, urban development, and urban life in relation to broader challenges such as sustainability and social inequality.

Content
Swiss Coloniality

Cities have never been isolated entities and have always existed by grace of the myriad connections with their hinterland. Throughout the past centuries, and especially since the 15th century onwards, these connections have become increasingly far-reaching across the globe, and the history of urban development in areas such as Europe has been intricately entwined with conditions and realities elsewhere. As such, urban history cannot be seen as entirely separate from global colonialism and its aftermath. While designing and constructing the architecture of the city, architects, urban designers, builders, and inhabitants also inevitably partake in the wider ecologies of material and immaterial flows that are shaped by and contribute to a global system of inequality. Not uncoincidentally, the metropole – a key term of colonial history – finds its roots in the political urban figure of the polis and identifies the center-periphery relationship between the ‘motherland’ and its hinterland. The metropole is the place from where power is exercised over foreign territories and the place that reaps the fruits of this exercising of power.

While Switzerland never had colonies of its own, it was nevertheless in many ways involved in and contributed to the history of global colonialism: by taking part in the economy sustained by colonialism, by financing and securing slave trade, by contributing to race-based science practices, etc. So, despite being a country without colonies, what if we consider Switzerland and its position in the world from the perspective of the colonial metropole? What would be the specific architectural and urban dimension of this figure of Metropole Switzerland? In raising such questions, in this Research Studio, we aim to focus on the entanglements of the architectural and urban histories of Switzerland and the history of global colonialism.

Starting to answer such questions requires a widened understanding of colonialism and its impact, which has been grasped with the notion of coloniality in recent debates. While colonialism refers to the historically specific phenomenon of one area of the world colonizing another, settling on foreign land, extracting its resources, and violently disciplining its inhabitants, the term coloniality refers to the more long-lasting processes and indirect effects that are the result of centuries of colonialism, and that mark a landscape of global inequality, even after the ‘official’ reign of colonialism has ended. In this sense, the disparity between the so-called ‘Global North’ and ‘Global South’, and the way in which a country such as Switzerland is still profiting from an advantageous position in this globally unequal world, can be considered the result of centuries of colonialism, and to be still part of a condition of coloniality. As this condition is a two-sided and mutually inflective phenomenon, to unravel the knot of Swiss coloniality, we not only aim to investigate how Switzerland was implicated in activities abroad but also, conversely, how these activities have impacted Switzerland. While in the fields of political, social and economic history, a revisionist effort is underway to reconsider/correct the image of Switzerland as a neutral country without colonies, in the field of architecture and urban history, however, we are yet to unravel the impact of this entanglement on the built environment, and, more widely, on the aesthetic, material and craft cultures of Swiss cities.
The overarching hypothesis of this Research Studio is that historical and theoretical research can profit profoundly from the use of the tools and knowledge of architects. On the one hand, the spatial, formal, material, and constructive knowledge gained throughout architectural studies will guide the historical research in the archives, in the library, and/or in the city itself and will allow students to articulate specifically architectural interpretations of the materials they find. On the other hand, the Studio explicitly asks students to employ specific architectural tools such as drawing, writing and model-making to explore the historical and theoretical realities that are being investigated. By actively reflecting on the composition of a varied set of analytical and interpretative drawings, texts, and models, students will probe the capacity of these tools to act as tools for historical and theoretical research.

Within the general theme of Swiss Coloniality, students will be guided to identify their own subtheme, which will require exploring their own specific research methodologies. These architecture-specific methodologies will be strategically chosen to discuss specific aspects of society: political, economic, social, cultural, or otherwise. Thus, conjoining these ‘autonomous’ and ‘heteronomous’ dimensions of architecture, a new understanding of the city and our built environment is developed that allows us to answer (some of) the research questions mentioned previously.

Research process

Students will be guided through three phases with different emphases: Definitions, Logics and Reinterpretations of Swiss Coloniality. The first phase, Definitions, is focused on developing an understanding of what the notion of Swiss Coloniality can entail and how it relates specifically to industry and the production of the city. This phase will allow students to become familiar with the historical and current entanglements of Switzerland with global colonialism and, by closely examining its main actors, practices, and materials, will set the stage for students to develop their own, individual research project.

The second phase, Logics, is about understanding and demonstrating the inner workings and mechanisms of Swiss Coloniality. Each of the students will focus on one specific case – a material, a site, an actor, a practice, etc. – and will examine it closely through targeted archival and library research, as well as through drawing, writing, and model-making.

In the third phase, Reinterpretations, students will formulate and investigate a hypothesis regarding the entanglements of Swiss industry with global colonialism. Based on this hypothesis, students will position themselves in relation to Swiss Coloniality, its history and its enduring impact. The position statement can take the form of a written text, architectural drawings and/or models and will be presented in the form of a student-curated studio exhibition and an online adaptation of it.

Course syllabus and reader will be made available during the course's first week.

Enrollment will not take place through the D-ARCH website. To enroll for this Fachsemester please send an e-mail to sebastiaan.loosen@gta.arch.ethz.ch by Wednesday 6 September 2023, 8PM. If necessary, available places will be allocated firstly conform the A-B-C-studio priority system, and secondly, randomly. You will receive a confirmation by Thursday 7 September 2023, 12AM (noon). In case of over-applications, students who are not selected have the opportunity to choose a regular design studio through the D-ARCH website (enrollment ends on September 7, at 6 p.m.).

The Research Studio is self-dependent work and tutoring takes place on Tuesdays and Wednesdays.

- **Electives**
  - **Number** 351-0778-01L
  - **Title** Discovering Management (Pitch)
  - **Type** W
  - **ECTS** 1
  - **Hours** 1U
  - **Lecturers** B. Clarysse

- **Abstract**
  - Does not take place this semester. Complementary exercises for the module Discovering Management.

- **Prerequisite**
  - Participation and successful completion of the module Discovering Management (351-0778-00L) is mandatory.

- **Objective**
  - The general objective of Discovering Management (Exercises) is to complement the course "Discovering Management" with one larger additional exercise.

- **Content**
  - Discovering Management (Exercises) thus focuses on developing the skills and competences to apply management theory to a real-life exercise from practice.

- **Students**
  - The exercise consists of delivering and submitting a "pitch" with a clear recommendation for one of the selected cases amongst those seen in Discovering Management, using your insights from Discovering Management, and an extra session on pitching.

  - Students have the option to either do this alone or in a group of two students.
The course consists of a set of theory and practice sessions, which will be taught on a weekly basis. The course will cover business concepts and theories. A reading list will be provided via moodle.ethz.ch at the beginning of the semester.

**Objective**

The general objective of Discovering Management is to introduce students into the field of business management and entrepreneurship. In particular, the aims of the course are to:

1. broaden understanding of management principles and frameworks
2. advance insights into the sources of corporate and entrepreneurial success
3. develop skills to apply this knowledge to real-life managerial problems

The course consists of three blocks of theory and practice sessions: Discovering Strategic Management, Discovering Innovation Management, and Discovering HR and Operations Management. Each block consists of two or three theory sessions, followed by one practice session where you will apply the theory to a case.

The theory sessions will follow a "lecture-style" approach and be presented by an area specialist within D-MTEC. Practical examples and case studies will bring the theoretical content to life. The practice sessions will introduce you to some real-life examples of managerial or entrepreneurial challenges. During the practice sessions, we will discuss these challenges in depth and guide your thinking through team coaching.

Through small group work, you will develop analyses of each of the cases. The theory sessions will be assessed via a multiple choice exam.

**Literature**

All course materials (readings, slides, videos, and worksheets) will be made available to inscribed course participants through Moodle. These course materials will form the point of departure for the lectures, class discussions and team work.

**Abstract**

This course addresses the role of policy and its underlying politics in the transformation of the energy sector. It covers historical, socio-economic, and political perspectives and applies various theoretical concepts to understand specific aspects of the governance of the energy transition.

**Objective**

- To gain an overview of the history of the transition of large technical systems
- To recognize current challenges in the energy system to understand the theoretical frameworks and concepts for studying transitions
- To gain knowledge on the role of policy and politics in energy transitions

**Content**

Climate change, access to energy and other societal challenges are directly linked to the way we use and create energy. Both the 2015 United Nations Paris climate change agreement and the UN Sustainable Development Goals make a fast and extensive transition of the energy system necessary.

This lecture introduces the social and environmental challenges involved in the energy sector and discusses the implications of these challenges for the rate and direction of technical change in the energy sector. It compares the current situation with historical socio-technical transitions and derives the consequences for policy-making. It introduces theoretical frameworks and concepts for studying innovation and transitions. It then focuses on the role of policy and policy change in governing the energy transition, considering the role of political actors, institutions and policy feedback.

The grade will be determined by a final exam.

**Lecture notes**

Slides and reading material will be made available via moodle.ethz.ch (only for registered students).

**Prerequisites / notice**

This course is primarily suited for students of the following programmes: MA Comparative International Studies; MSc Energy Science & Technology; MSc Environmental Sciences; MSc Management, Technology & Economics; MSc Science, Technology & Policy; ETH & UZH PhD programmes.

**Abstract**

A two-day field trip to international organizations in Geneva - e.g., the World Trade Organization, the World Health Organization and the International Committee of the Red Cross.

**Objective**

Become familiar with the work and challenges of international organizations based in Geneva.
This course deals with how and why international problem-solving efforts (cooperation) in environmental politics emerge and evolve, and under what circumstances such efforts are effective. Based on concepts, theories, and methods of political economy, political science, and public policy, various examples of international environmental policy-making are examined.

Objective
The objectives in this course are to (1) gain an overview of important questions in international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions in this policy area and how to address them in a conceptually and methodologically meaningful and insightful way; (3) gain an overview of important global and regional environmental problems and how they are or could be solved.

Content
This course deals with how and why international problem-solving efforts (cooperation) in environmental politics emerge and evolve, and under what circumstances such efforts are effective. Based on concepts, theories, and methods of political economy, political science, and public policy, various examples of international environmental policy-making are examined, for example international efforts to reduce air pollution, manage international water resources, mitigate and adapt to global warming, protect the stratospheric ozone layer, address biodiversity challenges, deal with plastic waste, and prevent pollution of the oceans.

Lecture notes
Reading materials and slides will be available via Moodle.

Literature
Reading materials and slides will be available via Moodle.

Prerequisites / notice
The course is open to all ETH students and visiting students from other universities. Participation does not require previous coursework in the social sciences or environmental policy. Most meetings in this course will take place on campus (ETH Main Building, HG F.3). There will be no live-streaming, and the course is not in hybrid (on-campus plus online) format. However, the lecture will be recorded (slides and voice, no video) and the recordings will be made available via the Moodle platform for this course a few days after the respective lecture for students who are unable to attend in person. All electronic correspondence will take place via the ETH mystudies system and Moodle, so please make sure you are properly registered there with a functioning email address/account.

Credits and Exam
After passing a written test at the end of the course (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test). Visiting students (e.g., from the University of Zurich, exchange students) are subject to the same conditions. Registration of visiting students in the web-based system of EETH is compulsory. Students who obtain a grade of < 4.0 for the test will have a second chance (see table below). Students who did not participate in the test on 16 December 2024 will not have access to the repeat test unless they submit compelling and documented (e.g., medical, other exam in parallel at ETH) reasons for why they are/were unable to participate in the first test. The test covers all contents of the lectures and the reading assignments. No separate registration for the exam is required, registration for the course as such covers everything. The exam will take place on campus, most likely in HG F3. That is, you must be present in person at ETH Zurich on the exam date/time.

701-1631-00L Foundations of Ecosystem Management

Abstract
This course introduces the broad variety of conflicts that arise in projects focusing on sustainable management of natural resources. It explores case studies of ecosystem management approaches and considers their practicability, their achievements and possible barriers to their uptake.

Objective
Students should be able to
a) Propose appropriate and realistic solutions to ecosystem management problems that integrate ecological, economic, and social dimensions across relevant temporal and spatial scales.

b) Identify important stakeholders, their needs and interests, and the main conflicts that exist among them in the context of land and resource management.

Content
Traditional management systems focus on extraction of natural resources, and their manipulation and governance. However, traditional management has frequently resulted in catastrophic failures such as, for example, the collapse of fish stocks and biodiversity loss. These failures have stimulated the development of alternative ecosystem management approaches that emphasise the functionality of human-dominated systems. Inherent to such approaches are system-wide perspectives and a focus on ecological processes and services, multiple spatial and temporal scales, as well as the need to incorporate diverse stakeholder interests in decision making. Thus, ecosystem management is the science and practice of managing natural resources, biodiversity and ecological processes, to meet multiple demands of society. It can be local, regional or global in scope, and addresses critical issues in developed and developing countries relating to economic and environmental security and sustainability.

This course provides an introduction to ecosystem management, and in particular the importance of integrating ecology into management systems to meet multiple societal demands. The course explores the extent to which human-managed terrestrial systems depend on underlying ecological processes, and the consequences of degradation of these processes for human welfare and environmental well-being. Building upon a theoretical foundation, the course will tackle issues in resource ecology and management, notably forests, agriculture and wild resources within the broader context of sustainability, biodiversity conservation and poverty alleviation or economic development. Case studies from tropical and temperate regions will be used to explore these issues. Dealing with ecological and economic uncertainty, and how this affects decision making, will be discussed. Strategies for conservation and management of terrestrial ecosystems will give consideration to landscape ecology, protected area systems, and community management, paying particular attention to alternative livelihood options and marketing strategies of common pool resources.

**851-0467-00L From Traffic Modeling to Smart Cities and Digital Democracies**

<table>
<thead>
<tr>
<th>W</th>
<th>3 credits</th>
<th>2S</th>
<th>D. Helbing, R. K. Dubey</th>
</tr>
</thead>
</table>

**Abstract**
This seminar will present speakers who discuss the challenges and opportunities arising for our cities and societies with the digital revolution.

**Objective**
To collect credit points, students must actively contribute and give an individual, circa 20-minute presentation in the seminar on a subject agreed upon with the lecturer. After the presentation, it will be discussed and graded.

**Content**
This seminar will present speakers who discuss the challenges and opportunities arising for our cities and societies with the digital revolution. Besides discussing questions of automation using Big Data, AI and other digital technologies, we will also reflect on the question of how democracy could be digitally upgraded, and how citizen participation could contribute to innovation, sustainability, resilience, and quality of life. This includes questions around collective intelligence and digital platforms that support creativity, engagement, coordination and cooperation.

**Literature**
Dirk Helbing  
*An Analytical Theory of Traffic Flow* (collection of papers)

Michael Batty, Kay Axhausen et al.  
*Smart cities of the future*

Books by Michael Batty:  
*How social influence can undermine the wisdom of crowd effect*  
*Evidence for a collective intelligence factor in the performance of human groups*  
*Optimal incentives for collective intelligence*  
*Collective Intelligence: Creating a Prosperous World at Peace*  
*Big Mind: How Collective Intelligence Can Change Our World*  
*Programming Collective Intelligence*

*Build digital democracy*  
*How to make democracy work in the digital age*  
*Digital Democracy: How to make it work?*  
*Proof of witness presence: Blockchain consensus for augmented democracy in smart cities*  
*Iterative Learning Control for Multi-agent Systems Coordination*  
*Decentralized Collective Learning for Self-managed Sharing Economies*  
*Students need to present a new subject, for which they have not earned any credit points before.*  
*Good scientific practices, in particular citation and quotation rules, must be properly complied with.*  
*Chatham House rules apply to this course. Materials may not be shared without previous written permission.*
Abstract
The seminar aims at three-fold integration: (1) bringing modeling and computer simulation of techno-socio-economic processes and phenomena together with related empirical, experimental, and data-driven work, (2) combining perspectives of different scientific disciplines (e.g. sociology, computer science, physics, complexity science, engineering), (3) bridging between fundamental and applied work. Computational Social Science and Global Systems Science serve to better understand the emerging digital society with its close co-evolution of information and communication technology (ICT) and society. They make current theories of crises and disasters applicable to the solution of global-scale problems, taking a data-based approach that builds on a serious collaboration between the natural, engineering, and social sciences, i.e. an interdisciplinary integration of knowledge.

Objective
Participants of the seminar should understand how tightly connected systems lead to networked risks, and why this can imply systems we do not understand and cannot control well, thereby causing systemic risks and extreme events. They should also be able to explain how systemic instabilities can be understood by changing the perspective from a component-oriented to an interaction- and network-oriented view, and what fundamental implications this has for the proper design and management of complex dynamical systems.

### Resource and Environmental Economics

**W 3 credits 2G** A. Miftakhova, A. Minabutdinov

#### Abstract

Relationship between economy and environment, market failures, external effects and public goods, contingent valuation, internalisation of externalities, economics of non-renewable resources, economics of renewable resources, environmental cost-benefit analysis, sustainability economics, and international resource and environmental problems.

#### Objective

A successful completion of the course will enable a thorough understanding of the basic questions and methods of resource and environmental economics and the ability to solve typical problems using appropriate tools consisting of concise verbal explanations, diagrams or mathematical expressions. Concrete goals are first of all the acquisition of knowledge about the main questions of resource and environmental economics and about the foundation of the theory with different normative concepts in terms of efficiency and fairness. Secondly, students should be able to deal with environmental externalities and internalisation through appropriate policies or private negotiations, including knowledge of the available policy instruments and their relative strengths and weaknesses. Thirdly, the course will allow for in-depth economic analysis of renewable and non-renewable resources, including the role of stock constraints, regeneration functions, market power, property rights and the impact of technology. A fourth objective is to successfully use the well-known tool of cost-benefit analysis for environmental policy problems, which requires knowledge of the benefits of the improved environmental level, the costs, and measuring costs. In the chapter on sustainability, the course covers concepts of sustainability, conflicts with optimality, and indicators of sustainability. In a final chapter, we consider international environmental problems and in particular climate change and climate policy.

### Urban Design III

**W 2 credits 2V** H. Klumppner, F. T. Salva Rocha Franco

#### Abstract

Students are introduced to a narrative of 'Urban Stories' through a series of three tools driven by social, governance, and environmental transformations in today's urbanization processes. Each lecture explores one city's spatial and organizational ingenuity born out of a particular place's realities, allowing students to transfer these inventions into a catalog of conceptual tools.

#### Objective

How can students of architecture become active agents of change? What does it take to go beyond a building's scale, making design instruments to the students to use, test, and start their designs. Urban Design is the basic practice of architecture and urban design. It introduces a repertoire of urban design tools to the students to use, test, and start their designs.

---

**Data: 06.08.2024 12:40  Autumn Semester 2024  Page 2301 of 2684**
Content

Urban form cannot be reduced to physical space. Cities result from social construction, under the influence of technologies, ecology, culture, the impact of experts, and accidents. Urban un-concluded processes respond to political interests, economic pressure, cultural inclinations, along with the imagination of architects and urbanists and the informal powers at work in complex adaptive systems. Current urban phenomena are the result of urban evolution. The facts stored in urban environments include contributions from its entire lifecycle, visible in the physical environment, and non-physical aspects. This imaginary city exists along with its potentials and problems and with the conflicts that have evolved. Knowledge and understanding, along with a critical observation of the actions and policies, are necessary to understand the diversity and instability present in the contemporary city and understand how urban form evolved to its current state.

How did cities develop into the cities we live in now? Urban plans, instruments, visions, political decisions, economic reasonings, cultural inputs, and social organization have been used to operate in urban settlements in specific moments of change. We have chosen cities that exemplify how these instruments have been implemented and how they have shaped urban environments. We transcribe these instruments into urban operational tools that we have recognized and collected within existing tested cases in contemporary cities across the globe.

This lecture series will introduce urban knowledge and the way it has introduced urban models and operational modes within different concrete realities, therefore shaping cities. The lecture series translates urban knowledge into operational tools, extracted from cities where they have been tested and become exemplary samples, most relevant for understanding how the urban landscape has taken shape. The tools are clustered in twelve thematic clusters and three tool scales for better comparability and cross-reflection.

The Tool case studies are compiled into a global urbanization toolbox, which we use as typological models to read the city and critically reflect upon it. The presented contents are meant to serve as inspiration for positioning in future professional life and provide instruments for future design decisions.

In an interview with a local designer, we measure our insights against the most pressing design topics in cities today, including inclusion, affordable housing, provision of public spaces, and infrastructure for all.

Lecture notes

The learning material, available via https://moodle-app2.let.ethz.ch/ is comprised of:
- Toolbox ‘Reader’ with an introduction to the lecture course and tool summaries
- Weekly exercise tasks
- Infographics with basic information of each city
- Quiz question for each tool
- Additional reading material
- Interviews with experts
- Archive of lecture recordings
- Reading material will be provided throughout the semester.

Literature

851-0101-86L Complex Social Systems: Modeling Agents, Learning, W 3 credits 2S D. N. Dailisan, D. Carpenteras, D. Helbing

Abstract

This course introduces mathematical and computational models to study techno-socioeconomic systems and the process of scientific research. Students develop a significant project to tackle techno-socio-economic challenges in application domains of complex systems. They are expected to implement a model and to communicate their results through a project report and a short oral presentation.

Objective

See your own field of study in a wider context (“Science in Perspective”), e.g. see the psychological, social, economic, environmental, historical, ethical, or philosophical connections and implications. Learn to think critically and out of the box. Question what you believe you know for sure. Get to know surprising, counterintuitive properties of complex (non-linearly interacting, networked, multi-component) systems. Learn about collaboration.

Content

By the end of the course, the students should be able to better understand the literature on complex social systems, develop their own models for studying specific phenomena and report results according to the standards of the relevant scientific literature by presenting their results both numerically and graphically.

At the end of the course, the students will deliver a report, computer code and a short oral presentation. To collect credit points, students will have to actively contribute and give a circa 30 minutes presentation in the course on a subject agreed with the lecturers, after which the presentation will be discussed. The presentation will be graded.

Students are expected to implement themselves models of techno-socio-economic processes and systems, particularly agent-based models, complex networks models, decision making, group dynamics, human crowds, or game-theoretical models. Credit points are finally earned for the implementation of a mathematical or empirical model from the complexity science literature, its presentation, and documentation by a project report.

Lecture notes

The lecture slides will be presented on the course Moodle after each lecture.

Abstract
This course introduces students to scientific and technological developments that require regulation or enable legal innovation. We focus particularly on the challenges to current law posed by prominent near-future technologies.

Objective
The course is designed for a wide range of ETH students as well as for law students who are keen to deepen their understanding of cutting-edge technology. It offers an overview of key legal areas important for technology regulation, complemented by guest lectures on emerging technological trends.

In previous years, the course has featured esteemed speakers from various sectors, including industry leaders like Google, NGOs such as Digital Society Switzerland and The European Consumer Organization, regulatory bodies like the Swiss Competition Commission, and noted academics.

The course is open to ETH students through the Science in Perspective program of the Department of Humanities, Social and Political Sciences.

Content
The planned course outline is below.
- Overview of Law and Technology
- Fundamental Rights
- AI & Discrimination
- Landmark Big Tech Cases
- Regulation of Digital Platforms & Content Moderation
- Online Consumer Protection
- Law and Tech Scholarship Series

A number of recent regulations will be discussed, including the EU's AI Act, the Digital Services Act (DSA), and the Digital Markets Act (DMA), as well as emerging internet phenomena, like ChatGPT.

Prerequisites / notice
You can find all course materials and the most recent announcements on Moodle. Please log in to Moodle using your ETH or UZH credentials. Then search for "Law & Tech (851-0732-06L, HS 2024)" and enroll.

Abstract
Since Europe surrendered their colonial assets, engineers from rich countries have returned to the African continent to address the real and perceived ills that they felt technology could solve. And yet, 70 years on, the promise of technology has largely failed to deliver widespread, substantive improvements in the quality of life. Why?
Building a Robot Judge: Data Science for Decision-Making

Objective

This course is meant for engineers who are interested in pursuing an ethical and relevant career internationally, and who are willing to examine the complex role that well-meaning foreigners have played and continue to play in the disappointing health outcomes that characterize much of the African continent.

After completing the course, participants will be able to

- critique the jargon and terms used by the international community, i.e. “development”, “aid”, “cooperation”, “assistance” “third world” “developing” “global south” “low and middle-income” and justify their own chosen terminology
- recognize the role of racism and white-supremacy in the development of the Aid industry
- understand the political, financial, and cultural reasons why technology and infrastructure have historically failed
- Debate the merits of international engineering in popular culture and media
- Propose improved SDG indicators that address current shortcomings
- Compare the engineering curricula of different countries to identify relative strengths and shortcomings
- Explain the inherent biases of academic publishing and its impact on engineering failure
- Analyse linkages between the rise of philanthropy and strategic priority areas
- Recommend equitable, just funding models to achieve more sustainable outcomes
- Formulate a vision for the international engineer of the future

Content

Role of international engineering during colonialism

Transition of international engineering following colonialism

White saviourism and racism in international engineering

International engineering in popular culture

The missing role of Engineering Education

Biases in academic publishing

The emerging role in Global Philanthropy

The paradox of International funding

Building a Robot Judge: Data Science for Decision-Making

W 3 credits 2V E. Ash

Does not take place this semester.

Particularly suitable for students of D-INFK, D-ITET, D-MTEC.

Abstract

This course explores the automation of decisions in the legal system. We delve into the machine learning tools needed to predict judge decision-making and ask whether techniques in model explanation and algorithmic fairness are sufficient to address the potential risks.

Objective

This course introduces students to the data science tools that may provide the first building blocks for a robot judge. While building a working robot judge might be far off in the future, some of the building blocks are already here, and we will put them to work.

Content

Data science technologies have the potential to improve legal decisions by making them more efficient and consistent. On the other hand, there are serious risks that automated systems could replicate or amplify existing legal biases and rigidities. Given the stakes, these technologies force us to think carefully about notions of fairness and justice and how they should be applied.

The focus is on legal prediction problems. Given the evidence and briefs in this case, how will a judge probably decide? How likely is a criminal defendant to commit another crime? How much additional revenue will this new tax law collect? Students will investigate and implement the relevant machine learning tools for making these types of predictions, including regression, classification, and deep neural networks models.

We then use these predictions to better understand the operation of the legal system. Under what conditions do judges tend to make errors? Against which types of defendants do parole boards exhibit bias? Which jurisdictions have the most tax loopholes? Students will be introduced to emerging applied research in this vein. In a semester paper, students (individually or in groups) will conceive and implement an applied data-science research project.

851-0685-00L

Data and Society

W 3 credits 2V M. Leese

Abstract

This lecture series explores the multifaceted role of data in shaping contemporary society, governance, and individual lives. The course equips students with a critical understanding of how data is made, managed, and preserved, and its implications for societal norms and individual rights.

Objective

At the end of the term, students will be able to:

- reflect concepts and theories that capture the performativity of data
- reflect concepts and theories that capture the socio-technical nature of data
- assess the implications of data practices for social and political ordering
- identify key actors, sites, and domain contexts of data practices
Internship

The performance counts as electives.

Abstract

This course aims to provide an understanding of the formation, evolution, composition, structure and dynamics of planetary bodies in our solar system and beyond, including new developments in the field and links to past, current and future space missions.

Objective

The goal of the course is to enable students to understand current knowledge and uncertainties regarding the formation, evolution, composition, structure and dynamics of planets, moons, asteroids and comets in our solar system, as well as ongoing discoveries from space missions and planets around other stars.

Content

The main topics covered are: Orbital Dynamics and Tides, Solar Heating and Energy Transport, Chronology and Compositions (bulk and isotopic), Geochemical Concepts, Planetary Atmospheres, Planetary Surfaces, Planetary Interiors, Asteroids and Meteorites, Comets, Planetary Rings, Magnetic Fields and Magnetospheres, the Sun and Stars, Planet Formation, Exoplanets and Exobiology.

The lectures introduce the basics of the terrestrial and giant planets, comets, and asteroids, gained from modern space missions and the study of extraterrestrial material from both the physical and geochemical perspectives. Students will practice making quantitative calculations relevant to various aspects of space weather predictions.

Abstract

The physics of solar flares, coronal mass ejections and the solar wind and how they are triggered and transport through the solar system is described. The impact of the Sun's activity and its activity cycle on the Earth and our technology will be outlined. The students will use real spacecraft data in the exercise classes to track space weather events and their impact.

Objective

The main goal of the course is to give the students an overview of physical phenomena that lead to impacts on the Earth and our technical infrastructure from the Sun. The areas described are at the forefront of scientific research internationally, and is an area known as ‘space weather’. The current status and reliability of space weather predictions will be reviewed.

Content

There will be 2 lectures given each week for 7 weeks followed by an exercise class. The exercise class will track the lectures and the students will use spacecraft data to determine their own space weather impacts from different solar storms.

Abstract

The aim of the course is to provide the fundamental knowledge about earth observation sensors, techniques and methods for bio/geophysical environmental parameter estimation.

Objective

The aim of the course is to provide the fundamental knowledge about earth observation sensors, techniques and methods for bio/geophysical environmental parameter estimation. Students should know at the end of the course:

1. Basics of measurement principle
2. Fundamentals of image acquisition
3. Basics of the sensor-specific geometries
4. Sensor-specific determination of environmental parameters

Content

Die Lehrveranstaltung gibt einen Einblick in die heutige Erdebachtung mit dem folgenden skizzierten Inhalt:

1. Einführung in die Fernerkundung von Luft- und Weltraum gestützten Systemen
2. Einführung in das Elektromagnetische Spektrum
3. Einführung in die Techniken und Methoden zur Bestimmung von Umweltparametern
4. Erkennen der Anwendungsmöglichkeiten der Satellitengeodäsie für interdisziplinäre Aufgaben (System Erde).

Students will practice making quantitative calculations relevant to various aspects of these topics through homework.

Lecture notes

Folien zu jedem Vorlesungsblock werden zur Verfügung gestellt.

Literature

Ausgewählte Literatur wird am Anfang der Vorlesung vorgestellt.

Deep Track Courses

At least 20 credits must be completed within the deep track courses. Surplus credit points can be counted towards the electives.

Laminar and turbulent flows, instability and origin of turbulence - Statistical description: averaging, turbulent energy, dissipation, closure

Preparation materials & slides are provided prior to each class

Reaction kinetics, fuel oxidation mechanisms, premixed and diffusion laminar flames, two-phase-flows, turbulence and turbulent

R. D'Andrea

W+ Zuggang zu den Unterrichtsmaterialen wird über polybox möglich sein.

fostered

Lecture notes are available

The main learning objectives of this course are: 1. Understand the thermodynamic, fluid-dynamic and chemical kinetics fundamentals of

N. Noiray

Basic physical phenomena of turbulent flows, quantitative and statistical description, basic and averaged equations, principles of turbulent

W+ Scanning, homogeneous isotropic turbulence, energy spectrum

- Turbulent free shear flows. Jet, wake, mixing layer
- Wall turbulence: Channel and boundary layer - Computation and modelling of turbulent flows
- Basic physical phenomena of turbulent flows, quantitative and statistical description, basic and averaged equations, principles of turbulent
- Properties of laminar, transitional and turbulent flows.
- Origin and control of turbulence. Instability and transition.
- Statistical description, averaging, equations for mean and fluctuating quantities, closure problem.

Fundamentals and Applications of Combustion

W+ 4 credits

2V+1U+2A

N. Noiray, F. Ernst, C. E. Frouzakis

Note: The previous course title until HS23 "Combustion and Reactive Processes in Energy and Materials Technology"

Abstract

This course will provide an introduction to the fundamentals and the applications of combustion in energy conversion and nanoparticles synthesis. The content is highly relevant for technologies which cannot be electrified such as long distance aviation and shipping, and which will more and more rely on carbon-neutral synthetic fuels.

Objective

The main learning objectives of this course are: 1. Understand the thermodynamic, fluid-dynamic and chemical kinetics fundamentals of combustion processes. 2. Predict relevant parameters for combustion systems, such as laminar and turbulent flame speeds, adiabatic flame temperature or quenching distance. 3. Understand the causal relations of relevant combustion parameters such as the pressure influence on the laminar flame speed. 4. Analyze the challenges of developing sustainable combustion technologies based on carbon-neutral synthetic fuels.

After this course, the students should be able to:

- Describe the major observation techniques in space geodesy.
- Describe the necessary modeling and analysis approaches to derive geodetic products of highest quality.
- Select the appropriate space geodetic data for scientific investigations.
- Analyze the space geodetic data for scientific purposes.
- Interpret the scientific results.

Overview of GNSS, Very Long Baseline Interferometry (VLBI), Satellite and Lunar Laser Ranging (SLR/LLR), Satellite Radar Altimetry with the basic principles, the instruments and observation equations.

Modelling of the station motions and the estimation of station coordinates. Basics of wave propagation in the atmosphere. Signal propagation in the ionosphere and troposphere for the different observation techniques and the determination of atmospheric parameters.

Equation of motion of the unperturbed and perturbed satellite orbit. Osculating and mean orbital elements. General and special perturbation theory and the determination of satellite orbits.

  - Self-direction and Self-management

**Literature**

**Aeroelasticity**

- Introduction to the basics and into the methods of Aeroelasticity. An overview of the main static and dynamic phenomena arising from the interaction between structural and aerodynamic loads.

- The course will provide a basic physical understanding of flow-structure interaction focused on lifting bodies such as wings. You will get to know the most important phenomena in the static and dynamic aeroelasticity, as well as a presentation of the most relevant analytical and numerical prediction methods.

- Introduction to steady and unsteady thin airfoil theory, extension to three dimension wing aerodynamics, strip theory, overview of numerical methods available (panel methods, CFD).

- Introduction to unsteady aerodynamics (theory): Theodorsen and Wagner functions. Unsteady aerodynamics observed from numerical experiments (CFD). Generation of simplified mathematical models.

- Presentation of steady aeroelasticity: equations of equilibrium for the typical section, aeroelastic deformation, effectiveness of the aeroelastic system, stability (definition), divergence condition, role played by a control surface, control effectiveness, sweep angle, aeroelastic tailoring of bending-torsion coupling. Ritz model to model beams, use of FEM, modal condensation, choice of generalized coordinates.

- Numerical aeroelasticity (Test Cases extracted from the latest AIAA Aeroelastic Prediction Workshops). Generation of Reduced Order Models from CFD data (in some cases though Machine Learning).

- Aeroelasticity of modern aircraft: assessment of the effects induced by the control surfaces and control systems (Aeroservoelasticity), active controlled aircraft, flutter-suppression systems, certification (EASA, FAA).

- Planning and execution of Wind Tunnel experiments with aeroelastic models. Live-execution of an experiment in the WT of the ETH.

- Brief presentation of phenomena like Limit-Cycle Oscillations (LCO) and panel flutter.

- A script in English language is available.

**Lecture notes**

A script in English language is available.

</tr>
<tr>
<td>Abstract</td>
<td>The course provides an introduction to theoretical foundations and practical usage of the Lattice Boltzmann Method for fluid dynamics simulations. Methods like molecular dynamics, DSMC, lattice Boltzmann etc are being increasingly used by engineers all over and these methods require knowledge of kinetic theory and statistical mechanics which are traditionally not taught at engineering departments. The goal of this course is to give an introduction to ideas of kinetic theory and non-equilibrium thermodynamics with a focus on developing simulation algorithms and their realizations. During the course, students will be able to develop a lattice Boltzmann code on their own. Practical issues about implementation and performance on parallel machines will be demonstrated hands on. Central element of the course is the completion of a lattice Boltzmann code (using the framework specifically designed for this course). The course will also include a review of topics of current interest in various fields of fluid dynamics, such as multiphase flows, reactive flows, microwaves among others. Optionally, we offer an opportunity to complete a project of student's choice as an alternative to the oral exam. Samples of projects completed by previous students will be made available.</td>

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 2311 of 2684
The course builds upon three parts:
I Elementary kinetic theory and lattice Boltzmann simulations introduced on simple examples.
II Theoretical basis of statistical mechanics and kinetic equations.
III Lattice Boltzmann method for real-world applications.

The content of the course includes:
1. Background: Elements of statistical mechanics and kinetic theory;
   Particle's distribution function, Liouville equation, entropy, ensembles; Kinetic theory: Boltzmann equation for rarefied gas, H-theorem, hydrodynamic limit and derivation of Navier-Stokes equations, Chapman-Enskog method, Grad method, boundary conditions; mean-field interactions, Vlasov equation;
   Kinetic models: BGK model, generalized BGK model for mixtures, chemical reactions and other fluids.

2. Basics of the Lattice Boltzmann Method and Simulations:
   Minimal kinetic models: lattice Boltzmann method for single-component fluid, discretization of velocity space, time-space discretization, boundary conditions, forcing, thermal models, mixtures.

3. Hands on:
   Development of the basic lattice Boltzmann code and its validation on standard benchmarks (Taylor-Green vortex, lid-driven cavity flow etc).

4. Practical issues of LBM for fluid dynamics simulations:
   Lattice Boltzmann simulations of turbulent flows; numerical stability and accuracy.

5. Microflow:
   Rarefaction effects in moderately dilute gases; Boundary conditions, exact solutions to Couette and Poiseuille flows; micro-channel simulations.

6. Advanced lattice Boltzmann methods:
   Entropic lattice Boltzmann scheme, subgrid simulations at high Reynolds numbers; Boundary conditions for complex geometries.

7. Introduction to LB models beyond hydrodynamics:
   Relativistic fluid dynamics; flows with phase transitions.

Lecture notes
Lecture notes on the theoretical parts of the course will be made available.
Selected original and review papers are provided for some of the lectures on advanced topics.
Handouts and basic code framework for implementation of the lattice Boltzmann models will be provided.

Prerequisites / notice
The course addresses mainly graduate students (MSc/Ph D) but BSc students can also attend.

Abstract
The course teaches the fundamentals of digital communication systems. The main topics are analog and digital modulation, signals and linear time-invariant systems, baseband and passband representations, continuous-time and discrete-time channels, noise, inter-symbol interference, detection theory, as well as the basics of forward error correction and information theory.

Objective
After attending the lectures, participating in the exercise sessions, and working on the homework problems (which include MATLAB coding assignments), the students will be able to:
- understand the fundamentals of digital communication systems
- explain the principles of modulation, demodulation, detection, and error correction
- analyze error rates of simple digital communication systems
- implement simple MATLAB simulations to calculate error rates

Content
The course focuses on the fundamentals of digital communication systems. The course starts with analog modulation and discusses the main building blocks of modern digital communication systems. The topics include:
- essential components of digital communication systems
- analog and digital modulation
- baseband and passband representation; up- and down-conversion
- communication channels as LTI systems
- discretizing communication systems; sampling and quantization
- noise, signal-to-noise ratio (SNR), and interference
- detection theory and error rates
- basics of forward error correction
- basics of information theory
- orthogonal frequency-division multiplexing (OFDM)
- building blocks of modern communication systems

The exercises cover theoretical aspects as well as the basics of software-based communication-system modeling in MATLAB.

Lecture notes
Lecture notes will be distributed electronically at the beginning of the semester.

Optical Communication Fundamentals
The path of an analog signal in the transmitter to the digital world in a communication link and back to the analog world at the receiver is discussed. The lecture covers the fundamentals of all important optical and optoelectronic components in a fiber communication system. This includes the transmitter, the fiber channel and the receiver with the electronic digital signal processing elements.
Objective
An in-depth understanding on how information is transmitted from source to destination. Also the mathematical framework to describe the important elements will be passed on. Students attending the lecture will further get engaged in critical discussion on societal, economical and environmental aspects related to the on-going exponential growth in the field of communications.

Content
* Chapter 1: Introduction: Analog/Digital conversion, The communication channel, Shannon channel capacity, Capacity requirements.
* Chapter 4: The Receiver: Photodiodes, Receiver noise, Detector schemes (direct detection, coherent detection), Bit-error ratios and error estimations.
* Chapter 5: Digital Signal Processing Techniques: Digital signal processing in a coherent receiver, Error detection techniques, Error correction coding.
* Chapter 6: Pulse Shaping and Multiplexing Techniques: WDM/FDM, TDM, OFDM, Nyquist Multiplexing, OCDMA.
* Chapter 7: Optical Amplifiers: Semiconductor Optical Amplifiers, Erbium Doped Fiber Amplifiers, Raman Amplifiers.

Lecture notes
Lecture notes are handed out.

Literature

Prerequisites / notice

227-0443-00L Space Communications

Abstract
The course has the following main goals: (a) to give a comprehensive overview of challenges on communication equipment imposed by space flight missions, (b) to present the theoretical fundamentals and existing practical solutions of communication technology for space missions, and (c) to review existing and future communication technologies for inter-satellite links, inter-spacecraft links, as well as space missions: scenarios and challenges on flight equipment.

Objective
After completing this course, a student will understand the challenges of space flight imposed on communication components and systems, the available existing solutions of those problems, the main components of communications systems suitable for a spacecraft, and future technologies capable of enabling ultra-fast RF/mm-Wave, THz, and Laser communication links.

Content
- Space communications: architectures, assets, payloads, link budgets, and use cases.
- Electromagnetic waves: radiation, operating principles of antennas, antenna types, and antenna parameters.
- RF electronics and antenna arrays architecture for SATCOM: low-noise amplifiers, beam forming, spatial filtering, and design examples.
- Laser communication links for free-space communication, architectures and implementation.
- Microwave photonics for space applications: analog photonic links, optical generation and distribution of RF signals, and advanced RF filtering using photonic techniques.
- Communication channels: channel modeling, incl. atmospheric effects, Doppler, synchronization tracking, beam forming, tracking and finding.
- Signal modulation: modulation formats, adaptive optics, phase noise, and quantum key distribution (QKD).
- Outlook for emerging use-cases (ranging, time-, nav- and position-transfer (PNT))

Lecture notes
Lecture notes, Matlab programs, exercises and their solutions will be handed out.

227-0417-00L Information Theory I W 6 credits 4G A. Lapidoth

Abstract
This course covers the basic concepts of information theory and of communication theory. Topics covered include the entropy rate of a source, mutual information, typical sequences, the asymptotic equi-partition property, Huffman coding, channel capacity, the channel coding theorem, the source-channel separation theorem, and feedback capacity.

Objective
The fundamentals of Information Theory including Shannon's source coding and channel coding theorems.

Content
The entropy rate of a source, Typical sequences, the asymptotic equi-partition property, the source coding theorem, Huffman coding, Arithmetic coding, channel capacity, the channel coding theorem, the source-channel separation theorem, feedback capacity.

Literature
T.M. Cover and J. Thomas, Elements of Information Theory (second edition)

227-0146-00L Data Conversion System Design W 6 credits 2V+2U T. Burger, G. Cervelli, R. Reutemann

Abstract
Up until HS23 named Analog-to-Digital Converters

This course provides a thorough treatment of integrated data conversion systems from system level specifications and trade-offs, over architecture choice down to circuit implementation.

Objective
Data conversion systems are substantial sub-parts of many electronic systems, e.g. the audio conversion system of a home-cinema systems or the base-band front-end of a wireless modem. Data conversion systems usually determine the performance of the overall system in terms of dynamic range and linearity. Students will learn the underlying principles of data conversion and be introduced to the different methods and circuit architectures to implement such a conversion. The conversion methods such as successive approximation or algorithmic conversion are explained based on their operation principle accompanied with the appropriate mathematical calculations, including effects of non-idealities in some cases. After successful completion of the course students should understand the concept of an ideal ADC, know all major converter architectures, their principle of operation and what governs their performance.
Content
- Introduction: examples of data conversion architectures; information representation; abstraction, categorization and symbolic representation; basic conversion algorithms; data converter application; tradeoffs among key parameters; ADC taxonomy.
- Dual-slope & successive approximation register (SAR) converters: dual slope principle & converter; SAR ADC operating principle; SAR implementation with a capacitive array; range extension with segmented array.
- Algorithmic & pipelined A/D converters: algorithmic conversion principle; sample & hold stage; pipelined converter: multiplying DAC; flash sub-ADC and n-bit MDAC; redundancy for correction of non-idealities, error correction.
- Performance metrics and non-linearity: ideal ADC; offset, gain error, differential and integral non-linearities; capacitor mismatch; impact of capacitor mismatch on SAR ADC's performance.
- Flash, folding an interpolating analog-to-digital converters; flash ADC principle, thermometer to binary coding, sparkle correction; limitations of flash converters; the folding principle, residue extraction; folding amplifiers; cascaded folding; interpolation for folding converters; cascaded folding and interpolation.
- Noise in analog-to-digital converters: types of noise; noise calculation in electronic circuit, kT/C-noise, sampled noise; noise analysis in switched-capacitor circuits; aperture time uncertainty and sampling jitter.
- Delta-sigma A/D-converters: linearity and resolution; from delta-modulation to delta-sigma modulation; first-order delta-sigma modulation, circuit level implementation; clock-jitter & SNR in delta-sigma modulators; second-order delta-sigma modulation, higher-order modulation, design procedure for a single-loop modulator.

227-0116-00L
VLSI 1: HDL Based Design for FPGAs

252-1411-00L
Security of Wireless Networks

Prerequisites:

This first course in a series that extends over three consecutive terms is concerned with tailoring algorithms and with devising high performance hardware architectures for their implementation as ASIC or with FPGAs. The focus is on front end design using HDLs and automatic synthesis for producing industrial-quality circuits.

Objectives
- Understand Very-Large-Scale Integrated Circuits (VLSI chips), Application-Specific Integrated Circuits (ASIC), and Field-Programmable Gate-Arrays (FPGA). Know their organization and be able to identify suitable application areas. Become fluent in front-end design from architectural conception to gate-level netlists. How to model digital circuits with SystemVerilog. How to ensure they behave as expected with the aid of simulation, testbenches, and assertions. How to take advantage of automatic synthesis tools to produce industrial-quality VLSI and FPGA circuits. Gain practical experience with the hardware description language SystemVerilog and with industrial Electronic Design Automation (EDA) tools.

Content
During the exercises, students learn how to model FPGAs with SystemVerilog. They write testbenches for simulation purposes and synthesize gate-level netlists for FPGAs. Commercial EDA software by leading vendors is being used throughout.

Lecture notes
Textbook and all further documents in English.

Literature

Prerequisites:
Basics of digital circuits.

Examination:
In written form following the course semester (spring term). Problems are given in English, answers will be accepted in either English oder German.

402-0448-01L Quantum Information Processing I: Concepts
This theory part QIP I together with the experimental part 402-0448-02L QIP II (both offered in the autumn semester) combine to the core course in experimental physics “Quantum Information Processing” (totally 10 ECTS credits). This applies to the Master's degree programme in Physics.

Abstract
The course covers the key concepts and formalism of quantum information processing. Topics include quantum algorithms, quantum error correction, quantum cryptography, and quantum metrology, with an emphasis on the power of quantum information processing beyond that of classical information processing. The formalism of quantum states, measurements, and channels is developed in detail.

Objective
By the end of the course students are able to explain the basic mathematical formalism of quantum mechanics and apply it to quantum information processing problems. They are able to adapt and apply these concepts and methods to analyze and discuss quantum algorithms and other quantum information-processing protocols.

Content
The topics covered in the course will include quantum circuits, gate decomposition and universal sets of gates, efficiency of quantum circuits, quantum algorithms (Shor, Grover, Deutsch-Josza,…), stabilizer-based quantum error correction, fault-tolerant designs, the BB84 quantum key distribution protocol, and simple methods of quantum metrology.

Lecture notes
Will be provided.

Literature

These courses can be credited either as a specialization subject or as an elective subject.

Number Title Type ECTS Hours Lecturers
102-0627-00L Applied Radar Remote Sensing W+ 3 credits 2G O. Frey

Abstract
This course provides an introduction to processing and interpreting radar and synthetic aperture radar (SAR) remote sensing data. The primary topics of the course are interferometric techniques and related applications such as topography mapping and mapping of surface displacements, with a strong emphasis on solving practical problems using MATLAB.

Objective
Understand the concepts and techniques required to process and to adequately interpret interferometric radar/SAR data for topographic mapping and surface displacement applications. At the end of the course the student is able to read, display, process, and interpret interferometric radar/SAR using MATLAB.

Content
The rationale behind the structure of the course follows the idea that radar imaging and radar/SAR interferometry are closely related and that a basic understanding of the radar imaging concept is helpful to understand and interpret interferometric radar data for various applications.

The course starts with the real-aperture radar case and a first introduction to the concept of radar interferometry with applications to topographic mapping and mapping of surface displacements. Based on that, the 2-D imaging concept used in synthetic aperture radar imaging is treated.

Then, we expand further on radar and SAR interferometric (InSAR) concepts and processing steps for single interferograms and stacks of interferograms also using persistent scatterer interferometry (PSI) to measure deformation based on time series of interferometric SAR data.

Finally, the 3-D radar imaging case (SAR tomography) is put into context with PSI/InSAR time series as an extension of the more classical interferometric approaches thereby closing the circle around the strongly related concepts of SAR imaging and interferometry.

Lecture notes
Lecture notes/handouts for each topic will be provided online.

102-0617-00L Basics and Principles of Radar Remote Sensing for Environmental Applications

Abstract
The course will provide the basics and principles of Radar Remote Sensing (specifically Synthetic Aperture Radar (SAR)) and its imaging techniques for the use of environmental parameter estimation.
Objective: The course should provide an understanding of SAR techniques and the use of the imaging tools for bio/geophysical parameter estimation. At the end of the course the student has the understanding of:
1. SAR basics and principles,
2. SAR polariometry,
3. SAR interferometry and
4. environmental parameter estimation from multi-parametric SAR data

Content: The course is giving an introduction into SAR techniques, the interpretation of SAR imaging responses and the use of SAR for different environmental applications. The outline of the course is the following:
1. Introduction into SAR basics and principles
2. Introduction into electromagnetic wave theory
3. Introduction into scattering theory and decomposition techniques
4. Introduction into SAR interferometry
5. Introduction into polarimetric SAR interferometry
6. Introduction into bio/geophysical parameter estimation (classification/segmentation, soil moisture estimation, earthquake and volcano monitoring, forest height inversion, wood biomass estimation etc.)

Lecture notes: Handouts for each topic will be provided.

Literature: First readings for the course:
Complete literature listing will be provided during the course.

**Abstract**

**Objective**
After this course, the students should be able to:
- Describe the major observation techniques in space geodesy
- Describe the necessary modeling and analysis approaches to derive geodetic products of highest quality
- Select the appropriate space geodetic data for scientific investigations
- Analyze the space geodetic data for scientific purposes
- Interpret the scientific results

**Content**
Modelling of the station motions and the estimation of station coordinates. Basics of wave propagation in the atmosphere. Signal propagation in the ionosphere and troposphere for the different observation techniques and the determination of atmospheric parameters.

**151-0632-00L Vision Algorithms for Mobile Robotics (University of Zurich)**

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.
UZH Module Code: DINF2039

Mind the enrolment deadlines at UZH:
https://www.uzh.ch/cmsssl/en/studies/application/deadline.s.html

**Abstract**
For a robot to be autonomous, it has to perceive and understand the world around it. This course introduces you to the key computer vision algorithms used in mobile robotics, such as feature extraction, structure from motion, dense reconstruction, tracking, image retrieval, event-based vision, and visual-inertial odometry and Simultaneous Localization And Mapping (SLAM) (the algorithms behind HoloLens, Oculus Quest, and the NASA Mars rovers).

**Objective**
Learn the fundamental computer vision algorithms used in mobile robotics, in particular: filtering, feature extraction, structure from motion, multiple view geometry, dense reconstruction, tracking, image retrieval, event-based vision, and visual-inertial odometry and Simultaneous Localization And Mapping (SLAM) (the algorithms behind HoloLens, Facebook-Oculus Quest, and the NASA Mars rovers).

**Content**
Each lecture will be followed by a lab session where you will learn to implement a building block of a visual odometry algorithm in Matlab. By the end of the course, you will integrate all these building blocks into a working visual odometry algorithm.

UZH Module Code: AST245

Mind the enrolment deadlines at UZH:  
https://www.uzh.ch/cmsssl/en/studies/application/deadline.s.html

**Objective**  
Acquire knowledge of main methodologies for computer-based models of astrophysical systems, the physical equations behind them, and
train such knowledge with simple examples of computer programmes

**Content**  
1. Integration of ODE, Hamiltonians and Symplectic integration techniques, time adaptivity, time reversibility
2. Large-N gravity calculation, collisionless N-body systems and their simulation
3. Fast Fourier Transform and spectral methods in general  
4. Eulerian Hydrodynamics: Upwinding, Riemann solvers, Limiters  
5. Lagrangian Hydrodynamics: The SPH method
6. Resolution and instabilities in Hydrodynamics
7. Initial Conditions: Cosmological Simulations and Astrophysical Disks
8. Physical Approximations and Methods for Radiative Transfer in Astrophysics

**Literature**  
Galactic Dynamics (Binney & Tremaine, Princeton University Press),
Computer Simulation using Particles (Hockney & Eastwood CRC press),
Targeted journal reviews on computational methods for astrophysics (SPH, AMR, moving mesh)

**Prerequisites / notice**  
Some knowledge of UNIX, scripting languages (see www.physik.uzh.ch/lectures/informatik/python/ as an example), some prior experience programming, knowledge of C ++ beneficial

**651-2338-00L**  
**Remote Sensing and Geographic Information Science III (University of Zürich)**  
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.  
UZH Module Code: GEO233

Mind the enrolment deadlines at UZH:  
https://www.uzh.ch/cmsssl/en/studies/application/deadline.s.html
Abstract
The course "Grundlagen der Fernerkundung" (Principles of Remote Sensing) introduces the underlying principles of remote sensing and a range of fundamental concepts for understanding, handling and manipulating remote sensing data and images. It provides first details on optical image geometries as well as classification and time series analysis.

Objective
The learning goals of this module comprise the following aspects:
- Understanding and being able to explain fundamental concepts of remote sensing
- Knowing basic image interpretation techniques and being able to interpret a variety of optical images
- Being able to choose and apply appropriate data analysis methods to solve a given remote sensing task
- Being able to interpret data, critically discuss the results and draw reasonable conclusions

651-4257-00L Specialisation in Remote Sensing: SAR and LiDAR (University of Zurich)
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.
UZH Module Code: GEO443
Prerequisite: Remote Sensing Methods (UZH Module Code: GEO0371)
Mind the enrolment deadlines at UZH:
https://www.uzh.ch/cmsssl/en/studies/application/deadline

Abstract
This module introduces advanced remote sensing methods and techniques to interpret and analyse SAR and LiDAR data. The variety of topics covered in this module begin with image focussing, move through geometric and radiometric data processing, as well as interferometric and polarimetric evaluations.

Objective
The aim of the module is to give students a thorough understanding of SAR and LiDAR data. Students will be able to carry out typical workflows in data processing and product generation. They will also be able to assess the quality of data products and understand the nature of errors that can affect the datasets. Students will acquire both theoretical and practical knowledge and understanding of aerial and satellite SAR imagery and LiDAR point cloud data. They will be able to derive solutions to problems presented and will have an understanding of applications including associated limitations.

Content
The module provides students with the skills to use state of the art software tools (e.g. SNAP, Matlab) to process data sets and develop new tools within existing frameworks. Examples of SAR applications treated include glacier and volcano monitoring, as well as height estimation using interferometry. Laser scanning exercises are focused on understanding LiDAR intensity, terrain model creation and their respective uncertainties and terrestrial laser scanning methods and applications. The module is composed of the lecture GEO 443.1, which teaches the underlying principles, and the exercise GEO443.2, which conveys important methods and skills of data processing and analysis.

651-4263-00L Remote Sensing and Geographic Information Science V (University of Zurich)
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.
UZH Module Code: GEO371
Prerequisite: Remote Sensing Methods (UZH Module Code: GEO0371)
Mind the enrolment deadlines at UZH:
https://www.uzh.ch/cmsssl/en/studies/application/deadline

Abstract
The course "Methoden der Fernerkundung" (Remote Sensing Methods) introduces advanced remote sensing methods and techniques for interpreting and analysing optical, RADAR and LiDAR data. The large variety of topics covered in this module range from radiative transfer to optical, RADAR and LiDAR imagery. Students will be able to derive solutions to given problems and will have an understanding of applications including associated limitations.

Objective
At the end of the module, students should:
- Have a thorough understanding of advanced image understanding techniques and interpret SAR and LiDAR data.
- Be able to choose the appropriate methods and use them to solve a given real-world task.
- Be able to write basic programming scripts and use common remote sensing software to analyze geospatial data.
- Be able to work scientifically on a given project (e.g. defining hypothesis and research questions).
- Be able to comprehensively interpret data, critically discuss the results and draw the main conclusions.

Content
Students will be able to carry out typical workflows in data processing and product generation. They will also be able to assess the quality of data products and understand the nature of errors that can affect the datasets. Students will acquire both theoretical and practical knowledge and understanding of aerial and satellite SAR imagery and LiDAR point cloud data. They will be able to derive solutions to problems presented and will have an understanding of applications including associated limitations.

651-4269-00L Specialisation in Remote Sensing: Spectroscopy of the Earth System (University of Zurich)
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.
UZH Module Code: GEO442
Prerequisite: Remote Sensing Methods (UZH Module Code: GEO0371)
Mind the enrolment deadlines at UZH:
https://www.uzh.ch/cmsssl/en/studies/application/deadline

Abstract
The Spectroscopy of the Earth System course series outlines key contributions of imaging spectroscopy to advance understanding of the Earth System. Various Earth spheres (i.e. Atmosphere, Biosphere, Cryosphere, Hydrosphere, and Pedosphere) are addressed and spectroscopic approaches to quantify biogeochemical ecosystem properties and Earth surface processes are discussed.

Objective
The aim of the module is to give students a thorough understanding of the concepts, principles and processing of imaging spectroscopy data applied to various spheres of the Earth system. Students will be able to carry out typical workflows in data acquisition, processing and product generation. They will be able to assess the quality of the product and understand the nature of the errors affecting the product. Students will acquire both theoretical and practical knowledge and understanding of ground-based, aerial and satellite spectrometry data. They will be able to derive solutions to given problems and will have an understanding of diverse Earth sphere applications and associated limitations of learned techniques.

Content
The individual lectures inherently focus on fundamentals of radiation interaction with the atmosphere and the surface, as well as on aspects of data acquisition, quality assessment and pre-processing. A comprehensive set of methods to extract information and from imaging spectroscopy data is described (e.g. spectral feature analysis, spectral unmixing, radiative transfer modeling, reflectance and fluorescence retrieval, calculation of spectral albedo). The module is composed of the lecture GEO 442.1, outlining the underlying principles, and the exercise GEO442.2, conveying important methods and skills of data processing and analysis.

651-7102-00L Introduction to Astrobiology (University of Zurich)
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 2318 of 2684
Mind the enrolment deadlines at UZH:
https://www.uzh.ch/cmsssl/en/studies/application/deadline s.html

Abstract
An overview of astrobiology - the study of the origin, evolution of life on Earth, the possibility of life on other worlds and how we can discover its presence. We address some old and fascinating questions: where we came from, where we are going, are we alone in the universe and what life could be like out there amongst the stars.

Content
1. What is life? Characteristics from replication to thermodynamics
2. How life works I: Biochemistry of life, from the cell to the ribosomes and genetic code
3. How life works II: Extremes of life on Earth, from archaea to tardigrades
4. Evidence for first life, conditions on the early Earth
5. Abiogenesis I: The last common ancestor and the origin of organic molecules
6. Abiogenesis II: How to form a replicating evolving living thing
7. Habitability I: Lessons from Earth, our evolving Sun, climate history, feedback loops
8. Habitability II: Carbon cycle, history of oxygen, role of our Moon
9. Life in our solar system - the grand tour, Mercury to Mars
10. Life in our solar system - the Moons of Jupiter and Saturn
11. Planet formation - origin of the Earth
12. Exoplanets, discovery, characterisation and properties
13. The search for life out there
14. Galactic habitability and alien anatomy

Objective
1. Integration of ODE, Hamiltonians and Symplectic integration techniques, time adaptivity, time reversibility.
2. Large-N gravity calculation, collisionless N-body systems and their simulation.
4. Eulerian Hydrodynamics: Upwinding, Riemann solvers, Limiters
5. Lagrangian Hydrodynamics: The SPH method
6. Resolution and instabilities in Hydrodynamics
7. Initial Conditions: Cosmological Simulations and Astrophysical Disks
8. Physical Approximations and Methods for Radiative Transfer in Astrophysics

651-7104-00L  Spatial Ecology and Remote Sensing (University of Zurich)
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.
UZH Module Code: UWW250

Abstract
This lecture focus on quantitative methods and data to study spatial ecological processes. Computing work includes an introduction to ArcGIS, remote sensing data handling, and spatial analyses. Students can bring their own data for the self-run project in the second part or use provided data.

Content
This course is an introduction to scientific concepts and methods in spatial ecology. Spatial ecological patterns and processes are discussed and methods to assess and analyze spatial relations are introduced. The course has a focus on satellite-derived environmental and ecosystems data and their spatial analysis with respect to vegetation distribution and activity, and animal movement.

The course includes lectures, hands-on computer labs, and a literature study relating to the theory. The lectures introduce the spatial component of ecological questions and methods to assess spatial relations and relationships with processes. During computer labs, the students will run exercises to introduce them to ArcGIS and get first skills in handling spatial data (including remote sensing data) and analyses.

Towards the end of the course, students do their own project based on provided or potentially own scientific data sets. The aim of the course is to develop knowledge and spatial analytical and mapping skills that can be applied in the master or PhD thesis to solve ecological questions and present results meaningfully.

651-7105-00L  Computational Thinking I (University of Zurich)
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.
UZH Module Code: ESC413

Abstract
The course will be organized around a series of "computational challenges" which will require an understanding of a broad range of computational topics in order to successfully tackle them.

Objective
To improve the knowledge base of all MSc and PhD students in Computational Science. This knowledge will also prepare the PhD students for questions during their eventual closed session exam, but in general will improve the performance of all students faced with computational questions during talks/conferences.

Content
1. Integration of ODE, Hamiltonians and Symplectic integration techniques, time adaptivity, time reversibility.
2. Large-N gravity calculation, collisionless N-body systems and their simulation.
4. Eulerian Hydrodynamics: Upwinding, Riemann solvers, Limiters
5. Lagrangian Hydrodynamics: The SPH method
6. Resolution and instabilities in Hydrodynamics
7. Initial Conditions: Cosmological Simulations and Astrophysical Disks
8. Physical Approximations and Methods for Radiative Transfer in Astrophysics

651-7106-00L  Computational Astrophysics (LAB & LECTURE)
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.
UZH Module Code: AST246

Abstract
1. Integration of ODE, Hamiltonians and Symplectic integration techniques, time adaptivity, time reversibility.
2. Large-N gravity calculation, collisionless N-body systems and their simulation.
4. Eulerian Hydrodynamics: Upwinding, Riemann solvers, Limiters
5. Lagrangian Hydrodynamics: The SPH method
6. Resolution and instabilities in Hydrodynamics
7. Initial Conditions: Cosmological Simulations and Astrophysical Disks
The purpose of this course is to provide fundamental background on the role of land surface processes (vegetation, soil moisture) and retrieval methods. A series of diverse remote sensing applications will be presented, including measurements/retreivals of various atmospheric composition parameters (ozone, aerosols, clouds, others) from surface based and satellite based instruments.

Objective
Main objectives of the course and what the students will be able to explain and use at the end of it are:
- The major atmospheric laws used for the retrieval of atmospheric composition and solar radiation parameters
- Ground based and satellite based retrieval examples for major atmospheric constituents
- Practical and experimental aspects on measuring atmospheric aerosols through the use of relevant instrumentation
- Explore major atmospheric measurement databases and use of the available data
- Interpretation of measurement and retrieval related results on atmospheric composition and solar radiation based on using combined retrieval data products

Content
Atmospheric passive and active remote sensing is connected with a large number of applications including: atmospheric composition, Earth-atmosphere radiative balance, atmospheric and weather prediction model assimilation, agriculture, energy and health related applications and many others.

The proposed lesson is divided in three sections including exercises:
- Fundamentals of remote sensing
- Sensors (surface based and satellites) and retrieval methods
- Applications

The first aim of the lecture is to provide an in-depth understand of the physical aspects and basic laws on the fundamentals of remote sensing to the students. The lectures will provide a basic to intermediate understanding of radiative transfer of electromagnetic radiation through the atmosphere, covering the spectrum from UV to thermal. Examples of atmospheric components that will be addressed are: ozone, aerosols, greenhouse gases, clouds, water vapor.

In addition, measuring sensors used from the surface or from satellites and the relevant retrieval methods based on passive and active remote sensing of atmospheric composition will be presented (e.g. Spectroradiometers, filter radiometers, Lidars and others).

Finally, we aim to demonstrate a series of diverse remote sensing applications, including atmospheric composition measurements and retrievals from surface- and satellite-based instruments, including calibration and validation aspects.

The exercises will be embedded in the overall course lectures to provide hands-on experience with the measurements and retrieval methods conducting measurements and organizing small field experiments. Also with the use of atmospheric datasets available from specific instruments (e.g. satellite sensors) and networks (e.g. AERONET, GAW/PFR).

-3 exercises include:
- 3 introductory courses on climate variables, sensors, solar measurements and radiative transfer basics
- 7 courses including remote sensing techniques on solar UV measurements, total column ozone, trace gases, greenhouse gases, aerosols, cloud retrievals and lidar active remote sensing.
-1 exercise:
  a. Conducting sun photometric measurements in the field and retrieve aerosol optical depth, including a visit in Davos, World Calibration Center
  b. Exploring ground and satellite based solar UV, Ozone and aerosol measurements
  c. Using radiative transfer modeling tools

Finally, students are involved on presenting scientific literature on subjects they are interested in.

All exercises are conducted in student-forming teams

Lecture notes
Lecture slides will be provided via Moodle before every lecture.

Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management

Social Competencies
- Communication
- Cooperation and Teamwork
- Customer Orientation
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation

Personal Competencies
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

Prerequisites / notice
Lecture slides will be provided via Moodle before every lecture.

Prerequisites: Introductory lectures in atmospheric and climate science

Objective
Overview the state of the art planet- and moon formation models and identify open questions in the field. Understanding the formation process of planetary systems, and the formation of habitable worlds.

Content
1) Planet types
2) The Solar System planets
3) Extrasolar Planets
4) The protoplanetary disk where planets are forming. The initial conditions for planet formation.
5) The formation of the building blocks of planets (so-called “planetesimals”)
6) Terrestrial Planet formation
7) Formation models of giant planets
8) Formation of moons
9) Evolution of planetary systems, orbital evolution of planets, resonances, planet-disk interactions
10) Origin of life, habitability, astrobiology

Literature
Astrophysics of Planet Formation
Armitage, Philip J.; Second edition – 2020

Elective Courses Earth Observation
These subjects can only be credited as electives.

Elective courses in Earth Observation from the deep track courses

Planetary Science
Deep Track Planetary Science
These courses can be credited either as a specialization subject or as an elective subject.

Number | Title | Type | ECTS | Hours | Lecturers |
--- | --- | --- | --- | --- | --- |
103-0187-01L | Space Geodesy | W+ | 6 credits | 4G | B. Soja |

Abstract

Objective
After this course, the students should be able to

- Describe the major observation techniques in space geodesy
- Describe the necessary modeling and analysis approaches to derive geodetic products of highest quality
- Select the appropriate space geodetic data for scientific investigations
- Analyze the space geodetic data for scientific purposes
- Interpret the scientific results

Content
Overview of GNSS, Very Long Baseline Interferometry (VLBI), Satellite and Lunar Laser Ranging (SLR/LLR), Satellite Radar Altimetry with the basic principles, the instruments and observation equations.

Modelling of the station motions and the estimation of station coordinates. Basics of wave propagation in the atmosphere. Signal propagation in the ionosphere and troposphere for the different observation techniques and the determination of atmospheric parameters.

Equation of motion of the unperturbed and perturbed satellite orbit. Osculating and mean orbital elements. General and special perturbation theory and the determination of satellite orbits.

Lecture notes

Cosmic Dust in the Solar System: From Science Case to Mission Design

**Abstract**
This course provides students with a basic understanding of the science of cosmic dust in the solar system and how to measure it with space-based satellites and instrumentation. The lectures include the physical processes of both interplanetary and interstellar dust, trajectory simulations (i.e. orbital dynamics), in situ measurement techniques, and mission design aspects.

**Objective**
Cosmic dust is an important building block for planets and towards life. This course provides students with a basic understanding of the science of cosmic dust in the solar system, and how to measure it with space-based satellites and instrumentation. The lectures include the physical processes of both interplanetary and interstellar dust, trajectory simulations (i.e. orbital dynamics), in situ measurement techniques, and mission design aspects.

At the end of the course, students are able to classify the different types of dust in the solar system, and to relate them to their sources, sinks, their importance for planetary science and astronomy, physical processes, and appropriate measurement techniques. They will be able to simulate dust trajectories and use them to gain insight in how orbital dynamics and the space environment shape them. Students can design a basic concept of a space mission for dust measurements. The skills taught in this course will be useful to students in a broader way for planetary sciences.

**Content**
1. Introduction, course outline, historical notes, interstellar and interplanetary dust, dust in the solar system, sources, sinks, importance for science
2. Dust instrumentation and observables: ground-based, space-based and sample return techniques, calibration of dust instruments in the lab
3. Dust dynamics; recap basic aspects of orbital dynamics, the SPICE toolkit, types of orbits
4. Dust dynamics; space environment, dust processes and implications (e.g. in the early solar system), dust charging, consequences for dynamics, comparison with spacecraft dynamics
5. Dust models and dust data analysis: types of models and their limitations, data analysis
6. Mission design aspects: orbits, mission design limitations, advantages, disadvantages, instrument accommodation, example missions

**Literature**
- Interplanetary dust (freely available online)
  https://link.springer.com/book/10.1007/978-3-642-56428-4
- Cosmic dust from the laboratory to the stars (ETH Library)

**Prerequisites / notice**
The exercise solutions are performed in the Julia programming language.
Earthquakes I: Seismotectonics

**Abstract**

If you're interested in knowing more about the relationship between seismicity and plate tectonics, this is the course for you. (If you're not that interested, but your program of study requires that you complete this course, this is also the course for you.)

**Objective**

The aim of the course is to obtain a basic understanding of the physical process behind earthquakes and their basic mathematical description. By the conclusion of this course, we hope that you will be able to:

- describe the relationship between earthquakes and plate tectonics in a more sophisticated and complete way;
- explain earthquake source representations of varying complexity;
- address earthquakes in the context of different tectonic settings;
- explain the statistical behaviour of global earthquakes;
- describe and connect the ingredients for a seismotectonic study.

**Notes**

- Notes handed out during lectures
- Extensive literature list distributed in course

**Lecture notes**

- Notes handed out during lectures

**Prerequisites / notice**

- 2 contact hours per lecture / week including lectures, exercises and practical study of samples, and small literature-based student presentations. Supplementary contact for sample practicals and exercises as required. Credits and mark based on participation in course (exercises, 50%) and 1h30 written exam in the last lecture of the semester (50%).

**402-0368-11L Earth - A (Unique?) Habitable Planet**

*Does not take place this semester.*

**Abstract**

While thousands of extrasolar planets are known to orbit stars other than the Sun, Earth is - until now - the only planet known to be habitable. This lecture takes an interdisciplinary view on Earth as a habitable planet, how it formed, evolved, allowed life to flourish, and how its future might look like. Would we be able to identify another Earth-like planet among the exoplanets?

**Objective**

Attending students will

- understand Earth place in the cosmos
- learn tools to discern the history of Earth and other planets
- explore the origin and co-evolution of Earth and life
- put Earth in context with extrasolar planets

**Content**

This lecture focuses on our home planet - Earth - from an interdisciplinary perspective. As the search for habitable - and potentially even inhabited - extrasolar planets is one of the most dynamic research fields in modern astrophysics, understanding what makes a planet habitable is a topic of increasing importance; and a highly interdisciplinary topic. In broad brushes, this lecture will discuss the building blocks of planetary systems and their formation, how we can learn about the history of Earth and other planets, what major epochs we can identify over the course of Earth’s 4.5 billion year history, when life arose on Earth and what impact it had on Earth’s evolution, how the future Earth might look like, and - last but certainly not least - how we can search for an Earth-like planet in our cosmic neighbourhood and what our chances are to be successful.

**Notes**

- Notes handed out during lectures
- Extensive literature list distributed in course

</table>
The course features a series of 14 meetings, in which we review some fundamentals of continuum mechanics and tensor analysis required for a complete understanding of the relation between earthquakes and plate tectonics. Our goal is to help you understand deformation of the small scale (fault) to the scale of plate tectonics. We will tell you about several ways to represent an earthquake source; we'll present these in order of increasing sophistication. You will enjoy (at least) a computer/class exercise and a guest lecture.

Topics covered in the course include:
- review of stress and deformation in the Earth, stress and strain tensors, rheology and failure criteria, fault stresses, friction and effects of fluids
- earthquake focal mechanisms; relationship between stress fields and focal mechanisms;
- seismic moment and moment tensors;
- crustal deformation from seismic, geologic, and geodetic observations;
- earthquake stress drop, scaling, and source parameters;
- global earthquake distribution; current global earthquake activity;
- different seismotectonic regions; examples of earthquake activity in different tectonic settings.

### Course Notes
Course notes will be made available on a designated course web site. Most of the topics discussed in the course are available in the book mentioned below.

This course will be taught in fall 2017 and it will be followed by Earthquakes 2: Source Physics in Spring 2018.

The course will be evaluated in a final written test covering the topics discussed during the lectures. The course will be worth 3 credit points, and a satisfactory total grade (4 or better) is needed to obtain 3 ECTS.

The course will be given in English.

### Prerequisites / Notice
Students registering for the course confirm having read and accepted the terms and conditions for excursions and field courses of D-EAPS: https://ethz.ch/content/dam/ethz/special-interest/erdw/department/dokumente/studium/exkursionen/AGB_ERDW_Exkursionen_dt.pdf

### Literature

### Prerequisites / Notice
Basic knowledge of continuum mechanics and rock mechanics, as well as notion of tensor analysis is strongly suggested. We recommend to have taken the course Continuum Mechanics (generally taught during the Fall semester).

Details on the program will be handed out during the first lecture.

---

**651-4041-00L** Sedimentology I: Physical Processes and Sedimentary Systems

**W+** 3 credits 2G V. Picotti

**Abstract**
Sediments preserved a record of past landscapes. This courses focuses on understanding the processes that modify sedimentary landscapes with time and how we can read these changes in the sedimentary record.

**Objective**
The students learn basic concepts of modern sedimentology and stratigraphy in the context of sequence stratigraphy and sea level change. They discuss the advantages and pitfalls of the method and look beyond. In particular we pay attention to introducing the importance of considering entire sediment routing systems and understanding their functioning.

**Content**
Details on the program will be handed out during the first lecture.

**Literature**
The sedimentary record of sea-level change

Students registering for the course confirm having read and accepted the terms and conditions for excursions and field courses of D-EAPS: https://ethz.ch/content/dam/ethz/special-interest/erdw/department/dokumente/studium/exkursionen/AGB_ERDW_Exkursionen_en.pdf

**Objective**
We will study traces in the lithosphere that have been left behind by organisms during the course of Earth history and mineral components, which were built through biological processes or used as sources of energy and nutrients by organisms. Traces of life from the past will be compared with the development of the diversity of today’s organisms.

**Content**
Details on the program will be handed out during the first lecture.

**Literature**

Numerical Modelling I and II: Theory and Applications

W+  3 credits  2V  P. A. Sossi, S. Flemetakis, E. Schettino, M. A. Thompson

Abstract
In this Masters-level course, we address the formation and evolution of the rocky planets with a particular focus on the chemical and isotopic make-up of the Earth and its mantle. This is achieved through analysis of its partial melting products in different tectonic settings and through time.

Objective
The goal of this course is for students to learn how to program numerical applications from scratch. By the end of the course, students should be able to write state-of-the-art MATLAB codes that solve systems of partial-differential equations relevant to Earth and Planetary Science applications. The commonality, i.e., using a similar approach to solve different applications, and modularity, i.e., re-use of code in different programs. The course will emphasise a hands-on learning approach rather than extensive theory.

Content
A provisional week-by-week schedule (subject to change) is as follows:

Week 1: Introduction to the finite difference approximation to differential equations. Introduction to programming in Matlab. Solving of 1D Poisson equation.

Week 3: Solving momentum and continuity equations in case of constant viscosity with stream function/vorticity formulation.

Weeks 5: Conservative finite differences for the momentum equation. "Free slip" and "no slip" boundary conditions. Solving momentum and continuity equations in case of variable viscosity using pressure-velocity formulation with staggered grid.

Week 7: Advection in 2-D with Marker-in-cell method. Combining flow calculation and advection for buoyancy driven flow.

Week 9: Solving 2D heat conservation equation in case of constant thermal conductivity with explicit and implicit approaches.

Week 10: Solving 2D heat conservation equation in case of variable thermal conductivity with implicit approach. Temperature advection with markers. Creating thermomechanical code by combining mechanical solution for 2D buoyancy driven flow with heat diffusion and advection based on marker-in-cell approach.

Week 11: Implementation of radioactive, adiabatic and shear heating to the thermomechanical code.

Week 12: Programming of solution of coupled solid-fluid momentum and continuity equations for the case of melt percolation in a rising mantle plume.

Week 14: Final project description for slab breakoff modeling.

GRADING will be based on weekly programming homeworks (50%) and a term project (50%) to develop an application of their choice to a more advanced level.
Objective
The goal of this course is to provide students with quantitative understanding of planetary science. The emphasis in this course will be on theoretical development of the fundamentals needed for understanding planetary materials, planetary formation and evolution, and planetary interiors.

Content
The course will loosely be divided into ~14 lectures on various topics to be held by the main lecturer. In addition to the lectures, the students will solve a number ‘take-home’ problems and will hand in reports.

Topics that will be covered in the course include:
1. Elasticity
2. Equations of state
3. Thermodynamics applied to mantle materials
4. Harmonicity and anharmonicity
5. Tidal potential, gravity and figure of a planet
6. Planetary rotation, precession and nutation
7. Orbital evolution and tidal dissipation
8. Heat
9. Free oscillations of a planet

Prerequisites
Completion of "651-4130-00 Mathematical Methods" is required.

Comprehensives
Completion of "651-4013-00L Potential Field Theory" is required.

Completion of "651-4096-00L Inverse Theory for Geophysics I: Basics" would be helpful.

651-3521-00L
Tectonics

Abstract
Comprehensive understanding of evolution, mechanics, and rheology of divergent, convergent and wrenching tectonic systems from the lithospheric scale to local shallow crustal and outcrop-scales. Evaluation of plate tectonic and other orogenic processes through the study of reference examples of taken in Alps-Himalaya orogenic system.

Objective
Comprehensive understanding of evolution, mechanics, and rheology of divergent, convergent and wrenching tectonic systems from the lithospheric scale to local shallow crustal and outcrop-scales.
Assessment of mechanisms responsible for plate movements (the Earth as a heat transfer machine, dynamics of earth mantle, plate driving forces) and subsequent large-scale structures (oceanic basins and cycle of the oceanic lithosphere, convergence and mountain systems and continental growth, etc) through theoretical and experimental information.
Evaluation of plate tectonic and other orogenic processes through the study of reference examples of taken in Alps-Himalaya orogenic system.

Content
Plate tectonic frame work: earth cooling and mantle-plate interaction, three kinds of plate boundaries and their roles and characteristics, cycle of oceanic lithosphere, longlife and growth of continents, supercontinents.
Rheology of layered lithosphere and upper mantle.
Obduction systems
Collisions systems
Baseline systems
Exstensional systems
Basin evolution
Passive and active continental margin evolution

Rock Mechanics and Rock Engineering

Abstract
This course focusses on the principles (fundamentals) and basic concepts of rock mechanics and rock engineering (e.g. tunnelling, rock slope stability).

Objective
The course aims to introduce the fundamentals and basic concepts of rock mechanics and generic rock engineering. The student shall understand how rocks behave at different scales, under various artificial loads and in the shallow subsurface (a few km below ground). The link between rock mechanics, geology, hydrogeology and tectonics (i.e. the conditions under which the rock formed) will be clearly established.
The student shall understand basic principles of rock mechanics and rock engineering. In addition, the student shall learn how to apply the results from lab and field investigations to simple engineering problems. This knowledge is required for subsequent integration courses (Landslide Analysis and Hazard Mitigation; Engineering Geology of Underground Excavations).

Content
This course focusses on the principles (fundamentals) and basic concepts of rock mechanics and generic rock engineering. The course is compulsory for the MSc Eng Geol. The applications of rock mechanical principles and rock engineering methods are extensively covered in subsequent courses.

Lecture notes
Written course documentation available on our homepage: https://www.ethz.ch/content/specialinterest/erdw/geological-institute/engineering-geology/en/teaching/msc/fall/rock_mechanics.html

651-3440-02L
Geophysics III

Abstract
This course builds on Geophysik I and Geophysik II, broadening the students' education in seismology, geodynamics and geodynamo theory, by considering various specific topics of particular interest.

Objective
To teach students the basics of observational seismology, earthquake source seismology, seismotectonics and the principle of seismic tomography, mantle convection over Earth history, structure of the oceanic and continental lithosphere, plate tectonics, hotspots, global heat flux, dynamo operation and magnetic field generation in Earth, planets, the Sun and stars and electromagnetism to probe the mantle.

Data: 06.08.2024 12:40 Autumn Semester 2024 Page 2326 of 2684
Content
Observational seismology, earthquake source seismology, seismotectonics and the principle of seismic tomography. Mantle convection over Earth history, structure of the oceanic and continental lithosphere, plate tectonics, hotspots, global heat flux. Dynamo operation and magnetic field generation in Earth, planets, the Sun and stars; electromagnetism to probe the mantle.

**701-0475-00L Atmospheric Physics**

| W+ | 3 credits | 2G | U. Lohmann |

**Abstract**
This course covers the basics of atmospheric physics, which consist of: cloud and precipitation formation, especially prediction of showers and severe convective storms, and optical phenomena

**Objective**
Students are able
- to explain the mechanisms of convective storm formation using knowledge of thermodynamics and cloud microphysics.
- to interpret precipitation radar images
- to evaluate the significance of clouds and aerosol particles for artificial weather modification.

In the course “Atmospheric Physics”, the competencies of process understanding, system understanding and data analysis & interpretation are taught, applied and examined. Measurement methods are taught as well.

**Content**
The course starts with introducing selected concepts of thermodynamics for atmospheric processes: The students learn the concept of the thermodynamic equilibrium and derive the Clausius-Clayperon equation from the first law of thermodynamics. This equation is central for the phase transitions in clouds.

Students also learn to use thermodynamic charts (tephigrams) and to identify cloud base, cloud top, available convective energy in radiosonde ascents. Atmospheric mixing processes are introduced as a basis for fog formation. The concept of an air parcel is used to understand convection.

Aerosol particles are introduced in terms of their physical properties and their role in cloud formation based on Köhler theory. Thereafter cloud microphysical processes including ice nucleation are discussed.

With these basics, the different forms of precipitation (convective vs. stratiform) are discussed and how they can be identified in radar images. Students will also learn under which conditions severe convective storms (especially supercells with tornados) can form.

The concepts are applied to understand and judge the validity of different proposed artificial weather modification ideas.

**Lecture notes**
Powerpoint slides and chapters from the textbook will be made available on moodle: https://moodle-app2.let.ethz.ch/course/view.php?id=22731

**Literature**

An electronic version of this book can be obtained via the ETH library.

pdf-files of the revised book will be provided on moodle on a chapter-by-chapter basis.

**Prerequisites / notice**
We offer a lab tour, in which we demonstrate how some of the processes discussed in the lectures are measured with instruments. There is a additional tutorial right after each lecture to give you the chance to ask further questions and discuss the exercises. The participation is recommended but voluntary.

**701-1241-00L Atmospheric Remote Sensing**

| W+ | 3 credits | 2G | J. Gröbner, S. Kazantzis |

**Abstract**
The course will provide advanced physical understanding on the fundamentals of passive and active remote sensing, measuring sensors and retrieval methods. A series of diverse remote sensing applications will be presented, including measurements/retrievals of various atmospheric composition parameters (ozone, aerosols, clouds, others) from surface based and satellite based instruments.

**Objective**
Main objectives of the course and what the students will be able to explain and use at the end of it are:
- The major atmospheric laws used for the retrieval of atmospheric composition and solar radiation parameters
- Ground based and satellite based retrieval examples for major atmospheric constituents
- Practical and experimental aspects on measuring atmospheric aerosols through the use of relevant instrumentation
- Explore major atmospheric measurement databases and use of the available data
- Interpretation of measurement and retrieval related results on atmospheric composition and solar radiation based on using combined retrieval data products
Atmospheric passive and active remote sensing is connected with a large number of applications including: atmospheric composition, Earth-atmosphere radiative balance, atmospheric and weather prediction model assimilation, agriculture, energy and health related applications and many others.

The proposed lesson is divided in three sections including exercises:
• Fundamentals of remote sensing
• Sensors (surface based and satellites) and retrieval methods
• Applications

The first aim of the lecture is to provide an in-depth understand of the physical aspects and basic laws on the fundamentals of remote sensing to the students. The lectures will provide a basic to intermediate understanding of radiative transfer of electromagnetic radiation through the atmosphere, covering the spectrum from UV to thermal. Examples of atmospheric components that will be addressed are: ozone, aerosols, greenhouse gases, clouds, water vapor.

In addition, measuring sensors used from the surface or from satellites and the relevant retrieval methods based on passive and active remote sensing of atmospheric composition will be presented (e.g. Spectroradiometers, filter radiometers, Lidars and others). Finally, we aim to demonstrate a series of diverse remote sensing applications, including atmospheric composition measurements and retrievals from surface- and satellite-based instruments, including calibration and validation aspects.

The exercises will be embedded in the overall course lectures to provide hands-on experience with the measurements and retrieval methods conducting measurements and organizing small field experiments. Also with the use of atmospheric datasets available from specific instruments (e.g. satellite sensors) and networks (e.g. AERONET, GAWPFRR).

More specific the course include:
- 3 introductory courses on climate variables, sensors, solar measurements and radiative transfer basics
- 7 courses including remote sensing techniques on solar UV measurements, total column ozone, trace gases, greenhouse gases, aerosols, cloud retrievals and lidar active remote sensing.
- 3 exercises:
  a. Conducting sun photometric measurements in the field and retrieve aerosol optical depth, including a visit in Davos, World Calibration Center
  b. Exploring ground and satellite based solar UV, Ozone and aerosol measurements
  c. Using radiative transfer modeling tools

Finally, students are involved on presenting scientific literature on subjects they are interested in. All exercises are conducted in student-forming teams.

Lecture notes
Lecture slides will be provided via Moodle before every lecture.

Statistical Learning for Atmospheric and Climate Science W+ 3 credits 2G L. Gudmundsson, D. Nerini

Abstract
This course offers a systematic introduction to statistical and machine learning methods with focus on applications in atmospheric and climate science. Focus is on the theoretical and mathematical basis of supervised statistical learning (advanced regression, nonparametric methods) and their application in practice with hands-on exercises.

Objective
Students:
- Understand the theoretical basis of machine learning
- Are familiar with overarching concepts such as bias-variance trade-off, cost-functions, hyper parameters, cross-validation
- Have good command of the theoretical basis of selected machine learning tools
- Are able to select the appropriate statistical learning tools to tackle atmospheric and climate research problems
- Can apply methods of statistical learning in atmospheric and climate research
- Data in atmospheric and climate research (data types, observations, models)
- Exploring properties of atmospheric and climate data (data in space and time, multivariate data)
- Concepts of supervised learning (bias variance trade-off, overfitting, cross-validation)
- Advanced linear regression (multiple linear regression, regularization)
- Non-linear regression (local linear regression, regression trees, gradient boosting, random forests, neural networks)
- Bootstrapping
- Keynote speakers showcasing recent topics in statistical learning and high-level applications for atmospheric and climate research
Elective Planetary Science

These subjects can only be credited as electives.

Elective courses in Planetary Sciences from the deep track courses

Robotic Deep Track Robotics

These courses can be credited either as a specialization subject or as an elective subject.

Note: The previous course title until HS20 "Autonomous Mobility on Demand: From Car to Fleet".

Abstract

This course is a hands-on introduction to self-driving cars using the Duckietown platform.

Each student is given a mobile wheeled robot and throughout the class must configure and program.

The objective of the class is to give the student a pragmatic view of what it takes to design and operate a fleet of self-driving cars or any other large robotic systems.

This course includes the basics of modeling, perception, planning, control, and learning for self-driving cars. The focus is on the integration and co-design of components and behaviors rather than algorithmic depth.

Perception, planning, modeling, and control, leveraging primarily on vision data.

Lecture notes

Lecture notes, primarily in the form of slides and tutorials, will be accessible from Moodle. Additional materials can also be accessed from the EdX MOOC called "Self-driving cars with Duckietown".

Course notes will be provided in an electronic form.

These are some books that can be used to provide background information or consulted as references:
(1) Siegwart, Nourbaksh, Scaramuzza - Introduction to autonomous mobile robots;
(2) Norvig, Russell - Artificial Intelligence, a modern approach;
(3) Peter Corke - Robotics Vision and Control
(4) Oussama Khatib, Bruno Siciliano - Handbook of Robotics

Students should have taken a basic course in probability theory, computer vision, and control systems, and should be familiar and comfortable with programming (Python), Linux, and GIT utilization.

Students should have taken a basic course in probability theory, computer vision, and control systems, and should be familiar and comfortable with programming (Python), Linux, and GIT utilization.

In introduction to ROS will be given, but it's strongly advised that students have prior exposure to and experience with ROS to effectively navigate through the homework assignments and the final project.

A shared space will be available to work with the robots.

It's advised students will have ~5 square meters of free space at their place to work with their assigned robot.

Planning and Decision Making for Autonomous Robots

Abstract
Planning safe and efficient motions for robots in complex environments, often shared with humans and other robots, is a difficult problem combining discrete and continuous mathematics, as well as probabilistic, game-theoretic, and ethical/regulatory aspects. This course will cover the algorithmic foundations of motion planning, with an eye to real-world implementation issues.

Objective
The students will learn how to design and implement state-of-the-art algorithms for planning the motion of robots executing challenging tasks in complex environments.

Content

Lecture notes
Course notes and other education material will be provided for free in an electronic form.

Literature
There is no required textbook, but an excellent reference is Steve Lavalle's book on "Planning Algorithms."

Prerequisites / notice
Students should have taken basic courses in optimization, control systems, probability theory, and should be familiar with modern programming languages and practices (e.g., Python, and/or C/C++). Previous exposure to robotic systems is a definite advantage.

Competencies
- Subject-specific Competencies

Advanced Model Predictive Control

Abstract
Model predictive control (MPC) has established itself as a powerful control technique for complex systems under state and input constraints. This course discusses the theory and application of recent advanced MPC concepts, focusing on system uncertainties and safety, as well as data-driven formulations and learning-based control.

Objective
Design, implement, and analyze advanced MPC formulations for robust and stochastic uncertainty descriptions, in particular with data-driven formulations.

Content
Topics include
- Nominal MPC for uncertain systems (nominal robustness)
- Robust MPC
- Stochastic MPC
- Review of regression methods
- Set-membership Identification and robust data-driven MPC
- Bayesian regression and stochastic data-driven MPC
- MPC as safety filter for reinforcement learning

Lecture notes
Lecture notes will be provided.

Prerequisites / notice
Basic courses in control, advanced course in optimal control, basic MPC course (e.g. 151-0660-00L Model Predictive Control in Spring Semester) strongly recommended. Background in linear algebra and stochastic systems recommended.

Dynamic Programming and Optimal Control

Abstract
Introduction to Dynamic Programming and Optimal Control.

Objective
Covers the fundamental concepts of Dynamic Programming & Optimal Control.

Content
Dynamic Programming Algorithm; Deterministic Systems and Shortest Path Problems; Infinite Horizon Problems, Bellman Equation; Deterministic Continuous-Time Optimal Control.

Literature

Prerequisites / notice
Requirements: Knowledge of advanced calculus, introductory probability theory, and matrix-vector algebra.

Real-World Robotics - A Hands-On Project Class

Abstract
During this course, the students will develop an articulated robotic hand to solve a real-world robotic challenge: the robot must autonomously grasp and place objects. The students will learn the key theoretical concepts required to model, manufacture, control, and test their robot, alongside developing machine learning, programming, hardware, and engineering skills through the hands-on project.

Objective
Learning Objective 1: High-Level System Design
System and product design combined with requirement generation and verification are essential for this robotics project. The students will apply previously acquired system design knowledge and methods to a hands-on challenge.

Learning Objective 2: Robot Design and Simulation
Students will gain experience implementing and simulating robotic systems using modern design, modeling, and simulation techniques such as CAD and Isaac Gym. These techniques are essential in any design process to understand the expected system behavior. This requires thoroughly understanding the system’s kinematics, dynamics, material, actuation principle, and physical limitations. Students will learn the theory and limitations behind modeling and simulation software.

Learning Objective 3: Robot Fabrication
Students will learn the use of the previously designed CAD models for successful robot fabrication. Additionally, the iterative nature of the process will allow them to develop their critical thinking skills in assessing the limitations of their design as well as possible sources for improvements. Building the robot will equip students with essential skills for using robots in the real world.

Learning Objective 4: Control, Integration, and Testing
Students can directly apply the knowledge acquired in their control courses. They will gain theoretical knowledge on how to model and develop intelligent control algorithms. Perception methods and state-of-the-art machine-learning techniques will be taught. They will gain experience testing their robots’ performance in both hard- and software to enhance their design and suggest future improvements.

Learning Objective 5: Robot production
Students will learn to choose between state-of-the-art industrial production processes to manufacture a soft robot by understanding their limitations and requirements. They will also learn how to optimize the robot design to account for a specific production process.
During this course, the students will be divided into teams and each group will independently develop an articulated robotic arm to solve a real-world robotic challenge, which will take place at the end of the course. The students will learn the key theoretical concepts required to model, manufacture, control and test a soft robot, along with developing the programming, hardware and engineering skills through hands-on workshops.

This course is composed of tutorials, which will be available on the course website where the lecturer will provide all the necessary theoretical input, focus talks where robotic experts will present a particular aspect of the manipulator in detail, and workshops where the students will have the possibility to hands-on learn how to implement the solutions required to solve their challenge. Finally, there will be time slots to autonomously work on the manufacturing and development of the team's robot and an online forum will be available to help the students throughout the entire course.

This course is divided into six parts:

Part 1: Challenge introduction
- Identify the functional requirements necessary for the final challenge
- Evaluate the existing manipulator designs to optimize them for the specific task

Part 2: Robot Design
- Develop a CAD model based on the high-level system design.
- Integrate motors, pneumatics components, and other required materials in the design

Part 3: Robot Fabrication
- Come up with a fabrication method and plan using the presented fabrication skills.
- Fabricate the robot and its actuators based on the CAD model.
- Evaluate, modify, and enhance the fabrication approach.

Part 4: Soft Robot Simulation
- Simulate the soft manipulator through a simulation framework
- Optimize the simulation parameters to reflect the experimental setup

Part 5: Control, Integration, and Testing
- Formulate the dynamic skills needed for real-life application.
- Develop traditional and learning-based control algorithms and test them in simulation.
- Integrate controller design into the fabricated robot.
- Build, test, fail, and repeat until the soft robot works as desired in simple tasks.
- Upgrade and validate the robot for performance in real-world conditions and verify requirements.

Part 6: Product development
- Propose a manufacturing process to bring the robot from a prototype to the final product
- Optimize the robot for production

Lecture notes
All class materials, including slides, video tutorials, and supporting literature, can be found on the class webpage (https://rwr.ethz.ch) and Moodle, supported by discussion and Q&A forums. Focus talks, Q&A sessions, and workshops will happen on Mondays between 14:00 and 16:00.

Literature

Prerequisites / notice
Students are expected to have attended introductory courses in dynamics, control systems, and robotics.

Registration for this course is limited due to the amount of resources needed to make this course happen. For this reason, it is required to apply through the following module: https://forms.gle/pnMHTCdZwgdawb519

The graded semester performance consists of the final team performance in the class challenge, a final team presentation and report, weekly Moodle quizzes, and attendance at the focus talks and workshops.

151-0632-00L Vision Algorithms for Mobile Robotics (University of Zurich)
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.
UZH Module Code: DINF2039

Mind the enrolment deadlines at UZH:

W+ 6 credits 2V+2U D. Scaramuzza

Data: 06.08.2024 12:40 Autumn Semester 2024 Page 2331 of 2684
For a robot to be autonomous, it has to perceive and understand the world around it. This course introduces you to the key computer vision algorithms used in mobile robotics, such as feature extraction, structure from motion, dense reconstruction, tracking, image retrieval, event-based vision, and visual-inertial odometry (the algorithms behind Hololens, Oculus Quest, and the NASA Mars rovers).

Learn the fundamental computer vision algorithms used in mobile robotics, in particular: filtering, feature extraction, structure from motion, multiple view geometry, dense reconstruction, tracking, image retrieval, event-based vision, and visual-inertial odometry and Simultaneous Localization And Mapping (SLAM) (the algorithms behind Hololens, Facebook-Oculus Quest, and the NASA Mars rovers).

Each lecture will be followed by a lab session where you will learn to implement a building block of a visual odometry algorithm in Matlab.

By the end of the course, you will integrate all these building blocks into a working visual odometry algorithm.

Lecture slides will be made available on the course official website: http://rpg.ifi.uzh.ch/teaching.html

Prerequisites / notice

Note: If you are interested in taking UZH courses, you must register as an incoming mobility student at UZH. For details, see as follows:

UZH course enrollment for ETH student at University of Zurich (UZH) > Mobility within Switzerland – Incoming > Module Mobility: The easiest way to take individual modules/courses to supplement your studies at your home university is with module mobility. This option is not available to students who have dropped out of their home university or have been definitely excluded or banned from the relevant a program > Application and Deadlines: Applications are submitted via the UZH application portal (https://www.uzh.ch/cmsssl/en/studies/application/chmobilityin.html)

ATTENTION: When you book the course at UZH, you are automatically registered for the exam at UZH and you can unregister until the October deadline. After registering for the course, you as an ETH student need to check out your “UZH email account” to receive the related information from the lecturer.

151-0851-00L

Robot Dynamics

Abstract

We will provide an overview on how to kinematically and dynamically model typical robotic systems such as robot arms, legged robots, rotary wing systems, or fixed wing.

Objective

The primary objective of this course is that the student develops an applied understanding of how to model the most common robotic systems. The student receives a solid background in kinematics, dynamics, and rotations of multi-body systems. On the basis of state of the art applications, he/she will learn all necessary tools to work in the field of del control or robotic systems.

Content

The course consists of three parts: First, we will refresh and deepen the student’s knowledge in kinematics, dynamics, and rotations of multi-body systems. In this context, the learning material will build upon the courses for mechanics and dynamics available at ETH, with the particular focus on their application to robotic systems. The goal is to foster the conceptual understanding of similarities and differences among the various types of robots. In the second part, we will apply the learned material to classical robotic arms as well as legged systems and discuss kinematic constraints and interaction forces. In the third part, focus is put on modeling fixed wing aircraft, along with related design and control concepts. In this context, we also touch aerodynamics and flight mechanics to an extent typically required in robotics. The last part finally covers different helicopter types, with a focus on quadrotors and the coaxial configuration which we see today in many UAV applications. Case studies on all main topics provide the link to real applications and to the state of the art in robotics.

151-1116-00L

Introduction to Aircraft and Car Aerodynamics

Abstract

Aircraft aerodynamics: atmosphere; aerodynamic forces (lift, drag); thrust.

Objective

An introduction to the basic principles and interrelationships of aircraft and automotive aerodynamics.

Content

To understand the basic relations of the origin of aerodynamic forces (ie lift, drag). To quantify the aerodynamic forces for basic configurations of aircraft and car components.

Using experimental and theoretical methods to illustrate possibilities and limits.

Vehicle Aerodynamics:

ETH Zurich Distinguished Seminar in Robotics, Systems and Controls

Abstract

This course consists of a series of seven lectures given by researchers who have distinguished themselves in the area of Robotics, Systems, and Controls.

Objective

Obtain an overview of various topics in Robotics, Systems, and Controls from leaders in the field. Please see http://www.msti.ethz.ch/education/distinguished-seminar-in-robotics--systems--controls--151-0623-0.html for a list of upcoming lectures.
Content
This course consists of a series of seven lectures given by researchers who have distinguished themselves in the area of Robotics, Systems, and Controls. MSc students in Robotics, Systems, and Controls are required to attend every lecture. Attendance will be monitored. If for some reason a student cannot attend one of the lectures, the student must select another ETH or University of Zurich seminar related to the field and submit a one page description of the seminar topic. Please see http://www.msi.ethz.ch/education/distinguished-seminar-in-robotics--systems--controls--151-0823-0.html for a suggestion of other lectures.

Prerequisites / notice
Students are required to attend all seven lectures to obtain credit. If a student must miss a lecture then attendance at a related special lecture will be accepted that is reported in a one page summary of the attended lecture. No exceptions to this rule are allowed.

227-0124-00L
Embedded Systems

W+ 6 credits

M. Magno

Abstract
An embedded system is a combination of hardware and software, either fixed in function or programmable, that is designed for a specific application scenario or for a specific task within a larger system. They are part of industrial machines such as agricultural and manufacturing equipment, automotive systems, medical equipment, household appliances, sensor networks, and the Internet of Things.

Objective
Understanding the specific requirements and problems that arise in embedded system applications.

Understanding the hardware structure of a microcontroller and an embedded system; memory architecture and memory map, internal and external peripherals, low-power and low-energy design as well as instruction sets and computational accelerators.

Understanding the firmware structure of a microcontroller and an embedded system; low-level instruction set, hardware-software interfaces, communication between components, embedded real-time operating systems, real-time scheduling, shared resources, low-power, and low-energy designs as well as computational accelerators.

Using formal models and methods for designing and optimizing embedded systems.

Gaining experience with practical applications of the C programming language, embedded real-time operating systems, and debug functionalities of the associated design environment to design, implement, and verify embedded firmware.

Through project-based activities, students will gain substantial experience in applying the C programming language in the context of embedded systems. Projects will involve developing and implementing firmware, utilizing embedded real-time operating systems, and exploring the debugging functionalities within design environments. This hands-on approach aims to bridge the gap between theoretical knowledge and practical application, allowing students to experience the full lifecycle of embedded system development from design to implementation and verification.

Content
This lecture focuses on the design of embedded systems using formal models and methods.

Besides the theoretical lecture, the course contains laboratory sessions where students transfer the learned theoretical aspects into praxis by programming a microcontroller and interfacing it with sensors and actuators.

Students will be exposed to a commercial microcontroller, and the development board extend with a custom-designed embedded systems educational platform.

Specifically, the following topics will be covered in the course: hardware and software structures of embedded systems, low-level instruction set, memory architecture and memory map, peripherals, hardware-software interfaces, communication between components, firmware design methodologies, firmware design using the C programming language, embedded real-time operating systems, real-time scheduling, shared resources, low-power, and low-energy designs as well as computational accelerators.

Lecture notes
Lecture material, publications, exercise sheets, and laboratory documentation will be available on the course’s Moodle page.

Image Analysis and Computer Vision

W+ 6 credits

E. Konukoglu, E. Erdil, F. Yu

Abstract

Objective
Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

Content
This course aims at offering a self-contained account of computer vision and its underlying concepts, including the recent use of deep learning.

The first part starts with an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First the interaction of light with matter is considered. The most important hardware components such as cameras and illumination sources are also discussed. The course then turns to image discretization, necessary to process images by computer.

The next part describes necessary pre-processing steps, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and 3D shape as two important examples. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed. A major part at the end is devoted to deep learning and AI-based approaches to image analysis. Its main focus is on object recognition, but also other examples of image processing using deep neural nets are given.

Lecture notes
Course material Script, computer demonstrations, exercises and problem solutions

Prerequisites / notice
Prerequisites: Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Python and Linux.

The course language is English.

227-0560-00L
Computer Vision and Artificial Intelligence for Autonomous Cars

W+ 6 credits

C. Sakaridis

Up until FS2022 offered as Deep Learning for Autonomous Driving

Abstract
This course introduces the core computer vision techniques and algorithms that autonomous cars use to perceive the semantics and geometry of their driving environment, localize themselves in it, and predict its dynamic evolution. Emphasis is placed on techniques tailored for real-world settings, such as multi-modal fusion, domain-adaptive and outlier-aware architectures, and multi-agent methods.
Objective
Students will learn about the fundamentals of autonomous cars and of the computer vision models and methods these cars use to analyze their environment and navigate themselves in it. Students will be presented with state-of-the-art representations and algorithms for semantic, geometric and temporal visual reasoning in automated driving and will gain hands-on experience in developing computer vision algorithms and architectures for solving such tasks.

After completing this course, students will be able to:
1. understand the operating principles of visual sensors in autonomous cars
2. differentiate between the core architectural paradigms and components of modern visual perception models and describe their logic and the role of their parameters
3. systematically categorize the main visual tasks related to automated driving and understand the primary representations and algorithms which are used for solving them
4. critically analyze and evaluate current research in the area of computer vision for autonomous cars
5. practically reproduce state-of-the-art computer vision methods in automated driving
6. independently develop new models for visual perception

Content
The content of the lectures consists in the following topics:

1. Fundamentals
   (a) Fundamentals of autonomous cars and their visual sensors
   (b) Fundamental computer vision architectures and algorithms for autonomous cars

2. Semantic perception
   (a) Semantic segmentation
   (b) Object detection
   (c) Instance segmentation and panoptic segmentation

3. Geometric perception and localization
   (a) Depth estimation
   (b) 3D reconstruction
   (c) Visual localization
   (d) Unimodal visual/lidar 3D object detection

4. Robust perception: multi-modal, multi-domain and multi-agent methods
   (a) Multi-modal 2D and 3D object detection
   (b) Visual grounding and verbo-visual fusion
   (c) Domain-adaptive and outlier-aware semantic perception
   (d) Vehicle-to-vehicle communication for perception

5. Temporal perception
   (a) Multiple object tracking
   (b) Motion prediction

The practical projects involve implementing complex computer vision architectures and algorithms and applying them to real-world, multi-modal driving datasets. In particular, students will develop models and algorithms for:
1. Semantic segmentation and depth estimation
2. Sensor calibration for multi-modal 3D driving datasets
3. 3D object detection using lidars

Lecture notes
Lecture slides are provided in PDF format.

Prerequisites / notice
Students are expected to have a solid basic knowledge of linear algebra, multivariate calculus, and probability theory, and a basic background in computer vision and machine learning. All practical projects will require solid background in programming and will be based on Python and libraries of it such as PyTorch.

Additional papers will be available via the course Moodle.
Objective

Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real-world data.

Content

The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:

- Fundamentals:
  - What is data?
  - Bayesian Learning
  - Computational learning theory

- Supervised learning:
  - Ensembles: Bagging and Boosting
  - Max Margin methods
  - Neural networks

- Unsupervised learning:
  - Dimensionality reduction techniques
  - Clustering
  - Mixture Models
  - Non-parametric density estimation
  - Learning Dynamical Systems

Lecture notes

No lecture notes, but slides will be made available on the course webpage.

Literature

Prerequisites / notice

The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.

Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.
How can we build systems that perform well in uncertain environments? How can we develop systems that exhibit "intelligent" behavior, without prescribing explicit rules? How can we build systems that learn from experience in order to improve their performance? We will study core modeling techniques and algorithms from statistics, optimization, planning, and control and study applications in areas such as robotics. The course is designed for graduate students.

### Prerequisites / notice

- Solid basic knowledge in statistics, algorithms and programming.
- The material covered in the course "Introduction to Machine Learning" is considered as a prerequisite.

### Competencies

#### Subject-specific Competencies
- Concepts and Theories assessed
- Techniques and Technologies assessed

#### Method-specific Competencies
- Analytical Competencies assessed
- Decision-making assessed
- Media and Digital Technologies assessed
- Problem-solving assessed
- Project Management assessed

#### Social Competencies
- Communication fostered
- Cooperation and Teamwork fostered

#### Personal Competencies
- Creative Thinking assessed
- Critical Thinking assessed
- Integrity and Work Ethics fostered

<table>
<thead>
<tr>
<th>W+</th>
<th>8 credits</th>
<th>3V+1U+3A</th>
<th>M. Pollefeys, S. Tang, F. Yu</th>
</tr>
</thead>
</table>

### Objective

The objective of this course is to provide students with a good understanding of computer vision and image analysis techniques. The main concepts and techniques will be studied in depth and practical algorithms and approaches will be discussed and explored through the exercises.

### Content

- Topics covered:
  - Probability
  - Probabilistic inference (variational inference, MCMC)
  - Bayesian learning (Gaussian processes, Bayesian deep learning)
  - Probabilistic planning (MDPs, POMDPs)
  - Multi-armed bandits and Bayesian optimization
  - Reinforcement learning

### Prerequisites / notice

- The course requires a strong background in linear algebra, probability, and statistics.
- It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts before taking this course.

### Objective

The objective of this course is to give an introduction to the fundamentals of physical human robot interaction, through lectures on the underlying theoretical/mechatronics aspects and application fields, in combination with a hands-on lab tutorial. The course will guide students through the design and evaluation process of such systems.

### Content

- Camera models and calibration, invariant features, Multiple view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition

### Prerequisites / notice

- It is recommended that students have taken Basic Robotics, Introduction to Computer Vision, or a similar course.

---

**Lecture notes**

Will be distributed on Moodle before the lectures.
Literature

Prerequisites / notice
The registration is limited to 26 students
There are 4 credit points for this lecture.
The lecture will be held in English.
The students are expected to have basic control knowledge from previous classes.

Abstract

Students learn principles of teaching beyond classroom and regular PE-Lessons:
- Planning and organizing camps and events
- Teaching the "Ergänzungsfach" Sport
- Long-term-curricula in PE

As a practical part students design the Outdoor event in EW4 of the following term.

Objective

Students know:
- How to plan events and camps
- To assess curricula critically and to use them properly
- How to combine theoretical and practical issues in the 'Ergänzungsfach'

Content

1. LV Semestereröffnung
2. LV Planung Outdoor-Weekend
3. LV Auswertung Outdoor-Event
4. LV Planung Event
5. LV Event-Präsentationen / Schlussveranstaltung

Prerequisites / notice

EW2 is compulsory requirement for EW4 Sport

---

Human Learning (EW1)

This lecture is only apt for students who intend to enrol in the programs "Teaching Diploma" or "Teaching Certificate". It is about learning in childhood and adolescence.

Abstract

This course looks into scientific theories and also empirical studies on human learning and relates them to the school.

Objective

Anyone wishing to be a successful teacher must first of all understand the learning process. Against this background, theories and findings on the way humans process information and on human behaviour are prepared in such a manner that they can be used for planning and conducting lessons. Students additionally gain an understanding of what is going on in learning and behavioural research so that teachers are put in a position where they can further educate themselves in the field of research into teaching and learning.

Content

Thematische Schwerpunkte:

- Lernen als Verhaltensänderung und als Informationsverarbeitung: Das menschliche Gedächtnis unter besonderer Berücksichtigung der Verarbeitung symbolischer Information; Lernen als Wissenskonstruktion und Kompetenzsverworb unter besonderer Berücksichtigung des Wissenstransfers; Lernen durch Instruktion und Erklärungen; Die Rolle von Emotion und Motivation beim Lernen; Interindividuelle Unterschiede in der Lernfähigkeit und ihre Ursachen: Intelligenztheorien, Geschlechtsunterschiede beim Lernen

Lernformen:

Lecture notes

Foliens werden zur Verfügung gestellt.

Abstract

Simultaneous enrollment in Introductory Internship Sports - course 557-0210-00L - is compulsory. Prerequisite: Professional Exercises (557-0215-00L) passed.

Objective

The students:
- Implement the objectives of general didactics in respect of the different types of sport at school.
- master the planning, implementation and evaluation of topics from all the sports-specific areas of tuition.
- gain an overview of the preparation necessary for the different requirements placed on a sports teacher at secondary school Level II.
- try out different teaching structures, such as the lesson, teaching unit, block periods and extra units in sport in addition to those on the timetable.

Content

Implementation of practical sport into general teacher training with planning, execution and evaluation of the topics from all sport-specific areas of the education at this level in Section II.

Lecture notes

Skript unter: https://moodle-app2.let.ethz.ch/course/view.php?id=117>
In their mentored work on subject didactics, students put into practice the contents of the subject-didactics lectures and go into these in greater depth. Under supervision, they compile tuition materials that are conducive to learning and/or analyse and reflect on certain topics from a subject-based and pedagogical angle.

**Objective**
- planning and organization of a longer period of instruction in school.

**Content**
- connection of educational goals and instruction

- 4 ECTS Specialized Courses with Educational Focus
- 2 ECTS Examination Lessons

---

### 557-0220-00L Partial Teaching Internship Sport

**Abstract**
The teaching practice takes in 30 Sessions. It lasts 4-6 weeks. It gives students the opportunity to implement the contents of their specialist-subject, educational science and subject-didactics training in the classroom. Students also conduct work assignments in parallel to their teaching practice.

**Objective**

Students use their disciplinary skills and educational knowledge for teaching. They know how to judge topics of their subject and can present them in class. Teaching and classroom management in practice is the main target of this course; students have to find a balance between instruction and self-determined activity of their pupils. Together with their supervisors they learn to assess their tasks and achievements.

**Content**

Students apply their theoretical background in practice. By teaching sports lessons they improve their teaching skills and classroom management and learn how to interact with pupils. Together with their supervisor they develop an ability of critical reflection of their tasks.

**Prerequisites / notice**

Dieses Praktikum kann nur zusammen mit dem Modul „Lehr- und Lernort Berufsfachschule“ (ETH: 851-0237-01/ UZH: 090LLB1S) im Rahmen der berufspädagogischen Zusatzausbildung der Universität Zürich absolviert werden. Studierende, die nur eine Lehrbefähigung anstreben, belegen das Unterrichtspraktikum Sport (557-0208-00L).

Voraussetzung für das Unterrichtspraktikum: Alle Leistungen im LD Sport müssen bereits erbracht sein, abgesehen von

- 3 ECTS EW-Fächer
- 4 ECTS Fachwissenschaftliche Vertiefung
- 2 ECTS Prüfungselekten

---

### 557-0211-01L Examination Lesson I Sports

**Abstract**

Simultaneous enrolment in "Examination Lesson II Sports" (557-0211-02L) is compulsory.

**Objective**

In the context of an examination lesson conducted and graded at a high school, the candidates provide evidence of the subject-matter-based and didactic skills they have acquired in the course of their training.

- to develop and conduct teaching that is conducive to learning at high school level, substantiating it in terms of the subject-matter and from the didactic angle
- to analyze the tuition they have given with regard to its strengths and weaknesses, and outline improvements.

**Content**

**Lecture notes**

Nach Abschluss der übrigen Ausbildung.

**Prerequisites / notice**

Dokument: Schriftliche Vorbereitung für Prüfungselekten.

**Abstract**

Comprehension for development and changes of sports from the ancient world to the present. Description of sports in services of national idea, from education and health promotion from the middle of the 18th century till this day.

**Objective**

Understanding for the development and adaptation of sports from the ancient world to present times.
The lectures set out to:

Development of pedagogical-psychological competences for the optimisation of future teaching activities.

Sensitivity to Diversity

These lectures deal with the current changes in society and sport and provide an overview of the many different problems and perspectives.

Instructional materials for each course will be made available to students. All lecture materials will be available to students on Moodle.

Sociology of Sport

Conflicts and politics: sports organizations, doping, violence

Social inequalities and distinctions: social impact, health and sport, sport and gender

The economy and the media: commercialisation, logic, dependencies

- take current examples to highlight the sociological view of sport.
- show how far sport reflects society and how it changes and becomes more differentiated in the process
- provide an introduction to the central theories and models of (sport) sociology
- present the different dimensions, functions and interrelationships of present-day sport
- show how far sport reflects society and how it changes and becomes more differentiated in the process
- take current examples to highlight the sociological view of sport.

A detailed program with additional references will be delivered at the beginning of the lecture.

Mentored Work Specialised Courses in the Respective O

Subject with an Educational Focus Sport A

Pedagogical application of research projects for schools

Introduction of sports pedagogical oriented research projects. Competency to a youth friendly movement and sports education. Competent "pedagogical application" of research projects in the field of movement and sport. Feed in of scientific findings to school lesson settings.
Objective
The students combine and apply general educational aims with a general and specific background of research projects. They know different educational concepts of the above mentioned, recognise its strengths and weaknesses and are able to apply concepts appropriate to the situation. They are interested in the (thought-) processes of education and research in sports in Switzerland. They use their knowledge of research matters to guide educational thought-processes. They are interested in processes of research in sports. They approach the research interest of their pupils with the knowledge of sports psychology, sports sociology, sports pedagogy, and sports history.

Prerequisites / notice
Auswahl von 2 aus 4 Angeboten:

a) Motor-Learning im Sport (Fachbereich Sportpsychologie)
- Vorlesung
- Praktische Umsetzung von Forschungsprojekten für die Schule

b) Sport im Spannungsfeld zwischen Ethik und Kommerz (Fachbereich Sportssoziologie)
- Vorlesung
- Praktische Umsetzung von Forschungsprojekten für die Schule

c) Mehrperspektivität im Sportunterricht (Fachbereich Sportpädagogik)
- Vorlesung
- Praktische Umsetzung von Forschungsprojekten für die Schule

d) Historische Entwicklung der Lehr- und Lernmodell im Sportunterricht (Fachbereich Sportgeschichte)
- Vorlesung
- Praktische Umsetzung von Forschungsprojekten für die Schule
Alle Wahlfachangebote beinhalten:
- Sportwissenschaftliche Fachpraxis
- Praktische Umsetzung der Erkenntnisse für die Schule

Specialized Courses in Respective Subject with Educational Focus II
At least 6 CP's must be obtained in this category.
Further courses must be chosen from the "Sports Practice: In-depth Education".

Compulsory Elective Courses
At least 6 CP's must be acquired in this category.
Further courses must be chosen from "Sports Practice: In-depth Education and Specialized Education".

Sports Practice
The Teaching Diploma in Sports will only be granted to students holding a Master, Diploma or Licentiate degree in Human Movement Sciences and Sports or Health Sciences and Technology. Additionally, a Sports Practice encompassing 56 CPs is required. The Sports Practice can be partly conducted during the Bachelor and Master programmes in Sports.

The students know the technical basic Basketball elements (dribbling, changes of hand, stops, starts, footwork, pass, shot, defense), they
- utilize their own strength as well as the resulting impact in a differentiate way in order to precisely move the swinging, falling, and
twisting body
- gain orientation safety and room orientation while twisting and flying
- gain sensitivity for social competences (e.g. to assist, to observe, to advise) within a small group.
- structural relationships within rotations (tumarounds, handsprings and free somersaults)
- core poses as motor basic training
- variety of position modifications in handstands
- core movements and combinations on parallel bars, high bar, floor and in swinging rings
- different forms of vaulting as well as springing in movements like handstands and somersaults

The students know the main rules of the game.
The students know the tactical Basketball elements (1 on 1, give & go, hand-off, pick & roll, pick & pop) and can apply these skills in a
game 3 on 3 on one basket.
The students can demonstrate them and use them correctly in a game situation 3 on 3 on one basket.
The students know the tactical Basketball elements (1 on 1, give & go, hand-off, pick & roll, pick & pop) and can apply these skills in a
game 3 on 3 on one basket.
The students know the main rules of the game.
Learning the basic elements in drills and games, learning (pre-)tactical elements (1-1, getting open, 2-2, backdoor cut, frontdoor cut, 3-3,
give & go, hand-off, pick & roll, pick & pop, spacing) and assemble them into systems, that can be used in a game situation 3 on 3 on one basket.

The students should be able to:
- acquire and consolidate apparatus related core movements as well as apply and create such combinations
- learns to know and understand the individual basic techniques
- improve technical skills and crafts
- variety of position modifications in handstands
- core movements and combinations on parallel bars, high bar, floor and in swinging rings
- different forms of vaulting as well as springing in movements like handstands and somersaults

Compulsory for Teaching Diploma Sports.

Prerequisites: Assessment Polysports passed (or Assessment I, II or III).

Abstract
To get to know and understand the basics of movement (core movements) and its respective actions and functions on apparatuses, on the
floor and in acrobatics as well as to create individual and cooperative combinations according to qualitative criteria.

Objective
The students should be able to:
- acquire and consolidate apparatus related core movements as well as apply and create such combinations
- utilize their own strength as well as the resulting impact in a differentiate way in order to precisely move the swinging, falling, and
twisting body
- gain orientation safety and room orientation while twisting and flying
- gain sensitivity for social competences (e.g. to assist, to observe, to advise) within a small group.
- structural relationships within rotations (tumarounds, handsprings and free somersaults)
- core poses as motor basic training
- variety of position modifications in handstands
- core movements and combinations on parallel bars, high bar, floor and in swinging rings
- different forms of vaulting as well as springing in movements like handstands and somersaults

Compulsory for Teaching Diploma Sports.

Prerequisites: Assessment Polysports passed (or Assessment I, II or III).

Abstract
Basic education in swimming: swimming, diving, water polo and artistic swimming

Objective
All kind of swimming:
- learns to know and understand the individual basic techniques
- improvement of technical skills and crafts
- Schwimmen: Erwerben und festigen der Schwimmtechniken Rücken, Brust und Kraul sowie Grundform Delfin. Erwerben und Festigen
Start und Wenden Kraul und Brust.
- Wasserspringen: Erwerben und festigen Grundtechniken Eintauchen und Abspriingen aus verschiedenen Ausgangspositionen und
Abprungshöhen. Einzelne Kernsprünge.
- Artistic Swimming: Erwerben und festigen Wassertreten, Paddeln, einzelne Grundfiguren.

- Self-direction and Self-management: assessed

Prerequisites: Assessment Polysports passed (or Assessment I, II or III).

Compulsory for Teaching Diploma Sports.

Abstract
Support and development the individual conditions/talent/skill and introduction of basic methods will be treated.

Objective
Support and development the individual conditions/talent/skill want to be at the centre of attention.

The introduction of basic methods complete the aim of the course.

Content
Technique:
- Dribble, short passport play, get the ball under control, shot,

Individual tactics:
- offensive/defensive 1vs1; keep ball in own rows

various contests in support of different techniques and tactics

Prerequisites / notice
1. Prerequisites:
- Small being able in soccer.
- Readiness to train.

2. Additional material
- wearing soccer shoes is mandatory
- wearing shin guards is mandatory

Competencies

Social Competencies
- Cooperation and Teamwork: fostered
- Customer Orientation: fostered
- Self-presentation and Social Influence: fostered

Personal Competencies
- Creative Thinking: fostered
- Integrity and Work Ethics: fostered
- Self-awareness and Self-reflection: fostered
- Self-direction and Self-management: fostered

Prerequisites: Assessment Polysports passed (or Assessment I, II, or III).

Compulsory for Teaching Diploma Sports.

Abstract
Learn by playing - from three-a-side to four-a-side games.

Game development takes place over the zone play of the game (2/1) 3/2 to the game 4/4 (6/6). The introduced technical elements form the requirements for the tactically-orientated zone plays and are exclusively trained in the execution and formation steps.

Objective
The students improve their personal skills and demonstrate the game in teams as well as groups of 4 against 4.

They deepen the development of the game

They improve their personal skills with an individual emphasis on game and practice.

Content
Spielend Handball lernen - Über das Spiel zum Spiel (Vom Spiel 3/3 zum Spiel 4/4)

Techniktraining ist Sache der Studierenden.

Die individuelle Grundschulung wird mit Lernkontrollen überprüft (Kontrollblätter).

Alle ausgewählten Formen müssen als Lernkontrolle durchführbar sein.

  - Experience and use of various aspects of volleyball as a teamplayer
  - Various forms of warmups and tournament setups

557-0603-01L Snowsports I - Ski

Only for BSc / MSC HST / Teaching Diploma Sports

100% presence is required!

W 2 credits 2G C. Elmiger-Schnyder, further lecturers

Registration via Study Administration necessary.

Compulsory for Teaching Diploma Sports.

Abstract

Education in the disciplines of winter sports.
- J+S Education possibility
- Transfer Offpist
- Transfer Nordic Cross

Objective

The students:
- experience the different winter sports.
- gain an understanding of how to ski off-piste.
- Transfer: Input Nordic Cross!

Content

- To apply and vary personal technique of alpine skiing
- To acquire and vary personal technique of cross-country skiing
- Competition in ski-jumping, and giant slalom
- To gain an understanding in how to ski off-piste
- To gain Nordic Cross

557-0603-02L Snowsports I - Snowboard

Only for BSc / MSC HST / Teaching Diploma Sports

100% presence required!

W 2 credits 2G C. Elmiger-Schnyder, further lecturers

Registration via Study Administration HST necessary.

Compulsory for Teaching Diploma Sports.

557-0446-02L  Athletics II  

Prerequisites: Athletics I attended.

Compulsory for Teaching Diploma Sports.

80% active participation required.

Abstract
The athletics level 2 course focuses on methodological and didactic aspects of disciplines taught in the level 1 course. Pole vault is introduced as a new and additional discipline. Central elements required for passing the course don’t include skill assessments or athletic performance tests but rather didactical contributions.

Objective
The level II courses focus on methodological concepts and didactics. The goal is to learn how to teach the specific sport at high school level. The didactical aspects are often conveyed through new skills and elements. It is not required to have passed the level I course, but it is mandatory to have attended it previously.

Content
- Specific warm-up for athletics
- Core elements of all disciplines
- Acquiring of technical pole vault skills
- Learning how to support an athlete during pole vaulting
- Keys to a successful baton handoff
- Written assignment on a movement observation task
- How to modulate intensity with task variations
- Developing feedback skills

557-0449-00L  Athletics III

Prerequisites:
Athletics I (557-0444-01L) attended.

Compulsory for Teaching Diploma sports.

80% active participation required.

Abstract
Athletic skills will be trained in the course. The course doesn’t include skill assessments or athletic performance tests.

Objective
Skills improvement in the athletic performance

Content
- Training in various track and field disciplines
- Group challenges

557-0523-00L  Handball II

Prerequisites: Handball I attended.

Compulsory for Teaching Diploma Sport.

80% active participation required.

Abstract
Recognizing and experiencing important aspects of the game and preparing them for your own lessons with the help of didactic-methodical concepts.

Objective
The level II courses focus on methodological concepts and didactics. The goal is to learn how to teach the specific sport at high school level. The didactical aspects are often conveyed through new skills and elements. It is not required to have passed the level I course, but it is mandatory to have attended it previously.

You will know and experience the most important aspects of teaching handball and prepare them for teaching with the help of didactic-methodical concepts.

You will know and experience different forms of assessment for the school.

You will improve your individual skills in technique and tactics.

Content
You will learn and discuss the didactic-methodological concepts to adapt exercises and the game in the sense of physical education and sport and to develop them further with a class.

You will learn and discuss different forms of assessment for the school.

You will improve your individual skills in technique and tactics.

Prerequisites / notice
It is not required to have passed the level I course, but it is mandatory to have attended it previously.

80% presence required.

557-0539-00L  Gymnastics / Acrobatics II

Prerequisite:
Attended basic education
- "Apparatus Gymnastics and Trampoline I" (557-0433-00L); and
- "Acrobatics I" (557-0432-01L).

Compulsory for Teaching Diploma Sports.

80% active participation required.

Abstract
Acquirement and Application of classic as well as modern forms of movement on different apparatuses and on the trampoline
Application and Creation of established basic skills

Objective
The level II courses focus on methodological concepts and didactics. The goal is to learn how to teach the specific sport at high school
level. The didactical aspects are often conveyed through new skills and elements. It is not required to have passed the level I course, but it is mandatory to have attended it previously

The students should be able to:
- enhance their repertoire on apparatus specific movements
- deepen their existing store of movements
- improve their individual performance competencies
- realize and comprehend transfer characteristics within the movement learning process
- work up methodically and didactically a chosen skill
- gain sensitivity for social competences (e.g. to assist, to observe, to advise) within a small group
- compose and present to music within a group of three a creative performance

Content
- further core movements on different apparatuses
- handsprings and (free) somersaults back- and forwards, respectively twists back- and forwards on different apparatuses
- creative and cooperative composition in a threesome accompanied by music
- vault springs and touching down springs (stuetz springs) to overcome obstacles in an artful way (Freerunning)
- integrated theoretical coherences of the qualitative movement learning process
- conveyance of methodical and didactical principles as well as topic specific criteria
- functional warm-up with regard to specific contents

557-0544-00L Floorball II
Prerequisite: Floorball I attended.
Compulsory for Teaching Diploma Sports.

Objective
The level II courses focus on methodological concepts and didactics. The goal is to learn how to teach the specific sport at high school
level. The didactical aspects are often conveyed through new skills and elements. It is not required to have passed the level I course, but it
is mandatory to have attended it previously.

Prerequisites / notice
80% presence required.

Competencies
- Method-specific Competencies
- Analytical Competencies
- Personal Competencies
- Decision-making
- Self-awareness and Self-reflection

557-0602-00L Badminton II
Prerequisite: Badminton I (557-0601-00L) attended.
Mandatory for Teaching Diploma Sports.

Objective
In this course you will build up and experience different tactical and technical exercise forms for classes. At the same time you will be able
to deepen your own badminton skills.

Content
In this course we work on possibilities to build up different tactical and technical exercise forms and structures for classes. You get to know
a variety of games. You learn how you can diversify exercises – depending on the level and the age of your pupils.

Prerequisites / notice
80% presence required.

Abstract
Acquisition of "SLRG Brevet Plus Pool".
Objective
Based on the Brevet Basic Pool, the Brevet Plus Pool provides you with skills to supervise groups in unguarded pools.

Prerequisites / notice
Prerequisites: please consult www.slrg.ch

| 557-0451-00L | First Responder Level 2 IVR | O | 2 credits | external organisers |

Abstract
Acquisition of the certificate "Ersthelfer Stufe II IVR".

In this course you will acquire the basic knowledge related to safety and hygiene measures in case of injuries and acute illnesses.
Objective
- To be able to judge an injured person and to apply life saving actions
- To carry out wound treatment with actual bandage
- To list the characteristics of a sprain, strain, dislocation and to apply first-aid interventions
- To carry out fixed bandages with common material
- To explain the function of the cardiovascular system
- To name the symptoms of poisoning
- To list the signs of acute illness
- To put together the content of a first-aid box
- To carry out safety interventions in daily situations.

Content
* Hautverletzungen
  * Wundinfektion / Blutvergiftung
  * Stürze im Alltag (Verstauchungen, Prellungen, Quetschungen)
  * Sportverletzungen, Knochenbrüche
  * Herzkreislaufstörungen
  * Alltagskrankheiten in der Familie

Abstract
Specialization training: Acquisitions of special skills, getting to know the performance factors and training methods in the areas of Snowsports.

Objective
Snow sports (Snowboarding):
- To deepen and expand experience and skills in snow sports and in the personal competency of technique of the chosen snow sport.
### Subject-specific Competencies

- Snowsports (snowboarding):
  - General and specific education of personal competency in technique of the chosen snow sport: Park, Piste and Off-Piste

### Prerequisites / notice

#### 557-0605-03L Snowsports II - Telemark

**Prerequisite:** Basic course Snowsports I (Ski or Snowboard) passed. 100% presence is required!

**Registration via Study Administration HST necessary.**

**Abstract**

Specialization training: Acquisitions of special skills, getting to know the performance factors and training methods in the areas of Snowsports.

**Objective**

- Snow sports:
  - To deepen and expand experience and skills in snow sports and in the personal competency of technique of the chosen snow sport.
  - To expand skills to the area of telemark

**Content**

Snow sports:
- General and specific education of personal competency in technique of the chosen snow sport.
- Telemark as an extra experience in the framework of technique on slope, park and off-piste.

**Prerequisites / notice**

Requirement: Basic course in Snowsport I completed.

#### 557-0605-04L Snowsports II - Off-Piste

**Prerequisite:** Basic course Snowsports I (Ski or Snowboard) passed. 100% presence is required!

**Registration via Study Administration necessary.**

**Abstract**

Specialization training: Acquisitions of special skills, getting to know the performance factors and training methods in the areas of Snowsports.

**Objective**

- Off-piste education:
  - Planning and realization of back-country skiing
  - Handling of the environment
  - Avalanche prophylaxis

**Content**

Off-piste education:
- Planning and realization of back-country skiing
- Handling of the environment
- Avalanche prophylaxis

**Prerequisites / notice**

Requirement: Basic course in Snowsport I completed.

### Additional Requirements in Sports Science

#### 376-0203-00L Movement and Sport Biomechanics

**Type** | **ECTS** | **Hours** | **Lecturers**
---|---|---|---
W | 4 | 3G | W. R. Taylor, R. List

**Abstract**

Learning to view the human body as a (bio-)mechanical system. Making the connections between everyday movements and sports activity with injury, discomfort, prevention and rehabilitation.

**Objective**

Students are able to describe the human body as a mechanical system. They analyse and describe human movement according to the laws of mechanics.

**Content**

Movement- and sports biomechanics deals with the attributes of the human body and their link to mechanics. The course includes topics such as functional anatomy, biomechanics of daily activities (gait, running, etc.) and looks at movement in sport from a mechanical point of view. Furthermore, simple reflections on the loading analysis of joints in various situations are discussed. Additionally, questions covering the statics and dynamics of rigid bodies, and inverse dynamics, relevant to biomechanics are investigated.

**Lecture notes**

Is available within the Moodle

**Competencies**

- Subject-specific Competencies: Concepts and Theories assessed
- Method-specific Competencies: Analytical Competencies fostered
- Personal Competencies: Critical Thinking fostered

#### 376-0207-00L Exercise Physiology

**Type** | **ECTS** | **Hours** | **Lecturers**
---|---|---|---
W | 4 | 3G | C. Spengler, F. Gabe Beltrami

**Abstract**

This course provides an overview over molecular and systemic aspects of neuromuscular, cardiovascular and respiratory adaptations to acute and chronic exercise as well as the interactions of the different systems influencing factors, e.g. genetics, gender, age, altitude/depth, heat/cold, with respect to performance and health.

**Objective**

The aim of this course is to understand molecular and systemic aspects of neuromuscular, cardiovascular and respiratory adaptations to acute and chronic exercise as well as the interaction of the different systems regarding health-relevant aspects and performance in healthy people and persons with selected diseases. Furthermore, students will understand the influence of genetics, gender, age, altitude/depth, heat and cold on the named factors.

**Content**

History of Exercise Physiology, research methods, fibertype heterogeneity and its functional significance, neural control of muscle force, molecular nad cellular mechanisms of muscle adaptation to resistance, endurance and stretching exercise, interindividual variability in the response to training, cardiorespiratory and metabolic responses to acute and chronic exercise, sex differences relevant to exercise performance, exercise in hot and cold environment, children and adolescents in sport and exercise, exercise at altitude and depth, aging and exercise performance, exercise for health, exercise in the context of disease.

**Lecture notes**

Online material is provided during the course.

**Literature**

Wird in der Vorlesung bekannt gegeben.

**Prerequisites / notice**

Anatomy and Physiology I + II

#### 376-1033-00L History of Sports

**Type** | **ECTS** | **Hours** | **Lecturers**
---|---|---|---
W | 2 | 2V | M. Gisler

**Abstract**

Comprehension for development and changes of sports from the ancient world to the presence. Description of sports in services of national idea, from education and health promotion from the middle of the 18th century till this day.

**Objective**

Understanding for the development and adaptation of sports from the ancient world to present times.

Ein Skript für die aktuelle Veranstaltung wird abgegeben.

**376-1107-00L**  
**Sport Pedagogy**  
**W**  
**2 credits**  
**2V**  
C. Herrmann

**Abstract**  
The teacher-student interaction presents a complex psychosocial event, demonstrating the need for a psychological extension of the classical social science / sports pedagogical perspective. Therefore, this lecture will be focused on "pedagogical-psychological aspects of competence development in the context of a multi-perspective physical education".

**Objective**  
Development of pedagogical-psychological competences for the optimisation of future teaching activities.

**Content**  
- Subject area of educational psychology
- Motivating students in physical education
- Building self-efficacy and strengthen the self-concept
- Promoting positive emotions and a positive attitude to anxiety
- Encouraging self-directed learning
- Leading classes and promoting cooperation
- Communicating with students efficiently
- Reflecting your own expectations critically
- Handling gender issues sensitively
- Promoting inclusion / Strengthening social and moral development
- Dealing with difficult students
- Evaluating achievements of students

**Lecture notes**  
Teaching materials for the individual lectures are provided to the students via moodle.

**Literature**  

**376-1117-00L**  
**Sport Psychology**  
**W**  
**2 credits**  
**2V**  
H. Gubelmann

**Abstract**  
This lecture is intended as an introduction to sport psychology and imparts knowledge on selected areas of the subject.

**Objective**  
- Students are given insight into different work areas of sport psychology. In order to understand what «sport psychology» is, it is necessary to explain the essence and tasks of sport psychology and what it relates to, and to work out an underlying basis for key topics, such as cognition and emotions. Students' expertise is furthered by presenting and providing more in-depth treatment of additional topics of sport psychology. Selected intervention forms are intended to provide insight into applied sport psychology and ensure that mental processes and their impact in sport can be recognised. Case studies and practical exercises (e.g. objective training) are intended to prompt students to reflect to a greater extent on the forms in which sport psychology can be applied in their practice of sports and to integrate these in their teaching.

**Content**  
- Main Topics
- Introduction to sport psychology
- Cognitions in sports: mental rehearsal and mental training
- Emotions and stress
- Motivation: goal-setting in sports
- Career and career transition in elite sport
- Coach-Athlete-Interaction
- Psychological aspects of sport-injury rehabilitation
- Group dynamics in sport

**Lecture notes**  
Instructional materials for each course will be made available to students. All lecture materials will be available to students on Moodle.

**Literature**  

**376-1127-00L**  
**Sociology of Sport**  
**W**  
**2 credits**  
**2V**  
R. Bürgi

**Abstract**  
These lectures deal with the current changes in society and sport and provide an overview of the many different problems and perspectives of sport sociology.

**Objective**  
The lectures set out to:
- present the different dimensions, functions and interrelationships of present-day sport
- provide an introduction to the central theories and models of (sport) sociology
- show how far sport reflects society and how it changes and becomes more differentiated in the process
- take current examples to highlight the sociological view of sport.

**Content**  
- Sport and social change: developments and trends
- The economy and the media: commercialisation, logic, dependencies
- Social inequalities and distinctions: social impact, health and sport and gender
- Conflicts and politics: sports organizations, doping, violence

**Lecture notes**  
Selected materials for the lecture are available on the Moodle platform.

**Literature**  

A detailed program with additional references will be delivered at the beginning of the lecture.

**Competencies**

- Subject-specific Competencies
- Concepts and Theories
- Method-specific Competencies
- Analytical Competencies
- Social Competencies
- Sensitivity to Diversity
- Personal Competencies
- Critical Thinking

**376-0130-00L**  
**Laboratory Course in Exercise Physiology**  
**W**  
**4 credits**  
**4P**  
C. Spengler

**Abstract**  
Conduct physical performance tests and measurements that are typically used to assess performance of athletes and/or patients and that deepen the understanding of physiological processes in response to physical exertion.

**Objective**  
Gain hands-on experience in exercise physiology and consolidate knowledge on physiological adaptations to different types and degrees of physical activity and climatic influences. Learn fundamental assessment techniques of the muscular system, the cardio-respiratory system and of whole-body performance, learn scientifically correct data analysis and interpretation of results. Insight into today's Sports Medicine.

Data: 06.08.2024 12:40  
Autumn Semester 2024  
Page 2351 of 2684
Skeletal muscle biology purposes to understand how muscles coordinate movement, regenerate following injury and adapt to exercise stimuli. In this course, the students will acquire insights into the molecular aspects of muscle biology and exercise, in addition to gaining hands-on experience in experimental techniques that are commonly used to research muscle regeneration and exercise.

To understand the potential effects of nutrition on exercise performance, with a focus on concepts and principles of nutrition before, during and after exercise. Although this is a scientific course, it is a goal of the course to translate basic sports nutrition science into practical sports nutrition examples.

New trends in physical activity for prevention and rehabilitation. This course includes an introduction to study design, measurement techniques, signal processing, as well as musculoskeletal modeling.

Critical Appraisal of Evidence for Exercise in Health

This course will discuss the mechanisms and latest evidence-based recommendations of physical activity and exercise for a series of conditions and populations. In the second part of each lecture session, published randomized controlled trials of the respective lecture’s topic will be discussed and critically appraised based on established tools.

On completion of this course students will be able to:
1. understand the role of physical activity and sedentary behavior in the maintenance of health and the etiology, prevention and treatment of disease
2. synthesize effective physical activity and exercise interventions for the prevention and management of several diseases and populations
3. evaluate recent evidence regarding physical activity and exercise interventions

Lab course: gaining hands-on experience in experimental techniques that are commonly used to research muscle regeneration and exercise.
Objective

The objective of this course is to introduce students into current research topics and outstanding questions in skeletal muscle biology. Also, the course will give students hands-on experience in respect to the tools needed to perform basic molecular biology research in the field of exercise and skeletal muscle biology. Students will learn how to translate a scientific question in muscle biology into a small scientific project. They will learn how to design an experiment and to analyze and critically interpret experimental data.

Content

The course will consist of 4 main research themes and the anticipated 16 students will be divided into 4 subgroups of 4 students each one will focus on one of the following research topics:

- **Topic 1:** Molecular pathways that control muscle stem cell self-renewal and differentiation
- **Topic 2:** Genome engineering to correct genetic mutations that cause muscle diseases
- **Topic 3:** Muscle fiber composition, force production and insulin sensitivity
- **Topic 4:** Amino acid sensitivity in skeletal muscle following exercise

The course will be organized into 7 sessions, each approx. 4 hours: the first 2 sessions will be theoretical and include an introductory lectures by the professors in addition to a journal club presentation by the students. This journal club aims to provide theoretical and scientific background that will be used to identify outstanding research questions. This will be followed by 4 practical sessions (hands-on experience) and 1 final evaluation session.

For the journal club, each group of students will receive a peer-review article that is highly relevant to the respective group’s research topic. Each of the 4 groups will present and discuss the article in a journal club format to the rest of the participants the following week. During the four practical sessions, students will gain hands-on experiences and learn different lab techniques related to molecular biology of exercise and muscle regeneration. Each group will be presented with a research objective that is related to their topic, and perform in collaboration with teaching assistants a set of experiments that aim to address the research objective. At the final evaluation session, each group of students will present their results and identify follow-up research questions and hypothesis based on their experimental achievements.

Select practical methods that the proposed course will teach include:

i. **Group 1:** tissue culture, isolation of muscle stem cells via FACS, differentiation of muscle stem cell into muscle fibers, small molecules screens, quantitative analysis of muscle cell proliferation and fusion, Immunofluorescence.

ii. **Group 2:** tissue culture, differentiation of muscle stem cells into muscle fibers, guide RNA design and Crispr-Cas9 gene editing of genetic mutations that cause muscle diseases in muscle stem cells and fibers. Immunofluorescence and PCR.

iii. **Group 3:** ex vivo assessment of muscle force characteristics, cryosectioning of muscle tissue, immunofluorescence and western blot.

iv. **Group 4:** tissue culture of muscle stem cells, isolation of muscle stem cells and differentiation into muscle fibers, amino acid stimulation of muscle fibers, Western blot.

Der Kurs besteht aus
- einem ersten Teil, der jeweils am Montag, ab 23. September 2024, wöchentlich bis und mit 16. Dezember 2024, 10:15-12:00, vor Ort auf dem Campus stattfindet (CHN E 46)

Die 5. Auflage dieses Lehrbuches ist via Buchhandlungen oder online erhältlich. Übungsfragen und ein Glossar finden Sie hier: https://ib.ethz.ch/teaching/pwgrundlagen.html

Vor der Sitzung:

2. Durch eine kurze (digitale) Umfrage in Moodle werden Übungsfragen ermittelt, welche von den Studierenden als besonders schwierig erachtet werden und die deshalb im Übungsteil (jeweils 12:15 – 13:00 Uhr) vertieft besprochen werden.

Der Ablauf der Sitzungen ist dann meist wie folgt:

1. Teil:
   1. Zu Beginn wird jeweils (in digitaler Form) ein unbenoteter Check-Up zum gelesenen Buchinhalt durchgeführt (mehr dazu weiter unten) und im Anschluss gleich besprochen.
   2. Es folgt eine ca. 30-minütige Vorlesung, die den Inhalt des/des gelesenen Buchkapitels kurz zusammenfasst und reflektiert.
   3. Danach stellen die Dozierenden meist eine aktuelle wissenschaftliche Studie vor, die im Bereich des/des jeweils behandelten Themen liegt (ca. 30 Minuten).

2. Teil:
   Wir behandeln Übungsfragen, die per Umfrage als besonders schwierig identifiziert wurden.

Die Sitzungen sind normalerweise somit wie folgt strukturiert:

- 10:15 – 10:30 Uhr: Check-Up & Auswertung & Besprechung
- 10:30 – 11:00 Uhr: Vorlesung
- 11:00 – 11:15 Uhr: Pause
- 11:15 – 11:45 Uhr: Vertiefung des Vorlesungsinhalts, z.B. durch Präsentation einer aktuellen Studie (in Sitzungen mit zwei zu lesenden Buchkapiteln zweiter Vorlesungsteil)
- 11:45 – 12:15 Uhr: Pause, dient auch dazu, sich zu verpflegen und (falls nicht vor der Sitzung schon erledigt) die Umfrage zur Priorisierung der Übungsfragen auszufüllen
- 12:15 – 13 Uhr: Besprechung der priorisierten Übungsfragen

Die 5. Auflage dieses Lehrbuches ist via Buchhandlungen oder online erhältlich. Übungsfragen und ein Glossar finden Sie hier: https://ib.ethz.ch/teaching/pwgrundlagen.html

The aim of this lecture is to give students an introductory overview of relevant topics regarding leadership research and practice, thus enabling them to gain a deeper understanding of the leadership phenomenon. Students should understand different concepts of leadership and be able to derive consequences for leadership in practical situations. They should grasp the concept of leadership styles, the concept of leadership responsibility and the role of communication in practical leadership. Students should understand different concepts of leadership styles, the concept of leadership responsibility and the role of communication in practical leadership.

Abstract
Introduction to the economic decisions of households and firms, and their coordination through markets. Analysis of different market structures and of situations in which markets may lead to socially undesirable outcomes.

Objective
Understanding of basic microeconomic models. Ability to apply these models to real world economic situations.
Content Economics as a science, division of labour and welfare (concept of comparative advantage), supply and demand (market equilibrium, elasticity), households (preferences, demand), firms (technology, cost analysis, profit maximisation, supply), perfect competition, monopoly and oligopoly, externalsities, public goods, information, factor markets and income distribution

853-0725-00L History Part One: Europe (The Cradle of Modernity, Britain, 1789-1914)

Abstract A range of fundamental processes have transformed European societies in the course of the 19th and the 20th centuries. This lecture series looks at several key aspects of these modernization processes and asks about their continuing relevance for our times. The regional focus lies on the Britain, where these processes took place for the first time.

Objective At the end of this lecture course, students can: (a) highlight the most important changes in the "long nineteenth century" in Britain (b) explain their long-term effects (also for other European countries); and (c) relate these changes to global developments today.

Content The thematic foci include: Industrialization, urban growth, democratisation and mass politics, shifting gender roles and ideals, and the emergence of consumerism and leisure culture.

Lecture notes Power Point Slides and references will be made available in digital form during the course of the semester.

Literature Mandatory and further reading will be listed on the course plan that is made available as from the first session.

Prerequisites / notice This lecture series does not build upon specific previous knowledge by the students.

853-0037-00L Military Psychology and Pedagogy I

Abstract Examine the fundamentals of the two sciences and establish links with military life. Discuss various schools of thought in psychology and focus on content and process theories of motivation. Explore characteristics of pedagogical thinking and discuss the values of military education with reference to the young adult serving in the armed forces.

Objective - Becoming acquainted with basic psychological views of human behaviour and experience
- Knowing content- and process theories of motivation and being able to transfer them to the military context
- Knowing the possibilities and limitations of military education and deriving consequences

Content Overall, the objective is to become acquainted with the basics of both scientific areas and to make references to military practice. Military psychology is a branch of applied psychology; consequently selected aspects of psychological principles will be covered. Military pedagogy has not yet established itself firmly as an independent scientific discipline, it nevertheless can draw on a deep-seated tradition in Switzerland. Thus, the great importance that has been attached to the discussion of education in Swiss society and academia will be taken into account.

Subjects:
- History of military psychology
- Introduction to psychological thinking
- Motivational theories
- Defence-, service-, operational- and combat motivation
- Swiss military pedagogy
- Education as defining feature of pedagogical thinking and acting

This course is completed by a compulsory one week course between terms.

Fostering Societal Change; Organizations as Societal Phenomena; Aims, Structures, Environments of Organizations; Specifics of the Military as an Organization

Teaching is focused on the acquisition of general English in the four classical skills, i.e. speaking, listening comprehension, reading comprehension and writing. The goal is to reach level B2 or C1 depending on the linguistic proficiency of the students.

**Objective**
1) Understanding the goal and the basic procedures of (empirical social sciences) scientific work (philosophy of science, theory building, research design, as well as the correct employment of sources, data and literature).
2) Identification of relevant research questions.
3) Creating a comprehensive list of the relevant literature and summarize that with her/his own words.

**Content**
Political Methodology I seeks to introduce students to the basics of scientific work and procedures in the social sciences, which in turn shall allow them - also in conjunction with Political Methodology II - to conduct work that fulfills satisfactory standards of research quality throughout their further studies.

With regard to Political Methodology I, this seminar primarily focuses on the philosophy and theory of (empirical) social sciences, its structure, and procedures. The seminar emphasizes substantive contents and ways of presenting them, research and, conceptual work. Additionally, it deals with the basis of establishing research designs with politically relevant questions and hypotheses.

**Literature**

**Prerequisites / notice**
Each student will be graded by two exercises (50% each).

1) Source analysis and acquisition: based upon a research question that will be given by the lecturer, the student shall collect a comprehensive list of the relevant literature and summarize that with her/his own words.

2) Critical analysis of sources: based upon a research article that the student chooses on her/his own, the student shall write a critical analysis of that, which mirrors frame and structure of scientific writing

Submission dates will be communicated in the first meeting.

| 853-0063-00L | Military History I | O    | 4 credits | 2V+3U | M. Olsansky, T. Cubito, A. Wettstein |
| Abstract   | The lecture outlines the development of the armed forces (assets regarding manpower, technology and armament), the concepts of warfare and the actual warfare in the 19th and 20th century. |
| Objective  | - Distinguish between military history as a subject and historiography as a way of describing events; |
|            | - Analyse the modern developments regarding armed forces and warfare in the context of socio-economic changes; |
|            | - Based on the approach regarding revolution in military affairs, describe the evolution of the armed forces and of warfare; |
|            | - Exemplify the issues regarding the evolution of the combat (First and Second World War, Vietnam War and Algerian War). |
The lecture first examines the bases of the science of (military) history. It focuses on how military history developed from war history, on specific similarities and differences between military history and general historiography, the different ways of dealing with history in Switzerland, Germany, France and in the Anglo-Saxon cultural area (different approaches) as well as on institutions which deal with military history such as universities, military academies, national and international commissions and associations etc.

The lecture is structured along the lines of the concept of "Military Revolution" and starts with the formation of modern, European armed forces after the Oranian Army reform in the 17th century.

Based on the "Military Revolution" approach, the lecture examines the structural changes regarding the armed forces and the development of warfare from the 18th to the 20th century. Special emphasis will be put on how the battlefield was revolutionized due to the Napoleonic wars, the industrialization in the 19th century, the First World War, the mechanization and totalization during the Second World War and the period of the Cold War.

The lecture Strategic Studies deals with the use of political and military power from an interdisciplinary and global perspective.

Abstract
The lecture Strategic Studies deals with the use of political and military power from an interdisciplinary and global perspective.

Objective
Participants know how the understanding of strategy has changed over time.

They understand the interplay between the basic components of strategy.

They know the main strategic concepts and models and are able to discuss them critically.

By examining selected historical and contemporary examples, they are aware of the inherent tension between the formulation (declaration) and application (implementation) of strategies. They are able to critically analyse original texts and contemporary publications in the field of strategic studies.

They are able to use case studies to explain how technological change affects strategic thinking.

The two-semester course covers key issues in strategic studies.

The first semester focuses on key concepts and foundations, which are applied and critically discussed in the second semester.

Both political and military theorists, practitioners and case studies will be discussed. The course also emphasizes the role of non-European thinkers and theories. The focus will then be on the impact and practical implementation.

For each of the strategies discussed, the original context and the state of technological development will be highlighted.

Lecture notes
Prior to the lectures, the respective slides are provided as well as a primary sources and literature, as preparatory readings (via Moodle).

Classical literature

Prerequisites / notice
The lecture is held in German.

Passive knowledge of English and French are required.

European Integration
Switzerland in the context of European integration

The course (lecture and tutorial) deals with the theory, development and central policy areas of European integration as well as the structures and processes of the EU as a political system. The course systematically links this basic knowledge with an analysis of the bilateral relationship between Switzerland and the EU.
The idea that Switzerland's relationship with the EU is at a 'crossroads' is a cliché that has been used repeatedly in recent decades. But could it be true this time? Since the breakdown of the negotiations on a framework agreement and the recently launched attempt for a third package of bilateral treaties, there is more uncertainty than ever in the Swiss-EU relationship. Switzerland is once again faced with the decision between greater proximity or isolation.

The seminar places the bilateral relationship between Switzerland and the EU in the broader context of European integration. It helps to understand the EU as a highly developed instrument of transnational problem solving and as a special political system. It provides basic knowledge about the history, institutions, procedures and policy areas of the EU and offers an introduction to important approaches in integration theory and political science analyses of European integration. The seminar systematically links this basic knowledge of the political system of the EU with an examination of the logic, development and perspective of the bilateral relationship between the EU and Switzerland.

### Content

**Course plan**

1. A brief history of European integration
2. The European Union as a political system
3. The European Union as a community of law
4. The European Union as a system of differentiated integration
5. Theories of integration: Why integration?
6. Ten years of polycrisis: What next for the EU?
7. A brief history of the relationship between Switzerland and the EU
8. Trade
9. Free movement of persons
10. Justice and home affairs, foreign affairs, migration
11. Research, cohesion, energy
12. Domestic political discourse and public opinion in Switzerland
13. The future of Switzerland-EU relations

### Literature

Literatur wird über Moodle bereitgestellt.

### Prerequisites / notice

Die Leistungskontrolle findet durch eine Seminarpräsentation und einen schriftlichen Schlusstest statt.

### Objective

- Recognizing parallels and contrasts between business and military thinking;
- Understanding the link between institutions, human action and economic results.

### Content

The semester program of the course is divided into 14 modules of 90 minutes each, which combine lecture (teaching of analytical techniques) and exercise (application by means of concrete case studies).

1. Fundamental military economic problems including historical introduction to the topic
2. The institutional foundations of a military organisation
3. The modern military as a planned economy system
4. Actors and stakeholders in the system

Lecture slides are given to the participants before the first lecture. In addition, the above mentioned book will be handed over to the participants. Participants of the lecture who are not professional officer candidates are requested to obtain the book from the library or bookstore.

Abstract
The knowledge and skills acquired in the second semester serve as a basis for further improvements in the areas of speaking, listening, reading and writing, which will enable students to enroll for the Cambridge exams. The goal is to reach Council of Europe (CEFR) level C1 or C2 depending on the linguistic proficiency of the students.

Objective
This three-semester English course should enable the participants to successfully use the English language in an international military setting.

Content
- Read, analyse and write military and civilian documents
- Listening comprehension using current radio or TV reports
- Practise speaking with group discussions and short presentations
- Systematic revision and extension of key grammar points
- Systematic acquisition of general and military vocabulary

<td>853-0049-00L</td>
<td>Introduction to Constitutional Law in Security Policy</td>
<td>O</td>
<td>3 credits</td>
<td>2V</td>
<td>R. Müller</td>
</tr>
</tbody>
</table>

Abstract
The lecture deals with questions of competence and the security policy instruments in the federal state, conveys the basic principles of police law and deals with the management of extraordinary situations. Special topics are the army, civil protection, the intelligence service, cooperation (at home and abroad), the legal status of army members and private security providers.

Objective
The students can
- explain the basic concepts of security law;
- outline the basic constitutional order for Swiss security policy, identify the competences of the Confederation and assess the advantages and disadvantages of this basic order;
- explain and evaluate special legal forms of action;
- distinguish the tasks of security policy actors and assess forms of cooperation;
- derive legal limitations for operations of the armed forces from the Federal Constitution;
- identify the basic principles and individual special aspects of military-civilian cooperation;
- identify the police powers of the armed forces and determine the permissibility of using forms of coercion;
- describe the legal status of members of the armed forces and explain the special responsibility of officers;
- establish the relationship between the actions of state actors and the guarantee of fundamental rights;
- assess current challenges in security law.

Content
The lecture consists of three parts: Basics, Security policy instruments, Consolidation.

In the first part, terms of security and police law are introduced, the Swiss security constitution (Confederation and cantons) is explained and the significance of fundamental rights guarantees is shown.

In the second part, the security policy instruments of the Confederation and the cantons are assessed critically. A special focus is placed on the army. In addition to its constitutional anchoring and its tasks, the forms of deployment enshrined in the relevant regulations (e.g. military act) are examined from a legal perspective. Special attention is given to police powers of military forces.

The third part of the course deals in greater depth with the intelligence service, civil protection, the legal permitted tasks of private security providers and the legal status of military personnel.

The last hour before the examination is reserved for revision and questions.

Swiss Foreign Policy

853-0038-00L

Abstract
This course analyzes the foundations and challenges of Swiss foreign policy. After reviewing the history of foreign policy conceptions since the early 20th century, we will discuss the determining factors of Swiss foreign policy and examine, together with guest speakers from the foreign ministry, current international developments and respective foreign policy challenges.

Objective
Students should acquire a sound understanding of Swiss foreign policy and the relevant academic and political debates associated with it.

Content
Nach einer Einführung in die Aussenpolitikanalyse behandelt die Lehrveranstaltung zunächst die historischen Grundlagen und die konzeptionelle Entwicklung der schweizerischen Aussenpolitik. Dabei stehen die unterschiedlichen Reaktionen der Schweiz auf die internationalen Neuordnungen nach 1918, 1945 und 1989 und die seitherige Ausgestaltung der Schweizer Aussenpolitik im Zentrum.

Fostered

Advanced Course II (Seminar)

853-0321-00L

Abstract
The objective of this two-semester seminar-style course is to write an advanced-level research paper in the field of Strategic Studies. In the second semester, students write their seminar paper and present it in plenary.

Objective
Students write their seminar paper based on the research design they developed during Advanced Course I (Seminar). Students should consider the seminar paper as preparation for their BA thesis.

Content
Advanced Course II builds upon Advanced Course I. Within the broader framework of the overall seminar topic (The Strategic Relevance of Surprise, Deception, and Intelligence) and based on the approved research design as developed during Advanced Course I, participants write their seminar papers in collaboration with their lecturers (30 pages max).

Lecture notes
none

Literature
Basic literature is available on Moodle (Advanced Course I). The search for additional literature is a fundamental part of the research process. Students may consult their lecturers if they have any questions.

Prerequisites / notice
Accepted research design (Advanced Course I) is required.

Introduction to Cybersecurity Politics

853-0061-00L

Abstract
The lecture is an introduction to global cybersecurity politics. The focus is on the strategic use of cyberspace by state and non-state actors (threats) and different answers to these new challenges (countermeasures).

Objective
Participants learn to assess the advantages and disadvantages of cyberspace as a domain for strategic military operations. They understand the technical basics of cyber operations and know how technology and politics are interlinked in this area. They understand the security challenges for and the motivations of states to be active in cyberspace offensively and defensively and they are familiar with the consequences for international politics.

Content
We start with an overview of cybersecurity issue from 1980 to today and look at events and actors responsible for turning cybersecurity into a security challenge. After reviewing the history and the evolution of the concept of cyberspace as a strategic domain, we then focus on the technical aspects of cyber operations and the technical challenges for security. In the third session, we turn to the political aspects of cybersecurity, such as the role of the state and the role of the non-state actors.

Lecture notes
A script with background information and comments on the literature will be made available at the beginning of the semester.

Social Psychology of Groups

853-0046-00L

Abstract
The lecture is being supported by a website on Moodle.

Objective
Participants will become familiar with the basic concepts and theories of social psychology and develop an understanding of how these concepts and theories are applied to real-world social situations.

Content
The course will be supported by an e-learning environment.

Lecture notes
The lecture is being supported by a website on Moodle.

Self-direction and Self-management
Abstract
Basic social psychological topics are elaborated, presented, and discussed in the most application-oriented way.

Objective
You are able to recognize and explain various social psychological aspects and factors and to evaluate them in your everyday decisions in terms of planning, content and operations. This means you will be able to assess when various social psychological aspects may play a role in your everyday work. And you are able to assess what this may subsequently mean for your work or leadership processes.

Content

1) Führungspychologie: Kurzer Einblick in neuere Führungstheorien.
2) Destructive Führung: Was sollten wir nicht machen?
3) Soziale Kognition: Warum und auf Basis welcher wenigen Informationen wir sehr schnell Urteile über Personen treffen.
4) Soziale Wahrnehmung/Attribution: Wie erklären wir uns, dass sich jemand im Alltag in gewisser Art und Weise verhält?
5) Diversity & Frauen & Führung: Woran kann es liegen, dass weibliche Führungskräfte besondere Herausforderungen bei der Ausübung von Führung haben?
6) Sozialer Einfluss: Welche Normen erleben Sie beim Militär? Und wie leiten diese Erwartungen unser Verhalten im Berufsalltag?
7) Gruppspsychologie: Was heißt "Gruppe"? Wie entwickeln sich (militärische) Gruppen, z.B. in der RSK? Welche Prozesse können zwischen Gruppen geschehen?
9) Überzeugungsstrategien

Literature

Plus: Zusatzliteratur
Lehrangebot im Studiengang Berufsoffizier
Based on the knowledge and skills acquired during the first semester, speaking and discussion skills related to military situations are examined and put into practice. Attention is focused on issues such as instruction, qualification and career interviews.

This two-semester French course should enable the German speaking participants to fulfil their function as professional officers also in the French language.

**Bachelor’s Colloquium and Bachelor’s Thesis**

**Abstract**
The BA Colloquium prepares students for their BA thesis with regard to content, administration, and methodology. During the colloquium, students choose a topic and a supervisor for their thesis. The skills students have acquired during the course of their studies are also enhanced and optimized.

**Objective**
The students are being prepared administratively and methodologically to write their BA-thesis after completing the course.

**Content**
The BA Colloquium prepares students for their BA thesis with regard to content, administration, and methodology. During the colloquium, each student has to choose a topic for his/her BA-thesis. The students also choose their supervisors, whereas the goal is an even distribution of the supervisors. Finally, the methodological competences which were acquired during the first four semesters will be complemented.

The teacher-student interaction presents a complex psychosocial event, demonstrating the need for a psychological extension of the classical social science / sports pedagogical perspective. Therefore, this lecture will be focused on "pedagogical-psychological aspects of competence development in the context of a multi-perspective physical education".

Abstract

Objective

Content

Development of pedagogical-psychological competences for the optimisation of future teaching activities.

- Subject area of educational psychology
- Motivating students in physical education
- Building self-efficacy and strengthen the self-concept
- Promoting positive emotions and a positive attitude to anxiety
- Encouraging self-directed learning
- Leading classes and promoting cooperation
- Communicating with students efficiently
- Reflecting your own expectations critically
- Handling gender issues sensitively
- Promoting inclusion / Strengthening social and moral development
- Dealing with difficult students
- Evaluating achievements of students

Lecture notes

Literature

Teaching materials for the individual lectures are provided to the students via moodle.

Primärliteratur:

376-1117-00L

Sport Psychology

W

2 credits

2V

H. Gubelmann

Abstract

This course is intended as an introduction to sport psychology and imparts knowledge on selected areas of the subject.

Objective

Content

- Introduction to sport psychology
- Cognitions in sports: mental rehearsal and mental training
- Emotions and stress
- Motivation: goal-setting in sports
- Career and career transition in elite sport
- Coach-Athlete-Interaction
- Psychological aspects of sport-injury rehabilitation
- Group dynamics in sport

Lecture notes

Literature

376-1127-00L

Sociology of Sport

W

2 credits

2V

R. Bürgi

Abstract

These lectures deal with the current changes in society and sport and provide an overview of the many different problems and perspectives of sport sociology.

Objective

Content

- The economy and the media: commercialisation, logic, dependencies
- Social inequalities and distinctions: social impact, health and sport, sport and gender
- Conflicts and politics: sports organizations, doping, violence

Lecture notes

Literature

International Environmental Politics

W

3 credits

2V

T. Bernauer

Abstract

This course deals with how and why international problem-solving efforts (cooperation) in environmental politics emerge and evolve, and under what circumstances such efforts are effective. Based on concepts, theories, and methods of political economy, political science, and public policy, various examples of international environmental policy-making are examined.

Objective

Content

- Present the different dimensions, functions and interrelationships of present-day sport
- Provide an introduction to the central theories and models of (sport) sociology
- Show how far sport reflects society and how it changes and becomes more differentiated in the process
- Take current examples to highlight the sociological view of sport.

Lecture notes

Literature

Reading materials and slides will be available via Moodle.

Reading materials and slides will be available via Moodle.
The course is open to all ETH students and visiting students from other universities. Participation does not require previous coursework in the social sciences or environmental policy. Most meetings in this course will take place on campus (ETH Main Building, HG F.3). There will be no live-streaming, and the course is not in hybrid (on-campus plus online) format. However, the lecture will be recorded (slides and voice, no video) and the recordings will be made available via the Moodle platform for this course a few days after the respective lecture for students who are unable to attend in person. All electronic correspondence will take place via the ETH mystudies system and Moodle, so please make sure you are properly registered there with a functioning email address/account.

Credits and Exam

After passing a written test at the end of the course (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test). Visiting students (e.g., from the University of Zurich, exchange students) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory. Students who obtain a grade of < 4.0 for the test will have a second chance (see table below). Students who did not participate in the test on 16 December 2024 will not have access to the repeat test unless they submit compelling and documented (e.g., medical, other exam in parallel at ETH) reasons for why they are/were unable to participate in the first test. The test covers all contents of the lectures and the reading assignments. No separate registration for the exam is required, registration for the course as such covers everything. The exam will take place on campus, most likely in HG F3. That is, you must be present in person at ETH Zurich on the exam date/time.

851-0735-10L Startups and Law

W 2 credits 2V P. Peyrot

Abstract
The students shall obtain a basic knowledge about the legal environment of entrepreneurs. They shall be able to recognize and evaluate legal issues connected to an entrepreneurial activity and suggest possible solutions.

Objective
- They shall obtain the following competence:
- They shall be able to contribute to the legal management of the company and to discuss legal issues.
- They shall have an understanding of the law as a part of the corporate strategy and as a valuable resource of the company.

Lecture notes
A comprehensive script will be made available online on the moodle platform.

101-0515-00L Project Management

W 2 credits 2G C. G. C. Marxt

Abstract
The course gives a detailed introduction on various aspects of professional project management out of theory and practice. Established concepts and methods for project organization, planning, execution and evaluation are introduced and major challenges discussed. The course includes an introduction to specialized project management software as well as agile project management concepts.

Objective
- Projects are not only the base of work in modern enterprises, but also the primary type of cooperation with customers. Students of ETH will often work in or manage projects in the course of their career. Good project management knowledge is not only a guarantee for individual, but also for company-wide success.
- The goal of this course is to give a detailed introduction into project management. The students should learn to plan and execute a project.

Content
- Project planning (aims, appointments, capacities, efforts and costs), project organization, scheduling and risk analysis, project execution, supervision and control, project evaluation, termination and documentation, conflict management, multinational project management, IT support as well as agile project management methods such as SCRUM.

Lecture notes
No. The lecture slides and other additional material will be available for download from Moodle a week before each class.

701-0703-00L Environmental Ethics (University of Zurich)

W 3 credits 2V University lecturers

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.
The course deals with the scientific production of knowledge about past mass atrocities. It looks at the interplay of different disciplines, methods and technological means that have been involved in this production over time. Further, it poses the question of what truth can mean in this context.

Objective

The students a) know the main features of the discussion about the truth in the reconstruction of past events; b) have an understanding of the interplay, but also the coexistence of different scientific methods and technological means in the multidisciplinary production of knowledge about past mass crimes; c) have knowledge of important processes of dealing with past mass crimes from the second half of the 20th century onwards.

Content

When discussing the truthfulness of the academic study of the past, politically and ideologically motivated mass crimes are often cited as historical events in order to substantiate the necessity of a claim to truth. In doing so, moral arguments can be made or historical truth can be asserted as a basic prerequisite for living together in a democratic society under constitutional conditions.

The production of knowledge about past atrocities has always been an endeavour in which various scientific disciplines have been involved. The multidisciplinary character of the production of knowledge about mass crimes has become even more accentuated since the second half of the 20th century.

The course offers a brief introduction to the discussion about the meaning of truth about past events. It looks at how different scientific approaches - from the humanities to the natural sciences - have been involved in coming to terms with mass crimes and how they have been related to each other. It deals with the question of what role certain techniques and technologies have played in the production of knowledge about past atrocities and how this has changed over time. These techniques and technologies range from the evaluation of documents and the taking of testimonies to specialised database programs, genetic analysis or imaging techniques, to digital technologies for the procurement of information on social media and the internet or for the modelling of past events.

In addressing these questions, the course looks at processes of dealing with the past from the middle of the 20th century onwards.

Abstract

In regression, the dependency of a random response variable on other variables is examined. We consider the theory of linear regression with one or more covariates, high-dimensional linear models, nonlinear models and generalized linear models, robust methods, model choice and nonparametric models. Several numerical examples will illustrate the theory.

Objective

Introduction into theory and practice of a broad and popular area of statistics, from a modern viewpoint.

Content

Prerequisites / notice

This is the course unit with former course title "Regression".

Abstract

The course offers an introduction into analyzing times series, that is observations which occur in time. The material will cover Stationary Models, ARMA processes, Spectral Analysis, Forecasting, Nonstationary Models, ARIMA Models and an introduction to GARCH models.

Objective

The goal of the course is to have a good overview of the different types of time series and the approaches used in their statistical analysis.

Content

This course treats modeling and analysis of time series, that is random variables which change in time. As opposed to the i.i.d. framework, the main feature exhibited by time series is the dependence between successive observations.

The key topics which will be covered as:

- Stationarity
- Autocorrelation
- Trend estimation
- Elimination of seasonality
- Spectral analysis, spectral densities
- Forecasting
- ARMA, ARIMA, Introduction into GARCH models

Literature

The main reference for this course is the book "Introduction to Time Series and Forecasting", by P. J. Brockwell and R. A. Davis

Abstract

In this course we study the basics of theoretical statistics. The course includes methods for designing estimators, confidence intervals and tests, and various ways to evaluate the accuracy of estimators, confidence intervals and tests. We consider optimality criteria such as admissibility and minimaxity, as well as Bayesian criteria. We will also present the asymptotic point of view.

Objective

The aim of this course is to gain insight into the main statistical ideas and concepts. The course considers classical low-dimensional models, with pointers towards today's highly complex models.
401-3601-00L Probability Theory
At most one of the three course units (Bachelor Core Courses) 401-3461-00L Functional Analysis I 401-3531-00L Differential Geometry I 401-3601-00L Probability Theory can be recognised for the Master's degree in Mathematics or Applied Mathematics. In this case, you cannot change the category assignment by yourself in myStudies but must take contact with the Study Administration Office (www.math.ethz.ch/studiensekretariat) after having received the credits. Moreover, 401-3601-00L Probability Theory can only be recognised for the Master Programme in Mathematics if neither 401-3642-00L Brownian Motion and Stochastic Calculus nor 401-3602-00L Applied Stochastic Processes has been recognised for the Bachelor Programme.

Abstract Basics of probability theory and the theory of stochastic processes in discrete time

Objective This course presents the basics of probability theory and the theory of stochastic processes in discrete time. The following topics are planned:
- measure theory formalism and probability theory, Dynkin's lemma and independence, convergence of series of independent random variables, law of large numbers, conditional expectation, martingale convergence theorems, uniform integrability, optional stopping theorem for martingales, the Bienaymé-Galton-Watson process and its R-number, convergence in distribution and the central limit theorem.

Content This course presents the basics of probability theory and the theory of stochastic processes in discrete time. The following topics are planned:
- measure theory formalism and probability theory, Dynkin's lemma and independence, convergence of series of independent random variables, law of large numbers, conditional expectation, martingale convergence theorems, uniform integrability, optional stopping theorem for martingales, the Bienaymé-Galton-Watson process and its R-number, convergence in distribution and the central limit theorem.

Lecture notes will be available in electronic form.

Prerequisites / notice Prerequisites: - Measure Theory - Basic notions in probability theory (probability space, conditional probability, Borel Cantelli, Dynkin Lemma, random variables, expectation, variance, law of large numbers).

Subject Specific Electives

Data: 06.08.2024 12:40 Autumn Semester 2024 Page 2371 of 2684
In statistics, we are used to search for the best predictors of some random variable. In many situations, however, we are interested in finding knowledge of basic concepts in probability theory, and intermediate knowledge of statistics (e.g. a course in linear models or computational statistics).

### Literature

### Prerequisites / notice

Knowledge of basic concepts in probability theory, and intermediate knowledge of statistics (e.g. a course in linear models or computational statistics).

#### 401-4632-15L Causality

**Objective**

- understand the language and concepts of causal inference
- know the assumptions under which one can infer causal relations from observational and/or interventional data
- describe and apply different methods for causal structure learning
- given data and a causal structure, derive causal effects and predictions of interventional experiments

**Content**

The material covered in this course has a significant overlap with the material that has been covered in 401-3620-22L Student Seminar in Statistics: Causality FS2023.

**Literature**

Parts of this course will be based on the book "Elements of Causal Inference" (MIT Press, open access). More details will follow.

**Prerequisites / notice**

Prerequisites: basic knowledge of probability theory and regression

**Competencies**

- Subject-specific Competencies
- Concepts and Theories
- assessed
- Techniques and Technologies
- assessed

---

#### 401-3612-00L Stochastic Simulation

**Abstract**

This course provides an introduction to statistical Monte Carlo methods. This includes applications of simulations in various fields (Bayesian statistics, statistical mechanics, operations research, financial mathematics), algorithms for the generation of random variables (accept-reject, importance sampling), estimating the precision, variance reduction, introduction to Markov chain Monte Carlo.

**Objective**

Stochastic simulation (also called Monte Carlo method) is the experimental analysis of a stochastic model by implementing it on a computer. Probabilities and expected values can be approximated by averaging simulated values, and the central limit theorem gives an estimate of the error of this approximation. The course shows examples of the many applications of stochastic simulation and explains different algorithms used for simulation. These algorithms are illustrated with the statistical software R.

**Content**

- Examples of simulations in different fields (computer science, statistics, statistical mechanics, operations research, financial mathematics).
- Generation of uniform random variables.
- Generation of random variables with arbitrary distributions (quantile transform, accept-reject, importance sampling).
- Simulation of Gaussian processes and diffusions. The precision of simulations, methods for variance reduction.
- Introduction to Markov chains and Markov chain Monte Carlo (Metropolis-Hastings, Gibbs sampler, Hamiltonian Monte Carlo, reversible jump MCMC).

**Lecture notes**

A script will be available in English.

**Literature**

**Prerequisites / notice**

Prerequisites: basic knowledge of probability theory (random variables, joint and conditional distributions, laws of large numbers and central limit theorem) will be assumed.

---

#### 401-4633-00L Data Analytics in Organisations and Business

**Abstract**

This lecture covers organizations and businesses’ end-to-end data analytics process and deepens each process stage. It shows why a stage is needed and what actions are taken in each stage. It gives steps successfully applied in practice and loopholes when issues arise. Case studies from various industries will be presented for each stage.

**Objective**

This course aims to give the students an understanding of the whole data analytics life cycle in the business world. It shows the expectations of companies and how it is measured. It enables the student to manage successfully all the non-methodological aspects of a data analytics project which are the primary source of failure in end-to-end executions. The student will become familiar with the "business language, and cultural aspects of organizations. It also gives an overview of the data analytics tool, platform, and methods ecosystem for successfully technical data analyses.

**Content**

1) Introduction
2) Framing the business problem
3) Framing the analytics problem
4) Data
5) Identification of problem-solving approaches and appropriate tools
6) How to set up and validate models
7) The deployment of a model
8) Model lifecycle
9) Operating models and roles
10) Some words about soft skills needed by statistical and mathematical professionals

**Lecture notes**

The lecture's presentation slides will be provided.

**Prerequisites / notice**

Prerequisites: Basic statistics and probability theory and regression

---

#### 401-6217-00L Using R for Data Analysis and Graphics (Part II)

**Abstract**

The course provides the second part an introduction to the statistical software R for scientists. Topics are data generation and selection, graphical functions, important statistical functions, types of objects, models, programming and writing functions.

**Objective**

The students will be able to use the software R efficiently for data analysis, graphics and simple programming.
The course provides the second part of an introduction to the statistical software R (https://www.r-project.org/) for scientists. R is free software that contains a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

Part II of the course builds on part I and covers the following additional topics:
- Elements of the R language: control structures (if, else, loops), lists, overview of R objects, attributes of R objects;
- More on R functions;
- Applying functions to elements of vectors, matrices and lists;
- Object oriented programming with R: classes and methods;
- Tayloring R: options
- Extending basic R: packages

The course focuses on practical work at the computer. We will make use of the graphical user interface RStudio: www.rstudio.org

An Introduction to R. http://stat.ethz.ch/CRAN/doc/contrib/Lam-IntroductionToR_LHL.pdf

Basic knowledge of R equivalent to "Using R .. (part 1)" (= 401-6215-00L ) is a prerequisite for this course.

The course resources will be provided via the Moodle web learning platform. As from FS 2019, subscribing via Mystudies should *automatically* make you a student participant of the Moodle course of this lecture, which is at

https://moodle-app2.let.ethz.ch/course/view.php?id=20848

**401-0627-00L** **Smoothing and Nonparametric Regression with Examples**

**W** 4 credits  **2G**  S. Beran-Ghosh

**Abstract**
Starting with an overview of selected results from parametric inference, kernel smoothing will be introduced along with some asymptotic theory, optimal bandwidth selection, data driven algorithms and some special topics. Selected numerical examples will be used for motivation. The presented methods will also be applicable elsewhere.

**Objective**
The students will learn about methods of kernel smoothing and application of concepts to data. The aim will be to build sufficient interest in the topic and intuition as well as the ability to implement the methods to various different datasets.

**Content**
Rough Outline:
- Parametric estimation methods: selection of important results
  - Method of Least squares: regression & diagnostics
- Nonparametric curve estimation
  - Density estimation, Kernel regression, Local polynomials, Bandwidth selection, various theoretical results related to consistency
  - Selection of special topics (as time permits, we will discuss some of the following): rapid change points, mode estimation, partial linear models, probability and quantile curve estimation, etc.
- Applications: potential areas of applications will be discussed such as, change assessment, trend and surface estimation and others.

**Lecture notes**
Summaries or outlines of some of the lecture material may be communicated to registered students by Email at irregular intervals.

Note: These summaries/outlines will tend to be brief, likely to be incomplete & may have typos. Only in-class lessons will contain complete information.

**Literature**
References:
- Statistical Inference, by S.D. Silvey, Chapman & Hall.
- Density Estimation, by B.W. Silverman, Chapman and Hall.
- Nonparametric Simple Regression, by J. Fox, Sage Publications.

Additional references will be given out in the lectures.

**Prerequisites / notice**
Prerequisites: A background in Linear Algebra, Calculus, Probability & Statistical Inference including Estimation and Testing.

### Subject-specific Competencies

**Mathematical treatment of optimization techniques for linear and combinatorial optimization problems.**

**Concepts and Theories**

- Bayesian Statistics

**Prerequisites / notice**

Familiarity with basic concepts of frequentist statistics and with basic concepts of probability theory (random variables, joint and conditional distributions, laws of large numbers and central limit theorem) will be assumed.

**Competencies**

- Subject-specific Competencies: fostered
- Analytical Competencies: fostered
- Decision-making: fostered
- Media and Digital Technologies: fostered
- Problem-solving: fostered
- Creativity: fostered
- Critical Thinking: fostered
- Integrity and Work Ethics: fostered
- Self-awareness and Self-reflection: fostered
- Self-direction and Self-management: fostered

### Bayesian Statistics

**401-3628-14L**

**Bayesian Statistics**

**W** 4 credits 2V

**Abstract**

Introduction to the Bayesian approach to statistics: decision theory, prior distributions, hierarchical Bayes models, empirical Bayes, Laplace approximation, Monte Carlo and Markov chain Monte Carlo methods.

**Objective**

Students understand the conceptual ideas behind Bayesian statistics and are familiar with common techniques used in Bayesian data analysis.

**Content**

Topics that we will discuss are:

- Difference between the frequentist and Bayesian approach (decision theory, principles), priors (conjugate priors, noninformative priors, Jeffreys prior), tests and model selection (Bayes factors, hyper-g priors for regression), hierarchical models and empirical Bayes methods, computational methods (Laplace approximation, Monte Carlo and Markov chain Monte Carlo methods).

**Literature**

- Additional references will be given in the course.

---

### Markov Processes

**401-3823-74L**

**Markov Processes**

**W** 3 credits 1V

**Abstract**

This course is meant to serve as an introduction to the theory of Markov processes on finite or countable state spaces. We will discuss what a Markov process is along with associated concepts such as transition probabilities, recurrence, transience, ergodicity, reversibility etc. We will motivate various abstract notions introduced with concrete examples from physics and statistics.

**Objective**

I. Discrete-time Markov processes, i.e. Markov chains, e.g. the random walk on the integers
II. Transition probabilities and Doeblin's theorem
III. Stationary probabilities and ergodic properties
IV. Continuous-time Markov processes. e.g. the Poisson process
V. Reversibility

**Literature**

An Introduction to Markov Processes: Daniel W. Stroock

- Additional references will be given in the course.

---

### Linear & Combinatorial Optimization

**401-3901-00L**

**Linear & Combinatorial Optimization**

**W** 10 credits 4V+2U

**Abstract**

Mathematical treatment of optimization techniques for linear and combinatorial optimization problems.

The goal of this course is to get a thorough understanding of various classical mathematical optimization techniques for linear and combinatorial optimization problems, with an emphasis on polyhedral approaches. In particular, we want students to develop a good understanding of some important problem classes in the field, of structural mathematical results linked to these problems, and of solution approaches based on such structural insights.

---

**Data: 06.08.2024 12:40 Autumn Semester 2024 Page 2374 of 2684**
Content

Key topics include:
- Linear programming and polyhedra;
- Flows and cuts;
- Combinatorial optimization problems and polyhedral techniques;
- Equivalence between optimization and separation.

Literature

Prerequisites / notice

Solid background in linear algebra.

Competencies

Mathematics of Data Science

W 8 credits 3V+2U A. Bandeira

Abstract

Mostly self-contained, but fast-paced, introductory masters level course on various theoretical aspects of algorithms that aim to extract information from data.

Objective

Introduction to various mathematical aspects of Data Science.

Content

These topics lie in overlaps of Mathematics with: Computer Science, Electrical Engineering, Statistics, and/or Operations Research. Most lectures will feature Mathematical Open Problems. The main mathematical tools used will be Probability and Linear Algebra, and a basic familiarity with these subjects is required. There will also be some (although knowledge of these tools is not assumed) Graph Theory, Representation Theory, Applied Harmonic Analysis, among others. The topics treated will include Dimension reduction, Manifold learning, Sparse recovery, Random Matrices, Approximation Algorithms, Community detection in graphs, and several others.

Lecture notes

Prerequisites / notice

The main mathematical tools used will be Probability, Linear Algebra (and real analysis), and a working knowledge of these subjects is required. In addition to these prerequisites, this class requires a certain degree of mathematical maturity--including abstract thinking and the ability to understand and write proofs.

We encourage students who are interested in mathematical data science to take both this course and "227-0434-10L Mathematics of Information" taught by Prof. H. Bölcskei. The two courses are designed to be complementary.

A. Bandeira and H. Bölcskei

401-4656-21L

AI in the Sciences and Engineering

W 6 credits 2V+2U S. Mishra

Aimed at students in a Master's Programme in Mathematics, Engineering and Physics.

Abstract

AI is having a profound impact on science by accelerating discoveries across physics, chemistry, biology, and engineering. This course aims to present a highly topical selection of AI applications across these fields. Emphasis will be placed on using AI, particularly deep learning, to understand systems modelled by PDEs, and key scientific machine learning concepts and themes will be discussed.

Objective

Learning objectives:

- Aware of advanced applications of AI in the sciences and engineering
- Familiar with the design, implementation, and theory of these algorithms
- Understand the pros/cons of using AI and deep learning for science
- Understand key scientific machine learning concepts and themes
Content
A selection of the following topics will be presented in the lectures:

1. Key scientific tasks common to many scientific domains, such as simulation, inverse problems, equation discovery, design, and control problems, and issues with traditional methods for solving them
2. Neural operators, including Fourier neural operators and DeepONets, for learning efficient surrogate models, and their theoretical foundations
3. Differentiable scientific algorithms, neural differential equations, and the benefits of hybrid workflows
4. AI for symbolic regression and equation discovery
5. Applications of graph neural networks in science
6. Applications of graph neural networks in science
7. Guest lectures on AI for chemistry and biology
8. Large language models and other Foundation models for scientific discovery

Applications using these techniques will be illustrated across fluid dynamics, wave physics, medical physics, molecular design, and computational biology. Several examples where AI algorithms outperform traditional scientific workflows will be shown.

Lecture notes
Lecture slides, recordings, and tutorials will be available on the course webpage.

Literature
All the material in the course is based on research articles written in last 1-3 years. The relevant references will be provided.

Prerequisites / notice
- An understanding of basic ML concepts including supervised learning, overfitting/underfitting, optimisation, and neural networks is required; you should understand the main concepts in the ETH 252-0229-00L Introduction to Machine Learning course (but note, completing this course is not a formal requirement)
- Familiar with PDEs and numerical methods for solving them
- Basic competence in Python and some practical familiarity with deep learning frameworks (e.g., PyTorch, TensorFlow, or Keras)

401-3931-00L Responsible Machine Learning with Insurance Applications

W 4 credits 2G M. Mayer, C. Lorentzen-Geiser

Abstract
This lecture covers important aspects of applying supervised machine learning models in a responsible way, based on sound statistical theory. The focus is on model interpretability, calibration (bias) assessment, and proper model comparison. The methods are illustrated with actuarial datasets.

Objective
The student is familiar with the main tools of model interpretability, calibration assessment, and model comparison and knows how to apply supervised machine learning in a responsible way.

Content
- Overview of supervised machine learning (statistical learning theory, GLMs, tree based methods, and neural nets; cross-validation)
- Model interpretability: methods (partial dependence plots, measures of variable importance, and SHAP)
- Bias/calibration assessment with identification functions
- Model comparison with consistent scoring functions
- Working with dependent observations and further topics

Prerequisites / notice
This course will be held in English and counts towards the diploma of “Aktuar SAV”. For the latter, see details under www.actuaries.ch.

252-0535-00L Advanced Machine Learning

W 10 credits 3V+2U+4A J. M. Buhmann, C. Cotrini Jimenez

Abstract
Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

Objective
Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real-world data.

Content
The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:
- Fundamentals:
  - What is data?
  - Bayesian Learning
- Computational learning theory
- Supervised learning:
  - Ensembles: Bagging and Boosting
  - Max Margin methods
  - Neural networks
- Unsupervised learning:
  - Dimensionality reduction techniques
  - Clustering
  - Mixture Models
  - Non-parametric density estimation
- Learning Dynamic Systems

Lecture notes
No lecture notes, but slides will be made available on the course webpage.
Natural Language Processing

W 7 credits 3V+3U+1A R. Cotterell

Abstract
This course presents topics in natural language processing with an emphasis on modern techniques, primarily focusing on statistical and deep learning approaches. The course provides an overview of the primary areas of research in language processing as well as a detailed exploration of the models and techniques used both in research and in commercial natural language systems.

Objective
The objective of the course is to learn the basic concepts in the statistical processing of natural languages. The course will be project-oriented so that the students can also gain hands-on experience with state-of-the-art tools and techniques.

Content
This course presents an introduction to general topics and techniques used in natural language processing today, primarily focusing on statistical approaches. The course provides an overview of the primary areas of research in language processing as well as a detailed exploration of the models and techniques used both in research and in commercial natural language systems.

Literature
Lectures will make use of textbooks such as the one by Jurafsky and Martin where appropriate, but will also make use of original research and survey papers.

Neural Network Theory

W 4 credits 2V+1U H. Bölcskei

Abstract
The class focuses on fundamental mathematical aspects of neural networks with an emphasis on deep networks: Universal approximation theorems, capacity of separating surfaces, generalization, fundamental limits of deep neural network learning, VC dimension.

Objective
After attending this lecture, participating in the exercise sessions, and working on the homework problem sets, students will have acquired a working knowledge of the mathematical foundations of neural networks.

Content
1. Universal approximation with single- and multi-layer networks
2. Introduction to approximation theory: Fundamental limits on compressibility of signal classes, Kolmogorov epsilon-entropy of signal classes, non-linear approximation theory
3. Fundamental limits of deep neural network learning
4. Geometry of decision surfaces
5. Separating capacity of nonlinear decision surfaces
6. Vapnik-Chervonenkis (VC) dimension
7. VC dimension of neural networks
8. Generalization error in neural network learning

Lecture notes
Detailed lecture notes are available on the course web page https://www.mins.ee.ethz.ch/teaching/nnt/

Prerequisites / notice
This course is aimed at students with a strong mathematical background in general, and in linear algebra, analysis, and probability theory in particular.

Deep Learning

W 8 credits 3V+2U+2A T. Hofmann

Abstract
Deep learning is an area within machine learning that deals with algorithms and models that automatically induce multi-level data representations.

Objective
In recent years, deep learning and deep networks have significantly improved the state-of-the-art in many application domains such as computer vision, speech recognition, and natural language processing. This class will cover the mathematical foundations of deep learning and provide insights into model design, training, and validation. The main objective is a profound understanding of why these methods work and how. There will also be a rich set of hands-on tasks and practical projects to familiarize students with this emerging technology.
Prerequisites / notice

This is an advanced level course that requires some basic background in machine learning. More importantly, students are expected to have a very solid mathematical foundation, including linear algebra, multivariate calculus, and probability. The course will make heavy use of mathematics and is not (!) meant to be an extended tutorial of how to train deep networks with tools like Torch or Tensorflow, although that may be a side benefit.

The participation in the course is subject to the following condition:
- Students must have taken the exam in Advanced Machine Learning (252-0535-00) or have acquired equivalent knowledge, see exhaustive list below:

Advanced Machine Learning
https://ml2.inf.ethz.ch/courses/aml/

Probabilistic Artificial Intelligence
https://las.inf.ethz.ch/teaching/pai-f18

Abstract

This course introduces core modeling techniques and algorithms from machine learning, optimization and control for reasoning and decision making under uncertainty, and study applications in areas such as robotics.

Objective

How can we build systems that perform well in uncertain environments? How can we develop systems that exhibit "intelligent" behavior, without prescribing explicit rules? How can we build systems that learn from experience in order to improve their performance? We will study core modeling techniques and algorithms from statistics, optimization, planning, and control and study applications in areas such as robotics. The course is designed for graduate students.

Content

Topics covered:
- Probability
- Probabilistic inference (variational inference, MCMC)
- Bayesian learning (Gaussian processes, Bayesian deep learning)
- Probabilistic planning (MDPs, POMDPs)
- Multi-armed bandits and Bayesian optimization
- Reinforcement learning

Prerequisites / notice

Solid basic knowledge in statistics, algorithms and programming.
The material covered in the course "Introduction to Machine Learning" is considered as a prerequisite.

Competencies

Subject-specific Competencies
Concepts and Theories assessed
Techniques and Technologies assessed

Method-specific Competencies
Analytical Competencies assessed
Decision-making assessed
Media and Digital Technologies assessed
Problem-solving assessed
Project Management assessed

Social Competencies

Guarantees for Machine Learning

Does not take place this semester.

Abstract

This course is aimed at advanced master and doctorate students who want to conduct independent research on theory for modern machine learning (ML). It teaches standard methods in statistical learning theory commonly used to prove theoretical guarantees for ML algorithms. The knowledge is then applied in independent project work to understand and follow-up on recent theoretical ML results.

Objective

By the end of the semester students should be able to
- understand a good fraction of theory papers published in the typical ML venues. For this purpose, students will learn common mathematical techniques from statistical learning in the first part of the course and apply this knowledge in the project work
- critically examine recently published work in terms of relevance and find impactful (novel) research problems. This will be an integral part of the project work and involves experimental as well as theoretical questions
- outline a possible approach to prove a conjectured theorem by e.g. reducing to more solvable subproblems. This will be practiced in in-person exercises, homeworks and potentially in the final project
- effectively communicate and present the problem motivation, new insights and results to a technical audience. This will be primarily learned via the final presentation and report as well as during peer-grading of peer talks.
Creating reliable, secure, robust, and fair machine learning models is a core challenge in artificial intelligence and one of fundamental importance. The goal of the course is to teach both the mathematical foundations of this new and emerging area as well as to introduce students to the latest and most exciting research in the space.

The project work focuses on current theoretical ML research that aims to understand modern phenomena in machine learning, including but not limited to:
- How overparameterized models generalize (statistically) and converge (computationally)
- Complexity measures and approximation theoretic properties of randomly initialized and trained neural networks
- Generalization of robust learning (adversarial or distribution-shift robustness)
- Private and fair learning

Students should have a very strong mathematical background (real analysis, probability theory, linear algebra) and solid knowledge of core concepts in machine learning taught in courses such as “Introduction to Machine Learning”, “Regression”/“Statistical Modelling”. In addition to these prerequisites, this class requires a high degree of mathematical maturity—including abstract thinking and the ability to understand and write proofs.

Students have usually taken a subset of Fundamentals of Mathematical Statistics, Probabilistic AI, Neural Network Theory, Optimization for Data Science, Advanced ML, Statistical Learning Theory, Probability Theory (D-MATH)

| 263-2400-00L | Reliable and Trustworthy Artificial Intelligence | W | 6 credits | 2V+2U+1A | M. Vechev

Abstract: Creating reliable, secure, robust, and fair machine learning models is a core challenge in artificial intelligence and one of fundamental importance. The goal of the course is to teach both the mathematical foundations of this new and emerging area as well as to introduce students to the latest and most exciting research in the space.

Objective: Upon completion of the course, the students should have mastered the underlying methods and be able to apply them to a variety of engineering and research problems. To facilitate deeper understanding, the course includes a group coding project where students will build a system based on the learned material.

Content: The course is split into 4 parts:

Robustness of Machine Learning

- Adversarial attacks and defenses on deep learning models.
- Certified training of deep neural networks (combining symbolic and continuous methods).

Privacy of Machine Learning

- Threat models (e.g., stealing data, poisoning, membership inference, etc.).
- Differential privacy for defending machine learning.
- AI Regulations and checking model compliance.

Fairness of Machine Learning

- Introduction to fairness (motivation, definitions).
- Enforcing individual fairness (for both vision and tabular data).
- Enforcing group fairness (e.g., demographic parity, equalized odds).

Robustness, Privacy and Fairness of Foundation Models

- We discuss all previous topics, as well as programmability, in the context of latest foundation models (e.g., LLMs).

Prerequisites / notice: While not a formal requirement, the course assumes familiarity with basics of machine learning (especially linear algebra, gradient descent, and neural networks as well as basic probability theory). These topics are usually covered in “Intro to ML” classes at most institutions (e.g., “Introduction to Machine Learning” at ETH).

The coding project will utilize Python and PyTorch. Thus some programming experience in Python is expected. Students without prior knowledge of PyTorch are expected to acquire it early in the course by solving exercise sheets.

| 263-5056-00L | Applications of Deep Learning on Graphs | W | 4 credits | 2G+1A | G. Rätsch

Abstract: Graphs are an incredibly versatile abstraction to represent arbitrary structures such as molecules, relational knowledge or social and traffic networks. This course provides a practical overview of deep (representation) learning on graphs and their applications.
Objective

Many established deep learning methods require dense input data with a well-defined structure (e.g. an image, a sequence of word embeddings). However, many practical applications deal with sparsely connected and complex data structures, such as molecules, knowledge graphs or social networks. Graph Neural Networks (GNNs) and general representation learning on graphs have recently experienced a surge in popularity because it addresses the challenge to effectively learn representations over said structures. In this course, we aim to understand the fundamental principles of deep (representation) learning on graphs, the similarities and differences to other concepts in deep learning, as well as the unique challenges from a practical point of view. Finally, we provide an overview of recent applications of graph neural networks.

Content

Introduction to GNN concepts: 1) problem-solving on graphs (node-, edge-, graph-level objectives), structural priors (inductive biases) of graph data, application for graph learning. 2) Graph Neural Networks: convolutional, attentional, message passing; overview on the zoo of published operators. Relations to Transformers and DeepSets. 3) Expressivity of GNNs. 4) Scalability of Graph Neural Networks: Subsampling, Clustering (Pooling). 5) Augmentations and self-supervised learning on Graphs Application: Drug Discovery, Knowledge graphs, Temporal GNMs. Geometric GNMs, Deep Generative Models for Graphs.

Prerequisites / notice

263-3210-00 Depp Learning or 263-0008-00 Computational Intelligence Lab; 252-0220-00 Introduction to Machine Learning; Statistics/Probability; Programming in Python; Unix Command Line.

263-5351-00L Machine Learning for Genomics

Objective

Over the last few years, the parallel development of machine learning, methods and molecular profiling technologies for human cells, such as sequencing, created an extremely powerful tool to get insights into the cellular mechanisms in healthy and diseased contexts. In this course, we will discuss the state-of-the-art machine learning methodology solving or attempting to solve common problems in human genomics. At the end of the course, you will be familiar with (1) classical and advanced machine learning architectures used in genomics, (2) bioinformatics analysis of human genomic and transcriptomic data methodology, and (3) data types used in this field.

Content

- Short introduction to major concepts of molecular biology: DNA, genes, genome, central dogma, transcription factors, epigenetic code, DNA methylation, signaling pathways
- Prediction of transcription factor binding sites, open chromatin, histone marks, promoters, nucleosome positioning (convolutional neural networks, position weight matrices)
- Prediction of variant effects and gene expression (hidden Markov models, topic models)
- Deconvolution of mixed signal (NMF, ICA)
- DNA, RNA and protein folding (RNN, LSTM, transformers)
- Data imputation for single-cell RNA-seq data, clustering and annotation (diffusion and methods on graphs)
- Batch correction (autoencoders, optimal transport)
- Survival analysis (Cox proportional hazard model, regularization penalties, multi-omics, multi-tasking)

401-6282-00L Statistical Analysis of High-Throughput Genomic and Transcriptomic Data (University of Zurich)

Objective

- Understand the fundamental "scientific process" in the field of Statistical Bioinformatics
- Be equipped with the skills/tools to preprocess genomic data (Unix, Bioconductor, mapping, etc.) and ensure reproducible research (Sweave)
- Have a general knowledge of the types of data and biological applications encountered with microarray and sequencing data
- Have the general knowledge of the range of statistical methods that get used with microarray and sequencing data
- Gain the ability to apply statistical methods/knowledge/software to a collaborative biological project
- Gain the ability to critically assess the statistical bioinformatics literature
- Write a coherent summary of a bioinformatics problem and its solution in statistical terms

Content

Lectures will include: microarray preprocessing; normalization; exploratory data analysis techniques such as clustering, PCA and multidimensional scaling; Controlling error rates of statistical tests (FPR versus FDR versus FWER); Imma (linear models for microarray analysis); mapping algorithms (for RNA/ChIP-seq); RNA-seq quantification; statistical analyses for differential count data; isoform switching; epigenomics data including DNA methylation; gene set analyses; classification

Lecture notes

Lecture notes, published manuscripts

Prerequisites / notice

Prerequisites: Basic knowledge of the programming language R, sufficient knowledge in statistics

Former course title: Statistical Methods for the Analysis of Microarray and Short-Read Sequencing Data

401-8625-00L Clinical Biostatistics (University of Zurich)

Objective

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: STA404

Abstract

Discussion of the different statistical methods that are used in clinical research.

Content

Discussion of the different statistical methods that are used in clinical research. Among other subjects the following will be introduced: sample size calculation, randomization and blinding, analysis of clinical trials (parallel groups design, analysis of covariance, crossover design, equivalence studies), intention-to-treat analysis, multiple testing, group sequential methods, adaptive designs, diagnostic studies, and agreement studies.
Supervisors

The seminar will cover a number of recent papers which have emerged as important contributions to the pattern recognition and machine learning literature. The topics will vary from year to year but they are centered on methodological issues in machine learning like new learning algorithms, ensemble methods or new statistical models for machine learning applications. Frequently, papers are selected from recent literature. The topics will play an important role and should reach the level of professional scientific presentations.

Abstract

Semester papers serve to delve into a problem in statistics and to study it with the appropriate methods or to compile and clearly exhibit a case study of a statistical evaluation.

Prerequisites

Basic knowledge of the programming language R, sufficient knowledge in calculus, linear algebra, probability, statistics

Abstract

In this seminar, recent papers of the pattern recognition and machine learning literature are presented and discussed. Possible topics cover statistical models in computer vision, graphical models and machine learning.

Objective

The seminar "Advanced Topics in Machine Learning" familiarizes students with recent developments in pattern recognition and machine learning. Original articles have to be presented and critically reviewed. The students will learn how to structure a scientific presentation in English which covers the key ideas of a scientific paper. An important goal of the seminar presentation is to summarize the essential ideas of the paper in sufficient depth while omitting details which are not essential for the understanding of the work. The presentation style will play an important role and should reach the level of professional scientific presentations.

Content

The seminar will cover a number of recent papers which have emerged as important contributions to the pattern recognition and machine learning literature. The topics will vary from year to year but they are centered on methodological issues in machine learning like new learning algorithms, ensemble methods or new statistical models for machine learning applications. Frequently, papers are selected from computer vision or bioinformatics - two fields, which relies more and more on machine learning methodology and statistical models.

Literature

The papers will be presented in the first session of the seminar.

| Free Electives |

Several further courses offered at the University of Zurich belong to the curriculum of the Master's Programme in Statistics. With the consent by the Advisor (http://stat.ethz.ch/~kalisch/) such a course is eligible as a free elective.

| Science in Perspective |

Two credits are needed from the "Science in Perspective" programme with language courses excluded if three credits from language courses have already been recognised for the Bachelor's degree. see https://ethz.ch/content/dam/ethz/common/docs/weisungssammlung/files-en/science-in-perspective.pdf (Eight credits must be acquired in this category: normally six during the Bachelor's degree programme, and two during the Master's degree programme. A maximum of three credits from language courses from the range of the Language Center of the University of Zurich and ETH Zurich may be recognised. In addition, only advanced courses (level B2 upwards) in the European languages English, French, Italian and Spanish are recognised. German language courses are recognised from level C2 upwards.)

Target audience:
Third year Bachelor students;
Master students who cannot document to have received
an adequate training in working scientifically.

Abstract
Introduction to scientific writing for students with focus on publication standards and ethical issues, especially in the case of citations (references to works of others.)

Objective
Learn the basic standards of scientific works in mathematics.

Content
- Types of mathematical works
- Publication standards in pure and applied mathematics
- Data handling
- Ethical issues
- Citation guidelines

Prerequisites / notice

401-2000-01L
Lunch Sessions – Thesis Basics for Mathematics
Students
Details and registration for the optional MathBib training course: https://www.math.ethz.ch/mathbib-schulungen

Abstract
Optional MathBib training course

401-4990-02L
Master's Thesis

Abstract
The master's thesis concludes the study programme. Thesis work should prove the students' ability to independent, structured and scientific working.

Objective
Thesis work should prove the students' ability to independent, structured and scientific working.

Content
Five-month project to solve a research question. The content can be more theoretical (e.g. proving a new result) or applied (developing new methods or making a very sophisticated application and adapting existing methods).

Prerequisites / notice
Supervisors are chosen on a first-come-first-served basis. Collaborations with industry are possible.

Course Units for Additional Admission Requirements

406-0603-AAL  Stochastics (Probability and Statistics)  E-  4 credits  9R  M. Kalisch
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Introduction to basic methods and fundamental concepts of statistics and probability theory for non-mathematicians. The concepts are presented on the basis of some descriptive examples. Learning the statistical program R for applying the acquired concepts will be a central theme.

Objective
The objective of this course is to build a solid fundament in probability and statistics. The student should understand some fundamental concepts and be able to apply these concepts to applications in the real world. Furthermore, the student should have a basic knowledge of the statistical programming language "R".

Content

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
- Probability spaces
- Discrete models, Random walk
- Conditional probabilities, independence
- Continuous models
- Limit theorems
- Methods of moments
- Maximum likelihood estimation
- Hypothesis testing
- Confidence intervals
- Introductory Bayesian statistics
- Linear regression model
Objective
The first part of the course gives an overview of the main concepts needed to understand probability theory (sample spaces, discrete models, random walk, continuous models and limit theorems such as the Laws of Large Numbers and the Central limit theorem). It will be based on the German script "Wahrscheinlichkeitsrechnung und Statistik".

The second part covers some fundamental results of mathematical statistics including estimation methods, hypothesis testing as well as the linear regression model. For this part, we will use the script "Statistics for Mathematics". Both scripts are available at https://www.stat.math.ethz.ch/~fadouab/

Content
Probability:
- Chapters 1-5 (Probabilities and events, Discrete and continuous random variables, Generating functions) and Sections 7.1-7.5 (Convergence of random variables) from the book "Probability and Random Processes". Most of this material is also covered in Chap. 1-5 of "Mathematical Statistics and Data Analysis"; on a slightly easier level.

Statistics:
- Sections 8.1 - 8.5 (Estimation of parameters), 9.1 - 9.4 (Testing Hypotheses), 11.1 - 11.3 (Comparing two samples) from "Mathematical Statistics and Data Analysis".

151-0223-10L Engineering Mechanics

O 4 credits 2V+2U+1K P. Tiso

Abstract
Introduction to engineering mechanics: kinematics, statics and dynamics of rigid bodies and systems of rigid bodies.

Objective
By learning the basics of kinematics, statics and dynamics, students should gain a basic understanding of the subject matter with which simple problems in engineering mechanics can be analyzed and solved. Based on this, further lectures, which require knowledge of mechanics, can be attended.

Content
- Basic notions: position and velocity of particles, rigid bodies, planar motion, kinematics of rigid bodies, force, torque, power.
- Statics: static equivalence, center of forces, centroid, principle of virtual power, equilibrium, constraints, analytical statics, friction.
- Dynamics: acceleration, inertial forces, d'Alembert's Principle, Newton's Second Law, principles of linear and angular momentum, equations of planar motion of rigid bodies.

Lecture notes
yes, in German

Abstract
General Chemistry I: Chemical bond and molecular structure, chemical thermodynamics, chemical equilibrium.

In the course "Chemistry I", the competencies of process understanding, system understanding, modeling, concept development and data analysis & interpretation are taught, applied and examined.

Objective
Introduction to general and inorganic chemistry. Basics of the composition and the change of the material world. Introduction to the thermodynamically controlled physico-chemical processes. Macroscopic phenomena and their explanation through atomic and molecular properties. Using the theories to solve qualitatively and quantitatively chemical and ecologically relevant problems.
Content

1. Stoichiometry
   Amount of substance and mass. Composition of chemical compounds. Reaction equation. Ideal gas law.

2. Atoms
   Elementary particles and atoms. Electron configuration of the elements. Periodic system.

4. Basics of chemical thermodynamics
   System and surroundings. Description of state and change of state of chemical systems.

5. First law of thermodynamics

6. Second law of thermodynamics
   Entropy. Change of entropy in chemical systems and universe. Reaction entropy.

7. Gibbs energy and chemical potential.

8. Chemical equilibrium
   Law of mass action. Reaction quotient and equilibrium constant. Phase transition equilibrium.

9. Acids and bases

10. Dissolution and precipitation.
    Heterogeneous equilibrium. Dissolution and solubility product. Carbon dioxide-carbonic acid-carbonate equilibrium.

Abstract
In this course students are introduced to how environmental problems in the areas of water quantity and quality, waste production and recycling, air pollution control, are formulated and solved with engineering methods. The course makes a connection between the theoretical Bachelor foundation classes and practical topics of environmental engineering in six main thematic areas.

Objective
After completing this course, the student will be able to:
- formulate key global environmental problems
- develop a systems perspective and solutions to the problems (critical thinking)
- identify and solve simple numerical problems in the domain areas
- understand why/how we use data/models in environmental engineering
- develop own interest in the domain areas and see career opportunities

Content
Topics of study:
0. Introduction – description of the Earth System, main stressors, global warming, introduction into the methods and goals of environmental engineering.
1. Water Science & Engineering – definition of the global water cycle and hydrological regimes, surface/subsurface flow equations (advection, diffusion), water resources management, climate change.
4. River and Hydraulic Engineering – utility hydraulic engineering (hydropower production), protective hydraulic engineering (flood protection), waters protection (river restoration, ecological measures at hydropower plants).
5. Air Quality – air quality parameters, main air pollutants, air quality in cities/indoor, emission control, the plume dispersion model.
6. Earth Observation – satellite observation of the Earth System from space, methods, environmental applications (glaciers, forest, land surface change)

Lecture notes
Course will take place in English and German (bilingual). The English textbook by Masters and Ela (see below) will be complemented by instructors materials to the individual thematic topics. Lecture presentations will be the main study material. There is no formal Script.

Literature
- lecture presentations and selected papers
The course introduces the students to engineering hydrology. It covers first physical hydrology, that is the description and the measurement of hydrological processes (precipitation, interception, evapotranspiration, runoff, erosion, and snow), and it introduces then the basic mathematical models of the single processes and of the rainfall-runoff transformation, thereby including flood analysis.

- **Abstract**: The hydrological cycle: global water resources, water balance, space and time scales of hydrological processes. Precipitation: mechanisms of precipitation formation, precipitation measurements, variability of precipitation in space and time, precipitation regimes, point/basin precipitation, isohyetal method, Thiessen polygons, storm rainfall, design hyetograph.
- **Objective**: Know the main features of engineering hydrology. Apply methods to estimate hydrological variables for dimensioning hydraulic structures and managing water resources.

### Literature

### Prerequisites / notice

Knowledge of statistics is a prerequisite. The required theoretical background, which is needed for understanding part of the lectures and performing part of the assignments, may be summarised as follows:

- Elementary data processing: hydrological measurements and data, frequency distribution, hydrological analysis and classification of water resources, parametric and non-parametric tests, parameter estimation.

### Lecture notes

- The lecture notes as well as the lecture presentations and handouts may be downloaded from the website of the Chair of Hydrology and Water Resources Management.

### Second and Third Year Compulsory Courses

</table>
Objective
The students gain general knowledge of air pollution and study the methods used for air pollution control. The students know the different strategies of air pollution control and are familiar with their scientific fundamentals. The students can evaluate possible control methods and equipment, design control systems and estimate their efficiencies and costs. They are able to incorporate goals concerning air quality into their engineering work.

Content
The reduction of the formation of pollutants is done by modifying the processes (process-integrated measures) and by different engineering operations for the cleaning of waste gas (downstream pollution control). It will be demonstrated, that the variety of these procedures can be traced back to the application of a few basic physical and chemical principles.

Procedures for the removal of particles (inertial separator, filtration, electrostatic precipitators, scrubbers) with their different mechanisms (field forces, impaction and diffusion processes) and the modelling of these mechanisms will be covered.

Procedures for the removal of gaseous pollutants and the description of the driving forces involved, as well as the equilibrium and the kinetics of the relevant processes (absorption, adsorption as well as thermal, catalytic and biological conversions) will be covered.

Discussion of the technical possibilities to solve the actual air pollution problems will be conducted.

| Abstract    | This course gives an overview of important concepts in classical dynamics, thermodynamics, electromagnetism, quantum physics, atomic physics, and special relativity. Emphasis is placed on demonstrating key phenomena using experiments, and in developing skills for quantitative problem solving. |
| Objective   | The goal of this course is to make students able to explain and apply the basic principles and methodology of physics to problems of interest in modern science and engineering. An important component of this is learning how to solve new, complex problems by breaking them down into parts and applying simplifications. A secondary goal is to provide to students an overview of important subjects in both classical and modern physics. |
| Content     | Electrodynamics, Thermodynamics, Quantum physics, Waves and Oscillations, special relativity |
| Lecture notes | Lecture notes and exercise sheets will be distributed via Moodle |

#### Abstract
The aim of the course is to provide the fundamental knowledge about earth observation sensors, techniques and methods for bio/geophysical environmental parameter estimation.

#### Objective
1. Basics of measurement principle
2. Fundamentals of image acquisition
3. Basics of the sensor-specific geometries
4. Sensor-specific determination of environmental parameters

#### Content
Die Lehrveranstaltung gibt einen Einblick in die heutige Erdbeforschung mit dem folgenden skizzierten Inhalt:
1. Einführung in die Fernerkundung von Luft- und Weltraum gestützten Systemen
2. Einführung in das Elektromagnetische Spektrum
3. Einführung in optische Systeme (optisch und hyperspektral)
4. Einführung in Mikrowellen-Technik (aktiv und passiv)
5. Einführung in atmosphärische Systeme (meteo und chemisch)
6. Einführung in die Techniken und Methoden zur Bestimmung von Umweltparametern
7. Einführung in die Anwendungen zur Bestimmung von Umweltparametern in der Hydrologie, Glaziologie, Forst und Landwirtschaft, Geologie und Topographie

#### Lecture notes
Folien zu jeden Vorlesungsblock werden zur Verfügung gestellt.

#### Literature
Ausgewählte Literatur wird am Anfang der Vorlesung vorgestellt.

**Abstract**
- Systems Engineering is a way of thinking that helps engineer sustainable systems, i.e., ones that meet the needs of stakeholders in the short, medium and long term.
- This course provides an overview of the main principles of Systems Engineering, and includes an introduction to the use of operations research methods in the determination of optimal systems.

**Objective**

The world's growing population, changing demographics, and changing climate pose formidable challenges to humanity’s ability to live sustainably. Ensuring that humanity can live sustainably requires accommodating Earth’s growing and changing population through the provision and operation of a sustainable and resilient built environment. This requires ensuring excellent decision-making as to how the built environment is constructed and modified.

The objective of this course is to ensure the best possible decision making when engineering sustainable systems, i.e., ones that meet the needs of stakeholders in the short, medium and long term. In this course, you will learn the main principles of Systems Engineering that can help you from the first idea that a system may not meet expectations, to the quantitative and qualitative evaluation of possible system modifications. Additionally, the course includes an introduction to the use of operations research methods in the determination of optimal solutions in complex systems.

More specifically upon completion of the course, you will have gained insight into:
- how to structure the large amount of information that is often associated with attempting to modify complex systems
- how to set goals and define constraints in the engineering of complex systems
- how to generate possible solutions to complex problems in ways that limit exceedingly narrow thinking
- how to compare multiple possible solutions over time with differences in the temporal distribution of costs and benefits and uncertainty as to what might happen in the future
- how to assess values of benefits to stakeholders that are not in monetary units
- how to assess whether it is worth obtaining more information in determining optimal solution
- how to take a step back from the numbers and qualitatively evaluate the possible solutions in light of the bigger picture
- the basics of operations research and how it can be used to determine optimal solutions to complex problems, including linear, integer and network programming, dealing with multiple objectives and conducting sensitivity analyses.

**Content**

The lectures are structured as follows:

1. Introduction – An introduction to System Engineering, a way of thinking that helps to engineer sustainable systems, i.e. ones that meet the needs of stakeholders in the short, medium and long terms. A high-level overview of the main principles of System Engineering. The expectations of your efforts throughout the semester.
2. Situation analysis – How to structure the large amount of information that is often associated with attempting to modify complex systems.
3. Goals and constraints – How to set goals and constraints to identify the best solutions as clearly as possible.
4. Generation of possible solutions – How to generate possible solutions to problems, considering multiple stakeholders.
5. The principles of net-benefit maximization and a series of methods that range from qualitative and approximate to quantitative and exact, including pairwise comparison, elimination, weighting, and expected value.
6. The idea behind the supply and demand curves and revealed preference methods.
7. The concept of equivalence, including the time value of money, interest, life times and terminal values.
8. The relationship between net-benefit and the benefit-cost ratio. How incremental cost benefit analysis can be used to determine the maximum net benefit. Internal rates of return.
9. How to consider multiple possible futures and use simple rules to help pick optimal solutions and to determine the value of more information.
10. Once quantitative analysis is used it becomes possible to use operations research methods to analyse large numbers of possible solutions. Linear programming and the simplex method.
11. How sensitivity analysis is conducted using linear programming.
12. How to use operations research to solve problems that consist of discrete values, as well as how to exploit the structure of networks to find optimal solutions to network problems.
13. How to set up and solve problems when there are multiple objectives.

**Lecture notes**
- The lecture materials consist of a script, the slides, example calculations in Excel, Moodle quizzes, and exercises.
- The lecture materials will be distributed via Moodle before each lecture.

**Literature**

Appropriate literature in addition to the lecture materials will be handed out when required via Moodle.

**Exam Block 3 (Spring Semester 2024)**

- **Course 1:** Environmental Law
  - **Number:** 851-0723-10L
  - **Type:** O
  - **ECTS:** 4
  - **Hours:** 3V
  - **Lecturers:** M. Pflüger, A. Gossweiler, C. Jäger
  - **Abstract:** This class introduces students to the fundamentals of legal systems, focusing on environmental law. It covers the fundamentals of constitutional and administrative law, as opposed to private and criminal law. The class will focus on concepts, terminology and procedures of Swiss environmental law, supplemented through case studies.

---

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 2391 of 2684
Objective
Students learn fundamental structures of the legal system, understand core concepts and selected problems of public law, focusing on Swiss and European environmental law. These insights can be applied in further law courses, in particular in the course “Environmental law: Areas and Case Studies.”

Abstract
A practical introduction to important measurement methods for environmental engineers. Results of the measurements are compared to models and deviations are quantified with statistical methods.

Objective
The laboratory offers students an insight into various experimental methods relevant to environmental engineering. The students deal with problems of measurement technology and measurement uncertainty, learn to characterize systems and to compare and discuss the results of the measurements with simple models. The work is documented with scientific reports or presented in presentations.

Content
Es werden Experimente zu den folgenden Themen durchgeführt:
- Verweilzeit in einer Rührkesselkaskade
- Hydrodynamische Versuche
- Photometrische Bestimmungen von Inhaltsstoffen
- Carbonatgleichgewicht
- Gasgleichgewichte

Die folgenden analytischen Methoden werden dabei eingesetzt:
- UV/VIS-Spektroskopie
- Leitfähigkeitsmessungen
- pH
- Druckmessungen

Theory of Structures (for Environmental Engineering)  W 3 credits  2.5G  B. Sudret

Abstract
Introduction to structural mechanics, statically determinate beams and frame structures, trusses. Stresses in statically determinate structures.

Objective
- Understanding the response of elastic beam and frame structures
- Ability to correctly apply the equilibrium conditions
- Understanding the basics of continuum mechanics
- Computation of stresses in elastic structures

In the course "Theory of Structures (for Environmental Engineering)", the competencies of process understanding, system understanding and modeling are taught and applied. The competence process understanding and system understanding are examined, too.

Content
- Equilibrium, reactions, static determinacy
- Internal forces (normal and shear forces, moments)
- Arches and cables
- Elastic trusses
- Influence lines
- Basics of continuum mechanics
- Stresses in elastic beams

103-0313-00L  Spatial Planning and Landscape Development  W  5 credits  4G  G. Debrunner, S. Hauller, D. Jerjen

Abstract
The lecture introduces the main-features of Swiss spatial planning. Core subjects are e.g., spatial planning as a federal responsibility, spatial planning instruments (federal, cantonal, municipal), as well as systematic problem solving techniques and methodologies of spatial planning. The lecture is complemented with in-depth topics and comparative international examples.
Die Studierenden kennen die Grundzüge der Schweizer Raumplanung, ihre wichtigsten Instrumente auf nationaler, kantonaler, regionaler und kommunaler Ebene und systematische Problemlösungsverfahren. Sie können das vermittelte theoretische Wissen direkt an konkreten, praxisorientierten Übungsaufgaben umsetzen.

- Grundzüge der Raumplanung und ihre wichtigsten Instrumente kennenlernen
- Erarbeiten der Fähigkeit, räumliche Probleme zu erkennen und Problemlösungsverfahren auf diese anwenden
- Planung und Landnutzungsmanagement als interaktiven und akteursbezogenen Prozess kennenlernen und anwenden
- Verstehen der mit Ressourcen und Boden verbundenen Potentiale, Nutzung und Prozesse
- Das vermittelte theoretische Wissen direkt an konkreten, praxisorientierten Fallbeispielen umsetzen können

Die Vorlesung deckt die Grundlagen der (Schweizerischen) Raumplanung und Landschaftsentwicklung ab:

- Was ist Raumplanung (Definitionen und Begriffe)
- Praktische Herausforderungen, Entwicklungen und Tendenzen der Raumplanung
- Grundprinzipien, historische Entwicklung und Gesetzgebungen der Schweizer Raumplanung
- Die Raumplanung als staatliche Aufgabe – Raumordnungspolitik auf Bundesebene
- Instrumente der Raumplanung auf nationaler, kantonaler, regionaler und kommunaler Ebene (u.a. Sachpläne und Konzepte, Richtplanung, Nutzungsplanung, Sondernutzungsplanung, Mehrwertausgleich)
- Problemlösungsverfahren in der Raumplanung – systemtechnisches Vorgehen
- Thematische Vertiefungen: Siedlungsentwicklung nach innen; Klimaangepasste Raumplanung; Grundeigentum und kooperative Planung; Raumbeobachtung

Lecture notes
Script und einzelne Dokumente werden ausgegeben. Unterlagen zur Vorlesung werden auf der SPUR-Kursseite und/oder auf Moodle direkt zur Verfügung gestellt.

Abstract
The course introduces the different components of the cryosphere - snow, glaciers, ice sheets, sea ice and lake ice, and permafrost - and their respective roles in the climate system. For each subsystem, essential physical aspects are emphasized, and their dynamics are described quantitatively and using examples.

Objective
Students are able to
- qualitativ und quantitativ relevant Prozesse, Feedbacks und Beziehungen zwischen den einzelnen Komponenten des Kryosphären system erklären.

In the course "Cryosphere", the competencies of process understanding, modeling, data analysis & interpretation and measurement methods are taught, applied and examined. System understanding is taught and examined.

Content
The course provides an introduction into the various components of the cryosphere: snow, glaciers, ice sheets, sea ice and lake ice, permafrost, and their roles in the climate system. Essential physical aspects are emphasized for each subsystem: e.g. the material properties of ice, mass balance and dynamics of glaciers, or the energy balance of sea ice.

Environmental Fluid Dynamics
701-0479-00L

Abstract
This course covers the basic physical concepts and mathematical equations used to describe environmental fluid systems on the rotating Earth. Fundamental concepts (e.g. vorticity dynamics and waves) are formally introduced, applied quantitatively and illustrated using examples. Exercises help to deepen knowledge of the material.

Objective
Students are able
- to name the basics, concepts and methods of environmental fluid dynamics.
- to understand and discuss the components of the basic physical equations
- to mathematically solve basic equations for simple problems of environmental fluid dynamics.

Content
Basic physical terminology and mathematical laws:
- Continuum hypothesis, forces, constitutive laws, state equations and basic principles of thermodynamics, kinematics, laws of mass and momentum on rotating earth.
- Concepts and illustrative flow systems: vorticity dynamics, boundary layers, instability, turbulence - with respect to environmental fluid systems.
- Scale analysis: dimensionless variables and dynamical similarity, simplification of the fluid system, e.g. shallow water assumption, geostrophic flow.
- Waves in environmental fluid systems.

Lecture notes
In English language

Forest Ecology
701-0561-00L

Abstract
This course conveys the basics of forest ecology with an emphasis on trees as those organisms that dominate the physiognomy and the dynamics of forest ecosystems. Based on this course, students have a good grasp of the qualitative and quantitative importance of forest ecosystems at the global and regional scales, with a focus on central Europe.

Objective
Students are able to
- summarize the fundamentals of forest ecology at the autecological, demecological and synecological level
- explain how trees dominate the physiognomy and dynamics of forest ecosystems
- describe the qualitative and quantitative importance of forest ecosystems at the global and regional scales, with an emphasis on central Europe and Alpine region.

Content
Introduction and overview of the forests of the world
- Forest ecosystem ecology: Production ecology of forests
- Autecology: light, temperature, wind, water, and nutrients
- Demecology: regeneration ecology, forest growth, mortality
- Synecology: fundamentals of trophic interactions (forest-ungulate interactions), succession

Climate and Air

Number Title Type ECTS Hours Lecturers
701-0023-00L Atmosphere W 3 credits 2V E. Fischer, U. Lohmann

Abstract
Basic principles of the atmosphere, physical structure and chemical composition, trace gases, atmospheric cycles, circulation, stability, radiation, condensation, clouds, oxidation capacity and ozone layer.
In the course "Atmospheric Physics", the competencies of process understanding, system understanding and data analysis & interpretation are taught, applied and examined. Students are able to explain the mechanisms of convective storm formation using knowledge of thermodynamics and cloud microphysics. They are taught, applied and examined. Measurement methods are taught as well.

In the course "Atmospheric Physics", the competencies of process understanding, system understanding and data analysis & interpretation are taught, applied and examined. Measurement methods are taught as well.

Students also learn to use thermodynamic charts (tephigrams) and to identify cloud base, cloud top, available convective energy in radiosonde ascents. Atmospheric mixing processes are introduced as a basis for fog formation. The concept of an air parcel is used to understand convection.

With these basics, the different forms of precipitation (convective vs. stratiform) are discussed and how they can be identified in radar images. Students will also learn under which conditions severe convective storms (especially supercells with tornados) can form.

Aerosol particles are introduced in terms of their physical properties and their role in cloud formation based on Köhler theory. Thereafter cloud microphysical processes including ice nucleation are discussed.

With these basics, the different forms of precipitation (convective vs. stratiform) are discussed and how they can be identified in radar images. Students will also learn under which conditions severe convective storms (especially supercells with tornados) can form.

The concepts are applied to understand and judge the validity of different proposed artificial weather modification ideas.

In the course "Atmospheric Physics", the competencies of process understanding, system understanding and data analysis & interpretation are taught, applied and examined. Measurement methods are taught as well.

The concepts are applied to understand and judge the validity of different proposed artificial weather modification ideas.

In the course "Atmospheric Physics", the competencies of process understanding, system understanding and data analysis & interpretation are taught, applied and examined. Measurement methods are taught as well.

There is a additional tutorial right after each lecture to give you the chance to ask further questions and discuss the exercises. The participation is recommended but voluntary.

In the course "Atmospheric Physics", the competencies of process understanding, system understanding and data analysis & interpretation are taught, applied and examined. Measurement methods are taught as well.

The students will understand the basics of noise abatement: acoustics, impact of noise, measurement techniques and legislation. The students will be able to analyze different noise problems and they will be able to solve simple problems of noise abatement.

In the course "Atmospheric Physics", the competencies of process understanding, system understanding and data analysis & interpretation are taught, applied and examined. Measurement methods are taught as well.

The concepts are applied to understand and judge the validity of different proposed artificial weather modification ideas.
Content

Physical Grundlagen: Schall, Wellen, Quellenarten.
Akustische Messtechnik: Umgang mit Deizibel, Akustische Masse, Schalpegelmesser, Spektralanalyse.
Lärnwirkungen: Gehör, Gesundheitliche Wirkungen von Lärm, Störung/Belästigung, Belastungsmasse.
Schallausbreitung im Freien: Abstandsgesetze, Luftdämpfung, Bodeneffekt, Abschirmung, Reflexion, Streuung, Bebauung, Wettereinfüsse.

Introduction to the formation and properties of soils as a function of parent rock, landscape position, climate, and soil organisms. Complex processes leading to soil degradation.
The course "Pedosphäre" teaches and examines the competences process understanding and systems understanding.

Lecture notes

Polybook

Prerequisites / notice

- Basic knowledge in chemistry, biology and geology.

Number | Title | Type | ECTS | Hours | Lecturers
--- | --- | --- | --- | --- | ---
101-0339-00L | Environmental Geotechnics – Polluted Sites and Waste Disposal | W | 3 credits | 2G | M. Plötze

Objective

On successful completion of this course students will be able to
- Assess the risk to the environment from landfills, contaminated sites and radioactive waste repositories in terms of the fate and transport of contaminants.
- Describe the technologies available to minimise environmental contamination.
- Describe the principles of dealing with polluted sites and propose and evaluate appropriate remediation techniques.
- Explain the concepts underlying radioactive waste management practices.

Content

This lecture course consists of lectures with exercises and case studies.
- An overview of the principles of environmental protection in waste management and how this is applied in legislation.
- An overview of the chemistry underlying the release and transport of contaminants from the landfilled/contaminated material/radioactive waste repository focusing on processes controlling mobility of heavy metals and organic compounds.
- Introduction to contaminant transport in porous adsorbing media.
- Design and function of engineered barriers. Clay as a barrier.
- Polluted site remediation: Site investigation, assessment, and remediation technologies.
- Concepts and safety in radioactive waste management.
- Role of the geological and engineered barriers and radionuclide transport in geological media.

Prerequisites / notice

- 1 - 2 Excursions

Number | Title | Type | ECTS | Hours | Lecturers

701-0501-00L | Pedosphere | W | 3 credits | 2V | R. Kretzschmar

Abstract

Introduction to the formation and properties of soils as a function of parent rock, landscape position, climate, and soil organisms. Complex relationships between soil forming processes, physical and chemical soil properties, soil biota, and ecological soil properties are explained and illustrated by numerous examples.

Objective

Understanding of soils as integral parts of ecosystems, development and distribution of soils as a function of environmental factors, and processes leading to soil degradation.

Content

Definition of the pedosphere, soil functions, rocks as parent materials, minerals and weathering, soil organisms, soil organic matter, soil formation, principles of soil classification, global soil regions, physical soil properties and functions, chemical soil properties and functions, soil fertility, land use and soil degradation.

Abstract
This course covers chemical and biogeochemical processes in soils and water and their influence on the behavior and cycling of nutrients and pollutants in terrestrial and aquatic systems. Approaches for quantitative modeling of the processes are introduced and applied in selected examples.

Objective
1. Understanding of important chemical properties and processes of soils and water and their influence on the behavior (e.g., chemical speciation, bioavailability, mobility) of nutrients and pollutants.
2. Quantitative applications of chemical equilibria to processes in natural systems.

Content
Chemical equilibria in aqueous solutions, gas equilibria, precipitation and dissolution of mineral phases, silicate weathering, weathering kinetics, formation of secondary minerals (clay minerals, oxides, sulfides), redox processes in natural systems, pH buffering and acidification, salinity and salinization, environmental behavior of selected essential and toxic trace elements.

Lecture notes
Lecture slides on Moodle

Literature
- Chapters 1, 3, 4, 6, 7 and 11 in Sigg/Stumm – Aquatische Chemie, 6. Auflage, vdf, 2016.

Prerequisites / notice
The lecture courses Pedosphere and Hydrosphere are highly recommended.

Competencies

Subject-specific Competencies

Abstract
This course provides the students with an introduction to thermodynamics and energy conversion. Students shall gain basic understanding of energy and energy interactions as well as their link to energy conversion technologies.

Objectives
Thermodynamics is key to understanding and use of energy conversion processes in Nature and technology. Main objective of this course is to give a compact introduction into basics of Thermodynamics: Thermodynamic states and thermodynamic processes; Work and Heat; First and Second Laws of Thermodynamics. Students shall learn how to use energy balance equation in the analysis of power cycles and shall be able to evaluate efficiency of internal combustion engines, gas turbines and steam power plants. The course shall extensively use thermodynamic charts to build up students’ intuition about opportunities and restrictions to increase useful work output of energy conversion. Thermodynamic functions such as entropy, enthalpy and free enthalpy shall be used to understand chemical and phase equilibrium. The course also gives introduction to refrigeration cycles, combustion and refrigeration. The course compactly covers the standard course of thermodynamics for engineers, with additional topics of a general physics interest (nonideal gas equation of state and Joule-Thomson effect) also included.

In the course "Energy Conversion", the competencies of process understanding and system understanding are applied and examined and the competencies process understanding and modeling are taught.

Content
1. Thermodynamic systems, states and state variables
2. Properties of substances: Water, air and ideal gas
3. Energy conservation in closed and open systems: work, internal energy, heat and enthalpy
4. Second law of thermodynamics and entropy
5. Energy analysis of steam power cycles
6. Energy analysis of gas power cycles
7. Refrigeration and heat pump cycles
8. Nonideal gas equation of state and Joule-Thomson effect
9. Maximal work and exergy
10. Mixtures
11. Chemical reactions and combustion systems; chemical and phase equilibrium

Lectures
Lecture slides and supplementary documentation will be available online.

Literature

Prerequisites / notice
This course is intended for students outside of D-MAVT.

Competencies

Subject-specific Competencies
Concepts and Theories assessed
Techniques and Technologies assessed

Method-specific Competencies
Analytical Competencies assessed
Decision-making assessed
Media and Digital Technologies fostered
Problem-solving assessed
Project Management fostered

Social Competencies

Self-direction and Self-management assessed
Introduction to Modeling and Optimization of Sustainable Energy Systems

**Abstract**

This course introduces the fundamentals of energy system modeling for the analysis and the optimization of the energy system design and operations.

**Objective**

At the end of this course, students will be able to:
- define and quantify the key performance indicators of sustainable energy systems;
- select and apply appropriate models for conversion, storage and transport of energy;
- develop mathematical models for the analysis, design and operations of multi-energy systems and solve them with appropriate mathematical tools;
- select and apply methodologies for the uncertainty analysis on energy systems models;
- apply the acquired knowledge to tackle the challenges of the energy transition.

In the course “Introduction to Modeling and Optimization of Sustainable Energy Systems”, the competencies of process understanding, system understanding, modeling, concept development, data analysis & interpretation and measurement methods are taught, applied and examined. Programming is applied.

**Content**

The global energy transition; Key performance indicators of sustainable energy systems; Optimization models; Heat integration and heat exchanger networks; Life-cycle assessment; Models for conversion, storage and transport technologies; Multi-energy systems; Design, operations and analysis of energy systems; Uncertainties in energy system modeling.

**Lecture notes**

Lecture slides and supplementary documentation will be available online. Reference to appropriate book chapters and scientific papers will be provided.

</table>

**Abstract**

Half-day to one-day excursions as a supplement to the environmental engineering lectures.

**Objective**

As a supplement to the environmental engineering-specific lectures, the professorships offer half-day to one-day excursions in various subject areas.

During the excursions, the students deepen the specialist knowledge acquired in the lectures and self-study and establish a link to practice and research.

These excursions are open to all Bachelor's students of Environmental Engineering, depending on availability, and can be assessed with credit points as part of the subject-specific electives.

The excursions are voluntary and should preferably be attended from the 4th semester onwards.

### Additional Compulsory Courses

<table>
<thead>
<tr>
<th>Number</th>
<th>Title</th>
<th>Type</th>
<th>ECTS</th>
<th>Hours</th>
<th>Lecturers</th>
</tr>
</thead>
</table>

**Abstract**

The course is organized in the form of seminars held by the students. Topics selected from the core disciplines of the curriculum (water resources, urban water engineering, material fluxes, waste technology, air pollution, earth observation) are discussed in the class on the basis of scientific papers that are illustrated and critically reviewed by the students.

**Competencies**

- Method-specific Competencies: fostered
- Social Competencies: fostered
- Personal Competencies: fostered

**Objective**

Learn about recent research results in environmental engineering and analyse practical applications in environmental engineering.

### Electives

The entire course programs of ETH Zurich and the University of Zurich are open to the students to individual selection.

Bachelor's Thesis

Number: 102-0006-00L  
Title: Bachelor's Thesis

Type: O  
ECTS: 10 credits  
Hours: 21D  
Lecturers: Supervisors

Abstract: The Bachelor Programme concludes with the Bachelor Thesis. This project is supervised by a professor. Writing up the Bachelor Thesis encourages students to show independence and to produce structured work.

Objective: Encourages students to show independence, to produce scientifically structured work and to apply engineering working methods.

Content: The contents base upon the fundamentals of the Bachelor Programme. Students can choose from different subjects and tasks. The thesis consists of both a written report and an oral presentation.

ECTS  
European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
This course deepens students' knowledge of environmental, economic, and social assessment methodologies and their various applications.

In particular, students completing the course should have the
- ability to judge the scientific quality and reliability of environmental assessment studies, the appropriateness of inventory data and modelling, and the adequacy of life cycle impact assessment models and factors
- knowledge about the current state of the scientific discussion and new research developments
- ability to properly plan, conduct and interpret environmental assessment studies

In the course element "Implementation of Environmental and other Sustainability Goals", students will learn to
- describe key sustainability problems of the current economic system and measuring units;
- describe the management system of an organisation and how to develop a sustainability orientation
- discuss approaches to measure environmental performance of an organisation, including 'organisational LCA' (Ecobalance)
- explain the pros and cons of single score environmental assessment methods
- demonstrate life cycle costing
- interpret stakeholder relations of an organisation
- (if time allows) describe sustainable supply chain management and stakeholder management

Part I (Advanced Environmental Assessments)
- Inventory database developments, transparency, data quality, data completeness, and data exchange formats, uncertainties
- Software tools (MFA, LCA)
- Allocation (multiooutput processes and recycling)
- Hybrid LCA methods.
- Consequential and marginal analysis
- Impact assessment of waterborne chemical emissions, sum parameters, mixture toxicity
- Spatial differentiation in Life Cycle Assessment
- Workplace and indoor exposure in Risk and Life Cycle Assessment
- Subjectivity in environmental assessments
- Multicriteria Decision Analysis
- Case Studies

Part II (Implementation of Environmental and other Sustainability Goals):
- Sustainability problems of the current economic system and its measuring units;
- The structure of a management system, and elements to integrate environmental management (ISO 14001) and social management
- Sustainability Opportunities and Innovation
- The concept of 'Continuous Improvement'
- Life Cycle Costing, Life Cycle Management
- environmental performance measurement of an organisation, including ‘organisational LCA’ (Ecobalance), based on practical examples of companies and new concepts
- single score env. assessment methods (Swiss ecopoints)
- stakeholder management and sustainability oriented communication
- an intro into sustainability issues of supply chain management

Students will get small excercises related to course issues.

Lecture notes
- Part I: Slides and background reading material will be available on lecture homepage
- Part II: Documents will be available on Ilias

Literature
- Will be made available.

Prerequisites / notice
- This course should only be elected by students of environmental engineering with a with a Module in Ecological Systems Design. All other students should take the individual courses in Advanced Environmental Assessment and/or Implementation of Environmental and other Sustainability goals (with or without exercise and lab).

Basic knowledge of environmental assessment tools is a prerequisite for this class. Students who have not yet had classwork in this topic are required to read an appropriate textbook before or at the beginning of this course (e.g. Jolliet, O et al. (2016). Environmental Life Cycle Assessment. CRC Press, Boca Raton - London - New York. ISBN 978-1-4398-8766-0 (Chapters 2-5,2)).
### System Analysis in Urban Water Management

<table>

**Abstract**
Systematic introduction of material balances, transport processes (kinetics, stoichiometry and conservation), ideal reactors, residence time distribution, heterogeneous systems, dynamic response of reactors, parameter identification, local sensitivity, error propagation, and Monte Carlo simulations. Introduction to real-time control (PID controllers). Extensive numerical simulations with coding.

**Objective**
The goal of this course is to provide the students with an understanding of how urban water system can be described with mathematical models, and give them the to plan experiments, to evaluate error propagation and to test simple process control strategies in the field of process engineering in urban water management.

**Content**
The course will provide a broad introduction into the fundamentals of modeling water treatment systems. The topics are:
- Introduction into modeling and simulation
- The material balance equations, transport processes, transformation processes (kinetics, stoichiometry, conservation)
- Ideal reactors
- Hydraulic residence time distribution and modeling of real reactors
- Dynamic behavior of reactor systems
- Systems analytical tools: Sensitivity, parameter identification, error propagation, Monte Carlo simulation
- Introduction to process control (PID controller, fuzzy control)

**Lecture notes**
Copies of handouts will be available digitally.

**Literature**
There will be a required textbook that students need to purchase:

**Prerequisites / notice**
Students should have a general understanding of urban water management as many examples are taken from processes relevant to related systems. This course is offered in parallel to the course Process Engineering Ia. It is beneficial but not necessary to follow both courses simultaneously.

**Competencies**
Subject-specific Competencies: Concepts and Theories, Techniques and Technologies, Analytical Competencies, Media and Digital Technologies, Problem-solving
Method-specific Competencies: Critical Thinking, Self-direction and Self-management

### Process Engineering Ia

**Abstract**
Biological processes used in wastewater treatment, organic waste management, biological resource recovery. Focus on fundamental principles of biological processes and process design based on kinetic and stoichiometric principles. Processes include anaerobic digestion for biogas production and aerobic wastewater treatment.

**Objective**
Students should be able to evaluate and design biological processes.

**Content**
Stoichiometry
Microbial transformation processes
Introduction to design and modeling of activated sludge processes
Anaerobic processes, industrial applications, sludge stabilization

**Literature**
There will be a textbook that students need to purchase (see http://www.sww.ifu.ethz.ch/education/lectures/process-engineering-ia.html for further information).

**Prerequisites / notice**
For detailed information on prerequisites the student should consult the lecture program and important information (syllabus) of Process Engineering Ia that can be accessed via http://www.sww.ifu.ethz.ch/education/lectures/process-engineering-ia.html

**Competencies**
Subject-specific Competencies: Concepts and Theories, Techniques and Technologies
Method-specific Competencies: Analytical Competencies, Decision-making, Problem-solving
Social Competencies: Communication
Personal Competencies: Critical Thinking

</tr>
</tbody>
</table>

**Abstract**
In this course, students learn modern urban drainage engineering approaches, critical thinking, decision making in a complex environment as well as dealing with insufficient data and ill-defined problems.

**Objective**
By the end of the course, you should be able to do the following:
- Apply different methods and methodologies to assess the impact of urban drainage on water pollution and flooding potential.
- Distinguish between hydrological and hydrodynamic models and their correct application.
- Identify the difference between emission and immission oriented approaches for identifying drainage measures.
- Identify relevant measures, quantify their effects and assess their relative ranking/priority.
- Consider uncertainties and handle incomplete data and information.
- Make decisions and recommendations in a complex application case.
- Teamwork. State principles of effective team performance and the functions of different team roles; work effectively in problem-solving teams.
- Communication. Communicate and document your findings in concise group presentations and a written report.
In urban drainage, the complexity of the decision-making, the available methodologies and the data availability have increased significantly. In current environmental engineering practice, the focus has shifted from tables and nomograms to sophisticated simulation tools. The topics cover:
- Integrated urban water management
- Hydrological and hydrodynamic modelling
- Water quality based assessment
- Freshwater ecology
- Hydraulic capacity assessment
- Sewer network operation
- Decision analysis

Prerequisites
Prerequisites: 102-0214-00 Siedlungswasserwirtschaft and 102-0215-00 Siedlungswasserwirtschaft II or comparable educational background.

Abstract
Air pollutants cause negative effects on humans, wildlife and buildings. To control and reduce the impact of air pollutants, their transfer from sources to receptors needs to be known. This transfer includes transport within the atmospheric boundary layer, chemical transformation reactions and phase-transfer processes from gases to particles.

Objective
The students understand the fundamental principles of atmospheric transport, dispersion and chemistry of pollutants on the local to regional scale and their transfer gas to particle phases (secondary aerosols). This includes the knowledge of important atmospheric reactions, sources and sinks. The obtained understanding enables the students to apply computational tools to predict the transport and transformation of chemicals at the local to regional scale.

Content
- Structure of the Atmosphere
- Thermodynamics of the atmosphere
- Atmospheric stability
- Atmospheric boundary layer and turbulence
- Dispersion in the atmospheric boundary layer
- Numerical models of atmospheric dispersion
- Gas phase reaction kinetics
- Tropospheric chemistry and ozone formation
- Chemistry box models
- Volatile organic pollutants (VOCs) and semi-volatile organic pollutants (SVOCs)
- Aerosol modelling
- Air pollution source apportionment
- Inverse modelling of emissions

Lecture notes
Continued updates of:
- Slides and handouts
- Home assignments and sample solutions
- R package and code for some of the home assignments
- MATLAB codes
- Key journal articles as discussed during lecture

### Fundamentals
- Properties of particles: Liberation conditions, Particle size and shape, Porosity of bulk materials
- Fluid dynamics of particles: Stationary particle bed, Fluidized beds, Free settling particles
- Flow sheet basics: Balancing mass flows
- Standard processes: batch vs. continuous
- Assessment of separation success: Separation function; grade vs. recovery

### Separation Processes
- Separation according to size and shape (Classification): Screening, Flow separation
- Separation according to material properties (Concentration): Manual Sorting, Gravity concentration, Magnetic separation, Eddy current separation, Electrostatic separation, Sensor technology, Froth flotation

### Lecture notes
The script consists of the slides shown during the lectures. Background material will be provided on the script-server.

### Literature
A list of recommended books will be provided. The topic will be discussed not from the perspective of theory, but rather in the context of practical application. However, solid fundamentals in physics (in particular in mechanics) are strongly recommended.

### Prerequisites / notice
For detailed information on prerequisites the student should consult the lecture program and important information (syllabus) of Process Engineering Ia that can be accessed via http://www.swwifu.ethz.ch/education/lectures/process-engineering-ia.html for further information.

### Objective
On successful completion of this course students will be able to
- Assess the risk to the environment from landfills, contaminated sites and radioactive waste repositories in terms of the fate and transport of contaminants.
- Describe the technologies available to minimise environmental contamination
- Describe the principles of dealing with polluted sites and propose and evaluate appropriate remediation techniques
- Explain the concepts underlying radioactive waste management practices.

### Content
This lecture course consists of lectures with exercises and case studies.
- An overview of the principles of environmental protection in waste management and how this is applied in legislation.
- An overview of the chemistry underlying the release and transport of contaminants from the landfilled/contaminated material/radioactive waste repository focusing on processes controlling mobility of heavy metals and organic compounds
- Introduction to contaminant transport in porous adsorbing media
- Design and function of engineered barriers. Clay as a barrier
- Polluted site remediation: Site investigation, assessment, and remediation technologies
- Concepts and safety in radioactive waste management
- Role of the geological and engineered barriers and radionuclide transport in geological media.

**Abstract**
This course deepens students' knowledge of environmental, economic, and social assessment methodologies and their various applications.

**Objective**
This course has the aim of deepening students' knowledge of the environmental, economic and social assessment methodologies and their various applications.

- ability to judge the scientific quality and reliability of environmental assessment studies, the appropriateness of inventory data and modelling, and the adequacy of life cycle impact assessment models and factors
- knowledge about the current state of the scientific discussion and new research developments
- ability to properly plan, conduct and interpret environmental assessment studies

In the course element "Implementation of Environmental and other Sustainability Goals", students will learn to
- describe key sustainability problems of the current economic system and measuring units.
- describe the management system of an organisation and how to develop a sustainability orientation
- discuss approaches to measure environmental performance of an organisation, including ‘organisational LCA’ (Ecobalance)
- explain the pros and cons of single score environmental assessment methods
- demonstrate life cycle costing
- interpret stakeholder relations of an organisation
- (if time allows) describe sustainable supply chain management and stakeholder management

**Content**

**Part I (Advanced Environmental Assessments)**
- Inventory database developments, transparency, data quality, data completeness, and data exchange formats, uncertainties
- Software tools (MFA, LCA)
- Allocation (multisource processes and recycling)
- Hybrid LCA methods.
- Consequential and marginal analysis
- Impact assessment of waterborne chemical emissions, sum parameters, mixture toxicity
- Spatial differentiation in Life Cycle Assessment
- Workplace and indoor exposure in Risk and Life Cycle Assessment
- Subjectivity in environmental assessments
- Multicriteria Decision Analysis
- Case Studies

**Part II (Implementation of Environmental and other Sustainability Goals):**
- Sustainability problems of the current economic system and its measuring units.
- The structure of a management system, and elements to integrate environmental management (ISO 14001) and social management (SA8000 as well as ISO 26000), especially into strategy development, planning, controlling and communication;
- Sustainability Opportunities and Innovation
- The concept of ‘Continuous Improvement’
- Life Cycle Costing, Life Cycle Management
- environmental performance measurement of an organisation, including ‘organisational LCA’ (Ecobalance), based on practical examples of companies and new concepts
- single score env. assessment methods (Swiss ecopoints)
- stakeholder management and sustainability oriented communication
- an intro into sustainability issues of supply chain management

**Lecture notes**
Part I: Slides and background reading material will be available on lecture homepage
Part II: Documents will be available on Ilias

**Literature**
Will be made available.

**Prerequisites / notice**
This course should only be elected by students of environmental engineering with a with a Module in Ecological Systems Design. All other students should take the individual courses in Advanced Environmental Assessment and/or Implementation of Environmental and other Sustainability goals (with or without exercise and lab).

**Waste Management**
Introduction

The practice of landfilling, remediation of polluted sites and the disposal of radioactive waste are based on the same concepts of biological processes used in wastewater treatment, organic waste management, biological resource recovery. Focus on fundamental concepts and theories.

Lecturers

E. Morgenroth

The script consists of the slides shown during the lectures. Background material will be provided on the script-server.

Prerequisites / notice

Students should be able to evaluate and design biological processes.

M. Plötze

Waste Recycling Technology (WRT) is a sub-discipline of Mechanical Process Engineering. WRT is employed in production plants processing contaminated soil, construction wastes, scrap metal, recovered paper and the like. While WRT is well established in Central Europe, it is only just now catching on in emerging markets as well.

Objective

At the core of this course is the separation of mixtures of solid bulk materials according to physical properties such as color, electrical conductivity, magnetism and so forth. After having taken this course, the students should have concept not only of the unit operations employed in WRT but also of how these unit operations are integrated into the flow sheets of production plants.  

Content

Introduction

Waste Recycling: Scope and objectives

Waste recycling technologies in Switzerland

Fundamentals

Properties of particles: Liberation conditions, Particle size and shape, Porosity of bulk materials

Fluid dynamics of particles: Stationary particle beds, Fluidized beds, Free settling particles

Flow sheet basics: Balancing mass flows

Standard processes: batch vs. continuous

Assessment of separation success: Separation function; grade vs. recovery

Separation Processes

Separation according to size and shape (Classification): Screening, Flow separation

Separation according to material properties (Concentration): Manual Sorting, Gravity concentration; Magnetic separation, Eddy current separation, Electrostatic separation, Sensor technology, Froth flotation

Lecture notes

The script consists of the slides shown during the lectures. Background material will be provided on the script-server.

Literature

A list of recommended books will be provided.

Prerequisites / notice

The topic will be discussed not from the perspective of theory, but rather in the context of practical application. However, solid fundamentals in physics (in particular in mechanics) are strongly recommended.

102-0217-00L Process Engineering Ia

Biological processes used in wastewater treatment, organic waste management, biological resource recovery. Focus on fundamental principles of biological processes and process design based on kinetic and stoichiometric principles. Processes include anaerobic digestion for biogas production and aerobic wastewater treatment.

Objective

Students should be able to evaluate and design biological processes.

Content

Stoichiometry

Microbial transformation processes

Introduction to design and modeling of activated sludge processes

Anaerobic processes, industrial applications, sludge stabilization

Literature

There will be a textbook that students need to purchase (see http://www.sww.ifu.ethz.ch/education/lectures/process-engineering-ia.html for further information).

Prerequisites / notice

For detailed information on prerequisites the student should consult the lecture program and important information (syllabus) of Process Engineering Ia that can be accessed via http://www.sww.ifu.ethz.ch/education/lectures/process-engineering-ia.html

101-0339-00L Environmental Geotechnics – Polluted Sites and Waste Disposal

The practice of landfilling, remediation of polluted sites and the disposal of radioactive waste are based on the same concepts of environmental protection. Understanding the contaminants behaviour and how to reduce their release to the environment is the key to remediating polluted sites and designing multi-barrier systems.

Objective

On successful completion of this course students will be able to:

- Assess the risk to the environment from landfills, contaminated sites and radioactive waste repositories in terms of the fate and transport of contaminants.
- Describe the technologies available to minimise environmental contamination
- Describe the principles of dealing with polluted sites and propose and evaluate appropriate remediation techniques
- Explain the concepts underlying radioactive waste management practices.

Content

This lecture course consists of lectures with exercises and case studies.

- An overview of the principles of environmental protection in waste management and how this is applied in legislation.
- An overview of the chemistry underlying the release and transport of contaminants from the landfilled/contaminated material/radioactive waste repository focusing on processes controlling mobility of heavy metals and organic compounds
- Introduction to contaminant transport in porous adsorbing media
- Design and function of engineered barriers. Clay as a barrier.
- Polluted site remediation: Site investigation, assessment, and remediation technologies
- Concepts and safety in radioactive waste management
- Role of the geological and engineered barriers and radionuclide transport in geological media.

Abstract: Watershed Modelling is a practical course on numerical water balance models for a range of catchment-scale water resource applications. The course covers GIS use in watershed analysis, models types from conceptual to physically-based, parameter calibration and model validation, and analysis of uncertainty. The course combines theory lectures with a series of practical tasks (exercises).

Objective: The main aim of the course is to provide practical training with watershed models for environmental engineers. The course is built on thematic lectures (2 hrs a week) and practical exercises (2 hrs a week). Theory and concepts in the lectures are underpinned by many examples from scientific studies. A comprehensive exercise block builds on the lectures with a series of 4 practical tasks to be conducted during the semester in group work. Exercise hours during the week focus on explanation of the tasks. The course is evaluated 50% by performance in the graded exercises and 50% by a semester-end oral examination (30 mins) on watershed modelling concepts.

Content: The first part (A) of the course is on watershed properties analysed from DEMs, and on global sources of hydrological data for modelling applications. Here students learn about GIS applications (ArcGIS, Q-GIS) in hydrology - flow direction routines, catchment morphometry, extracting river networks, and defining hydrological response units. In the second part (B) of the course on conceptual watershed models students build their own simple bucket model (Matlab, Python), they learn about performance measures in modelling, how to calibrate the parameters and how to validate models, about methods to simulate stochastic climate to drive models, uncertainty analysis. The third part (C) of the course is focussed on physically-based model components. Here students learn about components for soil water fluxes and evapotranspiration, they practice with a fully-distributed physically-based model Topkapi-ETH, and learn about other similar models at larger scales. They apply Topkapi-ETH to an alpine catchment and study simulated discharge, snow, soil moisture and evapotranspiration spatial patterns.

Lecture notes: There is no textbook. Learning materials consist of (a) video-recording of lectures; (b) lecture presentations; and (c) exercise task documents that allow independent work.

Literature: Literature consist of collections from standard hydrological textbooks and research papers, collected by the instructors on the course moodle page.

Prerequisites / notice: Basic Hydrology in Bachelor Studies (engineering, environmental sciences, earth sciences), Basic knowledge of Matlab (Python), ArcGIS (Q-GIS).

Method-specific Competencies: Concepts and Theories assessed, Analytical Competencies assessed, Decision-making assessed, Media and Digital Technologies assessed, Problem-solving fostered.

Social Competencies: Communication fostered.

Abstract: In the course Numerical Hydraulics the basics of numerical modelling of flows are presented.

Objective: The goal of the course is to develop the understanding of the students for numerical simulation of flows to an extent that they can later use commercial software in a responsible and critical way.

Content: The basic equations are derived from first principles. Possible simplifications relevant for practical problems are shown and their applicability is discussed. Using the example of non-steady-state pipe flow numerical methods such as the method of characteristics and finite difference methods are introduced. The finite volume method as well as the method of characteristics are used for the solution of the shallow water equations. Special aspects such as wave propagation and turbulence modelling are also treated.

All methods discussed are applied practically in exercises. This is done using programs in MATLAB which partially are programmed by the students themselves. Further, some generally available softwares such as BASEMENT for non-steady shallow water flows are used.

Lecture notes: Slides from the lectures and programs used can be downloaded.

Literature: Given in lecture.

<td>O</td>
<td>3 credits</td>
<td>2G</td>
<td>R. Stocker, K.-D. Jorde, L. G. Martins da Silva, A. Siviglia</td>
</tr>
</tbody>
</table>

**Abstract**
At a time in which humans have significantly affected the natural environment and yet society increasingly values the many services of natural ecosystems, accounting for ecological processes in engineering design is a major contemporary challenge for environmental and civil engineers.

**Objective**
This is the fundamental topic in ecohydraulics, the discipline that focuses on the consequences of fluid flow and related physical processes on the organisms that inhabit aquatic environments. While still a young science, ecohydraulics already endows the engineer with an overall understanding and quantitative tools to predict how physical processes shape habitat quality and quantity, enabling the analysis of different management options for natural and man-made water bodies in terms of their ecosystem consequences.

**Content**
This class will take a broad view of ecohydraulics and introduce students to key concepts in aquatic habitat modeling. Recognizing that an ecosystem is composed of diverse organisms with different seasonal habitat requirements across a range of scales, the class will focus on multiple representative groups of organisms, including fish, macroinvertebrates, plankton, and vegetation. The lectures will build on the students' knowledge of hydraulics, to give them both an appreciation for the dependence of organisms on their physical environment and a set of quantitative modeling approaches that they can take with them into engineering practice, in fields ranging from hydropower development and upgrade, to reservoir operation, river restoration, flood protection, water management and beyond. At the broadest scale, this class will contribute to the students' appreciation of the tight link between the natural and the built or impacted environment, and of the imperatives of considering both in the design process.

</tr>
</tbody>
</table>

**Abstract**
In the course, students learn about methods for the identification and measurement of landscape characteristics, as well as measures and policies for landscape planning. Landscape planning is put into the context of environmental systems (soil, water, air, climate, flora and fauna) and discussed with regard to socio-political questions of the future.

**Objective**
The aims of this course are:
1. To illustrate the concept of landscape planning, the economic relevance of landscape and nature in the context of the environmental systems (soil, water, air, climate, flora and fauna).
2. To show landscape planning as an integral information system for the coordination of different instruments by illustrating the aims, methods, instruments and their functions in landscape planning.
3. To show the importance of ecosystem services.
4. To learn basics about nature and landscape: Analysis and assessment of the complex interactions between landscape elements, effects of current and future land use (ecosystem goods and services, landscape functions).
5. To identify and measure the characteristics of landscape.
6. Learn how to use spatial data in landscape planning.

**Content**
In this course, the following topics are discussed:
- Definition of the concept of landscape
- Relevance of landscape planning
- Landscape metrics
- Landscape change
- Methods, instruments and aims of landscape planning (policy)
- Socio-political questions of the future
- Environmental systems, ecological connectivity
- Ecosystem services
- Urban landscape services
- Practice of landscape planning
- Use of GIS in landscape planning

**Lecture notes**
No script. The documentation, consisting of presentation slides are partly handed out and are provided for download on Moodle.

**Prerequisites / notice**
The contents of the course will be illustrated in the associated course 103-0347-01 U (Landscape Planning and Environmental Systems (GIS Exercises)) or in Project LAND within the Experimental and Computer Lab (for Environmental Engineers). A combination of courses is recommended.
The course presents a view of the catchment processes of sediment production and transport that shape the landscape. Focus is on sediment fluxes from sources on hillslopes to the river network. Students learn about how a fluvial system functions, how to identify sediment sources and sinks, how to make predictions with numerical models, develop sediment budgets, and quantify geomorphic change. The course has two fundamental aims: (1) The first aim is to provide environmental engineers with the physical process basis needed to understand fluvial system change, using the right language and terminology to describe landforms. We will cover the main geomorphic concepts of landscape change, e.g. thresholds, equilibrium, criticality, to describe change. Students will learn about the importance of the concepts of connectivity and timescales of change. (2) The second aim is to provide quantitative skills in making simple and more complex predictions of change and the data and models required. We will learn about typical landscape evolution models, and about hillslope erosion model concepts like RUSLE. We will learn how to identify sediment sources and sinks, and develop simple sediment budgets with the right data needed for this purpose. Finally we will learn about methods to describe the topology of river networks as conduits of sediment through the fluvial system.

The course consists of four sections: (1) Introduction to fluvial forms and processes and geomorphic concepts of landscape change, including climatic and human activities acting on the system. Concepts like thresholds, equilibrium, self-organised criticality, etc. are presented. (2) Landscape evolution modelling as a tool for describing the shape of the land surface. Soil formation and sediment production at long timescales. (3) The processes of sediment production, upland sheet-rill-gully erosion, basin sediment yield, rainfall-triggered landsliding, sediment budgets, and the modelling of the individual processes involved. Here we combine model concepts with field observations and look at many examples. (4) Processes in the river, floodplain and riparian zone, including river network topology, channel geometry, aquatic habitat, role of riparian vegetation, including basics of fluvial system management. The main focus of the course is on the hydrology-sediment connections at the field and catchment scale.

The course covers GIS use in watershed analysis, models types from conceptual to physically-based, parameter calibration and model validation, and analysis of uncertainty. The course combines theory (lectures) with a series of practical tasks (exercises). The first part (A) of the course is focussed on physically-based model components. Here students learn about components for soil water fluxes and parameters and how to validate models, about methods to simulate stochastic climate to drive models, uncertainty analysis. The third part (C) of the course is focussed on physically-based model components. Here students learn about components for soil water fluxes and evapotranspiration, they practice with a fully-distributed physically-based model Topkapi-ETH, and learn about other similar models at larger scales. They apply Topkapi-ETH to an alpine catchment and study simulated discharge, snow, soil moisture and evapotranspiration spatial patterns.

The course materials consist of a series of 13 lecture presentations and notes to each lecture. The lectures were developed from textbooks, professional papers, and ongoing research activities of the instructor. All material is on the course webpage.

| 102-0259-00L | Ecohydraulics and Habitat Modelling         | O    | 3    | 2G    | R. Stocker, K.-D. Jorde, L. G. Martins da Silva, A. Siviglia |
| Abstract    | At a time in which humans have significantly affected the natural environment and yet society increasingly values the many services of natural ecosystems, accounting for ecological processes in engineering design is a major contemporary challenge for environmental and civil engineers. |
| Objective   | This is the fundamental topic in ecohydraulics, the discipline that focuses on the consequences of fluid flow and related physical processes on the organisms that inhabit aquatic environments. While still a young science, ecohydraulics already endows the engineer with an overall understanding and quantitative tools to predict how physical processes shape habitat quality and quantity, enabling the analysis of different imperatives of considering both in the design process. |
| Content     | This class will take a broad view of ecohydraulics and introduce students to key concepts in aquatic habitat modeling. Recognizing that an ecosystem is composed of diverse organisms with different seasonal habitat requirements across a range of scales, the class will focus on multiple representative groups of organisms, including fish, macroinvertebrates, plankton, and vegetation. The lectures will build on the students' knowledge of hydraulics, to give them both an appreciation for the dependence of organisms on their physical environment and a set of quantitative modeling approaches that they can take with them into engineering practice, in fields ranging from hydropower development and upgrade, to reservoir operation, river restoration, flood protection, water management and beyond. At the broadest scale, this class will contribute to the students' appreciation of the tight link between the natural and the built or impacted environment, and of the imperatives of considering both in the design process. |

At the end of the course, the students will be able to:

- fostered
- assess
- fostered

The course presents a view of the catchment processes of sediment production and transport that shape the landscape. Focus is on sediment fluxes from sources on hillslopes to the river network. Students learn about how a fluvial system functions, how to identify sediment sources and sinks, how to make predictions with numerical models, develop sediment budgets, and quantify geomorphic change.

Objective

The course has two fundamental aims: (1) The first aim is to provide environmental engineers with the physical process basis needed to understand fluvial system change, using the right language and terminology to describe landforms. We will cover the main geomorphic concepts of landscape change, e.g., thresholds, equilibrium, criticality, to describe change. Students will learn about the importance of the concepts of connectivity and timescales of change. (2) The second aim is to provide quantitative skills in making simple and more complex predictions of change and the data and models required. We will learn about typical landscape evolution models, and about hillslope erosion model concepts like RUSLE. We will learn how to identify sediment sources and sinks, and develop simple sediment budgets with the right data needed for this purpose. Finally we will learn about methods to describe the topology of river networks as conduits of sediment through the fluvial system.

Remark: partly in German.

Number Title Type ECTS Hours Lecturers
101-0258-00L River Engineering O 3 credits 2G V. Weitbrecht, I. Schalko, K. Sperger

Abstract

The lecture addresses the fundamentals of river engineering to quantitatively describe the flow of water, transport of sediment and wood, and morphological changes such as erosion and deposition processes associated with river structures. In addition, design guidelines for river engineering structures are introduced.

Objective

At the end of the course, the students will be able to:

- recall and describe the fundamentals of transport processes in rivers,
- apply different calculation approaches and methods to tackle river engineering problems and tasks such as the discharge capacity of a river, scour estimation, or sediment budget of a river,
- design and dimension river engineering works needed to influence the processes in watercourses, and
- determine the interaction between flow (discharge), sediment transport, wood transport and the resulting channel evolution.

Content

The first part of the lecture introduces the fundamentals of river engineering, such as methods to determine and calculate the river discharge, or sampling methods to characterize the bed material. In addition, the transport processes of sediment (bedload and suspended load) and wood in rivers will be examined, including the principles of incipient motion, and initiation of erosion or deposition processes.

In the second part of the lecture, the methods will be explained to quantify the bed load budget and the morphological changes (erosion, deposition) in river systems. Specifically, natural channel formation processes, different bed forms and plan forms of rivers (straight, meandering, braided) are examined.

The last part of the lecture focuses on the design of river engineering structures, including examples from an ongoing flood and river rehabilitation project at the Alpine Rheine in Austria and Switzerland.

Literature

102-0287-00L River Basin Erosion O 3 credits 2G P. Molnar

Abstract

The course presents a view of the catchment processes of sediment production and transport that shape the landscape. Focus is on sediment fluxes from sources on hillslopes to the river network. Students learn about how a fluvial system functions, how to identify sediment sources and sinks, how to make predictions with numerical models, develop sediment budgets, and quantify geomorphic change.

Objective

The course has two fundamental aims: (1) The first aim is to provide environmental engineers with the physical process basis needed to understand fluvial system change, using the right language and terminology to describe landforms. We will cover the main geomorphic concepts of landscape change, e.g., thresholds, equilibrium, criticality, to describe change. Students will learn about the importance of the concepts of connectivity and timescales of change. (2) The second aim is to provide quantitative skills in making simple and more complex predictions of change and the data and models required. We will learn about typical landscape evolution models, and about hillslope erosion model concepts like RUSLE. We will learn how to identify sediment sources and sinks, and develop simple sediment budgets with the right data needed for this purpose. Finally we will learn about methods to describe the topology of river networks as conduits of sediment through the fluvial system.
Content

The course consists of four sections: (1) Introduction to fluvial forms and processes and geomorphic concepts of landscape change, including climatic and human activities acting on the system. Concepts like thresholds, equilibrium, self-organised criticality, etc. are presented. (2) Landscape evolution modelling as a tool for describing the shape of the land surface. Soil formation and sediment production at long timescales. (3) The processes of sediment production, upland sheet-rill-gully erosion, basin sediment yield, rainfall-triggered landsliding, sediment budgets, and the modelling of the individual processes involved. Here we combine model concepts with field observations and look at many examples. (4) Processes in the river, floodplain and riparian zone, including river network topology, channel geometry, aquatic habitat, role of riparian vegetation, including basics of fluvial system management. The main focus of the course is on the hydrology-sediment connections at the field and catchment scale.

Lecture notes

There is no script.

Literature

The course materials consist of a series of 13 lecture presentations and notes to each lecture. The lectures were developed from textbooks, professional papers, and ongoing research activities of the instructor. All material is on the course webpage.

Prerequisites / notice

Prerequisites: Basic Hydrology and Watershed Modelling (or contact instructor).

Water Resources Management

Abstract

Watershed Modelling is a practical course on numerical water balance models for a range of catchment-scale water resource applications. The course covers GIS use in watershed analysis, models types from conceptual to physically-based, parameter calibration and model validation, and analysis of uncertainty. The course combines theory (lectures) with a series of practical tasks (exercises).

Objective

The main aim of the course is to provide practical training with watershed models for environmental engineers. The course is built on thematic lectures (2 hrs a week) and practical exercises (2 hrs a week). Theory and concepts in the lectures are underpinned by many examples from scientific studies. A comprehensive exercise block builds on the lectures with a series of 4 practical tasks to be conducted during the semester in group work. Exercise hours during the week focus on explanation of the tasks. The course is evaluated 50% by performance in the graded exercises and 50% by a seminar-end oral examination (30 mins) on watershed modelling concepts.

Content

The first part (A) of the course is on watershed properties analysed from DEMs, and on global sources of hydrological data for modelling applications. Here students learn about GIS applications (ArcGIS, QGIS) in hydrology - flow direction routines, catchment morphometry, extracting river networks, and defining hydrological response units. In the second part (B) of the course on conceptual watershed models students build their own simple bucket model (Matlab, Python), they learn about performance measures in modelling, how to calibrate the parameters and how to validate models, about methods to simulate stochastic climate to drive models, uncertainty analysis. The third part (C) of the course is focussed on physically-based model components. Here students learn about components for soil water fluxes and evapotranspiration, they practice with a fully-distributed physically-based model Topkapi-ETH, and learn about other similar models at larger scales. They apply Topkapi-ETH to an alpine catchment and study simulated discharge, snow, soil moisture and evapotranspiration spatial patterns.

Lecture notes

There is no textbook. Learning materials consist of (a) video-recording of lectures; (b) lecture presentations; and (c) exercise task documents that allow independent work.

Literature

Library consist of collections from standard hydrological textbooks and research papers, collected by the instructors on the course moodle page.

Abstract

Air pollutants cause negative effects on humans, wildlife and buildings. To control and reduce the impact of air pollutants, their transfer from sources to receptors needs to be known. This transfer includes transport within the atmospheric boundary layer, chemical transformation reactions and phase-transfer processes from gases to particles.

Objective

The students understand the fundamental principles of atmospheric transport, dispersion and chemistry of pollutants on the local to regional scale and their transfer gas to particle phases (secondary aerosols). This includes the knowledge of important atmospheric reactions, sources and sinks. The obtained understanding enables the students to apply computational tools to predict the transport and transformation of chemicals at the local to regional scale.
Content
- Structure of the Atmosphere
- Thermodynamics of the atmosphere
- Atmospheric stability
- Atmospheric boundary layer and turbulence
- Dispersion in the atmospheric boundary layer
- Numerical models of atmospheric dispersion
- Gas phase reaction kinetics
- Tropospheric chemistry and ozone formation
- Chemistry box models
- Volatile organic pollutants (VOCs) and semi-volatile organic pollutants (SVOCs)
- Aerosol modelling
- Air pollution source apportionment
- Inverse modelling of emissions

Lecture notes
Continued updates of:
- Slides and handouts
- Home assignments and sample solutions
- R package and code for some of the home assignments
- MATLAB codes
- Key journal articles as discussed during lecture

Abstract
This course deepens students' knowledge of environmental, economic, and social assessment methodologies and their various applications.

Objective
This course has the aim of deepening students' knowledge of the environmental, economic and social assessment methodologies and their various applications.

In particular, students completing the course should have the
- ability to judge the scientific quality and reliability of environmental assessment studies, the appropriateness of inventory data and modelling, and the adequacy of life cycle impact assessment models and factors
- knowledge about the current state of the scientific discussion and new research developments
- ability to properly plan, conduct and interpret environmental assessment studies

In the course element "Implementation of Environmental and other Sustainability Goals", students will learn to
- describe key sustainability problems of the current economic system and measuring units.
- describe the management system of an organisation and how to develop a sustainability orientation
- discuss approaches to measure environmental performance of an organisation, including 'organisational LCA' (Ecobalance)
- explain the pros and cons of single score environmental assessment methods
- demonstrate life cycle costing
- interpret stakeholder relations of an organisation
- (if time allows) describe sustainable supply chain management and stakeholder management
The goal of the course is to develop the understanding of the students for numerical simulation of flows to an extent that they can later use

Concepts and Theories

2G

D. Vanzo

Part I (Advanced Environmental Assessments)

- Inventory database developments, transparency, data quality, data completeness, and data exchange formats, uncertainties
- Software tools (MFA, LCA)
- Allocation (multioutput processes and recycling)
- Hybrid LCA methods.
- Consequential and marginal analysis
- Impact assessment of waterborne chemical emissions, sum parameters, mixture toxicity
- Spatial differentiation in Life Cycle Assessment
- Workplace and indoor exposure in Risk and Life Cycle Assessment
- Subjectivity in environmental assessments
- Multicriteria Decision Analysis
- Case Studies

Part II (Implementation of Environmental and other Sustainability Goals):

- Sustainability problems of the current economic system and its measuring units;
- The structure of a management system, and elements to integrate environmental management (ISO 14001) and social management (SA8000 as well as ISO 26000), especially into strategy development, planning, controlling and communication;
- Sustainability Opportunities and Innovation
- The concept of 'Continuous Improvement'
- Life Cycle Costing, Life Cycle Management
- environmental performance measurement of an organisation, including 'organisational LCA' (Ecobalance), based on practical examples of companies and new concepts
- single score env. assessment methods (Swiss ecopoints)
- stakeholder management and sustainability oriented communication
- an intro into sustainability issues of supply chain management

Students will get small exercices related to course issues.

Lecture notes

Part I: Slides and background reading material will be available on lecture homepage
Part II: Documents will be available on Ilias

Literature

Will be made available.

Prerequisites / notice

This course should only be elected by students of environmental engineering with a with a Module in Ecological Systems Design. All other students should take the individual courses in Advanced Environmental Assessment and/or Implementation of Environmental and other Sustainability goals (with or without exercise and lab).

Basic knowledge of environmental assessment tools is a prerequisite for this class. Students who have not yet had classwork in this topic are required to read an appropriate textbook before or at the beginning of this course (e.g. Jolliet, O et al. (2016). Environmental Life Cycle Assessment. CRC Press, Boca Raton - London - New York. ISBN 978-1-4398-8766-0 (Chapters 2-5,2)).

101-0267-01L Numerical Hydraulics W 3 credits 2G E. Secchi, D. Vanzo

Abstract

In the course Numerical Hydraulics the basics of numerical modelling of flows are presented.

Objective

The goal of the course is to develop the understanding of the students for numerical simulation of flows to an extent that they can later use commercial software in a responsible and critical way.

Content

The basic equations are derived from first principles. Possible simplifications relevant for practical problems are shown and their applicability is discussed. Using the example of non-steady state pipe flow numerical methods such as the method of characteristics and finite difference methods are introduced. The finite volume method as well as the method of characteristics are used for the solution of the shallow water equations. Special aspects such as wave propagation and turbulence modelling are also treated.

All methods discussed are applied practically in exercises. This is done using programs in MATLAB which partially are programmed by the students themselves. Further, some generally available softwares such as BASEMENT for non-steady shallow water flows are used.

**Abstract**

Hydraulic structures and their functions within hydraulic systems are treated in this lecture. The basic concepts of their layout and design with regard to economy and safety are provided.

**Objective**

Knowledge of hydraulic structures and their functions within hydraulic systems. Skills for the layout and design of hydraulic structures with regard to economy and safety.

**Content**

- Weirs: Weir stability, gates, inflatable dams, appurtenant structures, fish up- and downstream passages.
- Conduits: Design of headraces, pressure shafts, and penstocks, structural details and construction.
- Hydropower plants: Powerhouse and turbine types, design, functionality, construction processes.
- Dams: Types, appurtenant structures (river diversion, spillways, bottom and low-level outlets), dam type selection criteria, layout and design of gravity dams, buttress dams, arch dams, rockfill dams with central core or concrete face, reservoir sedimentation and sediment management, dam surveillance.
- Artificial reservoirs: Purpose, layout, sealing, appurtenant structures, environmental aspects.
- Economical aspects of hydraulic infrastructure

103-0347-00L | **Landscape Planning and Environmental Systems** | W | 3 credits | 2V | A. Grêt-Regamey

**Abstract**

In the course, students learn about methods for the identification and measurement of landscape characteristics, as well as measures and policies for landscape planning. Landscape planning is put into the context of environmental systems (soil, water, air, climate, flora and fauna) and discussed with regard to socio-political questions of the future.

**Objective**

The aims of this course are:

1. To illustrate the concept of landscape planning, the economic relevance of landscape and nature in the context of the environmental systems (soil, water, air, climate, flora and fauna).
2. To show landscape planning as an integral information system for the coordination of different instruments by illustrating the aims, methods, instruments and the functions in landscape planning.
3. To show the importance of ecosystem services.
4. To learn basics about nature and landscape: Analysis and assessment of the complex interactions between landscape elements, effects of current and future land use (ecosystem goods and services, landscape functions).
5. To identify and measure the characteristics of landscape.
6. Learn how to use spatial data in landscape planning.
In this course, the following topics are discussed:
- Definition of the concept of landscape
- Relevance of landscape planning
- Landscape metrics
- Landscape change
- Methods, instruments and aims of landscape planning (policy)
- Socio-political questions of the future
- Environmental systems, ecological connectivity
- Ecosystem services
- Urban landscape services
- Practice of landscape planning
- Use of GIS in landscape planning

The course has two fundamental aims: (1) The first aim is to provide environmental engineers with the physical process basis needed to understand fluvial system change, using the right language and terminology to describe landforms. We will cover the main geomorphic concepts of landscape change, e.g. thresholds, equilibrium, criticality, to describe change. Students will learn about the importance of the concepts of connectivity and timescales of change. (2) The second aim is to provide quantitative skills in making simple and more complex predictions of change and the data and models required. We will learn about typical landscape evolution models, and about hillslope erosion model concepts like RUSLE. We will learn how to identify sediment sources and sinks, and develop simple sediment budgets with the right data needed for this purpose. Finally we will learn about methods to describe the topology of river networks as conduits of sediment through the fluvial system.

No script. The documentation, consisting of presentation slides are partly handed out and are provided for download on Moodle.

The contents of the course will be illustrated in the associated course 103-0347-01 U (Landscape Planning and Environmental Systems (GIS Exercises)) or in Project LAND within the Experimental and Computer Lab (for Environmental Engineers). A combination of courses is recommended.

### 102-0287-00L River Basin Erosion

**Abstract**
The course presents a view of the catchment processes of sediment production and transport that shape the landscape. Focus is on sediment fluxes from sources on hillslopes to the river network. Students learn about how a fluvial system functions, how to identify sediment sources and sinks, how to make predictions with numerical models, develop sediment budgets, and quantify geomorphic change.

**Objective**
The course has two fundamental aims: (1) The first aim is to provide environmental engineers with the physical process basis needed to understand fluvial system change, using the right language and terminology to describe landforms. We will cover the main geomorphic concepts of landscape change, e.g. thresholds, equilibrium, criticality, to describe change. Students will learn about the importance of the concepts of connectivity and timescales of change. (2) The second aim is to provide quantitative skills in making simple and more complex predictions of change and the data and models required. We will learn about typical landscape evolution models, and about hillslope erosion model concepts like RUSLE. We will learn how to identify sediment sources and sinks, and develop simple sediment budgets with the right data needed for this purpose. Finally we will learn about methods to describe the topology of river networks as conduits of sediment through the fluvial system.

**Content**
The course consists of four sections: (1) Introduction to fluvial forms and processes and geomorphic concepts of landscape change, including climatic and human activities acting on the system. Concepts like thresholds, equilibrium, self-organised criticality, etc. are presented. (2) Landscape evolution modelling as a tool for describing the shape of the land surface. Soil formation and sediment production at long timescales. (3) The processes of sediment production, upland sheet-rill-gully erosion, basin sediment yield, rainfall-triggered landsliding, sediment budgets, and the modelling of the individual processes involved. Here we combine model concepts with field observations and look at many examples. (4) Processes in the river, floodplain and riparian zone, including river network topology, channel geometry, aquatic habitat, role of riparian vegetation, including basics of fluvial system management. The main focus of the course is on the hydrology-sediment connections at the field and catchment scale.

No courses in autumn semester (HS), only in spring semester (FS).

### EM: Remote Sensing and Earth Observation

Remark: Students also taking module "Remote Sensing and Earth Observation" as replacement of 102-0617-01L Methodologies for Image Processing of Remote Sensing Data in module "Landscape" have to chose one out following list:
- 701-1250-00L Atmospheric Remote Sensing (HS, 3 KP)
- 701-1232-00L Radiation and Climate Change (FS, 3 KP)
- 701-1644-00L Mountain Forest Hydrology (HS, 5 KP)

**Number** 102-0627-00L  
**Title** Applied Radar Remote Sensing  
**Type** W  
**ECTS** 3 credits  
**Hours** 2G  
**Lecturers** O. Frey
This course provides an introduction to processing and interpreting radar and synthetic aperture radar (SAR) remote sensing data. The primary topics of the course are interferometric techniques and related applications such as topography mapping and mapping of surface displacements, with a strong emphasis on solving practical problems using MATLAB.

**Objective**

Understand the concepts and techniques required to process and to adequately interpret interferometric radar/SAR data for topographic mapping and surface displacement applications.

At the end of the course the student is able to read, display, process, and interpret interferometric radar/SAR using MATLAB.

**Content**

The rationale behind the structure of the course follows the idea that radar imaging and radar/SAR interferometry are closely related and that a basic understanding of the radar imaging concept is helpful to understand and interpret interferometric radar data for various applications.

The course starts with the real-aperture radar case and a first introduction to the concept of radar interferometry with applications to topographic mapping and mapping of surface displacements.

Based on that, the 2-D imaging concept used in synthetic aperture radar imaging is treated.

Then, we expand further on radar and SAR interferometric (InSAR) concepts and processing steps for single interferograms and stacks of interferograms also using persistent scatterer interferometry (PSI) to measure deformation based on time series of interferometric SAR data.

Finally, the 3-D radar imaging case (SAR tomography) is put into context with PSI/InSAR time series as an extension of the more classical interferometric approaches thereby closing the circle around the strongly related concepts of SAR imaging and interferometry.

**Lecture notes**

Lecture notes/handouts for each topic will be provided online.

**Literature**

Additional reading material:
  ISBN: 978-0-306-47633-4
  https://doi.org/10.1007/0-306-47633-9

**Prerequisites / notice**

It is highly recommended that the student has previously taken the following courses:
- 102-0617-00L: Basics and Principles of Radar Remote Sensing
- 102-0617-00L: Methodologies for Image Processing of Remote Sensing Data

**EM: River Systems**

Remark: partly in German.

Note only for HS23: The previous replacement course Wildbach- und Hangverbau for River Basin Erosion will not be offered in HS23. Students taking LAND and RIVER must take one from the following list as a substitute for River Basin Erosion, which occurs in both modules:
- 101-0577-00 An Introduction to Sustainable Development in the Built Environment (HS)
- 701-1257-00 European Climate Change (HS)
- 101-1249-00 Hydraulics of Engineering Structures (HS)

**Number**

101-0258-00L

**Title**

River Engineering

**Type**

W

**ECTS**

3 credits

**Hours**

2G

**Lecturers**

V. Weitbrecht, I. Schalko, K. Sperger

**Abstract**

The lecture addresses the fundamentals of river engineering to quantitatively describe the flow of water, transport of sediment and wood, and morphological changes such as erosion and deposition processes associated with river structures. In addition, design guidelines for river engineering structures are introduced.

**Objective**

At the end of the course, the students will be able to:
- recall and describe the fundamentals of transport processes in rivers,
- apply different calculation approaches and methods to tackle river engineering problems and tasks such as the discharge capacity of a river, scour estimation, or sediment budget of a river,
- design and dimension river engineering works needed to influence the processes in watercourses, and
- determine the interaction between flow (discharge), sediment transport, wood transport and the resulting channel evolution.
The first part of the lecture introduces the fundamentals of river engineering, such as methods to determine and calculate the river discharge, or sampling methods to characterize the bed material. In addition, the transport processes of sediment (bedload and suspended load) and wood in rivers will be examined, including the principles of incipient motion, and initiation of erosion or deposition processes.

In the second part of the lecture, the methods will be explained to quantify the bed load budget and the morphological changes (erosion, deposition) in river systems. Specifically, natural channel formation processes, different bed forms and plan forms of rivers (straight, meandering, braided) are examined.

The last part of the lecture focuses on the design of river engineering structures, including examples from an ongoing flood and river rehabilitation project at the Alpine Rhine in Austria and Switzerland.

Lecture notes
Lecture slides can be downloaded via Moodle.

Literature
1. Erosion and Sedimentation; Pierre Y. Julien

Prerequisites / notice
2. River Mechanics; Pierre Y. Julien

Recommended lectures:
Hydrology (102-0293-AAL), Hydraulics I (101-0203-01L), and Hydraulic Engineering (101-0206-00L).

Short practical exercises (voluntary) will be offered throughout the semester to improve the application of the learned subjects.

102-0287-00L River Basin Erosion W 3 credits 2G P. Molnar

Abstract
The course presents a view of the catchment processes of sediment production and transport that shape the landscape. Focus is on sediment fluxes from sources on hillslopes to the river network. Students learn about how a fluvial system functions, how to identify sediment sources and sinks, how to make predictions with numerical models, develop sediment budgets, and quantify geomorphic change.

Objective
The course has two fundamental aims: (1) The first aim is to provide environmental engineers with the physical process basis needed to understand fluvial system change, using the right language and terminology to describe landforms. We will cover the main geomorphic concepts of landscape change, e.g. thresholds, equilibrium, criticality, to describe change. Students will learn about the importance of the concepts of connectivity and timescales of change. (2) The second aim is to provide quantitative skills in making simple and more complex predictions of change and the data and models required. We will learn about typical landscape evolution models, and about hillslope erosion model concepts like RUSLE. We will learn how to identify sediment sources and sinks, and develop simple sediment budgets with the right data needed for this purpose. Finally we will learn about methods to describe the topology of river networks as conduits of sediment through the fluvial system.

Content
The course consists of four sections: (1) Introduction to fluvial forms and processes and geomorphic concepts of landscape change, including climatic and human activities acting on the system. Concepts like thresholds, equilibrium, self-organised criticality, etc. are presented. (2) Landscape evolution modelling as a tool for describing the shape of the land surface. Soil formation and sediment production at long timescales. (3) The processes of sediment production, upland sheet-rill-gully erosion, basin sediment yield, rainfall-triggered landsliding, sediment budgets, and the modelling of the individual processes involved. Here we combine model concepts with field observations and look at many examples. (4) Processes in the river, floodplain and riparian zone, including river network topology, channel geometry, aquatic habitat, role of riparian vegetation, including basics of fluvial system management. The main focus of the course is on the hydrology-sediment connections at the field and catchment scale.

Lecture notes
There is no script.

Literature
The course materials consist of a series of 13 lecture presentations and notes to each lecture. The lectures were developed from textbooks, professional papers, and ongoing research activities of the instructor. All material is on the course webpage.

Prerequisites / notice
Prerequisites: Basic Hydrology and Watershed Modelling (or contact instructor).

Abstract
The course provides theoretical and practical foundations for understanding and characterizing physical soil properties and processes and their relevance for terrestrial ecosystems, plant growth, hydrological processes and atmospheric-land gas exchange, across all relevant scales.

Objective
Students are able to:
- Characterize the different soils based on their key textural and structural properties.
- Simulate and predict soil water retention and flow under varying environmental conditions and understand the key driving forces (capillarity, gravity, friction) and related water properties (surface tension and viscosity).
- Predict soil hydraulic properties for varying textural classes.
- Predict solute transport in soils for varying environmental conditions.
- Predict energy balance and temperature dynamics in soils.
- Predict conditions for plant water stress
- Estimate the impact of soil properties on the hydrological cycle and on plant growth.
INTRODUCTION
Week 1 (September 18)
Presentation of the role of soil physics in environmental sciences and terrestrial ecosystems: soils in the water cycle; soils and vegetation; soils and solute transport. Survey on students' interests and expectations. Presentation of course structure and learning objectives.

BASIC SOIL PROPERTIES
Week 2 (September 25) and Week 3 (October 02)
soil texture, particle size distribution, soil structure, soil surface area, porosity and bulk density
Pore scale consideration (water in a single pore), pore sizes and shapes; surface tension; Young-Laplace equation; capillary rise; contact angle
Friction and laminar flow; Hagen-Poiseuille’s law; Washburn equation; numerical lab (REPORT 1)

SOIL HYDRAULIC PROPERTIES
Week 4 (October 09) and Week 5 (October 16)
Soil water content and soil water potential - The energy state of soil water; total water potential and its components; volumetric and gravimetric water contents; field capacity and wilting point
Soil water characteristics and pore size distribution
Saturated water flow in soils - Laminar flow in tubes (Poisueille’s Law); Darcy’s Law, conditions and states of flow; permeability and hydraulic conductivity, measurement and theoretical concepts; effective conductivity; unsaturated hydraulic conductivity; Buckingham law.
Unsaturated water flow in soils - Unsaturated hydraulic conductivity models and applications

TOOLBOX – MEASUREMENTS AND MODELING
Week 6 (October 23) and Week 7 (October 30)
Measuring soil hydraulic properties, fitting and interpretation; Lab tour - demonstration of soil physical methods; lecture on HYPROP method; report on Hyprop data (REPORT 2)
Modelling unsaturated water flow based on Richards equation - Using Hydrus1D for simulation of unsaturated flow; simulating HYPROP measurements (REPORT 3)

SOIL IN THE WATER CYCLE
Week 8 (November 06) – Week 9 (November 13)
Water infiltration - steady state solutions for infiltration; approximate solutions to infiltration (Green-Ampt, Philip); infiltration rate and ponding; outlook to preferential flow
Water evaporation - Energy balance and land atmosphere interactions - potential and actual evaporation, evaporation stages;

SOIL PLANT INTERACTIONS
Week 10 (November 20) Week 11 (November 27)
Root water uptake and transpiration – Theory and mechanisms controlling root water uptake; hydraulic properties of rhizosphere; plant and stomatal conductance.
Modelling root water uptake and transpiration; analytical approaches and modeling using Hydrus (REPORT 4)

SOLUTE TRANSPORT
Week 12 (December 04) Week 13 (December 11)
Transport mechanisms of solutes in porous media; breakthrough curves; convection-dispersion equation; solutions for pulse and step solute application
Transport of reactive substances, preferential flow, simulations with Hydrus

CLOSURE
Week 14 (December 18)
Summary, course synthesis, connections between the different topics, questions, exam preparation

Literature
Supplemental textbook (not mandatory) - Introduction to Environmental Soil Physics, by: D. Hille

701-1343-00L Soil-Plant Water Relations W 3 credits 2V A. Carminati

Abstract
Water limitation is a primary constraint on plant growth and terrestrial fluxes worldwide. In this course, the principles of water flow in soil and plants are discussed, with particular attention on the effect of drought on root water uptake, transpiration and plant growth. Strategies of plants to tolerate drought are discussed in relation to both agricultural and ecological implications.

Objective
The students are able to: explain and compare systematically the drivers of water stress to plants; to solve the equations of water flow in soil and plants and to calculate plant water status for varying soil and climatic conditions and plant traits; to critically review and present one research question in soil-plant water relations; to openly debate on the current trends in soil and plant water research and climate change ecology.
There will be a required textbook that students need to purchase:

**EM: System Analysis in Urban Water Management**

E. Morgenroth

**Number** | **Title** | **Type** | **ECTS** | **Hours** | **Lecturers**
--- | --- | --- | --- | --- | ---
102-0227-00L | Systems Analysis and Mathematical Modeling in Urban Water Management | W | 6 credits | 4G | E. Morgenroth, M. Maurer

**Abstract**
Systematic introduction of material balances, transport processes (kinetics, stoichiometry and conservation), ideal reactors, residence time distribution, heterogeneous systems, dynamic response of reactors, parameter identification, local sensitivity, error propagation, and Monte Carlo simulations. Introduction to real-time control (PID controllers). Extensive numerical simulations with coding.

**Objective**
The goal of this course is to provide the students with an understanding of how urban water system can be described with mathematical models, and give them the to plan experiments, to evaluate error propagation and to test simple process control strategies in the field of process engineering in urban water management.

**Content**
The course will provide a broad introduction into the fundamentals of modeling water treatment systems. The topics are:
- Introduction into modeling and simulation
- The material balance equations, transport processes, transformation processes (kinetics, stoichiometry, conservation)
- Ideal reactors
- Hydraulic residence time distribution and modeling of real reactors
- Dynamic behavior of reactor systems
- Systems analytical tools: Sensitivity, parameter identification, error propagation, Monte Carlo simulation
- Introduction to process control (PID controller, fuzzy control)

**Lecture notes**
Copies of handouts will be available digitally.

**Literature**

**Prerequisites / notice**
Students should have a general understanding of urban water management as many examples are taken from processes relevant to related systems. This course is offered in parallel to the course Process Engineering Ia. It is beneficial but not necessary to follow both courses simultaneously.

**Process Engineering Ia**

**Number** | **Title** | **Type** | **ECTS** | **Hours** | **Lecturers**
--- | --- | --- | --- | --- | ---
102-0217-00L | Process Engineering Ia | W | 3 credits | 2G | E. Morgenroth

**Abstract**
Biological processes used in wastewater treatment, organic waste management, biological resource recovery. Focus on fundamental principles of biological processes and process design based on kinetic and stoichiometric principles. Processes include anaerobic digestion for biogas production and aerobic wastewater treatment.

**Objective**
Students should be able to evaluate and design biological processes.

**Content**
- Stoichiometry
- Microbial transformation processes
- Introduction to design and modeling of activated sludge processes
- Anaerobic processes, industrial applications, sludge stabilization

**Literature**
There will be a textbook that students need to purchase (see http://www.sww.ifu.ethz.ch/education/lectures/process-engineering-ia.html for further information).
At the core of this course is the separation of mixtures of solid bulk materials according to physical properties such as color, electrical conductivity, magnetism and so forth. After having taken this course, the students should have concept not only of the unit operations employed in WRT but also of how these unit operations are integrated into the flow sheets of production plants.

### Separation Processes

- Separation according to size and shape (Classification): Screening, Flow separation
- Separation according to material properties (Concentration): Manual Sorting, Gravity concentration, Magnetic separation, Eddy current separation, Electrostatic separation, Sensor technology, Froth flotation

### Assessment of separation success

- Separation function
- grade vs. recovery

### Fundamentals

- Properties of particles: Liberation conditions, Particle size and shape, Porosity of bulk materials
- Fluid dynamics of particles: Stationary particle beds, Fluidized beds, Free settling particles
- Flow sheet basics: Balancing mass flows
- Standard processes: batch vs. continuous

### Personal Competencies

- Critical Thinking
  - assessed

---

### EM: Waste Management

**Selective Module for Majors “River and Hydraulic Engineering” “Urban Water Management” and “Water Resources Management”.

**Remark:** 101-0339-00 Environmental Geotechnics – Polluted Sites and Waste Disposal only for those students also taking module "System Analysis in Urban Water Management" as replacement of 102-0217-00 Process Engineering Ia in module "Waste Management".

### Waste Recycling Technologies

Waste Recycling Technology (WRT) is a sub-discipline of Mechanical Process Engineering. WRT is employed in production plants processing contaminated soil, construction wastes, scrap metal, recovered paper and the like. While WRT is well established in Central Europe, it is only just now catching on in emerging markets as well.

**Abstract**

Waste Recycling: Scope and objectives

Waste recycling technologies in Switzerland

**Objective**

At the core of this course is the separation of mixtures of solid bulk materials according to physical properties such as color, electrical conductivity, magnetism and so forth. After having taken this course, the students should have concept not only of the unit operations employed in WRT but also of how these unit operations are integrated into the flow sheets of production plants.

**Content**

- Introduction
- Waste Recycling: Scope and objectives
- Waste recycling technologies in Switzerland
- Fundamentals
  - Properties of particles: Liberation conditions, Particle size and shape, Porosity of bulk materials
  - Fluid dynamics of particles: Stationary particle beds, Fluidized beds, Free settling particles
  - Flow sheet basics: Balancing mass flows
  - Standard processes: batch vs. continuous

**Assessment of separation success**

- Separation function
- grade vs. recovery

**Separation Processes**

- Separation according to size and shape (Classification): Screening, Flow separation
- Separation according to material properties (Concentration): Manual Sorting, Gravity concentration, Magnetic separation, Eddy current separation, Electrostatic separation, Sensor technology, Froth flotation

**Lecture notes Literature**

The script consists of the slides shown during the lectures. Background material will be provided on the script-server.

A list of recommended books will be provided.

**Prerequisites / notice**

The topic will be discussed not from the perspective of theory, but rather in the context of practical application. However, solid fundamentals in physics (in particular in mechanics) are strongly recommended.

---

### Environmental Geotechnics – Polluted Sites and Waste Disposal

The practice of landfurring, remediation of polluted sites and the disposal of radioactive waste are based on the same concepts of environmental protection. Understanding the contaminants behaviour and how to reduce their release to the environment is the key to remediating polluted sites and designing multi-barrier systems.

**Abstract**

On successful completion of this course students will be able to

- Assess the risk to the environment from landfills, contaminated sites and radioactive waste repositories in terms of the fate and transport of contaminants.
- Describe the technologies available to minimise environmental contamination
- Describe the principles of dealing with polluted sites and propose and evaluate appropriate remediation techniques
- Explain the concepts underlying radioactive waste management practices.
Content
This lecture course consists of lectures with exercises and case studies.
- An overview of the principles of environmental protection in waste management and how this is applied in legislation.
- An overview of the chemistry underlying the release and transport of contaminants from the landfilled/contaminated material/radioactive waste repository focusing on processes controlling mobility of heavy metals and organic compounds
- Introduction to contaminant transport in porous adsorbing media
- Design and function of engineered barriers. Clay as a barrier.
- Polluted site remediation: Site investigation, assessment, and remediation technologies
- Concepts and safety in radioactive waste management
- Role of the geological and engineered barriers and radionuclide transport in geological media.

EM: Water Infrastructure Planning and Stormwater Management

Elective Module for Majors "Environmental Technologies", "Resource Management", "River and Hydraulic Engineering" and "Water Resources Management".

Number Title Type ECTS Hours Lecturers
102-0250-00L Urban Drainage Planning and Modelling W 6 credits 4G M. Maurer, U. Kaura, J. P. Leitão Correia, J. Snellbeck

Abstract
In this course, students learn modern urban drainage engineering approaches, critical thinking, decision making in a complex environment as well as dealing with insufficient data and ill-defined problems.

Objective
By the end of the course, you should be able to do the following:
- Apply different methods and methodologies to assess the impact of urban drainage on water pollution and flooding potential.
- Distinguish between hydrological and hydrodynamic models and their correct application.
- Identify the difference between emission and immission oriented approaches for identifying drainage measures.
- Identify relevant measures, quantify their effects and assess their relative ranking/priority.
- Consider uncertainties and handle incomplete data and information.
- Make decisions and recommendations in a complex application case.
- Teamwork. State principles of effective team performance and the functions of different team roles; work effectively in problem-solving teams.
- Communication. Communicate and document your findings in concise group presentations and a written report.

Content
In urban drainage, the complexity of the decision-making, the available methodologies and the data availability have increased significantly. In current environmental engineering practice, the focus has shifted from tables and nomograms to sophisticated simulation tools. The topics cover:
- Integrated urban water management
- Hydrological and hydrodynamic modelling
- Water quality based assessment
- Freshwater ecology
- Hydraulic capacity assessment
- Sewer network operation
- Decision analysis

Prerequisites / notice
Prerequisites: 102-0214-00 Siedlungswasserwirtschaft and 102-0215-00 Siedlungswasserwirtschaft II or comparable educational background.

EM: Water Resources Management

Elective Module for Majors "Environmental Technologies" and "Urban Water Management".

Number Title Type ECTS Hours Lecturers
Watershed Modelling is a practical course on numerical water balance models for a range of catchment-scale water resource applications. The course covers GIS use in watershed analysis, models types from conceptual to physically-based, parameter calibration and model validation, and analysis of uncertainty. The course combines theory (lectures) with a series of practical tasks (exercises).

The main aim of the course is to provide practical training with watershed models for environmental engineers. The course is built on thematic lectures (2 hrs a week) and practical exercises (2 hrs a week). Theory and concepts in the lectures are underpinned by many examples from scientific studies. A comprehensive exercise block builds on the lectures with a series of 4 practical tasks to be conducted during the semester in group work. Exercise hours during the week focus on explanation of the tasks. The course is evaluated 50% by performance in the graded exercises and 50% by a semester-end oral examination (30 mins) on watershed modelling concepts.

The first part (A) of the course is on watershed properties analysed from DEMs, and on global sources of hydrological data for modelling applications. Here students learn about GIS applications (ArcGIS, Q-GIS) in hydrology - flow direction routines, catchment morphometry, extracting river networks, and defining hydrological response units. In the second part (B) of the course on conceptual watershed models students build their own simple bucket model (Matlab, Python), they learn about performance measures in modelling, how to calibrate the parameters and how to validate models, about methods to simulate stochastic climate to drive models, uncertainty analysis. The third part (C) of the course is focussed on physically-based model components. Here students learn about components for soil water fluxes and evapotranspiration, they practice with a fully-distributed physically-based model Topkapi-ETH, and learn about other similar models at larger scales. They apply Topkapi-ETH to an alpine catchment and study simulated discharge, snow, soil moisture and evapotranspiration spatial patterns.

There is no textbook. Learning materials consist of (a) video-recording of lectures; (b) lecture presentations; and (c) exercise task documents that allow independent work.

Basic Hydrology in Bachelor Studies (engineering, environmental sciences, earth sciences), Basic knowledge of Matlab (Python), ArcGIS (Q-GIS).

Concepts and Theories assessed
Analytical Competencies assessed
Decision-making assessed
Media and Digital Technologies assessed
Problem-solving assessed
Communication fostered
Cooperation and Teamwork assessed
Critical Thinking assessed
Integrity and Work Ethics assessed
Self-awareness and Self-reflection fostered
Self-direction and Self-management fostered

In the Experimental and Computer Laboratory students are introduced to research and good scientific practice. Experiments are conducted in different disciplines of environmental engineering. Data collected during experiments are compared to the corresponding numeric simulations. The results are documented in reports or presentations.

The student will learn the following skills: basic scientific work, planning and conducting scientific experiments, uncertainty estimations of measurements, applied numerical simulations, modern sensor technology, writing reports.

The Experimental and Computer Laboratory is building on courses in the corresponding modules. Material from these courses is a prerequisite or co-prerequisite (as specified below) for participating in the Experimental and Computer Laboratory (MODULE: Project LAND in the Experimental and Computer Laboratory):
- WatInfra: Water Network Management
- UWM: SystUWM + ProcUWM: Operation of Lab-WWTP
- AIN: Air Quality Measurements
- WasteBic: Anaerobic Digestion
- WasteRec: Plastic Recycling
- ESS: Environmental Assessment
- GROUND: Groundwater Field Course Kappelen
- WRM: Modelling Optimal Water Allocation
- FLOW: 1D Open Channel Flow Modelling
- LAND: Landscape Planning and Environmental Systems
- RIVER: Discharge Measurements
- HydEng: Hydraulic Experiments
- RemSens: Earth Observation and Landscape Planning
- SOIL: Soil and Environmental Measurements Lab

This is a supplementary course for students in the Laboratory Courses in Environmental Engineering who wish to complete all the exercises in Landscape planning and environmental system, as in the 3CP course 103-0347-01L Landscape Planning and Environmental Systems (GIS Exercises).

Supplement course to Project LAND in the Experimental and Computer Lab. Methods for the identification and measurement of landscape structure, changes, functions and services, as well as measures and implementation of landscape planning are deepened.
The entire course programs of ETH Zurich and the University of Zurich are open to the students to individual selection.

**Abstract**
The Master Programme concludes with the Master Thesis, which has to be done in one of the chosen Majors and has to be completed within 28 weeks. The Master Thesis is supervised by a professor and shall attest the students ability to work independently and to produce scientifically structured work.

**Objective**
To work independently and to produce a scientifically structured work.

**Content**
The topics of the Master Thesis are published by the professors. The Topic can be set also in consultation between the student and the professor.

### Science in Perspective

**Abstract**
Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

**Objective**
Introduction to urban water management (water supply, urban drainage, wastewater treatment, sewage sludge treatment). This course provides an introduction and an overview over the topics of urban water management (water supply, urban drainage, wastewater treatment, sewage sludge treatment). It supports the understanding of the interactions of the relevant technical and natural systems. Simple design models are introduced.

**Content**

**Lecture notes**

**Literature**
In this self-study course the students must work through and understand selected sections from the following book

Students must understand and be able to discuss the required reading in a 30 min oral exam. The required reading is explained in detail on the website of the professorships of urban water management. Additional information can be obtained during the office hours of the professors' assistants.

The required reading and studying should correspond roughly the time invested in the course Siedlungswasserwirtschaft GZ. Students are welcome to ask the assistants (http://www.sww.ifi.ethz.ch/group/teaching-assistants.html) for help with questions they have regarding the reading.

Date: 06.08.2024 12:40  Autumn Semester 2024  Page 2425 of 2684
Some students joining the MSc program in Environmental Engineering at ETH Zürich have to take additional courses from our BSc program. The decision of what courses to take is done at the time of admission at ETH.

The course on "Introduction to Urban Water Management" is offered at ETH Zürich only in German. Students who can speak and understand German must take the course (Siedlungswasserwirtschaft GZ) and get a passing grade. For students that do not have sufficient German language skills there is a self-study course and they have to take an oral exam.

This course is required for further in depth courses in urban water management.

Prerequisite: Hydraulics I and Hydrology

102-0455-AAL  Groundwater I  E-  4 credits  9R  J. Jimenez-Martinez, M. Willmann

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement. Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
The course provides a quantitative introduction to groundwater flow and contaminant transport.

Objective
In "Groundwater I" the competencies of process understanding are taught, applied and examined. Furthermore, system understanding and concept development are taught and applied, which are previous steps to groundwater modeling. To add measurement methods are taught and data analysis & interpretation is applied during the course.

Understanding of the basic concepts on groundwater flow and contaminant transport processes. Formulation and solving of practical problems.

Content
- Properties of porous and fractured media, Darcy’s law, flow equation, stream functions, interpretation of pumping tests, transport processes, transport equation, analytical solutions for transport, numerical methods: finite differences method, aquifers remediation, case studies.

Literature
- W. Kinzelbach, R. Rausch, Grundwassermodellierung, Gebrüder Bornträger, Stuttgart, 1995

102-0635-AAL  Air Pollution Control  E-  3 credits  13R  J. Wang

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
The lecture provides an introduction to the formation of air pollutants by technical processes, the emission of these chemicals into the atmosphere and the impact on air quality. Theoretical description and modeling of these processes, air quality measurement techniques and pollution control techniques are covered.

Objective
The students gain general knowledge of the factors resulting in air pollution and the techniques used for air pollution control. The students can identify major air pollution sources and understand the methods for measurement, data collection and analysis. The students can evaluate possible control methods and equipment, design a control system and estimate the efficiency and cost.

Content
- the physical and chemical processes leading to emission of pollutants
- air quality analysis
- the meteorological parameters influencing air pollution dispersion
- deterministic and stochastic models, describing the air pollution dispersion
- measurement concepts to observe ambient air pollution
- removal of gaseous pollutants by absorption and adsorption
- control of NOx and SOx
- fundamentals of particulate control
- design and application of wet scrubbers

Literature
- Text book

Prerequisites / notice
College lectures on basic physics, chemistry and mathematics.
In the course "Computer Science II", the competencies of programming, modeling and data analysis & interpretation are taught, applied and examined. The students will be able to write simple programs and to modify existing programs. Working with a professional programming environment (Eclipse). Students can solve the exercises on their own laptop or in the computer labs at ETH. The software used in this course runs on MS Windows, MacOS X and Linux.

### Prerequisites / notice

Knowledge from the course “Hydrology” (3rd semester Environmental Engineering) and about basic statistics and probability theory is a prerequisite (not formal).

### Competencies

#### Subject-specific Competencies
- **Concepts and Theories**: assessed
- **Techniques and Technologies**: assessed

#### Method-specific Competencies
- **Analytical Competencies**: assessed
- **Decision-making**: assessed
- **Media and Digital Technologies**: fostered
- **Problem-solving**: assessed
- **Project Management**: fostered

#### Social Competencies
- **Communication**: assessed
- **Cooperation and Teamwork**: fostered
- **Customer Orientation**: fostered
- **Leadership and Responsibility**: fostered
- **Self-presentation and Social Influence**: fostered
- **Sensitivity to Diversity**: fostered
- **Negotiation**: fostered

#### Personal Competencies
- **Adaptability and Flexibility**: assessed
- **Creative Thinking**: assessed
- **Critical Thinking**: assessed
- **Integrity and Work Ethics**: assessed
- **Self-awareness and Self-reflection**: fostered
- **Self-direction and Self-management**: assessed

---

### Literature

- Handouts of slides and additional reading material are provided on the Moodle course webpage (https://moodle-app2.let.ethz.ch/course/view.php?id=14738)

---

### Prerequisites / notice

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

### Content

Example of application of modelling techniques are made available on selected topics. Four computer-based class exercises on selected topics are offered and guided through teaching assistants.

### Lecture notes

Handouts of slides and additional reading material are provided on the Moodle course webpage (https://moodle-app2.let.ethz.ch/course/view.php?id=14738)

### Literature

Literature information is provided either in the handouts or on the Moodle course webpage (https://moodle-app2.let.ethz.ch/course/view.php?id=14738)

---

### Prerequisites / notice

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract

General Chemistry I and II: Chemical bond and molecular structure, chemical thermodynamics, chemical equilibrium, kinetics, acids and bases, electrochemistry

Objective

Introduction to general and inorganic chemistry. Basics of the composition and the change of the material world. Introduction to the thermodynamically controlled physico-chemical processes. Macroscopic phenomena and their explanation through atomic and molecular properties. Using the theories to solve qualitatively and quantitatively chemical and ecologically relevant problems.

Content

1. Stoichiometry
2. Atoms and Elements (Quantenmechanical Model of the Atom)
3. Chemical Bonding
4. Thermodynamics
5. Chemical Kinetics
6. Chemical Equilibrium (Acids and Bases, Solubility Equilibria)
7. Electrochemistry

Lecture notes

Nivaldo J. Tro
Chemistry - A molecular Approach (Pearson), Chapter 1-18

Literature

Housecroft and Constable, CHEMISTRY
Oxtoby, Gillis, Nachtrieb, MODERN CHEMISTRY

Competencies

Subject-specific Competencies

Concepts and Theories assessed
Techniques and Technologies assessed

Method-specific Competencies

Analytical Competencies assessed
Decision-making assessed
Problem-solving assessed

Personal Competencies

Adaptability and Flexibility fostered
Critical Thinking assessed
Integrity and Work Ethics fostered

Self-direction and Self-management fostered

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract

Chemistry II: Redox reactions, chemistry of the elements, introduction to organic chemistry

Objective

Erweitern der allgemeinen Grundlagen und Erarbeiten einer Basis, um Prozesse in komplexeren Umweltsystemen (Wasser / Luft / Boden) in ihrem zeitlichen und quantitativen Ablauf verstehen und beurteilen zu können.

Content

1. Redox reactions
2. Inorganic Chemistry
3. Introduction to organic chemistry
4. Stereochemistry
5. Reaction mechanisms: SN1 and SN2 reactions, electrophilic aromatic substitutions, eliminations (E1 and E2), addition reactions (C=C and C=O double bonds), Chemistry of carbonyl and carboxyl groups.
6. Rules for nomenclature of inorganic compounds. Systematic description of the groups of elements in the periodical system and the most important compounds of these elements. Formation of compounds as a consequence of the electronoc structure of the elements.
7. Introduction to organic chemistry
8. Description of the most important classes of compounds and of the functional groups. Principal reactivity of these functional groups. Stereochemistry.
9. Reaction mechanisms: SN1 and SN2 reactions, electrophilic aromatic substitutions, eliminations (E1 and E2), addition reactions (C=C and C=O double bonds), Chemistry of carbonyl and carboxyl groups.

Biochemistry

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.
Abstract
Basic knowledge of enzymology, in particular the structure, kinetics and chemistry of enzyme-catalysed reaction in vitro and in vivo.

Objective
Biochemistry of metabolism: Those completing the course are able to describe and understand fundamental cellular metabolic processes.

Content
Program
Introduction, basics, composition of cells, biochemical units, repetition of relevant organic chemistry
Structure and function of proteins
Lipids and biological membranes
Enzymes and enzyme kinetics
Catalytic strategies
Metabolism: Basic concepts and design. Repetition of basic thermodynamics
Glycolysis
The citric acid cycle
Oxidative phosphorylation

752-4001-AAL Microbiology
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Self-study course in microbiology.

Objective
Teaching of basic knowledge in microbiology.

Content
This is a self-study course for students with microbiology as an admission requirement. The goal of the course is that students acquire basics in microbiology, including bacterial cell biology, genetics, growth and physiology, metabolism, phylogeny and microbial diversity, and applications of microbiology.

Literature
This self-study course is based on the book ‘Brock, Biology of Microorganisms’.

102-0293-AAL Hydrology
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract

Objective
Kenntnis der Grundzüge der Hydrologie. Kennenlernen von Methoden, zur Abschätzung hydrologischer Grössen, die zur Dimensionierung von Wasserbauwerken und für die Nutzung von Wasserressourcen relevant sind.

Content
Der hydrologische Kreislauf: globale Wasserressourcen, Wasserbilanz, räumliche und zeitliche Dimension der hydrologischen Prozesse.
Niederschlag: Niederschlagsmechanismen, Regenmessung, räumliche/zeitliche Verteilung des Regens, Niederschlagsregime, Punktniederschlag/Gebietsniederschlag, Isohyeten, Thiessenpolygon, Extremniederschlag, Dimensionierungsniederschlag.
Interzeption: Messung und Schätzung.
Evaporation und Evapotranspiration: Prozesse, Messung und Schätzung, potentielle und effektive Evapotranspiration, Energiebilanzmethode, empirische Methode.
Infiltration: Messung, Horton-Gleichung, empirische und konzeptionelle Methoden, F-index und Prozentuale Methode, SCS-CN Methode.
Schnee und Eis: Schneevegetationen und -messungen Schätzung des Schneeschmelzprozesses durch die Energiebilanzmethode, Abfluss aus Schneeschmelze, Temperatur-Index- und Grad-Tag-Verfahren.
Ein internes Skript ist zur Verfügung (kostenpflichtig, nur Herstellungskosten).

Die Kopie der Folien zur Vorlesung können auf den Webseiten der Professur für Hydrologie und Wasserwirtschaft herunterladen werden.

Prerequisites / notice
Vorbereitend zu Hydrologie I sind die Vorlesungen in Statistik. Der Inhalt, der um ein Teil der Übungen zu behandeln und um ein Teil der Vorlesungen zu verstehen notwendig ist, kann zusammengefasst werden, wie hintereinander es beschrieben wird:
Elementare Datenverarbeitung: Hydrologische Messungen und Daten, Datenreduzierung (grafische Darstellungen und numerische Kenngrössen).

**406-0023-AAL  Physics**
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Abstract
This course gives an overview of important concepts in classical dynamics, thermodynamics, electromagnetism, quantum physics, and special relativity. Emphasis is placed on demonstrating key phenomena using experiments, and in developing skills for quantitative problem solving.

Objective
The goal of this course is to make students able to explain and apply the basic principles and methodology of physics to problems of interest in modern science and engineering. An important component of this is learning how to solve new, complex problems by breaking them down into parts and applying approximations.

Content
Oscillations and waves in matter
Thermodynamics (temperature, heat, equations of state, laws of thermodynamics, entropy, transport)
Electromagnetism (electrostatics, magnetostatics, circuits, Maxwell's equations, electromagnetic waves, induction, electromagnetic properties of materials)
Overview of quantum and atomic physics
Introduction to special relativity

Lecture notes
Lecture notes and exercise sheets will be distributed via Moodle.

**406-0603-AAL  Stochastics (Probability and Statistics)**
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Abstract
Introduction to basic methods and fundamental concepts of statistics and probability theory for non-mathematicians. The concepts are presented on the basis of some descriptive examples. Learning the statistical program R for applying the acquired concepts will be a central theme.

Objective
The objective of this course is to build a solid fundament in probability and statistics. The student should understand some fundamental concepts and be able to apply these concepts to applications in the real world. Furthermore, the student should have a basic knowledge of the statistical programming language "R".

406-0141-AAL Linear Algebra E- 5 credits  11R  M. Akka Ginosar, R. Prohaska
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.
Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Introduction to Linear Algebra

Objective
Basic knowledge of linear algebra as a tool for solving engineering problems.
Understanding of abstract mathematical formulation of technical and scientific problems.

Content
Introduction and linear systems of equations, matrices, quadratic matrices, determinants and traces, general vector spaces, linear mappings, bases, change of basis, diagonalization, eigenvalues and eigenvectors, orthogonal transformations, scalar-product, inner product spaces.

Literature

406-0242-AAL Analysis II E- 7 credits 15R  M. Akveld
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.
Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Mathematical tools of an engineer

Objective
Mathematics as a tool to solve engineering problems, mathematical formulation of problems in science and engineering. Basic mathematical knowledge of an engineers.

Content

Literature

participation in the course 871-0240-00L "Human Learning (EW 1)".

Abstract
Course promotes exchange between student teachers and elementary school teachers in STEM teaching with 3 parts: 1) block seminar (ca. 16 h), 2) collaboration with elementary school teacher in a class (ca. 34 h, with approx. 50% spent in the elementary or middle school class and ca. 50% for preparation), and 3) final report (ca. 10 h). Registration implies participation in all 3 parts.

Objective
Deepening the understanding of knowledge formation and learning processes of primary and secondary students from a cognitive and developmental psychology perspective for students. The assistant ship provides didactic experience and exposure to a different school level (more heterogeneous groups such as for example low-performing to very high-performing Children, language problems etc.).

Content
Students learn more about the potential and challenges of pupils. They get to know the early stages of knowledge as well as the development of pre-concepts of students in their subject area. The seminar with a phase of cooperation consists of three phases: In the block seminar, pre-concepts are discussed in their own subject as well as theoretical inputs from developmental and cognitive psychology. During the cooperation phase, a teaching task defined by the primary and secondary school teachers is actively undertaken in a class. Finally, a final report is written, which contains a description of the students’ level of knowledge. This seminar is only suitable for students who can adapt flexibly to the needs of pupils from lower class levels.

Subject Didactics and Professional Training

Important: You can only enrol in the courses of this category if you have not more than 12 CP left for possible additional requirements.

Number | Title | Type | ECTS | Hours | Lecturers
--- | --- | --- | --- | --- | ---
701-0822-00L | Mentored Assignment | W | 2 credits | 4A | C. Colberg, F. Keller

Prerequisites: Environmental Education Didactics I (701-0823-00L) and Environmental Education Didactics II (701-0825-10L).

Abstract
The mentored paper is designed to bring together the findings from the 701-0823-00L Environmental Education Didactics I Information and the 701-0825-10L Environmental Education Didactics II. By using various teaching techniques and methods a semester plan, which is based on various curricula will be elaborated for a given topic.

Objective
1. The students have planned a curriculum for a semester course.
2. Students reflect on formative and summative ways such a teaching unit to examine and implement parts of it.
3. The students have implemented parts of the semester curriculum.
4. The students deal with the question to what extend teaching techniques, teaching methods but also sequences of self-study must be involved in the planning.

Content
Semester Planning
The students plan on the basis of the given curricula a teaching sequence. The resulting learning process is divided in phases with respect to a reasonable rhythm selecting different teaching methods.

Contents
Self-study
The students consider different principles (eg exemplarity, competence-orientation, systematic knowledge building), so that learners understand the contents and relate them to professional practice.

Tests
The students use adequate various types of examinations. They consider formative and summative ways. For this purpose they formulate test questions and tasks to match the objectives in the curriculum and semester schedule. The use of appropriate literature is required

Literature Study
The mentored assessment requires a specific study of literature which must be cited accordingly.

Lecture notes
A manual gives the students a guideline how to proceed.

Literature
The use of appropriate literature is part of the grading.

Prerequisites / notice
Completion of FD1 and FD2
Competencies

Subject-specific Competencies

- Techniques and Technologies (fostered)

Method-specific Competencies
- Analytical Competencies (fostered)
- Decision-making (fostered)
- Media and Digital Technologies (fostered)
- Problem-solving (assessed)
- Project Management (assessed)

Social Competencies
- Communication (assessed)
- Cooperation and Teamwork (assessed)
- Customer Orientation (fostered)
- Leadership and Responsibility (assessed)
- Self-presentation and Social Influence (fostered)
- Sensitivity to Diversity (assessed)
- Negotiation (assessed)

Personal Competencies
- Adaptability and Flexibility (fostered)
- Creative Thinking (fostered)
- Critical Thinking (assessed)
- Integrity and Work Ethics (fostered)
- Self-awareness and Self-reflection (assessed)
- Self-direction and Self-management (fostered)

Environmental Education Didactics I

Enrolment to Master’s degree studies required. Recognition either for Master’s degree studies or for Teaching Certificate.

Abstract
Environmental Education Didactics supplies the basic concepts for the application of the contents of the lecture Human Learning (EW 1) in environmental education.

On the basis of selected environmental topics didactical theories are used practice-oriented, whereas the appliance of different teaching methods is pointed out. In addition a didactical topic is exercised exemplary in an assignment.

Objective
Application of the principles and topics of educational sciences on environmental contexts.

Content
Berufsfelder, Denkansätze, unsere Orientierung, Möglichkeiten der Umweltlehre, Umsetzungen des Stoffes, Wirkungen auf Zuhörer/innen, Konfliktmanagement; Anwendungen allg. Didaktik z. B. in den Bereichen: Globale Umweltzusammenhänge, Klima, Kreisläufe, Boden als Lebensgrundlage, Abfallwirtschaft, Ökobilanzierung als Beurteilungsgrundlage, Schadstoffe in der Umwelt, Quellenarbeit, Umwelt und Wirtschaft, Medien und Umfeld, Zukunftsperspektiven

Lecture notes
Die Unterlagen zu den behandelten Themen werden über die Polybox abgegeben.

Literature
Gemäß Literaturliste, die jeweils in den Lehrveranstaltungen abgegeben wird.

Teaching Internship Including Examination Lessons

Environmental Studies

Prerequisite: successful participation in Mentored Assignment (701-0822-00L).

Repetition of the Teaching Internship is excluded even if Examination Lessons are to be repeated.

Abstract
Students apply the insights, abilities and skills they have acquired within the context of an educational institution. They observe 10 lessons and teach 20 lessons independently. Two of them are as assessed as Examination Lessons.

Objective
- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics for their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They learn the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils’ work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

Content
The students will be able to watch and evaluate the teaching of colleagues and experts. They get profit out of their teaching experiences not only when preparing but also when teaching. Doing so they will be supported by their mentors. Two lessons of the course will be split off for the examination - procedure.

</tbody>
</table>
Content
- Biodiversity: variation, threats and conservation
- Influence of environmental factors on organisms; adaptation to environmental conditions
- Population dynamics: causes, description, prediction and regulation
- Interactions between species (competition, coexistence, predation, parasitism, food webs)
- Ecological communities: structure, stability, succession
- Ecosystems: compartments, material and energy flows

Lecture notes
Documents, lecture slides, exercises and relevant literature are available in Moodle. The documents for the next lecture will be available on Friday morning at the latest.

401-0251-00L Mathematics I

Abstract
This course covers mathematical concepts and techniques necessary to model, solve and discuss scientific problems - notably through ordinary differential equations.

Objective
Mathematics is of ever increasing importance to the Natural Sciences and Engineering. The key is the so-called mathematical modelling cycle, i.e. the translation of problems from outside of mathematics into mathematics, the study of the mathematical problems (often with the help of high level mathematical software packages) and the interpretation of the results in the original environment.

Content
1. Single-Variable Calculus:
- review of differentiation, linearisation, Taylor polynomials, maxima and minima, antiderivative, fundamental theorem of calculus, integration methods, improper integrals.
2. Linear Algebra and Complex Numbers:
- systems of linear equations, Gauss-Jordan elimination, matrices, determinants, eigenvalues and eigenvectors, cartesian and polar forms for complex numbers, complex powers, complex roots, fundamental theorem of algebra.
3. Ordinary Differential Equations:
- separable ordinary differential equations (ODEs), integration by substitution, 1st and 2nd order linear ODEs, homogeneous systems of linear ODEs with constant coefficients, introduction to 2-dimensional dynamical systems.

Prerequisites
- Bretscher, O.: Linear Algebra with Applications (Pearson Prentice Hall).

529-2001-02L Chemistry I

Abstract
General Chemistry I: Chemical bond and molecular structure, chemical thermodynamics, chemical equilibrium.

Objective
Introduction to general and inorganic chemistry. Basics of the composition and the change of the material world. Introduction to the thermodynamically controlled physico-chemical processes. Macroscopic phenomena and their explanation through atomic and molecular properties. Using the theories to solve qualitatively and quantitatively chemical and ecologically relevant problems.

Content
1. Stoichiometry
- Amount of substance and mass. Composition of chemical compounds. Reaction equation. Ideal gas law.
2. Atoms
4. Basics of chemical thermodynamics
- System and surroundings. Description of state and change of state of chemical systems.
5. First law of thermodynamics
6. Second law of thermodynamics
- Entropy. Change of entropy in chemical systems and universe. Reaction entropy.
7. Gibbs energy and chemical potential.
8. Chemical equilibrium
9. Acids and bases
10. Dissolution and precipitation.
- Heterogeneous equilibrium. Dissolution and solubility product. Carbon dioxide-carbonic acid-carbonate equilibrium.

551-0001-00L General Biology I

Abstract
Organismic biology to teach the basic principles of classical and molecular genetics, evolutionary biology and phylogeny. First in a series of two lectures given over two semesters for students of agricultural and food sciences, as well as of environmental sciences.

Objective
The understanding of some basic principles of biology (inheritance, evolution and phylogeny) and an overview of the diversity of life.

Content
The first semester focuses on the organismal biology aspects of genetics, evolution and diversity of life in the Campbell chapters 12-34.

Week 1-7 by Alex Widmer, Chapters 12-25
12 Cell biology Mitosis
13 Genetics Sexual life cycles and meiosis
14 Genetics Mendelian genetics
15 Genetics Linkage and chromosomes
20 Genetics Evolution of genomes
21 Evolution How evolution works
22 Evolution Phylogenetic reconstructions
23 Evolution Microevolution
24 Evolution Species and speciation
25 Evolution Macroevolution

Week 8-14 by Oliver Martin, Chapters 26-34
26 Diversity of Life Introduction to viruses
27 Diversity of Life Prokaryotes
28 Diversity of Life Origin & evolution of eukaryotes
29 Diversity of Life Nonvascular/seedless vascular plants
30 Diversity of Life Seed plants
31 Diversity of Life Introduction to fungi
32 Diversity of Life Overview of animal diversity
33 Diversity of Life Introduction to invertebrates
34 Diversity of Life Origin & evolution of vertebrates

Abstract
Students learn to apply selected concepts and tools from computer science for working on interdisciplinary projects. The following topics are covered: modeling and simulations, managing data with lists, tables and relational databases, introduction to programming.

Objective
The students learn to:
- choose and apply appropriate tools from computer science,
- process and analyze real-world data from their subject of study,
- handle the complexity of real-world data,
- query databases and understand and evaluate the corresponding database model,
- encode a problem into a program, test the program, and correct errors,
- implement models from the natural sciences as a simulation.

Content
1. Modeling and simulations
2. Data management with lists and tables
3. Data management with a relational database
4. Introduction to programming with Python 1 (variables & data types)
5. Introduction to programming with Python 2 (control structures & logic)
6. Introduction to programming with Python 3 (sequential data structures)

Lecture notes
All materials for the lecture are available at www.evim.ethz.ch

Literature

Prerequisites / notice
This course is based on application-oriented learning. The students spend most of their time working through projects with data from natural science and discussing their results with teaching assistants. To learn the computer science basics there are electronic tutorials available.

### Abstract

This practical course provides an introduction to elementary laboratory techniques. The experiments cover a wide range of techniques, including analytical and synthetic techniques (e.g., investigation of soil and water samples or the preparation of simple compounds). Furthermore, the handling of gaseous substances is practised.

### Objective

This course is intended to provide an overview of experimental chemical methods. The handling of chemicals and proper laboratory techniques represent the main learning targets. Furthermore, the description and recording of laboratory processes is an essential part of this course.

### Content

- The classification and analysis of natural and artificial compounds is a key subject of this course. It provides an introduction to elementary laboratory techniques, and the experiments cover a wide range of analytic and synthetic tasks:
  - Selected samples (e.g., soil and water) will be analysed with various methods, such as titrations, spectroscopy or ion chromatography. The chemistry of aqueous solutions (acid-base equilibria and solvation or precipitation processes) is studied.
  - The synthesis of simple inorganic complexes or organic molecules is practised. Furthermore, the preparation and handling of environmentally relevant gaseous species like carbon dioxide or nitrogen oxides is a central subject of the Praktikum.
- The experiments cover a wide range of techniques, including analytical and synthetic techniques (e.g., investigation of soil and water samples or the preparation of simple compounds). Furthermore, the handling of gaseous substances is practised.

### Literature

The instructions to the experiments will be published on Moodle.

### Competencies

- **Concepts and Theories**
  - Fostered
- **Techniques and Technologies**

### Abstract

### Objective

- Capability of preparing biological specimen, microscopy and documentation. Understanding the correlation between plant structure and function at the level of organs, tissues and cells.
- Awareness of the link between plant anatomy, systematics, physiology, ecology, and development.

### Content

- Special features of plant cells: Plastids, vacuole, cell wall. Anatomy of seed plants: From cells to organs. Anatomy and function of various plant tissues (epidermis, vascular tissue, wood, etc.). Anatomy and function of different plant organs (root, stem, leaf, flower, fruit, seed).
- Anatomical adaptations to different environments.

### Abstract

Introduction to the way physicists think and work with the help of concept questions, demonstration experiments and problem solving. Wherever possible, applications from thermodynamics, electricity and magnetism are taught from the areas of the degree programmes.

### Objective

Introduction to the scientific methodology. The student should develop his/her capability to turn physical observations into mathematical models, and to solve them.

### Content

- Thermodynamics with first and second law, phase transformations, transport phenomena. Introduction to electricity and magnetism, as well as waves and modern physics.

### Literature

- A script will be distributed

752-4001-00L Microbiology  O  2 credits  2V  M. Schuppler, M. Pilhofer, S. Robinson, G. Velicer
Some parts of the lecture will be taught in English.

Abstract
Teaching of basic knowledge in microbiology with main focus on Microbial Cell Structure and Function, Molecular Genetics, Microbial Growth, Metabolic Diversity, Phylogeny and Taxonomy, Prokaryotic Diversity, Human-Microbe Interactions, Biotechnology.

Objective
Teaching of basic knowledge in microbiology.

Content

Lecture notes
Wird von den jeweiligen Dozenten ausgegeben.

Literature
Die Behandlung der Themen erfolgt auf der Basis des Lehrbuchs Brock, Biology of Microorganisms.

701-0024-00L Mathematics IV: Statistics  O  4 credits  2V+1U  N. Meinshausen

Abstract
Introduction to basic methods and fundamental concepts of statistics and probability theory for practitioners in natural sciences. The concepts will be illustrated with some real data examples and applied using the statistical software R.

Objective
Capacity to learn from data; good practice when dealing with data and recognizing possible fraud in statistics; basic knowledge about the laws of randomness and stochastic thinking (thinking in probabilities); application of simple methods in inferential statistics (e.g., several hypothesis tests will be introduced), i.a. also using the statistical software R. The lecture will be held in German.

Content

Lecture notes
Auszuführliches Skript zur Vorlesung ist erhältlich.

Literature

Prerequisites / notice
Die Übungen (ca. die Hälfte der Kontaktstunden; einschließlich Computerübungen) sind ein wichtiger Bestandteil der Lehrveranstaltung.

Voraussetzungen: Mathematik I, II

Examination Block 2

701-0071-00L Mathematics III: Systems Analysis  O  4 credits  2V+1U  C. Brunner, R. Knutti, H. Wernli

Abstract
The objective of the systems analysis course is to deepen and illustrate the mathematical concepts on the basis of a series of very concrete examples. Topics covered include: linear box models with one or several variables, non-linear box models with one or several variables, time-discrete models, and continuous models in time and space.

Objective
Learning and applying of concepts (models) and quantitative methods to address concrete problems of environmental relevance.

Content
Understanding and applying the systems-analytic approach, i.e., Recognizing the core of the problem - simplification - quantitative approach - prediction.

Lecture notes
https://iac.ethz.ch/edu/courses/bachelor/vorbereitung/systemanalyse.html

Literature

701-0023-00L Atmosphere  O  3 credits  2V  E. Fischer, U. Lohmann

Abstract
Basic principles of the atmosphere, physical structure and chemical composition, trace gases, atmospheric cycles, circulation, stability, radiation, condensation, clouds, oxidation capacity and ozone layer.

Objective
Students are able
- to explain the physical structure and chemical composition of the atmosphere
- to quantitatively describe and understand the fundamental physical and chemical process in the atmosphere
- to explain the interactions and feedbacks between atmosphere - ocean - land surface, troposphere - stratosphere and weather - climate.

In the course "Atmosphere", the competencies of process understanding, system understanding and data analysis & interpretation are taught, applied and examined.

Content
Basic principles of the atmosphere, physical structure and chemical composition, trace gases, atmospheric cycles, circulation, stability, radiation, condensation, clouds.

Lecture notes
Written information will be supplied.

701-0501-00L Pedosphere O 3 credits 2V R. Kretzschmar

Abstract
Introduction to the formation and properties of soils as a function of parent rock, landscape position, climate, and soil organisms. Complex relationships between soil forming processes, physical and chemical soil properties, soil biota, and ecological soil properties are explained and illustrated by numerous examples.

Objective
Understanding of soils as integral parts of ecosystems, development and distribution of soils as a function of environmental factors, and processes leading to soil degradation.

Content
Definition of the pedosphere, soil functions, rocks as parent materials, minerals and weathering, soil organisms, soil organic matter, soil formation, principles of soil classification, global soil regions, physical soil properties and functions, chemical soil properties and functions, soil fertility, land use and soil degradation.

701-0033-00L Laboratory Course in Physics for Students of Environmental Sciences O 2 credits 4P M. Münich, A. Biland, A. Eggenberger, N. Gruber

Abstract
Learning with the basic principles of scientific experimentation. By performing experiments in different fields of experimental physics the students will learn the usage of measurement instruments as well as the correct analysis and the estimation of the accuracy of the measurement results.

Objective
Working in a laboratory forms an important part of modern scientific education. Using simple experimental setup the laboratory course will provide basic knowledge of:
- the setup of experiments,
- various measurement techniques,
- the use of various measurement instruments,
- the correct performance of experiments,
- the analysis of the accuracy of the measurements,
- and the interpretations of the measured quantities.

The course will also deepen the knowledge of experimental physics.

Content
The students select 3 out of 18 offered experiments that they want to conduct. After conducting these experiments, the students document and analyze their measurements, estimate the accuracy of their results, and compare them with the values expected according to the laws of physics. Introductory lectures with exercises in Jupyter Notebooks as evaluation tools and in determining the accuracy of measurement results ("error calculation"), as well as a preliminary experiment for practicing experiment evaluation, complement the practical.

Lecture notes
Manuals for the experiments and Jupyter Notebook templates are provided online on the Moodle course pages.

Autumn Semester 2024
Analysing Arguments in Science and Ethics

**Abstract**
Problems of the environment and sustainable development are complex from a scientific as well as from an ethical point of view. Addressing them requires the ability to deal with arguments. This course provides basic knowledge and methods for reconstructing, analysing and evaluating arguments. We exercise and improve these abilities by using examples from science, ethics and political debates.

**Objective**
Students acquire basic knowledge and methods for analyzing arguments. They are able to apply these methods to complex arguments concerning scientific and ethical questions about the environment and sustainable development, and to construct themselves arguments and apply them successfully. Moreover, they are able to evaluate the contribution of arguments to controversial debates with the help of rules. Students acquire thereby a crucial skill for Critical Thinking, which aims at responsible argumentation, communication and action.

**Content**
In the sciences as well as in public discussions or in our everyday life, we try to convince others or to achieve consent in matters of disagreement. We do this with the help of arguments. But what are the criteria for arguments to be convincing and for claims to be clear? And how do we counter arguments by a debate? How can we identify and avoid fallacies in reasoning? How do we analyse and define concepts? This course provides basic knowledge of conceptual analysis and argumentation theory as well as methods for identifying, reconstructing and evaluating claims and arguments. Its focus is on systematically addressing the following two questions: What do you mean? How do you know? The first question aims at a better understanding of the claim in question, the second at assessing the reasons that support or undermine the claim. We exercise and improve the abilities to address these questions by using texts on scientific and ethical questions concerning the environment and sustainable development. The course provides thus crucial skills for Critical Thinking, which aims at responsible argumentation, communication and action.

**Lecture notes**
Handouts will be available.

**Literature**

**Prerequisites / notice**
This is a compulsory course in the social sciences and humanities in the second year of the BA Environmental sciences. For 2 ECTS-credits, all written tasks that are distributed during the course need to be solved.
Environmental law regulates the protection of human beings and their environment, such as animals, plants, habitats, soil, waters and air. It

University lecturers

2V Hours

R. Hansmann

Analytical Competencies

On completion of this lecture, you have acquired the ability to identify, analyze, critically reflect and resolve ethical challenges in general

Subject-specific Competencies

Critical Thinking

The students are able:
- to apply environmental law in a specific case.
- to explain in which cases the basic principles and the particular instruments of environmental law apply.
- to identify the shortcomings of environmental law and the legislative needs in this regard.
- to describe the tasks and competencies of environmental scientists compared to those of lawyers.

ECTS

Environmental Law

Students who have attended and passed the course unit 851-0741-00L in the spring semester may not attend this course unit (851-0738-04L) again and can't credited it.

Environmental law regulates the protection of human beings and their environment, such as animals, plants, habitats, soil, waters and air. It plays an increasing role in relation to public and private projects. The lecture gives an overall view of Swiss environmental law. Specific subjects will be dealt with in more detail based on case studies and group work.

The students are able:
- to apply environmental law in a specific case.
- to explain in which cases the basic principles and the particular instruments of environmental law apply.
- to identify the shortcomings of environmental law and the legislative needs in this regard.
- to describe the tasks and competencies of environmental scientists compared to those of lawyers.

Electives

Humanities

Environmental Ethics (University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student:

UZH Module Code: 07SMEEE266

Please register at:
https://www.uzh.ch/cmsssl/de/studies/application/chmobility/online.html

after you received your logon information you can enrol to courses at:
https://studentservices.uzh.ch/uzh/application/#/Logon

Mind the enrolment deadlines at UZH:
https://www.uzh.ch/cmsssl/en/studies/application/deadline.html

The pressing environmental challenges of today demand a critical reflection. Ethics is an important tool for doing so. This lecture introduces the basics of ethics and provides in-depth knowledge of environmental ethics and its debates. This theoretical background will be applied and critically reflected using examples of current environmental challenges.

Objective

On completion of this lecture, you have acquired the ability to identify, analyze, critically reflect and resolve ethical challenges in general and specifically regarding the environment. You know basic concepts, positions and lines of argumentation from the debate in environmental ethics, which you have applied and discussed in smaller exercises.

Social Sciences

Political Geography (University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.

UZH Module Code: 07SMGEO423

Mind the enrolment deadlines at UZH:
https://www.uzh.ch/cmsssl/en/studies/application/deadline.html

This module explores the relationship between politics, space, power, and the environment. Political processes today take shape in a complex geographic context; at the same time, they also impact geography, actively writing space itself. This module brings those dynamics to the fore and locates them both in blatantly politicized sites.

Objective

- Become familiar with key thinkers, concepts, theories, and illustrative case studies in political geography and apply key geography concepts to a particular case.
- Situate contemporary political events within global power relations, and political histories of colonialism, imperialism, and gendered violence.
- Cultivate critical, decolonial, and feminist approaches to research, policy, and practice. By critical, we encourage students to question how ‘problems’ are framed rather than start with a ’problem-solving’ mindset.
- Distinguish scientific, peer-reviewed and research-based knowledge from popular media and disinformation.
- Learn methodological skills necessary for academic research, encompassing considerations of ethics and power relations in the research process.
- Writing skills: write thoroughly researched and concise texts that analyze a case study using geographical concepts and adequate references to the scientific literature.
- Creative communication and Speaking Skills: Use the classroom as a safe space for dialogue and testing ideas respectfully, and apply artistic/ creative forms for communicating research (blogs, essays, podcasts, photography, film etc.)

Psychology

This course provides an introduction to psychological research and modelling, focusing on cognitive psychology and the psychological experiment. Participants learn to formulate problems for psychological investigation and apply basic forms of psychological experiment.

Assessment

- Describe the tasks and competencies of environmental scientists compared to those of lawyers.
- Apply concepts and theories to a particular case.
- Distinguish scientific, peer-reviewed and research-based knowledge from popular media and disinformation.
- Learn methodological skills necessary for academic research, encompassing considerations of ethics and power relations in the research process.
- Writing skills: write thoroughly researched and concise texts that analyze a case study using geographical concepts and adequate references to the scientific literature.
- Creative communication and Speaking Skills: Use the classroom as a safe space for dialogue and testing ideas respectfully, and apply artistic/ creative forms for communicating research (blogs, essays, podcasts, photography, film etc.)
Objective

Students are able to
- describe the areas, concepts, theories, methods and findings of psychology.
- differentiate scientific psychology from "everyday" psychology.
- structure the conclusions and significance of an experiment according to a theory of psychology.
- formulate a problem for psychological investigation.
- apply basic forms of psychological experiment.

Content

Einführung in die psychologische Forschung und Modellbildung unter besonderer Berücksichtigung der kognitiven Psychologie und des psychologischen Experiments. Themen sind u.a.: Wahrnehmung; Lernen und Entwicklung; Denken und Problemlösen; Kognitive Sozialpsychologie; Risiko und Entscheidung.

Competencies

Subject-specific Competencies

752-2120-00L Consumer Behaviour I W 2 credits 2V M. Siegrist, A. Bearth, A. Berthold

Abstract
Introduction in consumer research. The following aspects will be emphasized in the course: Consumer decision making, individual determinants of consumer behavior, environmental influences on consumer behavior, influencing consumer behavior.

Objective
Students will be able to,
- explain the decision-making processes underlying the purchasing process
- describe the factors that have an influence on consumer behavior
- develop strategies to influence purchasing behavior

Competencies

Subject-specific Competencies
- Concepts and Theories

Method-specific Competencies
- Analytical Competencies
- Decision-making

Social Competencies
- Cooperation and Teamwork
- Customer Orientation
- Self-presentation and Social Influence
- Sensitivity to Diversity

Personal Competencies
- Negotiation
- Critical Thinking

851-0577-00L Principles of Political Science W 4 credits 2V+1U T. Bernauer, C. Brügge, S. Rhein

Abstract
This course covers basic questions, concepts, theories, methods, and empirical findings of political science.

Objective
This course covers basic questions, concepts, theories, methods, and empirical findings of political science.

Die 5. Auflage dieses Lehrbuches ist via Buchhandlungen oder online erhältlich. Übungsfragen und ein Glossar finden Sie hier: https://ib.ethz.ch/teaching/pwgrundlagen.html

Vor der Sitzung:

2. Durch eine kurze (digitale) Umfrage in Moodle werden Übungsfragen ermittelt, welche von den Studierenden als besonders schwierig erachtet werden und die deshalb im Übungsteil (jeweils 12:15 – 13:00 Uhr) vertieft besprochen werden.

Der Ablauf der Sitzungen ist dann meist wie folgt:

1. Teil:
   1. Zu Beginn wird jeweils (in digitaler Form) ein unbenoteter Check-Up zum gelesenen Buchinhalt durchgeführt (mehr dazu weiter unten) und im Anschluss gleich besprochen.
   2. Es folgt eine ca. 30-minütige Vorlesung, die den Inhalt des/des gelesenen Buchkapitel kurz zusammenfasst und reflektiert.
   3. Danach stellen die Dozierenden meist eine aktuelle wissenschaftliche Studie vor, die im Bereich des/der jeweils behandelten Themen liegt (ca. 30 Minuten).

2. Teil:
Wir behandeln Übungsfragen, die per Umfrage als besonders schwierig identifiziert wurden.

Die Sitzungen sind normalerweise somit wie folgt strukturiert:

- 10:15 – 10:30 Uhr: Check-Up & Auswertung & Besprechung
- 10:30 – 11:00 Uhr: Vorlesung
- 11:00 – 11:15 Uhr: Pause
- 11:15 – 11:45 Uhr: Vertiefung des Vorlesungsinhalts, z.B. durch Präsentation einer aktuellen Studie (in Sitzungen mit zwei zu lesenden Buchkapiteln zweiter Vorlesungsblock)
- 11:45 – 12:15 Uhr: Pause, dient auch dazu, sich zu verpflegen und (falls nicht vor der Sitzung schon erledigt) die Umfrage zur Priorisierung der Übungsfragen auszufüllen
- 12:15 – 13 Uhr: Besprechung der priorisierten Übungsfragen

Lecture notes

This course analyzes the foundations and challenges of Swiss foreign policy. After reviewing the history of foreign policy conceptions since the early 20th century, we will discuss the determining factors of Swiss foreign policy and examine, together with guest speakers from the foreign ministry, current international developments and respective foreign policy challenges.

Competencies

- **Subject-specific Competencies**
  - Concepts and Theories
  - Analytical Competencies
  - Problem-solving
  - Communication
  - Cooperation and Teamwork
  - Self-presentation and Social Influence
  - Sensitivity to Diversity
  - Negotiation
  - Creative Thinking
  - Critical Thinking

Lecture notes

Students will receive a handout of slides accompanying the lectures.

This course will be supported by an e-learning environment.

Prerequisites / notice

For the two tests, you may use four pages of notes (two sheets of paper, double-sided).

860-0023-00L International Environmental Politics

<table>
<thead>
<tr>
<th>W</th>
<th>3 credits</th>
<th>2V</th>
<th>T, Bernauer</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Abstract</strong></td>
<td>This course deals with how and why international problem-solving efforts (cooperation) in environmental politics emerge and evolve, and under what circumstances such efforts are effective. Based on concepts, theories, and methods of political economy, political science, and public policy, various examples of international environmental policy-making are examined.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| **Objective** | The objectives in this course are to (1) gain an overview of important questions in international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions in this policy area and how to address them in a conceptually and methodologically meaningful and insightful way; (3) gain an overview of important global and regional environmental problems and how they can be solved.
This course deals with how and why international problem-solving efforts (cooperation) in environmental politics emerge and evolve, and under what circumstances such efforts are effective. Based on concepts, theories, and methods of political economy, political science, and public policy, various examples of international environmental policy-making are examined, for example international efforts to reduce air pollution, manage international water resources, mitigate and adapt to global warming, protect the stratospheric ozone layer, address biodiversity challenges, deal with plastic waste, and prevent pollution of the oceans.

Literature
Reading materials and slides will be available via Moodle.

Prerequisites / notice
The course is open to all ETH students and visiting students from other universities. Participation does not require previous coursework in the social sciences or environmental policy. Most meetings in this course will take place on campus (ETH Main Building, HG F.3). There will be no live-streaming, and the course is not in hybrid (on-campus plus online) format. However, the lecture will be recorded (slides and voice, no video) and the recordings will be made available via the Moodle platform for this course a few days after the respective lecture for students who are unable to attend in person. All electronic correspondence will take place via the ETH mystudies system and Moodle, so please make sure you are properly registered there with a functioning email address/account.

Credits and Exam
After passing a written test at the end of the course (requirement; grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test). Visiting students (e.g., from the University of Zurich, exchange students) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory. Students who obtain a grade of < 4.0 for the test will have a second chance (see table below). Students who did not participate in the test on 16 December 2024 will not have access to the repeat test unless they submit compelling and documented (e.g., medical, other exam in parallel at ETH) reasons for why they are/were unable to participate in the first test. The test covers all contents of the lectures and the reading assignments. No separate registration for the exam is required, registration for the course as such covers everything. The exam will take place on campus, most likely in HG F3. That is, you must be present in person at ETH Zurich on the exam date/time.

<td>Mediation in Environmental Planning: Theory and Case Studies</td>
<td>W</td>
<td>2</td>
<td>2G</td>
<td>K. Siegwart</td>
</tr>
</tbody>
</table>

Abstract
This course is intended to demonstrate how environmental decisions can be optimized and conflicts better dealt by using mediation. Case studies will focus on construction of windmills for electricity purpose, landfills, sustainable city-planning or Human-Wildlife Conflict and Coexistence.

Objective
- Develop comprehension of legal and social responses to environmental conflicts
- Recognize the most important participative techniques and their ranges
- Develop concepts for doing and evaluating mediation processes
- Estimate the potential and limitations of cooperative environmental planning
- Train communicative skills (presentation, moderation, discussion design, negotiation), especially by participating at a mediation

Content
To this end, we will look at the most important techniques of mediation and put them into the context of today's legislation, participation and conflict culture. The potential and limitations of the individual techniques will be discussed using current Swiss and international case studies, namely in the field of windenergy as well of landfills and Human-Wildlife Conflict and Coexistence (wolves, bears, elephants). Students can do conflict analyses, for instance, as part of individual and group analyses and a half-day mediation-simulation, develop technique concepts and train their own communicative and negotiation skills.

Lecture notes
A reader will be handed out.

Autumn Semester 2024
Content

The course consists of a set of theory and practice sessions, which will be taught on a weekly basis. The course will cover business management knowledge in corporate as well as entrepreneurial contexts.

The course consists of three blocks of theory and practice sessions: Discovering Strategic Management, Discovering Innovation Management, and Discovering HR and Operations Management. Each block consists of two or three theory sessions, followed by one practice session where you will apply the theory to a case.

The theory sessions will follow a "lecture-style" approach and be presented by an area specialist within D-MTEC. Practical examples and case studies will bring the theoretical content to life. The practice sessions will introduce you to some real-life examples of managerial or entrepreneurial challenges. During the practice sessions, we will discuss these challenges in depth and guide your thinking through team coaching.

Through small group work, you will develop analyses of each of the cases. The theory sessions will be assessed via a multiple choice exam.

Lecture notes

All course materials (readings, slides, videos, and worksheets) will be made available to inscribed course participants through Moodle. These course materials will form the point of departure for the lectures, class discussions and team work.

351-0778-01L Discovering Management (Pitch)

W 1 credit 1U B. Clarysse

Does not take place this semester.

Complementary exercises for the module Discovering Management.

Prerequisite: Participation and successful completion of the module Discovering Management (351-0778-00L) is mandatory.

Abstract

This course is offered complementary to the basis course 351-0778-00L, "Discovering Management". The course offers an additional exercise.

Objective

The general objective of Discovering Management (Exercises) is to complement the course "Discovering Management" with one larger additional exercise.

Discovering Management (Exercises) thus focuses on developing the skills and competencies to apply management theory to a real-life exercise from practice.

Content

The exercise consists of delivering and submitting a "pitch" with a clear recommendation for one of the selected cases amongst those seen in Discovering Management, using your insights from Discovering Management, and an extra session on pitching.

Students have the option to either do this alone or in a group of two students.

Literature

All course materials (readings, slides, videos, and worksheets) will be made available to inscribed course participants through Moodle. Students following this course should also be enrolled for course 351-0778-00L, "Discovering Management".

363-0387-00L Corporate Sustainability

W 3 credits 2G V. Hoffmann, C. Bening-Bach, B. Girod, L. Miehé

Abstract

The lecture explores current challenges of corporate sustainability and prepares students to become champions for sustainable business practices. The module combines asynchronous videos, live sessions, with a group work phase between weeks 5-10 of semester during which students deep-dive into one of 10 sustainability challenges.

Objective

Students
- assess the limits and the potential of corporate sustainability for sustainable development
- develop competencies that are useful in the context of corporate sustainability and beyond (analytical competency, critical thinking, problem solving)
- recognize and realize opportunities through team work for corporate sustainability in a business environment
- present strategic recommendations in teams

Content

Corporate Sustainability is the flagship course of the Group for Sustainability and Technology at D-MTEC. In this course, students learn about key concepts in corporate sustainability and develop skills to implement them in the real world. The course prepares students for making well-informed sustainability decisions in their future careers.

The course uses constructive alignment to bring the various innovative teaching and learning elements (e.g., case- based experiential learning, reflective thinking and blended learning with videos and quizzes) into a coherent transformational journey. Students can now flexibly, efficiently, and effectively acquire the conceptual foundations that are essential for a substantial understanding of corporate sustainability.

For part of the course, students work in groups to complete a set of graded assignments designed to guide them into a deep dive on a selected corporate sustainability challenge. Please note that full participation in this part is essential, so make sure you are available. Furthermore, these group assignments count towards the overall grade for the course.

For further details on the course structure etc. visit the following link: http://www.sustec.ethz.ch/teaching/lectures/corporate-sustainability.html
Presentation slides will be made available on Moodle after lectures.

Literature recommendations will be distributed via Moodle, and are available from the start of the course.

TEACHING FORMAT/ ATTENDANCE: The course includes several mandatory sessions that participants must attend to successfully earn credit points. It is not possible to take the class purely online.

Course: Startups and Law
W 2 credits 2V P. Peyrot

851-0735-10L
Startups and Law

Particularly suitable for students of D-ITET, D-MAVT.

Abstract
The students shall obtain a basic knowledge about the legal environment of entrepreneurs. They shall be able to recognize and evaluate legal issues connected to an entrepreneurial activity and suggest possible solutions.

Objective
The students shall obtain the following competence:
- They shall obtain a working knowledge on the legal aspects involved in setting up and managing an enterprise.
- They shall be able to contribute to the legal management of the company and to discuss legal issues.
- They shall have an understanding of the law as a part of the corporate strategy and as a valuable resource of the company.

Lecture notes
A comprehensive script will be made available online on the moodle platform.

Course: Introduction to Microeconomics
W 3 credits 2G M. Wörter, M. Beck

351-1109-00L
Introduction to Microeconomics

This course is only for students enrolled in a Bachelor's degree programme.

Students enrolled in a Master's degree programme may attend "Principles of Microeconomics" (LE 363-0503-00L) instead.

Note for D-MAVT students: If you have already successfully completed "Principles of Microeconomics" (LE 363-0503-00L), then you will not be permitted to attend it again.

Abstract
The course introduces basic principles, problems and approaches of microeconomics. It describes economic decisions of households and firms, and their coordination through perfectly competitive markets.

Objective
Students acquire a deeper understanding of basic microeconomic models.

They acquire the ability to apply these models in the interpretation of real world economic contexts.

Students acquire a reflective and contextual knowledge on how societies use scarce resources to produce goods and services and distribute them among themselves.

Content
Market, budget constraint, preferences, utility function, utility maximisation, demand, technology, profit function, cost minimisation, cost functions, perfect competition, information and communication technologies

Lecture notes
Course material in e-learning environment https://moodle-app2.let.ethz.ch/auth/shibboleth/login.php

Literature

Prerequisites / notice
This course "Einführung in die Mikroökonomie" (363-1109-00L) is intended for Bachelor students and LE 363-0503-00 "Principles of Microeconomics" for Master students.

I. Günther

Abstract

The course gives economic and empirical foundations for a sound understanding of the instruments, prospects and limitations of international development aid. Students are able to critically discuss the various aid instruments of bi- and multilateral donors and NGOs.

Content

Introduction to the Determinants of Underdevelopment; History of Aid; Aid and Development: Theories and Empirics; Political Economy of Aid; Experience and Impact of Aid; New Instruments of Aid: e.g. Micro-Finance, Budget-Support; Fair-Trade.

401-0649-00L Applied Statistical Regression

Abstract
This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning "good practice" that can be applied in every student's own projects and daily work life. A special focus will be laid in the use of the statistical software package R for regression analysis.

Objective
The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.

Content
The course starts with the basics of linear modeling, and then proceeds to parameter estimation, tests, confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, multicollinearity problems and model interpretation, as well as general modeling strategies.

The last third of the course is dedicated to an introduction to generalized linear models: this includes the generalized additive model, logistic regression for binary response variables, binomial regression for grouped data and poisson regression for count data.

Lecture notes
A script will be available.

Literature
Faraway (2005): Linear Models with R
Faraway (2006): Extending the Linear Model with R
Draper & Smith (1998): Applied Regression Analysis
Fox (2008): Applied Regression Analysis and GLMs
Montgomery et al. (2006): Introduction to Linear Regression Analysis

Prerequisites / notice
The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software R, for which an introduction will be held.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L "Applied Statistical Regression" and 401-3622-00L "Statistical Modelling" are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

227-0399-10L Physiology and Anatomy for Biomedical Engineers I W 3 credits 2G M. Wyss

Abstract
Students will be able to identify and enumerate important anatomical structures to describe basic physiological processes of the human body to use a 3d animation database/software to use 'anatomical language' to retrieve anatomical structures to understand basic medical terminology

Objective
To understand basic principles and structure of the human body in consideration of the clinical relevance and the medical terminology used in medical work and research.

### Abstract
Die Grundlagen des Welternährungssystem werden anhand von Fallbeispielen aus der Forschung entlang der Wertschöpfungskette vermittelt.

### Objective
Mit Besuch dieser Lehrveranstaltung soll Verständnis geschaffen werden, was ein Welternährungssystem ist, wo aktuell die grossen Herausforderungen liegen, was Elemente und Einflussfaktoren auf die Ernährungssicherheit sind, welche Wechselwirkungen zwischen diesen Elementen und Einflussfaktoren bestehen, und welche potentiellen Lösungsstrategien sich für spezifische Herausforderungen ableiten lassen.

### Content

### Lecture notes
Skripte und zusätzliches Lernmaterial werden auf Moodle verfügbar gemacht.

### Literature
Information zu Büchern und anderer Literatur wird während der Lehrveranstaltung bekanntgegeben.

### Prerequisites / notice

Das Fach ist Teil der Basisprüfung nach dem ersten Studienjahr.

### Abstract
Vermittlung von betriebswirtschaftlichen Grundlagenwissen und Analyse- und Planungsinstrumenten mit Anwendung auf Unternehmen der Agrar- und Ernährungswirtschaft

### Objective
Teilnehmer des Kurses sollen am Ende der Vorlesung i) grundlegende Unternehmensentscheide strukturieren und analysieren können, ii) verschiedene Analyse- und Planungsinstrumente auf Fragestellungen der Produktionsplanung, Investition und Finanzierung an Beispielen anwenden zu können, iii) verschiedene Werkzeuge zur unternehmerischen Entscheidungsunterstützung anwenden können und iv) die Spezifika von Unternehmen in der Agrar- und Ernährungswirtschaft kennen.

### Content
Die Vorlesung geht auf folgende Inhalte, mit spezifischen Anwendungen im Agrar- und Ernährungssektors ein:

- Grundlagen und Ziele unternehmerischen Entscheidens
- Kosten und Leistungsrechnung
- Produktionsstatistique
- Produktionsprogrammplanung
- Investitionsplanung und Finanzierung
- Entscheidungen unter Unsicherheit und Risikomanagement

### 751-3401-00L Plant Nutrition I

**Abstract**
The aim of this lecture is to present the processes controlling the uptake and transport of nutrients by the plant, the assimilation of nutrients in the plant, the effect of nutrients on crop yield and quality, the role of the soil as a source of nutrients for crops, and the basic principles of fertilization of different crop types using mineral and organic fertilizers.

**Objective**
At the end of the lecture, students know how mineral nutrients are taken up through roots and circulate in the plants and what their roles in plants are. They understand the importance of nutrients for yield formation and for crop product quality. They are able to propose fertilization plans adapted for field crops growing under Swiss conditions.

**Content**
A general introduction explains the needs of appropriately managing nutrients in plant production. Afterwards, we will study the physiology of plant nutrition (nutrient uptake by roots; nutrient transports in the plant; physiological roles of nutrients in the plant). Then the role of nutrients for yield formation and their effects on crop quality is dealt with. Finally, the bases of crop fertilization are taught (availability of nutrient in soil; N, P and K fertilization; different types of fertilizers).

**Lecture notes**
The slides will be distributed.

### 751-3700-00L Plant Ecophysiology

**Abstract**
The general theme of this course is the effect of environmental factors (such as light, temperature, relative humidity, CO2 concentrations, etc.) on plant physiology: water uptake and transport, transpiration, CO2 gas exchange of plants (photosynthesis, respiration), growth and C allocation, yield and production, stress physiology. Working with measurement data and Jupyter Notebooks is included.

**Objective**
The students will understand the impact of environmental factors on plant physiology and will learn the theoretical basis and terminology of plant ecophysiology that is necessary to analyze yield potentials in agriculture. The students will learn about classical and latest studies in plant ecophysiology. Students will check and implement their knowledge and understanding of ecophysiology using measurement data.

**Content**

**Lecture notes**
Handouts stehen online.

**Literature**

**Prerequisites / notice**
This course is based on basics of plant identification and plant physiology. It is the basis for the courses Plant Production, Part Forage Production and Grassland Systems.

### 751-5003-00L Sustainable Agroecosystems II

**Abstract**
This class conveys current topics and methods of agroecological and food systems research through selected case studies from ongoing research of the Sustainable Agroecosystems group. Students will be encouraged to develop critical thinking competencies, through individual and group work, on major agricultural and food system challenges and paths towards agricultural and food system transformation.

**Objective**
1. Systematically analyse and discuss case studies from ongoing agroecological and food system research.
2. Learn and experiment on methods for field and laboratory investigations in agroecology.
3. Engage with positive and empowering frameworks that motivate critical reflection and action on the types of transformative responses needed to adapt and thrive within agricultural and food systems.
4. Reflect critically on agricultural and food system transformation tools and methods from the perspective a food system stakeholder.
5. Identify and describe institutions in the context of sustainable agricultural development (for Bachelor and Master thesis and internships).

**Content**
The course will address a wide range of agricultural and food system challenges (e.g. food security, climate crisis, soil degradation, etc.) in both temperate and tropical contexts. In class we will address topics like building food system resilience through innovative measures, improving soil fertility management or understanding the effects of agroforestry systems. Case studies from the on-going research in the Sustainable Agroecosystems Group (sae.ethz.ch) will be presented, covering different scales (e.g. food value-chains, farm dynamics and soil management). The class is complemented by practical group work conducted with the CSA Meh Als Gmys in Zürich on Measuring and monitoring Agroecological performance.

**Literature**

**Prerequisites / notice**
Prior participation in the lecture Nachhaltige Agrarökosysteme I (Sustainable Agroecosystems I) 751-5000-00G (spring term) recommended.

751-5005-00L Agroecology W 2 credits 2G N. Buchmann, S. Keller, M. Sonneveld

Abstract
Agroecology is a discipline, an agricultural practice, and a political-social movement. Students will attend public lectures by experts from different fields and will reflect on agroecology and its principles. Moreover, students will expand their knowledge with case studies and discuss about the role of agroecology to support sustainable agriculture and food systems.

Objective
Students know the thirteen principles of the High-Level Panel of Experts (HLPE) of the Committee on World Food Security as well as the ten elements of agroecology suggested by FAO and can critically reflect on the important properties as well as benefits and trade-offs of agroecological systems and approaches.

Students will be able to transfer their disciplinary and interdisciplinary knowledge about the thirteen principles as guiding principles for policymakers, practitioners, and other stakeholders across the food system in planning, managing, and evaluating agroecological transformation. Students are part of small groups focusing on selected principles of the HLPE. During the course, students discuss the potential and limitations of agroecology and learn about scientific contributions to agroecology. Students form an opinion on the role of agroecology, reflect and argue on the different facets and develop recommendations for real-world applications of agroecology in supporting a transition towards sustainable food systems.

Content
The course is designed as a combination of public lectures/webinars on “Agroecology and the Transformation to Sustainable Food Systems” delivered by national and international experts and scientists as well as sessions in which students reflect on the topics addressed in the lecture series in a group work format. The public lectures bring different perspectives to the discussion and are intended as inputs for the students’ sessions. In the student sessions, the student groups deepen their knowledge of the 13 principles of agroecology proposed by the High-Level Panel of Experts (HLPE) of the Committee on World Food Security. They identify "unknows" and link to other closely related principles. The groups also work out the perspective of a chosen stakeholder. Finally, the groups will take part in a scientific discussion representing their stakeholder perspective. All groups will synthesize their discussions in a short report.

Lecture notes
Handouts will be available on the webpage of the course.

Literature

Report of HLPE on agroecology:

Prerequisites / notice
This course is based on fundamental knowledge about plant ecophysiology, soil science, biogeochemistry, crop and forage science, and ecology in general. The course will be taught in English. The course is only offered in fall.

752-6001-00L Introduction to Nutritional Science W 3 credits 2V I. Herter-Aeberli, K. Giller, C. Wolfrum

Abstract
This course introduces basic concepts of micro- and macronutrient nutrition. Micronutrients studied include fat-soluble and water-soluble vitamins, minerals and trace elements. Macronutrients include proteins, fat and carbohydrates. Special attention is given to nutrient digestion, bioavailability, metabolism and excretion with some focus on energy metabolism.

Objective
To introduce the students to the both macro- and micronutrients in relation to food and metabolism.

Content
The course is divided into two parts: Micronutrients and macronutrients. The micronutrient part includes fat-soluble vitamins, water-soluble vitamins, minerals and trace elements. The macronutrient part introduces basic nutritional aspects of proteins, fats, carbohydrates and energy metabolism. The nutrients are described in relation to digestion, absorption and metabolism. Special aspects of homeostasis and homeorhesis are emphasized.

Lecture notes
There is no script. Powerpoint presentations will be made available.

Soil Sciences

Number Title Type ECTS Hours Lecturers
701-0518-00L Soil Resources and Global Change W 3 credits 2G to be announced

Abstract
Introduction to the importance, problems and concepts of soil development and the use of soil resources in a changing world. The lecture deals with the topic with examples from a global, European and Swiss context.

Active participation and presence during the lectures are part of the performance assessment.

Objective
Understanding the
- conditions under which soils develop and are used at the global scale
- consequences and problems of the use of soil and the resulting pressure on soil resources
- impact of climate and global change on the future development of soil resources
- competencies concerning process understanding, system understanding as well as data analysis & interpretation of pedogenetical data will be taught and examined
Despite their numerous functions and their role in evaluating ecosystem services, soils and their diversity are often a sidelined element when it comes to the development of sustainable land use concepts. In many disciplines, soils are perceived as an important interface between dead and living elements of nature. All too often, however, soil processes are only included in a greatly simplified way for usage concepts or modeling of environmental and agricultural systems. This simplification does not correspond to the great global diversity of soils. They often vary greatly in terms of their resilience to, and ability to recover from, environmental stress. Also among the general public, the perception of the importance of soils as the basis of our ecosystems is diffuse at best. Measures for local soil protection and for the renovation of near-natural ecosystems are widely supported, but as little as possible should change in the wallet and in consumer behavior. The result are translocation effects and more intensive use of soils and ecosystem resources in countries of the Global South to fulfill consumer needs of the Global North.

The lecture gives an introduction to the meaning, problems and concepts of soil development and the use of soil resources in a changing world. The lecture also deals with the following current topics: What are the consequences of different conflicts (e.g. Russian attack on Ukraine) for soil health and food production in the affected region for the world market? What are the consequences of climate change for carbon storage in Swiss mountain soils? Or: How does massive deforestation and soil degradation affect nutrient cycles in tropical soils?

The lecture is aimed at students in later semesters in the bachelor's program in environmental sciences, agricultural and environmental engineering as well as students in earlier semesters in the master's programs of the same name. It provides an overview of the global framework conditions under which soils develop and are used. It also sheds light on the impact of humans on different types of soil and how this changes the soil. Above all, skills for process and system understanding as well as data analysis and interpretation in soil research are taught.

Indirect disturbances such as the effects of climate change (global warming, permafrost or drought stress) are treated as well as direct disturbances through land use (erosion, chemical pollution or soil degradation). Soil functions and soil formation, differences in regional and global soil development, disturbances of the water and air cycling of soils, forms of soil pollution as well as regional and global assessments of soil pollution are also discussed. The focus is thereby always on the consequences and problems of soil use and the resulting pressures and dangers for biogeochemical (nutrient) cycles, for the landscape water cycle and the restriction of soil functions through soil degradation.

In addition to these focal points in the field of soil degradation and soil development, the lecture also gives insights into methods of regenerative agriculture, soil improvement and the remediation of polluted soils. Finally, the lecture illuminates the planning and legal implementation of soil protection with examples from different climate and land use zones in order to give the students an insight into the later professional practice of the future environmental and agricultural scientists.

Indirect disturbances such as the effects of climate change (global warming, permafrost or drought stress) are treated as well as direct disturbances through land use (erosion, chemical pollution or soil degradation). Soil functions and soil formation, differences in regional and global soil development, disturbances of the water and air cycling of soils, forms of soil pollution as well as regional and global assessments of soil pollution are also discussed. The focus is thereby always on the consequences and problems of soil use and the resulting pressures and dangers for biogeochemical (nutrient) cycles, for the landscape water cycle and the restriction of soil functions through soil degradation.

Abstract
This course covers chemical and biogeochemical processes in soils and water and their influence on the behavior and cycling of nutrients and pollutants in terrestrial and aquatic systems. Approaches for quantitative modeling of the processes are introduced and applied in selected examples.

Objective
1. Understanding of important chemical properties and processes of soils and water and their influence on the behavior (e.g., chemical speciation, bioavailability, mobility) of nutrients and pollutants.
2. Quantitative applications of chemical equilibria to processes in natural systems.

Content
Chemical equilibria in aqueous solutions, gas equilibria, precipitation and dissolution of mineral phases, silicate weathering, weathering kinetics, formation of secondary minerals (clay minerals, oxides, sulfides), redox processes in natural systems, pH buffering and acidification, salinity and salinization, environmental behavior of selected essential and toxic trace elements.

Abstract
The course provides theoretical and practical foundations for understanding and characterizing physical soil properties and processes and their relevance for terrestrial ecosystems, plant growth, hydrological processes and atmospheric-land gas exchange, across all relevant scales.
Objective

Students are able to:
- Characterize the different soils based on their key textural and structural properties.
- Simulate and predict soil water retention and flow under varying environmental conditions and understand the key driving forces (capillarity, gravity, friction) and related water properties (surface tension and viscosity).
- Predict soil hydraulic properties for varying soil textural classes.
- Predict solute transport in soils for varying environmental conditions.
- Predict energy balance and temperature dynamics in soils.
- Predict conditions for plant water stress
- Estimate the impact of soil properties on the hydrological cycle and on plant growth.

Content

INTRODUCTION
Week 1 (September 18)
Presentation of the role of soil physics in environmental sciences and terrestrial ecosystems: soils in the water cycle; soils and vegetation; soils and solute transport. Survey on students' interests and expectations. Presentation of course structure and learning objectives.

BASIC SOIL PROPERTIES
Week 2 (September 25) and Week 3 (October 02)
soil texture, particle size distribution, soil structure, soil surface area, porosity and bulk density
Pore scale consideration (water in a single pore), pore sizes and shapes; surface tension; Young-Laplace equation; capillary rise; contact angle
Friction and laminar flow; Hagen-Poiseuille's law; Washburn equation; numerical lab (REPORT 1)

SOIL HYDRAULIC PROPERTIES
Week 4 (October 09) and Week 5 (October 16)
Soil water content and soil water potential - The energy state of soil water; total water potential and its components; volumetric and gravimetric water contents; field capacity and wilting point
Soil water characteristics and pore size distribution
Saturated water flow in soils - Laminar flow in tubes (Poiseuille's Law); Darcy's Law, conditions and states of flow; permeability and hydraulic conductivity, measurement and theoretical concepts; effective conductivity; unsaturated hydraulic conductivity; Buckingham law.
Unsaturated water flow in soils - Unsaturated hydraulic conductivity models and applications

TOOLBOX – MEASUREMENTS AND MODELING
Week 6 (October 23) and Week 7 (October 30)
Measuring soil hydraulic properties, fitting and interpretation; Lab tour - demonstration of soil physical methods; lecture on HYPROP method; report on Hyprop data (REPORT 2)
Modelling unsaturated water flow based on Richards equation - Using Hydrus1D for simulation of unsaturated flow; simulating HYPROP measurements (REPORT 3)

SOIL IN THE WATER CYCLE
Week 8 (November 06) – Week 9 (November 13)
Water infiltration - steady state solutions for infiltration; approximate solutions to infiltration (Green-Ampt, Philip); infiltration rate and ponding; outlook to preferential flow
Water evaporation - Energy balance and land atmosphere interactions - potential and actual evaporation, evaporation stages;

SOIL PLANT INTERACTIONS
Week 10 (November 20) Week 11 (November 27)
Root water uptake and transpiration – Theory and mechanisms controlling root water uptake; hydraulic properties of rhizosphere; plant and stomatal conductance.
Modelling root water uptake and transpiration; analytical approaches and modeling using Hydrus (REPORT 4)

SOLUTE TRANSPORT
Week 12 (December 04) Week 13 (December 11)
Transport mechanisms of solutes in porous media; breakthrough curves; convection-dispersion equation; solutions for pulse and step solute application
Transport of reactive substances, preferential flow, simulations with Hydrus

CLOSURE
Week 14 (December 18)
Summary, course synthesis, connections between the different topics, questions, exam preparation

Literature
Supplemental textbook (not mandatory) - Introduction to Environmental Soil Physics, by: D. Hillel

Competencies
Subject-specific Competencies
- Concepts and Theories assessed
- Techniques and Technologies assessed

Method-specific Competencies
- Analytical Competencies assessed
- Decision-making assessed
- Problem-solving assessed
- Project Management fostered

Social Competencies
- Communication fostered
- Cooperation and Teamwork fostered
- Leadership and Responsibility fostered

Personal Competencies
- Adaptable and Flexibility fostered
- Creative Thinking fostered
- Critical Thinking fostered
- Integrity and Work Ethics fostered
- Self-awareness and Self-reflection fostered
- Self-direction and Self-management fostered

Abstract
This course gives an overview of the basic concepts of geology and petrography and shows some links to the application of these concepts. The course consists of weekly lectures and bi-weekly exercises in groups.

Objective
This course gives an overview of the basic concepts of geology and petrography and shows some links to the application of these concepts.
Methods of Statistical Data Analysis

Lecturers

- L. Meier
- M. Dettling
The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L "Applied Statistical Regression" and 401-3622-00L "Statistical Modelling" are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

The course provides the first part an introduction to the statistical/graphical/data science software R (https://www.r-project.org/) for scientists. R is free software that contains a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

The students will be able to use the software R for simple data analysis and graphics.

Part I of the course covers the following topics:
- What is R?
- R Basics: reading and writing data from/to files, creating vectors & matrices, selecting elements of dataframes, vectors and matrices, arithmetics;
- Types of data: numeric, character, logical and categorical data, missing values;
- Simple (statistical) functions: summary, mean, var, etc., simple statistical tests;
- Writing simple functions;
- Introduction to graphics: scatter-, boxplots and other high-level plotting functions, embellishing plots by title, axis labels, etc., adding elements (lines, points) to existing plots.

The course focuses on practical work at the computer with R. We will make use of the graphical user interface RStudio: www.rstudio.org.

The course resources will be provided via the Moodle web learning platform. Subscribing via Mystudies "automatically" makes you a student participant of the Moodle course of this lecture, which is at https://moodle-app2.let.ethz.ch/course/view.php?id=20847

The course provides the second part an introduction to the statistical software R for scientists. R is free software that contains a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

Part II of the course builds on part I and covers the following additional topics:
- Elements of the R language: control structures (if, else, loops), lists, overview of R objects, attributes of R objects;
- More on R functions;
- Applying functions to elements of vectors, matrices and lists;
- Object oriented programming with R: classes and methods;
- Tailoring R: options;
- Extending basic R: packages

The course focuses on practical work at the computer. We will make use of the graphical user interface RStudio: www.rstudio.org.
The course resources will be provided via the Moodle web learning platform. As from FS 2019, subscribing via Mystudies should "automatically" make you a student participant of the Moodle course of this lecture, which is at https://moodle-app2.let.ethz.ch/course/view.php?id=20848.

<tr>
<td><strong>Abstract</strong></td>
<td>The course covers the ecology of birds and mammals. Important concepts of nutrition, physiology, behavioural ecology, population biology, biogeography and community ecology will be linked to applications in conservation and management. A worldwide perspective will be complemented by a focus on the Central European fauna and its dynamics.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Objective</strong></td>
<td>The students are familiar with important topics in animal ecology of vertebrates, with an emphasis on birds and mammals. They are able to link theoretical concepts with ecological phenomena and view them against an evolutionary backdrop. They can thus appraise applied aspects of the conservation and the use of animal populations, such as the influence of body size on the energy demand and nutrition, relationships between resource availability on habitat use of birds and mammals as well as between predators and prey species, or of herbivores on vegetation, and the effects of hunting and environmental change on animal populations. Students understand the biogeographical characteristics of the Central European vertebrate fauna and its temporal and spatial dynamics.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Content
The course deals with a number of topics that include feeding and resource use, spatial behaviour and migrations, reproduction, population dynamics, competition and predation, parasites and diseases, biodiversity and distributions, and dynamics of the Central European fauna. There is an emphasis on linking theory with management issues in conservation and management of wildlife populations. During the first half of the course, examples will be drawn worldwide whereas during the second half, the course will focus more strongly on the European fauna, particularly of the Alpine region. Although the course is not designed to teach species knowledge and determination, examples will cover much of the taxonomic range of the European fauna. The course includes a field excursion (7.12.2024, Alternative date: 14.12.24).

Program (Lecturers: Kurt Bollmann (KB), Urs Koramnn (UK)):
23.09.24 Birds and mammals: similarities & differences, endothermy & body isolation, moult in birds (KB)
30.09.24 Feeding I: Food, metabolism (KB)
07.10.24 Feeding II: Energetic needs, foraging, digestion (KB)
14.10.24 Distribution and habitat use, migration (UK)
21.10.24 Reproduction, litter and clutch size, breeding systems (UK)
28.10.24 Population dynamics (KB)
04.11.24 Predation, predator-prey-cycles (KB)
11.11.24 Competition (UK), Parasitism and diseases (self-study)
18.11.24 Biogeography of central European birds and mammals, return of ungulates and large predators (KB)
25.11.24 Herbivores as landscape engineers: the Serengeti ecosystem (Guest lecturer)
02.12.24 Exploitation of wild birds and mammals (KB)
09.12.24 Threats and conservation biology of selected species (UK)
16.12.24 Mammals and climate change (case study on roe deer) + questions and pilot test (KB)

Literature
Lecture notes and handouts will be available digitally.

Some books relevant to the course are (optional reading):
- Suter, W. 2017. Ökologie der Wirbeltiere. Vögel und Säugetiere. UTB/Haupt, Bern. This book is based on the course. It is in German.

Competencies
Subject-specific Competencies
- Concepts and Theories
- Analytical Competencies
- Decision-making
- Problem-solving

Method-specific Competencies
- Communication
- Cooperation and Teamwork

Social Competencies
- Adaptable and Flexible
- Creative Thinking
- Critical Thinking
- Self-awareness and Self-reflection
- Self-direction and Self-management

Personal Competencies
- Decision-making fostered is fostered
- Problem-solving assessed
- Communication assessed
- Cooperation and Teamwork fostered
- Adaptable and Flexible fostered
- Creative Thinking assessed
- Critical Thinking assessed
- Self-awareness and Self-reflection fostered

701-0405-00L Rivers: Concepts and Methods for Sustainable Management
W 3 credits 2G S. Fink, C. Weber, V. Weitbrecht

Abstract
This course deals with river ecosystems, their fundamental ecological characteristics, anthropogenic impacts and changes. We discuss concepts and interdisciplinary approaches (hydraulic engineering and ecology) for sustainable management. The students organize themselves in working groups (lecture and moderation of a discussion on a date of choice, writing of a report).

Objective
Understanding the basics of the functioning of river ecosystems:
- Basics of sustainable management of rivers
- Application of these principles to case studies
- Critical analyses, organization in discussion groups

Content
1) Planning, working groups, working methods
2) Water protection act and techniques for moderating discussions
3) Project implementation/realization
4) Floodplain management and revitalization
5) Restoration of sediment dynamics
6) Rivers under changing climate
7) River widening and ramps
8) Effects of restoration projects
9) Altered flow and temperature regimes in rivers and lakes
10) Water and health
11) Fish migration in rivers
12) Visitor control/recreational management
13) Peatland protection
14) Conclusion/evaluation

Literature
Themenspezifische Unterlagen (Vorlesung Dozierende, Literatur) werden verteilt und auf Moodle zugänglich gemacht (Link folgt).

Prerequisites / notice
Students will organize discussion groups (preparation of presentation and moderation, report).
The general theme of this course is the effect of environmental factors (such as light, temperature, relative humidity, CO2 concentrations, etc.) on plant physiology: water uptake and transport, transpiration, CO2 gas exchange of plants (photosynthesis, respiration), growth and allocation, yield and production, stress physiology. Working with measurement data and Jupyter Notebooks is included.

The students will understand the impact of environmental factors on plant physiology and will learn the theoretical basis and terminology of plant ecophysiology that is necessary to analyze yield potentials in agriculture. The students will learn about classical and latest studies in plant ecophysiology. Students will check and implement their knowledge and understanding of ecophysiology using measurement data.

- critically evaluate published work and data.
- name and recognize the most important classes of environmentally relevant anthropogenic chemicals and identify chemical moieties governing their fate processes.
- explain, on the basis of physical-chemical foundations, the most important processes (i.e., partitioning and substitution and elimination reactions) which determine the environmental behavior of organic pollutants.
- identify, on the basis of chemical structure, the processes relevant for the environmental behavior of a compound.
- overview of the most important classes of environmental organic pollutants
- molecular interactions that determine the partitioning behavior (adsorption and absorption processes) of organic compounds between different environmental compartments (gas, liquid, solid).
- physical-chemical properties (vapor pressure, aqueous solubility, air-water partition constant, organic solvent-water partition constants, etc.) and partitioning behavior of organic compounds between environmentally relevant phases (air, aerosols, soil, water, biota).
- Chemical transformation reactions of organic pollutants in aquatic and in terrestrial environments (hydrolysis, elimination, addition)

Important organic environmental pollutants are presented. The physical and chemical basics required for understanding the environmental behavior of such pollutants are taught and deepened in exercises.

- name and recognize the most important classes of environmentally relevant anthropogenic chemicals and identify chemical moieties governing their fate processes.
- explain, on the basis of physical-chemical foundations, the most important processes (i.e., partitioning and substitution and elimination reactions) which determine the environmental behavior of organic pollutants.
- identify, on the basis of chemical structure, the processes relevant for the environmental behavior of a compound.

#### Organic Chemistry (701-0225-00L)

**Abstract**

**Objective**
- Students will be able to:
  - Recall basic organic chemistry reactions, including substitution, elimination and addition reactions occurring at sp2- and sp3-hybridized carbon centers.
  - Explain the relative favorability of certain organic chemical structures or certain organic chemical reactions.
  - Apply their understanding of reaction mechanism principles to explain observations.
  - Differentiate the most reactive sites in a given organic chemical.
  - Propose reaction mechanisms to new chemical transformations.

**Content**
Descriptive chemistry of functional groups (alkyl halides, alkenes, aromatic systems, carbonyls).

**Literature**
Carsten Schmuck, Basisbuch Organische Chemie, Pearson

**Prerequisites / notice**
Der Stoff der Basischemie wird vorausgesetzt.

### Biochemistry (752-0100-00L)

**Abstract**
Basic knowledge of enzymology, in particular the structure, kinetics and chemistry of enzyme-catalysed reaction in vitro and in vivo. Biochemistry of metabolism: Those completing the course are able to describe and understand fundamental cellular metabolic processes.

**Objective**
- Students are able to describe the structure of proteins/enzymes and are able to explain biochemical functions depending on their 3D structures.
- Students are able to assess and propose hypothesis how proteins change during evolution.
- Connections between several metabolic pathways are known and students can evaluate how one pathway is influence by the activity of another pathway

**Content**
Program
- Introduction, basics, composition of cells, biochemical units, repetition of relevant organic chemistry
- Structure and function of proteins
- Enzymes and enzyme kinetics
- Catalytic strategies
- Metabolism: Basic concepts and design. Repetition of basic thermodynamics
- Glycolysis, fermentation
- The citric acid cycle
- Oxidative phosphorylation and ATP physiology

**Lecture notes**
Horton et al. (Pearson) serves as lecture notes.

**Prerequisites / notice**
Basic knowledge in biology and chemistry is a prerequisite.
## Environmental Physics

### 101-0203-01L Hydraulics I

- **Type:** W
- **ECTS:** 5 credits
- **Hours:** 3V+1U
- **Lecturers:** R. Stocker

**Abstract:**
The course teaches the basics of hydromechanics, relevant for civil and environmental engineers.

**Objective:**
In the course "Hydraulics I", the competency of process understanding is taught, applied and examined. Furthermore system understanding and measurement methods are taught.

**Content:**
Properties of water, hydrostatics, stability of floating bodies, continuity, Euler equation of motion, Navier-Stokes equations, similarity, Bernoulli principle, momentum equation for finite volumes, potential flows, ideal fluids vs. real fluids, boundary layer, pipe flow, open channel flow, flow measurements, demonstration experiments in the lecture hall.

**Lecture notes:**
Script and collection of previous problems

**Literature:**
Bollrich, Technische Hydromechanik 1, Verlag Bauwesen, Berlin

### 651-3561-00L Cryosphere

- **Type:** W
- **ECTS:** 3 credits
- **Hours:** 2V
- **Lecturers:** M. Huss, D. Farinotti, H. J. Horgan

**Abstract:**
The course introduces the different components of the cryosphere - snow, glaciers, ice sheets, sea ice and lake ice, and permafrost - and their respective roles in the climate system. For each subsystem, essential physical aspects are emphasized, and their dynamics are described quantitatively and using examples.

**Objective:**
Students are able to:
- qualitatively explain relevant processes, feedbacks and relationships between the different components of the cryosphere,
- quantify and interpret physical processes, which determine the state of the cryospheric components, with simple calculations.

In the course "Cryosphere", the competencies of process understanding, modeling, data analysis & interpretation and measurement methods are taught, applied and examined. System understanding is taught and examined.

**Content:**
The course provides an introduction into the various components of the cryosphere: snow, glaciers, ice sheets, sea ice and lake ice, permafrost, and their roles in the climate system. Essential physical aspects are emphasized for each subsystem: e.g. the material properties of ice, mass balance and dynamics of glaciers, or the energy balance of sea ice.

**Lecture notes:**
Handouts will be distributed during the teaching semester

**Literature:**

Further literature will be indicated during the lecture.

## Environmental Planning

### 701-0009-00L Tackling Environmental Problems III

- **Type:** W
- **ECTS:** 3 credits
- **Hours:** 4U
- **Lecturers:** M. Mader, C. E. Pohl

**Abstract:**
Students put the measures they developed during the courses Tackling Environmental Problems II into practice, in collaboration with partners from civil society, the public, and the private sector.

**Objective:**
Students are able to put the measures they developed to address sustainability problems into practice.

**Content:**
In Tackling Environmental Problems I & II, students analyze a sustainability topic, identify a specific problem within it, develop measures to address the problem and test the measures for feasibility by presenting them to concerned stakeholders. Some of the students develop their measures to such a degree, that the measures could actually be implemented. Tackling Environmental Problems III provides the opportunity to do so. Together with partners from civil society, the private and the public sector, students agree on the implementation plan, the financial and legal aspects and put the measure into practice.

**Prerequisites / notice:**
Tackling Environmental Problems I & II is a prerequisite for taking the course Tackling Environmental Problems III.
### Competencies

#### Method-specific Competencies
- Decision-making: fostered
- Problem-solving: assessed
- Project Management: assessed

#### Social Competencies
- Communication: fostered
- Cooperation and Teamwork: fostered
- Customer Orientation: fostered

#### Personal Competencies
- Adaptability and Flexibility: fostered
- Critical Thinking: fostered
- Self-direction and Self-management: assessed

### 701-0951-00L  
**GIST - Introduction into Geoinformation Science and Technology**  
W 5 credits 2V+3P M. A. M. Niederhuber

#### Abstract
Theoretical basics and fundamental concepts of Geographic Information Science are imparted and subsequently further elaborated with the software ArcGIS. At the end, the students will be able to independently solve basic realistic GIS problems.

#### Objective
Students are able to
- elucidate the theoretical and conceptional foundations of geographic information systems (GIS)  
- independently perform normal GIS work using commercial software and practical examples

#### Content
The course covers the following topics:
- What is GIS? What are spatial data?  
- The representation of reality by means of spatial data models: vector, raster, TIN  
- The four phases of data modelling: Spatial, conceptual, logical and physical model  
- Possibilities of data collection  
- Transition of reference frame  
- Spatial Analysis I: query and manipulation of vector data  
- Spatial Analysis II: operators and functions with raster data  
- Digital elevation models and derived products  
- Process modelling with vector and raster data  
- Presentation possibilities of spatial data

One Friday is reserved for a field trip or guest speaker;  

#### Literature

#### Prerequisites / notice
Aufgrund der Grösse des verfügbaren EDV-Schulungsraumes ist die Teilnehmerzahl auf 50 Studierende beschränkt! Für die Übungen werden die Studierenden auf zwei, max. drei Zeitfenster aufgeteilt. Pro Zeitfenster können maximal 25 Studierende betreut werden.

---

### 701-0967-00L  
**Project Development in Renewable Energies**  
W 2 credits 2G R. Rechsteiner, A. Appenzeller

#### Abstract
The focus is on the implementation of projects:
- photovoltaics  
- wind energy  
- hydropower  

You will learn about new business models, including storage and sector coupling, discuss framework conditions, economic efficiency, security of supply, market organization and business risks. Guidance from experts with many years of political and project experience.

#### Objective
You will receive a practice-oriented introduction to the regulatory and economic requirements for renewable energy projects. You will be familiar with the options for integrating fluctuating energy production in an environment of volatile prices. You will be familiar with the opportunities and risks and strategies for economic security.

#### Content
Detailed program  
https://www.rechsteiner-basel.ch/lehrmittel?no_cache=1#c273

#### Lecture notes
PPT presentation will be distributed (in German)

  - Sensitivity to Diversity
- Personal Competencies
  - Creative Thinking
  - Critical Thinking
  - Self-awareness and Self-reflection
  - Self-direction and Self-management

Abstract
Fundamentals of public and collective transport, in its different forms. Categorization of performance dimensions of public transport systems, and their implications to their design and operations.

Objective
Teaches the basic principles of public transport network and topology design, to understand the main characteristics and differences of public transport networks, based on buses, railways, or other technologies.
Teaches students to recognize the interactions between the infrastructure design and the production processes, and various performance criteria based on various perspective and stakeholders. At the end of this course, students can critically analyze existing networks of public transport, their design and use; consider and substantiate different choices of technologies to suitable cases; optimize the use of resources in public transport.

Content
Fundamentals: Infrastructures and vehicle technologies of public transport systems; interaction between track and vehicles; passengers and goods as infrastructure users; management and financing of networks.

- Infrastructure: Planning processes and decision levels in network development and infrastructure planning, planning of topologies; tracks and roadways, station infrastructures; Fundamentals of the infrastructure design for lines; track geometries; switches and crossings
- Vehicles: Classification, design and suitability for different goals
- Network design: design dilemmas, conceptual models for passenger transport on long distance, urban regional transport.
- Operations: Passenger/Supply requirements for line operations; timetabling, measures of realized operations, capacity

Lecture notes
Slides, in English, are made available some days before each lecture.

Literature
Reference material books are provided in German and English (list disseminated at lecture), plus Skript Bahninfrastruktur; System- und Netzplanung

Spatial Planning and Landscape Development

Abstract
The lecture introduces the main features of Swiss spatial planning. Core subjects are e.g., spatial planning as a federal responsibility, spatial planning instruments (federal, cantonal, municipal), as well as systematic problem solving techniques and methodologies of spatial planning. The lecture is complemented with in-depth topics and comparative international examples.

Objective
- Die Studierenden kennen die Grundzüge der Schweizer Raumplanung, ihre wichtigsten Instrumente auf nationaler, kantonaler, regionaler und kommunaler Ebene und systematische Problemlösungsverfahren. Sie können das vermittelte theoretische Wissen direkt an konkreten, praxisorientierten Übungsauflagge umsetzen.
- Grundzüge der Raumplanung und ihre wichtigsten Instrumente kennenlernen
- Erarbeiten der Fähigkeit, räumliche Probleme zu erkennen und Problemlösungsverfahren auf diese anzuwenden
- Planung und Landnutzungsmanagement als interaktiven und akteursbezogenen Prozess kennenlernen und anwenden
- Verstehen der mit Ressourcen und Boden verbundenen Potentiale, Nutzungen und Prozesse
- Das vermittelte theoretische Wissen direkt an konkreten, praxisorientierten Fallbeispielen umsetzen können

Content
Die Vorlesung deckt die Grundlagen der (Schweizerischen) Raumplanung und Landschaftsentwicklung ab:
- Was ist Raumplanung (Definitionen und Begriffe)
- Aktuelle Herausforderungen, Entwicklungen und Tendenzen der Raumplanung
- Grundprinzipien, historische Entwicklung und Gesetzgebungen der Schweizer Raumplanung
- Die Raumplanung als staatliche Aufgabe – Raumordnungspolitik auf Bundesebene
- Instrumente der Raumplanung auf nationaler, kantonaler, regionaler und kommunaler Ebene (u.a. Sachpläne und Konzepte, Richtplanung, Nutzungsplanung, Sondernutzungsplanung, Mehrwertausgleich)
- Problemlösungsverfahren in der Raumplanung – systemtechnisches Vorgehen
- Thematische Vertiefungen: Siedlungsentwicklung nach innen; Klimaangepasste Raumplanung; Grundeigentum und kooperative Planung; Raumbeobachtung

Lecture notes
Skript und einzelne Dokumente werden ausgegeben. Unterlagen zur Vorlesung werden auf der SPUR-Kursseite und/oder auf Moodle direkt zur Verfügung gestellt.

Literature

101-0515-00L Project Management W 2 credits 2G C. G. C. Marxt

Abstract
The course gives a detailed introduction on various aspects of professional project management out of theory and practice. Established concepts and methods for project organization, planning, execution and evaluation are introduced and major challenges discussed. The course includes an introduction to specialized project management software as well as agile project management concepts.

Objective
Projects are not only the base of work in modern enterprises, but also the primary type of cooperation with customers. Students of ETH will often work in or manage projects in the course of their career. Good project management knowledge is not only a guarantee for individual, but also for company-wide success.

The goal of this course is to give a detailed introduction into project management. The students should learn to plan and execute a project.

Content
Project planning (aims, appointments, capacities, efforts and costs), project organization, scheduling and risk analysis, project execution, supervision and control, project evaluation, termination and documentation, conflict management, multinational project management, IT support as well as agile project management methods such as SCRUM.

Lecture notes
No.
The lecture slides and other additional material will be available for download from Moodle a week before each class.

851-0654-00L The Sustainable Development Goals in Context W 1 credit 2G I. Günther, M. Mertens

Abstract
The United Nations Agenda 2030 and its 17 Sustainable Development Goals (SDGs) provide an opportunity for the international community to shape the course of sustainable development. The lectures center on 17 sustainability and equity challenges and provide insights from researchers as well as decision makers from policy, the private sector and civil society.

Objective
1. Students know important dimensions of sustainable development and the discourse in the context of the SDGs
2. Students get an overview how ETH Zurich contributes to sustainable development and the achievement of the SDGs
3. The lecture series enables students to contribute to sustainable development during their studies and research, as graduates on the job market, and as members of the society
4. Writing a short blog post trains students to communicate acquired knowledge effectively for a broader audience.
5. Students will learn to critically read short articles and ask follow-up questions to experts of a field.

Content
For each lecture we will invite one researcher or one decision maker from policy, the private sector or civil society to reflect on one particular SDG. These talks will be followed by discussions with students and the general public. Majority of the lectures and discussion sessions will be held on campus, and some sessions online.

Lecture notes
1 short paper will be posted on the Moodle each week that should be read before the talks.

Prerequisites / notice
Open to advanced Bachelor and all Master level students enrolled at ETH Zurich
This course covers the chemical and physical processes controlling the composition of the troposphere and stratosphere and introduces fostered ECTS Analytical Competencies

Documents are offered via the course's web page. Creative Thinking

At the end of this course, students are able to:

Subject-specific Competencies
Concepts and Theories

The seminar brings together students in the field of atmosphere and climate. Based on classic and current scientific articles, presentation techniques (presentations, poster presentations) are practised and students get a first insight into research in the field of atmosphere and climate.

In this seminar, students learn how to read scientific publications and how to transfer the scientific knowledge to a broader audience by means of oral and poster presentations. Students also get insight into the different research areas at the Institute for Atmospheric and Climate Science.

1st week: course organisation and presentation of the institute
2nd and 3rd week: introduction to oral presentation technique
11th week: introduction to poster presentation technique
12th and 13th week: poster design
14th week: concluding poster presentation

This course can only be offered to a limited number of students, however, in any case for everybody having to attend it compulsory. We beg you to sign in to this course early.

- Global aspects: air quality - climate interactions
- Multiphase chemistry: solubility of gases, Raoult's Law and hygroscopicity, kinetics of gas to particle transfer, N2O5 chemistry, aqueous phase sulfur chemistry, secondary organic aerosol formation
- Aerosols: primary and secondary sources, composition, quantities and measures, connections to climate
- Surface ozone chemistry: HOx-NOx cycle, role of VOCs, O3 isopleth, ozone production efficiency
- Tropospheric chemistry: oxidizing capacity of the troposphere and the role of OH, oxidation and global budgets of CO and CH4, role of NOx, and the global tropospheric O3 budget
- Atmospheres: primary and secondary sources, composition, quantities and measures, connections to climate
- Multiphase chemistry: solubility of gases, Raoult's Law and hygroscopicity, kinetics of gas to particle transfer, N2O5 chemistry, aqueous phase sulfur chemistry, secondary organic aerosol formation
- Air quality: role of planetary boundary layer, deposition processes, summer- versus winter-smog, environmental problems, legislation, long-term trends
- Global aspects: air quality - climate interactions

Atmospheric Chemistry

At the end of this course, students are able to:

1. describe the structure of the atmosphere and list atmospheric components and their main properties
2. define and describe the chemical and physical processes in the stratosphere and troposphere, follow reaction mechanisms, and apply rate laws
3. describe the physical and chemical principles of air pollution and summarize the most important legislative measures
4. discuss the local, regional, and global aspects of interactions between air quality, ecosystem health, and climate

- Origin and properties of the atmosphere: composition (gases and aerosols), atmospheric structure, UV radiation, transport timescales
- Kinetics of gas phase reactions: rate laws, mechanisms of bimolecular and termolecular reactions.
- Stratospheric chemistry: Chapman cycle, catalytic ozone destruction cycles, polar ozone hole, Montreal protocol
- Tropospheric chemistry: oxidizing capacity of the troposphere and the role of OH, oxidation and global budgets of CO and CH4, role of NOx, and the global tropospheric O3 budget
- Surface ozone chemistry: HOx-NOx cycle, role of VOCs, O3 isopleth, ozone production efficiency
- Aerosols: primary and secondary sources, composition, quantities and measures, connections to climate
- Multiphase chemistry: solubility of gases, Raoult's Law and hygroscopicity, kinetics of gas to particle transfer, N2O5 chemistry, aqueous phase sulfur chemistry, secondary organic aerosol formation
- Air quality: role of planetary boundary layer, deposition processes, summer- versus winter-smog, environmental problems, legislation, long-term trends
- Global aspects: air quality - climate interactions

Lecture materials (slides) are provided continuously during the semester, at least 2 days before each lecture. Annotations and corrections are provided at the latest within the same week.

Attendance of the lecture "Atmosphäre" LV 701-0023-00L or equivalent knowledge is a pre-requisite, and basic courses in physics and chemistry are expected.

On Mondays (or upon agreement) a tutorial is offered. This allows the students to discuss unresolved issues from the lecture or to discuss the problems of the exercise series and their solution. Participation is recommended.
Weather Systems  
W 3 credits  2G  M. A. Sprenger, I. Thurnherr

Abstract
Satellite observations; analysis of vertical soundings; geostrophic and thermal wind; cyclones at mid-latitude; global circulation; northatlantic oscillation; atmospheric blocking situations; Eulerian and Lagrangian perspective; Potential Vorticity; Alpine dynamics (storms, orographic wind); planetary boundary layer; water isotopes

Objective
The students are able to
- to discuss the mathematical basics of atmospheric dynamics, based on selected atmospheric flow phenomena
- to explain the basic dynamics of the global circulation and of synoptic- and meso-scale flow features
- to explain how mountains influence the atmospheric flow on different scales
- basic understanding of stable water isotopes as tracers for moist adiabatic processes in weather systems

Content
Satellite observations; analysis of vertical soundings; geostrophic and thermal wind; cyclones at mid-latitude; global circulation; northatlantic oscillation; atmospheric blocking situations; Eulerian and Lagrangian perspective; Potential Vorticity; Alpine dynamics (storms, orographic wind); planetary boundary layer; water vapour transport in the atmosphere; water isotopes

Environmental Fluid Dynamics  
W 3 credits  2G  H. Wernli, L. Papritz

Abstract
This course covers the basic physical concepts and mathematical equations used to describe environmental fluid systems on the rotating Earth. Fundamental concepts (e.g. vorticity dynamics and waves) are formally introduced, applied quantitatively and illustrated using examples. Exercises help to deepen knowledge of the material.

Objective
Students are able
- to name the basics, concepts and methods of environmental fluid dynamics.
- to understand and discuss the components of the basic physical equations
- to mathematically solve basic equations for simple problems of environmental fluid dynamics.
The competencies of process understanding and system understanding are taught, applied and examined.

Basic physical terminology and mathematical laws:
Continuum hypothesis, forces, constitutive laws, state equations and basic principles of thermodynamics, kinematics, laws of mass and momentum on rotating earth.
Concepts and illustrative flow systems: vorticity dynamics, boundary layers, instability, turbulence - with respect to environmental fluid systems.
Scale analysis: dimensionless variables and dynamical similarity, simplification of the fluid system, e.g. shallow water assumption, geostrophic flow.
Waves in environmental fluid systems.

Biogeochemistry
The following courses are highly recommended as preparation for the Specialization in Biogeochemistry:

701-0225-00L Organic Chemistry (Autumn semester)
752-0100-00L Biochemie (Autumn semester)
752-1300-00L Introduction to Toxicology (Spring semester)

These courses should be successfully completed during the second year.

Autumn Semester 2024
Objective

The seminar aims at introducing the students to current research in the field of biogeochemistry and connect them with researchers. After the seminar, students are able to:
- understand and critically evaluate original scientific papers and to communicate their findings in a coherent way (presentation); in doing so, they become familiar with different types of publications and relevant journals in the field of biogeochemistry;
- discuss scientific results, plan and lead discussion rounds (moderation);
- give and receive constructive feedback.

Content

Part 1: Literature search; presentation and moderation techniques.
Part 2: Literature study; online-exchange of information; presentation and discussion moderated by students.

Lecture notes

Selected handouts will be distributed in class.
https://moodle-app2.let.ethz.ch/auth/shibboleth/login.php

Prerequisites / notice

Restriction: only students enrolled in the environmental sciences bachelor's programm can register for this course.
Deadline for enrollment is the FIRST day of the semester. Later enrollment can only be accepted in exceptional cases and under certain conditions (e.g., restricted choice of topics and dates).

Competencies

Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: fostered

Method-specific Competencies
- Media and Digital Technologies: fostered

Social Competencies

701-0533-00L Soil and Water Chemistry

W 3 credits 2G
R. Kretzschmar, D. I. Christl, L. Winkel

Abstract

This course covers chemical and biogeochemical processes in soils and water and their influence on the behavior and cycling of nutrients and pollutants in terrestrial and aquatic systems. Approaches for quantitative modeling of the processes are introduced and applied in selected examples.

Objective

1. Understanding of important chemical properties and processes of soils and water and their influence on the behavior (e.g., chemical speciation, bioavailability, mobility) of nutrients and pollutants.
2. Quantitative applications of chemical equilibria to processes in natural systems.

Content

Chemical equilibria in aqueous solutions, gas equilibria, precipitation and dissolution of mineral phases, silicate weathering, weathering kinetics, formation of secondary minerals (clay minerals, oxides, sulfides), redox processes in natural systems, pH buffering and acidification, salinity and salinization, environmental behavior of selected essential and toxic trace elements.

Literature

- Chapters 1, 3, 4, 6, 7 and 11 in Sigg/Stumm – Aquatische Chemie, 6. Auflage, vdf, 2016.

Prerequisites / notice

The lecture courses Pedosphere and Hydrosphere are highly recommended.

Competencies

Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

Method-specific Competencies

701-0535-00L Environmental Soil Physics/Vadose Zone Hydrology

W 3 credits 2V+1U
A. Carminati, P. U. Lehmann Grunder

Abstract

The course provides theoretical and practical foundations for understanding and characterizing physical soil properties and processes and their relevance for terrestrial ecosystems, plant growth, hydrological processes and atmospheric-land gas exchange, across all relevant scales.

Objective

Students are able to:
- Characterize the different soils based on their key textural and structural properties.
- Simulate and predict soil water retention and flow under varying environmental conditions and understand the key driving forces (capillarity, gravity, friction) and related water properties (surface tension and viscosity).
- Predict soil hydraulic properties for varying soil textural classes.
- Predict solute transport in soils for varying environmental conditions.
- Predict energy balance and temperature dynamics in soils.
- Predict conditions for plant water stress.
- Estimate the impact of soil properties on the hydrological cycle and on plant growth.
Content
INTRODUCTION
Week 1 (September 18)
Presentation of the role of soil physics in environmental sciences and terrestrial ecosystems: soils in the water cycle; soils and vegetation; soils and solute transport. Survey on students' interests and expectations. Presentation of course structure and learning objectives.

BASIC SOIL PROPERTIES
Week 2 (September 25) and Week 3 (October 02)
- soil texture, particle size distribution, soil structure, soil surface area, porosity and bulk density
- Pore scale consideration (water in a single pore), pore sizes and shapes; surface tension; Young-Laplace equation; capillary rise; contact angle
- Friction and laminar flow; Hagen-Poiseuille's law; Washburn equation; numerical lab (REPORT 1)

SOIL HYDRAULIC PROPERTIES
Week (4 October 09) and Week 5 (October 16)
- Soil water content and soil water potential - The energy state of soil water; total water potential and its components; volumetric and gravimetric water contents; field capacity and wilting point
- Soil water characteristics and pore size distribution
- Saturated water flow in soils - Laminar flow in tubes (Poiseuille's Law); Darcy's Law, conditions and states of flow; permeability and hydraulic conductivity, measurement and theoretical concepts; effective conductivity; unsaturated hydraulic conductivity; Buckingham law.
- Unsaturated water flow in soils - Unsaturated hydraulic conductivity models and applications

TOOLBOX – MEASUREMENTS AND MODELING
Week (6 October 23) and Week 7 (October 30)
- Measuring soil hydraulic properties, fitting and interpretation; Lab tour - demonstration of soil physical methods; lecture on HYPROP method: report on Hyprop data (REPORT 2)
- Modelling unsaturated water flow based on Richards equation - Using Hydrus1D for simulation of unsaturated flow; simulating HYPROP measurements (REPORT 3)

SOIL IN THE WATER CYCLE
Week 8 (November 06) – Week 9 (November 13)
- Water infiltration - steady state solutions for infiltration; approximate solutions to infiltration (Green-Ampt, Philip); infiltration rate and ponding; outlook to preferential flow
- Water evaporation - Energy balance and land atmosphere interactions - potential and actual evaporation, evaporation stages;

SOIL PLANT INTERACTIONS
Week 10 (November 20) Week 11 (November 27)
- Root water uptake and transpiration – Theory and mechanisms controlling root water uptake; hydraulic properties of rhizosphere; plant and stomatal conductance.
- Modelling root water uptake and transpiration; analytical approaches and modeling using Hydrus (REPORT 4)

SOLUTE TRANSPORT
Week 12 (December 04) Week 13 (December 11)
- Transport mechanisms of solutes in porous media; breakthrough curves; convection-dispersion equation; solutions for pulse and step solute application
- Transport of reactive substances, preferential flow, simulations with Hydrus

CLOSURE
Week 14 (December 18)
- Summary, course synthesis, connections between the different topics, questions, exam preparation

Literature
Supplemental textbook (not mandatory) - Introduction to Environmental Soil Physics, by: D. Hillel

Competencies
Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies
- Analytical Competencies
- Decision-making

Number
Title
701-0658-00L Seminar for Bachelor Students: Human Environment Systems

Type ECTS Hours Lecturers
W 3 credits 2S J. W. McCaughey, A. Berthold, E. Lieberherr

Abstract Analysis and presentation of research papers from the involved chairs, relating to topics from human-environment systems.
Objective The students learn to read, understand, summarize and present current research papers related to human-environment systems. Furthermore, students train the critical discussion of these papers. The students also get to know a number of innovative approaches for such presentations.
Content Research in human-environment systems is characterised by a broad range of topics and methods. This is illustrated by the research papers that are discussed in this seminar. Students choose a paper from a list and present it to the seminar participants. Furthermore, they lead the discussion and train questions and answers related to such presentations. In the first three lessons, inputs to presentation techniques and innovative approaches to presentations are provided and discussed.
Lecture notes Will be provided in the seminar.

Data: 06.08.2024 12:40
Applied Statistical Regression

W 5 credits 2V+1U M. Dettling

Abstract
This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning “good practice” that can be applied in every student’s own projects and daily work life. A special focus will be laid in the use of the statistical software package R for regression analysis.

Objective
The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.

Content
The course starts with the basics of linear modeling, and then proceeds to parameter estimation, tests, confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, multicollinearity problems and model interpretation, as well as general modeling strategies.

The last third of the course is dedicated to an introduction to generalized linear models: this includes the generalized additive model, logistic regression for binary response variables, binomial regression for grouped data and poisson regression for count data.

Lecture notes
A script will be available.

Montgomery et al. (2006): Introduction to Linear Regression Analysis

Prerequisites / notice
The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L "Applied Statistical Regression" and 401-3622-00L "Statistical Modelling" are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

Principles of Political Science

W 4 credits 2V+1U T. Bernauer, C. Brügge, S. Rhein

Abstract
This course covers basic questions, concepts, theories, methods, and empirical findings of political science.

Objective
This course covers basic questions, concepts, theories, methods, and empirical findings of political science.

Der Kurs besteht aus

- einem ersten Teil, der jeweils am Montag, ab 23. September 2024, wöchentlich bis und mit 16. Dezember 2024, 10:15-12:00, vor Ort auf dem Campus stattfindet (CHN E 46)

Die 5. Auflage dieses Lehrbuches ist via Buchhandlungen oder online erhältlich. Übungsfragen und ein Glossar finden Sie hier: https://ib.ethz.ch/teaching/pwgrundlagen.html

Vor der Sitzung:

2. Durch eine kurze (digitale) Umfrage in Moodle werden Übungsfragen ermittelt, welche von den Studierenden als besonders schwierig erachtet werden und die deshalb im Übungsteil (jeweils 12:15 – 13:00 Uhr) vertieft besprochen werden.

Der Ablauf der Sitzungen ist dann meist wie folgt:

1. Teil:
   1. Zu Beginn wird jeweils (in digitaler Form) ein unbenoteter Check-Up zum gelesenen Buchinhalt durchgeführt (mehr dazu weiter unten) und im Anschluss gleich besprochen.
   2. Es folgt eine ca. 30-minütige Vorlesung, die den Inhalt des/des gelesenen Buchkapitels kurz zusammenfasst und reflektiert.
   3. Danach stellen die Dozierenden meist eine aktuelle wissenschaftliche Studie vor, die im Bereich des/des jeweils behandelten Themen liegt (ca. 30 Minuten).

2. Teil:
   Wir behandeln Übungsfragen, die per Umfrage als besonders schwierig identifiziert wurden.

Die Sitzungen sind normalerweise somit wie folgt strukturiert:

- 10:15 – 10:30 Uhr: Check-Up & Auswertung & Besprechung
- 10:30 – 11:00 Uhr: Vorlesung
- 11:00 – 11:15 Uhr: Pause
- 11:15 – 11:45 Uhr: Vertiefung des Vorlesungsinhalts, z.B. durch Präsentation einer aktuellen Studie (in Sitzungen mit zwei zu lesenden Buchkapiteln zweiter Vorlesungsblock)
- 11:45 – 12:15 Uhr: Pause, dient auch dazu, sich zu verpflegen und (falls nicht vor der Sitzung schon erledigt) die Umfrage zur Priorisierung der Übungsfragen auszufüllen
- 12:15 – 13 Uhr: Besprechung der priorisierten Übungsfragen

Die 5. Auflage dieses Lehrbuches ist via Buchhandlungen oder online erhältlich. Übungsfragen und ein Glossar finden Sie hier: https://ib.ethz.ch/teaching/pwgrundlagen.html

Die 5. Auflage dieses Lehrbuches ist via Buchhandlungen oder online erhältlich. Übungsfragen und ein Glossar finden Sie hier: https://ib.ethz.ch/teaching/pwgrundlagen.html
The following courses are highly recommended as preparation for the Specialization in Environmental Biology:

227-0399-10L Physiology and Anatomy for Biomedical Engineers I (Autumn semester)
551-0448-00L Zoologie (Spring semester)
701-0360-10L Systematische Biologie: Pflanzen (Spring semester)
227-0398-10L Physiology and Anatomy for Biomedical Engineers II (Spring semester)

These courses should be successfully completed during the second year.

</tr>
</tbody>
</table>

Objectives

- You know how to structure your inquiry and how to proceed the analysis when faced with a complex environmental issue. You can formulate the relevant questions, find answers (supported by discussions, input from the lecturers and the literature), and you are able to present your conclusions clearly and cautiously.
- You understand the complexity of interactions and structures in ecosystems. You know how ecosystem processes, functions and services interact and feed back across multiple spatio-temporal scales (in general, plus in depth case examples).
- You understand that biodiversity and the interaction between organisms are an integral part of ecosystems. You are aware that the link between biodiversity and process/function/service is rarely fully understood. You know how to honestly deal with this lack of understanding and can nevertheless find, critically analyse and communicate solutions.
- You understand the importance of ecosystem services for society.
- You have an overview of the methods of ecosystem research and have a deeper insight into some of them, e.g. ecosystem observation, manipulation and modelling.
- You have reflected on ecology as a young discipline at the heart of significant applied questions.

Note:

- The course provides the ecological systems’ knowledge needed to question applied solutions to current environmental issues. Our central aim is to balance participants’ respect for complexity with a sense of possibility by providing examples from the vast solution space offered by ecological systems, such as e.g. green infrastructure to manage water.
- The course fosters the ecological systems knowledge needed to question applied solutions to current environmental issues. Our central aim is to balance participants’ respect for complexity with a sense of possibility by providing examples from the vast solution space offered by ecological systems, such as e.g. green infrastructure to manage water.
- The course fosters the ecological systems knowledge needed to question applied solutions to current environmental issues. Our central aim is to balance participants’ respect for complexity with a sense of possibility by providing examples from the vast solution space offered by ecological systems, such as e.g. green infrastructure to manage water.
- The course fosters the ecological systems knowledge needed to question applied solutions to current environmental issues. Our central aim is to balance participants’ respect for complexity with a sense of possibility by providing examples from the vast solution space offered by ecological systems, such as e.g. green infrastructure to manage water.
- The course fosters the ecological systems knowledge needed to question applied solutions to current environmental issues. Our central aim is to balance participants’ respect for complexity with a sense of possibility by providing examples from the vast solution space offered by ecological systems, such as e.g. green infrastructure to manage water.
- The course fosters the ecological systems knowledge needed to question applied solutions to current environmental issues. Our central aim is to balance participants’ respect for complexity with a sense of possibility by providing examples from the vast solution space offered by ecological systems, such as e.g. green infrastructure to manage water.
This course provides the ecological systems' knowledge needed to question applied sustainability solutions. We will critically assess the complexity of current environmental issues, illustrating basic ecological concepts and principles. Our central aim is to balance participants' respect for complexity with a sense of possibility by providing examples from the vast solution space offered by ecological systems, such as e.g. green infrastructure to manage water.

The course is structured around four larger topical areas: (1) Integrated Water Management -- Green infrastructure (land management options) as an alternative to engineered solutions (e.g. large reservoirs) in flood and drought management; (2) Fire dynamics, the water cycle and biodiversity -- The surprising dynamics of species life cycles and populations in arid landscapes; (3) Rewilding, e.g. re-introducing apex predators (e.g. wolves), or large ungulates (e.g. bisons) in protected areas -- A nature conservation trend with counterintuitive effects; (4) Coupling of aquatic and terrestrial systems: carbon, nitrogen and phosphorus transfers of global importance on landscape scale.

It is not essential to borrow/buy the following books. We will continuously provide excerpts and other literature during the course.

In the seminar, students explore a specific topic in environmental biology (ecology, evolution, health). They find and read scientific articles, structure contents around core questions, talk to specialists about them, prepare a scientific presentation and lead a discussion. They are introduced to literature search and scientific presentations.

Students will acquire skills in:
- finding literature in scientific databases
- structuring a scientific topic through research questions
- giving a clear scientific presentation
- contributing constructively to a scientific discussion

In the first 3-5 weeks, the course will center around learning and discussing the skills needed to participate in scientific presentations: reading scientific papers, searching for literature, structuring slides, and speaking type. In the last 9-11 weeks, student presentations and discussions will occur.

Students will acquire skills in:
- contributing constructively to a scientific discussion
- finding literature in scientific databases
- structuring a scientific topic through research questions
- giving a clear scientific presentation

The course combines elements of a classic lecture, group discussions and problem based learning. It is helpful, but not essential to be familiar with the "seven stages" method (see e.g. course 701-0352-00L "Analysis and Assessment of Environmental Sustainability" by Christian Pohl et al.).

In this course, students will:
- Understand the theoretical underpinnings of conservation and restoration science.
- Consider alternative conservation concepts and approaches, and the role of science and evidence in implementing these ideas in practice.
- Appraise different conservation strategies, drawing on case studies and examples from around the world.
- Explore new and emerging technologies that can be useful to guide responsible decision making in land management decisions.
- Evaluate the future direction of conservation science, in terms of new concepts (resilience, restoration, rewilding, natural capital, de-extinction) and emerging technologies (remote sensing, AI, genetics).
- Explore conservation and restoration science and practice in the context of current societal pressures, and the prospects for biodiversity conservation in coming decades.
- Understand how responsible restoration and conservation goals should integrate local practices, customs, cultures, and economic requirements.

In this course, students will:
- Learn about the historical development of thinking in conservation and restoration ecology
- Learn about the ecological theories underpinning conservation and restoration ecology
- Learn about emerging statistical and analytical tools to guide effectively responsible conservation and restoration initiatives
- Learn about the practical challenges and trade-offs in decision making that ultimately govern the success of conservation and restoration challenges around the world.
- Understand, through the exploration of case studies and site visits, differing normative and management perspectives on landscape scale conservation and restoration

### 701-0320-00L Seminar for Bachelor Students: Environmental Biology

**W** 3 credits  **2S**

**J. Hille Ris Lambers**

**701-0371-00L Ecosystem Conservation and Restoration**

**W** 3 credits  **2G**

**T. Crowther, L. Blalic-Murphy, J. Ghazoul**

**Abstract**

Conservation and restoration are interdisciplinary sciences that nonetheless are founded on fundamental ecological concepts. The course will explore theoretical underpinnings of conservation and restoration science that inform planning and implementation, and consequent outcomes. New concepts and emerging technologies will be explored, alongside case studies that inform discussions.

**Objective**

Through the course, students will:
- Understand the theoretical underpinnings of conservation and restoration science.
- Consider alternative conservation concepts and approaches, and the role of science and evidence in implementing these ideas in practice.
- Appraise different conservation strategies, drawing on case studies and examples from around the world.
- Explore new and emerging technologies that can be useful to guide responsible decision making in land management decisions.
- Evaluate the future direction of conservation science, in terms of new concepts (resilience, restoration, rewilding, natural capital, de-extinction) and emerging technologies (remote sensing, AI, genetics).
- Explore conservation and restoration science and practice in the context of current societal pressures, and the prospects for biodiversity conservation in coming decades.
- Understand how responsible restoration and conservation goals should integrate local practices, customs, cultures, and economic requirements.

In this course, students will:
- Learn about the historical development of thinking in conservation and restoration ecology
- Learn about the ecological theories underpinning conservation and restoration ecology
- Learn about emerging statistical and analytical tools to guide effectively responsible conservation and restoration initiatives
- Learn about the practical challenges and trade-offs in decision making that ultimately govern the success of conservation and restoration challenges around the world.
- Understand, through the exploration of case studies and site visits, differing normative and management perspectives on landscape scale conservation and restoration

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 2481 of 2684
Content

2021 marked the start of the UN Decade on ecosystem restoration, a global initiative to conserve and restore nature for the benefit of climate change, biodiversity and human wellbeing. As an emerging workforce enters this exponentially growing field, we hope that they will be armed with the fundamental principles that are necessary to enhance the likelihood of success.

Conservation and restoration science is a relatively young discipline, yet it has undergone substantial change in recent decades on account of changing environmental realities, new conceptual framings, and opportunities afforded by emerging technologies. As a rapidly evolving discipline, with considerable relevance and impact to environment, policy, and society, it is essential that environmental science students understand the role of science for conservation practice.

This course will explore how science and technology provides the conceptual structure and knowledge base for new approaches to conservation of biodiversity, habitats, and resources. The course will begin by examining the theoretical foundations of conservation science, and how these concepts have developed over the past century. It will examine alternative approaches to conservation ranging from traditional protected area and wildlife management systems, through to more recent concepts and approaches, including ecosystem services, natural capital, restoration, and rewilding. It will emphasize the role of new technological and analytical methods, including Earth observation, monitoring systems, AI, and genetics. Finally, the students will use a horizon scanning approach to determine the future opportunities, priorities, and constraints for conservation science and practice in our rapidly changing world.

Students will evaluate several general questions, including:
- What is conservation, and what do we want to conserve?
- What ecological theories frame conservation and restoration practice, and how can science guide conservation decisions?
- What new concepts (ecological, societal, economical) shape conservation and restoration theory and practice, and what conflicts do they engender?
- What prospects does technology offer for future conservation and restoration efforts?

Ecosystem Conservation and Restoration will provide an excellent foundation on how theoretical and applied natural and social sciences are, and can be, coupled to emerging technologies and data science to conserve and restore biodiversity and ecological functions in landscapes. For students wishing to acquire a deeper level of understanding of both science and practice in conservation and restoration, this course will serve as the prerequisite for a two-week Masters-level field course (tentatively titled Conservation, Restoration, and Landscape Management) to Scotland, being developed by the Ghazoul and Crowther labs and planned for 2023. The field course will challenge students to apply the conceptual and technical understanding gained from the Ecosystem Conservation and Restoration course, specifically by working with a variety of stakeholders involved in selected forest and landscape restoration processes in Scotland.

Literature

Current literature will be provided in due course

Competencies

Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management

Method-specific Competencies
- Communication
- Cooperation and Teamwork
- Customer Orientation
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation

Social Competencies
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

Personal Competencies
- Customer Orientation
- Cooperation and Teamwork
- Leadership and Responsibility
- Problem-solving
- Teamwork

701-1413-00L Population and Quantitative Genetics 3 credits 2V T. Städler, J. Stapley

Abstract

This course is an introduction to the rapidly developing fields of population and quantitative genetics, emphasizing the major concepts and ideas over mathematical formalism. An overview is given of how mutation, genetic drift, gene flow, mating systems, and selection affect the genetic structure of populations. Evolutionary processes affecting quantitative and Mendelian characters are discussed.

Objective

Students are able to:
- describe types and sources of genetic variation.
- describe fundamental concepts and methods of quantitative genetics.
- use basic mathematical formalism to describe major population genetic concepts.
- discuss the main topics and developments in population and quantitative genetics.
- model population genetic processes using specific computer programs.

Content

Population Genetics:
- Types and sources of genetic variation; randomly mating populations and the Hardy-Weinberg equilibrium; effects of inbreeding; natural selection; random genetic drift and effective population size; gene flow and hierarchical population structure; molecular population genetics: neutral theory of molecular evolution and basics of coalescent theory.

Quantitative Genetics:
- Continuous variation; measurement of quant. characters; genes, environments and their interactions; measuring their influence; response to selection; inbreeding and crossbreeding, effects on fitness; Fisher's fundamental theorem.

701-1413-01L Ecological Genetics 3 credits 2V A. Widmer, S. Fior, M. Fischer

Abstract

This course focuses on fundamental concepts and methods in ecological genetics. Topics covered include genetic diversity, natural selection, adaptation, reproductive isolation, hybridization and speciation.

Objective

Students are familiar with fundamental concepts in ecological genetics and with current scientific methods. They can propose strategies to study evolutionary processes in natural populations by combining their knowledge from different disciplines, including population and quantitative genetics, ecology and evolution.

Content

Concepts and methods for the study of genetic diversity, biodiversity, natural selection, adaptation, reproductive isolation, hybridization and speciation.
Forestry and Landscape

The following courses are highly recommended as preparation for the Specialization in Forestry and Landscape:

- 701-0266-00L Einführung in die Dendrologie (Autumn semester)
- 701-0951-00L GIST - Einführung in die räumlichen Informationswissenschaften und -technologien (Autumn semester)
- 551-0448-00L Zoologie (Spring semester)
- 701-0360-00L Systematische Biologie: Pflanzen (Spring semester)

These courses should be successfully completed during the second year.

Abstract

The course provides theoretical and practical foundations for understanding and characterizing physical soil properties and processes and their relevance for terrestrial ecosystems, plant growth, hydrological processes and atmospheric-land gas exchange, across all relevant scales.

Objective

Students are able to:
- Characterize the different soils based on their key textural and structural properties.
- Simulate and predict soil water retention and flow under varying environmental conditions and understand the key driving forces (capillarity, gravity, friction) and related water properties (surface tension and viscosity).
- Predict soil hydraulic properties for varying soil textural classes.
- Predict solute transport in soils for varying environmental conditions.
- Predict energy balance and temperature dynamics in soils.
- Predict conditions for plant water stress.
- Estimate the impact of soil properties on the hydrological cycle and on plant growth.

Content

**INTRODUCTION**

Week 1 (September 18)
- Presentation of the role of soil physics in environmental sciences and terrestrial ecosystems: soils in the water cycle; soils and vegetation; soils and solute transport. Survey on students' interests and expectations. Presentation of course structure and learning objectives.

**BASIC SOIL PROPERTIES**

Week 2 (September 25) and Week 3 (October 02)
- soil texture, particle size distribution, soil structure, soil surface area, porosity and bulk density
- Pore scale consideration (water in a single pore), pore sizes and shapes; surface tension; Young-Laplace equation; capillary rise; contact angle
- Friction and laminar flow; Hagen-Poiseuille's law; Washburn equation; numerical lab (REPORT 1)

**SOIL HYDRAULIC PROPERTIES**

Week 4 (October 09) and Week 5 (October 16)
- Soil water content and soil water potential - The energy state of soil water; total water potential and its components; volumetric and gravimetric water contents; field capacity and wilting point
- Soil water characteristics and pore size distribution
- Saturated water flow in soils - Laminar flow in tubes (Poiseuille's Law); Darcy's Law, conditions and states of flow; permeability and hydraulic conductivity, measurement and theoretical concepts; effective conductivity; unsaturated hydraulic conductivity; Buckingham law.
- Unsaturated water flow in soils - Unsaturated hydraulic conductivity models and applications

**TOOLBOX – MEASUREMENTS AND MODELING**

Week 6 (October 23) and Week 7 (October 30)
- Measuring soil hydraulic properties, fitting and interpretation; Lab tour - demonstration of soil physical methods; lecture on HYPROP method; report on Hyprop data (REPORT 2)
- Modelling unsaturated water flow based on Richards equation - Using Hydrus1D for simulation of unsaturated flow; simulating HYPROP measurements (REPORT 3)

**SOIL IN THE WATER CYCLE**

Week 8 (November 06) – Week 9 (November 13)
- Water infiltration - steady state solutions for infiltration; approximate solutions to infiltration (Green-Ampt, Philip); infiltration rate and ponding: outlook to preferential flow
- Water evaporation - Energy balance and land atmosphere interactions - potential and actual evaporation, evaporation stages;

**SOIL PLANT INTERACTIONS**

Week 10 (November 20) Week 11 (November 27)
- Root water uptake and transpiration – Theory and mechanisms controlling root water uptake; hydraulic properties of rhizosphere; plant and stomatal conductance.
- Modelling root water uptake and transpiration; analytical approaches and modeling using Hydrus (REPORT 4)

**SOLUTE TRANSPORT**

Week 12 (December 04) Week 13 (December 11)
- Transport mechanisms of solutes in porous media; breakthrough curves; convection-dispersion equation; solutions for pulse and step solute application
- Transport of reactive substances, preferential flow, simulations with Hydrus

**CLOSURE**

Week 14 (December 18)
- Summary, course synthesis, connections between the different topics, questions, exam preparation

**Literature**

Supplemental textbook (not mandatory) - Introduction to Environmental Soil Physics, by: D. Hillel

### 701-0553-00L - Landscape Ecology

**Abstract**
The course is an introduction to Landscape Ecology and Landscape Modelling and provides various practical applications of Landscape Ecology in nature and landscape management.

**Objective**
The students are able to explain and apply the concepts and methods of landscape analysis using examples, to explain causes and effects of changes in landscape using examples and simulations, and to describe practical applications of Landscape Ecology in the management of nature and landscape.

**Content**
- important terms and concepts of Landscape Ecology,
- analysis of landscape pattern (metrics),
- landscape modelling,
- perception of landscapes,
- application of landscape ecology concepts in planning

**Lecture notes**
The course is offered via a MOOC (Edx) and Moodle Course.

**Literature**
List in the MOOC

**Prerequisites / notice**
This lecture is coordinated with a MOOC.

**Competencies**
- Subject-specific Competencies: Concepts and Theories, Techniques and Technologies, assessed
- Method-specific Competencies: Decision-making, Problem-solving, assessed

### 701-0559-00L - Seminar for Bachelor Students: Forest and Landscape

**Objective**
Interdisciplinary seminar on forest and landscape issues with particular emphasis on the key processes shaping the development of forest ecosystems and landscapes. Students perform literature researches, and train presentation and moderation techniques as well as a constructive feedback culture.

**Content**
- To critically analyze and discuss original scientific articles for selected processes and methods in relation to forest and landscape.
- Scientific exchange with subject-specific experts.
- Learn standard rhetoric and moderation methods through training in the seminar.
- Effective feedback regarding the independent development of presentation and moderation competencies.

**Lecture notes**
There will be a script for the rhetoric and moderation methods.

**Literature**
Literature references will be provided by the lecturers.

**Prerequisites / notice**
The credits are assigned if the following requirements are met:
- Independent literature research on the topic and exchange with experts for preparing for the presentation
- Presentation with questions and answers (15-20 min)
- Moderation of the scientific discussion (20-35 min)
- Actively contributing to the feedback of students' presentations, moderation and discussions.

**Abstract**
Interdisciplinary seminar on forest and landscape issues with particular emphasis on the key processes shaping the development of forest ecosystems and landscapes. Students perform literature researches, and train presentation and moderation techniques as well as a constructive feedback culture.

**Competencies**
- Subject-specific Competencies: Concepts and Theories, Techniques and Technologies, assessed
- Method-specific Competencies: Analytical Competencies, Media and Digital Technologies, assessed
- Social Competencies: Communication, Cooperation and Teamwork, Self-presentation and Social Influence, Sensitivity to Diversity, assessed
- Personal Competencies: Creative Thinking, Critical Thinking, Self-awareness and Self-reflection, Self-direction and Self-management, assessed

### 701-0561-00L - Forest Ecology

**Abstract**
This course conveys the basics of forest ecology with an emphasis on trees as those organisms that dominate the physiognomy and the dynamics of forest ecosystems. Based on this course, students have a good grasp of the qualitative and quantitative importance of forest ecosystems at the global and regional scales, with a focus on central Europe.
Objective

Students are able to
- summarize the fundamentals of forest ecology at the autecological, demecological and synecological levels
- explain how trees dominate the physiognomy and dynamics of forest ecosystems
- describe the qualitative and quantitative importance of forest ecosystems at the global and regional scales, with an emphasis on central Europe and Alpine regions.

Overall, the competences of process understanding, system understanding, modeling, concept development and data analysis & interpretation are taught and examined in this course.

Content

Introduction and overview of the forests of the world
Forest ecosystem ecology: Production ecology of forests
Auteology: light, temperature, wind, water, and nutrients
Demecology: regeneration ecology, forest growth, mortality
Syneology: fundamentals of trophic interactions (forest-ungulate interactions), succession

Lecture notes

Handsouts are available for download from https://fe.ethz.ch/studium/lehrmaterialien/bachelor/waldoekologie.html.

Literature

A. Ringenbach

Prerequisites / notice

The contents of the following courses of the 2nd year of the USYS BSc are required:
- Pedosphere, Hydrosphere, Fundamentals of biology and ecology, Introduction to dendrology (knowledge of European tree species),
- Einführung Mikrobiologie, Biologie und Ökologie
- Allgemeine Mikrobiologie, Biologie und Ökologie
- Einführung Pilze: Taxonomie, Strukturen des Thallus, Fruchtkörpertypen, Sexualität der Asko- und Basidiomyzeten, Pilzökologie,
- Einführung Insekten: Biologie, Morphologie, Physiologie und Ökologie
- Einführung Pilze: Taxonomie, Strukturen des Thallus, Fruchtkörpertypen, Sexualität der Asko- und Basidiomyzeten, Pilzökologie,
- Borkenkäfer und andere Rinden- und Holzbewohner, Schmetterlinge und andere Entlauber
- Blattläuse und andere Pflanzensauger, Gallbildner, Samen- und Zapfeninsekten
- Insekten und Pathogene – Vektoren und Komplexkrankheiten
- Wurzel- und Stammfäulen
- Abwehr im Baum gegen Pathogene - CODIT
- Rostkrankheiten
- Nützlinge, natürlich Feinde, Artenvielfalt, Biodiversität, Naturschutz
- Entomologische Methoden (Feld, Labor, Analysen, Schadensbegrenzung)
- Welkeerreger und Bläuepilze, Rindennekrosen
- Nadel- und Blattkrankheiten

Bachelor’s Thesis

In principle, all professors and lecturers involved in the teaching of the Environmental Sciences degree programme are entitled to supervise a Bachelor’s thesis (BA).
BA in the area of social sciences and humanities can only be supervised by lecturers who teach in this area. The same applies to BA in the field of natural sciences and technology.
Abstract
Students learn (a) to work on a question using scientific methods and concepts, (b) to write a report according to scientific standards and (c) to correctly cite knowledge from the literature. Depending on the orientation of the work, they learn this by means of an empirical investigation, a literature study, a planning task or a practical project.

Objective
With the Bachelor's thesis, students learn (a) to work on a problem using scientific methods and concepts, (b) to write a report according to scientific standards and (c) to correctly cite knowledge from the literature.

Content
The Bachelor's thesis is written either in the area of "Social Sciences and Humanities" or in the area of "Natural Sciences and Technology". It can also be interdisciplinary and transdisciplinary.
A Bachelor's thesis in the field of "Social Sciences and Humanities" usually deals with a question at the interface of these sciences and the environment and sustainability. Social science and humanities methods of data collection, analysis and interpretation are used.
A Bachelor's thesis in the field of "Natural Sciences" deals with a topic at the interface of the natural sciences and the environment and sustainability. Natural science methods of data collection, analysis and interpretation are used.
A thesis in the field of "technology" deals with the environmental impact of a use. It can be an analysis, an assessment or the future design of a use.
In interdisciplinary or transdisciplinary work, findings from different disciplines are brought together on the basis of an overarching question, or social actors are included in the work.

<td></td>
<td></td>
</tr>
</tbody>
</table>

In the course "Atmospheric Physics", the competencies of process understanding, system understanding and data analysis & interpretation are taught, applied and examined. Measurement methods are taught as well.
The course starts with introducing selected concepts of thermodynamics for atmospheric processes; The students learn the concept of the thermodynamic equilibrium and derive the Clausius-Clayperon equation from the first law of thermodynamics. This equation is central for the phase transitions in clouds.

Students also learn to use thermodynamic charts (tephigrams) and to identify cloud base, cloud top, available convective energy in radiosonde ascents. Atmospheric mixing processes are introduced as a basis for fog formation. The concept of an air parcel is used to understand convection.

Aerosol particles are introduced in terms of their physical properties and their role in cloud formation based on Köhler theory. Thereafter cloud microphysical processes including ice nucleation are discussed.

With these basics, the different forms of precipitation (convective vs. stratiform) are discussed and how they can be identified in radar images. Students will also learn under which conditions severe convective storms (especially supercells with tornados) can form.

The concepts are applied to understand and judge the validity of different proposed artificial weather modification ideas.

Lecture notes
Powerpoint slides and chapters from the textbook will be made available on moodle: https://moodle-app2.let.ethz.ch/course/view.php?id=22731

Literature

An electronic version of this book can be obtained via the ETH library.

pdf-ﬁles of the revised book will be provided on moodle on a chapter-by-chapter basis.

We offer a lab tour, in which we demonstrate how some of the processes discussed in the lectures are measured with instruments.

There is a additional tutorial right after each lecture to give you the chance to ask further questions and discuss the exercises. The participation is recommended but voluntary.

**Abstract**
New master students are introduced to the atmospheric and climate research field through keynotes given by the program's professors. In several self-assessment and networking workshops they get to know each other and obtain general information and guidance about the organisation of the MSc programme.

**Objective**
The aims of this course are i) to welcome all students to the master program and to ETH, ii) to acquaint students with the faculty teaching in the field of atmospheric and climate science at ETH and at the University of Bern, iii) that the students get to know each other and iv) to assess needs and discuss options for training and education of soft-skills during the Master program and to give an overview of the study options in general.

**Abstract**
The colloquium is a series of scientific talks by prominent invited speakers assembling interested students and researchers from around Zürich. Students take part of the scientific discussions.
The Planetary Boundary Layer (PBL) constitutes the lower part of the atmosphere, is characterized by turbulent mixing and ensures the exchange of energy, mass and momentum between the Earth's surface and the atmosphere. The course provides the theoretical background for understanding the structure and dynamics of the PBL. Idealized concepts are reviewed and contrasted to real world applications.

Objective
Students are able to:
- Name the basic approaches needed to describe planetary boundary layer flows and associated turbulent exchange processes.
- Apply these concepts to answer comprehension questions and solve simple problems related to the structure and dynamics of the PBL.
- Independently judge the applicability of learned concepts and tools to real-world situations.

Content
- Introduction
- PBL structure and stability
- Turbulence and turbulent transport
- Scaling and similarity theory
- Spectral characteristics
- Conservation equations in a turbulent flow
- Closure problem and closure assumptions
- Rough surfaces and the roughness sublayer
- Complex terrain

Objective
The lecture takes place if a minimum of 7 students register for it.

Abstract
Clouds are a fascinating atmospheric phenomenon central to the hydrological cycle and the Earth’s climate. Interactions between cloud particles can result in precipitation, glaciation or evaporation of the cloud depending on its microstructure and microphysical processes.

Objective
The learning objective of this course is that students understand the formation of clouds and precipitation and can apply learned principles to interpret atmospheric observations of clouds and precipitation.

Lecture notes
This course will be designed as a reading course in 1-2 small groups of 10-12 students maximum. It will be based on the textbook below. The students are expected to read chapters of this textbook prior to the class so that open issues, fascinating and/or difficult aspects can be discussed in depth. Check the course website for lecture dates and location.

701-1251-00L | Land-Climate Dynamics         | W     | 3    | 2G   | S. I. Seneviratne, R. Padrón Flasher, P. Sieber |

Abstract
The purpose of this course is to provide fundamental background on the role of land surface processes (vegetation, soil moisture dynamics, land energy, water and carbon balances) in the climate system. The course consists of 2 contact hours per week, including lectures, group projects and computer exercises.

Objective
The students can understand the role of land processes and associated feedbacks in the climate system.

Lecture notes
Powerpoint slides will be made available

Prerequisites / notice
Prerequisites: Introductory lectures in atmospheric and climate science

Abstract
Aerosols I deals with basic physical and chemical properties of aerosol particles. The importance of aerosols in the atmosphere and in other fields is discussed.

Objective
Physical and chemical principles:
The students...
- know the processes and physical laws of aerosol dynamics.
- understand the thermodynamics of phase equilibria and chemical equilibria.
- know the photo-chemical formation of particulate matter from inorganic and organic precursor gases.

Environmental impacts:
The students...
- know the major sources of atmospheric aerosols, their chemical composition and key physical properties.
- know the most important climate impacts of atmospheric aerosols.
- are aware of the health impacts of atmospheric aerosols.

Experimental methods:
The students...
- know the most important chemical and physical measurement instruments.
- understand the underlying chemistry and physics.

<td>Climate History and Palaeoclimatology</td>
<td>W</td>
<td>4</td>
<td>2G</td>
<td>H. Stoll, I. Hernández Almeida</td>
</tr>
</tbody>
</table>

Abstract
Climate history and paleoclimatology explores how the major features of the earth's climate system have varied in the past, and the driving forces and feedbacks for these changes. The major topics include the earth's CO2 concentration and mean temperature, the size and stability of ice sheets and sea level, the amount and distribution of precipitation, and the ocean heat transport.

Objective
The student will be able to describe the natural factors lead to variations in the earth's mean temperature, the growth and retreat of ice sheets, and variations in ocean and atmospheric circulation patterns, including feedback processes. Students will be able to interpret evidence of past climate changes from the main climate indicators or proxies recovered in geological records. Students will be able to use data from climate proxies to test if a given hypothesized mechanism for the climate change is supported or refuted. Students will be able to compare the magnitudes and rates of past changes in the carbon cycle, ice sheets, hydrological cycle, and ocean circulation, with predictions for climate changes over the next century to millennia.
Content
The course spans 5 thematic modules:

1. Cyclic variation in the earth's orbit and the rise and demise of ice sheets. Ice sheets and sea level - What do expansionist glaciers want? What is the natural range of variation in the earth's ice sheets and the consequent effect on sea level? How do cyclic variations in the earth's orbit affect the size of ice sheets under modern climate and under past warmer climates? What conditions the mean size and stability or fragility of the large polar ice caps and is their evidence that they have dynamic behavior? What rates and magnitudes of sea level change have accompanied past ice sheet variations? How stable or fragile is the ocean heat conveyor, past and present?
2. Feedbacks on climate cycles from CO2 and methane. What drives CO2 and methane variations over glacial cycles? What are the feedbacks with ocean circulation and the terrestrial biosphere?
3. Atmospheric circulation and variations in the earth's hydrological cycle - How variable are the earth's precipitation regimes? How large are the orbital scale variations in global monsoon systems?
4. Century-scale droughts and civil catastrophes. Will mean climate change El Nino frequency and intensity? What factors drive change in mid and high-latitude precipitation systems? Is there evidence that changes in water availability have played a role in the rise, demise, or dispersion of past civilizations?
5. How sensitive is Earth's long term climate to CO2 and cloud feedbacks? What regulates atmospheric CO2 over long tectonic timescales of millions to tens of millions of years?

The weekly two hour lecture periods will feature lecture on these themes interspersed with short interactive tasks to apply new knowledge. Over the semester, student teams will each present in class one debate based on two scientific articles of contrasting interpretations. With flexible scheduling, students will participate in a laboratory activity to generate a new paleoclimate record from stalagmites. Student teams will be supported by an individual tutorial meeting to assist in debate preparation and another to assist in the interpretation of the lab activity data.

701-1644-00L  Mountain Hydrology  W  5 credits  4G  M. Brunner, K. Meusburger Di Bella

Abstract: This course presents a process-based view of the hydrology of mountain streams. Students learn how to integrate process knowledge, data, and models to understand how landscapes regulate the fluxes of water, sediment, nutrients, and pollutants in streams, and how these factors affect changes in land use, water use, and climate.

Objective: Main learning objective: Describe the main elements and processes and their interlinkages of the water cycle in mountain catchments and analyze their characteristics and changes.

Objective 1: Identify and describe the important components of the water cycle and their influencing factors and discuss how changes in these influencing factors affect different parts of the hydrological cycle.

Objective 2: Analyse, visualize, and interpret climate and hydrological time series data.

Objective 3: Explain how hydrological data are collected, how hydrological models work, how they are calibrated, and how they are evaluated.

Content: Streams are integrated monitors of the health and functioning of their surrounding landscapes. Streams integrate the fluxes of water, solutes, and sediment from their contributing catchment area; thus they reflect the spatially integrated hydrological, ecophysiological, biogeochemical, and geomorphological processes in the surrounding landscape. At a practical level, there is a significant public interest in managing upland landscapes to provide a reliable supply of high-quality surface water and to minimize the risk of catastrophic flooding and debris flows, but the scientific background for such management advice is still evolving.

Using a combination of lectures, field exercises, and data analysis, we explore the processes controlling the delivery of water, solutes, and sediment to streams, and how these processes are affected by changes in land cover, land use, and climate. We review the connections between process understanding and predictive modeling in these complex environmental systems. Practical problems to be considered include the effects of land use and climate on streamflow and water quality, illustrated with data from experimental watersheds in North America and Europe.

Lecture notes: Handouts will be available through moodle.

Literature: Recommended and required reading will be specified at the first class session (with possible modifications as the semester proceeds).

Competencies: Subject-specific Competencies

102-0468-10L  Watershed Modelling  W  6 credits  4G  P. Molnar, A. Costa, S. Sinclair

Abstract: Watershed Modelling is a practical course on numerical water balance models for a range of catchment-scale water resource applications. The course covers GIS use in watershed analysis, models types from conceptual to physically-based, parameter calibration and model validation, and analysis of uncertainty. The course combines theory (lectures) with a series of practical tasks (exercises).

Objective: The main aim of the course is to provide practical training with watershed models for environmental engineers. The course is built on thematic lectures (2 hrs a week) and practical exercises (2 hrs a week). Theory and concepts in the lectures are underpinned by many examples from scientific studies. A comprehensive exercise builds on the lectures with a series of 4 practical tasks to be conducted during the semester in group work. Exercise hours during the week focus on explanation of the tasks. The course is evaluated 50% by performance in the graded exercises and 50% by a seminar-end oral examination (30 mins) on watershed modelling concepts.

Content: The first part (A) of the course is focussed on physically-based model components. Here students learn about components for soil water fluxes and evapotranspiration, they practice with a fully-distributed physically-based model Topkapi-ETH, and learn about other similar models at larger scales. They apply Topkapi-ETH to an alpine catchment and study simulated discharge, snow, soil moisture and evapotranspiration spatial patterns.

Lecture notes: There is no textbook. Learning materials consist of (a) video-lectures of recordings; (b) lecture presentations; and (c) exercise task documents that allow independent work.

Literature: Literature consists of collections from standard hydrological textbooks and research papers, collected by the instructors on the course moodle page.

Prerequisites / notice: Basic Hydrology in Bachelor Studies (engineering, environmental sciences, earth sciences), Basic knowledge of Matlab (Python), ArcGIS (Q-GIS).

651-4053-05L  Boundary Layer Meteorology  Z  4 credits  3G  M. Rotach, P. Calanca
Abstract
The Planetary Boundary Layer (PBL) constitutes the lower part of the atmosphere, is characterized by turbulent mixing and ensures the exchange of energy, mass and momentum between the Earth’s surface and the atmosphere. The course provides the theoretical background for understanding the structure and dynamics of the PBL. Idealized concepts are reviewed and contrasted to real world applications.

Objective
Students are able to:
- Name the basic approaches needed to describe planetary boundary layer flows and associated turbulent exchange processes.
- Apply these concepts to answer comprehension questions and solve simple problems related to the structure and dynamics of the PBL.
- Independently judge the applicability of learned concepts and tools to real-world situations.

Content
- Introduction
- PBL structure and stability
- Turbulence and turbulent transport
- Scaling and similarity theory
- Spectral characteristics
- Conservation equations in a turbulent flow
- Closure problem and closure assumptions
- Rough surfaces and the roughness sublayer
- Complex terrain

Abstract
The lecture provides an overview of climate change in Europe, from a physical and atmospheric science perspective. It covers the following topics:
- observational datasets, observation and detection of climate change;
- underlying physical processes and feedbacks;
- numerical and statistical approaches;
- currently available projections.

Objective
At the end of this course, participants should:
- understand the key physical processes shaping climate change in Europe;
- know about the methodologies used in climate change studies, encompassing observational, numerical, as well as statistical approaches;
- be familiar with relevant observational and modeling data sets;
- be able to tackle simple climate change questions using available data sets.

Content
- global context
- observational data sets, analysis of climate trends and climate variability in Europe
- global and regional climate modeling
- statistical downscaling
- key aspects of European climate change: intensification of the water cycle, Polar and Mediterranean amplification, changes in extreme events, changes in hydrology and snow cover, topographic effects
- projections of European and Alpine climate change

Lecture notes
Slides and lecture notes will be made available at http://www.iac.ethz.ch/edu/courses/master/electives/european-climate-change.html

Prerequisites / notice
Participants should have a background in natural sciences, and have attended introductory lectures in atmospheric sciences or meteorology.

Abstract
Sediments preserved a record of past landscapes. This courses focuses on understanding the processes that modify sedimentary landscapes with time and how we can read this changes in the sedimentary record.

Objective
The students learn basic concepts of modern sedimentology and stratigraphy in the context of sequence stratigraphy and sea level change. They discuss the advantages and pitfalls of the method and look beyond. In particular we pay attention to introducing the importance of considering entire sediment routing systems and understanding their functioning.

Content
- The sedimentary record of sea-level change
- The grading of students is based on in-class exercises and end-semester examination.

Literature

Abstract
The course will focus on biological and chemical aspects of sedimentation in marine environments. Marine sedimentation will be traced from coast to deep-sea. The use of stable isotopes, palaeoceanography will be discussed. Neritic, hemipelagic and pelagic sediments will be used as proxies for environmental change during times of major perturbations of climate and oceanography.

Objective
- You will understand chemistry and biology of the marine carbonate system
- You will be able to relate carbonate mineralogy with facies and environmental conditions
- You will be familiar with cool-water and warm-water carbonates
- You will see carbonate and organic-rich sediments as part of the global carbon cycle
- You will be able to recognize links between climate and marine carbonate systems (e.g., acidification of oceans and reef growth)
- You will be able to use geological archives as source of information on global change
- You will have an overview of marine sedimentation through time

Content
- carbonates: chemistry, mineralogy, biology
- carbonate sedimentation from the shelf to the deep sea
- carbonate facies
- cool-water and warm-water carbonates
- organic-carbon and black shales
- C-cycle, carbonates, Corg: CO2 sources and sinks
- Carbonates: their geochemical proxies for environmental change: stable isotopes, Mg/Ca, Sr
- marine sediments through geological time
- carbonates and evaporites
- lacustrine carbonates
- economic aspects of limestone

Lecture notes
no script. scientific articles will be distributed during the course

Prerequisites / notice
We will read and critically discuss scientific articles relevant for "biological and chemical processes in marine and lacustrine systems"

The grading of students is based on in-class exercises and end-semester examination.

651-4901-00L Quaternary Dating Methods

**Objective**
Students will be made familiar with the details of the six dating methods through lectures on basic principles, analysis of case studies, solving of problem sets for age calculation and visits to dating laboratories.

At the end of the course, students will:
1. understand the fundamental principles of the most frequently used dating methods for Quaternary studies.
2. choose which dating method (or combination of methods) suits a certain field problem.
3. critically read and evaluate the application of dating methods in scientific publications.

**Content**
1. Introduction: Isotopes and decay
2. Radiocarbon dating: principles and applications
3. AMS technique and its application in Quaternary geochronology
4. U-series disequilibrium dating
5. Luminescence dating
6. Introduction to incremental: varve counting, dendrochronology, and ice cores chronologies
7. Dating anthropogenic records

**Prerequisites / notice**
Visit to radiocarbon lab, cosmogenic nuclide lab, and accelerator (AMS) facility.

**Competencies**
- Subject-specific Competencies
  - Concepts and Theories
  - Techniques and Technologies
- Method-specific Competencies
  - Analytical Competencies
  - Media and Digital Technologies

651-4909-00L Conceptual and Quantitative Methods in Geochemistry

**Objective**
Development of a basic knowledge and understanding of the main tools available for the quantitative analysis of geochemical data. Emphasis will both be on conceptual understanding of these methods as well as on their practical application, using key software packages to analyse real geochemical datasets.

**Content**
- You will understand chemistry and biology of the marine carbonate system
- You will be able to relate carbonate mineralogy with facies and environmental conditions
- You will be familiar with cool-water and warm-water carbonates
- You will see carbonate and organic-rich sediments as part of the global carbon cycle
- You will be able to recognize links between climate and marine carbonate systems (e.g., acidification of oceans and reef growth)
- You will be able to use geological archives as source of information on global change
- You will have an overview of marine sedimentation through time

**Literature**
Slides of lectures will be available.

**Prerequisites / notice**
Pre-requisite: Geochemie I and II

651-4049-00L Conceptual and Quantitative Methods in Geochemistry

**Objective**
- You will understand chemistry and biology of the marine carbonate system
- You will be able to relate carbonate mineralogy with facies and environmental conditions
- You will be familiar with cool-water and warm-water carbonates
- You will see carbonate and organic-rich sediments as part of the global carbon cycle
- You will be able to recognize links between climate and marine carbonate systems (e.g., acidification of oceans and reef growth)
- You will be able to use geological archives as source of information on global change
- You will have an overview of marine sedimentation through time
### Introduction
The course provides theoretical and practical foundations for understanding and characterizing physical soil properties and processes and their relevance for terrestrial ecosystems, plant growth, hydrological processes and atmospheric-land gas exchange, across all relevant scales.

### Objective
Students are able to:
- Characterize the different soils based on their key textural and structural properties.
- Simulate and predict soil water retention and flow under varying environmental conditions and understand the key driving forces (capillarity, gravity, friction) and related water properties (surface tension and viscosity).
- Predict soil hydraulic properties for varying soil textural classes.
- Predict solute transport in soils for varying environmental conditions.
- Predict energy balance and temperature dynamics in soils.
- Predict conditions for plant water stress.
- Estimate the impact of soil properties on the hydrological cycle and on plant growth.

### Content

#### BASIC SOIL PROPERTIES
Week 2 (September 25) and Week 3 (October 02)
soil texture, particle size distribution, soil structure, soil surface area, porosity and bulk density
Pore scale consideration (water in a single pore), pore sizes and shapes; surface tension; Young-Laplace equation; capillary rise; contact angle
Friction and laminar flow; Hagen-Poiseuille’s law; Washburn equation; numerical lab (REPORT 1)

#### Soil Hydraulic Properties
Week 4 (October 09) and Week 5 (October 16)
Soil water content and soil water potential - The energy state of soil water; total water potential and its components; volumetric and gravimetric water contents; field capacity and wilting point
Soil water characteristics and pore size distribution
Saturated water flow in soils - Laminar flow in tubes (Poiseuille’s Law); Darcy’s Law, conditions and states of flow; permeability and hydraulic conductivity, measurement and theoretical concepts; effective conductivity; unsaturated hydraulic conductivity; Buckingham law.
Unsaturated water flow in soils - Unsaturated hydraulic conductivity models and applications

#### ToolBox – Measurements and Modeling
Week 6 (October 23) and Week 7 (October 30)
Measuring soil hydraulic properties, fitting and interpretation; Lab tour - demonstration of soil physical methods; lecture on HYPROP method; report on Hyprop data (REPORT 2)
Modelling unsaturated water flow based on Richards equation - Using Hydrus1D for simulation of unsaturated flow; simulating HYPROP measurements (REPORT 3)

#### Soil in the Water Cycle
Week 8 (November 06) – Week 9 (November 13)
Water infiltration - steady state solutions for infiltration; approximate solutions to infiltration (Green-Ampt, Philip); infiltration rate and ponding; outlook to preferential flow
Water evaporation - Energy balance and land atmosphere interactions - potential and actual evaporation, evaporation stages;

#### Soil Plant Interactions
Week 10 (November 20) Week 11 (November 27)
Root water uptake and transpiration – Theory and mechanisms controlling root water uptake; hydraulic properties of rhizosphere; plant and stomatal conductance.
Modelling root water uptake and transpiration; analytical approaches and modeling using Hydrus (REPORT 4)

#### Solute Transport
Week 12 (December 04) Week 13 (December 11)
Transport mechanisms of solutes in porous media; breakthrough curves; convection-dispersion equation; solutions for pulse and step solute application
Transport of reactive substances, preferential flow, simulations with Hydrus

#### Closures
Week 14 (December 18)
Summary, course synthesis, connections between the different topics, questions, exam preparation

### Literature
Supplemental textbook (not mandatory) - Introduction to Environmental Soil Physics, by: D. Hillel

### Competencies

#### Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

#### Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: assessed
- Problem-solving: assessed
- Project Management: fostered

#### Social Competencies

- Critical Thinking: fostered
- Integrity and Work Ethics: fostered
- Self-awareness and Self-reflection: fostered
- Self-direction and Self-management: fostered
The course presents a view of the catchment processes of sediment production and transport that shape the landscape. Focus is on sediment fluxes from sources on hillslopes to the river network. Students learn about how a fluvial system functions, how to identify sediment sources and sinks, how to make predictions with numerical models, develop sediment budgets, and quantify geomorphic change.

**Objective**

The course has two fundamental aims: (1) The first aim is to provide environmental engineers with the physical process basis needed to understand fluvial system change, using the right language and terminology to describe landscapes. We will cover the main geomorphic concepts of landscape change, e.g. thresholds, equilibrium, criticality, to describe change. Students will learn about the importance of the concepts of connectivity and timescales of change. (2) The second aim is to provide quantitative skills in making simple and more complex predictions of change and the data and models required. We will learn about typical landscape evolution models, and about hillslope erosion model concepts like RUSLE. We will learn how to identify sediment sources and sinks, and develop simple sediment budgets with the right data needed for this purpose. Finally we will learn about methods to describe the topology of river networks as conduits of sediment through the fluvial system.

**Content**

The course consists of four sections: (1) Introduction to fluvial forms and processes and geomorphic concepts of landscape change, including climatic and human activities acting on the system. Concepts like thresholds, equilibrium, self-organised criticality, etc. are presented. (2) Landscape evolution modelling as a tool for describing the shape of the land surface. Soil formation and sediment production at long timescales. (3) The processes of sediment production, upland sheet-rill-gully erosion, basin sediment yield, rainfall-triggered landsliding, sediment budgets, and the modelling of the individual processes involved. Here we combine model concepts with field observations and look at many examples. (4) Processes in the river, floodplain and riparian zone, including river network topography, channel geometry, aquatic habitat, role of riparian vegetation, including basics of fluvial system management. The main focus of the course is on the hydrology-sediment connections at the field and catchment scale.

**Lecture notes**

There is no script.

**Literature**

The course materials consist of a series of 13 lecture presentations and notes to each lecture. The lectures were developed from textbooks, professional papers, and ongoing research activities of the instructor. All material is on the course webpage.

**Prerequisites**

Prerequisites: Basic Hydrology and Watershed Modelling (or contact instructor).

**Abstract**

The course provides an introduction into quantitative analysis of groundwater flow and solute transport. It is focussed on understanding, formulating, and solving groundwater flow and solute transport problems.

**Objective**

a) Students understand the basic concepts of groundwater flow and solute transport processes, and boundary conditions.

b) Students are able to formulate simple, practical groundwater flow and solute transport problems.

c) Students are able to understand and apply simple analytical and/or numerical solutions to fluid flow and solute transport problems.

**Content**

1. Introduction to groundwater problems. Concepts to quantify properties of aquifers.

2. Flow equation. The generalised Darcy law.

3. The water balance equation and basic concepts of poroelasticity.

5. Analytical solutions to flow problems

6. Finite difference scheme solution for simple flow problems.

10. Analytical solutions to transport problems.

11. Fractured and karst aquifers.

12. The unsaturated zone and capillary pressure.

13. Examples of applied hydrogeology from Switzerland and around the world. (Given by Dr. Beatrice Marti from hydrosolutions GmbH)

<td>701-1241-00L</td>
<td>Atmospheric Remote Sensing</td>
<td>W</td>
<td>3</td>
<td>2G</td>
<td>J. Gröbner, S. Kazantzis</td>
</tr>
</tbody>
</table>

**Abstract**

The course will provide advanced physical understanding on the fundamentals of passive and active remote sensing, measuring sensors and retrieval methods. A series of diverse remote sensing applications will be presented, including measurements/retrivals of various atmospheric composition parameters (ozone, aerosols, clouds, others) from surface based and satellite based instruments.

**Objective**

Main objectives of the course and what the students will be able to explain and use at the end of it are:

- The major atmospheric laws used for the retrieval of atmospheric composition and solar radiation parameters
- Ground based and satellite based retrieval examples for major atmospheric constituents
- Practical and experimental aspects on measuring atmospheric aerosols through the use of relevant instrumentation
- Explore major atmospheric measurement databases and use of the available data
- Interpretation of measurement and retrieval related results on atmospheric composition and solar radiation based on using combined retrieval data products
Atmospheric passive and active remote sensing is connected with a large number of applications including: atmospheric composition, Earth-atmosphere radiative balance, atmospheric and weather prediction model assimilation, agriculture, energy and health related applications and many others.

The proposed lesson is divided in three sections including exercises:

- Fundamentals of remote sensing
- Sensors (surface based and satellites) and retrieval methods
- Applications

The first aim of the lecture is to provide an in-depth understand of the physical aspects and basic laws on the fundamentals of remote sensing to the students. The lectures will provide a basic to intermediate understanding of radiative transfer of electromagnetic radiation through the atmosphere, covering the spectrum from UV to thermal. Examples of atmospheric components that will be addressed are: ozone, aerosols, greenhouse gases, clouds, water vapor.

In addition, measuring sensors used from the surface or from satellites and the relevant retrieval methods based on passive and active remote sensing of atmospheric composition will be presented (e.g. Spectroradiometers, filter radiometers, Lidars and others). Finally, we aim to demonstrate a series of diverse remote sensing applications, including atmospheric composition measurements and retrievals from surface- and satellite-based instruments, including calibration and validation aspects.

The exercises will be embedded in the overall course lectures to provide hands-on experience with the measurements and retrieval methods conducting measurements and organizing small field experiments. Also with the use of atmospheric datasets available from specific instruments (e.g. satellite sensors) and networks (e.g. AERONET, GAWPF). More specific the course include:

- 3 introductory courses on climate variables, sensors, solar measurements  and radiative transfer basics
- 7 courses including remote sensing techniques on solar UV measurements, total column ozone, trace gases, greenhouse gases, aerosols, cloud retrievals and lidar active remote sensing.
- 3 exercises:
  a. Conducting sun photometric measurements in the field and retrieve aerosol optical depth, including a visit in Davos, World Calibration Center
  b. Exploring ground and satellite based solar UV, Ozone and aerosol measurements
  c. Using radiative transfer modeling tools

Finally, students are involved on presenting scientific literature on subjects they are interested in. All exercises are conducted in student-forming teams.

- Lecture notes
  Lecture slides will be provided via Moodle before every lecture.

701-1271-00L Statistical Learning for Atmospheric and Climate Science

W 3 credits 2G

L. Gudmundsson, D. Nerini

Abstract

This course offers a systematic introduction to statistical and machine learning methods with focus on applications in atmospheric and climate science. Focus is on the theoretical and mathematical basis of supervised statistical learning (advanced regression, nonparametric methods) and their application in practice with hands-on exercises.

Objective

Students:
- Understand the theoretical basis of machine learning
- Are familiar with overarching concepts such as bias-variance trade-off, cost-functions, hyper parameters, cross-validation
- Have good command of the theoretical basis of selected machine learning tools
- Are able to select the appropriate statistical learning tools to tackle atmospheric and climate research problems
- Can apply methods of statistical learning in atmospheric and climate research
- Data in atmospheric and climate research (data types, observations, models)
- Exploring properties of atmospheric and climate data (data in space and time, multivariate data)
- Concepts of supervised learning (bias variance trade-off, overfitting, cross-validation)
- Advanced linear regression (multiple linear regression, regularization)
- Non-linear regression (local linear regression, regression trees, gradient boosting, random forests, neural networks)
- Bootstrapping
- Keynote speakers showcasing recent topics in statistical learning and high-level applications for atmospheric and climate research
Students are introduced to advanced data science where environmental data are analyzed using state of the art machine learning methods and key aspects for each step through practical application. The course enables students to plan their own data science project in their specialization and to acquire more domain-specific methods independently or in further courses.

### Objective
- frame a data science problem and build a hypothesis
- describe the steps from data preparation to running and evaluating models
- conduct selected steps of a workflow on specifically prepared datasets, with a focus on choosing, fitting and evaluating appropriate algorithms and models
- critically think about the limits and implications of a method
- visualize data and results throughout the workflow
- access online resources to keep up with the latest data science methodology and deepen their understanding

### Competencies
- **Content**
  - The data science workflow
  - Access and handle (large) datasets
  - Prepare and clean data
  - Analysis: data exploratory steps
  - Analysis: machine learning and computational methods
  - Evaluate results and analyse uncertainty
  - Visualisation and communication

- **Prerequisites**
  - Basic experience in a programming language
  - Overview on the climate system
  - Knowledge of introductory statistics
  - Access online resources to keep up with the latest data science methodology and deepen their understanding

### Literature
- Knowledge of introductory statistics
- Overview on the climate system
- Basic experience in a programming language

### Course
- Course is limited to 30 participants.
- Exercises will be in the R for most of the sessions and in Python for deep learning.

- **Literature**

- **Prerequisites**
  - Math IV, VI (Statistics); R, Python; ESDS I

- **Subject-specific Competencies**
  - Concepts and Theories
  - Techniques and Technologies

- **Method-specific Competencies**
  - Analytical Competencies
  - Decision-making
  - Media and Digital Technologies
  - Problem-solving
  - Project Management

- **Social Competencies**
  - Communication
  - Cooperation and Teamwork
  - Leadership and Responsibility

- **Personal Competencies**
  - Creative Thinking
  - Critical Thinking
  - Integrity and Work Ethics
  - Self-direction and Self-management

### Content
- The data science workflow
- Access and handle (large) datasets
- Prepare and clean data
- Analysis: data exploratory steps
- Analysis: machine learning and computational methods
- Evaluate results and analyse uncertainty
- Visualisation and communication

### Prerequisites
- Math IV, VI (Statistics); R, Python; ESDS I

### Literature
The course introduces the scientific concepts and typical applications of tracers in biogeochemistry. The course covers stable and radioactive isotopes in biogeochemistry (natural abundance, fractionation); geochronological dating of rocks and onsets of environmental events and processes.

The measurement methods for all the important radionuclides and the interpretation of their results are discussed on a few examples from the application:
- $^{14}C$ – radiocarbon dating and environmental studies
- $^{10}Be$, $^{26}Al$, $^{36}Cl$ – cosmogenic dating and ice core research
- $^{129}I$, $^{236}U$, actinides – anthropogenic tracers in the environment
- $^{14}C$, $^{41}Ca$ – biomedical studies
- $^{60}Fe$, $^{244}Pu$ – astrophysics

Alternative methods: ICP-MS, RIMS, ATTA

A visit to the Tandem accelerator and AMS facilities at ETH Hönggerberg is organized as part of lectures and exercises.

**Numerical Modelling in Fortran (Project)**

This course gives an introduction to programming in Fortran, and is suitable for students who have only minimal programming experience. A hands-on approach will be emphasized rather than abstract concepts.

**Prerequisite:** 651-4273-00L Numerical Modelling in Fortran

**Objective:**
- Fortran is a modern programming language that is updated every few years (most recently in 2018) and is specifically designed for scientific and engineering applications. This course gives an introduction to programming in this language, and is suitable for students who have only minimal programming experience, for example with MATLAB scripts. The focus will be on Fortran 95-2018, but differences to Fortran 77 will be mentioned for those working with already-existing codes. A hands-on approach will be emphasized rather than abstract concepts, using example scientific problems relevant to Earth science.

**Lecture notes:** See http://jupiter.ethz.ch/~pjt/FORTRAN/FortranClass.html

**Competencies**
- Subject-specific Competencies: Techniques and Technologies
- Method-specific Competencies: Media and Digital Technologies

**Lecture notes**

This course gives an introduction to programming in this language, and is suitable for students who have only minimal programming experience, for example with MATLAB scripts. The focus will be on Fortran 95-2018, but differences to Fortran 77 will be mentioned for those working with already-existing codes. A hands-on approach will be emphasized rather than abstract concepts, using example scientific problems relevant to Earth science.

Content
- The project consists of writing a Fortran program to solve a problem agreed upon between the instructor and student; the topic is often related to (and helps to advance) the student’s Masters or PhD research. The project is typically started in the fall and continued into the spring.

**Abstract**
- The course introduces the scientific concepts and typical applications of tracers in biogeochemistry. The course covers stable and radioactive isotopes, geochronological dating of rocks and onsets of environmental events and processes.

**Objective**
- The course aims at understanding the fractionation of stable isotopes in biogeochemical processes. Students learn to know the origin and decay modes of relevant radiogenic isotopes. They discover the spectrum of possible geochronological tracers and biomarkers, their potential and limitations and get familiar with important applications.

**Content**
- Geonic and cosmogenic radionuclides (sources, decay chains);
- stable isotopes in biogeochemistry (natural abundance, fractionation);
- geochemical tracers for processes such as erosion, productivity, redox fronts; biomarkers for specific microbial processes.

**Literature**
- A list of relevant books and papers will be provided

**Prerequisites / notice**
- Students should have a basic knowledge of biogeochemical processes (BSc course on Biogeochemical processes in aquatic systems or equivalent)

**Abstract**
- The course addresses the biogeochemical classification and behavior of trace elements, including key processes driving the cycling of important trace elements in aquatic and terrestrial environments and the coupling of abiotic and biotic transformation processes of trace elements. Examples of the role of trace elements in natural or engineered systems will be presented and discussed in the course.

**Objective**
- The students are familiar with the chemical characteristics, the environmental behavior and fate, and the biogeochemical reactivity of different groups of trace elements. They are able to apply their knowledge on the interaction of trace elements with geosphere components and on abiotic and biotic transformation processes of trace elements to discuss and evaluate the behavior and impact of trace elements in aquatic and terrestrial systems.

**Content**
- (i) Definition, importance and biogeochemical classification of trace elements. (ii) Key biogeochemical processes controlling the cycling of different trace elements (base metals, redox-sensitive and chalcophile elements, volatile trace elements) in natural and engineered environments. (iii) Abiotic and biotic processes that determine the environmental fate and impact of selected trace elements.

**Lecture notes**
- Selected handouts (lecture notes, literature, exercises) will be distributed during the course.
Prerequisites / notice Students are expected to be familiar with the basic concepts of aquatic and soil chemistry covered in the respective classes at the bachelor level (soil mineralogy, soil organic matter, acid-base and redox reactions, complexation and sorption reactions, precipitation/dissolution reactions, thermodynamics, kinetics, carbonate buffer system).

The lecture 701-1315-00L Biogeochemistry of Trace Elements is a prerequisite for attending the laboratory course 701-1331-00L Trace Element Laboratory, or students must be concurrently enrolled in 701-1315-00L Biogeochemistry of Trace Elements in the same semester.

701-1644-00L Mountain Hydrology W 5 credits 3G M. Brunner, K. Meusburger Di Bella

Abstract This course presents a process-based view of the hydrology of mountain streams. Students learn how to integrate process knowledge, data, and models to understand how landscapes regulate the fluxes of water, sediment, nutrients, and pollutants in streams, and to anticipate how streams will respond to changes in land use, water use, and climate.

Objective Main learning objective: Describe the main elements and processes and their interlinkages of the water cycle in mountain catchments and analyze their characteristics and changes.

Objective 1: Identify and describe the important components of the water cycle and their influencing factors and discuss how changes in these influencing factors may affect different parts of the hydrological cycle.

Objective 2: Analyze, visualize, and interpret climate and hydrological time series data.

Objective 3: Explain how hydrological data are collected, how hydrological models work, how they are calibrated, and how they are evaluated.

Content Streams are integrated monitors of the health and functioning of their surrounding landscapes. Streams integrate the fluxes of water, solutes, and sediment from their contributing catchment area; thus they reflect the spatially integrated hydrological, ecophysiological, biogeochemical, and geomorphological processes in the surrounding landscape. At a practical level, there is a significant public interest in managing upland landscapes to provide a reliable supply of high-quality surface water and to minimize the risk of catastrophic flooding and debris flows, but the scientific background for such management advice is still evolving.

Using a combination of lectures, field exercises, and data analysis, we explore the processes controlling the delivery of water, solutes, and sediment to streams, and how those processes are affected by changes in land cover, land use, and climate. We review the connections between process understanding and predictive modeling in these complex environmental systems. Practical problems to be considered include the effects of land use and climate on streamflow and water quality, illustrated with data from experimental watersheds in North America and Europe.

Lecture notes Handouts will be available through moodle.

Literature Recommended and required reading will be specified at the first class session (with possible modifications as the semester proceeds).

701-1346-00L Climate Change Mitigation: Carbon Dioxide Removal W 3 credits 2G N. Gruber, C. Brunner

Abstract Future climate change can only kept within reasonable bounds when CO2 emissions are drastically reduced. In this course, we will discuss a portfolio of options involving the alteration of natural carbon sinks and carbon sequestration. The course includes introductory lectures, presentations from guest speakers from industry and the public sector, and final presentations by the students.

Objective The goal of this course is to investigate, as a group, a particular set of carbon mitigation/sequestration options and to evaluate their potential, their cost, and their consequences.

Content From the large number of carbon sequestration/mitigation options, a few options will be selected and then investigated in detail by the students. The results of this research will then be presented to the other students, the involved faculty, and discussed in detail by the whole group.

Lecture notes None

Literature Will be identified based on the chosen topic.

Prerequisites / notice Exam: No final exam. Pass/No-Pass is assigned based on the quality of the presentation and ensuing discussion.

701-1351-00L Anthropogenic Particles in the Environment W 3 credits 2G B. Nowack, T. Bucheli, D. Mitran

Abstract The lecture provides an overview on the behavior and effects of anthropogenic particles in the environment, covering engineered nanoparticles, micro/nanoplastics, tire wear, soot and pigments. The course will cover key concepts of particle behavior and analysis, fate in technical and natural systems, toxicity and environmental risk assessment and sustainability aspects and regulation.

Objective

- Successful application of knowledge gained in traditional disciplines of environmental sciences (e.g. biogeochemistry, environmental chemistry) to elucidate particle fate and behavior in the environment
- Identify key parameters that potentially influence the environmental fate and behavior of anthropogenic particles
- Get acquainted with the most common analytical tools for the quantification of anthropogenic particles in the environment
- Critical assessment of current state of research, including the sometimes controversial literature data
On successful completion of this course students will be able to:

- Assess the risk to the environment from landfills, contaminated sites and radioactive waste repositories in terms of the fate and transport of contaminants.
- Describe the technologies available to minimise environmental contamination.
- Describe the principles of dealing with polluted sites and propose and evaluate appropriate remediation techniques.
- Explain the concepts underlying radioactive waste management practices.

This lecture course consists of lectures with exercises and case studies.

- An overview of the principles of environmental protection in waste management and how this is applied in legislation.
- An overview of the chemistry underlying the release and transport of contaminants from the landfilled/contaminated material/radioactive waste repository focusing on processes controlling mobility of heavy metals and organic compounds.
- Introduction to contaminant transport in porous adsorbing media.
- Design and function of engineered barriers. Clay as a barrier.
- Polluted site remediation: Site investigation, assessment, and remediation technologies.
- Concepts and safety in radioactive waste management.
- Role of the geological and engineered barriers and radionuclide transport in geological media.

Prerequisites / notice

- Life cycle assessment.
- Environmental risk assessment.
- Uptake and toxicity of particles.
- Fate in technical systems: water treatment, waste incineration.
- Fate in the environment: water, soil, air.
- Release and emission.
- Fat in the environment: water, soil, air.
- Fate in technical systems: water treatment, waste incineration.
- Uptake and toxicity of particles.
- Environmental risk assessment.
- Life cycle assessment.

Abstract

The course offers a practical introduction into the investigation of the biogeochemistry of trace elements. Laboratory experiments are performed to study a selected environmental process. Advanced techniques for the analysis of total element contents and element speciation are used. The experimental findings are interpreted and discussed in their environmental context.

Objective

The objective of this course, is to offer students a practical introduction into the investigation of the biogeochemistry of trace elements. During the course, students will become familiar with some of the key experimental approaches typically used in the investigation of the biogeochemistry of trace elements in the laboratory. In addition, students will learn to use different advanced analytical techniques to measure the total content and the speciation of trace elements in both liquid and solid samples. The students will interpret and discuss their experimental findings in the context of the studied environmental system.

Content

Laboratory experiments are designed and performed to study the interplay of various biogeochemical processes in a specific environmental system. Moreover, the effect of these processes on the biogeochemical cycling of trace elements in the environment will be considered. Advanced techniques for the analysis of total element contents and element speciation are used. The experimental findings are interpreted and discussed in the context of the the environmental system under investigation.

701-1673-00L Environmental Measurement Laboratory W 5 credits 4G P. U. Lehmann Grunder, A. Carminati

Abstract
Measurements are the sole judge of scientific truth and provide access to unpredictable information, enabling the characterization and monitoring of complex terrestrial systems. Based on lectures and field- and laboratory training, the students learn to apply modern methods to determine forest inventory parameters and to measure subsurface properties and processes.

Objective
The students will be able to:
- explain measurement principles that are used for characterization of landscapes and terrestrial systems
- select appropriate measurement methods and sampling design to quantify key variables and processes above ground and in the subsurface
- deploy sensors in the field
- interpret collected laboratory and field data and report main conclusions deduced from measurements

Content
Week 1: Plant-Soil interactions – short introduction before sensor demonstration and installation in forest lab; Scholander pressure bomb (suction in leaves); LiCOR soil chamber
Weeks 2 to 6: Experimental Methods for Soil Health Assessment
Week 2: Lecture on soil health and soil indicators; defining measurable soil health indicators for case studies for different soil threats and climate regions
Week 3: Short lecture on sampling, sensors and data logging; preparing sensors and data loggers in the lab; measurements on water content and temperature in the lab
Week 4: Short introduction on field installation; sensor installation at field site Hönggerberg
Week 5: Lecture on geophysical methods on subsurface characterization: basic principles of ERT, GPR, and EM; planning of field experiment to assess soil health
Week 6: Short introduction on data analysis; field sampling and conducting field experiment to assess soil health
Week 7: Analysis of experimental data and soil health assessment; poster presentation and discussion
Week 8: Lecture on plant soil relationship; connecting information below and above ground – data analysis
Weeks 9 and 10: Forest characterization/ inventory: Principles of LiDAR; structures and features of the tree crowns, size/volume of the leaf area tree positions and diameters at breast height
Weeks 11 and 12: Eddy covariance methods -Principles for field measurement of water vapor, carbon dioxide, and energy exchange between terrestrial surfaces and the atmosphere; Analysis of measured time series to determine evaporation rate and CO2-fluxes
Week 13: Swiss Soil Monitoring networks – Monitoring of soil water content and potential; climate change and droughts
Week 14: Global data – Global modeling and data interpretation; SoilGrids and OpenLandMap; exercises on Budyko analysis

Literature
Lecture material will be online for registered students using moodle

Prerequisites / notice
The details of the schedule will be optimized based on the number of students; some blocks of the course will be offered as well to students of Environmental Engineering

Seminar and Semester Paper

Number Title Type ECTS Hours Lecturers
Term Paper 1: Writing

This class is the 2nd part of a series and participation is conditional on the successful completion of "Term Paper 1: Writing". The results from the term paper written during the previous term are presented to the other students and advisors and discussed with the audience.

The goal of the term paper seminars is to train the student's ability to communicate (scientific) results to a wider audience and the ability to respond to questions and comments.

Each student presents the results of their term paper to fellow students and advisors and responds to questions and comments from the audience.

There is no final exam. Grade is assigned based on the quality of the presentation and ensuing discussion.

To obtain the credits, it is mandatory to attend at least 60% of all seminar dates offered in the fall and spring semester. Active participation in discussion and feedback rounds is expected.

The ability to critically evaluate original (scientific) literature and to summarise the information in a succinct manner is an important skill for any student. This course aims to practice this ability, requiring each student to write a term paper of scientific quality on a topic of relevance for research in the areas of biogeochemistry and pollutant dynamics.

The goal of the term paper is to train the student's ability to critically evaluate scientific literature and to summarise the findings concisely in a paper addressing a research question.

At the end of the course, students will be able to:
- narrow down a research question.
- identify relevant literature to address the research question.
- concisely summarise and critically evaluate their findings.
- formulate key outstanding questions.

Each student is expected to write a paper with a length of approximately 15-20 pages. The students can choose from a list of topics prepared by the tutors, but the final topic will be determined based on a balance of choice and availability. The students will be guided and advised by their tutors throughout the term.

The paper itself should contain the following elements:
- Motivation and context of the given topic (25%)
- Concise presentation and critical evaluation of the state of the science (50%)
- Identification of open questions and perhaps opportunities for further research (20%)
- Declaration and reflection on the use of technical tools (5%)

In addition, the accurate use of citations, attribution of ideas, and the judicious use of figures, tables, equations and references are critical components of a successful paper. Specialised knowledge is not expected, nor required; neither is new research.

The term paper course is primarily aimed at master students majoring in biogeochemistry & pollutant dynamics and ISTP students with a solid background in natural sciences and a strong interest in biogeochemistry & pollutant dynamics.

Each student submits a term paper that will be reviewed by one fellow student and one faculty. The submission of the term paper and a written review of another student's term paper are a condition for obtaining the credit points.

There is no final exam. Grade is assigned based on the quality of the term paper and the submitted review as well as on the presentation in the following term.

The paper will be presented to fellow students and involved faculty in the following semester ("Term Paper 2: Seminar").

Results from the term paper will be presented to fellow students and involved faculty in the following semester ("Term Paper 2: Seminar").

In addition, the accurate use of citations, attribution of ideas, and the judicious use of figures, tables, equations and references are critical components of a successful paper. Specialised knowledge is not expected, nor required; neither is new research.

The term paper course is primarily aimed at master students majoring in biogeochemistry & pollutant dynamics and ISTP students with a solid background in natural sciences and a strong interest in biogeochemistry & pollutant dynamics.

Each student submits a term paper that will be reviewed by one fellow student and one faculty. The submission of the term paper and a written review of another student's term paper are a condition for obtaining the credit points.

There is no final exam. The grade is assigned based on the quality of the term paper and the submitted review as well as on the presentation in the following term.

Students are introduced to a typical data science workflow using various examples from environmental systems. They learn common methods and key aspects for each step through practical application. The course enables students to plan their own data science project in their specialization and to acquire more domain-specific methods independently or in further courses.
We will explore how ecological theories can provide insight into the effects of anthropogenic change as well as guide management to undo this process. This course presents a broad overview of the key processes structuring ecological populations and communities, with a particular focus on data science workflow. All course materials (videos, lecture notes, primary literature) will be provided on the course moodle.

The students are able to:
- frame a data science problem and build a hypothesis
- describe the steps of a typical data science project workflow
- conduct selected steps of a workflow on specifically prepared datasets, with a focus on choosing, fitting and evaluating appropriate algorithms and models
- critically think about the limits and implications of a method
- visualise data and results throughout the workflow
- access online resources to keep up with the latest data science methodology and deepen their understanding

The students are able to:
- The data science workflow
- Access and handle (large) datasets
- Prepare and clean data
- Analysis: data exploratory steps
- Analysis: machine learning and computational methods
- Evaluate results and analyse uncertainty
- Visualisation and communication

The learning objectives follow from the course goals. After attending this course, students should be able to:

- Introduce students to the major ecological processes that together shape the composition and abundance of species within ecological communities.
- Provide insight to students on the ecological impacts of anthropogenic change, and how an understanding of ecological processes can help us predict these ecological impacts and design conservation / restoration actions to mitigate their negative impacts.
- Teach students to critically summarize and analyze primary ecological literature, understanding how ecological studies contribute to our knowledge, how to critically evaluate their strengths and weaknesses, and practice designing follow up studies.

LEARNING OBJECTIVES
The learning objectives follow from the course goals. After attending this course, students should be able to:
- Describe key processes affecting the size of populations and abundance of species within ecological communities.
- Critically evaluate evidence and conclusions presented in primary ecological literature based on your understanding of these ecological processes.
- Apply knowledge of ecological processes to make predictions about the major responses of ecological communities to anthropogenic perturbations.

Content
We will explore how ecological theories can provide insight into the effects of anthropogenic change as well as guide management to undo undesired impacts. Collectively, this requires us to focus on classic problems in ecology (for example, competitive coexistence, top-down impacts of predators, diversity-ecosystem function relationships, the role of dispersal in spread).

The course is taught in a flipped format. Generally (with the exception of a few weeks), there will be online materials for students to watch or read during the first hour of class (lecture videos, readings), and the class will meet in person for the second half of class. The in person portions of the class will have students participate in activities to learn the content, including paper discussions, groupwork, and presentations. Students are also required to submit a written assignment.

Lecture notes
All course materials (videos, lecture notes, primary literature) will be provided on the course moodle.
Computational Biology

Abstract
The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Computational algorithms extracting biological information from genetic sequence data are discussed, and statistical tools to understand this information in detail are introduced.

Objective
Attendees will learn which information is contained in genetic sequencing data and how to extract information from this data using computational tools. The main concepts introduced are:

- stochastic models in molecular evolution
- phylogenetic & phylodynamic inference
- maximum likelihood and Bayesian statistics

Attendees will apply these concepts to a number of applications yielding biological insight into:

- epidemiology
- pathogen evolution
- macroevolution of species

Content
The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods for direct alignment analysis using approaches such as BLAST and GWAS. Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. Lastly, we introduce the field of phyloodynamics, the aim of which is to understand and quantify population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

Lecture notes
Lecture slides will be available on moodle.

Literature
The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:

- Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.

Prerequisites / notice
Basic knowledge in linear algebra, analysis, and statistics will be helpful. Programming in R will be required for the project work (compulsory continuous performance assessments). In case you do not have any previous experience with R, we strongly recommend to get familiar with R prior to the semester start. For the D-BSSE students, we highly recommend the voluntary course „Introduction to Programming“, which takes place in Basel before the start of the semester.

Competencies

Critical Thinking
Integrity and Work Ethics

Objective
This is an advanced course that will require significant student participation. Students will learn how to evaluate and present scientific literature and trace the development of ideas related to understanding the ecology and evolutionary biology of infectious diseases.

Content
A core set of ~10 classic publications encompassing unifying themes in infectious disease ecology and evolution, such as virulence, resistance, metapopulations, networks, and competition will be presented and discussed. Pathogens will include bacteria, viruses and fungi. Hosts will include animals, plants and humans.

Lecture notes
Publications and class notes can be downloaded from a web page announced during the lecture.

Literature
Papers will be assigned and downloaded from a web page announced during the lecture.

Competencies
Subject-specific Competencies
Concepts and Theories
Method-specific Competencies
Analytical Competencies
Social Competencies
Communication
Personal Competencies
Adaptability and Flexibility

Objective
This is a seminar course where students will present current topics from the field of infectious disease biology.

Content
Students of this course will discuss current topics from the field of infectious disease biology. From a list of publications, each student chooses some themes that he/she is going to explain and discuss with all other participants and under supervision. The actual topics will change from year to year corresponding to the progress and new results occurring in the field.

Lecture notes
Publications from web page announced during the lecture.

Literature
Papers will be assigned and downloaded from a web page announced during the lecture.

**Abstract**

In this research seminar we will critically discuss recent publications on current topics in Ecological Genetics.

**Objective**

It is our aim that participants gain insight into current research topics and approaches in Ecological Genetics and learn to critically assess and appreciate scientific publications in this field.

**Lecture notes**

none

**Literature**

will be distributed

**Prerequisites / notice**

Active and regular participation in the discussions, together with the presentation of a scientific paper are required to successfully pass this course. It is strongly recommended that participants have in advance successfully participated in the course Evolutionary Genetics (701-2413-00) or Ecological Genetics (701-1413-01).

**701-1471-00L Ecological Parasitology**

| Objective | 1. Identify common macroparasites in invertebrates.  
2. Understand ecological and evolutionary processes in host-parasite interactions.  
3. Conduct parasitological research |
| Content | Lectures:  
1. Diversity and natural history of parasites (i.e. systematic groups and life-cycles).  
2. Adaptations of parasites (e.g. evolution of life-cycles, host manipulation).  
3. Ecology of host-parasite interactions (e.g. parasite communities, effects of environmental changes).  
5. Human macroparasites (schistosomiasis, malaria). |
| Practical exercises: |  
1. Examination of parasites in molluscs (identification and examination of host exploitation strategies).  
2. Examination of parasites in amphipods (identification and examination of effects on hosts).  
3. Examination of parasitoids of aphids. |
| Prerequisites / notice | The three practicals will take place at the 03.10.2023, the 17.10.2023 and the 07.11.2023 at Eawag Dübendorf from 08:15 - 12:00. Note that each practical takes 2 hours longer than the weekly lecture. |

<tr>
<td>Abstract</td>
<td>This five-day winter school aims at teaching advanced Master students, PhD students and postdoctoral researchers on aspects of the genomics of environmental adaptation. It provides both theoretical background and hands-on exercises on major topics of contemporary environmental genomics such as signatures of selection, outlier analysis, genotype-environment associations, or GWAS.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>The genomics of environmental adaptation is an evolving scientific field of both basic and applied interest. Researchers make increasing use of diverse methodological approaches built on concepts from ecology, evolutionary biology and population genomics. This five-day winter school introduces students to some major concepts and methods of environmental genomics, i.e., (i) how the environment and adaptive genetic variation are related and (ii) how signatures of genomic adaptation can be detected in natural populations. The winter school focuses on current methods and hands-on exercises, emphasizing an understanding of the underlying concepts and a discussion of benefits, limitations and pitfalls of environmental genomics. It is specifically aimed at the needs of advanced Master students, PhD students and early postdoctoral researchers.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| Content | Topics:  
1. Molecular markers and next generation sequencing techniques; neutral and adaptive genetic variation, genetic drift and genetic population structure.  
2. Outlier analysis: concept, methodology and types of outlier analyses.  
3. Environmental data: which environmental data are available and used to identify signatures of adaptation; data limitations; collinearity.  
5. Genotypes and phenotypes: GWAS; follow-up analyses. |
| Lecture notes | Hand-outs will be distributed. |
| Literature | The course requires 4 hours of preparatory reading of selected papers on the genomics of environmental adaptation. The papers will be distributed by e-mail. |
**Prerequisites / notice**
Grading will be according to a written report (8-10 pages), in which students will have to design a complete study in environmental genomics, and according to student contributions during the course.

**Prerequisites:** students must have good knowledge in population genetics and evolutionary biology and some experience with R.

**Abstract**
This course explores infectious disease from both the host and pathogen perspective. Through short lectures, reading and active discussion, students will identify areas where evolutionary thinking can improve our understanding of infectious diseases and, ultimately, our ability to treat them effectively.

**Objective**
Students will learn to (i) identify evolutionary explanations for the origins and characteristics of infectious diseases in a range of organisms and (ii) evaluate ways of integrating evolutionary thinking into improved strategies for treating infections of humans and animals. This will incorporate principles that apply across any host-pathogen interaction, as well as system-specific mechanistic information, with particular emphasis on bacteria and viruses.

**Content**
We will cover several topics where evolutionary thinking is relevant to understanding or treating infectious diseases. This includes: (i) determinants of pathogen host range and virulence, (ii) dynamics of host-parasite coevolution, (iii) pathogen adaptation to evade or suppress immune responses, (iv) antimicrobial resistance, (v) evolution-proof medicine. For each topic there will be a short (< 20 minutes) introductory lecture, before students independently research the primary literature and develop discussion points and questions, followed by interactive discussion in class.

**Literature**
The focus is on primary literature, but for some parts the following text books provide good background information:

- Schmid Hempel 2011 Evolutionary Parasitology
- Stearns & Medzhitov 2016 Evolutionary Medicine
- I. Feigenwinter, N. Buchmann, K.-M. Kohonen

**Prerequisites / notice**
A basic understanding of evolutionary biology, microbiology or parasitology will be advantageous but is not essential.

**Abstract**
This course focuses on the interactions between ecology, biogeochemistry and management of agro- and forest ecosystems, thus, coupled human-environmental systems. Students learn how human impacts on ecosystems via management or global change are mainly driven by effects on biogeochemical cycles and thus ecosystem functioning, but also about feedback mechanisms of terrestrial ecosystems.

**Objective**
Students will analyse and understand the complex and interacting processes of ecology, biogeochemistry and management of agroecosystems. They will use their theoretical knowledge in two flipped classroom exercises, but also set up a small weather station and program a data logger to collect meteorological variables, analyze large meteorological and flux data sets, and evaluate the impacts of weather events and management practices on the ecosystem greenhouse gas exchange. Thus, students will expand their computational competences. Moreover, students will be able to coordinate and work successfully in small (interdisciplinary) teams.

**Content**
Agroecosystems play a major role in all landscapes, either for production purposes, ecological areas or for recreation. The human impact of any management on the environment is mainly driven by effects on biogeochemical cycles. Effects of global change impacts will also act via biogeochemistry at the soil-biosphere-atmosphere-interface. Thus, ecosystem functioning, i.e., the interactions between ecology, biogeochemistry and management of terrestrial systems, is the science topic for this course.

Students will gain profound knowledge about biogeochemical cycles and greenhouse gas fluxes in managed grassland and/or cropland ecosystems as well as expand their computational competences. Responses of agroecosystems to the environment, i.e., to climate and weather events, but also to management will be studied. Two flipped class-room exercises include the assessment of an ecosystem disturbance and the experimental design of an own study. Dataloggers will be programmed, and a small weather station will be set up. Different meteorological and greenhouse gas flux data will be analysed (using R) and assessed in terms of production, greenhouse gas budgets, and carbon sequestration. Thus, students will learn how to collect, analyse and interpret data about the complex interactions of a coupled human-environmental system.

Students will work in groups (3-4 persons per group) with data from a small weather station (dedicated to the course), as well as data from the long-term measurement network Swiss FluxNet and from global databases. Data from the intensively managed grassland site Chamau will be used to investigate the biosphere-atmosphere exchange of CO2, H2O, N2O and CH4. Functional relationships will be identified, greenhouse gas budgets will be calculated for different time periods and in relation to management over the course of a year.

**Lecture notes**
Handouts will be available in moodle.

**Prerequisites / notice**
Prerequisites: Attendance of introductory courses in plant ecophysiology, ecology, and grassland or forest sciences. Knowledge of data analyses in R and statistics. Course will be taught in English.

**Abstract**
The course provides methods and tools for ecological evaluations dealing with nature conservation or landscape planning. It covers census methods, ecological criteria, indicators, indices and critically appraises objectivity and accuracy of the available methods, tools and procedures. Birds and plants are used as main example guiding through different case studies.

**Objective**

- Students will be able to:
  1) critically consider biological data books and local, regional, and national inventories;
  2) evaluate the validity of ecological criteria used in decision making processes;
  3) critically appraise the handling of ecological data and criteria used in the process of evaluation
  4) perform an ecological evaluation project from the field survey up to the decision making and planning.

**Lecture notes**
Powerpoint slides are available on the moodle page. Additional documents are handed out as copies.

**Literature**
Basic literature and references are listed on the webpage.

**Prerequisites / notice**
The course structure changes between lecture parts, seminars and discussions. The didactic atmosphere is intended as working group.

Suggested prerequisites for attending this course are skills and knowledge equivalent to those taught in the following ETH courses:
- Pflanzen- und Vegetationsökologie
- Systematische Botanik
- Raum- und Regionalentwicklung
- Naturschutz und Naturschutzbio

**Abstract**
This course introduces landscapes as socially perceived, spatially and temporally dynamic entities that are shaped by natural and societal factors. Concepts and qualitative and quantitative methods to study landscapes from an ecological and societal perspective are presented. The course consists of a mixture of theoretical lectures and exercises or practical sessions.

**Objective**

- The use of spatial data and analyses for quantifying patterns and processes in landscapes
- Concepts and methods to quantify functional connectivity in landscapes and seascapes.
- The use of remote sensing (satellites images, drones) to extract information about landscape structure and change, with a focus on land-use.
- The use of landscape genetics and its application to biodiversity conservation.
- To computationally optimize land-use planning problems.
- Concepts and methods in scenario-based land-use change modelling.
- Landscape ecological concepts and planning tools for management of urban landscapes.
- Concepts of social preference of landscapes and related measurement methods.
- How to design urban environments that foster health and well-being.
- The role of landscape features in influencing human well-being.
- Approaches of actively influencing attitudes and behavior toward landscapes as well as their scientific evaluation.

**Content**

**Thematic topics**

1. Ecological quantification of landscape patterns:
   - Landscape resources and green infrastructure (e.g., ecological conservation areas).
   - Landscape and seascape connectivity.
   - Landscape genetics and conservation applications.
   - Concepts of spatial quantitative methods: least cost paths, resistance surfaces, Circuitscape, land-use change models, various statistical methods.
   - Image processing from remote sensing from satellites and drones.
   - Modelling future land-use.
   - Spatial optimization and trade-offs relative to biodiversity, agriculture and energy production.

2. Social perception and of landscapes:
   - Impact of urbanization on human-nature interactions
   - Approaches in planning urban landscapes
   - Theories on landscape preference and place identity.
   - Role of landscapes for recreation, health and well-being
   - Methods of investigating the human-landscape relationship and evaluating interventions

**Lecture notes**
Handouts will be available in the course and for download

**Prerequisites / notice**
Basic Landscape Ecology courses at Bachelor level and basic knowledge of the R programming language
This course introduces the broad variety of conflicts that arise in projects focusing on sustainable management of natural resources. It explores case studies of ecosystem management approaches and considers their practicability, their achievements and possible barriers to their uptake.

Objective
Students should be able to:

a) propose appropriate and realistic solutions to ecosystem management problems that integrate ecological, economic and social dimensions across relevant temporal and spatial scales.
b) identify important stakeholders, their needs and interests, and the main conflicts that exist among them in the context of land and resource management.

Content
Traditional management systems focus on extraction of natural resources, and their manipulation and governance. However, traditional management has frequently resulted in catastrophic failures such as, for example, the collapse of fish stocks and biodiversity loss. These failures have stimulated the development of alternative ecosystem management approaches that emphasise the functionality of human-dominated systems. Inherent to such approaches are system-wide perspectives and a focus on ecological processes and services, multiple spatial and temporal scales, as well as the need to incorporate diverse stakeholder interests in decision making. Thus, ecosystem management is the science and practice of managing natural resources, biodiversity and ecological processes, to meet multiple demands of society. It can be local, regional or global in scope, and addresses critical issues in developed and developing countries relating to economic and environmental security and sustainability.

This course provides an introduction to ecosystem management, and in particular the importance of integrating ecology into management systems to meet multiple societal demands. The course explores the extent to which human-managed terrestrial systems depend on underlying ecological processes, and the consequences of degradation of these processes for human welfare and environmental well-being. Building upon a theoretical foundation, the course will tackle issues in resource ecology and management, notably forests, agriculture and wild resources within the broader context of sustainability, biodiversity conservation and poverty alleviation or economic development. Case studies from tropical and temperate regions will be used to explore these issues. Dealing with ecological and economic uncertainty, and how this affects decision making, will be discussed. Strategies for conservation and management of terrestrial ecosystems will give consideration to landscape ecology, protected area systems, and community management, paying particular attention to alternative livelihood options and marketing strategies of common pool resources.

Abstract
Individual writing of an essay-type review paper about a specialized topic in the field of ecology and evolution, based on substantial reading of original literature and discussions with a senior scientist.

Objective

- Students acquire a thorough knowledge about a topic in which they are particularly interested
- They learn to assess the relevance of original literature and synthesize information
- They make the experience of becoming "experts" on a topic and develop their own perspective
- They practise academic writing according to professional standards in English
Content
Topics for the essays are proposed by the professors and lecturers of the major in Ecology and Evolution at a joint meeting at the beginning of the semester (the date will be communicated by e-mail to registered students).
Students will:
- choose a topic
- search and read appropriate literature
- develop a personal view on the topic and structure their arguments
- prepare figures and tables to represent ideas or illustrate them with examples
- write a clear, logical and well-structured text
- refine the text and present the paper according to professional standards

Lecture notes
In all steps, they will benefit from the advice and detailed feedback given by a senior scientist acting as personal tutor of the student.

Prerequisites / notice
The "Term Paper" requires considerable time set aside to read and digest original scientific literature, culminating in the writing of a review paper. The submission deadline is the first day of the spring semester, implying that much of the actual writing will be performed in January and February. Grading is based on the quality of the submitted review paper (2/3 of total grade), and on the "soft skills" such as the level of initiative, timeliness, independence, etc. of the student (1/3 of total grade). The personal supervisor is charged with grading the student's performance.

701-1411-00L | Environmental DNA - Concepts and Applications for Biodiversity Monitoring at the Landscape Scale | W | 3 credits | 3G | L. Pellissier, C. P. Albouy, K. Deiner, A. Frossard

Abstract
Environmental DNA (eDNA) allows the detection of organisms from traces of their DNA sampled from water, air or soil. Sampling eDNA instead of organisms makes monitoring fast, non-invasive, scalable and inexpensive. In this lecture, students will learn about eDNA and how it can be sampled, sequenced and analysed for biodiversity discovery and monitoring.

Objective
At the end of this course, participants should be able to:
- describe what eDNA is and how to harness the information in eDNA to turn it into a survey method for biodiversity
- describe the eDNA analytical steps, from the sampling, laboratory, data analysis and interpretation.
- summarise the common software and analytical tools for analysing eDNA data and be able to interpret the results.
- apply eDNA methods to design programs for monitoring in conservation and restoration through case studies.

Additionally, participants should be able to:
- provide constructive feedback to peers and learn from feedback,
- integrate concepts within and among disciplines of science.

Content
The course is consisting of two pillars:

Pillar 1: Theoretical background. The first pillar offers general theoretical knowledge about the nature of eDNA and its use in biodiversity science. It is structured into theoretical blocks with video content about sampling design, laboratory and data processing, which offer fundamental knowledge to solve the practical case studies of pillar 2.

Pillar 2: Data application on applied Case Studies. Each theory block will be associated with an exercise in which students are challenged to apply their knowledge from the theory. Students will collaborate on planning eDNA sampling design, visit the laboratory, run eDNA analysis (in R) following the best guidelines and interpret the results of analyses. These exercises will happen in person in the classroom.

Prerequisites / notice
- Basic knowledge of R and Geographic Information Systems (GIS).
- Basic understanding of genetics and molecular analyses.

The analytic part of the lecture will rely on skills from “Environmental Systems Data Science”

701-1677-00L | Quantitative Vegetation Dynamics: Models from Tree to Globe | W | 3 credits | 3G | H. Lischke, U. Hiltner, B. Rohner

Abstract
The course introduces basic concepts and applications of dynamic vegetation models at various temporal and spatial scales. Different modeling approaches and underlying principles are presented and critically discussed during the lectures. In the integrated exercise parts, students work in a number of small projects with some of the introduced models to gain practical experience.

Objective
Students will:
- be enabled to understand, assess and evaluate the fundamental properties of dynamic systems using vegetation models as case studies
- obtain an overview of dynamic modelling techniques and their applications from the individual plant to the global level
- understand the basic assumptions of the various model types, which dictate the applicability and limitations of the respective model
- be enabled to work with such model types on their own
- appreciate the methodological basis for impact assessments of future climate change and other environmental changes on ecosystems.

Content
Models of individuals
- Deriving single-plant models from inventory measurements
- Plant models based on 'first principles'

Models at the stand scale
- Simple approaches: matrix models
- Competition for light and other resources as central mechanisms
- Individual-based stand models: distance-dependent and distance-independent
- Theoretical models

Models at the landscape scale
- Simple approaches: cellular automata
- Dispersal and disturbances (windthrow, fire, bark beetles) as key mechanisms
- Landscape models

Global models
- Sacrificing local detail to attain global coverage: processes and entities
- Dynamic Global Vegetation Models (DGVMs)
- DGVMs as components of Earth System Models

**Prerequisites / notice**
- There will be two afternoons in class. The lab work in between the afternoons is done by the students according to their own schedule but with the support of the teacher and must be completed after 3 weeks. The workload is approximately 1-2 full days per week, depending on the student's ability. Student must know how to pipette.

**Data:** 06.08.2024 12:40  
**Autumn Semester 2024**  
**Page 2513 of 2684**
Objective

During the research project you will learn the principles of doing research to observe interrelations in aquatic ecosystems. You will measure and interpret biological and physical data (e.g. during experiments, field work). You will present the collected knowledge and write a report about it.

Content

The field excursions contain a 1-day excursion to a lake (Greifensee) and a 3-day excursion to a river (Glatt, Niederuzwil). The experimental part contains research projects in small groups within research groups at Eawag.

Lecture notes

Course notes and power point presentations provided during the course.

Prerequisites / notice

This course can only be taken together with "701-1437-00 Aquatic Ecology I", "701-1437-01 Bestimmungskurs aquatische Makroinvertebraten" and "701-1437-02 Bestimmungskurs Süßwasseralgen und aquatische Mikroinvertebraten".

The maximal participating number of students is 8 from D-USYS and 16 from D-BIOL (ETH & UNI).

Registration for the course until 12.08.2024, free places will be distributed after that. Students registering later cannot be guaranteed a place in the course.

The course includes a mandatory field trip to Greifensee (19.09.2024) and a three-day excursion to the river Glatt (25.-27.09. 2024).

Abstract

This course gives an overview of the typical aquatic macroinvertebrate groups in Switzerland. Beside a theoretical background on the different groups the focus is laid on the determination of the most important species groups and their indentation traits, also using identification keys. Practical experience in benthic sampling techniques is collected during an excursion.

Objective

During this course you will get an overview of the typical aquatic macroinvertebrates in Switzerland and the common sampling and preservation techniques. After this course you will be able to identify the most important aquatic species groups at the level of order/family and know the most important identification traits. You will also be able to use identification literature commonly used in Switzerland. During an excursion, you will apply the theoretical identification knowledge to field situations.

Content

The taxonomic part will cover macroinvertebrates (e.g. Crustacean, aquatic insects). The goal is to get to know the most common aquatic taxa in Switzerland, to identify them with commonly used identification literature, and to get an idea how these organisms are used in research and practice. (language: German, translation of the most important things during the course possible)

The field excursion takes place Tuesday 22.10.2024.

Lecture notes

Course notes and power point presentations provided during the course.

Prerequisites / notice

The maximal participating number of students is 12 from D-USYS and 16 from D-BIOL. In case of too many students, those that simultaneously participate in the courses "701-1437-00 Aquatic Ecology I", "701-1437-03 Aquatic Ecology II" and "701-1437-02 Bestimmungskurs Süßwasseralgen und aquatische Mikroinvertebraten" are given priority. Sign in until 12.08.2024, free places will be distributed after that. Students registrating later can not be guaranteed a place in the course.

The field excursion takes place Tuesday afternoon 22.10.2024 from 1pm-5pm.

**Abstract:**
Seminar of the groups Molecular Microbial Ecology, Theoretical Biology, Experimental Ecology, Evolutionary Biology. Talks given by members of these groups and external visitors.

**Objective:**
In-depth introduction into microbial evolution and ecology, especially the aspects that are the focus of on-going research in this area at Department of Environmental Systems Science.
Environmental Systems Data Science: Data Processing

**Objective**

The students are able to:
- frame a data science problem and build a hypothesis
- describe the steps of a typical data science project workflow
- conduct selected steps of a workflow on specifically prepared datasets, with a focus on choosing, fitting and evaluating appropriate algorithms and models
- critically think about the limits and implications of a method
- visualise data and results throughout the workflow
- access online resources to keep up with the latest data science methodology and deepen their understanding

**Content**

- The data science workflow
- Access and handle (large) datasets
- Prepare and clean data
- Analysis: data exploratory steps
- Analysis: machine learning and computational methods
- Evaluate results and analyse uncertainty
- Visualisation and communication

**Prerequisites / notice**

- 252-0640-02L Anwendungsnahes Programmieren mit Python
- 401-0624-00L Mathematik IV: Statistik
- 401-6215-00L Using R for Data Analysis and Graphics (Part I)
- 401-6217-00L Using R for Data Analysis and Graphics (Part II)
- 701-0105-00L Mathematik VI: Angewandte Statistik für Umweltwissenschaften

Environmental Systems Data Science: Machine Learning

**Objective**

The students are able to:
- select an appropriate model related to a research question and dataset
- describe the steps from data preparation to running and evaluating models
- prepare data for running machine learning with dependent and independent variable
- build and validate regressions and neural network models
- understand convolution and deep learning models
- access online resources to keep up with the latest data science methodology and deepen their understanding

**Content**

- The data science workflow
- Data preparation for running and validating machine learning models
- Get to know machine learning approaches including regression, random forest and neural network
- Model complexity and hyperparameters
- Model parameterization and loss
- Model evaluations and uncertainty
- Deep learning with convolutions

**Literature**

Building on existing data science resources

**Prerequisites / notice**

- Math IV, VI (Statistics); R, Python; ESDS I
- 252-0840-02L Anwendungsnahes Programmieren mit Python
- 401-0624-00L Mathematik IV: Statistik

- 701-0105-00L Mathematik VI: Angewandte Statistik für Umweltwissenschaften

Challenges in Plant Sciences

**Objective**

Introduction to resecent research in all fields of plant sciences
Working in interdisciplinary teams on the topics
Developing presentation and discussion skills

**Content**

The topics encompass integrated knowledge on current plant research, ranging from the molecular level to the ecosystem level, and from basic to applied science while making use of the synergies between the different research groups within the PSC.

**Competencies**

- Subject-specific Competencies

Data: 06.08.2024 12:40 Autumn Semester 2024 Page 2516 of 2684
Students will understand: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies.

Lecture Topics and Tentative Schedule

Week 1  The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrotrophs, disease cycles and pathogen life cycles.

Week 2  Nematode attack strategies and types of damage. Viral pathogens, classification, reproduction and transmission, attack strategies and types of damage. Examples TMV, BYDV. Bacterial pathogens and phytoplasmas, classification, reproduction and transmission.

Week 3  Bacterial attack strategies and symptoms. Example bacterial diseases: fire blight, Agrobacterium crown gall, soft rots. Fungal and oomycete pathogens, classification, growth and reproduction, sexual and asexual spores, transmission.

Week 4  Fungal and oomycete life cycles, disease cycles, infection processes, colonization, phytotoxins and mycotoxins. Attack strategies of fungal necrotrophs and biotrophs. Symptoms and signs of fungal infection. Example fungal diseases: potato late blight.

Week 5  Example fungal diseases: wheat stem rust, grape powdery mildew, wheat septoria tritici blotch. Plant defense mechanisms, host range and non-host resistance. Passive structural and chemical defenses, preformed chemical defenses. Active structural defense, histological and cellular (papillae).

Week 6  Active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytalexins and disease resistance. Pisatin and pisatin demethylase. Local and systemic acquired resistance (LAR, SAR), induced systemic resistance (ISR), signal molecules, defense activators (Bion). Pathogen effects on food quality. Positive and negative transformations.

Week 8  Epidemiology: Disease pyramid, environmental effects on epidemic development, plant effects on development of epidemics, including resistance, physiology, density, uniformity.

Week 9  Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity. Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies, ELISA.

Week 10  Molecular detection and diagnosis of pathogens: PCR, rDNA and loop-mediated isothermal amplification. Strategies for minimizing disease risks: calculating disease thresholds, disease forecasting systems.

Week 12  Physical control methods. Cultural control methods: avoidance, tillage practices, crop sanitation.

Week 13  Cultural control methods: fertilizers, crop rotations.

Lecture notes

Week 14  Open lecture.

</tr>
</tbody>
</table>

Abstract

This course provides an in-depth analysis of the theoretical underpinnings to different approaches to climate policy at the international and national levels, and how these different approaches have played out in practice. Students will learn how legislative frameworks have developed over the last 25 years, and also be able to appraise those frameworks critically.

Objective

The goal is to give students a glimpse into the enormous complexity of this policy area, an understanding of some of the many debates that are currently raging (of which the debate about whether climate change is actually real is probably the least complicated or interesting). We want to give students the ability to evaluate policy arguments made by politicians, experts, and academics with a critical eye, informed by a knowledge of history, an understanding of the theoretical underpinnings, and the results of empirical testing of different strategies. A student taking this course ought to be able to step into an NGO or government agency involved in climate policy analysis or political advocacy, and immediately be able to make an informed and creative contribution. Moreover, by experiencing the depth of this policy area, students should be able to appreciate the complexity inherent in all policy areas.
Climate change is one of the defining challenges of our time, touching all aspects of the environment and of society. There is broad recognition (although with some dissent) that governments ought to do something about it: making sure that emissions of greenhouse gases (GHGs) stop within the next 20 to 30 years; helping people to adapt to the consequences of the climate change to which we have already committed ourselves; and, most controversially, perhaps taking measures to actively remove GHG’s from the atmosphere, or to alter the radiation balance of the Earth through solar engineering.

It’s a complicated set of problems, especially the first of these, known as mitigation. Fundamentally this is because it means doing something that humanity has never really tried before at a planetary scale: deliberately altering the ways the we produce, convert, and consume energy, which is at the heart of modern society. Modern society – the entire anthropocene – grew up on fossil fuels, and the huge benefits they offered in terms of energy that was inexpensive, easy to transport and store, and very dense in terms of its energy content per unit mass or volume. How to manage a society of over 7 billion people, at anything like today’s living standards, without the benefits of that energy, is a question for which there is no easy answer. There are also other challenges outside of energy. How do we build houses, office buildings, and infrastructure networks without cement, a substance that releases large amounts of CO2 as it hardens? How do we reverse the pace of deforestation, particularly in developing countries? How do we eliminate the GHG emissions from agriculture: the methane from cows' bellies and rice paddies, together with the chemicals that enter the atmosphere from the application of fertilizer?

These are all tough questions at a technical level, but even tougher when you consider that governments typically need to employ indirect methods to get these things to happen. Arguably a government could simply pass a law that forbids people using fossil fuels. But politically this is simply unrealistic, at least while so many people depend on fossil fuels in their daily lives. What is to be done? For this, one needs to turn to various ideas about how government can and should influence society. On the one hand are ideas suggesting that government ought to play a very limited role, relative to private actors, and that should step in only to correct “market failures,” with interventions designed specifically around that failure. On the other hand are ideas suggesting that government (meaning all of us, working together through a democratic process) is the appropriate decision-making body for core decisions on where society can and should go. These issues come to the fore in climate policy discussions and debates.

Ministry of the Future, by Kim Stanley Robinson

Ten Principles for Policy Making in the Energy Transition, by Laura Diaz Anadon et al.

Geographies of Environmental Governance (University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: 07SMGEO837

Mind the enrolment deadlines at UZH:

The course provides an overview of dominant and emerging trends in the theory and practice of environmental governance. The course addresses environmental issues as policy problems and explores how the environment is regulated, controlled, and contested by a range of actors and institutions. The course focuses on the spatial dimension of environmental change and uses key concepts from geography.

Course participants will develop a theoretically as well as practically informed understanding of recent issues and debates in contemporary geographies of environmental governance.

The course provides an overview of dominant and emerging trends in the theory and practice of environmental governance. The course addresses environmental issues as policy problems and explores how the environment is regulated, controlled, and contested by a range of actors and institutions. The course focuses on the spatial dimension of environmental change and uses key concepts from geography (scale, region, network) to advance regional environmental governance thinking.

The lectures are complemented by seminar classes to work on case studies in smaller groups of students.

Environmental Governance

The course addresses environmental policies, focusing on new steering approaches, which are generally summarized as environmental governance. The course also provides students with tools to analyze environmental policy processes and assesses the key features of environmental governance by examining various practical environmental policy examples.

To understand how an environmental problem may (not) become a policy and explain political processes, using basic concepts and techniques from political science.

To be able to identify the main challenges and opportunities for environmental governance and to critically discuss them with reference to various practical policy examples.
Content

Improvements in environmental quality and sustainable management of natural resources cannot be achieved through technical solutions alone. The quality of the environment and the achievement of sustainable development strongly depend on human behavior and specifically the human uses of nature. To influence human behavior, we rely on public policies and other societal rules, which aim to steer the way humans use natural resources and their effects on the environment. Such steering can take place through government intervention alone. However, this often also involves governance, which includes the interplay between governmental and non-governmental actors, the use of diverse tools such as emission standards or financial incentives to steer actors' behavior and can occur at the local, regional, national or international level.

In this course, we will address both the practical aspects of as well as the scientific debate on environmental governance. The course gives future environmental experts a strong basis to position themselves in the governance debate, which does not preclude government but rather involves a spectrum from government to governance.

Key questions that this course seeks to answer: What are the core characteristics of environmental challenges from a policy perspective? What are key elements of 'environmental governance' and how legitimate and effective are these approaches in addressing persistent environmental challenges?

Furthermore, we encourage the development of soft skills by engaging students in activities such as moderating discussions in class, presenting own proposals, giving regular peer feedback, as well as critically reflecting on various relevant publications in the environmental governance domain.

Lecture notes

Lecture slides, a script and additional course material will be provided on Moodle.

Prerequisites / notice

A detailed course schedule will be made available at the beginning of the semester.

During the lecture we will work with Moodle. We ask that all students register themselves on this platform before the lecture.

We recommend that students have (a) three-years BSc education of a (technical) university; (b) successfully completed Bachelor introductory course to environmental policy (Entwicklungen nationaler Umweltpolitik (or equivalent)) and (c) familiarity with key issues in environmental policy and some fundamental knowledge of one social science or humanities discipline (political science, economics, sociology, history, psychology, philosophy).

850-0609-06L Governing the Energy Transition

Primarily suited for Master and PhD level.

Abstract

This course addresses the role of policy and its underlying politics in the transformation of the energy sector. It covers historical, socio-economic, and political perspectives and applies various theoretical concepts to understand specific aspects of the governance of the energy transition.

Objective

- To gain an overview of the history of the transition of large technical systems
- To recognize current challenges in the energy system to understand the theoretical frameworks and concepts for studying transitions
- To gain knowledge on the role of policy and politics in energy transitions

Content

Climate change, access to energy and other societal challenges are directly linked to the way we use and create energy. Both the 2015 United Nations Paris climate change agreement and the UN Sustainable Development Goals make a fast and extensive transition of the energy system necessary.

This lecture introduces the social and environmental challenges involved in the energy sector and discusses the implications of these challenges for the rate and direction of technical change in the energy sector. It compares the current situation with historical socio-technical transitions and derives the consequences for policy-making. It introduces theoretical frameworks and concepts for studying innovation and transitions. It then focuses on the role of policy and policy change in governing the energy transition, considering the role of political actors, institutions and policy feedback.

The grade will be determined by a final exam.

Lecture notes

Slides and reading material will be made available via moodle.ethz.ch (only for registered students).

Literature

A reading list will be provided via moodle.ethz.ch at the beginning of the semester.

860-0023-00L International Environmental Politics

Particularly suitable for students of D-ITET, D-USYS.

Abstract

This course deals with how and why international problem-solving efforts (cooperation) in environmental politics emerge and evolve, and under what circumstances such efforts are effective. Based on concepts, theories, and methods of political economy, political science, and public policy, various examples of international environmental policy-making are examined.

Objective

The objectives in this course are to (1) gain an overview of important questions in international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions in this policy area and how to address them in a conceptually and methodologically meaningful and insightful way; (3) gain an overview of important global and regional environmental problems and how they are or could be solved.

Content

This course deals with how and why international problem-solving efforts (cooperation) in environmental politics emerge and evolve, and under what circumstances such efforts are effective. Based on concepts, theories, and methods of political economy, political science, and public policy, various examples of international environmental policy-making are examined, for example international efforts to reduce air pollution, manage international water resources, mitigate and adapt to global warming, protect the stratospheric ozone layer, address biodiversity challenges, deal with plastic waste, and prevent pollution of the oceans.

Lecture notes

Reading materials and slides will be available via Moodle.

Literature

Reading materials and slides will be available via Moodle.
The objectives of this course are to develop the following key skills necessary for policy analysts: assessed fostered assessed

Powerpoint slides are available on the moodle page. Additional documents are handed out as copies.

Objective

Students will be able to:

1) critically consider biological data books and local, regional, and national inventories;
2) evaluate the validity of ecological criteria used in decision making processes;
3) critically appraise the handling of ecological data and criteria used in the process of evaluation
4) perform an ecological evaluation project from the field survey up to the decision making and planning.

Lecture notes

Powerpoint slides are available on the moodle page. Additional documents are handed out as copies.

Literature

Basic literature and references are listed on the webpage.

Prerequisites / notice

The course is open to all ETH students and visiting students from other universities. Participation does not require previous coursework in the social sciences or environmental policy. Most meetings in this course will take place on campus (ETH Main Building, HG F.3). There will be no live-streaming, and the course is not in hybrid (on-campus plus online) format. However, the lecture will be recorded (slides and voice, no video) and the recordings will be made available via the Moodle platform for this course a few days after the respective lecture for students who are unable to attend in person. All electronic correspondences will take place via the ETH mystudies system and Moodle, so please make sure you are properly registered there with a functioning email address/account.

 Credits and Exam

After passing a written test at the end of the course (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test). Visiting students (e.g., from the University of Zurich, exchange students) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory. Students who obtain a grade of < 4.0 for the test will have a second chance (see table below). Students who did not participate in the test on 16 December 2024 will not have access to the repeat test unless they submit compelling and documented (e.g., medical, other exam in parallel at ETH) reasons for why they are/were unable to participate in the first test. The test covers all contents of the lectures and the reading assignments. No separate registration for the exam is required, registration for the course as such covers everything. The exam will take place on campus, most likely in HG F3. That is, you must be present in person at ETH Zurich on the exam date/time.

This course provides an introduction to agent-based models for transportation policy analysis. Four essential topics are covered:

1) Introduction of agent-based modeling and its comparison to the traditional state of practice modeling
2) Introduction of MATSim, an open-source agent-based model, developed at ETH Zurich and TU Berlin, and its various parts
3) Setting up an agent-based model simulation, where different statistical methods used in the process will be introduced and explained. Here the open-source eqasim framework used at ETH Zurich to set up agent-based models will be introduced
4) Conducting a transport policy study. The case study will be performed in groups and will include a paper-like report.

At the end of the course, the students should:

- have practical experience of using MATSim to perform transportation studies
- have an understanding of MATSim
- have an understanding of agent-based modeling
- have an understanding of the process needed to set up an agent-based study
- have practical experience of using MATSim to perform transportation studies

The students are able to:

- select an appropriate model related to a research question and dataset
- describe the steps from data preparation to running and evaluating models
- prepare data for running machine learning with dependent and independent variable
- build and validate regressions and neural network models
- understand convolution and deep learning models
- access online resources to keep up with the latest data science methodology and deepen their understanding

Objective

The students are able to:

- frame a data science problem and build a hypothesis
- describe the steps of a typical data science project workflow
- conduct selected steps of a workflow on specifically prepared datasets, with a focus on choosing, fitting and evaluating appropriate algorithms and models
- critically think about the limits and implications of a method
- visualise data and results throughout the workflow
- access online resources to keep up with the latest data science methodology and deepen their understanding

Content

- The data science workflow
- Access and handle (large) datasets
- Prepare and clean data
- Analysis: data exploratory steps
- Analysis: machine learning and computational methods
- Evaluate results and analyse uncertainty
- Visualisation and communication

701-0491-00L Agent Based Modeling in Transportation

Abstract

This course provides an introduction to agent-based modeling in transportation. The lectures and exercises offer an opportunity to learn about agent-based simulation models' current methodology, focusing on MATSim, how agent-based models are set up, and perform a practical case study by working in groups.

Objective

At the end of the course, the students should:

- have an understanding of agent-based modeling
- have an understanding of MATSim
- have an understanding of the process needed to set up an agent-based study
- have practical experience of using MATSim to perform transportation studies

Content

This course provides an introduction to agent-based models for transportation policy analysis. Four essential topics are covered:

1) Introduction of agent-based modeling and its comparison to the traditional state of practice modeling
2) Introduction of MATSim, an open-source agent-based model, developed at ETH Zurich and TU Berlin, and its various parts
3) Setting up an agent-based model simulation, where different statistical methods used in the process will be introduced and explained. Here the open-source eqasim framework used at ETH Zurich to set up agent-based models will be introduced
4) Conducting a transport policy study. The case study will be performed in groups and will include a paper-like report.

During the course, outside lecturers will give several lectures on using MATSim in practice (i.e., SBB).
The goal is to give students a glimpse into the enormous complexity of this policy area, an understanding of some of the many debates that have fostered successful participation of the course is able to:

363-0541-00L Economic Dynamics and Complexity W 3 credits 3G F. Schweitzer, L. Verginer

Abstract

What causes economic business cycles? How are limited resources, competition, and cooperation reflected in growth dynamics? To answer such questions, we combine macroeconomic models and methods of nonlinear dynamics. We study the role of bifurcations and control parameters for dynamic stability. Feedback cycles and coupled dynamics are reasons for limited predictability, instability and chaos.

Objective

successful participant of the course is able to:
- understand the importance of different modeling approaches
- formalize and solve one- and two-dimensional nonlinear models
- identify critical conditions for stability and dynamic transitions
- analyze macroeconomic models of business cycles, supply and demand
- apply formal concepts to model economic growth and competition

Content

System theory sees the economy as a complex adaptive system. What does this mean for economic modeling?

We focus on two sources of complexity: (a) nonlinear dynamics, which is captured in this course, "Economic Dynamics and Complexity" and (b) collective interactions, which is captured in the course "Agent-Based Modeling of Economic Systems" (in Spring).

Our approach to economic dynamics combines insights from different disciplines: macroeconomics studying business cycles and growth, system dynamics rooted general system theory and cybernetics, and nonlinear dynamics using applied mathematics.

We start with a comparison of different modeling approaches, to highlight the problems and challenges of system modeling. The subsequent lectures then introduce different one- and two-dimensional nonlinear models with applications in economics, such as models of supply and demand, business cycles, growth and competition. Emphasis is on the formal analysis of these models using methods from applied mathematics and tools for solving coupled differential equations.

Weekly self-study tasks are used to apply the concepts introduced in the lectures. We practice how to solve nonlinear models formally and numerically and how to interpret the results.

Lecture notes

The lecture slides are provided as handouts - including notes and literature sources - to registered students only. All material is to be found on the Moodle platform. More details during the first lecture.

Prerequisites / notice

Students should be familiar with nonlinear differential equations and should have basic programming skills. All necessary details to solve nonlinear models will be provided in the course. The course will not build on mathematical proofs, optimization, statistics, efficient numerical computation and other specialized skills.

701-1563-00L Climate Policy W 6 credits 4G A. Patt, S. Hanger-Kopp

Abstract

This course provides an in-depth analysis both of the theoretical underpinnings to different approaches to climate policy at the international and national levels, and how these different approaches have played out in practice. Students will learn how legislative frameworks have developed over the last 25 years, and also be able to appraise those frameworks critically.

Objective

The goal is to give students a glimpse into the enormous complexity of this policy area, an understanding of some of the many debates that are currently raging (of which the debate about whether climate change is actually real is probably the least complicated or interesting). We want to give students the ability to evaluate policy arguments made by politicians, experts, and academics with a critical eye, informed by a knowledge of history, an understanding of the theoretical underpinnings, and the results of empirical testing of different strategies. A student taking this course ought to be able to step into an NGO or government agency involved in climate policy analysis or political advocacy, and immediately be able to make an informed and creative contribution. Moreover, by experiencing the depth of this policy area, students should be able to appreciate the complexity inherent in all policy areas.
Climate change is one of the defining challenges of our time, touching all aspects of the environment and of society. There is broad recognition (although with some dissent) that governments ought to do something about it: making sure that emissions of greenhouse gases (GHGs) stop within the next 20 to 30 years; helping people to adapt to the consequences of the climate change to which we have already committed ourselves; and, most controversially, perhaps taking measures to actively remove GHG’s from the atmosphere, or to alter the radiation balance of the Earth through solar engineering.

It’s a complicated set of problems, especially the first of these, known as mitigation. Fundamentally this is because it means doing something that humanity has never really tried before at a planetary scale: deliberately altering the ways the we produce, convert, and consume energy, which is at the heart of modern society. Modern society – the entire anthropocene – grew up on fossil fuels, and the huge benefits they offered in terms of energy that was inexpensive, easy to transport and store, and very dense in terms of its energy content per unit mass or volume. How to manage a society of over 7 billion people, at anything like today’s living standards, without the benefits of that energy, is a question for which there is no easy answer. There are also other challenges outside of energy. How do we build houses, office buildings, and infrastructure networks without cement, a substance that releases large amounts of CO2 as it hardens? How do we reverse the pace of deforestation, particularly in developing countries? How do we eliminate the GHG emissions from agriculture: the methane from cows’ bellies and rice paddies, together with the chemicals that enter the atmosphere from the application of fertilizer?

These are all tough questions at a technical level, but even tougher when you consider that governments typically need to employ indirect methods to get these things to happen. Arguably a government could simply pass a law that forbids people from using fossil fuels. But politically this is simply unrealistic, at least while so many people depend on fossil fuels in their daily lives. What is to be done? For this, one needs to turn to various ideas about how government can and should influence society. On the one hand are ideas suggesting that government ought to play a very limited role, relative to private actors, and should step in only to correct “market failures,” with interventions designed specifically around that failure. On the other hand are ideas suggesting that government (meaning all of us, working together through a democratic process) is the appropriate decision-making body for core decisions on where society can and should go. These issues come to the fore in climate policy discussions and debates.

Literature

There will be reading assignments for select classes. All of these will be posted in PDF format on a course Moodle. In addition, there will be one books and one report to be read over the course of the semester. They are:

- Ministry of the Future, by Kim Stanley Robinson
- Ten Principles for Policy Making in the Energy Transition, by Laura Diaz Anadon et al.

751-2107-00L Agrarian and Environmental Values: Tensions, Synergies, Practices and Policies

Limited to 20 students.

Abstract

In politics, society, and science, it can seem that the values and practices of agricultural production and environmental protection are in conflict. This tension is often described as “protection versus use” of natural resources. We will explore ways to move beyond the apparent conflict. We will apply this learning to field trips and transdisciplinary projects.

Objective

Students are able to:
- Define different kinds and categories of values.
- Relate value concepts to their own studies, life, and experiences through reflective journaling.
- Infer the underlying values in a text or policy about agri-environmental topics.
- Collaboratively develop a transdisciplinary project for an agri-environmental case study from the field trips.

Content

The course consists of interactive seminars alongside fieldtrips to farms that have found innovative solutions to balancing protection and production.

Seminars will cover topics such as the relationship between values and behavior and how people perceive value trade-offs. We will also discuss environmental ethics, environmental valuation and its critiques, the interplay of facts and values in agri-environmental decision-making, cultural ecosystem services, and relational values.

This class requires active participation. Learning is based on in-class activities, group work and fieldtrips.
Literature

Environmental Values, by O'Neill, Holland and Light, 2008

Abstract

The course deals with theoretical, methodological and practical foundations around the understanding and production of urban space. It discusses theoretical planning frameworks, and tasks of spatial planning at various scales, addresses current and future challenges of spatial development and reviews approaches for a sustainable development in Switzerland and beyond.
The overall aim of the course is to raise students’ awareness and curiosity about the aspects that guide and shape our environment. Through lectures, readings, discussions, and exercises, the course seeks to achieve this goal by accumulating crucial notions from both theoretical and practice-based examples, and applying such knowledge into tasks of spatial planning. At the end of this course, students should feel empowered to critically engage with the teaching topic from a variety of approaches. By taking up the lecture, the students should be able to analyse, interpret and reflect complex cross-scale tasks of spatial development and transformation, and to use their theoretical, methodical and professional knowledge to tackle them.

You as students will:
... assess present and future core challenges of spatial planning and development.
... discuss the role of spatial planning and development in shaping our living environment.
... differentiate the levels, scales and tasks of spatial planning instruments and processes.
... reflect on theoretical concepts and practical examples of decision-making of spatial tasks.
... identify and apply spatially relevant principles and systems for action-oriented planning and decision-making.
... acquire theoretical, methodological, practical know-how to examine, clarify, and solve tasks on spatial development.

### Content
Spatial development as a discipline deals with the development, (trans)formation, and arrangement of our urban environment. We simultaneously perceive and contribute to its transformation, making space the result of manifold intended and unintended changes. To mediate between different demands, interests and interventions of multiple actors, a forward-looking, evidence-based, and action-oriented planning is necessary. As guidance for future action, (spatial) planning has to be committed to the sustainable handling as well as just allocation of resources, in particular of the non-replicable resource land.

The course focuses on both theoretical concepts and practice-oriented approaches to gain knowledge and be equipped to address current issues in spatial planning and development. This is mirrored in the course’s structure made of both of lectures and exercises.

The lecture series introduces necessary key concepts and covers the following main topics:
- Drivers of spatial development, inward development, core tasks and current challenges for (spatial) planners.
- Interplay of formal and informal planning instruments across scales and actors.
- Differentiation urban typologies, their characteristics and challenges.
- Types of spatial analysis and key figures.
- Planning approaches and the (political) steering of spatial development.
- Types of processes and participation in spatial development.
- Approaches for planning complex urban situations.
- Concepts for sustainable development.

The exercises provide a framework for practical application of the learned theoretical concepts of spatial planning to real-life situations.

### Lecture notes
A course will be set up on Moodle for the provision of lectures and documents, to upload group deliverables and to ask questions in a discussion Forum. All documents provided are exclusively available for use within this course.

### Abstract
This course introduces landscapes as socially perceived, spatially and temporally dynamic entities that are shaped by natural and societal factors. Concepts and qualitative and quantitative methods to study landscapes from an ecological and societal perspective are presented. The course consists of a mixture of theoretical lectures and exercises or practical sessions.

### Objective
Students will learn:
- The use of spatial data and analyses for quantifying patterns and processes in landscapes.
- Concepts and methods to quantify functional connectivity in landscapes and seascapes.
- The use of remote sensing (satellite images, drones) to extract information about landscape structure and change, with a focus on land-use.
- The use of landscape genetics and its application to biodiversity conservation.
- To computationally optimize land-use planning problems.
- Concepts and methods in scenario-based land-use change modelling.
- Landscape ecological concepts and planning tools for management of urban landscapes.
- Concepts of social preference of landscapes and related measurement methods.
- How to design urban environments that foster health and well-being.
- The role of landscape planning in the structuring of human well-being.
- Approaches of actively influencing attitudes and behavior toward landscapes as well as their scientific evaluation.
This course presents a process-based view of the hydrology of mountain streams. Students learn how to integrate process knowledge, fostered

Streams are integrated monitors of the health and functioning of their surrounding landscapes. Streams integrate the fluxes of water, solutes, and sediment from their contributing catchment area; thus they reflect the spatially integrated hydrological, ecophysiological, biogeochemical, and geomorphological processes in the surrounding landscape. At a practical level, there is a significant public interest in managing upland landscapes to provide a reliable supply of high-quality surface water and to minimize the risk of catastrophic flooding and debris flows, but the scientific background for such management advice is still evolving.

Using a combination of lectures, field exercises, and data analysis, we explore the processes controlling the delivery of water, solutes, and sediment to streams, and how those processes are affected by changes in land cover, land use, and climate. We review the connections between process understanding and predictive modeling in these complex environmental systems. Practical problems to be considered include the effects of land use and climate on streamflow and water quality, illustrated with data from experimental watersheds in North America and Europe.

Lecture notes Handouts will be available in the course and for download

<tr>
<td></td>
<td>a) identify appropriate and realistic solutions to ecosystem management problems that integrate ecological, economic and social dimensions across relevant temporal and spatial scales.</td>
</tr>
</tbody>
</table>
Traditional management systems focus on extraction of natural resources, and their manipulation and governance. However, traditional management has frequently resulted in catastrophic failures such as, for example, the collapse of fish stocks and biodiversity loss. These failures have stimulated the development of alternative ecosystem management approaches that emphasise the functionality of human-dominated systems. Inherent to such approaches are system-wide perspectives and a focus on ecological processes and services, multiple spatial and temporal scales, as well as the need to incorporate diverse stakeholder interests in decision making. Thus, ecosystem management is the science and practice of managing natural resources, biodiversity and ecological processes, to meet multiple demands of society. It can be local, regional or global in scope, and addresses critical issues in developed and developing countries relating to economic and environmental security and sustainability.

This course provides an introduction to ecosystem management, and in particular the importance of integrating ecology into management systems to meet multiple societal demands. The course explores the extent to which human-managed terrestrial systems depend on underlying ecological processes, and the consequences of degradation of these processes for human welfare and environmental well-being. Building upon a theoretical foundation, the course will tackle issues in resource ecology and management, notably forests, agriculture and wild resources within the broader context of sustainability, biodiversity conservation and poverty alleviation or economic development. Case studies from tropical and temperate regions will be used to explore these issues. Dealing with ecological and economic uncertainty, and how this affects decision making, will be discussed. Strategies for conservation and management of terrestrial ecosystems will give consideration to landscape ecology, protected area systems, and community management, paying particular attention to alternative livelihood options and marketing strategies of common pool resources.

The course will cover important topics for the sustainable management of multifunctional forests and present silvicultural strategies to fulfil a variety of forest ecosystem goods and services. Current and future challenges of forest management will be presented. The course is structured into the following sub-topics:

1) Forest management under climate change and increasing disturbances.
2) Invasive alien species: Implications for forest management.
3) Non-native tree species: Risks, opportunities and management options.
4) Silvicultural and management options in multifunctional forests.
5) Challenges and silvicultural strategies for wood production.
6) Forest management and biodiversity in temperate forests.

**Content**

**Objective**

- To describe forest management and silvicultural measures for enhancing forest resilience to climate change, increased disturbances, and invasive species, and evaluate their feasibility and effectiveness in various situations;
- To concisely describe silvicultural options for the management of multifunctional forests and critically evaluate their feasibility and suitability;
- To explain the various social expectations towards forest ecosystem services and their implications for multifunctional forest management and critically analyse conflicts and synergies resulting from different forest ecosystem services;
- To carry out research on a given topic, identify relevant literature and present the results in a structured presentation and discuss the implications for forest management.

**Content**

The course will cover important topics for the sustainable management of multifunctional forests and present silvicultural strategies to fulfil a variety of forest ecosystem goods and services. 5) Challenges and silvicultural strategies for wood production.
6) Forest management and biodiversity in temperate forests.

**Lecture notes**

No class notes or text books

**Literature**

Literature will be provided for the group presentations.
Prerequisites / notice  
Course language is English. Prerequisites: Sufficient English language skills

In addition to the lectures, students need to attend 4 all-day field excursions.
Excursion topics: Forest management and climate change, Nature-based silvicultural concepts; Soil protection and forest management; Continuous cover forestry.

Participation at all 4 full-day excursions is a prerequisite for the credits.

Additional field excursions focusing on silvicultural systems and multifunctional forest management will be offered during the spring semester in the optional course "Selected Topics of Multifunctional Forest Management". 9 all-day field trips will provide the possibility to consolidate theoretical knowledge, to apply it to real examples in the field, to discuss with forest practitioners and further consolidate what has been taught in this course. The additional course is an important part of the formation of the Major in Forest and Landscape and is highly recommended.

Abstract

The course addresses environmental policies, focusing on new steering approaches, which are generally summarized as environmental governance. The course also provides students with tools to analyze environmental policy processes and assesses the key features of environmental governance by examining various practical environmental policy examples.

Objective

To understand how an environmental problem may (not) become a policy and explain political processes, using basic concepts and techniques from political science.

To analyze the evolution as well as the key elements of environmental governance.

To be able to identify the main challenges and opportunities for environmental governance and to critically discuss them with reference to various practical policy examples.

Content

Improvements in environmental quality and sustainable management of natural resources cannot be achieved through technical solutions alone. The quality of the environment and the achievement of sustainable development strongly depend on human behavior and specifically the human uses of nature. To influence human behavior, we rely on public policies and other societal rules, which aim to steer the way humans use natural resources and their effects on the environment. Such steering can take place through government intervention alone. However, this often also involves governance, which includes the interplay between governmental and non-governmental actors, the use of diverse tools such as emission standards or financial incentives to steer actors' behavior and can occur at the local, regional, national or international level.

In this course, we will address both the practical aspects of as well as the scientific debate on environmental governance. The course gives future environmental experts a strong basis to position themselves in the governance debate, which does not preclude government but rather involves a spectrum from government to governance.

Key questions that this course seeks to answer: What are the core characteristics of environmental challenges from a policy perspective? What are key elements of ‘environmental governance’ and how legitimate and effective are these approaches in addressing persistent environmental challenges?

Furthermore, we encourage the development of soft skills by engaging students in activities such as moderating discussions in class, presenting own proposals, giving regular peer feedback, as well as critically reflecting on various relevant publications in the environmental governance domain.

Lecture notes

Lecture slides, a script and additional course material will be provided on Moodle.

Prerequisites / notice

A detailed course schedule will be made available at the beginning of the semester.

During the lecture we will work with Moodle. We ask that all students register themselves on this platform before the lecture.

We recommend that students have (a) three-years BSc education of a (technical) university; (b) successfully completed Bachelor introductory course to environmental policy (Entwicklungen nationaler Umweltpolitik (or equivalent)) and (c) familiarity with key issues in environmental policy and some fundamental knowledge of one social science or humanities discipline (political science, economics, sociology, history, psychology, philosophy)
701-1657-00L Landscape Level Forest Management Planning

Abstract
This course covers and integrates knowledge from the disciplines of landscape level forest management planning, ecology, and forest economics. Students will apply knowledge and methods acquired throughout their studies to real world case studies, and will learn to make predictions about the development of forest ecosystems, prescribe realistic management solutions, and assess the economic consequences of these solutions.

Objective
After participating in this course, students will be able to:
• Identify and integrate environmental, social, and economic objectives for managing a forest.
• Design landscape level forest management concepts to meet these objectives.
• Identify criteria and indicators appropriate for assessing and monitoring the success of alternative forest management approaches in achieving their objectives.
• Apply standard procedures for cashflow-based evaluations to review the economic sustainability of different forest management scenarios.
• Develop forest-based business proposals including income from traditional timber harvesting operations and complementary sources.
• Prepare, write and defend a comprehensive landscape level forest management plan.

Content
What is forest management planning (FMP)? What is a Waldentwicklungsplan?
Basic definitions of forests as complex dynamic systems in the context of forest management planning.
The history of FMP and classic approaches to calculating sustained yield (Cotta, Hartig).
Components and structure of a sustainable forest management plan (SFMP).
The planning process and timber supply modelling.
Determining long-term sustained yields and allowable annual cut in clear cutting and close to nature systems.
Management choices and how they impact timber supply.
Certification standards and the use of criteria and indicators (taught by FSC externals).

Introduction to Business Planning and Financial evaluation in forestry.
Faustmann and the Land expectation value.
Calculating internal rates of return.
Choice experiments and valuing forest attributes.
Payments for ecosystem services.
Economics of risk, uncertainties and natural disturbances.
Economics of forest property rights and certification.

Abstract
Measurements are the sole judge of scientific truth and provide access to unpredictable information, enabling the characterization and monitoring of complex terrestrial systems. Based on lectures and field- and laboratory training, the students learn to apply modern methods to determine forest inventory parameters and to measure subsurface properties and processes.

Objective
The students will be able to:
- Explain measurement principles that are used for characterization of landscapes and terrestrial systems
- Select appropriate measurement methods and sampling design to quantify key variables and processes above ground and in the subsurface.
- Deploy sensors in the field.
- Interpret collected laboratory and field data and report main conclusions deduced from measurements.
Content

Week 1: Plant-Soil interactions – short introduction before sensor demonstration and installation in forest lab; Scholander pressure bomb (suction in leaves); LiCOR soil chamber

Weeks 2 to 6 - Experimental Methods for Soil Health Assessment

Week 2: Lecture on soil health and soil indicators; defining measurable soil health indicators for case studies for different soil threats and climate regions

Week 3: Short lecture on sampling, sensors and data logging; preparing sensors and data loggers in the lab; measurements on water content and temperature in the lab

Week 4: Short introduction on field installation; sensor installation at field site Hönggerberg

Week 5: Lecture on geophysical methods on subsurface characterization: basic principles of ERT, GPR, and EM; planning of field experiment to assess soil health

Week 6: Short introduction on data analysis; field sampling and conducting field experiment to assess soil health

Week 7: Analysis of experimental data and soil health assessment; poster presentation and discussion

Week 8: Lecture on plant soil relationship; connecting information below and above ground – data analysis

Weeks 9 and 10: Forest characterization/inventory: Principles of LiDAR; structures and features of the tree crowns, size/volume of the leaf area tree positions and diameters at breast height

Weeks 11 and 12: Eddy covariance methods -Principles for field measurement of water vapor, carbon dioxide, and energy exchange between terrestrial surfaces and the atmosphere; Analysis of measured time series to determine evaporation rate and CO2-fluxes

Week 13: Swiss Soil Monitoring networks – Monitoring of soil water content and potential; climate change and droughts

Week 14: Global data – Global modeling and data interpretation; SoilGrids and OpenLandMap; exercises on Budyko analysis

Literature

Lecture material will be online for registered students using moodle

Prerequisites / notice

The details of the schedule will be optimized based on the number of students; some blocks of the course will be offered as well to students of Environmental Engineering

701-1343-00L Soil-Plant Water Relations W 3 credits 2V A. Carminati

Abstract

Water limitation is a primary constraint on plant growth and terrestrial fluxes worldwide. In this course, the principles of water flow in soil and plants are discussed, with particular attention on the effect of drought on root water uptake, transpiration and plant growth. Strategies of plants to tolerate drought are discussed in relation to both agricultural and ecological implications.

Objective

The students are able to: explain and compare systematically the drivers of water stress to plants; to solve the equations of water flow in soil and plants and to calculate plant water status for varying soil and climatic conditions and plant traits; to critically review and present one research question in soil-plant water relations; to openly debate on the current trends in soil and plant water research and climate change ecology.

Content

Part 1 - Lectures

Week 1: Introduction.
Week 2: Soil water relations; Principles of soil water retention and soil water flow; Soil hydraulic properties.
Week 3: Root water uptake; soil hydraulic constraints on transpiration
Week 4: Rhizosphere processes and properties; root-soil contact; root hairs; mycorrhiza; rhizodeposition.
Week 5: Water flow in roots and xylem; root anatomy, architecture and plasticity; cavitation.
Week 6: Transpiration; Vapor Pressure Deficit; Photosynthesis; Stomatal regulation.
Week 7: Soil-plant-atmospheric continuum; Below- and above-ground feedbacks; Soil and atmospheric drivers of transpiration losses.

Part 2 - Seminar

Week 8: Plant response to drought and consequences for agriculture and forests. Open questions and introduction to seminar topics.
Week 9: Class work - preparation of the presentations/Debate
Week 10: Class work - preparation of the presentations/Debate
Week 11: Seminar/Debate (presentations)
Week 12: Seminar/Debate (presentations)
Week 13: Seminar/Debate (presentations)

Stable Isotope Ecology of Terrestrial Ecosystems

Abstract
This course provides an overview about the applicability of stable isotopes (carbon 13C, nitrogen 15N, oxygen 18O and hydrogen 2H) to process-oriented ecological research. Topics focus on stable isotopes as indicators for the origin of pools and fluxes, partitioning of composite fluxes as well as to trace and integrate processes. In addition, students carry out a small project during lab sessions.

Objective
Students will be familiar with basic and advanced applications of stable isotopes in studies on plants, soils, water and trace gases, know the relevant approaches, concepts and recent results in stable isotope ecology, know how to combine classical and modern techniques to solve ecophysiological or ecological problems, learn to design, carry out and interpret a small IsoProject, practice to search and analyze literature as well as to give an oral presentation.

Content
The analyses of stable isotopes often provide insights into ecophysiological and ecological processes that otherwise would not be available with classical methods only. Stable isotopes proved useful to determine origin of pools and fluxes in ecosystems, to partition composite fluxes and to integrate processes spatially and temporally.

Lecture notes
Handouts will be available on the webpage of the course.

Prerequisites / notice
This course is based on fundamental knowledge about plant ecophysiology, soil science, and ecology in general. Course will be taught in English.
### Decision Making, Policy and Planning

</tbody>
</table>

**Abstract**

In politics, society, and science, it can seem that the values and practices of agricultural production and environmental protection are in conflict. This tension is often described as “protection versus use” of natural resources. We will explore ways to move beyond the apparent conflict. We will apply this learning to field trips and transdisciplinary projects.

**Objective**

- Define different kinds and categories of values.
- Relate value concepts to their own studies, life, and experiences through reflective journaling.
- Infer the underlying values in a text or policy about agri-environmental topics.
- Collaboratively develop a transdisciplinary project for an agri-environmental case study from the field trips.

**Content**

The course consists of interactive seminars alongside fieldtrips to farms that have found innovative solutions to balancing protection and production.

Seminars will cover topics such as the relationship between values and behavior and how people perceive value trade-offs. We will also discuss environmental ethics, environmental valuation and its critiques, the interplay of facts and values in agri-environmental decision-making, cultural ecosystem services, and relational values.

This class requires active participation. Learning is based on in-class activities, group work and fieldtrips.
Literature will draw from political ecology, value theory and environmental values, as well as case studies and primary texts, such as the following (not all will be required reading; we will read 1 or 2 papers or book chapters each week).

Environmental Values, by O'Neill, Holland and Light, 2008

The course provides methods and tools for ecological evaluations dealing with nature conservation or landscape planning. It covers census methods, ecological criteria, indicators, indices and critically appraises objectivity and accuracy of the available methods, tools and procedures. Birds and plants are used as main example guiding through different case studies.
Objective

Students will be able to:
1) critically consider biological data books and local, regional, and national inventories;
2) evaluate the validity of ecological criteria used in decision making processes;
3) critically appraise the handling of ecological data and criteria used in the process of evaluation
4) perform an ecological evaluation project from the field survey up to the decision making and planning.

Lecture notes

Powerpoint slides are available on the moodle page. Additional documents are handed out as copies.

Literature

Basic literature and references are listed on the webpage.

Prerequisites / notice

The course structure changes between lecture parts, seminars and discussions. The didactic atmosphere is intended as working group.

Suggested prerequisites for attending this course are skills and knowledge equivalent to those taught in the following ETH courses:
- Pflanzen- und Vegetationsökologie
- Systematische Botanik
- Raum- und Regionalentwicklung
- Naturschutz und Naturschutzbiologie

Abstract

The discipline of Forest operations is constantly challenged to find solutions for unique problems. Each forest site requires specific technological approaches and machinery based on given management goals and ecological and environmental circumstances. Various terrain types and soil conditions, harvesting costs and taking care of the workforce by creating safe working conditions are some of the a

Objective

In this course, students will learn to use a wide variety of approaches grounded in the natural sciences, engineering and technology to develop solutions tailored to unique challenges from the field of forest operations.

The course is aimed at students who either plan an academic or professional career in the field of forest operations, or who will work at the interface between forest operations and the various related disciplines, such as forest ecosystem management and forestry in the wider sense.

After participating in this course students will have acquired foundational knowledge of a wide variety of core elements in the field of forest operations:
• The course will provide students with the ability to describe and differentiate site and stand conditions from an engineering perspective.
• Students will gain an overview and good working knowledge of current technology used in forest operations in Switzerland and around the world.
• Students will acquire the ability to assess the strength and weaknesses of the most commonly used equipment and analyze their suitability for a given set of environmental, economic and social factors.
• Students will be able to combine different types of technology to create an optimal harvesting system for a given task, and assess a given system for its task specific suitability.
• Participants will be able to assess the sustainability and potential short- and long-term impacts of harvesting systems under ecological, economic and social constraints.

</tr>
</tbody>
</table>

Abstract
Environmental DNA (eDNA) allows the detection of organisms from traces of their DNA sampled from water, air or soil. Sampling eDNA instead of organisms makes monitoring fast, non-invasive, scalable and inexpensive. In this lecture, students will learn about eDNA and how it can be sampled, sequenced and analysed for biodiversity discovery and monitoring.

Objective
At the end of this course, participants should be able to:
- describe what eDNA is and how to harness the information in eDNA to turn it into a survey method for biodiversity
- describe the eDNA analytical steps, from the sampling, laboratory, data analysis and interpretation.
- summarise the common software and analytical tools for analysing eDNA data and be able to interpret the results.
- apply eDNA methods to design programs for monitoring in conservation and restoration through case studies.

Additionally, participants should be able to:
- provide constructive feedback to peers and learn from feedback,
- integrate concepts within and among disciplines of science.
The course is consisting of two pillars:

Pillar 1: Theoretical background. The first pillar offers general theoretical knowledge about the nature of edNA and its use in biodiversity science. It is structured into theoretical blocks with video content about sampling design, laboratory and data processing, which offer fundamental knowledge to solve the practical case studies of pillar 2.

Pillar 2: Data application on applied Case Studies. Each theory block will be associated with an exercise in which students are challenged to apply their knowledge from the theory. Students will collaborate on planning edNA sampling design, visit the laboratory, run edNA analysis (in R) following the best guidelines and interpret the results of analyses. These exercises will happen in person in the classroom.

Objective
- Basic understanding of genetics and molecular analyses.
- Basic knowledge of R and Geographic Information Systems (GIS).
- The analytic part of the lecture will rely on skills from "Environmental Systems Data Science".

Abstract
The course dendroecology offers theoretical and practical aspects of dendrochronology. The impact of different environmental influences on tree-ring characteristics will be shown. The students learn various methods to date tree rings and they understand how ecological and environmental processes and patterns can be reconstructed using tree rings.

Objective
- Understand, how wood is configured and how tree-ring structures are formed.
- Are able to identify and describe different tree-ring structures.
- Understand the theoretical and practical aspects of the dating of tree rings.
- Know the effects of different abiotic and biotic environmental influences (climate, site, competition, insects, fire, physical-mechanical influences) on trees and tree rings.
- Discover a tool for understanding and reconstructing global change processes.
- Get to know software to date, standardize and analyze tree rings.
- Get hands-on experience based on the demonstration of wood (increment cores, stem discs, wedges), sampling in the field, and measuring and dating of tree rings in the tree-ring lab.
- Solve R-based exercises (R tutorial will be provided) and answer questions in Moodle.
- Work out an independent research question related to a dendroecological topic and write a short literature review based on scientific papers.

Content
- Overview and history of dendrochronology
- Principles of dendrochronology
- The formation and structure of wood and tree rings
- Wood anatomy and intra-seasonal tree-ring growth
- Continuous and discontinuous tree-ring characteristics
- Sampling and measuring of tree rings
- Crossdating methods (visual, skeleton plots, quantitative)
- Detrending and standardization of tree-ring series
- Development of tree-ring chronologies
- Water transport in trees
- Stable isotopes in tree rings
- Climate influences, climate-growth relationships, climate reconstructions
- Reconstruction of forest dynamics (regeneration, growth, competition, mortality)
- Disturbance ecology (fire, insects, blowdown)
- Application of tree-ring research in practice and in interdisciplinary research projects
- Field and lab day (date will be searched together with the students in the beginning of the semester): discussion of different dendroecological questions in the forest; sampling of trees; insight into different tree-ring projects in the lab (Swiss Federal Institute for Forest, Snow and Landscape Research WSL)

Lecture notes
Lecture notes (in English) will be handed out in the class.

Literature
The lecture notes and further documents (papers, software) can be downloaded from Moodle (https://moodle-app2.let.ethz.ch) following registration for the course.

701-1677-00L Quantitative Vegetation Dynamics: Models from Tree to Globe W 3 credits 3G H. Lischke, U. Hiltnner, B. Rohner

Abstract
The course introduces basic concepts and applications of dynamic vegetation models at various temporal and spatial scales. Different modeling approaches and underlying principles are presented and critically discussed during the lectures. In the integrated exercise parts, students work in a number of small projects with some of the introduced models to gain practical experience.

Objective
- Models of individuals
  - Deriving single-plant models from inventory measurements
  - Plant models based on "first principles"

Models at the stand scale
- Simple approaches: matrix models
- Competition for light and other resources as central mechanisms
- Individual-based stand models: distance-dependent and distance-independent
- Theoretical models

Models at the landscape scale
- Simple approaches: cellular automata
- Dispersal and disturbances (windthrow, fire, bark beetles) as key mechanisms
- Landscape models

Global models
- Sacrificing local detail to attain global coverage: processes and entities
- Dynamic Global Vegetation Models (DGVMs)
- DGVMs as components of Earth System Models

Lecture notes
Handouts will be available in the course and for download

Literature

Prerequisites / notice
- Basic knowledge of programming, ideally in R
- Good knowledge of general ecology, ideally of vegetation dynamics and forest systems

701-1682-00L Dendroecology W 3 credits 3G C. Bigler, K. Treydte, G. von Arx

Abstract
The course dendroecology offers theoretical and practical aspects of dendrochronology. The impact of different environmental influences on tree-ring characteristics will be shown. The students learn various methods to date tree rings and they understand how ecological and environmental processes and patterns can be reconstructed using tree rings.

Objective
- Understand, how wood is configured and how tree-ring structures are formed.
- Are able to identify and describe different tree-ring structures.
- Understand the theoretical and practical aspects of the dating of tree rings.
- Know the effects of different abiotic and biotic environmental influences (climate, site, competition, insects, fire, physical-mechanical influences) on trees and tree rings.
- Discover a tool for understanding and reconstructing global change processes.
- Get to know software to date, standardize and analyze tree rings.
- Get hands-on experience based on the demonstration of wood (increment cores, stem discs, wedges), sampling in the field, and measuring and dating of tree rings in the tree-ring lab.
- Solve R-based exercises (R tutorial will be provided) and answer questions in Moodle.
- Work out an independent research question related to a dendroecological topic and write a short literature review based on scientific papers.
- Be enabled to work with such model types on their own
- Appreciate the methodological basis for impact assessments of future climate change and other environmental changes on ecosystems.

Content
- Overview and history of dendrochronology
- Principles of dendrochronology
- Formation and structure of wood and tree rings
- Wood anatomy and intra-seasonal tree-ring growth
- Continuous and discontinuous tree-ring characteristics
- Sampling and measuring of tree rings
- Crossdating methods (visual, skeleton plots, quantitative)
- Detrending and standardization of tree-ring series
- Development of tree-ring chronologies
- Water transport in trees
- Stable isotopes in tree rings
- Climate influences, climate-growth relationships, climate reconstructions
- Reconstruction of forest dynamics (regeneration, growth, competition, mortality)
- Disturbance ecology (fire, insects, blowdown)
- Application of tree-ring research in practice and in interdisciplinary research projects
- Field and lab day (date will be searched together with the students in the beginning of the semester): discussion of different dendroecological questions in the forest; sampling of trees; insight into different tree-ring projects in the lab (Swiss Federal Institute for Forest, Snow and Landscape Research WSL)

Lecture notes
Lecture notes (in English) will be handed out in the class.

Geographic Data Processing with Python and ArcGIS

Objective
Students will learn the basics of geographic data processing using the Python programming language and ArcGIS Pro (arcpy). They will be able to implement their own geoprocessing scripts for spatial data analysis and modelling. Students will be able to integrate open source libraries into their Python scripts and know how to apply the libraries to geospatial datasets.

Content
The course covers basic Python language concepts such as data types, control structures and functions. It also introduces the use of key Python libraries in conjunction with geospatial datasets.

Prerequisites / notice
Basic knowledge of ArcGIS is assumed.

Environmental Systems Data Science: Data Processing

Objective
The students are able to
- frame a data science problem and build a hypothesis
- describe the steps of a typical data science project workflow
- conduct selected steps of a workflow on specifically prepared datasets, with a focus on choosing, fitting and evaluating appropriate algorithms and models
- critically think about the limits and implications of a method
- visualise data and results throughout the workflow
- access online resources to keep up with the latest data science methodology and deepen their understanding

Content
- The data science workflow
- Access and handle (large) datasets
- Prepare and clean data
- Analysis: data exploratory steps
- Analysis: machine learning and computational methods
- Evaluate results and analyse uncertainty
- Visualisation and communication

Abstract
Starting with an overview of selected results from parametric inference, kernel smoothing will be introduced along with some asymptotic theory, optimal bandwidth selection, data driven algorithms and some special topics. Selected numerical examples will be used for motivation. The presented methods will also be applicable elsewhere.

Objective
The students will learn about methods of kernel smoothing and application of concepts to data. The aim will be to build sufficient interest in the topic and intuition as well as the ability to implement the methods to various different datasets.

Content
Rough Outline:
- Parametric estimation methods: selection of important results
  - Method of Least squares: regression & diagnostics

- Nonparametric curve estimation
  - Density estimation, Kernel regression, Local polynomials, Bandwidth selection, various theoretical results related to consistency
  - Selection of special topics (as time permits, we will discuss some of the following): rapid change points, mode estimation, partial linear models, probability and quantile curve estimation, etc.

- Applications: potential areas of applications will be discussed such as, change assessment, trend and surface estimation and others.

Lecture notes
Summaries or outlines of some of the lecture material may be communicated to registered students by Email at irregular intervals.

Literature
References:
- Statistical Inference, by S.D. Silvey, Chapman & Hall.
- Density Estimation, by B.W. Silverman, Chapman and Hall.
- Additional references will be given out in the lectures.

Major in Human Health, Nutrition and Environment

Public Health
The module Public Health is compulsory for all students in the major Human Health, Nutrition and Environment.

### Applied Biostatistics

**Number**: 401-0629-00L  
**Title**: Applied Biostatistics  
**Type**: W  
**ECTS**: 4 credits  
**Hours**: 3G  
**Lecturers**: M. Tanadini

**Abstract**: This course covers the main methods used in Biostatistics. It starts by revising Linear Models (Regression, Anova), then moves to Generalised Linear Models (logistic regression and methods for count data) and finally introduces more advanced topics (Linear Mixed-Effects Models and Generalised Additive Models). The course strongly focuses on applied aspects of data analysis.

**Objective**: After this course students:
- revised Linear Models  
- revised or got introduced to Generalised Linear Models  
- got introduced to Linear Mixed-Effects Models  
- are able to select among these methods to solve an applied problem in Biostatistics  
- can perform the data analysis using the statistical software R  
- can interpret the results of such an analysis and draw valid "biological" conclusions

**Content**: This course is structured into three parts. The first part focuses on Linear and Generalised Linear Models. The second part introduces more advanced methodologies such as Linear Mixed-Effects Models and Generalised Additive Models. Both, part one and two will include the following topics: exploratory data analysis, model fitting, model "selection", residual diagnostics, model validation and results interpretation. Analyses will be carried out using the statistical software R. Finally, in the third part of the course students will be analysing real-world datasets to put into practice the knowledge and skills acquired during the first two parts.

**Prerequisites / notice**: The statistical software R will be used in the exercises. If you are unfamiliar with R, it is highly recommend to view the online R course "etutoR".

### Epidemiology and Prevention

**Number**: 752-6105-00L  
**Title**: Epidemiology and Prevention  
**Type**: W  
**ECTS**: 3 credits  
**Hours**: 2V  
**Lecturers**: M. Puhan, R. Heusser

**Abstract**: The module Epidemiology and prevention describes the process of scientific discovery from the detection of a disease and its causes, to the development and evaluation of preventive and treatment interventions and to improved population health.

**Objective**: The overall goal of the course is to introduce students to epidemiological thinking and methods, which are critical pillars for medical and public health research. Students will also become aware on how epidemiological facts are used in prevention, practice and politics.

**Content**: The module Epidemiology and prevention follows an overall framework that describes the course of scientific discovery from the detection of a disease to the development of prevention and treatment interventions and their evaluation in clinical trials and real world settings. We will discuss study designs in the context of existing knowledge and the type of evidence needed to advance knowledge. Examples from nutrition, chronic and infectious diseases will be used in order to show the underlying concepts and methods.

**Competencies**: Subject-specific Competencies: Concepts and Theories  
Method-specific Competencies: Analytical Competencies  
Decision-making  
Problem-solving  
Project Management  
Social Competencies: Communication  
Cooperation and Teamwork  
Personal Competencies: Creative Thinking  
Critical Thinking

### Public Health Concepts

**Number**: 752-6151-00L  
**Title**: Public Health Concepts  
**Type**: W  
**ECTS**: 3 credits  
**Hours**: 2V  
**Lecturers**: R. Heusser

**Abstract**: The module "public health concepts" offers an introduction to key principles of public health. Students get acquainted with the concepts and methods of epidemiology. Students also learn to use epidemiological data for prevention and health promotion purposes. Public health concepts and intervention strategies are presented, using examples from infectious and chronic diseases.

**Objective**: At the end of this module students are able:
- to interpret the results of epidemiological studies  
- to critically assess scientific literature  
- to know the definition, dimensions and determinants of health  
- to plan public health interventions and health promotion projects  
- to draw a bridge from evidence to policies and politics

**Content**: Concepts of descriptive and analytical epidemiology, study designs, measures of effect, confounding and bias, screening, surveillance, definition of health and health promotion, health dimensions and health determinants, prevention strategies, public health interventions, public health action cycle, epidemiology and prevention of infectious and chronic diseases (HIV, COVID-19, Obesity, Iodine/PH nutrition).

**Lecture notes**: Handouts are provided to students in the classroom.

**Competencies**: Subject-specific Competencies: Concepts and Theories  
Method-specific Competencies: Analytical Competencies  
Decision-making

### Nutrition and Health

#### Food and Consumer Behaviour

**Number**: 752-2122-00L  
**Title**: Food and Consumer Behaviour  
**Type**: W  
**ECTS**: 2 credits  
**Hours**: 2V  
**Lecturers**: M. Siegrist, F. Michel

**Abstract**: This course focuses on food consumer behavior, consumer's decision-making processes and consumer's attitudes towards food products.

**Objective**: Students will be able...
- to describe heuristics that influence consumer behavior in the food domain  
- to explain the consumer led food product development  
- to summarise how consumers perceive the environmental impact and the healthiness of foods  
- to assess the cultural, the environmental and the food policy impact on consumer behavior  
- to explain psychological factors influencing eating behavior

**Competencies**: Subject-specific Competencies: Concepts and Theories  
Method-specific Competencies: Analytical Competencies  
Decision-making  
Problem-solving  
Social Competencies: Communication  
Customer Orientation  
Sensitivity to Diversity  
Personal Competencies: Critical Thinking

#### Nutrition and Chronic Disease

**Number**: 752-6101-00L  
**Title**: Nutrition and Chronic Disease  
**Type**: W  
**ECTS**: 3 credits  
**Hours**: 2V  
**Lecturers**: F. von Meyenn, M. Andersson

**Abstract**: The module Nutrition and Chronic Disease is designed to introduce students to the following topics:
- to explain the consumption patterns and the role of the food industry in the development of chronic diseases  
- to analyse the role of the media in shaping consumer attitudes towards food  
- to assess the impact of food policies on consumer behavior

**Objective**: At the end of the course students will be able...
- to explain the relationship between nutrition and chronic disease  
- to assess the impact of food policies on consumer behavior  
- to analyse the role of the media in shaping consumer attitudes towards food  
- to assess the impact of food policies on consumer behavior

**Competencies**: Subject-specific Competencies: Concepts and Theories  
Method-specific Competencies: Analytical Competencies  
Decision-making  
Problem-solving  
Social Competencies: Communication  
Customer Orientation  
Sensitivity to Diversity  
Personal Competencies: Critical Thinking
Abstract
To have the student gain understanding of the links between the diet and the etiology and progression of chronic diseases, including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

Objective
To examine and understand the protective effect of foods and food ingredients in the maintenance of health and the prevention of chronic disease, as well as the progression of complications of the chronic diseases.

Content
The course evaluates food and food ingredients in relation to primary and secondary prevention of chronic diseases including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

Lecture notes
There is no script. PowerPoint presentations will be made available on-line to students.

Prerequisites / notice
No compulsory prerequisites, but prior completion of the courses "Introduction to Nutritional Science" and "Advanced Topics in Nutritional Science" is strongly advised.

Abstract
Fundamentals in nanostructured material - living system interactions focusing on the main exposure routes, lung, gastrointestinal tract, skin and intravenous injection.

Objective
Understanding the potential side effects of nanomaterials in a context-specific way, enabling to evaluate nanomaterial safety and provide knowledge to design safer materials.

Content
Building upon new technologies to engineer and functionalize well-defined nanostructured materials, a plethora of exciting discoveries were made and found their way in our daily live. These customized nanomaterials provides extraordinary properties and make them attractive for many innovative applications. Exactly these new properties may have the potential to be responsible for unforeseen side effects, which hamper a straightforward translation into new products. Therefore, the safety research provide the evidence for a responsible and sustainable use of nanomaterials.

The lecture will focus on basic principles of nanotoxicology, provide the understanding of the potential side effects of nanomaterial in a context-specific way addressing the main exposure routes such as inhalation, ingestion, topical applications and intravenous injections as well as it will provide impulses for safer material designs.

Structure of the planned lecture (2 x 45 min)
1. Introduction: the principles of nanotoxicology
2. Lung- particles interactions: two disease scenarios and their molecular mechanism
3. GI – particles interactions: intendent and unintended particle exposure via food
4. Skin – particles interactions: body care products and their influence on skin physiology
5. Intravenous injection: colloidal stability, protein corona and cellular effects
6. Micro- / Nanoplastics and development of a safety research plan
7. End of semester exam

Lecture notes
Handouts provided during the classes and references therein as well as primary literature as case studies will be posted to the course website.

</tbody>
</table>

Abstract
Students of this course will discuss current topics from the field of infectious disease biology. From a list of publications, each student chooses some themes that he/she is going to explain and discuss with all other participants and under supervision. The actual topics will change from year to year corresponding to the progress and new results occurring in the field.

Objective
This is an advanced course that will require significant student participation. Students will learn how to evaluate and present scientific literature and trace the development of ideas related to understanding the ecology and evolutionary biology of infectious diseases.

Content
A core set of ~10 classic publications encompassing unifying themes in infectious disease ecology and evolution, such as virulence, resistance, metapopulations, networks, and competition will be presented and discussed. Pathogens will include bacteria, viruses and fungi. Hosts will include animals, plants and humans.

Lecture notes
Publications and class notes can be downloaded from a web page announced during the lecture.

Literature
Papers will be assigned and downloaded from a web page announced during the lecture.

Ecological Parasitology

Does not take place this semester.
The course will not take place fall semester 2024.

Course focuses on the ecology and evolution of macroparasites and their hosts. Through lectures and practical work, students learn about diversity and natural history of parasites, adaptations of parasites, ecology of host-parasite interactions, applied parasitology, and human macroparasites in the modern world.

1. Identify common macroparasites in invertebrates.
2. Understand ecological and evolutionary processes in host-parasite interactions.
3. Conduct parasitological research

551-0223-00L Immunology III

Abstract

This course provides a detailed understanding of
- development of T and B cells
- the dynamics of a immune response during acute and chronic infection
- mechanisms of immunopathology
- modern vaccination strategies

Key experimental results will be shown to help understanding how immunological text book knowledge has evolved.
Guidelines will be handed out in the beginning.

Electronic copies of the presentation slides (PDF) and additional material will be made available for download to registered students.

Critical Thinking, A. Harms, fostered

Recommendations will be given in the first lecture

Literature will be identified based on the topic chosen.

Documents of the lectures are available for download at: https://moodle-app2.let.ethz.ch/course/view.php?id=2581

Obtain a detailed understanding of
- the development, activation, and differentiation of different types of T cells and their effector mechanisms during immune responses,
- Recognition of pathogenic microorganisms by the host cells and molecular events thereafter,
- events and signals for maturation of naive B cells to antibody producing plasma cells and memory B cells.

- Optimization of B cell responses by intelligent design of new vaccines

- Development and selection of CD4 and CD8 T cells, natural killer T cells (NKT), and regulatory T cells (Treg)
- NK T cells and responses to lipid antigens
- Differential, characterization, and function of CD4 T cell subsets such as Th1, Th2, and Th17
- Overview of cytokines and their effector function
- Co-stimulation (signals 1-3)
- Dendritic cells
- Evolution of the “Danger” concept
- Cells expressing Pattern Recognition Receptors and their downstream signals
- T cell function and dysfunction in acute and chronic viral infections

Immunology I and II recommended but not compulsory

Molecular Biology of Foodborne Pathogens 752-4009-00L

The course offers detailed information on selected foodborne pathogens and toxin producing organisms; the focus lies on relevant molecular biological aspects of pathogenicity and virulence, as well as on the occurrence and survival of these organisms in foods.

Detailed and current status of research and insights into the molecular basis of foodborne diseases, with a focus on interactions of the microorganism or the toxins they produce with the human system. Understanding the relationship between specific types of food and the associated pathogens and microbial risks. Another focus lies on the currently available methods and techniques useful for the various purposes, i.e., detection, differentiation (typing), and antimicrobial agents.

Molecular biology of infectious foodborne pathogens (Listeria, E. coli, Campylobacter, Salmonella, etc) and toxin-producing organisms (Bacillus, Clostridium, Staphylococcus). How and under which conditions will toxins and virulence factors be produced, and how do they work? How is the interaction between the human host and the microbial pathogen? What are the roles of food and the environment? What can be done to interfere with the potential risks? Which methods are best suited for what approach? Last, but not least, the role of bacteriophages in microbial pathogenicity will be highlighted, in addition to various applications of bacteriophage for both diagnostics and antimicrobial intervention.

Electronic copies of the presentation slides (PDF) and additional material will be made available for download to registered students.

Lectures (2 hours) will be held as a single session of approximately 60+ minutes (10:15 until approx. 11:15 h), without a break!

The compulsory course 701-1701-00L Human Health, Nutrition and Environment: Term Paper is offered in the autumn semester only.

Objective
- Acquisition of knowledge in the field of the review paper
- Assessment of original literature as well as synthesis and analysis of the findings
- Practising of academic writing in English
- Giving an oral presentation with discussion on the topic of the review paper
- Assessment of original literature as well as synthesis and analysis of the findings

Abstract
Writing of a review paper of scientific quality on a topic in the domain of Human Health, Nutrition and Environment based on critical evaluation of scientific literature.

- The development, activation, and differentiation of different types of T cells and their effector mechanisms during immune responses,
- Recognition of pathogenic microorganisms by the host cells and molecular events thereafter,
- Events and signals for maturation of naive B cells to antibody producing plasma cells and memory B cells.

- Optimization of B cell responses by intelligent design of new vaccines
- Development and selection of CD4 and CD8 T cells, natural killer T cells (NKT), and regulatory T cells (Treg)
- NK T cells and responses to lipid antigens
- Differential, characterization, and function of CD4 T cell subsets such as Th1, Th2, and Th17
- Overview of cytokines and their effector function
- Co-stimulation (signals 1-3)
- Dendritic cells

Data: 06.08.2024 12:40 Autumn Semester 2024 Page 2542 of 2684
Abstract

Students are introduced to a typical data science workflow using various examples from environmental systems. They learn common methods and key aspects for each step through practical application. The course enables students to plan their own data science project in their specialization and to use more domain-specific methods independently or in further courses.

Objective

The students are able to:

● frame a data science problem and build a hypothesis
● describe the steps of a typical data science project workflow
● conduct selected steps of a workflow on specifically prepared datasets, with a focus on choosing, fitting and evaluating appropriate algorithms and models
● critically think about the limits and implications of a method
● visualise data and results throughout the workflow
● access online resources to keep up with the latest data science methodology and deepen their understanding

Content

● The data science workflow
● Access and handle (large) datasets
● Prepare and clean data
● Analysis: data exploratory steps
● Analysis: machine learning and computational methods
● Evaluate results and analyse uncertainty
● Visualisation and communication

701-3003-00L Environmental Systems Data Science: Machine Learning

Abstract

Students are introduced to advanced data science where environmental data are analyzed using state of the art machine learning methods. Starting from known statistical approaches, they learn the principle of more advanced machine learning methods with practical application. The course enables students to plan their own data science project in their specialization and to apply machine learning methods.

Objective

The students are able to:

• select an appropriate model related to a research question and dataset
• describe the steps from data preparation to running and evaluating models
• prepare data for running machine learning with dependent and independent variable
• build and validate regressions and neural network models
• understand convolution and deep learning models
• access online resources to keep up with the latest data science methodology and deepen their understanding

Content

• The data science workflow
• Data preparation for running and validating machine learning models
• Get to know machine learning approaches including regression, random forest and neural network
• Model complexity and hyperparameters
• Model parameterization and loss
• Model evaluations and uncertainty
• Deep learning with convolutions

Literature

Building on existing data science resources

Abstract

The focus is on the implementation of projects:
- photovoltaics
- wind energy
- hydropower
You will learn about new business models, including storage and sector coupling, discuss framework conditions, economic efficiency, security of supply, market organization and business risks. Guidance from experts with many years of political and project experience.

Objective

You will receive a practice-oriented introduction to the regulatory and economic requirements for renewable energy projects.

You will be familiar with the options for integrating fluctuating energy production in an environment of volatile prices.

You will be familiar with the opportunities and risks and strategies for economic security.

Lecture notes

PPT presentation will be distributed (in German)
Fostering the reduction of CO2 emissions is crucial for limiting future climate change. In this course, we will explore various strategies and technologies for managing energy portfolios, particularly in the context of the European power market. The course will cover topics such as portfolio management, risk analysis, and trading strategies. Students will be expected to develop analytical and creative thinking skills, as well as effective communication and collaboration abilities.

Prerequisites / notice
For group exercises and presentations, the number of participants is limited to 30 students.

Competencies
Subject-specific Competencies
Method-specific Competencies
Social Competencies
Personal Competencies

Themes
Climate Change Mitigation: Carbon Dioxide Removal

Abstract
Future climate change can only be kept within reasonable bounds when CO2 emissions are drastically reduced. In this course, we will discuss a portfolio of options involving the alteration of natural carbon sinks and carbon sequestration. The course includes introductory lectures, presentations from guest speakers from industry and the public sector, and final presentations by the students.

Objective
The goal of this course is to investigate, as a group, a particular set of carbon mitigation/sequestration options and to evaluate their potential, their cost, and their consequences.

Content
From the large number of carbon sequestration/mitigation options, a few options will be selected and then investigated in detail by the students. The results of this research will then be presented to the other students, the involved faculty, and discussed in detail by the whole group.

Literature
For exercises, students build learning and presentation groups. Credit points are based on group performance.

Prerequisites / notice
Exam: No final exam. Pass/No-Pass is assigned based on the quality of the presentation and ensuing discussion.
Objective

Content
1. Pan-European power market and trading
   1.1. Power trading
   1.2. Development of the European power markets
   1.3. Energy economics
   1.4. Spot and OTC trading
   1.5. European energy exchange EEX

2. Market model
   2.1. Market place and organisation
   2.2. Balance groups / balancing energy
   2.3. Ancillary services
   2.4. Market for ancillary services
   2.5. Cross-border trading
   2.6. Capacity auctions

3. Portfolio and Risk management
   3.1. Portfolio management 1 (introduction)
   3.2. Forward and futures contracts
   3.3. Risk management 1 (m2m, VaR, hpfc, volatility, cVaR)
   3.4. Risk management 2 (PaR)
   3.5. Contract valuation (HPFC)
   3.6. Portfolio management 2
   2.8. Risk Management 3 (enterprise wide)

4. Energy & Finance I
   4.1. Options 1 basics
   4.2. Options 2 hedging with options
   4.3. Introduction to derivatives (swaps, cap, floor, collar)
   4.4. Financial modelling of physical assets
   4.5. Trading and hydro power
   4.6. Incentive regulation

Lecture notes
Handouts of the lecture

Prerequisites / notice
Case studies and ML exercise for Power Market can give bonus points for the exam. Guest speakers for specific topics.

</tbody>
</table>

Abstract
The course transmits fundamental knowledge for treating applied glaciological problems. Topics include climate-glacier interactions, glacier ice flow, glacier hydrology, ice avalanches, and lake ice.

Objective
The objectives of the courses are to:
- learn about fundamental glaciological processes, including glacier mass balance, ice dynamics, and glacier-related hazards;
- apply the above knowledge to some case studies inspired by contract-works performed at ETH's Glaciology section;
- generate the own computer code to solve the above case studies, and interpret the results;
- understand, both in class and in the field, the practical relevance of glaciology, with a focus on the Swiss applications.

Content
The course will develop along the following outline:
- How glaciology became a scientific discipline
- Glaciology and hydropower
- Glacier mechanics and ice flow
- Gravitational glacier instabilities
- Glacier hydrology and glacier lake outbursts
- Lake ice and ice bearing capacity
- Field excursion to Jungfraujoch
- Discussion of the exercises performed during the semester

Lecture notes
Digital lecture handouts will be distributed prior to each class.

Literature
Links to relevant literature will be provided during the classes.

Prerequisites / notice
Completed BSc studies. Basic knowledge in computer scripting in any language (e.g. Python, R, Julia, Matlab, IDL, ...) will be advantageous for solving the exercises. The exercises will be performed in groups. A minimal level of fitness is required for the field excursion.
Seminar in Glaciology

651-1581-00L

Abstract
Introduction to classic and modern literature of research in Glaciology. Active participation is expected and participants are mentored by PhD students of Glaciology.

Objective
In-depth knowledge of selected topics of research in Glaciology. Introduction to different types of scientific presentation. Improve ability of the discussion of scientific topics.

Content
Selected topics of scientific research in Glaciology
Lecture notes
Copies/pdf of scientific papers will be distributed during the course (moodle interface)
Prerequisites / notice
Active participation is expected with presence at the sessions. Only a limited number of participants can be accepted. One of the following courses should be taken as preparation:
- 651-3561-00L Kryosphäre
- 101-0289-00L Applied Glaciology
- 651-4101-00L Physics of Glaciers

Quantification and Modeling of the Cryosphere: Dynamic Processes (University of Zurich)

651-4077-00L

Abstract
This course introduces quantitative approaches and models to processes of the cryosphere in high mountain areas. The main focus are dynamic and thermal processes related to glaciers and permafrost. During the course, simple mathematical and numerical models will be used to investigate ground temperature profiles as well as glacier evolution and dynamics in relation to climate.

Objective
This course combines lectures providing the background on the physical processes and methods with computer practicals in which quantitative methods are applied to glaciers and permafrost processes. These lectures and practicals run as 2-hour blocks per week and are combined with group and individual excercises. Topics indicative for the content of this course are:

- Heat flow processes in the ground and in glaciers, and their solution with numerical models.
- Glacier dynamics and evolution in relation to climate change.
- Simple and reduced mathematical models for glacier flow.
- Numerical models for glacier dynamics.

Content
For the modeling and project parts of the course, programs written in the Python programming language are used. Prior Python or programming knowledge is not necessary, and introductory tutorials are given.

Physics of Glaciers

651-4101-00L

Abstract
Understanding glaciers and ice sheets with simple physical concepts. Topics include the reaction of glaciers to the climate, flow of glacier ice, temperature in glaciers and ice sheets, glacier hydrology, glacier seismology, basal motion and calving glaciers. A special focus is the current development of the ice sheets of Greenland and Antarctica.
Objective
After the course the students are able understand and interpret measurements of ice flow, subglacial water pressure and ice temperature. They will have an understanding of glaciology-related physical concepts sufficient to understand most of the contemporary literature on the topic. The students will be well equipped to work on glacier-related problems by numerical modeling, remote sensing, and field work.

Content
The dynamics of glaciers and polar ice sheets is the key requisite to understand their history and their future evolution. We will take a closer look at ice deformation, basal motion, heat flow and glacier hydraulics. The specific dynamics of tide water and calving glaciers is investigated, as is the reaction of glaciers to changes in mass balance (and therefore climate).

Abstract
This course provides an overview of the main natural hazards and their importance in a national and international context. The probability, risk and implications of various natural hazards will be discussed, along with potential management options. The course consists of introductory lectures and exercises, seminars with guest lectures by experts and a field trip.

Objective
By the end of the course, students will be able to:

- explain the main natural hazards, their processes and their importance in different contexts.
- describe the likelihood, risk, and consequences of natural hazards and their management options.
- identify and discuss the development of natural hazards in the context of climate change.

101-1250-00L | Transport Processes in Torrents | W | 3 credits | 2V | I. Schalko

Abstract
This course focuses on the various transport processes in torrents. This includes discharge, bedload, debris flow, and large wood. Differences between transport processes in rivers versus torrents will be discussed. Special focus will be put on the (1) analysis of the interaction between the transport processes (cascading processes) and the (2) design of countermeasures.

Objective
At the end of the course, the students will be able to:

(1) Describe the different transport processes in torrents, such as flow discharge or bedload transport,
(2) discuss how cascading processes affect the resulting natural hazard, and
(3) derive solutions for a sustainable hazard management.

Content
The first part of the lecture introduces the different transport processes in torrents such as discharge, bedload, debris flow, and large wood. This will include methods to determine and calculate the discharge, characterize debris flow, and quantify wood load.

In the second part of the lecture, special focus will be put on the cascading effects (what happens if multiple transport processes occur at once) and their implications on the resulting natural hazards.

The last part of the lecture focuses on the design of countermeasures such as check dams and will include examples from selected catchments in Switzerland.

Lecture notes
Lecture slides can be downloaded via Moodle.

Abstract
The discipline of Forest operations is constantly challenged to find solutions for unique problems. Each forest site requires specific technological approaches and machinery based on given management goals and ecological and environmental circumstances. Various terrain types and soil conditions, harvesting costs and taking care of the workforce by creating safe working conditions are some of the a

Objective
In this course, students will learn to use a wide variety of approaches grounded in the natural sciences, engineering and technology to develop solutions tailored to unique challenges from the field of forest operations. The course is aimed at students who either plan an academic or professional career in the field of forest operations, or who will work at the interface between forest operations and the various related disciplines, such as forest ecosystem management and forestry in the wider sense.

After participating in this course students will have acquired foundational knowledge of a wide variety of core elements in the field of forest operations:
• The course will provide students with the ability to describe and differentiate site and stand conditions from an engineering perspective.
• Students will gain an overview and good working knowledge of current technology used in forest operations in Switzerland and around the world.
• Students will acquire the ability to assess the strength and weaknesses of the most commonly used equipment and analyze their suitability for a given set of environmental, economic and social factors.
• Students will be able to combine different types of technology to create an optimal harvesting system for a given task, and assess a given system for its task specific suitability.
• Participants will be able to assess the sustainability and potential short- and long-term impacts of harvesting systems under ecological, economic and social constraints.
Content

Introduction
• Historic overview
• Scope of operation
• Site and stand characteristics

101-0637-10L Wood Structure and Function
W 3 credits 2G  I. Burgert, G. von Arx

Abstract
The course Wood structure and function conveys basic knowledge on the microstructure of softwoods and hardwoods as well as general and species-specific relationships between growth processes, wood properties and wood function in the living tree.

Objective
Learning target is a basic understanding of the anatomy of wood and the related impact of endogenous and exogenous factors. The students can learn how to distinguish common central European wood species at the macroscopic and microscopic level. A deeper insight will be given by wood identification exercises for softwood species. Further, the students will gain insight into the relationships between tree growth and wood properties with a specific focus on the wood function in the living tree.

Content
In an introduction to wood anatomy, the general structural features of softwoods and hardwoods will be explained and factors of diversity and variability will be discussed. A specific focus is laid on common central European tree species with relevance in the wood sector, which will be studied in macro-and microstructural investigations. In the following, relationships between wood structure, properties and function in the living tree will be the focus of the lectures. Topics covered are water transport, trends in wood anatomy within trees, environmental impact on wood anatomy, wood defects and their causes, tools to study wood properties over time, secondary changes in wood, and tree biomechanics.

101-0637-20L Wood processing
W 3 credits 2G  I. Burgert, S. Koch, M. Schubert

Abstract
The course Wood Processing conveys knowledge on the technological properties of wood and wood-based materials as well as on industrial processes for the fabrication of a vast variety of wood products and covers new developments in the field of digital technologies.

Objective
The learning target is a fundamental understanding of the dominating wood processing chains, which are applied to manufacture common wood products. Students will be introduced to the economic relevance of the renewable resource wood and are trained in its technological properties. The students will learn to identify the relationships between wood species and their properties as well as the suitable wood machining processes to fabricate targeted wood products. Finally, the digital transformation process, which will affect all sectors of the wood industry with an impact on the entire value chain and business models will be covered. It will be illustrated how production processes can become more flexible, efficient and less resource-demanding.
Content
The general introduction shows the economic relevance of the resource wood in a global, European, and Swiss context and reflects aspects of sustainability in wood production. In terms of bulk wood products, a specific focus is laid on sawn timber production and drying processes. Concerning wood veneer production, steaming, veneer cutting, and assembly to veneer lumber products are presented. Further, the common technologies for the production of particle boards and fibre boards will be discussed. Topics related to wood gluing and wood protection as well as potentials and limitations in the application of wood and wood-based products are covered. In a further part, the lecture deals with the most important digital technologies, e.g. Internet of Things, artificial intelligence, and their impact on the wood industry based on illustrative examples.

**Abstract**
Water limitation is a primary constraint on plant growth and terrestrial fluxes worldwide. In this course, the principles of water flow in soil and plants are discussed, with particular attention on the effects of drought and root water uptake, transpiration and plant growth. Strategies of plants to tolerate drought are discussed in relation to both agricultural and ecological implications.

**Objective**
The students are able to: explain and compare systematically the drivers of water stress to plants; to solve the equations of water flow in soil and plants; to calculate plant water status for varying soil and climatic conditions and plant traits; to critically review and present one research question in soil-plant water relations; to openly debate on the current trends in soil and plant water research and climate change ecology.

**Content**

**Part 1 - Lectures**
- Week 1: Introduction.
- Week 2: Soil water relations; Principles of soil water retention and soil water flow; Soil hydraulic properties.
- Week 3: Root water uptake; soil hydraulic constraints on transpiration
- Week 4: Rhizosphere processes and properties; root-soil contact; root hairs; mycorrhiza; rhizodeposition.
- Week 5: Water flow in roots and xylem; root anatomy, architecture and plasticity; cavitation.
- Week 6: Transpiration; Vapor Pressure Deficit; Photosynthesis; Stomatal regulation.
- Week 7: Soil-plant-atmospheric continuum; Below- and above-ground feedbacks; Soil and atmospheric drivers of transpiration losses.

**Part 2 - Seminar**
- Week 8: Plant response to drought and consequences for agriculture and forests. Open questions and introduction to seminar topics.
- Week 9: Class work - preparation of the presentations/Debate
- Week 10: Class work - preparation of the presentations/Debate
- Week 11: Seminar/Debate (presentations)
- Week 12: Seminar/Debate (presentations)
- Week 13: Seminar/Debate (presentations)
- Week 14: Feedback, Summary, Conclusion

**Abstract**

In this seminar, students are introduced to the multi-disciplinary field of political ecology to investigate human-environment relationships in food and agricultural systems.

**Objective**

- Being able to provide an overview of the multi-disciplinary field of political ecology for investigating the relationships of humans to our environment
- Learn to identify how power and interest influence social-ecological systems and to distinguish symptoms from systemic root causes
- Become enabled to analyse complex and sometimes distant human-ecology relationships choosing from a broad range of methods

**Content**

In this seminar, students will review common narratives in agri-food systems informed by a range of different theories and assisted by different analytical tools. For this purpose, we will start from different concepts of nature, power and interests, explore different ontologies and epistemologies through a set of topics such as hunger, obesity, agrobiodiversity and seeds, forests and deforestation, climate change and food production. Students will explain one concept in each course to the groups and practice their argumentative and writing skills in a final essay, applying the acquired tools to a topic of their choice. While specific inputs from external lecturers broaden our perspective, enough time for critical discussion and reflection will be granted.

Questions regarding the application to johanna.jacobi@usi.ch.

The selected students will be notified until 9 September.

751-2107-00L Agrarian and Environmental Values: Tensions, Synergies, Practices and Policies

**Abstract**

In politics, society, and science, it can seem that the values and practices of agricultural production and environmental protection are in conflict. This tension is often described as “protection versus use” of natural resources. We will explore ways to move beyond the apparent conflict. We will apply this learning to field trips and transdisciplinary projects.

**Objective**

Students are able to:

- Define different kinds and categories of values.
- Relate value concepts to their own studies, life, and experiences through reflective journaling.
- Infer the underlying values in a text or policy about agri-environmental topics.
- Collaboratively develop a transdisciplinary project for an agri-environmental case study from the field trips.

**Content**

The course consists of interactive seminars alongside fieldtrips to farms that have found innovative solutions to balancing protection and production.

Seminars will cover topics such as the relationship between values and behavior and how people perceive value trade-offs. We will also discuss environmental ethics, environmental valuation and its critiques, the interplay of facts and values in agri-environmental decision-making, cultural ecosystem services, and relational values.

This class requires active participation. Learning is based on in-class activities, group work and fieldtrips.
The students will understand the impact of environmental factors on plant physiology and will learn the theoretical basis and terminology of plant ecophysiology. Students will check and implement their knowledge and understanding of ecophysiology using measurement data. Plant ecophysiology that is necessary to analyze yield potentials in agriculture. The students will learn about classical and latest studies in C allocation, yield and production, stress physiology. Working with measurement data and Jupyter Notebooks is included.

Plant Ecophysiology

W 2 credits 2V N. Buchmann, A. Walter

Objective

The students will understand the impact of environmental factors on plant physiology and will learn the theoretical basis and terminology of plant ecophysiology that is necessary to analyze yield potentials in agriculture. The students will learn about classical and latest studies in plant ecophysiology. Students will check and implement their knowledge and understanding of ecophysiology using measurement data.
Content

Research results in agro- and forest ecosystem sciences will be presented by experienced researchers as well as by doctoral and graduate students. Citation classics as well as recent research results will be discussed. Topics will range from plant ecophysiology, biodiversity and biogeochemistry to management aspects in agro- and forest ecosystems.

Objective

Students will be able to understand and evaluate experimental design and data interpretation of on-going studies, be able to critically analyze published research results, practice to present and discuss results in the public, and gain a broad knowledge of recent research and current topics in agro- and forest ecosystem sciences.

Content

751-4104-00L Alternative Crops  W  2 credits  2V  A. Walter, K. Berger Büter

Abstract

Few crops dominate the crop rotations worldwide. Following the goal of an increased agricultural biodiversity, species such as buckwheat but also medicinal plants might become more important in future. The biology, physiology, stress tolerance and central aspects of the value-added chain of the above-mentioned and of other alternative crops will be depicted.

Objective

During this course, students learn to assess the potential of different minor or alternative crops compared to the dominant major crops based on their biological and agronomical features. Each student will assess and present a specific alternative crop of his or her choice based on information from scientific articles and Wikipedia. Wikipedia-entries will be generated.

751-4704-00L Weed Science  W  3 credits  2G  B. Streit, U. J. Haas

Abstract

Modern weed management comprises competent knowledge of weed biology, weed ecology, population dynamics, crop-weed-interactions and different measures to control weeds. Weeds are understood to be rather part of a habitat or a cropping system than just unwanted plants in crops.

Objective

At the end of the course the students are qualified to develop sustainable solutions for weed problems in agricultural and natural habitats.

Content

Modern weed management comprises competent knowledge of weed biology, weed ecology, population dynamics, crop-weed-interactions and different measures to control weeds. Weeds are understood to be rather part of a habitat or a cropping system than just unwanted plants in crops. Accordingly, this knowledge will be imparted during the course and will be required to understand the mechanisms of integrated weed control strategies.

751-5003-00L Sustainable Agroecosystems II  W  2 credits  2V  K. Benabderrazik, J. Six

Abstract

This class conveys current topics and methods of agroecological and food systems research through selected case studies from ongoing research of the Sustainable Agroecosystems group. Students will be encouraged to develop critical thinking competencies, through individual and group work, on major agricultural and food system challenges and paths towards agricultural and food system transformation.

Objective

(1) Systematically analyse and discuss case studies from ongoing agroecological and food system research.
(2) Learn and experiment on methods for field and laboratory investigations in agroecology.
(3) Engage with positive and empowering frameworks that motivate critical reflection and action on the types of transformative responses needed to adapt and thrive within agricultural and food systems.
(4) Reflect critically on agricultural and food system transformation tools and methods from the perspective a food system stakeholder.
(5) Identify and describe institutions in the context of sustainable agricultural development (for Bachelor and Master thesis and internships).
The course will address a wide range of agricultural and food system challenges (e.g., food security, climate crisis, soil degradation, etc.) in both temperate and tropical contexts. In class we will address topics like building food system resilience through innovative measures, improving soil fertility management or understanding the effects of agroforestry systems. Case studies from the on-going research in the Sustainable Agroecosystems Group (sae.ethz.ch) will be presented, covering different scales (e.g., food value-chains, farm dynamics and soil management).

The class is complemented by practical group work conducted with the CSA Meh Als Gmues in Zürich on Measuring and monitoring Agroecological performance.

Students will gain an overview on institutions and actors’ roles in the field of sustainable agricultural development. Throughout the group work, students will learn to engage directly with various stakeholders, monitor agroecological transition and communicate their research to a wider audience. Ultimately, this class should provide an overview on methods, tools, innovations and platforms that support a sustainable food transformation.

Literature

Prerequisites / notice
Prior participation in the lecture Nachhaltige Agrarökosysteme I (Sustainable Agroecosystems I) 751-5000-00G (spring term) recommended.

Abstract
Relationship between economy and environment, market failures, external effects and public goods, contingent valuation, internalisation of externalities, economics of non-renewable resources, economics of renewable resources, environmental cost-benefit analysis, sustainability economics, and international resource and environmental problems.

Objective
A successful completion of the course will enable a thorough understanding of the basic questions and methods of resource and environmental economics and the ability to solve typical problems using appropriate tools consisting of concise verbal explanations, diagrams or mathematical expressions. Concrete goals are first of all the acquisition of knowledge about the main questions of resource and environmental economics and about the foundation of the theory with different normative concepts in terms of efficiency and fairness. Secondly, students should be able to deal with environmental externalities and internalisation through appropriate policies or private negotiations, including knowledge of the available policy instruments and their relative strengths and weaknesses. Thirdly, the course will allow for in-depth economic analysis of renewable and non-renewable resources, including the role of stock constraints, regeneration functions, market power, property rights and the impact of technology. A fourth objective is to successfully use the well-known tool of cost-benefit analysis for environmental policy problems, which requires knowledge of the benefits of an improved natural environment. The last two objectives of the course are the acquisition of sufficient knowledge about the economics of sustainability and the application of environmental economic theory and policy at international level, e.g. to the problem of climate change.

Content
The course covers all the interactions between the economy and the natural environment. It introduces and explains basic welfare concepts and market failure; external effects, public goods, and environmental policy; the measurement of externalities and contingent valuation; the economics of non-renewable resources, renewable resources, cost-benefit-analysis, sustainability concepts; international aspects of resource and environmental problems; selected examples and case studies. After a general introduction to resource and environmental economics, highlighting its importance and the main issues, the course explains the normative basis, utilitarianism, and fairness according to different principles. Pollution externalities are a deep core topic of the lecture. We explain the governmental internalisation of externalities as well as the private internalisation of externalities (Coase theorem). Furthermore, the issues of free rider problems and public goods, efficient levels of pollution, tax vs. permits, and command and control instruments add to a thorough analysis of environmental policy. Turning to resource supply, the lecture first looks at empirical data on non-renewable natural resources and then develops the optimal price development (Hotelling-rule). It deals with the effects of explorations, new technologies, and market power. When treating the renewable resources, we look at biological growth functions, optimal harvesting of renewable resources, and the overuse of open-access resources. A next topic is cost-benefit analysis with the environment, requiring measuring environmental benefits and measuring costs. In the chapter on sustainability, the course covers concepts of sustainability, conflicts with optimality, and indicators of sustainability. In a final chapter, we consider international environmental problems and in particular climate change and climate policy.

Objective
- to develop a better understanding of decision making under uncertainty and risk;
- gain hands-on experience in risk analysis and management using R
- to gain experience in different approaches to analyze risky decisions;
- to develop an understanding for different sources of risk in agricultural production;
- to understand the crucial role of subjective perceptions and preferences for risk management decisions;
- to get an overview on risk management in the agricultural sector, with a particular focus on insurance solutions
- to get insights in the role of big data and machine learning for agricultural risk management

Content
- Quantification and measurement of risk
- Risk preferences, Expected Utility Theory, Cumulative Prospect Theory
- Production and input use decisions under risk
- Portfolio Theory and Farm Diversification
- Forwards, Futures, Crop Insurance
- Weather index insurance and satellite imagery
- Big data and machine learning for agricultural risk management
- Empirical Applications using R

Lecture notes
Handouts will be distributed in the lecture and available on the moodle.

Prerequisites / notice
knowledge of basic concepts of probability theory and microeconomics

Competencies

Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies
- Analytical Competencies
- Decision-making

- Sensitivity to Diversity

Personal Competencies
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

Prerequisites / notice
Empfohlene Vorkenntnisse:
- Grundkenntnisse der Ökonomie/Agrarökonomie
- Vorlesung Einführung in die Mikroökonomie

Literature

751-0903-00L Microeconomics of the Agriculture and Food Sector W 3 credits 2V L. Zachmann

Abstract
In dieser Vorlesung werden ökonomische Charakteristika des Agrar- und Lebensmittelsektors herausgearbeitet und anderen Sektoren gegenübergestellt. Fokus ist dabei Lebensmittelindustrie in der Schweiz und in der EU. Es werden mikroökonomische Zusammenhänge, insbesondere zur Preis- und Mengenbildung in verschiedenen Wettbewerbsmodellen, am Fallbeispiel des Agrar- und Ernährungssektors vermittelt.

Objective

Content
- Der Agrar- und Lebensmittelsektor in der EU und der Schweiz
- Preiselastizitäten von Angebot und Nachfrage im Ernährungssektor
- Gewinnmaximierung
- Grundlagen der Spieltheorie
- Monopol / Monopolistischer Wettbewerb
- Oligopol (Stackelberg, Cournot, Bertrand)
- Monopson
- Produktdifferenzierung
- Preisdiskriminierung
- Kartelle

Literature

751-1311-00L Introduction to Agricultural Management W 2 credits 2V R. Finger

Abstract
Vermittlung von betriebswirtschaftlichen Grundlagenwissen und Analyse- und Planungsinstrumenten mit Anwendung auf Unternehmen der Agrar- und Ernährungswirtschaft

Objective
Teilnehmer des Kurses sollen am Ende der Vorlesung i) grundlegende Unternehmensentscheide strukturieren und analysieren können, ii) verschiedene Analyse- und Planungsinstrumente auf Fragestellungen der Produktionsplanung, Investition und Finanzierung an Beispielen anwenden zu können, iii) verschiedene Werkzeuge zur unternehmerischen Entscheidungsunterstützung anwenden können und iv) die Spezifika von Unternehmen in der Agrar- und Ernährungswirtschaft kennen.

Content
Die Vorlesung geht auf folgende Inhalte, mit spezifischen Anwendungen im Agrar- und Ernährungssektors ein:

- Grundlagen und Ziele unternehmerischen Entscheidens
- Kosten und Leistungsrechnung
- Produktionstheorie
- Produktionsprogrammplanung
- Investitionsplanung und Finanzierung
- Entscheidungen unter Unsicherheit und Risikomanagement

### 751-1573-00L Dynamic Simulation in Agricultural and Regional Economics

**W** 3 credits 2V  B. Kopainsky

**Abstract**
In this class, students learn the basics of system dynamics and its application to agricultural and regional economic questions. In the second half of the class, students develop their own simulation model, with which they evaluate potential interventions for improving the economic as well as the ecological sustainability of food systems.

**Objective**
- Students learn the basic theory and practice of dynamic simulation
- Students can develop, analyze and extend a dynamic simulation model and interpret its results.
- By applying the developed simulation model, students gain insights into food system issues. They also learn to recognize the benefits and pitfalls of dynamic simulation, both from a theoretical and an applied perspective.

**Lecture notes**
slides (will be provided during the class)

**Literature**
articles and papers (will be provided during the class)

### 751-2103-00L Socioeconomics of Agriculture

**W** 2 credits 2V  S. Mann

**Abstract**
The main part of this lecture will examine constellations where hierarchies, markets or cooperation have been observed and described in the agricultural sector. On a more aggregated level, different agricultural systems will be evaluated in terms of main socioeconomic parameters like social capital or perceptions.

**Objective**
Students should be able to describe the dynamics of hierarchies, markets and cooperation in an agricultural context.

**Content**
- Introduction to Sociology
- Introduction to Socioeconomics
- Agricultural Administration: Path dependencies and efficiency issues
- Power in the Chain
- The farming family
- Occupational Choices
- Market segregation
- The issue of meat demand
- Common Resource Management in Alpine Farming
- Agricultural Cooperatives
- Societal perceptions of agriculture
- Perceptions of farming from within
- Varieties of agricultural systems and policies

**Lecture notes**

**Literature**
see script

**Prerequisites / notice**
Basic economic knowledge is expected.

**Competencies**
- Subject-specific Competencies: Concepts and Theories: assessed
- Techniques and Technologies: assessed
- Analytical Competencies: assessed
- Cooperation and Teamwork: assessed
- Creative Thinking: assessed
- Critical Thinking: assessed

### 751-2105-00L Political Ecology of Food and Agriculture

**W** 3 credits 2G  J. Jacobi

**Number of participants limited to 25.**
All students who register will be on the waiting list. A motivational application is required until 6 September:
- presenting yourself and your studies
- stating what topic in the field of Political Ecology that you are interested in
- suggesting one paper to enrich the literature list for the course

The selected students will be notified until 9 September.
Questions regarding the application to johanna.jacobi@usys.ethz.ch.

**Abstract**
In this seminar, students are introduced to the multi-disciplinary field of political ecology to investigate human-environment relationships in food and agricultural systems.

**Objective**
- Being able to provide an overview of the multi-disciplinary field of political ecology for investigating the relationships of humans to our environment
- Learn to identify how power and interest influence social-ecological systems and to distinguish symptoms from systemic root causes
- Become enabled to analyse complex and sometimes distant human-ecology relationships choosing from a broad range of methods

**Content**
We will review common narratives in agri-food systems informed by a range of different theories and assisted by different analytical tools.
For this purpose, we will start from different concepts of nature, power and interests, explore different ontologies and epistemologies through a set of topics such as hunger, obesity, agrobiodiversity and seeds, forests and deforestation, climate change and food production. Students will explain one concept in each course to the groups and practice their argumentative and writing skills in a final essay, applying the acquired tools to a topic of their choice. While specific inputs from external lecturers broaden our perspective, enough time for critical discussion and reflection will be granted.

Evaluation of Agricultural Policies

W 3 credits 2G

R. Huber, R. Finger, C. Schader

Abstract

In this course, students get an overview of agricultural policy evaluations and their societal and political relevance. They learn to understand and apply the principles of scientific based evaluations of agricultural policies.

Objective

The course has four major learning objectives: 1) Students know the conceptual background of evaluations and can relate concepts in agricultural economics to the evaluation of policies. 2) They know the basics of how to design and implement a policy evaluation study. 3) Students can transfer their methodological knowledge from other agricultural economics courses to the context of agricultural policy evaluations (econometrics, modelling etc.). They make hands-on experiences of methodological challenges. 4) They can critically assess the science-policy interface of policy evaluations.

Content

The course consists of two blocks: First, students will learn the basics of how to design, implement and interpret agricultural policy evaluations. In this block, the conceptual embedding, the design and methodological tools as well as case studies are presented. Secondly, the students make hands-on experience using econometric and modelling tools in the context of agricultural policy evaluations. They apply their theoretical and empirical knowledge to Swiss case studies.

J. Ghazoul

Abstract

This course introduces students to foundational texts that led to the emergence of the environment as a subject of scientific importance, and shaped its relevance to society. Above all, the course seeks to give confidence and raise enthusiasm among students to read more widely around the broad subject of environmental sciences and management both during the course and beyond.

Objective

The course will provide students with opportunities to read, discuss, evaluate and interpret key texts that have shaped the environmental movement and, more specifically, the environmental sciences. Students will gain familiarity with the foundational texts, but also understand the historical context within which their academic and future professional work is based. More directly, the course will encourage debate and discussion of each text that is studied, from both the original context as well as the modern context. In so doing students will be forced to consider and justify the current societal relevance of their work.
The course will be run as a book reading club. The first session will provide a short introduction as to how to explore a particular text (that is not a scientific paper) to identify the key points for discussion.

Thereafter, in each week a text (typically a chapter from a book or a paper) considered to be seminal or foundational will be assigned by a course lecturer. The lecturer will introduce the selected text with a brief background of the historical and cultural context in which it was written, with some additional biographical information about the author. He/she will also briefly explain the justification for selecting the particular text.

The students will read the text, with two to four students (depending on class size) being assigned to present it at the next session. Presentation of the text requires the students to prepare by, for example:

- identifying the key points made within the text
- identifying issues of particular personal interest and resonance
- considering the impact of the text at the time of publication, and its importance now
- evaluating the text from the perspective of our current societal and environmental position

Such preparation would be supported by a mid-week tutorial discussion (about 1 hour) with the assigning lecturer.

These students will then present the text (for about 15 minutes) to the rest of the class during the scheduled class session, with the lecturer facilitating the subsequent class discussion (about 45 minutes). Towards the end of the session the presenting students will summarise the emerging points (5 minutes) and the lecturer will finish with a brief discussion of how valuable and interesting the text was (10 minutes). In the remaining 15 minutes the next text will be presented by the assigning lecturer for the following week.

The specific texts selected for discussion will vary, but examples include:

- Leopold (1949) A Sand County Almanach
- Carson (1962) Silent Spring
- Jared Diamond (2005) Collapse

Discussions might also encompass films or other forms of media and communication about nature.

Content

The students are able to:

- frame a data science problem and build a hypothesis
- describe the steps of a typical data science project workflow
- conduct selected steps of a workflow on specifically prepared datasets, with a focus on choosing, fitting and evaluating appropriate algorithms and models
- critically think about the limits and implications of a method
- visualise data and results throughout the workflow
- access online resources to keep up with the latest data science methodology and deepen their understanding
- critically think about the limits and implications of a method
- visualise data and results throughout the workflow
- access online resources to keep up with the latest data science methodology and deepen their understanding
- critically think about the limits and implications of a method
- visualise data and results throughout the workflow
- access online resources to keep up with the latest data science methodology and deepen their understanding

Objective

- The data science workflow
- Access and handle (large) datasets
- Prepare and clean data
- Analysis: data exploratory steps
- Analysis: machine learning and computational methods
- Evaluate results and analyse uncertainty
- Visualisation and communication

Professional Internship

Course Catalogue of ETH Zurich

701-1001-00L Professional Internship

Only for Environmental Sciences MSc.

Completion and enrollment for the course «Professional Internship» is only possible after admission requirements and all additional requirements are fulfilled.

Registration and recognition of professional internship via https://www.lehrbetrieb.ethz.ch/praxis

No registration in myStudies required. For more information consult the Moodle-course Berufspraxis UMNW – Internship Env.Sc.: https://moodle-app2.let.ethz.ch/course/view.php?id=13229

In the internship outside of ETH Zürich, the students in Environmental Sciences learn about how environmental issues are handled professionally through their own practical work and by applying the knowledge they acquired. They will analyse complex environmental problems on scientific, technical and social levels and develop solutions in conjunction with social actors.
During the internship, students will learn how to professionally handle environmental issues from the technical-scientific, planning, administrative, and/or advisory perspective through their own practical experiences. They should apply the knowledge acquired from their studies. Furthermore, students will deepen their understanding in terms of development and implementation of environmental-friendly solutions in an everyday work-routine. Through this experience, they will develop important professional competence. Moreover, the internship will show them possible professional fields and establish valuable contacts for starting their careers in the future.

Job positions for environmental scientists are available in the following areas: environmental consulting firms, engineering and planning offices, clean-tech companies, industrial and service companies, federal administration, administration of cantons and municipalities, organizations and associations as well as companies operating in education, higher education, and media in relation to environmental and sustainable themes. Generally, the internship is performed outside of universities, colleges and research institutes.

Further support is provided by the company catalogue with companies in Switzerland and abroad that offer internships according to possibilities or where professional internships have taken place so far: https://www.usys.ethz.ch/pa-internship-envsc

Further information and support online https://moodle-app2.let.ethz.ch/course/view.php?id=15228

Upon successful completion of the course, you will be able to:
- Describe the basic microeconomic and macroeconomic problems and theories.
- Make economic arguments to a given topic.
- Evaluate economic measures.

Households, firms, supply and demand: How are household preferences and consumption behavior formed? How does a household react to price changes? How are goods prices formed? At what prices are firms willing to offer goods? How do we make economic decisions?

Markets: What is "perfect competition" and how does a competitive market work? Are monopolies always a bad thing? How can governments influence the market?

Market failure: What happens when prices give wrong signals?

Labor market: How do supply and demand work in the labor market? What influences unemployment?

National Accounts: How big is the Swiss economy?

Foreign trade: Why do countries trade with each other? What are the consequences for the domestic market?

Money and inflation: What exactly is money? How does money creation work, and what happens when there is too much (or too little) money on the market?

Students will be asked to apply these concepts to issues in their own field of study and to current issues in society.

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Concepts and tools in physics: mechanics of point-like and rigid bodies, elasticity theory, elements of hydrostatics and hydrodynamics, periodic motion and mechanical waves.
The "way of thinking" and the methodology in Physics. Magnetism, Refraction and Diffraction of Waves, Elements of Quantum Mechanics with applications to Spectroscopy, Thermodynamics, Phase Transitions, Transport Phenomena.

Objective
Introduction to the scientific methodology. The student should develop his/her capability to turn physical observations into mathematical models, and to solve the latter.
The student should acquire an overview over the basic concepts used in mechanics, in the theory of heat and electricity.

406-0251-AAL Mathematics I
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Abstract
This course covers mathematical concepts and techniques necessary to model, solve and discuss scientific problems – notably through ordinary differential equations.

Objective
Mathematics is of ever increasing importance to the Natural Sciences and Engineering. The key is the so-called mathematical modelling cycle, i.e. the translation of problems from outside of mathematics into mathematics, the study of the mathematical problems (often with the help of high level mathematical software packages) and the interpretation of the results in the original environment.

The goal of Mathematics I and II is to provide the mathematical foundations relevant for this paradigm. Differential equations are by far the most important tool for modelling and are therefore a main focus of these courses.

Content
1. Linear Algebra and Complex Numbers:
systems of linear equations, Gauss-Jordan elimination, matrices, determinants, eigenvalues and eigenvectors, cartesian and polar forms for complex numbers, complex powers, complex roots, fundamental theorem of algebra.

2. Single-Variable Calculus:
review of differentiation, linearisation, Taylor polynomials, maxima and minima, antiderivative, fundamental theorem of calculus, integration methods, improper integrals.

3. Ordinary Differential Equations:
separable ordinary differential equations (ODEs), integration by substitution, 1st and 2nd order linear ODEs, homogeneous systems of linear ODEs with constant coefficients, introduction to 2-dimensional dynamical systems.

Literature
- Bretscher, O.: Linear Algebra with Applications (Pearson Prentice Hall).

Prerequisites / notice
familiarity with the basic notions from Calculus, in particular those of function, derivative and integral.

Schedule and location of the assistance hours (Mathe-Lab) may be found on the Moodle webpages for the parallel courses in German:
- 401-0251-00L Mathematik I in the Fall semester and
- 401-0252-00L Mathematik II in the Spring semester.

Competencies
Subject-specific Competencies
Concepts and Theories assessed
Analytical Competencies assessed

406-0252-AAL Mathematics II
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Abstract
Continuation of the topics of Mathematics I, with main focus on multivariable calculus.
Objective

Mathematics is of ever increasing importance to the Natural Sciences and Engineering. The key is the so-called mathematical modelling cycle, i.e. the translation of problems from outside of mathematics into mathematics, the study of the mathematical problems (often with the help of high level mathematical software packages) and the interpretation of the results in the original environment.

The goal of Mathematics I and II is to provide the mathematical foundations relevant for this paradigm. Differential equations are by far the most important tool for modelling and are therefore a main focus of these courses.

Content

- **Multivariable Differential Calculus:**
  - functions of several variables, partial differentiation, curves and surfaces in space, scalar and vector fields, gradient, curl and divergence.
  - **Multivariable Integral Calculus:**
    - multiple integrals, line and surface integrals, work and flux, Green, Gauss and Stokes theorems, applications.

- **Introduction to Partial Differential Equations:**
  - separation of variables, heat equation, wave equation, Laplace equation.

Abstract

Introduction to basic methods and fundamental concepts of statistics and probability theory for non-mathematicians. The concepts are presented on the basis of some descriptive examples. Learning the statistical program R for applying the acquired concepts will be a central theme.
Objective

The objective of this course is to build a solid fundament in probability and statistics. The student should understand some fundamental concepts and be able to apply these concepts to applications in the real world. Furthermore, the student should have a basic knowledge of the statistical programming language "R".

Content

From "Statistics for research" (online)
Ch 1: The Role of Statistics
Ch 2: Populations, Samples, and Probability Distributions
Ch 3: Binomial Distributions
Ch 6: Sampling Distribution of Averages
Ch 7: Normal Distributions
Ch 8: Student's t Distribution
Ch 9: Distributions of Two Variables

From "Introductory Statistics with R (online)"
Ch 1: Basics
Ch 2: The R Environment
Ch 3: Probability and distributions
Ch 4: Descriptive statistics and tables
Ch 5: One- and two-sample tests
Ch 6: Regression and correlation

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract

General Chemistry I and II: Chemical bond and molecular structure, chemical thermodynamics, chemical equilibrium, kinetics, acids and bases, electrochemistry

Objective

Introduction to general and inorganic chemistry. Basics of the composition and the change of the material world. Introduction to the thermodynamically controlled physico-chemical processes. Macroscopic phenomena and their explanation through atomic and molecular properties. Using the theories to solve qualitatively and quantitatively chemical and ecologically relevant problems.

Content

1. Stoichiometry
2. Atoms and Elements (Quantenmechanical Model of the Atom)
3. Chemical Bonding
4. Thermodynamics
5. Chemical Kinetics
6. Chemical Equilibrium (Acids and Bases, Solubility Equilibria)
7. Electrochemistry

529-0234-AAL Chemistry I E- 4 credits 11R J. Cvengros
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract

Chemistry I: Chemical bonding and molecular structure, chemical thermodynamics and kinetics, chemical equilibrium.
Objective
Acquiring the basics for describing the structure, composition and transformations of the material world. Introduction to thermodynamically determined chemical-physical processes. Use modeling to show how macroscopic phenomena can be understood in terms of atomic and molecular properties. Applications of theory to quantitatively and qualitatively solve simple chemical and environmental problems.

Content
1. Stoichiometry
2. Atomic structure
4. Basics of chemical thermodynamics
   System and environment. Description of the state and changes of state of chemical systems.
5. First law of thermodynamics
   Internal energy, heat and work. Enthalpy and enthalpy of reaction. Standard thermodynamic conditions.
6. Second law of thermodynamics
   Entropy. Entropy changes in the system and in the universe. Reaction entropy due to heat of reaction and due to changes in matter.
7. Gibbs energy and chemical potential.
   Combination of the first and second law of thermodynamics. Reaction Gibbs energy.
8. Chemical equilibrium
   Mass action law, reaction quotient and equilibrium constant. Equilibrium in phase transitions.
9. Acids and bases
10. Dissolution and precipitation
    Heterogeneous equilibrium. Dissolution process and solubility constant. Speciation diagrams. The carbon dioxide-carbonate equilibrium in the environment.

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 2565 of 2684
Organismic biology to teach the basic principles of classical and molecular genetics, evolutionary biology and phylogeny.

The understanding of basic principles of biology (inheritance, evolution and phylogeny) and an overview of the diversity of life.

The first semester focuses on the organismal biology aspects of genetics, evolution and diversity of life in the Campbell chapters 12-34.

Week 1-7 by Alex Widmer, Chapters 12-25
- 12 Cell biology Mitosis
- 13 Genetics Sexual life cycles and meiosis
- 14 Genetics Mendelian genetics
- 15 Genetics Linkage and chromosomes
- 20 Genetics Evolution of genomes
- 21 Evolution How evolution works
- 22 Evolution Phylogenetic reconstructions
- 23 Evolution Microevolution
- 24 Evolution Species and speciation
- 25 Evolution Macroevolution

Week 8-14 by Oliver Martin, Chapters 26-34
- 26 Diversity of Life Introduction to viruses
- 27 Diversity of Life Prokaryotes
- 28 Diversity of Life Origin & evolution of eukaryotes
- 29 Diversity of Life Nonvascular & seedless vascular plants
- 30 Diversity of Life Seed plants
- 31 Diversity of Life Introduction to fungi
- 32 Diversity of Life Overview of animal diversity
- 33 Diversity of Life Introduction to invertebrates
- 34 Diversity of Life Origin & evolution of vertebrates

No script

This is a virtual self-study lecture for non-german speakers of the "Allgemeine Biology I (551-0001-00L)" lecture. The exam will be written jointly with the participants of this lecture.

Example exam questions will be discussed during the lectures, and old exam questions are kept by the various student organisations. If necessary, please contact Prof. Uwe Sauer (sauer@ethz.ch) for details regarding the exam.

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

General Biology I: Organismic biology to teach the basic principles of classical and molecular genetics, evolutionary biology and phylogeny.

General Biology II: Molecular biology approach to teach the basic principles of biochemistry, cell biology, cgenetics, evolutionary biology and form and function of vascular plants.

General Biology I: The understanding of basic principles of biology (inheritance, evolution and phylogeny) and an overview of the diversity of life.

General Biology II: The understanding basic concepts of biology: the hierarchy of the structural levels of biological organisation, with particular emphasis on the cell and its molecular functions, the fundamentals of metabolism and molecular genetics, as well as form and function of vascular plants.
Content
General Biology I:

701-0023-AAL Atmosphere E- 3 credits 6R E. Fischer
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.
Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Basic principles of the atmosphere, physical structure and chemical composition, trace gases, atmospheric cycles, circulation, stability, radiation, condensation, clouds, oxidation capacity and ozone layer.

Objective
Understanding of basic physical and chemical processes in the atmosphere. Understanding of mechanisms of and interactions between: weather - climate, atmosphere - ocean - continents, troposphere - stratosphere. Understanding of environmentally relevant structures and processes on vastly differing scales. Basis for the modelling of complex interrelations in the atmosphere.

Content
Basic principles of the atmosphere, physical structure and chemical composition, trace gases, atmospheric cycles, circulation, stability, radiation, condensation, clouds, oxidation capacity and ozone layer.

Lecture notes
Written information will be supplied.

Literature

701-0071-AAL Mathematics III: Systems Analysis E- 4 credits 9R R. Knutti, H. Wernli
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.
Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
The objective of the systems analysis course is to deepen and illustrate the mathematical concepts on the basis of a series of very concrete examples. Topics covered include: linear box models with one or several variables, non-linear box models with one or several variables, time-discrete models, and continuous models in time and space.

Objective
Learning and applying of concepts (models) and quantitative methods to address concrete problems of environmental relevance. Understanding and applying the systems-analytic approach, i.e., Recognizing the core of the problem - simplification - quantitative approach - prediction.
Introduction to principles of models; one-dimensional linear box models; multi-dimensional linear box models; nonlinear box models; models in space and time

Teaching material: book (see literature).

701-0106-AAL Mathematics V: Applied Deepening of Mathematics I - III

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Selected mathematical topics are presented for later use in more specialised lectures. Part of the topics were already discussed in the lectures Mathematics I-III. Here, they should be shortly recapitulated and most importantly applied to practical problems. If necessary, new mathematical concepts and methods will be introduced in order to solve challenging and inspiring problems from practice.

Objective
The aim of this lecture is to prepare the students for the more specialised lectures. They should become more familiar with the mathematical background, the mathematical concepts and most of all with their application and interpretation.

Content
Practical examples from the following areas will be discussed: ordinary differential equations; eigenvalue problems from linear algebra; systems of linear and nonlinear differential equations; partial differential equations (diffusion, transport, waves).

701-0243-AAL Biology III: Essentials of Ecology

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
This course assigns reading for students needing further background for understanding ecological processes. Central problems in ecology, including population growth and regulation, the dynamics of species interactions, the influence of spatial structure, the controls over species invasions, and community responses to environmental change will be explored from basic and applied perspectives.

Objective
Students will understand how ecological processes operate in natural communities. They will appreciate how mathematical theory, field experimentation, and observational studies combine to generate a predictive science of ecological processes.

Upon completing the course, students will be able to:

Understand the factors determining the outcome of species interactions in communities, and how this information informs management.

Apply theoretical knowledge on species interactions to predict the potential outcomes of novel species introductions.

Understand the role of spatial structure in mediating population dynamics and persistence, species interactions, and patterns of species diversity.

Use population and community models to predict the stability of interactions between predators and prey and between different competitors.

Understand the conceptual basis of predictions concerning how ecological communities will respond to climate change.

Content
Readings from a text book will focus on understanding central processes in community ecology. Topics will include demographic and spatial structure, consumer resource interactions, food webs, competition, invasion, and the maintenance of species diversity. Each of these more conceptual topics will be discussed in concert with their applications to the conservation and management of species and communities in a changing world.

Competencies

Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies
- Analytical Competencies
- Decision-making
- Problem-solving

Personal Competencies
- Integrity and Work Ethics
- Self-direction and Self-management

701-0401-AAL Hydrosphere

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
In this self-study course, students learn about relevant processes that control the water cycle on earth. Energy and mass exchange, mixing and transport processes are described and the coupling of the hydrosphere with the atmosphere and the solid Earth are discussed.

Objective
Qualitative and quantitative understanding on how physical (and geochemical) processes control the natural dynamics in groundwater, lakes ans oceans and constrain the exchange of mass and energy.
### Content
- Topics of the course.
- Physical properties of water (i.e. density and equation of state)
- Exchange at boundaries
  - energy (thermal & kinetic), gas exchange
  - vertical stratification, large scale transport
  - turbulence and mixing
  - mixing and exchange processes in rivers
- Groundwater and its dynamics
  - ground water as part of the terrestrial water cycle
  - ground water hydraulics, Darcy's law
  - aquifers and their properties
  - hydrochemistry and tracer
  - ground water use
- Case studies
  - 1. Water as resource, 2. Water and climate

### Lecture notes
- In addition to the self-learning literature handouts are distributed.

### Literature
- Textbooks for self-studying.
  - Surface water:
    - Chapter 19.2: Bottleneck Boundaries
  - Ground water:
      - Chapters 1 - 6, 8, 10, 11.
  - Optional additional readers.

### Competencies
- Subject-specific Competencies
  - Concepts and Theories
  - Analytical Competencies
  - Communication

### Additional Details
- **701-0473-AAL** Weather Systems
  - **Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.**
  - **Abstract**
    - The students learn about the dynamical features of the Earth's atmosphere. They interpret satellite imagery and learn about basic concepts in dynamical meteorology. The global circulation is briefly discussed, before introducing the Eulerian and the Lagrangian perspective, which are used to study air streams in extratropical cyclones and to investigate basic aspects in mountain meteorology.
  - **Objective**
    - The students are able to
      - explain basic measurement and analysis techniques that are relevant in atmospheric dynamics
      - to discuss the mathematical basics of atmospheric dynamics, based on selected atmospheric flow phenomena
      - to explain the basic dynamics of the global circulation and of synoptic- and meso-scale flow features
      - to explain how mountains influence the atmospheric flow on different scales
      - basic understanding of the role of moist adiabatic processes for weather systems and why stable water isotopes are useful in this context
  - **Content**
    - Satellite observations; analysis of vertical soundings; geostrophic and thermal wind; cyclones at mid-latitude; global circulation; north-atlantic oscillation; atmospheric blocking situations; Eulerian and Lagrangian perspective; potential vorticity; Alpine dynamics (storms, orographic wind); planetary boundary layer
  - **Lecture notes**
    - Lecture notes and slides
  - **Literature**
    - Atmospheric Science, An Introductory Survey
    - John M. Wallace and Peter V. Hobbs, Academic Press

- **701-0475-AAL** Atmospheric Physics
  - **Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.**
  - **Abstract**
    - This course is a self-study course for MSc students, who like to learn something about Atmospheric Physics but for cannot follow the course Atmosphärenphysik, because that is taught in German. However, the slides and the textbook of the course Atmosphärenphysik, and they form the basis also for this course.
  - **Objective**
    - See entry under LV 701-0475-00L Atmosphärenphysik
  - **Content**
    - See entry under LV 701-0475-00L Atmosphärenphysik
  - **Lecture notes**
    - Powerpoint slides and script from LV 701-0475-00L Atmosphärenphysik will be made available
  - **Literature**
    - From the Microscale to Climate, Cambridge Univ. Press, 391 pp., 2016.
      - pdf-files of the revised book will be provided as well.

- **701-0501-AAL** Pedosphere
  - **Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.**

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 2569 of 2684
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Introduction to the formation and properties of soils as a function of parent rock, landscape position, climate, and soil organisms. Complex relationships between soil forming processes, physical and chemical soil properties, soil biota, and ecological soil properties.

Objective
Understanding of soils as integral parts of ecosystems, development and distribution of soils as a function of environmental factors, and processes leading to soil degradation.

Content
Definition of the pedosphere, soil functions, rocks as parent materials, minerals and weathering, soil organisms, soil organic matter, physical soil properties and functions, chemical soil properties and functions, soil formation, principles of soil classification, global soil regions, soil fertility, land use and soil degradation.

Literature

Prerequisites / notice
Prerequisites: Basic knowledge in chemistry, biology and geology.

701-0721-AAL Psychology E- 3 credits 6R M. Siegrist

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
This self-study course is an introductory course in psychology. This course will emphasize cognitive psychology and the psychological experiment.

Objective
Knowledge of key concepts and exemplary theories of psychology and their relation to "daily" psychology. Comprehension of relation between theory and experiment in psychology.

Goals: Learning how psychologists are thinking, a side change from the ETH natural science perspective to psychological thinking.

Domains of psychology:
- Psychology fields
- Concept definitions of psychology
- Theories of psychology
- Methods of psychology
- Results of psychology

Capability:
Be able to define a psychological research question
Basics understanding of role of psychology

Comprehension:
Psychology as a science of experience and behavior of the human

Content
Einführung in die psychologische Forschung und Modellbildung unter besonderer Berücksichtigung der kognitiven Psychologie und des experimentellen Verhaltens. Themen sind u.a.: Wahrnehmung; Lernen und Entwicklung; Denken und Problemlösen; Kognitive Sozialpsychologie; Risiko und Entscheidung.

Literature
English book of Zimbardo (http://www.amazon.de/Psychology-Life-Discovering-Psych-Lab/dp/0205654770/ref=sr_1_2?s=books-intl-de&ie=UTF8&qid=1317208260&sr=1-2)

Prerequisites / notice
Determine with Prof. Dr. Michael Siegrist the chapters in "Zimbardo" which are compulsory reading
Read the two Psychology chapters (6 + 7) from the book of Prof. Roland W. Scholz

752-4001-AAL Microbiology E- 2 credits 4R M. Schuppler

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Self-study course in microbiology.

Objective
Teaching of basic knowledge in microbiology.

Content
This is a self-study course for students with microbiology as an admission requirement. The goal of the course is that students acquire basics in microbiology, including bacterial cell biology, genetics, growth and physiology, metabolism, phylogeny and microbial diversity, and applications of microbiology.

Literature
This self-study course is based on the book 'Brock, Biology of Microorganisms'.

<tr>
<td></td>
<td>The course provides an introduction to theoretical foundations and practical usage of the Lattice Boltzmann Method for fluid dynamics simulations.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Objective</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Methods like molecular dynamics, DSMC, lattice Boltzmann etc are being increasingly used by engineers all over and these methods require knowledge of kinetic theory and statistical mechanics which are traditionally not taught at engineering departments. The goal of this course is to give an introduction to ideas of kinetic theory and non-equilibrium thermodynamics with a focus on developing simulation algorithms and their realizations.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>During the course, students will be able to develop a lattice Boltzmann code on their own. Practical issues about implementation and performance on parallel machines will be demonstrated hands on.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Central element of the course is the completion of a lattice Boltzmann code (using the framework specifically designed for this course).</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>The course will also include a review of topics of current interest in various fields of fluid dynamics, such as multiphase flows, reactive flows, microlows among others.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Optionally, we offer an opportunity to complete a project of student's choice as an alternative to the oral exam. Samples of projects completed by previous students will be made available.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
The course builds upon three parts:
I. Elementary kinetic theory and lattice Boltzmann simulations introduced on simple examples.
II. Theoretical effects of statistical mechanics and kinetic equations.
III. Lattice Boltzmann method for real-world applications.

The content of the course includes:

1. Background: Elements of statistical mechanics and kinetic theory:
   Particle's distribution function, Liouville equation, entropy, ensembles; Kinetic theory; Boltzmann equation for rarefied gas, H-theorem, hydrodynamic limit and derivation of Navier-Stokes equations, Chapman-Enskog method, Grad method, boundary conditions; mean-field interactions, Vlasov equation; Kinetic models: BGK model, generalized BGK model for mixtures, chemical reactions and other fluids.

2. Basics of the Lattice Boltzmann Method and Simulations:
   Minimal kinetic models: lattice Boltzmann method for single-component fluid, discretization of velocity space, time-space discretization, boundary conditions, forcing, thermal models, mixtures.

3. Hands on:
   Development of the basic lattice Boltzmann code and its validation on standard benchmarks (Taylor-Green vortex, lid-driven cavity flow etc).

4. Practical issues of LBM for fluid dynamics simulations:
   Lattice Boltzmann simulations of turbulent flows; numerical stability and accuracy.

5. Microflow:
   Rarefaction effects in moderately dilute gases; Boundary conditions, exact solutions to Couette and Poiseuille flows; micro-channel simulations.

6. Advanced lattice Boltzmann methods:
   Entropic lattice Boltzmann scheme, subgrid simulations at high Reynolds numbers; Boundary conditions for complex geometries.

7. Introduction to LB models beyond hydrodynamics:
   Relativistic fluid dynamics; flows with phase transitions.

Lecture notes
Lecture notes on the theoretical parts of the course will be made available. Selected original and review papers are provided for some of the lectures on advanced topics. Handouts and basic code framework for implementation of the lattice Boltzmann models will be provided.

Prerequisites / notice
The course addresses mainly graduate students (MSc/Ph D) but BSc students can also attend.

151-0293-00L Fundamentals and Applications of Combustion W 4 credits 2V+1U+2A N. Noiray, F. Ernst, C. E. Frouzakis

Note: The previous course title until HS23 "Combustion and Reactive Processes in Energy and Materials Technology"

Abstract
This course will provide an introduction to the fundamentals and the applications of combustion in energy conversion and nanoparticles synthesis. The content is highly relevant for technologies which cannot be electrified such as long distance aviation and shipping, and which will more and more rely on carbon-neutral synthetic fuels.

Objective
The main learning objectives of this course are: 1. Understand the thermodynamic, fluid-dynamic and chemical kinetics fundamentals of combustion processes. 2. Predict relevant parameters for combustion systems, such as laminar and turbulent flame speeds, adiabatic flame temperature or quenching distance. 3. Understand the causal relations of relevant combustion parameters such as the pressure influence on the laminar flame speed. 4. Analyze the challenges of developing sustainable combustion technologies based on carbon-neutral synthetic fuels.

Content

Lecture notes
No script available. Instead, material will be provided in lecture slides and the following text book (which can be downloaded for free) will be followed:

Teaching language, assignments and lecture slides in English

151-0509-00L Acoustics in Fluid Media: From Robotics to Additive Manufacturing W 4 credits 3G D. Ahmed

Abstract
This course will provide you with the fundamentals of the new and exciting field of ultrasound-based microrobots to treat various diseases. Furthermore, we will explore how ultrasound can be used in additive manufacturing for tissue constructs and robotics.

Objective
The course is designed to equip students with skills in the design and development of ultrasound-based manipulation devices and microrobots for applications in medicine and additive manufacturing.

Content
Linear and nonlinear acoustics, foundations of fluid and solid mechanics and piezoelectricity, Gorkov potential, numerical modelling, acoustic streaming, applications from ultrasonic microrobots to surface acoustic wave devices

Lecture notes

Literature

Prerequisites / notice
Solid and fluid continuum mechanics. Notice: The exercise part is a mixture of presentation, lab sessions ( both compulsory) and hand in homework.
Abstract
Project-oriented learning on how to develop technological solutions to address unmet clinical needs.

Objective
After completing the course, you will be able to effectively collaborate with medical doctors in order to identify important unmet clinical needs. You will be able to ideate and develop appropriate engineering solutions and implementation strategies for real-world clinical problems. This lecture aims to prepare you for typical engineering challenges in the real-world where - in addition to the development of an elegant solution - interdisciplinary teamwork and effective communication play a key role.

Lecture notes will be available on the moodle.
Literature will be available on the moodle.
Prerequisites / notice On site presence during (most) of the lectures highly encouraged!
Graded innovation project will require on-site presence.

Introduction to Photonics
This course introduces students to the main concepts of optics and photonics. Specifically, we will describe the laws obeyed by optical waves and discuss how to use them to manipulate light.

Objective
Photonics, the science of light, has become ubiquitous in our lives. Control and manipulation of light is what enables us to interact with the screen of our smart devices and exchange large amounts of complex information. Photonics has also taken a preponderant role in cutting-edge science, allowing for instance to image nanospecimens, detect diseases or sense very tiny forces. The purpose of this course is three-fold: (i) We first aim to provide the fundamentals of photonics, establishing a solid basis for more specialised courses. (ii) Beyond theoretical concepts, our intention is to have students develop an intuition on how to manipulate light in practise. (iii) Finally, the course highlights how the taught concepts apply to modern research as well as to everyday life technologies (LCD screens, polarisation sun glasses, anti-reflection coating etc...). Content, including videos of laboratory experiments, has been designed to be approachable by students from a diverse set of science and engineering backgrounds.
I- BASICS OF WAVE THEORY
1) General concepts
2) Differential wave equation
3) Wavefront
4) Plane waves and Fourier decomposition of optical fields
5) Spherical waves and Huygens-Fresnel principle

II- ELECTROMAGNETIC WAVES
1) Maxwell equations
2) Wave equation for EM waves
3) Dielectric permittivity
4) Refractive index
5) Nonlinear optics
6) Polarisation and polarisation control

III- PROPAGATION OF LIGHT
1) Waves at an interface
2) The Fresnel coefficients
3) Total internal reflection
4) Evanescent waves
5) Dispersion diagram

IV- INTERFERENCES
1) General considerations
2) Temporal and spatial coherence
3) The Young double slit experiment
4) Diffraction gratings
5) The Michelson interferometer
6) Multi-wave interference
7) Antireflecting coating and interference filters
8) Optical holography

V- LIGHT MANIPULATION
1) Optical waveguides
2) Photonic crystals
3) Metamaterials and metasurfaces
4) Optical cavities

VI- OPTICAL FORCES AND OPTICAL TWEEZERS
1) History of optical forces
2) Theory of optical trapping
3) Atom cooling
4) Optomechanics
5) Applications of optical tweezers

VII- INTRODUCTION TO OPTICAL MICROSCOPY
1) Basic concepts
2) Direct and Fourier imaging
3) Image formation
4) Fluorescence microscopy
5) Scattering-based microscopy
6) Digital holography
7) Computational imaging

Abstract
This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore, the application of these principles to important engineering problems is demonstrated.

Objective
This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore, the application of these principles to important engineering problems is demonstrated.

Content
Fick's laws; application and significance of mass transfer; comparison of Fick's laws with Newton's and Fourier's laws; derivation of Fick's 2nd law; diffusion in dilute and concentrated solutions; rotating disk; dispersion; diffusion coefficients, viscosity and heat conduction (Pr and Sc numbers); Brownian motion; Stokes-Einstein equation; mass transfer coefficients (Nu and Sh numbers); mass transfer across interfaces; Analogies for mass-, heat-, and momentum transfer in turbulent flows; film-, penetration-, and surface renewal theories; simultaneous mass, heat and momentum transfer (boundary layers); homogeneous and heterogeneous reversible and irreversible reactions; diffusion-controlled reactions; mass transfer and first order heterogeneous reaction. Applications.

Literature

Prerequisites / notice
Students attending this highly-demanding course are expected to allocate sufficient time within their weekly schedule to successfully conduct the exercises.
Competencies
Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: fostered

Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: fostered
- Media and Digital Technologies: fostered
- Problem-solving: assessed

Social Competencies
- Communication: fostered
- Cooperation and Teamwork: fostered
- Sensitivity to Diversity: fostered

Personal Competencies
- Adaptability and Flexibility: fostered
- Creative Thinking: assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: fostered
- Self-awareness and Self-reflection: fostered
- Self-direction and Self-management: fostered

Competencies
151-0927-00L Rate-Controlled Separations in Fine Chemistry
W 6 credits 3V+1U M. Mazzotti, V. Becattini, N. Casas, F. Kiefer

Abstract
The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.

Objective
The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.

Content
The class covers separation techniques that are central in the purification and downstream processing of chemicals and biopharmaceuticals. Examples from both areas illustrate the utility of the methods: 1) Adsorption and chromatography; 2) Membrane processes; 3) Crystallization and precipitation.

Lecture notes
Handouts during the class

Literature
Recommendations for text books will be covered in the class

Prerequisites / notice
Requirements (recommended, not mandatory): Thermal separation Processes I (151-0926-00) and Modelling and mathematical methods in process and chemical engineering (151-0940-00)

Competencies
Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: fostered

Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: fostered
- Media and Digital Technologies: fostered
- Problem-solving: assessed

Social Competencies
- Communication: assessed
- Cooperation and Teamwork: fostered
- Customer Orientation: fostered
- Leadership and Responsibility: fostered
- Self-presentation and Social Influence: fostered
- Sensitivity to Diversity: fostered
- Negotiation: fostered

Personal Competencies
- Adaptability and Flexibility: fostered
- Creative Thinking: assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: fostered
- Self-awareness and Self-reflection: fostered
- Self-direction and Self-management: fostered

Competencies
151-0951-00L Process Design and Safety
W 4 credits 2V+1U F. Trachsel, C. Hutter

Abstract
The lecture Process Design and Saftey deals with the fundamentals of project management, scale-up, dimensioning and safety of chemical process equipment and plants.

Objective
The objective of the lecture is to expound the engineering design approach of important elements in chemical plant design.

Content
Fundamentals in Chemical engineering Design;
- Project Management,
- Cost estimate,
- Materials and Corrosion,
- Piping and Armatures,
- Pumps,
- Reactors and Scale-up,
- Safety of chemical processes,
- Patents

Lecture notes
The lecture slides will be distributed.

Literature

Prerequisites / notice
A 1-day excursion including a visit of a chemical plant will be part of the lecture.

Competencies
151-0957-00L Practica in Process Engineering I
W 2 credits 2P D. J. Norris, M. Tibbitt

Abstract
Practical training at pilot facilities for fundamental processing steps, typical laboratory and pilot facility experiments.

Objective
Getting acquainted with unit operations, measuring tools and data processing

Data: 06.08.2024 12:40 Autumn Semester 2024 Page 2576 of 2684
Content

4 modules in total (3 from Prof. Norris, 1 from Prof. Mark Tibbitt)
Details and dates will be communicated at the beginning of the semester.

Residence Time Distribution
Tibbitt
Perovskite Nanocrystals - Synthesis and Characterization
Norris
ICP Elemental Analysis
Norris
Scanning Electron Microscope Imaging (SEM)
Norris

Lecture notes
Scripts of the specific practice will be available shortly before the modules.

Overview of process simulation and flowsheeting:
- Definition and fundamentals
- Fields of application
- Case studies

Process simulation:
- Modeling strategies of process systems
- Mass and energy balances and degrees of freedom of process units and process systems

Process flowsheeting:
- Flowsheet partitioning and tearing
- Solution methods for process flowsheeting
- Simultaneous methods
- Sequential methods

Process optimization and analysis:
- Classification of optimization problems
- Linear programming, LP
- Non-linear programming, NLP
- Mixed-integer linear programming, MILP
- Mixed-integer nonlinear programming, MINLP

Commercial software for simulation (Aspen Plus):
- Thermodynamic property methods
- Reaction and reactors
- Separation / columns
- Convergence, optimisation & debugging

An exemplary literature list is provided below:
- Smith, R. Chemical process design and integration, Wiley (2005).

A basic understanding of material and energy balances, thermodynamic property methods and typical unit operations (e.g., reactors, flash separations, distillation/absorption columns etc.) is required.

Multidisciplinary Courses

The students are free to choose individually Master's courses from the Course Catalogue of ETH Zurich, ETH Lausanne and the Universities of Zurich (https://www.uzh.ch/cmsssl/en/studies/application/chmobilityin.html) and St. Gallen.

Course Catalogue of ETH Zurich

The subject of the Master Thesis and the choice of the supervisor (ETH-professor) are to be approved in advance by the tutor.

Abstract
The semester project is designed to train the students in the solution of specific engineering problems. This makes use of the technical and social skills acquired during the master's program. Tutors propose the subject of the project, elaborate the project plan, and define the roadmap together with their students, as well as monitor the overall execution.

Objective
The semester project is designed to train the students in the solution of specific engineering problems. This makes use of the technical and social skills acquired during the master's program.

Students who fulfill the following criteria are allowed to begin with their Master's Thesis:

a. successful completion of the bachelor program;
b. fulfilling of any additional requirements necessary to gain admission to the master programme;
c. successful completion of the semester project and industrial internship;
d. achievement of 28 ECTS in the category "Core Courses".

The Master's Thesis must be approved in advance by the tutor and is supervised by a professor of ETH Zurich.

Abstract
Master's programs are concluded by the master's thesis. The thesis is aimed at enhancing the student's capability to work independently toward the solution of a theoretical or applied problem. The subject of the master's thesis, as well as the project plan and roadmap, are proposed by the tutor and further elaborated with the student.

Objective
The thesis is aimed at enhancing the student's capability to work independently toward the solution of a theoretical or applied problem.

ECTS
European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
This course focuses on the history of the design of cities, as well as on the ideas, processes and actors that engender and lead their development and transformation. The history of urban design will be approached as a cross-cultural field of knowledge that integrates scientific, economic and technical innovation as well as social and cultural advances. The lectures deal mainly with the definition of urban design as an independent discipline, which maintains connections with other disciplines (politics, sociology, geography) that are concerned with the transformation of the city. The aim is to make students conversant with the multiple theories, concepts and approaches of urban design as they were articulated throughout time in a variety of cultural contexts, thus offering a theoretical framework for students' future design work.

In the first semester the genesis of the objects of study, the city, urban culture and urban design, are introduced and situated within their intellectual, cultural and political contexts:

01. The History and Theory of the City as Project
02. Of Rituals, Water and Mud: The Urban Revolution in Mesopotamia and the Indus
03: The Idea of the Polis: Rome, Greece and Beyond
04: The Long Middle Ages and their Counterparts: From the Towns of Tuscany to Delhi
05: Between Ideal and Laboratory: Of Middle Eastern Grids and European Renaissance Principles
06: Of Absolutism and Enlightenment: Baroque, Defense and Colonization
07: The City of Labor: Company Towns as Cross-Cultural Phenomenon
08: Garden Cities of Tomorrow: From the Global North to the Global South and Back Again
09: Civilized Wilderness and City Beautiful: The Park Movement of Olmsted and The Urban Plans of Burnham
10: The Extension of the European City: From the Viennese Ringstrasse to Amsterdam Zuid

Lecture notes
Prior to each lecture a chapter of the reader (Skript) will be made available through the webpage of the Chair. These chapters will provide an introduction to the lecture, the basic visual references of each lecture, key dates and events, as well as references to the compulsory and additional reading.

Literature
There are three books that will function as main reference literature throughout the course:

These books will be reserved for consultation in the ETH Baubibliothek, and will not be available for individual loans.

A list of further recommended literature will be found within each chapter of the reader (Skript).

Prerequisites / notice
Students are required to familiarize themselves with the conventions of architectural drawing (reading and analyzing plans at various scales).

---

</tbody>
</table>

**Abstract**
A range of fundamental processes have transformed European societies in the course of the 19th and the 20th centuries. This lecture series looks at several key aspects of these modernization processes and asks about their continuing relevance for our times. The regional focus lies on the Britain, where these processes took place for the first time.

**Objective**
At the end of this lecture course, students can: (a) highlight the most important changes in the "long nineteenth century" in Britain (b) explain their long-term effects (also for other European countries) and (c) relate these changes to global developments today.

**Content**
The thematic foci include: Industrialization, urban growth, democratisation and mass politics, shifting gender roles and ideals, and the emergence of consumerism and leisure culture.

**Lecture notes**
Power Point Slides and references will be made available in digital form during the course of the semester.

**Literature**
Mandatory and further reading will be listed on the course plan that is made available as from the first session.

**Prerequisites / notice**
This lecture series does not build upon specific previous knowledge by the students.

This lecture series explores the multifaceted role of data in shaping contemporary society, governance, and individual lives. The course equips students with a critical understanding of how data is made, managed, and preserved, and its implications for societal norms and individual rights.

At the end of the term, students will be able to:

- reflect concepts and theories that capture the socio-technical nature of data
- assess the implications of data practices for social and political ordering
- identify key actors, sites, and domain contexts of data practices

Subject-specific Competencies

Science Studies between economic growth, social needs and critique

Science has become a subject of research in its own right since the 20th century: the field of "science studies" examines the organization of science, its social benefits, its contribution to economic growth or its impact on people and nature. The seminar introduces the history of this research and sheds light on its applied and critical dimensions.

Using historical sources from the field of science studies, students learn to understand societal expectations and criticisms of the sciences in the 20th and 21st centuries.

The value of science for social and economic development has been an issue of debate since the 20th century. At the same time, science became a subject of research in its own right: the sociology of science in the 1930s dealt with the social benefits ("Science for Social Needs") and the organization of science. Since the 1950s, the research field of the "Science of Science" has quantified scientific publications ("Science Citation Index") and attempted to measure the relationship between research and innovation, between education and economic growth (OECD studies). Science seemed to promise scientific and technological progress, innovation and economic growth - both in the industrialized countries and, with the help of "technology transfer", to the then so-called "developing countries". At the same time, in the field of "technology assessment", the sciences were criticized for causing risks and damages to humans and nature (e.g. through pesticides or biotechnology) or entailing effects of social inequality.

The fact that the sciences have been the subject of debate since the 20th century is not only a matter of general public interest. It is also the effect of the development and funding of research fields that deal with measures to increase innovation or with the benefits and risks of science. The seminar deals with the history of this research in its political and economic contexts as well as in its applied and critical function. It examines the knowledge on which historical and current expectations of science in politics and society are based.

Philosophy of War

Does not take place this semester.

In the course we read classical texts from the field of philosophy of war (Clausewitz, Sun Tzu, Tolstoy, Machiaveli, Kant) and focus on questions such as: what is war? Strategy and tactics in war? Ethics of war? War and Politics?

Students learn about the different types of argumentative texts and their historical, social, political and ethical context. They learn to understand the descriptive and critical value of texts in regard to the topic of war.

Insect Histories: Bugs that Made the Modern World

The seminar explores insects as historical actors and their diverse interactions with human societies over time and space. It offers an overview of recent approaches in environmental history and multispecies ethnography while providing an analytical framework to understand global processes of natural resource exploitation, knowledge formation, and imperialism.

The objective is to analyze human-insect interactions by identifying key historical factors (economic, scientific, political). Students will integrate current frameworks in the study of environmental history through the combination of primary sources and interdisciplinary research. They will develop skills rooted in their interest in insects and learn to translate them into feedback to peers.
Content

Scholars typically approach Nature-related histories by focusing on environmental change, the commodification of resources, and the legacy of natural history collections. Examples of this approach include studies on deforestation, dam constructions, the rubber boom, and the colonial history of European museums. In contrast to these commonly explored topics, insects are often underrepresented in historical research, both as living creatures and metaphors. Addressing this gap, the seminar explores human-insect interactions from a global historical perspective between 1600 and 2000. This exploration encompasses a critical and relational understanding of the history of the scientific study of insects (entomology) and the processes of imperial expansion and global territorialization. To achieve this, students will learn how human-insect interactions led to radical transformations in diverse environments, reflecting a particular modern conception of nature influenced by control anxieties related to economic profit and tropical diseases. Moreover, students will examine how ways of knowing about insects and the environment were influenced by broader correlated economic and imperial factors. Focusing on insect (hi)stories, the aim of this seminar is to apply new methodologies for non-human agencies and source analysis on both micro and macro scales in global and environmental histories.

851-0201-00L Literature and History W 3 credits 2V

Abstract

Literature and history have often coexisted, "dialogued". History is a recurring theme in many literary works. In this seminar, we will explore the relationship between literature and history.

Objective

The aim is to evoke History as a source of creation for writers. The aim is to identify the bridges built by this transdisciplinarity, and to question the way in which History is "rewritten" by literature, after having been at its origin.

Content

Literature and history have often coexisted, "dialogued". History is a recurring theme in many literary works. In this seminar, we will explore the relationship between literature and history. We’ll look at several periods of world history, from America to Europe and Africa. The aim is to evoke History as a source of creation for writers. The aim is to identify the bridges built by this transdisciplinarity, and to question the way in which History is "rewritten" by literature, after having been at its origin. To illustrate our points, we will draw on 20th- and 21st-century novels by French, Haitian and Algerian authors...

- Rosalie L’Întâme, Evelyne Trouillot
- Le Manuscrit de Port-Ébène, Dominique Bona
- L’Affaire de l’esclave Furdy, Mohammed Alissaoui
- Cris, Laurent Gaudé (First World War)
- Sigmarigen, Pierre Assouline (World War II)
- Avant que les ombres s’effacent, Louis-Philippe Dalembre (Second World War)
- Ou [ai] laissé mon âme, Jérôme Ferreri (Second World War & Algerian War)

851-0101-56L From Cotton to Cocaine: Commodities That Made History (c.1700-1950) W 3 credits 2V H. Fischer-Tiné

Abstract

Each session focuses on a particular commodity and explores how its production, trade and consumption was entangled with important political, social and cultural developments. Taken together, the case studies (ranging from agricultural crops, via chemically produced drugs to mechanical marvels such as the gramophone) provide a picture of major global transformations in the past 300 years.

Objective

On one level, the course aims to familiarise students with a currently much debated approach to the writing of global history, namely the history of commodities. Each case study is used to deepen the participants understanding of complex historical developments by telling seemingly simple stories in a global frame. Thus, for instance, the session on sugar explores plantation economies in the Caribbean and the transatlantic slave trade as well as shifting patterns of diet and consumption in Europe. The session on rubber focuses on botanical expeditions in Latin America, the deployment of Chinese coolies on Malaysian Rubber farms and the rise of the automobile mass production in the USA. By linking the familiar to the unfamiliar and ‘exotic’ the inter-cultural sensitivity of the students will be enhanced. On a second level, the analysis and understanding of these complex interconnections, it is hoped, will help students to get a more nuanced understanding of the historical process that is currently referred to as ‘globalization’ and overcome the eurocentric perspective that still structures many scholarly and media writings on this topic.

851-0125-65L A Sampler of Histories and Philosophies of Mathematics Particularly suitable for students D-CHAB, D-INFK, D-ITET, D-MATH, D-PHYS W 3 credits 2V R. Wagner

Abstract

This course will review several case studies from the ancient, medieval and modern history of mathematics. The case studies will be analyzed from various philosophical perspectives, while situating them in their historical and cultural contexts.

Objective

The course aims are:

1. To introduce students to the historicity of mathematics
2. To make sense of mathematical practices that appear unreasonable from a contemporary point of view
3. To develop critical reflection concerning the nature of mathematical objects
4. To introduce various theoretical approaches to the philosophy and history of mathematics
5. To open the students’ horizons to the plurality of mathematical cultures and practices

Competencies

Subject-specific Competencies: Concepts and Theories, assessed
Method-specific Competencies: Analytical Competencies, assessed
Social Competencies: Sensitivity to Diversity, fostered
Personal Competencies: Critical Thinking, fostered

851-0045-00L Artificial Intelligence and Human Values W 3 credits 2G M. Boenig-Liptsin, K. Wodajo

Abstract

This course introduces students to the ethical, political and legal debates and transformations in relation to Artificial Intelligence and provides students with concepts and methods from the constructivist and interpretive social sciences to work towards responsible and democratic human-technology futures.

Objective

The main objectives of the course are to enable students to 1) identify the ways in which human values and developments of AI technologies are entangled, 2) articulate what is significant about contemporary transformations in AI and society, and 3) participate and shape the relationship between human values and AI as citizens and professionals.

Content

The growing presence of AI tools for public use, for public administration, inside corporations and in scientific research raises many questions about the ethical, political, legal consequences of these technologies. This course is built around multiple sites of encounter among human values and AI, including bodies, persons, cities, labs, law, and environment. In each site, we inquire about what and whose values are being prioritized and with what consequences. The course also investigates existing best-practices around how to "align" human values with AI (e.g. human-centric design, alignment, reproducibility, transparency, explainability) and introduces students to regimes of ethics and governance of AI being proposed in jurisdictions around the world. Students learn to unpack the values and assumptions in existing techniques and frameworks for the design and governance of AI and to engage constructively with diverse stakeholders to shape the human-technology future towards aims that are reflective, responsible, and democratic.

851-0157-28L Life and Death Particularly suitable for students of D-BIOL, D-HEST, D-CHAB, D-USYS W 3 credits 2V M. Hagner

Abstract

This course explores the relation between the scientific investigation of life and cultural notions of death from a historical perspective (assuming there is no such thing as the scientific investigation of death). While the course covers the times from antiquity up to the present, the main emphasis will be placed on the modern life sciences since the 19th century.
Objective There is only one certainty in life: death. This brute fact has animated much thought and work in theology, art and philosophy - but also in the natural sciences, such as biology and medicine. Questions regarding health and disease, evolution, extinction and mortality have played a crucial role in this connection. This course aims to explore above relations - the relations between the scientific investigation of life and cultural notions of death - from a historical perspective (assuming there is no such thing as the scientific investigation of death). While the course covers the times from antiquity up to the present, the main emphasis will be placed on the modern life sciences since the 19th century.

851-0540-00L Of Stainless Steel and Biocompatible Imk. History of Materials Science.

Abstract The seminar examines the history of materials science. Why and how were materials characterized, developed and tested? How did things as diverse as wood, concrete, ceramics and polymers become objects of a single discipline? How did social imaginaries and technical conditions affect scientific work with and on materials?

Objective Students learn to critically read and interpret different types of texts. They will be familiarised with the interdependencies of technical, scientific and social change. They reflect on (material) scientific practices.

Content The seminar discusses the socio-technical conditions and effects of materials research from a historical perspective in the 20th century. We observe physicists, chemists and engineers, as well as concrete, foams and electron microscopes, in research laboratories and materials testing institutes, in articles and patents.

Competencies

- Subject-specific Competencies: Concepts and Theories
- Method-specific Competencies: Analytical Competencies
- Social Competencies: Communication
- Personal Competencies: Creative Thinking

851-0541-00L Truth and Historical Injustice: The Production of Knowledge about Past Mass Atrocities

Abstract The course deals with the scientific production of knowledge about past mass atrocities. It looks at the interplay of different disciplines, methods and technological means that have been involved in this production over time. Further, it poses the question of what truth can mean in this context.

Objective The students a) know the main features of the discussion about the truth in the reconstruction of past events; b) have an understanding of the interplay, but also the coexistence of different scientific methods and technological means in the multidisciplinary production of knowledge about past mass crimes; c) have knowledge of important processes of dealing with past mass crimes from the second half of the 20th century onwards.

Content When discussing the truthfulness of the academic study of the past, politically and ideologically motivated mass crimes are often cited as historical events in order to substantiate the necessity of a claim to truth. In doing so, moral arguments can be made or historical truth can be asserted as a basic prerequisite for living together in a democratic society under constitutional conditions. The production of knowledge about past atrocities has always been an endeavour in which various scientific disciplines have been involved. The interdisciplinary character of the production of knowledge about mass crimes has become even more accentuated since the second half of the 20th century, not least due to the emergence of new technological possibilities.

The course offers a brief introduction to the discussion about the meaning of truth about past events. It looks at how different scientific approaches - from the humanities to the natural sciences - have been involved in coming to terms with mass crimes and how they have been related to each other. It deals with the question of what role certain techniques and technologies have played in the production of knowledge about past atrocities and how this has changed over time. These techniques and technologies range from the evaluation of documents and the taking of testimonies to specialised database programs, genetic analysis or imaging techniques, to digital technologies for the procurement of information on social media and the internet or for modelling past events.

In addressing these questions, the course looks at processes of dealing with the past from the middle of the 20th century to the 21st century in Europe, Latin America and Africa.

Competencies

- Subject-specific Competencies: Concepts and Theories
- Method-specific Competencies: Analytical Competences
- Personal Competencies: Critical Thinking

851-0202-00L Digital Humanities: Methods, Challenges, Perspectives

Abstract In the 21st century, the humanities and the social sciences are undergoing a ground-breaking transformation: Data-driven, collaborative projects open up new opportunities. Which are the promises and the challenges of digital methods? The lecture series provides an overview of the latest developments.

Objective — exploring the most important theoretical and methodological approaches since 2000
— understanding terms and procedures
— using digital texts, images and metadata
— reflecting on the conditions, opportunities and problems of digital methods

Content The possibilities (Franco Moretti, Graphs, Maps, Trees, Verso 2005; Andrew Piper, Enumerations, Chicago UP 2018) and pitfalls (Franco Moretti, The Wrong Move, Konstanz UP 2022) of cultural history under digital conditions require critical reflection and evaluation. The lecture will explore showcases and pioneering work, annotated texts, images, metadata and interfaces provided by libraries, archives and museums. Research approaches and practical applications will be presented and evaluated.

851-0297-00L Manipulation in Literature and Cultural History

Abstract This lecture focuses on the manipulation and control of individuals and the masses. The power of manipulation is based on subtle use of persuasive linguistic elements and knowledge of the desires and fears of the intended audience. In addition to a theoretical overview, the lecture concentrates on the literary and discursive texts that dispute the control of protagonists.

Objective Students will learn about manipulation as a linguistic and narrative phenomenon steeped in myth and classical rhetoric. Against the backdrop of cultural-historical developments, particularly with regard to major changes in media technology, we will examine how the reach of manipulation was extended from the individual to the masses. Students will be able to refine their critical discourse analysis skills and interdisciplinary abilities by studying texts from literature, politics, sociology, philosophy and psychoanalysis which reflect this shift in emphasis.
Content
Since the dawn of time mankind has tried to exert influence over others through the utilisation of certain techniques: initially for self-preservation – for example the interpretation of Sigmund Freud in Totem und Tabu. Later, desire became the driving force – centre stage: the desire for pleasure, power and control. Manipulation manifests itself in the form of characters and words, it is an authentically linguistic occurrence: classical antiquity, with the rhetoric, develops a system of verbal power of persuasion and, already then, questions were being raised in literary and discursive texts about how people could, or even should, manipulate. The exertion of influence and its impact will be clearly described, propagated, commented upon, criticised and ironised.

In contrast to oppressive overpowering, the power of manipulation (in Latin, manus hand, plere fill) is on the one hand, based on the subtle use of persuasive linguistic elements – it is always a (literary) discourse, too – and on the other, on knowing precisely what the fantasies, desires and fears of the manipulated are. The discourse of manipulation has its beginnings in the age of sophists and their belief in an omnipotence of language and rhetoric. It underwent further transformation under political and psychological signs in the early modern period through Giordano Bruno and Niccolo Machiavelli and culminated in the 20th century in a critique of the deceptive strategies of the culture industry (T. W Adorno) and “psychotechnology” (B. Stiegler) in global capitalism. Nowadays social media is the ‘radicalisation machine’ (J. Ebner) that present new challenges for society. Written in the 19th century, the Protocols of the Elders of Zion already gave indications of how present-day conspiracy theorists would manipulate their audience, and its impact can still be felt today. Since manipulation is a linguistic, narrative and also literary phenomenon, the central theme of the lecture is how in literature itself this often politically controversial and manipulative behaviour is picked up and reflected through poetry: such as in Tristan from Gottfried von Strassburg, Goethe's Wilhelm Meister, Friedrich Schiller's Die Verschwörung des Fiesco zu Genau or Heinrich von Kleist's Der zerbrochene Krug, the works of Edgar Allan Poe and Thomas Mann (Mario und der Zauberer) and, most recently in Eckhart Nickel's novel, Hysteria.

851-0527-00L Introduction to the History of Technology: Concepts, and Current Debates
Does not take place this semester.

Abstract
Technology and society cannot be separated: No society functions without technology. The seminar offers a problem-oriented introduction to basic questions of the history of technology, introduces approaches to the history of technology and discusses selected, ongoing debates.

Objective
The course seeks to provide a critical introduction to the issues, methods, and selected areas of research in the history of technology.

Content
History of technology investigates technological developments that arise in specific historical contexts. These developments are perceived as the consequences of the rivalry between the world of the colonizer and that of the colonized. However, these developments are not limited to the colonial context, but also continue in the postcolonial space. The lecture will examine the body of the colonized/migrant as a field of battle and resistance in real and metaphorical wars. Place where the stereotype is overthrown through a will for personal agency. Colonial space and the consequent postcolonial space is a hierarchical space where instruments of violence and oppression do not provide for the agency of the colonized subject or in the contemporary case of the migrant subject placed by power structures in a space of subalternity. But subjects are born free and though in a confined space seek the desire for pleasure, power and control. Manipulation manifests itself in the form of characters and words, it is an authentically linguistic occurrence: classical antiquity, with the rhetoric, develops a system of verbal power of persuasion and, already then, questions were being raised in literary and discursive texts about how people could, or even should, manipulate. The exertion of influence and its impact will be clearly described, propagated, commented upon, criticised and ironised.

In contrast to oppressive overpowering, the power of manipulation (in Latin, manus hand, plere fill) is on the one hand, based on the subtle use of persuasive linguistic elements – it is always a (literary) discourse, too – and on the other, on knowing precisely what the fantasies, desires and fears of the manipulated are. The discourse of manipulation has its beginnings in the age of sophists and their belief in an omnipotence of language and rhetoric. It underwent further transformation under political and psychological signs in the early modern period through Giordano Bruno and Niccolo Machiavelli and culminated in the 20th century in a critique of the deceptive strategies of the culture industry (T. W Adorno) and “psychotechnology” (B. Stiegler) in global capitalism. Nowadays social media is the ‘radicalisation machine’ (J. Ebner) that present new challenges for society. Written in the 19th century, the Protocols of the Elders of Zion already gave indications of how present-day conspiracy theorists would manipulate their audience, and its impact can still be felt today. Since manipulation is a linguistic, narrative and also literary phenomenon, the central theme of the lecture is how in literature itself this often politically controversial and manipulative behaviour is picked up and reflected through poetry: such as in Tristan from Gottfried von Strassburg, Goethe's Wilhelm Meister, Friedrich Schiller's Die Verschwörung des Fiesco zu Genau or Heinrich von Kleist's Der zerbrochene Krug, the works of Edgar Allan Poe and Thomas Mann (Mario und der Zauberer) and, most recently in Eckhart Nickel's novel, Hysteria.

851-0226-00L Postcolonial Readings

Abstract
The history of colonialism in the modern age begins with Christopher Columbus who, as Todrov has well told us, did not "discover" anything, but crossed the Ocean in search of riches, bringing with him a baggage of violence, stereotypes and violent conquest of resources and bodies. And from here, from that 1492, the story became one of blood and struggle.

Objective
The course will be based on case studies, linked to national realities (Brazil, Senegal, Eritrea, Great Britain, Italy, Peru, Somalia, etc.) and to physical places (the front, the museum, the field, the street, the body), to see how in different contexts, despite the peculiarity of the context, the dilemmas that are attempted to be answered are in fact very similar.

Content
WE are here, because YOU have been there, have you ever heard that phrase? In a university lecture hall? In an anti-racist demonstration? In a play? In a discussion on the bus? The YOU represents Europe and in a broader sense the West, the WE the peoples who suffered colonization by the very West that portrayed itself as a beacon of civilization. The history of colonialism in the modern age begins with Christopher Columbus who, as Todrov has well told us, did not "discover" anything, but crossed the Ocean in search of riches, bringing with him a baggage of violence, stereotypes and violent conquest of resources and bodies. And from here, from that 1492, the story became one of blood and struggle. It is a story that has covered a time span from precisely 1492 to the present, ranging from human trafficking to the extractive, and accumulation, policies of our contemporary times. The consequences of all this violence are sadly still visible on the body of the world, open wounds that bleed. Wounds in which lurk prejudice, systemic racism and murder.

Examine these consequences, to understand how contemporary societies in the global north and south, are still torn apart by this history that never seems to pass; we will rely on literature, on "postcolonial" texts that will show us the complexity of what exists. The course will be based on case studies, linked to national realities (Brazil, Senegal, Eritrea, Great Britain, Italy, Peru, Somalia, etc.) and to physical places (the front, the museum, the field, the street, the body), to see how in different contexts, despite the peculiarity of the context, the dilemmas that are attempted to be answered are in fact very similar.

The lecture will examine the body of the colonized/migrant as a field of battle and resistance in real and metaphorical wars. Place where the stereotype is overthrown through a will for personal agency. Colonial space and the consequent postcolonial space is a hierarchical space where instruments of violence and oppression do not provide for the agency of the colonized subject or in the contemporary case of the migrant subject placed by power structures in a space of subalternity. But subjects are born free and though in a confined space seek the desire for pleasure, power and control. Manipulation manifests itself in the form of characters and words, it is an authentically linguistic occurrence: classical antiquity, with the rhetoric, develops a system of verbal power of persuasion and, already then, questions were being raised in literary and discursive texts about how people could, or even should, manipulate. The exertion of influence and its impact will be clearly described, propagated, commented upon, criticised and ironised.

In contrast to oppressive overpowering, the power of manipulation (in Latin, manus hand, plere fill) is on the one hand, based on the subtle use of persuasive linguistic elements – it is always a (literary) discourse, too – and on the other, on knowing precisely what the fantasies, desires and fears of the manipulated are. The discourse of manipulation has its beginnings in the age of sophists and their belief in an omnipotence of language and rhetoric. It underwent further transformation under political and psychological signs in the early modern period through Giordano Bruno and Niccolo Machiavelli and culminated in the 20th century in a critique of the deceptive strategies of the culture industry (T. W Adorno) and “psychotechnology” (B. Stiegler) in global capitalism. Nowadays social media is the ‘radicalisation machine’ (J. Ebner) that present new challenges for society. Written in the 19th century, the Protocols of the Elders of Zion already gave indications of how present-day conspiracy theorists would manipulate their audience, and its impact can still be felt today. Since manipulation is a linguistic, narrative and also literary phenomenon, the central theme of the lecture is how in literature itself this often politically controversial and manipulative behaviour is picked up and reflected through poetry: such as in Tristan from Gottfried von Strassburg, Goethe's Wilhelm Meister, Friedrich Schiller's Die Verschwörung des Fiesco zu Genau or Heinrich von Kleist's Der zerbrochene Krug, the works of Edgar Allan Poe and Thomas Mann (Mario und der Zauberer) and, most recently in Eckhart Nickel's novel, Hysteria.
Students are introduced into how technological innovations take place within complex economic, political and cultural contexts. They get to know basic theories and practices of the field by acquiring the skills to interpret texts, to compare arguments, to research additional sources and complementary material and to author a common essay. All of this will yield into a student manual on the four core topics: technology and innovation, technology and catastrophes, technology as a dream machine and technology and association. The course language is German, and even if many texts will be in English, the ability to read and understand German is mandatory.

Towards a high tower reverberates in the present enthusiasm for Large Language Models. The story of Babel and its tower occupies only nine verses of the Hebrew Bible. These nine verses, which detail how over the course of a? massive project the one, common language of humanity splintered into a host of mutually incomprehensible tongues, have cast a long shadow across world literature. This course will track the sweep of this shadow across several languages and literatures, lingering over several moments in the story’s two-thousand-year history of transmission and translation— from Dante’s treatise on the vernacular to Early Modern “language projects” to Romantic philosophy and philology. The final unit of our course will examine the 19th and 20th-century tendency to recast of Babel’s tower of bricks as a vertiginous tower of texts. We will conclude the semester by discussing how the old story about a high tower reverberates in the present enthusiasm for Large Language Models.

Literature and history have often coexisted, "dialogued". History is a recurring theme in many literary works. In this seminar, we will explore the relationship between literature and history. We'll look at several periods of world history, from America to Europe and Africa. The aim is to evoke History as a source of creation for writers. The aim is to identify the bridges built by this transdisciplinarity, and to question the way in which History is "rewritten" by literature, after having been at its origin. To illustrate our points, we will draw on 20th- and 21st-century novels by French, Haitian and Algerian authors...

- Rosalie L'intâme, Evelyne Trouillot
- Le Manuscrit de Port-Ébène, Dominique Bona
- L'Affaire de l'esclave Furcy, Mohammed Alsaou
- Cris, Laurent Gaudé (First World War)
- Sigmarien, Pierre Assouline (World War II)
- Avant que les ombres s'effacent, Louis-Philippe Dalembert (Second World War)
- Ou j'ai laissé mon âme, Jérôme Ferrari (Second World War & Algerian War)

851-0304-00L Science Fiction

Abstract

Science fiction can be seen as fundamentally concerned with the forms and functions of knowledge and (sometimes scientific) understanding, but the genre of science fiction is unique in that it literalises this approach in a far-reaching fashion as the future of science and technology. We will explore knowledge, and the "science of literature" through a diverse range of science fiction texts.

Objective

- Concept and history of science fiction
- Theory of science fiction and related forms (e.g. utopia, fantasy)
- Contexts of the history of knowledge and technology in the 19th and 20th centuries.
- Potential of science fiction to criticise technology and society

Content

This course introduces students to the various forms and functions of knowledge and science in literature, particularly within the realm of science fiction, the genre that most directly epitomises this fundamental connection within literary texts.

In analyzing how it shapes our understanding of ourselves and of supposedly inalterable facts about the reality we inhabit, we will examine how science fiction demonstrates that fiction is neither fundamentally in conflict with scientific knowledge, as previously supposed, nor a mere vehicle for its celebration, as still commonly presumed of science fiction. Instead, the genre, with its radical investigations into other forms of being, fearing and hoping, plays a crucial role in the social formation, order and negation of knowledge. As such, science fiction also represents a vital thought experiment regarding the "science of fiction", i.e. the development of a knowledge of literature and the many fascinating ways in which it helps us to know our own world better, in turn.

In this course, we will take a systematic and theory-based approach to a deeper understanding of science fiction, particularly concerning its historical background, unique aesthetic/narrative tools, and relationship with the critical and technocultural contexts that shape it. Employing contemporary theoretical approaches, we will discuss a variety of themes within primary texts alongside diverse critical sources, all of which ultimately relate to knowledge and knowability. Particular areas of focus may include: other worlds and alien existences; altered temporality and alternate history; utopia and dystopia; climate fiction and the Anthropocene; trans- and posthumanist and cyborg identities; robots and AI; and alternative futures. Moreover, the course will thereby also engage with the fundamental (and at times overlooked) role of order and presentation of knowledge, i.e. its aesthetic and narrative forms, within science and literature.

851-0297-00L Manipulation in Literature and Cultural History

Abstract

This lecture focuses on the manipulation and control of individuals and the masses. The power of manipulation is based on subtle use of persuasive linguistic elements and knowledge of the desires and fears of the intended audience. In addition to a theoretical overview, the lecture concentrates on the literary and discursive texts that dispute the control of protagonists.

Objective

Students will learn about manipulation as a linguistic and narrative phenomenon steeped in myth and classical rhetoric. Against the backdrop of cultural-historical developments, particularly with regard to major changes in media technology, we will examine how the reach of manipulation was extended from the individual to the masses. Students will be able to refine their critical discourse analysis skills and interdisciplinary abilities by studying texts from literature, politics, sociology, philosophy and psychoanalysis which reflect this shift in emphasis.

Content

Since the dawn of time mankind has tried to exert influence over others through the utilisation of certain techniques: initially for self-preservation – for example the interpretation of Sigmund Freud in Totem and Tabu. Later, desire became the driving force – centre stage: the desire for pleasure, power and control. Manipulation manifests itself in the form of characters and words. It is an authentically linguistic occurrence: classical antiquity, with the rhetoric, develops a system of verbal power of persuasion and, already then, questions were being raised in literary and discursive texts about how people could, or even should, manipulate. The exertion of influence and its impact will be clearly described, propagated, commented upon, criticised and ironised.

In contrast to oppressive overpowering, the power of manipulation (in Latin, manus hand, plere fill) is on the one hand, based on the subtle use of persuasive linguistic elements – it is always a (literary) discourse, too – and on the other, on knowing precisely what the fantasies, desires and fears of the manipulated are. The discourse of manipulation has its beginnings in the age of sophists and their belief in an omnipotence of language and rhetoric. It underwent further transformation under political and philosophical signs in the early modern period through Giordano Bruno and Niccolò Machiavelli and culminated in the 20th century in a critique of the deception strategies of the "culture industry" (T. W Adorno) and "psychotechnology" (B. Stiegler) in global capitalism. Nowadays social media is the "radicalisation machine" (J. Eben) that present new challenges for society. Written in the 19th century, the Protocols of the Elders of Zion already gave indications of how present-day conspiracy theorists would manipulate their audience, and its impact can still be felt today. Since manipulation is a linguistic, narrative and also literary phenomenon, the central theme of the lecture is how in literature itself this often politically controversial and manipulative behaviour is picked up and reflected through poetry: such as in Tristan from Gottfried von Strassburg, Goethe's Wilhelm Meister, Friedrich Schiller's Die Verschwörung des Fiesco zu Genua or Heinrich von Kleist's Der zerbrochne Krug, the works of Edgar Allan Poe and Thomas Mann (Mario und der Zauberer) and, most recently in Eckhart Nickel's novel, Hysteria.

Abstract

The history of colonialism in the modern age begins with Christopher Columbus who, as Todorov has well told us, did not "discover" anything, but crossed the Ocean in search of riches, bringing with him a baggage of violence, stereotypes and violent conquest of resources and bodies. And from here, from that 1492, the story became one of blood and struggle.

Objective

WE are here, because YOU have been there, have you ever heard that phrase? In a university lecture hall? In an anti-racist demonstration? In a play? In a discussion on the bus? The YOU represents Europe and in a broader sense the West, the WE the peoples who suffered colonization by the very West that portrayed itself as a beacon of civilization. The history of colonialism in the modern age begins with Christopher Columbus who, as Todorov has well told us, did not "discover" anything, but crossed the Ocean in search of riches, bringing with him a baggage of violence, stereotypes and violent conquest of resources and bodies. And from here, from that 1492, the story became one of blood and struggle. It is a story that has covered a time span from precisely 1492 to the present, ranging from human trafficking to the extractive, and accumulation, policies of our contemporary times. The consequences of all this violence are sadly still visible on the body of the world, open wounds that bleed. Wounds in which lurk prejudice, systemic racism and murder.

Content

To examine these consequences, to understand how contemporary societies in the global north and south, are still torn apart by this history that never seems to pass; we will rely on literature, on "postcolonial" texts that will show us the complexity of what exists. The course will be based on case studies, linked to national realities (Brazil, Senegal, Eritrea, Great Britain, Italy, Peru, Somalia, etc.) and to physical places (the front, the museum, the field, the street, the body), to see how in different contexts, despite the peculiarity of the context, the dilemmas that are attempted to be answered are in fact very similar.

The lecture will examine the body of the colonized/migrant as a field of battle and resistance in real and metaphorical wars. Place where the stereotype is overthrown through a will for personal agency. Colonial space and the consequent postcolonial space is a hierarchical space where instruments of violence and oppression do not provide for the agency of the colonized subject or in the contemporary case of the migrant subject placed by power structures in a space of subalternity. But subjects are born free and though in a confined space seek their own path to freedom and awareness. In ways that are perhaps paradoxical in our eyes, but certainly effective in a very limited space granted. In the three lectures, through literary texts, three case studies related to as many books will be examined to understand precisely this tension between enclosed space and the search for freedom. A tension between (unjust) rules imposed, malevolent looks imposed and one's own body, one's own moral integrity.

Prerequisites / notice

This course is particularly suited for students of the following programmes: MA Comparative International Studies; MSc Energy Science & Technology; MSc Environmental Sciences; MSc Management, Technology & Economics; MSc Science, Technology & Policy; ETH & UZH PhD programmes.

Objective

- To gain an overview of the history of the transition of large technical systems
- To recognize current challenges in the energy system to understand the theoretical frameworks and concepts for studying transitions
- To gain knowledge on the role of policy and politics in energy transitions

Content

Climate change, access to energy and other societal challenges are directly linked to the way we use and create energy. Both the 2015 United Nations Paris climate change agreement and the UN Sustainable Development Goals make a fast and extensive transition of the energy system necessary.

Does not take place this semester.

Literature

A reading list will be provided via course website.
Corporate Sustainability is the flagship course of the Group for Sustainability and Technology at D-MTEC. In this course, students learn about key concepts in corporate sustainability and develop skills to implement them in the real world. The course prepares students for making well-informed sustainability decisions in their future careers.

The course uses constructive alignment to bring the various innovative teaching and learning elements (e.g., case-based experiential learning, reflective thinking and blended learning with videos and quizzes) into a coherent transformational journey. Students can now flexibly, efficiently, and effectively acquire the conceptual foundations that are essential for a substantial understanding of corporate sustainability.

For part of the course, students work in groups to complete a set of graded assignments designed to guide them into a deep dive on a selected corporate sustainability challenge. Please note that full participation in this part is essential, so make sure you are available. Furthermore, these group assignments count towards the overall grade for the course.

For further details on the course structure etc. visit the following link: http://www.sustec.ethz.ch/teaching/lectures/corporate-sustainability.html

Presentation slides will be made available on Moodle after lectures.

This course introduces the students to the long-standing tradition of actively involving users of technology and other knowledge-intensive products in the development and production process, and through own cases they develop an entrepreneurial understanding of product development under distributed, user-centered, or open innovation strategies.

This book can also be used for the course '363-0503-00L Principles of Microeconomics' (Filippini).

Besides this textbook, the slides, lecture notes and problem sets will cover the content of the lecture and the exam questions.

The course Moodle page contains announcements, course information and lecture slides.

This book can also be used for the course '363-0503-00L Principles of Microeconomics' (Filippini).

The course uses constructive alignment to bring the various innovative teaching and learning elements (e.g., case-based experiential learning, reflective thinking and blended learning with videos and quizzes) into a coherent transformational journey. Students can now flexibly, efficiently, and effectively acquire the conceptual foundations that are essential for a substantial understanding of corporate sustainability.

For part of the course, students work in groups to complete a set of graded assignments designed to guide them into a deep dive on a selected corporate sustainability challenge. Please note that full participation in this part is essential, so make sure you are available. Furthermore, these group assignments count towards the overall grade for the course.

For further details on the course structure etc. visit the following link: http://www.sustec.ethz.ch/teaching/lectures/corporate-sustainability.html

Presentation slides will be made available on Moodle after lectures.

This course introduces the students to the long-standing tradition of actively involving users of technology and other knowledge-intensive products in the development and production process, and through own cases they develop an entrepreneurial understanding of product development under distributed, user-centered, or open innovation strategies.
**Objective**

The course includes both lectures and exercises alternately. The goal is to understand the opportunity of user innovation for management and develop strategies to harness the value of user-developed ideas and contributions for firms and other organizations.

The students actively participate in discussions during the lectures and contribute presentations of case studies during the exercises. The combination should allow to compare theory with practical cases from various industries.

The course presents and builds upon recent research and challenges the students to devise innovation strategies that take into account the availability of user expertise, free and public knowledge, and the interaction with communities that span beyond one organization.

Performance assessment will be: a written group essay based on the open/user innovation case that participants will research and present during the block seminar (including the slides). Each group will have to hand in a 15-20 page essay, details on the required format and the content will be distributed during the course. Active iass participation is required.

**Content**

This course on user innovation extends courses on knowledge management and innovation as well as marketing. The students are introduced to the long-standing tradition of actively involving users of technology and other knowledge-intensive products in the development and production process, and through own cases they develop an entrepreneurial understanding of product development under distributed, user-centered, or open innovation strategies. Theoretical underpinnings taught in the course include models of innovation, the structuration of technology, and an introduction to entrepreneurship.

The slides of the lectures are made available and updated continuously through Moodle.

**Literature**

Relevant literature for the course includes slides and reading assignments. Papers will be made available through a corresponding Moodle group.

**Competencies**

  - Concepts and Theories
  - Analytical Competencies
  - Problem-solving
  - Communication
  - Cooperation and Teamwork
  - Customer Orientation
  - Creative Thinking
  - Critical Thinking

- **Method-specific Competencies:**
  - Sensitivity to Diversity
  - Self-direction and Self-management

- **Personal Competencies:**
  - Critical Thinking

---

**Abstract**

This course presents the basics of public policy analysis and the specific characteristics of Swiss environmental policy. Policy instruments, actors, and processes are addressed from a political science perspective both theoretically as well as by means of current Swiss environmental policy examples.

Beyond acquiring basic knowledge about public policy analysis, this course teaches students how to analytically address current and concrete questions of environmental policy. Through exercises the students learn about political science concepts and frameworks as well as real-life political decision-making processes. The well-grounded examination of complex political conflict situations is an important precondition for the entry into the (environmental policy) workforce or a future research career.

The processes of change, overuse or destruction of the natural environment through humans have historically placed high demands on social and political institutions. In the interplay between the environment, society and economy, the environmental policy field encompasses the sum of public measures that have the goal to eliminate, reduce or avoid environmental degradation. The course systematically presents the basics of environmental policy instruments, actors, programs and processes as well as their change over time. Invited practitioners will provide us with insight regarding the current developments in forest, water and spatial planning policies. A key aspect is the distinction between politics and political science and specifically environmental policy.

**Lecture notes**

The reader and additional lecture material and exercises will be posted on Moodle.

**Literature**

Reader and additional lecture material on moodle.

**Prerequisites / notice**

The detailed semester program (syllabus) is made available to the students at the beginning of the semester. During the lecture we will work with Moodle and eduApp. We ask that all students register themselves on these platforms before the lecture and to bring a laptop, tablet or smartphone to class, so that you can complete exercises using Moodle and eduApp.

**Abstract**

This course introduces basic economic concepts and theories. Beginning with microeconomics, the course starts with the topics of supply and demand, markets, and behavioral economics before moving on to the key macroeconomic concepts of national accounts, the labor market, trade, and monetary policy.

After successful completion of the course you will be able to:

- Describe the basic micro- and macroeconomic problems and theories.
- Introduce economic reasoning appropriately to a given topic.
- Evaluate economic measures.
Households, firms, supply and demand: How are household preferences and consumption patterns formed? How does a household react to price changes? How are goods prices formed? At what prices are companies willing to offer goods? How do we make economic decisions?

Markets: What is "perfect competition" and how does a competitive market work? Are monopolies always a bad thing? How can the state influence the market?

Market failure: What happens when prices give wrong signals?

Labour market: How do supply and demand work in the labour market? What influences unemployment?

National accounts: How big is the Swiss economy?

Foreign trade: Why do countries trade with each other? What are the consequences for the domestic market?

Money and inflation: What exactly is money? How does money creation work and what happens when there is too much (or too little) money on the market?

Students will be asked to apply these concepts to issues in their own field of study and to current issues in society. This goal will be achieved through participation in exercises, class discussions and reading material from current media. By the end of the course, students should be able to apply economic analysis confidently and independently.

351-1109-00L Introduction to Microeconomics

Abstract
The course introduces basic principles, problems and approaches of microeconomics. It describes economic decisions of households and firms, and their coordination through perfectly competitive markets.

Objective
Students acquire a deeper understanding of basic microeconomic models. They acquire the ability to apply these models in the interpretation of real world economic contexts.

Content
Market, budget constraint, preferences, utility function, utility maximisation, demand, technology, profit function, cost minimisation, cost functions, perfect competition, information and communication technologies

Lecture notes
Course material in e-learning environment https://moodle-app2.let.ethz.ch/auth/shibboleth/login.php

851-0622-00L Inequality and Injustice: Economic and Philosophical

Abstract
This course is only for students enrolled in a Bachelor's degree programme.

Note for D-MAVT students: If you have already successfully completed "Principles of Microeconomics" (LE 363-0503-00L), then you will not be permitted to attend it again.

Objective
Students acquire a reflective and contextual knowledge on how societies use scarce resources to produce goods and services and distribute them among themselves.

Content
Market, budget constraint, preferences, utility function, utility maximisation, demand, technology, profit function, cost minimisation, cost functions, perfect competition, information and communication technologies

Lecture notes
Course material in e-learning environment https://moodle-app2.let.ethz.ch/auth/shibboleth/login.php

Literature

Prerequisites / notice
This course "Einführung in die Mikroökonomie" (363-1109-00L) is intended for Bachelor students and LE 363-0503-00 "Principles of Microeconomics" for Master students.

Abstract

This lecture series explores the multifaceted role of data in shaping contemporary society, governance, and individual lives. The course equips students with a critical understanding of how data is made, managed, and preserved, and its implications for societal norms and individual rights.

Objective

At the end of the term, students will be able to:

- reflect concepts and theories that capture the performativity of data
- reflect concepts and theories that capture the socio-technical nature of data
- assess the implications of data practices for social and political ordering
- identify key actors, sites, and domain contexts of data practices

Abstract

The history of colonialism in the modern age begins with Christopher Columbus who, as Todvor has well told us, did not "discover" anything, but crossed the Ocean in search of riches, bringing with him a baggage of violence, stereotypes and violent conquest of resources and bodies. And from here, from that 1492, the story became one of blood and struggle. The lecture will examine the body of the colonized/migrant as a field of battle and resistance in real and metaphorical wars. Place where instruments of violence and oppression do not provide for the agency of the colonized subject or in the contemporary case of the migrant subject placed by power structures in a space of subalternity. But subjects are born free and though in a confined space seek their own path to freedom and awareness. In ways that are perhaps paradoxical in our eyes, but certainly effective in a very limited space granted. In the three lectures, through literary texts, three case studies related to as many books will be examined to understand precisely this tension between enclosed space and the search for freedom. A tension between (unjust) rules imposed, malevolent looks imposed and one's own body, one's own moral integrity.

Types of Competencies

Perspectives

Does not take place this semester.

Objective

Using philosophical and economic texts and discussions, students develop an understanding of the concepts, developments, causes, and consequences of inequality. Students will acquire the ability to participate in an informed discourse on the issues of inequality and injustice and to critically reflect on their actions and position in the world.

Content

In this seminar we will explore the issues of inequality and injustice. In doing so, we will explore the following questions: What is meant by inequality and injustice? Under what circumstances are inequalities unjust? Have inequalities and injustices increased or decreased over the last 50 years? What are the causes of increasing or decreasing inequality? What do these inequalities and injustices mean for our society? And what public and private measures are needed for more inclusive societies?

- Concepts of inequality and injustice
- Development of inequality over the last 50 years based on different dimensions of inequality: income, wealth, education, health, CO2 emissions, political participation.
- Discrimination of women, people with physical disabilities, people of the "Global South".
- Causes of inequality: globalization, technological progress, political systems and institutions, economic system, social discrimination, stereotypes and norms.
- Consequences of inequality: justice, dignity, inefficiency
- Towards more inclusive societies: the role of policies, civil society, social movements and individual behavior.

Autumn Semester 2024

Page 2590 of 2684
The pressing environmental challenges of today demand a critical reflection. Ethics is an important tool for doing so. This lecture introduces the basics of ethics and provides in-depth knowledge of environmental ethics and its debates. This theoretical background will be applied and critically reflected using examples of current environmental challenges.

On completion of this lecture, you have acquired the ability to identify, analyze, critically reflect and resolve ethical challenges in general and specifically regarding the environment. You know basic concepts, positions and lines of argumentation from the debate in environmental ethics, which you have applied and discussed in smaller exercises.

A. Identify ethical issues in in life sciences and biotechnology.
B. Analyze and critically discuss ethical issues in life sciences and biotechnology.
C. Become aware of relevant legal and public policy frameworks.
D. Distinguish different ethical approaches and argumentative strategies in applied ethics.
E. Recognize how ethical issues relate to different accounts of technology and innovation.
F. Develop a personal and critical attitude towards the ethical aspects of life sciences and their technological application.
G. Autonomously anticipate ethical issues.
H. Propose and communicate solutions to ethical challenges and dilemmas.

The course starts off with an introductory lecture on ethics as a discipline and an overview of the most relevant approaches in the domain of health sciences and their technological application. The students will acquire the necessary theoretical and analytic resources to develop critical thinking skills in the field of applied ethics and will practice how to use such resources to address concrete ethical issues in health sciences.

The course will continue with thematic sessions covering a broad variety of topics all of which are relevant to the different study tracks offered by the department. In particular, the course will cover the following domains: digital health technologies and medical AI; food, nutrition and healthy longevity; biomedical engineering; genetics; neuroscience and Neurotechnologies; medical robotics; disability and rehabilitation; environmental ethics. The course will also include sessions on cross-cutting ethically relevant aspects of health sciences and technologies, namely: access to innovation, translational research, and the relation between science and public policy. All the topics of the course will be illustrated and interactively discussed through many case studies, offering the students the opportunity to prepare and present them, and to use them in individual as well as group exercises. Throughout the course, the students will have multiple opportunities to experiment with ethical argumentation and to practice their evolving skills.
Critical Thinking

Globalization and technological progress in recent decades have on the one hand reduced inequality and led to new forms of inequality on the other. This lecture series covers psychedelic science mainly scientifically, and additionally philosophically, psychologically, religiously, and politically. It will additionally also be reflected from the viewpoint of the humanities and psychology. The psychedelic studies treated in this course that involve humans focus on controlled and ethically approved studies where these substances are administered to medically screened, prepared, and supported participants. This course is in no way intended to encourage the private use of psychedelic substances.

Psychelic science is overall a large multidisciplinary effort that requires collaboration of scholars of the human sciences, the natural sciences, and the humanities to advance the scientific knowledge of it. In this spirit, this course involves—besides the main lecturer (PD Dr. phil. Kurt Stocker, a psychologist)—also further psychedelic-scientific scholars giving individual lectures in their respective field of expertise: psychology (PD Dr. phil. Katrin Preller, University of Zurich & Yale University), pharmacology (Dr. phil. nat. Dino Luethi, University Hospital Basel; Dr. phil. nat. Deborah Rudin, University Hospital Basel; Prof. Dr. phil. Linda Simmler, University of Basel), physiology (PD Dr. sc. nat. Felix Scholkmann, University of Zurich & University of Bern), psychotherapy (Prof. Dr. med. Gregor Hasler, University of Fribourg; Dr. med. Dr. sc. ETH Milan Scheidegger, University of Zurich), religion (TBA), and politics (Dr. phil Claudia G. Schwarz, Karl Landsteiner University of Health Sciences, Krems). By incorporating all these disciplines, the curricular goal of this ETH course is to cover psychedelic science from the large variety of major academic disciplines that are involved in this field, and to thus introduce psychedelic science to the students as broadly and comprehensively as is possible within a single course.

In this seminar we will explore the issues of inequality and injustice. In doing so, we will explore the following questions: What is meant by inequality and injustice? Under what circumstances are inequalities unjust? Have inequalities and injustices increased or decreased over the last 50 years? What are the causes of increasing or decreasing inequality? What do these inequalities and injustices mean for our society? And what public and private measures are needed for more inclusive societies?

### Abstract
This course discusses ethical issues relating to life and death, e.g., reproductive technology, euthanasia, organ transplantation, genetic engineering, animal and nature conservation, human enhancement, animal welfare, nature conservation, biodiversity and our relation to nature more generally.

### Objective
Students will get an overview of different historical and contemporary approaches in bioethics. They are enabled to further developing their abilities to understand complex theories, to critically reflect on them and to put them up for discussion.

### Content
Bioethics is a very broad field, encompassing ethical issues relating to life and death, e.g., reproductive technology, euthanasia, organ transplantation, genetic engineering, human enhancement, animal welfare, biodiversity and our relation to nature more generally. Bioethics is addressed in various contexts and disciplines, in politics, in religious contexts, in social sciences, in biosciences, medicine and the biosciences. The focus in this course is on the fundamental debates in ethics as a philosophical discipline. In addition, topics are selected for discussion depending on the students’ interests.

### Abstract
Building practices have often been associated with utopian visions and promises of a more just way of living together. But to what extent can the built environment contribute to a better society? What role can mathematical models or data analyses play in questions of distributive justice in the city? Is it even possible to build sustainably, or is building always also destroying the environment?

### Objective
Students will learn about contemporary debates in architectural and urban planning ethics. We will discuss the positions against the background of their historical predecessors and current contexts. Students will work on small case studies in which they will critically analyze the construction of a building, a district or a city. The seminar includes a student-co-led expedition through Zurich.

### Content
Throughout history, there have always been utopian visions and promises tied to construction, be it of individual objects, such as towers, or of entire cities. For example, thanks to their geometric shapes, modern cities are supposed to enable more equality among people, even the equal distribution of sunshine, as Le Corbusier once dreamed. But to what extent is it even possible to create more equality by designing living spaces? A wall automatically excludes the far and the near, the center and the periphery, the upper and the lower. These orientations translate into social relations for example of those who commute far and those who are at the center of the action. Who determines how and what is built and whose perspective is not taken into account? To whom does a built landscape afford agency and to whom not? Mathematical models can predict the probabilities of encounters in space, which also can have an impact on social relationships. What is the relevance of such models as well as the more recent data analyses in questions of distributive justice? Is it possible to distribute social participation in the city? Does construction always have to destroy and replace the underlying nature? How do our building practices affect coexistence with other species?

We will not be able to solve these problems in one semester, but we will intensively grapple with the overarching question implied in all of them. The question is on the extent to which the built environment takes on ethical significance for human (and other) forms of life, and how are we to understand ethics in general if it is to respond to such questions.

### Abstract
This course will present an overview of feminist philosophies of science and technology and new materialist philosophies of science and technology.

### Objective
The students will be able to analyze techno-scientific knowledge and practices from the point of view of various recent philosophical framework from the context of feminist and new materialist philosophy.

### Content
The course will cover feminist approaches to empiricism, to the question of fact/value and to the re-articulation of the concept of objectivity. It will also cover new materialist approaches, such as those of Bennett, Barad and Latour. The discussion will be related to the science-technology-politics nexus, and evaluated critically.

<tbody>
<tr>
<td>Abstract</td>
<td>This course introduces students to the ethical, political and legal debates and transformations in relation to Artificial Intelligence and provides students with concepts and methods from the constructivist and interpretive social sciences to work towards responsible and democratic human-technology futures.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>The main objectives of the course are to enable students to 1) identify the ways in which human values and developments of AI technologies are entangled, 2) articulate what is significant about contemporary transformations in AI and society, and 3) participate and shape the relationship between human values and AI as citizens and professionals.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>The growing presence of AI tools for public use, for public administration, inside corporations and in scientific research raises many questions about the ethical, political, legal consequences of these technologies. This course is built around multiple sites of encounter among human values and AI, including bodies, persons, cities, labs, law, and environment. In each site, we inquire about what and whose values are being prioritized and with what consequences. The course also investigates existing best-practices around how to &quot;align&quot; human values with AI (e.g. human-centric design, alignment, reproducibility, transparency, explainability) and introduces students to regimes of ethics and governance of AI being proposed in jurisdictions around the world. Students learn to unpack the values and assumptions in existing techniques and frameworks for the design and governance of AI and to engage constructively with diverse stakeholders to shape the human-technology future towards aims that are reflexive, responsible, and democratic.</td>

Man-made climate change confronts us with difficult ethical problems. Our use of fossil fuels and the associated warming of the climate fosters assessed fostered assessed fostered. Over the course of the semester, students will learn not only to navigate some of the most heated contemporary debates, but also to articulate their own position on an issue of their choice.

The course addresses these questions by critically reviewing utilitarian approaches, exemplified by John Broome's book "Climate Matters: Ethics in a warming world" (e.g. the use of cost-benefit analyses to assess the ethical consequences of global warming) and contrasting them with virtue ethics and Kantian approaches. Specifically the course examines the ethical implications of our individual contributions to global warming, questions of justice and political responsibility borne by citizens, states and companies. Proposals that combine utilitarian theories with economic models, such as a market for carbon certificates and carbon off-setting, will form the starting point in the seminar in order to reflect on and critically examine one’s own ethical role and the ethical foundations of social measures.

The exercise of expertise is stumbling upon several conundrums. Which knowledge is relevant in which situation? How to make sure that some crucial perspectives are not left out in the shadows? How to identify representative experts and make sure that they speak on behalf of a structured community? Whose voices are being silenced? On the other side of the scale, who is the public often said to lack proper understanding of science and thus in need of being educated or disciplined. Or is it suspected of being manipulated by lobbies or foreign hostile powers, or of being too attached to its own privileges and unwilling to act in favor of the common good. Whose agency is being acknowledged in sociotechnical controversies and whose agency is being denied and why? The seminar will provide a deep understanding of these perspectives, by putting them in a broader historical and epistemological context. Students will thus learn to critically assess their strengths as well as their blind spots.

Whereas opposing technological developments (anti 5G or anti-vaccine activists) or pushing to act accordingly to science (pro climate movements such as Extinction Rebellion or Scientist Rebellion), activists’ movements make up for a rich field of investigation on the dynamics of expertise’s text and of scientific controversies. From the perspective of science studies and anthropology, this class will be organized as a structured conversation and a collective mapping of actors and key concepts of sociotechnical controversies.

### Competencies

### 851-0040-00L
**Can it Be Permissible to Kill a Few in Order to Save Many?**

**Abstract**

First, the relevant literature on moral justifications in trolley cases will be discussed (Foot, Thomson, Kamm, Otsuka, Kagan). Second, neuropsychological research on trolley cases (Greene, Haidt, Berkier, Kamm) and third, applications of such moral reasoning in cases potentially arising in autonomous robots (Rahwan, Nyholm and Smids, Wolkenstein) will be considered.

In this course, students critically engage with ethical problems posed by man-made climate change. These include 1) framing of climate change as a social dilemma; 2) the balancing of the costs of climate change as they relate to current and future generations as well as non-human entities; and 3) questions regarding the responsibility of the state and individuals in mitigating climate change.

Philosophical Perspective

Does not take place this semester.

Abstract
Understanding is a central goal of science and mathematics, but what exactly is the nature of scientific and mathematical understanding?

In this seminar, we will read and discuss a number of key philosophical contributions on understanding in philosophy of science, philosophy of mathematics, and epistemology. You will also practice your skills in giving clear and engaging oral presentations.

Objective

The main objective of this seminar is to gain an in-depth understanding of the recent literature on understanding in the philosophy of science, the philosophy of mathematics, and epistemology. Another practical objective is to increase your skills in giving clear and engaging oral presentations.

Content

Understanding is a central goal of science and mathematics: scientists seek to understand various phenomena in the natural world, while mathematicians aim to increase our understanding of the mathematical world. But what exactly is the nature of understanding in science and mathematics?

This issue has been largely neglected in twentieth century philosophy of science, philosophy of mathematics, and epistemology. Yet, in the past twenty years, there has been a regain of philosophical interest into the notion of understanding, leading to a flourishing literature.

The aim of this seminar is to gain an in-depth understanding of these recent philosophical developments.

To this end, we will read a number of key philosophical contributions on understanding in philosophy of science, philosophy of mathematics, and epistemology. Along the way, we will address general issues on understanding such as: What is the relation between understanding and knowledge? Does understanding necessarily require explanation? How can understanding be transmitted? What exactly is the value of understanding? We will also look into specific case studies of scientific and mathematical understanding.

Each session will be decomposed into three blocks. In blocks 1 and 2, we will have a short presentation (~15 minutes) of a contribution in the philosophy of understanding followed by a discussion. Block 3 will be methodological and will be concerned with how to give good oral presentations, an essential skill in academia. We will use this block to debrief on the presentations of the day and see how they could be improved. We will also discuss resources on best practices in oral communication.

|              | This course analyzes the foundations and challenges of Swiss foreign policy. After reviewing the history of foreign policy conceptions since the early 20th century, we will discuss the determining factors of Swiss foreign policy and examine, together with guest speakers from the foreign ministry, current international developments and respective foreign policy challenges. Students should acquire a sound understanding of Swiss foreign policy and the relevant academic and political debates associated with it.

Conflict Research I: Political Violence

Abstract
This lecture series provides students with an overview of the development of international relations since the end of World War II. The first part of the series deals with the development of and changes in Cold War security policy structures. The second part deals with the period after the transformation of 1989/91; the focus here is on current issues in international security policy.

Objective
By the end of the semester, participants should have a solid knowledge of the history and theoretical foundations of International Relations since the end of the Second World War.

Content
- "Diploma Supplement"

Prerequisites / notice
The lecture is supported by a website on Moodle. If you have any questions, please contact Fabio Schmocker (fabio.schmocker@sipo.gess.ethz.ch)

European Integration (Seminar without Tutorial)

Abstract
The lecturing course covers the theory, development, and core policy fields of European integration as well as structures and processes of the EU as a decision-making system.

Objective
The seminar is designed to help students understand the European Union as a particular kind of political system that differs from both the nation-state and other international organizations. It imparts basic knowledge on the development, institutions, procedures, and policies of the EU and provides an introduction to major approaches to integration theory and political science research on the EU.

Content
1. Introduction
2. Theories of European integration
3. Institutional development of European integration
4. Development of political integration
5. Internal market and monetary union
6. Internal and external security policies
7. Constitutionalization
8. Widening and differentiation
9. European integration in crisis
10. Institutions
11. Law-making and law enforcement
12. Statehood and democracy
13. Switzerland, the EEA and Neighbourhood Policies

Lecture notes
The seminar covers the theory, development, and core policy fields of European integration as well as structures and processes of the EU as a decision-making system.

Literature
Die Literatur wird auf Moodle bereitgestellt.

Prerequisites / notice
The grade is based on a written exam.

Method-specific Competencies
- Critical Thinking: assessed

International Environmental Politics

Abstract
This course deals with how and why international problem-solving efforts (cooperation) in environmental politics emerge and evolve, and under what circumstances such efforts are effective. Based on concepts, theories, and methods of political economy, political science, and public policy, various examples of international environmental policy-making are examined.

Objective
The objectives of this course are to (1) gain an overview of important questions in international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions in this policy area and how to address them in a conceptually and methodologically meaningful and insightful way; (3) gain an overview of important global and regional environmental problems and how they are or could be solved.

Content
This course deals with how and why international problem-solving efforts (cooperation) in environmental politics emerge and evolve, and under what circumstances such efforts are effective. Based on concepts, theories, and methods of political economy, political science, and public policy, various examples of international environmental policy-making are examined, for example international efforts to reduce air pollution, manage international water resources, mitigate and adapt to global warming, protect the stratospheric ozone layer, address biodiversity challenges, deal with plastic waste, and prevent pollution of the oceans.

Lecture notes
Reading materials and slides will be available via Moodle.

Literature
Reading materials and slides will be available via Moodle.
Introduction to Cybersecurity Politics

Credit and Exam
After passing a written test at the end of the course (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test). Visiting students (e.g., from the University of Zurich, exchange students) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory. Students who obtain a grade of < 4.0 for the test will have a second chance (see table below). Students who did not participate in the test on 16 December 2024 will not have access to the repeat test unless they submit compelling and documented (e.g., medical, other exam in parallel at ETH) reasons for why they are/were unable to participate in the first test. The test covers all contents of the lectures and the reading assignments. No separate registration for the exam is required, registration for the course as such covers everything. The exam will take place on campus, most likely in HG F3. That is, you must be present in person at ETH Zurich on the exam date/time.

Introduction to Cybersecurity Politics

Abstract
The lecture is an introduction to global cybersecurity politics. The focus is on the strategic use of cyberspace by state and non-state actors (threats) and different answers to these new challenges (countermeasures).

Objective
Participants learn to assess the advantages and disadvantages of cyberspace as a domain for strategic military operations. They understand the technical basics of cyber operations and know how technology and politics are interlinked in this area. They understand the security challenges for and the motivations of states to be active in cyberspace offensively and defensively and they are familiar with the consequences for international politics.

Content
We start with an overview of cybersecurity issues from 1980 to today and look at events and actors responsible for turning cybersecurity matters into a security political issue with top priority. After familiarizing ourselves with the technical basics, we look at different forms of cyberviolence and trends in cyber conflicts (technique in social and political practice). Then, we turn to countermeasures: we compare national cybersecurity strategies, examine international norms building, and scrutinize concepts such as cyber-power and cyber-deterrence (technique in social and political regulatory contexts).

Literature
A script with background information and comments on the literature will be made available at the beginning of the semester.

Prerequisites
The lecture is being supported by a website on Moodle.

The Role of Technology in National and International Security Policy

Abstract
The lecture provides an introduction to the role of security and military technologies in the formulation and implementation of national and international security policies. The focus is on challenges posed by new and developing technologies, the transformation of military capabilities, and the question of regulation.

Objective
Participants will gain an in-depth overview of the many ways in which technology is becoming part of security policies and practices, in both civilian and military contexts.

table
In this course students deepen their knowledge about global development and sustainability issues. We will show five movies each of them linked to one of the five P’s (Planet, People, Prosperity, Peace and Partnerships) reflecting the topics of the 2030 Agenda. Afterwards the movie will be critically discussed with researchers from policy, the private sector and civil society.

**Objective**
- Students get a broad understanding of some of the most important issues and discussions related to sustainable development.
- Students get exposed to diverse realities of young people in developing countries.
- Students can critically reflect upon the information that is presented to them in the movies and relate it to the broader discussions around sustainable development.
- Students reflect on issues concerning communicating research and the realities of low-income settings to a wider public.

**Content**
The aim of the course is to deepen student’s knowledge about global issues and to inspire them to reflect critically upon complex topics, which are related to the broader discourse on sustainable development. In each class, we show a documentary film, which is linked to one of the five critical areas of the 2030 Agenda (Planet, People, Prosperity, Peace and Partnerships), putting specific focus on realities in developing countries. Following the movie screenings, we will discuss the topic of the film in the light of sustainable development with an expert from academia and/or a practitioner from the field of development cooperation. In preparation for each class, the students read an academic paper, which will also be considered in the discussion. The idea of “Bridging Art and Science” is to expose an interdisciplinary group of students to artistic and scientific perspectives alike and to challenge them to deal with bias and polarization, and the role that the media and films play in that regard. The participants of the course will be given the chance to embrace the complexity of sustainable global development.

**Philosophy of War**

Does not take place this semester.

**Objective**
Students learn about the different types of argumentative texts and their historical, social, political and ethical context. They learn to understand the descriptive and critical value of texts in regard to the topic of war.

**Science, Trust and Politics**

**Objective**
1) Introduce to the role and functions of expertise in democratic societies. 2) Familiarize with assumptions about science and society embedded in contemporary controversies. 3) Inspire critical perspectives on (dis)trust in science through activists' movements on contested environmental and technological issues. 4) Develop a creative position on the relations between science, trust and politics.
The history of colonialism in the modern age begins with Christopher Columbus who, as Todorov has well told us, did not “discover” anything, but crossed the Ocean in search of resources and bodies. And from here, from that 1492, the story became one of blood and struggle. It is a story that has covered a time span from precisely 1492 to the present, ranging from the stereotype is overthrown through a will for personal agency. Colonial space and the consequent postcolonial space is a hierarchical structure of expertise and of how various publics can make sense of scientific knowledge. Cross-fertilizing activist’s texts and experiences with literature in science and technology studies and anthropology, this class will be organized as a structured conversation and a collective mapping of actors and key concepts of sociotechnical controversies. Over the course of the semester, students will learn not only to navigate some of the most heated contemporary debates, but also to articulate their own position on an issue of their choice.

Students will focus on the implications for tech companies, understanding the new challenges from a technological, policy and legal perspective.

The course presents current trends, analysing the risks involved in the digitisation of conflicts, both for civilians (as means and victims) and for private technology companies as the main actors of this transformation.

Postcolonial Readings

The course will be based on case studies, linked to national realities (Brazil, Senegal, Eritrea, Great Britain, Italy, Peru, Somalia, etc.) and to physical places (the front, the museum, the field, the street, the body), to see how in different contexts, despite the peculiarity of the context, the dilemmas that are attempted to be answered are in fact very similar.

The lecture will examine the body of the colonized/migrant as a field of battle and resistance in real and metaphorical wars. Place where the stereotype is overthrown through a will for personal agency. Colonial space and the consequent postcolonial space is a hierarchical space where instruments of violence and oppression do not provide the same sense of agency to the colonizer as to the colonized and the oppressed.

The course will provide a deep understanding of these perspectives, by putting them in a broader historical and epistemological context. Students will thus learn to critically assess their strengths as well as their blind spots.

Digital Technologies are increasing in presence in the context of armed conflicts, and they are primarily provided by private technology companies. This course presents current trends, analysing the risks involved in the digitisation of conflicts, both for civilians (as means and victims) and for private technology companies as the main actors of this transformation.

The lecture will examine the body of the colonized/migrant as a field of battle and resistance in real and metaphorical wars. Place where the stereotype is overthrown through a will for personal agency. Colonial space and the consequent postcolonial space is a hierarchical space where instruments of violence and oppression do not provide the same sense of agency to the colonizer as to the colonized and the oppressed.

The course will provide a deep understanding of these perspectives, by putting them in a broader historical and epistemological context. Students will thus learn to critically assess their strengths as well as their blind spots.

Digital Technologies and Armed Conflict

Student-specific Competencies

Method-specific Competencies

Social Competencies

- Communication: fostered
- Cooperation and Teamwork: fostered
- Sensitivity to Diversity: fostered
- Negotiation: fostered

Personal Competencies

- Adaptability and Flexibility: fostered
- Creative Thinking: fostered
- Critical Thinking: assessed
- Self-awareness and Self-reflection: assessed

Course Contents:

7. Case Studies (based on scenarios).
5. The Potential Human Cost of Cyber Operations.
4. Hybrid and Unconventional Warfare: Kinetic and cyber offensive operation coordination; Disruption of digital services; The dual-use dilemma; The public-private partnership dilemma; Civilization of digital warfare, Total offense and whole-of-societies: a digital perspective of society’s active participation; The cognitive warfare: a digital perspective of modern low-intensity constant warfare.
3. Connectivity in Crisis: No connectivity: the connectivity gap; Loss or limitation of connectivity; Stable connectivity: connected in crisis.
2. Digital Capabilities in Armed Conflict: Overview; Established cyber capabilities; The cyber weapons dilemma; Attribution and self-attribution; Other digital means during armed conflicts.
1. Connectivity in Crisis: No connectivity: the connectivity gap; Loss or limitation of connectivity; Stable connectivity: connected in crisis.

Psychology, Pedagogics

Number Title Type ECTS Hours Lecturers
871-0240-00L Human Learning (EW1) W 2 credits 2V E. Stern, M. Rau

This lecture is only apt for students who intend to enrol in the programs "Teaching Diploma" or "Teaching Certificate". It is about learning in childhood and fostered
Abstract
This course looks into scientific theories and also empirical studies on human learning and relates them to the school.

Objective
Anyone wishing to be a successful teacher must first of all understand the learning process. Against this background, theories and findings on the way humans process information and on human behaviour are prepared in such a manner that they can be used for planning and conducting lessons. Students additionally gain an understanding of what is going on in learning and behavioural research so that teachers are put in a position where they can further educate themselves in the field of research into teaching and learning.

Content
ThematISChe Schwerpunkte:
Lernen als Verhaltensänderung und als Informationsverarbeitung; Das menschliche Gedächtnis unter besonderer Berücksichtigung der Verarbeitung symbolischer Information; Lernen als Wissenskonstruktion und Kompetenzerwerb unter besonderer Berücksichtigung des Wissenstransfers; Lernen durch Instruktion und Erklärungen; Die Rolle von Emotion und Motivation beim Lernen; Interindividuelle Unterschiede in der Lernfähigkeit und ihre Ursachen; Intelligenztheorien, Geschlechtsunterschiede beim Lernen

Lernformen:

Lecture notes
Folien werden zur Verfügung gestellt.

Literature

Prerequisites / notice
This lecture is only apt for students who intend to enrol in the programs "Lehrdiplom" or "Didaktisches Zertifikat". It is about learning in childhood and adolescence.

871-0238-01L Support and Diagnosis of Knowledge Acquisition W 3 credits 3S C. M. Thurn, S. Daguati

Abstract
Enrolment only possible with matriculation in Teaching Diploma (except for students of Sport Teaching Diploma, who complete the sport-specific course unit EW3) and for students who intend to enrol in the "Teaching Diploma".

Objective
1) You have a deep understanding about the cognitive mechanisms of knowledge acquisition.
2) You have a basic understanding about psychological test theory and can appropriately administer tests.
3) You know various techniques of formative assessment and can apply these to uncover students' misconceptions.

Competencies
Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving

Social Competencies
- Communication
- Cooperation and Teamwork
- Leadership and Responsibility
- Sensitivity to Diversity

Personal Competencies
- Creative Thinking
- Critical Thinking

851-0252-01L Human-Computer Interaction: Cognition and Usability W 3 credits 2S C. Hölscher, I. Barisic, B. Davison, to be announced

Abstract
This seminar will introduce key topics, theories and methodology in human-computer interaction (HCI) and usability, with a focus on applying them to real situations.

Objective
Presentations will cover the basics of human-computer interaction and selected topics:
- History of HCI
- Research ethics
- Literature reviews
- Participant-free methods: cognitive walkthrough and heuristic evaluation
- Card sorting and information architecture
- Usability studies
- Unmoderated research and diary studies
- Surveys
- User Logs and metric frameworks

On a weekly basis, students will conduct authentic research in class covering the topics above. They will submit in-class research results regularly and also present their findings to the class once per semester.

The final project demonstrates class topic adoption by deeply exploring one HCI problem using the covered methods and tools. Students will choose a research topic and execute their research plan. They will individually write a formal report including problem definition, literature review, methodology, findings and discussion.

363-0311-00L Psychological Aspects of Risk Management and Technology W 3 credits 2V N. Bienefeld-Seall, G. Grote, R. Schneider, M. Zumbühl

Abstract
Using uncertainty management by organizations and individuals as conceptual framework, risk management and risk implications of new technologies are treated. Three components of risk management (risk identification/evaluation, risk mitigation, risk communication) and underlying psychological and organizational processes are discussed, using company case studies to promote in-depth understanding.

Status: 06.08.2024 12:40
Objective

- You know how risk and risk management is defined and applied in different industries
- You know the challenges of decision making under risk and uncertainty and its effects on organisations
- Know about and (partially) apply some risk management tools
- Gain some more in-depth knowledge in a selected field within risk management through the semester project (e.g. transport systems, IT, insurance)

This course consists of three main elements:

A) Attendance of lectures that provide the theoretical foundations of “Psychological Aspects of Risk Management and Technology” together with reading assignments for each lecture.

B) Attendance of guest lectures that provide a rich source of practical insights and enable the transfer of theory into practice by discussing real-life cases with experts from various industries.

C) Furthermore, this course enables you to apply what you have learned in the classroom into practice by participating in a group assignment in which you gain insights into various risk industries (e.g., aviation, healthcare, insurance) and topics (e.g., risks in cyber-attacks, mountaineering, autonomous vehicles). These projects help students understand key aspects through in-depth application of the course material on real-life topics. Each group project will be mentored and graded by one of the lecturers (70% of course grade). To round off the course at the end of the year, you will have the opportunity to present your group’s findings to the lecturers and to your peers (30% of course grade).

Content

The course is organized into fourteen sessions. Sessions comprise a mixture of (guest) lectures, case discussions, and presentations. Through class discussion we will further deepen understanding of the topics and themes of the class. For each session you are required to prepare by reading the assigned literature or case material provided on the Moodle e-learning platform. Topics covered include:

- Elements of risk management:
  - Risk identification and evaluation
  - Risk mitigation
  - Risk communication
- Psychological and organizational concepts relevant in risk management
  - Decision-making under uncertainty
  - Risk perception
  - Resilient organizational processes for managing uncertainty
- Case studies on different elements of risk management (e.g., rule-making, training, managing project risks, automation)
- Group projects related to company case studies

Lecture notes

There is no script, but slides will be made available before the lectures.

Literature

There are texts for each of the course topics made available before the lectures.

Prerequisites / notice

The course is restricted to 40 participants who will work closely with the lecturers on case studies prepared by the lecturers on topics relevant in their own companies (SWICA, SWISS, University Hospital Zurich).

701-0721-00L Psychology

W 3 credits 2V R. Hansmann, A. Bearth, M. Siegrist

Abstract

This course provides an introduction to psychological research and modelling, focusing on cognitive psychology and the psychological experiment. Participants learn to formulate problems for psychological investigation and apply basic forms of psychological experiment.

Objective

Students are able to

- describe the areas, concepts, theories, methods and findings of psychology.
- differentiate scientific psychology from "everyday" psychology.
- structure the conclusions and significance of an experiment. according to a theory of psychology.
- formulate a problem for psychological investigation.
- apply basic forms of psychological experiment.

Content

Einführung in die psychologische Forschung und Modellbildung unter besonderer Berücksichtigung der kognitiven Psychologie und des psychologischen Experiments. Themen sind u.a.: Wahrnehmung; Lernen und Entwicklung; Denken und Problemlösen; Kognitive Sozialpsychologie; Risiko und Entscheidung.
The course aims to teach students how to evaluate a design project from the perspective of the end user. The concept of evidence-based design is introduced, and complemented with theoretical background on space syntax and spatial cognition. This is a project-oriented course, students implement a range of methods on a sample project. The course is tailored for architecture design students.

Students will gain advanced knowledge and practical hands-on experience with agent-based simulations and spatial analysis tools to study of their choice, which can be at building or urban scale. For students taking a B-ARCH or M-ARCH degree, this can be a completed or ongoing design studio project. The course gives students the chance to implement the methods iteratively and explore how best to address the needs of the eventual end-user during the design process. The course is funded by an ETH innovation project entitled cogARCH: linking cognition and architecture to design resilient hospitals architecture.

After an introduction on exemplary security or privacy-related research questions. The teams will develop and evaluate a concept for a human-centered solution. Through input sessions and milestone presentations the human perspective will be incorporated and reflected upon. The course makes students familiar with usability and applicability of human-centered design and evaluation methods that will allow them to view their solution from the human perspective, e.g., the user, developer or website owner perspective. By taking part in the evaluation of other teams, they will also take the user perspective themselves.

The course is particularly suitable for students who have already completed the course "Human-centered IT Security and Privacy" as some of the concepts introduced will practically be applied in this course. However, the relevant literature and necessary material will be provided to all students and basic concepts will be briefly summarized so that all interested students can participate.

At the beginning of the course, the students will receive an introduction to usable IT security and privacy and relevant concepts. Afterwards, a selection of current research questions from that area will be presented. The students form teams and select one of the proposed research questions. This question will accompany the students throughout the semester. They will design and evaluate a concept for a human-centered solution to that question. To be able to do so, they will receive input on human-centered design and evaluation tools. Their progress and the inclusion of the human perspective will be subject to feedback in milestone presentations. The solutions will be user-tested by members of other teams that thereby take the perspective of a user themselves. In addition, the solutions will be analyzed from different stakeholders' perspectives, such as developers or website owners. Finally, the students will reflect on potential changes that results from the evaluations and their consequences.
Psychedelic science is a multidisciplinary field of study that involves scholars from the human sciences, the natural sciences, and the humanities to advance the scientific knowledge of it. In this spirit, this course involves—besides the main lecturer (PD Dr. phil. Kurt Stocker, a psychologist)—also further psychedelic-scientific scholars giving individual lectures in their respective field of expertise: psychology (PD Dr. phil. Katrin Preller, University of Zurich & Yale University), pharmacology (Dr. phil. nat. Dino Luehrs, University Hospital Basel; Dr. phil. nat. Deborah Rudin, University Hospital Basel; Prof. Dr. phil. Linda Simmler, University of Basel), physiology (PD Dr. sc. nat. Felix Scholkmann, University of Zurich & University of Bern), psychotherapy (Prof. Dr. med. Gregor Hasler, University of Fribourg; Dr. med. Dr. sc. ETH Milan Scheidegger, University of Zurich), philosophy (Dr. Peter Sjöstedt-Hughes, University of Exeter), religion (TBA), and politics (Dr. phil. Claudia G. Schwarz, Karl Landsteiner University of Health Sciences, Krems). By incorporating all these disciplines, the curricular goal of this ETH course is to cover psychedelic science from the large variety of major academic disciplines that are involved in this field, and to thus introduce psychedelic science to the students as broadly and comprehensively as is possible within a single course.

851-0251-00L

Psychedelic Science: Psychology Pharmacology Physiology Psychotherapy Philosophy Religion Politics

W 3 credits

This course is especially recommended after the related lecture "851-0390-00 G Human-Centered IT Security and Privacy".

Literature Recommendations:

This course is in no way intended to encourage the private/illegal use of psychedelic substances.

A psychedelic experience is occasioned by classic (serotonergic) psychedelics such as lysergic acid diethylamine (LSD), psilocybin, mescaline, and N,N-dimethyltryptamine (DMT). Psychologically, the psychedelic experience can be characterized as a temporary nonordinary state of consciousness (NSC) that basically differs from everyday waking consciousness in terms of all three traditionally identified components of the mind: cognition (perception and thought), affect (emotions and mood), and conation (volition, willpower). 

Psychological and physiological symptoms can reflect a temporary nonordinary state of consciousness. Of all these spontaneously occurring phenomena, psychedelic nonordinary affect may for instance involve great anxiety, deepest sadness, or highest bliss; and psychedelic nonordinary cognition may for instance involve visions of geometric patterns or the perception of a subject-object transcending oneness.
Abstract
In this seminar, we consider how the human brain processes social information. The approach focuses on exploring the neural bases of social cognition in healthy individuals, as well as providing case studies from atypical populations, whose pathologies are typified by dysfunction in social information processing, such as autism spectrum disorder and schizophrenia.

Objective
- To familiarise students with forms of social cognition in humans, as well as the neural systems that support social cognition.
- To critically evaluate theories and data relating to Social Cognition and Social Neuroscience.
- To relate how knowledge of typical brain function can inform our understanding of individuals who process social information differently, and vice versa.
- To develop effective scientific communication skills in oral and written formats.

Content
This seminar will consider how the human brain understands and organises social behaviour. The approach will focus on exploring the neural bases of social cognition in healthy individuals, as well as providing case studies from atypical populations, whose pathologies are typified by dysfunction in social information processing. Examples of such pathologies include autism spectrum disorder, schizophrenia and attention deficit hyperactivity disorder. By examining healthy and atypical populations, this module will highlight how disorders of social cognition can inform the understanding of healthy brain function, as well as how understanding healthy brain function can inform disorders of social cognition.

851-0392-00L Privacy Quantification and Usable Protection

W 3 credits 2S  N. Zufferey, V. Zimmermann

Mechanisms

Abstract
Students will gain an overview of the main privacy metrics that are used to evaluate privacy risks related to the use of a given technology. They will also be introduced to the concepts of privacy/utility balance and usable security. Practical exercises and reading of recently published scientific articles will be used to present practical cases of the theoretical tools presented in class.

Objective
This course aims to provide the students with a global knowledge of the concepts related to privacy, and the methodology and tools to identify, analyze, and address threats while taking the user into account in the process. They will adopt a "privacy mindset", thus enabling them to automatically take privacy into account, in a usable way, when designing or analyzing a system.

Content
First, the course will introduce the different definitions and approaches of privacy (e.g., privacy by control, privacy by design) as well as the ethical concerns and considerations related to information security and privacy research (e.g., responsible disclosure, full disclosure).

Second, the students will be introduced to the different methods, properties, and metrics to assess and/or guarantee a certain level of privacy. They will be introduced to the properties and metrics related to anonymization (e.g., k-anonymity, l-diversity), data aggregation (e.g., randomized responses, ε-differential privacy), as well as other privacy assessment methodologies (e.g., inferential privacy).

Third, the course will address usability issues and the role of individuals (i.e., users) in privacy management (i.e., usable security and privacy) and the design of privacy-enhancing technologies. In this context, we will analyze the main concepts seen during the course and discuss their advantages and disadvantages in terms of usability, as well as their implementation for mass-market and large-scale technologies.

Across all three parts of the course, practical exercises, as well as recent research articles reading, and presentations will be used as a complement to support the concepts seen in class, as well as to provide concrete examples of methodologies related to the assessment of privacy in general.

851-0271-00L Neuroaesthetics - Exploring the Science of Aesthetic Experience

W 2 credits 2S E. Cross, I. Bara

Abstract
This seminar introduces students to theory and research, challenges, and opportunities in neuroaesthetics, with a clear emphasis on the interdisciplinary nature of the discipline situated at the intersection of neuroscience, psychology, and art appreciation. Foundational empirical methods and critical perspectives of research approaches in neuroaesthetics are considered.

Objective
- to familiarize students with concepts, models, methods, brain and behavioral findings related to aesthetic experience.
- to develop a critical understanding in evaluating the theoretical and empirical findings in neuroaesthetics.
- to integrate the acquired knowledge to critically debate and discuss the conceptual and empirical issues related to the science of aesthetic experience.
- to relate how knowledge in neuroaesthetics can inform the design of art form and the experience of aesthetic pleasure.

Content
In this seminar, students will learn about the foundational principles of neuroaesthetics, which explores the cognitive and brain processes involved in aesthetic experience. A key focus will be placed on developing an appreciation of the interdisciplinary methods used in the neuroaesthetics field – ranging from neuroscience, psychology, philosophy, and art history. The seminar is based on the active engagement of students in reading, presenting, and critically discussing selected papers in the field. In a final small-group assignment, students are expected to incorporate and elaborate upon the content covered in the seminar by presenting and discussing a novel research proposal for tackling a timely research question related to aesthetic experience.
### The Cutting Edge of Social Brain Imaging

#### Abstract
This seminar introduces the fundamentals and latest research developments of brain imaging in real-world contexts. We explore topics from imaging multiple people’s brains simultaneously as they interact to neuro-ethics and neuro-art, while maintaining a strong focus on critical evaluation of research practices and applications of brain imaging of and during social interaction.

#### Objective
- To familiarize students with current concepts, theories, methods, and findings from social brain-imaging sciences
- To develop a critical view of extant findings and the tools for evaluating the quality of evidence and data, as well as ethical implications

#### Content
Rapid advances in the technologies and empirical approaches used in imaging the human brain have opened exciting windows into how the human brain coordinates social interaction. These advances include imaging the brain’s function during real social interactions, training behaviours with feedback based on real-time brain activity, and even generating art directly from brain signals. With them, these advances have brought novel ethical implications regarding their implementation in research and potentially, their use by the public, for both therapeutic and possible “neurohacking” applications. In this seminar, students will be introduced to various neuroimaging approaches for social neuroscience generally, as well as to approaches for measuring social brain function in real life, and will gain insights into related ethical considerations.

The seminar builds on the active participation of students in reading, presenting, and critically discussing selected papers in the field. In a final small-group assignment, students are required to integrate and elaborate upon topics covered in the seminar by presenting and debating a novel research proposal for addressing a timely research question related to the use of brain imaging in the context of social interactions. No prior experience or knowledge in brain imaging is required.

#### Abstract
This series is a joint project by ETH Zurich and the Universities of St. Gallen and Zurich. It provides an overview of interdisciplinary research on intellectual property, innovation, antitrust, privacy & technology policy. Scholars from law, economics, management and related fields present their current research. All speakers are internationally well-known experts from Europe, the U.S. & beyond.

#### Objective
After the workshop and lecture series, participants should be acquainted with interdisciplinary approaches towards intellectual property, innovation, antitrust, privacy and technology policy research. They should also have an overview of current topics of international research in these areas.

#### Content
The workshop and lecture series will present a mix of speakers who represent the wide range of current social science research methods applied to intellectual property, innovation, antitrust, privacy and technology policy issues. In particular, theoretical models, empirical and experimental research as well as legal research methods will be represented.

#### Lecture notes
Papers discussed in the workshop and lecture series are posted in advance on the course web page.
Contracts are agreements between parties to engage in transactions. A good contract creates value by giving parties the right incentives to meet their objectives. A good contract designer scrutinizes the economic situation in which parties find themselves and tailors the contract to the challenges at hand. To help you become sophisticated contract designers, we draw from insights for which more than half a dozen Nobel Prizes were awarded in the past two decades and transfer them to the art of writing real-world contracts. In other words, Contract Design will provide you with analytical tools to design contracts that help you be better lawyers, business leaders, and startup founders.

We will cover topics such as moral hazard, adverse selection, elicitation mechanisms, relationship-specific investments, and relational contracting and apply the theoretical insights to real-life case studies ranging from purchases & sales of assets, oil & gas exploration, movie financing, production & distribution, construction & development, M&A deals, venture capital financing, to executive compensation.

851-0703-00L Introduction to Law
- W 2 credits
- 2V O. Streifl Gnöpf

Abstract
This class introduces students into basic features of the legal system. Fundamental issues of constitutional law, administrative law, private law and the law of the EU are covered. The focus is on legal problems related to space. Active participation is expected in short interactive sequences.

Objective
Students are able to identify basic structures of the legal system. They understand selected topics of public and private law. They are able to apply the fundamentals in more advanced law classes and to recognize the relevance of law in their own field.

Content
- Basic concepts of law, sources of law.
- Private law: Contract law (particularly contract for work and services), tort law, property law.
- Public law: Human rights, administrative law, procurement law, procedural law.

Insights into the law of the EU.

851-0742-00L Contract Design I

You can find all course materials and the most recent announcements on Moodle. Please log in to Moodle using your ETH or UZH credentials. Then search for "Contract Design I (851-0742-00L; Fall 2023)" and enroll. The password is "ContractDesign01".

It is NOT a legal drafting class focused on contractual language.

Number of participants limited to 160.
Max 80 ETHZ and 80 UZH Students

Abstract
Contract Design I is taught by Professor Stremitzer and aims to bridge the gap between economic contract theory, contract law, and the writing of real-world contracts. In this course, we take a systematic approach to contract design. This means we first analyze the economic environment in which a transaction takes place and then engineer contracts that achieve the desired outcome.

Objective
Contracts are agreements between parties to engage in transactions. A good contract creates value by giving parties the right incentives to meet their objectives. A good contract designer scrutinizes the economic situation in which parties find themselves and tailors the contract to the challenges at hand. To help you become sophisticated contract designers, we draw from insights for which more than half a dozen Nobel Prizes were awarded in the past two decades and transfer them to the art of writing real-world contracts. In other words, Contract Design will provide you with analytical tools to design contracts that help you be better lawyers, business leaders, and startup founders.

We will cover topics such as moral hazard, adverse selection, elicitation mechanisms, relationship-specific investments, and relational contracting and apply the theoretical insights to real-life case studies ranging from purchases & sales of assets, oil & gas exploration, movie financing, production & distribution, construction & development, M&A deals, venture capital financing, to executive compensation and many other types of transactions.

The course follows a flipped-classroom model: You will watch learning videos specifically produced for this course ahead of class. We will use class time to discuss real-world case studies. The videos will be made available before the lecture each week and need to be watched ahead of coming to class. Computer-graded quizzes at the beginning of each class will test students’ understanding of the concepts introduced in the videos.

As the emphasis of this class is on class discussion, attendance is mandatory. Absent important reasons, you cannot miss class more than twice.

The lectures will be recorded but only made available to those who miss lectures with excused absence.

For ETH students: Your grade will consist of two parts:
1) You will take weekly computer-based quizzes during class time. Thus, it is important that you attend the lectures to be able to finish the quizzes and pass this course.
2) You compose short responses to take-home questions on case studies we assign and upload them ahead of class (Pass/Fail).

Note that UZH and UNISG students enrolling in this course need to earn more ECTS for completing this course than ETH students (due to curricula reasons). This is why UZH and UNISG students must complete a written assignment in addition to the weekly quizzes and take-home questions. UZH students also have to complete an additional group project.

UZH and UNISG students should check out the description of the class at their respective home institutions.

Note that UZH and UNISG students enrolling in this course need to earn more ECTS for completing this course than ETH students (due to curricula reasons). This is why UZH and UNISG students must complete a written assignment in addition to the weekly quizzes and take-home questions. UZH students also have to complete an additional group project.

UZH and UNISG students should check out the description of the class at their respective home institutions.

If you have any questions regarding the course, please write an email to the teaching assistants, Lucas Gericke (lucas.gericke@gess.ethz.ch) or Serge von Steiger (serge.vonsteiger@gess.ethz.ch).
Using the term «lawscape» (Philippopoulos-Mihalopoulos), we initially discuss general aspects of the interplay between legal rules and urban space. Students recognize the interplay between legal structures and urban space. They can describe legal concepts with spatial impact.

**Law and Urban Space**  
851-0703-04L  
**W**  2 credits  2V  O. Streiff Gnopff  
*Particularly suitable for students of D-ARCH.*

**Abstract**  
Legal rules are tied to urban space. Illustrative is the relation between land ownership and urban morphology. Legal concepts with spatial impacts are introduced and related to the theory of urban design. Moreover, it is discussed how these concepts shape specific places. The course includes interactive sequences for which active participation is expected.

**Objective**  
Students recognize the interplay between legal structures and urban space. They can describe legal concepts with spatial impact. Moreover, they are able to compare legally binding targets with theoretical approaches in urban design. By analysing a specific place, students learn to find relevant norms, to analyse and to judge them with regard to urban design theories. Thereby, they are able to distinguish design and policy questions.

**Content**  
Using the the term «lawscape» (Philippopoulos-Mihalopoulos), we initially discuss general aspects of the interplay between legal rules and urban space. In the following weeks we consider the interplay with reference to different dimensions of urban space (e.g. morphological, social, functional dimension).

Working tools are theoretical texts, legal rules, court decisions as well as site analyses. Students prepare the texts for joint discussions and undertake a case study in small groups. Selected case studies are presented and discussed in a final meeting.

**Literature**
Documents will be available online (see https://moodle-app2.let.ethz.ch/course/view.php?id=20128).

**Prerequisites / notice**
Number of participants limited to: 40

---

**Space Planning Law and Environment**  
851-0707-00L  
**W**  2 credits  2G  O. Bucher  
*Particularly suitable for students of D-ARCH, D-BAUG, D-USYS.*

**Abstract**  
System of swiss planning law, Constitutional and statutory provisions, Space planning and fundamental rights, Instruments, Application, legal protection, enforcement, Practical training.

**Objective**  
Basic understanding of nature and function of space planning from a legal point of view. Basic knowledge of space planning instruments, relationship between space planning and constitutional law (especially property rights), solving of practical cases.

**Content**

**Introduction to Civil Law**  
851-0709-00L  
**W**  2 credits  2V  H. Peter  

**Abstract**  
The course Private Law focuses on the Swiss Code of Obligations (contracts, torts) and on Property Law (ownership, mortgage and easements). In addition, the course will provide a short overview of Civil Procedure and Enforcement.

**Objective**  
Teaching of the principles of law, particularly private law. Introduction to law.

**Content**  
Le cours de droit civil porte notamment sur le droit des obligations (droit des contrats et responsabilité civile) et sur les droits réels (propriété, gages et servitudes). De plus, il est donné un bref aperçu du droit de la procédure et de l'exécution forcée.

**Literature**

- Sont indispensables:  
  - le Code civil et le Code des obligations;  
  - Sont conseillés:  
    - Nef, Urs Ch., Le droit des obligations à l’usage des ingénieurs et des architectes, trad. Bovay, J., éd. Payot, Lausanne  
    - Boillod, J.-P.: Manuel de droit, éd Slatkine, Genève

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 2608 of 2684
**851-0727-02L E-Business-Law**  
**W**  
2 credits  
2V  
D. Rosenthal

**Objective**  
The course deals with the basic legal framework for doing e-business as well as using information technology. It discusses a variety of legal concepts and rules to be taken into account in practice, be it when designing and planning new media business models, be it when implementing online projects and undertaking information technology activities.

**Content**

1. Which legal issue are relevant for doing e-business?  
- Internationalität des Internets  
- Internationale Verträge  
- Verpflichtungen und Rechte der Netzwerke  
- Verwendungsrechte  
- Haftung für Inhalte  
- Datenschutz  
- Verkauf von Produkten über das Internet  
- Absatz von Dienstleistungen über das Internet  
- Cyber-Werbung  
- Rechtliche Aspekte von Plattformen (z.B. Facebook, YouTube, Instagram)  
2. How to protect intellectual property in the context of e-business?  
- Copyright  
- Trademarks  
- Domain Names  
3. How to manage e-business risks?  
- Data Protection  
- Cybersecurity  
- liability issues connected to an entrepreneurial activity and suggest possible solutions.

**Prerequisites / notice**

- Le cours de droit civil et le cours de droit public (2e sem.) sont l'équivalent des cours "Recht I" et "Recht II" en langue allemande et des exercices y relatifs.
- Les examens peuvent se faire en français ou en italien.
- Examen au 1er propédeutique; convient pour travail de semestre.
- Con riassunti in italiano. E possibile sostenere l’esame in italiano.

**851-0735-10L Startups and Law**  
**W**  
2 credits  
2V  
P. Peyrot

**Objective**  
The students shall obtain a basic knowledge about the legal environment of entrepreneurs. They shall be able to recognize and evaluate legal issues connected to an entrepreneurial activity and suggest possible solutions.

**Lecture notes**

A comprehensive script will be made available online on the moodle platform.

**Competencies**

- Concepts and Theories  
- Techniques and Technologies  
- Analytical Competencies  
- Decision-making  
- Media and Digital Technologies  
- Problem-solving  
- Communication  
- Adaptability and Flexibility  
- Creative Thinking  
- Critical Thinking  
- Self-awareness and Self-reflection  
- Self-direction and Self-management

**851-0738-01L The Role of Intellectual Property in the Engineering**  
and Technical Sector**  
**W**  
2 credits  
2V  
K. Houshang Pour Islam

**Objective**  
Particularly suitable for students of D-BAUG, D-BIOL, D-BSSE, D-CHAB, D-ITET, D-MAVT.
The lecture gives an overview of the fundamental aspects of intellectual property, which plays an important role in the daily routine of engineers and scientists. The lecture aims to make participants aware of the various methods of protection and to put them in a position to use this knowledge in the workplace.

In recent years, knowledge about intellectual property has become increasingly important for engineers and scientists. Both in production and distribution and in research and development, they are increasingly being confronted with questions concerning the patenting of technical inventions and the use of patent information.

The lecture will acquaint participants with practical aspects of intellectual property and enable them to use the acquired knowledge in their future professional life.

Topics covered during the lecture will include:
- The importance of innovation in industrialised countries
- An overview of the different forms of intellectual property
- The protection of technical inventions and how to safeguard their commercialisation
- Patents as a source of technical and business information
- Practical aspects of intellectual property in day-to-day research, at the workplace and for the formation of start-ups.

Case studies will illustrate and deepen the topics addressed during the lecture.

The seminar will include practical exercises on how to use and search patent information. Basic knowledge of how to read and evaluate patent documents as well as how to use publicly available patent databases to obtain the required patent information will also be provided.

Prerequisites / notice
The lecture addresses students in the fields of engineering, science and other related technical fields.

Competencies
- Subject-specific Competencies: Concepts and Theories
- Method-specific Competencies: Problem-solving
- Personal Competencies: Critical Thinking, Self-awareness and Self-reflection

Abstract
This course explores the automation of decisions in the legal system. We delve into the machine learning tools needed to predict judge decision-making and ask whether techniques in model explanation and algorithmic fairness are sufficient to address the potential risks.

Objective
Data science technologies have the potential to improve legal decisions by making them more efficient and consistent. On the other hand, there are serious risks that automated systems could replicate or amplify existing legal biases and rigidities. Given the stakes, these technologies force us to think carefully about notions of fairness and justice and how they should be applied.

Content
The focus is on legal prediction problems. Given the evidence and briefs in this case, how will a judge probably decide? How likely is a criminal defendant to commit another crime? How much additional revenue will this new tax law collect? Students will investigate and implement the relevant machine learning tools for making these types of predictions, including regression, classification, and deep neural networks models.

We then use these predictions to better understand the operation of the legal system. Under what conditions do judges tend to make errors? Against which types of defendants do parole boards exhibit bias? Which jurisdictions have the most tax loopholes? Students will be introduced to emerging applied research in this vein. In a semester paper, students (individually or in groups) will conceive and implement an applied data-science research project.

Prerequisites / notice
Particularly suitable for students of D-ARCH, D-BAUG, D-USYS.

Abstract
Real estate property law (esp. content, acquisition, restrictions under private and public law, transmission and loss). Legal presentation: land register, surveying, cadastre. Basic questions of contract and tax law.

Objective
The legal principles of real estate property law can be correctly interpreted and applied in daily life.

Content
Real estate property law (esp. content, acquisition, restrictions under private and public law, transmission and loss). Legal presentation: land register, surveying, cadastre. Basic questions of contract and tax law.

**Abstract**

This course introduces students to scientific and technological developments that require regulation or enable legal innovation. We focus particularly on the challenges to current law posed by prominent near-future technologies.

**Objective**

The course is designed for a wide range of ETH students as well as for law students who are keen to deepen their understanding of cutting-edge technology. It offers an overview of key legal areas important for technology regulation, complemented by guest lectures on emerging technological trends.

In previous years, the course has featured esteemed speakers from various sectors, including industry leaders like Google, NGOs such as Digital Society Switzerland and The European Consumer Organization, regulatory bodies like the Swiss Competition Commission, and noted academics.

The course is open to ETH students through the Science in Perspective program of the Department of Humanities, Social and Political Sciences.

**Content**

The planned course outline is below.

- Overview of Law and Technology
- Fundamental Rights
- AI & Discrimination
- Landmark Big Tech Cases
- Regulation of Digital Platforms & Content Moderation
- Online Consumer Protection
- Law and Tech Scholarship Series

A number of recent regulations will be discussed, including the EU's AI Act, the Digital Services Act (DSA), and the Digital Markets Act (DMA), as well as emerging internet phenomena, like ChatGPT.

**Prerequisites / notice**

You can find all course materials and the most recent announcements on Moodle. Please log in to Moodle using your ETH or UZH credentials. Then search for "Law & Tech (851-0732-06L, HS 2024)" and enroll.

**Competencies**

Subject-specific Competencies

- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies

- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management

Social Competencies

- Communication
- Cooperation and Teamwork
- Customer Orientation
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation

Personal Competencies

**851-0685-00L Data and Society**

**W** 3 credits 2V  M. Leese

**Abstract**

This lecture series explores the multifaceted role of data in shaping contemporary society, governance, and individual lives. The course equips students with a critical understanding of how data is made, managed, and preserved, and its implications for societal norms and individual rights.

**Objective**

At the end of the term, students will be able to:

- reflect concepts and theories that capture the performativity of data
- reflect concepts and theories that capture the socio-technical nature of data
- assess the implications of data practices for social and political ordering
- identify key actors, sites, and domain contexts of data practices

**Competencies**

Subject-specific Competencies

- Concepts and Theories
- Analytical Competencies
- Media and Digital Technologies

Social Competencies

- Communication

Personal Competencies

- Adaptability and Flexibility
- Creative Thinking

**851-0763-00L Supervised Research (Law, Economics, and Data Science)**

**Does not take place this semester.**
This is a supervised student project for 3 ECTS, supervised by the professorship of Elliott Ash (D-GESS). Students will adapt tools from econometrics and machine learning to questions in law, data science, and social science.

Students must have some data science and/or statistics experience. Some programming experience in Python, Stata, or R is required.

Apply tools from data science and social science to a new project, potentially in a group, to develop a paper or app.

Some programming experience in Python, Stata, or R is required. Some experience with data science or statistics is required.

**Abstract**

Digital Technologies and Armed Conflict

**Objective**

Students will learn how digital technologies are impacting modern conflicts and what are the actual and future trends in this domain.

Students will focus on the implications for tech companies, understanding the new challenges from a technological, policy and legal perspective.

**Content**

1. Introduction: International Humanitarian Law IHL 101; International Committee of the Red Cross ICRC’s perspective; Terminology.
2. Digital Capabilities in Armed Conflict: Overview; Established cyber capabilities; The cyber weapons dilemma; Attribution and self-attribute; Other digital means during armed conflicts.
3. Connectivity in Crisis: No connectivity; the connectivity gap; Loss or limitation of connectivity; Stable connectivity: connected in crisis.
4. Hybrid and Unconventional Warfare: Kinetic and cyber offensive operation coordination; Disruption of digital services; The dual-use dilemma; The public-private partnership dilemma; Civilization of digital warfare. Total offense and whole-of-societies: a digital perspective of society’s active participation; The cognitive warfare: a digital perspective of modern low-intensity constant warfare.
5. The Potential Human Cost of Cyber Operations.
7. Case Studies (based on scenarios).

</table>

**Abstract**

In this seminar, students will study cognitive processes, behaviour and the underlying biological response to financial decisions. Research methods such as asset market experiments, lottery games, risk preference assessment, psychometrics, neuroimaging and psychophysiology of decision processes will be discussed. Financial bubbles and crashes will be the core interest.

**Objective**

This course has four main goals:
1) To learn about the most important topics within Behavioural Finance
2) To learn to effectively select, review and present information using modern telecommunication tools
3) To practice working on group projects in hybrid working conditions (online + in-person)
4) To solve an applied behavioral finance business case stemming from an industry partner

**Content**

The course does not contain mandatory reading. Instead, it offers suggested literature that provides guidance to the students who, prepare

Throughout the semester, students work on solutions to real business cases stemming from a company partner. They can receive feedback and guidance from project leaders of the industry partner and from the academic supervisors. In the final meeting of the semester, students pitch solutions to their business cases.

The course takes place entirely online. The objective is to prepare the students for the future work in online and hybrid arrangements.

Students from all domains of ETH and all levels of education are welcome in the course.

**Competencies**

**Method-specific Competencies**

- Analytical Competencies
- Decision-making
- Media and Digital Technologies

- Self-direction and Self-management

**Network Modeling**

**Abstract**

Social Network Science is a distinct domain of data science that focuses on relational systems. Various models have been proposed to describe structures and dynamics of networks, including statistical and mathematical methods. In this course, the emphasis is placed on the statistical analysis of (social) systems and their connection to social theories and data sources.

Students are required to have basic knowledge in inferential statistics, such as regression models.

 Particularly suitable for students of D-MTEC.

Particularly suitable for students of D-MATH, D-INFK and in the MSc Data Science

Students are required to have basic knowledge in inferential statistics, such as regression models.

Particularly suitable for students of D-MTEC.
Objective
The following topics will be covered:

- Introduction to network models and their applications

- Stylized models:
  * uniform random graph models
  * small world models
  * preferential attachment models

- Models for testing hypotheses while controlling for the network structure:
  * Quadratic assignment procedure regression (QAP regression)

- Models for testing hypotheses on the network structure:
  * Models for one single observation of a network: exponential random graph models (ERGMs)
  * Models for panel network data: stochastic actor-oriented models (SAOMs)

The application of these models is illustrated through examples and practical sessions involving the analysis of network data using the software R.

Content
The following topics will be covered:

- Introduction to network models and their applications

- Stylized models:

  * Models for panel network data: stochastic actor-oriented models (SAOMs)
  * Models for relational event data: dynamic network actor models (DyNAMs)

The application of these models is illustrated through examples and practical sessions involving the analysis of network data using the software R.

Lecture notes
Slides and lecture notes are distributed via the associated course moodle.

Literature

Prerequisites / notice
Students are required to have basic knowledge in inferential statistics and should be familiar with linear and logistic regression models.

Course Code: 851-0252-15L
Network Analysis
Particularly suitable for students of D-INFK, D-MATH.

Abstract
Network science is a distinct domain of data science that is characterized by a specific kind of data being studied. While areas of application range from archaeology to zoology, we concern ourselves with social networks for the most part. Emphasis is placed on descriptive and analytic approaches rather than theorizing, modeling, or data collection.

Objective
Students will be able to identify and categorize research problems that call for network approaches while appreciating differences across application domains and contexts. They will master a suite of mathematical and computational tools, and know how to design or adapt suitable methods for analysis. In particular, they will be able to evaluate such methods in terms of appropriateness and efficiency.

Content
The following topics will be covered with an emphasis on structural and computational approaches and frequent reference to their suitability with respect to substantive theory:

* Empirical Research and Network Data
* Macro and Micro Structure
* Centrality
* Roles
* Cohesion
* Influence

Lecture notes
Slides and lecture notes are distributed via the associated course moodle.

Literature
Abstract
The seminar aims at three-fold integration: (1) bringing modeling and computer simulation of techno-socio-economic processes and phenomena together with related empirical, experimental, and data-driven work, (2) combining perspectives of different scientific disciplines (e.g. sociology, computer science, physics, complexity science, engineering), (3) bridging between fundamental and applied work.

Objective
Participants of the seminar should understand how tightly connected systems lead to networked risks, and why this can imply systems we do not understand and cannot control well, thereby causing systemic risks and extreme events.

They should also be able to explain how systemic instabilities can be understood by changing the perspective from a component-oriented to an interaction- and network-oriented view, and what fundamental implications this has for the proper design and management of complex dynamical systems.

Computational Social Science and Global Systems Science serve to better understand the emerging digital society with its close co-evolution of information and communication technology (ICT) and society. They make current theories of crises and disasters applicable to the solution of global-scale problems, taking a data-based approach that builds on a serious collaboration between the natural, engineering, and social sciences, i.e. an interdisciplinary integration of knowledge.

851-0586-03L Applied Network Science: Sports Networks

Abstract
We study applications of network science methods, this semester in the domain of sports. Topics are selected for diversity in sports, research questions, and techniques with applications such as passing networks, team rankings, or career trajectories. Student teams present results from the recent literature, possibly with replication, in a conference format.

Objective
Network science as a paradigm is entering domains from engineering to the humanities but application is tricky. By examples from recent research on sports analytics, students learn to appreciate that, and how, context matters. They will be able to assess the appropriateness of approaches for substantive research problems, and especially when and why quantitative approaches are or are not suitable.

851-0745-00L Ethics Workshop: The Impact of Digital Life on Society

Abstract
This workshop focuses on understanding and managing the ethical and social issues arising from the integration of new technologies in various aspects of daily life.

Objective
- Explain relevant concepts in ethics.
- Evaluate the ethical dimensions of new technology uses.
- Identify impacted stakeholders and who is ethically responsible.
- Engage constructively in the public discourse relating to new technology impacts.
- Review tools and resources currently available that facilitate resolutions and ethical practice.
- Work in a more ethically reflective way.

Content
The workshop offers students an experience that trains their ability for critical analysis and develops awareness of responsibilities as a researcher, consumer and citizen. Learning will occur in the context of three intensive workshop days, which are highly interactive and focus on the development and application of reasoning skills.

The workshop will begin with some fundamentals: the nature of ethics, of consent and big data, of AI ethics, public trust and health ethics. Students will then be introduced to key ethical concepts such as fairness, autonomy, trust, accountability, justice, as well different ways of reasoning about the ethics of digital technologies.

A range of practical problems and issues in the domains of education, media, society, digital health and justice will be then considered. These domains are represented respectively by unique and interesting case studies. Each case study has been selected not only for its timely and engaging nature, but also for its relevance. Through the analysis of these case studies key ethical questions (such as fairness, accountability, explainability, access etc.) will be highlighted and questions of responsibility and tools for ethical practice will be explored. Throughout, the emphasis will be on learning to make sound arguments about the ethical aspects of policy, practice and research.

Advanced Topics in Evidence-Based Design for Architecture

Course requirements: Completion of the course Evidence-Based Design: Methods and Tools For Evaluating Architectural Design (851-0252-08L).

Abstract
Students will gain advanced knowledge and practical hands-on experience with agent-based simulations and spatial analysis tools to evaluate hospital layouts from the perspective of end-users.

Objective
Students will build on their previous projects as part of the course "Evidence-Based Design: Methods and Tools For Evaluating Architectural Design" (851-0252-08L). Students enrolled will participate in an international workshop with GSAPP at Columbia University Designing the post-pandemic hospital with evidence. for people. The course is funded by an ETH innvoedum project entitled cogARCH: linking cognition and architecture to design resilient hospitals architecture.

Complex Social Systems: Modeling Agents, Learning, and Games

Prerequisites: Basic programming skills, elementary probability and statistics.

Abstract
This course introduces mathematical and computational models to study techno-socioeconomic systems and the process of scientific research. Students develop a significant project to tackle techno-socio-economic challenges in application domains of complex systems. They are expected to implement a model and to communicate their results through a project report and a short oral presentation.

Objective
See your own field of study in a wider context ("Science in Perspective"), e.g. see the psychological, social, economic, environmental, historical, ethical,or philosophical connections and implications. Learn to think critically and out of the box. Question what you believe you know for sure. Get to know surprising, counterintuitive properties of complex (non-linearly interacting, networked, multi-component) systems. Learn about collaboration.

Content
By the end of the course, the students should be able to better understand the literature on complex social systems, develop their own models for studying specific phenomena and report results according to the standards of the relevant scientific literature by presenting their results both numerically and graphically.

At the end of the course, the students will deliver a report, computer code and a short oral presentation. To collect credit points, students will have to actively contribute and give a circa 30 minutes presentation in the course on a subject agreed with the lecturers, after which the presentation will be discussed. The presentation will be graded.

Students are expected to implement themselves models of techno-socio-economic processes and systems, particularly agent-based models, complex networks models, decision making, group dynamics, human crowds, or game-theoretical models. Credit points are finally earned for the implementation of a mathematical or empirical model from the complexity science literature, its presentation, and documentation by a project report.

Lecture notes
The lecture slides will be presented on the course Moodle after each lecture.

Prerequisites / notice
The number of participants is limited to the size of the available computer teaching room. The source code related to the seminar thesis should be well enough documented.

Good programming skills and a good understanding of probability & statistics and calculus are expected.

Students need to present a new subject, for which they have not earned any credit points before.

Good scientific practices, in particular citation and quotation rules, must be properly complied with.

Chatham House rules apply to this course. Materials may not be shared without previous written permission.
Abstract
This seminar will present speakers who discuss the challenges and opportunities arising for our cities and societies with the digital revolution.

Objective
To collect credit points, students must actively contribute and give an individual, circa 20-minute presentation in the seminar on a subject agreed upon with the lecturer. After the presentation, it will be discussed and graded.

Content
This seminar will present speakers who discuss the challenges and opportunities arising for our cities and societies with the digital revolution. Besides discussing questions of automation using Big Data, AI and other digital technologies, we will also reflect on the question of how democracy could be digitally upgraded, and how citizen participation could contribute to innovation, sustainability, resilience, and quality of life. This includes questions around collective intelligence and digital platforms that support creativity, engagement, coordination and cooperation.

Literature

An Analytical Theory of Traffic Flow (collection of papers)

Michael Batty, Kay Axhausen et al.
Smart cities of the future

Books by Michael Batty:
How social influence can undermine the wisdom of crowd effect
Evidence for a collective intelligence factor in the performance of human groups
Optimal incentives for collective intelligence
Collective Intelligence: Creating a Prosperous World at Peace
Big Mind: How Collective Intelligence Can Change Our World
Programming Collective Intelligence
Urban architecture as connective-collective intelligence. Which spaces of interaction?
Build digital democracy
How to make democracy work in the digital age
Digital Democracy: How to make it work?
Proof of witness presence: Blockchain consensus for augmented democracy in smart cities
Iterative Learning Control for Multi-agent Systems Coordination
Decentralized Collective Learning for Self-managed Sharing Economies

Prerequisites / notice
Students need to present a new subject, for which they have not earned any credit points before.

Good scientific practices, in particular citation and quotation rules, must be properly complied with.
Chatham House rules apply to this course. Materials may not be shared without previous written permission.
1. **Humans and Social Networks in the Digital Age**  
   **Abstract**  
The digital transformation profoundly impacts humans and how they behave online and offline. Interactions in online social networks offer new opportunities (e.g., political movements, global cultural diffusion) and risks (e.g., fake news). In this seminar, we examine recent sociological and psychological research on how the digital transformation affects individuals and their social behaviors.

2. **Data and Society**  
   **Abstract**  
This lecture series explores the multifaceted role of data in shaping contemporary society, governance, and individual lives. The course equips students with a critical understanding of how data is made, managed, and preserved, and its implications for societal norms and individual rights.

3. **AI Personhood, Social Justice, and Cross-Cultural Dialogues in the Digital Age**  
   **Abstract**  
The course fosters critical, culturally conscious reflection on AI development and regulation by 1) exploring cross-cultural assessment of the concept of personhood and collective in digital society and how these concepts are reflected in AI development and governance. 2) inspiring reflection on social justice issues stemming from major (mis)conceptions of personhood in AI development and governance.
On 13 March 2024, the European Parliament voted in favour of the long-awaited EU AI Act. On October 30, 2023, the US passed an Executive Order on the safe, secure, and trustworthy development and use of AI. Meanwhile, China has been adopting regulations: the 2021 regulation on recommendation algorithms, 2022 rules for deep synthesis (synthetically generated content), and draft rules on generative AI on August 15, 2023. In the face of this race to develop and regulate AI across various legal, regulatory, and cultural settings, this course exposes students to the overarching question: How can we envision an AI-human future that accommodates a pluriverse and ensures a just future?

In everyday life, from education, policy deliberation, planning and prediction, governance of the human behavior and the beyond human, to social and private life, and, entertainments, AI systems and AI-enabled products play a significant role. At the very core of this sociotechnical system is the human, often referred to as the ‘data subject’. This raises foundational questions: Who or what is this ‘data subject’? What warrants its protection or what makes it worthy of protection – is it the human dignity, autonomy, rationality, legally protected rights or something beyond and within all these? Who or what is considered a protected ‘data subject’, and who/what is not? While these questions might seem new, they revisit old ethical dilemmas.

However, there is no one-fits-all answer to these questions. Responses vary greatly depending on local and cultural contexts across different jurisdictions and societies. The way AI development and regulatory practices conceptualize the subject of protection – that is, the human and its environ diverges, leading to varied interpretations of personhood and what warrants protection. What personhood means and what is protected and not are not only matters of policy or legislative interpretations and standardization but a matter of social justice.

With this consideration, the course invites and encourages students to explore the concept of personhood from a cross-cultural perspective, incorporating epistemologies from the ‘South’, including Afro-communitarianism, pluriverse theories, and Confucianism. Students are then guided to critically examine personhood and community within the context of competing AI regulatory frameworks, such as those in the EU, China, Brazil, and the US, as well as in their own interactions with AI systems. By identifying conceptual limitations in current understandings of personhood and the centrality of the collective within contemporary AI regulation and practice, students can address core social justice issues. These include the overemphasis on individualism, which overlooks the communal and relational aspects of existence (including human and the beyond human), the instrumentalization of the environment, and exploitative business models.

851-0455-00L Science, Trust and Politics W 3 credits 2S G. Dorth

Abstract
The seminar aims to inspire a nuanced understanding of the dynamics of expertise in society. Cross-fertilizing literature from science and technology studies (STS) and from activists’ movements, it focuses on contemporary controversies around emerging technologies and climate policy, where trust in science is said to be undermined (e.g. climate skepticism or anti-vaccine movements).

Objective
1) Introduce to the role and functions of expertise in democratic societies. 2) Familiarize with assumptions about science and society embedded in contemporary controversies. 3) Inspire critical perspectives on (dis)trust in science through activists’ movements on contested environmental and technological issues. 4) Develop a creative position on the relations between science, trust and politics.

Content
Engineers and scientists often pursue their studies and research in the hope that their knowledge can contribute to make a better world, inform democratic deliberation and help public understanding of complex issues. Yet this special status of science and technology is being increasingly contested by marginalized publics, lobbies, exposed populations, and by members of the scientific communities themselves. Climate skepticism or vaccine hesitancy are some of the most vivid examples of this confusing situation. In this seminar, students will learn to reflect on expertise as a form of scientific engagement in the messiness of democratic deliberation and public life, beyond the noble but outdated ideal of “speaking truth to power”.

The exercise of expertise is stumbling upon several conundrums. Which knowledge is relevant in which situation? How to make sure that some crucial perspectives are not left in the shadows? How to identify representative experts and make sure that they speak on behalf of a structured community? Whose voices are being silenced? On the other side of the spectrum, the public is often said to lack proper understanding of science and thus in need of being educated or disciplined. Or it is suspected of being manipulated by lobbies or foreign hostile powers, or of being too attached to its own privileges and unwilling to act in favor of the common good. Whose agency is being acknowledged in sociotechnical controversies and whose agency is being denied and why? The seminar will provide a deep understanding of these perspectives, by putting them in a broader historical and epistemological context. Students will thus learn to critically assess their strengths as well as their blind spots.

Whereas opposing technological developments (anti 5G or anti-vaccine activists) or pushing to act accordingly to science (pro climate movements such as Extinction Rebellion or Scientist Rebellion), activists’ movements make up for a rich field of investigation on the dynamics of expertise and of how various publics can make sense of scientific knowledge. Cross-fertilizing activist’s texts and experiences with literature in science and technology studies and anthropology, this class will be organized as a structured conversation and a collective mapping of actors and key concepts of sociotechnical controversies. Over the course of the semester, students will learn not only to navigate some of the most heated contemporary debates, but also to articulate their own position on an issue of their choice.

701-0786-00L Mediation in Environmental Planning: Theory and Case Studies W 2 credits 2G K. Siegwart
This course is intended to demonstrate how environmental decisions can be optimized and conflicts better dealt by using mediation. Case studies will focus on construction of windmills for electricity purpose, landfills, sustainable city-planning or Human-Wildlife Conflict and Coexistence.

- Develop comprehension of legal and social responses to environmental conflicts
- Recognize the most important participative techniques and their ranges
- Develop concepts for doing and evaluating mediation processes
- Estimate the potential and limitations of cooperative environmental planning
- Train communicative skills (presentation, moderation, discussion design, negotiation), especially by participating at a mediation

To this end, we will look at the most important techniques of mediation and put them into the context of today’s legislation, participation and conflict culture. The potential and limitations of the individual techniques will be discussed using current Swiss and international case studies, namely in the field of windenergy as well of landfills and Human-Wildlife Conflict and Coexistence (wolves, bears, elephants).

Students can do conflict analyses, for instance, as part of individual and group analyses and a half-day mediation-simulation, develop technique concepts and train their own communicative and negotiation skills.

A reader will be handed out.

Subject-specific Competencies
- Concepts and Theories
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Communication
- Cooperation and Teamwork
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation

Creative Thinking

Technical and Social Competencies
- Decision-making

This class introduces students into basic features of the legal system. Fundamental issues of constitutional law, administrative law, private law and the law of the EU are covered. The focus is on legal problems related to space. Active participation is expected in short interactive sequences.

Students are able to identify basic structures of the legal system. They understand selected topics of public and private law. They are able to apply the fundamentals in more advanced law classes and to recognize the relevance of law in their own field.

Basic concepts of law, sources of law.

Private law: Contract law (particularly contract for work and services), tort law, property law.

Public law: Human rights, administrative law, procurement law, procedural law.

Insights into the law of the EU.

Jaap Hage, Bram Akkermans (Eds.), Introduction to Law, Cham 2017 (Online Resource ETH Library)

Further documents will be available online (https://moodle-app2.let.ethz.ch/course/view.php?id=22904).

Contract Design I

- Can find all course materials and the most recent announcements on Moodle. Please log in to Moodle using your ETH or UZH credentials. Then search for “Contract Design I (851-0742-00L; Fall 2023)” and enroll. The
Contract Design I is taught by Professor Stremitzer and aims to bridge the gap between economic contract theory, contract law, and the writing of real-world contracts. In this course, we take a systematic approach to contract design. This means we first analyze the economic environment in which a transaction takes place and then engineer contracts that achieve the desired outcome.

Contracts are agreements between parties to engage in transactions. A good contract creates value by giving parties the right incentives to undertake a case study in small groups. Selected case studies are presented and discussed in a final meeting. Working tools are theoretical texts, legal rules, court decisions as well as site analyses. Students prepare the texts for joint discussions and analysis.

We will cover topics such as moral hazard, adverse selection, elicitation mechanisms, relationship-specific investments, and relational contracting and apply the theoretical insights to real-life case studies ranging from purchases & sales of assets, oil & gas exploration, movie financing, production & distribution, construction & development, M&A deals, venture capital financing, to executive compensation and many other types of transactions.

The course follows a flipped-classroom model: You will watch learning videos specifically produced for this course ahead of class. We will use class time to discuss real-world case studies. The videos will be made available before the lecture each week and need to be watched ahead of coming to class. Computer-graded quizzes at the beginning of each class will test students’ understanding of the concepts introduced in the videos.

As the emphasis of this class is on class discussion, attendance is mandatory. Absent important reasons, you cannot miss class more than twice.

The lectures will be recorded but only made available to those who miss lectures with excused absence.

For ETH students: Your grade will consist of two parts:
1) You will take weekly computer-based quizzes during class time. Thus, it is important that you attend the lectures to be able to finish the quizzes and pass this course.
2) You compose short responses to take-home questions on case studies we assign and upload them ahead of class (Pass/Fail).

Note that UZH and UNISG students enrolling in this course need to earn more ECTS for completing this course than ETH students (due to curricula reasons). This is why UZH and UNISG students must complete a written assignment in addition to the weekly quizzes and take-home questions. UZH students also need to complete an additional group project.

UZH and UNISG students should check out the description of the class at their respective home institutions.

If you have any questions regarding the course, please write an email to the teaching assistants, Lucas Gericke (lucas.gericke@gess.ethz.ch) or Serge von Steiger (serge.vonsteiger@gess.ethz.ch).

Attendance is mandatory. You are only allowed to miss two lectures unless there are special circumstances.

Contract Design I is available to ETH students through the Science in Perspective (SiP) Program of D-GESS. This course is particularly suitable for students of D-ARCH, D-BAUG, D-CHAB, D-MATH, D-MTEC, D-INFK, and D-MAVT.

The legal principles of real estate property law can be correctly interpreted and applied in daily life.

S. Stucki

The course aims to teach students how to evaluate a design project from the perspective of the end user. The concept of evidence-based design is introduced, and complemented with theoretical background on space syntax and spatial cognition. This is a project-oriented course, students implement a range of methods on a sample project. The course is tailored for architecture design students. Particularly suitable for students of D-ARCH.

851-0707-00L Space Planning Law and Environment W 2 credits 2G O. Bucher

Abstract
System of swiss planning law, Constitutional and statutory provisions, Space planning and fundamental rights, Instruments, Application, legal protection, enforcement, Practical training.

Objective
Basic understanding of nature and function of space planning from a legal point of view. Basic knowledge of space planning instruments, relationship between space planning and constitutional law (especially property rights), solving of practical cases.

Content

Lecture notes
Haller, Walter/Karlen, Peter, Raumplanung-, Bau- und Umweltrecht, 3.A., Zürich 1999

851-0252-01L Human-Computer Interaction: Cognition and Usability W 3 credits 2S C. Hölscher, I. Barisic, B. Davison, to be announced

Abstract
This seminar will introduce key topics, theories and methodology in human-computer interaction (HCI) and usability, with a focus on applying them to real situations.

Objective
Presentations will cover the basics of human-computer interaction and selected topics:
● History of HCI
● Research ethics
● Literature reviews
● Participant-free methods: cognitive walkthrough and heuristic evaluation
● Card sorting and information architecture
● Usability studies
● Unmoderated research and diary studies
● Surveys
● User Logs and metric frameworks

On a weekly basis, students will conduct authentic research in class covering the topics above. They will submit their in-class research results regularly and also present their findings to the class once per semester.

The final project demonstrates class topic adoption by deeply exploring one HCI problem using the covered methods and tools. Students will choose a research topic and execute their research plan. They will individually write a formal report including problem definition, literature review, methodology, findings and discussion.

851-0252-08L Evidence-Based Design: Methods and Tools for Evaluating Architectural Design W 3 credits 2S C. Hölscher, M. Gath Morad, L. Narvaez Zertuche, C. Veddeler, to be announced

Abstract
Students are taught a variety of analytic techniques that can be used to evaluate architectural design. The concept of evidence-based design is introduced, and complemented with theoretical background on space syntax and spatial cognition. This is a project-oriented course, students implement a range of methods on a sample project. The course is tailored for architecture design students.

Objective
The course aims to teach students how to evaluate a design project from the perspective of the end user. The concept of evidence-based design is introduced through a series of case studies. Students are given a theoretical background in space syntax and spatial cognition, with a view to applying this knowledge during the design process. The course covers a range of methods including visibility analysis, network analysis, conducting real-world observations, and virtual reality for architectural design. Students apply these methods to a case study of their choice, which can be at building or urban scale. For students taking a B-ARCH or M-ARCH degree, this can be a completed or ongoing design studio project. The course gives students the chance to implement the methods iteratively and explore how best to address the needs of the eventual end-user during the design process.

The course is tailored for students studying for B-ARCH and M-ARCH degrees. As an alternative to obtaining D-GESS credit, architecture students can obtain course credit in "Vertiefungsfach" or "Wahlfach".

851-0724-01L Real Estate Property Law W 3 credits 3V S. Stucki, R. Müller-Wys

Abstract
Real estate property law (esp. content, acquisition, restrictions under private and public law, transmission and loss). Legal presentation: land register, surveying, cadastre. Basic questions of contract and tax law.

Objective
The legal principles of real estate property law can be correctly interpreted and applied in daily life.

Content
Real estate property law (esp. content, acquisition, restrictions under private and public law, transmission and loss). Legal presentation: land register, surveying, cadastre. Basic questions of contract and tax law.

Analytical Competencies

851-0253-08L Advanced Topics in Evidence-Based Design for Architecture  
Course objectives: Completion of the course Evidence-Based Design: Methods and Tools For Evaluating Architectural Design (851-0252-08L).

- Students will gain advanced knowledge and practical hand-on experience with agent-based simulations and spatial analysis tools to evaluate hospital layouts from the perspective of end-users.

Objective

- Students will build on their previous projects as part of the course “Evidence-Based Design: Methods and Tools For Evaluating Architectural Design” (851-0252-08L). Students enrolled will participate in an international workshop with GSAPP at Columbia University Designing the post-pandemic hospital with evidence, for people. The course is funded by an ETH innoventa project entitled cogARCH: linking cognition and architecture to design resilient hospital architecture.

Abstract

Artificial Intelligence and Human Values

851-0453-00L Artificial Intelligence and Human Values  
This course introduces students to the ethical, political and legal debates and transformations in relation to Artificial Intelligence and provides students with concepts and methods from the constructivist and interpretive social sciences to work towards responsible and democratic human-technology futures.

- The main objectives of the course are to enable students to 1) identify the ways in which human values and developments of AI technologies are entangled, 2) articulate what is significant about contemporary transformations in AI and society, and 3) participate and shape the relationship between human values and AI as citizens and professionals.

Objective

- The growing presence of AI tools for public use, for public administration, inside corporations and in scientific research raises many questions about the ethical, political, legal consequences of these technologies. This course is built around multiple sites of encounter among human values and AI, including bodies, persons, cities, labs, law, and environment. In each site, we inquire about what and whose values are being prioritized and with what consequences. The course also investigates existing best-practices around how to “align” human values with AI (e.g. human-centric design, alignment, reproducibility, transparency, explainability) and introduces students to regimes of ethics and governance of AI being proposed in jurisdictions around the world. Students learn to unpack the values and assumptions in existing techniques and frameworks for the design and governance of AI and to engage constructively with diverse stakeholders to shape the human-technology future towards aims that are reflexive, responsible, and democratic.

Content

Ethics of Building

851-0037-00L Ethics of Building  
This course introduces students to the ethical, political and legal debates and transformations in relation to Artificial Intelligence and provides students with concepts and methods from the constructivist and interpretive social sciences to work towards responsible and democratic human-technology futures.

- Building practices have often been associated with utopian visions and promises of a more just way of living together. But to what extent can the built environment contribute to a better society? What role can mathematical models or data analyses play in questions of distributive justice in the city? Is it ever possible to build sustainably, or is building always also destroying the environment?

Objective

- Students will learn about contemporary debates in architectural and urban planning ethics. We will discuss the positions against the background of their historical predecessors and current contexts. Students will work on small case studies in which they will ethically analyze the construction of a building, a district or a city. The seminar includes a student-co-led expedition through Zurich.

Content

We will not be able to solve these problems in one semester, but we will intensively grapple with the overarching question implied in all of them. The question is on the extent to which the built environment takes on ethical significance for human (and other) forms of life, and how are we to understand ethics in general if it is to respond to such questions.

**Abstract**

This seminar introduces students to theory and research, challenges, and opportunities in neuroaesthetics, with a clear emphasis on the interdisciplinary nature of the discipline situated at the intersection of neuroscience, psychology, and art appreciation. Foundational empirical methods and critical perspectives of research approaches in neuroaesthetics are considered.

**Objective**

- to familiarize students with concepts, models, methods, brain and behavioral findings related to aesthetic experience.
- to develop a critical understanding in evaluating the theoretical and empirical findings in neuroaesthetics
- to integrate the acquired knowledge to critically debate and discuss the conceptual and empirical issues related to the science of aesthetic experience

**Content**

In this seminar, students will learn about the foundational principles of neuroaesthetics, which explores the cognitive and brain processes involved in aesthetic experience. A key focus will be placed on developing an appreciation of the interdisciplinary methods used in the neuroaesthetics field – ranging from neuroscience, psychology, philosophy, and art history. The seminar is based on the active engagement of students in reading, presenting, and critically discussing selected papers in the field. In a final small-group assignment, students are expected to incorporate and elaborate upon the content covered in the seminar by presenting and discussing a novel research proposal for tackling a timely research question related to aesthetic experience.

**Abstract**

The lecture gives an overview of the fundamental aspects of intellectual property, which plays an important role in the daily routine of engineers and scientists. The lecture aims to make participants aware of the various methods of protection and to put them in a position to use this knowledge in the workplace.

**Objective**

In recent years, knowledge about intellectual property has become increasingly important for engineers and scientists. Both in production and distribution and in research and development, they are increasingly being confronted with questions concerning the patenting of technical inventions and the use of patent information.

The lecture will acquaint participants with practical aspects of intellectual property and enable them to use the acquired knowledge in their future professional life.

**Topics covered during the lecture will include:**

- The importance of innovation in industrialised countries
- An overview of the different forms of intellectual property
- The protection of technical inventions and how to safeguard their commercialisation
- Patents as a source of technical and business information
- Practical aspects of intellectual property in day-to-day research, at the workplace and for the formation of start-ups.

**Case studies will illustrate and deepen the topics addressed during the lecture.**

**Prerequisites / notice**

The lecture addresses students in the fields of engineering, science and other related technical fields.

---

**Data:** 06.08.2024 12:40  | **Autumn Semester 2024**  | **Page 2625 of 2684**
Contract Design I is taught by Professor Stremitzer and aims to bridge the gap between economic contract theory, contract law, and the assessed Communication Subject-specific Competencies

Handouts, prerecorded videos, slides, case studies, and other materials available on a dedicated webpage: contractdesign.org. Access to assessed Contract Design I assessed System of swiss planning law, Contracts are agreements between parties to engage in transactions. A good contract creates value by giving parties the right incentives to Problem-solving assessed Basic understanding of nature and function of space planning from a legal point of view. Basic knowledge of space planning Instruments, Constitutional and statutory provisions, Space planning and fundamental rights, Instruments, Application, legal protection, enforcement, Practical training.

We will cover topics such as moral hazard, adverse selection, elicitation mechanisms, relationship-specific investments, and relational contracting and apply the theoretical insights to real-life case studies ranging from purchases & sales of assets, oil & gas exploration, movie financing, production & distribution, construction & development, M&A deals, venture capital financing, to executive compensation and many other types of transactions.

The course follows a flipped-classroom model: You will watch learning videos specifically produced for this course ahead of class. We will use class time to discuss real-world case studies. The videos will be made available before the lecture each week and need to be watched ahead of coming to class. Computer-graded quizzes at the beginning of each class will test students’ understanding of the concepts introduced in the videos.

As the emphasis of this class is on class discussion, attendance is mandatory. Absent important reasons, you cannot miss class more than twice.

The lectures will be recorded but only made available to those who miss lectures with excused absence.

For ETH students: Your grade will consist of two parts:
1) You will take weekly computer-based quizzes during class time. Thus, it is important that you attend the lectures to be able to finish the quizzes and pass this course.
2) You compose short responses to take-home questions on case studies we assign and upload them ahead of class (Pass/Fail).

Note that UZH and UNISG students enrolling in this course need to earn more ECTS for completing this course than ETH students (due to curricula reasons). This is why UZH and UNISG students must complete a written assignment in addition to the weekly quizzes and take-home questions. UZH students also have to complete an additional group project.

UZH and UNISG students should check out the description of the class at their respective home institutions.

Handouts, prerecorded videos, slides, case studies, and other materials available on a dedicated webpage: contractdesign.org. Access to this webpage is free of charge for ETH students as ETH purchased a license for ETH students.

Attendance is mandatory. You are only allowed to miss two lectures unless there are special circumstances.

Contract Design I is available to ETH students through the Science in Perspective (SiP) Program of D-GESS. This course is particularly suitable for students of D-ARCH, D-BAUG, D-CHAB, DMATH, D-MTEC, D-INFK, and D-MAVT.

If you have any questions regarding the course, please write an email to the teaching assistants, Lucas Gericke (lucas.gericke@geess.ethz.ch) or Serge von Steiger (serge.vonsteiger@geess.ethz.ch).

Competencies Subject-specific Competencies
Concepts and Theories assessed

Space Planning Law and Environment
Particularly suitable for students of D-ARCH, D-BAUG, D-CHAB, DMATH, D-MTEC, D-INFK, and D-MAVT.

System of swiss planning law, Constitutional and statutory provisions, Space planning and fundamental rights, Instruments, Application, legal protection, enforcement, Practical training.

Basic understanding of nature and function of space planning from a legal point of view. Basic knowledge of space planning instruments, relationship between space planning and constitutional law (especially property rights), solving of practical cases.
On completion of this lecture, you have acquired the ability to identify, analyze, critically reflect and resolve ethical challenges in general.

**Subject-specific Competencies assessed**

**Global History of Urban Design I**

The lectures deal mainly with the definition of urban design as an independent discipline, which maintains connections with other disciplines (politics, sociology, geography) that are concerned with the transformation of the city. The aim is to make students conversant with the multiple theories, concepts and approaches of urban design as they were articulated throughout time in a variety of cultural contexts, thus offering a theoretical framework for students' future design work.

**Objective**

On completion of this lecture, you have acquired the ability to identify, analyze, critically reflect and resolve ethical challenges in general and specifically regarding the environment. You know basic concepts, positions and lines of argumentation from the debate in environmental ethics, which you have applied and discussed in smaller exercises.

**Content**

01. The History and Theory of the City as Project
02. Of Rituals, Water and Mud: The Urban Revolution in Mesopotamia and the Indus
03: The Idea of the Polis: Rome, Greece and Beyond
04: The Long Middle Ages and their Counterparts: From the Towns of Tuscany to Delhi
05: Between Ideal and Laboratory: Of Middle Eastern Grids and European Renaissance Principles
06: Of Absolutism and Enlightenment: Baroque, Defense and Colonization
07: The City of Labor: Company Towns as Cross-Cultural Phenomenon
08: Garden Cities of Tomorrow: From the Global North to the Global South and Back Again
09: Civilized Wilderness and City Beautiful: The Park Movement of Olmsted and The Urban Plans of Burnham
10: The Extension of the European City: From the Viennese Ringstrasse to Amsterdam Zuid

**Literature**

These books will be reserved for consultation in the ETH Baubibliothek, and will not be available for individual loans.

A list of further recommended literature will be found within each chapter of the reader (Skript).

**Prerequisites / notice**

Students are required to familiarize themselves with the conventions of architectural drawing (reading and analyzing plans at various scales).

The Role of Intellectual Property in the Engineering and Technical Sector

**Abstract**

The lecture gives an overview of the fundamental aspects of intellectual property, which plays an important role in the daily routine of engineers and scientists. The lecture aims to make participants aware of the various methods of protection and to put them in a position to use this knowledge in the workplace.

**Objective**

In recent years, knowledge about intellectual property has become increasingly important for engineers and scientists. Both in production and distribution and in research and development, they are increasingly being confronted with questions concerning the patenting of technical inventions and the use of patent information.

The lecture will acquaint participants with practical aspects of intellectual property and enable them to use the acquired knowledge in their future professional life.

Topics covered during the lecture will include:
- The importance of innovation in industrialised countries
- An overview of the different forms of intellectual property
- The protection of technical inventions and how to safeguard their commercialisation
- Patents as a source of technical and business information
- Practical aspects of intellectual property in day-to-day research, at the workplace and for the formation of start-ups.

Case studies will illustrate and deepen the topics addressed during the lecture.

**Prerequisites / notice**

The lecture addresses students in the fields of engineering, science and other related technical fields.

**Competencies**

- Concepts and Theories
- Problem-solving
- Critical Thinking
- Self-awareness and Self-reflection

**Number** 851-0738-01L

**Lecturer** K. Houshang Pour Islam

---

**Law & Tech**

This course introduces students to scientific and technological developments that require regulation or enable legal innovation. We focus particularly on the challenges to current law posed by prominent near-future technologies.

**Abstract**

The course is designed for a wide range of ETH students as well as for law students who are keen to deepen their understanding of cutting-edge technology. It offers an overview of key legal areas important for technology regulation, complemented by guest lectures on emerging technological trends.

In previous years, the course has featured esteemed speakers from various sectors, including industry leaders like Google, NGOs such as Digital Society Switzerland and The European Consumer Organization, regulatory bodies like the Swiss Competition Commission, and noted academics.

The course is open to ETH students through the Science in Perspective program of the Department of Humanities, Social and Political Sciences.

**Content**

The planned course outline is below.

- Overview of Law and Technology
- Fundamental Rights
- AI & Discrimination
- Landmark Big Tech Cases
- Regulation of Digital Platforms & Content Moderation
- Online Consumer Protection
- Law and Tech Scholarship Series

A number of recent regulations will be discussed, including the EU’s AI Act, the Digital Services Act (DSA), and the Digital Markets Act (DMA), as well as emerging internet phenomena, like ChatGPT.

**Prerequisites / notice**

You can find all course materials and the most recent announcements on Moodle. Please log in to Moodle using your ETH or UZH credentials. Then search for “Law & Tech (851-0732-06L, HS 2024)” and enroll.

**Competencies**

**Title** Ethics of Life Sciences and Biotechnology

**Type** W

**ECTS** 3 credits

2V

**Lecturer** A. Blasimme, E. Vayena
This semester course enables students to recognize, anticipate and address ethical issues in the domain of health sciences and their technological application. The students will acquire the necessary theoretical and analytic resources to develop critical thinking skills in the field of applied ethics and will practice how to use such resources to address concrete ethical issues in health sciences.

The course is tailored to students who want to become familiar with the analysis of ethical issues in all the different domains of life sciences and biotechnology. The course aims at equipping students with the necessary knowledge and analytic skills to understand, discuss and address the ethical aspects of science and technology in the domain of human health. The specific learning objectives of this course are:

A. Identify ethical issues in in life sciences and biotechnology.  
B. Analyze and critically discuss ethical issues in life sciences and biotechnology.  
C. Become aware of relevant legal and public policy frameworks.  
D. Distinguish different ethical approaches and argumentative strategies in applied ethics.  
E. Recognize how ethical issues relate to different accounts of technology and innovation.  
F. Develop a personal and critical attitude towards the ethical aspects of life sciences and their technological application.  
G. Autonomously anticipate ethical issues.  
H. Propose and communicate solutions to ethical challenges and dilemmas.

The course starts off with an introductory lecture on ethics as a discipline and an overview of the most relevant approaches in the domain of applied ethics. The students will also be introduced to current theoretical accounts of technology and will start to appreciate the relevance of ethics especially with respect to new and emerging technologies. Usable analytic tools will also be provided, thus enabling the students to engage with the discipline in a practical way from the very onset of the semester.

The course will continue with thematic sessions covering a broad variety of topics all of which are relevant to the different study tracks offered by the department. In particular, the course will cover the following domains: digital health technologies and medical AI; food, nutrition and healthy longevity; biomedical engineering; genetics; neuroscience and Neurotechnologies; medical robotics; disability and rehabilitation; environmental ethics. The course will also include sessions on cross-cutting ethically relevant aspects of health sciences and technologies, namely: access to innovation, translational research, and the relation between science and public policy.

All the topics of the course will be illustrated and interactively discussed through many case studies, offering the students the opportunity to prepare and present them, and to use them in individual as well as group exercises. Throughout the course, the students will have multiple opportunities to experiment with ethical argumentation and to practice their evolving skills.

Rapid advances in the technologies and empirical approaches used in imaging the human brain have opened exciting windows into how the human brain coordinates social interaction. These advances include imaging the brain’s function during real social interactions, training behaviours with feedback based on real-time brain activity, and even generating art directly from brain signals. With them, these advances have brought novel ethical implications regarding their implementation in research and potentially, their use by the public, for both therapeutic and possible “neurohacking” applications. In this seminar, students will be introduced to various neuroimaging approaches for social neuroscience generally, as well as to approaches for measuring social brain function in real life, and will gain insights into related ethical considerations.

The seminar builds on the active participation of students in reading, presenting, and critically discussing selected papers in the field. In a final small-group assignment, students are required to integrate and elaborate upon topics covered in the seminar by presenting and debating a novel research proposal for addressing a timely research question related to the use of brain imaging in the context of social interactions. No prior experience or knowledge in brain imaging is required.

**851-0271-00L Neuroaesthetics - Exploring the Science of Aesthetic Experience**

**W 2 credits 2S E. Cross, I. Bara**

**Abstract**

This seminar introduces students to theory and research, challenges, and opportunities in neuroaesthetics, with a clear emphasis on the interdisciplinary nature of the discipline situated at the intersection of neuroscience, psychology, and art appreciation. Foundational empirical methods and critical perspectives of research approaches in neuroaesthetics are considered.

**Objective**

- to familiarize students with concepts, models, methods, brain and behavioral findings related to aesthetic experience.
- to develop a critical understanding in evaluating the theoretical and empirical findings in neuroaesthetics
- to integrate the acquired knowledge to critically debate and discuss the conceptual and empirical issues related to the science of aesthetic experience

**Content**

In this seminar, students will learn about the foundational principles of neuroaesthetics, which explores the cognitive and brain processes involved in aesthetic experience. A key focus will be placed on developing an appreciation of the interdisciplinary methods used in the neuroaesthetics field – ranging from neuroscience, psychology, philosophy, and art history. The seminar is based on the active engagement of students in reading, presenting, and critically discussing selected papers in the field. In a final small-group assignment, students are expected to incorporate and elaborate upon the content covered in the seminar by presenting and discussing a novel research proposal for tackling a timely research question related to aesthetic experience.

The lecture gives an overview of the fundamental aspects of intellectual property, which plays an important role in the daily routine of engineers and scientists. The lecture aims to make participants aware of the various methods of protection and to put them in a position to use this knowledge in the workplace.
In recent years, knowledge about intellectual property has become increasingly important for engineers and scientists. Both in production and distribution and in research and development, they are increasingly being confronted with questions concerning the patenting of technical inventions and the use of patent information.

The lecture will acquaint participants with practical aspects of intellectual property and enable them to use the acquired knowledge in their future professional life.

Topics covered during the lecture will include:
- The importance of innovation in industrialised countries
- An overview of the different forms of intellectual property
- The protection of technical inventions and how to safeguard their commercialisation
- Patents as a source of technical and business information
- Practical aspects of intellectual property in day-to-day research, at the workplace and for the formation of start-ups.

Case studies will illustrate and deepen the topics addressed during the lecture.

The seminar will include practical exercises on how to use and search patent information. Basic knowledge of how to read and evaluate patent documents as well as how to use publicly available patent databases to obtain the required patent information will also be provided.

Contract Design I (851-0742-00L) taught by Professor Stremitzer aims to bridge the gap between economic contract theory, contract law, and the use of econometrics and machine learning to questions in law, data science, and social science.

Students must have some data science and/or statistics experience. Some programming experience in Python, Stata, or R is required.

Apply tools from data science and social science to a new project, potentially in a group, to develop a paper or app.

**D-CHAB**

**Title** Contract Design I

You can find all course materials and the most recent announcements on Moodle. Please log in to Moodle using your ETH or UZH credentials. Then search for "Contract Design I (851-0742-00L; Fall 2023)" and enroll. The password is "ContractDesign01".

It is NOT a legal drafting class focused on contractual language.

Number of participants limited to 160. Max 80 ETHZ and 80 UZH Students

**Abstract** Contract Design I is taught by Professor Stremitzer and aims to bridge the gap between economic contract theory, contract law, and the writing of real-world contracts. In this course, we take a systematic approach to contract design. This means we first analyze the economic environment in which a transaction takes place and then engineer contracts that achieve the desired outcome. We will cover topics such as moral hazard, adverse selection, elicitation mechanisms, relationship-specific investments, and relational contracting and apply the theoretical insights to real-life case studies ranging from purchases & sales of assets, oil & gas exploration, movie financing, production & distribution, construction & development, M&A deals, venture capital financing, to executive compensation. In recent years, knowledge about intellectual property has become increasingly important for engineers and scientists. Both in production and distribution and in research and development, they are increasingly being confronted with questions concerning the patenting of technical inventions and the use of patent information.

We will cover topics such as moral hazard, adverse selection, elicitation mechanisms, relationship-specific investments, and relational contracting and apply the theoretical insights to real-life case studies ranging from purchases & sales of assets, oil & gas exploration, movie financing, production & distribution, construction & development, M&A deals, venture capital financing, to executive compensation and many other types of transactions.

The course follows a flipped-classroom model: You will watch learning videos specifically produced for this course ahead of class. The videos will be made available before the lecture each week and need to be watched ahead of coming to class. Abstract

This lecture series covers psychedelic science mainly psychologically, and additionally pharmacologically, physiologically, psychotherapeutically, philosophically, religiously, and politically. All contributions will also be reflected on from the viewpoint of the humanities and psychology.

Objective

To provide students with a multidisciplinary introduction to psychedelic science, and to also comprehensively embed this in a reflection from a humanities/psychology viewpoint.

Subject-specific Competencies

Life and Death

This course explores the relation between the scientific investigation of life and cultural notions of death from a historical perspective. It is a supervised student project for 3 ECTS, supervised by the professorship of Elliott Ash (D-GESS). Students will adapt tools from disciplines that are involved in this field, and to thus introduce psychedelic science to the students as broadly and comprehensively as is possible within a single course.

Abstract

This course explores the relation between the scientific investigation of life and cultural notions of death - from a historical perspective (assuming there is no such thing as the scientific investigation of death). While psychedelic experiences can also be challenging/confrontational, they are often deeply meaningful to the individual experiencing them. Studies have shown that such experiences are often associated with enduring positive effects on attitudes, mood, and behavior in healthy individuals and—in conjunction with psychotherapy—with sustained symptom reductions in individuals suffering from depression, anxiety, and addiction (also showing some first promise for a number of other mental conditions, such as obsessive-compulsive and eating disorders).

Psychadelic science is overall a large multidisciplinary effort that requires collaboration of scholars of the human sciences, the natural sciences, and the humanities to advance the scientific knowledge of it. In this spirit, this course involves—besides the main lecturer (PD Dr. phil. Kurt Stocker, a psychologist)—also further psychedelic-scientific scholars giving individual lectures in their respective field of expertise: psychology (PD Dr. phil. Katrin Preller, University of Zurich & Yale University), pharmacology (Dr. phil. nat. Dino Luethi, University Hospital Basel; Dr. phil. nat. Deborah Rudin, University Hospital Basel; Prof. Dr. phil. Linda Simmler, University of Basel), physiology (Prof. Dr. sc. nat. Felix Scholkmann, University of Zurich & University of Bern), psychotherapy (Prof. Dr. med. Gregor Hasler, University of Fribourg; Dr. med. Dr. sc. ETH Milan Scheidegger, University of Zurich), philosophy (Dr. Peter Sjöstedt-Hughes, University of Exeter), religion (TBA), and politics (Dr. phil Claudia G. Schwarz, Karl Landsteiner University of Health Sciences, Krems). By incorporating all these disciplines, the curricular goal of this ETH course is to cover psychedelic science from the large variety of major academic disciplines that are involved in this field, and to thus introduce psychedelic science to the students as broadly and comprehensively as is possible within a single course.

Prerequisites / notice

Some programming experience in Python, Stata, or R is required. Some experience with data science or statistics experience. Some programming experience in Python, Stata, or R is required. Some experience with data science or statistics is required.

Objective

Apply tools from data science and social science to a new project, potentially in a group, to develop a paper or app.

Methodic Competencies

Particularly suitable for students D-CHAB, D-INFK, D-ITET, D-MATH, D-PHYS

Analytical Competencies

Sensitivity to Diversity

Abstract

This course will review several case studies from the ancient, medieval and modern history of mathematics. The case studies will be analyzed from various philosophical perspectives, while situating them in their historical and cultural contexts.

Objective

The course aims are:

1. To introduce students to the historicity of mathematics
2. To make sense of mathematical practices that appear unreasonable from a contemporary point of view
3. To develop critical reflection concerning the nature of mathematical objects
4. To introduce various theoretical approaches to the philosophy and history of mathematics
5. To open the students' horizons to the plurality of mathematical cultures and practices

Abstract

This course explores the relation between the scientific investigation of life and cultural notions of death from a historical perspective (assuming there is no such thing as the scientific investigation of death). While the course covers the times from antiquity up to the present, the main emphasis will be placed on the modern life sciences since the 19th century.

Objective

There is only one certainty in life: death. This brute fact has animated much thought and work in theology, art and philosophy - but also in the natural sciences, such as biology and medicine. Questions regarding health and disease, evolution, extinction and immortality have played a crucial role in this connection. This course aims to explore these relations. This course aims to explore these relations.

Focus on the Human: Human-Centered Security and Privacy Lab

The course is particularly suitable for all students who have already completed the course “Human-centered IT Security and Privacy” as some of the concepts introduced will practically be applied in this course. However, the relevant literature and necessary material will be provided to all students and basic concepts will be briefly summarized so that all interested students can participate.

Abstract

After an introduction on usable security as the intersection of computer science and psychology, students will form teams and work on exemplary security- or privacy-related research questions. The teams will develop and evaluate a concept for a human-centered solution. Throughout input sessions and milestone presentations the human perspective will be incorporated and reflected upon.

Objective

The course makes students experience an exemplary human-centered design process. They will learn about and practically apply human-centered design and evaluation methods that will allow them to view their solution from the human perspective, e.g., the user, developer or website owner perspective. By taking part in the evaluation of other teams, they will also take the user perspective themselves.

Some programing experience in Python, Stata, or R is required. Some experience with data science or statistics is required.

Presented in this course at:

Website: https://www.uzh.ch/cmsssl/en/studies/application/deadline-s.html

Mind the enrolment deadlines at UZH:
https://www.uzh.ch/cmsssl/en/studies/application/deadline-s.html

After you received your logon information you can enrol to courses at:
https://studentservices.uzh.ch/uzh/application/#/Logon

1. Focus on the Human: Human-Centered Security and Privacy Lab
   - ECTS: 3
   - Report: to be announced
   - Prerequisites: Some programming experience in Python, Stata, or R is required. Some experience with data science or statistics is required.
   - Objective: The course makes students experience an exemplary human-centered design process. They will learn about and practically apply human-centered design and evaluation methods that will allow them to view their solution from the human perspective, e.g., the user, developer or website owner perspective. By taking part in the evaluation of other teams, they will also take the user perspective themselves.
At the beginning of the course, the students will receive an introduction to usable IT security and privacy and relevant concepts. Afterwards, a selection of current research questions from that area will be presented. The students form teams and select one of the proposed research questions. This question will accompany the students throughout the semester. They will design and evaluate a concept for a human-centered solution to that question. To be able to do so, they will receive input on human-centered design and evaluation tools. Their progress and the inclusion of the human perspective will be subject to feedback in milestone presentations.

The students' human-centered solution can take the form of a concept (e.g., a concept for a product or app), interface (e.g., a visual or tangible interface), or prototype (e.g., sketches, a click-dummy or a built prototype). The solution will then be subject to evaluations. The solutions will be user-tested by members of other teams that thereby take the perspective of a user themselves. In addition, the solutions will be analyzed from different stakeholders' perspectives, such as developers or website owners.

Finally, the students will reflect on potential changes that result from the evaluations and their consequences.

**Literature**

This course is especially recommended after the related lecture "851-0390-00 G Human-Centered IT Security and Privacy". However, previous participation in the lecture is not a requirement and not necessary for succeeding in the course.

**Psychadelic Science: Psychology Pharmacology:**

**Psychology Psychotherapy Philosophy Religion Politics**

*W* 3 credits  2V

K. Stocker

**Abstract**

This lecture series covers psychadelic science mainly psychologically, and additionally pharmacologically, physiologically, psychotherapeutically, philosophically, religiously, and politically. All contributions will also be reflected on from the viewpoint of the humanities and psychology.

**Objective**

To provide students with a multidisciplinary introduction to psychadelic science, and to also comprehensively embed this in a reflection from a humanities/psychology viewpoint.

**Content**

Psychadelic science is a multidisciplinary field of study that involves scholars of the human sciences, the natural sciences, and the humanities. In this course, psychadelic science is presented mainly from the viewpoint of psychology, but it will additionally also be considered from the viewpoints of pharmacology, physiology, psychotherapy, philosophy, religion, and politics. All contributions will also be reflected from the viewpoint of the humanities and psychology. The psychadelic studies treated in this course that involve humans focus on controlled and ethically approved studies where these substances are administered to medically screened, prepared, and supported participants. This course is in no way intended to encourage the private/illegal use of psychadelic substances.

A psychadelic experience is occasioned by classic (serotonergic) psychadelics such as lysergic acid diethylamide (LSD), psilocybin, mescaline, and N,N-dimethyltryptamine (DMT). Psychologically, the psychadelic experience can be characterized as a temporary nonordinary state of consciousness (NSC) that basically differs from everyday waking consciousness in terms of all three traditionally identified components of the mind: cognition (perception and thought), affect (emotions and mood), and conation (vollition, willpower).

Psychadelic nonordinary cognition may for instance involve visualizations or geometrical patterns or the perception of a subject-object transcending oneness; psychadelic nonordinary affect may for instance involve great anxiety, deepest sadness, or highest bliss; and psychadelic nonordinary conation may for instance involve threats such as surrendering to the psychadelic experience or letting go of emotionally difficult aspects of one's life.

Studying the psychadelic experience is a worthwhile endeavor. While psychadelic experiences can also be challenging/confrontational, they are often deeply meaningful to the individual experiencing them. Studies have shown that such experiences are often associated with enduring positive effects on attitudes, mood, and behavior in healthy individuals and— in conjunction with psychotherapy— with sustained symptom reductions in individuals suffering from depression, anxiety, and addiction (also showing some first promise for a number of other mental conditions, such as obsessive-compulsive and eating disorders).

Psychadelic science is overall a large multidisciplinary effort that requires collaboration of scholars of the human sciences, the natural sciences, and the humanities to advance the scientific knowledge of it. In this spirit, this course involves— besides the main lecturer (PD Dr. phil. Kurt Stocker, a psychologist)— also further psychadelic-scientific scholars giving individual lectures in their respective field of expertise: psychology (PD Dr. phil. Katrin Preller, University of Zurich & Yale University), pharmacology (Dr. phil. nat. Dino Luethi, University Hospital Basel; Dr. phil. nat. Deborah Rudin, University Hospital Basel; Prof. Dr. phil. Linda Simmler, University of Basel), physiology (PD Dr. sc. nat. Felix Scholkmann, University of Zurich & University of Bern), psychotherapy (Prof. Dr. med. Gregor Hasler, University of Fribourg; Dr. med. Dr. sc. ETH Milan Scheidegger, University of Zurich), philosophy (Dr. Peter Sjöstedt-Hughes, University of Exeter), religion (TBA), and politics (Dr. phil. Claudia G. Schwarz, Karl Landsteiner University of Health Sciences, Krems). By incorporating all these disciplines, the curricular goal of this ETH course is to cover psychadelic science from the large variety of major academic disciplines that are involved in this field, and to thus introduce psychadelic science to the students as broadly and comprehensively as is possible within a single course.

**Data:** 06.08.2024 12:40  **Autumn Semester 2024**  **Page 2636 of 2684**
This course introduces students to the ethical, political and legal debates and transformations in relation to Artificial Intelligence and provides students with concepts and methods from the constructivist and interpretive social sciences to work towards responsible and democratic human-technology futures.

Objective
The main objectives of the course are to enable students to 1) identify the ways in which human values and developments of AI technologies are entangled, 2) articulate what is significant about contemporary transformations in AI and society, and 3) participate and shape the relationship between human values and AI as citizens and professionals.

Content
The growing presence of AI tools for public use, for public administration, inside corporations and in scientific research raises many questions about the ethical, political, legal consequences of these technologies. This course is built around multiple sites of encounter among human values and AI, including bodies, persons, cities, labs, law, and environment. In each site, we inquire about what and whose values are being prioritized and what consequences. The course also investigates existing best-practices around how to "align" human values with AI (e.g., human-centric design, alignment, reproducibility, transparency, explainability) and introduces students to regimes of ethics and governance of AI being proposed in jurisdictions around the world. Students learn to unpack the values and assumptions in existing techniques and frameworks for the design and governance of AI and to engage constructively with diverse stakeholders to shape the human-technology future towards aims that are reflexive, responsible, and democratic.

851-0175-28L

Life and Death
Particularly suitable for students of D-BIOL, D-HEST, D-CHAB, D-USYS

W 3 credits

M. Hagner

Abstract
This course explores the relation between the scientific investigation of life and cultural notions of death from a historical perspective (assuming there is no such thing as the scientific investigation of death). While the course covers the times from antiquity up to the present, the main emphasis will be placed on the modern life sciences since the 19th century.

Objective
There is only one certainty in life: death. This brute fact has animated much thought and work in theology, art and philosophy - but also in the natural sciences, such as biology and medicine. Questions regarding health and disease, evolution, extinction and immortality have played a crucial role in this connection. This course aims to explore above relations - the relations between the scientific investigation of life and cultural notions of death - from a historical perspective (assuming there is no such thing as the scientific investigation of death). While the course covers the times from antiquity up to the present, the main emphasis will be placed on the modern life sciences since the 19th century.

851-0272-00L

The Cutting Edge of Social Brain Imaging

W 2 credits

E. Cross, R. Moffat

Abstract
This seminar introduces the fundamentals and latest research developments of brain imaging in real-world contexts. We explore topics from imaging multiple people’s brains simultaneously as they interact to neuro-ethics and neuro-art, while maintaining a strong focus on critical evaluation of research practices and applications of brain imaging of and during social interaction.

Objective
- To familiarize students with current concepts, theories, methods, and findings from social brain-imaging sciences
- To develop a critical view of extant findings and the tools for evaluating the quality of evidence and data, as well as ethical implications

Content
Rapid advances in the technologies and empirical approaches used in imaging the human brain have opened exciting windows into how the human brain coordinates social interaction. These advances include imaging the brain’s function during real social interactions, training behaviours with feedback based on real-time brain activity, and even generating art directly from brain signals. With them, these advances have brought novel ethical implications regarding their implementation in research and potentially, their use by the public, for both therapeutic and possible “neurohacking” applications. In this seminar, students will be introduced to various neuroimaging approaches for social neuroscience generally, as well as approaches for measuring social brain function in real life, and will gain insights into related ethical considerations.

The seminar builds on the active participation of students in reading, presenting, and critically discussing selected papers in the field. In a final small-group assignment, students are required to integrate and elaborate upon topics covered in the seminar by presenting and debating a novel research proposal for addressing a timely research question related to the use of brain imaging in the context of social interactions. No prior experience or knowledge in brain imaging is required.

Privacy Quantification and Usable Protection Mechanisms

W 3 credits

N. Zufferey, V. Zimmermann

Abstract
This is a supervised student project for 3 ECTS, supervised by the professorship of Elliott Ash (D-GESS). Students will adapt tools from econometrics and machine learning to questions in law, data science, and social science.

Objective
Students must have some data science and/or statistics experience. Some programming experience in Python, Stata, or R is required.

Prerequisites / notice
Apply tools from data science and social science to a new project, potentially in a group, to develop a paper or app.

Some programming experience in Python, Stata, or R is required. Some experience with data science or statistics is required.
In this seminar, students will learn about the foundational principles of neuroaesthetics, which explores the cognitive and brain processes involved in aesthetic experience. A key focus will be on developing an appreciation of the interdisciplinary methods used in the neuroaesthetics field—ranging from neuroscience, psychology, philosophy, and art history. The seminar is based on the active engagement of students in reading, presenting, and critically discussing selected papers in the field. In a final small-group assignment, students are expected to incorporate and elaborate upon the concepts seen in class, as well as to provide concrete examples of methodologies related to the assessment of privacy in general.

This course aims to provide the students with a global knowledge of the concepts related to privacy, and the methodology and tools to identify, analyze, and address threats while taking the user into account in the process. They will adopt a "privacy mindset," thus enabling them to automatically take privacy into account, in a usable way, when designing or analyzing a system.

Third, the course will address usability issues and the role of individuals (i.e., users) in privacy management (i.e., usable security and privacy) and the design of privacy-enhancing technologies. In this context, we will analyze the main concepts seen during the course and discuss their advantages and disadvantages in terms of usability, as well as their implementation for mass-market and large-scale technologies.

Across all three parts of the course, practical exercises, as well as recent research articles reading, and presentations will be used as a complement to support the concepts seen in class, as well as to provide concrete examples of methodologies related to the assessment of privacy in general.

Literature
Contracts are agreements between parties to engage in transactions. A good contract creates value by giving parties the right incentives to apply them to real situations.

Objective
Presentations will cover the basics of human-computer interaction and selected topics:
- History of HCI
- Research ethics
- Literature reviews
- Participant-free methods: cognitive walkthrough and heuristic evaluation
- Card sorting and information architecture
- Usability studies
- Unmoderated research and diary studies
- Surveys
- User Logs and metric frameworks

On a weekly basis, students will conduct authentic research in class covering the topics above. They will submit their in-class research results regularly and also present their findings to the class once per semester.

The final project demonstrates class topic adoption by deeply exploring one HCI problem using the covered methods and tools. Students will choose a research topic and execute their research plan. They will individually write a formal report including problem definition, literature review, methodology, findings and discussion.

Contract Design I

Number of participants limited to 160.
Max 80 ETHZ and 80 UZH Students

Abstract
Contract Design I is taught by Professor Stremitzer and aims to bridge the gap between economic contract theory, contract law, and the writing of real-world contracts. In this course, we take a systematic approach to contract design. This means we first analyze the economic environment in which a transaction takes place and then engineer contracts that achieve the desired outcome.

Objective
Contracts are agreements between parties to engage in transactions. A good contract creates value by giving parties the right incentives to meet their objectives. A good contract designer scrutinizes the economic situation in which parties find themselves and tailors the contract to the challenges at hand. To help you become sophisticated contract designers, we draw from insights for which more than half a dozen Nobel Prizes were awarded in the past two decades and transfer them to the art of writing real-world contracts. In other words, Contract Design will provide you with analytical tools to design contracts that help you be better lawyers, business leaders, and startup founders.

We will cover topics such as moral hazard, adverse selection, elicitation mechanisms, relationship-specific investments, and relational contracting and apply the theoretical insights to real-life case studies ranging from purchases & sales of assets, oil & gas exploration, movie financing, production & distribution, construction & development, M&A deals, venture capital financing, to executive compensation contracting and apply the theoretical insights to real-life case studies ranging from purchases & sales of assets, oil & gas exploration, movie financing, production & distribution, construction & development, M&A deals, venture capital financing, to executive compensation.

We will cover topics such as moral hazard, adverse selection, elicitation mechanisms, relationship-specific investments, and relational contracting and apply the theoretical insights to real-life case studies ranging from purchases & sales of assets, oil & gas exploration, movie financing, production & distribution, construction & development, M&A deals, venture capital financing, to executive compensation.

As the emphasis of this class is on class discussion, attendance is mandatory. Absent important reasons, you cannot miss class more than twice.

The lectures will be recorded but only made available to those who miss lectures with excused absence.

For ETH students: Your grade will consist of two parts:
1) You will take weekly computer-based quizzes during class time. Thus, it is important that you attend the lectures to be able to finish the quizzes and pass this course.
2) You compose short responses to take-home questions on case studies we assign and upload them ahead of class (Pass/Fail).

Note that UZH and UNISG students enrolling in this course need to earn more ECTS for completing this course than ETH students (due to curricula reasons). This is why UZH and UNISG students must complete an additional group project. UZH and UNISG students should check the description of the class at their respective home institutions.

Handouts, prerecorded videos, slides, case studies, and other materials available on a dedicated webpage: contractdesign.org. Access to this webpage is free of charge for ETH students as ETH purchased a license for ETH students.

Attendance is mandatory. You are only allowed to miss two lectures unless there are special circumstances.

Handouts, prerecorded videos, slides, case studies, and other materials available on a dedicated webpage: contractdesign.org. Access to this webpage is free of charge for ETH students as ETH purchased a license for ETH students.

If you have any questions regarding the course, please write an email to the teaching assistants, Lucas Gericke (lucas.gericke@gess.ethz.ch) or Serge von Steiger (serge.vonsteiger@gess.ethz.ch).

Prerequisites / notice
Contract Design I is available to ETH students through the Science in Perspective (SiP) Program of D-GESS. This course is particularly suitable for students of D-ARCH, D-BAUG, D-CHAB, D-MATH, D-MTEC, D-INFK, and D-MAVT.

If you have any questions regarding the course, please write an email to the teaching assistants, Lucas Gericke (lucas.gericke@gess.ethz.ch) or Serge von Steiger (serge.vonsteiger@gess.ethz.ch).

Personal Competencies
Creative Thinking assessed

**851-0727-02L** E-Business-Law
Particularly suitable for students of D-INFK, D-ITET.

**Abstract**
The course deals with the basic legal framework for doing e-business as well as using information technology. It discusses a variety of legal concepts and rules to be taken into account in practice, be it when designing and planning new media business models, be it when implementing online projects and undertaking information technology activities.

**Objective**
The objective is knowing and understanding key legal concepts relevant for doing e-business, in particularly understanding how e-business is regulated by law nationally and internationally, how contracts are concluded and performed electronically, which rules have to be obeyed in particular in the Internet with regard to third party and own content and client data, the concept of liability applied in e-business and the role of the law in the practical implementation and operation of e-business applications.

**Content**
Vorgesehene Strukturierung der Vorlesung:

1) Welches Recht gilt im E-Business?
   - Internationalität des Internets
   - Regulierte Branchen

2) Gestaltung und Vermarktung von E-Business-Angeboten
   - Verwendung fremder und Schutz der eigenen Inhalte
   - Haftung im E-Business (und wie sie beschränkt werden kann)
   - Domain-Namen

3) Beziehung zu E-Business-Kunden
   - Verträge im E-Business, Konsumentenschutz
   - Elektronische Signaturen
   - Datenschutz
   - Spam

4) Verträge mit E-Business-Providern

Änderungen, Umstellungen und Kürzungen bleiben vorbehalten. Der aktuelle Termin- und Themenplan ist zu gegebener Zeit über Moodle abrufbar.

**Lecture notes**
Es wird mit Folien gearbeitet, die als PDF über Moodle vorgängig abrufbar sind. Auf dem Termin- und Themenplan (ebenfalls online abrufbar) sind Links zu Gesetzestexten und weiteren Unterlagen abrufbar. Schliesslich wird jede Vorlesung auch als Podcast aufgezeichnet, der jedoch nur für die Studierenden mit einem Passwort (erhältlich beim Dozenten) zugänglich sind.

**Literature**
Weiterführende Materialien, Links und Literatur sind auf dem Termin- und Themenplan aufgeführt (zu gegebener Zeit abrufbar via Moodle).

**Prerequisites / notice**

**Competencies**
Subject-specific Competencies
Concepts and Theories assessed
Techniques and Technologies assessed

Method-specific Competencies
Analytical Competencies assessed
Decision-making assessed

Problem-solving assessed

Social Competencies
Communication fostered

Personal Competencies
Adaptability and Flexibility fostered
Creative Thinking fostered
Critical Thinking assessed
Self-awareness and Self-reflection fostered
Self-direction and Self-management fostered

**851-0252-13L** Network Modeling
Particularly suitable for students of D-MATH, D-INFK and in the MSc Data Science

**Abstract**
Social Network Science is a distinct domain of data science that focuses on relational systems. Various models have been proposed to describe structures and dynamics of networks, including statistical and mathematical methods. In this course, the emphasis is placed on the statistical analysis of (social) systems and their connection to social theories and data sources.

**Students are required to have basic knowledge in inferential statistics, such as regression models.**

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 2640 of 2684
Objective

The following topics will be covered:

- Introduction to network models and their applications
- Stylized models:
  * uniform random graph models
  * small world models
  * preferential attachment models
- Models for testing hypotheses while controlling for the network structure:
  * Quadratic assignment procedure regression (QAP regression)
- Models for testing hypotheses on the network structure:
  * Models for one single observation of a network: exponential random graph models (ERGMs)
  * Models for panel network data: stochastic actor-oriented models (SAOMs)

The application of these models is illustrated through examples and practical sessions involving the analysis of network data using the software R.

Content

The following topics will be covered:

- Introduction to network models and their applications
- Stylized models:
  * uniform random graph models
  * small world models
  * preferential attachment models
- Models for testing hypotheses while controlling for the network structure:
  * Quadratic assignment procedure regression (QAP regression)
- Models for testing hypotheses on the network structure:
  * Models for one single observation of a network: exponential random graph models (ERGMs)

851-0732-06L Law & Tech

Abstract

This course introduces students to scientific and technological developments that require regulation or enable legal innovation. We focus particularly on the challenges to current law posed by prominent near-future technologies. It offers an overview of key legal areas important for technology regulation, complemented by guest lectures on emerging technological trends.

In previous years, the course has featured esteemed speakers from various sectors, including industry leaders like Google, NGOs such as Digital Society Switzerland and The European Consumer Organization, regulatory bodies like the Swiss Competition Commission, and noted academics. The course is open to ETH students through the Science in Perspective program of the Department of Humanities, Social and Political Sciences.

Objective

The course is designed for a wide range of ETH students as well as for law students who are keen to deepen their understanding of cutting-edge technology. It offers an overview of key legal areas important for technology regulation, complemented by guest lectures on emerging technological trends.

Content

The planned course outline is below.

- Overview of Law and Technology
- Fundamental Rights
- AI & Discrimination
- Landmark Big Tech Cases
- Regulation of Digital Platforms & Content Moderation
- Online Consumer Protection
- Law and Tech Scholarship Series

A number of recent regulations will be discussed, including the EU’s AI Act, the Digital Services Act (DSA), and the Digital Markets Act (DMA), as well as emerging internet phenomena, like ChatGPT.

Prerequisites / notice

You can find all course materials and the most recent announcements on Moodle. Please log in to Moodle using your ETH or UZH credentials. Then search for “Law & Tech (851-0732-06L, HS 2024)” and enroll.

851-0101-86L Complex Social Systems: Modeling Agents, Learning, and Games

Prerequisites: Basic programming skills, elementary probability and statistics.

Abstract

This course introduces mathematical and computational models to study techno-socioeconomic systems and the process of scientific research. Students develop a significant project to tackle techno-socio-economic challenges in application domains of complex systems. They are expected to implement a model and to communicate their results through a project report and a short oral presentation.

Objective

See your own field of study in a wider context (“Science in Perspective”), e.g. see the psychological, social, economic, environmental, historical, ethical or philosophical connections and implications. Learn to think critically and out of the box. Question what you believe you know for sure. Get to know surprising, counterintuitive properties of complex (non-linearly interacting, networked, multi-component) systems. Learn about collaboration.

Content

By the end of the course, the students should be able to better understand the literature on complex social systems, develop their own models for studying specific phenomena and report results according to the standards of the relevant scientific literature by presenting their results both numerically and graphically.

At the end of the course, the students will deliver a report, computer code and a short oral presentation. To collect credit points, students will have to actively contribute and give a circa 30 minutes presentation in the course on a subject agreed with the lecturers, after which the presentation will be discussed. The presentation will be graded.

Students are expected to implement themselves models of techno-socio-economic processes and systems, particularly agent-based models, complex networks models, decision making, group dynamics, human crowds, or game-theoretical models. Credit points are finally earned for the implementation of a mathematical or empirical model from the complexity science literature, its presentation, and documentation by a project report.

Lecture notes

The lecture slides will be presented on the course Moodle after each lecture.
The number of participants is limited to the size of the available computer teaching room. The source code related to the seminar thesis should be well enough documented.

Prerequisites / notice

Good programming skills and a good understanding of probability & statistics and calculus are expected.

Students need to present a new subject, for which they have not earned any credit points before.

Good scientific practices, in particular citation and quotation rules, must be properly complied with.

Chatham House rules apply to this course. Materials may not be shared without previous written permission.

851-0760-00L Building a Robot Judge: Data Science for Decision-Making

W 3 credits 2V E. Ash

Abstract

This course explores the automation of decisions in the legal system. We delve into the machine learning tools needed to predict judge decision-making and ask whether techniques in model explanation and algorithmic fairness are sufficient to address the potential risks.

Objective

This course introduces students to the data science tools that may provide the first building blocks for a robot judge. While building a working robot judge might be far off in the future, some of the building blocks are already here, and we will put them to work.

Content

Data science technologies have the potential to improve legal decisions by making them more efficient and consistent. On the other hand, there are serious risks that automated systems could replicate or amplify existing legal biases and rigidities. Given the stakes, these technologies force us to think carefully about notions of fairness and justice and how they should be applied.

The focus is on legal prediction problems. Given the evidence and briefs in this case, how will a judge probably decide? How likely is a criminal defendant to commit another crime? How much additional revenue will this new tax law collect? Students will investigate and implement the relevant machine learning tools for making these types of predictions, including regression, classification, and deep neural networks models.

We then use these predictions to better understand the operation of the legal system. Under what conditions do judges tend to make errors? Against which types of defendants do parole boards exhibit bias? Which jurisdictions have the most tax loopholes? Students will be introduced to emerging applied research in this vein. In a semester paper, students (individually or in groups) will conceive and implement an applied data-science research project.

851-0467-00L From Traffic Modeling to Smart Cities and Digital Democracies

W 3 credits 2S D. Helbing, R. K. Dubey

Abstract

This seminar will present speakers who discuss the challenges and opportunities arising for our cities and societies with the digital revolution.

Objective

To collect credit points, students must actively contribute and give an individual, circa 20-minute presentation in the seminar on a subject agreed upon with the lecturer. After the presentation, it will be discussed and graded.
This seminar will present speakers who discuss the challenges and opportunities arising for our cities and societies with the digital revolution. Besides discussing questions of automation using Big Data, AI and other digital technologies, we will also reflect on the question of how democracy could be digitally upgraded, and how citizen participation could contribute to innovation, sustainability, resilience, and quality of life. This includes questions around collective intelligence and digital platforms that support creativity, engagement, coordination and cooperation.

**Literature**

- Dirk Helbing
  - An Analytical Theory of Traffic Flow (collection of papers)
- Michael Batty, Kay Axhausen et al.
  - Smart cities of the future
- Books by Michael Batty:
  - How social influence can undermine the wisdom of crowd effect
  - Evidence for a collective intelligence factor in the performance of human groups
  - Optimal incentives for collective intelligence
  - Collective Intelligence: Creating a Prosperous World at Peace
  - Big Mind: How Collective Intelligence Can Change Our World
  - Programming Collective Intelligence

Urban architecture as connective-collective intelligence. Which spaces of interaction?

- Build digital democracy
- How to make democracy work in the digital age
- Digital Democracy: How to make it work?
- Proof of witness presence: Blockchain consensus for augmented democracy in smart cities
- Iterative Learning Control for Multi-agent Systems Coordination
- Decentralized Collective Learning for Self-managed Sharing Economies

**Prerequisites / notice**

Students need to present a new subject, for which they have not earned any credit points before.

Good scientific practices, in particular citation and quotation rules, must be properly complied with.

**Competencies**

**Subject-specific Competencies**

- Concepts and Theories
- Techniques and Technologies

**Method-specific Competencies**

- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management

**Social Competencies**

- Communication
- Cooperation and Teamwork
- Customer Orientation
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity

**Personal Competencies**

- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

**Abstract**

After an introduction on usable security as the intersection of computer science and psychology, students will form teams and work on exemplary security- or privacy-related research questions. The teams will develop and evaluate a concept for a human-centered solution. Through input sessions and milestone presentations the human perspective will be incorporated and reflected upon.

**Objective**

The course makes students experience an exemplary human-centered design process. They will learn about and practically apply human-centered design and evaluation methods that will allow them to view their solution from the human perspective, e.g., the user, developer or website owner perspective. By taking part in the evaluation of other teams, they will also take the user perspective for themselves.

---

**851-0391-00L Focus on the Human: Human-Centered Security and Privacy Lab**

The course is particularly suitable for all students who have already completed the course “Human-centered IT Security and Privacy” as some of the concepts introduced will practically be applied in this course. However, the relevant literature and necessary material will be provided to all students and basic concepts will be briefly summarized so that all interested students can participate.

W 3 credits 2S V. Zimmermann, A. Toth

Autumn Semester 2024
At the beginning of the course, the students will receive an introduction to usable IT security and privacy and relevant concepts. Afterwards, a selection of current research questions from that area will be presented. The students form teams and select one of the proposed research questions. This question will accompany the students throughout the semester. They will design and evaluate a concept for a human-centered solution to that question. To be able to do so, they will receive input on human-centered design and evaluation tools. Their progress and the inclusion of the human perspective will be subject to feedback in milestone presentations. The students' human-centered solution can take the form of a concept (e.g., a concept for a product or app), interface (e.g., a visual or tangible interface), or prototype (e.g., sketches, a click-dummy or a built prototype). The solution will then be subject to evaluations. The solutions will be user-tested by members of other teams that thereby take the perspective of a user themselves. In addition, the solutions will be analyzed from different stakeholders' perspectives, such as developers or website owners. Finally, the students will reflect on potential changes that results from the evaluations and their consequences.

**Literature**

**Literature Recommendations:**

**Prerequisites / notice**

This course is especially recommended after the related lecture "851-0390-00 G Human-Centered IT Security and Privacy".

**851-0125-65L**  
**A Sampler of Histories and Philosophies of Mathematics**

**W 3 credits 2V R. Wagner**

**Abstract**

This course will review several case studies from the ancient, medieval and modern history of mathematics. The case studies will be analyzed from various philosophical perspectives, while situating them in their historical and cultural contexts.

**Objective**

The course aims at:

1. To introduce students to the historicity of mathematics
2. To make sense of mathematical practices that appear unreasonable from a contemporary point of view
3. To develop critical reflection concerning the nature of mathematical objects
4. To introduce various theoretical approaches to the philosophy and history of mathematics
5. To open the students' horizons to the plurality of mathematical cultures and practices

**Competencies**

**Subject-specific Competencies**

- Concepts and Theories
  - Assessed

**Method-specific Competencies**

- Analytical Competencies
  - Assessed

**Social Competencies**

- Sensitivity to Diversity
  - Fostered

**Personal Competencies**

---

**851-0453-00L**  
**Artificial Intelligence and Human Values**

**W 3 credits 2G M. Boening-Liptsin, K. Wodajo**

**Abstract**

This course introduces students to the ethical, political and legal debates and transformations in relation to Artificial Intelligence and provides students with concepts and methods from the constructivist and interpretive social sciences to work towards responsible and democratic human-technology futures.

**Objective**

The main objectives of the course are to enable students to 1) identify the ways in which human values and developments of AI technologies are entangled, 2) articulate what is significant about contemporary transformations in AI and society, and 3) participate and shape the relationship between human values and AI as citizens and professionals.

**Content**

The growing presence of AI tools for public use, for public administration, inside corporations and in scientific research raises many questions about the ethical, political, legal consequences of these technologies. This course is built around multiple sites of encounter among human values and AI, including bodies, persons, cities, labs, law, and environment. In each site, we inquire about what and whose values are being prioritized and with what consequences. The course also investigates existing best-practices around how to “align” human values with AI (e.g. human-centric design, alignment, reproducibility, transparency, explainability) and introduces students to regimes of ethics and governance of AI being proposed in jurisdictions around the world. Students learn to unpack the values and assumptions in existing techniques and frameworks for the design and governance of AI and to engage constructively with diverse stakeholders to shape the human-technology future towards aims that are reflexive, responsible, and democratic.

---

**851-0272-00L**  
**The Cutting Edge of Social Brain Imaging**

**W 2 credits 2S E. Cross, R. Moffat**

**Abstract**

This seminar introduces the fundamentals and latest research developments of brain imaging in real-world contexts. We explore topics from imaging multiple people’s brains simultaneously as they interact to neuro-ethics and neuro-art, while maintaining a strong focus on critical evaluation of research practices and applications of brain imaging of and during social interaction.

**Objective**

- To familiarize students with current concepts, theories, methods, and findings from social brain-imaging sciences
- To develop a critical view of extant findings and the tools for evaluating the quality of evidence and data, as well as ethical implications
Rapid advances in the technologies and empirical approaches used in imaging the human brain have opened exciting windows into how the human brain coordinates social interaction. These advances include imaging the brain’s function during real social interactions, training behaviors with feedback based on real-time brain activity, and even generating art directly from brain signals. With them, these advances have brought novel ethical implications regarding their implementation in research and potentially, their use by the public, for both therapeutic and possible “neurohacking” applications. In this seminar, students will be introduced to various neuroimaging approaches for social neuroscience generally, as well as to approaches for measuring social brain function in real life, and will gain insights into related ethical considerations.

The seminar builds on the active participation of students in reading, presenting, and critically discussing selected papers in the field. In a final small-group assignment, students are required to integrate and elaborate upon topics covered in the seminar by presenting and debating a novel research proposal for addressing a timely research question related to the use of brain imaging in the context of social interactions. No prior experience or knowledge in brain imaging is required.

851-0392-00L Privacy Quantification and Usable Protection

| Competencies | Subject-specific Competencies | Concepts and Theories | fostered |
| | Method-specific Competencies | Analytical Competencies | fostered |
| | Social Competencies | Communication | assessed |
| | Personal Competencies | Adaptability and Flexibility | fostered |

Abstract

Students will gain an overview of the main privacy metrics that are used to evaluate privacy risks related to the use of a given technology. They will also be introduced to the concepts of privacy/utility balance and usable security. Practical exercises and reading of recently published scientific articles will be used to present practical cases of the theoretical tools presented in class.

Objective

This course aims to provide the students with a global knowledge of the concepts related to privacy, and the methodology and tools to identify, analyze, and address threats while taking the user into account in the process. They will adopt a “privacy mindset”, thus enabling them to automatically take privacy into account, in a usable way, when designing or analyzing a system.

Content

First, the course will introduce the different definitions and approaches of privacy (e.g., privacy by control, privacy by design) as well as the ethical concerns and considerations related to information security and privacy research (e.g., responsible disclosure, full disclosure).

Second, the students will be introduced to the different methods, properties, and metrics to assess and/or guarantee a certain level of privacy. They will be introduced to the properties and metrics related to anonymization (e.g., k-anonymity, l-diversity), data aggregation (e.g., randomized responses, ε-differential privacy), as well as other privacy assessment methodologies (e.g., inferential privacy).

Third, the course will address usability issues and the role of individuals (i.e., users) in privacy management (i.e., usable security and privacy) and the design of privacy-enhancing technologies. In this context, we will analyze the main concepts seen during the course and discuss their advantages and disadvantages in terms of usability, as well as their implementation for mass-market and large-scale technologies.

Across all three parts of the course, practical exercises, as well as recent research articles reading, and presentations will be used as a complement to support the concepts seen in class, as well as to provide concrete examples of methodologies related to the assessment of privacy in general.

Abstract
This seminar introduces students to theory and research, challenges, and opportunities in neuroaesthetics, with a clear emphasis on the interdisciplinary nature of the discipline situated at the intersection of neuroscience, psychology, and art appreciation. Foundational empirical methods and critical perspectives of research approaches in neuroaesthetics are considered.

Objective
- to familiarize students with concepts, models, methods, brain and behavioral findings related to aesthetic experience.
- to develop a critical understanding in evaluating the theoretical and empirical findings in neuroaesthetics
- to integrate the acquired knowledge to critically debate and discuss the conceptual and empirical issues related to the science of aesthetic experience.

Content
In this seminar, students will learn about the foundational principles of neuroaesthetics, which explores the cognitive and brain processes involved in aesthetic experience. A key focus will be placed on developing an appreciation of the interdisciplinary methods used in the neuroaesthetics field – ranging from neuroscience, psychology, philosophy, and art history. The seminar is based on the active engagement of students in reading, presenting, and critically discussing selected papers in the field. In a final small-group assignment, students are expected to incorporate and elaborate upon the content covered in the seminar by presenting and discussing a novel research proposal for tackling a timely research question related to aesthetic experience.

WEBCLASS 851-0549-00L WebClass Introductory Course History of Technology

Abstract
Technology stands for innovation and catastrophes; it works as a dream machine and is associated with the most diverse ways of utilization. In WebClass Introductory Course History of Technology students become familiar with explanations for how technology works within complex economic, political and cultural contexts, by interpreting and researching texts and authoring a student manual.

Objective
Students are introduced into how technological innovations take place within complex economic, political and cultural contexts. They get to know basic theories and practices of the field by acquiring the skills to interpret texts, to compare arguments, to research additional sources and complementary material and to author a common essay. All of this will yield into a student manual on the four core topics: technology and innovation, technology and catastrophes, technology as a dream machine and technology and association. The course language is German, and even if many texts will be in English, the ability to read and understand German is mandatory.

Content
Technik steht für Innovation und Katastrophen, sie dient als Wunschmaschine und ist mit unterschiedlichsten Nutzungsf orm en assoziiert. Die WebClass Technikgeschichte ist ein webgestützter Einführungskurs, der um diese technikhistorischen Grundthemen kreist.

Lecture notes

WEBCLASS D-ITET 860-0023-00L International Environmental Politics

Abstract
This course deals with how and why international problem-solving efforts (cooperation) in environmental politics emerge and evolve, and under what circumstances such efforts are effective. Based on concepts, theories, and methods of political economy, political science, and public policy, various examples of international environmental policy-making are examined.

Objective
The objectives in this course are to (1) gain an overview of important questions in international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions in this policy area and how to address them in a conceptually and methodologically meaningful and insightful way; (3) gain an overview of important global and regional environmental problems and how they are or could be solved.

Content
This course deals with how and why international problem-solving efforts (cooperation) in environmental politics emerge and evolve, and under what circumstances such efforts are effective. Based on concepts, theories, and methods of political economy, political science, and public policy, various examples of international environmental policy-making are examined; for example international efforts to reduce air pollution, manage international water resources, mitigate and adapt to global warming, protect the stratospheric ozone layer, address biodiversity challenges, deal with plastic waste, and prevent pollution of the oceans.

Lecture notes
Reading materials and slides will be available via Moodle.

Literature
Reading materials and slides will be available via Moodle.
Prerequisites / notice

The course is open to all ETH students and visiting students from other universities. Participation does not require previous coursework in the social sciences or environmental policy. Most meetings in this course will take place on campus (ETH Main Building, HG F.3). There will be no live-streaming, and the course is not in hybrid (on-campus plus online) format. However, the lecture will be recorded (slides and voice, no video) and the recordings will be made available via the Moodle platform for this course a few days after the respective lecture for students who are unable to attend in person. All electronic correspondence will take place via the ETH mystudies system and Moodle, so please make sure you are properly registered there with a functioning email address/account.

Credits and Exam

After passing a written test at the end of the course (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test). Visiting students (e.g., from the University of Zurich, exchange students) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory. Students who obtain a grade of < 4.0 for the test will have a second chance (see table below). Students who did not participate in the test on 16 December 2024 will not have access to the repeat test unless they submit compelling and documented (e.g., medical, other exam in parallel at ETH) reasons for why they are/were unable to participate in the first test. The test covers all contents of the lectures and the reading assignments. No separate registration for the exam is required, registration for the course as such covers everything. The exam will take place on campus, most likely in HG F3. That is, you must be present in person at ETH Zurich on the exam date/time.

Abstract

The course deals with the basic legal framework for doing e-business as well as using information technology. It discusses a variety of legal concepts and rules to be taken into account in practice, be it when designing and planning new media business models, be it when implementing online projects and undertaking information technology activities.

Objective

The objective is knowing and understanding key legal concepts relevant for doing e-business, in particularly understanding how e-business is regulated by law nationally and internationally, how contracts are concluded and performed electronically, which rules have to be obeyed in particular in the Internet with regard to third party and own content and client data, the concept of liability applied in e-business and the role of the law in the practical implementation and operation of e-business applications.

Content

Vorgesehene Strukturierung der Vorlesung:

1) Welches Recht gilt im E-Business?
   - Internationalität des Internets
   - Regulierte Branchen

2) Gestaltung und Vermarktung von E-Business-Angeboten
   - Verwendung fremder und Schutz der eigenen Inhalte
   - Haftung im E-Business (und wie sie beschränkt werden kann)
   - Domain-Namen

3) Beziehung zu E-Business-Kunden
   - Verträge im E-Business, Konsumentenschutz
   - Elektronische Signaturen
   - Datenschutz
   - Spam

4) Verträge mit E-Business-Providern

Lecture notes

Es wird mit Folien gearbeitet, die als PDF über Moodle vorgängig abrufbar sind. Auf dem Termin- und Themenplan (ebenfalls online abrufbar) sind Links zu Gesetzeszitaten und weiteren Unterlagen abrufbar. Schliesslich wird jede Vorlesung auch als Podcast aufgezeichnet, der jedoch nur für die Studierenden mit einem Passwort (erhältlich beim Dozenten) zugänglich sind.

Literature

Weiterführende Materialien, Links und Literatur sind auf dem Termin- und Themenplan aufgeführt (zu gegebener Zeit über Moodle abrufbar).

Prerequisites / notice

Es wird angegeben, welche Unterlagen beim jeweiligen Thema den Prüfungsstoff definieren. Der Test wird möglicherweise elektronisch aufgezeichnet, der jedoch nur für die Studierenden mit einem Passwort (erhältlich beim Dozenten) zugänglich sind.

Abstract

This seminar will introduce key topics, theories and methodology in human-computer interaction (HCI) and usability, with a focus on applying them to real situations.
The Role of Intellectual Property in the Engineering Complex Social Systems: Modeling Agents, Learning, Startups and Law

Objective
Presentations will cover the basics of human-computer interaction and selected topics:
- History of HCI
- Research ethics
- Literature reviews
- Participant-free methods: cognitive walkthrough and heuristic evaluation
- Card sorting and information architecture
- Usability studies
- Unmoderated research and diary studies
- Surveys
- User Logs and metric frameworks

On a weekly basis, students will conduct authentic research in class covering the topics above. They will submit their in-class research results regularly and also present their findings to the class once per semester.

The final project demonstrates class topic adoption by deeply exploring one HCI problem using the covered methods and tools. Students will choose a research topic and execute their research plan. They will individually write a formal report including problem definition, literature review, methodology, findings and discussion.

851-0735-10L  
Startups and Law  
Particularly suitable for students of D-ITET, D-MAVT.

Abstract
The students shall obtain a basic knowledge about the legal environment of entrepreneurs. They shall be able to recognize and evaluate legal issues connected to an entrepreneurial activity and suggest possible solutions.

Objective
The students shall obtain the following competence:
- They shall obtain a working knowledge on the legal aspects involved in setting up and managing an enterprise.
- They shall be able to contribute to the legal management of the company and to discuss legal issues.
- They shall have an understanding of the law as a part of the corporate strategy and as a valuable resource of the company.

Lecture notes
A comprehensive script will be made available online on the moodle platform.

851-0738-01L  
The Role of Intellectual Property in the Engineering and Technical Sector  
Particularly suitable for students of D-BAUG, D-BIOL, D-BSSE, D-CHAB, D-ITET, D-MAVT.

Abstract
The lecture gives an overview of the fundamental aspects of intellectual property, which plays an important role in the daily routine of engineers and scientists. The lecture aims to make participants aware of the various methods of protection and to put them in a position to use this knowledge in the workplace.

Objective
In recent years, knowledge about intellectual property has become increasingly important for engineers and scientists. Both in production and distribution and in research and development, they are increasingly being confronted with questions concerning the patenting of technical inventions and the use of patent information.

The lecture will acquaint participants with practical aspects of intellectual property and enable them to use the acquired knowledge in their future professional life.

Topics covered during the lecture will include:
- The innovation of importance in industrialised countries
- An overview of the different forms of intellectual property
- The protection of technical inventions and how to safeguard their commercialisation
- Patents as a source of technical and business information
- Practical aspects of intellectual property in day-to-day research, at the workplace and for the formation of start-ups.

Case studies will illustrate and deepen the topics addressed during the lecture.

The seminar will include practical exercises on how to use and search patent information. Basic knowledge of how to read and evaluate patent documents as well as how to use publicly available patent databases to obtain the required patent information will also be provided.

Prerequisites / notice
The lecture addresses students in the fields of engineering, science and other related technical fields.

851-0101-86L  
Complex Social Systems: Modeling Agents, Learning, and Games

Abstract
This course introduces mathematical and computational models to study techno-socioeconomic systems and the process of scientific research. Students develop a significant project to tackle techno-socio-economic challenges in application domains of complex systems. They are expected to implement a model and to communicate their results through a project report and a short oral presentation.

Objective
See your own field of study in a wider context ("Science in Perspective"), e.g. see the psychological, social, economic, environmental, historical, ethical or philosophical connections and implications. Learn to think critically and out of the box. Question what you believe you know for sure. Get to know surprising, counterintuitive properties of complex (non-linearly interacting, networked, multi-component) systems. Learn about collaboration.
Content

By the end of the course, the students should be able to better understand the literature on complex social systems, develop their own models for studying specific phenomena and report results according to the standards of the relevant scientific literature by presenting their results both numerically and graphically.

At the end of the course, the students will deliver a report, computer code and a short oral presentation. To collect credit points, students will have to actively contribute and give a circa 30 minutes presentation in the course on a subject agreed with the lecturers, after which the presentation will be discussed. The presentation will be graded.

Students are expected to implement themselves models of techno-socio-economic processes and systems, particularly agent-based models, complex networks models, decision making, group dynamics, human crowds, or game-theoretical models. Credit points are finally earned for the implementation of a mathematical or empirical model from the complexity science literature, its presentation, and documentation by a project report.

Lecture notes

The lecture slides will be presented on the course Moodle after each lecture.

Prerequisites / notice

The number of participants is limited to the size of the available computer teaching room. The source code related to the seminar thesis should be well enough documented.

Good programming skills and a good understanding of probability & statistics and calculus are expected.

Students need to present a new subject, for which they have not earned any credit points before.

Good scientific practices, in particular citation and quotation rules, must be properly complied with.

Chatham House rules apply to this course. Materials may not be shared without previous written permission.

851-0760-00L Building a Robot Judge: Data Science for Decision-Making

Abstract
This course explores the automation of decisions in the legal system. We delve into the machine learning tools needed to predict judge decision-making and ask whether techniques in model explanation and algorithmic fairness are sufficient to address the potential risks.

Objective
This course introduces students to the data science tools that may provide the first building blocks for a robot judge. While building a working robot judge might be far off in the future, some of the building blocks are already here, and we will put them to work.
Data science technologies have the potential to improve legal decisions by making them more efficient and consistent. On the other hand, there are serious risks that automated systems could replicate or amplify existing legal biases and rigidities. Given the stakes, these technologies force us to think carefully about notions of fairness and justice and how they should be applied.

The focus is on legal prediction problems. Given the evidence and briefs in this case, how will a judge probably decide? How likely is a criminal defendant to commit another crime? How much additional revenue will this new tax law collect? Students will investigate and implement the relevant machine learning tools for making these types of predictions, including regression, classification, and deep neural networks models.

We then use these predictions to better understand the operation of the legal system. Under what conditions do judges tend to make errors? Against which types of defendants do parole boards exhibit bias? Which jurisdictions have the most tax loopholes? Students will be introduced to emerging applied research in this vein. In a semester paper, students (individually or in groups) will conceive and implement an applied data-science research project.

From Traffic Modeling to Smart Cities and Digital Democracies

Abstract
This seminar will present speakers who discuss the challenges and opportunities arising for our cities and societies with the digital revolution.

Objective
To collect credit points, students must actively contribute and give an individual, circa 20-minute presentation in the seminar on a subject agreed upon with the lecturer. After the presentation, it will be discussed and graded.

Content
This seminar will present speakers who discuss the challenges and opportunities arising for our cities and societies with the digital revolution. Besides discussing questions of automation using Big Data, AI and other digital technologies, we will also reflect on the question of how democracy could be digitally upgraded, and how citizen participation could contribute to innovation, sustainability, resilience, and quality of life. This includes questions around collective intelligence and digital platforms that support creativity, engagement, coordination and cooperation.

851-0467-00L  Law & Tech  W  3 credits  2S  A. Stremitzer, J. Merane

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 2651 of 2684
The course is designed for a wide range of ETH students as well as for law students who are keen to deepen their understanding of cutting-edge technology. It offers an overview of key legal areas important for technology regulation, complemented by guest lectures on emerging technological trends.

In previous years, the course has featured esteemed speakers from various sectors, including industry leaders like Google, NGOs such as Digital Society Switzerland and The European Consumer Organization, regulatory bodies like the Swiss Competition Commission, and noted academics.

The course is open to ETH students through the Science in Perspective program of the Department of Humanities, Social and Political Sciences.

The planned course outline is below.

- Overview of Law and Technology
- Fundamental Rights
- AI & Discrimination
- Landmark Big Tech Cases
- Regulation of Digital Platforms & Content Moderation
- Online Consumer Protection
- Law and Tech Scholarship Series

A number of recent regulations will be discussed, including the EU’s AI Act, the Digital Services Act (DSA), and the Digital Markets Act (DMA), as well as emerging internet phenomena, like ChatGPT.

You can find all course materials and the most recent announcements on Moodle. Please log in to Moodle using your ETH or UZH credentials. Then search for “Law & Tech (851-0732-06L, HS 2024)” and enroll.

This course introduces students to scientific and technological developments that require regulation or enable legal innovation. We focus particularly on the challenges to current law posed by prominent near-future technologies.

The course is especially recommended after the related lecture "851-0390-00L Human-Centered IT Security and Privacy" as some of the concepts introduced will practically be applied in this course. However, the relevant literature and necessary material will be provided to all students and basic concepts will be briefly summarized so that all interested students can participate.

The course makes students experience an exemplary human-centered design process. They will learn about and practically apply human-centered design and evaluation tools. Their research questions. This question will accompany the students throughout the semester. They will design and evaluate a concept for a human-centered solution. The students’ human-centered solution can take the form of a concept (e.g., a concept for a product or app), interface (e.g., a visual or tangible interface), or prototype (e.g., sketches, a click-dummy or a built prototype). The solution will then be subject to evaluations. The solutions will be user-tested by members of other teams that thereby take the perspective of a user themselves. In addition, the solutions will be analyzed from different stakeholders’ perspectives, such as developers or website owners.

Finally, the students will reflect on potential changes that results from the evaluations and their consequences.

The course is particularly suitable for all students who have already completed the course “Human-centered IT Security and Privacy” as some of the concepts introduced will practically be applied in this course. However, the relevant literature and necessary material will be provided to all students and basic concepts will be briefly summarized so that all interested students can participate.

Abstract
After an introduction on usable security as the intersection of computer science and psychology, students will form teams and work on exemplary security- or privacy-related research questions. The teams will develop and evaluate a concept for a human-centered solution. Through input sessions and milestone presentations the human perspective will be incorporated and reflected upon.

Objective
The course makes students experience an exemplary human-centered design process. They will learn about and practically apply human-centered design and evaluation methods that will allow them to view their solution from the human perspective, e.g., the user, developer or website owner perspective. By taking part in the evaluation of other teams, they will also take the user perspective themselves.

Content
At the beginning of the course, the students will receive an introduction to usable IT security and privacy and relevant concepts. Afterwards, a selection of current research questions from that area will be presented. The students form teams and select one of the proposed research questions. This question will accompany the students throughout the semester. They will design and evaluate a concept for a human-centered solution to that question. To be able to do so, they will receive input on human-centered design and evaluation tools. Their progress and the inclusion of the human perspective will be subject to feedback in milestone presentations.

Literature

This course is especially recommended after the related lecture "851-0390-00G Human-Centered IT Security and Privacy". However, previous participation in the lecture is not a requirement and not necessary for succeeding in the course.

851-0453-00L Artificial Intelligence and Human Values

W 3 credits 2G M. Boenig-Liptsin, K. Wodajo

Abstract 
This course introduces students to the ethical, political and legal debates and transformations in relation to Artificial Intelligence and provides students with concepts and methods from the constructivist and interpretive social sciences to work towards responsible and democratic human-technology futures.

Objective 
The main objectives of the course are to enable students to 1) identify the ways in which human values and developments of AI technologies are entangled, 2) articulate what is significant about contemporary transformations in AI and society, and 3) participate and shape the relationship between human values and AI as citizens and professionals.

Content 
The growing presence of AI tools for public use, for public administration, inside corporations and in scientific research raises many questions about the ethical, political, legal consequences of these technologies. This course is built around multiple sites of encounter among human values and AI, including bodies, persons, cities, labs, law, and environment. In each site, we inquire about what and whose values are being prioritized and with what consequences. The course also investigates existing best-practices around how to "align" human values with AI (e.g. human-centric design, alignment, reproducibility, transparency, explainability) and introduces students to regimes of ethics and governance of AI being proposed in jurisdictions around the world. Students learn to unpack the values and assumptions in existing techniques and frameworks for the design and governance of AI and to engage constructively with diverse stakeholders to shape the human-technology future towards aims that are reflexive, responsible, and democratic.

851-0392-00L Privacy Quantification and Usable Protection Mechanisms

W 3 credits 2S N. Zufferey, V. Zimmermann

Abstract 
Students will gain an overview of the main privacy metrics that are used to evaluate privacy risks related to the use of a given technology. The course will introduce the concepts of privacy/utility balance and usabe security. Practical exercises and reading of recently published scientific articles will be used to present practical cases of the theoretical tools presented in class.

Objective 
This course aims to provide the students with a global knowledge of the concepts related to privacy, and the methodology and tools to identify, analyze, and address threats while taking the user into account in the process. They will adopt a “privacy mindset”, thus enabling them to automatically take privacy into account, in a usable way, when designing or analyzing a system.

Content 
First, the course will introduce the different definitions and approaches of privacy (e.g., privacy by control, privacy by design) as well as the ethical concerns and considerations related to information security and privacy research (e.g., responsible disclosure, full disclosure).

Second, the students will be introduced to the different methods, properties, and metrics to assess and/or guarantee a certain level of privacy. They will be introduced to the properties and metrics related to anonymization (e.g., k-anonymity, l-diversity), data aggregation (e.g., randomized responses, ε-differential privacy), as well as other privacy assessment methodologies (e.g., inferential privacy).

Third, the course will address usability issues and the role of individuals (i.e., users) in privacy management (i.e., usable security and privacy) and the design of privacy-enhancing technologies. In this context, we will analyze the main concepts seen during the course and discuss their advantages and disadvantages in terms of usability, as well as their implementation for mass-market and large-scale technologies.

Across all three parts of the course, practical exercises, as well as recent research articles reading, and presentations will be used as a complement to support the concepts seen in class, as well as to provide concrete examples of methodologies related to the assessment of privacy in general.
Technik steht für Innovation und Katastrophen, sie dient als Wunschmaschine und ist mit unterschiedlichsten Nutzungsformen assoziiert. A. Stremitzer

Contract Design I
Particularly suitable for students D-BAUG, D-INFK, D-ITET, D-MATL, D-MAVT.

851-0549-00L WebClass Introductory Course History of Technology W 3 credits 2V R. Wichum

Abstract
Technology stands for innovation and catastrophes; it works as a dream machine and is associated with the most diverse ways of utilization. In WebClass Introductory Course History of Technology students become familiar with explanations for how technology works within complex economic, political and cultural contexts, by interpreting and researching texts and authoring a student manual. The course language is German, and even if many texts will be in English, the ability to read and understand German is mandatory.

Objective
Students are introduced into how technological innovations take place within complex economic, political and cultural contexts. They get to know basic theories and practices of the field by acquiring the skills to interpret texts, to compare arguments, to research additional sources and complementary material and to author a common essay. All of this will yield into a student manual on the four core topics: technology and innovation, technology and catastrophes, technology as a dream machine and technology and association. The course language is German, and even if many texts will be in English, the ability to read and understand German is mandatory.

851-0742-00L Contract Design I W 3 credits 2V A. Stremitzer, A. Tacconelli

Number Title Type ECTS Hours Lecturers

851-0742-00L Contract Design I W 3 credits 2V A. Stremitzer, A. Tacconelli

Abstract
Contract Design I is taught by Professor Stremitzer and aims to bridge the gap between economic contract theory, contract law, and the writing of real-world contracts. In this course, we take a systematic approach to contract design. This means we first analyze the economic environment in which a transaction takes place and then engineer contracts that achieve the desired outcome.
Objective

Contracts are agreements between parties to engage in transactions. A good contract creates value by giving parties the right incentives to meet their objectives. A good contract designer scrutinizes the economic situation in which parties find themselves and tailors the contract to the challenges at hand. To help you become sophisticated contract designers, we draw from insights for which more than half a dozen Nobel Prizes were awarded in the past two decades and transfer them to the art of writing real-world contracts. In other words, Contract Design will provide you with analytical tools to design contracts that help you be better lawyers, business leaders, and startup founders.

We will cover topics such as moral hazard, adverse selection, elicitation mechanisms, relationship-specific investments, and relational contracting and apply the theoretical insights to real-life case studies ranging from purchases & sales of assets, oil & gas exploration, movie financing, production & distribution, construction & development, M&A deals, venture capital financing, to executive compensation and many other types of transactions.

The course follows a flipped-classroom model; You will watch learning videos specifically produced for this course ahead of class. We will use class time to discuss real-world case studies. The videos will be made available before the lecture each week and need to be watched ahead of coming to class. Computer-graded quizzes at the beginning of each class will test students’ understanding of the concepts introduced in the videos.

As the emphasis of this class is on class discussion, attendance is mandatory. Absent important reasons, you cannot miss class more than twice.

The lectures will be recorded but only made available to those who miss lectures with excused absence.

For ETH students: Your grade will consist of two parts:
1) You will take weekly computer-based quizzes during class time. Thus, it is important that you attend the lectures to be able to finish the quizzes and pass this course.
2) You compose short responses to take-home questions on case studies we assign and upload them ahead of class (Pass/Fail).

Note that UZH and UNISG students enrolling in this course need to earn more ECTS for completing this course than ETH students (due to curricula reasons). This is why UZH and UNISG students must complete a written assignment in addition to the weekly quizzes and take-home questions. UZH students also have to complete an additional group project.

UZH and UNISG students should check out the description of the class at their respective home institutions.

Lecture notes

Handouts, prerecorded videos, slides, case studies, and other materials available on a dedicated webpage: contractdesign.org. Access to this webpage is free of charge for ETH students as ETH purchased a license for ETH students.

Prerequisites / notice

Attendance is mandatory. You are only allowed to miss two lectures unless there are special circumstances.

Contract Design I is available to ETH students through the Science in Perspective (SiP) Program of D-GESS. This course is particularly suitable for students of D-ARCH, D-BAUG, D-CHAB, DMATH, D-MTEC, D-INFK, and D-MAVT.

If you have any questions regarding the course, please write an email to the teaching assistants, Lucas Gericke (lucas.gericke@gess.ethz.ch) or Serge von Steiger (serge.vonsteiger@gess.ethz.ch).

851-0252-15L Network Analysis

Particularly suitable for students of D-INFK, D-MATH.

Abstract

Network science is a distinct domain of data science that is characterized by a specific kind of data being studied. While areas of application range from archaeology to zoology, we concern ourselves with social networks for the most part. Emphasis is placed on descriptive and analytic approaches rather than theorizing, modeling, or data collection.

Objective

Students will be able to identify and categorize research problems that call for network approaches while appreciating differences across application domains and contexts. They will master a suite of mathematical and computational tools, and know how to design or adapt suitable methods for analysis. In particular, they will be able to evaluate such methods in terms of appropriateness and efficiency.

Content

The following topics will be covered with an emphasis on structural and computational approaches and frequent reference to their suitability with respect to substantive theory:

- Empirical Research and Network Data
- Macro and Micro Structure
- Centrality
- Roles
- Cohesion
- Influence

Lecture notes

Slides and lecture notes are distributed via the associated course moodle.

Literature

The lecture is an introduction to global cybersecurity politics. The focus is on the strategic use of cyberspace by state and non-state actors. Participants will gain an in-depth overview of the many ways in which technology is becoming part of security policies and practices, in both civilian and military contexts. The lecture provides an introduction to the role of security and military technologies in the formulation and implementation of national and international security policies. The focus is on challenges posed by new and developing technologies, the transformation of military capabilities, and the question of regulation.

The lecture is being supported by a website on Moodle. If you have any questions, please contact Fabio Schmocker (fabio.schmocker@ispo.gess.ethz.ch).

**Literature**

A script with background information and comments on the literature will be made available at the beginning of the semester.

**Prerequisites / notice**

Some programming experience in Python, Stata, or R is required. Some experience with data science or statistics is required. Students must have some data science and/or statistics experience. Some programming experience in Python, Stata, or R is required. Some experience with data science or statistics is required.
Understanding in Science and Mathematics: A Social Network Science is a distinct domain of data science that focuses on relational systems. Various models have been proposed to

Slides and lecture notes are distributed via the associated course moodle.

Understanding is a central goal of science and mathematics: scientists seek to understand various phenomena in the natural world, while mathematicians aim to increase our understanding of the mathematical world. But what exactly is the nature of understanding in science and mathematics? This issue has been largely neglected in twentieth century philosophy of science, philosophy of mathematics, and epistemology. Yet, in the past twenty years, there has been a regain of philosophical interest into the notion of understanding, leading to a flourishing literature. The aim of this seminar is to gain an in-depth understanding of these recent philosophical developments.

To this end, we will read a number of key philosophical contributions on understanding in philosophy of science, philosophy of mathematics, and epistemology. Along the way, we will address general issues on understanding such as: What is the relation between understanding and knowledge? Does understanding necessarily require explanation? How can understanding be transmitted? What exactly is the value of understanding? We will also look into specific case studies of scientific and mathematical understanding.

Each session will be decomposed into three blocks. In blocks 1 and 2, we will have a short presentation (~15 minutes) of a contribution in the philosophy of understanding followed by a discussion. Block 3 will be methodological and will be concerned with how to give good oral presentations, an essential skill in academia. We will use this block to debrief on the presentations of the day and see how they could be improved. We will also discuss resources on best practices in oral communication.

Network Modeling

particularly suitable for students of D-MATH, D-INFK and in the MSc Data Science

Students are required to have basic knowledge in inferential statistics, such as regression models.

Social Network Science is a distinct domain of data science that focuses on relational systems. Various models have been proposed to describe structures and dynamics of networks, including statistical and mathematical methods. In this course, the emphasis is placed on the statistical analysis of (social) systems and their connection to social theories and data sources.

The following topics will be covered:

- Introduction to network models and their applications
- Stylized models:
  * uniform random graph models
  * small world models
  * preferential attachment models
- Models for testing hypotheses while controlling for the network structure:
  * Quadratic assignment procedure regression (QAP regression)
- Models for testing hypotheses on the network structure:
  * Models for one single observation of a network: exponential random graph models (ERGMs)
  * Models for panel network data: stochastic actor-oriented models (SAOMs)

The application of these models is illustrated through examples and practical sessions involving the analysis of network data using the software R.

The following topics will be covered:

- Introduction to network models and their applications
- Stylized models:
  * uniform random graph models
  * small world models
  * preferential attachment models
- Models for testing hypotheses while controlling for the network structure:
  * Quadratic assignment procedure regression (QAP regression)
- Models for testing hypotheses on the network structure:
  * Models for one single observation of a network: exponential random graph models (ERGMs)
  * Models for panel network data: stochastic actor-oriented models (SAOMs)
  * Models for relational event data: dynamic network actor models (DyNAMs)

The application of these models is illustrated through examples and practical sessions involving the analysis of network data using the software R.

- Stylized models:
  * Models for one single observation of a network: exponential random graph models (ERGMs)
  * Models for panel network data: stochastic actor-oriented models (SAOMs)
  * Models for relational event data: dynamic network actor models (DyNAMs)

The application of these models is illustrated through examples and practical sessions involving the analysis of network data using the software R.

Students are required to have basic knowledge in inferential statistics and should be familiar with linear and logistic regression models.

Abstract
This class introduces students into basic features of the legal system. Fundamental issues of constitutional law, administrative law, private law and the law of the EU are covered. The focus is on legal problems related to space. Active participation is expected in short interactive sequences.

Objective
Students are able to identify basic structures of the legal system. They understand selected topics of public and private law. They are able to apply the fundamentals in more advanced law classes and to recognize the relevance of law in their own field.

Content
Basic concepts of law, sources of law.
Private law: Contract law (particularly contract for work and services), tort law, property law.
Public law: Human rights, administrative law, procurement law, procedural law.
Insights into the law of the EU.

851-0763-00L WebClass Introductory Course History of Technology

Abstract
This is a supervised student project for 3 ECTS, supervised by the professorship of Elliott Ash (D-GESS). Students will adapt tools from economics and machine learning to questions in law, data science, and social science.

Objective
Participants will gain an in-depth overview of the many ways in which technology is becoming part of security policies and practices, in both civilian and military contexts.

Content
The lecture provides an introduction to the role of security and military technologies in the formulation and implementation of national and international security policies. The focus is on challenges posed by new and developing technologies, the transformation of military capabilities, and the question of regulation.

851-0549-00L WebClass Introductory Course History of Technology

Abstract
Technology stands for innovation and catastrophes; it works as a dream machine and is associated with the most diverse ways of utilization. In WebClass Introductory Course History of Technology students become familiar with explanations for how technology works within complex economic, political and cultural contexts, by interpreting and researching texts and authoring a student manual.

Objective
Students are introduced into how technological innovations take place within complex economic, political and cultural contexts. They get to know basic theories and practices of the field by acquiring the skills to interpret texts, to compare arguments, to research additional sources and complementary material and to author a common essay. All of this will yield into a student manual on the four core topics: technology and innovation, technology and catastrophes, technology as a dream machine and technology and association. The course language is German, and even if many texts will be in English, the ability to read and understand German is mandatory.

Content

Lecture notes

Data: 06.08.2024 12:40 Autumn Semester 2024 Page 2659 of 2684
In this seminar, students will study cognitive processes, behaviour and the underlying biological response to financial decisions. Research methods such as asset market experiments, lottery games, risk preference assessment, psychometrics, neuroimaging and psychophysiology of decision processes will be discussed. Financial bubbles and crashes will be the core interest.

This course has four main goals:
1) To learn about the most important topics within Behavioural Finance
2) To learn to effectively select, review and present information using modern telecommunication tools
3) To practice working on group projects in hybrid working conditions (online + in-person)
4) To solve an applied behavioral finance business case stemming from an industry partner

The course does not contain mandatory reading. Instead, it offers suggested literature that provides guidance to the students who, prepare a presentation on core topics in behavioral finance. The point of this exercise is to critically select the most relevant information on a given topic and present to non-expert educated colleagues. At the same time, the audience learns about the key topics in behavioral finance.

Every session involves a discussion moderated and supported by the lecturers.

Throughout the semester, students work on solutions to real business cases stemming from a company partner. They can receive feedback and guidance from project leaders of the industry partner and from the academic supervisors. In the final meeting of the semester, students pitch solutions to their business cases.

The course takes place entirely online. The objective is to prepare the students for the future work in online and hybrid arrangements.

Students from all domains of ETH and all levels of education are welcome in the course.

This course examines the behaviour of macroeconomic variables, such as gross domestic product, unemployment and inflation rates. It tries to answer questions like: How can we explain fluctuations of national economic activity? What can economic policy do against unemployment and inflation?

This lecture will introduce the fundamentals of macroeconomic theory and explain their relevance to every-day economic problems.

This course helps you understand the world in which you live. There are many questions about the macroeconomy that might spark your curiosity. Why are living standards so meagre in many African countries? Why do some countries have high rates of inflation while others have stable prices? Why have some European countries adopted a common currency? These are just a few of the questions that this course will help you answer.

Furthermore, this course will give you a better understanding of the potential and limits of economic policy. As a voter, you help choose the policies that guide the allocation of society's resources. When deciding which policies to support, you may find yourself asking various questions about economics. What are the burdens associated with alternative forms of taxation? What are the effects of free trade with other countries? How does the government budget deficit affect the economy? These and similar questions are always on the minds of policy makers.

Besides this textbook, the slides, lecture notes and problem sets will cover the content of the lecture and the exam questions.

This book can also be used for the course '363-0503-00L Principles of Microeconomics' (Filippini).

Besides this textbook, the slides, lecture notes and problem sets will cover the content of the lecture and the exam questions.

This course is only for students enrolled in a Bachelor's
degree programme.

Students enrolled in a Master's degree programme may attend "Principles of Microeconomics" (LE 363-0503-00L) instead.

Note for D-MAVT students: If you have already successfully completed "Principles of Microeconomics" (LE 363-0503-00L), then you will not be permitted to attend it again.

Abstract

The course introduces basic principles, problems and approaches of microeconomics. It describes economic decisions of households and firms, and their coordination through perfectly competitive markets.

Objective

Students acquire a deeper understanding of basic microeconomic models.

They acquire the ability to apply these models in the interpretation of real world economic contexts.

Students acquire a reflective and contextual knowledge on how societies use scarce resources to produce goods and services and distribute them among themselves.

Content

Market, budget constraint, preferences, utility function, utility maximisation, demand, technology, profit function, cost minimisation, cost functions, perfect competition, information and communication technologies

Lecture notes

Course material in e-learning environment https://moodle-app2.let.ethz.ch/auth/shibboleth/login.php

Literature

Prerequisites / notice

This course "Einführung in die Mikroökonomie" (363-1109-00L) is intended for Bachelor students and LE 363-0503-00 "Principles of Microeconomics" for Master students.

Contract Design I

You can find all course materials and the most recent announcements on Moodle. Please log in to Moodle using your ETH or UZH credentials. Then search for "Contract Design I (851-0742-00L; Fall 2023)" and enroll. The password is "ContractDesign01".

It is NOT a legal drafting class focused on contractual language.

Number of participants limited to 160.
Max 80 ETHZ and 80 UZH Students

Abstract

Contract Design I is taught by Professor Stremitzer and aims to bridge the gap between economic contract theory, contract law, and the writing of real-world contracts. In this course, we take a systematic approach to contract design. This means we first analyze the economic environment in which a transaction takes place and then engineer contracts that achieve the desired outcome.
Objective

Contracts are agreements between parties to engage in transactions. A good contract creates value by giving parties the right incentives to meet their objectives. A good contract design scrutinizes the economic situation in which parties find themselves and tailors the contract to the challenges at hand. To help you become sophisticated contract designers, we draw from insights for which more than half a dozen Nobel Prizes were awarded in the past two decades and transfer them to the art of writing real-world contracts. In other words, Contract Design will provide you with analytical tools to design contracts that help you be better lawyers, business leaders, and startup founders.

We will cover topics such as moral hazard, adverse selection, elicitation mechanisms, relationship-specific investments, and relational contracting and apply the theoretical insights to real-life case studies ranging from purchases & sales of assets, oil & gas exploration, movie financing, production & distribution, construction & development, M&A deals, venture capital financing, to executive compensation and many other types of transactions.

The course follows a flipped-classroom model: You will watch learning videos specifically produced for this course ahead of class. We will use class time to discuss real-world case studies. The videos will be made available before the lectures each week and need to be watched ahead of coming to class. Computer-graded quizzes at the beginning of each class will test students’ understanding of the concepts introduced in the videos.

As the emphasis of this class is on class discussion, attendance is mandatory. Absent important reasons, you cannot miss class more than twice.

The lectures will be recorded but only made available to those who miss lectures with excused absence.

For ETH students: Your grade will consist of two parts:
1) You will take weekly computer-based quizzes during class time. Thus, it is important that you attend the lectures to be able to finish the quizzes and pass this course.
2) You compose short responses to take-home questions on case studies we assign and upload them ahead of class (Pass/Fail).

Note that UZH and UNISG students enrolling in this course need to earn more ECTS for completing this course than ETH students (due to curricula reasons). This is why UZH and UNISG students must complete a written assignment in addition to the weekly quizzes and take-home questions. UZH students also have to complete an additional group project. UZH and UNISG students should check out the description of the class at their respective home institutions.

851-0760-00L Building a Robot Judge: Data Science for Decision-Making

851-0732-06L Law & Tech
The planned course outline is below.

- Overview of Law and Technology
- Fundamental Rights
- AI & Discrimination
- Landmark Big Tech Cases
- Regulation of Digital Platforms & Content Moderation
- Online Consumer Protection
- Law and Tech Scholarship Series

A number of recent regulations will be discussed, including the EU’s AI Act, the Digital Services Act (DSA), and the Digital Markets Act (DMA), as well as emerging internet phenomena, like ChatGPT.

**Prerequisites**
You can find all course materials and the most recent announcements on Moodle. Please log in to Moodle using your ETH or UZH credentials. Then search for "Law & Tech (851-0732-00L, HS 2024)" and enroll.

**Literature**

**851-0391-00L Focus on the Human: Human-Centered Security and Privacy Lab**
The course is particularly suitable for all students who have already completed the course “Human-centered IT Security and Privacy” as some of the concepts introduced will practically be applied in this course. However, the relevant literature and necessary material will be provided to all students and basic concepts will be briefly summarized so that all interested students can participate.

**Abstract**
After an introduction on usable security as the intersection of computer science and psychology, students will form teams and work on exemplary security- or privacy-related research questions. The teams will develop and evaluate a concept for a human-centered solution. Through input sessions and milestone presentations the human perspective will be incorporated and reflected upon.

**Objective**
The course makes students experience an exemplary human-centered design process. They will learn about and practically apply human-centered design and evaluation methods that will allow them to view their solution from the human perspective, e.g., the user, developer or website owner perspective. By taking part in the evaluation of other teams, they will also take the user perspective themselves.

**Content**
At the beginning of the course, the students will receive an introduction to usable IT security and privacy and relevant concepts. Afterwards, a selection of current research questions from that area will be presented. The students form teams and select one of the proposed research questions. This question will accompany the students throughout the semester. They will design and evaluate a concept for a human-centered design solution to that question. To be able to do so, they will receive input on human-centered design and evaluation tools. Their progress and the inclusion of the human perspective will be subject to feedback in milestone presentations. The students’ human-centered solution can take the form of a concept (e.g., a concept for a product or app), interface (e.g., a visual or tangible interface), or prototype (e.g., sketches, a click-dummy or a built prototype). The solution will then be subject to evaluations. The solutions will be user-tested by members of other teams that thereby take the perspective of a user themselves. In addition, the solutions will be analyzed from different stakeholders’ perspectives, such as developers or website owners. Finally, the students will reflect on potential changes that result from the evaluations and their consequences.

**Literature**

**851-0763-00L Supervised Research (Law, Economics, and Data Science)**
*Does not take place this semester.*
This course aims to provide the students with a global knowledge of the concepts related to privacy, and the methodology and tools to assessed Apply tools from data science and social science to a new project, potentially in a group, to develop a paper or app. Some programming experience in Python, Stata, or R is required. Some experience with data science or statistics is required.

Students will gain an overview of the main privacy metrics that are used to evaluate privacy risks related to the use of a given technology. They will also be introduced to the concepts of privacy/utility balance and usable security. Practical exercises and reading of recently published scientific articles will be used to present practical cases of the theoretical tools presented in class.

Second, the students will be introduced to the different methods, properties, and metrics to assess and/or guarantee a certain level of privacy. They will be introduced to the properties and metrics related to anonymization (e.g., k-anonymity, l-diversity), data aggregation (e.g., randomized responses, \( \varepsilon \)-differential privacy), as well as other privacy assessment methodologies (e.g., inferential privacy).

Third, the course will address usability issues and the role of individuals (i.e., users) in privacy management (i.e., usable security and privacy) and the design of privacy-enhancing technologies. In this context, we will analyze the main concepts seen during the course and discuss their advantages and disadvantages in terms of usability, as well as their implementation for mass-market and large-scale technologies.

Across all three parts of the course, practical exercises, as well as recent research articles reading, and presentations will be used as a complement to support the concepts seen in class, as well as to provide concrete examples of methodologies related to the assessment of privacy in general.

<table>
<thead>
<tr>
<th>851-0392-00L Privacy Quantification and Usable Protection</th>
<th>W 3 credits</th>
<th>2S N. Zufferey, V. Zimmermann</th>
</tr>
</thead>
</table>

Abstract

Students will gain an overview of the main privacy metrics that are used to evaluate privacy risks related to the use of a given technology. They will also be introduced to the concepts of privacy/utility balance and usable security. Practical exercises and reading of recently published scientific articles will be used to present practical cases of the theoretical tools presented in class.

Objective

This course aims to provide the students with a global knowledge of the concepts related to privacy, and the methodology and tools to identify, analyze, and address threats while taking the user into account in the process. They will adopt a “privacy mindset”, thus enabling them to automatically take privacy into account, in a usable way, when designing or analyzing a system.

Content

First, the course will introduce the different definitions and approaches of privacy (e.g., privacy by control, privacy by design) as well as the ethical concerns and considerations related to information security and privacy research (e.g., responsible disclosure, full disclosure).

Second, the students will be introduced to the different methods, properties, and metrics to assess and/or guarantee a certain level of privacy. They will be introduced to the properties and metrics related to anonymization (e.g., k-anonymity, l-diversity), data aggregation (e.g., randomized responses, \( \varepsilon \)-differential privacy), as well as other privacy assessment methodologies (e.g., inferential privacy).

Third, the course will address usability issues and the role of individuals (i.e., users) in privacy management (i.e., usable security and privacy) and the design of privacy-enhancing technologies. In this context, we will analyze the main concepts seen during the course and discuss their advantages and disadvantages in terms of usability, as well as their implementation for mass-market and large-scale technologies.

Across all three parts of the course, practical exercises, as well as recent research articles reading, and presentations will be used as a complement to support the concepts seen in class, as well as to provide concrete examples of methodologies related to the assessment of privacy in general.

Course: Contract Design I

You can find all course materials and the most recent announcements on Moodle. Please log in to Moodle using your ETH or UZH credentials. Then search for “Contract Design I (851-0742-00L: Fall 2023)” and enroll. The password is “ContractDesign01”.

It is NOT a legal drafting class focused on contractual language.

Number of participants limited to 160.
Max 80 ETHZ and 80 UZH Students

Abstract

Contract Design I is taught by Professor Stremitzer and aims to bridge the gap between economic contract theory, contract law, and the writing of real-world contracts. In this course, we take a systematic approach to contract design. This means we first analyze the economic environment in which a transaction takes place and then engineer contracts that achieve the desired outcome.
Contracts are agreements between parties to engage in transactions. A good contract creates value by giving parties the right incentives to meet their objectives. A good contract designer scrutinizes the economic situation in which parties find themselves and tailors the contract to the challenges at hand. To help you become sophisticated contract designers, we draw from insights for which more than half a dozen Nobel Prizes were awarded in the past two decades and transfer them to the art of writing real-world contracts. In other words, Contract Design will provide you with analytical tools to design contracts that help you be better lawyers, business leaders, and startup founders.

We will cover topics such as moral hazard, adverse selection, elicitation mechanisms, relationship-specific investments, and relational contracting and apply the theoretical insights to real-life case studies ranging from purchases & sales of assets, oil & gas exploration, movie financing, production & distribution, construction & development, M&A deals, venture capital financing, to executive compensation and many other types of transactions.

The course follows a flipped-classroom model: You will watch learning videos specifically produced for this course ahead of class. We will use class time to discuss real-world case studies. The videos will be made available before the lecture each week and need to be watched ahead of coming to class. Computer-graded quizzes at the beginning of each class will test students' understanding of the concepts introduced in the videos.

As the emphasis of this class is on class discussion, attendance is mandatory. Absent important reasons, you cannot miss class more than twice.

The lectures will be recorded but only made available to those who miss lectures with excused absence.

For ETH students: Your grade will consist of two parts:
1) You will take weekly computer-based quizzes during class time. Thus, it is important that you attend the lectures to be able to finish the quizzes and pass this course.
2) You compose short responses to take-home questions on case studies we assign and upload them ahead of class (Pass/Fail).

Note that UZH and UNISG students enrolling in this course need to earn more ECTS for completing this course than ETH students (due to curricula reasons). This is why UZH and UNISG students must complete a written assignment in addition to the weekly quizzes and take-home questions. UZH students also have to complete an additional group project. UZH and UNISG students should check out the description of the class at their respective home institutions.

Handouts, prerecorded videos, slides, case studies, and other materials available on a dedicated webpage: contractdesign.org. Access to this webpage is free of charge for ETH students as ETH purchased a license for ETH students.

Lecture notes
Handouts, prerecorded videos, slides, case studies, and other materials available on a dedicated webpage: contractdesign.org. Access to this webpage is free of charge for ETH students as ETH purchased a license for ETH students.

Prerequisites / notice
Attendance is mandatory. You are only allowed to miss two lectures unless there are special circumstances.

Contract Design I is available to ETH students through the Science in Perspective (SiP) Program of D-GESS. This course is particularly suitable for students of D-ARCH, D-BAUG, D-CHAB, D-MATH, D-MTEC, D-INFK, and D-MAVT.

If you have any questions regarding the course, please write an email to the teaching assistants, Lucas Gericke (lucas.gericke@gess.ethz.ch) or Serge von Steiger (serge.vonsteiger@gess.ethz.ch).

Abstract
The students shall obtain a basic knowledge about the legal environment of entrepreneurs. They shall be able to recognize and evaluate legal issues connected to an entrepreneurial activity and suggest possible solutions.

Objective
The students shall obtain the following competence:
- They shall obtain a working knowledge on the legal aspects involved in setting up and managing an enterprise.
- They shall be able to contribute to the legal management of the company and to discuss legal issues.
- They shall have an understanding of the law as a part of the corporate strategy and as a valuable resource of the company.

Lecture notes
A comprehensive script will be made available online on the moodle platform.

Introduction to Law
851-0703-00L

Abstract
This class introduces students into basic features of the legal system. Fundamental issues of constitutional law, administrative law, private law and the law of the EU are covered. The focus is on legal problems related to space. Active participation is expected in short interactive sequences.

Objective
Students are able to identify basic structures of the legal system. They understand selected topics of public and private law. They are able to apply the fundamentals in more advanced law classes and to recognize the relevance of law in their own field.

Content
Basic concepts of law, sources of law. Private law: Contract law (particularly contract for work and services), tort law, property law. Public law: Human rights, administrative law, procurement law, procedural law. Insights into the law of the EU.

Literature
Jaap Hage, Bram Akkermans (Eds.), Introduction to Law, Cham 2017 (Online Resource ETH Library)

Further documents will be available online (https://moodle-app2.let.ethz.ch/course/view.php?id=22904).

World Politics Since 1945: The History of International Relations (Without Exercises)
853-0047-01L

Abstract
This lecture series provides students with an overview of the development of international relations since the end of World War II. The first part of the series deals with the development of and changes in Cold War security policy structures. The second part deals with the period after the transformation of 1989/91; the focus here is on current issues in international security policy.

Objective
By the end of the semester, participants should have a solid knowledge of the history and theoretical foundations of International Relations since the end of the Second World War.

Content
- The lecture is being supported by a website on Moodle. If you have any questions, please contact Fabio Schmocker (fabio.schmocker@sipo.gess.ethz.ch)

History Part One: Europe (The Cradle of Modernity, Britain, 1789-1914)
853-0725-00L

Abstract
A range of fundamental processes have transformed European societies in the course of the 19th and the 20th centuries. This lecture serieslooks a several key aspects of these modernization processes and ask about their continuing relevance for our times. The regional focus lies on the Britain, where these processes took place for the first time.

Objective
At the end of this lecture course, students can: (a) highlight the most important changes in the "long nineteenth century" in Britain (b) explain their long-term effects (also for other European countries) and (c) relate these changes to global developments today.

Content
The thematic foci include: Industrialization, urban growth, democratisation and mass politics, shifting gender roles and ideals, and the emergence of consumerism and leisure culture.

Literature
Power Point Slides and references will be made available in digital form during the course of the semester.

This lecture series does not build upon specific previous knowledge by the students.

Environmental Ethics (University of Zurich)
701-0703-00L

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: 07SMEEE266

Please register at:
We start with an overview of cybersecurity issues from 1980 to today and look at events and actors responsible for turning cybersecurity into a critical concern.

On completion of this lecture, you have acquired the ability to identify, analyze, critically reflect and resolve ethical challenges in general and specifically regarding the environment. You know basic concepts, positions and lines of argumentation from the debate about environmental ethics, which you have applied and discussed in smaller exercises.

**Introduction to Cybersecurity Politics**

**Objective**

Participants learn to assess the advantages and disadvantages of cyberspace as a domain for strategic military operations. They understand the technical basics of cyber operations and know how technology and politics are interlinked in this area. They understand the security challenges for and the motivations of states to be active in cyberspace offensively and defensively and they are familiar with the consequences for international politics.

**Content**

We start with an overview of cybersecurity issues from 1980 to today and look at events and actors responsible for turning cybersecurity matters into a security policy issue with top priority. After familiarizing ourselves with the technical basics, we look at different forms of cyberviolence and trends in cyber conflicts (technique in social and political practice). Then, we turn to countermeasures: we compare national cybersecurity strategies, examine international norms building, and scrutinize concepts such as cyber-power and cyber-deterrence (technique in social and political regulatory contexts).

**Literature**

A script with background information and comments on the literature will be made available at the beginning of the semester.

**Competencies**

- **Subject-specific Competencies**
  - Concepts and Theories
  - Analytical Competencies
  - Decision-making
  - Media and Digital Technologies
  - Problem-solving

- **Method-specific Competencies**
  - Communication

**851-0391-00L Focus on the Human: Human-Centered Security and Privacy Lab**

*The course is particularly suitable for all students who have already completed the course "Human-centered IT Security and Privacy" as some of the concepts introduced will practically be applied in this course. However, the relevant literature and necessary material will be provided to all students and basic concepts will be briefly summarized so that all interested students can participate.*
After an introduction on usable security as the intersection of computer science and psychology, students will form teams and work on exemplary security- or privacy-related research questions. The teams will develop and evaluate a concept for a human-centered solution. Through input sessions and milestone presentations the human perspective will be incorporated and reflected upon.

The course makes students experience an exemplary human-centered design process. They will learn about and practically apply human-centered design and evaluation methods that will allow them to view their solution from the human perspective, e.g., the user, developer or website owner perspective. By taking part in the evaluation of other teams, they will also take the user perspective themselves.

At the beginning of the course, the students will receive an introduction to usable IT security and privacy and relevant concepts. Afterwards, a selection of current research questions from that area will be presented. The students form teams and select one of the proposed research questions. This question will accompany the students throughout the semester. They will design and evaluate a concept for a human-centered solution to that question. To be able to do so, they will receive input on human-centered design and evaluation tools. Their progress and the inclusion of the human perspective will be subject to feedback in milestone presentations.

The students' human-centered solution can take the form of a concept (e.g., a concept for a product or app), interface (e.g., a visual or tangible interface), or prototype (e.g., sketches, a click-dummy or a built prototype). The solution will then be subject to evaluations. The solutions will be user-tested by members of other teams that thereby take the perspective of a user themselves. In addition, the solutions will be analyzed from different stakeholders' perspectives, such as developers or website owners.

Finally, the students will reflect on potential changes that results from the evaluations and their consequences.

Literature Recommendations:

However, previous participation in the lecture is not a requirement and not necessary for succeeding in the course.

Prerequisites / notice

This course is especially recommended after the related lecture *851-0390-00 G Human-Centered IT Security and Privacy*. However, previous participation in the lecture is not a requirement and not necessary for succeeding in the course.

Supervised Research (Law, Economics, and Data Science) Does not take place this semester.

This is a supervised student project for 3 ECTS, supervised by the professorship of Elliott Ash (D-GESS). Students will adapt tools from econometrics and machine learning to questions in law, data science, and social science.

Students must have some data science and/or statistics experience. Some programming experience in Python, Stata, or R is required. Apply tools from data science and social science to a new project, potentially in a group, to develop a paper or app. Some programming experience in Python, Stata, or R is required. Some experience with data science or statistics is required.
This course aims to provide the students with a global knowledge of the concepts related to privacy, and the methodology and tools to identify, analyze, and address threats while taking the user into account in the process. They will adopt a “privacy mindset”, thus enabling them to automatically take privacy into account, in a usable way, when designing or analyzing a system.

First, the course will introduce the different definitions and approaches of privacy (e.g., privacy by control, privacy by design) as well as the ethical concerns and considerations related to information security and privacy research (e.g., responsible disclosure, full disclosure).

Second, the students will be introduced to the different methods, properties, and metrics to assess and/or guarantee a certain level of privacy. They will be introduced to the properties and metrics related to anonymization (e.g., k-anonymity, l-diversity), data aggregation (e.g., randomized responses, ε-differential privacy), as well as other privacy assessment methodologies (e.g., inferential privacy).

Third, the course will address usability issues and the role of individuals (i.e., users) in privacy management (i.e., usable security and privacy) and the design of privacy-enhancing technologies. In this context, we will analyze the main concepts seen during the course and discuss their advantages and disadvantages in terms of usability, as well as their implementation for mass-market and large-scale technologies.

Across all three parts of the course, practical exercises, as well as recent research articles reading, and presentations will be used as a complement to support the concepts seen in class, as well as to provide concrete examples of methodologies related to the assessment of privacy in general.

Course Information

**Course Code:** 851-0549-00L
**Course Title:** WebClass Introductory Course History of Technology
**Credits:** 3 credits
**ECTS:** 2V

**Objective**

Students are introduced into how technological innovations take place within complex economic, political and cultural contexts. They get to know basic theories and practices of the field by acquiring the skills to interpret texts, to compare arguments, to research additional sources and complementary material and to author a common essay. All of this will yield into a student manual on the four core topics: technology and innovation, technology and catastrophes, technology as a dream machine and technology and association. The course language is German, and even if many texts will be in English, the ability to read and understand German is mandatory.

**Content**

Technology stands for innovation and catastrophes; it works as a dream machine and is associated with the most diverse ways of utilization. In WebClass Introductory Course History of Technology students become familiar with explanations for how technology works within complex economic, political and cultural contexts, by interpreting and researching texts and authoring a student manual.

**Prerequisites:** Basic programming skills, elementary probability and statistics.

**Lecture notes**

**D-PHYS**

**Course Code:** 851-0101-86L
**Course Title:** Complex Social Systems: Modeling Agents, Learning, and Games
**Credits:** 3 credits

**Prerequisites:** Basic programming skills, elementary probability and statistics.

**Abstract**

This course introduces mathematical and computational models to study techno-socioeconomic systems and the process of scientific research. Students develop a significant project to tackle techno-socio-economic challenges in application domains of complex systems. They are expected to implement a model and to communicate their results through a project report and a short oral presentation.

**Objective**

See your own field of study in a wider context (“Science in Perspective”), e.g. see the psychological, social, economic, environmental, historical, ethical or philosophical connections and implications. Learn to think critically and out of the box. Question what you believe you know for sure. Get to know surprising, counterintuitive properties of complex (non-linearly interacting, networked, multi-component) systems. Learn about collaboration.
Content

By the end of the course, the students should be able to better understand the literature on complex social systems, develop their own models for studying specific phenomena and report results according to the standards of the relevant scientific literature by presenting their results both numerically and graphically.

At the end of the course, the students will deliver a report, computer code and a short oral presentation. To collect credit points, students will have to actively contribute and give a circa 30 minutes presentation in the course on a subject agreed with the lecturers, after which the presentation will be discussed. The presentation will be graded.

Students are expected to implement themselves models of techno-socio-economic processes and systems, particularly agent-based models, complex networks models, decision making, group dynamics, human crowds, or game-theoretical models. Credit points are finally earned for the implementation of a mathematical or empirical model from the complexity science literature, its presentation, and documentation by a project report.

Lecture notes

The lecture slides will be presented on the course Moodle after each lecture.

Prerequisites / notice

The number of participants is limited to the size of the available computer teaching room. The source code related to the seminar thesis should be well enough documented.

Good programming skills and a good understanding of probability & statistics and calculus are expected.

Students need to present a new subject, for which they have not earned any credit points before.

Good scientific practices, in particular citation and quotation rules, must be properly complied with.

Chatham House rules apply to this course. Materials may not be shared without previous written permission.

851-0763-00L Supervised Research (Law, Economics, and Data Science)

Does not take place this semester.

Abstract

This is a supervised student project for 3 ECTS, supervised by the professorship of Elliott Ash (D-GESS). Students will adapt tools from econometrics and machine learning to questions in law, data science, and social science.

Objective

Apply tools from data science and social science to a new project, potentially in a group, to develop a paper or app.

Prerequisites / notice

Some programming experience in Python, Stata, or R is required. Some experience with data science or statistics is required.

851-0125-65L A Sampler of Histories and Philosophies of Mathematics

Particularly suitable for students D-CHAB, D-INFK, D-ITET, D-MATH, D-PHYS

Abstract

This course will review several case studies from the ancient, medieval and modern history of mathematics. The case studies will be analyzed from various philosophical perspectives, while situating them in their historical and cultural contexts.
Objective
The course aims are:
1. To introduce students to the historicity of mathematics
2. To make sense of mathematical practices that appear unreasonable from a contemporary point of view
3. To develop critical reflection concerning the nature of mathematical objects
4. To introduce various theoretical approaches to the philosophy and history of mathematics
5. To open the students' horizons to the plurality of mathematical cultures and practices

Abstract
This course deals with how and why international problem-solving efforts (cooperation) in environmental politics emerge and evolve, and under what circumstances such efforts are effective. Based on concepts, theories, and methods of political economy, political science, and public policy, various examples of international environmental policy-making are examined.

Objective
The objectives in this course are to (1) gain an overview of important questions in international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions in this policy area and how to address them in a conceptually and methodologically meaningful and insightful way; (3) gain an overview of important global and regional environmental problems and how they are or could be solved.

Content
This course deals with how and why international problem-solving efforts (cooperation) in environmental politics emerge and evolve, and under what circumstances such efforts are effective. Based on concepts, theories, and methods of political economy, political science, and public policy, various examples of international environmental policy-making are examined, for example international efforts to reduce air pollution, manage international water resources, mitigate and adapt to global warming, protect the stratospheric ozone layer, address biodiversity challenges, deal with plastic waste, and prevent pollution of the oceans.
Critical Thinking

Real estate property law (esp. content, acquisition, restrictions under private and public law, transmission and loss). Legal presentation:

Environmental Policy of Switzerland
- Adrian Mühlematter / Stephan Stucki: Grundbuchrecht für die Praxis, Zürich 2016

Analytical Competencies
The processes of change, overuse or destruction of the natural environment through humans have historically placed high demands on humans to act ethically. Today's pressing environmental challenges demand a critical reflection. Ethics is an important tool for doing so. This lecture introduces students to basic concepts of ethics that are useful for analyzing and critically reflecting on ethical challenges in general and specifically regarding the environment. You know basic concepts, positions and lines of argumentation from the debate in environmental ethics, which you have applied and discussed in smaller exercises.

701-0747-00L Environmental Policy of Switzerland

Objective
Beyond acquiring basic knowledge about public policy analysis, this course teaches students how to analytically address current and concrete questions of environmental policy. Through exercises the students learn about political science concepts and frameworks as well as real-life political decision-making processes. The well-grounded examination of complex political conflict situations is an important precondition for the entry into the (environmental policy) workforce or a future research career.

Content
The processes of change, overuse or destruction of the natural environment through humans have historically placed high demands on social and political institutions. In the interplay between the environment, society and economy, the environmental policy field encompasses the sum of public measures that have the goal to eliminate, reduce or avoid environmental degradation. The course systematically presents the basics of environmental policy instruments, actors, programs and processes as well as their change over time. Invited practitioners will provide us with insight regarding the current developments in forest, water and spatial planning policies. A key aspect is the distinction between politics and political science and specifically environmental policy.

Lecture notes
The reader and additional lecture material and exercises will be posted on Moodle.

Literature
Reader and additional lecture material on moodle.

Prerequisites / notice
The detailed semester program (syllabus) is made available to the students at the beginning of the semester.

During the lecture we will work with Moodle and eduApp. We ask that all students register themselves on these platforms before the lecture and to bring a laptop, tablet or smartphone to class, so that you can complete exercises using Moodle and eduApp.

The detailed semester program (syllabus) is made available to the students at the beginning of the semester.

The detailed semester program (syllabus) is made available to the students at the beginning of the semester.

Competencies
Subject-specific Competencies
- Concepts and Theories: assessed

Method-specific Competencies
- Analytical Competencies: assessed

Social Competencies
- Sensitivity to Diversity: assessed

Personal Competencies
- Critical Thinking: assessed
- Self-direction and Self-management: assessed

851-0724-01L Real Estate Property Law

Objective
Real estate property law (esp. content, acquisition, restrictions under private and public law, transmission and loss). Legal presentation: land register, surveying, cadastre. Basic questions of contract and tax law.

Content
Real estate property law (esp. content, acquisition, restrictions under private and public law, transmission and loss). Legal presentation: land register, surveying, cadastre. Basic questions of contract and tax law.
To this end, we will look at the most important techniques of mediation and put them into the context of today's legislation, participation and subject-specific competencies assessed.

### Mediation in Environmental Planning: Theory and Case Studies

**851-0157-28L**  
**Life and Death**  
*Particularly suitable for students of D-BIOL, D-HEST, D-CHAB, D-USYS*  
**W** 3 credits  
**M. Hagner**

**Abstract**  
This course explores the relation between the scientific investigation of life and cultural notions of death from a historical perspective (assuming there is no such thing as the scientific investigation of death). While the course covers the times from antiquity up to the present, the main emphasis will be placed on the modern life sciences since the 19th century.

**Objective**  
There is only one certainty in life: death. This brute fact has animated much thought and work in theology, art and philosophy - but also in the natural sciences, such as biology and medicine. Questions regarding health and disease, evolution, extinction and immortality have played a crucial role in this connection. This course aims to explore above relations - the relations between the scientific investigation of life and cultural notions of death - from a historical perspective (assuming there is no such thing as the scientific investigation of death). While the course covers the times from antiquity up to the present, the main emphasis will be placed on the modern life sciences since the 19th century.

**Content**  
To this end, we will look at the most important techniques of mediation and put them into the context of today's legislation, participation and conflict culture. The potential and limitations of the individual techniques will be discussed using current Swiss and international case studies, namely in the field of windenergy as well of landfills and Human-Wildlife Conflict and Coexistence (wolves, bears, elephants). Students can do conflict analyses, for instance, as part of individual and group analyses and a half-day mediation-simulation, develop conflict culture. The potential and limitations of the individual techniques will be discussed using current Swiss and international case studies, namely in the field of windenergy as well of landfills and Human-Wildlife Conflict and Coexistence (wolves, bears, elephants).

**Lecture notes**  
A reader will be handed out.

### Language Courses of the UZH and ETH Zurich

A maximum of 3 credit points from language courses may be recognised in the category "Science in Context" throughout the entire bachelor's and master's degree program. Moreover, the following restrictions apply: In the case of the European languages English, French, Italian and Spanish, only advanced language courses from level B2 will be credited. German language courses are credited from level C2.
Only the courses listed below will be recognized as "Science in Perspective" courses.

</table>
The course helps participants to explore various ways in which they can express complex thoughts and ideas through different types of media. The course uses art as a means for participants to practice all four language skills: Reading, writing, speaking, and listening.

The main objective of this course is to improve participants’ competence in written French through the mastery of grammatical rules and their practical application; this will ensure the correctness of participants’ utterances at text level and help them with some difficult areas of the French language. The course focuses on a descriptive approach of linguistic tools to improve written French (reports, abstracts) and business writing in general (covering letters) through targeted exercises.

**Abstract**

This course offers participants the opportunity to recognize, practice, and improve some of the fundamental and relevant linguistic tools they need in order to write academic texts in French. The course focuses on improving participants’ grammatical and lexical repertoire through reading and discussion.

**Objective**

* Improve participants’ grammatical and lexical repertoire through reading and discussion
* Improve the ways in which participants organize their ideas and arguments in a sustained, coherent, and logical manner
* Provide participants with an opportunity to enhance and practice their argumentation skills in discussions and in writing
* Help participants to develop critical, creative, and personal approaches to analyzing literary texts and by extension become more astute readers in general
* Improve the ways in which participants organize their ideas and arguments in a sustained, coherent, and logical manner
* Help participants to develop critical, creative, and personal approaches to analyzing literary texts and by extension become more astute readers in general
* Improve participants’ grammatical and lexical repertoire through reading and discussion
* Import a life-long interest in literature written in English

**Italian B2-C1: Outside the Classroom**

*Does not take place this semester.*

No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zurich".

**Course fees:**

**Registration dates:**

**Abstract**

This course allows participants to practice Italian in a real-life situation: At the Zurich art museum (Kunsthaus), participants look at art works while listening to an Italian audio guide; they then discuss the art. The course alternates between seven museum visits and seven in-class lessons. At home, participants study their chosen art works in more depth and prepare oral and written summaries.

**Objective**

The course uses art as a means for participants to practice all four language skills: Reading, writing, speaking, and listening. Further activities enable participants to enhance vocabulary and grammar learning. Participants receive written feedback on their written work, and recurring errors are discussed in class.

**Italian B2-C1: Language Structure**

*Does not take place this semester.*

No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zurich".

**Course fees:**

**Registration dates:**

**Abstract**

The course gives participants the opportunity to broaden and intensify their knowledge of complex morphosyntactic structures. The objective is to improve their proficiency in expressing complex content. The aim is that at the end of the course, participants understand a wide range of texts and are able to express themselves clearly and effectively in a wide variety of oral and written situations.

**Objective**

The course helps participants to explore various ways in which they can express complex thoughts and ideas through different types of subordinate clauses, including consecutive, concessive, and hypothetical sentences, and indirect speech. Using a range of written and oral activities, participants also practice aspects of grammar that often pose difficulties at an advanced level: verb tenses and modes, use of articles and pronouns, adjectives and past participle agreement, choice of prepositions, and word order. At the same time, the course focuses on vocabulary expansion.

**English Language and Literature (C1-C2)**

No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zurich".

**Course fees:**

**Registration dates:**

**Abstract**

The course is open to participants who have already reached C1-level English. The course enhances participants’ appreciation and understanding of literature in English. Through the analysis and interpretation of literary texts, participants improve their analytical and English language skills; their grammar skills through writing; and their vocabulary through reading, discussions, and writing.

**Objective**

The aims of the course are to:
* Introduce participants to a variety of literary texts in English
* Help participants to develop critical, creative, and personal approaches to analyzing literary texts and by extension become more astute readers in general
* Provide participants with an opportunity to enhance and practice their argumentation skills in discussions and in writing
* Improve the ways in which participants organize their ideas and arguments in a sustained, coherent, and logical manner
* Improve participants’ grammatical and lexical repertoire through reading and discussion
* Import a life-long interest in literature written in English

**Advanced English for Academic Purposes (C1-C2)**

No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zurich".

**Course fees:**

**Registration dates:**

**Abstract**

This course is designed for Bachelor’s and Master’s students from all disciplines who wish to improve their English from C1 towards C2 level and train their language skills at mastery level. Selected academic English features are included to add value to the course to meet standard entrance requirements by leading universities and colleges worldwide.
In this course, participants improve their comprehension of written and oral texts that deal with current issues, as well as of scientific texts. The course aims to train and develop linguistic skills at mastery level, with a focus on formal and informal academic lexis, on listening and oral communication skills, and on increasing fluency, accuracy, and complexity of spoken language. Students will work on writing well-structured descriptive texts and argumentative essays, with the aim of fulfilling the language requirements for study at an English-speaking university or following university Master’s courses held in English.

### 851-0846-01L Spanish B2: Starter

No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zürich".

**Abstract**
The grammar in this course focuses on the introduction of the "imperfecto de subjuntivo" and the "pluscuamperfecto de subjuntivo". The corresponding indicatives are also included. Various text types are focused on, and participants give simple oral presentations on a topic from their field of study. Participants also practice their oral expression and discussion skills.

**Objective**
Participants improve their understanding of grammatical usage by investigating written and spoken texts. They put newly acquired language patterns into practice when writing and speaking, and they acquire vocabulary on current contemporary issues; they also acquire specialist vocabulary from their fields of study. Participants are able to write clear and detailed texts on scientific issues from their specific fields of study.

No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zürich".

**Abstract**
The most important grammar topics of this course are past tense forms, subordinate clauses, linking devices, reported speech, periphrastic verb constructions, and verbs that express change. The course also deals with topics that typically cause problems for higher level learners, including ser/estar, por/para, and indicative and subjunctive forms of verbs.

**Objective**
In this course, participants improve their comprehension of written and oral texts that deal with current issues, as well as of scientific texts from participants' own fields of study. They are able to analyse various points of view and can create clear and detailed oral and written texts on scientific issues from their field of study, while taking a position and expressing definite views on these issues.

**Abstract**
This course is designed for participants with a basic knowledge of Portuguese (level A1). The course deals with everyday topics. Participants practice simple forms of communication as these occur in daily life. Lexical and linguistic structures are taught within these contexts. Intercultural and socio-cultural issues relating to Brazil are also taken into consideration.

**Objective**
Participants can talk and write about themselves and everyday topics using simple sentences. They can take part in simple daily conversations, understand and write simple messages, describe an event in a time sequence, and express wishes, assumptions, and recommendations.

Modern Greek Language I A1.1

No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zürich".

Course fees: https://www.sprachenzentrum.uzh.ch/en/Sprachkurse/Kursegebuehren1.html

Abstract
Modern Greek I leads to A1.1 level on the Common European Framework of Reference for Languages. It is the first part of a four-semester Modern Greek course. The goal of the course is for participants to acquire basic language skills in speaking, listening comprehension, and reading and writing Greek script. The focus is also on building basic vocabulary and on acquiring basic grammar.

Objective
Participants are able to use Modern Greek adequately in selected areas. They have basic vocabulary skills, which they can use actively. They can read and write Greek script well. They can filter out a general overview from the information presented on Greek websites. The focus is on speaking, reading comprehension, and listening comprehension skills at A1.1 level of the Common European Framework of Reference for Languages, and on the development of cultural competence. Special importance is attached to an academic environment and student life. Content areas that are embedded in various communicative tasks include: Giving information about yourself, your job, your studies, your place of residence, and your personal preferences; and conducting simple, everyday conversations (including ordering food and drink, shopping, and inquiring about places).

Modern Greek Language III A2.1

No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zürich".

Course fees: https://www.sprachenzentrum.uzh.ch/en/Sprachkurse/Kursegebuehren1.html

Abstract
Modern Greek III leads to A2.1 level on the Common European Framework of Reference for Languages. It is the third part of a four-semester Modern Greek course. The goal of the course is for participants to expand their language skills in speaking and listening comprehension, reading, and writing. The focus is also on grammar structures vocabulary extension.

Objective
Participants are able to use Modern Greek adequately in selected areas. They improve their listening comprehension skills and expand their vocabulary. They can read a simple text fluently and can answer content questions in speech and in writing. They understand Greek as the language of instruction and have developed strategies needed to ask questions in Greek. The focus is on speaking, reading comprehension, and writing skills at A2.1 level of the Common European Framework of Reference for Languages and on developing cultural competence. Special importance is attached to an academic environment and student life. Content areas that are embedded in various communicative listening, reading, and writing tasks include: Describing an apartment, people, and objects; making comparisons; talking about past experiences and future plans; participating in interviews; asking for permission; giving advice; making appointments; and acting out dialogues.

Swedish I A1.2

No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zürich".

Course fees: https://www.sprachenzentrum.uzh.ch/en/Sprachkurse/Kursegebuehren1.html

Abstract
Swedish I leads to A1.2 level on the Common European Framework of Reference for Languages. The course is the first part of a two-semester Swedish course. The goal of the course is for participants to gain basic language skills in speaking, listening comprehension, reading, and writing.

Objective
Participants are able to use Swedish adequately in selected areas. The focus is on speaking, reading comprehension, and listening comprehension skills at A1.2 level of the Common European Framework of Reference for Languages, and on developing cultural competence. Special importance is attached to an academic environment and student life. Content areas that are embedded in various communicative tasks include: Greetings, introducing yourself, and speaking about yourself (including about your personal and professional identity and your interests); and asking for information and requesting services.

Swedish II A2.1

No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zürich".

Course fees: https://www.sprachenzentrum.uzh.ch/en/Sprachkurse/Kursegebuehren1.html

Abstract
Swedish II leads to A2.1 level on the Common European Framework of Reference for Languages. The course is the second part of a two-semester Swedish course. The goal of the course is for participants to extend their skills in speaking, listening comprehension, reading, and writing. Participants expand their skills in basic grammar, extend their vocabulary and improve their pronunciation.
Objective
Participants are able to use Swedish adequately in selected areas. The focus is on speaking, listening comprehension, and reading comprehension skills at A2.1 level of the Common European Framework of Reference for Languages, and on developing cultural competence. Special importance is attached to an academic environment and student life. Content areas that are embedded in various communicative tasks include: Talking about your relatives and family; talking about past and future events; expressing your views on things you (don’t) like; expressing your opinion; and requesting information (including about directions and the weather).

851-0851-00L
Russian I A1.1
No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zürich".

Course fees:

Registration dates:

Abstract
Russian I is the first part of a five-semester Russian course. The course leads to A1.1 level on the Common European Framework of Reference for Languages. The goal of the course is to introduce participants to the Cyrillic alphabet and to Russian phonetics; participants build up a basic vocabulary; learn the basics of Russian grammar, and are introduced to Russian culture.

Objective
Participants are able to use Russian adequately in selected areas. The focus is on speaking, reading comprehension, and listening comprehension skills at A1.1 level of the Common European Framework of Reference for Languages, and on developing cultural competence. Special importance is attached to an academic environment and student life. The course deals with the following content: Reading and writing Russian script; saying hello and goodbye; introducing yourself; asking for someone’s name; addressing someone; apologizing; indicating your country and place of origin and residence; stating your profession; talking about family; talking about your wellbeing; asking about prices; and ordering items in a café.

851-0853-00L
Russian III A2.1
No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zürich".

Course fees:

Registration dates:

Abstract
Russian III leads to A2.1 level on the Common European Framework of Reference for Languages. The course is the third part of a five-semester Russian course. In this course, participants extend their ability to express themselves, in particular regarding daily life (eating, shopping) and work and education (daily routines); it also extends participants’ grammar skills.

Objective
Participants are able to use Russian adequately in selected areas. The focus is on speaking, reading comprehension, and listening comprehension skills at A2.1 level of the Common European Framework of Reference for Languages, and on developing cultural competence. Special importance is attached to an academic environment and student life. The course deals with the following content: Talking about food and meals; indicating packaging and quantities; talking about things you need or that you have to buy; talking to people while shopping; naming food establishments, crockery, and cutlery; extending invitations and responding to invitations; asking for explanations of unfamiliar terms; expressing congratulations and wishes; describing daily routines; describing actions in the present, past, and future; and explaining how you get to work.

851-0855-00L
Russian V A2.2+
No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zürich".

Course fees:

Registration dates:

Abstract
Russian V leads to A2.2+ level on the Common European Framework of Reference for Languages. The course is the final part of a five-semester Russian course. In this course, participants extend their ability to express themselves, in particular regarding daily life (holidays) and personality (biography, education, and professional career); it also extends participants’ grammar skills.

Objective
Participants are able to use Russian adequately in selected areas. The focus is on speaking, reading comprehension, and listening comprehension skills at A2.2+ level of the Common European Framework of Reference for Languages, and on developing cultural competence. Special importance is attached to an academic environment and student life. The course deals with the following content: Talking about the weather; naming the seasons and months; understanding activities offered to tourists; expressing agreement, disagreement, and indifference; making appointments; talking about holiday plans and arrangements; expressing prohibitions; making comparisons; talking about learning; indicating date and year; saying what you are interested in and what you are doing; giving biographical details; saying what you would like to do; making and obtaining recommendations; passing on information.

</tr>
</tbody>
</table>
Objective

The main objective of this course is to develop participants' written comprehension and expression and, more specifically, to explore the implicit and cultural aspects of a variety of text genres (academic writing, essays, investigative journalism). This course aims to improve participants' language skills through the acquisition of precise and context-specific vocabulary. It also raises their awareness of the argumentative character of written texts, words or expressions used in writing, and various types of discourse and language registers.

851-0849-03L Brazilian Portuguese A2-B2: Urban Popular Music

No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zürich".

Course fees: https://www.sprachenzentrum.uzh.ch/en/Sprachkurse/Kursgebuehren1.html

Registration dates: https://www.sprachenzentrum.uzh.ch/en/Sprachkurse.html

Abstract

In this course, participants engage with various themes of urban popular music in Brazil. They gain an understanding of some aspects of culture and the history of Brazil in relation to various music genres, periods of artistic expression, main composers, and interpreters of Brazilian music.

Objective

The aim of this course is to expose the participants to the language with a musical approach using linguistic and cultural resources to develop and improve their oral and written learning and communication skills.

851-0846-02L Spanish B2-C1: Language and Cinema

No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zürich".

Course fees: https://www.sprachenzentrum.uzh.ch/en/Sprachkurse/Kursgebuehren1.html

Registration dates: https://www.sprachenzentrum.uzh.ch/en/Sprachkurse.html

Abstract

The course introduces specific thematics in Spanish-speaking regions or countries through the cinema, taking into account the geopolitical and cultural spectrum of the Spanish language.

Objective

The course aims to visualize observation, development of ideas, presentation, and interaction. Some basic elements of movie-making are presented.

The participant gets familiarized with images, customs, dialogs, and vocabulary, carrying out an observation, analysis, and comment of these elements. Glossaries of different linguistic regions are created.

Does not take place this semester.

No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zürich".

Course fees: https://www.sprachenzentrum.uzh.ch/en/Sprachkurse/Kursgebuehren1.html

Registration dates: https://www.sprachenzentrum.uzh.ch/en/Sprachkurse.html

Abstract

The main subject matter of this course includes a systematic discussion of the usage of past tenses; subordinate clauses; linking expressions; reported speech; periphrastic verb constructions; and verbs of change. In addition, participants undertake individual reading of various text types, with a particular emphasis on technical subjects and/or subjects related to their fields of study.

Objective

In this course, participants acquire oral and written academic communication skills; they acquire knowledge of the grammar areas relevant to B2-C1 level of the Common European Framework Reference for Languages; and they consolidate previously acquired grammar.

Does not take place this semester.

No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zürich".

Course fees: https://www.sprachenzentrum.uzh.ch/en/Sprachkurse/Kursgebuehren1.html

Registration dates: https://www.sprachenzentrum.uzh.ch/en/Sprachkurse.html

Abstract

This course offers participants the opportunity to carry out a "case study" based on a topical issue in order to practice and improve the four language skills by developing a fictitious but plausible scenario that requires the use of specific rhetorical, lexical, and pragmatic tools.

Objective

The main objective of this course is to give participants an opportunity to practice and improve the four language skills (speaking and listening comprehension, writing and reading comprehension) through "case studies." Participants present a complex topic and interact by defending a point of view and/or responding to objections. In addition, the course allows participants to develop their knowledge of Francophone culture (the media and the press).

851-0820-01L French B2-C1: Language and Cinema

Registration dates:

Abstract

This course aims to expose the participants to the language with a musical approach using linguistic and cultural resources to develop and improve their oral and written learning and communication skills.
This course offers participants a choice of films that reflect recent issues in order to raise their awareness of the ongoing concerns of contemporary French cinema, and also to enable them to improve their speaking skills, mainly through oral presentations.

Objective: The primary objective of this course is to develop participants' listening comprehension skills and more specifically, to improve their understanding of implicit and cultural meanings of the films on the program. It further aims to raise participants' awareness of the history, aesthetics, and contemporary issues of French cinema. The second objective of the course is to improve participants' speaking skills, especially by giving them the opportunity to produce structured presentations and to express their personal, informed, and nuanced opinions.

851-0834-17L
**Spanish B2: Oral Interaction**

*Does not take place this semester.*

No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zürich".

Abstract: Participants practice a range of oral interactions, such as casual and formal conversation, interviews, debates, negotiations, and presentations. They discuss current issues and their fields of study and/or work.

Objective: The course aims to expose participants to a range of conversational situations, providing them with tools that help them to improve their ability to perform various tasks linguistically and socially.

851-0826-04L
**Italian B2-C1: Language and Literature**

Abstract: The course approaches the Italian language through short stories, relevant both for their linguistic structures and content, which is related to historical and sociological realities typical for Italy. Participants deepen their lexical and syntactic competence by means of oral and written presentations, class discussions, reflections on the structures of the stories, and targeted exercises.

Objective: The course offers participants the opportunity to:
- Better understand complex literary texts
- Be able to grasp nuances of meaning expressed through certain lexical and syntactical choices more effectively
- Learn how to express themselves clearly and in a differentiated way
- Understand through short narrative texts some cultural and social realities typical of Italy

**Chinese V 2.2+**

Abstract: Chinese V concludes the five-semester Chinese course. Chinese V goes beyond level A2.2 of the Common European Framework of Reference for Languages and includes some B1-level skills. The goal is to further develop oral skills, and listening and reading comprehension skills on selected topics. There is a special focus on university and student life.

Objective: The following topics are integrated into various communicative situations:
- Travel: Destinations of choice; organizing and describing a trip, etc.
- Education and training: Your career; your current academic or professional situation; comparing the Swiss and Chinese education systems.

### Abstract

**Arabic I-III (fast track)** is an intensive course that leads to A2.1 level on the Common European Framework of Reference for Languages. The target group are people who: understand or speak an Arabic dialect and wish to learn Standard Arabic; have learnt to read Arabic fluently during a religious education; or have already learnt some basic Arabic and wish to invest time in an intensive course.

### Objective

Participants are able to use the Arabic language adequately in selected areas and can conduct themselves in a culturally appropriate manner. To this end, the following content is dealt with: Talking about your life; daily routines; expressing wishes, commands, and eventualities; talking about language and language learning (meta-language skills); writing messages and short texts. In terms of grammar, this course attaches particular importance to the basic principles of the grammar of Standard Arabic and its verbal system. Among the cultural and meta-language skills are the creation of awareness regarding the difference between the Arabic varieties and registers.

### Prerequisites / notice

In all cases, knowledge of Arabic script is a prerequisite.

Objective
Participants will have adequate language in selected everyday situations. Special consideration is given to an academic environment and student life.

The Japanese I (Part 1) and Japanese I (Part 2) courses aim to cover the entire content of Japanese I A1.1 in two semesters. They are designed so that busy participants who can only attend Japanese classes once a week can slowly but steadily acquire A1.1 proficiency over the course of two semesters.

The focus is equally on fostering speaking, listening, writing, and reading skills at A1.1 level of the Common European Framework of Reference for Languages, as well as on the development of cultural competence. In addition, the two syllabic writing systems and the use of Japanese computer word processing are expanded.

Content areas that are embedded in various communicative tasks include: talking about yourself (personal and professional identity, interests, daily routine, etc.), asking for information, and requesting services.

Prerequisites / notice
Special admission requirement: Attendance of the course Japanese I A1.1 (Part 1) or equivalent knowledge.

851-0819-00L French B2: Points of View on Current Affairs
No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zürich":

Course fees:

Registration dates:

Abstract
In this course, we deal with current affairs from the French-speaking world through various media, both written and audio-visual. Each topic is approached from a different perspective, with an emphasis on group discussion. At the end of the course, participants choose and present one current topic from the French-speaking world and lead a discussion on their topic.

Objective
The objectives of this course are to provide the tools (linguistic and cultural) necessary to understand and address francophone current affairs. Participants work on specific vocabulary related to current affairs and communicative competence (expressing opinions; expressing agreement or disagreement; arguing). By the end of the course, participants are able to give a presentation in French on a chosen topic and propose and lead a discussion. The emphasis of the course is on oral interaction skills and written and oral comprehension (newspaper articles, reports, documentaries).
