<td><strong>Abstract</strong></td>
<td>This course covers fundamental and advanced concepts of modern computer graphics. Students will learn the fundamentals of digital scene representations, advanced physically-based light transport algorithms for generating photorealistic images from these scene representations, and inverse rendering methods for recovering digital scene representations from captured images.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Objective</strong></td>
<td>At the end of the course, the students will be able to build a rendering system based on path-tracing algorithms. The students will learn the principles of physically-based rendering and computer graphics. In addition, the course is intended to stimulate the student's curiosity to explore the field of computer graphics in subsequent classes or on their own.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Content</strong></td>
<td>We will begin with an introduction to light emission and radiometric quantities, followed by an exploration of geometry representations and texture mapping. Next, we will mathematically formulate the physics of light transport and appearance modeling. Subsequently, we will introduce relevant concepts from Monte Carlo integration and develop path-tracing algorithms to solve these equations by simulating light transport for direct and global illumination due to hard surfaces and participating media, such as fog, smoke, and translucent objects. Moreover, we will present techniques for significantly improving path-tracing efficiency, including importance sampling, multiple importance sampling, stratified sampling, denoising, and acceleration data structures. The course lectures will conclude with an overview of image-based capture and rendering methods. Topics covered will include geometry reconstruction, material acquisition, differentiable rendering, and image-based rendering.</td>

Data: 26.07.2024 12:39    Autumn Semester 2024    Page 2204 of 2680
Objective
Do you want to be able to query your own data productively and efficiently in your future semester projects, bachelor's thesis, master thesis, or PhD thesis? Are you looking for something beyond the Python+Pandas hype? This courses teaches you how to do so as well as the dos and don'ts.

This lesson is complementary with Big Data for Engineers as they cover different time periods of database history and practices -- you can take them in any order, even though it might be more enjoyable to take this lecture first.

After visiting this course, you will be capable to:

1. Explain, in the big picture, how a relational database works and what it can do in your own words.

2. Explain the relational data model (tables, rows, attributes, primary keys, foreign keys), formally and informally, including the relational algebra operators (select, project, rename, all kinds of joins, division, cartesian product, union, intersection, etc).

3. Perform non-trivial reading SQL queries on existing relational databases, as well as insert new data, update and delete existing data.

4. Design new schemas to store data in accordance to the real world's constraints, such as relationship cardinality

5. Explain what bad design is and why it matters.

6. Adapt and improve an existing schema to make it more robust against anomalies, thanks to a very good theoretical knowledge of what is called "normal forms".

7. Understand how indices work (hash indices, B-trees), how they are implemented, and how to use them to make queries faster.

8. Access an existing relational database from a host language such as Java, using bridges such as JDBC.

9. Explain what data independence is all about and didn't age a bit since the 1970s.

10. Explain, in the big picture, how a relational database is physically implemented.

11. Know and deal with the natural syntax for relational data, CSV.

12. Explain the data cube model including slicing and dicing.

13. Studio data cubes in a relational database.

14. Map cube queries to SQL.

15. Slice and dice cubes in a UI.

And of course, you will think that tables are the most wonderful object in the world.

Content
Using a relational database

1. Introduction
2. The relational model
3. Data definition with SQL
4. The relational algebra
5. Queries with SQL

Taking a relational database to the next level

6. Database design theory
7. Databases and host languages
8. Databases and host languages
9. Indices and optimization
10. Database architecture and storage

Analytics on top of a relational database

12. Data cubes

Outlook

13. Outlook

Literature
- Lecture material (slides).
- Book: "Database Systems: The Complete Book", H. Garcia-Molina, J.D. Ullman, J. Widom (It is not required to buy the book, as the library has it)

Prerequisites / notice
For non-CS/DS students only, BSc and MSc
Elementary knowledge of set theory and logic
Knowledge as well as basic experience with a programming language such as Pascal, C, C++, Java, Haskell, Python

Data: 26.07.2024 12:39 Autumn Semester 2024 Page 2205 of 2680

**401-3627-00L High-Dimensional Statistics**

**W** 4 credits 2V not available

**Abstract**

“High-Dimensional Statistics” deals with modern methods and theory for statistical inference when the number of unknown parameters is of much larger order than sample size. Statistical estimation and algorithms for complex models and aspects of multiple testing will be discussed.

**Objective**

Knowledge of methods and basic theory for high-dimensional statistical inference

**Content**

Lasso and Group Lasso for high-dimensional linear and generalized linear models; Additive models and many smooth univariate functions; Non-convex loss functions and 1 regularization; Stability selection, multiple testing and construction of p-values; Undirected graphical modeling

**Literature**

**Prerequisites / notice**

Knowledge of basic concepts in probability theory, and intermediate knowledge of statistics (e.g. a course in linear models or computational statistics).

---

**401-4623-00L Time Series Analysis**

**W** 4 credits 2G F. Balabdaoui

**Abstract**

The course offers an introduction into analyzing times series, that is observations which occur in time. The material will cover Stationary Models, ARMA processes, Spectral Analysis, Forecasting, Nonstationary Models, ARIMA Models and an introduction to GARCH models.

**Objective**

The goal of the course is to have a good overview of the different types of time series and the approaches used in their statistical analysis.

**Content**

This course treats modeling and analysis of time series, that is random variables which change in time. As opposed to the i.i.d. framework, the main feature exhibited by time series is the dependence between successive observations.

The key topics which will be covered as:

- Stationarity
- Autocorrelation
- Trend estimation
- Elimination of seasonality
- Spectral analysis, spectral densities
- Forecasting
- ARMA, ARIMA, Introduction into GARCH models

**Literature**

The main reference for this course is the book “Introduction to Time Series and Forecasting”, by P. J. Brockwell and R. A. Davis

**Prerequisites / notice**

Basic knowledge in probability and statistics

---

**401-3901-00L Linear & Combinatorial Optimization**

**W** 10 credits 4V+2U R. Zenklusen

**Abstract**

Mathematical treatment of optimization techniques for linear and combinatorial optimization problems.

**Objective**

The goal of this course is to get a thorough understanding of various classical mathematical optimization techniques for linear and combinatorial optimization problems, with an emphasis on polyhedral approaches. In particular, we want students to develop a good understanding of some important problem classes in the field, of structural mathematical results linked to these problems, and of solution approaches based on such structural insights.

**Content**

Key topics include:
- Linear programming and polyhedra;
- Flows and cuts;
- Combinatorial optimization problems and polyhedral techniques;
- Equivalence between optimization and separation.

**Literature**

**Prerequisites / notice**

Solid background in linear algebra.

---

Neuromorphic Engineering I

Registration in this class requires the permission of the instructors. Class size will be limited to available lab spots. Preference is given to students that require this class as part of their major.

Information for UZH students:
Enrolment to this course unit only possible at ETH. No enrolment to module IN404 at UZH.
Please mind the ETH enrolment deadlines for UZH students: https://ethz.ch/en/studies/non-degree-courses/special-students/university-of-zurich.html

Abstract
This course covers analog circuits with emphasis on neuromorphic engineering: MOS transistors in CMOS technology, static circuits, dynamic circuits, systems (silicon neuron, silicon retina, silicon cochlea) with an introduction to multi-chip systems. The lectures are accompanied by weekly laboratory sessions.

Objective
Understanding of the characteristics of neuromorphic circuit elements.

Content
Neuromorphic circuits are inspired by the organizing principles of biological neural circuits. Their computational primitives are based on physics of semiconductor devices. Neuromorphic architectures often rely on collective computation in parallel networks. Adaptation, learning and memory are implemented locally within the individual computational elements. Transistors are often operated in weak inversion (below threshold), where they exhibit exponential I-V characteristics and low currents. These properties lead to the feasibility of high-density, low-power implementations of functions that are computationally intensive in other paradigms. Application domains of neuromorphic circuits include silicon retinas and cochleas for machine vision and audition, real-time emulations of networks of biological neurons, the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS transistor, phototransducers), static circuits (differential pair, current mirror, transconductance amplifier, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silicon neuron, silicon retina and cochlea) and an introduction to multi-chip systems that communicate events analogous to spikes. The lectures are accompanied by weekly laboratory sessions on the characterization of neuromorphic circuits, from elementary devices to systems.

Literature
S.-C. Liu et al.: Analog VLSI Circuits and Principles; various publications.

Prerequisites / notice
Particular: The course is highly recommended for those who intend to take the spring semester course ‘Neuromorphic Engineering II’, that teaches the conception, simulation, and physical layout of such circuits with chip design tools.

Prerequisites: Background in basics of semiconductor physics helpful, but not required.
### Boundary Layer Meteorology

**Number:** 651-4053-05L

**Title:** Boundary Layer Meteorology

**Type:** W

**ECTS:** 4 credits

**Hours:** 3G

**Lecturers:** M. Rotach, P. Calanca

**Abstract:** The Planetary Boundary Layer (PBL) constitutes the lower part of the atmosphere, is characterized by turbulent mixing and ensures the exchange of energy, mass, and momentum between the Earth's surface and the atmosphere. The course provides the theoretical background for understanding the structure and dynamics of the PBL. Idealized concepts are reviewed and contrasted to real-world applications.

**Objective:**
- Students are able to:
  - Name the basic approaches needed to describe planetary boundary layer flows and associated turbulent exchange processes.
  - Apply these concepts to answer comprehension questions and solve simple problems related to the structure and dynamics of the PBL.
  - Independently judge the applicability of learned concepts and tools to real-world situations.

**Content:**
- Introduction
- PBL structure and stability
- Turbulence and turbulent transport
- Scaling and similarity theory
- Spectral characteristics
- Conservation equations in a turbulent flow
- Closure problem and closure assumptions
- Rough surfaces and the roughness sublayer
- Complex terrain

**Competencies**

**Subject-specific Competencies**
- Concepts and Theories
- Techniques and Technologies

**Method-specific Competencies**
- Analytical Competencies
- Decision-making
- Problem-solving

**Personal Competencies**
- Creative Thinking

**Literature**

**Prerequisites / notice**

### Dynamics of Large-Scale Atmospheric Flow

**Number:** 701-1221-00L

**Title:** Dynamics of Large-Scale Atmospheric Flow

**Type:** W

**ECTS:** 4 credits

**Hours:** 2V+1U

**Lecturers:** H. Wernli, J. Riboli

**Abstract:** This lecture course is about the fundamental aspects of the dynamics of extratropical weather systems (quasi-geostrophic dynamics, potential vorticity, Rossby waves, baroclinic instability). The fundamental concepts are formally introduced, quantitatively applied and illustrated with examples from the real atmosphere. Exercises (quantitative and qualitative) form an essential part of the course.

**Objective:** Understanding of dynamic processes of large-scale atmospheric flow and their mathematical-physical formulation.

**Content:**
- Dynamical Meteorology is concerned with the dynamical processes of the earth's atmosphere. The fundamental equations of motion in the atmosphere will be discussed along with the dynamics and interactions of synoptic system - i.e. the low and high pressure systems that determine our weather. The motion of such systems can be understood in terms of quasi-geostrophic theory. The lecture course provides a derivation of the mathematical basis along with some interpretations and applications of the concept.

**Competencies**

**Subject-specific Competencies**
- Concepts and Theories
- Techniques and Technologies

**Method-specific Competencies**
- Analytical Competencies
- Decision-making
- Problem-solving

**Personal Competencies**
- Creative Thinking

**Literature**
- Picher H., Dynamik der Atmosphäre, Bibliographisches Institut, 456 pp. 1997

**Prerequisites / notice**

### Advanced Quantum Chemistry

**Number:** 529-0003-01L

**Title:** Advanced Quantum Chemistry

**Type:** W

**ECTS:** 6 credits

**Hours:** 3G

**Lecturers:** M. Reiher, T. Weymouth

**Abstract:** Advanced, but fundamental topics central to the understanding of theory in chemistry and for solving actual chemical problems with a computer. Examples are:
- Operators derived from principles of relativistic quantum mechanics
- Relativistic effects + methods of relativistic quantum chemistry
- Open-shell molecules + spin-density functional theory
- New electron-correlation theories

**Objective:**
- The aim of the course is to provide an in-depth knowledge of theory and method development in theoretical chemistry. It will be shown that this is necessary in order to be able to solve actual chemical problems on a computer with quantum chemical methods.

- The relativistic re-derivation of all concepts known from (nonrelativistic) quantum mechanics and quantum-chemistry lectures will finally explain the form of all operators in the molecular Hamiltonian - usually postulated rather than deduced. From this, we derive operators needed for molecular spectroscopy (like those required by magnetic resonance spectroscopy). Implications of other assumptions in standard non-relativistic quantum chemistry shall be analyzed and understood, too. Examples are the Born-Oppenheimer approximation and the expansion of the electronic wave function in a set of pre-defined many-electron basis functions (Slater determinants). Overcoming these concepts, which are so natural to the theory of chemistry, will provide deeper insights into many-particle quantum mechanics. Also revisiting the workhorse of quantum chemistry, namely density functional theory, with an emphasis on open-shell electronic structures (radicals, transition-metal complexes) will contribute to this endeavor. It will be shown how these insights allow us to make more accurate predictions in chemistry in practice - at the frontier of research in theoretical chemistry.

**Schedule:**
- Autumn Semester 2024
- Data: 26.07.2024 12:39

**Page:** 2208 of 2680

---

Data: 26.07.2024 12:39

Autumn Semester 2024

Page 2208 of 2680
Content

1) Introductory lecture: basics of quantum mechanics and quantum chemistry
2) Einstein's special theory of relativity and the (classical) electromagnetic interaction of two charged particles
3) Klein-Gordon and Dirac equation; the Dirac hydrogen atom
4) Numerical methods based on the Dirac-Fock-Coulomb Hamiltonian, two-component and scalar relativistic Hamiltonians
5) Response theory and molecular properties, derivation of property operators, Breit-Pauli-Hamiltonian
6) Relativistic effects in chemistry and the emergence of spin
7) Spin in density functional theory
8) New electron-correlation theories: Tensor network and matrix product states, the density matrix renormalization group

Lecture notes
A set of detailed lecture notes will be provided, which will cover the whole course.

Literature

2) F. Schwabl: Quantenmechanik für Fortgeschrittene (QM II), Springer-Verlag, 1997
3) R. McWeeny: Methods of Molecular Quantum Mechanics, Academic Press, 1992

Prerequisites / notice
Strongly recommended (preparatory) courses are: quantum mechanics and quantum chemistry

Competencies

Subject-specific Competencies
- Concepts and Theories: assessed

151-0109-00L Turbulent Flows W 4 credits 2V+1U P. Jenny

Abstract
Laminar and turbulent flows, instability and origin of turbulence - Statistical description: averaging, turbulent energy, dissipation, closure problem - Scalings. Homogeneous isotropic turbulence, correlations, Fourier representation, energy spectrum - Free turbulence: wake, jet, mixing layer - Wall turbulence: Channel and boundary layer - Computation and modelling of turbulent flows

Objective
Basic physical phenomena of turbulent flows, quantitative and statistical description, basic and averaged equations, principles of turbulent flow computation and elements of turbulence modelling

Content
- Properties of laminar, transitional and turbulent flows.
- Origin and control of turbulence, instability and transition.
- Statistical description, averaging, equations for mean and fluctuating quantities, closure problem.
- Scalings, homogeneous isotropic turbulence, energy spectrum.
- Turbulent free shear flows. Jet, wake, mixing layer.
- Wall-bounded turbulent flows.
- Turbulent flow computation and modeling.

Lecture notes
Lecture notes are available

Literature

151-0213-00L Fluid Dynamics with the Lattice Boltzmann Method W 4 credits 3G I. Karlin

Abstract
The course provides an introduction to theoretical foundations and practical usage of the Lattice Boltzmann Method for fluid dynamics simulations.

Objective
Methods like molecular dynamics, DSMC, lattice Boltzmann etc are being increasingly used by engineers all over and these methods require knowledge of kinetic theory and statistical mechanics which are traditionally not taught at engineering departments. The goal of this course is to give an introduction to ideas of kinetic theory and non-equilibrium thermodynamics with a focus on developing simulation algorithms and their realizations.

During the course, students will be able to develop a lattice Boltzmann code on their own. Practical issues about implementation and performance on parallel machines will be demonstrated hands on.

Central element of the course is the completion of a lattice Boltzmann code (using the framework specifically designed for this course).

The course will also include a review of topics of current interest in various fields of fluid dynamics, such as multiphase flows, reactive flows, microflows among others.

Optionally, we offer an opportunity to complete a project of student’s choice as an alternative to the oral exam. Samples of projects completed by previous students will be made available.
The course builds upon three parts:

I. Elementary kinetic theory and lattice Boltzmann simulations introduced on simple examples.
II. Theoretical basis of statistical mechanics and kinetic equations.
III. Lattice Boltzmann method for real-world applications.

The content of the course includes:

1. Background: Elements of statistical mechanics and kinetic theory:
   - Particle’s distribution function, Liouville equation, entropy, ensembles; Kinetic theory; Boltzmann equation for rarefied gas, H-theorem, hydrodynamic limit and derivation of Navier-Stokes equations, Chapman-Enskog method, Grad method, boundary conditions; mean-field interactions, Vlasov equation;
   - Kinetic models: BGK model, generalized BGK model for mixtures, chemical reactions and other fluids.

2. Basics of the Lattice Boltzmann Method and Simulations:
   - Minimal kinetic models: lattice Boltzmann method for single-component fluid, discretization of velocity space, time-space discretization, boundary conditions, forcing, thermal models, mixtures.

3. Hands on:
   - Development of the basic lattice Boltzmann code and its validation on standard benchmarks (Taylor-Green vortex, lid-driven cavity flow etc).

4. Practical issues of LBM for fluid dynamics simulations:
   - Lattice Boltzmann simulations of turbulent flows; numerical stability and accuracy.

5. Microlow:
   - Rarefaction effects in moderately dilute gases; Boundary conditions, exact solutions to Couette and Poiseuille flows; micro-channel simulations.

6. Advanced lattice Boltzmann methods:
   - Entropic lattice Boltzmann scheme, subgrid simulations at high Reynolds numbers; Boundary conditions for complex geometries.

7. Introduction to LB models beyond hydrodynamics:
   - Relativistic fluid dynamics; flows with phase transitions.

Lecture notes

Lecture notes on the theoretical parts of the course will be made available.

Prerequisites / notice

The course addresses mainly graduate students (MSc/Ph D) but BSc students can also attend.

Abstract
Invited speakers from ETH, from other universities as well as from industry give a talk on an applied topic. Beside of attending the scientific talks students are asked to give short presentations (10 minutes) on a published paper out of a list.

Objective
+ actual techniques for the presentation of scientific results in a scientific talk
+ awareness of actual questions in research and development in CSE related areas

Content
In the CSE Case Studies Seminar invited speakers from ETH, from other universities as well as from industry give a talk on an applied topic. Beside of attending the scientific talks students are asked to give short presentations (10 minutes) on a published paper out of a list (containing articles from, e.g., Nature, Science, Scientific American, etc.). If the underlying paper comprises more than 15 pages, two or three consecutive case studies presentations delivered by different students can be based on it. Consistency in layout, style, and contents of those presentations is expected.

Students have to register their presentations online on https://rw.ethz.ch/the-programme/case-studies.html by the first week of the teaching period.

Prerequisites / notice
75% attendance and a short presentation on a published paper out of a list or on some own project are mandatory.

Students have to register their presentations online until the first Sunday of the semester on https://rw.ethz.ch/the-programme/case-studies.html

The student talks will be grouped by subject, so we’ll decide the actual dates of the individual talks.

Students that realize that they will not fulfill this criteria have to contact the teaching staff or de-register before the end of semester from the Seminar if they want to avoid a “Fail” in their documents. Later de-registrations will not be considered.

Successful participation in the course unit 401-2000-00L Scientific Works in Mathematics or 402-2000-00L Scientific Works in Physics is required.

Approval via the form https://my.cse.ethz.ch/ is MANDATORY (caution: in myStudies all lecturers can be selected despite the fact that some of them are actually not authorised as supervisors).

Abstract

The BSc thesis concludes the curriculum. In their BSc thesis, students should demonstrate their ability to carry out independent, structured scientific work. The purpose of the BSc thesis is to deepen knowledge in a certain subject and to bring students into closer contact with applications in an existing computational group. The BSc thesis requires approximately 420 hours of work.

Objective

In their BSc thesis students should demonstrate their ability to carry out independent, structured scientific work. The purpose is to deepen knowledge in a certain subject and to enable students to collaborate in an existing scientific group to take a computational approach to problems encountered in applications.

Prerequisites / notice

The supervisor responsible for the Bachelor thesis defines the task and determines the start and the submission date. The Bachelor thesis concludes with a written report. The Bachelor thesis is graded.

</table>
The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:

**Fundamentals:**
- What is data?
- Bayesian Learning
- Computational learning theory

**Supervised learning:**
- Ensembles: Bagging and Boosting
- Max Margin methods
- Neural networks

**Unsupervised learning:**
- Dimensionality reduction techniques
- Clustering
- Mixture Models
- Non-parametric density estimation
- Learning Dynamical Systems

**Lecture notes**
No lecture notes, but slides will be made available on the course webpage.

**Literature**

**Prerequisites / notice**
The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.

Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

Only one of the two course units 263-5210-00L Probabilistic Artificial Intelligence resp. 252-0535-00L Advanced Machine Learning may be recognised for credits as a core course. However, the other course unit may be recognised for a different category.

For the category assignment take contact with the Study Administration (www.math.ethz.ch/studiensekretariat).
263-5210-00L  Probabilistic Artificial Intelligence  W  8 credits  3V+2U+2A  A. Krause

Abstract
This course introduces core modeling techniques and algorithms from machine learning, optimization and control for reasoning and decision making under uncertainty, and study applications in areas such as robotics.

Objective
How can we build systems that perform well in uncertain environments? How can we develop systems that exhibit "intelligent" behavior, without prescribing explicit rules? How can we build systems that learn from experience in order to improve their performance? We will study core modeling techniques and algorithms from statistics, optimization, planning, and control and study applications in areas such as robotics. The course is designed for graduate students.

Content
Topics covered:
- Probability
- Probabilistic inference (variational inference, MCMC)
- Bayesian learning (Gaussian processes, Bayesian deep learning)
- Probabilistic planning (MDPs, POMDPs)
- Multi-armed bandits and Bayesian optimization
- Reinforcement learning

Prerequisites / notice
The material covered in the course "Introduction to Machine Learning" is considered as a prerequisite.

Competencies
- Subject-specific Competencies
  - Concepts and Theories
  - Techniques and Technologies
- Method-specific Competencies
  - Analytical Competencies
  - Decision-making
  - Media and Digital Technologies
  - Problem-solving
  - Project Management
- Social Competencies
  - Communication
  - Cooperation and Teamwork
- Personal Competencies
  - Creative Thinking
  - Critical Thinking
  - Integrity and Work Ethics

Fields of Specialization

 Astrophysics

Number  Title  Type  ECTS  Hours  Lecturers

401-7851-00L  Theoretical Astrophysics (University of Zurich)  W  10 credits  4V+2U  University lecturers

Abstract
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: AST512

Mind the enrolment deadlines at UZH:

Content
This course covers the foundations of astrophysical fluid dynamics, the Boltzmann equation, equilibrium systems and their stability, the structure of stars, astrophysical turbulence, accretion disks and their stability, the foundations of radiative transfer, collisionless systems, the structure and stability of dark matter halos and stellar galactic disks.

Literature
Course Materials:
1- The Physics of Astrophysics, Volume 1: Radiation by Frank H. Shu
2- The Physics of Astrophysics, Volume 2: Gas Dynamics by Frank H. Shu
3- Foundations of radiation hydrodynamics, Dimitri Mihalas and Barbara Weibel-Mihalas
4- Radiative Processes in Astrophysics, George B. Rybicki and Alan P. Lightman
5- Galactic Dynamics, James Binney and Scott Tremaine

Prerequisites / notice
This is a full blackboard ad chalk experience for students with a strong background in mathematics and physics.

- Prerequisites:
  - Introduction to Astrophysics
  - Mathematical Methods for the Physicist
  - Quantum Mechanics
  - Introduction to Astrophysics

- Prior Knowledge:
  - Mechanics
  - Quantum Mechanics and atomic physics
  - Thermodynamics
  - Fluid Dynamics
  - Electrodynamics

401-7855-00L  Computational Astrophysics (University of Zurich)  W  6 credits  2V  L. M. Mayer

Abstract
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: AST245

Mind the enrolment deadlines at UZH:

Objective
Acquire knowledge of main methodologies for computer-based models of astrophysical systems, the physical equations behind them, and train such knowledge with simple examples of computer programmes.

Data: 26.07.2024 12:39  Autumn Semester 2024  Page 2215 of 2680
**Physics of the Atmosphere**

**Number** 701-0023-00L  
**Title** Atmosphere  
**Type** W  
**ECTS** 3 credits  
**Hours** 2V  
**Lecturers** E. Fischer, U. Lohmann

**Abstract** Basic principles of the atmosphere, physical structure and chemical composition, trace gases, atmospheric cycles, circulation, stability, radiation, condensation, clouds, oxidation capacity and ozone layer.

**Competencies**  
Subject-specific Competencies: Concepts and Theories assessed  
Method-specific Competencies: Analytical Competencies assessed  
Social Competencies: Communication fostered  
Personal Competencies: Creative Thinking fostered

**Literature**  

**Prerequisites / notice** Some knowledge of UNIX, scripting languages (see www.physik.uzh.ch/lectures/informatik/python/ as an example), some prior experience programming, knowledge of C, C++ beneficial

---

**Number** 701-1221-00L  
**Title** Dynamics of Large-Scale Atmospheric Flow  
**Type** W  
**ECTS** 4 credits  
**Hours** 2V+1U  
**Lecturers** H. Wernli, J. Riboldi

**Abstract** This lecture course is about the fundamental aspects of the dynamics of extratropical weather systems (quasi-geostrophic dynamics, potential vorticity, Rossby waves, baroclinic instability). The fundamental concepts are formally introduced, quantitatively applied and illustrated with examples from the real atmosphere. Exercises (quantitative and qualitative) form an essential part of the course.

**Objective** Understanding of dynamic processes of large-scale atmospheric flow and their mathematical-physical formulation.
Analytical Competencies

ECTS, T. Weymuth

Subject-specific Competencies

- Decision-making
- Molecular models, classical force fields, configuration sampling, molecular dynamics simulation, boundary conditions, electrostatic interactions
- Creative Thinking

Method-specific Competencies

- Scientific writing
- Advanced, but fundamental topics central to the understanding of theory in chemistry and for solving actual chemical problems with a computer.

Social Competencies

- Cooperation and Teamwork

Personal Competencies

- Critical Thinking

401-5930-00L Seminar in Physics of the Atmosphere for CSE

Abstract

The process of writing a scientific proposal is introduced and the essential elements, including the peer review process, are outlined and class exercises train scientific writing skills. Knowledge exchange between class participants is promoted through the preparation of a master thesis proposal and evaluation of each other's work. An introduction to presentation skills is provided.

Objective

- Scientific writing
- Introduction to peer review process
- Correction / feedback to the proposals of other participants
- Presentation skills

Content

In this seminar, the process of writing a scientific proposal is introduced. The essential elements of a proposal, including the peer review process, are outlined and class exercises train scientific writing skills. Knowledge exchange between class participants is promoted through the preparation of a master thesis proposal and evaluation of each other's work. Furthermore, an introduction to presentation skills is provided.

Prerequisites / notice

In this seminar it is mandatory to write a proposal about an upcoming MSc thesis or semester project. If no such project is planned, this seminar cannot be taken. Please contact the lecturers (hanna.joos@env.ethz.ch) on time if you plan to take this seminar.

529-0003-01L Advanced Quantum Chemistry

Abstract

Advanced, but fundamental topics central to the understanding of theory in chemistry and for solving actual chemical problems with a computer. Examples are:

- Operators derived from principles of relativistic quantum mechanics
- Relativistic effects + methods of relativistic quantum chemistry
- Open-shell molecules + spin-density functional theory
- New electron-correlation theories
The aim of the course is to provide an in-depth knowledge of theory and method development in theoretical chemistry. It will be shown that this is necessary in order to be able to solve actual chemical problems on a computer with quantum chemical methods.

The relativistic re-derivation of all concepts known from (nonrelativistic) quantum mechanics and quantum-chemistry lectures will finally explain the form of all operators in the molecular Hamiltonian - usually postulated rather than deduced. From this, we derive operators needed for molecular spectroscopy (like those required by magnetic resonance spectroscopy). Implications of other assumptions in standard non-relativistic quantum chemistry shall be analyzed and understood, too. Examples are the Born-Oppenheimer approximation and the expansion of the electronic wave function in a set of pre-defined many-electron basis functions (Slater determinants). Overcoming these concepts, which are so natural to the theory of chemistry, will provide deeper insights into many-particle quantum mechanics. Also revisiting the workhorse of quantum chemistry, namely density functional theory, with an emphasis on open-shell electronic structures (radicals, transition-metal complexes) will contribute to this endeavor. It will be shown how these insights allow us to make more accurate predictions in chemistry in practice - at the frontier of research in theoretical chemistry.

### Content
1) Introductory lecture: basics of quantum mechanics and quantum chemistry
2) Einstein's special theory of relativity and the (classical) electromagnetic interaction of two charged particles
3) Klein-Gordon and Dirac equation; the Dirac hydrogen atom
4) Numerical methods based on the Dirac-Fock-Coulomb Hamiltonian, two-component and scalar relativistic Hamiltonians
5) Response theory and molecular properties, derivation of property operators, Breit-Pauli-Hamiltonian
6) Relativistic effects in chemistry and the emergence of spin
7) Spin in density functional theory
8) New electron-correlation theories: Tensor network and matrix product states, the density matrix renormalization group

### Lecture notes
A set of detailed lecture notes will be provided, which will cover the whole course.

**Seminar in Chemistry for CSE**

**W** 4 credits  2S  P. H. Hünenberger, M. Reiher

**Abstract**

The student will carry out a literature study on a topic of his or her liking (suggested by or in agreement with the supervisor) in the area of computer simulation in chemistry (Prof. Hünenberger) or of quantum chemistry (Prof. Reiher), the results of which are to be presented both orally and in written form.

For more information:

http://www.csms.ethz.ch/education/CSE_seminar.html

---

**Fluid Dynamics**

**One of the course units**

151-0103-00L Fluid Dynamics II

151-0109-00L Turbulent Flows is compulsory.

Students able to follow courses in German are advised to choose 151-0103-00L Fluid Dynamics II.

**Abstract**

- Laminar and turbulent flows, instability and origin of turbulence - Statistical description: averaging, turbulent energy, dissipation, closure problem - Scalings, Homogeneous isotropic turbulence, correlations, Fourier representation, energy spectrum - Free turbulence: wake, jet, mixing layer - Wall turbulence: Channel and boundary layer - Computation and modelling of turbulent flows

**Objective**

Basic physical phenomena of turbulent flows, quantitative and statistical description, basic and averaged equations, principles of turbulent flow computation and elements of turbulence modelling

**Content**

- Properties of laminar, transitional and turbulent flows.
- Origin and control of turbulence, Instability and transition.
- Statistical description, averaging, equations for mean and fluctuating quantities, closure problem.
- Scalings, homogeneous isotropic turbulence, energy spectrum.
- Turbulent free shear flows. Jet, wake, mixing layer.
- Wall-bounded turbulent flows.
- Turbulent flow computation and modeling.

</tr>
</tbody>
</table>

**Abstract**

Basic facts about nonlinear systems; stability and near-equilibrium dynamics; bifurcations; dynamical systems on the plane; non-autonomous dynamical systems; chaotic dynamics.

**Objective**

This course is intended for Masters and Ph.D. students in engineering sciences, physics and applied mathematics who are interested in the behavior of nonlinear dynamical systems. It offers an introduction to the qualitative study of nonlinear physical phenomena modeled by differential equations or discrete maps. We discuss applications in classical mechanics, electrical engineering, fluid mechanics, and biology. A more advanced Part II of this class is offered every other year.

**Content**

1. Basic facts about nonlinear systems: Existence, uniqueness, and dependence on initial data.
2. Near equilibrium dynamics: Linear and Lyapunov stability
3. Bifurcations of equilibria: Center manifolds, normal forms, and elementary bifurcations
4. Nonlinear dynamical systems on the plane: Phase plane techniques, limit sets, and limit cycles.
5. Time-dependent dynamical systems: Floquet theory, Poincare maps, averaging methods, resonance

**Lecture notes**

The class lecture notes will be posted electronically after each lecture. Students should not rely on these but prepare their own notes during the lecture.

**Prerequisites / notice**

- Prerequisites: Analysis, linear algebra and a basic course in differential equations.

**Abstract**

The course provides an introduction to theoretical foundations and practical usage of the Lattice Boltzmann Method for fluid dynamics simulations.
Objective

Methods like molecular dynamics, DSMC, lattice Boltzmann etc are being increasingly used by engineers all over and these methods require knowledge of kinetic theory and statistical mechanics which are traditionally not taught at engineering departments. The goal of this course is to give an introduction to ideas of kinetic theory and non-equilibrium thermodynamics with a focus on developing simulation algorithms and their realizations.

During the course, students will be able to develop a lattice Boltzmann code on their own. Practical issues about implementation and performance on parallel machines will be demonstrated hands on.

Central element of the course is the completion of a lattice Boltzmann code (using the framework specifically designed for this course).

The course will also include a review of topics of current interest in various fields of fluid dynamics, such as multiphase flows, reactive flows, microlows among others.

Optionally, we offer an opportunity to complete a project of student's choice as an alternative to the oral exam. Samples of projects completed by previous students will be made available.

Content

The course builds upon three parts:
I Elementary kinetic theory and lattice Boltzmann simulations introduced on simple examples.
II Theoretical basis of statistical mechanics and kinetic equations.
III Lattice Boltzmann method for real-world applications.

The content of the course includes:

1. Background: Elements of statistical mechanics and kinetic theory:
   Particle's distribution function, Liouville equation, entropy, ensembles; Kinetic theory: Boltzmann equation for rarefied gas, H-theorem, hydrodynamic limit and derivation of Navier-Stokes equations, Chapman-Enskog method, Grad method, boundary conditions; mean-field interactions, Vlasov equation;
   Kinetic models: BGK model, generalized BGK model for mixtures, chemical reactions and other fluids.

2. Basics of the Lattice Boltzmann Method and Simulations:
   Minimal kinetic models: lattice Boltzmann method for single-component fluid, discretization of velocity space, time-space discretization, boundary conditions, forcing, thermal models, mixtures.

3. Hands on:
   Development of the basic lattice Boltzmann code and its validation on standard benchmarks (Taylor-Green vortex, lid-driven cavity flow etc).

4. Practical issues of LBM for fluid dynamics simulations:
   Lattice Boltzmann simulations of turbulent flows; numerical stability and accuracy.

5. Microflow:
   Rarefaction effects in moderately dilute gases; Boundary conditions, exact solutions to Couette and Poiseuille flows; micro-channel simulations.

6. Advanced lattice Boltzmann methods:
   Entropic lattice Boltzmann scheme, subgrid simulations at high Reynolds numbers; Boundary conditions for complex geometries.

7. Introduction to LB models beyond hydrodynamics:
   Relativistic fluid dynamics; flows with phase transitions.

The course addresses mainly graduate students (MSc/Ph D) but BSc students can also attend.

Lecture notes

Lecture notes on the theoretical parts of the course will be made available.
Selected original and review papers are provided for some of the lectures on advanced topics.
Handouts and basic code framework for implementation of the lattice Boltzmann models will be provided.

Prerequisites /
notice

The course provides an introduction into stochastic methods that are applicable for the description, treatment, and modeling of systems that are subject to uncertainties or that respond to parameter changes in a chaotic manner. Corresponding systems may arise in fluid dynamics, structural mechanics, biology, electrical engineering as well as other areas.

By the end of the course you will be familiar with a range of mathematical/statistical tools that enable a quantitative treatment of problems that involve uncertainties.

- Probability theory, single and multiple random variables, mappings of random variables
- Estimation of statistical moments and probability densities based on data
- Stochastic differential equations, Ito calculus, PDF evolution equations
- Monte Carlo integration with importance and stratified sampling
- Markov-chain Monte Carlo sampling
- Control-variate and multi-level Monte Carlo estimation
- Kalman filters (classical and ensemble-based)
- Statistical tests for means and goodness-of-fit

Detailed lecture notes will be provided.

Some textbooks related to the material covered in the course:
The main learning objectives of this course are:

- To understand and apply the fundamental results in linear system theory to analyze and control linear dynamical systems.
- To develop skills in proof techniques and practices.
- To foster creative thinking and analytical competencies.
- To acquire subject-specific competencies in control systems for single input - single output and multivariable systems.
- To expand ECTS and lecture hours.

The course gives an overview on the following topics: basics of hydrodynamics, capillarity, hydrodynamic instabilities, liquid fragmentation.

Students should be able to:

1. Identify and describe dominant effects in liquid fluid flows through physical modelling.
2. Describe acoustic wave behaviour in liquids.
3. Explain tension, nucleation and phase-change in liquids.
4. Predict the behaviour of a gas bubble subject to changes in surrounding liquid pressure.
5. Describe hydrodynamic cavitation and its consequences in physical terms.
6. Recognise experimental techniques and industrial and medical applications for cavitation.
7. Read and evaluate research papers on recent research on cavitation and bubble dynamics and communicate the content orally to a multidisciplinary audience.

Content:

- Acoustics in liquids, tension in liquids, phase change. Cavitation and bubble dynamics: single bubbles (nucleation, dynamics, collapse), bubble clouds and cavitating flows. Industrial applications and measurement techniques.

Lecture notes:

- Class notes and handouts

Literature:

- Literature will be provided in the course material.

Prerequisites:

- Fluid dynamics I & II or equivalent

Competencies:

- Subject-specific Competencies
  - Concepts and Theories
  - Techniques and Technologies
- Method-specific Competencies
  - Analytical Competencies
  - Decision-making
  - Media and Digital Technologies
  - Problem-solving
- Social Competencies
  - Communication
  - Cooperation and Teamwork
- Personal Competencies
  - Creative Thinking
  - Critical Thinking

| 227-0225-00L | Linear System Theory        | W    | 6    | 5G   | J. Lygeros, A. Tsiamis |
| Abstract     | The class is intended to provide a comprehensive overview of the theory of linear dynamical systems, stability analysis, and their use in control and estimation. The focus is on the mathematics behind the physical properties of these systems and on understanding and constructing proofs of properties of linear control systems. |
| Objective    | Students should be able to apply the fundamental results in linear system theory to analyze and control linear dynamical systems. |
| Content      | Proof techniques and practices. |
|             | Linear spaces, normed linear spaces and Hilbert spaces. |
|             | Ordinary differential equations, existence and uniqueness of solutions. |
|             | Continuous and discrete-time, time-varying linear systems. Time domain solutions. Time invariant systems treated as a special case. |
|             | Controllability and observability, duality. Time invariant systems treated as a special case. |
|             | Stability and stabilization, observers, state and output feedback, separation principle. |
| Lecture notes | Available on the course Moodle platform. |
Nonlinear Dynamics and Chaos I - Master the basics of signals and systems. Apply this knowledge to problems in the homework assignments and programming exercise.

Analytical Competencies fostered

Lecture notes available on course website.

Signals arise in most engineering applications. They contain information about the behavior of physical systems. Systems respond to signals and produce other signals. In this course, we explore how signals can be represented and manipulated, and their effects on systems. We further explore how we can discover basic system properties by exciting a system with various types of signals.

Subject-specific Competencies

This course aims at offering a self-contained account of computer vision and its underlying concepts, including the recent use of deep learning. Model predictive control (MPC) has established itself as a powerful control technique for complex systems under state and input constraints. This course discusses the theory and application of recent advanced MPC concepts, focusing on system uncertainties and safety, as well as data-driven formulations and learning-based control.

Number of participants limited to 60.

Prerequisites / notice

The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments. Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

151-0371-00L Advanced Model Predictive Control

Abstract

Model predictive control (MPC) has established itself as a powerful control technique for complex systems under state and input constraints. This course discusses the theory and application of recent advanced MPC concepts, focusing on system uncertainties and safety, as well as data-driven formulations and learning-based control.

Objective

Design, implement and analyze advanced MPC formulations for robust and stochastic uncertainty descriptions, in particular with data-driven formulations.

Content

Topics include:
- Nominal MPC for uncertain systems (nominal robustness)
- Robust MPC
- Stochastic MPC
- Review of regression methods
- Set-membership Identification and robust data-driven MPC
- Bayesian regression and stochastic data-driven MPC
- MPC as safety filter for reinforcement learning

Lecture notes

Lecture notes will be provided.

Prerequisites / notice

Basic courses in control, advanced course in optimal control, basic MPC course (e.g. 151-0660-00L Model Predictive Control in Spring Semester) strongly recommended. Background in linear algebra and stochastic systems recommended.

401-5850-00L Seminar in Systems and Control for CSE

Abstract

Guided self-study on a topic related to systems and control

227-0447-00L Image Analysis and Computer Vision

Abstract

Objective

This course aims at offering a self-contained account of computer vision and its underlying concepts, including the recent use of deep learning.

The first part starts with an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First the interaction of light with matter is considered. The most important hardware components such as cameras and illumination sources are also discussed. The course then turns to image discretization, necessary to process images by computer.

The next part describes necessary pre-processing steps, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and 3D shape as two important examples. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed. A major part at the end is devoted to deep learning and AI-based approaches to image analysis. Its main focus is on object recognition, but also other examples of image processing using deep neural nets are given.

Lecture notes

Course material Script, computer demonstrations, exercises and problem solutions

No lecture notes, but slides will be made available on the course webpage.

**Literature**

**Prerequisites / notice**
The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

**252-3005-00L**
**Natural Language Processing**
- **W** 7 credits
- **3V+3U+1A**
- R. Cotterell

**Abstract**
This course presents topics in natural language processing with an emphasis on modern techniques, primarily focusing on statistical and deep learning approaches. The course provides an overview of the primary areas of research in language processing as well as a detailed exploration of the models and techniques used both in research and in commercial natural language systems.

**Objective**
The objective of the course is to learn the basic concepts in the statistical processing of natural languages. The course will be project-oriented so that the students can also gain hands-on experience with state-of-the-art tools and techniques.

**Content**
This course presents an introduction to general topics and techniques used in natural language processing today, primarily focusing on statistical approaches. The course provides an overview of the primary areas of research in language processing as well as a detailed exploration of the models and techniques used both in research and in commercial natural language systems.

**Literature**
Lectures will make use of textbooks such as the one by Jurafsky and Martin where appropriate, but will also make use of original research and survey papers.

**263-3210-00L**
**Deep Learning**
- **W** 8 credits
- **3V+2U+2A**
- T. Hofmann

**Abstract**
Deep learning is an area within machine learning that deals with algorithms and models that automatically induce multi-level data representations.

**Objective**
In recent years, deep learning and deep networks have significantly improved the state-of-the-art in many application domains such as computer vision, speech recognition, and natural language processing. This class will cover the mathematical foundations of deep learning and provide insights into model design, training, and validation. The main objective is a profound understanding of why these methods work and how. There will also be a rich set of hands-on tasks and practical projects to familiarize students with this emerging technology.

**Prerequisites / notice**
This is an advanced level course that requires some basic background in machine learning. More importantly, students are expected to have a very solid mathematical foundation, including linear algebra, multivariate calculus, and probability. The course will make heavy use of mathematics and is not (!) meant to be an extended tutorial of how to train deep networks with tools like Torch or Tensorflow, although that may be a side benefit.

The participation in the course is subject to the following condition:
- Students must have taken the exam in Advanced Machine Learning (252-0535-00) or have acquired equivalent knowledge, see exhaustive list below:
  - Advanced Machine Learning
    https://ml2.inf.ethz.ch/courses/aml/
  - Computational Intelligence Lab

**151-0563-01L**
**Dynamic Programming and Optimal Control**
- **W** 4 credits
- **2V+1U**
- R. D’Andrea

**Abstract**
Introduction to Dynamic Programming and Optimal Control.
How can we build systems that perform well in uncertain environments? How can we develop systems that exhibit "intelligent" behavior?

Topics covered:
- Dynamic Programming Algorithm; Deterministic Systems and Shortest Path Problems; Infinite Horizon Problems, Bellman Equation; Deterministic Continuous-Time Optimal Control.

Requirements: Knowledge of advanced calculus, introductory probability theory, and matrix-vector algebra.

---

151-0851-00L Robot Dynamics

Abstract
We will provide an overview on how to kinematically and dynamically model typical robotic systems such as robot arms, legged robots, rotary wing systems, or fixed wing.

Objective
The primary objective of this course is that the student deepens an applied understanding of how to model the most common robotic systems. The student receives a solid background in kinematics, dynamics, and rotations of multi-body systems. On the basis of state of the art applications, he/she will learn all necessary tools to work in the field of design or control of robotic systems.

Content
The course consists of three parts: First, we will refresh and deepen the student's knowledge in kinematics, dynamics, and rotations of multi-body systems. In this context, the learning material will build upon the courses for mechanics and dynamics available at ETH, with the particular focus on their application to robotic systems. The goal is to foster the conceptual understanding of similarities and differences among the various types of robots. In the second part, we will apply the learned material to classical robotic arms as well as legged systems and discuss kinematic constraints and interaction forces. In the third part, focus is put on modeling fixed wing aircraft, along with related design and control concepts. In this context, we also touch aerodynamics and flight mechanics to an extent typically required in robotics. The last part finally covers different helicopter types, with a focus on quadrotors and the coaxial configuration which we see today in many UAV applications. Case studies on all main topics provide the link to real applications and to the state of the art in robotics.

Prerequisites / notice
The contents of the following ETH Bachelor lectures or equivalent are assumed to be known: Mechanics, Dynamics, Control, Basics in Fluid Dynamics.

---

401-5860-00L Seminar in Robotics for CSE

Abstract
This course provides an opportunity to familiarize yourself with the advanced topics of robotics and mechatronics research. The study plan has to be discussed with the lecturer based on your specific interests and/or the relevant seminar series such as the IRIS'S Robotics Seminars and BIRONZ lectures, for example.

Objective
The students are familiar with the challenges of the fascinating and interdisciplinary field of Robotics and Mechatronics. They are introduced in the basics of independent non-experimental scientific research and are able to summarize and to present the results efficiently.

Content
This 4 ECTS course requires each student to discuss a study plan with the lecturer and select minimum 10 relevant scientific publications to read through, or attend 5-10 lectures of the public robotics oriented seminars (e.g. Public robotics seminars such as the IRIS'S Robotics Seminars http://www.iris.ethz.ch/iris/series/, and BIRONZ lectures http://www.birl.ethz.ch/bironz/index are good examples). At the end of semester, the results should be presented in an oral presentation and summarized in a report, which takes the discussion of the presentation into account.

Robotics (continued)

Only one of the two course units
263-5902-00L Computer Vision resp. 227-0447-00L Image Analysis and Computer Vision may be recognised for credits for the overall (CSE Bachelor and Master) study programmes.

Only one of the two course units
263-5210-00L Probabilistic Artificial Intelligence resp. 252-0535-00L Advanced Machine Learning may be recognised for credits in the field of specialisation 'Robotics' for the overall (CSE Bachelor and Master) study programmes. However, the other course unit may be recognised for a different category.

For the category assignment take contact with the Study Administration (www.math.ethz.ch/studiensekretariat).

---

263-5902-00L Computer Vision

Abstract
The goal of this course is to provide students with a good understanding of computer vision and image analysis techniques. The main concepts and techniques will be studied in depth and practical algorithms and approaches will be discussed and explored through the exercises.

Objective
The objectives of this course are:
1. To introduce the fundamental problems of computer vision.
2. To introduce the main concepts and techniques used to solve those.
3. To enable participants to implement solutions for reasonably complex problems.
4. To enable participants to make sense of the computer vision literature.

Content
Camera models and calibration, invariant features, Multiple-view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition

Prerequisites / notice
It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts before taking this course.

263-5210-00L Probabilistic Artificial Intelligence

Abstract
This course introduces core modeling techniques and algorithms from machine learning, optimization and control for reasoning and decision making under uncertainty, and study applications in areas such as robotics.

Objective
How can we build systems that perform well in uncertain environments? How can we develop systems that exhibit "intelligent" behavior, without prescribing explicit rules? How can we build systems that learn from experience in order to improve their performance? We will study core modeling techniques and algorithms from statistics, optimization, planning, and control and study applications in areas such as robotics. The course is designed for graduate students.

Content
Topics covered:
- Probability
- Probabilistic inference (Bayesian, MCMC) without specifying explicit rules? How can we build systems that learn from experience in order to improve their performance? We will study core modeling techniques and algorithms from statistics, optimization, planning, and control and study applications in areas such as robotics. The course is designed for graduate students.

Prerequisites / notice
Solid basic knowledge in statistics, algorithms and programming.

The material covered in the course "Introduction to Machine Learning" is considered as a prerequisite.
Introduction to Computational Physics

**Abstract**
This course offers an introduction to computer simulation methods for physics problems and their implementation on PCs and super computers. The covered topics include classical equations of motion, partial differential equations (wave equation, diffusion equation, Maxwell's equations), Monte Carlo simulations, percolation, phase transitions, and N-Body problems.

**Objective**
Students learn to apply the following methods: Random number generators, Determination of percolation critical exponents, numerical solution of problems from classical mechanics and electrodynamics, canonical Monte-Carlo simulations to numerically analyze magnetic systems. Students also learn how to implement their own numerical frameworks in Julia and how to use existing libraries to solve physical problems. In addition, students learn to distinguish between different numerical methods to apply them to solve a given physical problem.

**Content**
Introduction to computer simulation methods for physics problems. Models from classical mechanics, electrodynamics and statistical mechanics as well as some interdisciplinary applications are used to introduce modern programming methods for numerical simulations using Julia. Furthermore, an overview of existing software libraries for numerical simulations is presented.

**Lecture notes**
Lecture notes and slides are available online and will be distributed if desired.

**Literature**
Literature recommendations and references are included in the lecture notes.

**Prerequisites / notice**
Lecture and exercise lessons in english, exams in German or in English

**Quantum Mechanics I**

**Abstract**

**Objective**
Introduction to single-particle quantum mechanics. Familiarity with basic ideas and concepts (quantisation, operator formalism, symmetries, angular momentum, perturbation theory) and generic examples and applications (bound states, tunneling, hydrogen atom, harmonic oscillator). Ability to solve simple problems.

**Content**
The beginnings of quantum theory with Planck, Einstein and Bohr; Wave mechanics; Simple examples; The formalism of quantum mechanics (states and observables, Hilbert spaces and operators, the measurement process); Heisenberg uncertainty relation; Harmonic oscillator; Symmetries (in particular rotations); Hydrogen atom; Angular momentum addition; Quantum mechanics and classical physics (EPR paradox and Bell's inequality); Perturbation theory.

</table>
The course covers the key concepts and formalism of quantum information processing. Topics include quantum algorithms, quantum error correction, quantum cryptography, and quantum metrology, with an emphasis on the power of quantum information processing beyond that of classical information processing. The formalism of quantum states, measurements, and channels is developed in detail.

Objective

By the end of the course students are able to explain the basic mathematical formalism of quantum mechanics and apply it to quantum information processing problems. They are able to adapt and apply these concepts and methods to analyze and discuss quantum algorithms and other quantum information-processing protocols.

Content

The topics covered in the course will include quantum circuits, gate decomposition and universal sets of gates, efficiency of quantum circuits, quantum algorithms (Shor, Grover, Deutsch-Josza, ...), stabilizer-based quantum error correction, fault-tolerant designs, the BB84 quantum key distribution protocol, and simple methods of quantum metrology.

Lecture notes

Will be provided.

Literature

Quantum Computation and Quantum Information
Michael Nielsen and Isaac Chuang
Cambridge University Press

Prerequisites / notice

A good understanding of finite dimensional linear algebra is recommended.

Competencies

402-0777-00L Particle Accelerator Physics and Modeling I

W 6 credits 2V+1U A. Adelmann

Abstract

This is the first of two courses, introducing particle accelerators from a theoretical point of view and covers state-of-the-art modelling techniques.

Objective

You obtain a theoretical understanding of the building blocks of particle accelerators. Modern numerical analysis tools allows you to model state-of-the-art particle accelerators. We will develop a Julia simulation tool (JuliaAccel.jl) that reflects the theory from the lecture.

Content

Here is the rough plan of the topics, however the actual pace may vary relative to this plan.

- Recap of Relativistic Classical Mechanics and Electrodynamics
- Building Blocks of Particle Accelerators
- Lie Algebraic Structure of Classical Mechanics and Application to Particle Accelerators
- Symplectic Maps & Analysis of Maps
- Symplectic Particle Tracking
- Collective Effects
- Linear & Circular Accelerators

401-3913-01L Mathematical Foundations for Finance

W 4 credits 3V+2U D. Possamaï

Abstract

First introduction to main modelling ideas and mathematical tools from mathematical finance

Objective

This course gives a first introduction to the main modelling ideas and mathematical tools from mathematical finance. It mainly aims at non-mathematicians who need an introduction to the main tools from stochastic used in mathematical finance. However, mathematicians who want to learn some basic modelling ideas and concepts for quantitative finance (before continuing with a more advanced course) may also find this of interest. The main emphasis will be on ideas, but important results will be given with (sometimes partial) proofs.

Content

Topics to be covered include

- financial market models in finite discrete time
- absence of arbitrage and martingale measures
- valuation and hedging in complete markets
- basics about Brownian motion
- stochastic integration
- stochastic calculus: Itô's formula, Girsanov transformation, Itô's representation theorem
- Black-Scholes formula

Lecture notes

See information on course homepage
While there are many textbooks on mathematical finance, none of them is ideal to cover the contents of this course. References include the following books:

Abstract
This course is on the numerical approximations of stochastic ordinary differential equations (SDEs) driven by Brownian motions and Lévy processes. SDEs have several applications, for example in financial engineering. The contents cover stochastic processes, stochastic calculus, well-posedness results for SDEs, strong and weak approximations of SDEs, and simulation via Monte Carlo methods.

Objective
The aim of this course is to enable the students to carry out simulations and their mathematical convergence analysis for stochastic models originating from applications such as mathematical finance. For this the course teaches a decent knowledge of the different numerical methods, their underlying ideas, convergence properties and implementation issues.

Content
Brownian motion and Lévy processes
Stochastic integration and stochastic calculus
Stochastic ordinary differential equations (SDEs)
Numerical approximations of SDEs
Stochastic simulation and Monte Carlo methods
Applications to computational finance: Option valuation

Lecture notes
There will be English, typed lecture notes for registered participants in the course.

401-3915-73L Machine Learning in Finance and Insurance
W 5 credits 2V+1U P. Cheridito

Abstract
This course introduces machine learning methods that can be used in finance and insurance applications.

Objective
The goal is to learn methods from machine learning that can be used in financial and insurance applications.

Content
Linear, polynomial, logistic, ridge and lasso regression, dimension reduction methods, singular value decomposition, kernel methods, support vector machines, classification and regression trees, random forests, XGBoost, neural networks, stochastic gradient descent, autoencoders, graph neural networks, transformers, credit analytics, pricing, hedging, insurance claim prediction.

Electromagnetics

Number Title Type ECTS Hours Lecturers
227-0110-00L Electromagnetic Waves: Materials, Effects, and Antennas W 6 credits 4G

Does not take place this semester.

Abstract
This course provides profound knowledge about electromagnetic waves. Various types of materials, nonlinear and resonant effects, and antenna applications are discussed.

Objective
You can describe wave propagation in classical and nonclassical materials and know the fundamental solutions. You know how waves interact with matter and about nonlinear, scattering and resonant effects. You can apply the acquired knowledge in scattering, waveguiding, radiation, and antenna problems.

Content
The lecture covers the following topics:
- Generic time-harmonic electromagnetic fields
- Fundamental solutions of the wave equation
- Wave propagation in various types of materials
- Interaction of waves with matter
- Nonlinear effects
- Resonant effects
- Applications like scattering, waveguiding, radiation
- Radio frequency and optical antennas

Lecture notes
Lecture notes and slides will be handed out during the lectures.

Abstract

This module consists of (a) an introduction to fundamental equations of electromagnetics, mechanics, and heat transfer, (b) a detailed overview of numerical methods for field simulations, and (c) practical examples solved in form of small projects.

Objective

Basic knowledge of the fundamental equations and effects of electromagnetics, mechanics, and heat transfer. Knowledge of the main concepts of numerical methods for physical modelling and simulation. Ability (a) to develop own simple field simulation programs, (b) to select an appropriate field solver for a given problem, (c) to perform field simulations, (d) to evaluate the obtained results, and (e) to interactively improve the models until sufficiently accurate results are obtained.

Content

The module begins with an introduction to the fundamental equations and effects of electromagnetics, mechanics, and heat transfer. After the introduction follows a detailed overview of the available numerical methods for solving electromagnetic, thermal and mechanical boundary value problems. This part of the course contains a general introduction into numerical methods, differential and integral forms, linear equation systems, Finite Difference Method (FDM), Boundary Element Method (BEM), Method of Moments (MoM), Multiple Multipole Program (MMP) and Finite Element Method (FEM). The theoretical part of the course finishes with a presentation of multiphysics simulations through several practical examples of HF-engineering such as coupled electromagnetic-mechanical and electromagnetic-thermal analysis of MEMS.

In the second part of the course the students will work in small groups on practical simulation problems. For solving practical problems the students can develop and use own simulation programs or chose an appropriate commercial field solver for their specific problem. This practical simulation work of the students is supervised by the lecturers.

Abstract

The path of an analog signal in the transmitter to the digital world in a communication link and back to the analog world at the receiver is discussed. The lecture covers the fundamentals of all important optical and optoelectronic components in a fiber communication system. This includes the transmitter, the fiber channel and the receiver with the electronic digital signal processing elements.

Objective

An in-depth understanding on how information is transmitted from source to destination. Also the mathematical framework to describe the important elements will be passed on. Students attending the lecture will further get engaged in critical discussion on societal, economical and environmental aspects related to the on-going exponential growth in the field of communications.

Content

* Chapter 1: Introduction: Analog/Digital conversion, The communication channel, Shannon channel capacity, Capacity requirements.

Abstract

The aim of this course is to review new and fundamental mathematical tools, computational approaches, and inversion and optimal design methods used to address challenging problems in nanophotonics. The emphasis will be on analyzing plasmon resonant nanoparticles, super-focusing & super-resolution of electromagnetic waves, photonic crystals, electromagnetic cloaking, metamaterials, and metasurfaces.
Objective

The field of photonics encompasses the fundamental science of light propagation and interactions in complex structures, and its technological applications.

The recent advances in nanoscience present great challenges for the applied and computational mathematics community. In nanophotonics, the aim is to control, manipulate, reshape, guide, and focus electromagnetic waves at nanometer length scales, beyond the resolution limit. In particular, one wants to break the resolution limit by reducing the focal spot and confine light to length scales that are significantly smaller than half the wavelength.

Interactions between the field of photonics and mathematics has led to the emergence of a multitude of new and unique solutions in which today's conventional technologies are approaching their limits in terms of speed, capacity and accuracy. Light can be used for detection and measurement in a fast, sensitive and accurate manner, and thus photonics possesses a unique potential to revolutionize healthcare. Light-based technologies can be used effectively for the very early detection of diseases, with non-invasive imaging techniques or point-of-care applications. They are also instrumental in the analysis of processes at the molecular level, giving a greater understanding of the origin of diseases, and hence allowing prevention along with new treatments. Photonic technologies also play a major role in addressing the needs of our ageing society: from pace-makers to synthetic bones, and from endoscopes to the micro-cameras used in in-vivo processes. Furthermore, photonics are also used in advanced lighting technology, and in improving energy efficiency and quality. By using photonic media to control waves across a wide band of wavelengths, we have an unprecedented ability to fabricate new materials with specific microstructures.

The main objective in this course is to report on the use of sophisticated mathematics in diffractive optics, plasmonics, super-resolution, photonic crystals, and metamaterials for electromagnetic invisibility and cloaking. The book merges highly nontrivial multi-mathematics in order to make a breakthrough in the field of mathematical modelling, imaging, and optimal design of optical nanodevices and nanostructures capable of light enhancement, and of the focusing and guiding of light at a subwavelength scale. We demonstrate the power of layer potential techniques in solving challenging problems in photonics, when they are combined with asymptotic analysis and the elegant theory of Gohberg and Sigal on meromorphic operator-valued functions.

In this course we shall consider both analytical and computational matters in photonics. The issues we consider lead to the investigation of fundamental problems in various branches of mathematics. These include asymptotic analysis, spectral analysis, mathematical imaging, optimal design, stochastic modelling, and analysis of wave propagation phenomena. On the other hand, deriving mathematical foundations, and new and efficient computational frameworks and tools in photonics, requires a deep understanding of the different scales in the wave propagation problem, an accurate mathematical modelling of the nanodevices, and fine analysis of complex wave propagation phenomena. An emphasis is put on mathematically analyzing plasmon resonant nanoparticles, diffractive optics, photonic crystals, super-resolution, and metamaterials.

401-5870-00L Seminar in Electromagnetics for CSE W 4 credits 2S J. Smajic

Abstract

Various topics of electromagnetics, including electromagnetic theory, computational electromagnetics, electromagnetic wave propagation, applications from statics to optics. Traditional problems such as antennas, electromagnetic scattering, waveguides, resonators, etc. as well as modern topics such as photonic crystals, metamaterials, plasmonics, etc. are considered.

Objective

Knowledge of the fundamentals of electromagnetic theory, development and application of numerical methods for solving Maxwell equations, analysis and optimal design of electromagnetic structures

Geophysics

Recommended combinations:

- Subject 2 + Subject 5 + Subject 6 + Subject 7
- Subject 2 + Subject 4 + Subject 5 + Subject 6 + Subject 8
- Subject 2 + Subject 5 + Subject 6 + (Subject 1 or Subject 3)

Geophysics: Subject 1

Number Title Type ECTS Hours Lecturers

651-4007-00L Continuum Mechanics W 3 credits 2V T. Gerya

Abstract

In this course, students learn crucial partial differential equations (conservation laws) that are applicable to any continuum including the Earth's mantle, core, atmosphere and ocean. The course will provide step-by-step introduction into the mathematical structure, physical meaning and analytical solutions of the equations. The course has a particular focus on solid Earth applications.

Objective

The goal of this course is to learn and understand few principal partial differential equations (conservation laws) that are applicable for analysing and modelling of any continuum including the Earth's mantle, core, atmosphere and ocean. By the end of the course, students should be able to write, explain and analyse the equations and apply them for simple analytical cases. Numerical solving of these equations will be discussed in the Numerical Modelling I and II course running in parallel.
A provisional week-by-week schedule (subject to change) is as follows:

Weeks 1,2: The continuity equation

Weeks 3,4: Density and gravity

Weeks 5,6: Stress and strain

Weeks 7,8: The momentum equation

Week 9: Viscous rheology of rocks
Theory: Solid-state creep of minerals and rocks as the major mechanism of deformation of the Earth's interior. Dislocation and diffusion creep mechanisms. Rheological equations for minerals and rocks. Effective viscosity and its dependence on temperature, pressure and strain rate. Formulation of the effective viscosity from empirical flow laws. Exercise: Deriving viscous rheological equations for computing effective viscosities from empirical flow laws.

Weeks 10: The heat conservation equation

Weeks 11,12: Elasticity and plasticity

GRADING will be based on homeworks (1/3) and oral exam (2/3).

Number  Title  Type  ECTS  Hours  Lecturers
651-4241-00L Numerical Modelling I and II: Theory and Applications  W  6 credits  4G  T. Gerya

Abstract
In this 13-week sequence, students learn how to write programs from scratch to solve partial differential equations that are useful for Earth science applications. Programming will be done in MATLAB and will use the finite-difference method and marker-in-cell technique. The course will teach the student how to program numerical applications from scratch. By the end of the course, students should be able to write state-of-the-art MATLAB codes that solve systems of partial-differential equations relevant to Earth and Planetary Science applications using finite-difference method and marker-in-cell technique. Applications include Poisson equation, buoyancy driven variable viscosity flow, heat diffusion and advection, and state-of-the-art thermomechanical code programming. The emphasis will be on commonality, i.e., using a similar approach to solve different applications, and modularity, i.e., re-use of code in different programs. The course will emphasize a hands-on learning approach rather than extensive theory, and will begin with an introduction to programming in MATLAB.
A provisional week-by-week schedule (subject to change) is as follows:

Week 1: Introduction to the finite difference approximation to differential equations. Introduction to programming in Matlab. Solving of 1D Poisson equation.

Week 3: Solving momentum and continuity equations in case of constant viscosity with stream function/vorticity formulation.

Weeks 5: Conservative finite differences for the momentum equation. "Free slip" and "no slip" boundary conditions. Solving momentum and continuity equations in case of variable viscosity using pressure-velocity formulation with staggered grid.

Week 7: Advection in 2-D with Marker-in-cell method. Combining flow calculation and advection for buoyancy driven flow.

Week 9: Solving 2D heat conservation equation in case of constant thermal conductivity with explicit and implicit approaches.

Week 10: Solving 2D heat conservation equation in case of variable thermal conductivity with implicit approach. Temperature advection with markers. Creating thermomechanical code by combining mechanical solution for 2D buoyancy driven flow with heat diffusion and advection based on marker-in-cell approach.

Week 11: Implementation of radioactive, adiabatic and shear heating to the thermomechanical code.

Week 12: Programming of solution of coupled solid-fluid momentum and continuity equations for the case of melt percolation in a rising mantle plume.

Week 14: Final project description for slab breakoff modeling.

GRADING will be based on weekly programming homeworks (50%) and a term project (50%) to develop an application of their choice to a more advanced level.

**Abstract**
This course gives an introduction to programming in Fortran, and is suitable for students who have only minimal programming experience. The focus will be on Fortran 95-2018, but differences to Fortran 77 will be mentioned for those working with already-existing codes. A hands-on approach will be emphasized rather than abstract concepts.

**Objective**
Fortran is a modern programming language that is updated every few years (most recently in 2018) and is specifically designed for scientific and engineering applications. This course gives an introduction to programming in this language, and is suitable for students who have only minimal programming experience, for example with MATLAB scripts. The focus will be on Fortran 95-2018, but differences to Fortran 77 will be mentioned for those working with already-existing codes. A hands-on approach will be emphasized rather than abstract concepts, using example scientific problems relevant to Earth science.

**Abstract**
The seminar in geophysics for CSE is a work on a small research project for 4 credit points. The project can be supervised and graded by any member of the Institute of Geophysics with doctoral degree.

**Objective**
Students will learn modern quantitative geophysical research by conducting a small original project on a relevant subject.

**Content**
Students should find a project of interest by contacting potential supervisors from the Institute of Geophysics and agree on the content and timing of the project. At the end of the project, a written report of free format should be submitted by the student, which is then graded by the supervisor.

**Lecture notes**
No script

**Abstract**
Study of fundamental concepts, models and computational methods for the analysis of complex biological networks. Topics: Systems approaches in biology, biology and reaction network fundamentals, modelling and simulation approaches (topological, probabilistic, stoichiometric, qualitative, linear / nonlinear ODEs, stochastic), and systems analysis (complexity reduction, stability, identification).

**Objective**
The aim of this course is to provide an introductory overview of mathematical and computational methods for the modeling, simulation and analysis of biological networks.
The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Computational algorithms extracting biological information from genetic sequence data are discussed, and statistical tools to understand this information in detail are introduced. Attendees will learn which information is contained in genetic sequencing data and how to extract information from this data using computational tools. The main concepts introduced are:

- stochastic models in molecular evolution
- phylogenetic & phylodynamic inference
- maximum likelihood and Bayesian statistics

Attendees will apply these concepts to a number of applications yielding biological insight into:

- epidemiology
- pathogen evolution
- macroevolution of species

The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods for direct alignment analysis using approaches such as BLAST and GWAS. Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. Lastly, we introduce the field of phylodynamics, the aim of which is to understand and quantify population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:

- Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.

Basic knowledge in linear algebra, analysis, and statistics will be helpful. Programming in R will be required for the project work (compulsory continuous performance assessments). In case you do not have any previous experience with R, we strongly recommend to get familiar with R prior to the semester start. For the D-BSSE students, we highly recommend the voluntary course „Introduction to Programming“, which takes place in Basel before the start of the semester.

- Concepts and Theories: assessed
- Techniques and Technologies: assessed

**Method-specific Competencies**

- Analytical Competencies: assessed
- Decision-making: assessed
- Problem-solving: assessed

**Personal Competencies**

- Creative Thinking: assessed
- Critical Thinking: assessed

**Prerequisites / notice**

- Basic knowledge in linear algebra, analysis, and statistics will be helpful. Programming in R will be required for the project work (compulsory continuous performance assessments). In case you do not have any previous experience with R, we strongly recommend to get familiar with R prior to the semester start. For the D-BSSE students, we highly recommend the voluntary course „Introduction to Programming“, which takes place in Basel before the start of the semester.
Deep-learning a brain-inspired weak form of AI allows training of large artificial neuronal networks (ANNs) that, like humans, can learn real-world tasks such as recognizing objects in images. However, DL is far from being understood and investigating learning in biological networks might serve again as a compelling inspiration to think differently about state-of-the-art ANN training methods.

The main goal of this lecture is to provide a comprehensive overview into the learning principles neuronal networks as well as to introduce a diverse skill set (e.g. simulating a spiking neuronal network) that is required to understand learning in large, hierarchical neuronal networks. To achieve this the lectures and exercises will merge ideas, concepts and methods from machine learning and neuroscience.

The course will use training basic ANNs, simulating spiking neuronal networks as well as being able to read and understand the main ideas presented in today's neuroscience papers.

After this course students will be able to:
- read and understand the main ideas and methods that are presented in today's neuroscience papers
- explain the basic ideas and concepts of plasticity in the mammalian brain
- implement alternative ANN learning algorithms to 'error backpropagation' in order to train deep neuronal networks.
- use a diverse set of ANN regularization methods to improve learning
- simulate spiking neuronal networks that learn simple (e.g. digit classification) tasks in a supervised manner.

This advanced level lecture requires some basic background in machine/deep learning. Thus, students are expected to have a basic mathematical foundation, including linear algebra, multivariate calculus, and probability. The course is not to be meant as an extended tutorial of how to train deep networks in PyTorch or Tensorflow, although those tools used.

The lecture slides will be provided as a PDF after each lecture.

The lecture course is not based on any textbook. The following textbooks are related to some of its content. The textbooks may be of interest for further reading, but are not necessary to follow the course:

Murray, Mathematical Biology, Springer
Forgacs and Newman, Biological Physics of the Developing Embryo, CUP
Keener and Sneyd, Mathematical Physiology, Springer
Fall et al, Computational Cell Biology, Springer
Szalasi et al, System Modeling in Cellular Biology, MIT Press
Wolfgang, Sytems Biology
Kreyszig, Engineering Mathematics, Wiley

Prerequisites / notice

The course is self-contained. The course assumes no background in biology but a good foundation regarding mathematical and computational techniques.

Literature

227-0421-00L Learning in Deep Artificial and Biological Neuronal Networks

Objective

Deep-learning (DL) a brain-inspired weak form of AI allows training of large artificial neuronal networks (ANNs) that, like humans, can learn real-world tasks such as recognizing objects in images. However, DL is far from being understood and investigating learning in biological networks might serve again as a compelling inspiration to think differently about state-of-the-art ANN training methods.

The main goal of this lecture is to provide a comprehensive overview into the learning principles neuronal networks as well as to introduce a diverse skill set (e.g. simulating a spiking neuronal network) that is required to understand learning in large, hierarchical neuronal networks. To achieve this the lectures and exercises will merge ideas, concepts and methods from machine learning and neuroscience.

This advanced level lecture requires some basic background in machine/deep learning. Thus, students are expected to have a basic mathematical foundation, including linear algebra, multivariate calculus, and probability. The course is not to be meant as an extended tutorial of how to train deep networks in PyTorch or Tensorflow, although those tools used.

The lecture slides will be provided as a PDF after each lecture.

The participation in the course is subject to the following conditions:

1) The number of participants is limited to 120 students (MSc and PhDs).
2) Students must have taken the exam in Deep Learning (263-3210-00L) or have acquired equivalent knowledge.

Prerequisites / notice

227-1037-00L Introduction to Neuroinformatics

Objective

Understanding computation by neurons and neuronal circuits is one of the great challenges of science. Many different disciplines can contribute their tools and concepts to solving mysteries of neural computation. The goal of this introductory course is to introduce the monocultures of physics, maths, computer science, engineering, biology, psychology, and even philosophy and history, to discover the enclaves and challenges that we all face in taking on this major 21st century problem and how each discipline can contribute to discovering solutions.

The course provides an introduction to the functional properties of neurons. Particularly the description of membrane electrical properties (action potentials, channels), neuronal anatomy, synaptic structures, and neuronal networks. Simple models of computation, learning, and behavior will be explained. Some artificial systems (robot, chip) are presented.

This course considers the structure and function of biological neuronal networks at different levels. The function of neuronal networks lies fundamentally in their wiring and in the electro-chemical properties of nerve cell membranes. Thus, the biological structure of the nerve cell needs to be understood if biologically-realistic models are to be constructed. These simpler models are used to estimate the electrical current flow through dendritic cables and explore how a more complex geometry of neurons influences this current flow. The active properties of nerves are studied to understand both sensory transduction and the generation and transmission of nerve impulses along axons. The concept of local neuronal circuits arises in the context of the rules governing the formation of nerve connections and topographic projections within the nervous system. Communication between neurons in the network can be thought of as information flow across synapses, which can be modified by experience. We need an understanding of the action of inhibitory and excitatory neurotransmitters and neuromodulators, so that the dynamics and logic of synapses can be interpreted. Finally, simple neuronal architectures of feedforward and recurrent networks are discussed in the context of co-ordination, control, and integration of sensory and motor information.

Connections to computer science and artificial intelligence are discussed, but the main focus of the course is on establishing the biological basis of computations in neurons.

551-1299-00L Bioinformatics

Abstract

Students will study bioinformatic concepts in the areas of metagenomics, genomics, transcriptomics, proteomics, biological networks and biostatistics. Through integrated lectures, practical hands-on exercises and project work, students will also be trained in analytical and programming skills to meet the emerging increase in data-driven knowledge generation in biology in the 21st century.
Students will have an advanced understanding of the underlying concepts behind modern bioinformatic analyses at genome, metagenome and proteome-wide scales. They will be familiar with the most common data types, where to access them, and how to analytically work with them to address contemporary questions in the field of biology.

Course participants have already acquired basic programming skills in UNIX, Python and R.

Students bring their own computer with keyboard, internet access (browser) and software to connect to the ETH network via VPN.

- **Abstract**
  
  This course aims to cover state-of-the-art methods in modern parallel computing on Graphics Processing Unit (GPU), supercomputing and code development with applications to natural sciences and engineering.

- **Objective**
  
  When quantitative assessment of physical processes governing natural and engineered systems relies on numerically solving differential equations, fast and accurate solutions require performant algorithms leveraging parallel hardware. The goal of this course is to offer a practical approach to solve systems of differential equations in parallel on GPUs using the Julia language. Julia combines high-level language conciseness to low-level language performance which enables efficient code development.

  The course will be taught in a hands-on fashion, putting emphasis on you writing code and completing exercises; lecturing will be kept at a minimum. In a final project you will solve a solid mechanics or fluid dynamics problem of your interest, such as the shallow water equation, the shallow ice equation, acoustic wave propagation, nonlinear diffusion, viscous flow, elastic deformation, viscous or elastic poromechanics, frictional heating, and more. Your Julia GPU application will be hosted on a git-platform and implement modern software development practices.

- **Content**
  
  **Part 1 - Discovering a modern parallel computing ecosystem**
  
  - Learn the basics of the Julia language;
  - Learn how to solve diffusion, wave propagation and advection processes;
  - Implement efficient iterative algorithms;
  - Get started with software development tools: git, version control.

  **Part 2 - Developing your own parallel algorithms on GPUs**
  
  - Implement wave propagation and porous convection;
  - Apply spatial and temporal discretisation (finite-differences, various time-stepper);
  - Understand the practical challenges of parallel computing: GPUs, multi-core CPUs;
  - Learn about main simulation performance limiters;
  - Implement software development tooling: unit tests, continuous integration (CI).

  **Part 3 - Multi-GPU computing projects**
  
  - Understand the practical challenges of distributed parallel computing on multi-GPUs;
  - Implement shared (on CPU and GPU) and distributed memory parallelisation (multi-GPUs/CPUs);
  - Automatise the software tooling using remote runners.

- **Final projects**
  - Apply your new skills in a final project;
  - Implement advanced physical processes (solid and fluid dynamic - elastic and viscous solutions).

- **Lecture notes**
  
  Digital lecture notes, interactive Julia notebooks, online material.

- **Literature**
  
  Links to relevant literature will be provided during classes.

- **Prerequisites / notice**
  
  Completed BSc studies. Interest in and basic knowledge of numerics, applied mathematics, and physics/engineering sciences. Basic programming skills (in e.g. Matlab, Python, Julia); advanced programming skills are a plus.

- **Competencies**
  
  **Subject-specific Competencies**
  
  - Concepts and Theories
  - Techniques and Technologies

  **Method-specific Competencies**
  
  - Analytical Competencies
  - Decision-making
  - Media and Digital Technologies
  - Problem-solving
  - Project Management

  **Social Competencies**
  
  - Communication
  - Cooperation and Teamwork
  - Sensitivity to Diversity

  **Personal Competencies**
  
  - Creative Thinking
  - Critical Thinking
  - Integrity and Work Ethics
  - Self-awareness and Self-reflection
  - Self-direction and Self-management
151-0317-00L  Visualization, Simulation and Interaction - Virtual Reality II

**Abstract**

This lecture provides deeper knowledge on the possible applications of virtual reality, its basic technology, and future research fields. The goal is to provide a strong knowledge on Virtual Reality for a possible future use in business processes.

**Objective**

Virtual Reality can not only be used for the visualization of 3D objects, but also offers a wide application field for small and medium enterprises (SME). This could be for instance an enabling technology for net-based collaboration, the transmission of images and other data, the interaction of the human user with the digital environment, or the use of augmented reality systems. The goal of the lecture is to provide a deeper knowledge of today's VR environments that are used in business processes. The technical background, the algorithms, and the applied methods are explained more in detail. Finally, future tasks of VR will be discussed and an outlook on ongoing international research is given.

**Content**

Introduction into Virtual Reality; basics of augmented reality; interaction with digital data, tangible user interfaces (TUI); basics of simulation; compression procedures of image-, audio-, and video signals; new materials for force feedback devices; introduction into data security; cryptography; definition of free-form surfaces; digital factory; new research fields of virtual reality

**Lecture notes**

The handout is available in German and English.

**Prerequisites / notice**

"Visualization, Simulation and Interaction - Virtual Reality II" is recommended, but not mandatory.

**Didactical concept:**

The course consists of lectures and exercises.

**Competencies**

- **Subject-specific Competencies**
  - Concepts and Theories
  - Techniques and Technologies
- **Method-specific Competencies**
  - Analytical Competencies
  - Media and Digital Technologies
- **Social Competencies**
  - Communication
- **Personal Competencies**
  - Creative Thinking
  - Critical Thinking

**151-0833-00L  Applied Finite Element Analysis**

**Abstract**

Most problems in engineering are of nonlinear nature. The nonlinearities are caused basically due to the nonlinear material behavior, contact conditions and instabilities of structures. The principles of the nonlinear Finite-Element-Method (FEM) will be introduced for treating such problems. The finite element program ABAQUS is introduced to investigate real engineering problems.

**Objective**

The goal of the lecture is to provide the students with the fundamentals of the non linear Finite Element Method (FEM). The lecture focuses on the principles of the nonlinear Finite-Element-Method based on explicit and implicit formulations. Typical applications of the nonlinear Finite-Element-Methods are simulations of:

- Crash
- Collapse of structures
- Material behavior (metals and rubber)
- General forming processes

Special attention will be paid to the modeling of the nonlinear material behavior, thermo-mechanical processes and processes with large plastic deformations. The ability to independently create a virtual model which describes the complex non linear systems will be acquired through accompanying exercises. These will include the Matlab programming of important model components such as constitutive equations. The FEM Program ABAQUS will be introduced to investigate real engineering problems

**Content**

- introduction into FEM
- Fundamentals of continuum mechanics to characterize large plastic deformations
- Elasto-plastic material models
- Lagrange and Euler approaches
- FEM implementation of constitutive equations
- Element formulations
- Implicit and explicit FEM methods
- FEM formulations of coupled thermo-mechanical problems
- Modeling of tool contact and the influence of friction
- Solvers and convergence
- Instability problems

**Lecture notes**

Lecture slides

**Literature**

**151-0529-00L  Nonlinear FEA**

**Abstract**

The course provides an introduction to non-linear finite element analysis. The treated sources of non-linearity are related to material properties (hyperelasticity, plasticity), kinematics (large deformations, instability problems) and boundary conditions (contact).

**Objective**

To be able to address all major sources of non-linearity in theory and numerics, and to apply this knowledge to the solution of relevant problems in solid mechanics.

**Content**

1. Introduction: various sources of nonlinearities and implications for FEA.

**Lecture notes**

Lecture notes will be provided. However, students are encouraged to take their own notes.

**Prerequisites / notice**

Mechanics 1, 2, Dynamics, Continuum Mechanics I and Introduction to FEA. Ideally also Continuum Mechanics II.

**263-2800-00L  Design of Parallel and High-Performance Computing**

**Abstract**

Advanced topics in parallel and high-performance computing.

Understand concurrency paradigms and models from a higher perspective and acquire skills for designing, structuring and developing possibly large parallel high-performance software systems. Become familiar with important technical concepts and with concurrency folklore.

**Objective**

Note: The previous course title until HS23 "Computational Mechanics II: Nonlinear FEA"

Does not take place this semester.
After attending this course, students will:

1. Understand the foundations of 3D graphics, Computer Vision, and Human-Machine Interaction
2. Have a clear understanding on how to build mixed reality apps
3. Have a good overview of state-of-the-art Mixed Reality
4. Be able to critically analyze and assess current research in this area.

The course introduces latest mixed reality technology and provides introductory elements for a number of related fields including: Introduction to Mixed Reality / Augmented Reality / Virtual Reality Introduction to 3D Computer Graphics, 3D Computer Vision. This will take place in the form of short lectures, followed by student presentations discussing the current state-of-the-art. The main focus of this course is on mixed reality topics, where small groups of students will work on a particular project with the goal to design, develop and deploy a mixed reality application. The project topics are flexible and can reach from proof-of-concept vision(graphics/HMI research, to apps that support teaching with interactive augmented reality, or game development. The default platform will be Microsoft HoloLens in combination with C# and Unity3D - other platforms are also possible to use, such as tablets and phones.

Prerequisites / notice

- Good programming skills (C# / C++ / Java etc.)
- Computer graphics/vision experience: Students should have taken, at a minimum, Visual Computing. Higher level courses are recommended, such as Introduction to Computer Graphics, 3D Vision, Computer Vision.

**Abstract**

The goal of this course is an introduction and hands-on experience on latest mixed reality technology at the cross-section of 3D computer graphics and vision, human machine interaction, as well as gaming technology.

**Objective**

1. Understand the foundations of 3D graphics, Computer Vision, and Human-Machine Interaction
2. Have a clear understanding on how to build mixed reality apps
3. Have a good overview of state-of-the-art Mixed Reality
4. Be able to critically analyze and assess current research in this area.

7. Petri Nets

Lecture notes

Available at https://disco.ethz.ch/courses/des/
This first course in a series that extends over three consecutive terms is concerned with tailoring algorithms and with devising high performance hardware architectures for their implementation as ASIC or with FPGAs. The focus is on front end design using HDLs and automatic synthesis for producing industrial-quality circuits.

**Objective**
Understand Very-Large-Scale Integrated Circuits (VLSI chips), Application-Specific Integrated Circuits (ASIC), and Field-Programmable Gate-Arrays (FPGA). Know their organization and be able to identify suitable application areas. Become fluent in front-end design from architectural conception to gate-level netlists. How to model digital circuits with SystemVerilog. How to ensure they behave as expected with the aid of simulation, testbenches, and assertions. How to take advantage of automatic synthesis tools to produce industrial-quality VLSI and FPGA circuits. Gain practical experience with the hardware description language SystemVerilog and with industrial Electronic Design Automation (EDA) tools.

**Content**
This course is concerned with system-level issues of VLSI design and FPGA implementations. Topics include:
- Overview on design methodologies and fabrication depths.
- Levels of abstraction for circuit modeling.
- Organization and configuration of commercial field-programmable components.
- FPGA design flows.
- Dedicated and general purpose architectures compared.
- How to obtain an architecture for a given processing algorithm.
- Meeting throughput, area, and power goals by way of architectural transformations.
- Hardware Description Languages (HDL) and the underlying concepts.
- SystemVerilog.
- Register Transfer Level (RTL) synthesis and its limitations.
- Building blocks of digital VLSI circuits.
- Functional verification techniques and their limitations.
- Modular and largely reusable testbenches.
- Assertion-based verification.
- Synchronous versus asynchronous circuits.
- The case for synchronous circuits.
- Periodic events and the Anceau diagram.
- Case studies, ASICs compared to microprocessors, DSPs, and FPGAs.

During the exercises, students learn how to model FPGAs with SystemVerilog. They write testbenches for simulation purposes and synthesize gate-level netlists for FPGAs. Commercial EDA software by leading vendors is being used throughout.
An embedded system is a combination of hardware and software, either fixed in function or programmable, that is designed for a specific application scenario or for a specific task within a larger system. They are part of industrial machines such as agricultural and manufacturing equipment, automotive systems, medical equipment, household appliances, sensor networks, and the Internet of Things. Understanding the specific requirements and problems that arise in embedded system applications.

Using formal models and methods for designing and optimizing embedded systems.

Gaining experience with practical applications of the C programming language, embedded real-time operating systems, and debug functionalities of the associated design environment to design, implement, and verify embedded firmware.

Through project-based activities, students will gain substantial experience in applying the C programming language in the context of embedded systems. Projects will involve developing and implementing firmware, utilizing embedded real-time operating systems, and exploring the debugging functionalities within design environments. This hands-on approach aims to bridge the gap between theoretical knowledge and practical application, allowing students to experience the full lifecycle of embedded system development from design to implementation and verification.
This lecture focuses on the design of embedded systems using formal models and methods. Specifically, the following topics will be covered in the course: hardware and software structures of embedded systems, low-level instruction set, memory architecture and memory map, peripherals, hardware/software interfaces, communication between components, firmware design methodologies, firmware design using the C programming language, embedded real-time operating systems, real-time scheduling, shared resources, low-power, and low-energy designs well as computational accelerators.

Besides the theoretical lecture, the course contains laboratory sessions where students transfer the learned theoretical aspects into praxis by programming a microcontroller and interfacing it with sensors and actuators. Students will be exposed to a commercial microcontroller, and the development board extend with a custom-designed embedded systems educational platform.

Lecture material, publications, exercise sheets, and laboratory documentation will be available on the course's Moodle page.

252-0546-00L Physically-Based Simulation in Computer Graphics

Abstract
This lecture provides an introduction to physically-based animation in computer graphics and gives an overview of fundamental methods and algorithms. The practical exercises include three assignments which are to be solved in small groups. In an additional course project, topics from the lecture will be implemented into a 3D game or a comparable application.

Objective
The aim of this course is to gain insight into the main statistical ideas and concepts.

Content
The course considers classical low-dimensional models, with pointers towards today's highly complex models.

Prerequisites / notice
Knowledge of basic concepts in probability theory, and intermediate knowledge of statistics (e.g. a course in linear models or computational statistics).

Fundamentals of Mathematical Statistics

Abstract
In this course we study the basics of theoretical statistics. The course includes methods for designing estimators, confidence intervals and tests, and various ways to evaluate the accuracy of estimators, confidence intervals and tests. We consider optimality criteria such as admissibility and minimaxity, as well as Bayesian criteria. We will also present the asymptotic point of view.

Objective
The aim of this course is to gain insight into the main statistical ideas and concepts.

High-Dimensional Statistics

Abstract
"High-Dimensional Statistics" deals with modern methods and theory for statistical inference when the number of unknown parameters is of much larger order than sample size. Statistical estimation and algorithms for complex models and aspects of multiple testing will be discussed.

Objective
Knowledge of methods and basic theory for high-dimensional statistical inference

Content
Lasso and Group Lasso for high-dimensional linear and generalized linear models; Additive models and many smooth univariate functions; Non-convex loss functions and 11-regularization; Stability selection, multiple testing and construction of p-values; Undirected graphical modeling

Literature

Time Series Analysis

Abstract
The course offers an introduction into analyzing times series, that is observations which occur in time. The material will cover Stationary Models, ARMA processes, Spectral Analysis, Forecasting, Nonstationary Models, ARIMA Models and an introduction to GARCH models.

Objective
The goal of the course is to have a good overview of the different types of time series and the approaches used in their statistical analysis.

Content
This course treats modeling and analysis of time series, that is random variables which change in time. As opposed to the i.i.d. framework, the main feature exhibited by time series is the dependence between successive observations.

The key topics which will be covered as:
- Stationarity
- Autocorrelation
- Trend estimation
- Elimination of seasonality
- Spectral analysis, spectral densities
- Forecasting
- ARMA, ARIMA, Introduction into GARCH models

Literature
The main reference for this course is the book "Introduction to Time Series and Forecasting", by P. J. Brockwell and R. A. Davis

Data: 26.07.2024 12:39 Autumn Semester 2024 Page 2244 of 2680
### 401-3901-00L Linear & Combinatorial Optimization

**W 10 credits 4V+2U  R. Zenklusen**

**Abstract**
Mathematical treatment of optimization techniques for linear and combinatorial optimization problems.

**Objective**
The goal of this course is to get a thorough understanding of various classical mathematical optimization techniques for linear and combinatorial optimization problems, with an emphasis on polyhedral approaches. In particular, we want students to develop a good understanding of some important problem classes in the field, of structural mathematical results linked to these problems, and of solution approaches based on such structural insights.

**Content**
Key topics include:
- Linear programming and polyhedra;
- Flows and cuts;
- Combinatorial optimization problems and polyhedral techniques;
- Equivalence between optimization and separation.

**Literature**

**Prerequisites / notice**
Basic knowledge in probability and statistics.

---

### 401-4944-20L Mathematics of Data Science

**W 8 credits 3V+2U  A. Bandeira**

**Abstract**
Mostly self-contained, but fast-paced, introductory masters level course on various theoretical aspects of algorithms that aim to extract information from data.

**Objective**
Introduction to various mathematical aspects of Data Science.

**Content**
These topics lie in overlaps of Mathematics with: Computer Science, Electrical Engineering, Statistics, and/or Operations Research. Most lectures will feature Mathematical Open Problems. The main mathematical tools used will be Probability and Linear Algebra, and a basic familiarity with these subjects is required. There will also be some (although knowledge of these tools is not assumed) Graph Theory, Representation Theory, Applied Harmonic Analysis, among others. The topics treated will include Dimension reduction, Manifold learning, Sparse recovery, Random Matrices, Approximation Algorithms, Community detection in graphs, and several others.

**Lecture notes**

**Prerequisites / notice**
The main mathematical tools used will be Probability, Linear Algebra (and real analysis), and a working knowledge of these subjects is required. In addition to these prerequisites, this class requires a certain degree of mathematical maturity—including abstract thinking and the ability to understand and write proofs.

We encourage students who are interested in mathematical data science to take both this course and "227-0434-10L Mathematics of Information" taught by Prof. H. Bölcskei. The two courses are designed to be complementary.

A. Bandeira and H. Bölcskei

### 402-0448-02L Quantum Information Processing II: Implementations

This experimental part QIP II together with the theory part 402-0448-01L QIP I (both offered in the autumn semester) combine to the core course in experimental physics "Quantum Information Processing" (totally 10 ECTS credits). This applies to the Master's degree programme in Quantum Information Processing.

**W 5 credits 2V+1U  A. Wallraff, J.-C. Besse**

Objective
Throughout the past 20 years the realm of quantum physics has entered the domain of information technology in more and more prominent ways. Enormous progress in the physical sciences and in engineering and technology has allowed us to build novel types of information processors based on the concepts of quantum physics. In these processors information is stored in the quantum state of physical systems forming quantum bits (qubits). The interaction between qubits is controlled and the resulting states are read out on the level of single quanta in order to process information. Realizing such challenging tasks is believed to allow constructing an information processor much more powerful than a classical computer. This task is taken on by academic labs, startups and major industry. The aim of this class is to give a thorough introduction to physical implementations pursued in current research for realizing quantum information processors. The field of quantum information science is one of the fastest growing and most active domains of research in modern physics.

Content
Introduction to experimental systems for quantum information processing (QIP).
- Quantum bits
- Coherent Control
- Measurement
- Decoherence
- QIP with Ions
- Superconducting Circuits
- Photons
- NMR
- Rydberg atoms
- NV-centers
- Quantum dots

Lecture notes
Course material be made available at www.qudev.ethz.ch and on the Moodle platform for the course. More details to follow.

Literature
Quantum Computation and Quantum Information
Michael Nielsen and Isaac Chuang
Cambridge University Press

Prerequisites / notice
Basic knowledge of concepts of quantum physics and quantum systems, e.g from courses such as Physiscs III, Quantum Mechanics I and II or courses on topics such as atomic physics, solid state physics, quantum electronics are considered helpful.
Creating reliable, secure, robust, and fair machine learning models is a core challenge in artificial intelligence and one of fundamental importance.

Reliable and Trustworthy Artificial Intelligence

Abstract
Advanced design and analysis methods for algorithms and data structures: Randomized Search Trees, Point Location, Minimum Cut, Linear Programming, Randomized Algebraic Algorithms (matchings), Probabilistically Checkable Proofs (introduction).

Objective
Studying and understanding of fundamental advanced concepts in algorithms, data structures and complexity theory.

Literature

Reliable and Trustworthy Artificial Intelligence

The coding project will utilize Python and PyTorch. Thus some programming experience in Python is expected. Students without prior knowledge of PyTorch are expected to acquire it early in the course by solving exercise sheets.
Content
The lecture "Applied Computer Architecture" gives technical and corporate insights in innovative Computer Systems/Architectures (CPU, GPU, FPGA, dedicated processors) and their real implementations and applications. Often the designs have to deal with technical limits.

Which computer architecture allows the control of the over 1000 magnets at the Swiss Light Source (SLS) at the PSI?
Which architecture is behind the alarm center of the Swiss Railway (SBB)?
Which computer architecture is hidden behind a professional digital audio mixing desk?
How can data streams of about 30 TB/s, produced by a proton accelerator, be processed in real time?
Can the weather forecast also be processed with GPUs?
How could a fast trading system be set up for the stock exchange?
How can a good computer architecture be found?
Which are the driving factors in successful computer architecture design?

Lecture notes
Script and exercises sheets.

### Science in Perspective

Two credits are needed from the “Science in Perspective” programme with language courses excluded if three credits from language courses have already been recognised for the Bachelor's degree.

see https://ethz.ch/content/dam/ethz/common/docs/weisungssammlung/files-en/science-in-perspective.pdf (Eight credits must be acquired in this category: normally six during the Bachelor's degree programme, and two during the Master's degree programme. A maximum of three credits from language courses from the range of the Language Center of the University of Zürich and ETH Zürich may be recognised. In addition, only advanced courses (level B2 upwards) in the European languages English, French, Italian and Spanish are recognised. German language courses are recognised from level C2 upwards.)

- see Science in Perspective: Language Courses ETH/UZH
- see Science in Perspective: Type A: Enhancement of Reflection Capability

- Recommended Science in Perspective (Type B) for D-MATH

### Master's Thesis

If you wish to have recognised 402-2000-00L Scientific Works in Physics instead of 401-2000-00L Scientific Works in Mathematics (as allowed for the CSE programme), take contact with the Study Administration Office (www.math.ethz.ch/studiensekretariat) after having passed the performance assessment.

Abstract
Introduction to basic methods and fundamental concepts of statistics and probability theory for non-mathematicians. The concepts are presented on the basis of some descriptive examples. Learning the statistical program R for applying the acquired concepts will be a central theme.

Objective
The objective of this course is to build a solid fundament in probability and statistics. The student should understand some fundamental concepts and be able to apply these concepts to applications in the real world. Furthermore, the student should have a basic knowledge of the statistical programming language “R”.

Content
From “Statistics for research” (online)
Ch 1: The Role of Statistics
Ch 2: Populations, Samples, and Probability Distributions
Ch 3: Binomial Distributions
Ch 6: Sampling Distribution of Averages
Ch 7: Normal Distributions
Ch 8: Student’s t Distribution
Ch 9: Distributions of Two Variables

From “Introductory Statistics with R (online)"
Ch 1: Basics
Ch 2: The R Environment
Ch 3: Probability and distributions
Ch 4: Descriptive statistics and tables
Ch 5: One- and two-sample tests
Ch 6: Regression and correlation

Integrity and Work Ethics fostered

406-0603-AAL Stochastics (Probability and Statistics) E- 4 credits 9R M. Kalisch
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.
Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Introduction to basic methods and fundamental concepts of statistics and probability theory for non-mathematicians. The concepts are presented on the basis of some descriptive examples. Learning the statistical program R for applying the acquired concepts will be a central theme.

Objective
The objective of this course is to build a solid fundament in probability and statistics. The student should understand some fundamental concepts and be able to apply these concepts to applications in the real world. Furthermore, the student should have a basic knowledge of the statistical programming language “R”.

Content
From “Statistics for research” (online)
Ch 1: The Role of Statistics
Ch 2: Populations, Samples, and Probability Distributions
Ch 3: Binomial Distributions
Ch 6: Sampling Distribution of Averages
Ch 7: Normal Distributions
Ch 8: Student’s t Distribution
Ch 9: Distributions of Two Variables

From “Introductory Statistics with R (online)"
Ch 1: Basics
Ch 2: The R Environment
Ch 3: Probability and distributions
Ch 4: Descriptive statistics and tables
Ch 5: One- and two-sample tests
Ch 6: Regression and correlation

Literature
- "Statistics for research" by S. Dowdy et. al. (3rd edition); Print ISBN: 9780471267355; Online ISBN: 9780471477433; DOI: 10.1002/0471477435
From within the ETH, this book is freely available online under: http://onlinelibrary.wiley.com/book/10.1002/0471477435

Competencies
Subject-specific Competencies
Concepts and Theories assessed
Techniques and Technologies assessed

Method-specific Competencies
Analytical Competencies assessed
Decision-making assessed
Media and Digital Technologies assessed
Problem-solving assessed

Personal Competencies
Self-direction and Self-management assessed
Content

* Direct Methods for linear systems of equations
* Least Squares Techniques
* Data Interpolation and Fitting
* Filtering Algorithms
* Approximation of Functions
* Numerical Quadrature
* Iterative Methods for non-linear systems of equations

Lecture notes

Lecture materials (PDF documents and codes) will be made available to participants.

Literature

M. Hanke-Bourgeois “Grundlagen der Numerischen Mathematik und des wissenschaftlichen Rechnens”, BG Teubner, 2002

P. Deuflhard and A. Hohmann, "Numerische Mathematik I", DeGruyter, 2002

M. Hanke-Bourgeois "Grundlagen der Numerischen Mathematik und des wissenschaftlichen Rechnens", BG Teubner, 2002

Prerequisites / notice

Solid knowledge about fundamental concepts and techniques from linear algebra & calculus as taught in the first year of science and engineering curricula.

The course will be accompanied by programming exercises in C++ relying on the template library EIGEN. Familiarity with C++, object oriented and generic programming is an advantage. Participants of the course are expected to learn C++ by themselves.

401-0674-AAL Numerical Methods for Partial Differential Equations E- 10 credits 21R not available

Abstract

Derivation, properties, and implementation of fundamental numerical methods for a few key partial differential equations: convection-diffusion, heat equation, wave equation, conservation laws. Implementation in C++ based on a finite element library.

Objective

Main skills to be acquired in this course:

* Ability to implement fundamental numerical methods for the solution of partial differential equations efficiently.
* Ability to modify and adapt numerical algorithms guided by awareness of their mathematical foundations.
* Ability to select and assess numerical methods in light of the predictions of theory
* Ability to identify features of a PDE (= partial differential equation) based model that are relevant for the selection and performance of a numerical algorithm.
* Ability to understand research publications on theoretical and practical aspects of numerical methods for partial differential equations.
* Skills in the efficient implementation of finite element methods on unstructured meshes.

This course is neither a course on the mathematical foundations and numerical analysis of methods nor an course that merely teaches recipes and how to apply software packages.
1 Case Study: A Two-point Boundary Value Problem

1.1 Introduction
1.2 A model problem
1.3 Variational approach
1.4 Simplified model
1.5 Discretization
1.5.1 Galerkin discretization
1.5.2 Collocation [optional]
1.5.3 Finite differences

1.6 Convergence

2 Second-order Scalar Elliptic Boundary Value Problems
2.1 Equilibrium models
2.1.1 Taut membrane
2.1.2 Electrostatic fields
2.1.3 Quadratic minimization problems
2.2 Sobolev spaces
2.3 Variational formulations
2.4 Equilibrium models: Boundary value problems

3 Finite Element Methods (FEM)
3.1 Galerkin discretization
3.2 Case study: Triangular linear FEM in two dimensions
3.3 Building blocks of general FEM
3.4 Lagrangian FEM
3.4.1 Simplicial Lagrangian FEM
3.4.2 Tensor-product Lagrangian FEM
3.5 Implementation of FEM in C++
3.5.1 Mesh file format (Gmsh)
3.5.2 Mesh data structures (DUNE)
3.5.3 Assembly
3.5.4 Local computations and quadrature
3.5.5 Incorporation of essential boundary conditions
3.6 Parametric finite elements
3.6.1 Affine equivalence
3.6.2 Example: Quadrilateral Lagrangian finite elements
3.6.3 Transformation techniques
3.6.4 Boundary approximation
3.7 Linearization [optional]

4 Finite Differences (FD) and Finite Volume Methods (FV) [optional]
4.1 Finite differences
4.2 Finite volume methods (FVM)

5 Convergence and Accuracy
5.1 Galerkin error estimates
5.2 Empirical Convergence of FEM
5.3 Finite element error estimates
5.4 Elliptic regularity theory
5.5 Variational crimes
5.6 Duality techniques [optional]
5.7 Discrete maximum principle [optional]

6 2nd-Order Linear Evolution Problems
6.1 Parabolic initial-boundary value problems
6.1.1 Heat equation
6.1.2 Spatial variational formulation
6.1.3 Method of lines
6.1.4 Timestepping
6.1.5 Convergence
6.2 Wave equations [optional]
6.2.1 Vibrating membrane
6.2.2 Wave propagation
6.2.3 Method of lines
6.2.4 Timestepping
6.2.5 CFL-condition

7 Convection-Diffusion Problems [optional]
7.1 Heat conduction in a fluid
7.1.1 Modelling fluid flow
7.1.2 Heat convection and diffusion
7.1.3 Incompressible fluids
7.1.4 Transient heat conduction
7.2 Stationary convection-diffusion problems
7.2.1 Singular perturbation
7.2.2 Upwinding
7.3 Transient convection-diffusion BVP
7.3.1 Method of lines
7.3.2 Transport equation
7.3.3 Lagrangian split-step method
7.3.4 Semi-Lagrangian method

8 Numerical Methods for Conservation Laws
8.1 Conservation laws: Examples
8.2 Scalar conservation laws in 1D
8.3 Conservative finite volume discretization
8.3.1 Semi-discrete conservation form
8.3.2 Discrete conservation property
8.3.3 Numerical flux functions
8.3.4 Monotone schemes
8.4 Timestepping
8.4.1 Linear stability
8.4.2 CFL-condition
8.4.3 Convergence
8.5 Higher order conservative schemes [optional]
8.5.1 Slope limiting
8.5.2 MUSCL scheme
8.6. FV-schemes for systems of conservation laws [optional]

“optional” indicates that the corresponding topic might be skipped depending on the progress of the course.

Lecture notes
The lecture will be taught in flipped classroom format:
- Video tutorials for all thematic units will be published online.
- Solution of homework problems will partly be covered by video tutorials.
- Lecture documents and tablet notes accompanying the videos will be made available to the audience as PDF.

Literature
Chapters of the following books provide supplementary reading
(detailed references in course material):

However, study of supplementary literature is not important for for following the course.

Prerequisites / notice
Mastery of basic calculus and linear algebra is taken for granted.
Familiarity with fundamental numerical methods (solution methods for linear systems of equations, interpolation, approximation, numerical quadrature, numerical integration of ODEs) is essential.

Important: Coding skills and experience in C++ are essential.

Homework assignments involve substantial coding, partly based on a C++ finite element library. The written examination will be computer based and will comprise coding tasks.

### Core Courses

#### 151-0323-00L Hands-on Self-Driving Cars with Duckietown

**Abstract**
This course is a hands-on introduction to self-driving cars using the Duckietown platform.

**Objective**
Each student is given a mobile wheeled robot and throughout the class must configure and program.

**Content**
This course includes the basics of modeling, perception, planning, control, and learning for self-driving cars. The focus is on the integration and co-design of components and behaviors rather than algorithmic dept.

**Prerequisites / notice**
Students should have taken a basic course in probability theory, computer vision, and control systems, and should be familiar and comfortable with programming (Python), Linux, and GIT utilization.

**Competencies**
- Subject-specific Competencies: Concepts and Theories, assessed
- Method-specific Competencies: Techniques and Technologies, assessed
- Social Competencies: Communication, fostered
- Personal Competencies: Adaptability and Flexibility, fostered

**Additional information**
A shared space will be available to work with the robots.

It’s advised students will have ~5 square meters of free space at their place to work with their assigned robot.

**Literature**
These are some books that can be used to provide background information or consulted as references:
1. Siegwart, Nourbakhsh, Scaramuzza - Introduction to autonomous mobile robots;
2. Norvig, Russell - Artificial Intelligence, a modern approach.
3. Peter Corke - Robotics Vision and Control
4. Oussama Khatib, Bruno Siciliano - Handbook of Robotics

**Prerequisites**
Students should have taken basic courses in optimization, control systems, probability theory, and should be familiar with modern programming languages and practices (e.g., Python, and/or C/C++). Previous exposure to robotic systems is a definite advantage.

**Lecture notes**
Lecture notes, primarily in the form of slides and tutorials, will be accessible from Moodle.

**Course notes**
Course notes will be provided in an electronic form.

**Additional materials**
Additional materials can also be accessed from the EdX MOOC called "Self-driving cars with Duckietown".

#### 151-0325-00L Planning and Decision Making for Autonomous Robots

**Abstract**
Planning safe and efficient motions for robots in complex environments, often shared with humans and other robots, is a difficult problem combing discrete and continuous mathematics, as well as probabilistic, game-theoretic, and ethical/regulatory aspects. This course will cover the algorithmic foundations of motion planning, with an eye to real-world implementation issues.

**Objective**
The students will learn how to design and implement state-of-the-art algorithms for planning the motion of robots executing challenging tasks in complex environments.

**Content**

**Lecture notes**
Course notes and other education material will be provided for free in an electronic form.

**Prerequisites**
These are some books that can be used to provide background information or consulted as references:
1. Siegwart, Nourbakhsh, Scaramuzza - Introduction to autonomous mobile robots;
2. Norvig, Russell - Artificial Intelligence, a modern approach.
3. Peter Corke - Robotics Vision and Control
4. Oussama Khatib, Bruno Siciliano - Handbook of Robotics

**Competencies**
- Subject-specific Competencies: Concepts and Theories, assessed
- Method-specific Competencies: Techniques and Technologies, assessed

**Additional information**
It’s advised students will have ~5 square meters of free space at their place to work with their assigned robot.

**Literature**
There is no required textbook, but an excellent reference is Steve Lavalle’s book on “Planning Algorithms.”

**Prerequisites**
Students should have taken basic courses in optimization, control systems, probability theory, and should be familiar with modern programming languages and practices (e.g., Python, and/or C/C++). Previous exposure to robotic systems is a definite advantage.

**Lecture notes**
Lecture notes, primarily in the form of slides and tutorials, will be accessible from Moodle.

**Course notes**
Course notes will be provided in an electronic form.

**Additional materials**
Additional materials can also be accessed from the EdX MOOC called "Self-driving cars with Duckietown".

#### 151-0371-00L Advanced Model Predictive Control

**Abstract**
Model predictive control (MPC) has established itself as a powerful control technique for complex systems under state and input constraints. This course discusses the theory and application of recent advanced MPC concepts, focusing on system uncertainties and safety, as well as data-driven formulations and learning-based control.

**Objective**
Design, implement and analyze advanced MPC formulations for robust and stochastic uncertainty descriptions, in particular with data-driven formulations.

**Content**
Topics include:
- Nominal MPC for uncertain systems (nominal robustness)
- Robust MPC
- Stochastic MPC
- Review of regression methods
- Set-membership Identification and robust data-driven MPC
- Bayesian regression and stochastic data-driven MPC
- MPC as safety filter for reinforcement learning

**Prerequisites**
Students should have taken a basic course in probability theory, computer vision, and control systems, and should be familiar and comfortable with programming (Python), Linux, and GIT utilization.

**Competencies**
- Subject-specific Competencies: Concepts and Theories, assessed
- Method-specific Competencies: Techniques and Technologies, assessed

**Additional information**
It’s advised students will have ~5 square meters of free space at their place to work with their assigned robot.

**Literature**
There is no required textbook, but an excellent reference is Steve Lavalle’s book on “Planning Algorithms.”

**Prerequisites**
These are some books that can be used to provide background information or consulted as references:
1. Siegwart, Nourbakhsh, Scaramuzza - Introduction to autonomous mobile robots;
2. Norvig, Russell - Artificial Intelligence, a modern approach.
3. Peter Corke - Robotics Vision and Control
4. Oussama Khatib, Bruno Siciliano - Handbook of Robotics

**Competencies**
- Subject-specific Competencies: Concepts and Theories, assessed
- Method-specific Competencies: Techniques and Technologies, assessed

**Lecture notes**
Lecture notes, primarily in the form of slides and tutorials, will be accessible from Moodle.

**Course notes**
Course notes will be provided in an electronic form.

**Additional materials**
Additional materials can also be accessed from the EdX MOOC called "Self-driving cars with Duckietown".
Lecture notes will be provided.

### Prerequisites / notice
Basic courses in control, advanced course in optimal control, basic MPC course (e.g. 151-0660-00L Model Predictive Control in Spring Semester) strongly recommended.
Background in linear algebra and stochastic systems recommended.

**Abstract**
The course will provide you with the fundamentals of the new and exciting field of ultrasound-based microrobots to treat various diseases. Furthermore, we will explore how ultrasound can be used in additive manufacturing for tissue constructs and robotics.

**Objective**
The course is designed to equip students with skills in the design and development of ultrasound-manipulated devices and microrobots for applications in medicine and additive manufacturing.

**Content**
Linear and nonlinear acoustics, foundations of fluid and solid mechanics and piezoelectricity, Gorkov potential, numerical modelling, acoustic streaming, applications from ultrasonic microrobotics to surface acoustic wave devices.

**Lecture notes**

**Prerequisites / notice**
Solid and fluid continuum mechanics. Notice: The exercise part is a mixture of presentation, lab sessions (both compulsory) and hand in homework.

| 151-0532-00L | Nonlinear Dynamics and Chaos I | W | 4 credits | 4G | G. Haller |

**Abstract**
Basic facts about nonlinear systems; stability and near-equilibrium dynamics; bifurcations; dynamical systems on the plane; non-autonomous dynamical systems; chaotic dynamics.

**Objective**
This course is intended for Masters and Ph.D. students in engineering sciences, physics and applied mathematics who are interested in the behavior of nonlinear dynamical systems. It offers an introduction to the qualitative study of nonlinear physical phenomena modeled by differential equations or discrete maps. We discuss applications in classical mechanics, electrical engineering, fluid mechanics, and biology. A more advanced Part II of this class is offered every other year.

**Content**
(1) Basic facts about nonlinear systems: Existence, uniqueness, and dependence on initial data.

(2) Near equilibrium dynamics: Linear and Lyapunov stability

(3) Bifurcations of equilibria: Center manifolds, normal forms, and elementary bifurcations

(4) Nonlinear dynamical systems on the plane: Phase plane techniques, limit sets, and limit cycles.

(5) Time-dependent dynamical systems: Floquet theory, Poincaré maps, averaging methods, resonance

**Lecture notes**
The class lecture notes will be posted electronically after each lecture. Students should not rely on these but prepare their own notes during the lecture.

**Prerequisites / notice**
- Prerequisites: Analysis, linear algebra and a basic course in differential equations.

**Abstract**
This course provides a comprehensive overview of embedded control systems. The concepts introduced are implemented and verified on a microprocessor-controlled haptic device.

**Objective**
Familiarize students with main architectural principles and concepts of embedded control systems.
An embedded system is a microprocessor used as a component in another piece of technology, such as cell phones or automobiles. In this intensive two-week block course the students are presented the principles of embedded digital control systems using a haptic device as an example for a mechatronic system. A haptic interface allows for a human to interact with a computer through the sense of touch.

Subjects covered in lectures and practical lab exercises include:
- The application of C-programming on a microprocessor
- Digital I/O and serial communication
- Quadrature decoding for wheel position sensing
- Queued analog-to-digital conversion to interface with the analog world
- Pulse width modulation
- Timer interrupts to create sampling time intervals
- System dynamics and virtual worlds with haptic feedback
- Introduction to rapid prototyping

Prerequisite courses are Control Systems I and Informatics I.

This course is restricted to 33 students due to limited lab infrastructure. Interested students please contact Marianne Schmid Daners (E-Mail: marischm@ethz.ch)

After your reservation has been confirmed please register online at www.mystudies.ethz.ch.

Detailed information can be found on the course website http://www.idsc.ethz.ch/education/lectures/embedded-control-systems.html

151-0604-00L Microrobotics

Abstract
Microrobotics is an interdisciplinary field that combines aspects of robotics, micro and nanotechnology, biomedical engineering, and materials science. The aim of this course is to expose students to the fundamentals of this emerging field. Throughout the course, the students apply these concepts in assignments. The course concludes with an end-of-semester examination.

Objective
The objective of this course is to expose students to the fundamental aspects of the emerging field of microrobotics. This includes a focus on physical laws that predominate at the microscale, technologies for fabricating small devices, bio-inspired design, and applications of the field.

Content
Main topics of the course include:
- Scaling laws at micro/nano scales
- Electrostatics
- Electromagnetism
- Low Reynolds number flows
- Observation tools
- Materials and fabrication methods
- Applications of biomedical microrobots

Lecture notes
The powerpoint slides presented in the lectures will be made available as pdf files. Several readings will also be made available electronically.

Prerequisites / notice
The lecture will be taught in English.

151-0615-00L Real-World Robotics - A Hands-On Project Class

Abstract
During this course, the students will develop an articulated robotic hand to solve a real-world robotic challenge: the robot must autonomously grasp and place objects. The students will learn the key theoretical concepts required to model, manufacture, control, and test their robot, alongside developing machine learning, programming, hardware, and engineering skills through the hands-on project.

Objective
Learning Objective 2: Robot Design and Simulation
Students will gain experience implementing and simulating robotic systems using modern design, modeling, and simulation techniques such as CAD and Isaac Gym. These techniques are essential in any design process to understand the expected system behavior. This requires thoroughly understanding the system’s kinematics, dynamics, material, actuation principle, and physical limitations. Students will learn the theory and limitations behind modeling and simulation software.

Learning Objective 3: Robot Fabrication
Students will learn to use the previously designed CAD models for successful robot fabrication. Additionally, the iterative nature of the process will allow them to develop their critical thinking skills in assessing the limitations of their design as well as possible sources for improvements. Building the robot will equip students with essential skills for using robots in the real world.

Learning Objective 4: Control, Integration, and Testing
Students can directly apply the knowledge acquired in their control courses. They will gain theoretical knowledge on how to model and develop intelligent control algorithms. Perception methods and state-of-the-art machine-learning techniques will be taught. They will gain experience testing their robots’ performance in both hard- and software to enhance their design and suggest future improvements.

Learning Objective 5: Robot production
Students will learn to choose between state-of-the-art industrial production processes to manufacture a soft robot by understanding their limitations and requirements. They will also learn how to optimize the robot design to account for a specific production process.
During this course, the students will be divided into teams and each group will independently develop an articulated robotic arm to solve a real-world robotic challenge, which will take place at the end of the course. The students will learn the key theoretical concepts required to model, manufacture, control and test a soft robot, along with developing the programming, hardware and engineering skills through hands-on workshops.

This course is composed of tutorials, which will be available on the course website where the lecturer will provide all the necessary theoretical input, focus talks where robotic experts will present a particular aspect of the manipulator in detail, and workshops where the students will have the possibility to hands-on learn how to implement the solutions required to solve their challenge. Finally, there will be time slots to autonomously work on the manufacturing and development of the team's robot and an online forum will be available to help the students throughout the entire course.

This course is divided into six parts:

**Part 1: Challenge introduction**
- Identify the functional requirements necessary for the final challenge
- Evaluate the existing manipulator designs to optimize them for the specific task

**Part 2: Robot Design**
- Develop a CAD model based on the high-level system design.
- Integrate motors, pneumatics components, and other required materials in the design

**Part 3: Robot Fabrication**
- Come up with a fabrication method and plan using the presented fabrication skills.
- Fabricate the robot and its actuators based on the CAD model.
- Evaluate, modify, and enhance the fabrication approach.

**Part 4: Soft Robot Simulation**
- Simulate the soft manipulator through a simulation framework
- Optimize the simulation parameters to reflect the experimental setup

**Part 5: Control, Integration, and Testing**
- Formulate the dynamic skills needed for real-life application.
- Develop traditional and learning-based control algorithms and test them in simulation.
- Integrate controller design into the fabricated robot.
- Build, test, fail, and repeat until the soft robot works as desired in simple tasks.
- Upgrade and validate the robot for performance in real-world conditions and verify requirements.

**Part 6: Product development**
- Propose a manufacturing process to bring the robot from a prototype to the final product
- Optimize the robot for production

**Lecture notes**
All class materials, including slides, video tutorials, and supporting literature, can be found on the class webpage (https://rwr.ethz.ch) and Moodle, supported by discussion and Q&A forums. Focus talks, Q&A sessions, and workshops will happen on Mondays between 14:00 and 16:00.

**Literature**

**Prerequisites / notice**
Students are expected to have attended introductory courses in dynamics, control systems, and robotics.

Registration for this course is limited due to the amount of resources needed to make this course happen. For this reason, it is required to apply through the following module: https://forms.gle/pnMHTCdZwgdawb519

The graded semester performance consists of the final team performance in the class challenge, a final team presentation and report, weekly Moodle quizzes, and attendance at the focus talks and workshops.

**Competencies**

- **Subject-specific Competencies**
  - Concepts and Theories assessed
  - Techniques and Technologies assessed

- **Method-specific Competencies**
  - Analytical Competencies assessed
  - Decision-making assessed
  - Problem-solving assessed
  - Project Management assessed

- **Social Competencies**
  - Communication assessed
  - Cooperation and Teamwork assessed

- **Personal Competencies**
  - Adaptability and Flexibility assessed
  - Creative Thinking assessed
  - Critical Thinking assessed

151-0632-00L Vision Algorithms for Mobile Robotics (University of Zurich)

*No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.*

**UZH Module Code**: DINF2039

Mind the enrolment deadlines at UZH: https://www.uzh.ch/cmsssl/en/studies/application/deadlines.html

**151-0632-00L Vision Algorithms for Mobile Robotics (University of Zurich)**

*No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.*

**UZH Module Code**: DINF2039

Mind the enrolment deadlines at UZH: https://www.uzh.ch/cmsssl/en/studies/application/deadlines.html

**Data**: 26.07.2024 12:39  **Autumn Semester 2024**  **Page 2258 of 2680**
Abstract
For a robot to be autonomous, it has to perceive and understand the world around it. This course introduces you to the key computer vision algorithms used in mobile robotics, such as feature extraction, structure from motion, dense reconstruction, tracking, image retrieval, event-based vision, and visual-inertial odometry (the algorithms behind Hololens, Oculus Quest, and the NASA Mars rovers).

Objective
Learn the fundamental computer vision algorithms used in mobile robotics, in particular: filtering, feature extraction, structure from motion, multiple view geometry, dense reconstruction, tracking, image retrieval, event-based vision, and visual-inertial odometry and Simultaneous Localization And Mapping (SLAM) (the algorithms behind Hololens, Facebook-Oculus Quest, and the NASA Mars rovers).

Content
Each lecture will be followed by a lab session where you will learn to implement a building block of a visual odometry algorithm in Matlab. By the end of the course, you will integrate all these building blocks into a working visual odometry algorithm.

Lecture notes
Lecture slides will be made available on the course official website: http://rpg.inf.uzh.ch/teaching.html

Literature

Prerequisites / notice
Note: If you are interested in taking UZH courses, you must register as an incoming mobility student at UZH. For details, see as follows:

UZH course enrollment for ETH student at University of Zurich (UZH) > Mobility within Switzerland – Incoming > Module Mobility: The easiest way to take individual modules/courses to supplement your studies at your home university is with module mobility. This option is not available to students who have dropped out of their home university or have been definitely excluded or banned from the relevant program > Application and Deadlines: Applications are submitted via the UZH application portal (https://www.uzh.ch/cmsssl/en/studies/application/chmobilityin.html)

ATTENTION: When you book the course at UZH, you are automatically registered for the exam at UZH and you can unregister until the October deadline. After registering for the course, you as an ETH student need to check out your **"UZH email account"** to receive the relateled information from the lecturer.

151-0851-00L Robot Dynamics W 4 credits 2V+2U M. Hutter, R. Siegwart
Abstract
We will provide an overview on how to kinematically and dynamically model typical robotic systems such as robot arms, legged robots, rotary wing systems, or fixed wing.

Objective
The primary objective of this course is that the student develops an applied understanding of how to model the most common robotic systems. The student receives a solid background in kinematics, dynamics, and rotations of multi-body systems. On the basis of state of the art applications, he/she will learn all necessary tools to work in the field of design or control of robotic systems.

Content
The course consists of three parts: First, we will refresh and deepen the student’s knowledge in kinematics, dynamics, and rotations of multi-body systems. In this context, the learning material will build upon the courses for mechanics and dynamics available at ETH, with the particular focus on their application to robotic systems. The goal is to foster the conceptual understanding of similarities and differences among the various types of robots. In the second part, we will apply the learned material to classical robotic arms as well as legged systems and discuss kinematic constraints and interaction forces. In the third part, focus is put on modeling fixed wing aircraft, along with related design and control concepts. In this context, we also touch aerodynamics and flight mechanics to an extent typically required in robotics. The last part mainly covers different helicopter types, with a focus on quadrotors and the coaxial configuration which we see today in many UAV applications. Case studies on all main topics provide the link to real applications and to the state of the art in robotics.

Prerequisites / notice
The contents of the following ETH Bachelor lectures or equivalent are assumed to be known: Mechanics and Dynamics, Basics in Fluid Dynamics.

151-1116-00L Introduction to Aircraft and Car Aerodynamics W 4 credits 3G M. Immer, F. Schröder
Abstract
Aircraft aerodynamics: Atmosphere; aerodynamic forces (lift, drag); thrust.

Objective
An introduction to the basic principles and interrelationships of aircraft and automotive aerodynamics.

Content
To understand the basic relations of the origin of aerodynamic forces (ie lift, drag). To quantify the aerodynamic forces for basic configurations of aircraft and car components.
Illustration of the intrinsic problems and results using examples.

Using experimental and theoretical methods to illustrate possibilities and limits.

Lecture notes
Preparation materials & slides are provided prior to each class

151-9905-00L Applied Category Theory for Engineering I W 4 credits 3G A. Censi, J. Lorand
Abstract
Applied Category Theory is an exciting multidisciplinary field of research which harnesses the mathematical language of category theory for applications across a broad range of disciplines. This course is a gentle introduction to the theory, emphasizing applications in engineering and the “compositional approach” to systems analysis, co-design, and computation.
Objective
1) Learn basic concepts from algebra and category theory, together with ways to make use of these concepts for engineering applications.

2) Become familiar with case studies of applied category theory, for instance involving dynamical systems, databases, and complex system co-design (e.g. in the context of autonomous vehicles).

3) Be able to recognize compositional structures in concrete scenarios at different levels of abstraction.

4) Understand the “compositional way of thinking” as an approach to systems analysis, co-design, and computation.

Content
Review of basic algebraic structures [sets, relations, (semi)groups, monoids, actions, order theory]

Gentle introduction to category theory [series and parallel composition, feedback, actions, functors, universal properties]

Many simple applied examples illustrating concepts along the way. Extended examples from dynamical systems, databases, and systems co-design in engineering.

Homework will consist of 1) basic exercises to check one’s understanding of core concepts, and 2) a choice between either A) coding exercises (in python) to learn how to implement concepts in software or B) further theory exercises to deepen mathematical understanding.

Homework will be graded on a schedule that allows some flexibility, and it will constitute 100% of the grade (no exam).

Lecture notes
Slides and a (work-in-progress) textbook for the course will be provided (A. Censi, J. Lorand, G. Zardini, “Applied Compositional Thinking for Engineers”).

Literature

For many further resources, see also https://applied-compositional-thinking.engineering/

Prerequisites / notice
A knowledge of algebra at the level of a bachelor’s degree in engineering/computer science.

Competencies
Subject-specific Competencies
Concepts and Theories assessed

Method-specific Competencies
Analytical Competencies assessed

Social Competencies
Problem-solving assessed

Personal Competencies
Communication fostered

Critical Thinking fostered

Integrity and Work Ethics fostered

Self-direction and Self-management fostered

227-0102-00L Discrete Event Systems W 6 credits 4G L. Josipovic, B. Keller, L. Vanbever, R. Wattenhofer

Abstract
Introduction to discrete event systems. We start out by studying popular models of discrete event systems. Then we analyze discrete event systems from an average-case and from a worst-case perspective, and study verification. Topics include: Automata and Languages, Specification Models, Stochastic Discrete Event Systems, Worst-Case Event Systems, Verification, Petri Nets.

Objective
Over the past few decades the rapid evolution of computing, communication, and information technologies has brought about the proliferation of new dynamic systems. A significant part of activity in these systems is governed by operational rules designed by humans. The dynamics of these systems are characterized by asynchronous occurrences of discrete events, some controlled (e.g. hitting a keyboard key, sending a message), some not (e.g. spontaneous failure, packet loss).

The mathematical arsenal centered around differential equations that has been employed in systems engineering to model and study processes governed by the laws of nature is often inadequate or inappropriate for discrete event systems. The challenge is to develop new modeling frameworks, analysis techniques, design tools, testing methods, and optimization processes for this new generation of systems.

In this lecture we give an introduction to discrete event systems. We start out the course by exploring the limits of what is computable and what is not. In doing so, we will consider three distinct models of computation which are often used to model discrete event systems: finite automata, push-down automata and Turing machines (ranked in terms of expressiveness power). In the second part of the course we analyze discrete events systems. We first examine discrete event systems from an average-case perspective: we model discrete events as stochastic processes, and then apply continuous time markov chains and queueing theory for an understanding of the typical behavior of a system. Then we analyze discrete event systems from a worst-case perspective using the theory of online algorithms and adversarial queueing. In the last part of the course we introduce methods that allow to formally verify certain properties of Finite Automata and Petri Nets. These are some typical analysis questions we will look at: Do two given systems behave the same? Does a given system behave as intended? Does the system eventually enter a dangerous state?

Content
1. Regular Languages
2. Non-Regular Languages
3. Markov Chains
4. Stochastic Discrete Event Systems
5. Worst-Case Event Systems
6. Verification of Finite Automata
7. Petri Nets

Embedded Systems

W  6 credits  4G  M. Magno

Abstract
An embedded system is a combination of hardware and software, either fixed in function or programmable, that is designed for a specific application scenario or for a specific task within a larger system. They are part of industrial machines such as agricultural and manufacturing equipment, automotive systems, medical equipment, household appliances, sensor networks, and the Internet of Things.

Objective
Understanding the specific requirements and problems that arise in embedded system applications.

Understanding the hardware structure of a microcontroller and an embedded system; memory architecture and memory map, internal and external peripherals, low-power and low-energy design as well as instruction sets and computational accelerators.

Understanding the firmware structure of a microcontroller and an embedded system; low-level instruction set, hardware-software interfaces, communication between components, embedded real-time operating systems, real-time scheduling, shared resources, low-power and low-energy programming as well as computational accelerators.

Using formal models and methods for designing and optimizing embedded systems.

Gaining experience with practical applications of the C programming language, embedded real-time operating systems, and debug functionalities of the associated design environment to design, implement, and verify embedded firmware.

Through project-based activities, students will gain substantial experience in applying the C programming language in the context of embedded systems. Projects will involve developing and implementing firmware, utilizing embedded real-time operating systems, and exploring the debugging functionalities within design environments. This hands-on approach aims to bridge the gap between theoretical knowledge and practical application, allowing students to experience the full lifecycle of embedded system development from design to implementation and verification.

Content
This lecture focuses on the design of embedded systems using formal models and methods.

Besides the theoretical lecture, the course contains laboratory sessions where students transfer the learned theoretical aspects into praxis by programming a microcontroller and interfacing it with sensors and actuators. Students will be exposed to a commercial microcontroller, and the development board extend with a custom-designed embedded systems educational platform.

Specifically, the following topics will be covered in the course: hardware and software structures of embedded systems, low-level instruction set, memory architecture and memory map, peripherals, hardware-software interfaces, communication between components, firmware design methodologies, firmware design using the C programming language, embedded real-time operating systems, real-time scheduling, shared resources, low-power, and low-energy designs as well as computational accelerators.

Lecture notes
Lecture material, publications, exercise sheets, and laboratory documentation will be available on the course's Moodle page.

**Literature**

**Prerequisites / notice**
- Basics of the switching behavior, gate drive and snubber circuits of power semiconductors are discussed. Soft-switching and resonant DC/DC converters are analyzed in detail and high frequency loss mechanisms of magnetic components are explained. Space vector modulation of three-phase inverters is introduced and the main power components are designed for typical industry applications.
- Detailed understanding of the principle of operation and modulation of advanced power electronics converter systems, especially of zero voltage switching and zero current switching non-isolated and isolated DC/DC converter systems and three-phase voltage DC link inverter systems. Furthermore, the course should convey knowledge on the switching frequency related losses of power semiconductors and inductive power components and introduce the concept of space vector calculus which provides a basis for the comprehensive discussion of three-phase PWM converters systems in the lecture Power Electronic Systems II.
- Basics of the switching behavior and gate drive circuits of power semiconductor devices and auxiliary circuits for minimizing the switching losses are explained. Furthermore, zero voltage switching, zero current switching, and resonant DC/DC converters are discussed in detail; the operating behavior of isolated three-phase DC/DC converters is detailed for different secondary side rectifier topologies; high frequency loss mechanisms of magnetic components of converter circuits are explained and approximate calculation methods are presented; the concept of space vector calculus for analyzing three-phase systems is introduced; finally, phase-oriented and space vector modulation of three-phase inverter systems are discussed related to voltage DC link inverter systems and the design of the main power components based on analytical calculations is explained.
- Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

**Competencies**

  - Concepts and Theories
  - Techniques and Technologies
- Method-specific Competencies
  - Analytical Competencies
  - Problem-solving
- Personal Competencies
  - Creative Thinking
  - Critical Thinking
  - Integrity and Work Ethics

**Lecture notes**
Available on the course Moodle platform.

**Prerequisites**
Sufficient mathematical maturity, in particular in linear algebra, analysis.

**Literature**

**Prerequisites / notice**
- Recommended: basic knowledge of assembly programming and computer architecture.
- Prerequisites: Introductory course on power electronics is recommended.
- Course material Script, computer demonstrations, exercises and problem solutions

**Competencies**
- Subject-specific Competencies
  - Concepts and Theories
  - Techniques and Technologies
- Method-specific Competencies
  - Analytical Competencies
- Personal Competencies
  - Creative Thinking

**Lecture notes**
Lecture notes and associated exercises including correct answers.

**Prerequisites**
- Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Python and Linux.
- The course language is English.
### Abstract
The goal of this course is understanding the stationary dependencies in electrical power systems. The course includes the development of stationary models of the electrical network, their mathematical representation and special characteristics and solution methods of large linear and non-linear systems of equations related to electrical power networks.

### Objective
The goal of this course is understanding the stationary dependencies in electrical power systems and the application of analysis tools in normal but also in faulty state.

### Content
The course includes the development of stationary models of the electrical network, their mathematical representation and special characteristics and solution methods of large linear and non-linear systems of equations related to electrical power networks. Approaches such as the Newton-Raphson algorithm applied to power flow equations, superposition technique for short-circuit analysis and symmetrical components are discussed as well as power flow computation techniques for distribution grids and state estimation.

### Computer Vision and Artificial Intelligence for Autonomous Cars

#### Abstract
Up until FS2022 offered as Deep Learning for Autonomous Driving

This course introduces the core computer vision techniques and algorithms that autonomous cars use to perceive the semantics and geometry of their driving environment, localize themselves in it, and predict its dynamic evolution. Emphasis is placed on techniques tailored for real-world settings, such as multi-modal fusion, domain-adaptive and outlier-aware architectures, and multi-agent methods.

#### Objective
Students will learn about the fundamentals of autonomous cars and of the computer vision models and methods these cars use to analyze their environment and navigate themselves in it. Students will be presented with state-of-the-art representations and algorithms for semantic, geometric and temporal visual reasoning in automated driving and will gain hands-on experience in developing computer vision algorithms and architectures for solving such tasks.

After completing this course, students will be able to:
1. understand the operating principles of visual sensors in autonomous cars
2. differentiate between the core architectural paradigms and components of modern visual perception models and describe their logic and the role of their parameters
3. systematically categorize the main visual tasks related to automated driving and understand the primary representations and algorithms which are used for solving them
4. critically analyze and evaluate current research in the area of computer vision for autonomous cars
5. practically reproduce state-of-the-art computer vision methods in automated driving
6. independently develop new models for visual perception

#### Content
The content of the lectures consists in the following topics:

1. Fundamentals
   (a) Fundamentals of autonomous cars and their visual sensors
   (b) Fundamental computer vision architectures and algorithms for autonomous cars

2. Semantic perception
   (a) Semantic segmentation
   (b) Object detection
   (c) Instance segmentation and panoptic segmentation

3. Geometric perception and localization
   (a) Depth estimation
   (b) 3D reconstruction
   (c) Visual localization
   (d) Unimodal visual/lidar 3D object detection

4. Robust perception: multi-modal, multi-domain and multi-agent methods
   (a) Multi-modal 2D and 3D object detection
   (b) Visual grounding and verbo-visual fusion
   (c) Domain-adaptive and outlier-aware semantic perception
   (d) Vehicle-to-vehicle communication for perception

5. Temporal perception
   (a) Multiple object tracking
   (b) Motion prediction

The practical projects involve implementing complex computer vision architectures and algorithms and applying them to real-world, multi-modal driving datasets. In particular, students will develop models and algorithms for:

1. Semantic segmentation and depth estimation
2. Sensor calibration for multi-modal 3D driving datasets
3. 3D object detection using lidars

### Lecture notes
Lecture slides are provided in PDF format.

### Prerequisites / notice
Students are expected to have a solid basic knowledge of linear algebra, multivariate calculus, and probability theory, and a basic background in computer vision and machine learning. All practical projects will require solid background in programming and will be based on Python and libraries of it such as PyTorch.

Prerequisites / notice

The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.

Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

252-3110-00L Human Computer Interaction

Abstract

The course provides an introduction to the field of human-computer interaction, emphasising the central role of the user in system design. Through detailed case studies, students will be introduced to different methods used to analyse the user experience and shown how these can inform the design of new interfaces, systems and technologies.

Objective

The goal of the course is that students should understand the principles of user-centred design and be able to apply these in practice. As well as understand the basic notions of Computational Design in a HCI context.

Content

The seminar will cover a number of recent papers which have emerged as important contributions to the pattern recognition and machine learning literature. The topics will vary from year to year but they are centered on methodological issues in machine learning like new learning algorithms, ensemble methods or new statistical models for machine learning applications. Frequently, papers are selected from computer vision or bioinformatics - two fields, which relies more and more on machine learning methodology and statistical models.

252-5051-00L Advanced Topics in Machine Learning

Abstract

The deadline for deregistering expires at the end of the second week of the semester. Students who are still registered after that date, but do not attend the seminar, will officially fail the seminar.

Objective

In this seminar, recent papers of the pattern recognition and machine learning literature are presented and discussed. Possible topics cover statistical models in computer vision, graphical models and machine learning.

Content

The seminar covers advanced topics in computer vision, such as 3D reconstruction, image understanding, object detection, people tracking, motion prediction, and other related topics. Each time the course is offered, a collection of research papers is selected and each student presents one paper to the class and leads a discussion about the paper and related topics.

252-5701-00L Seminar in Advanced Topics in Vision

Abstract

This seminar covers advanced topics in computer vision, such as 3D reconstruction, image understanding, object detection, people tracking, motion prediction, and other related topics. Each time the course is offered, a collection of research papers is selected covering topics such as 3D reconstruction, image understanding, object detection, people tracking, motion prediction and others. Each student presents one paper to the class and leads a discussion about the paper and related topics.

Objective

The goal is to get an in-depth understanding of actual problems and research topics in the field of computer vision as well as improve presentations and critical analysis skills.

Content

This seminar covers advanced topics in computer vision by reading and presenting classic and state-of-the-art papers. Each time the course is offered, a collection of research papers are selected covering topics such as 3D reconstruction, image understanding, object detection, people tracking, motion prediction and others. Each student presents one paper to the class and leads a discussion about the paper and related topics.

Lecture notes

No script

Literature

Individual research papers are selected each term.

263-5210-00L Probabilistic Artificial Intelligence

Abstract

This course introduces core modeling techniques and algorithms from machine learning, optimization and control for reasoning and decision making under uncertainty, and study applications in areas such as robotics.

Objective

How can we build systems that perform well in uncertain environments? How can we develop systems that exhibit "intelligent" behavior, without prescribing explicit rules? How can we build systems that learn from experience in order to improve their performance? We will study core modeling techniques and algorithms from statistics, optimization, planning, and control and study applications in areas such as robotics. The course is designed for graduate students.

Content

Topics covered:
- Probability
- Probabilistic inference (variational inference, MCMC)
- Bayesian learning (Gaussian processes, Bayesian deep learning)
- Probabilistic planning (MDPs, POMDPs)
- Multi-armed bandits and Bayesian optimization
- Reinforcement learning

Prerequisites / notice

Solid basic knowledge in statistics, algorithms and programming.

The material covered in the course "Introduction to Machine Learning" is considered as a prerequisite.
The goal of this course is to provide students with a good understanding of computer vision and image analysis techniques. The main concepts and techniques will be studied in depth and practical algorithms and approaches will be discussed and explored through the exercises.

Objective

The objectives of this course are:
1. To introduce the fundamental problems of computer vision.
2. To introduce the main concepts and techniques used to solve those.
3. To enable participants to implement solutions for reasonably complex problems.
4. To enable participants to make tasks possible of computer vision literature.

Content

Camera models and calibration, invariant features, Multiple-view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition

Prerequisites / notice

It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts before taking this course.

263-5902-00L Computer Vision W 8 credits 3V+1U+3A M. Pollefeys, S. Tang, F. Yu

Abstract

The goal of this course is to provide students with a good understanding of computer vision and image analysis techniques. The main concepts and techniques will be studied in depth and practical algorithms and approaches will be discussed and explored through the exercises.

Objective

The objectives of this course are:
1. To introduce the fundamental problems of computer vision.
2. To introduce the main concepts and techniques used to solve those.
3. To enable participants to implement solutions for reasonably complex problems.
4. To enable participants to make tasks possible of computer vision literature.

Content

Camera models and calibration, invariant features, Multiple-view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition

Prerequisites / notice

It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts before taking this course.

263-5905-00L Mixed Reality W 5 credits 3G+1A Z. Bauer, C. Holz, M. Pollefeys

Abstract

The goal of this course is an introduction and hands-on experience on latest mixed reality technology at the cross-section of 3D computer graphics and vision, human machine interaction, as well as gaming technology.

Objective

After attending this course, students will:
1. Understand the foundations of 3D graphics, Computer Vision, and Human-Machine Interaction
2. Have a clear understanding on how to build mixed reality apps
3. Have a good overview of state-of-the-art Mixed Reality
4. Be able to critically analyze and assess current research in this area.

Content

The course introduces latest mixed reality technology and provides introductory elements for a number of related fields including:
Introduction to Mixed Reality / Augmented Reality / Virtual Reality Introduction to 3D Computer Graphics, 3D Computer Vision. This will take place in the form of short lectures, followed by student presentations discussing the current state-of-the-art. The main focus of this course is student projects on mixed reality topics, where small groups of students will work on a particular project with the goal to design, develop and deploy a mixed reality application. The project topics are flexible and can reach from proof-of-concept vision/graphics/HMI research, to apps that support teaching with interactive augmented reality, or game development. The default platform will be Microsoft HoloLens in combination with C# and Unity3D - other platforms are also possible to use, such as tablets and phones.

Prerequisites / notice

Prerequisites include:
- Good programming skills (C# / C++ / Java etc.)
- Computer graphics/vision experience: Students should have taken, at a minimum, Visual Computing. Higher level courses are recommended, such as Introduction to Computer Graphics, 3D Vision, Computer Vision.

376-1504-00L Physical Human Robot Interaction (pHRI) W 4 credits 2V+2U O. Lambercy, P. Wolf

Abstract

This course focuses on the emerging, interdisciplinary field of physical human-robot interaction, bringing together themes from robotics, real-time control, human factors, haptics, virtual environments, interaction design and other fields to enable the development of human-oriented robotic systems.

Objective

The objective of this course is to give an introduction to the fundamentals of physical human robot interaction, through lectures on the underlying theoretical/mechatronics aspects and application fields, in combination with a hands-on lab tutorial. The course will guide students through the design and evaluation process of such systems.

By the end of this course, you should understand the critical elements in human-robot interactions - both in terms of engineering and human factors - and use these to evaluate and de- sign safe and efficient assistive and rehabilitative robotic systems. Specifically, you should be able to:

1) Identify critical human factors in physical human-robot interaction and use these to derive design requirements;
2) Compare and select mechatronic components that optimally fulfill the defined design requirements;
3) Derive a model of the device dynamics to guide and optimize the selection and integration of selected components into a functional system;
4) Design control hardware and software and implement and test human-interactive control strategies on the physical setup;
5) Characterize and optimize such systems using both engineering and psychophysical evaluation metrics;
6) Investigate and optimize one aspect of the physical setup and convey and defend the gained insights in a technical presentation.

Content

This course provides an introduction to fundamental aspects of physical human-robot interaction. After an overview of human haptic, visual and auditory sensing, neurophysiology and psychophysics, principles of human-robot interaction systems (kinematics, mechanical transmissions, robot sensors and actuators used in these systems) will be introduced. Throughout the course, students will gain knowledge of interaction control strategies including impedance/admittance and force control, haptic rendering basics and issues in device design for humans such as transparency and stability analysis, safety hardware and procedures. The course is organized into lectures that aim to bring students up to speed with the basics of these systems, readings on classical and current topics in physical human-robot interaction, laboratory sessions and lab visits.

Students will attend periodic laboratory sessions where they will implement the theoretical aspects learned during the lectures. Here the salient features of haptic device design will be identified and theoretical aspects will be implemented in a haptic system based on the haptic paddle (https://relab.ethz.ch/downloads/open-hardware/haptic-paddle.html), by creating simple dynamic haptic virtual environments and understanding the performance limitations and causes of instabilities (direct/virtual coupling, friction, damping, time delays, sampling rate, sensor quantization, etc.) during rendering of different mechanical properties.

Lecture notes

Will be distributed on Moodle before the lectures.
### Literature

### Prerequisites / notice

Notice:
The registration is limited to 26 students.
There are 4 credit points for this lecture.
The lecture will be held in English.
The students are expected to have basic control knowledge from previous classes.

### Objective

The aim of this course is to provide an introductory overview of mathematical and computational methods for the modeling, simulation and analysis of biological networks.

### Content

Biological systems have witnessed an unprecedented increase in experimental data and, correspondingly, an increased need for computational methods to analyze this data. The explosion of sequenced genomes, and subsequently, of bioinformatics methods for the storage, analysis and comparison of genetic sequences provides a prominent example. Recently, however, an additional area of research, captured by the label "Systems Biology", focuses on how networks, which are more than the mere sum of their parts' properties, establish biological functions. This is essentially a task of reverse engineering. The aim of this course is to provide an introductory overview of corresponding computational methods for the modeling, simulation and analysis of biological networks.

We will start with an introduction into the basic units, functions and design principles that are relevant for biology at the level of individual cells. Making extensive use of example systems, the course will then focus on methods and algorithms that allow for the investigation of biological networks with increasing detail. These include (i) graph theoretical approaches for revealing large-scale network organization, (ii) probabilistic (Bayesian) network representations, (iii) structural network analysis based on reaction stoichiometries, (iv) qualitative methods for dynamic modeling and simulation (Boolean and piece-wise linear approaches), (v) mechanistic modeling using ordinary differential equations (ODEs) and finally (vi) stochastic simulation methods.

Abstract
This course consists of a series of seven lectures given by researchers who have distinguished themselves in the area of Robotics, Systems, and Controls.

Objective
Obtain an overview of various topics in Robotics, Systems, and Controls from leaders in the field. Please see http://www.msrl.ethz.ch/education/distinguished-seminar-in-robotics--systems--controls--151-0623-0.html for a list of upcoming lectures.

Content
This course consists of a series of seven lectures given by researchers who have distinguished themselves in the area of Robotics, Systems, and Controls. MSc students in Robotics, Systems, and Controls are required to attend every lecture. Attendance will be monitored. If for some reason a student cannot attend one of the lectures, the student must select another ETH or University of Zurich seminar related to the field and submit a one page description of the seminar topic. Please see http://www.msrl.ethz.ch/education/distinguished-seminar-in-robotics--systems--controls--151-0623-0.html for a suggestion of other lectures.

Prerequisites / notice
Students are required to attend all seven lectures to obtain credit. If a student must miss a lecture then attendance at a related special lecture will be accepted that is reported in a one page summary of the attended lecture. No exceptions to this rule are allowed.

Abstract
The semester project is designed to train the students in the solution of specific engineering problems. This makes use of the technical and social skills acquired during the master's program. Tutors propose the subject of the project, elaborate the project plan, and define the roadmap togehter with their students, as well as monitor the overall execution.

Objective
The semester project is designed to train the students in the solution of specific engineering problems. This makes use of the technical and social skills acquired during the master's program.

</table>

Abstract
Master's programs are concluded by the master's thesis. The thesis is aimed at enhancing the student's capability to work independently toward the solution of a theoretical or applied problem. The subject of the master's thesis, as well as the project plan and roadmap, are proposed by the tutor and further elaborated with the student.

Objective
The thesis is aimed at enhancing the student's capability to work independently toward the solution of a theoretical or applied problem.

ECTS: European Credit Transfer and Accumulation System

- Special students and auditors need special permission from the lecturers.
Subject-specific Competencies
Students obtain insights into different policy-related research fields and participate in scientific discussions.

Readings will be available on Moodle.

Assessing Political Feasibility of Policies - Public Opinion Research, Survey and Field Experiments
Priority for Science, Technology, and Policy MSc and PhD students.

This course teaches the basics of public opinion surveys. We start with the theoretical foundations of the formation of (public) opinion formation and ideology, then turn to the practical lessons of developing and implementing own surveys with a focus on causal inference via survey experiments. Finally, we give practical insights into the analysis of (complex) survey data.

The goals of this class are:
- to understand the basics of public opinion research
- to translate this theoretical knowledge into the practical design and implementation of surveys
- to make use of survey experiments for causal inference

At the end of the course, students should be able to use and evaluate public opinion data and design survey experiments to test policy-relevant questions.

Concepts, Theories, and Methods for Public Policy Analysis
ISTP-PhD students please register via the Study Administration.

This course helps students with an educational background in natural sciences or engineering to transition into the field of public policy analysis (PPA). It starts with a broad conceptual and historical perspective on technological and scientific innovation, and then focuses on concepts, theories, and methods for policy analysis as well as their application to policy questions in a variety of issue areas. The course is heavily based on reading assignments and their discussion in class. The overall goal is to expose students to a variety of ways in which policy analysis can be undertaken, but not to teach specific policy analysis tools in great depth – those skills will be acquired in other, dedicated courses of the MSc STP program.

The course is open only to the ISTP's MSc students and to ISTP doctoral students.

Policy Analysis
Does not take place this semester.

The course Policy Analysis 1 will introduce important concepts and methods for ex-ante policy analysis. It will mostly focus on the policy content (vis-à-vis the policy process). We will primarily discuss quantitative methods. The course will contain several practical assignments in which students have to apply the concepts and methods studied.

Students should gain the skill to perform policy analyses independently. To this end, students will be enabled to understand a policy problem and the rationale for policy intervention; to select appropriate impact categories and methods to address a policy problem through policy analysis; to assess policy alternatives, using various ex-ante policy analysis methods; and to communicate the results of the analysis.

The course has four major topics:
- Rationales for public policy in Science and Technology
- Impact of policies on firms and investors
- Impacts of policies on socio-technical systems
- Impact of policies on society at large

The course introduces basic principles, problems and approaches of microeconomics. This provides the students with reflective and contextual knowledge on how societies use scarce resources to produce goods and services and ensure a (fair) distribution.
The resources on our planet are finite. The discipline of microeconomics therefore deals with the question of how society can use scarce resources to produce goods and services and ensure a (fair) distribution. In particular, microeconomics deals with the behaviour of consumers and firms in different market forms. Economic considerations and discussions are not part of classical engineering and science study programme. Thus, the goal of the lecture "Principles of Microeconomics" is to teach students how economic thinking and argumentation works. The course should help the students to look at the contents of their own studies from a different perspective and to be able to critically reflect on economic problems discussed in the society.

Topics covered by the course are:

- Supply and demand
- Consumer demand: neoclassical and behavioural perspective
- Cost of production: neoclassical and behavioural perspective
- Welfare economics, deadweight losses
- Governmental policies
- Market failures, common resources and public goods
- Public sector, tax system
- Market forms (competitive, monopolistic, monopolistic competitive, oligopolistic)
- International trade

Lecture notes: Lecture notes, exercises and reference material can be downloaded from Moodle.

For students taking only the course 'Principles of Microeconomics' there is a shorter version of the same book: N. Gregory Mankiw and Mark P. Taylor (2023), "Microeconomics", 6th edition, South-Western Cengage Learning.

Complementary:

Prerequisites / notice: GESS (Science in Perspective): This lecture is for MSc students only. BSc students register for 363-1109-00L Einführung in die Mikroökonomie.

Competencies:

<tbody>
<tr>
<td>This course examines the behaviour of macroeconomic variables, such as gross domestic product, unemployment and inflation rates. It tries to answer questions like: How can we explain fluctuations of national economic activity? What can economic policy do against unemployment and inflation?</td>
<td>This lecture will introduce the fundamentals of macroeconomic theory and explain their relevance to every-day economic problems.</td>
</tr>
</tbody>
</table>
This course helps you understand the world in which you live. There are many questions about the macroeconomy that might spark your curiosity. Why are living standards so meagre in many African countries? Why do some countries have high rates of inflation while others have stable prices? Why have some European countries adopted a common currency? These are just a few of the questions that this course will help you answer.

Furthermore, this course will give you a better understanding of the potential and limits of economic policy. As a voter, you help choose the policies that guide the allocation of society’s resources. When deciding which policies to support, you may find yourself asking various questions about economics. What are the burdens associated with alternative forms of taxation? What are the effects of free trade with other countries? How does the government budget deficit affect the economy? These and similar questions are always on the minds of policy makers.

Besides this textbook, the slides, lecture notes and problem sets will cover the content of the lecture and the exam questions.

**Public Institutions and Policy-Making Processes**

- **Number of participants limited to 30.**
- **Priority for Science, Technology, and Policy Master.**

**Abstract**

Students acquire the contextual knowledge for analyzing public policies. They learn why and how public policies and laws are developed, designed, and implemented at national and international levels, and what challenges arise in this regard.

**Objective**

Public policies result mainly from decision-making processes that take place within formal institutions of the state (parliament, government, public administration, courts) or inter-/supranational organizations (e.g., EU, UN, World Bank). That is, policies are shaped by the characteristics of decision-making processes and the characteristics of public institutions and related actors (e.g., citizens, interest groups, news media). In this course, students acquire the contextual knowledge for analyzing public policies – hence this course is complementary to the ISTP course on concepts and methods of policy analysis. Students learn why and how public policies and laws are developed, designed, and implemented at national and international levels.

**Content**

The course is organized in three modules. The first module (taught by Stefan Bechtold) examines basic concepts and the role of law, lawmaking, and law enforcement in modern societies. The second module (taught by Thomas Bernauer) deals with political behavior (including elections and electoral systems), and the functioning of legislatures, governments, and interest groups. The third module (taught by Frank Schimmelfennig) focuses on the European Union and international organizations.

**Lecture notes**

Course materials will be available on Moodle.

**Literature**

Readings will be available on Moodle.

**Prerequisites / notice**

This is a Master level course. The course is capped at 27 students, with ISTP Master students having priority.

---

**Minor in Natural Sciences and Engineering**

**Urbanization and Planning**

**Ecological Assessment and Evaluation**

- **Number of participants limited to 30.**
- **Priority for Science, Technology, and Policy Master.**

**Abstract**

The course provides methods and tools for ecological evaluations dealing with nature conservation or landscape planning. It covers census methods, ecological criteria, indicators, indices and critically appraises objectivity and accuracy of the available methods, tools and procedures. Birds and plants are used as main example guiding through different case studies.

**Objective**

Students will be able to:
1) critically consider biological data books and local, regional, and national inventories;
2) evaluate the validity of ecological criteria used in decision making processes;
3) critically appraise the handling of ecological data and criteria used in the process of evaluation
4) perform an ecological evaluation project from the field survey up to the decision making and planning.

**Lecture notes**

Powerpoint slides are available on the moodle page. Additional documents are handed out as copies.

**Literature**

Basic literature and references are listed on the webpage.
The main objective of this course is to provide students with some basic tools to analyze the fundamental economic forces at play in urban systems. By the end of the course, students should be able to answer after having completed the course: How do urban areas grow or decline? How do transport networks affect the location of individuals and firms? Does the location of a firm determine the productivity? Can transport infrastructure investments reduce economic disparities? These are some of the questions that students should be able to answer after having completed the course.

In the second part, I discuss the planning and pricing of transport networks, moving from simple local models to more complex transport models at a global scale. The key aspects include: the first and second best road pricing, the public provision of transport networks and the demographic effects of transport networks.

In the third part, I combine the previous two parts and analyze the interaction between urban systems and transportation. Thereby, the main focus is to understand the economic mechanisms that can lead to a general equilibrium of all actors involved. However, as the study of the historical development of urban systems and transport networks provides interesting insights, I will discuss how their interaction in the past shapes today’s economic geography.

Finally, I broaden the scope of the course and explore related topics. There will be a particular emphasis on the relation between urban systems and fiscal federalism as well as environmental policies. Both aspects are important determinants of the contemporary developments of urban systems, and as such deserve our attention.

In general, this class focuses on the latest research developments in urban and regional economics, though it does not require prior knowledge in this field. It pays particular attention to economic approaches, which are based on theoretical frameworks with strong micro-foundations and allow for precise policy recommendations.

Prerequisites / notice
Suggested prerequisites for attending this course are skills and knowledge equivalent to those taught in the following ETH courses:
- Pflanzen- und Vegetationsökologie
- Systematische Botanik
- Raum- und Regionalentwicklung
- Naturschutz und Naturschutzbiologie

363-1047-00L Urban Systems and Transportation
W 3 credits 2G
M. Köthenbürger, G. Loumeau

Abstract

This course is an introduction to urban and regional economics. It focuses on the formation and development of urban systems, and highlight how transport infrastructure investments can affect the location, size and composition of such systems.

Objective

- The main objective of this course is to provide students with some basic tools to analyze the fundamental economic forces at play in urban systems (i.e., agglomeration and congestion forces), and the role of transport networks in shaping the structure of these systems. Why do urban areas grow or decline? How do transport networks affect the location of individuals and firms? Does the location of a firm determine its productivity? Can transport infrastructure investments reduce economic disparities? These are some of the questions that students should be able to answer after having completed the course.

Content

- The course is organized in four parts. I start with the key observation that economic activity (both in terms of population density and productivity) is unevenly distributed in space. For instance, the share of the population living in urban centers is increasing globally, from 16% in 1900 and 50% in 2000 to about 68% by the year 2050 (UN, World Economic Prospects, 2014). The goal of the first part is then to understand the economic forces at play behind these trends, looking at the effects within and across urban areas. I will also discuss how natural or man-made geographical characteristics (e.g., rivers, mountains, borders, etc.) affect the development of such urban systems.

- In the second part, I discuss the planning and pricing of transport networks, moving from simple local models to more complex transport models at a global scale. The key aspects include: the first and second best road pricing, the public provision of transport networks and the demographic effects of transport networks.

- In the third part, I combine the previous two parts and analyze the interaction between urban systems and transportation. Thereby, the main focus is to understand the economic mechanisms that can lead to a general equilibrium of all actors involved. However, as the study of the historical development of urban systems and transport networks provides interesting insights, I will discuss how their interaction in the past shapes today’s economic geography.

- Finally, I broaden the scope of the course and explore related topics. There will be a particular emphasis on the relation between urban systems and fiscal federalism as well as environmental policies. Both aspects are important determinants of the contemporary developments of urban systems, and as such deserve our attention.

Lecture notes

Course slides will be made available to students prior to each class.

Literature

Course slides will be made available to students.

101-0509-00L Infrastructure Management 1: Process
W 6 credits 2G
B. T. Adey

Abstract

Infrastructure management is the process that ensures infrastructure provides desired service over time. This course provides an overview of the process and insight into some of the most important parts, i.e., defining service, justifying interventions, monitoring the infrastructure system, and ensuring a well-functioning infrastructure management organisation.

Objective

- The objective of this course is to provide an overview of the infrastructure management process. The high-level process can be used as a starting point to ensure that infrastructure management is done professionally, efficiently and effectively. This process can be used to help improve the specific infrastructure management processes in the organisations.

- More specifically upon completion of the course, students had their first experience with defining the service to be provided by infrastructure, developing and evaluating asset strategies, and converting them into programs / project portfolios, establishing a monitoring program for an infrastructure system, and establishing basic rules and principles to ensure an infrastructure management organisation is running well.
The weekly lectures are structured as follows:

1. **Introduction**: An introduction to infrastructure management and the project.
2. **Service**: Determination of what service you are trying to provide with an infrastructure network is important in justifying the interventions you think are required and ensuring that investment decisions are aligned throughout an infrastructure management organisation. This lecture introduces the concept of serve and connects it to measurable indicators.
3. **Help session 1**: This session provides time for your group to ask questions as you define the service you want your infrastructure network to provide.
4. **Presentation 1**: 4 groups will present their ideas on how they want their networks to provide service.
5. **Interventions**: Justifying the interventions you want to execute to ensure you continue to provide the defined service requires you to model deterioration, determining economically justifiable strategies and explain which interventions will be postponed if you cannot do all of them. This lecture is focused on explaining the main principles behind each of these concepts.
6. **Help session 2**: This session provides time for your group to ask questions as you justify the interventions you want to execute on your infrastructure network over time and explain what you will postpone if you cannot do all of them.
7. **Presentation 2**: 4 groups will present how they have justified interventions and how they have selected the ones they would like to postpone if required.
8. **Monitoring**: To ensure you the infrastructure network is providing what you expect you need to monitor its performance and how projects are being done. This lecture is focused on the principles to ensure a monitoring system is set up that ensure that the infrastructure system is providing the expected service.
9. **Help session 3**: This session provides time for your group to ask questions on how to establish the monitoring systems for your infrastructure networks.
10. **Presentation 3**: 4 groups will present how they intended to monitor their systems and projects.
11. **Organisation**: Managing infrastructure only works well with great teams of people with great processes. This lecture focuses on the principles of ensuring a well function organisation and well-functioning processes.
12. **Help session 4**: This session provides time for your group to ask questions on how to ensure well-functioning organisations and well-functioning processes.
13. **Presentation 4**: 4 groups will present how they intended to ensure well-functioning organisations and well-functioning processes.

**Lecture notes**
- The lecture materials consist of handouts and the slides.
- The lecture materials will be distributed via Moodle by the beginning of each lecture.
- The questions to be discussed in the discussion session will be distributed by the end of the day on the Monday before the discussion session.

**Literature**
- Appropriate literature will be handed out when required via Moodle.

**Prerequisites / notice**
- This course has no prerequisites.

**Competencies**

- **Subject-specific Competencies**
  - Concepts and Theories: assessed
  - Techniques and Technologies: assessed

- **Method-specific Competencies**

**103-0347-01L Landscape Planning and Environmental Systems (GIS W 3 credits 2U)**

**Abstract**
The course content of the lecture Landscape Planning and Environmental Systems (103-0347-00 V) will be illustrated in practical GIS exercises (e.g. habitat modelling, land use change, ecosystem services, connectivity).

**Objective**
- Practical application of theory from the lectures
- Quantitative assessment and evaluation of landscape characteristics
- Learning useful applications of GIS for landscape planning
- Developing landscape planning measures for practical case studies

**Content**
- Applications of GIS in landscape planning
- Landscape analysis
- Landscape structural metrics
- Modelling habitats and land use change
- Calculating urban ecosystem services
- Ecological connectivity

**Lecture notes**
- A script and presentation slides for each exercise will be provided on Moodle.

**Literature**
- Will be named in the lecture.

**Prerequisites / notice**
- Basic GIS skills are strongly recommended.
Abstract
In the course, students learn about methods for the identification and measurement of landscape characteristics, as well as measures and policies for landscape planning. Landscape planning is put into the context of environmental systems (soil, water, air, climate, flora and fauna) and discussed with regard to socio-political questions of the future.

Objective
The aims of this course are:
1) To illustrate the concept of landscape planning, the economic relevance of landscape and nature in the context of the environmental systems (soil, water, air, climate, flora and fauna).
2) To show landscape planning as an integral information system for the coordination of different instruments by illustrating the aims, methods, instruments and their functions in landscape planning.
3) To show the importance of ecosystem services.
4) To learn basics about nature and landscape: Analysis and assessment of the complex interactions between landscape elements, effects of current and future land use (ecosystem goods and services, landscape functions).
5) To identify and measure the characteristics of landscape.
6) Learn how to use spatial data in landscape planning.

Content
In this course, the following topics are discussed:
- Definition of the concept of landscape
- Relevance of landscape planning
- Landscape metrics
- Landscape change
- Methods, instruments and aims of landscape planning (policy)
- Socio-political questions of the future
- Environmental systems, ecological connectivity
- Ecosystem services
- Urban landscape services
- Practice of landscape planning
- Use of GIS in landscape planning

Lecture notes
No script. The documentation, consisting of presentation slides are partly handed out and are provided for download on Moodle.

Prerequisites / notice
The contents of the course will be illustrated in the associated course 103-0347-01 U (Landscape Planning and Environmental Systems (GIS Exercises)) or in Project LAND within the Experimental and Computer Lab (for Environmental Engineers). A combination of courses is recommended.
Public transport is a key driver for making our cities more livable, clean and accessible, providing safe, and sustainable travel options for millions of people around the globe. Proper planning of public transport system also ensures that the system is competitive in terms of speed and cost. Public transport is a crucial asset, whose social, economic and environmental benefits extend beyond those who use it regularly; it reduces the amount of cars and road infrastructure in cities; reduces injuries and fatalities associated to car accidents, and gives transport accessibility to very large demographic groups.

Goal of the class is to understand the main characteristics and differences of public transport networks. Their various performance criteria based on various perspective and stakeholders. The most relevant decision making problems in a planning tactical and operational point of view At the end of this course, students can critically analyze existing networks of public transport, their design and use; consider and substantiate possible improvements to existing networks of public transport and the management of those networks; optimize the use of resources in public transport.

General structure:
- general introduction of transport, modes, technologies, system design and line planning for different situations, mathematical models for design and line planning, timetabling and tactical planning, and related mathematical approaches operations, and quantitative support to operational problems, evaluation of public transport systems.

Content
- Basics for line transport systems and networks
- Passenger/Supply requirements for line operations
- Objectives of system and network planning, from different perspectives and users, design dilemmas
- Conceptual concepts for passenger transport: long-distance, urban transport, regional, local transport

Planning process, from demand evaluation to line planning to timetables to operations
- Matching demand and modes
- Line planning techniques
- Timetabling principles
- Allocation of resources
- Management of operations
- Measures of realized operations
- Improvements of existing services

103-0317-00L Spatial Planning and Development W 3 credits 2G D. Kaufmann, A. Kuitenbrouwer

Only for master students, otherwise a special permission by the lecturer is required.

Abstract
The course deals with theoretical, methodological and practical foundations around the understanding and production of urban space. It discusses theoretical planning frameworks, and tasks of spatial planning at various scales, addresses current and future challenges of spatial development and reviews approaches for a sustainable development in Switzerland and beyond.
Cooperation and Teamwork

Students are introduced to a narrative of 'Urban Stories' through a series of three tools driven by social, governance, and environmental fostered. A course will be set up on Moodle for the provision of lectures and documents, to upload group deliverables and to ask questions in a assessed. H. Klumpner.

Creative Thinking

Subject-specific Competencies

The overall aim of the course is to raise students' awareness and curiosity about the aspects that guide and shape our environment. Through lectures, readings, discussions, and exercises, the course seeks to achieve this goal by accumulating crucial notions from both theoretical and practice-based examples, and applying such knowledge into tasks of spatial planning. At the end of this course, students should feel empowered to critically engage with the teaching topic from a variety of approaches. By taking up the lecture, the students should be able to to analyse, interpret and reflect complex cross-scale tasks of spatial development and transformation, and to use their theoretical, methodical and professional knowledge to tackle them.

You as students will...

... assess present and future core challenges of spatial planning and development.
... discuss the role of spatial planning and development in shaping our living environment.
... differentiate the levels, scales and tasks of spatial planning instruments and processes.
... reflect on theoretical concepts and practical examples of decision-making of spatial tasks.
... identify and apply spatially relevant principles and systems for action-oriented planning and decision-making.
... acquire theoretical, methodological, practical know-how to examine, clarify, and solve tasks on spatial development

Spatial development as a discipline deals with the development, (trans)formation, and arrangement of our urban environment. We simultaneously perceive and contribute to its transformation, making space the result of manifold intended and unintended changes. To mediate between different demands, interests and interventions of multiple actors, a forward-looking, evidence-based, and action-oriented planning is necessary. As guidance for future action, (spatial) planning has to be committed to the sustainable handling as well as just allocation of resources, in particular of the non-replicable resource land.

The course focuses on both theoretical concepts and practice-oriented approaches to gain knowledge and be equipped to address current issues in spatial planning and development. This is mirrored in the course's structure made of both of lectures and exercises. The lecture series introduces necessary key concepts and covers the following main topics:

- Drivers of spatial development, inward development, core tasks and current challenges for (spatial) planners.
- Interplay of formal and informal planning instruments across scales and actors.
- Differentiation urban typologies, their characteristics and challenges
- Types of spatial analysis and key figures
- Planning approaches and the (political) steering of spatial development.
- Types of processes and participation in spatial development.
- Approaches for planning complex urban situations
- Concepts for sustainable development

The exercises provide a framework for practical application of the learned theoretical concepts of spatial planning to real-life situations.

The lecture series introduces necessary key concepts and covers the following main topics:

- Drivers of spatial development, inward development, core tasks and current challenges for (spatial) planners.
- Interplay of formal and informal planning instruments across scales and actors.
- Differentiation urban typologies, their characteristics and challenges
- Types of spatial analysis and key figures
- Planning approaches and the (political) steering of spatial development.
- Types of processes and participation in spatial development.
- Approaches for planning complex urban situations
- Concepts for sustainable development

Lecture notes

A course will be set up on Moodle for the provision of lectures and documents, to upload group deliverables and to ask questions in a discussion Forum. All documents provided are exclusively available for use within this course.

W 2 credits 2V

H. Klumpner.

F. T. Salva Rocha Franco

Abstract

Students are introduced to a narrative of 'Urban Stories' through a series of three tools driven by social, governance, and environmental transformations in today's urbanization processes. Each lecture explores one city's spatial and organizational ingenuity born out of a particular place's realities, allowing students to transfer these inventions into a catalog of conceptual tools.

Objective

How can students of architecture become active agents of change? What does it take to go beyond a building's scale, making design-relevant decisions to the city rather than a single client? How can we design in cities with a lack of land, tax base, risk, and resilience, understanding that Zurich is the exception and these other cities are the rule? How can we discover, set rather than follow trends and understand existing urban phenomena activating them in a design process? The lecture series produces a growing catalog of operational urban tools across the globe, considering Governance, Social, and Environmental realities. Instead of limited binary comparing of cities, we are building a catalog of change, analyzing what design solutions cities have been developing informally incrementally over time, why, and how. We look at the people, institutions, culture behind the design and make concepts behind these tools visible. Students get first-hand information from cities where the chair as a Team has researched, worked, or constructed projects over the last year, allowing competent, practical insight about the people and topics that make these places unique. Students will be able to use and expand an alternative repertoire of experiences and evidence-based design tools, go to the conceptual core of them, and understand how and to what extent they can be relevant in other places. Urban Stories is the basic practice of architecture and urban design. It introduces a repertoire of urban design instruments to the students to use, test, and start their designs.
Urban form cannot be reduced to physical space. Cities result from social construction, under the influence of technologies, ecology, culture, the impact of experts, and accidents. Urban un-concluded processes respond to political interests, economic pressure, cultural inclinations, along with the imagination of architects and urbanists and the informal powers at work in complex adaptive systems. Current urban phenomena are the result of urban evolution. The facts stored in urban environments include contributions from its entire lifecycle, visible in the physical environment, and non-physical aspects. This imaginary city exists along with its potentials and problems and with the conflicts that have evolved. Knowledge and understanding, along with a critical observation of the actions and policies, are necessary to understand the diversity and instability present in the contemporary city and understand how urban form evolved to its current state.

How did cities develop into the cities we live in now? Urban plans, instruments, visions, political decisions, economic reasonings, cultural inputs, and social organization have been used to operate in urban settlements in specific moments of change. We have chosen cities that exemplify how these instruments have been implemented and how they have shaped urban environments. We transcribe these instruments into urban operational tools that we have recognized and collected within existing tested cases in contemporary cities across the globe.

This lecture series will introduce urban knowledge and how it has introduced urban models and operational modes within different concrete realities, therefore shaping cities. The lecture series translates urban knowledge into operational tools, extracted from cities where they have been, to students in a way most relevant for understanding how an urban landscape has taken shape. The tools are clustered in twelve thematic clusters and three tool scales for better comparability and cross-reflection.

The Tool case studies are compiled into a global urbanization toolbox, which we use as typological models to read the city and critically reflect upon it. The presented contents are meant to serve as inspiration for positioning in future professional life and provide instruments for future design decisions.

In an interview with a local designer, we measure our insights against the most pressing design topics in cities today, including inclusion, affordable housing, provision of public spaces, and infrastructure for all.

The Tool case studies are compiled into a global urbanization toolbox, which we use as typological models to read the city and critically reflect upon it. The presented contents are meant to serve as inspiration for positioning in future professional life and provide instruments for future design decisions.

In an interview with a local designer, we measure our insights against the most pressing design topics in cities today, including inclusion, affordable housing, provision of public spaces, and infrastructure for all.

The Tool case studies are compiled into a global urbanization toolbox, which we use as typological models to read the city and critically reflect upon it. The presented contents are meant to serve as inspiration for positioning in future professional life and provide instruments for future design decisions.
The course is organized in four parts. I start with the key observation that economic activity (both in terms of population density and productivity) is unevenly distributed in space. For instance, the share of the population living in urban centers is increasing globally, from 16% in 1900 and 50% in 2000 to about 68% by the year 2050 (UN, World Economic Prospects, 2014). The goal of the first part is then to understand the economic forces at play behind these trends, looking at the effects within and across urban areas. I will also discuss how natural or man-made geographical characteristics (e.g., rivers, mountains, borders, etc.) affect the development of such urban systems.

In the second part, I discuss the planning and pricing of transport networks, moving from simple local models to more complex transport models at a global scale. The key aspects include: the first and second best road pricing, the public provision of transport networks and the role of transport networks in shaping the structure of such systems.

In the third part, I combine the previous two parts and analyze the interaction between urban systems and transport networks. Thereby, the main focus is to understand the economic mechanisms that can lead to a general equilibrium of all actors involved. However, as the study of the historical development of urban systems and transport networks provides interesting insights, I will discuss how their interaction in the past shapes today’s economic geography.

Finally, I broaden the scope of the course and explore related topics. There will be a particular emphasis on the relation between urban systems and fiscal federalism as well as environmental policies. Both aspects are important determinants of the contemporary developments of urban systems, and as such deserve our attention.

In general, this class focuses on the latest research developments in urban and regional economics, though it does not require prior knowledge in this field. It pays particular attention to economic approaches, which are based on theoretical frameworks with strong micro-foundations and allow for precise policy recommendations.
Abstract
Physical fundamentals of the fission reaction and the sustainable chain reaction, thermal design, construction, function and operation of nuclear reactors and power plants, light water reactors and other reactor types, conversion and breeding

Objective
Students get an overview on energy conversion in nuclear power plants, on construction and function of the most important types of nuclear reactors with special emphasis to light water reactors. They obtain the mathematical/physical basis for quantitative assessments concerning most relevant aspects of design, dynamic behaviour as well as material and energy flows.

Content
Nuclear physics of fission and chain reaction. Thermodynamics of nuclear reactors. Design of the reactor core. Introduction into the dynamic behaviour of nuclear reactors. Overview on types of nuclear reactors, difference between thermal reactors and fast breeders. Construction and operation of nuclear power plants with pressurized and boiling water reactors, role and function of the most important safety systems, special features of the energy conversion. Development tendencies of reactor technology.

Lecture notes
Hand-outs will be distributed. Additional literature and information on the website of the lab: https://www.ethz.ch/content/special interest/mavt/energy/technology/lab-of-nuclear-energy-systems/en/studium/teaching-materials/151-0163-00l-nuclear-energy-conversion.html

<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>Thermodynamics is key to understanding and use of energy conversion processes in Nature and technology. Main objective of this course is to give a compact introduction into basics of Thermodynamics: Thermodynamic states and thermodynamic processes; Work and Heat; First and Second Laws of Thermodynamics. Students shall learn how to use energy balance equation in the analysis of power cycles and shall be able to evaluate efficiency of internal combustion engines, gas turbines and steam power plants. The course shall extensively use thermodynamic charts to build up students' intuition about opportunities and restrictions to increase useful work output of energy conversion. Thermodynamic functions such as entropy, enthalpy and free enthalpy shall be used to understand chemical and phase equilibrium. The course also gives introduction to refrigeration cycles, combustion and refrigeration. The course compactly covers the standard course of thermodynamics for engineers, with additional topics of a general physics interest (nonideal gas equation of state and Joule-Thomson effect) also included.</td>

227-0122-00L Introduction to Electric Power Transmission: System & Technology

Abstract
Introduction to theory and technology of electric power transmission systems.

Objective
At the end of this course, the student will be able to: describe the structure of electric power systems, name the most important components and describe what they are needed for, apply models for transformers and overhead power lines, explain the technology of lines, know about electrical safety, calculate electric withstand strength of gas gaps, stationary power flows and other basic parameters in simple power systems.

Content
Structure of electric power systems, transformer and power line models, analysis of and power flow calculation in basic systems, technology and principle of electric power systems.

Lecture notes
Lecture script in English, exercises and sample solutions.

Data: 26.07.2024 12:39   Autumn Semester 2024   Page 2281 of 2680
The first part of the lecture covers hardware-based security concepts. Topics include the concept of physical and software-based side channel attacks on hardware resources, architectural support for security (e.g., memory management and permissions, disk encryption), and trusted execution environments (Intel SGX, ARM TrustZone, AMD SEV, and RISC-V Keystone).

In the second part, the focus is on system design and methodologies for building secure systems. Topics include: common software faults (e.g., buffer overflows, etc.), buggy detection, writing secure software (design, architecture, QA, testing), compiler-supported security (e.g., control-flow integrity), and language-supported security (e.g., memory safety).

Along the lectures, model cases will be elaborated and evaluated in the exercises.

### Content

#### Abstract

Some of today's most damaging attacks on computer systems involve exploitation of network infrastructure, either as the target of attack or as a vehicle to attack end systems. This course provides an in-depth study of network attack techniques and methods to defend against them.

#### Objective

- Students are familiar with fundamental network-security concepts.
- Students can implement network-security protocols based on cryptographic libraries.
- Students can identify and assess vulnerabilities in software systems and network protocols.
- Students can implement network-security protocols based on cryptographic libraries.

#### Content

This course will cover topics spanning four broad themes with a focus on the first two themes:

1. network defense mechanisms such as public-key infrastructures, TLS, VPNs, and cyber-communication systems; secure routing protocols, secure DNS systems, and network intrusion-detection systems;
2. Students have an in-depth understanding of a range of important state-of-the-art security technologies.
3. Students can implement network-security protocols based on cryptographic libraries.
4. Students can identify and assess vulnerabilities in software systems and network protocols.

In addition, several guest lectures will provide in-depth insights into specific current real-world network-security topics.

#### Prerequisites / notice

This course is accompanied by practical machine learning projects.

- Self-direction and Self-management: assessed

### Network Security

**W 8 credits 2V+2U+3A**

- P. De Vaere, S. Frei, K. Paterson, A. Perrig

#### Abstract

Some of today's most damaging attacks on computer systems involve exploitation of network infrastructure, either as the target of attack or as a vehicle to attack end systems. This course provides an in-depth study of network attack techniques and methods to defend against them.

#### Objective

- Students are familiar with fundamental network-security concepts.
- Students can implement network-security protocols based on cryptographic libraries.
- Students can identify and assess vulnerabilities in software systems and network protocols.
- Students can implement network-security protocols based on cryptographic libraries.

#### Content

This course will cover topics spanning four broad themes with a focus on the first two themes:

1. network defense mechanisms such as public-key infrastructures, TLS, VPNs, and cyber-communication systems; secure routing protocols, secure DNS systems, and network intrusion-detection systems;
2. Students have an in-depth understanding of a range of important state-of-the-art security technologies.
3. Students can implement network-security protocols based on cryptographic libraries.
4. Students can identify and assess vulnerabilities in software systems and network protocols.

In addition, several guest lectures will provide in-depth insights into specific current real-world network-security topics.

#### Prerequisites / notice

This course is intended for students with an interest in securing Internet communication services and network devices. Students are assumed to have knowledge in networking as taught in 252-0064-00L or 227-0120-00L.

Basic knowledge of information security or applied cryptography as taught in 252-0211-00L or 263-4660-00L is beneficial, but an overview of the most important cryptographic primitives will be provided at the beginning of the course.

The course will involve several graded course projects. Students are expected to be familiar with a general-purpose or network programming language such as C/C++, Go, Python, or Rust.

### Advanced Machine Learning

**W 10 credits 3V+2U+4A**

- C. Cotrini Jimenez

#### Abstract

Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

#### Objective

Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real-world data.
The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:

**Fundamentals:**
- What is data?
- Bayesian Learning
- Computational learning theory

**Supervised learning:**
- Ensembles: Bagging and Boosting
- Max Margin methods
- Neural networks

**Unsupervised learning:**
- Dimensionality reduction techniques
- Clustering
- Mixture Models
- Non-parametric density estimation
- Learning Dynamical Systems

**Lecture notes**
No lecture notes, but slides will be made available on the course webpage.

**Literature**

**Prerequisites / notice**
The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments. Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

263-2400-00L Reliable and Trustworthy Artificial Intelligence

**Abstract**
Creating reliable, secure, robust, and fair machine learning models is a core challenge in artificial intelligence and one of fundamental importance. The goal of the course is to teach both the mathematical foundations of this new and emerging area as well as to introduce students to the latest and most exciting research in the space.

**Objective**
Upon completion of the course, the students should have mastered the underlying methods and be able to apply them to a variety of engineering and research problems. To facilitate deeper understanding, the course includes a group coding project where students will build a system based on the learned material.

**Content**
The course is split into 4 parts:

- **Robustness of Machine Learning**
  - Adversarial attacks and defenses on deep learning models.
  - Certified training of deep neural networks (combining symbolic and continuous methods).

- **Privacy of Machine Learning**
  - Threat models (e.g., stealing data, poisoning, membership inference, etc.).
  - Attacking federated machine learning (across vision, natural language and tabular data).
  - Differential privacy for defending machine learning.
  - AI Regulations and checking model compliance.

- **Fairness of Machine Learning**
  - Introduction to fairness (motivation, definitions).
  - Enforcing individual fairness (for both vision and tabular data).
  - Enforcing group fairness (e.g., demographic parity, equalized odds).

- **Robustness, Privacy and Fairness of Foundation Models**
  - We discuss all previous topics, as well as programmability, in the context of latest foundation models (e.g., LLMs).

**Prerequisites / notice**
While not a formal requirement, the course assumes familiarity with basics of machine learning (especially linear algebra, gradient descent, and neural networks as well as basic probability theory). These topics are usually covered in "Intro to ML" classes at most institutions (e.g., "Introduction to Machine Learning" at ETH).

The coding project will utilize Python and PyTorch. Thus some programming experience in Python is expected. Students without prior knowledge of PyTorch are expected to acquire it early in the course by solving exercise sheets.
Lectures will make use of textbooks such as the one by Jurafsky and Martin where appropriate, but will also make use of original research. The goal of the course is to convey the fundamental aspects of efficient data management from a systems implementation perspective.

The objectives of this course are:

- The main source of information for the course will be articles and research papers describing the architecture of the systems discussed. The list of papers will be provided at the beginning of the course.

- The course requires to have completed the Data Modeling and Data Bases course at the Bachelor level as it assumes knowledge of databases and SQL.

- It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts before taking this course.

- The course presents topics in natural language processing with an emphasis on modern techniques, primarily focusing on statistical and deep learning approaches. The course provides an overview of the primary areas of research in language processing as well as a detailed exploration of the models and techniques used both in research and in commercial natural language systems.

- The course presents an introduction to general topics and techniques used in natural language processing today, primarily focusing on statistical and deep learning approaches. The course provides an overview of the primary areas of research in language processing as well as a detailed exploration of the models and techniques used both in research and in commercial natural language systems.

- The list of papers will be provided at the beginning of the course.
Many disciplines are meeting at the nanoscale, from physics, chemistry to engineering, from the life sciences to medicine. The course will foster students to communicate more effectively across disciplinary boundaries, and will provide them with deep insights into the various frontiers.

In addition to the presentations, students will also be required to write critical reviews of the assigned publications throughout the course. The reviews will be evaluated based on the students’ ability to identify the strengths and weaknesses of the publications and to provide insightful and constructive feedback.

Prerequisites / notice

The course is intended for advanced undergraduate and graduate students with a background in computer science, bioinformatics, or a related field and interest in applying their skills to medical research.

This course assumes a working knowledge of R/Python and intermediate statistical analysis, including linear, logistic, survival regressions or ability and interest to learn them outside of the class.

</table>
Starting with the fabrication and analysis of nanoparticles and nanostructured materials that enable a variety of scientific and technical applications, we will transition to discussing biological nanosystems, how they work and what bioinspired engineering principles can be derived, to finally discussing biomedical applications and potential health risk issues. Scientific aspects as well as the many of the emerging technologies will be covered that start impacting so many aspects of our lives. This includes new phenomena in physics, advanced materials, novel technologies and new methods to address major medical challenges.

The course covers the following topics:

- **Concepts and Theories:**
  - Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.
  - Biocompatible Materials

- **Method-specific Competencies:**
  - Translating Ideas into Treatments
  - How does the regulatory environment impact innovation?
  - How to handle IP in the development process?
  - How are medical devices developed?
  - How to measure success?
  - How to identify need?

- **Techniques and Technologies:**

- **Personal Competencies:**
  - Creativity and Innovation
  - Critical Thinking
  - Integrity and Work Ethics
  - Self-awareness and Self-reflection
  - Self-direction and Self-management

All the enrolled students will get access to a password protected website where they can find pdf files of the lecture notes, and typically 1-2 journal articles per lecture that cover selected topics.

**Abstract**

Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.

**Objective**

The course covers the following topics:
1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
2. The concept of biocompatibility.
3. Introduction into methodology used in biomaterials research and application.
4. Introduction to different material classes in use for medical applications.

**Content**

Introduction into natural and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering, drug delivery and for medical devices are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated. Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed.

A link between academic research and industrial entrepreneurship is demonstrated by external guest speakers, who present their current research topics.

**Lecture notes**

Handouts are deposited online (moodle).

**Literature**

(available online via ETH library)

**Prerequisites / notice**

4x online input lecture followed by case preparation and symposium
The module Epidemiology and prevention follows an overall framework that describes the course of scientific discovery from the detection of a disease to the development of prevention and treatment interventions and their evaluation in clinical trials and real world settings. We will discuss study designs in the context of existing knowledge and the type of evidence needed to advance knowledge. Examples from nutrition, chronic and infectious diseases will be used in order to show the underlying concepts and methods.

---

**752-6151-00L Public Health Concepts**

- **W** 3 credits
- **2V**
- **R. Heusser**

**Abstract**

The module "public health concepts" offers an introduction to key principles of public health. Students get acquainted with the concepts and methods of epidemiology. Students also learn to use epidemiological data for prevention and health promotion purposes. Public health concepts and intervention strategies are presented, using examples from infectious and chronic diseases.

**Objective**

At the end of this module students are able:

- to interpret the results of epidemiological studies
- to critically assess scientific literature
- to know the definition, dimensions and determinants of health
- to plan public health interventions and health promotion projects
- to draw a bridge from evidence to policies and politics

---

**636-0109-00L Stem Cells: Biology and Therapeutic Manipulation**

- **W** 4 credits
- **3G**
- **T. Schroeder**

**Abstract**

Stem cells are central in tissue regeneration and repair, and hold great potential for therapy. We will discuss the role of stem cells in health and disease, and possibilities to manipulate their behavior for therapeutic application. Basic molecular and cell biology, engineering and novel technologies relevant for stem cell research and therapy will be discussed.

**Objective**

Understanding of current knowledge, and lack thereof, in stem cell biology, regenerative medicine and required technologies. Theoretical preparation for practical laboratory experimentation with stem cells.

**Content**

Topics will include:

- Embryonic and adult stem cells and their niches
- Induced stem cells by directed reprogramming
- Relevant basic cell biology and developmental biology
- Relevant molecular biology
- Cell culture systems
- Cell fates and their molecular control by transcription factors and signalling pathways
- Cell reprogramming
- Disease modelling
- Tissue engineering
- Bioimaging, Bioinformatics
- Single cell technologies

---

**376-0225-00L Critical Appraisal of Evidence for Exercise in Health and Disease**

- **W** 3 credits
- **2V**
- **E. Giannouli, E. de Bruin, R. Knols**

**Abstract**

This course will discuss the mechanisms and latest evidence-based recommendations of physical activity and exercise for a series of conditions and populations. In the second part of each lecture session, published randomized controlled trials of the respective lecture’s topic will be discussed and critically appraised based on established tools.

**Objective**

On completion of this course students will be able to:

1. understand the role of physical activity and sedentary behavior in the maintenance of health and the etiology, prevention and treatment of disease
2. synthesize effective physical activity and exercise interventions for the prevention and management of several diseases and populations
3. evaluate recent evidence regarding physical activity and exercise interventions

Abstract
In the course, students learn about methods for the identification and measurement of landscape characteristics, as well as measures and policies for landscape planning. Landscape planning is put into the context of environmental systems (soil, water, air, climate, flora and fauna) and discussed with regard to socio-political questions of the future.

Objective
The aims of this course are:
1) To illustrate the concept of landscape planning, the economic relevance of landscape and nature in the context of the environmental systems (soil, water, air, climate, flora and fauna).
2) To show landscape planning as an integral information system for the coordination of different instruments by illustrating the aims, methods, instruments and their functions in landscape planning.
3) To show the importance of ecosystem services.
4) To learn basics about nature and landscape: Analysis and assessment of the complex interactions between landscape elements, effects of current and future land use (ecosystem goods and services, landscape functions).
5) To identify and measure the characteristics of landscape.
6) Learn how to use spatial data in landscape planning.

Content
In this course, the following topics are discussed:
- Definition of the concept of landscape
- Relevance of landscape planning
- Landscape metrics
- Landscape change
- Methods, instruments and aims of landscape planning (policy)
- Socio-political questions of the future
- Environmental systems, ecological connectivity
- Ecosystem services
- Urban landscape services
- Practice of landscape planning
- Use of GIS in landscape planning

Lecture notes
No script. The documentation, consisting of presentation slides are partly handed out and are provided for download on Moodle.

Prerequisites / notice
The contents of the course will be illustrated in the associated course 103-0347-01 U (Landscape Planning and Environmental Systems (GIS Exercises)) or in Project LAND within the Experimental and Computer Lab (for Environmental Engineers). A combination of courses is recommended.

651-4057-00L Climate History and Palaeoclimatology W 4 credits 2G H. Stoll, I. Hernández Almeida
Climate history and paleoclimateology explores how the major features of the earth's climate system have varied in the past, and the driving forces and feedbacks for these changes. The major topics include the earth's CO2 concentration and mean temperature, the size and stability of ice sheets and sea level, the amount and distribution of precipitation, and the ocean heat transport.

The student will be able to describe the natural factors lead to variations in the earth's mean temperature, the growth and retreat of ice sheets, and variations in ocean and atmospheric circulation patterns, including feedback processes. Students will be able to interpret evidence of past climate changes from the main climate indicators or proxies recovered in geological records. Students will be able to use data from climate proxies to test if a given hypothesized mechanism for the climate change is supported or refuted. Students will be able to compare the magnitudes and rates of past changes in the carbon cycle, ice sheets, hydrological cycle, and ocean circulation, with predictions for climate changes over the next century to millennia.

The course spans 5 themes: models of individuals, models at the stand scale, models at the landscape scale, and global models. Students will:

- be enabled to understand, assess and evaluate the fundamental properties of dynamic systems using vegetation models as case studies
- obtain an overview of dynamic modelling techniques and their applications from the individual plant to the global level
- understand the basic assumptions of the various model types, which dictate the applicability and limitations of the respective model
- be enabled to work with such model types on their own
- appreciate the methodological basis for impact assessments of future climate change and other environmental changes on ecosystems.

Models at the stand scale
- Simple approaches: matrix models
- Competition for light and other resources as central mechanisms
- Individual-based stand models: distance-dependent and distance-independent
- Theoretical models

Models at the landscape scale
- Simple approaches: cellular automata
- Dispersal and disturbances (windthrow, fire, bark beetles) as key mechanisms
- Landscape models

Global models
- Sacrificing local detail to attain global coverage: processes and entities
- Dynamic Global Vegetation Models (DGVMs)
- DGVMs as components of Earth System Models

Lecture notes
Handouts will be available in the course and for download

Literature
Will be indicated at the beginning of the course

Prerequisites / notice
- Ideally basic experiences in modelling and systems analysis
- Basic knowledge of programming, ideally in R
- Good knowledge of general ecology, ideally of vegetation dynamics and forest systems

Future climate change can only kept within reasonable bounds when CO2 emissions are drastically reduced. In this course, we will discuss a portfolio of options involving the alteration of natural carbon sinks and carbon sequestration. The course includes introductory lectures, presentations from guest speakers from industry and the public sector, and final presentations by the students.

The goal of this course is to investigate, as a group, a particular set of carbon mitigation/sequestration options and to evaluate their potential, their cost, and their consequences.
From the large number of carbon sequestration/mitigation options, a few options will be selected and then investigated in detail by the students. The results of this research will then be presented to the other students, the involved faculty, and discussed in detail by the whole group.

Lecture notes
None

Literature
Will be identified based on the chosen topic.

Prerequisites / notice
Exam: No final exam. Pass/No-Pass is assigned based on the quality of the presentation and ensuing discussion.

Abstract
The course content of the lecture Landscape Planning and Environmental Systems (103-0347-00 V) will be illustrated in practical GIS exercises (e.g. habitat modelling, land use change, ecosystem services, connectivity).

Objective
- Practical application of theory from the lectures
- Quantitative assessment and evaluation of landscape characteristics
- Learning useful applications of GIS for landscape planning
- Developing landscape planning measures for practical case studies
- Applications of GIS in landscape planning
- Landscape analysis
- Landscape structural metrics
- Modelling habitats and land use change
- Calculating urban ecosystem services
- Ecological connectivity

Lecture notes
A script and presentation slides for each exercise will be provided on Moodle.

Literature
Will be named in the lecture.

Prerequisites / notice
Basic GIS skills are strongly recommended.

Abstract
The lecture provides an overview of climate change in Europe, from a physical and atmospheric science perspective. It covers the following topics:
- observational datasets, observation and detection of climate change;
- underlying physical processes and feedbacks;
- numerical and statistical approaches;
- currently available projections.

Objective
At the end of this course, participants should:
- understand the key physical processes shaping climate change in Europe;
- know about the methodologies used in climate change studies, encompassing observational, numerical, as well as statistical approaches;
- be familiar with relevant observational and modeling data sets;
- be able to tackle simple climate change questions using available data sets.
Fostered understanding of the fundamental processes of hydrothermal, magmatic and supergene ore formation, recognizing and interpreting.

Notes handed out during lectures assessed.

Participants should have a background in natural sciences, and have attended introductory lectures in atmospheric sciences or meteorology.

751-5201-10L Tropical Cropping Systems, Soils and Livelihoods

With Excursion

IMPORTANT: Students who enroll for this course are strongly recommended to verify with lecturers from other courses whether their absence of two weeks may affect their performance in the respective courses.

Abstract

This course guides students in analyzing and comprehending tropical agroecosystems and food systems. Students gain practical knowledge of field methods, diagnostic tools and survey methods for tropical soils and agroecosystems. An integral part of the course is the two-week field project in the Mount Kenya Region, which is co-organized with the University of Embu (Kenya).

Objective

1. Overview of the major land use systems in Tropical agroecosystems in several contexts Africa
2. Interdisciplinary analysis of agricultural production systems
3. Knowledge on methods to assess agroecological performance of a tropical agroecosystems
4. Hands-on training on the use of field methods, diagnostic tools and survey methods.
5. Gain practical knowledge on how to assess to climate resilience and farming systems.
6. Collaboration in international students and stakeholders

Content

This course guides students in analyzing and comprehending tropical agroecosystems. Students of ETH Zürich will work together with the students from Embu University (Kenya) in an interdisciplinary and intercultural team. Students will focus on the Agroecological performance and climate resilience of diverse farming systems in the Mount Kenya Region.

From October 28th to November 11th, The students will take part in a field course in the Mount Kenya Region. Students will then gain practical knowledge on field, meeting several stakeholders of the agricultural and food systems and conducting various assessments related to climate resilience and farming systems.

We would require the students enrolled to the class to send a short cover letter (1-page max.) by September 18rd 2023, justifying your motivation to enroll to this class. A selection of 20 students will be done on the basis of the letters.

651-4037-00L Mineral Resources I

Can be chosen as an elective course within the Bachelor. Prospective MSc-Students attending the module "Mineral Resources" should attend Mineral Resources I and II in the first year of their MSc studies.

Abstract

Principles of hydrothermal ore formation, using base metal deposits (Cu, Pb, Zn) in sedimentary basins to explain the interplay of geological, chemical and physical factors from global scale to sample scale. Introduction to orthomagmatic ore formation (mostly Cr, Ni, PGE), Introduction to supergene residual deposits (Ni, Al)

Objective

Understanding the fundamental processes of hydrothermal, magmatic and supergene ore formation, recognising and interpreting mineralised rocks in geological context

Content

(a) Principles of hydrothermal ore formation: base metal deposits in sedimentary basins. Practical classification of sample suites by genetic ore deposit types

(b) Introduction to orthomagmatic ore formation. Chromite, Ni-Cu sulphides and PGE in layered mafic melts. Distribution coefficients between silicate and sulphide melts. Carbonatites and pegmatite deposits.

(c) Introduction to supergene residual deposits with emphasis on Ni laterites and bauxites

Lecture notes

Notes handed out during lectures

Literature

Extensive literature list distributed in course

Prerequisites / notice

2 contact hours per lecture / week including lectures, exercises and practical study of samples, and small literature-based student presentations. Supplementary contact for sample practicals and exercises as required. Credits and mark based on participation in course (exercises, 50%) and 1h30 written exam in the last lecture of the semester (50%).

Prerequisites: Good mathematical skills, basic programming skills, elementary probability and statistics.

Abstract
This course introduces mathematical and computational models to study techno-socio-economic systems and the process of scientific research. Students develop a significant project to tackle techno-economic challenges in application domains of complex systems. They are expected to implement a model and communicating their results through a seminar thesis and a short oral presentation.

Objective
The students are expected to know a programming language and environment (Python, Java or Matlab) as a tool to solve various scientific problems. The use of a high-level programming environment makes it possible to quickly find numerical solutions to a wide range of scientific problems. Students will learn to take advantage of a rich set of tools to present their results numerically and graphically.

The students should be able to implement simulation models and document their skills through a seminar thesis and finally give a short oral presentation.

Content
Students are expected to implement themselves models of various social processes and systems, including agent-based models, complex networks models, decision making, group dynamics, human crowds, or game-theoretical models.

Credit points are finally earned for the implementation of a mathematical or empirical model from the complexity science literature and the documentation in a seminar thesis.

Lecture notes
The lecture slides will be presented on the course web page after each lecture.

Further literature will be recommended in the lectures.

Prerequisites / notice
The number of participants is limited to the size of the available computer teaching room. The source code related to the seminar thesis should be well enough documented.

Good programming skills and a good understanding of probability & statistics and calculus are expected.

Students need to present a new subject, for which they have not earned any credit points before.

Good scientific practices, in particular citation and quotation rules, must be properly complied with.

Chatham House rules apply to this course. Materials may not be shared without previous written permission.

### Method-specific Competencies

- Knowledge and understanding of statistical methods and algorithms commonly used in transport planning
- Comprehend the reasoning and capabilities of transport models
- Ability to independently develop a transport model able to solve / answer planning problem
- Getting familiar with cost-benefit analysis as a decision-making supporting tool

### Social Competencies

- Communication assessed
- Cooperation and Teamwork assessed
- Customer Orientation assessed
- Leadership and Responsibility assessed
- Self-presentation and Social Influence assessed
- Sensitivity to Diversity assessed
- Negotiation assessed

### Personal Competencies

- Adaptability and Flexibility assessed
- Creative Thinking assessed
- Critical Thinking assessed
- Integrity and Work Ethics assessed
- Self-awareness and Self-reflection assessed
- Self-direction and Self-management assessed

### Transport Planning Methods

The course provides the necessary knowledge to develop models supporting and also evaluating the solution of given planning problems. The course is composed of a lecture part, providing the theoretical knowledge, and an applied part in which students develop their own models in order to evaluate a transport project policy by means of cost-benefit analysis.

**Objective**

- Knowledge and understanding of statistical methods and algorithms commonly used in transport planning
- Comprehend the reasoning and capabilities of transport models
- Ability to independently develop a transport model able to solve / answer planning problem
- Getting familiar with cost-benefit analysis as a decision-making supporting tool

**Content**

The course provides the necessary knowledge to develop models supporting the solution of given planning problems and also introduces cost-benefit analysis as a decision-making tool. Examples of such planning problems are the estimation of traffic volumes, prediction of estimated utilization of new public transport lines, and evaluation of effects (e.g. change in emissions of a city) triggered by building new infrastructure and changes to operational regulations.

To cope with that, the problem is divided into sub-problems, which are solved using various statistical models (e.g. regression, discrete choice analysis) and algorithms (e.g. iterative proportional fitting, shortest path algorithms, method of successive averages).

The course is composed of a lecture part, providing the theoretical knowledge, and an applied part in which students develop their own models in order to evaluate a transport project policy by means of cost-benefit analysis. Interim lab sessions take place regularly to guide and support students with the applied part of the course.

### 860-0040-00L Case Study Research Paper in Science, Technology and Policy 1

**Abstract**

In the case study research paper, students apply skills and knowledge acquired in the social sciences courses of the ISTP curriculum to address a particular societal challenge.

**Objective**

Students are able to apply their problem-solving and analytical skills to address a particular societal challenge.

**Content**

Based on what they have learned, or are learning, in the companion course, and the skills and knowledge acquired in the social sciences courses of the ISTP curriculum, students identify a particular policy challenge to be addressed. Coached by the instructor of the companion course, or in exceptional cases by another ISTP professor, the develop and implement their research idea, according to the ISTP guidelines to this end. The result should be a research paper of around 4000 words (all inclusive, except appendices) that will be graded by the supervisor on the 1-6 scale, based on a grading scheme for this purpose.

**Prerequisites / notice**

Students can enroll in this unit exclusively in combination with another (companion) course to complete the Case Study requirements in the MSc ISTP. The unit allows students to carry out case studies on specific policy issues based on their individual preferences. The companion course should have a policy focus or deal with a policy relevant issue and can be taken either in parallel or prior to the Case Study Research Paper per unit. The instructor of the companion course should be able and willing to also serve as the supervisor of the associated case study paper. After successfully completing the companion course and the research paper, the student office will assign both courses to the category case studies.

### 851-0760-00L Building a Robot Judge: Data Science for Decision-Making

**Abstract**
This course explores the automation of decisions in the legal system. We delve into the machine learning tools needed to predict judge decision-making and ask whether techniques in model explanation and algorithmic fairness are sufficient to address the potential risks.

**Objective**
This course introduces students to the data science tools that may provide the first building blocks for a robot judge. While building a working robot judge might be far off in the future, some of the building blocks are already here, and we will put them to work.

**Content**
Data science technologies have the potential to improve legal decisions by making them more efficient and consistent. On the other hand, there are serious risks that automated systems could replicate or amplify existing legal biases and rigidities. Given the stakes, these technologies force us to think carefully about notions of fairness and justice and how they should be applied.

The focus is on legal prediction problems. Given the evidence and briefs in this case, how will a judge probably decide? How likely is a criminal defendant to commit another crime? How much additional revenue will this new tax law collect? Students will investigate and implement the relevant machine learning tools for making these types of predictions, including regression, classification, and deep neural networks models.

We then use these predictions to better understand the operation of the legal system. Under what conditions do judges tend to make errors? Against which types of defendants do parole boards exhibit bias? Which jurisdictions have the most tax loopholes? Students will be introduced to emerging applied research in this vein. In a semester paper, students (individually or in groups) will conceive and implement an applied data-science research project.

---

### 701-1563-00L Climate Policy

**Abstract**
This course provides an in-depth analysis of the theoretical underpinnings of various approaches to climate policy at the international and national levels, and how these different approaches have played out in practice. Students will learn how legislative frameworks have developed over the last 25 years, and also be able to appraise those frameworks critically.

**Objective**
The goal is to give students a glimpse into the enormous complexity of this policy area, an understanding of some of the many debates that are currently raging (of which the debate about whether climate change is actually real is probably the least complicated or interesting). We want to give students the ability to evaluate policy arguments made by politicians, experts, and academics with a critical eye, informed by a knowledge of history, an understanding of the theoretical underpinnings, and the results of empirical testing of different strategies.

A student taking this course ought to be able to step into an NGO or government agency involved in climate policy analysis or political advocacy, and immediately be able to make an informed and creative contribution. Moreover, by experiencing the depth of this policy area, students should be able to appreciate the complexity inherent in all policy areas.

**Content**
Climate change is one of the defining challenges of our time, touching all aspects of the environment and of society. There is broad recognition (although with some dissent) that governments ought to do something about it: making sure that emissions of greenhouse gases (GHGs) stop within the next 20 to 30 years; helping people to adapt to the consequences of the climate change to which we have already committed ourselves; and, most controversially, perhaps taking measures to actively remove GHG’s from the atmosphere, or to alter the radiation balance of the Earth through solar engineering.

It’s a complicated set of problems, especially the first of these, known as mitigation. Fundamentally this is because it means doing something that humanity has never really tried before at a planetary scale: deliberately altering the ways we produce, convert, and consume energy, which is at the heart of modern society. Modern society – the entire anthropocene – grew up on fossil fuels, and the huge benefits they offered in terms of energy that was inexpensive, easy to transport and store, and very dense in terms of its energy content per unit mass or volume. How to manage a society of over 7 billion people, at anything like today’s living standards, without the benefits of that energy, is a question for which there is no easy answer. There are also other challenges outside of energy. How do we build houses, office buildings, and infrastructure networks without cement, a substance that releases large amounts of CO2 as it hardens? How do we reverse the pace of deforestation, particularly in developing countries? How do we eliminate the GHG emissions from agriculture: the methane from cows’ bellies and rice paddies, together with the chemicals that enter the atmosphere from the application of fertilizer?

These are all tough questions at a technical level, but even tougher when you consider that governments typically need to employ indirect methods to get these things to happen. Arguably a government could simply pass a law and tell people to stop using fossil fuels. But politically this is simply unrealistic, at least while so many people depend on fossil fuels in their daily lives. What is to be done? For this, one needs to turn to various ideas about how government can and should influence society. On the one hand are ideas suggesting that government ought to play a very limited role, relative to private actors, and should step in only to correct “market failures,” with interventions designed specifically around that failure. On the other hand are ideas suggesting that government (meaning all of us, working together through a democratic process) is the appropriate decision-making body for core decisions on where society can and should go. These issues come to the fore in climate policy discussions and debates.

**Literature**
There will be reading assignments for select classes. All of these will be posted in PDF format on a course Moodle. In addition, there will be one book and one report to be read over the course of the semester. They are:

- Ten Principles for Policy Making in the Energy Transition, by Laura Diaz Anadon et al.
- Ministry of the Future, by Kim Stanley Robinson

**Data: 26.07.2024 12:39**

**Autumn Semester 2024**

**Page 2294 of 2680**
History and Theory of Urban Design (Avermaete)

Does not take place this semester.
A student can only register once for a "Fachsemester" during the Master studies!

The application deadline for this "Fachsemester" 4.9.2024, 8 p.m. You will receive a message about acceptance or rejection for the subject semester by 5.9.2024, 2 p.m. at the latest. Students who have been rejected have the opportunity to choose a design class (enrollment ends on 5.9.2024, at 6 p.m.).

Abstract
This Research Studio focuses on the entanglements of the architectural and urban histories of Switzerland and the history of global colonialism. Through architecture-specific research methods, it investigates how centuries of colonialism have historically influenced the aesthetic, construction and craft cultures of Swiss cities, and explores ways to engage with these contested legacies today.

Objective
The Research Studio has two main objectives:

1. Archaeology of Swiss Coloniality.

First, students will develop an ‘archaeology’ of the historical entanglements of Swiss industry with global colonialism. In this part, the studio work is understood as an archaeological venture, digging up traces of the past. Students will systematically probe the built environment of Switzerland for traces and influences of global colonialism and its aftermath. The result will be a catalogue of colonial entanglements, illustrating how they are inscribed into architectural and urban figures and how they continue to impact the urban fabric of Switzerland and its industry.

2. Processing Swiss Coloniality.

In a second step, students will attempt to 'process' the enduring impact of Swiss Coloniality. Based on the ‘Archaeology,’ students will explore the inherent logics of global colonialism in relation to Swiss industry as it impacts the present. The central idea is to avoid considering the past as a closed chapter, but as an ongoing process and condition of coloniality that still structures our present and future, which needs acknowledgement and dialogue. Students will be asked, using the tools of the architect, to explore strategies to represent these entanglements and suggest openings for repair where needed.

Based on these main objectives, this course will:
- offer students an overview of the most important historical and contemporary contributions to debates on postcolonial and decolonial theory and the entanglement of Switzerland’s industry with global colonialism;
- equip students to reflect critically upon the manifestations of Swiss Coloniality in the built environment with the help of both theoretical and historical perspectives;
- make students aware that the production of the city is not a neutral given but is always shaped by cultural values, assumptions, and expectations, which impact the everyday environment and, as such, condition inhabitants and users;
- help students to position themselves within current debates on cities, urban development, and urban life in relation to broader challenges such as sustainability and social inequality.

Content
Swiss Coloniality

Cities have never been isolated entities and have always existed by grace of the myriad connections with their hinterland. Throughout the past centuries, and especially since the 15th century onwards, these connections have become increasingly far-reaching across the globe, and the history of urban development in areas such as Europe has been intricately entwined with conditions and realities elsewhere. As such, urban history cannot be seen as entirely separate from global colonialism and its aftermath. While designing and constructing the architecture of the city, architects, urban designers, builders, and inhabitants also inevitably take part in the wider ecologies of material and immaterial flows that are shaped by and contribute to a global system of inequality. Not uncoincidentally, the metropole – a key term of colonial history – finds its roots in the political urban figure of the polis and identifies the center-periphery relationship between the ‘motherland’ and its hinterland. The metropole is the place from where power is exercised over foreign territories and the place that reaps the fruits of this exercising of power.

While Switzerland never had colonies of its own, it was nevertheless in many ways involved in and contributed to the history of global colonialism: by taking part in the economy sustained by colonialism, by financing and securing slave trade, by contributing to race-based science practices, etc. So, despite being a country without colonies, what if we consider Switzerland and its position in the world from the perspective of the colonial metropole? What would be the specific architectural and urban dimension of this figure of Metropole Switzerland? In raising such questions, in this Research Studio, we aim to focus on the entanglements of the architectural and urban histories of Switzerland and the history of global colonialism.

Starting to answer such questions requires a widened understanding of colonialism and its impact, which has been grasped with the notion of coloniality in recent debates. While colonialism refers to the historically specific phenomenon of one area of the world colonizing another, settling on foreign land, extracting its resources, and violently disciplining its inhabitants, the term coloniality refers to the more long-lasting processes and indirect effects that are the result of centuries of colonialism, and that mark a landscape of global inequality, even after the ‘official’ reign of colonialism has ended. In this sense, the disparity between the so-called ‘Global North’ and ‘Global South’, and the way in which a country such as Switzerland is still profiting from an advantageous position in this globally unequal world, can be considered the result of centuries of colonialism, and to be still part of a condition of coloniality. As this condition is a two-sided and mutually inflective phenomenon, to unravel the knot of Swiss coloniality, we not only aim to investigate how Switzerland was implicated in activities abroad but also, conversely, how these activities have impacted Switzerland. While in the fields of political, social and economic history, a revisionist effort is underway to reconsider/correct the image of Switzerland as a neutral country without colonies, in the field of architecture and urban history, however, we are yet to unravel the impact of this entanglement on the built environment, and, more widely, on the aesthetic, material and craft cultures of Swiss cities.
The overarching hypothesis of this Research Studio is that historical and theoretical research can profit profoundly from the use of the tools and knowledge of architects. On the one hand, the spatial, formal, material, and constructive knowledge gained throughout architectural studies will guide the historical research in the archives, in the library, and/or in the city itself and will allow students to articulate specifically architectural interpretations of the materials they find. On the other hand, the Studio explicitly asks students to employ specific architectural tools such as drawing, writing and model-making to explore the historical and theoretical realities that are being investigated. By actively reflecting on the composition of a varied set of analytical and interpretative drawings, texts, and models, students will probe the capacity of these media to act as tools for historical and theoretical research.

Within the general theme of Swiss Coloniality, students will be guided to identify their own subtheme, which will require exploring their own specific research methodologies. These architecture-specific methodologies will be strategically chosen to discuss specific aspects of society: political, economic, social, cultural, or otherwise. Thus, concentrating these ‘autonomous’ and ‘heteronomous’ dimensions of architecture, a new understanding of the city and our built environment is developed that allows us to answer (some of) the research questions mentioned previously.

Research process

Students will be guided through three phases with different emphases: Definitions, Logics and Reinterpretations of Swiss Coloniality. The first phase, Definitions, is focused on developing an understanding of what the notion of Swiss Coloniality can entail and how it relates specifically to industry and the production of the city. This phase will allow students to become familiar with the historical and current entanglements of Switzerland with global colonialism and, by closely examining its main actors, practices, and materials, will set the stage for students to develop their own, individual research project.

The second phase, Logics, is about understanding and demonstrating the inner workings and mechanisms of Swiss Coloniality. Each of the students will focus on one specific case – a material, a site, an actor, a practice, etc. – and will examine it closely through targeted archival and library research, as well as through drawing, writing, and model-making.

In the third phase, Reinterpretations, students will formulate and investigate a hypothesis regarding the entanglements of Swiss industry with global colonialism. Based on this hypothesis, students will position themselves in relation to Swiss Coloniality, its history and its enduring impact. The position statement can take the form of a written text, architectural drawings and/or models and will be presented in the form of a student-curated studio exhibition and an online adaptation of it.

Course syllabus and reader will be made available during the course’s first week.

Further course information on https://avermaete.arch.ethz.ch/researchstudio

Enrollment will not take place through the D-ARCH website. To enroll for this Fachsemester please send an e-mail to sebastian.loosen@gta.arch.ethz.ch by Wednesday 6 September 2023, 8PM. If necessary, available places will be allocated firstly conform the A-B-C-studio priority system, and secondly, randomly. You will receive a confirmation by Thursday 7 September 2023, 12AM (noon). In case of over-applications, students who are not selected have the opportunity to choose a regular design studio through the D-ARCH website (enrollment ends on September 7, at 6 p.m.).

The Research Studio is self-dependent work and tutoring takes place on Tuesdays and Wednesdays.

Students can register only once for a “Fachsemester” during the Master studies.

Number Title Type ECTS Hours Lecturers
351-0778-01L Discovering Management (Pitch) W 1 credit 1U B. Clarysse

Prerequisite: Participation and successful completion of the module Discovering Management (351-0778-00L) is mandatory.

Abstract
This course is offered complementary to the basis course 351-0778-00L, “Discovering Management”. The course offers an additional exercise.

Objective
The general objective of Discovering Management (Exercises) is to complement the course “Discovering Management” with one larger additional exercise.

Discovering Management (Exercises) thus focuses on developing the skills and competences to apply management theory to a real-life exercise from practice.

Content
The exercise consists of delivering and submitting a “pitch” with a clear recommendation for one of the selected cases amongst those seen in Discovering Management, using your insights from Discovering Management, and an extra session on pitching.

Students have the option to either do this alone or in a group of two students.
All course materials (readings, slides, videos, and worksheets) will be made available to inscribed course participants through Moodle. Students following this course should also be enrolled for course 351-0778-00L "Discovering Management".

**Discovering Management**

**Objective**

The general objective of Discovering Management is to introduce students into the field of business management and entrepreneurship.

In particular, the aims of the course are to:
1. Broaden understanding of management principles and frameworks
2. Advance insights into the sources of corporate and entrepreneurial success
3. Develop skills to apply this knowledge to real-life managerial problems

The course will help students to successfully take on managerial and entrepreneurial responsibilities in their careers and/or appreciate the challenges that entrepreneurs and managers deal with.

**Content**

The course consists of a set of theory and practice sessions, which will be taught on a weekly basis. The course will cover business management knowledge in corporate as well as entrepreneurial contexts.

The course consists of three blocks of theory and practice sessions: Discovering Strategic Management, Discovering Innovation Management, and Discovering HR and Operations Management. Each block consists of two or three theory sessions, followed by one practice session where you will apply the theory to a case.

The theory sessions will follow a "lecture-style" approach and be presented by an area specialist within D-MTEC. Practical examples and case studies will bring the theoretical content to life. The practice sessions will introduce you to some real-life examples of managerial or entrepreneurial challenges. During the practice sessions, we will discuss these challenges in depth and guide your thinking through team coaching.

Through small group work, you will develop analyses of each of the cases. The theory sessions will be assessed via a multiple choice exam.

**Lecture notes**

All course materials (readings, slides, videos, and worksheets) will be made available to inscribed course participants through Moodle. These course materials will form the point of departure for the lectures, class discussions and team work.

**Governing the Energy Transition**

**Objective**

This course addresses the role of policy and its underlying politics in the transformation of the energy sector. It covers historical, socio-economic, and political perspectives and applies various theoretical concepts to understand specific aspects of the governance of the energy transition.

- To gain an overview of the history of the transition of large technical systems
- To recognize current challenges in the energy system to understand the theoretical frameworks and concepts for studying transitions
- To gain knowledge on the role of policy and politics in energy transitions

**Content**

Climate change, access to energy and other societal challenges are directly linked to the way we use and create energy. Both the 2015 United Nations Paris climate change agreement and the UN Sustainable Development Goals make a fast and extensive transition of the energy system necessary.

This lecture introduces the social and environmental challenges involved in the energy sector and discusses the implications of these challenges for the rate and direction of technical change in the energy sector. It compares the current situation with historical socio-technical transitions and derives the consequences for policy-making. It introduces theoretical frameworks and concepts for studying innovation and transitions. It then focuses on the role of policy and policy change in governing the energy transition, considering the role of political actors, institutions and policy feedback.

The grade will be determined by a final exam.

**Lecture notes**

Slides and reading material will be made available via moodle.ethz.ch (only for registered students).

**Prerequisites / notice**

This course is primarily suited for Master and PhD level.

**Literature**

A reading list will be provided via moodle.ethz.ch at the beginning of the semester.

**International Organizations (Field Trip)**

**Objective**

Become familiar with the work and challenges of international organizations based in Geneva.
Creative Thinking

Reading materials and slides will be available via Moodle.

Analytical Competencies

This course deals with how and why international problem-solving efforts (cooperation) in environmental politics emerge and evolve, and under what circumstances such efforts are effective. Based on concepts and theories of political economy, political science, and public policy, various examples of international environmental policy-making are examined.

Content

This course deals with how and why international problem-solving efforts (cooperation) in environmental politics emerge and evolve, and under what circumstances such efforts are effective. Based on concepts and theories of political economy, political science, and public policy, various examples of international environmental policy-making are examined, for example international efforts to reduce air pollution, manage international water resources, mitigate and adapt to global warming, protect the stratospheric ozone layer, address biodiversity challenges, deal with plastic waste, and prevent pollution of the oceans.

Lecture notes

Reading materials and slides will be available via Moodle.

Prerequisites / notice

The course is open to all ETH students and visiting students from other universities. Participation does not require previous coursework in the social sciences or environmental policy. This course will take place on campus (ETH Main Building, HG F.3). There will be no live-streaming, and the course is NOT in hybrid (on-campus plus online) format. However, the lecture will be recorded and the recordings will be made available via the Moodle platform for this course a few days after the respective lecture for students who are unable to attend in person. All electronic correspondence will take place via the ETH mystudies system and Moodle, so please make sure you are properly registered there with a functioning email address/account.

Credits and Exam

After passing a written test at the end of the course (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The written test is around 90 hours (meetings, reading assignments, preparation of test). Students who obtained grades of < 4.0 for the test will have a second chance (see table below). Students who did not participate in the test on 18 December 2023 will not have access to the repeat test unless they submit compelling and documented (e.g., medical, other exam in parallel at ETH) reasons for why they were unable to participate in the first test. It conflicts in the respective lectures and the reading assignments. Visiting students (e.g., from the University of Zurich or other universities) are subject to the same conditions. Registration for the course in the mystudies system of ETH is compulsory. No separate registration for the exam is required, registration for the course as such covers everything. The exam will take place on campus, either in the F3 lecture hall or in a computer room. That is, you must be present in person at ETH Zurich on the exam date/time.

Access / Prerequisites

The course is open to all ETH students and visiting students from other universities. Participation does not require previous coursework in the social sciences or environmental policy. This course will take place on campus (ETH Main Building, HG F.3). There will be no live-streaming, and the course is NOT in hybrid (on-campus plus online) format. However, the lecture will be recorded and the recordings will be made available via the Moodle platform for this course a few days after the respective lecture for students who are unable to attend in person. All electronic correspondence will take place via the ETH mystudies system and Moodle, so please make sure you are properly registered there with a functioning email address/account.

Credits and Exam

After passing a written test at the end of the course (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The written test is around 90 hours (meetings, reading assignments, preparation of test). Students who obtained grades of < 4.0 for the test will have a second chance (see table below). Students who did not participate in the test on 18 December 2023 will not have access to the repeat test unless they submit compelling and documented (e.g., medical, other exam in parallel at ETH) reasons for why they were unable to participate in the first test. It conflicts in the respective lectures and the reading assignments. Visiting students (e.g., from the University of Zurich or other universities) are subject to the same conditions. Registration for the course in the mystudies system of ETH is compulsory. No separate registration for the exam is required, registration for the course as such covers everything. The exam will take place on campus, either in the F3 lecture hall or in a computer room. That is, you must be present in person at ETH Zurich on the exam date/time.

Foundations of Ecosystem Management

This course introduces the broad variety of conflicts that arise in projects focusing on sustainable management of natural resources. It explores case studies of ecosystem management approaches and considers their practicability, their achievements and possible barriers to their uptake.

Objective

Students should be able to

a) propose appropriate and realistic solutions to ecosystem management problems that integrate ecological, economic and social dimensions across relevant temporal and spatial scales.

b) identify important stakeholders, their needs and interests, and the main conflicts that exist among them in the context of land and resource management.

Content

Traditional management systems focus on extraction of natural resources, and their manipulation and governance. However, traditional management has frequently resulted in catastrophic failures such as, for example, the collapse of fish stocks and biodiversity loss. These failures have stimulated the development of alternative ecosystem management approaches that emphasise the functionality of human-dominated systems. Inherent to such approaches are system-wide perspectives and a focus on ecological processes and services, multiple spatial and temporal scales, as well as the need to incorporate diverse stakeholder interests in decision making. Thus, ecosystem management is the science and practice of managing natural resources, biodiversity and ecological processes, to meet multiple demands of society. It can be local, regional or global in scope, and addresses critical issues in developed and developing countries relating to economic and environmental security and sustainability.

This course provides an introduction to ecosystem management, and in particular the importance of integrating ecology into management systems to meet multiple societal demands. The course explores the extent to which human-managed terrestrial systems depend on underlying ecological processes, and the consequences of degradation of these processes for human welfare and environmental well-being. Building upon a theoretical foundation, the course will tackle issues in resource ecology and management, notably forests, agriculture and wild resources within the broader context of sustainability, biodiversity conservation and poverty alleviation or economic development. Case studies from tropical and temperate regions will be used to explore these issues. Dealing with ecological and economic uncertainty, and how this affects decision making, will be discussed. Strategies for conservation and management of terrestrial ecosystems will give consideration to landscape ecology, protected area systems, and community management, paying particular attention to alternative livelihood options and marketing strategies of common pool resources.

Abstract
This seminar will present speakers who discuss the challenges and opportunities arising for our cities and societies with the digital revolution.

Objective
To collect credit points, students must actively contribute and give an individual, circa 20-minute presentation in the seminar on a subject agreed upon with the lecturer. After the presentation, it will be discussed and graded.

Content
This seminar will present speakers who discuss the challenges and opportunities arising for our cities and societies with the digital revolution. Besides discussing questions of automation using Big Data, AI and other digital technologies, we will also reflect on the question of how democracy could be digitally upgraded, and how citizen participation could contribute to innovation, sustainability, resilience, and quality of life. This includes questions around collective intelligence and digital platforms that support creativity, engagement, coordination and cooperation.

Computational Social Science

W 3 credits 2S D. Helbing, C. I. Hausladen, J. C.-Y. Yang

Abstract
The seminar aims at three-fold integration: (1) bringing modeling and computer simulation of techno-socio-economic processes and phenomena together with related empirical, experimental, and data-driven work, (2) combining perspectives of different scientific disciplines (e.g. sociology, computer science, physics, complexity science, engineering), (3) bridging between fundamental and applied work.

Objective
Participants of the seminar should understand how tightly connected systems lead to networked risks, and why this can imply systems we do not understand and cannot control well, thereby causing systemic risks and extreme events.

They should also be able to explain how systemic instabilities can be understood by changing the perspective from a component-oriented to an interaction- and network-oriented view, and what fundamental implications this has for the proper design and management of complex dynamical systems.

Computational Social Science and Global Systems Science serve to better understand the emerging digital society with its close co-evolution of information and communication technology (ICT) and society. They make current theories of crises and disasters applicable to the solution of global-scale problems, taking a data-based approach that builds on a serious collaboration between the natural, engineering, and social sciences, i.e. an interdisciplinary integration of knowledge.

Prerequisites / notice
Students need to present a new subject, for which they have not earned any credit points before.

Good scientific practices, in particular citation and quotation rules, must be properly complied with.

Chatham House rules apply to this course. Materials may not be shared without previous written permission.
A successful completion of the course will enable a thorough understanding of the basic questions and methods of resource and environmental economics and the ability to solve typical problems using appropriate tools consisting of concise verbal explanations, diagrams or mathematical expressions. Concrete goals are first of all the acquisition of knowledge about the main questions of resource and environmental economics and about the foundation of the theory with different normative concepts in terms of efficiency and fairness. Secondly, students should be able to deal with environmental externalities and internalisation through appropriate policies or private negotiations, including knowledge of the available policy instruments and their relative strengths and weaknesses. Thirdly, the course will allow for in-depth economic analysis of renewable and non-renewable resources, including the role of stock constraints, regeneration functions, market power, property rights and the impact of technology. A fourth objective is to successfully use the well-known tool of cost-benefit analysis for environmental policy problems, which requires knowledge of the benefits of the improved natural environment. The last two objectives of the course are the acquisition of sufficient knowledge about the economics of sustainability and the application of environmental economic theory and policy at international level, e.g. to the problem of climate change.

**Abstract**

The course covers all the interactions between the economy and the natural environment. It introduces and explains basic welfare concepts and market failure; external effects, public goods, and environmental policy; the measurement of externality and contingent valuation; the economics of non-renewable resources, renewable resources, cost-benefit-analysis, sustainability concepts; international aspects of resource and environmental problems; selected examples and case studies. After a general introduction to resource and environmental economics, highlighting its importance and the main issues, the course explains the normative basis, utilitarianism, and fairness according to different principles. Pollution externalities are a deep core topic of the lecture. We explain the governmental internalisation of externalities as well as the private internalisation of externalities (Coase theorem). Furthermore, the issues of free rider problems and public goods, efficient levels of pollution, tax vs. permits, and command and control instruments add to a thorough analysis of environmental policy. Turning to resource supply, the lecture first looks at empirical data on non-renewable natural resources and then develops the optimal price development (Hotelling-rule). It deals with the effects of explorations, new technologies, and market power. When treating the renewable resources, we look at biological growth functions, optimal harvesting of renewable resources, and the overuse of open-access resources. A next topic is cost-benefit analysis with the environment, requiring measuring environmental benefits and measuring costs. In the chapter on sustainability, the course covers concepts of sustainability, conflicts with optimality, and indicators of sustainability. In a final chapter, we consider international environmental problems and in particular climate change and climate policy.

**Abstract**

Students are introduced to a narrative of ‘Urban Stories’ through a series of three tools driven by social, governance, and environmental transformations in today’s urbanization processes. Each lecture explores one city's spatial and organizational ingenuity born out of a particular place's realities, allowing students to transfer these inventions into a catalog of conceptual tools.

**Objective**

How can students of architecture become active agents of change? What does it take to go beyond a building's scale, making design instruments to the students to use, test, and start their designs.

The lecture slides will be presented on the course Moodle after each lecture. See your own field of study in a wider context ("Science in Perspective"), e.g. see the psychological, social, economic, environmental, and other aspects of urbanism. This imaginary city exists along with its potentials and problems and with the conflicts that have evolved. Knowledge and understanding, along with a critical observation of the actions and policies, are necessary to understand the diversity and instability present in the contemporary city and understand how urban form evolved to its current state.

How did cities develop into the cities we live in now? Urban plans, instruments, visions, political decisions, economic reasonings, cultural inputs, and social organization have been used to operate in urban settlements in specific moments of change. We have chosen cities that exemplify how these instruments have been implemented and how they have shaped urban environments. We transcribe these instruments into urban operational tools that we have recognized and collected within existing tested cases in contemporary cities across the globe.

This lecture series will introduce urban knowledge and the way it has introduced urban models and operational modes within different concrete realities, therefore shaping cities. The lecture series translates urban knowledge into operational tools, extracted from cities where they have been tested and become exemplary samples, most relevant for understanding how the urban landscape has taken shape. The tools are clustered in twelve thematic clusters and three tool scales for better comparability and cross-reflection.

The Tool case studies are compiled into a global urbanization toolbox, which we use as typological models to read the city and critically reflect upon it. The presented contents are meant to serve as inspiration for positioning in future professional life and provide instruments for future design decisions.

In an interview with a local designer, we measure our insights against the most pressing design topics in cities today, including inclusion, affordable housing, provision of public spaces, and infrastructure for all.

### Content

Urban form cannot be reduced to physical space. Cities result from social construction, under the influence of technologies, ecology, culture, the impact of experts, and accidents. Urban un-concluded processes respond to political interests, economic pressure, cultural inclinations, along with the imagination of architects and urbanists and the informal powers at work in complex adaptive systems. Current urban phenomena are the result of urban evolution. The facts stored in urban environments include contributions from its entire lifecycle, visible in the physical environment, and non-physical aspects. This imaginary city exists along with its potentials and problems and with the conflicts that have evolved. Knowledge and understanding, along with a critical observation of the actions and policies, are necessary to understand the diversity and instability present in the contemporary city and understand how urban form evolved to its current state.

How did cities develop into the cities we live in now? ### Literature

- **851-0101-86L Complex Social Systems: Modeling Agents, Learning, and Games**
  - Prerequisites: Basic programming skills, elementary probability and statistics.
  - **Abstract**
    This course introduces mathematical and computational models to study techno-socioeconomic systems and the process of scientific research. Students develop a significant project to tackle techno-socio-economic challenges in application domains of complex systems. They are expected to implement a model and to communicate their results through a project report and a short oral presentation.
  - **Objective**
    See your own field of study in a wider context ("Science in Perspective"), e.g. see the psychological, social, economic, environmental, historical, ethical, or philosophical connections and implications. Learn to think critically and out of the box. Question what you believe you know for sure. Get to know surprising, counterintuitive properties of complex (non-linearly interacting, networked, multi-component) systems. Learn about collaboration.
  - **Content**
    By the end of the course, the students should be able to better understand the literature on complex social systems, develop their own models for studying specific phenomena and report results according to the standards of the relevant scientific literature by presenting their results both numerically and graphically.
    At the end of the course, the students will deliver a report, computer code and a short oral presentation. To collect credit points, students will have to actively contribute and give a circa 30 minutes presentation in the course on a subject agreed with the lecturers, after which the presentation will be discussed. The presentation will be graded.
    Students are expected to implement themselves models of techno-socio-economic processes and systems, particularly agent-based models, complex networks models, decision making, group dynamics, human crowds, or game-theoretical models. Credit points are finally earned for the implementation of a mathematical or empirical model from the complexity science literature, its presentation, and documentation by a project report.
  - **Lecture notes**
    The lecture slides will be presented on the course Moodle after each lecture.

### 851-0732-06L Law & Tech

**Abstract**

This course introduces students to scientific and technological developments that require regulation or enable legal innovation. We focus particularly on the challenges to current law posed by prominent near-future technologies.

**Objective**

The course is designed for a wide range of ETH students as well as for law students who are keen to deepen their understanding of cutting-edge technology. It offers an overview of key legal areas important for technology regulation, complemented by guest lectures on emerging technological trends.

In previous years, the course has featured esteemed speakers from various sectors, including industry leaders like Google, NGOs such as Digital Society Switzerland and The European Consumer Organization, regulatory bodies like the Swiss Competition Commission, and noted academics.

The course is open to ETH students through the Science in Perspective program of the Department of Humanities, Social and Political Sciences.

**Content**

The planned course outline is below.

- Overview of Law and Technology
- Fundamental Rights
- AI & Discrimination
- Landmark Big Tech Cases
- Regulation of Digital Platforms & Content Moderation
- Online Consumer Protection
- Law and Tech Scholarship Series

A number of recent regulations will be discussed, including the EU's AI Act, the Digital Services Act (DSA), and the Digital Markets Act (DMA), as well as emerging internet phenomena, like ChatGPT.

**Prerequisites / notice**

You can find all course materials and the most recent announcements on Moodle. Please log in to Moodle using your ETH or UZH credentials. Then search for "Law & Tech (851-0732-06L, HS 2024)" and enroll.

### 151-8101-00L International Engineering: from Hubris to Hope

**Abstract**

Since Europe surrendered their colonial assets, engineers from rich countries have returned to the African continent to address the real and perceived ills that they felt technology could solve. And yet, 70 years on, the promise of technology has largely failed to deliver widespread, substantive improvements in the quality of life. Why?
Objective
This course is meant for engineers who are interested in pursuing an ethical and relevant career internationally, and who are willing to examine the complex role that well-meaning foreigners have played and continue to play in the disappointing health outcomes that characterize much of the African continent.

After completing the course, participants will be able to
- critique the jargon and terms used by the international community, i.e. “development”, “aid”, “cooperation”, “assistance” “third world” “developing” “global south” “low and middle-income” and justify their own chosen terminology
- recognize the role of racism and white-supremacy in the development of the Aid industry
- understand the political, financial, and cultural reasons why technology and infrastructure have historically failed
- Debate the merits of international engineering in popular culture and media
- Propose improved SDG indicators that address current shortcomings
- Compare the engineering curricula of different countries to identify relative strengths and shortcomings
- Explain the inherent biases of academic publishing and its impact on engineering failure
- Analyse linkages between the rise of philanthropy and strategic priority areas
- Recommend equitable, just funding models to achieve more sustainable outcomes
- Formulate a vision for the international engineer of the future

Content
Role of international engineering during colonialism
Transition of international engineering following colonialism
White saviourism and racism in international engineering
International engineering in popular culture
The missing role of Engineering Education
Biases in academic publishing
The emerging role in Global Philanthropy
The paradox of International funding

851-0760-00L  Building a Robot Judge: Data Science for Decision-Making  W  3 credits  2V  E. Ash

Abstract
This course explores the automation of decisions in the legal system. We delve into the machine learning tools needed to predict judge decision-making and ask whether techniques in model explanation and algorithmic fairness are sufficient to address the potential risks.

Objective
This course introduces students to the data science tools that may provide the first building blocks for a robot judge. While building a working robot judge might be far off in the future, some of the building blocks are already here, and we will put them to work.

Content
Data science technologies have the potential to improve legal decisions by making them more efficient and consistent. On the other hand, there are serious risks that automated systems could replicate or amplify existing legal biases and rigidities. Given the stakes, these technologies force us to think carefully about notions of fairness and justice and how they should be applied.

The focus is on legal prediction problems. Given the evidence and briefs in this case, how will a judge probably decide? How likely is a criminal defendant to commit another crime? How much additional revenue will this new tax law collect? Students will investigate and implement the relevant machine learning tools for making these types of predictions, including regression, classification, and deep neural networks models.

We then use these predictions to better understand the operation of the legal system. Under what conditions do judges tend to make errors? Against which types of defendants do parole boards exhibit bias? Which jurisdictions have the most tax loopholes? Students will be introduced to emerging applied research in this vein. In a semester paper, students (individually or in groups) will conceive and implement an applied data-science research project.

851-0685-00L  Data and Society  W  3 credits  2V  M. Leese

Abstract
This lecture series explores the multifaceted role of data in shaping contemporary society, governance, and individual lives. The course equips students with a critical understanding of how data is made, managed, and preserved, and its implications for societal norms and individual rights.

Objective
At the end of the term, students will be able to:
- reflect concepts and theories that capture the performativity of data
- reflect concepts and theories that capture the socio-technical nature of data
- assess the implications of data practices for social and political ordering
- identify key actors, sites, and domain contexts of data practices
Public Institutions and Policy-Making Processes; fostered

860-0001-00L Public Institutions and Policy-Making Processes; fostered
Research Paper
Prerequisite: you have to be enrolled in 860-0001-00L during the same semester.

Abstract
This is an add-on module to the course: 860-0001-00L. It focuses on students writing an essay on an issue covered by the main course 860-0001-00L.

Objective
Students learn how to write an essay on a policy issue they select.

Content
Public policies result from decision-making processes that take place within formal institutions of the state (parliament, government, public administration, courts). That is, policies are shaped by the characteristics of decision-making processes and the characteristics of public institutions and related actors (e.g. interest groups). In this course, students acquire the contextual knowledge for analyzing public policies - hence this course is complementary to the ISTP course on concepts and methods of policy analysis. Students learn why and how public policies and laws are developed, designed, and implemented at national and international levels. The course is organized in three modules. The first module (taught by Stefan Bechtold) examines basic concepts and the role of law, law-making, and law enforcement in modern societies. The second module (taught by Thomas Bernauer) deals with the functioning of legislatures, governments, and interest groups. The third module (taught by Frank Schimmelfennig) focuses on the European Union and international organizations. This teaching unit is an add-on module to the course: 860-0001-00L. It focuses on students writing an essay on an issue covered by the main course 860-0001-00L.

Abstract
The main topics covered are: Orbital Dynamics and Tides, Solar Heating and Energy Transport, Chronology and Compositions (bulk and isotopic), Geochemical Concepts, Planetary Atmospheres, Planetary Surfaces, Planetary Interiors, Asteroids and Meteorites, Comets, Planetary Rings, Magnetic Fields and Magnetospheres, the Sun and Stars, Planet Formation, Exoplanets and Exobiology.

Objective
The lectures introduce the basics of the terrestrial and giant planets, comets, and asteroids, gained from modern space missions and the study of extraterrestrial material from both the physical and geochemical perspectives.

Students will practice making quantitative calculations relevant to various topics through homework.

Deep Track Courses

At least 20 credits must be completed within the deep track courses. Surplus credit points can be counted towards the electives.

Aerospace Engineering

Deep Track Aerospace Engineering

These courses can be credited either as a specialization subject or as an elective subject.

Abstract
The aim of the course is to provide the fundamental knowledge about earth observation sensors, techniques and methods for bio/geophysical environmental parameter estimation.

Objective
The main goal of the course is to give the students an overview of physical phenomena that lead to impacts on the Earth and our technical infrastructure from the Sun. The areas described are at the forefront of scientific research internationally, and is an area known as ‘space weather’. The current status and reliability of space weather predictions will be reviewed.

Content
There will be 2 lectures given each week for 7 weeks followed by an exercise class. The exercise class will track the lectures and the students will use spacecraft data to determine their own space weather impacts from different solar storms.

103-0187-02L | Satellite Geodesy                          | W+  | 4    | 3G    | M. Alchinger-Rosenberger        |

Abstract

Objective
- Sicherheit im Umgang mit Koordinaten-, Referenz- und Zeitsystemen
- Grundlegendes Verständnis der Berechnung von Satellitengeodäsie
- Grundlegendes Verständnis der geodätischen Weltraumverfahren und deren Stärken und Schwächen
- Kenntnis der wichtigsten Prozesse, die für Änderungen in der Geometrie, der Rotation und dem Schwerkraft der Erde verantwortlich sind.
- Erkennen der Anwendungsmöglichkeiten der Satellitengeodäsie für interdisziplinäre Aufgaben (System Erde).

Content
- Koordinatensysteme, Transformationen
- Referenz- und Zeitsysteme
- Grundlagen Satellitengeodäsie
- Weltraumverfahren: VLBI, SLR, DORIS, Altimetrie
- Schwerkraftmissionen
- Kombination der Weltraumverfahren zur Bestimmung der Geometrie, Orientierung sowie des Schwerkeldes der Erde
- Interdisziplinäre Anwendungen (Meteorologie, Klimatologie, Hydrologie, etc.)
The main learning objectives of this course are: 1. Understand the thermodynamic, fluid-dynamic and chemical kinetics fundamentals of aircraft aerodynamics: Atmosphere; aerodynamic forces (ascending force: profile, wing, body, tail), Resistance, residual resistance, induced resistance. 2. Predict relevant parameters for combustion systems, such as laminar and turbulent flame speeds, adiabatic, combustible or quantum and statistical descriptions, or the effect of reaction rates, temperature or quenching distance. 3. Understand the causal relations of relevant combustion parameters such as the pressure influence on the laminar flame speed. 4. Analyze the challenges of developing sustainable combustion technologies based on carbon-neutral synthetic fuels.

Vehicle Aerodynamics

**151-0109-00L** Turbulent Flows  
**Objective**

Laminar and turbulent flows, instability and origin of turbulence - Statistical description: averaging, turbulent energy, dissipation, closure problem - Scalings, Homogeneous isotropic turbulence, correlations, Fourier representation, energy spectrum - Free turbulence: wake, jet, mixing layer - Wall turbulence: Channel and boundary layer - Computation and modelling of turbulent flows  

**Content**

- Properties of laminar, transitional and turbulent flows.
- Origin of control of turbulence. Instability and transition.
- Statistical description, averaging, equations for mean and fluctuating quantities, closure problem.
- Scalings, homogeneous isotropic turbulence, energy spectrum.
- Turbulent free shear flows. Jet, wake, mixing layer.
- Wall-bounded turbulent flows.
- Turbulent flow computation and modeling.

**Lecture notes**

Lecture notes are available

**Literature**

**151-0293-00L** Fundamentals and Applications of Combustion  
**Note:** The previous course title until H529 "Combustion and Reactive Processes in Energy and Materials Technology"

**Abstract**

This course will provide an introduction to the fundamentals and the applications of combustion in energy conversion and nanoparticles synthesis. The content is highly relevant for technologies which cannot be electrified such as long distance aviation and shipping, and which will more and more rely on carbon-neutral synthetic fuels.

**Objective**

The main learning objectives of this course are: 1. Understand the thermodynamic, fluid-dynamic and chemical kinetics fundamentals of combustion processes. 2. Predict relevant parameters for combustion systems, such as laminar and turbulent flame speeds, adiabatic flame temperature or quenching distance. 3. Understand the causal relations of relevant combustion parameters such as the pressure influence on the laminar flame speed. 4. Analyze the challenges of developing sustainable combustion technologies based on carbon-neutral synthetic fuels.

**Content**

An embedded system is a combination of hardware and software, either fixed in function or programmable, that is designed for a specific application scenario or for a specific task within a larger system. They are part of industrial machines such as agricultural and manufacturing equipment, automotive systems, medical equipment, household appliances, sensor networks, and the Internet of Things.

Understanding the specific requirements and problems that arise in embedded system applications.

Understanding the hardware structure of a microcontroller and an embedded system; memory architecture and memory map, internal and external peripherals, low-power and low-energy design as well as instruction sets and computational accelerators.

Understanding the firmware structure of a microcontroller and an embedded system; low-level instruction set, hardware-software interfaces, communication between components, embedded real-time operating systems, real-time scheduling, shared resources, low-power and low-energy programming as well as computational accelerators.

Using formal models and methods for designing and optimizing embedded systems.

Gaining experience with practical applications of the C programming language, embedded real-time operating systems, and debug functionalities of the associated design environment to design, implement, and verify embedded firmware.

Through project-based activities, students will gain substantial experience in applying the C programming language in the context of embedded systems. Projects will involve developing and implementing firmware, utilizing embedded real-time operating systems, and exploring the debugging functionalities within design environments. This hands-on approach aims to bridge the gap between theoretical knowledge and practical application, allowing students to experience the full lifecycle of embedded system development from design to implementation and verification.

Specifically, the following topics will be covered in the course: hardware and software structures of embedded systems, low-level instruction set, memory architecture and memory map, peripherals, hardware-software interfaces, communication between components, firmware design methodologies, firmware design using the C programming language, embedded real-time operating systems, real-time scheduling, shared resources, low-power, and low-energy designs well as computational accelerators.

This lecture focuses on the design of embedded systems using formal models and methods.

Besides the theoretical lecture, the course contains laboratory sessions where students transfer the learned theoretical aspects into praxis by programming a microcontroller and interfacing it with sensors and actuators. Students will be exposed to a commercial microcontroller, and the development board extend with a custom-designed embedded systems educational platform.

Lecture notes

Lecture material, publications, exercise sheets, and laboratory documentation will be available on the course's Moodle page.

Literature

Prerequisites / notice

Recommended: basic knowledge of assembly programming and computer architecture.

assessed

assessed

151-3207-00L Lightweight Structures W+ 6 credits 4G T. Tancogne-Dejean

Note: the previous course title until HS23 "Leichtbau" in German.

Abstract

The elective course Lightweight includes numerical methods for the analysis of the load carrying and failure behavior of lightweight structures, as well as construction methods and design principles for lightweight design.

Objective

The goal of this course is to convey substantiated background for the understanding and the design and sizing of modern lightweight structures in mechanical engineering, vehicle and airplane design.

Content

Lightweight design

Thin-walled beams and structures

Instability behavior of thin walled structures

Reinforced shell structures

Load introduction in lightweight structures

Joining technology

Sandwich design

Elective Courses Aerospace Engineering

These subjects can only be credited as electives.

Abstract

Objective
After this course, the students should be able to

- Describe the major observation techniques in space geodesy
- Describe the necessary modelling and analysis approaches to derive geodetic products of highest quality
- Select the appropriate space geodetic data for scientific investigations
- Analyze the space geodetic data for scientific purposes
- Interpret the scientific results

Content
Overview of GNSS, Very Long Baseline Interferometry (VLBI), Satellite and Lunar Laser Ranging (SLR/LLR), Satellite Radar Altimetry with the basic principles, the instruments and observation equations.

Modelling of the station motions and the estimation of station coordinates. Basics of wave propagation in the atmosphere. Signal propagation in the ionosphere and troposphere for the different observation techniques and the determination of atmospheric parameters.

Equation of motion of the unperturbed and perturbed satellite orbit. Osculating and mean orbital elements. General and special perturbation theory and the determination of satellite orbits.

151-0368-00L Aeroelasticity W+ 4 credits 2V+1U M. Righi

Abstract
Introduction to the basics and into the methods of Aeroelasticity. An overview of the main static and dynamic phenomena arising from the interaction between structural and aerodynamic loads.

Objective
The course will provide a basic physical understanding of flow-structure interaction focused on lifting bodies such as wings. You will get to know the most important phenomena in the static and dynamic aeroelasticity, as well as a presentation of the most relevant analytical and numerical prediction methods.

Content
Introduction to steady and unsteady thin airfoil theory, extension to three dimension wing aerodynamics, strip theory, overview of numerical methods available (panel methods, CFD).

Introduction to unsteady aerodynamics (theory): Theodorsen and Wagner functions. Unsteady aerodynamics observed from numerical experiments (CFD). Generation of simplified mathematical models.

Presentation of steady aeroelasticity: equations of equilibrium for the typical section, aeroelastic deformation, effectiveness of the aeroelastic system, stability (definition), divergence condition, role played by a control surface, control effectiveness, sweep angle, aeroelastic tailoring of bending-torsion coupling. Ritz model to model beams, use of FEM, modal condensation, choice of generalized coordinates.

Numerical aeroelasticity (Test Cases extracted from the latest AIAA Aeroelastic Prediction Workshops). Generation of Reduced Order Models from CFD data (in some cases though Machine Learning).

Aeroelasticity of modern aircraft: assessment of the effects induced by the control surfaces and control systems (Aerovservoelasticity), active controlled aircraft, flutter-suppression systems, certification (EASA, FAA).

Planning and execution of Wind Tunnel experiments with aeroelastic models. Live-execution of an experiment in the WT of the ETH.

Lecture notes
A script in English language is available.

<tbody>
<tr>
<td>Abstract</td>
<td>The course provides an introduction to theoretical foundations and practical usage of the Lattice Boltzmann Method for fluid dynamics simulations. Methods like molecular dynamics, DSMC, lattice Boltzmann etc are being increasingly used by engineers all over and these methods require knowledge of kinetic theory and statistical mechanics which are traditionally not taught at engineering departments. The goal of this course is to give an introduction to ideas of kinetic theory and non-equilibrium thermodynamics with a focus on developing simulation algorithms and their realizations. During the course, students will be able to develop a lattice Boltzmann code on their own. Practical issues about implementation and performance on parallel machines will be demonstrated hands on. Central element of the course is the completion of a lattice Boltzmann code (using the framework specifically designed for this course). The course will also include a review of topics of current interest in various fields of fluid dynamics, such as multiphase flows, reactive flows, microflows among others. Optionally, we offer an opportunity to complete a project of student's choice as an alternative to the oral exam. Samples of projects completed by previous students will be made available.</td>
<td></td>
<td></td>
<td></td>

<td>Books will be recommended for each chapter</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
The course builds upon three parts:
I Elementary kinetic theory and lattice Boltzmann simulations introduced on simple examples.
II Theoretical basis of statistical mechanics and kinetic equations.
III Lattice Boltzmann method for real-world applications.

The content of the course includes:

1. Background: Elements of statistical mechanics and kinetic theory;
   Particle's distribution function, Liouville equation, entropy, ensembles; Kinetic theory; Boltzmann equation for rarefied gas, H-theorem, hydrodynamic limit and derivation of Navier-Stokes equations, Chapman-Enskog method, Grad method, boundary conditions; mean-field interactions, Vlasov equation;
   Kinetic models: BGK model, generalized BGK model for mixtures, chemical reactions and other fluids.

2. Basics of the Lattice Boltzmann Method and Simulations:
   Minimal kinetic models: lattice Boltzmann method for single-component fluid, discretization of velocity space, time-space discretization, boundary conditions, forcing, thermal models, mixtures.

3. Hands on:
   Development of the basic lattice Boltzmann code and its validation on standard benchmarks (Taylor-Green vortex, lid-driven cavity flow etc).

4. Practical issues of LBM for fluid dynamics simulations:
   Lattice Boltzmann simulations of turbulent flows;
   numerical stability and accuracy.

5. Microflow:
   Rarefaction effects in moderately dilute gases; Boundary conditions, exact solutions to Couette and Poiseuille flows; micro-channel simulations.

6. Advanced lattice Boltzmann methods:
   Entropic lattice Boltzmann scheme, subgrid simulations at high Reynolds numbers; Boundary conditions for complex geometries.

7. Introduction to LB models beyond hydrodynamics:
   Relativistic fluid dynamics; flows with phase transitions.

Lecture notes
Lecture notes on the theoretical parts of the course will be made available.
Selected original and review papers are provided for some of the lectures on advanced topics.
Handouts and basic code framework for implementation of the lattice Boltzmann models will be provided.

Prerequisites / notice
The course addresses mainly graduate students (MSc/Ph D) but BSc students can also attend.

Abstract
The course teaches the fundamentals of digital communication systems. The main topics are analog and digital modulation, signals and linear time-invariant systems, baseband and passband representations, continuous-time and discrete-time channels, noise, inter-symbol interference, detection theory, as well as the basics of forward error correction and information theory.

Objective
After attending the lectures, participating in the exercise sessions, and working on the homework problems (which include MATLAB coding assignments), the students will be able to:
- understand the fundamentals of digital communication systems
- explain the principles of modulation, demodulation, detection, and error correction
- analyze error rates of simple digital communication systems
- implement simple MATLAB simulations to calculate error rates

Content
The course focuses on the fundamentals of digital communication systems. The course starts with analog modulation and discusses the main building blocks of modern digital communication systems. The topics include:
- essential components of digital communication systems
- analog and digital modulation
- baseband and passband representation; up- and down-conversion
- communication channels as LTI systems
- discretizing communication systems; sampling and quantization
- noise, signal-to-noise ratio (SNR), and interference
- detection theory and error rates
- basics of forward error correction
- basics of information theory
- orthogonal frequency-division multiplexing (OFDM)
- building blocks of modern communication systems

The exercises cover theoretical aspects as well as the basics of software-based communication-system modeling in MATLAB.

Lecture notes
Lecture notes will be distributed electronically at the beginning of the semester.

Optical Communication Fundamentals
The path of an analog signal in the transmitter to the digital world in a communication link and back to the analog world at the receiver is discussed. The lecture covers the fundamentals of all important optical and optoelectronic components in a fiber communication system. This includes the transmitter, the fiber channel and the receiver with the electronic digital signal processing elements.
This course covers the basic concepts of information theory and of communication theory. Topics covered include the entropy rate of a source, mutual information, typical sequences, the asymptotic equipartition property, Huffman coding, channel capacity, the channel coding theorem, the source-channel separation theorem, and feedback capacity.

Objective
After completing this course, a student will understand the challenges of space flight imposed on communication components and systems, the available existing solutions of those problems, the main components of communications systems suitable for a spacecraft, and future technologies capable of enabling ultra-fast RF/mm-Wave, THz, and Laser communication links.

Content
- Space communications: architectures, assets, payloads, link budgets, and use cases.
- Electromagnetic waves: radiation, operating principles of antennas, antenna types, and antenna parameters.
- RF electronics and antenna arrays architecture for SATCOM: low-noise amplifiers, beam forming, spatial filtering, and design examples.
- Laser communication links for free-space communication, architectures and implementation
- Microwave photonics for space applications: analog photonic links, optical generation and distribution of RF signals, and advanced RF filtering using photonic techniques.
- Communication channels: channel modeling, incl. atmospheric effects, Doppler, synchronization tracking, beam forming, tracking and finding.
- Signal modulation: modulation formats, adaptive optics, phase noise, and quantum key distribution (QKD).
- Outlook for emerging use-cases (ranging, time-, nav- and position-transfer (PNT))

Prerequisites
Bachelor Studies of Electrical Engineering or Physics.
After this course, students should be able to describe and classify security goals of and attacks on various wireless networks and technologies, with an emphasis on physical layer aspects.

This first course in a series that extends over three consecutive terms is concerned with tailoring algorithms and with devising high performance hardware architectures for their implementation as ASIC or with FPGAs. The focus is on front end design using HDLs and automatic synthesis for producing industrial-quality circuits.

Security of Wireless Networks

W 6 credits
2V+1U+2A

S. Capkun, K. Kostiainen

This course discusses physical layer aspects of wireless communication and a wide range of security-related topics in the domain of wireless technologies. It mainly targets computer science students. Though useful, a background in signal processing or physical layer concepts is not required. A basic understanding of security (e.g. as taught in 252-0211.00L Information Security) is recommended.

After this course, students should be able to describe and classify security goals of and attacks on various wireless networks and technologies, with an emphasis on physical layer aspects.

- Introduction to wireless communication
- Physical layer security schemes
- Spreading techniques and their application in jamming-resilient communication and Global Navigation Satellite Systems (GNSSs)
- Secure ranging with Ultra-Wide Band (UWB)
- Security aspects of cellular networks, WiFi, and Bluetooth Low Energy (BLE)

402-0448-01L Quantum Information Processing I: Concepts

This theory part QIP I together with the experimental part 402-0448-02L QIP II (both offered in the autumn semester) combine to the core course in experimental physics “Quantum Information Processing” (totally 10 ECTS credits). This applies to the Master's degree programme in Physics.

Objective By the end of the course students are able to explain the basic mathematical formalism of quantum mechanics and apply it to quantum information processing problems. They are able to adapt and apply these concepts and methods to analyze and discuss quantum algorithms and other quantum information-processing protocols.

Content The topics covered in the course will include quantum circuits, gate decomposition and universal sets of gates, efficiency of quantum algorithms, quantum algorithms (Shor, Grover, Deutsch-Josza,…), stabilizer-based quantum error correction, fault-tolerant designs, the BB84 quantum key distribution protocol, and simple methods of quantum metrology.

Lecture notes Will be provided.

Abstract This course provides an introduction to processing and interpreting radar and synthetic aperture radar (SAR) remote sensing data. The primary topics of the course are interferometric techniques and related applications such as topography mapping and mapping of surface displacements, with a strong emphasis on solving practical problems using MATLAB.

Objective Understand the concepts and techniques required to process and to adequately interpret interferometric radar/SAR data for topographic mapping and surface displacement applications.

Content The course starts with the real-aperture radar case and a first introduction to the concept of radar interferometry with applications to topographic mapping and mapping of surface displacements.

</table>

Abstract The course will provide the basics and principles of Radar Remote Sensing (specifically Synthetic Aperture Radar (SAR)) and its imaging techniques for the use of environmental parameter estimation.
The course should provide an understanding of SAR techniques and the use of the imaging tools for bio/geophysical parameter estimation. At the end of the course the student has the understanding of
1. SAR basics and principles,
2. SAR polarimetry,
3. SAR interferometry and
4. environmental parameter estimation from multi-parametric SAR data

The course is giving an introduction into SAR techniques, the interpretation of SAR imaging responses and the use of SAR for different environmental applications. The outline of the course is the following:
1. Introduction into SAR basics and principles
2. Introduction into electromagnetic wave theory
3. Introduction into scattering theory and decomposition techniques
4. Introduction into SAR interferometry
5. Introduction into polarimetric SAR interferometry
6. Introduction into bio/geophysical parameter estimation (classification/segmentation, soil moisture estimation, earth quake and volcano monitoring, forest height inversion, wood biomass estimation etc.)

Lecture notes
Handouts for each topic will be provided

Objective
- Modelling of the station motions and the estimation of station coordinates. Basics of wave propagation in the atmosphere. Signal propagation in the ionosphere and troposphere for the different observation techniques and the determination of atmospheric parameters.
- Equation of motion of the unperturbed and perturbed satellite orbit. Osculating and mean orbital elements. General and special perturbation theory and the determination of satellite orbits.

Lecture notes
Lecture slides will be made available on the course official website: http://rpg.ifl.uzh.ch/teaching.html

Literature
## Prerequisites / notice

Fundamentals of algebra, geometry, matrix calculus, and Matlab programming.

Note: If you are interested in taking UZH courses, you must register as an incoming mobility student at UZH. For details, see as follows:

UZH course enrollment for ETH student at University of Zurich (UZH) > Mobility within Switzerland – Incoming > Module Mobility: The easiest way to take individual modules/courses to supplement your studies at your home university is with module mobility. This option is not available to students who have dropped out of their home university or have been definitely excluded or banned from the relevant program > Application and Deadlines: Applications are submitted via the UZH application portal (https://www.uzh.ch/cmsssl/en/studies/application/chmobilityin.html)

Step-by-step guidelines on how ETH students can register for this course, are given on the official course website: https://rpg.ifi.uzh.ch/teaching.html

ATTENTION: When you book the course at UZH, you are automatically registered for the exam at UZH and you can unregister until the October deadline. After registering for the course, you as an ETH student need to check out your "**UZH email account**" to receive the related information from the lecturer.

### 401-7851-00L Theoretical Astrophysics (University of Zurich)

- **W***
- **10 credits**
- **4V+2U**

**University lecturers**

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: AST512

Mind the enrolment deadlines at UZH:
https://www.uzh.ch/cmsssl/en/studies/application/deadline.s.html

**Abstract**

This course covers the foundations of astrophysical fluid dynamics, the Boltzmann equation, equilibrium systems and their stability, the structure of stars, astrophysical turbulence, accretion disks and their stability, the foundations of radiative transfer, collisionless systems, the structure and stability of dark matter halos and stellar galactic disks.

**Content**

This course covers the foundations of astrophysical fluid dynamics, the theory of collisions and the Boltzmann equation, the notion of equilibrium systems and their stability, the structure of stars, the theory of astrophysical turbulence, the theory of accretion disks and their stability, the foundations of astrophysical radiative transfer, the theory of collisionless system, the structure and stability of dark matter halos and stellar galactic disks.

**Literature**

Course Materials:

1. The Physics of Astrophysics, Volume 1: Radiation by Frank H. Shu
2. The Physics of Astrophysics, Volume 2: Gas Dynamics by Frank H. Shu
3. Foundations of radiation hydrodynamics, Dimitri Mihalas and Barbara Weibel-Mihalas
4. Radiative Processes in Astrophysics, George B. Rybicki and Alan F. Lightman
5. Galactic Dynamics, James Binney and Scott Tremaine

**Prerequisites / notice**

This is a full black board ad chalk experience for students with a strong background in mathematics and physics.

**Prerequisites:**

- Introduction to Astrophysics
- Mathematical Methods for the Physicist
- Quantum Mechanics
  (All preferred but not obligatory)

**Prior Knowledge:**

- Mechanics
- Quantum Mechanics and atomic physics
- Thermodynamics
- Fluid Dynamics
- Electrodynamics

### 401-7855-00L Computational Astrophysics (University of Zurich)

- **W***
- **6 credits**
- **2V**

**L. M. Mayer**

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: AST245

Mind the enrolment deadlines at UZH:
https://www.uzh.ch/cmsssl/en/studies/application/deadline.s.html

**Objective**

Acquire knowledge of main methodologies for computer-based models of astrophysical systems, the physical equations behind them, and train such knowledge with simple examples of computer programmes

**Content**

1. Integration of ODE, Hamiltonians and Symplectic integration techniques, time adaptivity, time reversibility
2. Large-N gravity calculation, collisionless N-body systems and their simulation
3. Fast Fourier Transform and spectral methods in general
4. Eulerian Hydrodynamics: Upwinding, Riemann solvers, Limiters
5. Lagrangian Hydrodynamics: The SPH method
6. Resolution and instabilities in Hydrodynamics
7. Initial Conditions: Cosmological Simulations and Astrophysical Disks
8. Physical Approximations and Methods for Radiative Transfer in Astrophysics

**Literature**

Galactic Dynamics (Binney & Tremaine, Princeton University Press),
Computer Simulation using Particles (Hockney & Eastwood CRC press),
Targeted journal reviews on computational methods for astrophysics fluids (SPH, AMR, moving mesh)

**Prerequisites / notice**

Some knowledge of UNIX, scripting languages (see www.physik.uzh.ch/lectures/informatik/python/ as an example), some prior experience programming, knowledge of C++ beneficial

### 651-2338-00L Remote Sensing and Geographic Information Science III (University of Zürich)

The course "Grundlagen der Fernerkundung" (Principles of Remote Sensing) introduces the underlying principles of remote sensing and a range of fundamental concepts for understanding, handling and manipulating remote sensing data and images. It provides first details on optical image as well as visualization and time series analysis.

**Objective**

The learning goals of this module comprise the following aspects:
- Understanding and being able to explain fundamental concepts of remote sensing
- Knowing basic image understanding techniques and being able to apply these to optical imagery.
- Being able to choose and apply appropriate data analysis methods to solve a given remote sensing task
- Being able to interpret data, critically discuss the results and draw reasonable conclusions

**Abstract**

This module introduces advanced remote sensing methods and techniques for interpreting and analysing optical, RADAR and LiDAR data. The variety of topics covered in this module begin with image focusing, move through geometric and radiometric data processing, as well as interferometric and polarimetric evaluations.

**Objective**

The aim of the module is to give students a thorough understanding of the concepts, principles and processing of SAR and LiDAR data. Students will be able to carry out typical workflows in data processing and product generation. They will also be able to assess the quality of data products and understand the nature of errors that can affect the datasets. Students will acquire both theoretical and practical knowledge and understanding of aerial and satellite SAR imagery and LiDAR point cloud data. They will be able to derive solutions to problems presented and will have an understanding of applications including associated limitations.

**Content**

The module provides students with the skills to use state of the art software tools (e.g. SNAP, Matlab) to process data sets and develop new tools within existing frameworks. Examples of SAR applications treated include glacier and volcano monitoring, as well as height estimation using interferometry. Laser scanning exercises are focused on understanding LiDAR intensity, terrain model creation and their respective uncertainties and terrestrial laser scanning methods and applications. The module is composed of the lecture GEO 443.1, which teaches the underlying principles, and the exercise GEO443.2, which conveys important methods and skills of data processing and analysis.

**Abstract**

The course "Methoden der Fernerkundung" (Remote Sensing Methods) introduces advanced remote sensing methods and techniques for interpreting and analysing optical, RADAR and LiDAR data. The large variety of topics covered in this module range from radiative transfer over environmental monitoring to geometric and radiometric data processing techniques.

**Objective**

At the end of the module, students should: • Have a thorough understanding of advanced image understanding techniques and can apply these to optical, RADAR and LiDAR imagery. • Be able to choose the appropriate methods and use them to solve a given real-world task. • Be able to write basic programming scripts and use common remote sensing software to analyze geospatial data. • Be able to work scientifically on a given project (e.g. defining hypothesis and research questions). • Be able to comprehensively interpret data, critically discuss the results and draw the main conclusions.

**Content**

The individual lectures inherently focus on fundamentals of radiation interaction with the atmosphere and the surface, as well as aspects of data acquisition, quality assessment and pre-processing. A comprehensive set of methods to extract information and from imaging spectroscopy data is described (e.g. spectral feature analysis, spectral unmixing, radiative transfer modeling, reflectance and fluorescence retrieval, calculation of spectral albedo). The module is composed of the lecture GEO 442.1, outlining the underlying principles, and the exercise GEO442.2, conveying important methods and skills of data processing and analysis.

**Abstract**

This module introduces advanced remote sensing methods and techniques for interpreting and analysing optical, RADAR and LiDAR data. The variety of topics covered in this module begin with image focusing, move through geometric and radiometric data processing, as well as interferometric and polarimetric evaluations.

The learning goals of this module comprise the following aspects:
- Understanding and being able to explain fundamental concepts of remote sensing
- Knowing basic image understanding techniques and being able to apply these to optical imagery.
- Being able to choose and apply appropriate data analysis methods to solve a given remote sensing task
- Being able to interpret data, critically discuss the results and draw reasonable conclusions
An overview of astrobiology - the study of the origin, evolution of life on Earth, the possibility of life on other worlds and how we can discover its presence. We address some old and fascinating questions: where we came from, where we are going, are we alone in the universe and what life could be like out there amongst the stars.

Content
1. What is life? Characteristics from replication to thermodynamics.
2. How life works I: Biochemistry of life, from the cell to the ribosomes and genetic code
3. How life works II: Extremes of life on Earth, from archaea to tardigrades
4. Evidence for first life, conditions on the early Earth
5. Abiogenesis I: The last common ancestor and the origin of organic molecules
6. Abiogenesis II: How to form a replicating evolving living thing
7. Habitability I: Lessons from Earth, our evolving Sun, climate history, feedback loops
8. Habitability II: Carbon cycle, history of oxygen, role of our Moon
9. Life in our solar system - the grand tour, Mercury to Mars
10. Life in our solar system - the Moons of Jupiter and Saturn
11. Planet formation - origin of the Earth
12. Exoplanets, discovery, characterisation and properties
13. The search for life out there
14. Galactic habitability and alien anatomy

651-7104-00L Spatial Ecology and Remote Sensing (University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.
UZH Module Code: UIW250

Abstract
This lecture focus on quantitative methods and data to study spatial ecological processes. Computing work includes an introduction to ArcGIS, remote sensing data handling, and spatial analyses. Students can bring their own data for the self-run project in the second part or use provided data.

Content
This course is an introduction to scientific concepts and methods in spatial ecology. Spatial ecological patterns and processes are discussed and methods to assess and analyze spatial relations are introduced. The course has a focus on satellite-derived environmental and ecosystems data and their spatial analysis with respect to vegetation distribution and activity, and animal movement.

The course includes lectures, hands-on computer labs, and a literature study relating to the theory. The lectures introduce the spatial component of ecological questions and methods to assess spatial patterns and relationships with processes. During computer labs, the students will run exercises to introduce them to ArcGIS and get first skills in handling spatial data (including remote sensing data) and analyses.

Towards the end of the course, students do their own project based on provided or potentially own scientific data sets. The aim of the course is to develop knowledge and spatial analytical and mapping skills that can be applied in the master or PhD thesis to solve ecological questions and present results meaningfully.

651-7105-00L Computational Thinking I (University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.
UZH Module Code: ESC413

Abstract
The course will be organized around a series of "computational challenges" which will require an understanding of a broad range of computational topics in order to successfully tackle them.

Objective
To improve the knowledge base of all MSc and PhD students in Computational Science. This knowledge will also prepare the PhD students for questions during their eventual closed session exam, but in general will improve the performance of all students faced with computational questions during talks/conferences.

651-7106-00L Computational Astrophysics (LAB & LECTURE)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.
UZH Module Code: AST246

Abstract
1. Integration of ODE, Hamiltonians and Symplectic integration techniques, time adaptivity, time reversibility.
2. Large-N gravity calculation, collisionless N-body systems and their simulation.
4. Eulerian Hydrodynamics: Upwinding, Riemann solvers, Limiters
5. Lagrangian Hydrodynamics: The SPH method
6. Resolution and instabilities in Hydrodynamics
7. Initial Conditions: Cosmological Simulations and Astrophysical Disks
8. Physical Approximations and Methods for Radiative Transfer in Astrophysics
Abstract

The purpose of this course is to provide fundamental background on the role of land surface processes (vegetation, soil moisture dynamics, land energy, water and carbon balances) in the climate system. The course consists of 2 contact hours per week, including lectures, group projects and computer exercises.

Objective

The students can understand the role of land processes and associated feedbacks in the climate system.

Lecture notes

Powerpoint slides will be made available.

Prerequisites / notice

Prerequisites: Introductory lectures in atmospheric and climate science

402-0355-00L

Planet Formation

W+ 4 credits 2V  J. Szulágyi

Abstract

This course reviews the formation processes of terrestrial- and gaseous planets, and their moons. It provides a basic understanding on how our Solar System came to be, and how other planetary systems form, as well as how when planets & moons can be habitable places for life.
Objective

Overview the state of the art planet- and moon formation models and identify open questions in the field. Understanding the formation process of planetary systems, and the formation of habitable worlds.

Content

1) Planet types
2) The Solar System planets
3) Extrasolar Planets
4) The protoplanetary disk where planets are forming. The initial conditions for planet formation.
5) The formation of the building blocks of planets (so-called “planetesimals”)
6) Terrestrial Planet formation
7) Formation models of giant planets
8) Formation of moons
9) Evolution of planetary systems, orbital evolution of planets, resonances, planet-disk interactions
10) Origin of life, habitability, astrobiology

Literature

Astrophysics of Planet Formation

Abstract

Objective

After this course, the students should be able to

- Describe the major observation techniques in space geodesy
- Describe the necessary modeling and analysis approaches to derive geodetic products of highest quality
- Select the appropriate space geodetic data for scientific investigations
- Analyze the space geodetic data for scientific purposes
- Interpret the scientific results

Content

Overview of GNSS, Very Long Baseline Interferometry (VLBI), Satellite and Lunar Laser Ranging (SLR/LLR), Satellite Radar Altimetry with the basic principles, the instruments and observation equations.

Modelling of the station motions and the estimation of station coordinates. Basics of wave propagation in the atmosphere. Signal propagation in the ionosphere and troposphere for the different observation techniques and the determination of atmospheric parameters.

Equation of motion of the unperturbed and perturbed satellite orbit. Osculating and mean orbital elements. General and special perturbation theory and the determination of satellite orbits.

402-0398-00L Cosmic Dust in the Solar System: From Science Case to Mission Design

Abstract
This course provides students with a basic understanding of the science of cosmic dust in the solar system and how to measure it with space-based satellites and instrumentation. The lectures include the physical processes of both interplanetary and interstellar dust, trajectory simulations (i.e. orbital dynamics), in situ measurement techniques, and mission design aspects.

Objective
Cosmic dust is an important building block for planets and towards life. This course provides students with a basic understanding of the science of cosmic dust in the solar system, and how to measure it with space-based satellites and instrumentation. The lectures include the physical processes of both interplanetary and interstellar dust, trajectory simulations (i.e. orbital dynamics), in situ measurement techniques, and mission design aspects.

At the end of the course, students are able to classify the different types of dust in the solar system, and to relate them to their sources, sinks, their importance for planetary science and astronomy, physical processes, and appropriate measurement techniques. They will be able to simulate dust trajectories and use them to gain insight in how orbital dynamics and the space environment shape them. Students can design a basic concept of a space mission for dust measurements. The skills taught in this course will be useful to students in a broader way for planetary sciences.

Content
1. Introduction, course outline, historical notes, interstellar and interplanetary dust, dust in the solar system, sources, sinks, importance for science
2. Dust instrumentation and observables: ground-based, space-based and sample return techniques, calibration of dust instruments in the lab
3. Dust dynamics; recap basic aspects of orbital dynamics, the SPICE toolkit, types of orbits
4. Dust dynamics; space environment, dust processes and implications (e.g. in the early solar system), dust charging, consequences for dynamics, comparison with spacecraft dynamics
5. Dust models and dust data analysis; types of models and their limitations, data analysis
6. Mission design aspects; orbits, mission design limitations, advantages, disadvantages, instrument accommodation, example missions

Lecture notes
Slides will be provided before each lecture.

Mineral Resources I

Introduction to hydrothermal ore formation, using base metal deposits (Cu, Pb, Zn) in sedimentary basins to explain the interplay of mineral solubility and ore deposition, principles & thermodynamic prediction using activity diagrams. Driving forces and structural focussing of hydrothermal fluid flow

Principles of hydrothermal ore formation, using base metal deposits (Cu, Pb, Zn) in sedimentary basins to explain the interplay of geological, chemical and physical factors from global scale to sample scale. Introduction to orthomagmatic ore formation (mostly Cr, Ni, PGE). Introduction to supergene residual deposits (Ni, Al)

This lecture focuses on our home planet - Earth - from an interdisciplinary perspective. As the search for habitable - and potentially even inhabited - extrasolar planets is one of the most dynamic research fields in modern astrophysics, understanding what makes a planet habitable is a topic of increasing importance; and a highly interdisciplinary topic. In broad brushes, this lecture will discuss the building blocks of planetary systems and their formation, how we can learn about the history of Earth and other planets, what major epochs we can identify over the course of Earth’s 4.5 billion year history, when life arose on Earth and what impact it had on Earth’s evolution, how the future Earth might look like, and - last but certainly not least - how we can search for an Earth-like planet in our cosmic neighbourhood and what our chances are to be successful.

Lecture notes
Notes handed out during lectures

Literature
Extensive literature list distributed in course

Prerequisites / notice
2 contact hours per lecture / week including lectures, exercises and practical study of samples, and small literature-based student presentations. Supplementary contact for sample practicals and exercises as required. Credits and mark based on participation in course (exercises, 50%) and 1h30 written exam in the last lecture of the semester (50%).

651-4015-00L Earthquakes I: Seismotectonics

If you're interested in knowing more about the relationship between seismicity and plate tectonics, this is the course for you. (If you're not that interested, but your program of study requires that you complete this course, this is also the course for you.)

The aim of the course is to obtain a basic understanding of the physical process behind earthquakes and their basic mathematical description. By the conclusion of this course, we hope that you will be able to:

- describe the relationship between earthquakes and plate tectonics in a more sophisticated and complete way
- explain earthquake source representations of varying complexity;
- address earthquakes in the context of different tectonic settings;
- explain the statistical behaviour of global earthquakes
- describe and connect the ingredients for a seismotectonic study
Content
The course features a series of 14 meetings, in which we review some fundamentals of continuum mechanics and tensor analysis required for a complete understanding of the relation between earthquakes and plate tectonics. Our goal is to help you understand deformation the small scale (fault) to the scale of plate tectonics. We will tell you about several ways to represent an earthquake source; we'll present these in order of increasing sophistication. You will enjoy (at least) a computer/class exercise and a guest lecture.

Topics covered in the course include:
- review of stress and deformation in the Earth, stress and strain tensors, rheology and failure criteria, fault stresses, friction and effects of fluids
- earthquake focal mechanisms; relationship between stress fields and focal mechanisms;
- seismic moment and moment tensors;
- crustal deformation from seismic, geologic, and geodetic observations;
- earthquake stress drop, scaling, and source parameters;
- global earthquake distribution; current global earthquake activity;
- different seismites;otectonic regions; examples of earthquake activity in different tectonic settings.

Lecture notes
Course notes will be made available on a designated course web site. Most of the topics discussed in the course are available in the book mentioned below.

Literature

Prerequisites / notice
Basic knowledge of continuum mechanics and rock mechanics, as well as notion of tensor analysis is strongly suggested. We recommend to have taken the course Continuum Mechanics (generally taught during the Fall semester).

This course will be taught in fall 2017 and it will be followed by Earthquakes 2: Source Physics in Spring 2018.

The course will be evaluated in a final written test covering the topics discussed during the lectures.

The course will be worth 3 credit points, and a satisfactory total grade (4 or better) is needed to obtain 3 ECTS.

The course will be given in English.

651-4041-00L Sedimentology I: Physical Processes and Sedimentary Systems

Abstract
Sediments preserved a record of past landscapes. This courses focuses on understanding the processes that modify sedimentary landscapes with time and how we can read these changes in the sedimentary record.

Objective
The students learn basic concepts of modern sedimentology and stratigraphy in the context of sequence stratigraphy and sea level change.

Content
Details on the program will be handed out during the first lecture.

Literature
The sedimentary record of sea-level change

651-4143-00L Geobiology

Students registering for the course confirm having read and accepted the terms and conditions for excursions and field courses of D-EAPS:
https://ethz.ch/content/dam/ethz/special-interest/erdw/department/dokumente/studium/exkursionen/AGB_ERDW_Exkursionen_d.pdf

Abstract
We will study traces in the lithosphere that have been left behind by organisms during the course of Earth history and mineral components, which were built through biological processes or used as sources of energy and nutrients by organisms. Traces of life from the past will be compared with the development of the diversity of today's organisms.

Objective
The course will allow you to ask questions about the origin and the evolution of life on Earth, to understand contemporary hypotheses and create new methods of developing them further. Theory is supplemented with observations in the field, exercises and the application of simple mathematical models. The course will enable you to integrate geobiological knowledge into topics that will be taught in subsequent earth science courses and into the current understanding of Earth history. You will learn to better understand modern geological settings and, if necessary, to recommend biogeochemically well-founded and responsible interventions or protective measures.

Content
The course focuses on (a) geochemical cycles that play major roles in Earth history in aquatic and terrestrial ecosystems, (b) biosynthetic and metabolic processes, which are essential for life, (c) organisms which regulate and maintain geochemical cycling, and (d) chemical signals of past life in the geological record.

Accordingly, we must understand
-- how biological cells and its components are built from essential elements and molecules,
-- how cells function and which life styles organisms developed,
-- where organisms can exist and which factors select for their presence,
-- where biologically useable forms of energy come from, and under which conditions they can be exploited,
-- how biological metabolism can change environmental conditions and composition,
-- which biological products can lead to signals preserved in the rock record, and how biomolecules and elements are altered in sedimentary deposits,
-- how organic and inorganic components are cycled through the biosphere, and how biogeochemical cycles function,
-- how "biological innovations" evolved and changed in response to environmental changes.

Applied Case Studies, which supplement and illustrate the contents:
-- Scientific applications of geobiological knowledge are found in fields like Microbial Ecology, Geochemistry, Palaeontology, Sedimentology, Petrology, Ocean Research, Environmental Sciences, Astrobiology and Archaeology.
-- Practical applications of geobiological knowledge are needed in fields like stabilisation of existing and design of safe waste repositories, surveilling ground water resources, sewage treatment, exploitation of and prospecting for fossil carbon sources, soil remediation, mineral exploration and teaching, forensic science and medicine.

Prerequisites / notice
Als integraler Bestandteil der Vorlesung wird eine Exkursion durchgeführt.
In this 13-week sequence, students learn how to write programs from scratch to solve partial differential equations that are useful for Earth science applications. Programming will be done in MATLAB and will use the finite-difference method and marker-in-cell technique. The course will emphasise a hands-on learning approach rather than extensive theory.

### Objective
Students will gain an insight into cutting-edge research in planetary science and the geochemical evolution of Earth's mantle. The objective is to be able to synthesize scientific studies whose conclusions differ, and, eventually, to form a coherent opinion by debating and scrutinising the available data. This will be achieved by weekly lectures and exercises throughout the semester, culminating in a debate on a topical subject in Earth and planetary science.

### Content
A provisional week-by-week schedule (subject to change) is as follows:

**Week 1:** Introduction to the finite difference approximation to differential equations. Introduction to programming in Matlab. Solving of 1D Poisson equation.

**Week 2:** Direct and iterative methods for obtaining numerical solutions. Solving of 2D Poisson equation with direct method. Solving of 2D Poisson equation with Gauss-Seidel and Jacobi iterative methods.

**Week 3:** Solving momentum and continuity equations in case of constant viscosity with stream function/vorticity formulation.

**Weeks 4:** Staggered grid for formulating momentum and continuity equations. Indexing of unknowns. Solving momentum and continuity equations in case of variable viscosity using pressure-velocity formulation with staggered grid.

**Weeks 5:** Conservative finite differences for the momentum equation. "Free slip" and "no slip" boundary conditions. Solving momentum and continuity equations in case of variable viscosity using pressure-velocity formulation with staggered grid.

**Week 6:** Advection in 1-D. Eulerian methods. Marker-in-cell method. Comparison of different advection methods and their accuracy.

**Week 7:** Advection in 2-D with Marker-in-cell method. Combining flow calculation and advection for buoyancy driven flow.

**Week 8:** "Free surface" boundary condition and "sticky air" approach. Free surface stabilization. Runge-Kutta schemes. Continuity-based velocity interpolation.

**Week 9:** Solving 2D heat conservation equation in case of constant thermal conductivity with explicit and implicit approaches.

**Week 10:** Solving 2D heat conservation equation in case of variable thermal conductivity with explicit approach. Temperature advection with markers. Creating thermomechanical code by combining mechanical solution for 2D buoyancy driven flow with heat diffusion and advection based on marker-in-cell approach.

**Week 11:** Implementation of radioactive, adiabatic and shear heating to the thermomechanical code.

**Week 12:** Programming of solution of coupled solid-fluid momentum and continuity equations for the case of melt percolation in a rising mantle plume.

**Week 13:** Subgrid diffusion of temperature and its implementation. Implementation of temperature-, pressure- and strain rate-dependent viscosity, temperature- and pressure-dependent density and temperature-dependent thermal conductivity to the thermomechanical code.

**Week 14:** Final project description for slab breakoff modeling.

GRADING will be based on weekly programming homeworks (50%) and a term project (50%) to develop an application of their choice to a more advanced level.

### 651-4233-00L
**Composition and Evolution of the Earth and Planets**

**Abstract**
In this Masters-level course, we address the formation and evolution of the rocky planets with a particular focus on the chemical and isotopic make-up of the Earth and its mantle. This is achieved through analysis of its partial melting products in different tectonic settings and through time.

**Objective**
The goal of this course is for students to learn how to program numerical applications from scratch. By the end of the course, students should be able to write state-of-the-art MATLAB codes that solve systems of partial-differential equations relevant to Earth and Planetary Science applications using finite-difference method and marker-in-cell technique. Applications include Poisson equation, buoyancy driven variable viscosity flow, heat diffusion and advection, and state-of-the-art thermomechanical code programming. The emphasis will be on commonality, i.e., using a similar approach to solve different applications, and modularity, i.e., re-use of code in different programs. The course will emphasise a hands-on learning approach rather than extensive theory, and will begin with an introduction to programming in MATLAB.

**Content**
A 13-week sequence is designed to cover the following topics:

- **Week 1:** Introduction to the finite difference approximation to differential equations. Introduction to programming in Matlab. Solving of 1D Poisson equation.
- **Week 2:** Direct and iterative methods for obtaining numerical solutions. Solving of 2D Poisson equation with direct method. Solving of 2D Poisson equation with Gauss-Seidel and Jacobi iterative methods.
- **Week 3:** Solving momentum and continuity equations in case of constant viscosity with stream function/vorticity formulation.
- **Weeks 4:** Staggered grid for formulating momentum and continuity equations. Indexing of unknowns. Solving momentum and continuity equations in case of variable viscosity using pressure-velocity formulation with staggered grid.

### 651-5107-00L
**Physics of Planetary Interiors**

**Abstract**
Planetary science encompasses the study of the physical and chemical nature of planetary bodies both in the Solar System and in extrasolar systems. The formation of planets, the forces that shaped their orbits and the processes that molded their interiors are part of planetary science. Understanding these complex phenomena requires knowledge from various geo- and astrophysically-related fields.
Objective

The goal of this course is to provide students with quantitative understanding of planetary science. The emphasis in this course will be on theoretical development of the fundamentals needed for understanding planetary materials, planetary formation and evolution, and planetary interiors.

Content

The course will loosely be divided into ~14 lectures on various topics to be held by the main lecturer. In addition to the lectures, the students will solve a number 'take-home' problems and will hand in reports.

Topics that will be covered in the course include:

1. Elasticity
2. Equations of state
3. Thermodynamics applied to mantle materials
4. Harmonicity and anharmonicity
5. Tidal potential, gravity and figure of a planet
6. Planetary rotation, precession and nutation
7. Orbital evolution and tidal dissipation
8. Heat
9. Free oscillations of a planet

Prerequisites / notice

Completion of "651-4130-00 Mathematical Methods" is required.
Completion of "651-4013-00L Potential Field Theory" is required.
Completion of "651-4096-00L Inverse Theory for Geophysics I: Basics" would be helpful.

651-3521-00L Tectonics

W+ 3 credits 2V W. Behr, S. Willett

Abstract

Comprehensive understanding of evolution, mechanics, and rheology of divergent, convergent and wrenching tectonic systems from the lithospheric scale to local shallow crustal and outcrop-scales. Evaluation of plate tectonic and other orogenic processes through the study of reference examples of taken in Alp-Himalaya orogenic system.

Objective

Comprehensive understanding of evolution, mechanics, and rheology of divergent, convergent and wrenching tectonic systems from the lithospheric scale to local shallow crustal and outcrop-scales. Assessment of mechanisms responsible for plate movements (the Earth as a heat transfer machine, dynamics of earth mantle, plate driving forces) and subsequent large-scale structures (oceanic basins and cycle of the oceanic lithosphere, convergence and mountain systems and continental growth, etc) through theoretical and experimental information. Evaluation of plate tectonic and other orogenic processes through the study of reference examples of taken in Alp-Himalaya orogenic system.

Content

Plate tectonic frame work: earth cooling and mantle-plate interaction, three kinds of plate boundaries and their roles and characteristics, cycle of oceanic lithosphere, longlifity and growth of continents, supercontinents. Rheology of layered lithosphere and upper mantle. Obduction systems Collisions systems Extentional systems Basin evolution Passive and active continental margin evolution

Literature

651-4025-00L Rock Mechanics and Rock Engineering

W+ 4 credits 4V V. Gischig, P. A. Selvadurai

Abstract

This course focusses on the principles (fundamentals) and basic concepts of rock mechanics and rock engineering (e.g. tunnelling, rock slope stability).

Objective

The course aims to introduce the fundamentals and basic concepts of rock mechanics and generic rock engineering. The student shall understand how rocks behave at different scales, under various artificial loads and in the shallow subsurface (a few km below ground). The link between rock mechanics, geology, hydrogeology and tectonics (i.e. the conditions under which the rock formed) will be clearly established.

Content

This course focusses on the principles (fundamentals) and basic concepts of rock mechanics and generic rock engineering. The course is compulsory for the MSc Eng Geol. The applications of rock mechanical principles and rock engineering methods are extensively covered in subsequent courses.

Lecture notes

Written course documentation available on our homepage: https://www.ethz.ch/content/specialinterest/erdw/geological-institute/engineering-geology/en/teaching/msc/fall/rock_mechanics.html

651-3440-02L Geophysics III

W+ 4 credits 4V A. Jackson, M.-A. Meier, P. Tackley

Abstract

This course builds on Geophysik I and Geophysik II, broadening the students' education in seismology, geodynamics and geodynamo theory, by considering various specific topics of particular interest.

Objective

To teach students the basics of observational seismology, earthquake source seismology, seismotectonics and the principle of seismic tomography, mantle convection over Earth history, structure of the oceanic and continental lithosphere, plate tectonics, hotspots, global heat flux, dynamo operation and magnetic field generation in Earth, planets, the Sun and stars and electromagnetism to probe the mantle.
Observational seismology, earthquake source seismology, seismotectonics and the principle of seismic tomography. Mantle convection over Earth history, structure of the oceanic and continental lithosphere, plate tectonics, hotspots, global heat flux. Dynamo operation and magnetic field generation in Earth, planets, the Sun and stars; electromagnetism to probe the mantle.

Atmospheric Physics

Abstract
This course covers the basics of atmospheric physics, which consist of: cloud and precipitation formation, especially prediction of showers and severe convective storms, and optical phenomena.

Objective
Students are able:
- to explain the mechanisms of convective storm formation using knowledge of thermodynamics and cloud microphysics.
- to interpret precipitation radar images
- to evaluate the significance of clouds and aerosol particles for artificial weather modification.

In the course “Atmospheric Physics”, the competencies of process understanding, system understanding and data analysis & interpretation are taught, applied and examined. Measurement methods are taught as well.

Content
The course starts with introducing selected concepts of thermodynamics for atmospheric processes: The students learn the concept of the thermodynamic equilibrium and derive the Clausius-Clayperon equation from the first law of thermodynamics. This equation is central for the phase transitions in clouds.

Students also learn to use thermodynamic charts (tephigrams) and to identify cloud base, cloud top, available convective energy in radiosonde ascents. Atmospheric mixing processes are introduced as a basis for fog formation. The concept of an air parcel is used to understand convection.

Aerosol particles are introduced in terms of their physical properties and their role in cloud formation based on Köhler theory. Thereafter cloud microphysical processes including ice nucleation are discussed.

With these basics, the different forms of precipitation (convective vs. stratiform) are discussed and how they can be identified in radar images. Students will also learn under which conditions severe convective storms (especially supercells with tornados) can form.

The concepts are applied to understand and judge the validity of different proposed artificial weather modification ideas.

Lecture notes
Powerpoint slides and chapters from the textbook will be made available on moodle: https://moodle-app2.let.ethz.ch/course/view.php?id=22731

Literature

An electronic version of this book can be obtained via the ETH library.

pdf-files of the revised book will be provided on moodle on a chapter-by-chapter basis.

Prerequisites / notice
We offer a lab tour, in which we demonstrate how some of the processes discussed in the lectures are measured with instruments.

There is an additional tutorial right after each lecture to give you the chance to ask further questions and discuss the exercises. The participation is recommended but voluntary.

Atmospheric Remote Sensing

Abstract
The course will provide advanced physical understanding on the fundamentals of passive and active remote sensing, measuring sensors and retrieval methods. A series of diverse remote sensing applications will be presented, including measurements/retrievals of various atmospheric composition parameters (ozone, aerosols, clouds, others) from surface based and satellite based instruments.

Objective
Main objectives of the course and what the students will be able to explain and use at the end of it are:
- The major atmospheric laws used for the retrieval of atmospheric composition and solar radiation parameters
- Ground based and satellite based retrieval examples for major atmospheric constituents
- Practical and experimental aspects on measuring atmospheric aerosols through the use of relevant instrumentation
- Explore major atmospheric measurement databases and use of the available data
- Interpretation of measurement and retrieval related results on atmospheric composition and solar radiation based on using combined retrieval data products
Atmospheric passive and active remote sensing is connected with a large number of applications including: atmospheric composition, Earth-atmosphere radiative balance, atmospheric and weather prediction model assimilation, agriculture, energy and health related applications and many others.

The proposed lesson is divided in three sections including exercises:
- Fundamentals of remote sensing
- Sensors (surface based and satellites) and retrieval methods
- Applications

The first aim of the lecture is to provide an in-depth understand of the physical aspects and basic laws on the fundamentals of remote sensing to the students. The lectures will provide a basic to intermediate understanding of radiative transfer of electromagnetic radiation through the atmosphere, covering the spectrum from UV to thermal. Examples of atmospheric components that will be addressed are: ozone, aerosols, greenhouse gases, clouds, water vapor.

In addition, measuring sensors used from the surface or from satellites and the relevant retrieval methods based on passive and active remote sensing of atmospheric composition will be presented (e.g. Spectroradiometers, filter radiometers, Lidars and others).

Finally, we aim to demonstrate a series of diverse remote sensing applications, including atmospheric composition measurements and retrievals from surface- and satellite-based instruments, including calibration and validation aspects.

The exercises will be embedded in the overall course lectures to provide hands-on experience with the measurements and retrieval methods conducting measurements and analyzing small field experiments. Also with the use of atmospheric datasets available from specific instruments (e.g. satellite sensors) and networks (e.g. AERONET, GAWPFIR).

More specific the course include:
- 3 introductory courses on climate variables, sensors, solar measurements and radiative transfer basics
- 7 courses including remote sensing techniques on solar UV measurements, total column ozone, trace gases, greenhouse gases, aerosols, cloud retrievals and lidar active remote sensing.
- 3 exercises:
  a. Conducting sun photometric measurements in the field and retrieve aerosol optical depth, including a visit in Davos, World Calibration Center
  b. Exploring ground and satellite based solar UV, Ozone and aerosol measurements
  c. Using radiative transfer modeling tools

Finally, students are involved on presenting scientific literature on subjects they are interested in. All exercises are conducted in student-forming teams

Lecture notes
Lecture slides will be provided via Moodle before every lecture.

701-1271-00L Statistical Learning for Atmospheric and Climate Science W+ 3 credits 2G L. Gudmundsson, D. Nerini

Abstract
This course offers a systematic introduction to statistical and machine learning methods with focus on applications in atmospheric and climate science. Focus is on the theoretical and mathematical basis of supervised statistical learning (advanced regression, nonparametric methods) and their application in practice with hands-on exercises.

Objective
Students:
- Understand the theoretical basis of machine learning
- Are familiar with overarching concepts such as bias-variance trade-off, cost-functions, hyper parameters, cross-validation
- Have good command of the theoretical basis of selected machine learning tools
- Are able to select the appropriate statistical learning tools to tackle atmospheric and climate research problems
- Can apply methods of statistical learning in atmospheric and climate research
- Data in atmospheric and climate research (data types, observations, models)
- Exploring properties of atmospheric and climate data (data in space and time, multivariate data)
- Concepts of supervised learning (bias variance trade-off, overfitting, cross-validation)
- Advanced linear regression (multiple linear regression, regularization)
- Non-linear regression (local linear regression, regression trees, gradient boosting, random forests, neural networks)
- Bootstrapping
- Keynote speakers showcasing recent topics in statistical learning and high-level applications for atmospheric and climate research

Number of participants limited to 30.

Abstract
This course is a hands-on introduction to self-driving cars using the Duckietown platform.

Objective
Each student is given a mobile wheeled robot and throughout the class must configure and program.

The objective of the class is to give the student a pragmatic view of what it takes to design and operate a fleet of self-driving cars or any other large robotic systems.

Content
Perception, planning, modeling, and control, leveraging primarily on vision data.

Lecture notes
Lecture notes, primarily in the form of slides and tutorials, will be accessible from Moodle. Additional materials can also be accessed from the EdX MOOC called "Self-driving cars with Duckietown".

Literature
Course notes will be provided in an electronic form. These are some books that can be used to provide background information or consulted as references:
(1) Siegwart, Nourbakhsh, Scaramuzza - Introduction to autonomous mobile robots;
(2) Norvig, Russell - Artificial Intelligence, a modern approach;
(3) Peter Corke - Robotics Vision and Control;
(4) Oussama Khatib, Bruno Siciliano - Handbook of Robotics.

Prerequisites / notice
Students should have taken a basic course in probability theory, computer vision, and control systems, and should be familiar and comfortable with programming (Python), Linux, and GIT utilization.

In introduction to ROS will be given, but it's strongly advised that students have prior exposure to and experience with ROS to effectively navigate through the homework assignments and the final project.

A shared space will be available to work with the robots.

Competencies
It's advised students will have ~5 square meters of free space at their place to work with their assigned robot.

Planning and Decision Making for Autonomous Robots

Abstract
Planning safe and efficient motions for robots in complex environments, often shared with humans and other robots, is a difficult problem combining discrete and continuous mathematics, as well as probabilistic, game-theoretic, and ethical/regulatory aspects. This course will cover the algorithmic foundations of motion planning, with an eye to real-world implementation issues.

Objective
The students will learn how to design and implement state-of-the-art algorithms for planning the motion of robots executing challenging tasks in complex environments.

Content

Lecture notes
Course notes and other education material will be provided for free in an electronic form.

Literature
There is no required textbook, but an excellent reference is Steve LaValle's book on "Planning Algorithms."

Prerequisites / notice
Students should have taken basic courses in optimization, control systems, probability theory, and should be familiar with modern programming languages and practices (e.g., Python, and/or C/C++). Previous exposure to robotic systems is a definite advantage.

Competencies
Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies
- Decision-making
- Problem-solving

Advanced Model Predictive Control

Abstract
Model predictive control (MPC) has established itself as a powerful control technique for complex systems under state and input constraints. This course discusses the theory and application of recent advanced MPC concepts, focusing on system uncertainties and safety, as well as data-driven formulations and learning-based control.

Objective
Design, implement and analyze advanced MPC formulations for robust and stochastic uncertainty descriptions, in particular with data-driven formulations.

Content
Topics include
- Nominal MPC for uncertain systems (nominal robustness)
- Robust MPC
- Stochastic MPC
- Review of regression methods
- Set-membership Identification and robust data-driven MPC
- Bayesian regression and stochastic data-driven MPC
- MPC as safety filter for reinforcement learning

Lecture notes
Lecture notes will be provided.

Prerequisites / notice
Basic courses in control, advanced course in optimal control, basic MPC course (e.g. 151-0660-00L Model Predictive Control in Spring Semester) strongly recommended.

Background in linear algebra and stochastic systems recommended.

Dynamic Programming and Optimal Control

Abstract
Introduction to Dynamic Programming and Optimal Control.

Objective
Covers the fundamental concepts of Dynamic Programming & Optimal Control.

Content
Dynamic Programming Algorithm; Deterministic Systems and Shortest Path Problems; Infinite Horizon Problems, Bellman Equation; Deterministic Continuous-Time Optimal Control.

Literature

Prerequisites / notice
Requirements: Knowledge of advanced calculus, introductory probability theory, and matrix-vector algebra.

Real-World Robotics - A Hands-On Project Class

Abstract
During this course, the students will develop an articulated robotic hand to solve a real-world robotic challenge: the robot must autonomously grasp and place objects. The students will learn the key theoretical concepts required to model, manufacture, control, and test their robot, alongside developing machine learning, programming, hardware, and engineering skills through the hands-on project.

Objective
Learning Objective 1: High-Level System Design
System and product design combined with requirement generation and verification are essential for this robotics project. The students will apply previously acquired system design knowledge and methods to a hands-on challenge.

Learning Objective 2: Robot Design and Simulation
Students will gain experience implementing and simulating robotic systems using modern design, modeling, and simulation techniques such as CAD and Isaac Gym. These techniques are essential in any design process to understand the expected system behavior. This requires thoroughly understanding the system’s kinematics, dynamics, material, actuation principle, and physical limitations. Students will learn the theory and limitations behind modeling and simulation software.

Learning Objective 3: Robot Fabrication
Students will learn to use the previously designed CAD models for successful robot fabrication. Additionally, the iterative nature of the process will allow them to develop their critical thinking skills in assessing the limitations of their design as well as possible sources for improvements. Building the robot will equip students with essential skills for using robots in the real world.

Learning Objective 4: Control, Integration, and Testing
Students can directly apply the knowledge acquired in their control courses. They will gain theoretical knowledge on how to model and develop intelligent control algorithms. Perception methods and state-of-the-art machine-learning techniques will be taught. They will gain experience testing their robots’ performance in both hard- and software to enhance their design and suggest future improvements.

Learning Objective 5: Robot production
Students will learn to choose between state-of-the-art industrial production processes to manufacture a soft robot by understanding their limitations and requirements. They will also learn how to optimize the robot design to account for a specific production process.
During this course, the students will be divided into teams and each group will independently develop an articulated robotic arm to solve a real-world robotic challenge, which will take place at the end of the course. The students will learn the key theoretical concepts required to model, manufacture, control and test a soft robot, along with developing the programming, hardware and engineering skills through hands-on workshops.

This course is composed of tutorials, which will be available on the course website where the lecturer will provide all the necessary theoretical input, focus talks where robotic experts will present a particular aspect of the manipulator in detail, and workshops where the students will have the possibility to hands-on learn how to implement the solutions required to solve their challenge. Finally, there will be time slots to autonomously work on the manufacturing and development of the team's robot and an online forum will be available to help the students throughout the entire course.

This course is divided into six parts:

Part 1: Challenge introduction
- Identify the functional requirements necessary for the final challenge
- Evaluate the existing manipulator designs to optimize them for the specific task

Part 2: Robot Design
- Develop a CAD model based on the high-level system design.
- Integrate motors, pneumatics components, and other required materials in the design

Part 3: Robot Fabrication
- Come up with a fabrication method and plan using the presented fabrication skills.
- Fabricate the robot and its actuators based on the CAD model.
- Evaluate, modify, and enhance the fabrication approach.

Part 4: Soft Robot Simulation
- Simulate the soft manipulator through a simulation framework
- Optimize the simulation parameters to reflect the experimental setup

Part 5: Control, Integration, and Testing
- Formulate the dynamic skills needed for real-life application.
- Develop traditional and learning-based control algorithms and test them in simulation.
- Integrate controller design into the fabricated robot.
- Build, test, fail, and repeat until the soft robot works as desired in simple tasks.
- Upgrade and validate the robot for performance in real-world conditions and verify requirements.

Part 6: Product development
- Propose a manufacturing process to bring the robot from a prototype to the final product
- Optimize the robot for production

Lecture notes
All class materials, including slides, video tutorials, and supporting literature, can be found on the class webpage (https://rwr.ethz.ch) and Moodle, supported by discussion and Q&A forums. Focus talks, Q&A sessions, and workshops will happen on Mondays between 14:00 and 16:00.

Literature

Prerequisites / notice
Students are expected to have attended introductory courses in dynamics, control systems, and robotics.

Registration for this course is limited due to the amount of resources needed to make this course happen. For this reason, it is required to apply through the following module: https://forms.gle/pnMHTCdZwgdawb519

The graded semester performance consists of the final team performance in the class challenge, a final team presentation and report, weekly Moodle quizzes, and attendance at the focus talks and workshops.

Competencies

Subject-specific Competencies
- Concepts and Theories assessed
- Techniques and Technologies assessed

Method-specific Competencies
- Analytical Competencies assessed
- Decision-making assessed
- Problem-solving assessed
- Project Management assessed

Social Competencies
- Communication assessed
- Cooperation and Teamwork assessed

Personal Competencies
- Adaptability and Flexibility assessed
- Creative Thinking assessed
- Critical Thinking assessed

151-0632-00L Vision Algorithms for Mobile Robotics (University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: DINF2039

Mind the enrolment deadlines at UZH: https://www.uzh.ch/cmsssl/en/studies/application/deadlines.html

Data: 26.07.2024 12:39   Autumn Semester 2024   Page 2331 of 2680
For a robot to be autonomous, it has to perceive and understand the world around it. This course introduces you to the key computer vision algorithms used in mobile robotics, such as feature extraction, structure from motion, dense reconstruction, tracking, image retrieval, event-based vision, and visual-inertial odometry (the algorithms behind Hololens, Oculus Quest, and the NASA Mars rovers).

Learn the fundamental computer vision algorithms used in mobile robotics, in particular: filtering, feature extraction, structure from motion, multiple view geometry, dense reconstruction, tracking, image retrieval, event-based vision, and visual-inertial odometry and Simultaneous Localization And Mapping (SLAM) (the algorithms behind Hololens, Facebook-Oculus Quest, and the NASA Mars rovers).

Each lecture will be followed by a lab session where you will learn to implement a building block of a visual odometry algorithm in Matlab. By the end of the course, you will integrate all these building blocks into a working visual odometry algorithm.

Lecture slides will be made available on the course official website: http://rpg.ifl.uzh.ch/teaching.html

An Invitation to 3D Vision, by Y. Ma, S. Soatto, J. Kosecka, S.S. Sastry.

Multiple view Geometry, by R. Hartley and A. Zisserman.

Fundamentals of algebra, geometry, matrix calculus, and Matlab programming.

Note: If you are interested in taking UZH courses, you must register as an incoming mobility student at UZH. For details, see as follows:

UZH course enrollment for ETH student at University of Zurich (UZH) > Mobility within Switzerland – Incoming > Module Mobility: The easiest way to take individual modules/courses to supplement your studies at your home university is with module mobility. This option is not available to students who have dropped out of their home university or have been definitely excluded or banned from the relevant a program > Application and Deadlines: Applications are submitted via the UZH application portal (https://www.uzh.ch/cmsssl/en/studies/application/chmobility.html)

Step-by-step guidelines on how ETH students can register for this course, are given on the official course website: https://rpg.ifl.uzh.ch/teaching.html

ATTENTION: When you book the course at UZH, you are automatically registered for the exam at UZH and you can unregister until the October deadline. After registering for the course, you as an ETH student need to check out your “**UZH email account**” to receive the related information from the lecturer.

**151-0851-00L**

**Objective**

We will provide an overview on how to kinematically and dynamically model typical robotic systems such as robot arms, legged robots, rotary wing systems, or fixed wing.

**Content**

The primary objective of this course is that the student deepens an applied understanding of how to model the most common robotic systems. The student receives a solid background in kinematics, dynamics, and rotations of multi-body systems. On the basis of state of the art applications, he/she will learn all necessary tools to work in the field of del control or robotic systems.

The course consists of three parts: First, we will refresh and deepen the student’s knowledge in kinematics, dynamics, and rotations of multi-body systems. In this context, the learning material will build upon the courses for mechanics and dynamics available at ETH, with the particular focus on their application to robotic systems. The goal is to foster the conceptual understanding of similarities and differences among the various types of robots. In the second part, we will apply the learned material to classical robotic arms as well as legged systems and discuss kinematic constraints and interaction forces. In the third part, focus is put on modeling fixed wing aircraft, along with related design and control concepts. In this context, we also touch aerodynamics and flight mechanics to an extent typically required in robotics. The last part finally covers different helicopter types, with a focus on quadrotors and the coaxial configuration which we see today in many UAV applications. Case studies on all main topics provide the link to real applications and to the state of the art in robotics.

**Prerequisites / notice**

The contents of the following ETH Bachelor lectures or equivalent are assumed to be known: Mechanics and Dynamics, Control, Basics in Fluid Dynamics.

**151-1116-00L**

**Objective**

We provide an overview on how to kinematically and dynamically model typical robotic systems such as robot arms, legged robots, rotary wing systems, or fixed wing.

**Content**

An introduction to the basic principles and interrelationships of aircraft and automotive aerodynamics.

To understand the basic relations of the origin of aerodynamic forces (ie lift, drag). To quantify the aerodynamic forces for basic configurations of aircraft and car components.

Illustration of the intrinsic problems and results using examples.

Using experimental and theoretical methods to illustrate possibilities and limits.

**Prerequisites / notice**

Mechanics and Dynamics, Control, Basics in Fluid Dynamics.

**151-0623-00L**

**Objective**

This course consists of a series of seven lectures given by researchers who have distinguished themselves in the area of Robotics, Systems, and Controls.

Obtain an overview of various topics in Robotics, Systems, and Controls from leaders in the field. Please see http://www.msr.ethz.ch/education/distinguished-seminar-in-robotics--systems--controls--151-0623-0.html for a list of upcoming lectures.
This course consists of a series of seven lectures given by researchers who have distinguished themselves in the area of Robotics, Systems, and Controls. MSc students in Robotics, Systems, and Controls are required to attend every lecture. Attendance will be monitored. If for some reason a student cannot attend one of the lectures, the student must select another ETH or University of Zurich seminar related to the field and submit a one page description of the seminar topic. Please see http://www.msr.ethz.ch/education/distinguished-seminar-in-robotics--systems--controls--151-0823-0.html for a suggestion of other lectures.

Prerequisites / notice
Students are required to attend all seven lectures to obtain credit. If a student must miss a lecture then attendance at a related special lecture will be accepted that is reported in a one page summary of the attended lecture. No exceptions to this rule are allowed.

**227-0124-00L Embedded Systems**

**Abstract**
An embedded system is a combination of hardware and software, either fixed in function or programmable, that is designed for a specific application scenario or for a specific task within a larger system. They are part of industrial machines such as agricultural and manufacturing equipment, automotive systems, medical equipment, household appliances, sensor networks, and the Internet of Things.

**Objective**
Understanding the specific requirements and problems that arise in embedded system applications.

Understanding the hardware structure of a microcontroller and an embedded system; memory architecture and memory map, internal and external peripherals, low-power and low-energy design as well as instruction sets and computational accelerators.

Understanding the firmware structure of a microcontroller and an embedded system; low-level instruction set, hardware-software interfaces, communication between components, embedded real-time operating systems, real-time scheduling, shared resources, low-power, and low-energy designs as well as computational accelerators.

Using formal models and methods for designing and optimizing embedded systems.

Gaining experience with practical applications of the C programming language, embedded real-time operating systems, and debug functionalities of the associated design environment to design, implement, and verify embedded firmware.

Through project-based activities, students will gain substantial experience in applying the C programming language in the context of embedded systems. Projects will involve developing and implementing firmware, utilizing embedded real-time operating systems, and exploring the debugging functionalities within design environments. This hands-on approach aims to bridge the gap between theoretical knowledge and practical application, allowing students to experience the full lifecycle of embedded system development from design to implementation and verification.

**Content**
This lecture focuses on the design of embedded systems using formal models and methods.

Besides the theoretical lecture, the course contains laboratory sessions where students transfer the learned theoretical aspects into praxis by programming a microcontroller and interfacing it with sensors and actuators.

Students will be exposed to a commercial microcontroller, and the development board extend with a custom-designed embedded systems educational platform.

Specifically, the following topics will be covered in the course: hardware and software structures of embedded systems, low-level instruction set, memory architecture and memory map, peripherals, hardware-software interfaces, communication between components, firmware design methodologies, firmware design using the C programming language, embedded real-time operating systems, real-time scheduling, shared resources, low-power, and low-energy designs as well as computational accelerators.

**Lecture notes**
Lecture material, publications, exercise sheets, and laboratory documentation will be available on the course’s Moodle page.

**Literature**

**Prerequisites / notice**
Prerequisites: C programming, circuit theory, digital logic, binary number representations.

**Competencies**
Subject-specific Competencies

- Concepts and Theories
- Techniques and Technologies

**227-0447-00L Image Analysis and Computer Vision**

**Abstract**

**Objective**
Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

**Content**
This course aims at offering a self-contained account of computer vision and its underlying concepts, including the recent use of deep learning.

The first part starts with an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First the interaction of light with matter is considered. The most important hardware components such as cameras and illumination sources are also discussed. The course then turns to image discretization, necessary to process images by computer.

The next part describes necessary pre-processing steps, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and 3D shape as two important examples. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed. A major part at the end is devoted to deep learning and AI-based approaches to image analysis. Its main focus is on object recognition, but also other examples of image processing using deep neural nets are given.

**Lecture notes**
Course material Script, computer demonstrations, exercises and problem solutions

**Prerequisites / notice**
Prerequisites:

- Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Python and Linux.
- The course language is English.

**227-0560-00L Computer Vision and Artificial Intelligence for Autonomous Cars**

**Abstract**
This course introduces the core computer vision techniques and algorithms that autonomous cars use to perceive the semantics and geometry of their driving environment, localize themselves in it, and predict its dynamic evolution. Emphasis is placed on techniques tailored for real-world settings, such as multi-modal fusion, domain-adaptive and outlier-aware architectures, and multi-agent methods.
Objective

Students will learn about the fundamentals of autonomous cars and of the computer vision models and methods these cars use to analyze their environment and navigate themselves in it. Students will be presented with state-of-the-art representations and algorithms for semantic, geometric and temporal visual reasoning in automated driving and will gain hands-on experience in developing computer vision algorithms and architectures for solving such tasks.

After completing this course, students will be able to:
1. understand the operating principles of visual sensors in autonomous cars
2. differentiate between the core architectural paradigms and components of modern visual perception models and describe their logic and the role of their parameters
3. systematically categorize the main visual tasks related to automated driving and understand the primary representations and algorithms which are used for solving them
4. critically analyze and evaluate current research in the area of computer vision for autonomous cars
5. practically reproduce state-of-the-art computer vision methods in automated driving
6. independently develop new models for visual perception

Content

The content of the lectures consists in the following topics:

1. Fundamentals
   (a) Fundamentals of autonomous cars and their visual sensors
   (b) Fundamental computer vision architectures and algorithms for autonomous cars

2. Semantic perception
   (a) Semantic segmentation
   (b) Object detection
   (c) Instance segmentation and panoptic segmentation

3. Geometric perception and localization
   (a) Depth estimation
   (b) 3D reconstruction
   (c) Visual localization
   (d) Unimodal visual/lidar 3D object detection

4. Robust perception: multi-modal, multi-domain and multi-agent methods
   (a) Multi-modal 2D and 3D object detection
   (b) Visual grounding and verbo-visual fusion
   (c) Domain-adaptive and outlier-aware semantic perception
   (d) Vehicle-to-vehicle communication for perception

5. Temporal perception
   (a) Multiple object tracking
   (b) Motion prediction

The practical projects involve implementing complex computer vision architectures and algorithms and applying them to real-world, multi-modal driving datasets. In particular, students will develop models and algorithms for:
1. Semantic segmentation and depth estimation
2. Sensor calibration for multi-modal 3D driving datasets
3. 3D object detection using lidars

Lecture notes

Lecture slides are provided in PDF format.

Prerequisites / notice

Students are expected to have a solid basic knowledge of linear algebra, multivariate calculus, and probability theory, and a basic background in computer vision and machine learning. All practical projects will require solid background in programming and will be based on Python and libraries of it such as PyTorch.

Competencies

227-0689-00L System Identification W+ 4 credits 2V+1U R. Smith
Abstract
Theory and techniques for the identification of dynamic models from experimentally obtained system input-output data.

Objective
To provide a series of practical techniques for the development of dynamical models from experimental data, with the emphasis being on the development of models suitable for feedback control design purposes. To provide sufficient theory to enable the practitioner to understand the trade-offs between model accuracy, data quality and data quantity.

Content
Introduction to modeling: Black-box and grey-box models; Parametric and non-parametric models; ARX, ARMAX (etc.) models.
Predictive, open-loop, black-box identification methods. Time and frequency domain methods. Subspace identification methods.
Optimal experimental design, Cramer-Rao bounds, input signal design.
Parametric identification methods. On-line and batch approaches.
Closed-loop identification strategies. Trade-off between controller performance and information available for identification.

Literature
Additional papers will be available via the course Moodle.

Prerequisites / notice
Control systems (227-0216-00L) or equivalent.

252-0535-00L Advanced Machine Learning W+ 10 credits 3V+2U+4A C. Cotrini Jimenez
Abstract
Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.
Objective

Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real world data.

Content

The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:

- Fundamentals:
  - What is data?
  - Bayesian Learning
  - Computational learning theory

- Supervised learning:
  - Ensembles: Bagging and Boosting
  - Max Margin methods
  - Neural networks

- Unsupervised learning:
  - Dimensionality reduction techniques
  - Clustering
  - Mixture Models
  - Non-parametric density estimation
  - Learning Dynamical Systems

Lecture notes

No lecture notes, but slides will be made available on the course webpage.

Literature

Prerequisites / notice

The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.

Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>This course provides an introduction to fundamental aspects of physical human-robot interaction. After an overview of human haptic, visual and auditory sensing, neurophysiology and psychophysics, principles of human-robot interaction systems (kinematics, mechanical transmissions, robot sensors and actuators used in these systems) will be introduced. Throughout the course, students will gain knowledge of interaction control strategies including impedance/admittance and force control, haptic rendering basics and issues in device design for humans such as transparency and stability analysis, safety hardware and procedures. The course is organized into lectures that aim to bring students up to speed with the basics of these systems, readings on classical and current topics in physical human-robot interaction, laboratory sessions and lab visits. Students will attend periodic laboratory sessions where they will implement the theoretical aspects learned during the lectures. Here the salient features of haptic device design will be identified and theoretical aspects will be implemented in a haptic system based on the haptic paddle (<a href="https://relab.ethz.ch/downloads/open-hardware/haptic-paddle.html">https://relab.ethz.ch/downloads/open-hardware/haptic-paddle.html</a>), by creating simple dynamic haptic virtual environments and understanding the performance limitations and causes of instabilities (direct/virtual coupling, friction, damping, time delays, sampling rate, sensor quantization, etc.) during rendering of different mechanical properties.</td>

Abstract

Students learn principles of teaching beyond classroom and regular PE-Lessons:
- Planning and organizing camps and events
- Teaching the "Ergänzungsfach Sport"
- Long-term-curricula in PE

As a practical part students design the Outdoor event in EW4 of the following term.

Objective

Students know:
- How to plan events and camps
- To assess curricula critically and to use them properly
- How to combine theoretical and practical issues in the ‘Ergänzungsfach’

Content

1. LV Semestereinführung
2. LV Planung Outdoor-Weekend
3. LV Auswertung Outdoor-Event
4. LV Planung Event
5. LV Event-Präsentationen / Schlussveranstaltung

Lecturers

This course is only apt for students who intend to enrol in the programs "Lehrdiplom" or "Didaktisches Zertifikat". It is about learning in childhood and adolescence.

This course looks into scientific theories and also empirical studies on human learning and relates them to the school.

Anyone wishing to be a successful teacher must first of all understand the learning process. Against this background, theories and findings on the way humans process information and on human behaviour are prepared in such a manner that they can be used for planning and conducting lessons. Students additionally gain an understanding of what is going on in learning and behavioural research so that teachers are put in a position where they can further educate themselves in the field of research into teaching and learning.

This lecture is only apt for students who intend to enrol in the programs "Teaching Diploma" or "Teaching Certificate". It is about learning in childhood and adolescence.

Thematische Schwerpunkte:
Lernen als Verhaltensänderung und als Informationsverarbeitung: Das menschliche Gedächtnis unter besonderer Berücksichtigung der Verarbeitung symbolischer Information; Lernen als Wissenskonstruktion und Kompetenzerwerb unter besonderer Berücksichtigung des Wissenstransfers; Lernen durch Instruktion und Erklärungen; Die Rolle von Emotion und Motivation beim Lernen; Interindividuelle Unterschiede in der Lernfähigkeit und ihre Ursachen: Intelligenztheorien, Geschlechtsunterschiede beim Lernen

Folien werden zur Verfügung gestellt.

This is a compulsory requirement for EW4 Sport.

Subject Didactics in Sport

Important: You can only enroll in the courses of this category if you have not more than 12 CP left for possible additional requirements.

Abstract

Practical implementation in sports of general didactics, with the planning, implementation and evaluation of topics from all the sports-specific areas of tuition in secondary school Level II.

Objective

- Implement the objectives of general didactics in respect of the different types of sport at school.
- Master the planning, implementation and evaluation of topics from all the sports-specific areas of tuition.
- Gain an overview of the preparation necessary for the different requirements placed on a sports teacher at secondary school Level II.
- Try out different teaching structures, such as the lesson, teaching unit, block periods and extra units in sport in addition to those on the timetable.

Content

Implementation of practical sport into general teacher training with planning, execution and evaluation of the topics from all sport-specific areas of the education at this level in Section II.

**Abstract**
In their mentorated work on subject didactics, students put into practice the contents of the subject-didactics lectures and go into these in greater depth. Under supervision, they compile tuition materials that are conducive to learning and/or analyse and reflect on certain topics from a subject-based and pedagogical angle.

**Objective**
planning and organization of a longer period of instruction in school.

**Content**
connection of educational goals and instruction

**Abstract**
During the introductory teaching practice, the students sit in on 3 lessons given by the teacher responsible for their teaching practice, and teach 7 lessons themselves. The students are given observation and reflection assignments by the teacher responsible for their teaching practice.

**Objective**
Right at the start of their training, students acquire initial experience with the observation of teaching, the establishment of concepts for Kernlernmittel Jugend und Sport

**Content**
Students apply their theoretical background in practice. By teaching sports lessons they improve their teaching skills and classroom management and learn how to interact with pupils. Together with their supervisor they develop an ability of critical reflection of their tasks.

**Abstract**
The teaching practice takes in 50 sessions. The teaching practice lasts 4-6 weeks. It gives students the opportunity to implement the contents of their specialist-subject, educational science and subject-didactics training in the classroom. Students also conduct work assignments in parallel to their teaching practice.

**Objective**
Students use their disciplinary skills and educational knowledge for teaching. They know how to judge topics of their subject and can present them in class.

**Content**
Teaching and classroom management is the main target of this course; students have to find a balance between instruction and self-determined activity of their pupils. Together with their supervisors they learn to assess their tasks and achievements.

Comprehension for development and changes of sports from the ancient world to the present times. Description of sports in services of national idea, from education and health promotion from the middle of the 18th century till this day.

Understanding for development and adaptation of sports from the ancient world to present times.

Lecture notes Ein Skript für die aktuelle Veranstaltung wird abgegeben.

376-1107-00L Sport Pedagogy W 2 credits 2V C. Herrmann

Abstract The teacher-student interaction presents a complex psychosocial event, demonstrating the need for a psychological extension of the classical social science / sports pedagogical perspective. Therefore, this lecture will be focused on "pedagogical-psychological aspects of competence development in the context of a multi-perspective physical education".

Objective Development of pedagogical-psychological competences for the optimisation of future teaching activities.

Content - Subject area of educational psychology
- Motivating students in physical education
- Building self-efficacy and strengthen the self-concept
- Promoting positive emotions and a positive attitude to anxiety
- Encouraging self-directed learning
- Leading classes and promoting cooperation
- Communicating with students efficiently
- Reflecting your own expectations critically
- Handling gender issues sensitively
- Promoting inclusion / Strengthening social and moral development
- Dealing with difficult students
- Evaluating achievements of students

Lecture notes Teaching materials for the individual lectures are provided to the students via moodle.

376-1117-00L Sport Psychology W 2 credits 2V H. Gubelmann

Abstract This lecture is intended as an introduction to sport psychology and imparts knowledge on selected areas of the subject.

Objective Students are given insight into different work areas of sport psychology. In order to understand what «sport psychology» is, it is necessary to explain the essence and tasks of sport psychology and what it relates to, and to work out an underlying basis for key topics, such as cognition and emotions. Students’ expertise is furthered by presenting and providing more in-depth treatment of additional topics of sport psychology. Selected intervention forms are intended to provide insight into applied sport psychology and ensure that mental processes and their impact in sport can be recognised. Case studies and practical exercises (e.g. objective training) are intended to prompt students to reflect to a greater extent on the forms in which sport psychology can be applied in their practice of sports and to integrate these in their teaching.

Content Main Topics
- Introduction to sport psychology
- Cognitions in sports: mental rehearsal and mental training
- Emotions and stress
- Motivation: goal-setting in sports
- Career and career transition in elite sport
- Coach-Athlete-Interaction
- Psychological aspects of sport-injury rehabilitation
- Group dynamics in sport

Lecture notes Instructional materials for each course will be made available to students. All lecture materials will be available to students on Moodle.

376-1127-00L Sociology of Sport W 2 credits 2V R. Bürgi

Abstract These lectures deal with the current changes in society and sport and provide an overview of the many different problems and perspectives of sport sociology.

Objective The lectures set out to:
- present the different dimensions, functions and interrelationships of present-day sport
- provide an introduction to the central theories and models of (sport) sociology
- show how far sport reflects society and how it changes and becomes more differentiated in the process
- take current examples to highlight the sociological view of sport.

Content Sport and social change: developments and trends
- The economy and the media: commercialisation, logic, dependencies
- Social inequalities and distinctions: social impact, health and sport, sport and gender
- Conflicts and politics: sports organizations, doping, violence

Lecture notes Selected materials for the lecture are available on the Moodle platform.

Abstract Pedagogical application of research projects for schools

Subject with an Educational Focus Sport A

Introduction of sports pedagogical oriented research projects. Competency to a youth friendly movement and sports education. Competent 'pedagogical application' of research projects in the field of movement and sport. Feed in of scientific findings to school lesson settings.
Objective
The students combine and apply general educational aims with a general and specific background of research projects. They know different educational concepts of the above mentioned, recognise its strengths and weaknesses and are able to apply concepts appropriate to the situation. They are interested in the (thought-) processes of education and research in sports in Switzerland. They use their knowledge of research matters to guide educational thought-processes. They are interested in processes of research in sports. They approach the research interest of their pupils with the knowledge of sports psychology, sports sociology, sports pedagogy, and sports history.

Apparatus Gymnastics and Trampoline I

**Prerequisites:** Assessment Polysports passed (or Assessment I, II or III).

**Compulsory for Teaching Diploma Sports.**

**Abstract**

To get to know and understand the basics of movement (core movements) and its respective actions and functions on apparatuses, on the floor and in acrobatics as well as to create individual and cooperative combinations according to qualitative criteria.

**Objective**

The students should be able to:
- acquire and consolidate apparatus related core movements as well as apply and create such combinations
- utilize their own strength as well as the resulting impact in a differentiative way in order to precisely move the swinging, flying, falling and twisting body
- gain orientation safety and room orientation while twisting and flying
- gain sensitivity for social competences (e.g. to assist, to observe, to advise) within a small group.
- structural relationships within rotations (tumarounds, handsprings and free somersaults)
- core poses as motor basic training
- variety of position modifications in handstands
- core movements and combinations on parallel bars, high bar, floor and in swinging rings
- different forms of vaulting as well as springing in movements like handstands and somersaults

**Content**

- Trampolinschule nach der Part-Methode, BASPO 2013

**Swimming I**

**Prerequisite:** Assessment Polysport passed (or Assessment I or II or III).

**Compulsory for Teaching Diploma Sports.**

**Abstract**

Basic education in swimming: swimming, diving, water polo and artistic swimming

**Objective**

All kind of swimming:
- learns to know and understand the individual basic techniques
- improvement of technical skills and crafts
- Artistic Swimming: Erwerben und festigen Wassertreten, Paddeln, einzelne Grundfiguren.

**Content**

- Swimsports.ch: Schweizerische Tests im Schwimmsport

    - Theorie: Schriftliche Prüfung

-不堪的 -

**Basketball I**

**Prerequisites:** Assessment Polysports passed (or Assessment I, II or III).

**Compulsory for Teaching Diploma Sports.**

**Abstract**

Basketball-Basics: Basic technical skills: dribbling/ballhandling, passing, shooting, footwork and defense related to the specific Basketball rules. Tactical skills: 1 on 1, give & go, hand-off, pick & roll, pick & pop and the application of these skills in a game 3 on 3 on one basket.

**Objective**

The students know the technical basic Basketball elements (dribbling, changes of hand, stops, starts, footwork, pass, shot, defense), they can demonstrate them and use them correctly in a game situation 3 on 3 on one basket.

The students know the tactical Basketball elements (1 on 1, give & go, hand-off, pick & roll, pick & pop) and can apply these skills in a game 3 on 3 on one basket.

The students know the main rules of the game.

**Content**

Learning the basic elements in drills and games, learning (pre-)tactical elements (1-1, getting open, 2-2, backdoor cut, frontdoor cut, 3-3, give & go, hand-off, pick & roll, pick & pop, spacing) and assemble them into systems, that can be used in a game 3 on 3 on one basket.

**Lecture notes**

- manual for monitors of the Swiss Youth & Sports program (available through the "Jugend & Sport" office, german / french / italian)

**Notice**

### Competencies

**Subject-specific Competencies**

- Concepts and Theories
- Techniques and Technologies

**Method-specific Competencies**

- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management

**Social Competencies**

- Communication
- Cooperation and Teamwork
- Customer Orientation
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation

**Personal Competencies**

- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

### Prerequisites:

557-0514-03L **Soccer I**

- Assessment Polysports passed (or Assessment I, II or III).

- Compulsory for Teaching Diploma Sports.

**Abstract**

Acquisition/consolidation basic skills for soccer.

**Objective**

Support and development the individual conditions/talent/skill and introduction of basic methods will be treated.

**Content**

- Technique:
  - Dribble, short passport play, get the ball under control, shot,

- Individual tactics:
  - offensive/defensive 1vs1; keep ball in own rows

- various contests in support of different techniques and tactics

**Prerequisites / notice**

1. Prerequisites:
   - Small being able in soccer.
   - Readiness to train.

2. Additional material
   - wearing soccer shoes is mandatory
   - wearing shin guards is mandatory

**557-0522-01L **Handball I**

- Assessment Polysports passed (or Assessment I, II or III).

- Compulsory for Teaching Diploma Sports.

**Abstract**

Learn by playing - from three-a-side to four-a-side games.

**Objective**

The students improve their personal skills and demonstrate the game in teams as well as groups of 4 against 4.

**Content**

- Spielend Handball lernen - Über das Spiel zum Spiel (Vom Spiel 3/3 zum Spiel 4/4)
  - Techniktraining ist Sache der Studierenden.
  - Die individuelle Grundschulung wird mit Lernkontrollen überprüft (Kontrollblätter).

**Lecture notes**

Lehrunterlagen können von der Homepage abgerufen werden.
Prerequisites / notice
Prüfungen Inhalte: Die Prüfungsinhalte werden während des Semesters erarbeitet und am Ende des Semesters online schriftlich zur Verfügung gestellt.

557-0542-01L Volleyball I
Prerequisite: Assessment Polysport passed (or Assessment I or II or III).

W 2 credits 2G M. Attinger, N. Beeler

Abstract
Acquire technical and tactical abilities in the game of volleyball

Objective
- Experience and use of various aspects of volleyball as a teamplayer
- Various forms of warmups and tournament setups

Content
- Techniques and tactics of indoor-volleyball (1:1 to 6:6)

Compulsory for Teaching Diploma Sports.

557-0603-01L Snowsports I - Ski
Only for BSc / MSc HST / Teaching Diploma Sports
100% presence is required!

Registration via Study Administration necessary. Compulsory for Teaching Diploma Sports.

Abstract
Education in the disciplines of winter sports.
- J+S Education possibility
- Transfer Offpist
- Transfer Nordic Cross

Objective
The students:
- experience the different winter sports.
- gain an understanding of how to ski off-piste.
- Transfer: Input Nordic Cross!

Content
- To apply and vary personal technique of alpine skiing
- To acquire and vary personal technique of cross-country skiing
- Competition in ski-jumping, and giant slalom
- To gain an understanding in how to ski off-piste
- To gain Nordic Cross

557-0603-02L Snowsports I - Snowboard
Only for BSc / MSc HST / Teaching Diploma Sports
100% presence is required!

Registration via Study Administration HST necessary. Compulsory for Teaching Diploma Sports.

Abstract
Education in the disciplines of winter sports.
- J+S Education possibility
- Transfer Offpist

In-depth Education
**Athletics II**

**Prerequisites:** Athletics I attended.

**Compulsory for Teaching Diploma Sports.**

**80% active participation required.**

**Abstract**

The athletics level 2 course focuses on methodological and didactic aspects of disciplines taught in the level 1 course. Pole vault is introduced as a new and additional discipline. Central elements required for passing the course don’t include skill assessments or athletic performance tests but rather didactical contributions.

**Objective**

The level II courses focus on methodological concepts and didactics. The goal is to learn how to teach the specific sport at high school level. The didactical aspects are often conveyed through new skills and elements. It is not required to have passed the level I course, but it is mandatory to have attended it previously.

**Content**

- Specific warm-up for athletics
- Core elements of all disciplines
- Acquiring of technical pole vault skills
- Learning how to support an athlete during pole vaulting
- Keys to a successful baton handoff
- Written assignment on a movement observation task
- How to modulate intensity with task variations
- Developing feedback skills

**Lecture notes**

No script

**Handball II**

**Prerequisites:** Handball I attended.

**Compulsory for Teaching Diploma Sport.**

**80% active participation required.**

**Abstract**

Recognizing and experiencing important aspects of the game and preparing them for your own lessons with the help of didactic-methodical concepts.

**Objective**

The level II courses focus on methodological concepts and didactics. The goal is to learn how to teach the specific sport at high school level. The didactical aspects are often conveyed through new skills and elements. It is not required to have passed the level I course, but it is mandatory to have attended it previously.

You will know and experience different forms of assessment for the school.

You will improve your individual skills in technique and tactics.

**Content**

You will learn and discuss the didactic-methodological concepts to adapt exercises and the game in the sense of physical education and sport and to develop them further with a class.

You will learn and discuss different forms of assessment for the school.

You will improve your individual skills in technique and tactics.

**Prerequisites / notice**

It is not required to have passed the level I course, but it is mandatory to have attended it previously.

**Gymnastics / Acrobatics II**

**Prerequisite:**

Attended basic education

- "Apparatus Gymnastics and Trampoline I" (557-0433-00L); and

- "Acrobatics I" (557-0432-01L).

**Compulsory for Teaching Diploma Sport.**

**80% presence required.**

**Abstract**

the course doesn’t include skill assessments or athletic performance tests.

**Objective**

Skills improvement in the athletic performance

It is not required to have passed the level I course, but it is mandatory to have attended it previously.

Abstract
Acquirement and Application of classic as well as modern forms of movement on different apparatuses and on the trampoline
Application and Creation of established basic skills

Objective
The level II courses focus on methodological concepts and didactics. The goal is to learn how to teach the specific sport at high school level. The didactical aspects are often conveyed through new skills and elements. It is not required to have passed the level I course, but it is mandatory to have attended it previously.

The students should be able to:
- enhance their repertoire on apparatus specific movements
- deepen their existing store of movements
- improve their individual performance competencies
- realize and comprehend transfer characteristics within the movement learning process
- work up methodically and didactically a chosen skill
- gain sensitivity for social competences (e.g. to assist, to observe, to advise) within a small group
- compose and present to music within a group of three a creative performance

Content
- further core movements und its combinations on different apparatuses
- handsprings and (free) somersaults back- and forwards, respectively twists back- and forwards on different apparatuses
- creative and cooperative composition in a threesome accompanied by music
- vault springs and touching down springs (stuetz springs) to overcome obstacles in an artful way (Freerunning)
- integrated theoretical coherences of the qualitative movement learning process
- conveyance of methodical and didactical principles as well as topic specific criteria
- functional warm-up with regard to specific contents

557-0544-00L Floorball II
Prerequisite: Floorball I attended. Compulsory for Teaching Diploma Sports.

80% active participation required.

Abstract
Learning the methodology and the didactics for teaching floorball and guiding floorball games at high school level.

Objective
The level II courses focus on methodological concepts and didactics. The goal is to learn how to teach the specific sport at high school level. The didactical aspects are often conveyed through new skills and elements. It is not required to have passed the level I course, but it is mandatory to have attended it previously.

557-0602-00L Badminton II
Prerequisite: Badminton I (557-0601-00L) attended. Mandatory for Teaching Diploma Sports.

80% active participation required.

Abstract
In this course you will build up and experience different tactical and technical exercise forms for classes. At the same time you will be able to deepen your own badminton skills.

Objective
The level II courses focus on methodological concepts and didactics. The goal is to learn how to teach the specific sport at high school level. The didactical aspects are often conveyed through new skills and elements. It is not required to have passed the level I course, but it is mandatory to have attended it previously.

Content
In this course we work on possibilities to build up different tactical and technical exercise forms and structures for classes. You get to know a variety of games. You learn how you can diversify exercises – depending on the level and the age of your pupils.

Prerequisites / notice
80% presence required.

Objective
- To be able to judge an injured person and to apply life saving actions
- To carry out wound treatment with actual bandage
- To list the characteristics of a sprain, strain, dislocation and to apply first-aid interventions
- To carry out fixed bandages with common material
- To explain the function of the cardiovascular system
- To name the symptoms of poisoning
- To list the signs of acute illness
- To put together the content of a first-aid box
- To carry out safety interventions in daily situations.

Content
* Hautverletzungen
* Wundinfektion / Blutvergiftung
* Stürze im Alltag (Verstauchungen, Prellungen, Quetschungen)
* Sportverletzungen, Knochenbrüche
* Herzkreislaufstörungen
* Alltagserscheinungen in der Familie

**Data:** 26.07.2024 12:39  |  **Autumn Semester 2024**  |  **Page 2350 of 2680**
Subject area of educational psychology

Students are given insight into different work areas of sport psychology. In order to understand what «sport psychology» is, it is necessary to explain the essence and tasks of sport psychology and what it relates to, and to work out an underlying basis for key topics, such as cognition and emotions. Students' expertise is furthered by presenting and providing more in-depth treatment of topics of sport psychology. Selected intervention forms are intended to provide insight into applied sport psychology and ensure that mental processes and their impact in sport can be recognised. Case studies and practical exercises (e.g. objective training) are intended to prompt students to reflect to a greater extent on the forms in which sport psychology can be applied in their practice of sports and to integrate these in their teaching.

Main Topics
- Introduction to sport psychology
- Cognitions in sports: mental rehearsal and mental training
- Emotions and stress
- Motivation: goal-setting in sports
- Career and career transition in elite sport
- Coach-Athlete-Interaction
- Psychological aspects of sport-injury rehabilitation
- Group dynamics in sport

Content

Teaching materials for the individual lectures are provided to the students via moodle.

Literature

Personal Competencies

- Evaluating achievements of students
- Dealing with difficult students
- Handling gender issues sensitively
- Reflecting your own expectations critically
- Communicating with students efficiently
- Leading classes and promoting cooperation
- Encouraging self-directed learning

Objective

A detailed program with additional references will be delivered at the beginning of the lecture.

Competencies

Subject-specific Competencies: Concepts and Theories
Method-specific Competencies: Analytical Competencies
Social Competencies: Sensitivity to Diversity
Personal Competencies: Critical Thinking

Objective

Gain hands-on experience in exercise physiology and consolidate knowledge on physiological adaptations to different types and degrees of physical activity and climatic influences. Learn fundamental assessment techniques of the muscular system, the cardio-respiratory system and of whole-body performance, learn scientifically correct data analysis and interpretation of results. Insight into today's Sports Medicine.
Laboratory course:
Various exercise tests assessing human performance and assessments of physiological responses to activity (examples are VO2max-test, Conconi-Tests. Determination of anaerobic threshold, Cooper-Test, 1-repetition maximum test, lactate minimum test), dynamometry, mechanography, body composition etc.). Insight into measurements in Sports Medicine.

Lecture notes
Tutorial on Laboratory Experiments in Exercise Physiology (Editor: Exercise Physiology Lab)

Literature
Schmidt/Lang/Heckmann: Physiologie des Menschen, Springer-Verlag, Heidelberg

Kenney/Wilmore/Costill: Physiology of Sport and Exercise, Human Kinetics

Prerequisites / notice
Anatomy and physiology classes and lab course in physiology successfully completed (BWS students please contact C. M. Spengler)

Desirable:
Exercise Physiology Lecture (concomitantly or passed; is selection criterion in case of more applications than lab spaces)

376-0225-00L Critical Appraisal of Evidence for Exercise in Health W 3 credits 2V E. Giannouli, E. de Bruin, R. Knols

Abstract
This course will discuss the mechanisms and latest evidence-based recommendations of physical activity and exercise for a series of conditions and populations.

In the second part of each lecture session, published randomized controlled trials of the respective lecture’s topic will be discussed and critically appraised based on established tools.

Objective
On completion of this course students will be able to:
1. understand the role of physical activity and sedentary behavior in the maintenance of health and the etiology, prevention and treatment of disease
2. synthesize effective physical activity and exercise interventions for the prevention and management of several diseases and populations
3. evaluate recent evidence regarding physical activity and exercise interventions

Content
New trends in physical activity for prevention and rehabilitation

Introduction to critical appraisal tools
Exercise for Cancer Rehabilitation
Exercise for Musculoskeletal Rehabilitation (Focus on Osteoarthritis and Low Back Pain)
Exercise in Parkinson’s disease
Exercise for Rehabilitation of Metabolic Disorders (Focus on Obesity and Diabetes type 2)
Exercise for age-related diseases and disorders, Part A (Focus on Frailty and Falls)
Exercise for Stroke Rehabilitation
Exercise in Dementia and Mild Cognitive Impairment
Exercise for Children’s Rehabilitation (focus on Cerebral Palsy)
Exercise for age-related diseases and disorders, Part B (Focus on Sarcopenia and Osteoporosis)
Exercise in Multiple Sclerosis
Exercise for Cardiovascular Rehabilitation (Focus on Heart Failure)

Literature

Competencies
- Subject-specific Competencies
  - Concepts and Theories: assessed
  - Techniques and Technologies: fostered

Method-specific Competencies
- Analytical Competencies: fostered
- Decision-making: fostered
- Problem-solving: fostered

Personal Competencies
- Critical Thinking: assessed
- Integrity and Work Ethics: fostered

376-1651-00L Clinical and Movement Biomechanics W 4 credits 3G D. K. Ravi, S. H. Hosseini Nasab, R. List, further lecturers

Abstract
This course includes an introduction to study design, measurement techniques, signal processing, as well as musculoskeletal modeling with regards to human movement and its clinical applications.

Objective
The students are able to analyse the human movement from a technical point of view, to process the data and perform modeling with a focus towards clinical application.

Competencies
- Subject-specific Competencies
  - Concepts and Theories: assessed
  - Techniques and Technologies: assessed

752-5403-00L Nutrition and Performance W 2 credits 2V S. Mettler

Abstract
The course introduces basic concepts of the interaction between nutrition and exercise performance.

Objective
To understand the potential effects of nutrition on exercise performance, with a focus on concepts and principles of nutrition before, during and after exercise.

Content
The course will cover elementary aspects of sports nutrition physiology, including carbohydrate, glycogen, fat, protein and energy metabolism. A main focus will be to understand nutritional aspects before exercise to be prepared for intensive exercise bouts, how exercise performance can be supported by nutrition during exercise and how recovery after exercise performance can be assisted by nutrition after exercise. Although this is a scientific course, it is a goal of the course to translate basic sports nutrition science into practical sports nutrition examples.

Lecture notes
Lecture slides and required handouts will be available on the ETH website (moodle).

Literature
Information on further reading will be announced during the lecture. There will be some mandatory as well as voluntary readings.

Prerequisites / notice
General knowledge about nutrition, human biology, physiology and biochemistry is a prerequisite for this course. The course builds on basic nutrition and biochemistry knowledge to address exercise and performance related aspects of nutrition.

The course is designed for 3rd year Bachelor students, Master students and postgraduate students (MAS/CAS).

376-0208-00L Molecular and Cellular Biology of Exercise and Muscle Regeneration - Practical Aspects W 3 credits 2G O. Bar-Nur, K. De Bock

Prerequisites:
Laboratory Course in Molecular Biology (376-0006-02L)

Abstract
This course is designed for students interested in understanding how muscles coordinate movement, regenerate following injury and adapt to exercise stimuli. In this course, the students will acquire insights into the molecular aspects of muscle biology and exercise, in addition to gaining hands-on experience in experimental techniques that are commonly used to research muscle regeneration and exercise.
Objective

The objective of this course is to introduce students into current research topics and outstanding questions in skeletal muscle biology. Also, the course will give students hands-on experience in respect to the tools needed to perform basic molecular biology research in the field of exercise and skeletal muscle biology. Students will learn how to translate a scientific question in muscle biology into a small scientific project. They will learn how to design an experiment and to analyze and critically interpret experimental data.

Content

The course will consist of 4 main research themes and the anticipated 16 students will be divided into 4 subgroups of 4 students each one will focus on one of the following research topics:

- **Topic 1:** Molecular pathways that control muscle stem cell self-renewal and differentiation
- **Topic 2:** Genome engineering to correct genetic mutations that cause muscle diseases
- **Topic 3:** Muscle fiber composition, force production and insulin sensitivity
- **Topic 4:** Amino acid sensitivity in skeletal muscle following exercise

The course will be organized into 7 sessions, each approx. 4 hours: the first 2 sessions will be theoretical and include an introductory lectures by the professors in addition to a journal club presentation by the students. This journal club aims to provide theoretical and scientific background that will be used to identify outstanding research questions. This will be followed by 4 practical sessions (hands-on experience) and 1 final evaluation session.

For the journal club, each group of students will receive a peer-review article that is highly relevant to the respective group’s research topic. Each of the 4 groups will present and discuss the article in a journal club format to the rest of the participants the following week. During the four practical sessions, students will gain hands-on experiences and learn different techniques related to molecular biology of exercise and muscle regeneration. Each group will be presented with a research objective that is related to their topic, and perform in collaboration with teaching assistants a set of experiments that aim to address the research objective. At the final evaluation session, each group of students will present their results and identify follow-up research questions and hypothesis based on their experimental achievements.

Select practical methods that the proposed course will teach include:

i. **Group 1:** tissue culture, isolation of muscle stem cells via FACS, differentiation of muscle stem cell into muscle fibers, small molecules screens, quantitative analysis of muscle cell proliferation and fusion, Immunofluorescence.

ii. **Group 2:** tissue culture, differentiation of muscle stem cells into muscle fibers, guide RNA design and Crispr-Cas9 gene editing of genetic mutations that cause muscle diseases in muscle stem cells and fibers. Immunofluorescence and PCR.

iii. **Group 3:** ex vivo assessment of muscle force characteristics, cryosectioning of muscle tissue, immunofluorescence and western blot.

iv. **Group 4:** tissue culture of muscle stem cells, isolation of muscle stem cells and differentiation into muscle fibers, amino acid stimulation of muscle fibers, Western blot.

**Prerequisites / notice**

Prerequisites: 376-0006-02L Laboratory Course in Molecular biology

| **Abstract** | This course deals with basic questions, concepts, theories, methods, and empirical findings of political science. |      |      |       |                        |
| **Objective** | This course deals with basic questions, concepts, theories, methods, and empirical findings of political science. |      |      |       |                        |
The aim of this lecture is to give students an introductory overview of relevant topics regarding leadership research and practice, thus fostering the development of leadership skills and competencies.

The lectures "Leadership I" (WS) and "Leadership II" (SS) have been designed as a two-semester lecture series, but may also be followed independently of one another or in reverse order. "Leadership I" covers the following fields: leadership basics, leadership theories and leadership styles, the concept of leadership responsibility and the role of communication in practical leadership. The lectures "Leadership II" (SS) have been designed as a two-semester lecture series, but may also be followed independently of one another or in reverse order. "Leadership II" covers the following fields: leadership basics, leadership theories and leadership styles, the concept of leadership responsibility and the role of communication in practical leadership.

The course focuses on the fundamental importance of communication in leadership situations and enables students to communicate leadership effectively. Students should understand different concepts of leadership responsibility (leadership ethics) and be able to derive consequences for leadership in practical situations. They should grasp the concept of leadership responsibility (leadership ethics) and be able to derive consequences for leadership in practical situations. They should recognize the fundamental importance of communication in leadership situations and receive input that enables them to communicate adequately in specific situations.

The course is based on the textbook "Einführung in die Politikwissenschaft", 5th edition (2022), by Bernauer, Jahn, Kritzinger, Kuhn, Walter. The course is conducted on campus (LEE E 101, Leonhardstrasse 21) and is not streamed online or recorded.

The course is assessed in terms of personal, social, method-specific, subject-specific, and analytical competencies.

Examining the fundamentals of the two sciences and establish links with military life. Discuss various schools of thought in psychology and focus on content and process theories of motivation. Explore characteristics of pedagogical thinking and discuss the values of military education with reference to the young adult serving in the armed forces.

Data: 26.07.2024 12:39
Autumn Semester 2024
Page 2356 of 2680
Objective
- Becoming acquainted with basic psychological views of human behaviour and experience
- Knowing content- and process theories of motivation and being able to transfer them to the military context
- Knowing the possibilities and limitations of military education and deriving consequences

Content
Overall, the objective is to become acquainted with the basics of both scientific areas and to make references to military practice. Military psychology is a branch of applied psychology; consequently selected aspects of psychological principles will be covered. Military pedagogy hasn't yet established itself firmly as an independent scientific discipline, it nevertheless can draw on a deep-seated tradition in Switzerland. Thus, the great importance that has been attached to the discussion of education in Swiss society and academia will be taken into account. Subjects:
- History of military psychology
- Introduction to psychological thinking
- Motivational theories
- Defence-, service-, operational- and combat motivation
- Swiss military pedagogy
- Education as defining feature of pedagogic thinking and acting

This course is completed by a compulsory one week course between terms.

Literature
- Annen, H., Steiger, R. & Zwygart, U.: Gemeinsam zum Ziel, Huber, Frauenfeld 2004 (provided as pdf)
- Stadelmann, J.: Führung unter Belastung, Huber, Frauenfeld 1998 (provided as pdf)

The lecture is supported by a virtual learning environment containing relevant documents (presentations and texts) and information to further literature.

Abstract
Teaching of formal requirements of scientific work (philosophy of science with a focus on the social sciences); literature reviews and the basics of conducting independent research on short as well as simple topics, basics of conceptualizing research designs for politically relevant questions and hypotheses.

Objective
1) Understanding the goal and the basic procedures of (empirical social sciences) scientific work (philosophy of science, theory building, research design, as well as the correct employment of sources, data and literature).
2) Identification of relevant research questions.
3) Creating a common basis for a thorough and systematic analysis of these.

Content
Political Methodology I seeks to introduce students to the basics of scientific work and procedures in the social sciences, which in turn shall allow them - also in conjunction with Political Methodology II - to conduct work that fulfills satisfactory standards of research quality throughout their further studies.

With regard to Political Methodology I, this seminar primarily focuses on the philosophy and theory of (empirical social) sciences, its structure, and procedures. The seminar emphasizes substantive contents and ways of presenting them, research and, conceptual work. Additionally, it deals with the basis of establishing research designs with politically relevant questions and hypotheses.

Literature

Prerequisites / notice
Each student will be graded by two exercises (50% each).

1) Source analysis and acquisition: based upon a research question that will be given by the lecturer, the student shall collect a comprehensive and relevant research literature and summarize that with her/his own words.

2) Critical analysis of sources: based upon a research article that the student chooses on her/his own, the student shall write a critical analysis of that, which mirrors frame and structure of scientific writing

Submission dates will be communicated in the first meeting.

Abstract
Beside of the most important terms of sociology, demographic changes and the related value and structure change will be analysed. The second part focuses on organizational sociology. Thirdly, the course examines to which extent armed forces can be considered as organizations like any other and to which extent they constitute a special case from an organizational and normative point of view.

Objective
Recognize and explain current changes (social change) in modern society (individualisation, pluralisation); describe demographic changes in Switzerland; explain the structures of societies; define issues and fields of research in modern military sociology and explain the foundations of organisational sociology; explain the military in terms of organisational sociology and identify specific traits of the military as an organization.

Content
Societal change; organizations as societal phenomena; aims, structures, environments of organizations; specifics of the military as an organization; impacts of technological and societal changes on the armed forces in modern societies.

Literature
A reader with a set of texts will be handed out.

Abstract
Teaching is focused on the acquisition of general English in the four classical skills, i.e. speaking, listening comprehension, reading comprehension and writing. The goal is to reach level B2 or C1 depending on the linguistic proficiency of the students.

Objective
This three-semester English course should enable the participants to successfully use the English language in an international military setting.

Content
- Read, analyse and write military and civilian documents
- Listening comprehension using current radio or TV reports
- Practise speaking through group discussions and short presentations
- Systematic revision and extension of key grammar points
- Systematic acquisition of general and military vocabulary

Abstract
Introduction to research on political violence in domestic and international politics. This course covers the causes and solutions to different types of political violence including interstate wars, civil wars, terrorism or social protests.

Objective
Knowledge on different types of political violence and their causes.

Content
This course offers an introduction to research on the causes and solutions to political violence in domestic and international politics. First, we discuss the definitions and concepts used in conflict research, the data and methods commonly applied and their historical development. Second, we focus on interstate wars and examine in this context state formation, nationalism and democracy. The third part of the course focuses on different types of political violence, including civil war, terrorism or social protests.

Prerequisites / notice
The course «Conflict Research II» in the following semester further examines civil wars.

Exercises complete the lectures, where the literature will be further discussed. The participants write a short memo (max. 3 pages) about one of the required readings.

Literature

853-0063-00L Military History I

Abstract
The lecture outlines the development of the armed forces (assets regarding manpower, technology and armament), the concepts of warfare and the actual warfare in the 19th and 20th century.

Objective
- Distinguish between military history as a subject and historiography as a way of describing events;
- Analyse the modern developments regarding armed forces and warfare in the context of socio-economic changes;
- Based on the approach regarding revolution in military affairs, describe the evolution of the armed forces and of warfare;
- Exemplify the issues regarding the evolution of the combat (First and Second World War, Vietnam War and Algerian War).

Content
The lecture first examines the bases of the science of (military) history. It focuses on how military history developed from war history, on specific similarities and differences between military history and general historiography, the different ways of dealing with history in Switzerland, Germany, France and in the Anglo-Saxon cultural area (different approaches) as well as on institutions which deal with military history such as universities, military academies, national and international commissions and associations etc.

The lecture is structured along the lines of the concept of "Military Revolution" and starts with the formation of modern, European armed forces after the Oranian Army reform in the 17th century.

Based on the "Military Revolution" approach, the lecture examines the structural changes regarding the armed forces and the development of warfare from the 18th to the 20th century. Special emphasis will be put on how the battlefield was revolutionized due to the Napoleonic wars, the industrialization in the 19th century, the First World War, the mechanization and totalization during the Second World War and the period of the Cold War.

853-0082-00L Strategic Studies I

Abstract
The lecture Strategic Studies deals with the use of political and military power from an interdisciplinary and global perspective.

Objective
Participants know how the understanding of strategy has changed over time.
They understand the interplay between the basic components of strategy.
They know the main strategic concepts and models and are able to discuss them critically.
By examining selected historical and contemporary examples, they are aware of the inherent tension between the formulation (declaration) and application (implementation) of strategies. They are able to critically analyse original texts and contemporary publications in the field of strategic studies.
They are able to use case studies to explain how technological change affects strategic thinking.

Content
The two-semester course covers key issues in strategic studies.
The first semester focuses on key concepts and foundations, which are applied and critically discussed in the second semester.
Both political and military theorists, practitioners and case studies will be discussed. The course also emphasizes the role of non-European thinkers and theories. The focus will then be on the impact and practical implementation.
For each of the strategies discussed, the original context and the state of technological development will be highlighted.

Lecture notes
Prior to the lectures, the respective slides are provided as well as a primary sources and literature, as preparatory readings (via Moodle).
Literature

Prerequisites / notice

The lecture is held in German.

Passive knowledge of English and French are required.

853-0302-00L European Integration

Abstract

Switzerland in the context of European integration

The course (lecture and tutorial) deals with the theory, development and central policy areas of European integration as well as the structures and processes of the EU as a political system. The course systematically links this basic knowledge with an analysis of the bilateral relationship between Switzerland and the EU.

Objective

The idea that Switzerland's relationship with the EU is at a 'crossroads' is a cliché that has been used repeatedly in recent decades. But could it be true this time? Since the breakdown of the negotiations on a framework agreement and the recently launched attempt for a third package of bilateral treaties, there is more uncertainty than ever in the Swiss-EU relationship. Switzerland is once again faced with the decision between greater proximity or isolation.

The seminar places the bilateral relationship between Switzerland and the EU in the broader context of European integration. It helps to understand the EU as a highly developed instrument of transnational problem solving and as a special political system. It provides basic knowledge about the history, institutions, procedures and policy areas of the EU and offers an introduction to important approaches in integration theory and political science analyses of European integration. The seminar systematically links this basic knowledge of the political system of the EU with an examination of the logic, development and perspective of the bilateral relationship between the EU and Switzerland.

Content

Course plan

1. A brief history of European integration
2. The European Union as a political system
3. The European Union as a community of law
4. The European Union as a system of differentiated integration
5. Theories of integration: Why integration?
6. Ten years of polycrisis: What next for the EU?
7. A brief history of the relationship between Switzerland and the EU
8. Trade
9. Free movement of persons
10. Justice and home affairs, foreign affairs, migration
11. Research, cohesion, energy
12. Domestic political discourse and public opinion in Switzerland
13. The future of Switzerland-EU relations

853-0101-02L Defense Economics I

Abstract

In terms of structure and content, the event follows the lecturer's book "Militärökonomie" (Military Economics), which is available in two language versions:

- German language: ISBN 978-3-658-06146-3

Objective

* Recognizing parallels and contrasts between business and military thinking;
* Recognize and analyze planned economic systems;
* Understand the link between institutions, human action and economic results.
The semester program of the course is divided into 14 modules of 90 minutes each, which combine lecture (teaching of analytical techniques) and exercise (application by means of concrete case studies).

The contents correspond to sections 1 to 2.2.5 of the above book. The following will be discussed:

1. fundamental military economic problems including historical introduction to the topic
2. the institutional foundations of a military organisation
3. the modern military as a planned economy system
4. actors and stakeholders in the system

Lecture notes
Lecture slides are given to the participants before the first lecture. In addition, the above mentioned book will be handed over to the participants. Participants of the lecture who are not professional officer candidates are requested to obtain the book from the library or bookstore.

Literature

Prerequisites / notice
none.

Abstract
The knowledge and skills acquired in the second semester serve as a basis for further improvements in the areas of speaking, listening, reading and writing, which will enable students to enroll for the Cambridge exams. The goal is to reach Council of Europe (CEFR) level C1 or C2 depending on the linguistic proficiency of the students.

Objective
This three-semester English course should enable the participants to successfully use the English language in an international military setting.

Content
Read, analyse and write military and civilian documents
Listening comprehension using current radio or TV reports
Practise speaking with group discussions and short presentations
Systematic revision and extension of key grammar points
Systematic acquisition of general and military vocabulary

<td>Introduction to Constitutional Law in Security Policy</td>
<td>O</td>
<td>3 credits</td>
<td>2V</td>
<td>R. Müller</td>
</tr>
</tbody>
</table>

Abstract
The lecture deals with questions of competence and the security policy instruments in the federal state, conveys the basic principles of police law and deals with the management of extraordinary situations. Special topics are the army, civil protection, the intelligence service, cooperation (at home and abroad), the legal status of army members and private security providers.

Objective
The students can
- explain the basic concepts of security law;
- outline the basic constitutional order for Swiss security policy, identify the competences of the Confederation and assess the advantages and disadvantages of this basic order;
- explain and evaluate special legal forms of action;
- distinguish the tasks of security policy actors and assess forms of cooperation;
- derive legal limitations for operations of the armed forces from the Federal Constitution;
- identify the basic principles and individual special aspects of military-civilian cooperation;
- identify the police powers of the armed forces and determine the permissibility of using forms of coercion;
- describe the legal status of members of the armed forces and explain the special responsibility of officers;
- establish the relationship between the actions of state actors and the guarantee of fundamental rights;
- assess current challenges in security law.
The course analyzes the foundations and challenges of Swiss foreign policy. After reviewing the history of foreign policy conceptions since the early 20th century, we will discuss the determining factors of Swiss foreign policy and examine, together with guest speakers from the foreign ministry, current international developments and respective foreign policy challenges.

Objective
Students should acquire a sound understanding of Swiss foreign policy and the relevant academic and political debates associated with it.

Content
Nach einer Einführung in die Aussenpolitikanalyse behandelt die Lehrveranstaltung zunächst die historischen Grundlagen und die konzeptionelle Entwicklung der schweizerischen Aussenpolitik. Dabei stehen die unterschiedlichen Reaktionen der Schweiz auf die internationalen Neuordnungen nach 1918, 1945 und 1989 und die seitherige Ausgestaltung der Schweizer Aussenpolitik im Zentrum.

The last part of the course deals with the intelligence service, civil protection, the legal permitted tasks of private security providers and the legal status of military personnel.

The course will be supported by an e-learning environment.

- Method-specific Competencies: Analytical Competencies
- Social Competencies: Leadership and Responsibility
- Personal Competencies: Critical Thinking

853-0321-00L Advanced Course II (Seminar) ■

Abstract
The objective of this two-semester seminar-style course is to write an advanced-level research paper in the field of Strategic Studies. In the second semester, students write their seminar paper and present it in plenary.

Objective
Students write their seminar paper based on the research design they developed during Advanced Course I (Seminar). Students should consider the seminar paper as preparation for their BA thesis.

Content
Advanced Course II builds upon Advanced Course I. Within the broader framework of the overall seminar topic (The Strategic Relevance of Surprise, Deception, and Intelligence) and based on the approved research design as developed during Advanced Course I, participants write their seminar papers in consultation with their lecturers (30 pages max).

Lecture notes
none

Literature
Basic literature is available on Moodle (Advanced Course I). The search for additional literature is a fundamental part of the research process. Students may consult their lecturers if they have any questions.

Competencies
- Subject-specific Competencies: Concepts and Theories
- Method-specific Competencies: Analytical Competencies
- Social Competencies: Leadership and Responsibility
- Personal Competencies: Critical Thinking

853-0061-00L Introduction to Cybersecurity Politics

Abstract
The lecture is an introduction to global cybersecurity politics. The focus is on the strategic use of cyberspace by state and non-state actors (threats) and different answers to these new challenges (countermeasures).

Objective
Participants learn to assess the advantages and disadvantages of cyberspace as a domain for strategic military operations. They understand the technical basics of cyber operations and know how technology and politics are interlinked in this area. They understand the security challenges for and the motivations of states to be active in cyberspace offensively and defensively and they are familiar with the consequences for international politics.
We start with an overview of cybersecurity issues from 1980 to today and look at events and actors responsible for turning cybersecurity matters into a security political issue with top priority. After familiarizing ourselves with the technical basics, we look at different forms of cyberviolence and trends in cyber conflicts (technique in social and political practice). Then, we turn to countermeasures: we compare national cybersecurity strategies, examine international norms building, and scrutinize concepts such as cyber-power and cyber-deterrence (technique in social and political regulatory contexts).

Lecture notes
A script with background information and comments on the literature will be made available at the beginning of the semester.

Literature
Literature for each session will be available on Moodle.

Prerequisites / notice
The lecture is being supported by a website on Moodle.

Abstract
Basic social psychological topics are elaborated, presented, and discussed in the most application-oriented way.

Objective
You are able to recognize and explain various social psychological aspects and factors and to evaluate them in your everyday decisions in terms of planning, content and operations. This means you will be able to assess when various social psychological aspects may play a role in your everyday work. And you are able to assess what this may subsequently mean for your work or leadership processes.

Content

1) Führungpsychologie: Kurzer Einblick in neuere Führungstheorien.
2) Destruktive Führung: Was sollten wir nicht machen?
3) Soziale Kognition: Warum und auf Basis welcher wenigen Informationen wir sehr schnell Urteile über Personen treffen.
4) Soziale Wahrnehmung/Attribution: Wie erklären wir uns, dass sich jemand im Alltag in gewisser Art und Weise verhält?
5) Diversity & Frauen & Führung: Woran kann es liegen, dass weibliche Führungskräfte besondere Herausforderungen bei der Ausübung von Führung haben?
6) Sozialer Einfluss: Welche Normen erleben Sie beim Militär? Und wie leiten diese Erwartungen unser Verhalten im Berufsalltag?
7) Gruppenpsychologie: Was heisst "Gruppe"? Wie entwickeln sich (militärische) Gruppen, z.B. in der RS? Welche Prozesse können zwischen Gruppen geschehen?
9) Überzeugungsstrategien

853-0654-00L Bachelor's Thesis

Abstract
The Bachelor Thesis completes the Bachelor program and consists of a scientific project carried out independently under the tutelage of an ETH or MILAK lecturer in Public Policy.

Objective
The elaboration of the Bachelor Thesis should further students' capacities to work independently, structured and scientifically.

Bachelor's Thesis

853-8002-00L The Role of Technology in National and International Security Policy

Abstract
The lecture provides an introduction to the role of security and military technologies in the formulation and implementation of national and international security policies. The focus is on challenges posed by new and developing technologies, the transformation of military capabilities, and the question of regulation.

Objective
Participants will gain an in-depth overview of the many ways in which technology is becoming part of security policies and practices, in both civilian and military contexts.

Content

Literature
Lituratur für die einzelnen Sitzungen wird auf Moodle bereitgestellt.

Prerequisites / notice
The lecture is being supported by a website on Moodle. If you have any questions, please contact Fabio Schmocker (fabio.schmocker@sipo.gess.ethz.ch)

Bachelor's Thesis

853-1030-00L History of Sports W 2 credits 2V M. Gisler

Abstract
Comprehension for development and changes of sports from the ancient world to the present. Description of sports in services of national idea, from education and health promotion from the middle of the 18th century till this day.

Objective
Understanding for the development and adaptation of sports from the ancient world to present times.

Content

Lecture notes
Ein Skript für die aktuelle Veranstaltung wird abgegeben.

Literature

Bachelor's Thesis

853-1107-00L Sport Pedagogy W 2 credits 2V C. Herrmann

Abstract
The teacher-student interaction presents a complex psychosocial event, demonstrating the need for a psychological extension of the classical social science / sports pedagogical perspective. Therefore, this lecture will be focused on "pedagogical-psychological aspects of competence development in the context of a multi-perspective physical education".

Objective
Development of pedagogical-psychological competences for the optimisation of future teaching activities.

Content
- Subject area of educational psychology
- Motivating students in physical education
- Building self-efficacy and strengthen the self-concept
- Promoting positive emotions and a positive attitude to anxiety
- Encouraging self-directed learning
- Leading classes and promoting cooperation
- Communicating with students efficiently
- Reflecting your own expectations critically
- Handling gender issues sensitively
- Promoting inclusion / Strengthening social and moral development
- Dealing with difficult students
- Evaluating achievements of students

Lecture notes
Teaching materials for the individual lectures are provided to the students via Moodle.

Sociology of Sport

Objective:
The objective of this course is to provide students with an overview of the various dimensions, functions, and interrelations of present-day sport psychology, and to apply these to the central theories and models of sport sociology. Students will learn how to identify interesting/innovative questions in this policy area and how to address them in a sociological view of sport. They will also learn how far sport reflects society and how it changes and becomes more differentiated in the process.

Content:
The course covers the following topics:
- Introduction to sport psychology
- Cognitions in sports: mental rehearsal and mental training
- Emotions and stress
- Motivation: goal-setting in sports
- Career and career transition in elite sport
- Coach-Athlete-Interaction
- Psychological aspects of sport-injury rehabilitation
- Group dynamics in sport

Competencies:
- Subject-specific Competencies: Concepts and Theories
- Method-specific Competencies: Analytical Competencies
- Social Competencies: Sensitivity to Diversity
- Personal Competencies: Critical Thinking

Literature:

International Environmental Politics

Objective:
This course deals with how and why international problem-solving efforts (cooperation) in environmental politics emerge and evolve, and under what circumstances such efforts are effective. The objectives in this course are to (1) gain an overview of important questions pertaining to international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions in this policy area and how to address them in a conceptually and methodologically meaningful and insightful way; (3) gain an overview of important global and regional environmental problems and how they are or could be solved.

Content:
The course covers the following topics:
- Introduction to international environmental politics
- The economy and the media: commercialisation, logic, dependencies
- Social inequalities and distinctions: social impact, health and sport, sport and gender
- Conflicts and politics: sports organizations, doping, violence

Literature:

Startups and Law

**W 2 credits 2V**
P. Peyrot

**Abstract**
The students shall obtain a basic knowledge about the legal environment of entrepreneurs. They shall be able to recognize and evaluate legal issues connected to an entrepreneurial activity and suggest possible solutions.

**Objective**
The students shall obtain the following competence:
- They shall obtain a working knowledge on the legal aspects involved in setting up and managing an enterprise.
- They shall be able to contribute to the legal management of the company and to discuss legal issues.
- They shall have an understanding of the law as a part of the corporate strategy and as a valuable resource of the company.

**Lecture notes**
A comprehensive script will be made available online on the moodle platform.

**Competencies**
- **Subject-specific Competencies**
  - Concepts and Theories (assessed)
- **Method-specific Competencies**
  - Analytical Competencies (assessed)
- **Personal Competencies**
  - Creative Thinking (assessed)
  - Critical Thinking (assessed)

---

Project Management

**W 2 credits 2G**
C. G. C. Marx

**Abstract**
The course gives a detailed introduction on various aspects of professional project management out of theory and practice. Established concepts and methods for project organization, planning, execution and evaluation are introduced and major challenges discussed. The course includes an introduction to specialized project management software as well as agile project management concepts.

**Objective**
Projects are not only the base of work in modern enterprises, but also the primary type of cooperation with customers. Students of ETH will often work in or manage projects in the course of their career. Good project management knowledge is not only a guarantee for individual, but also for company-wide success.

The goal of this course is to give a detailed introduction into project management. The students should learn to plan and execute a project.

**Content**
Project planning (aims, appointments, capacities, efforts and costs), project organization, scheduling and risk analysis, project execution, supervision and control, project evaluation, termination and documentation, conflict management, multinational project management, IT support as well as agile project management methods such as SCRUM.

**Lecture notes**
No.

**Competencies**
- **Subject-specific Competencies**
  - Concepts and Theories (assessed)
  - Techniques and Technologies (fostered)
- **Method-specific Competencies**
  - Analytical Competencies (assessed)
  - Decision-making (fostered)
  - Media and Digital Technologies (fostered)
  - Problem-solving (assessed)
  - Project Management (assessed)
  - Social Competencies
  - Communication (fostered)
  - Customer Orientation (fostered)
  - Leadership and Responsibility (assessed)
  - Self-presentation and Social Influence (fostered)
  - Sensitivity to Diversity (fostered)
  - Negotiation (assessed)
- **Personal Competencies**
  - Adaptable (fostered)
  - Creative Thinking (fostered)
  - Critical Thinking (assessed)
  - Integrity and Work Ethics (fostered)
  - Self-awareness and Self-reflection (fostered)
  - Self-direction and Self-management (assessed)

---

Environmental Ethics (University of Zurich)

**W 3 credits 2V**
University lecturers

**Abstract**
The pressing environmental challenges of today demand a critical reflection. Ethics is an important tool for doing so. This lecture introduces the basics of ethics and provides in-depth knowledge of environmental ethics and its debates. This theoretical background will be applied and critically reflected using examples of current environmental challenges.
Objective
On completion of this lecture, you have acquired the ability to identify, analyze, critically reflect and resolve ethical challenges in general and specifically regarding the environment. You know basic concepts, positions and lines of argumentation from the debate in environmental ethics, which you have applied and discussed in smaller exercises.

851-0861-01L Arabic I A1.1

No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zürich".

Course fees:

Registration dates:

Abstract
Arabic I leads to A1.1 level on the Common European Framework of Reference for Languages. Arabic I is the first part (A1.1 level) of a four-semester Arabic course. The goal of the course is for participants to acquire basic language skills in speaking, listening comprehension, and the reading and writing of Arabic script.

Objective
Participants are able to use the Arabic language adequately in selected areas. The focus is on speaking; reading and listening comprehension at A1.1 level on the Common European Framework of Reference for Languages; learning Arabic script; and the development of cultural competence. The following content areas are embedded in various communicative tasks: Greeting each other, introducing yourself and speaking about yourself (personal and professional identity, place of residence), making simple phone calls, requesting information, and making appointments.

851-0541-00L Truth and Historical Injustice: The Production of Knowledge about Past Mass Atrocities

Abstract
The course deals with the scientific production of knowledge about past mass atrocities. It looks at the interplay of different disciplines, methods and technological means that have been involved in this production over time. Further, it poses the question of what truth can mean in this context.

Objective
The students a) know the main features of the discussion about the truth in the reconstruction of past events; b) have an understanding of the interplay, but also the coexistence of different scientific methods and technological means in the multidisciplinary production of knowledge about past mass crimes; c) have knowledge of important processes of dealing with past mass crimes from the second half of the 20th century onwards.

Content
When discussing the truthfulness of the academic study of the past, politically and ideologically motivated mass crimes are often cited as historical events in order to substantiate the necessity of a claim to truth. In doing so, moral arguments can be made or historical truth can be asserted as a basic prerequisite for living together in a democratic society under constitutional conditions.

The production of knowledge about past atrocities has always been an endeavour in which various scientific disciplines have been involved. The multidisciplinary character of the production of knowledge about mass crimes has become even more accentuated since the second half of the 20th century, not least due to the emergence of new technological possibilities.

The course offers a brief introduction to the discussion about the meaning of truth about past events. It looks at how different scientific approaches - from the humanities to the natural sciences - have been involved in coming to terms with mass crimes and how they have been related to each other. It deals with the question of what role certain techniques and technologies have played in the production of knowledge about past atrocities and how this has changed over time. These techniques and technologies range from the evaluation of documents and the taking of testimonies to specialised database programs, genetic analysis or imaging techniques, to digital technologies for the procurement of information on social media and the internet or for the modelling of past events.

In addressing these questions, the course looks at processes of dealing with the past from the middle of the 20th century to the 21st century in Europe, Latin America and Africa.

Data: 26.07.2024 12:39  Autumn Semester 2024  Page 2369 of 2680
Overview over the basics of likelihood inference.

This course presents the basics of probability theory and the theory of stochastic processes in discrete time. The following topics are covered:

- Methods and theory for high-dimensional statistical inference
- Knowledge of methods and basic theory for high-dimensional statistical inference

Objectives:
- Understand the language and concepts of causal inference
- Know the assumptions under which one can infer causal relations from observational and/or intervention data
- Be able to describe and apply different methods for causal structure learning
- Use given data and a causal structure to derive causal effects and predictions of interventional experiments

Literature:
- D. Williams, Probability with martingales, Cambridge University Press 1991

401-3627-00L High-Dimensional Statistics

Does not take place this semester.

Abstract:

“High-Dimensional Statistics” deals with modern methods and theory for statistical inference when the number of unknown parameters is of much larger order than sample size. Statistical estimation and algorithms for complex models and aspects of multiple testing will be discussed.

Objective:

- Knowledge of methods and basic theory for high-dimensional statistical inference
- Lasso and Group Lasso for high-dimensional linear and generalized linear models; Additive models and many smooth univariate functions
- Non-convex loss functions and 1-regularization; Stability selection, multiple testing and construction of p-values; Undirected graphical modeling

Literature:

- Peter Bühlmann and Sara van de Geer (2011), Statistics for High-Dimensional Data: Methods, Theory and Applications. Springer Verlag.

Prerequisites:

- Knowledge of basic concepts in probability theory, and intermediate knowledge of statistics (e.g. a course in linear models or computational statistics).

401-4632-15L Causality

Abstract:

In statistics, we are used to search for the best predictors of some random variable. In many situations, however, we are interested in predicting a system's behavior under manipulations. For such an analysis, we require knowledge about the underlying causal structure of the system. In this course, we study concepts and theory behind causal inference.

Objective:

- After this course, you should be able to understand the language and concepts of causal inference
- Know the assumptions under which one can infer causal relations from observational and/or intervention data
- Describe and apply different methods for causal structure learning
- Given data and a causal structure, derive causal effects and predictions of interventional experiments

Lecturers: J. Peters
The course provides the second part of an introduction to the statistical software R (https://www.r-project.org/) for scientists. R is free.

Objective

Stochastic simulation (also called Monte Carlo method) is the experimental analysis of a stochastic model by implementing it on a computer. Probabilities and expected values can be approximated by averaging simulated values, and the central limit theorem gives an estimate of the error of this approximation. The course shows examples of the many applications of stochastic simulation and explains different algorithms used for simulation. These algorithms are illustrated with the statistical software R.

Content

Examples of simulations in different fields (computer science, statistics, statistical mechanics, operations research, financial mathematics), Generation of uniform random variables, Generation of random variables with arbitrary distributions (quantile transform, accept-reject, importance sampling), simulation of Gaussian processes and diffusions. The precision of simulations, methods for variance reduction, Introduction to Markov chains and Markov chain Monte Carlo (Metropolis-Hastings, Gibbs sampler, Hamiltonian Monte Carlo, reversible jump MCMC).

Prerequisites / notice

Familiarity with basic concepts of probability theory (random variables, joint and conditional distributions, laws of large numbers and central limit theorem) will be assumed.

Literature

Using R for Data Analysis and Graphics (Part II)

Abstract

The course provides the second part of an introduction to the statistical software R for scientists. Topics are data generation and selection, graphical functions, important statistical functions, types of objects, models, programming and writing functions. Note: This part builds on "Using R .. (Part I)", but can be taken independently if the basics of R are already known.

Objective

The students will be able to use the software R efficiently for data analysis, graphics and simple programming

Content

Part II of the course builds on part I and covers the following additional topics:
- Elements of the R language: control structures (if, else, loops), lists, overview of R objects, attributes of R objects;
- More on R functions;
- Applying functions to elements of vectors, matrices and lists;
- Object oriented programming with R: classes and methods;
- Tailoring R: options
- Extending basic R: packages

Lecture notes

The course focuses on practical work at the computer. We will make use of the graphical user interface RStudio: www.rstudio.org

Prerequisites / notice

Basic knowledge of R equivalent to "Using R .. (part 1)" ( = 401-6215-00L ) is a prerequisite for this course.

The course resources will be provided via the Moodle web learning platform. As from FS 2019, subscribing via Mystudies should "automatically" make you a student participant of the Moodle course of this lecture, which is at

https://moodle-app2.let.ethz.ch/course/view.php?id=20848
401-0627-00L  Smoothing and Nonparametric Regression with Examples

Abstract
Starting with an overview of selected results from parametric inference, kernel smoothing will be introduced along with some asymptotic theory, optimal bandwidth selection, data-driven algorithms and some special topics. Selected numerical examples will be used for motivation. The presented methods will also be applicable elsewhere.

Objective
The students will learn about methods of kernel smoothing and application of concepts to data. The aim will be to build sufficient interest in the topic and intuition as well as the ability to implement the methods to various different datasets.

Content
Rough Outline:
- Parametric estimation methods: selection of important results
  - Method of Least squares: regression & diagnostics
- Nonparametric curve estimation
  - Density estimation, Kernel regression, Local polynomials, Bandwidth selection, various theoretical results related to consistency
  - Selection of special topics (as time permits, we will discuss some of the following): rapid change points, mode estimation, partial linear models, probability and quantile curve estimation, etc.
- Applications: potential areas of applications will be discussed such as, change assessment, trend and surface estimation and others.

Lecture notes
Summaries or outlines of some of the lecture material may be communicated to registered students by Email at irregular intervals.

Literature
- Statistical Inference, by S.D. Silvey, Chapman & Hall.
- Density Estimation, by B.W. Silverman, Chapman and Hall.
- Nonparametric Simple Regression, by J. Fox, Sage Publications.

Additional references will be given out in the lectures.

Prerequisites / notice
Prerequisites: A background in Linear Algebra, Calculus, Probability & Statistical Inference including Estimation and Testing.

447-6289-00L  Sampling Surveys

Abstract
The elements of a sample survey are explained. The most important classical sample designs (simple random sampling and stratified random sampling) with their estimation procedures and the use of auxiliary information including the Horvitz-Thompson estimator are introduced. Data preparation, non-response and its treatment, variance estimation and analysis of survey data is discussed.

Objective
Knowledge of the Elements and the process of a sample survey. Understanding of the paradigm of random samples. Knowledge of simple random sampling and stratified random sampling and capability to apply the corresponding methods. Knowledge of further methods of sampling and estimation as well as data preparation and analysis.

Lecture notes
Introduction to the statistical methods of survey research

401-3628-14L  Bayesian Statistics

Abstract
Introduction to the Bayesian approach to statistics: decision theory, prior distributions, hierarchical Bayes models, empirical Bayes, Bayesian tests and model selection, empirical Bayes, Laplace approximation, Monte Carlo and Markov chain Monte Carlo methods.
Objective
Students understand the conceptual ideas behind Bayesian statistics and are familiar with common techniques used in Bayesian data analysis.

Content
Topics that we will discuss are:

Difference between the frequentist and Bayesian approach (decision theory, principles), priors (conjugate priors, noninformative priors, Jeffreys prior), tests and model selection (Bayes factors, hyper-g priors for regression), hierarchical models and empirical Bayes methods, computational methods (Laplace approximation, Monte Carlo and Markov chain Monte Carlo methods)

Lecture notes
A script will be available in English.

Literature

Additional references will be given in the course.

Prerequisites / notice
Familiarity with basic concepts of frequentist statistics and with basic concepts of probability theory (random variables, joint and conditional distributions, laws of large numbers and central limit theorem) will be assumed.

Competencies
Subject-specific Competencies
Concepts and Theories assessed
Techniques and Technologies assessed

Method-specific Competencies
Analytical Competencies assessed

401-3823-74L Markov Processes W 3 credits 1V R. S. Gvalani

Abstract
This course is meant to serve as an introduction to the theory of Markov processes on finite or countable state spaces. We will discuss what a Markov process is along with associated concepts such as transition probabilities, recurrence, transience, ergodicity, reversibility etc. We will motivate various abstract notions introduced with concrete examples from physics and statistics.

Objective
I. Discrete-time Markov processes, i.e. Markov chains, e.g. the random walk on the integers
II. Transition probabilities and Doeblin's theorem
III. Stationary probabilities and ergodic properties
IV. Continuous-time Markov processes, e.g. the Poisson process
V. Reversibility

Literature
An Introduction to Markov Processes: Daniel W. Stroock

Prerequisites / notice
Probability and Statistics
Recommended: Analysis III (measure theory)

Competencies
Subject-specific Competencies
Concepts and Theories assessed
Techniques and Technologies assessed

Method-specific Competencies
Analytical Competencies assessed
Problem-solving assessed

Social Competencies
Self-presentation and Social Influence assessed

Personal Competencies
Creative Thinking assessed
Critical Thinking assessed

401-3901-00L Linear & Combinatorial Optimization W 10 credits 4V+2U R. Zenklusen

Abstract
Mathematical treatment of optimization techniques for linear and combinatorial optimization problems.

Objective
The goal of this course is to get a thorough understanding of various classical mathematical optimization techniques for linear and combinatorial optimization problems, with an emphasis on polyhedral approaches. In particular, we want students to develop a good understanding of some important problem classes in the field, of structural mathematical results linked to these problems, and of solution approaches based on such structural insights.

Content
Key topics include:
- Linear programming and polyhedra;
- Flows and cuts;
- Combinatorial optimization problems and polyhedral techniques;
- Equivalence between optimization and separation.

Literature

Prerequisites / notice
Solid background in linear algebra.

Competencies
Subject-specific Competencies
Concepts and Theories assessed
Techniques and Technologies fostered

Method-specific Competencies
Analytical Competencies assessed
Decision-making assessed
Media and Digital Technologies fostered
Problem-solving assessed

Social Competencies
Communication assessed
Cooperation and Teamwork fostered
Sensitivity to Diversity fostered

Personal Competencies
Adaptability and Flexibility fostered
Creative Thinking assessed
Critical Thinking assessed
Integrity and Work Ethics fostered
Self-awareness and Self-reflection fostered
Self-direction and Self-management fostered

401-4944-20L Mathematics of Data Science W 8 credits 3V+2U A. Bandeira

Abstract
Mostly self-contained, but fast-paced, introductory masters level course on various theoretical aspects of algorithms that aim to extract information from data.

Objective
Introduction to various mathematical aspects of Data Science.
AI is having a profound impact on science by accelerating discoveries across physics, chemistry, biology, and engineering. This course aims to present a highly topical selection of AI applications across these fields. Emphasis will be placed on using AI, particularly deep learning, to understand systems modelled by PDEs, and key scientific machine learning concepts and themes will be discussed. 

Aimed at students in a Master's Programme in Mathematics, Engineering and Physics.

Learning objectives:
- Aware of advanced applications of AI in the sciences and engineering
- Familiar with the design, implementation, and theory of these algorithms
- Understand the pros/cons of using AI and deep learning for science
- Understand key scientific machine learning concepts and themes

Content
A selection of the following topics will be presented in the lectures:
1. Key scientific tasks common to many scientific domains, such as simulation, inverse problems, equation discovery, design, and control problems, and issues with traditional methods for solving them
2. Physics-informed neural networks for solving forward, inverse and equation discovery problems related to PDEs
3. Neural operators, including Fourier neural operators and DeepONets, for learning efficient surrogate models, and their theoretical foundations
4. Differentiable scientific algorithms, neural differential equations, and the benefits of hybrid workflows
5. AI for symbolic regression and equation discovery
6. Applications of graph neural networks in science
7. Guest lectures on AI for chemistry and biology
8. Large language models and other Foundation models for scientific discovery

Applications using these techniques will be illustrated across fluid dynamics, wave physics, medical physics, molecular design, and computational biology. Several examples where AI algorithms outperform traditional scientific workflows will be shown.

Lecture notes
Lecture slides, recordings, and tutorials will be available on Moodle.

Prerequisites / notice
The main mathematical tools used will be Probability, Linear Algebra (and real analysis), and a working knowledge of these subjects is required. In addition to these prerequisites, this class requires a certain degree of mathematical maturity— including abstract thinking and the ability to understand and write proofs.

We encourage students who are interested in mathematical data science to take both this course and "227-0434-10L Mathematics of Information" taught by Prof. H. Bölcskei. The two courses are designed to be complementary.

A. Bandeira and H. Bölcskei
### Advanced Machine Learning

**Abstract**
The lecture covers important aspects of applying supervised machine learning models in a responsible way, based on sound statistical theory. The focus is on model interpretability, calibration (bias) assessment, and proper model comparison. The methods are illustrated with actuarial datasets.

**Objective**
The student is familiar with the main tools of model interpretability, calibration assessment, and model comparison and knows how to apply supervised machine learning in a responsible way.

**Content**
- Overview of supervised machine learning (statistical learning theory, GLMs, tree based methods, and neural nets; cross-validation)
- Model interpretability methods (partial dependence plots, measures of variable importance, and SHAP)
- Bias/calibration assessment with identification functions
- Model comparison with consistent scoring functions
- Working with dependent observations and further topics

**Prerequisites / notice**
This course will be held in English and counts towards the diploma of "Aktuar SAV". For the latter, see details under www.actuaries.ch.

**Competencies**
- Subject-specific Competencies: fostered
  - Concepts and Theories: fostered
  - Techniques and Technologies: fostered
- Analytical Competencies: fostered

**Literature**

**Prerequisites / notice**
- This course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.
- Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

**Content**
The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

### Neural Network Theory

**Abstract**
This course presents topics in natural language processing with an emphasis on deep learning approaches. The course provides an overview of the primary areas of research in language processing as well as a detailed exploration of the models and techniques used both in research and in commercial natural language systems.

**Objective**
The course is accompanied by practical machine learning projects.

**Content**
- Topics covered in the lecture include:
  - Fundamentals: What is data?
  - Bayesian Learning
  - Computational learning theory
  - Supervised learning: Ensembles: Bagging and Boosting
  - Max Margin methods
  - Neural networks
  - Unsupervised learning: Dimensionality reduction techniques Clustering Mixture Models Non-parametric density estimation Learning Dynamical Systems

**Literature**

**Prerequisites / notice**
This course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.

After attending this lecture, participating in the exercise sessions, and working on the homework problem sets, students will have acquired a working knowledge of the mathematical foundations of neural networks.
1. Universal approximation with single- and multi-layer networks

2. Introduction to approximation theory: Fundamental limits on compressibility of signal classes, Kolmogorov epsilon-entropy of signal classes, non-linear approximation theory

3. Fundamental limits of deep neural network learning

4. Geometry of decision surfaces

5. Separating capacity of nonlinear decision surfaces

6. Vapnik-Chervonenkis (VC) dimension

7. VC dimension of neural networks

8. Generalization error in neural network learning

**Lecture notes**

Detailed lecture notes are available on the course web page

https://www.mins.ee.ethz.ch/teaching/intnt/
This course is aimed at advanced master and doctorate students who want to conduct independent research on theory for modern machine learning (ML). It teaches standard methods in statistical learning theory commonly used to prove theoretical guarantees for ML algorithms. The knowledge is then applied in independent project work to understand and follow-up on recent theoretical ML results.

Upon completion of the course, the students should have mastered the underlying methods and be able to apply them to a variety of research problems. This will be an integral part of the project work and involves experimental as well as theoretical questions.

The project work focuses on current theoretical ML research that aims to understand modern phenomena in machine learning, including but not limited to:

- how overparameterized models generalize (statistically) and converge (computationally)
- complexity measures and approximation theoretic properties of randomly initialized and trained neural networks
- generalization of robust learning (adversarial or distribution-shift robustness)
- private and fair learning

Students should have a very strong mathematical background (real analysis, probability theory, linear algebra) and solid knowledge of core concepts in machine learning taught in courses such as “Introduction to Machine Learning”, “Regression”/“Statistical Modelling”. In addition to these prerequisites, this class requires a high degree of mathematical maturity—including abstract thinking and the ability to understand and write proofs.

The course is split into 4 parts:

- Adversarial attacks and defenses on deep learning models.
- Certified training of deep neural networks (combining symbolic and continuous methods).

Privacy of Machine Learning

- Threat models (e.g., stealing data, poisoning, membership inference, etc.).
- Attacking federated machine learning (across vision, natural language and tabular data).
- Differential privacy for defending machine learning.
- AI Regulations and checking model compliance.

Fairness of Machine Learning

- Introduction to fairness (motivation, definitions).
- Enforcing individual fairness (for both vision and tabular data).
- Enforcing group fairness (e.g., demographic parity, equalized odds).

Robustness, Privacy and Fairness of Foundation Models

- We discuss all previous topics, as well as programmability, in the context of latest foundation models (e.g., LLMs).

While not a formal requirement, the course assumes familiarity with basics of machine learning (especially linear algebra, gradient descent, and neural networks as well as basic probability theory). These topics are usually covered in “Intro to ML” classes at most institutions (e.g., “Introduction to Machine Learning” at ETH).

The coding project will utilize Python and PyTorch. Thus some programming experience in Python is expected. Students without prior knowledge of PyTorch are expected to acquire it early in the course by solving exercise sheets.

**263-5056-00L** Applications of Deep Learning on Graphs

*W* 4 credits 2G+1A G. Rätsch

**Abstract**

Graphs are an incredibly versatile abstraction to represent arbitrary structures such as molecules, relational knowledge or social and traffic networks. This course provides a practical overview of deep (representation) learning on graphs and their applications.

**Objective**

Many established deep learning methods require dense input data with a well-defined structure (e.g. an image, a sequence of word embeddings). However, many practical applications deal with sparsely connected and complex data structures, such as molecules, knowledge graphs or social networks. Graph Neural Networks (GNNs) and general representation learning on graphs have recently experienced a surge in popularity because it addresses the challenge to effectively learn representations over said structures. In this course, we aim to understand the fundamental principles of deep (representation) learning on graphs, the similarities and differences to other concepts in deep learning, as well as the unique challenges from a practical point of view. Finally, we provide an overview of recent applications of graph neural networks.

**Content**

Introduction to GNN concepts: 1) problem-solving on graphs (node-, edge-, graph-level objectives), structural priors (inductive biases) of graph data, applications for graph learning. 2) Graph Neural Networks: convolutional, attentional, message passing; overview on the zoo of published operators. Relations to Transformers and DeepSets. 3) Expressivity of GNNs. 4) Scalability of Graph Neural Networks: Subsampling, Clustering (Pooling). 5) Augmentations and self-supervised learning on Graphs Application: Drug Discovery, Knowledge graphs. 5) Temporal GNNs, Geometric GNNs, Deep Generative Models for Graphs.

**Prerequisites / notice**

263-3210-00 Deep Learning or 263-0008-00 Computational Intelligence Lab; 252-0220-00 Introduction to Machine Learning; Statistics/Probability; Programming in Python; Unix Command Line.

**263-5351-00L** Machine Learning for Genomics

*W* 6 credits 2V+2U+1A V. Boeva

**Abstract**

The course reviews solutions provided by machine learning to the most challenging questions in human genomics.

**Objective**

Over the last few years, the parallel development of machine learning methods and molecular profiling technologies for human cells, such as sequencing, created an extremely powerful tool to get insights into the cellular mechanisms in healthy and diseased contexts. In this course, we will discuss the state-of-the-art machine learning solving or attempting to solve common problems in human genomics. At the end of the course, you will be familiar with (1) classical and advanced machine learning architectures used in genomics, (2) bioinformatics analysis of human genomic and transcriptomic data, and (3) data types used in this field.

**Content**

- Short introduction to major concepts of molecular biology: DNA, genes, genome, central dogma, transcription factors, epigenetic code, DNA methylation, signaling pathways
- Prediction of transcription factor binding sites, open chromatin, histone marks, promoters, nucleosome positioning (convolutional neural networks, position weight matrices)
- Prediction of variant effects and gene expression (hidden Markov models, topic models)
- Deconvolution of mixed signal (NMF, ICA)
- DNA, RNA and protein folding (RNN, LSTM, transformers)
- Data imputation for single-cell RNA-seq data, clustering and annotation (diffusion and methods on graphs)
- Batch correction (autoencoders, optimal transport)
- Survival analysis (Cox proportional hazard model, regularization penalties, multi-omics, multi-tasking)

**Prerequisites / notice**

**401-6282-00L** Statistical Analysis of High-Throughput Genomic and Transcriptomic Data (University of Zurich)

*W* 5 credits 3G H. Rehrauer, M. Robinson

**Abstract**

A range of topics will be covered, including basic molecular biology, genomics technologies and in particular, a wide range of statistical and computational methods that have been used in the analysis of DNA microarray and high throughput sequencing experiments.

**Objective**

- Understand the fundamental "scientific process" in the field of Statistical Bioinformatics
- Be equipped with the skills/tools to preprocess genomic data (Unix, Bioconductor, mapping, etc.) and ensure reproducible research (Sweave)
- Have a general knowledge of the types of data and biological applications encountered with microarray and sequencing data
- Have the general knowledge of the range of statistical methods that get used with microarray and sequencing data
- Gain the ability to apply statistical methods/knowledge/software to a collaborative biological project
- Write a coherent summary of a bioinformatics problem and its solution in statistical terms

**Content**

Lectures will include: microarray preprocessing; normalization; exploratory data analysis techniques such as clustering, PCA and multidimensional scaling; Controlling error rates of statistical tests (FPR versus FDR versus FWER); limma (linear models for microarray analysis); mapping algorithms (for RNA/ChIP-seq); RNA-seq quantification; statistical analyses for differential count data; isoform switching; epigenomics data including DNA methylation; gene set analyses; classification

**Lecture notes**

Lecture notes, published manuscripts

**Prerequisites / notice**

Prerequisites: Basic knowledge of the programming language R, sufficient knowledge in statistics, experience with statistical methods, and familiarity with basic concepts and techniques of bioinformatics.
Clinical Biostatistics (University of Zurich)  

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: STA404

Mind the enrolment deadlines at UZH: https://www.uzh.ch/cmsssl/en/studies/application/deadline.html

Abstract
Discussion of the different statistical methods that are used in clinical research.

Content
Discussion of the different statistical methods that are used in clinical research. Among other subjects the following will be introduced: sample size calculation, randomization and blinding, analysis of clinical trials (parallel groups design, analysis of covariance, crossover design, equivalence studies), intention-to-treat analysis, multiple testing, group sequential methods, adaptive designs, diagnostic studies, and agreement studies.

Literature

Prerequisites / notice
Basic knowledge of the programming language R, sufficient knowledge in calculus, linear algebra, probability, statistics

Abstract
Semester papers serve to delve into a problem in statistics and to study it with the appropriate methods or to compile and clearly exhibit a case study of a statistical evaluation.

| 252-5051-00L| Advanced Topics in Machine Learning ■              | W    | 2    | 2S    | R. Kotterell, M. El-Assady, N. He, F. Yang |
|             | The deadline for deregistering expires at the end of the second week of the semester. Students who are still registered after that date, but do not attend the seminar, will officially fail the seminar. |

Abstract
In this seminar, recent papers of the pattern recognition and machine learning literature are presented and discussed. Possible topics cover statistical models in computer vision, graphical models and machine learning.

Objective
The seminar "Advanced Topics in Machine Learning" familiarizes students with recent developments in pattern recognition and machine learning. Original articles have to be presented and critically reviewed. The students will learn how to structure a scientific presentation in English which covers the key ideas of a scientific paper. An important goal of the seminar presentation is to summarize the essential ideas of the paper in sufficient depth while omitting details which are not essential for the understanding of the work. The presentation style will play an important role and should reach the level of professional scientific presentations.

Content
The seminar will cover a number of recent papers which have emerged as important contributions to the pattern recognition and machine learning literature. The topics will vary from year to year but they are centered on methodological issues in machine learning like new learning algorithms, ensemble methods or new statistical models for machine learning applications. Frequently, papers are selected from computer vision or bioinformatics - two fields, which relies more and more on machine learning methodology and statistical models.

Literature
The papers will be presented in the first session of the seminar.

Free Electives

Several further courses offered at the University of Zurich belong to the curriculum of the Master's Programme in Statistics. With the consent by the Advisor (http://stat.ethz.ch/~kalisch/) such a course is eligible as a free elective.

Course Catalogue

Science in Perspective

Two credits are needed from the "Science in Perspective" programme with language courses excluded if three credits from language courses have already been recognised for the Bachelor's degree.

see https://ethz.ch/content/dam/ethz/common/docs/weisungsammlung/files-en/science-in-perspective.pdf (Eight credits must be acquired in this category: normally six during the Bachelor's degree programme, and two during the Master's degree programme. A maximum of three credits from...
language courses from the range of the Language Center of the University of Zurich and ETH Zurich may be recognised. In addition, only advanced
courses (level B2 upwards) in the European languages English, French, Italian and Spanish are recognised. German language courses are recognised
from level C2 upwards.)

Analysis I and II
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Mathematical tools for the engineer

Objective
Mathematics as a tool to solve engineering problems. Basic mathematical knowledge for engineers. Mathematical formulation of technical and scientific problems.

Content
Complex numbers. Calculus for functions of one variable with applications. Simple Mathematical models in engineering.

Literature

406-0603-AAL
Stochastics (Probability and Statistics)
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Introduction to basic methods and fundamental concepts of statistics and probability theory for non-mathematicians. The concepts are presented on the basis of some descriptive examples. Learning the statistical program R for applying the acquired concepts will be a central theme.

Objective
The objective of this course is to build a solid fundament in probability and statistics. The student should understand some fundamental concepts and be able to apply these concepts to applications in the real world. Furthermore, the student should have a basic knowledge of the statistical programming language "R".

Content
From "Statistics for research" (online)
Ch 1: The Role of Statistics
Ch 2: Populations, Samples, and Probability Distributions
Ch 3: Binomial Distributions
Ch 6: Sampling Distribution of Averages
Ch 7: Normal Distributions
Ch 8: Student's t Distribution
Ch 9: Distributions of Two Variables

From "Introductory Statistics with R (online)"
Ch 1: Basics
Ch 2: The R Environment
Ch 3: Probability and distributions
Ch 4: Descriptive statistics and tables
Ch 5: One- and two-sample tests
Ch 6: Regression and correlation

Probability and Statistics
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.
Abstract

- Probability spaces
- Discrete models, Random walk
- Conditional probabilities, independence
- Continuous models
- Limit theorems
- Methods of moments
- Maximum likelihood estimation
- Hypothesis testing
- Confidence intervals
- Introductory Bayesian statistics
- Linear regression model

Objective

The first part of the course gives an overview of the main concepts needed to understand probability theory (sample spaces, discrete models, random walk, continuous models and limit theorems such as the Laws of Large Numbers and the Central limit theorem). It will be based on the German script "Wahrscheinlichkeitsrechnung und Statistik".

The second part covers some fundamental results of mathematical statistics including estimation methods, hypothesis testing as well as the linear regression model. For this part, we will use the script "Statistics for Mathematics". Both scripts are available at https://www.stat.math.ethz.ch/~fadouab/

Content

Probability:

- Chapters 1-5 (Probabilities and events, Discrete and continuous random variables, Generating functions) and Sections 7.1-7.5 (Convergence of random variables) from the book "Probability and Random Processes". Most of this material is also covered in Chap. 1-5 of "Mathematical Statistics and Data Analysis" on a slightly easier level.

Statistics:

- Sections 8.1 - 8.5 (Estimation of parameters), 9.1 - 9.4 (Testing Hypotheses), 11.1 - 11.3 (Comparing two samples) from "Mathematical Statistics and Data Analysis".

<tr>
<td>Abstract</td>
<td>This introductory lecture in ecology covers basic ecological concepts and the most important levels of complexity in ecological research. Ecological concepts are exemplified by using aquatic and terrestrial systems; corresponding methodological approaches are demonstrated. Threats to biodiversity and the appropriate management are discussed. The objective of this lecture is to teach basic ecological concepts and the different levels of complexity in ecological research. The students should learn ecological concepts at these different levels in the context of concrete examples from terrestrial and aquatic ecology. Corresponding methods for studying the systems will be presented. A further aim of the lecture is that students achieve an understanding of biodiversity, why it is threatened and how it can be managed.</td>

Abstract
Introduction to engineering mechanics: kinematics, statics and dynamics of rigid bodies and systems of rigid bodies.

Objective
By learning the basics of kinematics, statics and dynamics, students should gain a basic understanding of the subject matter with which simple problems in engineering mechanics can be analyzed and solved. Based on this, further lectures, which require knowledge of mechanics, can be attended.

Content
Basic notions: position and velocity of particles, rigid bodies, planar motion, kinematics of rigid bodies, force, torque, power. Statics: static equilibrium, center of forces, centroid, principle of virtual power, equilibrium, constraints, analytical statics, friction. Dynamics: acceleration, inertial forces, d'Alembert's Principle, Newton's Second Law, principles of linear and angular momentum, equations of planar motion of rigid bodies.

Lecture notes
yes, in German

Abstract
In this course students are introduced to how environmental problems in the areas of water quantity and quality, waste production and recycling, air pollution control, are formulated and solved with engineering methods. The course makes a connection between the theoretical Bachelor foundation classes and practical topics of environmental engineering in six main thematic areas.

Objective
After completing this course, the student will be able to:
- formulate key global environmental problems
- develop a systems perspective and solutions to the problems (critical thinking)
- identify and solve simple numerical problems in the domain areas
- understand why/how we use data/models in environmental engineering
- develop own interest in the domain areas and see career opportunities

Content
- Introduction – description of the Earth System, main stressors, global warming, introduction into the methods and goals of environmental engineering.
  1. Water Science & Engineering – definition of the global water cycle and hydrological regimes, surface/subsurface flow equations (advection, diffusion), water resources management, climate change.
  4. River and Hydraulic Engineering – utility hydraulic engineering (hydropower production), protective hydraulic engineering (flood protection), waters protection (river restoration, ecological measures at hydropower plants).
  5. Air Quality – air quality parameters, main air pollutants, air quality in cities/indoor, emission control, the plume dispersion model.
  6. Earth Observation – satellite observation of the Earth System from space, methods, environmental applications (glaciers, forest, land surface change)

Lecture notes
Course will take place in English and German (bilingual). The English textbook by Masters and Ela (see below) will be complemented by instructors materials to the individual thematic topics. Lecture presentations will be the main study material. There is no formal Script.

Literature
- lecture presentations and selected papers
In the course “Hydraulics I”, the competency of process understanding is taught, applied and examined. Furthermore system fostered

- Sensitivity to Diversity

**Concepts and Theories**

Properties of water, hydrostatics, stability of floating bodies, continuity, Euler equation of motion, Navier-Stokes equations, similarity, channel flow, flow measurements, demonstration experiments in the lecture hall, Bernoulli principle, momentum equation for finite volumes, potential flows, ideal fluids vs. real fluids, boundary layer, pipe flow, open channel flow, flow measurements, demonstration experiments in the lecture hall, parametric and non-parametric tests, parameter estimation.

**Creative Thinking**

Evaporation and evapotranspiration: processes, measurement and estimation, potential and actual evapotranspiration, energy balance method, empirical methods.

Infiltration: measurement, Horton’s equation, empirical and conceptual models, phi-index and percentage method, SCS-CN method.

Surface runoff and subsurface flow: Hortonian and Dunnian surface runoff, streamflow measurement, streamflow regimes, annual hydrograph, flood hydrograph analysis – baseflow separation, flow duration curve.

Basin characteristics: morphology, topographic and phreatic divide, hypsometric curve, slope, drainage density.

Rainfall-runoff models (R-R): rationale, linear model of rainfall-runoff transformation, concept of the instantaneous unit hydrograph (IUH), linear reservoir, Nash model.

Flood estimation methods: flood frequency analysis, deterministic methods, probabilistic methods (e.g. statistical regionalisation, indirect R-R methods for flood estimation, rational method).

Erosion and sediment transport: watershed scale erosion, soil erosion by water, estimation of surface erosion, sediment transport.

Snow (and ice) hydrology: snow characteristic variables and measurements, estimation of snowmelt processes by the energy budget equation and conceptual melt models (temperature index method and degree-day method), snowmelt runoff.

**Prerequisites / notice**

Knowledge of statistics is a prerequisite. The required theoretical background, which is needed for understanding part of the lectures and performing part of the assignments, may be summarised as follows:

- Elementary data processing: hydrological measurements and data, data visualisation (graphical representation and numerical parameters), frequency analysis: hydrological data as random variables, return period, frequency factor, probability paper, probability distribution fitting, parametric and non-parametric tests, parameter estimation.

**Abstract**

The course introduces the students to engineering hydrology. It covers first physical hydrology, that is the description and the measurement of hydrological processes (precipitation, interception, evapotranspiration, runoff, erosion, and snow), and it introduces then the basic mathematical models of the single processes and of the rainfall-runoff transformation, thereby including flood analysis.

**Objective**

Know the main features of engineering hydrology. Apply methods to estimate hydrological variables for dimensioning hydraulic structures and managing water resources.

**Content**

- The hydrological cycle: global water resources, water balance, space and time scales of hydrological processes.
- Precipitation: mechanisms of precipitation formation, precipitation measurements, variability of precipitation in space and time, precipitation regimes, point-basin precipitation, isohyetal method, Thiessen polygons, storm rainfall, design hyetograph.
- Interception: measurement and estimation.
- Evaporation and evapotranspiration: processes, measurement and estimation, potential and actual evapotranspiration, energy balance method, empirical methods.
- Infiltration: measurement, Horton’s equation, empirical and conceptual models, phi-index and percentage method, SCS-CN method.
- Surface runoff and subsurface flow: Hortonian and Dunnian surface runoff, streamflow measurement, streamflow regimes, annual hydrograph, flood hydrograph analysis – baseflow separation, flow duration curve.
- Basin characteristics: morphology, topographic and phreatic divide, hypsometric curve, slope, drainage density.
- Rainfall-runoff models (R-R): rationale, linear model of rainfall-runoff transformation, concept of the instantaneous unit hydrograph (IUH), linear reservoir, Nash model.
- Flood estimation methods: flood frequency analysis, deterministic methods, probabilistic methods (e.g. statistical regionalisation, indirect R-R methods for flood estimation, rational method).
- Erosion and sediment transport: watershed scale erosion, soil erosion by water, estimation of surface erosion, sediment transport.
- Snow (and ice) hydrology: snow characteristic variables and measurements, estimation of snowmelt processes by the energy budget equation and conceptual melt models (temperature index method and degree-day method), snowmelt runoff.

**Lecture notes**

The lecture notes as well as the lecture presentations and handouts may be downloaded from the website of the Chair of Hydrology and Water Resources Management.

**Literature**

**Prerequisites / notice**

Knowledge of statistics is a prerequisite. The required theoretical background, which is needed for understanding part of the lectures and performing part of the assignments, may be summarised as follows:

- Elementary data processing: hydrological measurements and data, data visualisation (graphical representation and numerical parameters), frequency analysis: hydrological data as random variables, return period, frequency factor, probability paper, probability distribution fitting, parametric and non-parametric tests, parameter estimation.
Objective
The students gain general knowledge of air pollution and study the methods used for air pollution control. The students know the different strategies of air pollution control and are familiar with their scientific fundamentals. The students can evaluate possible control methods and equipment, design control systems and estimate their efficiencies and costs. They are able to incorporate goals concerning air quality into their engineering work.

Content
The reduction of the formation of pollutants is done by modifying the processes (process-integrated measures) and by different engineering operations for the cleaning of waste gas (downstream pollution control). It will be demonstrated, that the variety of these procedures can be traced back to the application of a few basic physical and chemical principles.

Procedures for the removal of particles (inertial separator, filtration, electrostatic precipitators, scrubbers) with their different mechanisms (field forces, impaction and diffusion processes) and the modelling of these mechanisms will be covered.

Procedures for the removal of gaseous pollutants and the description of the driving forces involved, as well as the equilibrium and the kinetics of the relevant processes (absorption, adsorption as well as thermal, catalytic and biological conversions) will be covered.

Discussion of the technical possibilities to solve the actual air pollution problems will be conducted.

Abstract
Fundamentals of geographic information systems: spatial data modeling; metrics & topology; vector, raster and network data; thematic data; spatial statistics; system architectures; data quality; spatial queries and analysis; geovisualisation; spatial databases; labs with GIS software

Objective
Knowing theoretical aspects of geographic information regarding data acquisition, representation, analysis and visualisation. Knowing the fundamentals of geoinformation technologies for the realization, application and operation of geographic information systems in engineering projects.

Content
- Einführung GIS & GIScience
- Konzeptionelles Modell & Datenschema
- Vektorgeometrie & Topologie
- Raster-geometrie und -algebra
- Netzwerke
- Themenatische Daten
- Räumliche Statistik
- Systemarchitekturen & Interoperabilität
- Datenqualität, Unsicherheiten & Metadaten
- Räumliche Abfragen und Analysen
- Präsentation raumbezogener Daten
- Geodatenbanken

Lecture notes
Vorlesungspräsentationen werden digital zur Verfügung gestellt.

Literature
The lectures are structured as follows:

The world’s growing population, changing demographics, and changing climate pose formidable challenges to humanity’s ability to live sustainably. Ensuring that humanity can live sustainably requires accommodating Earth’s growing and changing population through the provision and operation of a sustainable and resilient built environment. This requires ensuring excellent decision-making as to how the built environment is constructed and modified.

The objective of this course is to ensure the best possible decision making when engineering sustainable systems, i.e., ones that meet the needs of stakeholders in the short, medium and long term. In this course, you will learn the main principles of Systems Engineering that can help you from the first idea that a system may not meet expectations, to the quantitative and qualitative evaluation of possible system modifications. Additionally, the course includes an introduction to the use of operations research methods in the determination of optimal solutions in complex systems.

More specifically upon completion of the course, you will have gained insight into:

- how to structure the large amount of information that is often associated with attempting to modify complex systems
- how to set goals and define constraints in the engineering of complex systems
- how to generate possible solutions to complex problems in ways that limit exceedingly narrow thinking
- how to compare multiple possible solutions over time with differences in the temporal distribution of costs and benefits and uncertainty as to what might happen in the future
- how to assess values of benefits to stakeholders that are not in monetary units
- how to assess whether it is worth obtaining more information in determining optimal solutions
- how to take a step back from the numbers and qualitatively evaluate the possible solutions in light of the bigger picture
- the basics of operations research and how it can be used to determine optimal solutions to complex problems, including linear, integer and network programming, dealing with multiple objectives and conducting sensitivity analyses.

Abstract

The lectures are structured as follows:

1. Introduction – An introduction to System Engineering, a way of thinking that helps to engineer sustainable systems, i.e., ones that meet the needs of stakeholders in the short, medium and long terms. A high-level overview of the main principles of System Engineering. The expectations of your efforts throughout the semester.
2. Situation analysis – How to structure the large amount of information that is often associated with attempting to modify complex systems.
3. Goals and constraints – How to set goals and constraints to identify the best solutions as clearly as possible.
4. Generation of possible solutions – How to generate possible solutions to problems, considering multiple stakeholders.
5. The principles of net-benefit maximization and a series of methods that range from qualitative and approximate to quantitative and exact, including pairwise comparison, elimination, weighting, and expected value.
6. The idea behind the supply and demand curves and revealed preference methods.
7. The concept of equivalence, including the time value of money, interest, life times and terminal values.
8. The relationship between net-benefit and the benefit-cost ratio. How incremental cost benefit analysis can be used to determine the maximum net benefit. Internal rates of return.
9. How to consider multiple possible futures and use simple rules to help pick optimal solutions and to determine the value of more information.
10. Once quantitative analysis is used it becomes possible to use operations research methods to analyse large numbers of possible solutions. Linear programming and the simplex method.
11. How sensitivity analysis is conducted using linear programming.
12. How to use operations research to solve problems that consist of discrete values, as well as how to exploit the structure of networks to find optimal solutions to network problems.
13. How to set up and solve problems when there are multiple objectives.

The course uses a combination of qualitative and quantitative approaches.

Lecture notes

- The lecture materials consist of a script, the slides, example calculations in Excel, Moodle quizzes, and exercises.
- The lecture materials will be distributed via Moodle before each lecture.

Literature

Appropriate literature in addition to the lecture materials will be handed out when required via Moodle.

Competencies

Subject-specific Competencies

- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies

- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving

Environmental Law

This class introduces students to the fundamentals of legal systems, focusing on environmental law. It covers the fundamentals of constitutional and administrative law, as opposed to private and criminal law. The class will focus on concepts, terminology and procedures of Swiss environmental law, supplemented through case studies.

Data: 26.07.2024 12:39
Autumn Semester 2024
Page 2389 of 2680
Objective

Students learn fundamental structures of the legal system, understand core concepts and selected problems of public law, focusing on Swiss and European environmental law. These insights can be applied in further law courses, in particular in the course “Environmental law: Areas and Case Studies.”

102-0527-10L Environmental Laboratory I ■ O 4 credits 4P D. Braun, L. Biolley, M. Vogt, L. von Känel

Abstract

A practical introduction to important measurement methods for environmental engineers. Results of the measurements are compared to models and deviations are quantified with statistical methods.

Objective

The laboratory offers students an insight into various experimental methods relevant to environmental engineering. The students deal with problems of measurement technology and measurement uncertainty, learn to characterize systems and to compare and discuss the results of the measurements with simple models. The work is documented with scientific reports or presented in presentations.

Content

Es werden Experimente zu den folgenden Themen durchgeführt:

- Verweilzeit in einer Rührkesselkaskade
- Hydrodynamische Versuche
- Photometrische Bestimmungen von Inhaltsstoffen
- Carbonatgleichgewicht
- Gasgleichgewichte

Die folgenden analytischen Methoden werden dabei eingesetzt:

- UV/VIS-Spektroskopie
- Leitfähigkeitsmessungen
- pH
- Druckmessungen

River and Hydraulic Engineering

Number Title Type ECTS Hours Lecturers

101-1249-00L Hydraulics of Engineering Structures W 3 credits 2G I. Albayrak, F. Evers

Abstract

Hydraulic fundamentals are applied to hydraulic structures for wastewater, flood protection and hydropower. Typical case studies from engineering practice are further described.

Objective

Understanding and quantification of fundamental hydraulic processes with particular focus on hydraulic structures for wastewater, flood protection and hydropower.

In the course “Hydraulics of Engineering Structures”, the competencies of process understanding, system understanding and measurement methods are taught, applied and examined. The competencies modeling, concept development and data analysis & interpretation are taught and data analysis & interpretation is applied in addition.
Content
1. Introduction & Basic equations
2. Losses in flow & Maximum discharge
3. Uniform flow & Critical flow
4. Hydraulic jump & Stillling basin
5. Backwater curves
6. Weirs & End overfall
7. Sidewir & Side channel
8. Bottom opening, Venturi & Culverts, Restrictors, Inverted siphons
9. Fall manholes & Vortex drop
10. Supercritical flow & Special manholes
11. Aerated flows & Low level outlets
12. Hydraulics of sediment bypass tunnels
13. Vegetated flows - Introduction & Application
14. Summary

Lecture notes
Text books

Exhaustive references are contained in the suggested text book.

101-0113-10L Theory of Structures (for Environmental Engineering)  W 3 credits  2.5G  B. Sudret

Abstract
Introduction to structural mechanics, statically determinate beams and frame structures, trusses. Stresses in statically determinate structures.

Objective
- Understanding the response of elastic beam and frame structures
- Ability to correctly apply the equilibrium conditions
- Understanding the basics of continuum mechanics
- Computation of stresses in elastic structures

In the course "Theory of Structures (for Environmental Engineering)", the competencies of process understanding, system understanding and modeling are taught and applied. The competence process understanding and system understanding are examined, too.

Content
- Equilibrium, reactions, static determinacy
- Internal forces (normal and shear forces, moments)
- Arches and cables
- Elastic trusses
- Influence lines
- Basics of continuum mechanics
- Stresses in elastic beams

Lecture notes
Bruno Sudret, "Einführung in die Baustatik", 2021

102-0215-00L Urban Water Management II  W 4 credits  2G  P. Stauffer

Abstract

Objective
Vertiefung der Grundlagen für die Dimensionierung anspruchsvoller Bauwerke mithilfe der numerischen Simulation und Darstellung der Ergebnisse für Zielgruppen in der schweizerischen Wasserwirtschaft.

Content
- Generelle Entwässerungsplanung (GEP)
- Siedlungshydrologie: Niederschlag, Abflussbildung
- Stofftransport in der Kanalisation
- Emissions- und Immissionsbetrachtungen, Einleitbedingungen
- Versickerung von Regenwasser
- Blau-grüne Infrastrukturen (BGI)

Lecture notes
Die schriftlichen Unterlagen stehen digital zur Verfügung.

Prerequisites / notice
Als Voraussetzung wird der Besuch der Lernveranstaltung "Siedlungswasserwirtschaft GZ“ empfohlen.

103-0313-00L Spatial Planning and Landscape Development  W 5 credits  4G  G. Debrunner, S. Hauller, D. Jerjen

Abstract
The lecture introduces the main-features of Swiss spatial planning. Core subjects are e.g., spatial planning as a federal responsibility, spatial planning instruments (federal, cantonal, municipal), as well as systematic problem solving techniques and methodologies of spatial planning. The lecture is complemented with in-depth topics and comparative international examples.
Die Studierenden kennen die Grundzüge der Schweizer Raumplanung, ihre wichtigsten Instrumente auf nationaler, kantonaler, regionaler und kommunaler Ebene und systematische Problemlösungsverfahren. Sie können das vermittelte theoretische Wissen direkt an konkreten, praxisorientierten Übungsaufgaben umsetzen.

- Grundzüge der Raumplanung und ihre wichtigsten Instrumente kennenlernen
- Erarbeiten der Fähigkeit, räumliche Probleme zu erkennen und Problemlösungsverfahren auf diese anzuwenden
- Planung und Landnutzungsmanagement als interaktiven und akteursbezogenen Prozess kennenlernen und anwenden
- Verstehen der mit Ressourcen und Boden verbundenen Potentiale, Nutzungen und Prozesse
- Das vermittelte theoretische Wissen direkt an konkreten, praxisorientierten Fallbeispielen umsetzen können

Die Vorlesung deckt die Grundlagen der (Schweizerischen) Raumplanung und Landschaftsentwicklung ab:

- Was ist Raumplanung (Definitionen und Begriffe)
- Aktuelle Herausforderungen, Entwicklungen und Tendenzen der Raumplanung
- Grundprinzipien, historische Entwicklung und Gesetzgebungen der Schweizer Raumplanung
- Die Raumplanung als staatliche Aufgabe – Raumordnungspolitik auf Bundesebene
- Instrumente der Raumplanung auf nationaler, kantonaler, regionaler und kommunaler Ebene (u.a. Sachpläne und Konzepte, Richtplanung, Nutzungsplanung, Sondernutzungsplanung, Mehrwertausgleich)
- Problemlösungsverfahren in der Raumplanung – systemtechnisches Vorgehen
- Thematische Vertiefungen: Siedlungsentwicklung nach innen; Klimaangepasste Raumplanung; Grundeigentum und kooperative Planung; Raumbeobachtung

**Environment and Water**

**Number** 651-3561-00L

**Title** Cryosphere

**Type** W

**ECTS** 3 credits

**Hours** 2V

**Lecturers** M. Huss, D. Farinotti, H. J. Horgan

**Abstract**

The course introduces the different components of the cryosphere - snow, glaciers, ice sheets, sea ice and lake ice, and permafrost - and their respective roles in the climate system. For each subsystem, essential physical aspects are emphasized, and their dynamics are described quantitatively and using examples.

**Objective**

Students are able to

- qualitatively explain relevant processes, feedbacks and relationships between the different components of the cryosphere,
- quantify and interpret physical processes, which determine the state of the cryospheric components, with simple calculations.

In the course "Cryosphere", the competencies of process understanding, modeling, data analysis & interpretation and measurement methods are taught, applied and examined. System understanding is taught and examined.

**Content**

The course provides an introduction into the various components of the cryosphere: snow, glaciers, ice sheets, sea ice and lake ice, permafrost, and their roles in the climate system. Essential physical aspects are emphasized for each subsystem: e.g. the material properties of ice, mass balance and dynamics of glaciers, or the energy balance of sea ice.

**Lecture notes**

Handouts will be distributed during the teaching semester
Further literature will be indicated during the lecture.

### Literature

### 701-0479-00L Environmental Fluid Dynamics

**Abstract**
This course covers the basic physical concepts and mathematical equations used to describe environmental fluid systems on the rotating Earth. Fundamental concepts (e.g., vorticity dynamics and waves) are formally introduced, applied quantitatively and illustrated using examples. Exercises help to deepen knowledge of the material.

**Objective**
Students are able to:
- Name the basics, concepts and methods of environmental fluid dynamics.
- Understand and discuss the components of the basic physical equations.
- Mathematically solve basic equations for simple problems of environmental fluid dynamics.

**Content**
Basic physical terminology and mathematical laws:
- Continuum hypothesis, forces, constitutive laws, state equations and basic principles of thermodynamics, kinematics, laws of mass and momentum on rotating earth.
- Concepts and illustrative flow systems: vorticity dynamics, boundary layers, instability, turbulence - with respect to environmental fluid systems.
- Scale analysis: dimensionless variables and dynamical similarity, simplification of the fluid system, e.g., shallow water assumption, geostrophic flow.
- Waves in environmental fluid systems.

**Lecture notes**
In English language

**Literature**
Will be presented in class.
See also: web-site.

**Competencies**

- Subject-specific Competencies: assessed
- Method-specific Competencies: assessed

### 701-0561-00L Forest Ecology

**Abstract**
This course conveys the basics of forest ecology with an emphasis on trees as those organisms that dominate the physiognomy and the dynamics of forest ecosystems. Based on this course, students have a good grasp of the qualitative and quantitative importance of forest ecosystems at the global and regional scales, with a focus on central Europe.

**Objective**
Students are able to:
- Summarize the fundamentals of forest ecology at the autecological, demecological and synecological level.
- Explain how trees dominate the physiognomy and dynamics of forest ecosystems.
- Describe the qualitative and quantitative importance of forest ecosystems at the global and regional scales, with an emphasis on central Europe and Alpine region.

Overall, the competences of process understanding, system understanding, modeling, concept development and data analysis & interpretation are taught and examined in this course.

**Content**
Introduction and overview of the forests of the world
- Forest ecosystem ecology: Production ecology of forests
- Autecology: light, temperature, wind, water, and nutrients
- Demecology: regeneration ecology, forest growth, mortality
- Synecology: fundamentals of trophic interactions (forest-ungulate interactions), succession

**Lecture notes**
Handouts are available for download from [https://fe.ethz.ch/studium/lehrmaterialien/bachelor/waldoekologie.html](https://fe.ethz.ch/studium/lehrmaterialien/bachelor/waldoekologie.html).

**Literature**

**Prerequisites / notice**
The contents of the following courses of the 2nd year of the USYS BSc are required:
- Pedosphere, Hydrosphere, Fundamentals of biology and ecology, Introduction to dendrology (knowledge of European tree species).

**Competencies**

- Subject-specific Competencies: assessed
- Method-specific Competencies: assessed
- Personal Competencies: assessed

Abstract

The practice of landfilling, remediation of polluted sites and the disposal of radioactive waste are based on the same concepts of environmental protection. Understanding the contaminants behaviour and how to reduce their release to the environment is the key to remediating polluted sites and designing multi-barrier systems.

Objective

On successful completion of this course students will be able to
- Assess the risk to the environment from landfills, contaminated sites and radioactive waste repositories in terms of the fate and transport of contaminants.
- Describe the technologies available to minimise environmental contamination
- Describe the principles of dealing with polluted sites and propose and evaluate appropriate remediation techniques
- Explain the concepts underlying radioactive waste management practices.

Content

This lecture course consists of lectures with exercises and case studies.
- An overview of the principles of environmental protection in waste management and how this is applied in legislation.
- An overview of the chemistry underlying the release and transport of contaminants from the landfilled/contaminated material/radioactive waste repository focusing on processes controlling mobility of heavy metals and organic compounds
- Introduction to contaminant transport in porous adsorbing media
- Design and function of engineered barriers. Clay as a barrier.
- Polluted site remediation: Site investigation, assessment, and remediation technologies
- Concepts and safety in radioactive waste management
- Role of the geological and engineered barriers and radionuclide transport in geological media.

Prerequisites / notice

excursion
Abstract
This course covers chemical and biogeochemical processes in soils and water and their influence on the behavior and cycling of nutrients and pollutants in terrestrial and aquatic systems. Approaches for quantitative modeling of the processes are introduced and applied in selected examples.

Objective
1. Understanding of important chemical properties and processes of soils and water and their influence on the behavior (e.g., chemical speciation, bioavailability, mobility) of nutrients and pollutants.
2. Quantitative applications of chemical equilibria to processes in natural systems.

The course “Soil and Water Chemistry” teaches, applies and examines the competences process understanding, systems understanding, and modelling.

Content
Chemical equilibria in aqueous solutions, gas equilibria, precipitation and dissolution of mineral phases, silicate weathering, weathering kinetics, formation of secondary minerals (clay minerals, oxides, sulfides), redox processes in natural systems, pH buffering and acidification, salinity and salinization, environmental behavior of selected essential and toxic trace elements.

Abstract
Thermodynamics is key to understanding and use of energy conversion processes in Nature and technology. Main objective of this course is to give a compact introduction into basics of Thermodynamics: Thermodynamic states and thermodynamic processes; Work and Heat; First and Second Laws of Thermodynamics. Students shall learn how to use energy balance equation in the analysis of power cycles and shall be able to evaluate efficiency of internal combustion engines, gas turbines and steam power plants. The course shall extensively use thermodynamic charts to building up students’ intuition about opportunities and restrictions to increase useful work output of energy conversion. Thermodynamic functions such as entropy, enthalpy and free enthalpy shall be used to understand chemical and phase equilibrium. The course also gives introduction to refrigeration cycles, combustion and refrigeration. The course compactly covers the standard course of thermodynamics for engineers, with additional topics of a general physics interest (nonideal gas equation of state and Joule-Thomson effect) also included.

In the course "Energy Conversion", the competences of process understanding and system understanding are applied and examined and the competencies process understanding and modeling are taught.

Content
1. Thermodynamic systems, states and state variables
2. Properties of substances: Water, air and ideal gas
3. Energy conservation in closed and open systems: work, internal energy, heat and enthalpy
4. Second law of thermodynamics and entropy
5. Energy analysis of steam power cycles
6. Energy analysis of gas power cycles
7. Refrigeration and heat pump cycles
8. Nonideal gas equation of state and Joule-Thomson effect
9. Maximal work and exergy
10. Mixtures
11. Chemical reactions and combustion systems; chemical and phase equilibrium

Lecture notes
Lecture slides and supplementary documentation will be available online.

Literature

Prerequisites / notice
This course is intended for students outside of D-MAVT.

Students are assumed to have an adequate background in calculus, physics, and engineering mechanics.

Introduction to Modeling and Optimization of Sustainable Energy Systems

**W 4 credits 4G  G. Sansavini, A. Bardow, S. Moreschi**

**Abstract**
This course introduces the fundamentals of energy system modeling for the analysis and the optimization of the energy system design and operations.

**Objective**
At the end of this course, students will be able to:
- define and quantify the key performance indicators of sustainable energy systems;
- select and apply appropriate models for conversion, storage and transport of energy;
- develop mathematical models for the analysis, design and operations of multi-energy systems and solve them with appropriate mathematical tools;
- select and apply methodologies for the uncertainty analysis on energy systems models;
- apply the acquired knowledge to tackle the challenges of the energy transition.

In the course “Introduction to Modeling and Optimization of Sustainable Energy Systems”, the competencies of process understanding, system understanding, modeling, concept development, data analysis & interpretation and measurement methods are taught, applied and examined. Programming is applied.

**Content**
The global energy transition; Key performance indicators of sustainable energy systems; Optimization models; Heat integration and heat exchanger networks; Life-cycle assessment; Models for conversion, storage and transport technologies; Multi-energy systems; Design, operations and analysis of energy systems; Uncertainties in energy system modeling.

**Lecture notes**
Lecture slides and supplementary documentation will be available online. Reference to appropriate book chapters and scientific papers will be provided.

</table>

**Abstract**
Half-day to one-day excursions as a supplement to the environmental engineering lectures.

**Objective**
As a supplement to the environmental engineering-specific lectures, the professorships offer half-day to one-day excursions in various subject areas.

During the excursions, the students deepen the specialist knowledge acquired in the lectures and self-study and establish a link to practice and research.

These excursions are open to all Bachelor's students of Environmental Engineering, depending on availability, and can be assessed with credit points as part of the subject-specific electives.

The excursions are voluntary and should preferably be attended from the 4th semester onwards.

**Abstract**
The course is organized in the form of seminars held by the students. Topics selected from the core disciplines of the curriculum (water resources, urban water engineering, material fluxes, waste technology, air pollution, earth observation) are discussed in the class on the basis of scientific papers that are illustrated and critically reviewed by the students.

**Objective**
Learn about recent research results in environmental engineering and analyse practical applications in environmental engineering.

**Competencies**
Subject-specific Competencies: Concepts and Theories
Method-specific Competencies: Media and Digital Technologies
Social Competencies: Communication, Cooperation and Teamwork, Customer Orientation, Self-presentation and Social Influence
Personal Competencies: Creative Thinking, Critical Thinking, Self-awareness and Self-reflection

*Electives*

The entire course programs of ETH Zurich and the University of Zurich are open to the students to individual selection.

**Abstract**

The Bachelor Programme concludes with the Bachelor Thesis. This project is supervised by a professor. Writing up the Bachelor Thesis encourages students to show independence and to produce structured work.

**Objective**

Encourages students to show independence, to produce scientifically structured work and to apply engineering working methods.

**Content**

The contents base upon the fundamentals of the Bachelor Programme. Students can choose from different subjects and tasks. The thesis consists of both a written report and an oral presentation.

Abstract
This course deepens students' knowledge of environmental, economic, and social assessment methodologies and their various applications.

Objective
This course has the aim of deepening students' knowledge of the environmental, economic and social assessment methodologies and their various applications.

In particular, students completing the course should have the
- ability to judge the scientific quality and reliability of environmental assessment studies, the appropriateness of inventory data and modelling, and the adequacy of life cycle impact assessment models and factors
- knowledge about the current state of the scientific discussion and new research developments
- ability to properly plan, conduct and interpret environmental assessment studies

Content
Part I (Advanced Environmental Assessments)
- Inventory database developments, transparency, data quality, data completeness, and data exchange formats, uncertainties
- Software tools (MFA, LCA)
- Allocation (multiooutput processes and recycling)
- Hybrid LCA methods.
- Consequential and marginal analysis
- Impact assessment of waterborne chemical emissions, sum parameters, mixture toxicity
- Spatial differentiation in Life Cycle Assessment
- Workplace and indoor exposure in Risk and Life Cycle Assessment
- Subjectivity in environmental assessments
- Multicriteria Decision Analysis
- Case Studies

Part II (Implementation of Environmental and other Sustainability Goals):
- Sustainability problems of the current economic system and its measuring units;
- The structure of a management system, and elements to integrate environmental management (ISO 14001) and social management
(SA8000 as well as ISO 26000), especially into strategy development, planning, controlling and communication;
- Sustainability Opportunities and Innovation
- The concept of ‘Continuous Improvement’
- Life Cycle Costing, Life Cycle Management
- environmental performance measurement of an organisation, including ‘organisational LCA’ (Ecobalance), based on practical examples of companies and new concepts
- single score env. assessment methods (Swiss ecopoints)
- stakeholder management and sustainability oriented communication
- an intro into sustainability issues of supply chain management

Students will get small excercises related to course issues.

Lecture notes
Part I: Slides and background reading material will be available on lecture homepage
Part II: Documents will be available on Ilias

Literature
Will be made available.

Prerequisites / notice
Become acquainted with various software programs for environmental assessment including Life Cycle Assessment, Environmental Risk Assessment, Probabilistic Modeling, Material Flow Analysis.

Competencies
Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies
- Analytical Competencies

Personal Competencies
- Creative Thinking
- Critical Thinking

102-0317-03L
Advanced Environmental Assessment (Computer Lab)

Abstract
Different tools and software used for environmental assessments, such as LCA are introduced. The students will have hands-on exercises in the computer rooms and will gain basic knowledge on how to apply the software and other resources in practice

Objective
Become acquainted with various software programs for environmental assessment including Life Cycle Assessment, Environmental Risk Assessment, Probabilistic Modeling, Material Flow Analysis.

Competencies
Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies
- Analytical Competencies

**Abstract**
Systematic introduction of material balances, transport processes (kinetics, stoichiometry and conservation), ideal reactors, residence time distribution, heterogeneous systems, dynamic response of reactors, parameter identification, local sensitivity, error propagation, and Monte Carlo simulations. Introduction to real-time control (PID controllers). Extensive numerical simulations with coding.

**Objective**
The goal of this course is to provide the students with an understanding of how urban water system can be described with mathematical models, and give them the tools to plan experiments, to evaluate error propagation and to test simple process control strategies in the field of process engineering in urban water management.

**Content**
The course will provide a broad introduction into the fundamentals of modeling water treatment systems. The topics are:
- Introduction into modeling and simulation
- The material balance equations, transport processes, transformation processes (kinetics, stoichiometry, conservation)
- Ideal reactors
- Hydraulic residence time distribution and modeling of real reactors
- Dynamic behavior of reactor systems
- Systems analytical tools: Sensitivity, parameter identification, error propagation, Monte Carlo simulation
- Introduction to process control (PID controller, fuzzy control)

**Lecture notes**
Copies of handouts will be available digitally.

**Literature**
There will be a required textbook that students need to purchase:

**Prerequisites / notice**
Students should have a general understanding of urban water management as many examples are taken from processes relevant to related systems. This course is offered in parallel to the course Process Engineering Ia. It is beneficial but not necessary to follow both courses simultaneously.

**Abstract**
Biological processes used in wastewater treatment, organic waste management, biological resource recovery. Focus on fundamental principles of biological processes and process design based on kinetic and stoichiometric principles. Processes include anaerobic digestion for biogas production and aerobic wastewater treatment.

**Objective**
Students should be able to evaluate and design biological processes.

**Content**
Stoichiometry
- Microbial transformation processes
- Introduction to design and modeling of activated sludge processes
- Anaerobic processes, industrial applications, sludge stabilization

**Literature**
There will be a textbook that students need to purchase (see http://www.sww.ifu.ethz.ch/education/lectures/process-engineering-ia.html for further information).

**Prerequisites / notice**
For detailed information on prerequisites the student should consult the lecture program and important information (syllabus) of Process Engineering Ia that can be accessed via http://www.sww.ifu.ethz.ch/education/lectures/process-engineering-ia.html

</tbody>
</table>

**Abstract**
In this course, students learn modern urban drainage engineering approaches, critical thinking, decision making in a complex environment as well as dealing with insufficient data and ill-defined problems.

**Objective**
By the end of the course, you should be able to do the following:
- Apply different methods and methodologies to assess the impact of urban drainage on water pollution and flooding potential.
- Distinguish between hydrological and hydrodynamic models and their correct application.
- Identify the difference between emission and immission oriented approaches for identifying drainage measures.
- Identify relevant measures, quantify their effects and assess their relative ranking/priority.
- Consider uncertainties and handle incomplete data and information.
- Make decisions and recommendations in a complex application case.
- Teamwork. State principles of effective team performance and the functions of different team roles; work effectively in problem-solving teams.
- Communication. Communicate and document your findings in concise group presentations and a written report.
In urban drainage, the complexity of the decision-making, the available methodologies and the data availability have increased significantly. In current environmental engineering practice, the focus has shifted from tables and nomograms to sophisticated simulation tools. The topics cover:
- Integrated urban water management
- Hydrological and hydrodynamic modelling
- Water quality based assessment
- Freshwater ecology
- Hydraulic capacity assessment
- Sewer network operation
- Decision analysis

Prerequisites / notice
Prerequisites: 102-0214-00 Siedlungswasserwirtschaft and 102-0215-00 Siedlungswasserwirtschaft II or comparable educational background.

Abstract
Air pollutants cause negative effects on humans, wildlife and buildings. To control and reduce the impact of air pollutants, their transfer from sources to receptors needs to be known. This transfer includes transport within the atmospheric boundary layer, chemical transformation reactions and phase-transfer processes from gases to particles.

Objective
The students understand the fundamental principles of atmospheric transport, dispersion and chemistry of pollutants on the local to regional scale and their transfer gas to particle phases (secondary aerosols). This includes the knowledge of important atmospheric reactions, sources and sinks. The obtained understanding enables the students to apply computational tools to predict the transport and transformation of chemicals at the local to regional scale.

Content
- Structure of the Atmosphere
- Thermodynamics of the atmosphere
- Atmospheric stability
- Atmospheric boundary layer and turbulence
- Dispersion in the atmospheric boundary layer
- Numerical models of atmospheric dispersion
- Gas phase reaction kinetics
- Tropospheric chemistry and ozone formation
- Chemistry box models
- Volatile organic pollutants (VOCs) and semi-volatile organic pollutants (SVOCs)
- Aerosol modelling
- Air pollution source apportionment
- Inverse modelling of emissions

Lecture notes
Continued updates of:
- Slides and handouts
- Home assignments and sample solutions
- R package and code for some of the home assignments
- MATLAB codes
- Key journal articles as discussed during lecture

### Waste Management

**Remark:** 101-0339-00 Environmental Geotechnics – Polluted Sites and Waste Disposal only for those students also taking module "System Analysis in Urban Water Management" as replacement of 102-0217-00 Process Engineering Ia in module "Waste Management".

#### Abstract
Waste Recycling Technologies (WRT) is a sub-discipline of Mechanical Process Engineering. WRT is employed in production plants processing contaminated soil, construction wastes, scrap metal, recovered paper and the like. While WRT is well established in Central Europe, it is only now just catching on in emerging markets as well.

#### Objective
At the core of this course is the separation of mixtures of solid bulk materials according to physical properties such as color, electrical conductivity, magnetism and so forth. After having taken this course, the students should have a general understanding of urban water management as many examples are taken from processes relevant to related systems. This course is offered in parallel to the course Process Engineering Ia. It is beneficial but not necessary to follow both courses simultaneously.

### Lecture Notes
Copies of handouts will be available digitally.

### Literature
There will be a required textbook that students need to purchase:

- For detailed information on prerequisites the student should consult the lecture program and important information (syllabus) of Process Engineering Ia that can be accessed via [http://www.sww.ifu.ethz.ch/education/lectures/process-engineering-ia.html](http://www.sww.ifu.ethz.ch/education/lectures/process-engineering-ia.html) for further information.

### Prerequisites / Notice
- For detailed information on prerequisites the student should consult the lecture program and important information (syllabus) of Process Engineering Ia that can be accessed via [http://www.sww.ifu.ethz.ch/education/lectures/process-engineering-ia.html](http://www.sww.ifu.ethz.ch/education/lectures/process-engineering-ia.html).
- Students should have a general understanding of urban water management as many examples are taken from processes relevant to related systems. This course is offered in parallel to the course Process Engineering Ia. It is beneficial but not necessary to follow both courses simultaneously.
Introduction
Waste Recycling: Scope and objectives
Waste recycling technologies in Switzerland

Fundamentals
Properties of particles: Liberation conditions, Particle size and shape, Porosity of bulk materials
Fluid dynamics of particles: Stationary particle beds, Fluidized beds, Free settling particles
Flow sheet basics: Balancing mass flows
Standard processes: batch vs. continuous
Assessment of separation success: Separation function; grade vs. recovery

Separation Processes
Separation according to size and shape (Classification): Screening, Flow separation
Separation according to material properties (Concentration): Manual Sorting, Gravity concentration; Magnetic separation, Eddy current separation, Electrostatic separation, Sensor technology, Froth flotation

Lecture notes
The script consists of the slides shown during the lectures. Background material will be provided on the script-server.

Literature
A list of recommended books will be provided.

Prerequisites /
notice
The topic will be discussed not from the perspective of theory, but rather in the context of practical application. However, solid fundamentals in physics (in particular in mechanics) are strongly recommended.

102-0217-00L Process Engineering Ia O 3 credits 2G E. Morgenroth

Abstract
Biological processes used in wastewater treatment, organic waste management, biological resource recovery. Focus on fundamental principles of biological processes and process design based on kinetic and stoichiometric principles. Processes include anaerobic digestion for biogas production and aerobic wastewater treatment.

Objective
Students should be able to evaluate and design biological processes.

Content
Stoichiometry
Microbial transformation processes
Introduction to design and modeling of activated sludge processes
Anaerobic processes, industrial applications, sludge stabilization

Literature
There will be a textbook that students need to purchase (see http://www.sww.ifu.ethz.ch/education/lectures/process-engineering-ia.html for further information).

101-0339-00L Environmental Geotechnics – Polluted Sites and Waste Disposal O 3 credits 2G M. Plötze

Abstract
The practice of landfiling, remediation of polluted sites and the disposal of radioactive waste are based on the same concepts of environmental protection. Understanding the contaminants behaviour and how to reduce their release to the environment is the key to remediating polluted sites and designing multi-barrier systems.

Objective
On successful completion of this course students will be able to
- Assess the risk to the environment from landfills, contaminated sites and radioactive waste repositories in terms of the fate and transport of contaminants.
- Describe the technologies available to minimise environmental contamination
- Describe the principles of dealing with polluted sites and propose and evaluate appropriate remediation techniques
- Explain the concepts underlying radioactive waste management practices.

Content
This lecture course consists of lectures with exercises and case studies.
- An overview of the principles of environmental protection and how this is applied in legislation.
- An overview of the chemistry underlying the release and transport of contaminants from the landfilled/contaminated material/radioactive waste repository focusing on processes controlling mobility of heavy metals and organic compounds
- Introduction to contaminant transport in porous adsorbing media
- Design and function of engineered barriers. Clay as a barrier.
- Polluted site remediation: Site investigation, assessment, and remediation technologies
- Concepts and safety in radioactive waste management
- Role of the geological and engineered barriers and radionuclide transport in geological media.

Advanced Environmental, Social and Economic Assessments

**Abstract**
This course deepens students' knowledge of environmental, economic, and social assessment methodologies and their various applications.

**Objective**
This course has the aim of deepening students' knowledge of the environmental, economic and social assessment methodologies and their various applications.

In particular, students completing the course should have the:
- ability to judge the scientific quality and reliability of environmental assessment studies, the appropriateness of inventory data and modelling, and the adequacy of life cycle impact assessment models and factors;
- knowledge about the current state of the scientific discussion and new research developments;
- ability to properly plan, conduct and interpret environmental assessment studies.

In the course element "Implementation of Environmental and other Sustainability Goals", students will learn to:
- describe key sustainability problems of the current economic system and measuring units;
- describe the management system of an organisation and how to develop a sustainability orientation;
- discuss approaches to measure environmental performance of an organisation, including ' organisational LCA' (Ecobalance);
- explain the pros and cons of single score environmental assessment methods;
- demonstrate life cycle costing;
- interpret stakeholder relations of an organisation;
- (if time allows) describe sustainable supply chain management and stakeholder management.

**Content**

**Part I (Advanced Environmental Assessments):**
- Inventory database developments, transparency, data quality, data completeness, and data exchange formats, uncertainties;
- Software tools (MFA, LCA);
- Allocation (multisource processes and recycling);
- Hybrid LCA methods;
- Consequential and marginal analysis;
- Impact assessment of waterborne chemical emissions, sum parameters, mixture toxicity;
- Spatial differentiation in Life Cycle Assessment;
- Workplace and indoor exposure in Risk and Life Cycle Assessment;
- Subjectivity in environmental assessments;
- Multicriteria Decision Analysis;
- Case Studies.

**Part II (Implementation of Environmental and other Sustainability Goals):**
- Sustainability problems of the current economic system and its measuring units;
- The structure of a management system, and elements to integrate environmental management (ISO 14001) and social management (SA8000 as well as ISO 26000), especially into strategy development, planning, controlling and communication;
- Sustainability Opportunities and Innovation;
- The concept of 'Continuous Improvement';
- Life Cycle Costing, Life Cycle Management;
- Environmental performance measurement of an organisation, including ' organisational LCA' (Ecobalance), based on practical examples of companies and new concepts;
- Single score env. assessment methods (Swiss ecopoints);
- Stakeholder management and sustainability oriented communication;
- An intro into sustainability issues of supply chain management.

Students will get small excercises related to course issues.

**Lecture notes**
Part I: Slides and background reading material will be available on lecture homepage.
Part II: Documents will be available on Ilias.

**Literature**
Will be made available.

**Prerequisites / notice**
This course should only be elected by students of environmental engineering with a with a Module in Ecological Systems Design. All other students should take the individual courses in Advanced Environmental Assessment and/or Implementation of Environmental and other Sustainability goals (with or without exercise and lab).

Basic knowledge of environmental assessment tools is a prerequisite for this class. Students who have not yet had classwork in this topic are required to read an appropriate textbook before or at the beginning of this course (e.g. Jolliet, O et al. (2016). Environmental Life Cycle Assessment. CRC Press, Boca Raton - London - New York. ISBN 978-1-4398-8766-0 (Chapters 2-5,2)).

**Competencies**

**Subject-specific Competencies**
- Concepts and Theories
- Techniques and Technologies
- Analytical Competencies
- Problem-solving
- Creative Thinking
- Critical Thinking

**Method-specific Competencies**
- Concepts and Theories
- Techniques and Technologies
- Analytical Competencies
- Critical Thinking

**Personal Competencies**
- Critical Thinking

---

**Advanced Environmental Assessment (Computer Lab)**

**Abstract**
Different tools and software used for environmental assessments, such as LCA are introduced. The students will have hands-on exercises in the computer rooms and will gain basic knowledge on how to apply the software and other resources in practice.

**Objective**
Become acquainted with various software programs for environmental assessment including Life Cycle Assessment, Environmental Risk Assessment, Probabilistic Modeling, Material Flow Analysis.

**Competencies**

**Subject-specific Competencies**
- Concepts and Theories
- Techniques and Technologies
- Analytical Competencies
- Critical Thinking

---

**Groundwater**

Module is offered in Spring Semester.

**Waste Management**
Environmental Geotechnics – Polluted Sites and Waste Disposal

Abstract
The practice of landfilling, remediation of polluted sites and the disposal of radioactive waste are based on the same concepts of environmental protection. Understanding the contaminants behaviour and how to reduce their release to the environment is the key to remediating polluted sites and designing multi-barrier systems. 

Objective
On successful completion of this course students will be able to:
- Assess the risk to the environment from landfills, contaminated sites and radioactive waste repositories in terms of the fate and transport of contaminants.
- Describe the technologies available to minimise environmental contamination.
- Describe the principles of dealing with polluted sites and propose and evaluate appropriate remediation techniques.
- Explain the concepts underlying radioactive waste management practices.

Content
This lecture course consists of lectures with exercises and case studies.
- An overview of the principles of environmental protection in waste management and how this is applied in legislation.
- An overview of the chemistry underlying the release and transport of contaminants from the landfilled/contaminated material/radioactive waste repository focusing on processes controlling mobility of heavy metals and organic compounds.
- Introduction to contaminant transport in porous adsorbing media.
- Design and function of engineered barriers. Clay as a barrier.
- Polluted site remediation: Site investigation, assessment, and remediation technologies.
- Concepts and safety in radioactive waste management.
- Role of the geological and engineered barriers and radionuclide transport in geological media.

Prerequisites / notice
- Excursion to sites of radioactive waste and polluted sites.

Literature
- Customers of radioactive waste and polluted sites.
- Reports on radioactive waste and polluted sites.
- Literature on radioactive waste and polluted sites.

Content
- Waste Recycling and Disposal Technologies
- Waste Recycling: Scope and objectives
- Waste Recycling technologies in Switzerland

Abstract
Waste Recycling Technology (WRT) is a sub-discipline of Mechanical Process Engineering. WRT is employed in production plants processing contaminated soil, construction wastes, scrap metal, recovered paper and the like. While WRT is well established in Central Europe, it is only just now catching on in emerging markets as well.

Objective
At the core of this course is the separation of mixtures of solid bulk materials according to physical properties such as color, electrical conductivity, magnetism and so forth. After having taken this course, the students should have concept not only of the unit operations employed in WRT but also of how these unit operations are integrated into the flow sheets of production plants.

Content
Introduction
- Waste Recycling: Scope and objectives
- Waste Recycling technologies in Switzerland

Abstract
Biological processes used in wastewater treatment, organic waste management, biological resource recovery. Focus on fundamental principles of biological processes and process design based on kinetic and stoichiometric principles. Processes include anaerobic digestion for biogas production and aerobic wastewater treatment.

Objective
Students should be able to evaluate and design biological processes.

Content
- Fundamentals
  - Properties of particles: Liberation conditions, Particle size and shape, Porosity of bulk materials
  - Fluid dynamics of particles: Stationary particle beds, Fluidized beds, Free settling particles
  - Flow sheet basics: Balancing mass flows
  - Standard processes: batch vs. continuous

- Separation Processes
  - Separation according to size and shape (Classification): Screening, Flow separation
  - Separation according to material properties (Concentration): Manual Sorting, Gravity concentration, Magnetic separation, Eddy current separation, Electrostatic separation, Sensor technology, Froth flotation

- Lecture notes
The script consists of the slides shown during the lectures. Background material will be provided on the script-server.

- Literature
A list of recommended books will be provided.

- Prerequisites / notice
The topic will be discussed not from the perspective of theory, but rather in the context of practical application. However, solid fundamentals in physics (in particular in mechanics) are strongly recommended.

- Prerequisites / notice
For detailed information on prerequisites the student should consult the lecture program and important information (syllabus) of Process Engineering Ia.

- Competencies

Data: 26.07.2024 12:39  Autumn Semester 2024  Page 2405 of 2680
In the course Numerical Hydraulics the basics of numerical modelling of flows are presented. Watershed Modelling is a practical course on numerical water balance models for a range of catchment-scale water resource applications.

The main aim of the course is to provide practical training with watershed models for environmental engineers. The course is built on the first part (A) of the course on watershed properties analysed from DEMs, and on global sources of hydrological data for modelling applications. Here students learn about GIS applications (ArcGIS, Q-GIS) in hydrology - flow direction routines, catchment morphometry, extracting river networks, and defining hydrological response units. In the second part (B) of the course on conceptual watershed models students build their own simple bucket model (Matlab, Python), they learn about performance measures in modelling, how to calibrate the parameters and how to validate models, about methods to simulate stochastic climate to drive models, uncertainty analysis. The third part (C) of the course is focussed on physically-based model components. Here students learn about components for soil water fluxes and evapotranspiration, they practice with a fully-distributed physically-based model Topkapi-ETH, and learn about other similar models at larger scales. They apply Topkapi-ETH to an alpine catchment and study simulated discharge, snow, soil moisture and evapotranspiration spatial patterns.

There is no textbook. Learning materials consist of (a) video-recording of lectures; (b) lecture presentations; and (c) exercise task documents that allow independent work.

Literature consist of collections from standard hydrological textbooks and research papers, collected by the instructors on the course moodle page.

Prerequisites / notice
Basic Hydrology in Bachelor Studies (engineering, environmental sciences, earth sciences). Basic knowledge of Matlab (Python), ArcGIS (Q-GIS).

Competencies
Subject-specific Competencies
- Concepts and Theories: assessed
- Analytical Competencies: assessed
- Decision-making: assessed
- Media and Digital Technologies: assessed
- Problem-solving: assessed

Method-specific Competencies
- Communication: fostered
- Cooperation and Teamwork: fostered
- Customer Orientation: fostered
- Negotiation: fostered

Social Competencies
- Self-awareness and Self-reflection: fostered
- Self-direction and Self-management: fostered

Personal Competencies
- Adaptability and Flexibility: fostered
- Creative Thinking: assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: fostered

Objective
The goal of the course is to develop the understanding of the students for numerical simulation of flows to an extent that they can later use commercial software in a responsible and critical way.

Content
The basic equations are derived from first principles. Possible simplifications relevant for practical problems are shown and their applicability is discussed. Using the example of non-steady state pipe flow numerical methods such as the method of characteristics and finite difference methods are introduced. The finite volume method as well as the method of characteristics are used for the solution of the shallow water equations. Special aspects such as wave propagation and turbulence modelling are also treated. All methods discussed are applied practically in exercises. This is done using programs in MATLAB which partially are programmed by the students themselves. Further, some generally available softwares such as BASEMENT for non-steady shallow water flows are used.

Lecture notes
Slides from the lectures and programs used can be downloaded.

102-0259-00L Ecohydraulics and Habitat Modelling O 3 credits 2G R. Stocker, K.-D. Jorde, L. G. Martins da Silva, A. Siviglia

Abstract
At a time in which humans have significantly affected the natural environment and yet society increasingly values the many services of natural ecosystems, accounting for ecological processes in engineering design is a major contemporary challenge for environmental and civil engineers.

Objective
This is the fundamental topic in ecohydraulics, the discipline that focuses on the consequences of fluid flow and related physical processes on the organisms that inhabit aquatic environments. While still a young science, ecohydraulics already endows the engineer with an overall understanding and quantitative tools to predict how physical processes shape habitat quality and quantity, enabling the analysis of different management options for natural and man-made water bodies in terms of their ecosystem consequences.

Content
This class will take a broad view of ecohydraulics and introduce students to key concepts in aquatic habitat modeling. Recognizing that an ecosystem is composed of diverse organisms with different seasonal habitat requirements across a range of scales, the class will focus on multiple representative groups of organisms, including fish, macroinvertebrates, plankton, and vegetation. The lectures will build on the students' knowledge of hydraulics, to give them both an appreciation for the dependence of organisms on their physical environment and a set of quantitative modeling approaches that they can take with them into engineering practice, in fields ranging from hydropower development and upgrade, to reservoir operation, river restoration, flood protection, water management and beyond. At the broadest scale, this class will contribute to the students' appreciation of the tight link between the natural and the built or impacted environment, and of the imperatives of considering both in the design process.

<td>A. Grêt-Regamey</td>
<td></td>
</tr>
</tbody>
</table>

Abstract
In the course, students learn about methods for the identification and measurement of landscape characteristics, as well as measures and policies for landscape planning. Landscape planning is put into the context of environmental systems (soil, water, air, climate, flora and fauna) and discussed with regard to socio-political questions of the future.

Objective
The aims of this course are:
1) To illustrate the concept of landscape planning, the economic relevance of landscape and nature in the context of the environmental systems (soil, water, air, climate, flora and fauna).
2) To show landscape planning as an integral information system for the coordination of different instruments by illustrating the aims, methods, instruments and their functions in landscape planning.
3) To show the importance of ecosystem services.
4) To learn basics about nature and landscape: Analysis and assessment of the complex interactions between landscape elements, effects of current and future land use (ecosystem goods and services, landscape functions).
5) To identify and measure the characteristics of landscape.
6) Learn how to use spatial data in landscape planning.

Content
In this course, the following topics are discussed:
- Definition of the concept of landscape
- Relevance of landscape planning
- Landscape metrics
- Landscape change
- Methods, instruments and aims of landscape planning (policy)
- Socio-political questions of the future
- Environmental systems, ecological connectivity
- Ecosystem services
- Urban landscape services
- Practice of landscape planning
- Use of GIS in landscape planning

Lecture notes
No script. The documentation, consisting of presentation slides are partly handed out and are provided for download on Moodle.

Prerequisites / notice
The contents of the course will be illustrated in the associated course 103-0347-01 U (Landscape Planning and Environmental Systems (GIS Exercises)) or in Project LAND within the Experimental and Computer Lab (for Environmental Engineers). A combination of courses is recommended.
The course has two fundamental aims: (1) The first aim is to provide environmental engineers with the physical process basis needed to understand fluvial system change, using the right language and terminology to describe landforms. We will cover the main geomorphic concepts of landscape change, e.g. thresholds, equilibrium, criticality, to describe change. Students will learn about the importance of the concepts of connectivity and timescales of change. (2) The second aim is to provide quantitative skills in making simple and more complex predictions of change and the data and models required. We will learn about typical landscape evolution models, and about hillslope erosion model concepts like RUSLE. We will learn how to identify sediment sources and sinks, and develop simple sediment budgets with the right data needed for this purpose. Finally we will learn about methods to describe the topology of river networks as conduits of sediment through the fluvial system.

The course consists of four sections: (1) Introduction to fluvial forms and processes and geomorphic concepts of landscape change, including climatic and human activities acting on the system. Concepts like thresholds, equilibrium, self-organised criticality, etc. are presented. (2) Landscape evolution modelling as a tool for describing the shape of the land surface. Soil formation and sediment production at long timescales. (3) The processes of sediment production, upland sheet-riparian gully erosion, basin sediment yield, rainfall-triggered landsliding, sediment budgets, and the modelling of the individual processes involved. Here we combine model concepts with field observations and look at many examples. (4) Processes in the river, floodplain and riparian zone, including river network topology, channel geometry, aquatic habitat, role of riparian vegetation, including basics of fluvial system management. The main focus of the course is on the hydrology-sediment connections at the field and catchment scale.

The course presents a view of the catchment processes of sediment production and transport that shape the landscape. Focus is on sediment fluxes from sources on hillslopes to the river network. Students learn about how a fluvial system functions, how to identify sediment sources and sinks, how to make predictions with numerical models, develop sediment budgets, and quantify geomorphic change. The main aim of the course is to provide practical training with watershed models for environmental engineers. The course is built on textbooks, professional papers, and ongoing research activities of the instructor. All material is on the course webpage.

Abstract
Watershed Modelling is a practical course on numerical water balance models for a range of catchment-scale water resource applications. The course covers GIS use in watershed analysis, models types from conceptual to physically-based, parameter calibration and model validation, and analysis of uncertainty. The course combines theory (lectures) with a series of practical tasks (exercises).

Objective
The main aim of the course is to provide practical training with watershed models for environmental engineers. The course is built on thematic lectures (2 hrs a week) and practical exercises (2 hrs a week). Theory and concepts in the lectures are underpinned by many examples from scientific studies. A comprehensive exercise block builds on the lectures with a series of 4 practical tasks to be conducted during the semester in group work. Exercise hours during the week focus on explanation of the tasks. The course is evaluated 50% by performance in the graded exercises and 50% by a semester-end oral examination (30 mins) on watershed modelling concepts.

Content
The first part (A) of the course is on watershed properties analysed from DEMs, and on global sources of hydrological data for modelling applications. Here students learn about GIS applications (ArcGIS, Q-GIS) in hydrology - flow direction routines, catchment morphometry, extracting river networks, and defining hydrological response units. In the second part (B) of the course on conceptual watershed models students build their own simple bucket model (Matlab, Python), they learn about performance measures in modelling, how to calibrate the parameters and how to validate models, about methods to simulate stochastic climate to drive models, uncertainty analysis. The third part (C) of the course is focussed on physically-based model components. Here students learn about components for soil water fluxes and evapotranspiration, they practice with a fully-distributed physically-based model Topkapi-ETH, and learn about other similar models at larger scales. They apply Topkapi-ETH to an alpine catchment and study simulated discharge, snow, soil moisture and evapotranspiration spatial patterns.

The course has two fundamental aims: (1) The first aim is to provide environmental engineers with the physical process basis needed to understand fluvial system change, using the right language and terminology to describe landforms. We will cover the main geomorphic concepts of connectivity and timescales of change. (2) The second aim is to provide quantitative skills in making simple and more complex predictions of change and the data and models required. We will learn about typical landscape evolution models, and about hillslope sediment sources and sinks, how to make predictions with numerical models, develop sediment budgets, and quantify geomorphic change.

At the end of the course, the students will be able to:
- recall and describe the fundamentals of transport processes in rivers,
- apply different calculation approaches and methods to tackle river engineering problems and tasks such as the discharge capacity of a river, scour estimation, or sediment budget of a river,
- design and dimension river engineering works needed to influence the processes in watercourses, and determine the interaction between flow (discharge), sediment transport, wood transport and the resulting channel evolution.

In the last part of the lecture focuses on the design of river engineering structures, including examples from an ongoing flood and river rehabilitation project at the Alpine Rhine in Austria and Switzerland.

The course presents a view of the catchment processes of sediment production and transport that shape the landscape. Focus is on sediment fluxes from sources on hillslopes to the river network. Students learn about how a fluvial system functions, how to identify sediment sources and sinks, how to make predictions with numerical models, develop sediment budgets, and quantify geomorphic change.

The last part of the lecture focuses on the design of river engineering structures, including examples from an ongoing flood and river rehabilitation project at the Alpine Rhine in Austria and Switzerland.
The students understand the fundamental principles of atmospheric transport, dispersion and chemistry of pollutants on the local to regional scale. Additionally, they are familiar with the processes of sediment production, upland sheet-rill-gully erosion, basin sediment yield, rainfall-triggered landsliding, sediment budgets, and the modelling of the individual processes involved. Here we combine model concepts and field observations and look at many examples. The obtained understanding enables the students to apply computational tools to predict the transport and transformation of chemicals at the local to regional scale. The main focus of the course is on the hydrology-sediment connections at the field and catchment scale.

**Abstract**
Working during one semester on a task on a topic in the chosen major.

**Objective**
Promote independent, structured and scientific work; learn to apply engineering methods; deepen the knowledge in the field of the treated task.

**Content**
The project work is supervised by a professor. Students can choose from different subjects and tasks.

</tbody>
</table>

**Abstract**
Air pollutants cause negative effects on humans, wildlife and buildings. To control and reduce the impact of air pollutants, their transfer from sources to receptors needs to be known. This transfer includes transport within the atmospheric boundary layer, chemical transformations, reactions and phase-transfer processes from gases to particles.

**Objective**
The students understand the fundamental principles of atmospheric transport, dispersion and chemistry of pollutants on the local to regional scale and their transfer gas to particle phases (secondary aerosols). This includes the knowledge of important atmospheric reactions, sources and sinks. The obtained understanding enables the students to apply computational tools to predict the transport and transformation of chemicals at the local to regional scale.
Content
- Structure of the Atmosphere
- Thermodynamics of the atmosphere
- Atmospheric stability
- Atmospheric boundary layer and turbulence
- Dispersion in the atmospheric boundary layer
- Numerical models of atmospheric dispersion
- Gas phase reaction kinetics
- Tropospheric chemistry and ozone formation
- Chemistry box models
- Volatile organic pollutants (VOCs) and semi-volatile organic pollutants (SVOCs)
- Aerosol modelling
- Air pollution source apportionment
- Inverse modelling of emissions

Lecture notes
- Continued updates of:
  - Slides and handouts
  - Home assignments and sample solutions
  - R package and code for some of the home assignments
  - MATLAB codes
  - Key journal articles as discussed during lecture

Abstract
This course deepens students' knowledge of environmental, economic, and social assessment methodologies and their various applications.

Objective
This course has the aim of deepening students’ knowledge of the environmental, economic and social assessment methodologies and their various applications.

In particular, students completing the course should have the
- ability to judge the scientific quality and reliability of environmental assessment studies, the appropriateness of inventory data and modelling, and the adequacy of life cycle impact assessment models and factors
- knowledge about the current state of the scientific discussion and new research developments
- ability to properly plan, conduct and interpret environmental assessment studies

In the course element "Implementation of Environmental and other Sustainability Goals", students will learn to
- describe key sustainability problems of the current economic system and measuring units.
- describe the management system of an organisation and how to develop a sustainability orientation
- discuss approaches to measure environmental performance of an organisation, including ‘organisational LCA’ (Ecobalance)
- explain the pros and cons of single score environmental assessment methods
- demonstrate life cycle costing
- interpret stakeholder relations of an organisation
- (if time allows) describe sustainable supply chain management and stakeholder management
Part I (Advanced Environmental Assessments)
- Inventory database developments, transparency, data quality, data completeness, and data exchange formats, uncertainties
- Software tools (MFA, LCA)
- Allocation (multiooutput processes and recycling)
- Hybrid LCA methods.
- Consequential and marginal analysis
- Impact assessment of waterborne chemical emissions, sum parameters, mixture toxicity
- Spatial differentiation in Life Cycle Assessment
- Workplace and indoor exposure in Risk and Life Cycle Assessment
- Subjectivity in environmental assessments
- Multicriteria Decision Analysis
- Case Studies

Part II (Implementation of Environmental and other Sustainability Goals):
- Sustainability problems of the current economic system and its measuring units;
- The structure of a management system, and elements to integrate environmental management (ISO 14001) and social management (SA8000 as well as ISO 26000), especially into strategy development, planning, controlling and communication;
- Sustainability Opportunities and Innovation
- The concept of 'Continuous Improvement'
- Life Cycle Costing, Life Cycle Management
- environmental performance measurement of an organisation, including 'organisational LCA' (Ecobalance), based on practical examples of companies and new concepts
- single score env. assessment methods (Swiss ecopoints)
- stakeholder management and sustainability oriented communication
- an intro into sustainability issues of supply chain management
Students will get small exericses related to course issues.

Lecture notes
Part I: Slides and background reading material will be available on lecture homepage
Part II: Documents will be available on ilias

Literature
Will be made available.

Prerequisites / notice
This course should only be elected by students of environmental engineering with a with a Module in Ecological Systems Design. All other students should take the individual courses in Advanced Environmental Assessment and/or Implementation of Environmental and other Sustainability goals (with or without exercise and lab).

Basic knowledge of environmental assessment tools is a prerequisite for this class. Students who have not yet had classwork in this topic are required to read an appropriate textbook before or at the beginning of this course (e.g. Jolliet, O et al. (2016), Environmental Life Cycle Assessment. CRC Press, Boca Raton - London - New York. ISBN 978-1-4398-8766-0 (Chapters 2-5,2)).

101-0267-01L Numerical Hydraulics W 3 credits 2G E. Secchi, D. Vanzo

Abstract
In the course Numerical Hydraulics the basics of numerical modelling of flows are presented.

Objective
The goal of the course is to develop the understanding of the students for numerical simulation of flows to an extent that they can later use commercial software in a responsible and critical way.

Content
The basic equations are derived from first principles. Possible simplifications relevant for practical problems are shown and their applicability is discussed. Using the example of non-steady state pipe flow numerical methods such as the method of characteristics and finite difference methods are introduced. The finite volume method as well as the method of characteristics are used for the solution of the shallow water equations. Special aspects such as wave propagation and turbulence modelling are also treated.

All methods discussed are applied primarily in exercises. This is done using programs in MATLAB which partially are programmed by the students themselves. Further, some generally available softwares such as BASEMENT for non-steady shallow water flows are used.

102-0259-00L Ecohydraulics and Habitat Modelling W 3 credits 2G R. Stocker, K.-D. Jorde,
Hydraulic structures and their functions within hydraulic systems are treated in this lecture. The basic concepts of their layout and design is specified in the lecture and in the manuscript.

Adaptability and Flexibility

R. Boes

This class will take a broad view of ecohydraulics and introduce students to key concepts in aquatic habitat modeling. Recognizing that an ecosystem is composed of diverse organisms with different seasonal habitat requirements across a range of scales, the class will focus on multiple representative groups of organisms, including fish, macroinvertebrates, plants, and birds. The lectures will build on the students’ knowledge of hydraulics, to give them both an appreciation for the dependence of organisms on their physical environment and a set of quantitative modeling approaches that they can take with them into engineering practice, in fields ranging from hydropower development and upgrade, to reservoir operation, river restoration, flood protection, water management and beyond. At the broadest scale, this class will contribute to the students’ appreciation of the tight link between the natural and the built or impacted environment, and of the imperatives of considering both in the design process.

Competencies

Subject-specific Competencies: Concepts and Theories

Method-specific Competencies: Analytical Competencies, Problem-solving

Personal Competencies: Critical Thinking

EM: Hydraulic Engineering

101-0247-01L | Hydraulic Engineering II | W | 6 credits | 4G | R. Boes

Abstract: Hydraulic structures and their functions within hydraulic systems are treated in this lecture. The basic concepts of their layout and design with regard to economy and safety are provided.

Objective: Knowledge of hydraulic structures and their functions within hydraulic systems. Skills for the layout and design of hydraulic structures with regard to economy and safety.

Lecture notes: manuscript and further documentation

Prerequisites / notice: Information: Because Hydraulic Engineering II is strongly based on Hydraulic Engineering (Wasserbau, 101-0206-00L) it is strongly recommended to have taken this course (101-0206-00L) or a similar one previously.

Competencies: Subject-specific Competencies: Concepts and Theories assessed, Techniques and Technologies assessed, Analytical Competencies assessed, Decision-making assessed, Problem-solving assessed.

Method-specific Competencies: Analytical Competencies assessed, Decision-making assessed, Problem-solving assessed.

Personal Competencies: Adaptability and Flexibility fostered, Critical Thinking fostered, Self-direction and Self-management fostered.

EM: Landscape

Number | Title | Type | ECTS | Hours | Lecturers
---|---|---|---|---|---
103-0347-00L | Landscape Planning and Environmental Systems | W | 3 credits | 2V | A. Grêt-Regamey

Abstract: In the course, students learn about methods for the identification and measurement of landscape characteristics, as well as measures and policies for landscape planning. Landscape planning is put into the context of environmental systems (soil, water, air, climate, flora and fauna) and discussed with regard to socio-political questions of the future.

Objective: The aims of this course are:
1) To illustrate the concept of landscape planning, the economic relevance of landscape and nature in the context of the environmental systems (soil, water, air, climate, flora and fauna).
2) To show landscape planning as an integral information system for the coordination of different instruments by illustrating the aims, methods, instruments, and their functions in landscape planning.
3) To show the importance of ecosystem services.
4) To learn basics about nature and landscape: Analysis and assessment of the complex interactions between landscape elements, effects of current and future land use (ecosystem goods and services, landscape functions).
5) To identify and measure the characteristics of landscape.
6) Learn how to use spatial data in landscape planning.
In this course, the following topics are discussed:
- Definition of the concept of landscape
- Relevance of landscape planning
- Landscape metrics
- Landscape change
- Methods, instruments and aims of landscape planning (policy)
- Socio-political questions of the future
- Environmental systems, ecological connectivity
- Ecosystem services
- Urban landscape services
- Practice of landscape planning
- Use of GIS in landscape planning

The course presents a view of the catchment processes of sediment production and transport that shape the landscape. Focus is on communication, concepts and theories. Applied Radar Remote Sensing fosters communication and concepts in the field of remote sensing.

The course materials consist of a series of 13 lecture presentations and notes to each lecture. The lectures were developed from textbooks, professional papers, and ongoing research activities of the instructor. All material is on the course webpage.

The contents of the course will be illustrated in the associated course 103-0347-01 U (Landscape Planning and Environmental Systems (GIS Exercises)) or in Project LAND within the Experimental and Computer Lab (for Environmental Engineers). A combination of courses is recommended.

### Prerequisites / notice

There is no script. The documentation, consisting of presentation slides are partly handed out and are provided for download on Moodle.

The Prerequisites / notice is on the hydrology-sediment connections at the field and catchment scale. The course consists of four sections: (1) Introduction to fluvial forms and processes and geomorphic concepts of landscape change, including climatic and human activities acting on the system. Concepts like thresholds, equilibrium, self-organised criticality, etc. are presented. (2) Landscape evolution modelling as a tool for describing the shape of the land surface. Soil formation and sediment production at long timescales. (3) The processes of sediment production, upland sheet-rill-gully erosion, basin sediment yield, rainfall-triggered landsliding, sediment budgets, and the modelling of the individual processes involved. Here we combine model concepts with field observations and look at many examples. (4) Processes in the river, floodplain and riparian zone, including river network topology, channel geometry, aquatic habitat, role of riparian vegetation, including basics of fluvial system management. The main focus of the course is on the hydrology-sediment connections at the field and catchment scale.

### Content

#### Abstract

The course presents a view of the catchment processes of sediment production and transport that shape the landscape. Focus is on sediment fluxes from sources on hillslopes to the river network. Students learn about how a fluvial system functions, how to identify sediment sources and sinks, and how to make predictions with numerical models, develop sediment budgets, and quantify geomorphic change.

#### Objective

The course has two fundamental aims: (1) The first aim is to provide environmental engineers with the physical process basis needed to understand fluvial system change, using the right language and terminology to describe landforms. We will cover the main geomorphic concepts of landscape change, e.g. thresholds, criticality, to describe change. Students will learn about the importance of the concepts of connectivity and timescales of change. (2) The second aim is to provide quantitative skills in making simple and more complex predictions of change and the data and models required. We will learn about typical landscape evolution models, and about hillslope erosion model concepts like RUSLE. We will learn how to identify sediment sources and sinks, and develop simple sediment budgets with the right data needed for this purpose. Finally we will learn about methods to describe the topology of river networks as conduits of sediment through the fluvial system.

#### Lecture notes

There is no script. The documentation, consisting of presentation slides are partly handed out and are provided for download on Moodle.

The literature consists of a series of 13 lecture presentations and notes to each lecture. The lectures were developed from textbooks, professional papers, and ongoing research activities of the instructor. All material is on the course webpage.

### Prerequisites / notice

Prerequisites: Basic Hydrology and Watershed Modelling (or contact instructor).

#### EM: Process Engineering in Urban Water Management

**Elective Module for Majors **“Resource Management”, “River and Hydraulic Engineering” and “Water Resources Management”.

*No courses in autumn semester (HS), only in spring semester (FS).*

#### EM: Remote Sensing and Earth Observation

**Remark:** Students also taking module “Remote Sensing and Earth Observation” as replacement of 102-0617-01L Methodologies for Image Processing of Remote Sensing Data in module “Landscape” have to chose one out following list:

- 102-1241-00L Atmospheric Remote Sensing (HS, 3 KP)
- 102-1532-00L Radiation and Climate Change (FS, 3 KP)
- 102-1644-00L Mountain Forest Hydrology (HS, 5 KP)

Data: 26.07.2024 12:39 Autumn Semester 2024 Page 2415 of 2680
This course provides an introduction to processing and interpreting radar and synthetic aperture radar (SAR) remote sensing data. The primary topics of the course are interferometric techniques and related applications such as topography mapping and mapping of surface displacements, with a strong emphasis on solving practical problems using MATLAB.

Understand the concepts and techniques required to process and to adequately interpret interferometric radar/SAR data for topographic mapping and surface displacement applications.

At the end of the course the student is able to read, display, process, and interpret interferometric radar/SAR using MATLAB.

The rationale behind the structure of the course follows the idea that radar imaging and radar/SAR interferometry are closely related and that a basic understanding of the radar imaging concept is helpful to understand and interpret interferometric radar data for various applications.

The course starts with the real-aperture radar case and a first introduction to the concept of radar interferometry with applications to topographic mapping and mapping of surface displacements.

Based on that, the 2-D imaging concept used in synthetic aperture radar imaging is treated.

Then, we expand further on radar and SAR interferometric (InSAR) concepts and processing steps for single interferograms and stacks of interferograms also using persistent scatterer interferometry (PSI) to measure deformation based on time series of interferometric SAR data.

Finally, the 3-D radar imaging case (SAR tomography) is put into context with PSI/InSAR time series as an extension of the more classical interferometric approaches thereby closing the circle around the strongly related concepts of SAR imaging and interferometry.

The 3-D radar imaging case (SAR tomography) is put into context with PSI/InSAR time series as an extension of the more classical interferometric approaches thereby closing the circle around the strongly related concepts of SAR imaging and interferometry.

It is highly recommended that the student has previously taken the following courses:
- 102-0617-00L: Basics and Principles of Radar Remote Sensing
- 102-0617-00L: Methodologies for Image Processing of Remote Sensing Data

Handouts for each topic will be provided online.

Additional reading material:
- ISBN: 978-0-306-47633-4
- https://doi.org/10.1007/0-306-47633-9

It is highly recommended that the student has previously taken the following courses:

102-0617-00L: Basics and Principles of Radar Remote Sensing

Environmental Applications

The course will provide the basics and principles of Radar Remote Sensing (specifically Synthetic Aperture Radar (SAR)) and its imaging techniques for the use of environmental parameter estimation.

At the end of the course the student has the understanding of:
1. SAR basics and principles,
2. SAR polarimetry,
3. SAR interferometry and
4. environmental parameter estimation from multi-parametric SAR data

The course is giving an introduction into SAR techniques, the interpretation of SAR imaging responses and the use of SAR for different environmental applications. The outline of the course is the following:
1. Introduction into SAR basics and principles
2. Introduction into electromagnetic wave theory
3. Introduction into scattering theory and decomposition techniques
4. Introduction into SAR interferometry
5. Introduction into polarimetric SAR interferometry
6. Introduction into bio/geophysical parameter estimation (classification/segmentation, soil moisture estimation, earth quake and volcano monitoring, forest height inversion, wood biomass estimation etc.)

Handouts for each topic will be provided.

First readings for the course:

Complete literature listing will be provided during the course.

Note only for HS23: The previous replacement course Wildbach- und Hangverbau for River Basin Erosion will not be offered in HS23. Students taking LAND and RIVER must take one from the following list as a substitute for River Basin Erosion, which occurs in both modules:
- 101-0577-00 An Introduction to Sustainable Development in the Built Environment (HS)
- 701-1257-00 European Climate Change (HS)
- 101-1249-00 Hydraulics of Engineering Structures (HS)

The course will provide the basics and principles of Radar Remote Sensing (specifically Synthetic Aperture Radar (SAR)) and its imaging techniques for the use of environmental parameter estimation.

At the end of the course the student is able to read, display, process, and interpret interferometric radar/SAR using MATLAB.

The primary topics of the course are interferometric techniques and related applications such as topography mapping and mapping of surface displacements, with a strong emphasis on solving practical problems using MATLAB.

The lecture addresses the fundamentals of river engineering to quantitatively describe the flow of water, transport of sediment and wood, and morphological changes such as erosion and deposition processes associated with river structures. In addition, design guidelines for river engineering structures are introduced.

At the end of the course, the students will be able to:
- recall and describe the fundamentals of transport processes in rivers,
- apply different calculation approaches and methods to tackle river engineering problems and tasks such as the discharge capacity of a river, scour estimation, or sediment budget of a river,
- design and dimension river engineering works needed to influence the processes in watercourses, and
- determine the interaction between flow (discharge), sediment transport, wood transport and the resulting channel evolution.

The primary topics of the course are interferometric techniques and related applications such as topography mapping and mapping of surface displacements, with a strong emphasis on solving practical problems using MATLAB.
Content
The first part of the lecture introduces the fundamentals of river engineering, such as methods to determine and calculate the river discharge, or sampling methods to characterize the bed material. In addition, the transport processes of sediment (bedload and suspended load) and wood in rivers will be examined, including the principles of incipient motion, and initiation of erosion or deposition processes.

In the second part of the lecture, the methods will be explained to quantify the bed load budget and the morphological changes (erosion, deposition) in river systems. Specifically, natural channel formation processes, different bed forms and plan forms of rivers (straight, meandering, braided) are examined.

The last part of the lecture focuses on the design of river engineering structures, including examples from an ongoing flood and river rehabilitation project at the Alpine Rhine in Austria and Switzerland.

Abstract
The course provides theoretical and practical foundations for understanding and characterizing physical soil properties and processes and their relevance for terrestrial ecosystems, plant growth, hydrological processes and atmospheric-land gas exchange, across all relevant scales.

Objective
Students are able to:
- Characterize the different soils based on their key textural and structural properties.
- Simulate and predict soil water retention and flow under varying environmental conditions and understand the key driving forces (capillarity, gravity, friction) and related water properties (surface tension and viscosity).
- Predict soil hydraulic properties for varying soil textural classes.
- Predict solute transport in soils for varying environmental conditions.
- Predict energy balance and temperature dynamics in soils.
- Predict conditions for plant water stress
- Estimate the impact of soil properties on the hydrological cycle and on plant growth.
INTRODUCTION
Week 1 (September 18)
Presentation of the role of soil physics in environmental sciences and terrestrial ecosystems: soils in the water cycle; soils and vegetation; soils and solute transport. Survey on students' interests and expectations. Presentation of course structure and learning objectives.

BASIC SOIL PROPERTIES
Week 2 (September 25) and Week 3 (October 02)
soil texture, particle size distribution, soil structure, soil surface area, porosity and bulk density
Pore scale consideration (water in a single pore), pore sizes and shapes; surface tension; Young-Laplace equation; capillary rise; contact angle
Friction and laminar flow; Hagen-Poiseuille’s law; Washburn equation; numerical lab (REPORT 1)

SOIL HYDRAULIC PROPERTIES
Week 4 (October 09) and Week 5 (October 16)
Soil water content and soil water potential - The energy state of soil water; total water potential and its components; volumetric and gravimetric water contents; field capacity and wilting point
Soil water characteristics and pore size distribution
Saturated water flow in soils - Laminar flow in tubes (Poiseuille’s Law); Darcy's Law, conditions and states of flow; permeability and hydraulic conductivity, measurement and theoretical concepts; effective conductivity; unsaturated hydraulic conductivity; Buckingham law.
Unsaturated water flow in soils - Unsaturated hydraulic conductivity models and applications

TOOLBOX – MEASUREMENTS AND MODELING
Week 6 (October 23) and Week 7 (October 30)
Measuring soil hydraulic properties, fitting and interpretation; Lab tour - demonstration of soil physical methods; lecture on HYPROP method; report on Hyprop data (REPORT 2)
Modelling unsaturated water flow based on Richards equation - Using Hydrus1D for simulation of unsaturated flow; simulating HYPROP measurements (REPORT 3)

SOIL IN THE WATER CYCLE
Week 8 (November 06) – Week 9 (November 13)
Water infiltration - steady state solutions for infiltration; approximate solutions to infiltration (Green-Ampt, Philip); infiltration rate and ponding; outlook to preferential flow
Water evaporation - Energy balance and land atmosphere interactions - potential and actual evaporation, evaporation stages;

SOIL PLANT INTERACTIONS
Week 10 (November 20) Week 11 (November 27)
Root water uptake and transpiration – Theory and mechanisms controlling root water uptake; hydraulic properties of rhizosphere; plant and stomatal conductance.
Modelling root water uptake and transpiration; analytical approaches and modeling using Hydrus (REPORT 4)

SOLUTE TRANSPORT
Week 12 (December 04) Week 13 (December 11)
Transport mechanisms of solutes in porous media; breakthrough curves; convection-dispersion equation; solutions for pulse and step solute application
Transport of reactive substances, preferential flow, simulations with Hydrus

CLOSURE
Week 14 (December 18)
Summary, course synthesis, connections between the different topics, questions, exam preparation

Literature
Supplemental textbook (not mandatory) - Introduction to Environmental Soil Physics, by: D. Hillel

Abstract
Soil-Plant Water Relations
W 3 credits 2V A. Carminati

Objective
Water limitation is a primary constraint on plant growth and terrestrial fluxes worldwide. In this course, the principles of water flow in soil and plants are discussed, with particular attention on the effect of drought on root water uptake, transpiration and plant growth. Strategies of plants to tolerate drought are discussed in relation to both agricultural and ecological implications.

The students are able to: explain and compare systematically the drivers of water stress to plants; to solve the equations of water flow in soil and plants and to calculate plant water status for varying soil and climatic conditions and plant traits; to critically review and present one research question in soil-plant water relations; to openly debate on the current trends in soil and plant water research and climate change ecology.
EM: System Analysis in Urban Water Management

Elective Module for Majors “Resource Management”, “River and Hydraulic Engineering” and “Water Resources Management”.

Abstract
Systematic introduction of material balances, transport processes (kinetics, stoichiometry and conservation), ideal reactors, residence time distribution, heterogeneous systems, dynamic response of reactors, parameter identification, local sensitivity, error propagation, and Monte Carlo simulations. Introduction to real-time control (PID controllers). Extensive numerical simulations with coding.

Objective
The goal of this course is to provide the students with an understanding of how urban water system can be described with mathematical models, and give them the to plan experiments, to evaluate error propagation and to test simple process control strategies in the field of process engineering in urban water management.

Content
The course will provide a broad introduction into the fundamentals of modeling water treatment systems. The topics are:
- Introduction into modeling and simulation
- The material balance equations, transport processes, transformation processes (kinetics, stoichiometry, conservation)
- Ideal reactors
- Hydraulic residence time distribution and modeling of real reactors
- Dynamic behavior of reactor systems
- Systems analytical tools: Sensitivity, parameter identification, error propagation, Monte Carlo simulation
- Introduction to process control (PID controller, fuzzy control)

Lecture notes
Copies of handouts will be available digitally.

Literature
There will be a required textbook that students need to purchase:

Prerequisites / notice
Students should have a general understanding of urban water management as many examples are taken from processes relevant to related systems. This course is offered in parallel to the course Process Engineering Ia. It is beneficial but not necessary to follow both courses simultaneously.

Abstract
Biological processes used in wastewater treatment, organic waste management, biological resource recovery. Focus on fundamental principles of biological processes and process design based on kinetic and stoichiometric principles. Processes include anaerobic digestion for biogas production and aerobic wastewater treatment.

Objective
Students should be able to evaluate and design biological processes.

Content
Stoichiometry
Microbial transformation processes
Introduction to design and modeling of activated sludge processes
Anaerobic processes, industrial applications, sludge stabilization

Literature
There will be a textbook that students need to purchase (see http://www.sww.ifu.ethz.ch/education/lectures/process-engineering-ia.html for further information).
Critical Thinking fostered

Process Engineering Ia

The practice of landfilling, remediation of polluted sites and the disposal of radioactive waste are based on the same concepts of Environmental Geotechnics - Polluted Sites and Waste Disposal. These concepts involve understanding the behavior of contaminants and how to reduce their release to the environment. This knowledge is crucial for environmental protection. Understanding the contaminants' behavior and how to reduce their release to the environment is key to remediating polluted sites and designing multi-barrier systems.

Assessment of separation success: Separation function; grade vs. recovery

Techniques and Technologies

Froth flotation

Data: 26.07.2024 12:39

Autumn Semester 2024

Page 2420 of 2680
This lecture course consists of lectures with exercises and case studies.
- An overview of the principles of environmental protection in waste management and how this is applied in legislation.
- An overview of the chemistry underlying the release and transport of contaminants from the landfilled/contaminated material/radioactive waste repository focusing on processes controlling mobility of heavy metals and organic compounds
- Introduction to contaminant transport in porous adsorbing media
- Design and function of engineered barriers. Clay as a barrier.
- Polluted site remediation: Site investigation, assessment, and remediation technologies
- Concepts and safety in radioactive waste management
- Role of the geological and engineered barriers and radionuclide transport in geological media.

Abstract
In this course, students learn modern urban drainage engineering approaches, critical thinking, decision making in a complex environment as well as dealing with insufficient data and ill-defined problems.

Objective
By the end of the course, you should be able to do the following:
- Apply different methods and methodologies to assess the impact of urban drainage on water pollution and flooding potential.
- Distinguish between hydrological and hydrodynamic models and their correct application.
- Identify the difference between emission and immission oriented approaches for identifying drainage measures.
- Identify relevant measures, quantify their effects and assess their relative ranking/priority.
- Consider uncertainties and handle incomplete data and information.
- Make decisions and recommendations in a complex application case.
- Teamwork. State principles of effective team performance and the functions of different team roles; work effectively in problem-solving teams.
- Communication. Communicate and document your findings in concise group presentations and a written report.

Content
In urban drainage, the complexity of the decision-making, the available methodologies and the data availability have increased significantly. In current environmental engineering practice, the focus has shifted from tables and nomograms to sophisticated simulation tools. The topics cover:
- Integrated urban water management
- Hydrological and hydrodynamic modelling
- Water quality based assessment
- Freshwater ecology
- Hydraulic capacity assessment
- Sewer network operation
- Decision analysis

Prerequisites / notice
Prerequisites: 102-0214-00 Siedlungswasserwirtschaft and 102-0215-00 Siedlungswasserwirtschaft II or comparable educational background.

### 102-0468-10L Watershed Modelling

**W** 6 credits 4G  P. Molinar, A. Costa, S. Sinclair

**Abstract**

Watershed Modelling is a practical course on numerical water balance models for a range of catchment-scale water resource applications. The course covers GIS use in watershed analysis, models types from conceptual to physically-based, parameter calibration and model validation, and analysis of uncertainty. The course combines theory (lectures) with a series of practical tasks (exercises).

**Objective**

The main aim of the course is to provide practical training with watershed models for environmental engineers. The course is built on thematic lectures (2 hrs a week) and practical exercises (2 hrs a week). Theory and concepts in the lectures are underpinned by many examples from scientific studies. A comprehensive exercise block builds on the lectures with a series of 4 practical tasks to be conducted during the semester in group work. Exercise hours during the week focus on explanation of the tasks. The course is evaluated 50% by performance in the graded exercises and 50% by a semester-end oral examination (30 mins) on watershed modelling concepts.

**Content**

The first part (A) of the course is on watershed properties analysed from DEMs, and on global sources of hydrological data for modelling applications. Here students learn about GIS applications (ArcGIS, Q-GIS) in hydrology - flow direction routines, catchment morphometry, extracting river networks, and defining hydrological response units. In the second part (B) of the course on conceptual watershed models students build their own simple bucket model (Matlab, Python), they learn about performance measures in modelling, how to calibrate the parameters and how to validate models, about methods to simulate stochastic climate to drive models, uncertainty analysis. The third part (C) of the course is focussed on physically-based model components. Here students learn about components for soil water fluxes and evapotranspiration, they practice with a fully-distributed physically-based model Topkapi-ETH, and learn about other similar models at larger scales. They apply Topkapi-ETH to an alpine catchment and study simulated discharge, snow, soil moisture and evapotranspiration spatial patterns.

**Lecture notes**

There is no textbook. Learning materials consist of (a) video-recording of lectures; (b) lecture presentations; and (c) exercise task documents that allow independent work.

**Literature**

Literature consist of collections from standard hydrological textbooks and research papers, collected by the instructors on the course Moodle page.

**Prerequisites / notice**

Basic Hydrology in Bachelor Studies (engineering, environmental sciences, earth sciences), Basic knowledge of Matlab (Python), ArcGIS (Q-GIS).

Only students who fulfill the following criteria are allowed to begin with their master thesis:

a. successful completion of the bachelor programme;

b. fulfilling of any additional requirements necessary to gain admission to the master programme.

Abstract

The Master Programme concludes with the Master Thesis, which has to be done in one of the chosen Majors and has to be completed within 28 weeks. The Master Thesis is supervised by a professor and shall attest the students ability to work independently and to produce scientifically structured work.

Objective

To work independently and to produce a scientifically structured work.

Content

The topics of the Master Thesis are published by the professors. The Topic can be set also in consultation between the student and the professor.

Science in Perspective

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract

The course teaches the basics of hydromechanics, relevant for civil and environmental engineers.

Objective

Familiarization with the basics of hydromechanics of steady state flows

Content

Properties of water, hydrostatics, continuity, Euler equation of motion, Navier Stokes equation, similarity, Bernoulli principle, momentum equation for finite volumes, potential flows, ideal fluids-real fluids, boundary layer, pipe flow, open channel flow, flow in porous media, flow measurements, demonstration experiments in the lecture hall and in the laboratory

Lecture notes

Script and collection of problems available

Literature

102-0214-AAL | Introduction to Urban Water Management         | E-   | 6 credits | 13R   | E. Morgenroth, M. Maurer |

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract

Introduction to urban water management (water supply, urban drainage, wastewater treatment, sewage sludge treatment). Introduction to Urban Water Management is a self-study course.

Objective

This course provides an introduction and an overview over the topics of urban water management (water supply, urban drainage, wastewater treatment, sewage sludge treatment). It supports the understanding of the interactions of the relevant technical and natural systems. Simple design models are introduced.

Content

Overview over the field of urban water management.

Introduction into systems analysis.

Characterization of water and water quality.

Requirement of drinking water, production of wastewater and pollutants

Production and supply of drinking water.

Urban drainage, treatment of combined sewer overflow.

Wastewater treatment, nutrient elimination, sludge handling.

Planning of urban water infrastructure.

Lecture notes

Water Supply and Pollution Control, 8th edition (2009).

By: Warren Viessman, Jr., Mark J. Hammer, Elizabeth M. Perez and Paul A. Chadik.

Pearson Prentice Hall, Upper Saddle River, NJ.

Literature

In this self-study course the students must work through and understand selected sections from the following book

Students must understand and be able to discuss the required reading in a 30 min oral exam. The required reading is explained in detail on the website of the professorships of urban water management. Additional information can be obtained during the office hours of the professors' assistants.

The required reading and studying should correspond roughly the time invested in the course Siedlungswasserwirtschaft GZ. Students are welcome to ask the assistants (http://www.sww.ifu.ethz.ch/group/teaching-assistants.html) for help with questions they have regarding the reading.

Data: 26.07.2024 12:39   Autumn Semester 2024   Page 2423 of 2680
Some students joining the MSc program in Environmental Engineering at ETH Zürich have to take additional courses from our BSc program. The decision of what courses to take is done at the time of admission at ETH.

The course on "Introduction to Urban Water Management" is offered at ETH Zürich only in German. Students who can speak and understand German must take the course (Siedlungswasserwirtschaft GZ) and get a passing grade. For students that do not have sufficient German language skills there is a self-study course and they have to take an oral exam.

This course is required for further in depth courses in urban water management.

Prerequisite: Hydraulics I and Hydrology

102-0324-AAL  Ecological Systems Analysis  E-  6 credits  13R  S. Hellweg

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract  Methodological basics and application of various environmental assessment tools.

Objective  Students learn about environmental assessment tools, such as material flow analysis, risk assessment, and life cycle assessment. They can identify and apply the appropriate tool in a given situation. Also, they are able to critically assess existing studies.

Content
- Methodological basics of material flow analysis, risk assessment and life cycle assessment
- Application of these methods to case studies

Lecture notes  No script, but literature available on moodle

102-0325-AAL  Waste Management  E-  4 credits  9R  M. Haupt

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract  Introduction into the problems of waste handling with the goal to get the ability of seeing and improving the influence of commodities and products with their packaging to the environment - as they are becoming waste. Knowing the different mechanical and chemical processes, which are applicable in the field of waste management.

Objective  In the course “Waste Management”, the competencies of process understanding, system understanding, modeling, concept development, measurement methods and data analysis & interpretation are taught. The competencies process understanding and system understanding are applied and examined in addition. Concept development is also examined.

Content  This lecture gives a comprehensive overview of the different waste-types and waste handling possibilities:
* Waste composition as a mirror of the human evolution
* Waste definition (formation, amount, energy content, waste composition)
* Several recycling possibilities and processes
* Thermal waste treatment (electricity/district heat as products), including off-gas cleaning and incineration residue handling with regards to the final residue storage in a landfill and the problems which have to be solved there
* Special fields like biological waste handling (composting, fermentation), handling of special wastes and municipal sewage sludge treatment
* Economical aspects

Prerequisites / notice  basic of chemical processes has to be known

Groundwater I

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement. Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

J. Jimenez-Martinez, M. Willmann

Abstract

The course provides a quantitative introduction to groundwater flow and contaminant transport.

Objective

In “Groundwater I” the competencies of process understanding are taught, applied and examined. Furthermore, system understanding and concept development are taught and applied, which are previous steps to groundwater modeling. To add measurement methods are taught and data analysis & interpretation is applied during the course.

Understanding of the basic concepts on groundwater flow and contaminant transport processes. Formulation and solving of practical problems.

Content

Properties of porous and fractured media, Darcy’s law, flow equation, stream functions, interpretation of pumping tests, transport processes, transport equation, analytical solutions for transport, numerical methods: finite differences method, aquifers remediation, case studies.

Literature

W. Kinzelbach, R. Rausch, Grundwassermodellierung, Gebrüder Bornträger, Stuttgart, 1995

Air Pollution Control

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

J. Wang

Abstract

The lecture provides an introduction to the formation of air pollutants by technical processes, the emission of these chemicals into the atmosphere and the impact on air quality. Theoretical description and modeling of these processes, air quality measurement techniques and pollution control techniques are covered.

Objective

The students gain general knowledge of the factors resulting in air pollution and the techniques used for air pollution control. The students can identify major air pollution sources and understand the methods for measurement, data collection and analysis. The students can evaluate possible control methods and equipment, design a control system and estimate the efficiency and cost.

Content

- the physical and chemical processes leading to emission of pollutants
- air quality analysis
- the meteorological parameters influencing air pollution dispersion
- deterministic and stochastic models, describing the air pollution dispersion
- measurement concepts to observe ambient air pollution
- removal of gaseous pollutants by absorption and adsorption
- control of NOx and SOx
- fundamentals of particulate control
- design and application of wet scrubbers

Literature

Text book

Prerequisites / notice

College lectures on basic physics, chemistry and mathematics.

Abstract

The course offers an introduction to the basics of water resources analysis and management covering the topics of water demand vs. availability, water exploitation and reservoir design, aquatic physics, water quality and pollution, water conservation and remediation in rivers, lakes and aquifers, sustainable water use.

Objective

Introduction to the basics of sustainable water resources management based on relevant hydrological processes, management approaches and mathematical models.

Content

Example of application of modelling techniques are made available on selected topics. Four computer-based class exercises on selected topics are offered and guided through teaching assistants.

Lecture notes

Handouts of slides and additional reading material are provided on the Moodle course webpage (https://moodle-app2.let.ethz.ch/course/view.php?id=14738)

Literature

Literature information is provided either in the handouts or on the Moodle course webpage (https://moodle-app2.let.ethz.ch/course/view.php?id=14738)

Prerequisites / notice

Knowledge from the course “Hydrology” (3rd semester Environmental Engineering) and about basic statistics and probability theory is a prerequisite (not formal).

529-2002-AAL
Chemistry II
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Abstract
Chemistry II: Redox reactions, chemistry of the elements, introduction to organic chemistry

Objective
Erweitern der allgemeinen Grundlagen und Erarbeiten einer Basis, um Prozesse in komplexeren Umweltsystemen (Wasser / Luft / Boden) in ihrem zeitlichen und quantitativen Ablauf verstehen und beurteilen zu können.

Content
1. Redoxreactions
2. Inorganic Chemistry
   - Rules for nomenclature of inorganic compounds. Systematic description of the groups of elements in the periodical system and the most important compounds of these elements. Formation of compounds as a consequence of the electronoc structure of the elements.

   - Description of the most important classes of compounds and of the functional groups. Principal reactivity of these functional groups. Stereochemistry.
   - Reaction mechanisms: SN1- and SN2-reactions, electrophilic aromatic substitutions, eliminations (E1 and E2), addition reactions (C=C and C=O double bonds). Chemistry of carbony and carboxyl groups.

Abstract
Basic knowledge of enzymology, in particular the structure, kinetics and chemistry of enzyme-catalysed reaction in vitro and in vivo. Biochemistry of metabolism: Those completing the course are able to describe and understand fundamental cellular metabolic processes.

Objective
Based on the biology and chemistry courses in the 1. and 2. semester more detailed biochemical knowledge about enzymology, membrane biochemistry, and central metabolism will be presented.

Content
Program
Introduction, basics, composition of cells, biochemical units, repetition of relevant organic chemistry
Structure and function of proteins
Lipids and biological membranes
Enzymes and enzyme kinetics
Catalytic strategies
Metabolism: Basic concepts and design. Repetition of basic thermodynamics
Glycolysis
The citric acid cycle
Oxidative phosphorylation

752-4001-AAL Microbiology
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Abstract
Self-study course in microbiology.

Objective
Teaching of basic knowledge in microbiology.

Content
This is a self-study course for students with microbiology as an admission requirement. The goal of the course is that students acquire basics in microbiology, including bacterial cell biology, genetics, growth and physiology, metabolism, phylogeny and microbial diversity, and applications of microbiology.

Literature
This self-study course is based on the book ‘Brock, Biology of Microorganisms’.

102-0293-AAL Hydrology
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Abstract

Objective
Kenntnis der Grundzüge der Hydrologie. Kennenlernen von Methoden, zur Abschätzung hydrologischer Grössen, die zur Dimensionierung von Wasserbauwerken und für die Nutzung von Wasserressourcen relevant sind.

Content
Der hydrologische Kreislauf: globale Wasserressourcen, Wasserbilanz, räumliche und zeitliche Dimension der hydrologischen Prozesse.
Niederschlag: Niederschlagsmechanismen, Regenmessung, räumliche/zeitliche Verteilung des Regens, Niederschlagsregime, Punktniederschlag/Gebietsniederschlag, Isohyeten, Thiessenpolygon, Extremniederschlag, Dimensionierungsniederschlag.
Interzeption: Messung und Schätzung.
Evaporation und Evapotranspiration: Prozesse, Messung und Schätzung, potentielle und effektive Evapotranspiration, Energiebilanzmethode, empirische Methode.
Infiltration: Messung, Horton-Gleichung, empirische und konzeptionelle Methoden, F-index und Prozentuale Methode, SCS-CN Methode.
Einzugsgebietsscharakteristik: Morphologie des Einzugsgebiets, topografische und unterirdische Wasserscheide, hypsometrische Kurve, Gefälle, Dichte des Entwässerungsnetzes.
Schnee und Eis: Schneeigenschaften und -messungen Schätzung des Schneeschmelzprozesses durch die Energiebilanzmethode, Abfluss aus Schneeschmelze, Temperatur-Index- und Grad-Tag-Verfahren.
Ein internes Skript ist zur Verfügung (kostenpflichtig, nur Herstellungskosten)

Die Kopie der Folien zur Vorlesung können auf den Webseiten der Professur für Hydrologie und Wasserwirtschaft herunterladen werden

Vorbereitend zu Hydrologie I sind die Vorlesungen in Statistik. Der Inhalt, der um ein Teil der Übungen zu behandeln und um ein Teil der Vorlesungen zu verstehen notwendig ist, kann zusammengefasst werden, wie hintereinander es beschrieben wird:

Elementare Datenverarbeitung: Hydrologische Messungen und Daten, Datenreduzierung (grafische Darstellungen und numerische Kenngrössen).

**Physics**

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Abstract

This course gives an overview of important concepts in classical dynamics, thermodynamics, electromagnetism, quantum physics, and special relativity. Emphasis is placed on demonstrating key phenomena using experiments, and in developing skills for quantitative problem solving.

Objective

The goal of this course is to make students able to explain and apply the basic principles and methodology of physics to problems of interest in modern science and engineering. An important component of this is learning how to solve new, complex problems by breaking them down into parts and applying approximations.

Content

Oscillations and waves in matter

Thermodynamics (temperature, heat, equations of state, laws of thermodynamics, entropy, transport)

Electromagnetism (electrostatics, magnetostatics, circuits, Maxwell's equations, electromagnetic waves, induction, electromagnetic properties of materials)

Overview of quantum and atomic physics

Introduction to special relativity

Lecture notes

Lecture notes and exercise sheets will be distributed via Moodle.

**Stochastics (Probability and Statistics)**

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Abstract

Introduction to basic methods and fundamental concepts of statistics and probability theory for non-mathematicians. The concepts are presented on the basis of some descriptive examples. Learning the statistical program R for applying the acquired concepts will be a central theme.

Objective

The objective of this course is to build a solid fundament in probability and statistics. The student should understand some fundamental concepts and be able to apply these concepts to applications in the real world. Furthermore, the student should have a basic knowledge of the statistical programming language "R".
Abstract
Introduction to Linear Algebra

Objective
Basic knowledge of linear algebra as a tool for solving engineering problems. Understanding of abstract mathematical formulation of technical and scientific problems.

Content
Introduction and linear systems of equations, matrices, quadratic matrices, determinants and traces, general vector spaces, linear mappings, bases, change of basis, diagonalization, eigenvalues and eigenvectors, orthogonal transformations, scalar-product, inner product spaces.

</table>
participation in the course 871-0240-00L "Human Learning (EW 1)".

Abstract
Course promotes exchange between student teachers and elementary school teachers in STEM teaching with 3 parts: 1) block seminar (ca. 16 h), 2) collaboration with elementary school teacher in a class (ca. 34 h, with approx. 50% spent in the elementary or middle school class and ca. 50% for preparation), and 3) final report (ca. 10 h). Registration implies participation in all 3 parts.

Objective
Deeplening the understanding of knowledge formation and learning processes of primary and secondary students from a cognitive and developmental psychology perspective for students. The assistant ship provides didactic experience and exposure to a different school level (more heterogeneous groups such as for example low-performing to very high-performing Children, language problems etc.).

Content
Students learn more about the potential and challenges of pupils. They get to know the early stages of knowledge as well as the development of pre-concepts of students in their subject area. The seminar with a phase of cooperation consists of three phases: In the block seminar, pre-concepts are discussed in their own subject as well as theoretical inputs from developmental and cognitive psychology. During the cooperation phase, a teaching task defined by the primary and secondary school teachers is actively undertaken in a class. Finally, a final report is written, which contains a description of the students' level of knowledge. This seminar is only suitable for students who can adapt flexibly to the needs of pupils from lower class levels.

Important: You can only enrol in the courses of this category if you have not more than 12 CP left for possible additional requirements.

Number Title Type ECTS Hours Lecturers
701-0822-00L Mentored Assignment W 2 credits 4A C. Colberg, F. Keller

Abstract
The mentored paper is designed to bring together the findings from the 701-0823-00L Environmental Education Didactics I Information and the 701-0825-10L Environmental Education Didactics II. By using various teaching techniques and methods a semester plan, which is based on various curricula will be elaborated for a given topic.

Objective
1. The students have planned a curriculum for a semester course.
2. Students reflect on formative and summative ways such a teaching unit to examine and implement parts of it.
3. The students have implemented parts of the semester curriculum.
4. The students deal with the question to what extend teaching techniques, teaching methods but also sequences of self-study must be involved in the planning.

Content
Semester Planning
The students plan on the basis of the given curricula a teaching sequence. The resulting learning process is divided in phases with respect to a reasonable rhythm selecting different teaching methods.

Contents
Self-study
The students deal with various forms of self-study (moderated self-study, learning journal, PBL, case studies, etc.) and their integration in the semester plan. In addition to the formulation and determination of elements for self-study, they consider how they can check their effectiveness.

Tests
The students use adequate various types of examinations. They consider formative and summative ways. For this purpose they formulate test questions and tasks to match the objectives in the curriculum and semester schedule. The use of appropriate literature is required

Literature Study
The mentored assessment requires a specific study of literature which must be cited accordingly.

Lecture notes
A manual gives the students a guideline how to proceed.

Literature
The use of appropriate literature is part of the grading.

Prerequisites / notice
Completion of FD1 and FD2

701-0827-00L
Teaching Internship Including Examination Lessons
Environmental Studies
Prerequisite: successful participation in Mentored Assignment (701-0822-00L).

Abstract
Students apply the insights, abilities and skills they have acquired within the context of an educational institution. They observe 10 lessons and teach 20 lessons independently. Two of them are as assessed as Examination Lessons.

Objective
- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics for their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They learn the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils’ work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

Content
The students will be able to watch and evaluate the teaching of colleagues and experts. They get profit out of their teaching experiences not only when preparing but also when teaching. Doing so they will be supported by their mentors.

Two lessons of the course will be split off for the examination - procedure.

</tr>
</tbody>
</table>

**Abstract**
In the case study we analyse a different topic from the field of sustainable development each year and develop solutions to it. Students are able:
- carry out research on a given topic and present the results in a structured report which (a) shows the state of knowledge and (b) the need for knowledge and action (UPL I).
- to integrate knowledge of diverse perspectives in a qualitative systems model, to identify problems and to suggest possible solutions from a specific stakeholder's perspective (UPL II).
- name the different roles within a group, explain the role(s) they are suited for, self-organise in groups, identify problems of collaboration and constructively address the problems (UPL I and II).

**Objective**

During synthesis week, which takes place during semester break, the results of the different part inquiries are integrated in a qualitative system model. The students identify specific problems and develop solutions.

Most of the time students work independently in groups. Tutors support the students in key steps. Introductions are given for:
- The overall topic of the case study (by external experts),
- Inquiry, scientific writing and managing references (by experts of ETH library),
- Role behaviour and collaboration in groups,
- Preparing reports, posters and presentations,
- Qualitative system modelling (SystemQ),
- Developing solutions (design thinking, Checkland's soft systems methodology, sustainability assessment).

**Content**

In the first semester the students compile what is known about the case topic, its principles and challenges. Each group of students makes an inquiry to a given part of the overall problem. The inquiry includes a thematic as well as stakeholder analysis. The results are written in a report and presented at an internal conference.

In the second semester, students work independently and in exchange with stakeholders on previously identified problems. They develop a sustainability project with concrete measures that they could implement voluntarily in the third semester. The course concludes with the presentation of the student projects on the public "Market of Measures".

Most of the time students work independently in groups. Tutors support the students in key steps. Introductions are given for:
- The overall topic of the case study (by external experts),
- Inquiry, scientific writing and managing references (by experts of ETH library),
- Role behaviour and collaboration in groups,
- Preparing reports, posters and presentations,
- Qualitative system modelling (SystemQ),
- Developing solutions (design thinking, Checkland's soft systems methodology, sustainability assessment).

**Lecture notes**

Tutors will compile the case study dossier on the basis of the student reports of the autumn semester.

**Literature**

Methodological documentation will be made available on Moodle during the case study together with the relevant background literature.

**Abstract**
The lecture provides a science-based exploration of environmental aspects from three research fields: earth, climate, and health sciences. The students are able to explain important properties of the three environmental systems, to discuss critical drivers, trends and conflicts of their use, and to compare potential solutions.

**Objective**
The students should learn ecological concepts at these different levels in the context of concrete examples from terrestrial and aquatic ecosystems. Corresponding methods for studying the systems will be presented.

**Content**
The lecture discusses the role of the environmental systems based on selected environmental problems, among these the exploration of raw materials and fossil fuels, climate change and its impacts on man and environment, and the spread and control of infectious diseases in the human population and agricultural systems.

**Lecture notes**
Slides are provided by instructors and are accessible via moodle.

**Abstract**
The lecture provides a science-based exploration of three important environmental systems: Inland waters, forest, and of food systems. The students are able to explain important properties of the three environmental systems, to discuss critical drivers, trends and conflicts of their use and to compare potential solutions.

**Objective**
The students are able to explain important properties of these three environmental systems, to discuss critical drivers, trends and conflicts of their use and to compare potential solutions.

**Content**

Aquatic ecosystems and their function, water use and its impact, water pollution and water treatment, water and health, water technologies, water & energy. Forests and agroforest systems, trends and drivers of land use changes, sustainable forest management.

**Lecture notes**
Lecture notes or other documentation are provided by instructors and accessible via moodle.

**Abstract**
This introductory lecture in ecology covers basic ecological concepts and the most important levels of complexity in ecological research. Ecological concepts are exemplified by using aquatic and terrestrial systems; corresponding methodological approaches are demonstrated.

**Objective**
The objective of this lecture is to teach basic ecological concepts and the different levels of complexity in ecological research. The students should learn ecological concepts at these different levels in the context of concrete examples from terrestrial and aquatic ecology. Corresponding methods for studying the systems will be presented. A further aim of the lecture is that students achieve an understanding of biodiversity, why it is threatened and how it can be managed.
- Biodiversity: variation, threats and conservation
- Influence of environmental factors on organisms; adaptation to environmental conditions
- Population dynamics: causes, description, prediction and regulation
- Interactions between species (competition, coexistence, predation, parasitism, food webs)
- Ecological communities: structure, stability, succession
- Ecosystems: compartments, material and energy flows

**Lecture notes**
Documents, lecture slides, exercises and relevant literature are available in Moodle. The documents for the next lecture will be available on Friday morning at the latest.

</table>

**Objectives**
- Mathematics is of ever increasing importance to the Natural Sciences and Engineering. The key is the so-called mathematical modelling cycle, i.e. the translation of problems from outside of mathematics into mathematics, the study of the mathematical problems (often with the help of high level mathematical software packages) and the interpretation of the results in the original environment.
- The goal of Mathematics I and II is to provide the mathematical foundations relevant for this paradigm. Differential equations are by far the most important tool for modelling and are therefore a main focus of both of these courses.

551-0001-00L General Biology I
3 credits
U. Sauer, O. Y. Martin, A. Widmer

Abstract
Organismic biology to teach the basic principles of classical and molecular genetics, evolutionary biology and phylogeny. First in a series of two lectures given over two semesters for students of agricultural and food sciences, as well as of environmental sciences.

Objective
The understanding of some basic principles of biology (inheritance, evolution and phylogeny) and an overview of the diversity of life.

Content
The first semester focuses on the organismal biology aspects of genetics, evolution and diversity of life in the Campbell chapters 12-34.

Week 1-7 by Alex Widmer, Chapters 12-25
12 Cell biology Mitosis
13 Genetics Sexual life cycles and meiosis
14 Genetics Mendelian genetics
15 Genetics Linkage and chromosomes
20 Genetics Evolution of genomes
21 Evolution How evolution works
22 Evolution Phylogenetic reconstructions
23 Evolution Microevolution
24 Evolution Species and specialization
25 Evolution Macroevolution

Week 8-14 by Oliver Martin, Chapters 26-34
26 Diversity of Life Introduction to viruses
27 Diversity of Life Prokaryotes
28 Diversity of Life Origin & evolution of eukaryotes
29 Diversity of Life Nonvascular&seedless vascular plants
30 Diversity of Life Seed plants
31 Diversity of Life Introduction to fungi
32 Diversity of Life Overview of animal diversity
33 Diversity of Life Introduction to invertebrates
34 Diversity of Life Origin & evolution of vertebrates

Abstract
Students learn to apply selected concepts and tools from computer science for working on interdisciplinary projects. The following topics are covered: modeling and simulations, managing data with lists, tables and relational databases, introduction to programming.

Objective
The students learn to...
- choose and apply appropriate tools from computer science,
- process and analyze real-world data from their subject of study,
- handle the complexity of real-world data,
- query databases and understand and evaluate the corresponding database model,
- encode a problem into a program, test the program, and correct errors,
- implement models from the natural sciences as a simulation.

Content
1. Modeling and simulations
2. Data management with lists and tables
3. Data management with a relational database
4. Introduction to programming with Python 1 (variables & data types)
5. Introduction to programming with Python 2 (control structures & logic)
6. Introduction to programming with Python 3 (sequential data structures)

Lecture notes
All materials for the lecture are available at www.evim.ethz.ch

Literature

Prerequisites / notice
This course is based on application-oriented learning. The students spend most of their time working through projects with data from natural science and discussing their results with teaching assistants. To learn the computer science basics there are electronic tutorials available.
This course is intended to provide an overview of experimental chemical methods. The handling of chemicals and proper laboratory techniques represent the main learning targets. Furthermore, the description and recording of laboratory processes is an essential part of this course.

The classification and analysis of natural and artificial compounds is a key subject of this course. It provides an introduction to elementary laboratory techniques, and the experiments cover a wide range of analytic and synthetic tasks:

- Selected samples (e.g., soil and water) will be analysed with various methods, such as titrations, spectroscopy or ion chromatography. The chemistry of aqueous solutions (acid-base equilibria and solvation or precipitation processes) is studied.
- The synthesis of simple inorganic complexes or organic molecules is practised.
- Special features of plant cells: Plastids, vacuole, cell wall. Anatomy and function of various plant tissues (epidermis, vascular tissue, wood, etc.). Anatomy and function of different plant organs (root, stem, leaf, flower, fruit, seed).
- Plant tissues (epidermis, vascular tissue, wood, etc.). Anatomy and function of different plant organs. Special features of plant cells. Anatomy and function of plant organs. Anatomical adaptations to different environments.

The experiments cover a wide range of techniques, including analytical and synthetic techniques (e.g., investigation of soil and water samples or the preparation of simple compounds). Furthermore, the handling of gaseous substances is practised.

The experiments cover a wide range of techniques, including analytical and synthetic techniques (e.g., investigation of soil and water samples or the preparation of simple compounds). Furthermore, the handling of gaseous substances is practised.

Furthermore, the preparation and handling of environmentally relevant gaseous species like carbon dioxide or nitrogen oxides is a central subject of the Praktikum.

The instructions to the experiments will be published on Moodle.

A thorough study of all script materials is requested before the course starts.

Prerequisites / notice

Groups of a maximum of 20 students.

(4. Auflage 2022)
Comprehend the Atmosphere, Physical Structure, and Chemical Composition of the Atmosphere

- to explain the physical structure and chemical composition of the atmosphere
- to quantitatively describe and understand the fundamental physical and chemical processes in the atmosphere
- to explain the interactions and feedbacks between atmosphere - ocean - land surface, troposphere - stratosphere and weather - climate.

In the course "Atmosphere", the competencies of process understanding, system understanding and data analysis & interpretation are taught, applied and examined.

Basic principles of the atmosphere, physical structure and chemical composition, trace gases, atmospheric cycles, circulation, stability, radiation, condensation, clouds, oxidation capacity and ozone layer.

**701-0501-00L  Pedosphere**

**Abstract**
Introduction to the formation and properties of soils as a function of parent rock, landscape position, climate, and soil organisms. Complex relationships between soil forming processes, physical and chemical soil properties, soil biota, and ecological soil properties are explained and illustrated by numerous examples.

**Objective**
Understanding of soils as integral parts of ecosystems, development and distribution of soils as a function of environmental factors, and processes leading to soil degradation.

**Content**
Definition of the pedosphere, soil functions, rocks as parent materials, minerals and weathering, soil organisms, soil organic matter, soil formation, principles of soil classification, global soil regions, physical soil properties and functions, chemical soil properties and functions, soil fertility, land use and soil degradation.

**Lecture notes**
Polybook

**Literature**

**Prerequisites / notice**
Prerequisites: Basic knowledge in chemistry, biology and geology.

701-0033-00L | Laboratory Course in Physics for Students of Environmental Sciences | O | 2 credits | 4P | M. Münnich, A. Biland, A. Eggenberger, N. Gruber

**Abstract**
Learning with the basic principles of scientific experimentation. By performing experiments in different fields of experimental physics the students will learn the usage of measurement instruments as well as the correct analysis and the estimation of the accuracy of the measurement results.

**Objective**
Working in a laboratory forms an important part of modern scientific education. Using simple experimental setup the laboratory course will provide basic knowledge of:
- the setup of experiments,
- various measurement techniques,
- the use of various measurement instruments,
- the correct performance of experiments,
- the analysis of the accuracy of the measurements,
- and the interpretations of the measured quantities.

The course will also deepen the knowledge of experimental physics.

In addition to experiments selected from the physics lab for physicists, this lab course offers experiments specially developed for bachelor students in environmental sciences, which illustrate the mutual relationships between physical processes and chemical and biological phenomena.

**Content**
The students select 3 out of 18 offered experiments that they want to conduct. After conducting these experiments, the students document and analyze their measurements, estimate the accuracy of their results, and compare them with the values expected according to the laws of physics. Introductory lectures with exercises in Jupyter Notebooks as evaluation tools and in determining the accuracy of measurement results ("error calculation"), as well as a preliminary experiment for practicing experiment evaluation, complement the practical.

**Lecture notes**
Manuscripts of the experiments and Jupyter Notebook templates are provided online on the Moodle course pages.

**Social Sciences and Humanities**

**Compulsory**

**Number** | **Title** | **Type** | **ECTS** | **Hours** | **Lecturers**
--- | --- | --- | --- | --- | ---
Students acquire basic knowledge and methods for analyzing arguments. They are able to apply these methods to complex arguments concerning scientific and ethical questions about the environment and sustainable development, and to construct themselves arguments and apply them successfully. Moreover, they are able to evaluate the contribution of arguments to controversial debates with the help of rules. Students acquire thereby a crucial skill for Critical Thinking, which aims at responsible argumentation, communication and action.

Content

In the sciences as well as in public discussions or in our everyday life, we try to convince others or to achieve consent in matters of disagreement. We do this with the help of arguments. But what are the criteria for arguments to be convincing and for claims to be clear? And how do we expediently feed arguments into a debate? How can we identify and avoid fallacies in reasoning? How do we analyse and define concepts? This course provides basic knowledge of conceptual analysis and argumentation theory as well as methods for identifying, reconstructing and evaluating claims and arguments. Its focus is on systematically addressing the following two questions:

What do you mean? How do you know? The first question aims at a better understanding of the claim in question, the second at assessing the reasons that support or undermine the claim. We exercise and improve the abilities to address these questions by using texts on scientific and ethical questions concerning the environment and sustainable development. The course provides thus crucial skills for Critical Thinking, which aims at responsible argumentation, communication and action.

Lecture notes

Handouts will be available.

Literature

Prerequisites / notice

This is a compulsory course in the social sciences and humanities in the second year of the BA Environmental sciences. For 2ECTS credits, all written tasks that are distributed during the course need to be solved.

351-1158-00L  Economics

Not for students belonging to D-MTEC!

Abstract

This course introduces basic economic concepts and theories. Beginning with microeconomics, the course starts with the topics of supply and demand, markets, and behavioral economics before moving on to the key macroeconomic concepts of national accounts, the labor market, trade, and monetary policy.

Objective

After successful completion of the course you will be able to:

- Describe the basic micro- and macroeconomic problems and theories.
- Introduce economic reasoning appropriately to a given topic.
- Evaluate economic measures.

Content

Households, firms, supply and demand: How are household preferences and consumption patterns formed? How does a household react to price changes? How are goods prices formed? At what prices are companies willing to offer goods? How do we make economic decisions?

Markets: What is “perfect competition” and how does a competitive market work? Are monopolies always a bad thing? How can the state influence the market?

Market failure: What happens when prices give wrong signals?

Labour market: How do supply and demand work in the labour market? What influences unemployment?

National accounts: How big is the Swiss economy?

Foreign trade: Why do countries trade with each other? What are the consequences for the domestic market?

Money and inflation: What exactly is money? How does money creation work and what happens when there is too much (or too little) money on the market?

Students will be asked to apply these concepts to issues in their own field of study and to current issues in society. This goal will be achieved through participation in exercises, class discussions and reading material from current media. By the end of the course, students should be able to apply economic analysis confidently and independently.
The pressing environmental challenges of today demand a critical reflection. Ethics is an important tool for doing so. This lecture introduces Environmental Law

Abstract

The pressing environmental challenges of today demand a critical reflection. Ethics is an important tool for doing so. This lecture introduces the basics of ethics and provides in-depth knowledge of environmental ethics and its debates. This theoretical background will be applied and critically reflected using examples of current environmental challenges.

Objective

On completion of this lecture, you have acquired the ability to identify, analyze, critically reflect and resolve ethical challenges in general and specifically regarding the environment. You know basic concepts, positions and lines of argumentation from the debate in environmental ethics, which you have applied and discussed in smaller exercises.

Abstract

This module explores the relationship between politics, space, power, and the environment. Political processes today take shape in a complex geographic context; at the same time, they also impact geography, actively writing space itself. This module brings those dynamics to the fore and locates them both in blatantly politicized sites.

Objective

- Become familiar with key thinkers, concepts, theories, and illustrative case studies in political geography and apply key geography concepts to a particular case.
- Situate contemporary political events within global power relations, and political histories of colonialism, imperialism, and gendered violence.
- Cultivate critical, decolonial, and feminist approaches to research, policy, and practice. By critical, we encourage students to question how ‘problems’ are framed rather than start with a ‘problem-solving’ mindset.
- Distinguish scientific, peer-reviewed and research-based knowledge from popular media and disinformation.
- Learn methodological skills necessary for academic research, encompassing considerations of ethics and power relations in the research process.
- Writing skills: write thoroughly researched and concise texts that analyze a case study using geographical concepts and adequate references to the scientific literature.
- Creative communication and Speaking Skills: Use the classroom as a safe space for dialogue and testing ideas respectfully, and apply artistic/ creative forms for communicating research (blogs, essays, podcasts, photography, film etc.)

Data: 26.07.2024 12:39  Autumn Semester 2024  Page 2443 of 2680
Objective

Students are able to
- describe the areas, concepts, theories, methods and findings of psychology.
- differentiate scientific psychology from "everyday" psychology.
- structure the conclusions and significance of an experiment, according to a theory of psychology.
- formulate a problem for psychological investigation.
- apply basic forms of psychological experiment.

Content

Einführung in die psychologische Forschung und Modellbildung unter besonderer Berücksichtigung der kognitiven Psychologie und des psychologischen Experiments. Themen sind u.a.: Wahrnehmung; Lernen und Entwicklung; Denken und Problemlösen; Kognitive Sozialpsychologie; Risiko und Entscheidung.

Abstract

Introduction in consumer research. The following aspects will be emphasized in the course: Consumer decision making, individual determinants of consumer behavior, environmental influences on consumer behavior, influencing consumer behavior.

Objective

Students will be able to,
- explain the decision-making processes underlying the purchasing process
- describe the factors that have an influence on consumer behavior
- develop strategies to influence purchasing behavior

Abstract

This course deals with basic questions, concepts, theories, methods, and empirical findings of political science.

Objective

This course deals with basic questions, concepts, theories, methods, and empirical findings of political science.
Der Kurs findet vor Ort statt und wird weder online gestreamt noch aufgezeichnet.

Der Kurs besteht aus

- einem ersten Teil, der jeweils am Montag, ab 25. September 2023, wöchentlich bis und mit 18. Dezember 2023, 10:15-12:00, vor Ort auf dem Campus stattfindet (LEE E 101, Leonhardstrasse 21)

Die 5. Auflage dieses Lehrbuches ist via Buchhandlungen oder online erhältlich. Übungsfragen und ein Glossar finden Sie hier: https://ib.ethz.ch/teaching/pwgrundlagen.html

Vor der Sitzung:
2. Durch eine kurze (digitale) Umfrage in Moodle werden Übungsfragen ermittelt, welche von den Studierenden als besonders schwierig erachtet werden und die deshalb im Übungsblock (jeweils 12:15 – 13:00) vertieft besprochen werden.

Der Ablauf der Sitzungen ist dann meist wie folgt:
1. Teil:
   - Zu Beginn wird jeweils (in digitaler Form) ein unbekannter Kurztest zum gelesenen Buchinhalt durchgeführt (mehr dazu weiter unten) und im Anschluss gleich besprochen.
   - Es folgt eine ca. 30-minütige Vorlesung, die den Inhalt des/der gelesenen Buchkapitel kurz zusammenfasst und reflektiert.
   - Danach stellen die Dozierenden eine aktuelle wissenschaftliche Studie vor, die im Bereich des/des jeweils behandelten Themen liegt (ca. 30 Minuten).

2. Teil:
   - Wir behandeln Übungsfragen, die per Umfrage als besonders schwierig identifiziert wurden.

Die 5. Auflage dieses Lehrbuches ist via Buchhandlungen oder online erhältlich. Übungsfragen und ein Glossar finden Sie hier: https://ib.ethz.ch/teaching/pwgrundlagen.html

853-0038-00L
Swiss Foreign Policy
W 3 credits
V 2D. Möckli Weder

Abstract
This course analyzes the foundations and challenges of Swiss foreign policy. After reviewing the history of foreign policy conceptions since the early 20th century, we will discuss the determining factors of Swiss foreign policy and examine, together with guest speakers from the foreign ministry, current international developments and respective foreign policy challenges.

Objective Content
Students should acquire a sound understanding of Swiss foreign policy and the relevant academic and political debates associated with it.

Lecture notes
Students will receive a handout of slides accompanying the lectures.

The course will be supported by an e-learning environment.

**860-0023-00L International Environmental Politics**

**W 3 credits 2V T. Bernauer**

**Abstract**
This course deals with how and why international problem-solving efforts (cooperation) in environmental politics emerge and evolve, and under what circumstances such efforts are effective. Based on concepts and theories of political economy, political science, and public policy, various examples of international environmental policy-making are examined. To this end, we will look at the most important techniques of mediation and put them into the context of today's legislation, participation and conflict culture. The potential and limitations of the individual techniques will be discussed using current Swiss and international case studies, namely in the field of windenergy as well as landfills and Human-Wildlife Conflict and Coexistence (wolves, bears, elephants). Students can do conflict analyses, for instance, as part of individual and group analyses and a half-day mediation-simulation, develop mediation technique concepts and train their own communicative and negotiation skills.

**Objective**
The objectives in this course are to (1) gain an overview of important questions pertaining to international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions in this policy area and how to address them in a conceptually and methodologically meaningful and insightful way; (3) gain an overview of important global and regional environmental problems and how they are or could be solved.

**Content**
This course deals with how and why international problem-solving efforts (cooperation) in environmental politics emerge and evolve, and under what circumstances such efforts are effective. Based on concepts and theories of political economy, political science, and public policy, various examples of international environmental policy-making are examined. For instance, international efforts to reduce air pollution, manage international water resources, mitigate and adapt to global warming, protect the stratospheric ozone layer, address biodiversity challenges, deal with plastic waste, and prevent pollution of the oceans.

**Literature**
Reading materials and slides will be available via Moodle.

**Prerequisites**
Access / Prerequisites
The course is open to all ETH students and visiting students from other universities. Participation does not require previous coursework in the social sciences or environmental policy. This course will take place on campus (ETH Main Building, HG F.3). There will be no live-streaming, and the course is NOT in hybrid (on-campus plus online) format. However, the lecture will be recorded and the recordings will be made available via the Moodle platform for this course a few days after the respective lecture for students who are unable to attend in person. All electronic correspondence will take place via the ETH mystudies system and Moodle, please make sure you are properly registered there with a functioning email address/account.

**Credits and Exam**
After passing a written test at the end of the course (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test). Visiting students (e.g., from the University of Zurich, exchange students) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory. Students who did not participate in the test on 18 December 2023 will not have access to the repeat test unless they submit compelling and documented (e.g. medical, other exam in parallel at ETH) reasons for why they were unable to participate in the first test. It covers all contents of the lectures and the reading assignments. Visiting students (e.g., from the University of Zurich or other universities) are subject to the same conditions. Registration for the course in the mystudies system of ETH is compulsory. No separate registration for the exam is required, registration for the course as such covers everything. The exam will take place on campus, either in the F3 lecture hall or in a computer room. That is, you must be present in person at ETH Zurich on the exam date/time.

</tr>
</tbody>
</table>

**Abstract**
This course is intended to demonstrate how environmental decisions can be optimized and conflicts better dealt by using mediation. Case studies focus on construction of windmills for electricity purpose, landfills, sustainable city-planning or Human-Wildlife Conflict and Coexistence.

**Objective**
- Develop comprehension of legal and social responses to environmental conflicts
- Recognize the most important participative techniques and their ranges
- Develop concepts for doing and evaluating mediation processes
- Estimate the potential and limitations of cooperative environmental planning
- Train communicative skills (presentation, moderation, discussion design, negotiation), especially by participating at a mediation

**Content**
To this end, we will look at the most important techniques of mediation and put them into the context of today's legislation, participation and conflict culture. The potential and limitations of the individual techniques will be discussed using current Swiss and international case studies, namely in the field of windenergy as well as landfills and Human-Wildlife Conflict and Coexistence (wolves, bears, elephants).

**Lecture notes**
A reader will be handed out.

**351-0778-00L Discovering Management**

**W 3 credits 3G B. Clarysse, S. Brusoni, V. Hoffmann, T. Netland**

Does not take place this semester.
Discovering Management offers an introduction to the field of business management and entrepreneurship for engineers and natural scientists. By taking this course, students will enhance their understanding of management principles and the tasks that entrepreneurs and managers deal with. The course consists of theory and practice sessions, presented by a set of area specialists at D-MTEC.

**Objective**

The general objective of Discovering Management is to introduce students into the field of business management and entrepreneurship.

In particular, the aims of the course are to:

1. broaden understanding of management principles and frameworks
2. advance insights into the sources of corporate and entrepreneurial success
3. develop skills to apply this knowledge to real-life managerial problems

The course will help students to successfully take on managerial and entrepreneurial responsibilities in their careers and / or appreciate the challenges that entrepreneurs and managers deal with.

**Content**

The course consists of a set of theory and practice sessions, which will be taught on a weekly basis. The course will cover business management knowledge in corporate as well as entrepreneurial contexts.

The course consists of three blocks of theory and practice sessions: Discovering Strategic Management, Discovering Innovation Management, and Discovering HR and Operations Management. Each block consists of two or three theory sessions, followed by one practice session where you will apply the theory to a case.

The theory sessions will follow a "lecture-style" approach and be presented by an area specialist within D-MTEC. Practical examples and case studies will bring the theoretical content to life. The practice sessions will introduce you to some real-life examples of managerial or entrepreneurial challenges. During the practice sessions, we will discuss these challenges in depth and guide your thinking through team coaching.

Through small group work, you will develop analyses of each of the cases. The theory sessions will be assessed via a multiple choice exam.

**Lecture notes**

All course materials (readings, slides, videos, and worksheets) will be made available to inscribed course participants through Moodle. These course materials will form the point of departure for the lectures, class discussions and team work.

**Abstract**

This course is offered complementary to the basis course 351-0778-00L, "Discovering Management". The course offers an additional exercise.

**Objective**

The general objective of Discovering Management (Exercises) is to complement the course "Discovering Management" with one larger additional exercise.

Discovering Management (Exercises) thus focuses on developing the skills and competences to apply management theory to a real-life exercise from practice.

**Content**

The exercise consists of delivering and submitting a "pitch" with a clear recommendation for one of the selected cases amongst those seen in Discovering Management, using your insights from Discovering Management, and an extra session on pitching.

Students have the option to either do this alone or in a group of two students.

**Literature**

All course materials (readings, slides, videos, and worksheets) will be made available to inscribed course participants through Moodle.
Objective
Students
- assess the limits and the potential of corporate sustainability for sustainable development
- develop competencies that are useful in the context of corporate sustainability and beyond (analytical competency, critical thinking, problem solving)
- recognize and realize opportunities through team work for corporate sustainability in a business environment
- present strategic recommendations in teams

Content
Corporate Sustainability is the flagship course of the Group for Sustainability and Technology at D- MTEC. In this course, students learn about key concepts in corporate sustainability and develop skills to implement them in the real world. The course prepares students for making well-informed sustainability decisions in their future careers.

The course uses constructive alignment to bring the various innovative teaching and learning elements (e.g., case-based experiential learning, reflective thinking and blended learning with videos and quizzes) into a coherent transformational journey. Students can now flexibly, efficiently, and effectively acquire the conceptual foundations that are essential for a substantial understanding of corporate sustainability.

For part of the course, students work in groups to complete a set of graded assignments designed to guide them into a deep dive on a selected corporate sustainability challenge. Please note that full participation in this part is essential, so make sure you are available. Furthermore, these group assignments count towards the overall grade for the course.

For further details on the course structure etc. visit the following link: http://www.sustec.ethz.ch/teaching/lectures/corporate-sustainability.html

Lecture notes
Presentation slides will be made available on Moodle after lectures.

Literature
Literature recommendations will be distributed via Moodle, and are available from the start of the course.

Prerequisites / notice
TEACHING FORMAT/ ATTENDANCE: The course includes several mandatory sessions that participants must attend to successfully earn credit points. It is not possible to take the class purely online.

851-0735-10L Startups and Law W 2 credits 2V P. Peyrot

Abstract
The students shall obtain a basic knowledge about the legal environment of entrepreneurs. They shall be able to recognize and evaluate legal issues connected to an entrepreneurial activity and suggest possible solutions.

Objective
The students shall obtain the following competence:
- They shall obtain a working knowledge on the legal aspects involved in setting up and managing an enterprise.
- They shall be able to contribute to the legal management of the company and to discuss legal issues.
- They shall have an understanding of the law as a part of the corporate strategy and as a valuable resource of the company.

Lecture notes
A comprehensive script will be made available online on the moodle platform.

This course is only for students enrolled in a Bachelor’s degree programme.

Students enrolled in a Master’s degree programme may attend “Principles of Microeconomics” (LE 363-0503-00L) instead.

Note for D-MAVT students: If you have already successfully completed “Principles of Microeconomics” (LE 363-0503-00L), then you will not be permitted to attend it again.

Abstract
The course introduces basic principles, problems and approaches of microeconomics. It describes economic decisions of households and firms, and their coordination through perfectly competitive markets.

Objective
Students acquire a deeper understanding of basic microeconomic models.

They acquire the ability to apply these models in the interpretation of real world economic contexts.

Content
Students acquire a reflective and contextual knowledge on how societies use scarce resources to produce goods and services and distribute them among themselves.

Market, budget constraint, preferences, utility function, utility maximisation, demand, technology, profit function, cost minimisation, cost functions, perfect competition, information and communication technologies

Prerequisites / notice: This course “Einführung in die Mikroökonomie” (363-1109-00L) is intended for Bachelor students and LE 363-0503-00 “Principles of Microeconomics” for Master students.

### Resource and Environmental Economics (363-0537-00L)

**Abstract**
A successful completion of the course will enable a thorough understanding of the basic questions and methods of resource and environmental economics and the ability to solve typical problems using appropriate tools consisting of concise verbal explanations, diagrams or mathematical expressions. Concrete goals are first of all the acquisition of knowledge about the main questions of resource and environmental economics and about the foundation of the theory with different normative concepts in terms of efficiency and fairness.

**Objective**
Students shall understand the relationship between economy and environment, market failures, external effects and public goods, contingent valuation, internalisation of externalities, economics of non-renewable resources, economics of renewable resources, environmental cost-benefit analysis, sustainability economics, and international resource and environmental problems.

**Content**
The course covers the main interactions between the economy and the natural environment. It introduces and explains basic welfare concepts and market failure; external effects, public goods, and environmental policy; the measurement of externalities and contingent valuation; the economics of non-renewable resources, renewable resources, cost-benefit-analysis, sustainability concepts; international aspects of resource and environmental problems; selected examples and case studies. After a general introduction to resource and environmental economics, highlighting its importance and the main issues, the course explains the normative basis, utilitarianism, and fairness according to different principles. Pollution externalities are a deep core topic of the lecture. We explain the governmental internalisation of externalities as well as the private internalisation of externalities (Coase theorem). Furthermore, the issues of free rider problems and public goods, efficient levels of pollution, tax vs. permits, and command and control instruments add to a thorough analysis of environmental policy. Turning to resource supply, the lecture first looks at empirical data on non-renewable natural resources and then develops the optimal price development (Hotelling-rule). It deals with the effects of explorations, new technologies, and market power. When treating the renewable resources, we look at biological growth functions, optimal harvesting of renewable resources, and the overuse of open-access resources. A next topic is cost-benefit analysis with the environment, requiring measuring environmental benefits and measuring costs. In the chapter on sustainability, the course covers concepts of sustainability, conflicts with optimality, and indicators of sustainability. In a final chapter, we consider international environmental problems and in particular climate change and climate policy.

**Literature**

---

### International Development Cooperation (851-0626-01L)

**Abstract**
The course gives economic and empirical foundations for a sound understanding of the instruments, prospects and limitations of international development aid.

**Objective**
Students have a theoretically and empirically sound understanding of the prospects and limitations of international development aid. Students are able to critically discuss the various aid instruments of bi- and multilateral donors and NGOs.

**Content**
Introduction to the Determinants of Underdevelopment: History of Aid; Aid and Development; Theories and Empirics; Political Economy of Aid; Experience and Impact of Aid; New Instruments of Aid; e.g. Micro-Finance, Budget-Support; Fair-Trade.

**Literature**
- Particularly suitable for students of D-ITET, D-MAVT. Articles and book abstracts will be uploaded to a course website.

---

### Startups and Law (851-0735-10L)

**Abstract**
- Reaction mechanisms in organic chemistry: substitutions, additions, eliminations, condensations, rearrangements, electrophilic aromatic substitution

**Objective**
- Students will be able to:
  - Recall basic organic chemistry reactions, including substitution, elimination and addition reactions occurring at sp2- and sp3-hybridized carbon centers.
  - Explain the relative favorability of certain organic chemical structures or certain organic chemical reactions.
  - Apply their understanding of reaction mechanism principles to explain observations.
  - Differentiate the most reactive sites in a given organic chemical.
  - Propose reaction mechanisms to new chemical transformations.

**Content**
- Descriptive chemistry of functional groups (alkyl halides, alkenes, aromatic systems, carbonyls).
- Reaction mechanisms (substitutions, additions, eliminations, condensations, electrophilic aromatic substitution).

**Literature**
- Carsten Schmuck, Basisbuch Organische Chemie, Pearson

**Prerequisites / notice**
- Der Stoff der Basischemie wird vorausgesetzt.

**Abstract**
- Basic knowledge of enzymology, in particular the structure, kinetics and chemistry of enzyme-catalysed reaction in vitro and in vivo.
- Biochemistry of metabolism: Those completing the course are able to describe and understand fundamental cellular metabolic processes.

**Objective**
- Students are able to describe the structure of proteins/enzymes and are able to explain biochemical functions depending on their 3D structures.
- Students are able to assess and propose hypothesis how proteins change during evolution.
- Connections between several metabolic pathways are known and students can evaluate how one pathway is influence by the activity of another pathway

**Content**
- Introduction, basics, composition of cells, biochemical units, repetition of relevant organic chemistry
- Structure and function of proteins
- Enzymes and enzyme kinetics
- Catalytic strategies
- Metabolism: Basic concepts and design. Repetition of basic thermodynamics
- Glycolysis, fermentation
- The citric acid cycle
- Oxidative phosphorylation and ATP physiology

**Lecture notes**
- Horton et al. (Pearson) serves as lecture notes.

**Prerequisites / notice**
- Basic knowledge in biology and chemistry is a prerequisite.

**401-0649-00L Applied Statistical Regression** | W | 5 credits | 2V+1U | M. Dettling

**Abstract**

This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning "good practice" that can be applied in every student's own projects and daily work life. A special focus will be laid in the use of the statistical software package R for regression analysis.

**Objective**

The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.

**Content**

The course starts with the basics of linear modeling, and then proceeds to parameter estimation, tests, confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, multicollinearity problems and model interpretation, as well as general modeling strategies.

The last third of the course is dedicated to an introduction to generalized linear models: this includes the generalized additive model, logit regression for binary response variables, binomial regression for grouped data and poisson regression for count data.

**Lecture notes**

A script will be available.

**Literature**

- Faraway (2005): Linear Models with R
- Faraway (2006): Extending the Linear Model with R
- Draper & Smith (1998): Applied Regression Analysis
- Fox (2008): Applied Regression Analysis and GLMs
- Montgomery et al. (2006): Introduction to Linear Regression Analysis

**Prerequisites / notice**

The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software R, for which an introduction will be held.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L "Applied Statistical Regression" and 401-3622-00L "Statistical Modelling" are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

Abstract
Woody plants are important elements of forest ecosystems and landscapes. The course gives an introduction to dendrology as well as to the identification of native tree and shrub species. It is a highly recommended course for the BSc specialization of Forest and Landscape and it provides the basic requirements for the consecutive course Woody Plants of Central Europe in the spring semester.

Objective
Knowledge of selected native tree and shrub species. Understanding of biological and ecological relations by means of in situ observation of woody plants. Differentiated view on forest ecosystems.

Content
Introduction to dendrology on the basis of concrete examples. Emphasis on identification of tree and shrub species (80 frequent tree and shrub species) and on the understanding of tree structure (morphology of woody plants). The illustrative way of presentation and the relations between different scale levels (organ, individual, stand, ecosystem) provide an attractive insight into forest and landscape topics as well as into environmental biology.

Lecture notes
- Lecture notes and handouts
- Rudow, A., 2023: Dendrologie 1 - Folien (in German).
- Rudow, A., 2011: eBot Dendrologie (Betaversion). E-learning-Tool for the support of dendrology courses at ETHZ (application integrated in eBot, in German).

Prerequisites / notice
Half of the course will be held in form of excursions and practical training in the forest (ETH Hönggerberg). Besides that 4 half day excursions (Zurich and surroundings, on weekends, dates by arrangement). Weatherproof clothes are presupposed. The course provides the basic knowledge for the advanced course 701-0516-00L Woody plants of Central Europe (Dendrology 2)

Competencies

Title
GIST - Introduction into Geoinformation Science and Technology

Abstract
Theoretical basics and fundamental concepts of Geographic Information Science are imparted and subsequently further elaborated with the software ArcGIS.

At the end, the students will be able to independently solve basic realistic GIS problems.

Objective
Students are able to
- elucidate the theoretical and conceptional foundations of geographic information systems (GIS)
- independently perform normal GIS work using commercial software and practical examples

Content
The course covers the following topics:
- What is GIS? What are spatial data?
- The representation of reality by means of spatial data models: vector, raster, TIN
- The four phases of data modelling: Spatial, conceptual, logical and physical model
- Possibilities of data collection
- Transition of reference frame
- Spatial Analysis I: query and manipulation of vector data
- Spatial Analysis II: operators and functions with raster data
- Digital elevation models and derived products
- Process modelling with vector and raster data
- Presentation possibilities of spatial data

One Friday is reserved for a field trip or guest speaker;

Literature

Prerequisites / notice
- Aufgrund der Grösse des verfügbaren EDV-Schulungsraumes ist die Teilnehmerzahl auf 50 Studierende beschränkt! Für die Übungen werden die Studierenden auf zwei, max. drei Zeitenfenster aufgeteilt. Pro Zeitenfenster können maximal 25 Studierende betreut werden.

Abstract
Die Grundlagen des Welternährungssystem werden anhand von Fallbeispielen aus der Forschung entlang der Wertschöpfungskette vermittelt.

Objective
Mit Besuch dieser Lehrveranstaltung soll Verständnis geschaffen werden, was ein Welternährungssystem ist, wo aktuell die grossen Herausforderungen liegen, was Elemente und Einflussfaktoren auf die Ernährungssicherheit sind, welche Wechselwirkungen zwischen diesen Elementen und Einflussfaktoren bestehen, und welche potentiellen Lösungsstrategien sich für spezifische Herausforderungen ableiten lassen.

Content

Lecture notes
Skripte und zusätzliches Lernmaterial werden auf Moodle verfügbar gemacht.

Literature
Information zu Büchern und anderer Literatur wird während der Lehrveranstaltung bekanntgegeben.

Abstract
Vermittlung von betriebswirtschaftlichen Grundlagenwissen und Analyse- und Planungsinstrumenten mit Anwendung auf Unternehmen der Agrar- und Ernährungswirtschaft

Objective
Teilnehmer des Kurses sollen am Ende der Vorlesung i) grundlegende Unternehmensentscheide strukturieren und analysieren können, ii) verschiedene Analyse- und Planungsinstrumente auf Fragestellungen der Produktionsplanung, Investition und Finanzierung an Beispielen anwenden zu können, iii) verschiedene Werkzeuge zur unternehmerischen Entscheidungsunterstützung anwenden können und iv) die Spezifik von Unternehmen in der Agrar- und Ernährungswirtschaft kennen.

Content
Die Vorlesung geht auf folgende Inhalte, mit spezifischen Anwendungen im Agrar- und Ernährungssektors ein:

Grundlagen und Ziele unternehmerischen Entscheidens
Kosten und Leistungsrechnung
Produktionstheorie
Produktionsprogrammplanung
Investitionsplanung und Finanzierung
Entscheidungen unter Unsicherheit und Risikomanagement

Lecture notes
Vorlesungsunterlagen werden im Laufe des Semesters zur Verfügung gestellt

Literature
751-3401-00L  Plant Nutrition I

Abstract
The aim of these lectures is to present the processes controlling the uptake and transport of nutrients by the plant, the assimilation of nutrients in the plant, the effect of nutrients on crop yield and quality, the role of the soil as a source of nutrients for crops, and the basic principles of fertilization in different crop types using mineral and organic fertilizers.

Objective
At the end of the lecture, students know how mineral nutrients are taken up through roots and circulate in the plants and what their roles in plants are. They understand the importance of nutrients for yield formation and for crop product quality. They are able to propose fertilization plans adapted for field crops growing under Swiss conditions.

Content
A general introduction explains the needs of appropriately managing nutrients in plant production. Afterwards, we will study the physiology of plant nutrition (nutrient uptake by roots; nutrient transports in the plant; physiological roles of nutrients in the plant). Then the role of nutrients for yield formation and their effects on crop quality is dealt with. Finally, the bases of crop fertilization are taught (availability of nutrient in soil; N, P and K fertilization; different types of fertilizers).

Lecture notes
The slides will be distributed.

751-3700-00L  Plant Ecophysiology

Abstract
The general theme of this course is the effect of environmental factors (such as light, temperature, relative humidity, CO2 concentrations, etc.) on plant physiology: water uptake and transport, transpiration, CO2 gas exchange of plants (photosynthesis, respiration), growth and C allocation, yield and production, stress physiology. Working with measurement data and Jupyter Notebooks is included.

Objective
The students will understand the impact of environmental factors on plant physiology and will learn the theoretical basis and terminology of plant ecophysiology that is necessary to analyze yield potentials in agriculture. The students will learn about classical and latest studies in plant ecophysiology. Students will check and implement their knowledge and understanding of ecophysiology using measurement data.

Literature

751-5003-00L  Sustainable Agroecosystems II

Abstract
This class conveys current topics and methods of agroecological and food systems research through selected case studies from ongoing research of the Sustainable Agroecosystems group. Students will be encouraged to develop critical thinking competencies, through individual and group work, on major agricultural and food system challenges and paths towards agricultural and food system transformation.

Objective
1) Systematically analyse and discuss case studies from ongoing agroecological and food system research.
2) Learn and experiment on methods for field and laboratory investigations in agroecology.
3) Engage with positive and empowering frameworks that motivate critical reflection and action on the types of transformative responses needed to adapt and thrive within agricultural and food systems.
4) Reflect critically on agricultural and food system transformation tools and methods from the perspective of successful agroecosystem stakeholder.
5) Identify and describe institutions in the context of sustainable agricultural development (for Bachelor and Master thesis and internships).

Data: 26.07.2024 12:39  Autumn Semester 2024  Page 2454 of 2680
The course will address a wide range of agricultural and food system challenges (e.g. food security, climate crisis, soil degradation, etc.) in both temperate and tropical contexts. In class we will address topics like building food system resilience through innovative measures, improving soil fertility management or understanding the effects of agroforestry systems. Case studies from the on-going research in the Sustainable Agroecosystems Group (sae.ethz.ch) will be presented, covering different scales (e.g. food value-chains, farm dynamics and soil management).

The class is complemented by practical group work conducted with the CSA Meh Als Gmues in Zürich on Measuring and monitoring Agroecological performance.

Students will gain an overview on institutions and actors’ roles in the field of sustainable agricultural development. Throughout the group work, students will learn to engage directly with various stakeholders, monitor agroecological transition and communicate their research to a wider audience. Ultimately, this class should provide an overview on methods, tools, innovations and platforms that support a sustainable food transformation.

**Course Information**

**Number**: 751-5005-00L

**Title**: Agroecology

**ECTS**: 2 credits

**Type**: W

**Hours**: 2G

**Lecturers**: N. Buchmann, S. Keller, M. Sonnevelt

**Abstract**

Agroecology is a discipline, an agricultural practice, and a political-social movement. Students will attend public lectures by experts from different fields and will reflect on agroecology and its principles. Moreover, students will expand their knowledge with case studies and discuss about the role of agroecology to support sustainable agriculture and food systems.

**Objective**

Students know the thirteen principles of the High-Level Panel of Experts (HLPE) of the Committee on World Food Security as well as the ten elements of agroecology suggested by FAO and can critically reflect on the important properties as well as benefits and trade-offs of agroecological systems and approaches.

Students will be able to transfer their disciplinary and interdisciplinary knowledge about the thirteen principles as guiding principles for policymakers, practitioners, and other stakeholders across the food system in planning, managing, and evaluating agroecological transformation. Students are part of small groups focusing on selected principles of the HLPE. During the course, students discuss the potential and limitations of agroecology and learn about scientific contributions to agroecology. Students form an opinion on the role of agroecology, reflect and argue on the different facets and develop recommendations for real-world applications of agroecology in supporting a transition towards sustainable food systems.

**Content**

The course is designed as a combination of public lectures/webinars on “Agroecology and the Transformation to Sustainable Food Systems” delivered by national and international experts and scientists as well as sessions in which students reflect on the topics addressed in the lecture series in a group work format. The public lectures bring different perspectives to the discussion and are intended as inputs for the students’ sessions. In the student sessions, the student groups deepen their knowledge of the 13 principles of agroecology proposed by the High-Level Panel of Experts (HLPE) of the Committee on World Food Security. They identify “unknows” and link to other closely related principles. The groups also work out the perspective of a chosen stakeholder. Finally, the groups will take part in a scientific discussion representing their stakeholder perspective. All groups will synthesize their discussions in a short report.

**Lecture notes**

Handouts will be available on the webpage of the course.

**Literature**

**Prerequisites / notice**

This course is based on fundamental knowledge about plant ecophysiology, soil science, biogeochemistry, crop and forage science, and ecology in general. The course will be taught in English. The course is only offered in fall.

Autumn Semester 2024
Page 2455 of 2680
Abstract
Students will be able to identify and enumerate important anatomical structures to describe basic physiological processes of the human body to use a 3d animation database/software to use 'anatomical language' to retrieve anatomical structures to understand basic medical terminology

Objective
To understand basic principles and structure of the human body in consideration of the clinical relevance and the medical terminology used in medical work and research.

Content
- The Human Body: nomenclature, orientations, tissues
- Musculoskeletal system, Muscle contraction
- Blood vessels, Heart, Circulation
- Blood, Immune system
- Respiratory system
- Acid-Base-Homeostasis

551-0317-00L Immunology I W 3 credits 2V M. Kopf, A. Oxenius

Abstract
Introduction into structural and functional aspects of the immune system.

Objective
Basic knowledge of the mechanisms and the regulation of an immune response.

Content
- Introduction and historical background
- Innate and adaptive immunity, Cells and organs of the immune system
- B cells and antibodies
- Generation of diversity
- Antigen presentation and Major Histoincompatibility (MHC) antigens
- Thymus and T cell selection
- Autoimmunity
- Cytotoxic T cells and NK cells
- Th1 and Th2 cells, regulatory T cells
- Allergies
- Hypersensitivities
- Vaccines, immune-therapeutic interventions

Lecture notes
Electronic access to the documentation will be provided. The link can be found at "Lernmaterialien"

Literature

752-6001-00L Introduction to Nutritional Science W 3 credits 2V I. Herter-Aeberli, K. Giller, C. Wolfrum

Abstract
This course introduces basic concepts of micro- and macronutrient nutrition. Micronutrients studied include fat-soluble and water-soluble vitamins, minerals and trace elements. Macronutrients include proteins, fat and carbohydrates. Special attention is given to nutrient digestion, bioavailability, metabolism and excretion with some focus on energy metabolism.

Objective
To introduce the students to the both macro- and micronutrients in relation to food and metabolism.

Content
The course is devided into two parts: Micronutrients and macronutrients. The micronutrient part includes fat-soluble vitamins, water-soluble vitamins, minerals and trace elements. The macronutrient part introduces basic nutritional aspects of proteins, fats, carbohydrates and energy metabolism. The nutrients are described in relation to digestion, absorption and metabolism. Special aspects of homeostasis and homeorhesis are emphasized.

Lecture notes

Soil Sciences

Number Title Type ECTS Hours Lecturers
701-0518-00L Soil Resources and Global Change W 3 credits 2G to be announced

This course unit will be offered for the next time in autumn semester 2025. So far it has taken place in spring semester.
Introduction to the importance, problems and concepts of soil development and the use of soil resources in a changing world. The lecture deals with the topic examples from a global, European and Swiss context. Active participation and presence during the lectures are part of the performance assessment.

Understanding the conditions under which soils develop and are used at the global scale. Consequences and problems of the use of soil and the resulting pressure on soil resources. Impact of climate and global change on the future development of soil resources. Competencies concerning process understanding, system understanding as well as data analysis & interpretation of pedogenetical data will be taught and examined.

Despite their numerous functions and their role in evaluating ecosystem services, soils and their diversity are often a sidelined element when it comes to the development of sustainable land use concepts. In many disciplines, soils are perceived as an important interface between dead and living elements of nature. All too often, however, soil processes are only included in a greatly simplified way for usage concepts or modeling of environmental and agricultural systems. This simplification does not correspond to the great global diversity of soils. They often vary greatly in terms of their resilience to, and ability to recover from, environmental stress. Also among the general public, the perception of the importance of soils as the basis of our ecosystems is diffuse at best. Measures for local soil protection and for the re- naturation of near-natural ecosystems are widely supported, but as little as possible should change in the wallet and in consumer behavior. The result are translocation effects and more intensive use of soils and ecosystem resources in countries of the Global South to fulfill consumer needs of the Global North.

The lecture gives an introduction to the meaning, problems and concepts of soil development and the use of soil resources in a changing world. The lecture also deals with the following current topics: What are the consequences of different conflicts (e.g. Russian attack on Ukraine) for soil health and food production in the affected region for the world market? What are the consequences of climate change for carbon storage in Swiss mountain soils? Or: How does massive deforestation and soil degradation affect nutrient cycles in tropical soils? The lecture is aimed at students in later semesters in the bachelor's program in environmental sciences, agricultural and environmental engineering as well as students in earlier semesters in the master's programs of the same name. It provides an overview of the global framework conditions under which soils develop and are used. It also sheds light on the impact of humans on different types of soil and how this changes the soil. Above all, skills for process and system understanding as well as data analysis and interpretation in soil research are taught.

Indirect disturbances such as the effects of climate change (global warming, permafrost or drought stress) are treated as well as direct disturbances through land use (erosion, chemical pollution or soil destruction). Soil functions and soil formation, differences in regional and global soil development, disturbances of the water and air cycling of soils, forms of soil pollution as well as regional and global assessments of soil pollution are also discussed. The focus is thereby always on the consequences and problems of soil use and the resulting pressures and dangers for biogeochemical (nutrient) cycles, for the landscape water cycle and the restriction of soil functions through soil degradation.

In addition to these focal points in the field of soil degradation and soil development, the lecture also gives insights into methods of regenerative agriculture, soil improvement and the remediation of polluted soils. Finally, the lecture illuminates the planning and legal implementation of soil protection with examples from different climate and land use zones in order to give the students an insight into the later professional practice of the future environmental and agricultural scientists.

Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed
- Analytical Competencies: assessed
- Problem-solving: assessed

Method-specific Competencies
- Creative Thinking: assessed
- Critical Thinking: assessed
- Self-direction and Self-management: assessed

The course "Soil and Water Chemistry" teaches, applies and examines the competences process understanding, systems understanding, and modelling.

The lecture covers chemical and biogeochemical processes in soils and water and their influence on the behavior of nutrients and pollutants in terrestrial and aquatic systems. Approaches for quantitative modeling of the processes are introduced and applied in selected examples.

1. Understanding of important chemical properties and processes of soils and water and their influence on the behavior (e.g., chemical speciation, bioavailability, mobility) of nutrients and pollutants.
2. Quantitative applications of chemical equilibria to processes in natural systems.

The course "Soil and Water Chemistry" teaches, applies and examines the competences process understanding, systems understanding, and modelling.

Chemical equilibria in aqueous solutions, gas equilibria, precipitation and dissolution of mineral phases, silicate weathering, weathering kinetics, formation of secondary minerals (clay minerals, oxides, sulfides), redox processes in natural systems, pH buffering and acidification, salinity and salinization, environmental behavior of selected essential and toxic trace elements.

The lecture courses Pedosphere and Hydrosphere are highly recommended.
Abstract
The course provides theoretical and practical foundations for understanding and characterizing physical soil properties and processes and their relevance for terrestrial ecosystems, plant growth, hydrological processes and atmospheric-land gas exchange, across all relevant scales.

Objective
Students are able to:
- Characterize the different soils based on their key textural and structural properties.
- Simulate and predict soil water retention and flow under varying environmental conditions and understand the key driving forces (capillarity, gravity, friction) and related water properties (surface tension and viscosity).
- Predict soil hydraulic properties for varying soil textural classes.
- Predict solute transport in soils for varying environmental conditions.
- Predict energy balance and temperature dynamics in soils.
- Predict conditions for plant water stress.
- Estimate the impact of soil properties on the hydrological cycle and on plant growth.

Content
INTRODUCTION
Week 1 (September 18)
Presentation of the role of soil physics in environmental sciences and terrestrial ecosystems: soils in the water cycle; soils and vegetation; soils and solute transport. Survey on students' interests and expectations. Presentation of course structure and learning objectives.

BASIC SOIL PROPERTIES
Week 2 (September 25) and Week 3 (October 02)
soil texture, particle size distribution, soil structure, soil surface area, porosity and bulk density
Pore scale consideration (water in a single pore), pore sizes and shapes; surface tension; Young-Laplace equation; capillary rise; contact angle
Friction and laminar flow; Hagen-Poiseuille's law; Washburn equation; numerical lab (REPORT 1)

SOIL HYDRAULIC PROPERTIES
Week (4 October 09) and Week 5 (October 16)
Soil water content and soil water potential - The energy state of soil water; total water potential and its components; volumetric and gravimetric water contents; field capacity and wilting point
Soil water characteristics and pore size distribution
Saturated water flow in soils - Laminar flow in tubes (Poiseuille's Law); Darcy's Law, conditions and states of flow; permeability and hydraulic conductivity, measurement and theoretical concepts; effective conductivity; unsaturated hydraulic conductivity; Buckingham law.
Unsaturated water flow in soils - Unsaturated hydraulic conductivity models and applications

TOOLBOX – MEASUREMENTS AND MODELING
Week (6 October 23) and Week 7 (October 30)
Measuring soil hydraulic properties, fitting and interpretation; Lab tour - demonstration of soil physical methods; lecture on HYPROP method; report on Hyprop data (REPORT 2)
Modelling unsaturated water flow based on Richards equation - Using Hydrus1D for simulation of unsaturated flow; simulating HYPROP measurements (REPORT 3)

SOIL IN THE WATER CYCLE
Week 8 (November 06) – Week 9 (November 13)
Water infiltration - steady state solutions for infiltration; approximate solutions to infiltration (Green-Ampt, Philip); infiltration rate and ponding; outlook to preferential flow
Water evaporation - Energy balance and land atmosphere interactions - potential and actual evaporation, evaporation stages;

SOIL PLANT INTERACTIONS
Week 10 (November 20) Week 11 (November 27)
Root water uptake and transpiration – Theory and mechanisms controlling root water uptake; hydraulic properties of rhizosphere; plant and stomatal conductance.
Modelling root water uptake and transpiration; analytical approaches and modeling using Hydrus (REPORT 4)

SOLUTE TRANSPORT
Week 12 (December 04) Week 13 (December 11)
Transport mechanisms of solutes in porous media; breakthrough curves; convection-dispersion equation; solutions for pulse and step solute application
Transport of reactive substances, preferential flow, simulations with Hydrus

CLOSURE
Week 14 (December 18)
Summary, course synthesis, connections between the different topics, questions, exam preparation

Literature
Supplemental textbook (not mandatory) - Introduction to Environmental Soil Physics, by: D. Hillel
At the end of the lecture, students know how mineral nutrients are taken up through roots and circulate in the plants and what their roles in plant production are. They understand the importance of nutrients for yield formation and for crop product quality. They are able to propose fertilization plans adapted for field crops growing under Swiss conditions.

**Literature**
401-0649-00L Applied Statistical Regression

Abstract
This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning “good practice” that can be applied in every student's own projects and daily work life. A special focus will be laid in the use of the statistical software package R for regression analysis.

Objective
The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.

Content
The course starts with the basics of linear modeling, and then proceeds to parameter estimation, tests, confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, multicollinearity problems and model interpretation, as well as general modeling strategies.

The last third of the course is dedicated to an introduction to generalized linear models: this includes the generalized additive model, logistic regression for binary response variables, binomial regression for grouped data and poisson regression for count data.

Lecture notes
A script will be available.

Literature

Faraway (2006): Extending the Linear Model with R
Draper & Smith (1998): Applied Regression Analysis
Fox (2008): Applied Regression Analysis and GLMs
Montgomery et al. (2006): Introduction to Linear Regression Analysis

Prerequisites / notice
The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L “Applied Statistical Regression” and 401-3622-00L “Statistical Modelling” are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

401-6215-00L Using R for Data Analysis and Graphics (Part I)

Abstract
The course provides the first part an introduction to the statistical/graphical/data science software R (https://www.r-project.org/) for scientists. Topics covered are data generation and selection, graphical and basic statistical functions, creating simple functions, basic types of objects.

Objective
The course provides the first part of an introduction to the statistical software R for scientists. R is free software that contains a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

Content
Part I of the course covers the following topics:
- What is R?
- R Basics: reading and writing data from/to files, creating vectors & matrices, selecting elements of dataframes, vectors and matrices, arithmetics;
- Types of data: numeric, character, logical and categorical data, missing values;
- Simple (statistical) functions: summary, mean, var, etc., simple statistical tests;
- Writing simple functions;
- Introduction to graphics: scatter-, boxplots and other high-level plotting functions, embellishing plots by title, axis labels, etc., adding elements (lines, points) to existing plots.

The course focuses on practical work at the computer with R. We will make use of the graphical user interface RStudio: www.rstudio.org

Lecture notes
An Introduction to R. http://stat.ethz.ch/CRAN/doc/contrib/Lam-IntroductionToR_LHL.pdf

Prerequisites / notice
The course resources will be provided via the Moodle web learning platform. Subscribing via Mystudies “automatically” makes you a student participant of the Moodle course of this lecture, which is at https://moodle-app2.let.ethz.ch/course/view.php?id=20847

Competencies
Subject-specific Competencies
Concepts and Theories assessed
Techniques and Technologies assessed

Method-specific Competencies
Analytical Competencies assessed
Media and Digital Technologies assessed
Problem-solving assessed

Social Competencies
Cooperation and Teamwork fostered

Personal Competencies
Creative Thinking assessed
The course provides the second part of an introduction to the statistical software R (https://www.r-project.org/) for scientists. R is free software that contains a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

Part II of the course builds on part I and covers the following additional topics:
- Elements of the R language: control structures (if, else, loops), lists, overview of R objects, attributes of R objects;
- More on R functions;
- Applying functions to elements of vectors, matrices and lists;
- Object oriented programming with R: classes and methods;
- Tayloring R: options
- Extending basic R: packages

The course focuses on practical work at the computer. We will make use of the graphical user interface RStudio: www.rstudio.org

The course resources will be provided via the Moodle web learning platform. As from FS 2019, subscribing via Mystudies should “automatically” make you a student participant of the Moodle course of this lecture, which is at

https://moodle-app2.let.ethz.ch/course/view.php?id=20848

Introduction to Dendrology

Abstract
Woody plants are important elements of forest ecosystems and landscapes. The course gives an introduction to dendrology as well as to the identification of native tree and shrub species. It is a highly recomended course for the BSc specialization of Forest and Landscape and it provides the basic requirements for the consecutive course Woody Plants of Central Europe in the spring semester.

Objective
Knowledge of selected native tree and shrub species. Understanding of biological and ecological relations by means of in situ observation of woody plants. Differentiated view on forest ecosystems.

Content
Introduction to dendrology on the basis of concrete examples. Emphasis on identification of tree and shrub species (80 frequent tree and shrub species) and on the understanding of tree structure (morphology of woody plants). The illustrating way of presentation and the relations between different scale levels (organ, individual, stand, ecosystem) provide an attractive insight into forest and landscape topics as well as into environmental biology.

Lecture notes
Rudow, A., 2023: Dendrologie 1 - Folien (in German).

Prerequisites / notice
Half of the course will be held in form of excursions and practical training in the forest (ETH Hönggerberg). Besides that 4 half day excursions (Zurich and surroundings, on weekends, dates by arrangement). Weatherproof clothes are presupposed.

The course provides the basic knowledge for the advanced course 701-0316-00L Woody Plants of Central Europe (Dendrology 2)

The course covers the ecology of birds and mammals. Important concepts of nutrition, physiology, behavioural ecology, population biology, biogeography and community ecology will be linked to applications in conservation and management. A worldwide perspective will be complemented by a focus on the Central European fauna and its dynamics.

The students are familiar with important topics in animal ecology of vertebrates, with an emphasis on birds and mammals. They are able to link theoretical concepts with ecological phenomena and view them against an evolutionary backdrop. They can thus appraise applied aspects of the conservation and the use of animal populations, such as the influence of body size on the energy demand and nutrition, relationships between resource availability on habitat use of birds and mammals as well as between predators and prey species, or of herbivores on vegetation, and the effects of hunting and environmental change on animal populations. Students understand the biogeographical characteristics of the Central European vertebrate fauna and its temporal and spatial dynamics.

The course deals with a number of topics that include feeding and resource use, spatial behaviour and migrations, reproduction, population dynamics, competition and predation, parasites and diseases, biodiversity and distributions, and dynamics of the Central European fauna. There is an emphasis on linking theory with management issues in conservation and management of wildlife populations. During the first half of the course, examples will be drawn worldwide whereas during the second half, the course will focus more strongly on the European fauna, particularly of the Alpine region. Although the course is not designed to teach species knowledge and determination, examples will cover much of the taxonomic range of the European fauna.

The course includes a field excursion (7.12.2024, Alternative date: 14.12.24).

Program (Lecturers: Kurt Bollmann (KB), Urs Koramnn (UK)):
23.09.24 Birds and mammals: similarities & differences, endothermy & body isolation, moul in birds (KB)
30.09.24 Feeding I: Food, metabolism (KB)
07.10.24 Feeding II: Energetic needs, foraging, digestion (KB)
14.10.24 Distribution and habitat use, migration (UK)
21.10.24 Reproduction, litter and clutch size, breeding systems (UK)
28.10.24 Population dynamics (KB)
04.11.24 Predation, predator-prey-cycles (KB)
11.11.24 Competition (UK), Parasitism and diseases (self-study)
18.11.24 Biogeography of central European birds and mammals, return of ungulates and large predators (KB)
25.11.24 Herbivores as landscape engineers: the Serengeti ecosystem (Guest lecturer)
02.12.24 Exploitation of wild birds and mammals (KB)
09.12.24 Threats and conservation biology of selected species (UK)
16.12.24 Mammals and climate change (case study on roe deer) + questions and pilot test (KB)

Lecture notes
Lecture notes and handouts will be available digitally.

Literature
Literature will be listed in the lecture notes. Some additional papers will be distributed.

Some books relevant to the course are (optional reading):
- Suter, W., 2017. Ökologie der Wirbeltiere. Vögel und Säugetiere. UTB/Haupt, Bern. This book is based on the course. It is in German.

Some books relevant to the course are (optional reading):

701-0405-00L Rivers: Concepts and Methods for Sustainable Management
Abstract
This course deals with river ecosystems, their fundamental ecological characteristics, anthropogenic impacts and changes. We discuss concepts and interdisciplinary approaches (hydraulic engineering and ecology) for sustainable management. The students organize themselves in working groups (lecture and moderation of a discussion on a date of choice, writing of a report).

Objective
Understanding the basics of the functioning of river ecosystems:
- Basics of sustainable management of rivers
- Application of these principles to case studies
- Critical analyses, organization in discussion groups

Content
1) Planning, working groups, working methods
2) Water protection act and techniques for moderating discussions
3) Project implementation/realization
4) Floodplain management and revitalization
5) Restoration of sediment dynamics
6) Rivers under changing climate
7) River widening and ramps
8) Effects of restoration projects
9) Altered flow and temperature regimes in rivers and lakes
10) Water and health
11) Fish migration in rivers
12) Visitor control/recreational management
13) Pearlnd protection
14) Conclusion/ evaluation

Lecture notes
Themenspezifische Unterlagen (Vorlesung Dozierende, Literatur) werden verteilt und auf Moodle zugänglich gemacht (Link folgt).

Literature
Litertaturlisten zu den Gruppenarbeiten (Votrag und Moderation einer ausgewählten Vorlesungstunde, sowie Bericht) werden abgegeben und auf Moodle zugänglich gemacht (Link folgt).

Prerequisites / notice
Students will organize discussion groups (preparation of presentation and moderation, report).

Data: 26.07.2024 12:39
Autumn Semester 2024
Page 2462 of 2680
Das Ziel vieler landwirtschaftlicher Managemententscheidungen, d. h., das Erhöhen der Produktivität und des Ertrages, basiert häufig auf angesprochen.

Die Lehrveranstaltung richtet sich nicht nur an jene Studierenden, welche sich später chemisch vertiefen wollen, sondern ausdrücklich auch an alle jene, welche sich mit der Problematik von organischen Schadstoffen in der Umwelt vertraut machen wollen, um dieses Wissen in anderen Vertiefungen anzuwenden.

- name and recognize the most important classes of environmentally relevant anthropogenic chemicals and identify chemical moieties governing their fate processes.
- explain, on the basis of physical-chemical foundations, the most important processes (i.e., partitioning and substitution and elimination reactions) which determine the environmental behavior of organic pollutants.
- identify, on the basis of chemical structure, the processes relevant for the environmental behavior of a compound.
- critically evaluate published work and data.
- Overview of the most important classes of environmental organic pollutants
- Molecular interactions that determine the partitioning behavior (adsorption and absorption processes) of organic compounds between different environmental compartments (gas, liquid, solid)
- Physical-chemical properties (vapor pressure, aqueous solubility, air-water partition constant, organic solvent-water partition constants, etc) and partitioning behavior of organic compounds between environmentally relevant phases (air, aerosols, soil, water, biota)
- Chemical transformation reactions of organic pollutants in aquatic and in terrestrial environments (hydrosynthesis, elimination, addition)

Spezielle Literatur

Die Lehreinstellung richtet sich nicht nur an jene Studierenden, welche sich später chemisch vertiefen wollen, sondern ausdrücklich auch an alle jene, welche sich mit der Problematik von organischen Schadstoffen in der Umwelt vertraut machen wollen, um dieses Wissen in anderen Vertiefungen anzuwenden.
Organic Chemistry

**Abstract**

**Objective**
Students will be able to:
- Recall basic organic chemistry reactions, including substitution, elimination and addition reactions occurring at sp2- and sp3-hybridized carbon centers.
- Explain the relative favorability of certain organic chemical structures or certain organic chemical reactions.
- Apply their understanding of reaction mechanism principles to explain observations.
- Differentiate the most reactive sites in a given organic chemical.
- Propose reaction mechanisms to new chemical transformations.

**Content**
- Descriptive chemistry of functional groups (alkyl halides, alkenes, aromatic systems, carbonyls).
- Reaction mechanisms (substitutions, additions, eliminations, condensations, electrophilic aromatic substitution).

**Literature**
Carsten Schmuck, *Basisbuch Organische Chemie*, Pearson

**Prerequisites / notice**
Der Stoff der Basischemie wird vorausgesetzt.

---

Biochemistry

**Abstract**
Basic knowledge of enzymology, in particular the structure, kinetics and chemistry of enzyme-catalysed reaction in vitro and in vivo. Biochemistry of metabolism: Those completing the course are able to describe and understand fundamental cellular metabolic processes.

**Objective**
Students are able to describe the structure of proteins/enzymes and are able to explain biochemical functions depending on their 3D structures.
- Students are able to assess and propose hypothesis how proteins change during evolution.
- Connections between several metabolic pathways are known and students can evaluate how one pathway is influence by the activity of another pathway

**Content**
- Program
  - Introduction, basics, composition of cells, biochemical units, repetition of relevant organic chemistry
  - Structure and function of proteins
  - Enzymes and enzyme kinetics
  - Catalytic strategies
  - Metabolism: Basic concepts and design. Repetition of basic thermodynamics
  - Glycolysis, fermentation
  - The citric acid cycle
  - Oxidative phosphorylation and ATP physiology

**Lecture notes**
Horton et al. (Pearson) serves as lecture notes.

**Prerequisites / notice**
Basic knowledge in biology and chemistry is a prerequisite.

Abstract
The course teaches the basics of hydromechanics, relevant for civil and environmental engineers.

Objective
In the course "Hydraulics I", the competency of process understanding is taught, applied and examined. Furthermore system understanding and measurement methods are taught.

Content
Properties of water, hydrostatics, stability of floating bodies, continuity, Euler equation of motion, Navier-Stokes equations, similarity, Bernoulli principle, momentum equation for finite volumes, potential flows, ideal fluids vs. real fluids, boundary layer, pipe flow, open channel flow, flow measurements, demonstration experiments in the lecture hall

Lecture notes
Script and collection of previous problems

Literature

Abstract
Students put the measures they developed during the courses Tackling Environmental Problems II into practice, in collaboration with partners from civil society, the public, and the private sector.

Objective
Students are able to put the measures they developed to address sustainability problems into practice.

Content
In Tackling Environmental Problems I & II, students analyze a sustainability topic, identify a specific problem within it, develop measures to address the problem and test the measures for feasibility by presenting them to concerned stakeholders. Some of the students develop their measures to such a degree that the measures could actually be implemented. Tackling Environmental Problems III provides the opportunity to do so. Together with partners from civil society, the private and the public sector, students agree on the implementation plan, the financial and legal aspects and put the measure into practice.

Prerequisites / notice
Tackling Environmental Problems I & II is a prerequisite for taking the course Tackling Environmental Problems III.
701-0951-00L  GIST - Introduction into Geoinformation Science and Technology  W  5 credits  2V+3P  M. A. M. Niederhuber

Abstract
Theoretical basics and fundamental concepts of Geographic Information Science are imparted and subsequently further elaborated with the software ArcGIS. At the end, the students will be able to independently solve basic realistic GIS problems.

Objective
Students are able to
- elucidate the theoretical and conceptional foundations of geographic information systems (GIS)
- independently perform normal GIS work using commercial software and practical examples

Content
The course covers the following topics:
- What is GIS? What are spatial data?
- The representation of reality by means of spatial data models: vector, raster, TIN
- The four phases of data modelling: Spatial, conceptual, logical and physical model
- Possibilities of data collection
- Transition of reference frame
- Spatial Analysis I: query and manipulation of vector data
- Spatial Analysis II: operators and functions with raster data
- Digital elevation models and derived products
- Process modelling with vector and raster data
- Presentation possibilities of spatial data

One Friday is reserved for a field trip or guest speaker;

Literature

Prerequisites / notice
Aufgrund der Grösse des verfügbaren EDV-Schulungsraumes ist die Teilnehmerzahl auf 50 Studierende beschränkt! Für die Übungen werden die Studierenden auf zwei, max. drei Zeitfenster aufgeteilt. Pro Zeitfenster können maximal 25 Studierende betreut werden.

701-0967-00L  Project Development in Renewable Energies  W  2 credits  2G  R. Rechsteiner, A. Appenzeller

Abstract
The focus is on the implementation of projects:
- photovoltaics
- wind energy
- hydropower
You will learn about new business models, including storage and sector coupling, discuss framework conditions, economic efficiency, security of supply, market organization and business risks. Guidance from experts with many years of political and project experience.

Objective
You will receive a practice-oriented introduction to the regulatory and economic requirements for renewable energy projects.
You will be familiar with the options for integrating fluctuating energy production in an environment of volatile prices.
You will be familiar with the opportunities and risks and strategies for economic security.

Content
Detailed program
https://www.rechsteiner-basel.ch/lehrmittel?no_cache=1#c273

Lecture notes
PPT presentation will be distributed (in German)
Literature

Public Transport and Railways

W 3 credits 2G F. Corman

Abstract
Fundamentals of public and collective transport, in its different forms.

Objective
Teaches the basic principles of public transport network and topology design, to understand the main characteristics and differences of public transport networks, based on buses, railways, or other technologies.
Teaches students to recognize the interactions between the infrastructure design and the production processes, and various performance criteria based on numerous perspectives and stakeholders.
At the end of this course, students can critically analyze existing networks of public transport, their design and use; consider and substantiate different choices of technologies to suitable cases; optimize the use of resources in public transport.

Content
Fundamentals: Infrastructures and vehicle technologies of public transport systems; interaction between track and vehicles; passengers and goods as infrastructure users; management and financing of networks.
Infrastructure: Planning processes and decision levels in network development and infrastructure planning, planning of topologies; tracks and roadways, station infrastructures; Fundamentals of the infrastructure design for lines; track geometries; switches and crossings
Vehicles: Classification, design and suitability for different goals
Network design: design dilemmas, conceptual models for passenger transport on long distance, urban regional transport.

Lecture notes
Slides, in English, are made available some days before each lecture.

Literature
Reference material books are provided in German and English (list disseminated at lecture), plus Script Bahninfrastruktur; System- und Netzplanung

103-0313-00L Spatial Planning and Landscape Development W 5 credits 4G G. Debrunner, S. Hauller, D. Jerjen

Abstract
The lecture introduces the main-features of Swiss spatial planning. Core subjects are e.g., spatial planning as a federal responsibility, spatial planning instruments (federal, cantonal, municipal), as well as systematic problem solving techniques and methodologies of spatial planning. The lecture is complemented with in-depth topics and comparative international examples.

Objective
Die Studierenden kennen die Grundzüge der Schweizer Raumplanung, ihre wichtigsten Instrumente auf nationaler, kantonaler, regionaler und kommunaler Ebene und systematische Problemlösungsverfahren. Sie können das vermittelte theoretische Wissen direkt an konkreten, praxisorientierten Übungsaufgaben umsetzen.

- Grundzüge der Raumplanung und ihre wichtigsten Instrumente kennenlernen
- Erarbeiten der Fähigkeit, räumliche Probleme zu erkennen und Problemlösungsverfahren auf diese anzuwenden
- Planung und Landnutzungsmanagement als interaktiven und akteursbezogenen Prozess kennenlernen und anwenden
- Verstehen der mit Ressourcen und Boden verbundenen Potentiale, Nutzungen und Prozesse
- Das vermittelte theoretische Wissen direkt an konkreten, praxisorientierten Fallbeispielen umsetzen können

Content
Die Vorlesung deckt die Grundlagen der (Schweizerischen) Raumplanung und Landschaftsentwicklung ab:

- Was ist Raumplanung (Definitionen und Begriffe)
- Aktuelle Herausforderungen, Entwicklungen und Tendenzen der Raumplanung
- Grundprinzipien, historische Entwicklung und Gesetzgebungen der Schweizer Raumplanung
- Die Raumplanung als staatliche Aufgabe – Raumordnungspolitik auf Bundesebene
- Instrumente der Raumplanung auf nationaler, kantonaler, regionaler und kommunaler Ebene (u.a. Sachpläne und Konzepte, Richtplanung, Nutzungsplanung, Sondernutzungsplanung, Mehrwertausgleich)
- Problemlösungsverfahren in der Raumplanung – systemtechnisches Vorgehen
- Thematische Vertiefungen: Siedlungsentwicklung nach innen; Klimaangepasste Raumplanung; Grundeigentum und kooperative Planung; Raumbeobachtung

Lecture notes
Skript und einzelne Dokumente werden ausgegeben. Unterlagen zur Vorlesung werden auf der SPUR-Kursseite und/oder auf Moodle direkt zur Verfügung gestellt.

Literature

101-0515-00L Project Management W 2 credits 2G C. G. C. Marx

Abstract
The course gives a detailed introduction on various aspects of professional project management out of theory and practice. Established concepts and methods for project organization, planning, execution and evaluation are introduced and major challenges discussed. The course includes an introduction to specialized project management software as well as agile project management concepts.

Objective
Projects are not only the base of work in modern enterprises, but also the primary type of cooperation with customers. Students of ETH will often work in or manage projects in the course of their career. Good project management knowledge is not only a guarantee for individual, but also for company-wide success.

The goal of this course is to give a detailed introduction into project management. The students should learn to plan and execute a project.

Content
- Project planning (aims, appointments, capacities, efforts and costs)
- Project organization
- Scheduling and risk analysis
- Project execution, supervision and control
- Project evaluation, termination and documentation
- Conflict management
- Multinational project management
- IT support as well as agile project management methods such as SCRUM

Lecture notes
The lecture slides and other additional material will be available for download from Moodle a week before each class.

851-0654-00L The Sustainable Development Goals in Context W 1 credit 2G I. Günther, M. Mertens

Abstract
The United Nations Agenda 2030 and its 17 Sustainable Development Goals (SDGs) provide an opportunity for the international community to shape the course of sustainable development. The lectures center on 17 sustainability and equity challenges and provide insights from researchers as well as decision makers from policy, the private sector and civil society.

Objective
1. Students know important dimensions of sustainable development and the discourse in the context of the SDGs
2. Students get an overview how ETH Zurich contributes to sustainable development and the achievement of the SDGs
3. The lecture series enables students to contribute to sustainable development during their studies and research, as graduates on the job market, and as members of the society
4. Writing a short blog post trains students to communicate acquired knowledge effectively for a broader audience.
5. Students will learn to critically read short articles and ask follow-up questions to experts of a field.

Content
For each lecture we will invite one researcher or one decision maker from policy, the private sector or civil society to reflect on one particular SDG. These talks will be followed by discussions with students and the general public. Majority of the lectures and discussion sessions will be held on campus, and some sessions online.

Lecture notes
1 short paper will be posted on the Moodle each week that should be read before the talks.

Prerequisites / notice
Open to advanced Bachelor and all Master level students enrolled at ETH Zurich

701-0471-01L Atmospheric Chemistry

Atmospheric Chemistry

- fostered

Abstract

This course covers the chemical and physical processes controlling the composition of the troposphere and stratosphere and introduces the relevant fundamentals for processes in the gas phase, in aerosols and clouds. These concepts are explored in the context of key environmental issues, such as urban air pollution, stratospheric ozone depletion, and air quality connections to climate change.

Objective

At the end of this course, students are able to:

1. describe the structure of the atmosphere and list atmospheric components and their main properties
2. describe and define the chemical and physical processes in the stratosphere and troposphere, follow reaction mechanisms, and apply rate laws
3. describe the physical and chemical principles of air pollution and summarize the most important legislative measures
4. discuss the local, regional, and global aspects of interactions between air quality, ecosystem health, and climate

Content

- Origin and properties of the atmosphere: composition (gases and aerosols), atmospheric structure, UV radiation, transport timescales
- Kinetics of gas phase reactions: rate laws, mechanisms of bimolecular and termolecular reactions.
- Stratospheric chemistry: Chapman cycle, catalytic ozone destruction cycles, polar ozone hole, Montreal protocol
- Tropospheric chemistry: oxidizing capacity of the troposphere and the role of OH, oxidation and global budgets of CO and CH4, role of NOx, and the global tropospheric O3 budget
- Surface ozone chemistry: HOx-NOx cycle, role of VOCs, O3 isopleth, ozone production efficiency
- Aerosols: primary and secondary sources, composition, quantities and measures, connections to climate
- Multiphase chemistry: solubility of gases, Raoult’s Law and hygroscopicity, kinetics of gas to particle transfer, N2O5 chemistry, aqueous phase sulfur chemistry, secondary organic aerosol formation
- Air quality: role of planetary boundary layer, deposition processes, summer- versus winter-smog, environmental problems, legislation, long-term trends
- Global aspects: air quality - climate interactions

Lecture notes

Lecture materials (slides) are provided continuously during the semester, at least 2 days before each lecture. Announcements and corrections are provided at the latest within the same week.

Prerequisites / notice

Attendance of the lecture "Atmosphäre" LV 701-0023-00L or equivalent knowledge is a pre-requisite, and basic courses in physics and chemistry are expected. On Mondays (or upon agreement) a tutorial is offered. This allows the students to discuss unresolved issues from the lecture or to discuss the problems of the exercise series and their solution. Participation is recommended.

Competencies

701-0473-00L  Weather Systems  W  3 credits  2G  M. A. Sprenger, I. Thurnherr

Abstract
Satellite observations; analysis of vertical soundings; geostrophic and thermal wind; cyclones at mid-latitude; global circulation; north-Atlantic oscillation; atmospheric blocking situations; Eulerian and Lagrangian perspective; Potential Vorticity; Alpine dynamics (storms, orographic wind); planetary boundary layer; water isotopes

Objective
The students are able to:
- explain basic measurement and analysis techniques that are relevant in atmospheric dynamics
- to discuss the mathematical basics of atmospheric dynamics, based on selected atmospheric flow phenomena
- to explain the basic dynamics of the global circulation and of synoptic- and meso-scale flow features
- to explain how mountains influence the atmospheric flow on different scales
- basic understanding of stable water isotopes as tracers for moist adiabatic processes in weather systems

Content
Satellite observations; analysis of vertical soundings; geostrophic and thermal wind; cyclones at mid-latitude; global circulation; north-Atlantic oscillation; atmospheric blocking situations; Eulerian and Lagrangian perspective; Potential Vorticity; Alpine dynamics (storms, orographic wind); planetary boundary layer; water vapour transport in the atmosphere; water isotopes

701-0475-00L  Environmental Fluid Dynamics  W  3 credits  2G  U. Lohmann

Abstract
This course covers the basics of atmospheric physics, which consist of: cloud and precipitation formation, especially prediction of showers and severe convective storms, and optical phenomena

Objective
Students are able to:
- to explain the mechanisms of convective storm formation using knowledge of thermodynamics and cloud microphysics.
- to interpret precipitation radar images
- to evaluate the significance of clouds and aerosol particles for artificial weather modification.

Content
The course starts with introducing selected concepts of thermodynamics for atmospheric processes: The students learn the concept of the thermodynamic equilibrium and derive the Clausius-Clayperon equation from the first law of thermodynamics. This equation is central for the phase transitions in clouds.

Students also learn to use thermodynamic charts (tephigrams) and to identify cloud base, cloud top, available convective energy in radiosonde ascents. Atmospheric mixing processes are introduced as a basis for fog formation. The concept of an air parcel is used to understand convection.

Aerosol particles are introduced in terms of their physical properties and their role in cloud formation based on Köhler theory. Thereafter cloud microphysical processes including ice nucleation are discussed.

With these basics, the different forms of precipitation (convective vs. stratiform) are discussed and how they can be identified in radar images. Students will also learn under which conditions severe convective storms (especially supercells with tornados) can form.

The concepts are applied to understand and judge the validity of different proposed artificial weather modification ideas.

Lecture notes
Powerpoint slides and chapters from the textbook will be made available on moodle: https://moodle-app2.let.ethz.ch/course/view.php?id=22731

Literature

An electronic version of this book can be obtained via the ETH library.

Prerequisites / notice
pdf-files of the revised book will be provided on moodle on a chapter-by-chapter basis.

We offer a lab tour, in which we demonstrate how some of the processes discussed in the lectures are measured with instruments.

701-0479-00L  Environmental Fluid Dynamics  W  3 credits  2G  H. Wernli, L. Papritz

Abstract
This course covers the basic physical concepts and mathematical equations used to describe environmental fluid systems on the rotating Earth. Fundamental concepts (e.g. vorticity dynamics and waves) are formally introduced, applied quantitatively and illustrated using examples. Exercises help to deepen knowledge of the material.

Objective
Students are able to:
- to name the basics, concepts and methods of environmental fluid dynamics.
- to understand and discuss the components of the basic physical equations
- to mathematically solve basic equations for simple problems of environmental fluid dynamics.

The competencies of process understanding and system understanding are taught, applied and examined.

Data: 26.07.2024 12:39  Autumn Semester 2024  Page 2471 of 2680
Basic physical terminology and mathematical laws:
Continuum hypothesis, forces, constitutive laws, state equations and basic principles of thermodynamics, kinematics, laws of mass and momentum on rotating earth.
Concepts and illustrative flow systems: vorticity dynamics, boundary layers, instability, turbulence - with respect to environmental fluid systems.
Scale analysis: dimensionless variables and dynamical similarity, simplification of the fluid system, e.g. shallow water assumption, geostrophic flow.
Waves in environmental fluid systems.

Abstract
Important organic environmental pollutants are presented. The physical and chemical basics required for understanding the environmental behavior of such pollutants are taught and deepened in exercises.

Objective
The students are able to:
- name and recognize the most important classes of environmentally relevant anthropogenic chemicals and identify chemical moieties governing their fate processes.
- explain, on the basis of physical-chemical foundations, the most important processes (i.e., partitioning and substitution and elimination reactions) which determine the environmental behavior of organic pollutants.
- identify, on the basis of chemical structure, the processes relevant for the environmental behavior of a compound.
- critically evaluate published work and data.

Content
- Overview of the most important classes of environmental organic pollutants
- Molecular interactions that determine the partitioning behavior (adsorption and absorption processes) of organic compounds between different environmental compartments (gas, liquid, solid)
- Physical-chemical properties (vapor pressure, aqueous solubility, air-water partition constant, organic solvent-water partition constants, etc) and partitioning behavior of organic compounds between environmentally relevant phases (air, aerosols, soil, water, biota)
- Chemical transformation reactions of organic pollutants in aquatic and in terrestrial environments (hydrolysis, elimination, addition)

Lecture notes
Script will be distributed

Literature

Prerequisites / notice
Die Lehrveranstaltung richtet sich nicht nur an jene Studierenden, welche sich später chemisch vertiefen wollen, sondern ausdrücklich auch an alle jene, welche sich mit der Problematik von organischen Schadstoffen in der Umwelt vertraut machen wollen, um dieses Wissen in anderen Vertiefungen anzuwenden.

Autumn Semester 2024
Objective

The seminar aims at introducing the students to current research in the field of biogeochemistry and connect them with researchers. After the seminar, students are able to:
- understand and critically evaluate original scientific papers and to communicate their findings in a coherent way (presentation); in doing so, they become familiar with different types of publications and relevant journals in the field of biogeochemistry;
- discuss scientific results, plan and lead discussion rounds (moderation);
- give and receive constructive feedback.

Content

Part 1: Literature search; presentation and moderation techniques.
Part 2: Literature study; online-exchange of information; presentation and discussion moderated by students.

Lecture notes

Selected handouts will be distributed in class.

Prerequisites / notice

Restriction: only students enrolled in the environmental sciences bachelor's programm can register for this course.
Deadline for enrollment is the FIRST day of the semester. Later enrollment can only be accepted in exceptional cases and under certain conditions (e.g., restricted choice of topics and dates).

701-0533-00L Soil and Water Chemistry W 3 credits 2G R. Kretzschmar, D. I. Christl, L. Winkel

Abstract

This course covers chemical and biogeochemical processes in soils and water and their influence on the behavior and cycling of nutrients and pollutants in terrestrial and aquatic systems. Approaches for quantitative modeling of the processes are introduced and applied in selected examples.

Objective

1. Understanding of important chemical properties and processes of soils and water and their influence on the behavior (e.g., chemical speciation, bioavailability, mobility) of nutrients and pollutants.
2. Quantitative applications of chemical equilibria to processes in natural systems.

The course "Soil and Water Chemistry" teaches, applies and examines the competences process understanding, systems understanding, and modelling.

Content

Chemical equilibria in aqueous solutions, gas equilibria, precipitation and dissolution of mineral phases, silicate weathering, weathering kinetics, formation of secondary minerals (clay minerals, oxides, sulfides), redox processes in natural systems, pH buffering and acidification, salinity and salinization, environmental behavior of selected essential and toxic trace elements.

701-0535-00L Environmental Soil Physics/Vadose Zone Hydrology W 3 credits 2V+1U A. Carminati, P. U. Lehmann Grunder

Abstract

The course provides theoretical and practical foundations for understanding and characterizing physical soil properties and processes and their relevance for terrestrial ecosystems, plant growth, hydrological processes and atmospheric-land gas exchange, across all relevant scales.

Objective

Students are able to:
- Characterize the different soils based on their key textural and structural properties.
- Simulate and predict soil water retention and flow under varying environmental conditions and understand the key driving forces (capillarity, gravity, friction) and related water properties (surface tension and viscosity).
- Predict soil hydraulic properties for varying soil textural classes.
- Predict solute transport in soils for varying environmental conditions.
- Predict energy balance and temperature dynamics in soils.
- Predict conditions for plant water stress.
- Estimate the impact of soil properties on the hydrological cycle and on plant growth.
INTRODUCTION
Week 1 (September 18)
Presentation of the role of soil physics in environmental sciences and terrestrial ecosystems: soils in the water cycle; soils and vegetation; soils and solute transport. Survey on students’ interests and expectations. Presentation of course structure and learning objectives.

BASIC SOIL PROPERTIES
Week 2 (September 25) and Week 3 (October 02)
soil texture, particle size distribution, soil structure, soil surface area, porosity and bulk density
Pore scale consideration (water in a single pore), pore sizes and shapes; surface tension; Young-Laplace equation; capillary rise; contact angle
Friction and laminar flow; Hagen-Poiseuille’s law; Washburn equation; numerical lab (REPORT 1)

SOIL HYDRAULIC PROPERTIES
Week 4 (October 09) and Week 5 (October 16)
Soil water content and soil water potential - The energy state of soil water; total water potential and its components; volumetric and gravimetric water contents; field capacity and wilting point
Soil water characteristics and pore size distribution
Saturated water flow in soils - Laminar flow in tubes (Poiseuille’s Law); Darcy’s Law, conditions and states of flow; permeability and hydraulic conductivity, measurement and theoretical concepts; effective conductivity; unsaturated hydraulic conductivity; Buckingham law.
Unsaturated water flow in soils - Unsaturated hydraulic conductivity models and applications

TOOLBOX – MEASUREMENTS AND MODELING
Week 6 (October 23) and Week 7 (October 30)
Measuring soil hydraulic properties, fitting and interpretation; Lab tour - demonstration of soil physical methods; lecture on HYPROP method; report on Hyprop data (REPORT 2)
Modelling unsaturated water flow based on Richards equation - Using Hydrus1D for simulation of unsaturated flow; simulating HYPROP measurements (REPORT 3)

SOIL IN THE WATER CYCLE
Week 8 (November 06) – Week 9 (November 13)
Water infiltration - steady state solutions for infiltration; approximate solutions to infiltration (Green-Ampt, Philip); infiltration rate and ponding; outlook to preferential flow
Water evaporation - Energy balance and land atmosphere interactions - potential and actual evaporation, evaporation stages;

SOIL PLANT INTERACTIONS
Week 10 (November 20) – Week 11 (November 27)
Root water uptake and transpiration – Theory and mechanisms controlling root water uptake; hydraulic properties of rhizosphere; plant and stomatal conductance.
Modelling root water uptake and transpiration; analytical approaches and modeling using Hydrus (REPORT 4)

SOLUTE TRANSPORT
Week 12 (December 04) Week 13 (December 11)
Transport mechanisms of solutes in porous media; breakthrough curves; convection-dispersion equation; solutions for pulse and step solute application
Transport of reactive substances, preferential flow, simulations with Hydrus

CLOSURE
Week 14 (December 18)
Summary, course synthesis, connections between the different topics, questions, exam preparation

Literature
Supplemental textbook (not mandatory) -Introduction to Environmental Soil Physics, by: D. Hillel

Human-Environment Systems
The following courses are highly recommended as preparation for the Specialization in Human-Environment Systems:
401-0625-01L Applied Analysis of Variance and Experimental Design
401-0649-00L Applied Statistical Regression; Prerequisite: 701-0105-00L Mathematics VI: Applied Statistics for Environmental Sciences

Seminar for Bachelor Students: Human Environment Systems

Number Title Type ECTS Hours Lecturers
701-0658-00L Seminar for Bachelor Students: Human Environment Systems W 3 credits 2S J. W. McCaughey, A. Berthold, E. Lieberherr

Abstract Analysis and presentation of research papers from the involved chairs, relating to topics from human-environment systems.
Objective The students learn to read, understand, summarize and present current research papers related to human-environment systems. Furthermore, students train the critical discussion of these papers. The students also get to know a number of innovative approaches for such presentations.
Content Research in human-environment systems is characterised by a broad range of topics and methods. This is illustrated by the research papers that are discussed in this seminar. Students choose a paper from a list and present it to the seminar participants. Furthermore, they lead the discussion and train questions and answers related to such presentations. In the first three lessons, inputs to presentation techniques and innovative approaches to presentations are provided and discussed.
Lecture notes Will be provided in the seminar.
This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning “good practice” that can be applied in every student’s own projects and daily work life. A special focus will be laid in the use of the statistical software package R for regression analysis.

The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.

The course starts with the basics of linear modeling, and then proceeds to parameter estimation, tests, confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, multicollinearity problems and model interpretation, as well as general modeling strategies.

The last third of the course is dedicated to an introduction to generalized linear models: this includes the generalized additive model, logistic regression for binary response variables, binomial regression for grouped data and poisson regression for count data.

A script will be available.

This course deals with basic questions, concepts, theories, methods, and empirical findings of political science.

This course deals with basic questions, concepts, theories, methods, and empirical findings of political science.
The following courses are highly recommended as preparation for the Specialization in Environmental Biology:

227-0399-10L Physiology and Anatomy for Biomedical Engineers I (Autumn semester)
227-0448-00L Zoology (Spring semester)
701-0360-00L Systematische Biologie: Pflanzen (Spring semester)
227-0398-10L Physiology and Anatomy for Biomedical Engineers II (Spring semester)

These courses should be successfully completed during the second year.

### Environmental Biology

#### Content

This course provides the ecological systems' knowledge needed to question applied solutions to current environmental issues. Our central aim is to balance participants' respect for complexity with a sense of possibility by providing examples from the vast solution space offered by ecological systems, such as e.g. green infrastructure to manage water.

#### Der Kurs besteht aus

- einem ersten Teil, der jeweils am Montag, ab 25. September 2023, wöchentlich bis und mit 18. Dezember 2023, 10:15-12:00, vor Ort auf dem Campus stattfindet (LEE E 101, Leonhardstrasse 21)

Die 5. Auflage dieses Lehrbuches ist via Buchhandlungen oder online erhältlich. Übungsfragen und ein Glossar finden Sie hier:

https://ib.ethz.ch/teaching/pwgrundlagen.html

#### Der Kurs findet vor Ort statt und wird weder online gestreamt noch aufgezeichnet.

#### Der Kurs besteht aus

- einem ersten Teil, der jeweils am Montag, ab 25. September 2023, wöchentlich bis und mit 18. Dezember 2023, 10:15-12:00, vor Ort auf dem Campus stattfindet (LEE E 101, Leonhardstrasse 21)

Die 5. Auflage dieses Lehrbuches ist via Buchhandlungen oder online erhältlich. Übungsfragen und ein Glossar finden Sie hier:

https://ib.ethz.ch/teaching/pwgrundlagen.html

#### Vor der Sitzung:

2. Durch eine kurze (digitale) Umfrage in Moodle werden Übungsfragen ermittelt, welche von den Studierenden als besonders schwierig erachtet werden und die deshalb im Übungsteil (jeweils 12:15 – 13:00) vertieft besprochen werden.

#### Der Ablauf der Sitzungen ist dann meist wie folgt:

1. 1. Teil: Zu Beginn wird jeweils (in digitaler Form) ein unbenoteter Kurztest zum gelesenen Buchinhalt durchgeführt (mehr dazu weiter unten) und im Anschluss gleich besprochen.
2. 2. Es folgt eine ca. 30-minütige Vorlesung, die den Inhalt des/der gelesenen Buchkapitel kurz zusammenfasst und reflektiert.
3. 3. Danach stellen die Dozierenden meist eine aktuelle wissenschaftliche Studie vor, die im Bereich des/der jeweils behandelten Themen liegt (ca. 30 Minuten).

2. 2. Teil: Wir behandeln Übungsfragen, die per Umfrage als besonders schwierig identifiziert wurden.

#### Lecture notes

### Environmental Biology

*The following courses are highly recommended as preparation for the Specialization in Environmental Biology:*

227-0399-10L Physiology and Anatomy for Biomedical Engineers I (Autumn semester)
227-0448-00L Zoology (Spring semester)
701-0360-00L Systematische Biologie: Pflanzen (Spring semester)
227-0398-10L Physiology and Anatomy for Biomedical Engineers II (Spring semester)

These courses should be successfully completed during the second year.
At the end of the course...
...you know how to structure your inquiry and how to proceed the analysis when faced with a complex environmental issue. You can formulate the relevant questions, find answers (supported by discussions, input from the lecturers and the literature), and you are able to present your conclusions clearly and cautiously.
...you understand the complexity of interactions and structures in ecosystems. You know how ecosystem processes, functions and services interact and feed back across multiple spatio-temporal scales (in general, plus in depth case examples).
...you understand that biodiversity and the interaction between organisms are an integral part of ecosystems. You are aware that the link between biodiversity and process/function/service is rarely fully understood. You know how to honestly deal with this lack of understanding and can nevertheless find, critically analyse and communicate solutions.
...you understand the importance of ecosystem services for society.
...you have an overview of the methods of ecosystem research and have a deeper insight into some of them, e.g. ecosystem observation, manipulation and modelling.
...you have reflected on ecology as a young discipline at the heart of significant applied questions.

This course provides the ecological systems’ knowledge needed to question applied sustainability solutions. We will critically assess the complexity of current environmental issues, illustrating basic ecological concepts and principles. Our central aim is to balance participants’ respect for complexity with a sense of possibility by providing examples from the vast solution space offered by ecological systems, such as e.g. green infrastructure to manage water.

The course is structured around four larger topical areas: (1) Integrated Water Management -- Green infrastructure (land management options) as an alternative to engineered solutions (e.g. large reservoirs) in flood and drought management; (2) Fire dynamics, the water cycle and biodiversity -- The surprising dynamics of species life cycles and populations in arid landscapes; (3) Rewilding, e.g. re-introducing apex predators (e.g. wolves), or large ungulates (e.g. bisons) in protected areas -- A nature conservation trend with counterintuitive effects; (4) Coupling of aquatic and terrestrial systems: carbon, nitrogen and phosphorus transfers of global importance on landscape scale.

Case descriptions, commented glossary and a list of literature and further resources per case.

This course provides the ecological systems' knowledge needed to question applied sustainability solutions. We will continuously provide excerpts and other literature during the course.

It is not essential to borrow/buy the following books. We will continuously provide excerpts and other literature during the course.

The course combines elements of a classic lecture, group discussions and problem based learning. It is helpful, but not essential to be familiar with the “seven stages” method (see e.g. course 701-0352-00L “Analysis and Assessment of Environmental Sustainability” by Christian Pohl et al.).

In this course, students will:
- Understand the theoretical underpinnings of conservation and restoration science.
- Consider alternative conservation concepts and approaches, and the role of science and evidence in implementing these ideas in practice.
- Appraise different conservation strategies, drawing on case studies and examples from around the world.
- Explore new and emerging technologies that can be useful to guide responsible decision making in land management decisions.
- Evaluate the future direction of conservation science, in terms of new concepts (resilience, restoration, rewilding, natural capital, de-extinction) and emerging technologies (remote sensing, AI, genetics).
- Explore conservation and restoration science and practice in the context of current societal pressures, and the prospects for biodiversity conservation in coming decades.
- Understand how responsible restoration and conservation goals should integrate local practices, customs, cultures, and economic requirements.

In this course, students will:
- Learn about the historical development of thinking in conservation and restoration ecology
- Learn about the ecological theories underpinning conservation and restoration ecology
- Learn about emerging statistical and analytical tools to guide effectively responsible conservation and restoration initiatives
- Learn about the practical challenges and trade-offs in decision making that ultimately govern the success of conservation and restoration challenges around the world.
- Understand, through the exploration of case studies and site visits, differing normative and management perspectives on landscape scale conservation and restoration.

The course is structured around four larger topical areas: (1) Integrated Water Management -- Green infrastructure (land management options) as an alternative to engineered solutions (e.g. large reservoirs) in flood and drought management; (2) Fire dynamics, the water cycle and biodiversity -- The surprising dynamics of species life cycles and populations in arid landscapes; (3) Rewilding, e.g. re-introducing apex predators (e.g. wolves), or large ungulates (e.g. bisons) in protected areas -- A nature conservation trend with counterintuitive effects; (4) Coupling of aquatic and terrestrial systems: carbon, nitrogen and phosphorus transfers of global importance on landscape scale.

In the first 3-5 weeks, the course will center around learning and discussing the skills needed to participate in scientific presentations: reading scientific papers, searching for literature, structuring slides, and speaking type. In the last 9-11 weeks, student presentations and discussions will occur.

701-0320-00L Seminar for Bachelor Students: Environmental Biology

- In the seminar, students explore a specific topic in environmental biology (ecology, evolution, health). They find and read scientific articles, structure contents around core questions, talk to specialists about them, prepare a scientific presentation and lead a discussion. They are introduced to literature search and scientific presentations.

Objective

Students will acquire skills in:
- finding literature in scientific databases
- structuring a scientific topic through research questions
- giving a clear scientific presentation
- contributing constructively to a discussion

Content

In the first 3-5 weeks, the course will center around learning and discussing the skills needed to participate in scientific presentations: reading scientific papers, searching for literature, structuring slides, and speaking type. In the last 9-11 weeks, student presentations and discussions will occur.

701-0371-00L Ecosystem Conservation and Restoration

Conservation and restoration are interdisciplinary sciences that nonetheless are founded on fundamental ecological concepts. The course will explore theoretical underpinnings of conservation and restoration science that inform planning and implementation, and consequent outcomes. New concepts and emerging technologies will be explored, alongside case studies that inform discussions.

Objective

Through the course, students will:
- Understand the theoretical underpinnings of conservation and restoration science.
- Consider alternative conservation concepts and approaches, and the role of science and evidence in implementing these ideas in practice.
- Appraise different conservation strategies, drawing on case studies and examples from around the world.
- Explore new and emerging technologies that can be useful to guide responsible decision making in land management decisions.
- Evaluate the future direction of conservation science, in terms of new concepts (resilience, restoration, rewilding, natural capital, de-extinction) and emerging technologies (remote sensing, AI, genetics).
- Explore conservation and restoration science and practice in the context of current societal pressures, and the prospects for biodiversity conservation in coming decades.
- Understand how responsible restoration and conservation goals should integrate local practices, customs, cultures, and economic requirements.

In this course, students will:
- Learn about the historical development of thinking in conservation and restoration ecology
- Learn about the ecological theories underpinning conservation and restoration ecology
- Learn about emerging statistical and analytical tools to guide effectively responsible conservation and restoration initiatives
- Learn about the practical challenges and trade-offs in decision making that ultimately govern the success of conservation and restoration challenges around the world.
- Understand, through the exploration of case studies and site visits, differing normative and management perspectives on landscape scale conservation and restoration.
Content

2021 marked the start of the UN Decade on ecosystem restoration, a global initiative to conserve and restore nature for the benefit or climate change, biodiversity and human wellbeing. As an emerging workforce enters this exponentially growing field, we hope that they will be armed with the fundamental principles that are necessary to enhance the likelihood of success. Conservation and restoration science is a relatively young discipline, yet it has undergone substantial change in recent decades on account of changing environmental realities, new conceptual framings, and opportunities afforded by emerging technologies. As a rapidly evolving discipline, with considerable relevance and impact to environment, policy, and society, it is essential that environmental science students understand the role of science for conservation practice.

This course will explore how science and technology provides the conceptual structure and knowledge base for new approaches to conservation of biodiversity, habitats, and resources. The course will begin by examining the theoretical foundations of conservation science, and how these concepts have developed over the past century. It will examine alternative approaches to conservation ranging from traditional protected area and wildlife management systems, through to more recent concepts and approaches, including ecosystem services, natural capital, restoration, and rewilding. It will emphasize the role of new technological and analytical methods, including Earth observation, monitoring systems, AI, and genetics. Finally, the students will use a horizon scanning approach to determine the future opportunities, priorities, and constraints for conservation science and practice in our rapidly changing world.

Students will evaluate several general questions, including:
- What is conservation, and what do we want to conserve?
- What ecological theories frame conservation and restoration practice, and how can science guide conservation decisions?
- What new concepts (ecological, societal, economical) shape conservation and restoration theory and practice, and what conflicts do they engender?
- What prospects does technology offer for future conservation and restoration efforts?

Ecosystem Conservation and Restoration will provide an excellent foundation on how theoretical and applied natural and social sciences are, and can be, coupled to emerging technologies and data science to conserve and restore biodiversity and ecological functions in landscapes. For students wishing to acquire a deeper level of understanding of both science and practice in conservation and restoration, this course will serve as the prerequisite for a two-week Masters-level field course (tentatively titled Conservation, Restoration, and Landscape Management) to Scotland, being developed by the Ghazoul and Crowther labs and planned for 2023. The field course will challenge students to apply the conceptual and technical understanding gained from the Ecosystem Conservation and Restoration course, specifically by working with a variety of stakeholders involved in selected forest and landscape restoration processes in Scotland.

Literature

Current literature will be provided in due course

Forest and Landscape
The following courses are highly recommended as preparation for the Specialization in Forest and Landscape:

701-0266-00L Einführung in die Dendrologie (Autumn semester)
701-0951-00L GIST - Einführung in die räumlichen Informationswissenschaften und -technologien (Autumn Semester)
551-0448-00L Zoologie (Spring semester)
701-0360-00L Systematische Biologie: Pflanzen (Spring semester)

These courses should be successfully completed during the second year.

Abstract
The course provides theoretical and practical foundations for understanding and characterizing physical soil properties and processes and their relevance for terrestrial ecosystems, plant growth, hydrological processes and atmospheric-land gas exchange, across all relevant scales.

Objective
Students are able to:
- Characterize the different soils based on their key textural and structural properties.
- Simulate and predict soil water retention and flow under varying environmental conditions and understand the key driving forces (capillarity, gravity, friction) and related water properties (surface tension and viscosity).
- Predict soil hydraulic properties for varying soil textural classes.
- Predict solute transport in soils for varying environmental conditions.
- Predict energy balance and temperature dynamics in soils.
- Predict conditions for plant water stress.
- Estimate the impact of soil properties on the hydrological cycle and on plant growth.

Content

INTRODUCTION
Week 1 (September 18)
Presentation of the role of soil physics in environmental sciences and terrestrial ecosystems: soils in the water cycle; soils and vegetation; soils and solute transport. Survey on students' interests and expectations. Presentation of course structure and learning objectives.

BASIC SOIL PROPERTIES
Week 2 (September 25) and Week 3 (October 02)
soil texture, particle size distribution, soil structure, soil surface area, porosity and bulk density
Pore scale consideration (water in a single pore), pore sizes and shapes; surface tension; Young-Laplace equation; capillary rise; contact angle
Friction and laminar flow; Hagen-Poiseuille’s law; Washburn equation; numerical lab (REPORT 1)

SOIL HYDRAULIC PROPERTIES
Week (4 October 09) and Week 5 (October 16)
Soil water content and soil water potential - The energy state of soil water; total water potential and its components; volumetric and gravimetric water contents; field capacity and wilting point
Soil water characteristics and pore size distribution
Saturated water flow in soils - Laminar flow in tubes (Poiseuille's Law); Darcy's Law, conditions and states of flow; permeability and hydraulic conductivity, measurement and theoretical concepts; effective conductivity; unsaturated hydraulic conductivity; Buckingham law.
Unsaturated water flow in soils - Unsaturated hydraulic conductivity models and applications

TOOLBOX – MEASUREMENTS AND MODELING
Week (6 October 23) and Week 7 (October 30)
Measuring soil hydraulic properties, fitting and interpretation; Lab tour - demonstration of soil physical methods; lecture on HYPROP method; report on Hyprop data (REPORT 2)
Modelling unsaturated water flow based on Richards equation - Using Hydrus1D for simulation of unsaturated flow; simulating HYPROP measurements (REPORT 3)

SOIL IN THE WATER CYCLE
Week 8 (November 06) – Week 9 (November 13)
Water infiltration - steady state solutions for infiltration; approximate solutions to infiltration (Green-Ampt, Philip); infiltration rate and ponding; outlook to preferential flow
Water evaporation - Energy balance and land atmosphere interactions - potential and actual evaporation, evaporation stages;

SOIL PLANT INTERACTIONS
Week 10 (November 20) Week 11 (November 27)
Root water uptake and transpiration – Theory and mechanisms controlling root water uptake; hydraulic properties of rhizosphere; plant and stomatal conductance.
Modelling root water uptake and transpiration; analytical approaches and modeling using Hydrus (REPORT 4)

SOLUTE TRANSPORT
Week 12 (December 04) Week 13 (December 11)
Transport mechanisms of solutes in porous media; breakthrough curves; convection-dispersion equation; solutions for pulse and step solute application
Transport of reactive substances, preferential flow, simulations with Hydrus

CLOSURE
Week 14 (December 18)
Summary, course synthesis, connections between the different topics, questions, exam preparation

Literature
Supplemental textbook (not mandatory) - Introduction to Environmental Soil Physics, by: D. Hillel
### 701-0553-00L Landscape Ecology

**Abstract**
The course is an introduction to Landscape Ecology and Landscape Modelling and provides various practical applications of Landscape Ecology in nature and landscape management.

**Objective**
The students are able
- to explain and apply the concepts and methods of landscape analysis using examples,
- to explain causes and effects of changes in landscape using examples and simulations,
- to describe practical applications of Landscape Ecology in the management of nature and landscape.

**Content**
- Contents of the lecture:
  - important terms and concepts of Landscape Ecology,
  - analysis of landscape pattern (metrics),
  - landscape modelling,
  - perception of landscapes,
  - application of landscape ecology concepts in planning
- Seminar for Bachelor Students: Forest and Landscape
- Literature
  - listet in the MOOC
- Prerequisites / notice
  - This lecture is coordinated with a MOOC.
  - It is advantageous but not required to have some R programming and GIS knowledge for this lecture and the practical Praktikum Wald und Landschaft (spring semester) which is loosely linked with this lecture.

**Competencies**

### 701-0559-00L Seminar for Bachelor Students: Forest and Landscape

**Abstract**
Interdisciplinary seminar on forest and landscape issues with particular emphasis on the key processes shaping the development of forest ecosystems and landscapes. Students perform literature researches, and train presentation and moderation techniques as well as a constructive feedback culture.

**Objective**
- To critically analyze and discuss original scientific articles for selected processes and methods in relation to forest and landscape.
- Scientific exchange with subject-specific experts.
- Learn standard rhetoric and moderation methods through training in the seminar.
- Effective feedback regarding the independent development of presentation and moderation competencies.

**Content**
Seminars will deal with the following topics: 1) Biological, ecological and physical processes, and technical aspects in forest ecosystems with effects on the community, ecosystem and landscape; 2) Social and political processes and institutions with relation to land use; 3) Products and services of forest ecosystems and landscapes and 4) Forest management systems. The contributions will be grouped by topics. Furthermore, the seminar teaches rhetoric and moderation methods, which will serve to deepen the above topics through presentations and discussions.

**Lecture notes**
There will be a script for the rhetoric and moderation methods.

**Literature**
Literature references will be provided by the lecturers.

**Prerequisites / notice**
- The credits are assigned if the following requirements are met
  a) Independent literature research on the topic and exchange with experts for preparing for the presentation
  b) Presentation with questions and answers (15-20 min)
  c) Moderation of the scientific discussion (20-35 min)
  d) Actively contributing to the feedback of students' presentations, moderation and discussions.

**The presentations can be made in German or English.**

We expect a regular and active participation.

### 701-0561-00L Forest Ecology

**Abstract**
This course conveys the basics of forest ecology with an emphasis on those organisms that dominate the physiognomy and the dynamics of forest ecosystems. Based on this course, students have a good grasp of the qualitative and quantitative importance of forest ecosystems at the global and regional scales, with a focus on central Europe.
<table>
<thead>
<tr>
<th>Objective</th>
<th>Students are able to:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- summarize the fundamentals of forest ecology at the autecological, demeological and synecological level</td>
</tr>
<tr>
<td></td>
<td>- explain how trees dominate the physiognomy and dynamics of forest ecosystems</td>
</tr>
<tr>
<td></td>
<td>- describe the qualitative and quantitative importance of forest ecosystems at the global and regional scales, with an emphasis on central Europe and Alpine region.</td>
</tr>
</tbody>
</table>

| Content | Overall, the competences of process understanding, system understanding, modeling, concept development and data analysis & interpretation will be taught and examined in this course. |
|         | Introduction and overview of the forests of the world  |
|         | Forest ecosystem ecology; Production ecology of forests |
|         | Autecology: light, temperature, wind, water, and nutrients |
|         | Demeology: regeneration ecology, forest growth, mortality |

| Lecture notes | Handouts are available for download from https://fe.ethz.ch/studium/lehrmaterialien/bachelor/waldoekologie.html. |

Data: 26.07.2024 12:39  Autumn Semester 2024  Page 2481 of 2680
Abstract
Students learn (a) to work on a question using scientific methods and concepts, (b) to write a report according to scientific standards and (c) to correctly cite knowledge from the literature. Depending on the orientation of the work, they learn this by means of an empirical investigation, a literature study, a planning task or a practical project.

Objective
With the Bachelor's thesis, students learn (a) to work on a problem using scientific methods and concepts, (b) to write a report according to scientific standards and (c) to correctly cite knowledge from the literature.

Content
The Bachelor's thesis is written either in the area of "Social Sciences and Humanities" or in the area of "Natural Sciences and Technology". It can also be interdisciplinary and transdisciplinary.

A Bachelor's thesis in the field of "Social Sciences and Humanities" usually deals with a question at the interface of these sciences and the environment and sustainability. Social science and humanities methods of data collection, analysis and interpretation are used.

A Bachelor's thesis in the field of "Natural Sciences" deals with a topic at the interface of the natural sciences and the environment and sustainability. Natural science methods of data collection, analysis and interpretation are used.

A thesis in the field of "technology" deals with the environmental impact of a use. It can be an analysis, an assessment or the future design of a use.

In interdisciplinary or transdisciplinary work, findings from different disciplines are brought together on the basis of an overarching question, or social actors are included in the work.

</tbody>
</table>
Content

The course starts with introducing selected concepts of thermodynamics for atmospheric processes; The students learn the concept of the thermodynamic equilibrium and derive the Clausius-Clayperon equation from the first law of thermodynamics. This equation is central for the phase transitions in clouds.

Students also learn to use thermodynamic charts (tephigrams) and to identify cloud base, cloud top, available convective energy in radiosonde ascents. Atmospheric mixing processes are introduced as a basis for fog formation. The concept of an air parcel is used to understand convection.

Aerosol particles are introduced in terms of their physical properties and their role in cloud formation based on Köhler theory. Thereafter cloud microphysical processes including ice nucleation are discussed.

With these basics, the different forms of precipitation (convective vs. stratiform) are discussed and how they can be identified in radar images. Students will also learn under which conditions severe convective storms (especially supercells with tornados) can form.

The concepts are applied to understand and judge the validity of different proposed artificial weather modification ideas.

Lecture notes

Powerpoint slides and chapters from the textbook will be made available on moodle: https://moodle-app2.let.ethz.ch/course/view.php?id=22731

Literature

An electronic version of this book can be obtained via the ETH library.

pdf-files of the revised book will be provided on moodle on a chapter-by-chapter basis.

Prerequisites / notice

We offer a lab tour, in which we demonstrate how some of the processes discussed in the lectures are measured with instruments.

There is an additional tutorial right after each lecture to give you the chance to ask further questions and discuss the exercises. The participation is recommended but voluntary.

and Climate

Abstract

New master students are introduced to the atmospheric and climate research field through keynotes given by the programme's professors. In several self-assessment and networking workshops they get to know each other and obtain general information and guidance about the organisation of the MSc programme.

Objective

The aims of this course are i) to welcome all students to the master program and to ETH, ii) to acquaint students with the faculty teaching in the field of atmospheric and climate science at ETH and at the University of Bern, iii) that the students get to know each other and iv) to assess needs and discuss options for training and education of soft-skills during the Master program and to give an overview of the study options in general.

<td>The Planetary Boundary Layer (PBL) constitutes the lower part of the atmosphere, is characterized by turbulent mixing and ensures the exchange of energy, mass and momentum between the Earth's surface and the atmosphere. The course provides the theoretical background for understanding the structure and dynamics of the PBL. Idealized concepts are reviewed and contrasted to real world applications.</td>
</tr>
</tbody>
</table>
Objective
Students are able to:
- Name the basic approaches needed to describe planetary boundary layer flows and associated turbulent exchange processes.
- Apply these concepts to answer comprehension questions and solve simple problems related to the structure and dynamics of the PBL.
- Independently judge the applicability of learned concepts and tools to real-world situations.

Content
- Introduction
- PBL structure and stability
- Turbulence and turbulent transport
- Scaling and similarity theory
- Spectral characteristics
- Conservation equations in a turbulent flow
- Closure problem and closure assumptions
- Rough surfaces and the roughness sublayer
- Complex terrain

Abstract
Clouds are a fascinating atmospheric phenomenon central to the hydrological cycle and the Earth’s climate. Interactions between cloud particles can result in precipitation, glaciation or evaporation of the cloud depending on its microstructure and microphysical processes.

Objective
The learning objective of this course is that students understand the formation of clouds and precipitation and can apply learned principles to interpret atmospheric observations of clouds and precipitation.

Content

Lecture notes
This course will be designed as a reading course in 1-2 small groups of 10-12 students maximum. It will be based on the textbook below. The students are expected to read chapters of this textbook prior to the class so that open issues, fascinating and/or difficult aspects can be discussed in depth. Check the course website for lecture dates and location.

701-1251-00L Land-Climate Dynamics

Abstract
The purpose of this course is to provide fundamental background on the role of land surface processes (vegetation, soil moisture dynamics, land energy, water and carbon balances) in the climate system. The course consists of 2 contact hours per week, including lectures, group projects and computer exercises.

Objective
The students can understand the role of land processes and associated feedbacks in the climate system.

Lecture notes
Powerpoint slides will be made available

Prerequisites / notice
Prerequisites: Introductory lectures in atmospheric and climate science

Data: 26.07.2024 12:39  Autumn Semester 2024  Page 2486 of 2680
### Atmospheric Composition and Cycles

#### Number | Title | Type | ECTS | Hours | Lecturers
--- | --- | --- | --- | --- | ---
701-1239-00L | Aerosols I: Physical and Chemical Principles | W | 4 credits | 2V+1U | M. Gysel Beer, D. Bell, E. Weingartner

**Abstract**
Aerosols I deals with basic physical and chemical properties of aerosol particles. The importance of aerosols in the atmosphere and in other fields is discussed.

**Objective**
Physical and chemical principles:
The students... 
- know the processes and physical laws of aerosol dynamics.
- understand the thermodynamics of phase equilibria and chemical equilibria.
- know the photo-chemical formation of particulate matter from inorganic and organic precursor gases.

Experimental methods:
The students... 
- know the most important chemical and physical measurement instruments.
- understand the underlying chemistry and physics.

Environmental impacts:
The students... 
- know the major sources of atmospheric aerosols, their chemical composition and key physical properties.
- know the most important climate impacts of atmospheric aerosols.
are aware of the health impacts of atmospheric aerosols.

### Climate History and Paleoclimatology

#### Number | Title | Type | ECTS | Hours | Lecturers
--- | --- | --- | --- | --- | ---
651-4057-00L | Climate History and Palaeoclimatology | W | 4 credits | 2G | H. Stoll, I. Hernández Almeida

**Abstract**
Climate history and paleoclimatology explores how the major features of the earth's climate system have varied in the past, and the driving forces and feedbacks for these changes. The major topics include the earth's CO2 concentration and mean temperature, the size and stability of ice sheets and sea level, the amount and distribution of precipitation, and the ocean heat transport.

**Objective**
The student will be able to describe the natural factors lead to variations in the earth's mean temperature, the growth and retreat of ice sheets, and variations in ocean and atmospheric circulation patterns, including feedback processes. Students will be able to interpret evidence of past climate changes from the main climate indicators or proxies recovered in geological records. Students will be able to use data from climate proxies to test if a given hypothesized mechanism for the climate change is supported or refuted. Students will be able to compare the magnitudes and rates of past changes in the carbon cycle, ice sheets, hydrological cycle, and ocean circulation, with predictions for climate changes over the next century to millennia.
The course spans 5 thematic modules:

1. Cyclic variation in the earth's orbit and the rise and demise of ice sheets. Ice sheets and sea level - What do expansionist glaciers want? What is the natural range of variation in the earth's ice sheets and the consequent effect on sea level? How do cyclic variations in the earth's orbit affect the size of ice sheets under modern climate and under past warmer climates? What conditions the mean size and stability or fragility of the large polar ice caps and is their evidence that they have dynamic behavior? What rates and magnitudes of sea level change have accompanied past ice sheet variations? How stable or fragile is the ocean heat conveyor, past and present?

2. Feedbacks on climate cycles from CO2 and methane. What drives CO2 and methane variations over glacial cycles? What are the feedbacks with ocean circulation and the terrestrial biosphere?

3. Atmospheric circulation and variations in the earth's hydrological cycle - How variable are the earth's precipitation regimes? How large are the orbital scale variations in global monsoon systems?

4. Century-scale droughts and civil catastrophes. Will mean climate change El Nino frequency and intensity? What factors drive change in mid and high-latitude precipitation systems? Is there evidence that changes in water availability have played a role in the rise, demise, or dispersion of past civilizations?

5. How sensitive is Earth's long term climate to CO2 and cloud feedbacks? What regulates atmospheric CO2 over long tectonic timescales of millions to tens of millions of years?

The weekly two hour lecture periods will feature lecture on these themes interspersed with short interactive tasks to apply new knowledge. Over the semester, student teams will each present in class one debate based on two scientific articles of contrasting interpretations. With flexible scheduling, students will participate in a laboratory activity to generate a new paleoclimate record from stalagmites. Student teams will be supported by an individual tutorial meeting to assist in debate preparation and another to assist in the interpretation of the lab activity data.

### Literature

This course presents a process-based view of the hydrology of mountain streams. Students learn how to integrate process knowledge, data, and models to understand how landscapes regulate the fluxes of water, sediment, nutrients, and pollutants in streams, and to anticipate how streams will respond to changes in land use, water use, and climate.

Objective 1: Identify and describe the important components of the water cycle and their influencing factors and discuss how changes in these influencing factors may affect different parts of the hydrological cycle.

Objective 2: Analyse, visualize, and interpret climate and hydrological time series data.

Objective 3: Explain how hydrological data are collected, how hydrological models work, how they are calibrated, and how they are evaluated.

Using a combination of lectures, field exercises, and data analysis, we explore the processes controlling the delivery of water, solutes, and sediment to streams, and how these processes are affected by changes in land cover, land use, and climate. We review the connections between process understanding and predictive modeling in these complex environmental systems. Practical problems to be considered include the effects of land use and climate on streamflow and water quality, illustrated with data from experimental watersheds in North America and Europe.

Lecture notes: Handouts will be available through moodle.

Literature: Recommended and required reading will be specified at the first class session (with possible modifications as the semester proceeds).

The Planetary Boundary Layer (PBL) constitutes the lower part of the atmosphere, is characterized by turbulent mixing and ensures the exchange of energy, mass and momentum between the Earth’s surface and the atmosphere. The course provides the theoretical background for understanding the structure and dynamics of the PBL. Idealized concepts are reviewed and contrasted to real world applications.

Students are able to:
- Name the basic approaches needed to describe planetary boundary layer flows and associated turbulent exchange processes.
- Apply these concepts to answer comprehension questions and solve simple problems related to the structure and dynamics of the PBL.
- Independently judge the applicability of learned concepts and tools to real-world situations.

- Introduction
- PBL structure and stability
- Turbulence and turbulent transport
- Scaling and similarity theory
- Spectral characteristics
- Conservation equations in a turbulent flow
- Closure problem and closure assumptions
- Rough surfaces and the roughness sublayer
- Complex terrain

Abstract
The lecture provides an overview of climate change in Europe, from a physical and atmospheric science perspective. It covers the following topics:
- observational datasets, observation and detection of climate change;
- underlying physical processes and feedbacks;
- numerical and statistical approaches;
- currently available projections.

Objective
At the end of this course, participants should:
- understand the key physical processes shaping climate change in Europe;
- know about the methodologies used in climate change studies, encompassing observational, numerical, as well as statistical approaches;
- be familiar with relevant observational and modeling data sets;
- be able to tackle simple climate change questions using available data sets.

Content
 Contents:
- global context
- observational data sets, analysis of climate trends and climate variability in Europe
- global and regional climate modeling
- statistical downscaling
- key aspects of European climate change: intensification of the water cycle, Polar and Mediterranean amplification, changes in extreme events, changes in hydrology and snow cover, topographic effects
- projections of European and Alpine climate change

Lecture notes
Slides and lecture notes will be made available at http://www.iac.ethz.ch/edu/courses/master/electives/european-climate-change.html

Prerequisites / notice
Participants should have a background in natural sciences, and have attended introductory lectures in atmospheric sciences or meteorology.

Abstract
Sediments preserved a record of past landscapes. This courses focuses on understanding the processes that modify sedimentary landscapes with time and how we can read these changes in the sedimentary record.

Objective
The students learn basic concepts of modern sedimentology and stratigraphy in the context of sequence stratigraphy and sea level change. They discuss the advantages and pitfalls of the method and look beyond. In particular we pay attention to introducing the importance of considering entire sediment routing systems and understanding their functioning.

Content
Details on the program will be handed out during the first lecture.

Literature
The sedimentary record of sea-level change
Angela Coe, the Open University.
Cambridge University Press

Prerequisites / notice
The grading of students is based on in-class exercises and end-semester examination.

Sedimentology II: Biological and Chemical Processes in Lacustrine and Marine Systems

Prerequisite: Successful completion of the MSc-course "Sedimentology I" (651-4041-00L).
The course will focus on biological and chemical aspects of sedimentation in marine environments. Marine sedimentation will be traced from coast to deep-sea. The use of stable isotopes palaeoceanography will be discussed. Neritic, hemipelagic and pelagic sediments will be used as proxies for environmental change during times of major perturbations of climate and oceanography.

Objective
- You will understand chemistry and biology of the marine carbonate system
- You will be able to relate carbonate mineralogy with facies and environmental conditions
- You will be familiar with cool-water and warm-water carbonates
- You will see carbonate and organic-carbon rich sediments as part of the global carbon cycle
- You will be able to recognize links between climate and marine carbonate systems (e.g. acidification of oceans and reef growth)
- You will be able to use geological archives as source of information on global change
- You will have an overview of marine sedimentation through time

Content
- carbonates, chemistry, mineralogy, biology
- carbonate sedimentation from the shelf to the deep sea
- carbonate facies
- cool-water and warm-water carbonates
- organic-carbon and black shales
- C-cycle, carbonates, Corg : CO2 sources and sink
- Carbonates: their geochemical proxies for environmental change: stable isotopes, Mg/Ca, Sr
- marine sediments through geological time
- carbonates and evaporites
- lacustrine carbonates
- economic aspects of limestone

Lecture notes
no script. scientific articles will be distributed during the course

Prerequisites / notice
We will read and critically discuss scientific articles relevant for "biological and chemical processes in marine and lacustrine systems"

The grading of students is based on in-class exercises and end-semester examination.

561-4049-00L
Conceptual and Quantitative Methods in Geochemistry

W 3 credits 2G  G. De Souza, B. J. Peters, J. Storck

Abstract
This course will introduce some of the main qualitative methods available for the quantitative treatment of geochemical data, as well as the main modelling tools. Emphasis will both be on conceptual understanding of these methods as well as on their practical application, using key software packages to analyse real geochemical datasets.

Objective
Development of a basic knowledge and understanding of the main tools available for the quantitative analysis of geochemical data.

Content
The following approaches will be discussed in detail: major and trace element modelling of magmas, with application to igneous systems; methods and statistics for calculation of isochrons and model ages; reservoir dynamics and modelling of ocean (biogeo)chemistry.

We will discuss how these methods are applied in a range of Earth Science fields, from cosmochemistry, through mantle and crustal geochemistry, volcanology and igneous petrology, to chemical oceanography.

A special emphasis will be put on dealing with geochemical problems through modeling. Where relevant, software packages will be introduced and applied to real geochemical data.

Lecture notes
Slides of lectures will be available.

Prerequisites / notice
Pre-requisite: Geochemie I and II

Quaternary Dating Methods

W 2 credits 1G  I. Hajdas, M. Christl

Abstract
Reconstruction of time scales is critical for all Quaternary studies in Geology and Archeology. Various methods are applied depending on the time range of interest and the archive studied. In this lecture, we focus on the last 50 ka and the methods that are most frequently used for dating Quaternary sediments and landforms in this time range.

Objective
Students will be made familiar with the details of the six dating methods through lectures on basic principles, analysis of case studies, solving of problem sets for age calculation and visits to dating laboratories.

Content
At the end of the course, students will:
1. understand the fundamental principles of the most frequently used dating methods for Quaternary studies.
2. choose which dating method (or combination of methods) suits a certain field problem.
3. critically read and evaluate the application of dating methods in scientific publications.

1. Introduction: Isotopes and decay
2. Radiocarbon dating: principles and applications
3. AMS technique and its application in Quaternary geochronology
4. U-series disequilibrium dating
5. Luminescence dating
6. Introduction to incremental: varve counting, dendrochronology, and ice cores chronologies
7. Dating anthropogenic records

Prerequisites / notice
Visit to radiocarbon lab, cosmogenic nuclide lab, and accelerator (AMS) facility.

Required: attending the lecture, visiting laboratories, handing back solutions for problem sets, short presentations or written report

Optional (individual): 1-5 days of hands-on radiocarbon dating at the 14C lab, ETH Hoenggerberg

| 701-0535-00L | Environmental Soil Physics/Vadose Zone Hydrology | W    | 3 credits | 2V+1U | A. Carminati,  
P. U. Lehmann Grunder |

Abstract
The course provides theoretical and practical foundations for understanding and characterizing physical soil properties and processes and their relevance for terrestrial ecosystems, plant growth, hydrological processes and atmospheric-land gas exchange, across all relevant scales.

Objective
Students are able to:
- Characterize the different soils based on their key textural and structural properties.
- Simulate and predict soil water retention and flow under varying environmental conditions and understand the key driving forces (capillarity, gravity, friction) and related water properties (surface tension and viscosity).
- Predict soil hydraulic properties for varying soil textural classes.
- Predict solute transport in soils for varying environmental conditions.
- Predict energy balance and temperature dynamics in soils.
- Predict conditions for plant water stress
- Estimate the impact of soil properties on the hydrological cycle and on plant growth.

Content
INTRODUCTION
Week 1 (September 18)
Presentation of the role of soil physics in environmental sciences and terrestrial ecosystems: soils in the water cycle; soils and vegetation; soils and solute transport. Survey on students' interests and expectations. Presentation of course structure and learning objectives.

BASIC SOIL PROPERTIES
Week 2 (September 25) and Week 3 (October 02)
soil texture, particle size distribution, soil structure, soil surface area, porosity and bulk density
Pore scale consideration (water in a single pore), pore sizes and shapes; surface tension; Young-Laplace equation; capillary rise; contact angle
Friction and laminar flow; Hagen-Poiseuille's law; Washburn equation; numerical lab (REPORT 1)

SOIL HYDRAULIC PROPERTIES
Week 4 (October 09) and Week 5 (October 16)
Soil water content and soil water potential - The energy state of soil water; total water potential and its components; volumetric and gravimetric water contents; field capacity and wilting point
Soil water characteristics and pore size distribution
Saturated water flow in soils - Laminar flow in tubes (Poiseuille's Law); Darcy's Law, conditions and states of flow; permeability and hydraulic conductivity, measurement and theoretical concepts; effective conductivity; unsaturated hydraulic conductivity; Buckingham law.
Unsaturated water flow in soils - Unsaturated hydraulic conductivity models and applications

TOOLBOX – MEASUREMENTS AND MODELING
Week 6 (October 23) and Week 7 (October 30)
Measuring soil hydraulic properties, fitting and interpretation; Lab tour - demonstration of soil physical methods; lecture on HYPROP method; report on Hyprop data (REPORT 2)
Modelling unsaturated water flow based on Richards equation - Using Hydrus1D for simulation of unsaturated flow; simulating HYPROP measurements (REPORT 3)

SOIL IN THE WATER CYCLE
Week 8 (November 06) – Week 9 (November 13)
Water infiltration - steady state solutions for infiltration; approximate solutions to infiltration (Green-Ampt, Philip); infiltration rate and ponding; outlook to preferential flow
Water evaporation - Energy balance and land atmosphere interactions - potential and actual evaporation, evaporation stages;

SOIL PLANT INTERACTIONS
Week 10 (November 20) Week 11 (November 27)
Root water uptake and transpiration – Theory and mechanisms controlling root water uptake; hydraulic properties of rhizosphere; plant and stomatal conductance.
Modelling root water uptake and transpiration; analytical approaches and modeling using Hydrus (REPORT 4)

SOLUTE TRANSPORT
Week 12 (December 04) Week 13 (December 11)
Transport mechanisms of solutes in porous media; breakthrough curves; convection-dispersion equation; solutions for pulse and step solute application
Transport of reactive substances, preferential flow, simulations with Hydrus

CLOSURE
Week 14 (December 18)
Summary, course synthesis, connections between the different topics, questions, exam preparation

Literature
Supplemental textbook (not mandatory) - Introduction to Environmental Soil Physics, by: D. Hillel

102-0287-00L River Basin Erosion W 3 credits 2G P. Molnar
The course presents an introduction to groundwater problems. Concepts to quantify properties of aquifers.

**Abstract**
The course provides an introduction into quantitative analysis of groundwater flow and solute transport. Students learn about how a fluvial system functions, how to identify sediment sources and sinks, and how to make predictions with numerical models, develop sediment budgets, and quantify geomorphic change.

**Objective**
The course has two fundamental aims: (1) The first aim is to provide environmental engineers with the physical process basis needed to understand fluvial system change, using the right language and terminology to describe landforms. We will cover the main geomorphic concepts of landscape change, including climatic and human activities acting on the system. Concepts like thresholds, equilibrium, self-organised criticality, etc. are presented. (2) Landscape evolution modelling as a tool for describing the shape of the land surface. Soil formation and sediment production at long timescales. (3) The processes of sediment production, upland sheet-riparian gully erosion, basin sediment yield, rainfall-triggered landsliding, sediment budgets, and the modelling of the individual processes involved. Here we combine model concepts with field observations and look at many examples. (4) Processes in the river, floodplain and riparian zone, including river network topology, channel geometry, aquatic habitat, role of riparian vegetation, including basics of fluvial system management. The main focus of the course is on the hydrology-sediment connections at the field and catchment scale.

**Content**
The course consists of four sections: (1) Introduction to fluvial forms and processes and geomorphic concepts of landscape change, including climatic and human activities acting on the system. Concepts like thresholds, equilibrium, self-organised criticality, etc. are presented. (2) Landscape evolution modelling as a tool for describing the shape of the land surface. Soil formation and sediment production at long timescales. (3) The processes of sediment production, upland sheet-riparian gully erosion, basin sediment yield, rainfall-triggered landsliding, sediment budgets, and the modelling of the individual processes involved. Here we combine model concepts with field observations and look at many examples. (4) Processes in the river, floodplain and riparian zone, including river network topology, channel geometry, aquatic habitat, role of riparian vegetation, including basics of fluvial system management. The main focus of the course is on the hydrology-sediment connections at the field and catchment scale.

**Lecture notes**
There is no script.

**Literature**
The course materials consist of a series of 13 lecture presentations and notes to each lecture. The lectures were developed from textbooks, professional papers, and ongoing research activities of the instructor. All material is on the course webpage.

**Prerequisites / notice**
Prerequisites: Basic Hydrology and Watershed Modelling (or contact instructor).

---

### Additional Elective Courses

</table>

**Abstract**
The course will provide advanced physical understanding on the fundamentals of passive and active remote sensing, measuring sensors and retrieval methods. A series of diverse remote sensing applications will be presented, including measurements/retrievals of various atmospheric composition parameters (ozone, aerosols, clouds, others) from surface based and satellite based instruments.

**Objective**
Main objectives of the course and what the students will be able to explain and use at the end of it are:
- The major atmospheric laws used for the retrieval of atmospheric composition and solar radiation parameters
- Ground based and satellite based retrieval examples for major atmospheric constituents
- Practical and experimental aspects on measuring atmospheric aerosols through the use of relevant instrumentation
- Explore major atmospheric measurement databases and use of the available data
- Interpretation of measurement and retrieval related results on atmospheric composition and solar radiation based on using combined retrieval data products
Atmospheric passive and active remote sensing is connected with a large number of applications including: atmospheric composition, Earth-atmosphere radiative balance, atmospheric and weather prediction model assimilation, agriculture, energy and health related applications and many others.

The proposed lesson is divided in three sections including exercises:

- Fundamentals of remote sensing
- Sensors (surface based and satellites) and retrieval methods
- Applications

The first aim of the lecture is to provide an in-depth understand of the physical aspects and basic laws on the fundamentals of remote sensing to the students. The lectures will provide a basic to intermediate understanding of radiative transfer of electromagnetic radiation through the atmosphere, covering the spectrum from UV to thermal. Examples of atmospheric components that will be addressed are: ozone, aerosols, greenhouse gases, clouds, water vapor.

In addition, measuring sensors used from the surface or from satellites and the relevant retrieval methods based on passive and active remote sensing of atmospheric composition will be presented (e.g. Spectroradiometers, filter radiometers, Lidars and others).

Finally, we aim to demonstrate a series of diverse remote sensing applications, including atmospheric composition measurements and retrievals from surface- and satellite-based instruments, including calibration and validation aspects.

The exercises will be embedded in the overall course lectures to provide hands-on experience with the measurements and retrieval methods conducting measurements and organizing small field experiments. Also with the use of atmospheric datasets available from specific instruments (e.g. satellite sensors) and networks (e.g. AERONET, GAWPFR).

More specific the course include:

- 3 introductory courses on climate variables, sensors, solar measurements and radiative transfer basics
- 7 courses including remote sensing techniques on solar UV measurements, total column ozone, trace gases, greenhouse gases, aerosols, cloud retrievals and lidar active remote sensing.
- 3 exercises:
  a. Conducting sun photometric measurements in the field and retrieve aerosol optical depth, including a visit in Davos, World Calibration Center
  b. Exploring ground and satellite based solar UV, Ozone and aerosol measurements
  c. Using radiative transfer modeling tools

Finally, students are involved in presenting scientific literature on subjects they are interested in. All exercises are conducted in student-forming teams.

Lecture notes
Lecture slides will be provided via Moodle before every lecture.

701-1271-00L Statistical Learning for Atmospheric and Climate Science

Abstract
This course offers a systematic introduction to statistical and machine learning methods with focus on applications in atmospheric and climate science. Focus is on the theoretical and mathematical basis of supervised statistical learning (advanced regression, nonparametric methods) and their application in practice with hands-on exercises.

Objective
Students:
- Understand the theoretical basis of machine learning
- Are familiar with overarching concepts such as bias-variance trade-off, cost-functions, hyper parameters, cross-validation
- Have good command of the theoretical basis of selected machine learning tools
- Are able to select the appropriate statistical learning tools to tackle atmospheric and climate research problems
- Can apply methods of statistical learning in atmospheric and climate research
- Data in atmospheric and climate research (data types, observations, models)
- Exploring properties of atmospheric and climate data (data in space and time, multivariate data)
- Concepts of supervised learning (bias variance trade-off, overfitting, cross-validation)
- Advanced linear regression (multiple linear regression, regularization)
- Non-linear regression (local linear regression, regression trees, gradient boosting, random forests, neural networks)
- Bootstrapping
- Keynote speakers showcasing recent topics in statistical learning and high-level applications for atmospheric and climate research
# Environmental Systems Data Science: Data Science Workflow

**Objective**

- frame a data science problem and build a hypothesis
- describe the steps from data preparation to running and evaluating models
- conduct selected steps of a workflow on specifically prepared datasets, with a focus on choosing, fitting and evaluating appropriate algorithms and models
- critically think about the limits and implications of a method
- visually data and results throughout the workflow
- access online resources to keep up with the latest data science methodology and deepen their understanding

**Content**

- The data science workflow
- Access and handle (large) datasets
- Prepare and clean data
- Analysis: data exploratory steps
- Analysis: machine learning and computational methods
- Evaluate results and analyse uncertainty
- Visualisation and communication

**Prerequisites / notice**

- Basic experience in a programming language
- Overview on the climate system
- Knowledge of introductory statistics
- Basic experience in a programming language

**Literature**

## Exercises

Exercises will be in the R for most of the sessions and in Python for deep learning.
Introduction into the physics of ion matter interaction: ion stopping, ion scattering and charge exchange.

Ion optics and ion acceleration.

Mass separation, molecular destruction and isobar separation.

Ion detection and identification.

The measurement methods for all the important radionuclides and the interpretation of their results are discussed on a few examples from the application:

- 14C – radiocarbon dating and environmental studies
- 10Be, 26Al, 36Cl – cosmogenic dating and ice core research
- 239, 238U, actinides – anthropogenic tracers in the environment
- 14C, 41Ca – biomedical studies
- 60Fe, 244Pu – astrophysics

Alternative methods: ICP-MS, RIMS, ATTA

A visit to the Tandem accelerator and AMS facilities at ETH Hönggerberg is organized as part of lectures and exercises.

**Lecture notes**

Lecture notes will be distributed in pdf

**651-4273-00L**

**Numerical Modelling in Fortran (Project)**

**W** 3 credits  **2V**  **P. Tackley**

**Abstract**

This course gives an introduction to programming in Fortran, and is suitable for students who have only minimal programming experience. The focus will be on Fortran 77, but differences to Fortran 77 will be mentioned for those working with already-existing codes. A hands-on approach will be emphasized rather than abstract concepts.

**Objective**

Fortran is a modern programming language that is updated every few years (most recently in 2018) and is specifically designed for scientific and engineering applications. This course gives an introduction to programming in this language, and is suitable for students who have only minimal programming experience, for example with MATLAB scripts. The focus will be on Fortran 95-2018, but differences to Fortran 77 will be mentioned for those working with already-existing codes. A hands-on approach will be emphasized rather than abstract concepts, using example scientific problems relevant to Earth science.

**Lecture notes**

See [http://jupiter.ethz.ch/~pjt/FORTTRAN/FortranClass.html](http://jupiter.ethz.ch/~pjt/FORTTRAN/FortranClass.html)

**Competencies**

- Subject-specific Competencies
  - Techniques and Technologies
  - Media and Digital Technologies
  - Problem-solving

See [http://jupiter.ethz.ch/~pjt/FORTTRAN/FortranClass.html](http://jupiter.ethz.ch/~pjt/FORTTRAN/FortranClass.html)

**651-4273-01L**

**Numerical Modelling in Fortran (Project) (BSc)**

**W** 1 credit  **1U**  **P. Tackley**

**Prerequisite:** 651-4273-00L Numerical Modelling in Fortran

**Abstract**

This course gives an introduction to programming in Fortran, and is suitable for students who have only minimal programming experience. The focus will be on Fortran 95-2018, but differences to Fortran 77 will be mentioned for those working with already-existing codes. A hands-on approach will be emphasized rather than abstract concepts.

**Objective**

Fortran is a modern programming language that is updated every few years (most recently in 2018) and is specifically designed for scientific and engineering applications. This course gives an introduction to programming in this language, and is suitable for students who have only minimal programming experience, for example with MATLAB scripts. The focus will be on Fortran 95-2018, but differences to Fortran 77 will be mentioned for those working with already-existing codes. A hands-on approach will be emphasized rather than abstract concepts, using example scientific problems relevant to Earth science.

**Content**

The project consists of writing a Fortran program to solve a problem agreed upon between the instructor and student; the topic is often related to (and helps to advance) the student’s Masters or PhD research. The project is typically started towards the end of the end of the main Fortran class when the student has acquired sufficient programming skills, and is due by the end of Semesterprüfung week.

**Abstract**

The course introduces the scientific concepts and typical applications of tracers in biogeochemistry. The course covers stable and radioactive isotopes, geochemical tracers and biomarkers and their application in biogeochemical processes as well as regional and global cycles. The course provides essential theoretical background for the lab course "Isotopic and Organic Tracers Laboratory".

**Objective**

The course aims at understanding the fractionation of stable isotopes in biogeochemical processes. Students learn to know the origin and decay modes of relevant radionic isotopes. They discover the spectrum of possible geochemical tracers and biomarkers, their potential and limitations and get familiar with important applications

**Content**

- Geogenic and cosmogenic radionuclides (sources, decay chains);
- stable isotopes in biogeochemistry (natural abundance, fractionation);
- geochemical tracers for processes such as erosion, productivity, redox fronts; biomarkers for specific microbial processes.

**Lecture notes**

handouts will be provided for every chapter

**Literature**

A list of relevant books and papers will be provided

**Prerequisites / notice**

Students should have a basic knowledge of biogeochemical processes (BSc course on Biogeochemical processes in aquatic systems or equivalent)

**Abstract**

The course addresses the biogeochemical classification and behavior of trace elements, including key processes driving the cycling of important trace elements in aquatic and terrestrial environments and the coupling of abiotic and biotic transformation processes of trace elements. Examples of the role of trace elements in natural or engineered systems will be presented and discussed in the course.

**Objective**

The students are familiar with the chemical characteristics, the environmental behavior and fate, and the biogeochemical reactivity of different groups of trace elements. They are able to apply their knowledge on the interaction of trace elements with geosphere components and on abiotic and biotic transformation processes of trace elements to discuss and evaluate the behavior and impact of trace elements in aquatic and terrestrial systems.

**Content**

- (i) Definition, importance and biogeochemical classification of trace elements.
- (ii) Key biogeochemical processes controlling the cycling of different trace elements (base metals, redox-sensitive and chalcophile elements, volatile trace elements) in natural and engineered environments.
- (iii) Abiotic and biotic processes that determine the environmental fate and impact of selected trace elements.

**Lecture notes**

Selected handouts (lecture notes, literature, exercises) will be distributed during the course.
Prerequisites / notice

Students are expected to be familiar with the basic concepts of aquatic and soil chemistry covered in the respective classes at the bachelor level (soil mineralogy, soil organic matter, acid-base and redox reactions, complexation and sorption reactions, precipitation/dissolution reactions, thermodynamics, kinetics, carbonate buffer system).

The lecture 701-1315-00L Biogeochemistry of Trace Elements is a prerequisite for attending the laboratory course 701-1331-00L Trace Elements Laboratory, or students must be concurrently enrolled in 701-1315-00L Biogeochemistry of Trace Elements in the same semester.

701-1644-00L Mountain Hydrology

Abstract

This course presents a process-based view of the hydrology of mountain streams. Students learn how to integrate process knowledge, data, and models to understand how landscapes regulate the fluxes of water, sediment, nutrients, and pollutants in streams, and to anticipate how streams will respond to changes in land use, water use, and climate.

Objective

Main learning objective: Describe the main elements and processes and their interlinkages of the water cycle in mountain catchments and analyze their characteristics and changes.

Objective 1: Identify and describe the important components of the water cycle and their influencing factors and discuss how changes in these influencing factors may affect different parts of the hydrological cycle.

Objective 2: Analyze, visualize, and interpret climate and hydrological time series data.

Objective 3: Explain how hydrological data are collected, how hydrological models work, how they are calibrated, and how they are evaluated.

Content

Streams are integrated monitors of the health and functioning of their surrounding landscapes. Streams integrate the fluxes of water, solutes, and sediment from their contributing catchment area; thus they reflect the spatially integrated hydrological, ecophysiological, biogeochemical, and geomorphological processes in the surrounding landscape. At a practical level, there is a significant public interest in managing upland landscapes to provide a reliable supply of high-quality surface water and to minimize the risk of catastrophic flooding and debris flows, but the scientific background for such management advice is still evolving.

Using a combination of lectures, field exercises, and data analysis, we explore the processes controlling the delivery of water, solutes, and sediment to streams, and how these processes are affected by changes in land cover, land use, and climate. We review the connections between process understanding and predictive modeling in these complex environmental systems. Practical problems to be considered include the effects of land use and climate on streamflow and water quality, illustrated with data from experimental watersheds in North America and Europe.

Lecture notes

Handouts will be available through moodle.

Literature

Recommended and required reading will be specified at the first class session (with possible modifications as the semester proceeds).

Autumn Semester 2024 Page 2497 of 2680
Environmental Geotechnics – Polluted Sites and Waste Disposal

The practice of landfilling, remediation of polluted sites, and the disposal of radioactive waste are based on the same concepts of environmental protection. Understanding the contaminants behaviour and how to reduce their release to the environment is the key to remediation. This lecture course consists of lectures with exercises and case studies. Laboratory experiments are designed and performed to study a selected environmental process. Advanced techniques for the analysis of total element contents and element speciation are used. The experimental findings are interpreted in the context of the studied environmental system. Moreover, the effect of these processes on the biogeochemical cycling of trace elements in the environment will be considered. Students will learn to use different advanced analytical techniques to measure the total content and the speciation of trace elements in both liquid and solid samples. The students will interpret and discuss their experimental findings in the context of the studied environmental system.

Prerequisites / notice
- Pre- or corequisite: Lecture "Biogeochemistry of Trace Elements".

Abstract
The course offers a practical introduction into the investigation of the biogeochemistry of trace elements. Laboratory experiments are performed to study a selected environmental process. Advanced techniques for the analysis of total element contents and element speciation are used. The experimental findings are interpreted and discussed in their environmental context.

Objective
The objective of this course, is to offer students a practical introduction into the investigation of the biogeochemistry of trace elements. During the course, students will become familiar with some of the key experimental approaches typically used in the investigation of the biogeochemistry of trace elements in the laboratory. In addition, students will learn to use different advanced analytical techniques to measure the total content and the speciation of trace elements in both liquid and solid samples. The students will interpret and discuss their experimental findings in the context of the studied environmental system.

Content
Laboratory experiments are designed and performed to study the interplay of various biogeochemical processes in a specific environmental system. Moreover, the effect of these processes on the biogeochemical cycling of trace elements in the environment will be considered. Advanced techniques for the analysis of total element contents and element speciation are used. The experimental findings are interpreted and discussed in the context of the studied environmental system under investigation.
The main part of the course is the investigation of real samples of soils/sediments in the lab working in groups. A brief theoretical introduction into the overall principle and the meaning of physical, mineralogical and chemical parameters of soils and sediments and into each analytical method for their investigation will be given in advance.

Upon successful completion of this course students are able to:
- describe structural, mineralogical and chemical properties of the inorganic solid part of soils and sediments,
- propose and apply different advanced methods and techniques to measure these properties,
- critically assess the data and explain the relationships between them,
- communicate the results in a scientific report.

The competencies of process understanding, system understanding, concept development, and measurement methods are taught and assessed.

### Content

Basic introduction to mineralogy and texture of soils
Analytical techniques
Practical exercises in sample preparation
Measurement and evaluation of the data:
- physical parameters (grain size distribution, surface, densities, porosity, (micro)structure)
- mineralogical/geochronological parameters (quantitative mineralogical composition, thermal analysis, cation exchange etc.)

### Literature

Selected handouts will be distributed during the course.

### Prerequisites / notice

Useful preparatory courses are: "Soil Chemistry", "Clays in Geotechnics", and "X-ray powder diffraction".

---

### Isotopes and Biomarkers in Biogeochemistry: Laboratory

**W 3 credits 4P C. Schubert, R. Kipfer**

**Abstract**

This course will illustrate how different tracers and isotopes are used in natural systems. Here especially the processes (transformation, timescales) that take place and can be revealed by tracers/isotopes will be demonstrated.

**Objective**

Students know how to use tracers/isotopes to investigate/understand ecosystems
They will understand the methods and analytical devices related to tracer/isotope work
Have a feeling for timescales on which natural processes occur
Students will be able to apply different sampling techniques in aquatic sciences

**Content**

Basics:

O,H isotopes as tracers for mixing in aquatic systems
Carbon isotopes as tracer for methane oxidation
210Pb, 137Cs as a tracer for sedimentation rate/mixing
SF6, Neon, He as tracers for exchange processes at the air/water interface

Case assessment:
Sampling of a Swiss lake (Rotsee)
Sampling techniques for different elements
Sample preparation for different techniques
Measurements at isotope mass spectrometer/gamma counter

Interpretation of results from the special sampling campaign and in a broader context

**Prerequisites / notice**

Sampling will take place in Rotsee (Lucerne). We will have 3 laboratory days at Eawag Kastanienbaum, 1 laboratory day at Eawag Duebendorf, and 2 days of preparation of a presentation and the presentation itself at ETH (Center). The presentation will be evaluated and is necessary to pass the class.

---

### Forest Soils in a Changing Environment

**W 3 credits 4P F. Hagedorn, P. F. Schleppi**

**Abstract**

The students are measuring carbon and nutrient fluxes in forest soils under a changing climate and land-use. In laboratory and field experiments, they are manipulating climatic conditions (temperature, drought) and quantify the response of C and N fluxes in soils, and plant-soil interactions. The results will be interpreted and discussed in the context of changes in climate and land-use.

**Objective**

The students get first-hand experience with field and laboratory methods to measure carbon and nutrient fluxes and the application of stable isotope techniques. They shall learn about physico-chemical properties of Swiss forest soils, how these properties determine the ecological functions of soils and how soils respond to changes in climate and land-use. Finally the students shall interpret, discuss and present their experimental data.

**Content**

1. Introduction to the ecological functions of Swiss forest soils
2. Measurement of soil CO2 efflux, carbon and nutrient leaching in forest and grassland soils
3. Sampling and preparation of litter and soil samples from selected soil profiles under different land-uses
4. Setting-up laboratory experiments in microcosms. Measurement of soil respiration and leaching of carbon, nutrients and/or contaminants in climate chambers under different environmental conditions.
5. Analyses of litter, soil, and soil water for selected physical and chemical properties.
7. Interpretation and final presentation of data

**Lecture notes / Literature**

A manual will be distributed during the course.

---

### Soil Solids Laboratory

**W 3 credits 4G M. Plötze**

**Abstract**

The main part of the course is the investigation of real samples of soils/sediments in the lab working in groups. A brief theoretical introduction into the overall principle and the meaning of physical, mineralogical and chemical parameters of soils and sediments and into each analytical method for their investigation will be given in advance.

**Objective**

Upon successful completion of this course students are able to:
- describe structural, mineralogical and chemical properties of the inorganic solid part of soils and sediments,
- propose and apply different advanced methods and techniques to measure these properties,
- critically assess the data and explain the relationships between them,
- communicate the results in a scientific report.

The competencies of process understanding, system understanding, concept development, and measurement methods are taught and assessed.

**Content**

Basic introduction to mineralogy and texture of soils
Analytical techniques
Practical exercises in sample preparation
Measurement and evaluation of the data:
- physical parameters (grain size distribution, surface, densities, porosity, (micro)structure)
- mineralogical/geochronological parameters (quantitative mineralogical composition, thermal analysis, cation exchange etc.)

**Lecture notes / Literature**

Selected handouts will be distributed during the course.

Environmental Measurement Laboratory

Abstract
Measurements are the sole judge of scientific truth and provide access to unpredictable information, enabling the characterization and monitoring of complex terrestrial systems. Based on lectures and field- and laboratory training, the students learn to apply modern methods to determine forest inventory parameters and to measure subsurface properties and processes.

Objective
The students will be able to:
- explain measurement principles that are used for characterization of landscapes and terrestrial systems
- select appropriate measurement methods and sampling design to quantify key variables and processes above ground and in the subsurface
- deploy sensors in the field
- interpret collected laboratory and field data and report main conclusions deduced from measurements

Content
Week 1: Plant-Soil interactions – short introduction before sensor demonstration and installation in forest lab; Scholander pressure bomb (suction in leaves); LiCOR soil chamber

Weeks 2 to 6 - Experimental Methods for Soil Health Assessment

Week 2: Lecture on soil health and soil indicators; defining measurable soil health indicators for case studies for different soil threats and climate regions

Week 3: Short lecture on sampling, sensors and data logging; preparing sensors and data loggers in the lab; measurements on water content and temperature in the lab

Week 4: Short introduction on field installation; sensor installation at field site Hönggerberg

Week 5: Lecture on geophysical methods on subsurface characterization: basic principles of ERT, GPR, and EM; planning of field experiment to assess soil health

Week 6: Short introduction on data analysis; field sampling and conducting field experiment to assess soil health

Week 7: Analysis of experimental data and soil health assessment; poster presentation and discussion

Week 8: Lecture on plant soil relationship; connecting information below and above ground – data analysis

Weeks 9 and 10: Forest characterization/ inventory: Principles of LiDAR; structures and features of the tree crowns, size/volume of the leaf area tree positions and diameters at breast height

Weeks 11 and 12: Eddy covariance methods -Principles for field measurement of water vapor, carbon dioxide, and energy exchange between terrestrial surfaces and the atmosphere; Analysis of measured time series to determine evaporation rate and CO2-fluxes

Week 13: Swiss Soil Monitoring networks – Monitoring of soil water content and potential; climate change and droughts

Week 14: Global data – Global modeling and data interpretation; SoilGrids and OpenLandMap; exercises on Budyko analysis

Literature
Lecture material will be online for registered students using moodle

Prerequisites / notice
The details of the schedule will be optimized based on the number of students; some blocks of the course will be offered as well to students of Environmental Engineering

Seminar and Semester Paper

<table>
<thead>
<tr>
<th>Number</th>
<th>Title</th>
<th>Type</th>
<th>ECTS</th>
<th>Hours</th>
<th>Lecturers</th>
</tr>
</thead>
</table>

Prerequisite: Term Paper 1: Writing (701-1303-00L).
The goal of the term paper seminars is to train the student’s ability to communicate (scientific) results to a wider audience and the ability to respond to questions and comments.

Each student presents the results of their term paper to fellow students and advisors and responds to questions and comments from the audience.

Guidelines and supplementary material are distributed on the Moodle platform.

There is no final exam. Grade is assigned based on the quality of the presentation and ensuing discussion.

To obtain the credits, it is mandatory to attend at least 60% of all seminar dates offered in the fall and spring semester. Active participation in discussion and feedback rounds is expected.

The ability to critically evaluate original (scientific) literature and to summarise the findings concisely in a paper addressing a research question is an important skill for any student. This course aims to practice this ability, requiring each student to write a term paper of scientific quality on a topic of relevance for research in the areas of biogeochemistry and pollutant dynamics.

The goal of the term paper is to train the student’s ability to critically evaluate scientific literature and to summarise the findings concisely in a paper addressing a research question.

At the end of the course, students will be able to:
- narrow down a research question.
- identify relevant literature to address the research question.
- concisely summarise and critically evaluate their findings.
- formulate key outstanding questions.

Each student is expected to write a paper with a length of approximately 15-20 pages. The students can choose from a list of topics prepared by the tutors, but the final topic will be determined based on a balance of choice and availability. The students will be guided and advised by their tutors throughout the term.

The paper itself should contain the following elements:
- Motivation and context of the given topic (25%)
- Concise presentation and critical evaluation of the state of the science (50%)
- Identification of open questions and perhaps opportunities for further research (20%)
- Declaration and reflection on the use of technical tools (5%)

In addition, the accurate use of citations, attribution of ideas, and the judicious use of figures, tables, equations and references are critical components of a successful paper. Specialised knowledge is not expected, nor required; neither is new research.

- Declaration and reflection on the use of technical tools (5%)
- Identification of open questions and perhaps opportunities for further research (20%)
- Motivation and context of the given topic (25%)

The paper itself should contain the following elements:

At the end of the course, students will be able to:
- narrow down a research question.
- identify relevant literature to address the research question.
- concisely summarise and critically evaluate their findings.
- formulate key outstanding questions.

Each student submits a term paper that will be reviewed by one fellow student and one faculty. The submission of the term paper and a written review of another student’s term paper are a condition for obtaining the credit points.

Results from the term paper will be presented to fellow students and involved faculty in the following semester ("Term Paper 2: Seminar").

Students are introduced to a typical data science workflow using various examples from environmental systems. They learn common methods and key aspects for each step through practical application. The course enables students to plan their own data science project in their specialization and to acquire more domain-specific methods independently or in further courses.

Abstract

Students are introduced to a typical data science workflow using various examples from environmental systems. They learn common methods and key aspects for each step through practical application. The course enables students to plan their own data science project in their specialization and to acquire more domain-specific methods independently or in further courses.
Students are introduced to advanced data science where environmental data are analyzed using state of the art machine learning methods. This course presents a broad overview of the key processes structuring ecological populations and communities, with a particular focus on environmental systems data science: machine learning. The students are able to:

- frame a data science problem and build a hypothesis
- describe the steps of a typical data science project workflow
- conduct selected steps of a workflow on specifically prepared datasets, with a focus on choosing, fitting and evaluating appropriate algorithms and models
- critically think about the limits and implications of a method
- visualise data and results throughout the workflow
- access online resources to keep up with the latest data science methodology and deepen their understanding

The students are able to:

- The data science workflow
- Access and handle (large) datasets
- Prepare and clean data
- Analysis: data exploratory steps
- Analysis: machine learning and computational methods
- Evaluate results and analyse uncertainty
- Visualisation and communication

Abstract

Students are introduced to advanced data science where environmental data are analyzed using state of the art machine learning methods. Starting from known statistical approaches, they learn the principle of more advanced machine learning methods with practical application. The course enables students to plan their own data science project in their specialization and to apply machine learning methods. The learning objectives follow from the course goals. After attending this course, students should be able to:

- Introduce students to the major ecological processes that together shape the composition and abundance of species within ecological communities.
- Provide insight to students on the ecological impacts of anthropogenic change, and how an understanding of ecological processes can help us predict these ecological impacts and design conservation / restoration actions to mitigate their negative impacts.
- Teach students to critically summarize and analyze primary ecological literature, understanding how ecological studies contribute to our knowledge, how to critically evaluate their strengths and weaknesses, and practice designing follow up studies.

LEARNING OBJECTIVES

The learning objectives follow from the course goals. After attending this course, students should be able to:

- Describe key processes affecting the size of populations and abundance of species within ecological communities.
- Critically evaluate evidence and conclusions presented in primary ecological literature based on your understanding of these ecological processes.
- Apply knowledge of ecological processes to make predictions about the major responses of ecological communities to anthropogenic perturbations.

Content

We will explore how ecological theories can provide insight into the effects of anthropogenic change as well as guide management to undo undesired impacts. Collectively, this requires us to focus on classic problems in ecology (for examples, competitive coexistence, top-down impacts of predators, diversity-ecosystem function relationships, the role of dispersal in spread).

The course is taught in a flipped format. Generally (with the exception of a few weeks), there will be online materials for students to watch or read during the first hour of class (lecture videos, readings), and the class will meet in person for the second half of class. The in person portions of the class will have students participate in activities to learn the content, including paper discussions, groupwork, and presentations. Students are also required to submit a written assignment.

Lecture notes

All course materials (videos, lecture notes, primary literature) will be provided on the course moodle.
This is an advanced course that will require significant student participation. Students will learn how to evaluate and present scientific information. The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:

- *Yang, Z. 2006. Computational Molecular Evolution.*
- *Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.*

Students of this course will discuss current topics from the field of infectious disease biology. From a list of publications, each student chooses some themes that he/she is going to explain and discuss with all other participants and under supervision. The actual topics will be decided by the student in cooperation with the lecturers.

The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Combinatorial algorithms extracting biological information from genetic sequence data are discussed, and statistical tools to understand this information in detail are introduced.

- **Computational Biology**
  - **701-0263-01L Seminar in Evolutionary Ecology of Infectious Diseases**
  - **636-0017-00L Research Seminar: Ecological Genetics**

**Abstract**

Students of this course will discuss current topics from the field of infectious disease biology. From a list of publications, each student chooses some themes that he/she is going to explain and discuss with all other participants and under supervision. The actual topics will change from year to year corresponding to the progress and new results occurring in the field.

**Objective**

This is an advanced course that will require significant student participation. Students will learn how to evaluate and present scientific literature and trace the development of ideas related to understanding the ecology and evolutionary biology of infectious diseases.

**Content**

A core set of ~10 classic publications encompassing unifying themes in infectious disease ecology and evolution, such as virulence, resistance, metapopulations, networks, and competition will be presented and discussed. Pathogens will include bacteria, viruses and fungi. Hosts will include animals, plants and humans.

**Lecture notes**

Publications and class notes can be downloaded from a web page announced during the lecture.

**Literature**

Papers will be assigned and downloaded from a web page announced during the lecture.

Data: 26.07.2024 12:39
Autumn Semester 2024
Page 2503 of 2680
In this research seminar we will critically discuss recent publications on current topics in Ecological Genetics.

Lectures:
The genomics of environmental adaptation is an evolving scientific field of both basic and applied interest. Researchers make increasing efforts to understand how the environment and natural history of parasites, adaptations of parasites, ecology of host-parasite interactions, applied parasitology, and human macroparasites are related and (ii) how signatures of genomic adaptation can be detected in natural populations. The winter school focuses on current methods and hands-on exercises, emphasizing an understanding of the underlying concepts and a discussion of benefits, limitations and pitfalls of environmental genomics. It is specifically aimed at the needs of advanced Master students, PhD students and early postdoctoral researchers.

Prerequisites:
It is strongly recommended that participants have in advance successfully participated in the course Evolutionary Genetics (701-2413-00) or Ecological Genetics (701-1413-01).

Prerequisites / notice:
The three practicals will take place at the 03.10.2023. The 17.10.2023 and the 07.11.2023 at Eawag Dübendorf from 08:15 - 12:00. Note that each practical takes 2 hours longer than the weekly lecture.

Abstract:
The course will not take place fall semester 2024.

Course focuses on the ecology and evolution of macroparasites and their hosts. Through lectures and practical work, students learn about diversity and natural history of parasites, adaptations of parasites, ecology of host-parasite interactions, applied parasitology, and human macroparasites in the modern world.

Objective:
The course will take place in the fall semester 2024.

Content:
Lectures:
1. Diversity and natural history of parasites (i.e. systematic groups and life-cycles).
2. Adapts of parasites (e.g. evolution of life-cycles, host manipulation).
3. Ecology of host-parasite interactions (e.g. parasite communities, effects of environmental changes).
5. Human macroparasites (schistosomiasis, malaria).

Practical exercises:
1. Examination of parasites in molluscs (identification and examination of host exploitation strategies).
2. Examination of parasites in amphipods (identification and examination of effects on hosts).
3. Examination of parasites of amphipods.

Competencies:
Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: assessed
- Media and Digital Technologies: assessed
- Problem-solving: assessed
- Project Management: assessed

Social Competencies
- Communication: assessed
- Cooperation and Teamwork: assessed
- Leadership and Responsibility: fostered
- Self-presentation and Social Influence: fostered
- Sensitivity to Diversity: fostered
- Negotiation: fostered

Personal Competencies
- Adaptability and Flexibility: fostered
- Creative Thinking: assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: fostered
- Self-awareness and Self-reflection: fostered
- Self-direction and Self-management: assessed

Data: 26.07.2024 12:39 Autumn Semester 2024 Page 2504 of 2680
Students will learn to (i) identify evolutionary explanations for the origins and characteristics of infectious diseases in a range of organisms and (ii) evaluate ways of integrating evolutionary thinking into improved strategies for treating infections of humans and animals. This will incorporate principles that apply across any host-pathogen interaction, as well as system-specific mechanistic information, with particular emphasis on bacteria and viruses.

We will cover several topics where evolutionary thinking is relevant to understanding or treating infectious diseases. This includes: (i) determinants of pathogen host range and virulence, (ii) dynamics of host-parasite coevolution, (iii) pathogen adaptation to evade or suppress immune responses, (iv) antimicrobial resistance, (v) evolution-proof medicine. For each topic there will be a short (< 20 minutes) introductory lecture, before students independently research the primary literature and develop discussion points and questions, followed by interactive discussion in class.

The focus is on primary literature, but for some parts the following text books provide good background information:

- Schmid Hempel 2011 Evolutionary Parasitology
- Stearns & Medzhitov 2016 Evolutionary Medicine

A basic understanding of evolutionary biology, microbiology or parasitology will be advantageous but is not essential.

Students will gain profound knowledge about biogeochemical cycles and greenhouse gas fluxes in managed grassland and/or cropland ecosystems as well as expand their computational competences. Responses of agroecosystems to the environment, i.e., to climate and weather events, but also to management will be studied. Two flipped classroom exercises include the assessment of an ecosystem disturbance and the experimental design of an own study. Dataloggers will be programmed, and a small weather station will be set up. Different meteorological and greenhouse gas flux data will be analysed (using R) and assessed in terms of production, greenhouse gas budgets, and carbon sequestration. Thus, students will learn how to collect, analyse and interpret data about the complex interactions of a coupled human-environmental system.

Students will work in groups (3-4 persons per group) with data from a small weather station (dedicated to the course), as well as data from the long-term measurement network Swiss FluxNet and from global databases. Data from the intensively managed grassland site Chamau will be used to investigate the biosphere-atmosphere exchange of CO2, H2O, N2O and CH4. Functional relationships will be identified, greenhouse gas budgets will be calculated for different time periods and in relation to management over the course of a year.

Handouts will be available in moodle.

- Conceptual and theoretical knowledge in evolutionary medicine
- Methodological skills to design and perform a research project in the field of evolutionary medicine
- A critical thinking approach towards infectious diseases
- Development of personal skills and professional networking

**Abstract**
The course provides methods and tools for ecological evaluations dealing with nature conservation or landscape planning. It covers census methods, ecological criteria, indicators, indices and critically appraises objectivity and accuracy of the available methods, tools and procedures. Birds and plants are used as main example guiding through different case studies.

**Objective**
Students will be able to:
1) critically consider biological data books and local, regional, and national inventories;
2) evaluate the validity of ecological criteria used in decision making processes;
3) critically appraise the handling of ecological data and criteria used in the process of evaluation
4) perform an ecological evaluation project from the field survey up to the decision making and planning.

**Lecture notes**
Powerpoint slides are available on the moodle page. Additional documents are handed out as copies.

**Literature**
Basic literature and references are listed on the webpage.

**Prerequisites / notice**
The course structure changes between lecture parts, seminars and discussions. The didactic atmosphere is intended as working group.

Suggested prerequisites for attending this course are skills and knowledge equivalent to those taught in the following ETH courses:
- Pflanzen- und Vegetationsökologie
- Systematische Botanik
- Raum- und Regionalentwicklung
- Naturschutz und Naturschutzbio(nomy)

### Competencies

**Subject-specific Competencies**
- Concepts and Theories
- Techniques and Technologies

**Method-specific Competencies**
- Analytical Competencies
- Problem-solving
- Project Management

**Social Competencies**
- Communication
- Cooperation and Teamwork
- Negotiation

**Personal Competencies**
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Self-direction and Self-management

**Abstract**
This course introduces landscapes as socially perceived, spatially and temporally dynamic entities that are shaped by natural and societal factors. Concepts and qualitative and quantitative methods to study landscapes from an ecological and societal perspective are presented. The course consists of a mixture of theoretical lectures and exercises or practical sessions.

**Objective**
Students will learn:
- The use of spatial data and analyses for quantifying patterns and processes in landscapes
- Concepts and methods to quantify functional connectivity in landscapes and seascapes.
- The use of remote sensing (satellites images, drones) to extract information about landscape structure and change, with a focus on land-use.
- The use of landscape genetics and its application to biodiversity conservation.
- To computationally optimize land-use planning problems.
- Concepts and methods in scenario-based land-use change modelling.
- Landscape ecological concepts and planning tools for management of urban landscapes.
- Concepts of social preference of landscapes and related measurement methods.
- How to design urban environments that foster health and well-being.
- The role of landscape features in influencing human well-being.
- Approaches of actively influencing attitudes and behavior toward landscapes as well as their scientific evaluation.

**Content**

1. Ecological quantification of landscape patterns:
- Landscape resources and green infrastructure (e.g., ecological conservation areas).
- Landscape and seascapes connectivity.
- Landscape genetics and conservation applications.
- Concepts of spatial quantitative methods: least cost paths, resistance surfaces, Circuitscape, land-use change models, various statistical methods.
- Image processing from remote sensing from satellites and drones.
- Modelling future land-use.
- Spatial optimization and trade-offs relative to biodiversity, agriculture and energy production.

2. Social perception and of landscapes:
- Impact of urbanization on human-nature interactions
- Approaches in planning urban landscapes
- Theories on landscape preference and place identity.
- Role of landscapes for recreation, health and well-being
- Methods of investigating the human-landscape relationship and evaluating interventions

**Lecture notes**
Handouts will be available in the course and for download

**Prerequisites / notice**
Basic Landscape Ecology courses at Bachelor level and basic knowledge of the R programming language
This course introduces the broad variety of conflicts that arise in projects focusing on sustainable management of natural resources. It explores case studies of ecosystem management approaches and considers their practicability, their achievements and possible barriers to their uptake.

Students should be able to:

a) propose appropriate and realistic solutions to ecosystem management problems that integrate ecological, economic and social dimensions across relevant temporal and spatial scales.

b) identify important stakeholders, their needs and interests, and the main conflicts that exist among them in the context of land and resource management.

Traditional management systems focus on extraction of natural resources, and their manipulation and governance. However, traditional management has frequently resulted in catastrophic failures such as, for example, the collapse of fish stocks and biodiversity loss. These failures have stimulated the development of alternative ecosystem management approaches that emphasise the functionality of human-dominated systems. Inherent to such approaches are system-wide perspectives and a focus on ecological processes and services, multiple spatial and temporal scales, as well as the need to incorporate diverse stakeholder interests in decision making. Thus, ecosystem management is the science and practice of managing natural resources, biodiversity and ecological processes, to meet multiple demands of society. It can be local, regional or global in scope, and addresses critical issues in developed and developing countries relating to economic and environmental security and sustainability.

This course provides an introduction to ecosystem management, and in particular the importance of integrating ecology into management systems to meet multiple societal demands. The course explores the extent to which human-managed terrestrial systems depend on underlying ecological processes, and the consequences of degradation of these processes for human welfare and environmental well-being. Building upon a theoretical foundation, the course will tackle issues in resource ecology and management, notably forests, agriculture and wild resources within the broader context of sustainability, biodiversity conservation and poverty alleviation or economic development. Case studies from tropical and temperate regions will be used to explore these issues. Dealing with ecological and economic uncertainty, and how this affects decision making, will be discussed. Strategies for conservation and management of terrestrial ecosystems will give consideration to landscape ecology, protected area systems, and community management, paying particular attention to alternative livelihood options and marketing strategies of common pool resources.

Abstract

Individual writing of an essay-type review paper about a specialized topic in the field of ecology and evolution, based on substantial reading of original literature and discussions with a senior scientist.

Objective

- Students acquire a thorough knowledge about a topic in which they are particularly interested
- They learn to assess the relevance of original literature and synthesize information
- They make the experience of becoming "experts" on a topic and develop their own perspective
- They practise academic writing according to professional standards in English
Topics for the essays are proposed by the professors and lecturers of the major in Ecology and Evolution at a joint meeting at the beginning of the semester (the date will be communicated by e-mail to registered students). Students will:
- choose a topic
- search and read appropriate literature
- develop a personal view on the topic and structure their arguments
- prepare figures and tables to represent ideas or illustrate them with examples
- write a clear, logical and well-structured text
- refine the text and present the paper according to professional standards

In all steps, they will benefit from the advice and detailed feedback given by a senior scientist acting as personal tutor of the student.

The "Term Paper" requires considerable time set aside to read and digest original scientific literature, culminating in the writing of a review paper. The submission deadline is the first day of the spring semester, implying that much of the actual writing will be performed in January and February. Grading is based on the quality of the submitted review paper (2/3 of total grade), and on the "soft skills" such as the level of initiative, timeliness, independence, etc. of the student (1/3 of total grade). The personal supervisor is charged with grading the student's performance.

### Prerequisites

**Term Paper**
- Environmental DNA (eDNA) allows the detection of organisms from traces of their DNA sampled from water, air or soil. Sampling eDNA instead of organisms makes monitoring fast, non-invasive, scalable and inexpensive. In this lecture, students will learn about eDNA and how it can be sampled, sequenced and analysed for biodiversity discovery and monitoring.

### Competencies

### Content

#### 701-1411-00L: Environmental DNA - Concepts and Applications for Biodiversity Monitoring at the Landscape Scale

**Abstract**
Environmental DNA (eDNA) allows the detection of organisms from traces of their DNA sampled from water, air or soil. Sampling eDNA instead of organisms makes monitoring fast, non-invasive, scalable and inexpensive. In this lecture, students will learn about eDNA and how it can be sampled, sequenced and analysed for biodiversity discovery and monitoring.

**Objective**
- At the end of this course, participants should be able to:
  - describe what eDNA is and how to harness the information in eDNA to turn it into a survey method for biodiversity monitoring
  - describe the eDNA analytical steps, from the sampling, laboratory, data analysis and interpretation.
  - summarise the common software and analytical tools for analysing eDNA data and be able to interpret the results.
  - apply eDNA methods to design programs for monitoring in conservation and restoration through case studies.

**Content**
The course is consisting of two pillars:
- **Pillar 1**: Theoretical background. The first pillar offers general theoretical knowledge about the nature of eDNA and its use in biodiversity science. It is structured into theoretical blocks with video content about sampling design, laboratory and data processing, which offer fundamental knowledge to solve the practical case studies of pillar 2.
- **Pillar 2**: Data application on applied Case Studies. Each theory block will be associated with an exercise in which students are challenged to apply their knowledge from the theory. Students will participate in training eDNA sampling design, visit the laboratory, run eDNA analysis (in R) following the best guidelines and interpret the results of analyses. These exercises will happen in person in the classroom.

**Prerequisites**
- Basic understanding of genetics and molecular analyses.
- Basic knowledge of R and Geographic Information Systems (GIS).

The analytic part of the lecture will rely on skills from “Environmental Systems Data Science”.

#### 701-1677-00L: Quantitative Vegetation Dynamics: Models from Tree to Globe

**Abstract**
The course introduces basic concepts and applications of dynamic vegetation models at various temporal and spatial scales. Different modeling approaches and underlying principles are presented and critically discussed during the lectures. In the integrated exercise parts, students work in a number of small projects with some of the introduced models to gain practical experience.

**Objective**
- Students will:
  - be enabled to understand, assess and evaluate the fundamental properties of dynamic systems using vegetation models as case studies
  - obtain an overview of dynamic modelling techniques and their applications from the individual plant to the global level
  - understand the basic assumptions of the various model types, which dictate the applicability and limitations of the respective model
  - be enabled to work with such model types on their own
  - appreciate the methodological basis for impact assessments of future climate change and other environmental changes on ecosystems.

**Content**
Models of individuals
- Deriving single-plant models from inventory measurements
- Plant models based on 'first principles'

Models at the stand scale
- Simple approaches: matrix models
- Competition for light and other resources as central mechanisms
- Individual-based stand models: distance-dependent and distance-independent
- Theoretical models

Models at the landscape scale
- Simple approaches: cellular automata
- Dispersal and disturbances (windthrow, fire, bark beetles) as key mechanisms
- Landscape models

Global models
- Sacrificing local detail to attain global coverage: processes and entities
- Dynamic Global Vegetation Models (DGVMs)
- DGVMs as components of Earth System Models

<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Objective
During the research project you will learn the principles of doing research to observe interrelations in aquatic ecosystems. You will measure and interpret biological and physical data (e.g. during experiments, fieldwork). You will present the collected knowledge and write a report about it.

Content
The field excursions contain a 1-day excursion to a lake (Greifensee) and a 3-day excursion to a river (Glatt, Niederuzwil). The experimental part contains research projects in small groups within research groups at Eawag.

Lecture notes
Course notes and power point presentations provided during the course.

Prerequisites / notice
This course can only be taken together with "701-1437-00 Aquatic Ecology I", "701-1437-01 Bestimmungskurs aquatische Makroinvertebraten" and "701-1437-02 Bestimmungskurs Süsswasseralgen und aquatische Mikroinvertebraten".

The maximal participating number of students is 8 from D-USYS and 16 from D-BIOL (ETH & UNI).
Registration for the course until 12.08.2024, free places will be distributed after that. Students registering later cannot be guaranteed a place in the course.

The course includes a mandatory field trip to Greifensee (19.09.2024) and a three-day excursion to the river Glatt (25.-27.09. 2024).

Abstract
This course gives an overview of the typical aquatic macroinvertebrate groups in Switzerland. Beside a theoretical background on the different groups the focus is laid on the determination of the most important species groups and their identification traits, also using identification keys. Practical experience in benthic sampling techniques is collected during an excursion.

Objective
During this course you will get an overview of the typical aquatic macroinvertebrates in Switzerland and the common sampling and preservation techniques. After this course you will be able to identify the most important aquatic species groups at the level of order/family and know the most important identification traits. You will also be able to use identification literature commonly used in Switzerland. During an excursion, you will apply the theoretical identification knowledge to field situations.

Content
The taxonomic part will cover macroinvertebrates (e.g. Crustacean, aquatic insects). The goal is to get to know the most common aquatic taxa in Switzerland, to identify them with commonly used identification literature, and to get an idea how these organisms are used in research and practice. (language: German, translation of the most important things during the course possible)

The field excursion takes place Tuesday 22.10.2024.

Lecture notes
Course notes and power point presentations provided during the course.

Prerequisites / notice
The maximal participating number of students is 12 from D-USYS and 16 from D-BIOL. In case of too many students, those that simultaneously participate in the courses "701-1437-00 Aquatic Ecology I", "701-1437-03 Aquatic Ecology II" and "701-1437-02 Bestimmungskurs Süsswasseralgen und aquatische Mikroinvertebraten" are given priority. Sign in until 12.08.2024, free places will be distributed after that. Students registering later cannot be guaranteed a place in the course.

The field excursion takes place Tuesday afternoon 22.10.2024 from 1pm-5pm.
Identification Course Freshwater Algae and Aquatic Microinvertebrates

701-1437-02L

**Abstract**
This course gives an overview of the typical aquatic microinvertebrate and freshwater algae groups in Switzerland. Beside a theoretical background of the different groups the focus is laid on the recognition of the most important species groups and their identification traits. Practical experience is collected during an excursion.

**Objective**
During this course you will get an overview of the typical aquatic microinvertebrates (e.g. zooplankton) and algae in Switzerland. You will also get to know commonly used sampling techniques. After this course you will know the most important aquatic species groups and the most important identification traits.

You will apply the theoretical knowledge during an excursion.

**Content**
The taxonomic part will cover microinvertebrates and freshwater algae. The goal is to get to know the most common aquatic taxa in Switzerland, to identify them and to get an idea how these organisms are used in research and practice. (language: German, translation of the most important things during the course possible)

The identification exercise takes place Thursday afternoon 17.10.2024 from 1pm-5pm.

**Lecture notes**
Course notes and power point presentations provided during the course.

**Prerequisites / notice**
The maximal participating number of students is 12 from D-USYS and 16 from D-BIOL. In case of too many students, those that simultaneously participate in the courses "701-1437-00 Aquatic Ecology I" "701-1437-03 Aquatic Ecology II", and "701-1437-01 Bestimmungskurs aquatischer Makroinvertebraten" are given priority. Sign in until 12.08.2024, free places will be distributed after that. Students registrating later can not be guaranteed a place in the course.

The identification exercise takes place Thursday 17.10.2024 from 1pm-5pm.
The topics encompass integrated knowledge on current plant research, ranging from the molecular level to the ecosystem level, and from conceptual to applied science while making use of the synergies between the different research groups within the PSC.

Objectives of the colloquium are:

- Developing presentation and discussion skills
- Introducing students to interdisciplinary topics in the field of plant sciences
- Introducing to recent research in all fields of plant sciences

Content

- The data science workflow
- Data preparation for running and validating machine learning models
- Access online resources to keep up with the latest data science methodology and deepen their understanding
- Visualisation and communication
- Critical Thinking
- Work in interdisciplinary teams on the topics
- Developing presentation and discussion skills
- Introduction to resecent research in all fields of plant sciences

Prerequisites / Literature

- Building on existing data science resources
- Math IV, VI (Statistics); R, Python; ESDS I

Abstract

Students are introduced to a typical data science workflow using various examples from environmental systems. They learn common methods and key aspects for each step through practical application. The course enables students to plan their own data science project in their specialization and to acquire more domain-specific methods independently or in further courses.

Objective

The students are able to:

- frame a data science problem and build a hypothesis
- describe the steps of a typical data science project workflow
- conduct selected steps of a workflow on specifically prepared datasets, with a focus on choosing, fitting and evaluating appropriate algorithms and models
- critically think about the limits and implications of a method
- visualise data and results throughout the workflow
- access online resources to keep up with the latest data science methodology and deepen their understanding

Content

- The data science workflow
- Access and handle (large) datasets
- Prepare and clean data
- Analysis: data exploratory steps
- Analysis: machine learning and computational methods
- Evaluate results and analyse uncertainty
- Visualisation and communication

Abstract

Students are introduced to advanced data science where environmental data are analyzed using state of the art machine learning methods. Starting from known statistical approaches, they learn the principle of more advanced machine learning methods with practical application. The course enables students to plan their own data science project in their specialization and to apply machine learning methods.

Objective

The students are able to:

- select an appropriate model related to a research question and dataset
- describe the steps from data preparation to running and evaluating models
- prepare data for running machine learning with dependent and independent variable
- build and validate regressions and neural network models
- understand convolution and deep learning models
- access online resources to keep up with the latest data science methodology and deepen their understanding

Content

- The data science workflow
- Data preparation for running and validating machine learning models
- Get to know machine learning approaches including regression, random forest and neural network
- Model complexity and hyperparameters
- Model parameterization and loss
- Model evaluations and uncertainty
- Deep learning with convolutions

Abstract

The colloquium “Challenges in Plant Sciences” is a core class of the Zurich-Basel Plant Science Center’s PhD program. The colloquium introduces participants to the broad spectrum of plant sciences within the network. The course offers the opportunity to approach interdisciplinary topics in the field of plant sciences.

Objective

Objectives of the colloquium are:

- Introduction to resecent research in all fields of plant sciences
- Working in interdisciplinary teams on the topics
- Developing presentation and discussion skills

Content

The topics encompass integrated knowledge on current plant research, ranging from the molecular level to the ecosystem level, and from basic to applied science while making use of the synergies between the different research groups within the PSC.

Data: 26.07.2024 12:39  Autumn Semester 2024  Page 2512 of 2680
Abstract

Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems.

Objective

Students will understand: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems as a basis for implementing disease management strategies in agroecosystems.

Content

Course description: Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies.

Lecture Topics and Tentative Schedule

Week 1  The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrotrophs, disease cycles and pathogen life cycles.

Week 2  Nematode attack strategies and types of damage. Viral pathogens, classification, reproduction and transmission, attack strategies and types of damage. Examples TMV, BYDV. Bacterial pathogens and phytoplasmas, classification, reproduction and transmission.

Week 3  Bacterial attack strategies and symptoms. Example bacterial diseases: fire blight, Agrobacterium crown gall, soft rots. Fungal and oomycete pathogens, classification, growth and reproduction, sexual and asexual spores, transmission.

Week 4  Fungal and oomycete life cycles, disease cycles, infection processes, colonization, phytotoxins and mycotoxins. Attack strategies of fungal necrotrophs and biotrophs. Symptoms and signs of fungal infection. Example fungal diseases: potato late blight.

Week 5  Example fungal diseases: wheat stem rust, grape powdery mildew, wheat septoria tritici blotch. Plant defense mechanisms, host range and non-host resistance. Passive structural and chemical defenses, preformed chemical defenses. Active structural defense, histological and cellular (papillae).

Week 6  Active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytoalexins and disease resistance. Pisatin and pisatin demethylase. Local and systemic acquired resistance (LAR, SAR), induced systemic resistance (ISR), signal molecules, defense activators (Bion). Pathogen effects on food quality. Positive and negative transformations.

Week 8  Epidemiology: Disease pyramid, environmental effects on epidemic development, plant effects on development of epidemics, including resistance, physiology, density, uniformity.

Week 9  Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity. Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies, ELISA.

Week 10  Molecular detection and diagnosis of pathogens: PCR, rDNA and loop-mediated isothermal amplification. Strategies for minimizing disease risks: calculating disease thresholds, disease forecasting systems.

Week 12  Physical control methods. Cultural control methods: avoidance, tillage practices, crop sanitation.

Week 13  Cultural control methods: fertilizers, crop rotations.

Week 14  Open lecture.

Lecture notes

Detailed lecture notes (~160 pages) will be available for purchase at the cost of reproduction at the start of the semester.

Abstract

This course provides an in-depth analysis both of the theoretical underpinnings to different approaches to climate policy at the international and national levels, and how these different approaches have played out in practice. Students will learn how legislative frameworks have developed over the last 25 years, and also be able to appraise those frameworks critically.

Objective

The goal is to give students a glimpse into the enormous complexity of this policy area, an understanding of some of the many debates that are currently raging (of which the debate about whether climate change is actually real is probably the least complicated or interesting). We want to give students the ability to evaluate policy arguments made by politicians, experts, and academics with a critical eye, informed by a knowledge of history, an understanding of the theoretical underpinnings, and the results of empirical testing of different strategies. A student taking this course ought to be able to step into an NGO or government agency involved in climate policy analysis or political advocacy, and immediately be able to make an informed and creative contribution. Moreover, by experiencing the depth of this policy area, students should be able to appreciate the complexity inherent in all policy areas.
Climate change is one of the defining challenges of our time, touching all aspects of the environment and of society. There is broad recognition (although with some dissent) that governments ought to do something about it: making sure that emissions of greenhouse gases (GHGs) stop within the next 20 to 30 years; helping people to adapt to the consequences of the climate change to which we have already committed ourselves; and, most controversially, perhaps taking measures to actively remove GHG’s from the atmosphere, or to alter the radiation balance of the Earth through solar engineering.

It’s a complicated set of problems, especially the first of these, known as mitigation. Fundamentally this is because it means doing something that humanity has never really tried before at a planetary scale: deliberately altering the ways the we produce, convert, and consume energy, which is at the heart of modern society. Modern society – the entire anthropocene – grew up on fossil fuels, and the huge benefits they offered in terms of energy that was inexpensive, easy to transport and store, and very dense in terms of its energy content per unit mass or volume. How to manage a society of over 7 billion people, at anything like today’s living standards, without the benefits of that energy, is a question for which there is no easy answer. There are also other challenges outside of energy. How do we build houses, office buildings, and infrastructure networks without cement, a substance that releases large amounts of CO2 as it hardens? How do we reverse the pace of deforestation, particularly in developing countries? How do we eliminate the GHG emissions from agriculture: the methane from cows’ bellies and rice paddies, together with the chemicals that enter the atmosphere from the application of fertilizer?

These are all tough questions at a technical level, but even tougher when you consider that governments typically need to employ indirect methods to get these things to happen. Arguably a government could simply pass a law that forbids people from using fossil fuels. But politically this is simply unrealistic, at least while so many people depend on fossil fuels in their daily lives. What is to be done? For this, one needs to turn to various ideas about how government can and should influence society. On the one hand are ideas suggesting that government ought to play a very limited role, relative to private actors, and should step in only to correct “market failures,” with interventions designed specifically around that failure. On the other hand are ideas suggesting that government (meaning all of us, working together through a democratic process) is the appropriate decision-making body for core decisions on where society can and should go. These issues come to the fore in climate policy discussions and debates.

### Literature

There will be reading assignments for select classes. All of these will be posted in PDF format on a course Moodle. In addition, there will be one book and one report to be read over the course of the semester. They are:

- Ministry of the Future, by Kim Stanley Robinson
- Ten Principles for Policy Making in the Energy Transition, by Laura Diaz Anadon et al.

#### Abstract

The course provides an overview of dominant and emerging trends in the theory and practice of environmental governance. The course addresses environmental issues as policy problems and explores how the environment is regulated, controlled, and contested by a range of actors and institutions. The course focuses on the spatial dimension of environmental change and uses key concepts from geography.

#### Objective

Course participants will develop a theoretically as well as practically informed understanding of recent issues and debates in contemporary geographies of environmental governance.

#### Content

The course provides an overview of dominant and emerging trends in the theory and practice of environmental governance. The course addresses environmental issues as policy problems and explores how the environment is regulated, controlled, and contested by a range of actors and institutions. The course focuses on the spatial dimension of environmental change and uses key concepts from geography (scale, region, network) to advance regional environmental governance thinking. The lectures are complemented by seminar classes to work on case studies in smaller groups of students.

#### Abstract

The course addresses environmental policies, focusing on new steering approaches, which are generally summarized as environmental governance. The course also provides students with tools to analyze environmental policy processes and assesses the key features of environmental governance by examining various practical environmental policy examples.

#### Objective

To understand how an environmental problem may (not) become a policy and explain political processes, using basic concepts and techniques from political science.

To be able to identify the main challenges and opportunities for environmental governance and to critically discuss them with reference to various practical policy examples.
Governing the Energy Transition

This lecture introduces the social and environmental challenges involved in the energy sector and discusses the implications of these challenges for policy-making. It compares the current situation with historical socio-technological changes and derives the consequences for policy-making. It introduces theoretical frameworks and concepts for studying innovation and transitions. This lecture will focus on the role of policy and policy change in governing the energy transition, considering the role of political actors, institutions and policy feedback.

The grade will be determined by a final exam.

Method-specific Competencies
- Problem-solving
- Project Management

Social Competencies
- Communication
- Cooperation and Teamwork
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation

Personal Competencies
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

Literature
- A detailed course schedule will be provided at the beginning of the semester.

Prerequisites
- Lecture slides, a script and additional course material will be provided on Moodle.
- A detailed course schedule will be provided at the beginning of the semester.
- We recommend that students have (a) three-years BSc education of a (technical) university; (b) successfully completed Bachelor introductory course to environmental policy (Entwicklungen nationaler Umweltpolitik (or equivalent)) and (c) familiarity with key issues in environmental policy and some fundamental knowledge of one social science or humanities discipline (political science, economics, sociology, history, psychology, philosophy).
- We recommend that students have (a) three-years BSc education of a (technical) university; (b) successfully completed Bachelor introductory course to environmental policy (Entwicklungen nationaler Umweltpolitik (or equivalent)) and (c) familiarity with key issues in environmental policy and some fundamental knowledge of one social science or humanities discipline (political science, economics, sociology, history, psychology, philosophy).

A detailed course schedule will be provided at the beginning of the semester.
The course provides methods and tools for ecological evaluations dealing with nature conservation or landscape planning. It covers census methods, ecological criteria, indicators, indices and critically appraises objectivity and accuracy of the available methods, tools and procedures. Birds and plants are used as main example guiding through different case studies.

### Objective

Students will be able to:

1) critically consider biological data books and local, regional, and national inventories;
2) evaluate the validity of ecological criteria used in decision making processes;
3) critically appraise the handling of ecological data and criteria used in the process of evaluation
4) perform an ecological evaluation project from the field survey up to the decision making and planning.

### Literature

Basic literature and references are listed on the webpage. Additional documents are handed out as copies.

### Prerequisites / notice

Suggested prerequisites for attending this course are skills and knowledge equivalent to those taught in the following ETH courses:

- Pflanzen- und Vegetationsökologie
- Systematische Botanik
- Pflanzen- und Vegetationsökologie
- Naturschutz und Naturschutzbiologie

### Competencies

- Subject-specific Competencies: Concepts and Theories - assessed
- Method-specific Competencies: Analytical Competencies - assessed
- Social Competencies: Communication fostered
- Personal Competencies: Adaptability and Flexibility fostered

### Credits and Exam

After passing a written test at the end of the course (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test). Visiting students (e.g., from the University of Zurich, exchange students) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory. Students who obtain a grade of < 4.0 for the test will have a second chance (see table below). Students who did not participate in the test on 18 December 2023 will not have access to the repeat test unless they submit compelling and documented (e.g. medical, other exam in parallel at ETH) reasons for why they were unable to participate in the first test. It covers all contents of the lectures and the reading assignments. Visiting students (e.g., from the University of Zurich or other universities) are subject to the same conditions. Registration for the course in the mystudies system of ETH is compulsory. No separate registration for the exam is required, registration for the course as such covers everything. The exam will take place on campus, either in the F3 lecture hall or in a computer room. That is, you must be present in person at ETH Zurich on the exam date/time.

- Social Competencies: Communication fostered
- Personal Competencies: Adaptability and Flexibility fostered
- Project Management fostered
- Cooperation and Teamwork assessed
- Negotiation fostered
- Creative Thinking assessed
- Critical Thinking assessed
- Self-direction and Self-management fostered

### Credits and Exam

The objectives of this course are to develop the following key skills necessary for policy analysts:

- Identifying the critical quantitative factors that are of importance to policy makers in a range of decision-making situations.
- Developing conceptual models of the types of processes and relationships governing these quantitative factors, including stock-flow dynamics, feedback loops, optimization, sources and effects of uncertainty, and agent coordination problems.
- Develop and program numerical models to simulate the processes and relationships, in order to identify policy problems and the effects of policy interventions.
- Communicate the findings from these simulations and associated analysis in a manner that makes transparent their theoretical foundation, the level and sources of uncertainty, and ultimately their applicability to the policy problem.

The course will proceed through a series of policy analysis and modeling exercises, involving real-world or hypothetical problems. The specific examples around which work will be done will concern the environment, energy, health, and natural hazards management.
### Environmental Systems Data Science: Data Processing

#### 701-3001-00L

**Abstract**

Students are introduced to a typical data science workflow using various examples from environmental systems. They learn common methods and key aspects for each step through practical application. The course enables students to plan their own data science project in their specialization and to acquire more domain-specific methods independently or in further courses.

**Objective**

The students are able to:
- frame a data science problem and build a hypothesis
- describe the steps of a typical data science project workflow
- conduct selected steps of a workflow on specifically prepared datasets, with a focus on choosing, fitting and evaluating appropriate algorithms and models
- critically think about the limits and implications of a method
- visualise data and results throughout the workflow
- access online resources to keep up with the latest data science methodology and deepen their understanding

#### Content

- The data science workflow
- Access and handle (large) datasets
- Prepare and clean data
- Analysis: data exploratory steps
- Analysis: machine learning and computational methods
- Evaluate results and analyse uncertainty
- Visualisation and communication

**Prerequisites / notice**

- 252-0840-02L Anwendungsnahes Programmieren mit Python
- 401-0624-00L Mathematik IV: Statistik
- 401-6215-00L Using R for Data Analysis and Graphics (Part I)
- 401-6217-00L Using R for Data Analysis and Graphics (Part II)
- 701-0105-00L Angewandte Statistik für Umwelt- und Naturwissenschaften

### Environmental Systems Data Science: Machine Learning

#### 701-3003-00L

**Abstract**

Students are introduced to advanced data science where environmental data are analyzed using state of the art machine learning methods. Starting from known statistical approaches, they learn the principle of more advanced machine learning methods with practical application. The course enables students to plan their own data science project in their specialization and to apply machine learning mode

**Objective**

The students are able to:
- select an appropriate model related to a research question and dataset
- describe the steps from data preparation to running and evaluating models
- prepare data for running machine learning with dependent and independent variable
- build and validate regressions and neural network models
- understand convolution and deep learning models
- access online resources to keep up with the latest data science methodology and deepen their understanding

#### Content

- The data science workflow
- Data preparation for running and validating machine learning models
- Get to know machine learning approaches including regression, random forest and neural network
- Model complexity and hyperparameters
- Model parameterization and loss
- Model evaluations and uncertainty
- Deep learning with convolutions

**Prerequisites / notice**

- Math IV, VI (Statistics); R, Python; ESDS I

### Agent Based Modeling in Transportation

#### 101-0491-00L

**Abstract**

This course provides an introduction to agent-based modeling in transportation. The lectures and exercises offer an opportunity to learn about agent-based simulation models' current methodology, focusing on MATSim, how agent-based models are set up, and perform a practical case study by working in groups.

**Objective**

At the end of the course, the students should:
- have an understanding of agent-based modeling
- have an understanding of MATSim
- have an understanding of the process needed to set up an agent-based study
- have practical experience of using MATSim to perform transportation studies

**Content**

This course provides an introduction to agent-based models for transportation policy analysis. Four essential topics are covered:

1) Introduction of agent-based modeling and its comparison to the traditional state of practice modeling
2) Introduction of MATSim, an open-source agent-based model, developed at ETH Zurich and TU Berlin, and its various parts
3) Setting up an agent-based model simulation, where different statistical methods used in the process will be introduced and explained. Here the open-source egaisim framework used at ETH Zurich to set up agent-based models will be introduced
4) Conducting a transport policy study. The case study will be performed in groups and will include a paper-like report.

During the course, outside lecturers will give several lectures on using MATSim in practice (i.e., SBB).
Creative Thinking fostered

Economic Dynamics and Complexity

What causes economic business cycles? How are limited resources, competition, and cooperation reflected in growth dynamics? To answer such questions, we combine macroeconomic models and methods of nonlinear dynamics. We study the role of bifurcations and control parameters for dynamic stability. Feedback cycles and coupled dynamics are reasons for limited predictability, instability and chaos.

Objective

- understand the importance of different modeling approaches
- formalize and solve one- and two-dimensional nonlinear models
- identify critical conditions for stability and dynamic transitions
- analyze macroeconomic models of business cycles, supply and demand
- apply formal concepts to model economic growth and competition

Content

System theory sees the economy as a complex adaptive system. What does this mean for economic modeling?

We focus on two sources of complexity: (a) nonlinear dynamics, which is captured in this course, "Economic Dynamics and Complexity" and (b) collective interactions, which is captured in the course "Agent-Based Modeling of Economic Systems" (in Spring).

Our approach to economic dynamics combines insights from different disciplines: macroeconomics studying business cycles and growth, system dynamics rooted general system theory and cybernetics, and nonlinear dynamics using applied mathematics.

We start with a comparison of different modeling approaches, to highlight the problems and challenges of system modeling. The subsequent lectures then introduce different one- and two-dimensional nonlinear models with applications in economics, such as models of supply and demand, business cycles, growth and competition.

Emphasis is on the formal analysis of these models using methods from applied mathematics and tools for solving coupled differential equations.

Weekly self-study tasks are used to apply the concepts introduced in the lectures. We practice how to solve nonlinear models formally and numerically and how to interpret the results.

Lecture notes

The lecture slides are provided as handouts - including notes and literature sources. All material is to be found on the Moodle platform. More details during the first lecture.

Prerequisites / notice

Students should be familiar with nonlinear differential equations and should have basic programming skills. All necessary details to solve nonlinear models will be provided in the course. The course will not build on mathematical proofs, optimization, statistics, efficient numerical computation and other specialized skills.

Competencies

- apply formal concepts to model economic growth and competition
- analyze macroeconomic models of business cycles, supply and demand
- identify critical conditions for stability and dynamic transitions
- understand the importance of different modeling approaches

Economic Dynamics and Complexity

W 3 credits 3G F. Schweitzer, L. Verginer

Agent-based modeling in general

MATSim

Additional relevant readings, primarily scientific articles, will be recommended throughout the course.

Prerequisites / notice

There are no strict prerequisites regarding which lectures the students should have previously attended. However, experience with at least one high-level programming language (Java, R, Python, or other) is recommended.

For those without object-oriented programming experience, a crash course 101-0491-10 Basics of Java and Best Practices for Scientific Computing before the start of HS is recommended.

Competencies

- apply formal concepts to model economic growth and competition
- analyze macroeconomic models of business cycles, supply and demand
- identify critical conditions for stability and dynamic transitions
- understand the importance of different modeling approaches

Abstract

In politics, society, and science, it can seem that the values and practices of agricultural production and environmental protection are in conflict. This tension is often described as “protection versus use” of natural resources. We will explore ways to move beyond the apparent conflict. We will apply this learning to field trips and transdisciplinary projects.

Objective

Students are able to:
- Define different kinds and categories of values.
- Relate value concepts to their own studies, life, and experiences through reflective journaling.
- Infer the underlying values in a text or policy about agri-environmental topics.
- Collaboratively develop a transdisciplinary project for an agri-environmental case study from the field trips.

Content

The course consists of interactive seminars alongside fieldtrips to farms that have found innovative solutions to balancing protection and production.

Seminars will cover topics such as the relationship between values and behavior and how people perceive value trade-offs. We will also discuss environmental ethics, environmental valuation and its critiques, the interplay of facts and values in agri-environmental decision-making, cultural ecosystem services, and relational values.

This class requires active participation. Learning is based on in-class activities, group work and fieldtrips.
The course deals with theoretical, methodological and practical foundations around the understanding and production of urban space. It discusses theoretical planning frameworks, and tasks of spatial planning at various scales, addresses current and future challenges of spatial development and reviews approaches for a sustainable development in Switzerland and beyond.

Literature

Literature will draw from political ecology, value theory and environmental values, as well as case studies and primary texts, such as the following (not all will be required reading; we will read 1 or 2 papers or book chapters each week).

Competencies

Subject-specific Competencies
- Concepts and Theories assessed
- Techniques and Technologies fostered

Method-specific Competencies
- Analytical Competencies fostered
- Decision-making fostered
- Problem-solving assessed
- Project Management assessed

Social Competencies
- Communication assessed
- Cooperation and Teamwork assessed
- Customer Orientation fostered
- Leadership and Responsibility fostered
- Sensitivity to Diversity fostered

Personal Competencies
- Adaptability and Flexibility fostered
- Critical Thinking assessed
- Integrity and Work Ethics fostered
- Self-awareness and Self-reflection assessed
- Self-direction and Self-management fostered

Abstract

The course deals with theoretical, methodological and practical foundations around the understanding and production of urban space. It discusses theoretical planning frameworks, and tasks of spatial planning at various scales, addresses current and future challenges of spatial development and reviews approaches for a sustainable development in Switzerland and beyond.
Objective

The overall aim of the course is to raise students’ awareness and curiosity about the aspects that guide and shape our environment. Through lectures, readings, discussions, and exercises, the course seeks to achieve this goal by accumulating crucial notions from both theoretical and practice-based examples, and applying such knowledge into tasks of spatial planning. At the end of this course, students should feel empowered to critically engage with the teaching topic from a variety of approaches. By taking up the lecture, the students should be able to analyse, interpret and reflect complex cross-scale tasks of spatial development and transformation, and to use their theoretical, methodical and professional knowledge to tackle them.

You as students will:

... assess present and future core challenges of spatial planning and development.
... discuss the role of spatial planning and development in shaping our living environment.
... differentiate the levels, scales and tasks of spatial planning instruments and processes.
... reflect on theoretical concepts and practical examples of decision-making of spatial tasks.
... identify and apply spatially relevant principles and systems for action-oriented planning and decision-making.
... acquire theoretical, methodological, practical know-how to examine, clarify, and solve tasks on spatial development

Content

Spatial development as a discipline deals with the development, (trans)formation, and arrangement of our urban environment. We simultaneously perceive and contribute to its transformation, making space the result of manifold intended and unintended changes. To mediate between different demands, interests and interventions of multiple actors, a forward-looking, evidence-based, and action-oriented planning is necessary. As guidance for future action, (spatial) planning has to be committed to the sustainable handling as well as just allocation of resources, in particular of the non-replicable resource land.

The course focuses on both theoretical concepts and practice-oriented approaches to gain knowledge and be equipped to address current issues in spatial planning and development. This is mirrored in the course’s structure made of both of lectures and exercises.

The lecture series introduces necessary key concepts and covers the following main topics:

- Drivers of spatial development, inward development, core tasks and current challenges for (spatial) planners.
- Interplay of formal and informal planning instruments across scales and actors.
- Differentiation urban typologies, their characteristics and challenges
- Types of spatial analysis and key figures
- Planning approaches and the (political) steering of spatial development.
- Types of processes and participation in spatial development.
- Approaches for planning complex urban situations
- Concepts for sustainable development

The exercises provide a framework for practical application of the learned theoretical concepts of spatial planning to real-life situations.

Lecture notes

A course will be set up on Moodle for the provision of lectures and documents, to upload group deliverables and to ask questions in a discussion Forum. All documents provided are exclusively available for use within this course.

Abstract

This course introduces landscapes as socially perceived, spatially and temporally dynamic entities that are shaped by natural and societal factors. Concepts and qualitative and quantitative methods to study landscapes from an ecological and societal perspective are presented. The course consists of a mixture of theoretical lectures and exercises or practical sessions.

Objective

Students will learn:

- The use of spatial data and analyses for quantifying patterns and processes in landscapes
- Concepts and methods to quantify functional connectivity in landscapes and seascapes.
- The use of remote sensing (satellites images, drones) to extract information about landscape structure and change, with a focus on land-use.
- The use of landscape genetics and its application to biodiversity conservation.
- To computationally optimize land-use planning problems.
- Concepts and methods in scenario-based land-use change modelling.
- Landscape ecological concepts and planning tools for management of urban landscapes.
- Concepts of social preference of landscapes and related measurement methods.
- how to design urban environments that foster health and well-being
- The role of landscape planning to influence human well-being.
- Approaches of actively influencing attitudes and behavior toward landscapes as well as their scientific evaluation.
Lecturers

Students should be able to foster creative thinking. Thematic topics include foundations of ecosystem management, fostering analytical competencies, fostering subject-specific competencies, fostering social competencies, fostering personal competencies, and fostering method-specific competencies.

Lecture notes

Handouts will be available in the course and for download. Prerequisites / notice

Basic Landscape Ecology courses at Bachelor level and basic knowledge of the R programming language.

Comptenecies

Subject-specific Competencies: Concepts and Theories - assessed, Techniques and Technologies - assessed.
Personal Competencies: Creative Thinking - fostered, Critical Thinking - fostered.

Mountain Hydrology

W 5 credits 3G M. Brunner, K. Meusburger Di Bella

Abstract

This course presents a process-based view of the hydrology of mountain streams. Students learn how to integrate process knowledge, data, and models to understand how landscapes regulate the fluxes of water, sediment, nutrients, and pollutants in streams, and to anticipate how streams will respond to changes in land use, water use, and climate.

Objective

Main learning objective: Describe the main elements and processes and their interlinkages of the water cycle in mountain catchments and analyze their characteristics and changes.
Objective 1: Identify and describe the important components of the water cycle and their influencing factors and discuss how changes in these influencing factors may affect different parts of the hydrological cycle.
Objective 2: Analyze, visualize, and interpret climate and hydrological time series data.
Objective 3: Explain how hydrological data are collected, how hydrological models work, how they are calibrated, and how they are evaluated.

Content

Streams are integrated monitors of the health and functioning of their surrounding landscapes. Streams integrate the fluxes of water, solutes, and sediment from their contributing catchment area; thus they reflect the spatially integrated hydrological, ecophysiological, biogeochemical, and geomorphological processes in the surrounding landscape. At a practical level, there is a significant public interest in managing upland landscapes to provide a reliable supply of high-quality surface water and to minimize the risk of catastrophic flooding and debris flows, but the scientific background for such management advice is still evolving.

Using a combination of lectures, field exercises, and data analysis, we explore the processes controlling the delivery of water, solutes, and sediment to streams, and how those processes are affected by changes in land cover, land use, and climate. We review the connections between process understanding and predictive modeling in these complex environmental systems. Practical problems to be considered include the effects of land use and climate on streamflow and water quality, illustrated with data from experimental watersheds in North America and Europe.

Lecture notes

Handouts will be available through moodle.

Literature

Recommended and required reading will be specified at the first class session (with possible modifications as the semester proceeds).

Comptenecies

Subject-specific Competencies: Concepts and Theories - assessed, Techniques and Technologies - assessed.

Ecosystem Management

Number Title Type ECTS Hours Lecturers

701-1631-00L Foundations of Ecosystem Management W 5 credits 3G J. Ghazoul, A. Giger Dray

Abstract

This course introduces the broad variety of conflicts that arise in projects focusing on sustainable management of natural resources. It explores case studies of ecosystem management approaches and considers their practicability, their achievements and possible barriers to their uptake.

Objective

Students should be able to a) propose appropriate and realistic solutions to ecosystem management problems that integrate ecological, economic and social dimensions across relevant temporal and spatial scales.
b) identify important stakeholders, their needs and interests, and the main conflicts that exist among them in the context of land and resource management.
Forests provide a variety of ecosystem goods and services. Multifunctional forest management attempts to control natural processes in a fostered way, building upon a theoretical foundation. The course will tackle issues in resource ecology and management, notably forests, agriculture, and wild resources within the broader context of sustainability, biodiversity conservation, and poverty alleviation or economic development. Case studies from tropical and temperate regions will be used to explore these issues. Dealing with ecological and economic uncertainty, and how this affects decision making, will be discussed. Strategies for conservation and management of terrestrial ecosystems will give consideration to landscape ecology, protected area systems, and community management, paying particular attention to alternative livelihood options and marketing strategies of common pool resources.

This course provides an introduction to ecosystem management, and in particular the importance of integrating ecology into management systems to meet multiple societal demands. The course explores the extent to which human-managed terrestrial systems depend on underlying ecological processes, and the consequences of degradation of these processes for human welfare and environmental well-being. Building upon a theoretical foundation, the course will tackle issues in resource ecology and management, notably forests, agriculture, and wild resources within the broader context of sustainability, biodiversity conservation, and poverty alleviation or economic development. Case studies from tropical and temperate regions will be used to explore these issues. Dealing with ecological and economic uncertainty, and how this affects decision making, will be discussed. Strategies for conservation and management of terrestrial ecosystems will give consideration to landscape ecology, protected area systems, and community management, paying particular attention to alternative livelihood options and marketing strategies of common pool resources.

### Literature

Course language is English. Prerequisites: Sufficient English language skills

In addition to the lectures, students need to attend 4 all-day field excursions.

Excursion topics: Forest management and climate change, Nature-based silvicultural concepts; Soil protection and forest management; Continuous cover forestry.

Participation at all 4 full-day excursions is a prerequisite for the credits.

Excursions are held in English, German and French (some German and French knowledge is good to have).

Additional field excursions focusing on silvicultural systems and multifunctional forest management will be offered during the spring semester in the optional course "Selected Topics of Multifunctional Forest Management". 9 all-day field trips will provide the possibility to consolidate theoretical knowledge, to apply it to real examples in the field, to discuss with forest practitioners and further consolidate what has been taught in this course. The additional course is an important part of the formation of the Major in Forest and Landscape and is highly recommended.

Abstract

The course addresses environmental policies, focusing on new steering approaches, which are generally summarized as environmental governance. The course also provides students with tools to analyze environmental policy processes and assesses the key features of environmental governance by examining various practical environmental policy examples.

Objective

To understand how an environmental problem may (not) become a policy and explain political processes, using basic concepts and techniques from political science.

To analyze the evolution as well as the key elements of environmental governance.

To be able to identify the main challenges and opportunities for environmental governance and to critically discuss them with reference to various practical policy examples.

Content

Improvements in environmental quality and sustainable management of natural resources cannot be achieved through technical solutions alone. The quality of the environment and the achievement of sustainable development strongly depend on human behavior and specifically the human uses of nature. To influence human behavior, we rely on public policies and other societal rules, which aim to steer the way humans use natural resources and their effects on the environment. Such steering can take place through government intervention alone. However, this often also involves governance, which includes the interplay between governmental and non-governmental actors, the use of diverse tools such as emission standards or financial incentives to steer actors' behavior and can occur at the local, regional, national or international level.

In this course, we will address both the practical aspects of as well as the scientific debate on environmental governance. The course gives future environmental experts a strong basis to position themselves in the governance debate, which does not preclude government but rather involves a spectrum from government to governance.

Key questions that this course seeks to answer: What are the core characteristics of environmental challenges from a policy perspective? What are key elements of 'environmental governance' and how legitimate and effective are these approaches in addressing persistent environmental challenges?

Furthermore, we encourage the development of soft skills by engaging students in activities such as moderating discussions in class, presenting own proposals, giving regular peer feedback, as well as critically reflecting on various relevant publications in the environmental governance domain.

Lecture notes

Lecture slides, a script and additional course material will be provided on Moodle.

Prerequisites / notice

A detailed course schedule will be made available at the beginning of the semester.

During the lecture we will work with Moodle. We ask that all students register themselves on this platform before the lecture.

We recommend that students have (a) three-years BSc education of a (technical) university; (b) successfully completed Bachelor introductory course to environmental policy (Entwicklungen nationaler Umweltpolitik (or equivalent)) and (c) familiarity with key issues in environmental policy and some fundamental knowledge of one social science or humanities discipline (political science, economics, sociology, history, psychology, philosophy)

701-1657-00L Landscape Level Forest Management Planning

Abstract
This course covers and integrates knowledge from the disciplines of landscape level forest management planning, ecology, and forest economics. Students will apply knowledge and methods acquired throughout their studies to real world case studies, and will learn to make predictions about the development of forest ecosystems, prescribe realistic management solutions, and assess the economic consequence.

Objective
After participating in this course, students will be able to:
- Identify and integrate environmental, social and economic objectives for managing a forest.
- Design landscape level forest management concepts to meet these objectives.
- Identify criteria and indicators appropriate for assessing and monitoring the success of alternative forest management approaches in achieving their objectives.
- Apply standard procedures for cashflow-based evaluations to review the economic sustainability of different forest management scenarios.
- Develop forest-based business proposals including income from traditional timber harvesting operations and complementary sources.
- Prepare, write and defend a comprehensive landscape level forest management plan.

Additionally, students will practice and enhance soft skills – such as providing constructive feedback to peers – or by learning to effectively work in diverse teams.

Content
What is forest management planning (FMP)? What is a Waldentwicklungsplan?
Basic definitions of forests as complex dynamic systems in the context of forest management planning.
The history of FMP and classic approaches to calculating sustained yield (Cotta, Hartig).
Components and structure of a sustainable forest management plan (SFMP).
The planning process and timber supply modelling.
Determining long-term sustained yields and allowable annual cut in clear cutting and close to nature systems.
Management choices and how they impact timber supply.
Certification standards and the use of criteria and indicators (taught by FSC externals)

- Introduction to Business Planning and Financial evaluation in forestry.
- Faustmann and the Land expectation value.
- Calculating internal rates of return.
- Choice experiments and valuing forest attributes
- Payments for ecosystem services
- Economics of risk, uncertainties and natural disturbances
- Economics of forest property rights and certification.

Abstract
Measurements are the sole judge of scientific truth and provide access to unpredictable information, enabling the characterization and monitoring of complex terrestrial systems. Based on lectures and field- and laboratory training, the students learn to apply modern methods to determine forest inventory parameters and to measure subsurface properties and processes.

Objective
The students will be able to:
- explain measurement principles that are used for characterization of landscapes and terrestrial systems
- select appropriate measurement methods and sampling design to quantify key variables and processes above ground and in the subsurface
- deploy sensors in the field
- interpret collected laboratory and field data and report main conclusions deduced from measurements
Week 1: Plant-Soil interactions – short introduction before sensor demonstration and installation in forest lab; Scholander pressure bomb (suction in leaves); LiCOR soil chamber

Weeks 2 to 6 - Experimental Methods for Soil Health Assessment

- Week 2: Lecture on soil health and soil indicators; defining measurable soil health indicators for case studies for different soil threats and climate regions
- Week 3: Short lecture on sampling, sensors and data logging; preparing sensors and data loggers in the lab; measurements on water content and temperature in the lab
- Week 4: Short introduction on field installation; sensor installation at field site Hönggerberg
- Week 5: Lecture on geophysical methods on subsurface characterization: basic principles of ERT, GPR, and EM; planning of field experiment to assess soil health
- Week 6: Short introduction on data analysis; field sampling and conducting field experiment to assess soil health

Week 7: Analysis of experimental data and soil health assessment; poster presentation and discussion

Week 8: Lecture on plant soil relationship; connecting information below and above ground – data analysis

Weeks 9 and 10: Forest characterization/inventory: Principles of LiDAR; structures and features of the tree crowns, size/volume of the leaf area tree positions and diameters at breast height

Weeks 11 and 12: Eddy covariance methods -Principles for field measurement of water vapor, carbon dioxide, and energy exchange between terrestrial surfaces and the atmosphere; Analysis of measured time series to determine evaporation rate and CO2-fluxes

Week 13: Swiss Soil Monitoring networks – Monitoring of soil water content and potential; climate change and droughts

Week 14: Global data – Global modeling and data interpretation; SoilGrids and OpenLandMap; exercises on Budyko analysis

Abstract

Water limitation is a primary constraint on plant growth and terrestrial fluxes worldwide. In this course, the principles of water flow in soil and plants are discussed, with particular attention on the effect of drought on root water uptake, transpiration and plant growth. Strategies of plants to tolerate drought are discussed in relation to both agricultural and ecological implications.

Objective

The students are able to: explain and compare systematically the drivers of water stress to plants; to solve the equations of water flow in soil and plants and to calculate plant water status for varying soil and climatic conditions and plant traits; to critically review and present one research question in soil-plant water relations; to openly debate on the current trends in soil and plant water research and climate change ecology.

Content

Part 1 - Lectures
- Week 1: Introduction.
- Week 2: Soil water relations; Principles of soil water retention and soil water flow; Soil hydraulic properties.
- Week 3: Root water uptake; soil hydraulic constraints on transpiration
- Week 4: Rhizosphere processes and properties; root-soil contact; root hairs; mycorrhiza; rhizodeposition.
- Week 5: Water flow in roots and xylem; root anatomy, architecture and plasticity; cavitation
- Week 6: Transpiration; Vapor Pressure Deficit; Photosynthesis; Stomatal regulation
- Week 7: Soil-plant-atmospheric continuum; Below- and above-ground feedbacks; Soil and atmospheric drivers of transpiration losses.

Part 2 - Seminar
- Week 8: Plant response to drought and consequences for agriculture and forests. Open questions and introduction to seminar topics.
- Week 9: Class work - preparation of the presentations/Debate
- Week 10: Class work - preparation of the presentations/Debate
- Week 11: Seminar/Debate (presentations)
- Week 12: Seminar/Debate (presentations)
- Week 13: Seminar/Debate (presentations)
- Week 14: Feedback, Summary, Conclusion

Trees are important elements and drivers of ecosystem processes in forests and landscapes. Tree species diversity and intraspecific
gene diversity are relevant factors for continuous adaptation, required for a sustainable maintenance of forest products and services. Sustainable forest and landscape management under climate change has to take forest genetic resources into consideration.

The educational goals of the course are:

To know basic concepts of evolution and molecular and quantitative methods of genetics.

To understand the most relevant processes of gene flow, adaptation and species interactions, on the basis of ecological theories and case studies on forest tree species.

To know management principles and instruments for the promotion and the conservation of forest genetic resources, with a view on application in practice.

The course provides a comprehensive overview on concepts and applications of tree genetics and complements basic knowledge of
biology, dendrology, forest ecology and forest management in the frame of forest and landscape management topics. It introduces
concepts of evolution and genetic methods as foundations, explains the most important processes and drivers of gene flow and adaptation,
including coevolutionary aspects of associated organisms, and shows relevant topics of the management of genetic resources from
reproduction to conservation and monitoring. Theories and their application into practice are illustrated on behalf of case studies on forest
tree species. Two full-day excursions illustrate the contents with exemplary objects, actors and applications in Switzerland.

Script: modular slide script (parts by each lecturer).

Textbook: collection of accompanying or background articles according to detailed contents (to be defined).

No mandatory prerequisites. Basic knowledge of genetics is advantageous and recommended.

This course provides an overview about the applicability of stable isotopes (carbon 13C, nitrogen 15N, oxygen 18O and hydrogen 2H) at natural isotope abundance and tracer levels. Lectures will be supplemented by intensive laboratory sessions, short presentations by students and computer exercises.

Handouts will be available on the webpage of the course.

This course will provide an introduction to the applicability of stable isotopes to ecological research questions. Topics will focus on carbon
(13C), nitrogen (15N), oxygen (18O) and hydrogen (2H) at natural isotope abundance and tracer levels. Lectures will be supplemented by
intensive laboratory sessions, short presentations by students and computer exercises.

This course is based on fundamental knowledge about plant ecophysiology, soil science, and ecology in general. Course will be taught in
English.

751-2107-00L | Agrarian and Environmental Values: Tensions, Synergies, Practices and Policies | W | 5 credits | 3G | M. Chapman, J. Jacobi

Limited to 20 students.

Abstract
In politics, society, and science, it can seem that the values and practices of agricultural production and environmental protection are in conflict. This tension is often described as “protection versus use” of natural resources. We will explore ways to move beyond the apparent conflict. We will apply this learning to field trips and transdisciplinary projects.

Objective
Students are able to:
- Define different kinds and categories of values.
- Relate value concepts to their own studies, life, and experiences through reflective journaling.
- Infer the underlying values in a text or policy about agri-environmental topics.
- Collaboratively develop a transdisciplinary project for an agri-environmental case study from the field trips.

Content
The course consists of interactive seminars alongside fieldtrips to farms that have found innovative solutions to balancing protection and production.

Seminars will cover topics such as the relationship between values and behavior and how people perceive value trade-offs. We will also discuss environmental ethics, environmental valuation and its critiques, the interplay of facts and values in agri-environmental decision-making, cultural ecosystem services, and relational values.

This class requires active participation. Learning is based on in-class activities, group work and fieldtrips.
Literature

Literature will draw from political ecology, value theory and environmental values, as well as case studies and primary texts, such as the following (not all will be required reading; we will read 1 or 2 papers or book chapters each week).

Environental Values, by O'Neill, Holland and Light, 2008

Abstract

The course provides methods and tools for ecological evaluations dealing with nature conservation or landscape planning. It covers census methods, ecological criteria, indicators, indices and critically appraises objectivity and accuracy of the available methods, tools and procedures. Birds and plants are used as main example guiding through different case studies.
Objective

Students will be able to:
1) critically consider biological data books and local, regional, and national inventories;
2) evaluate the validity of ecological criteria used in decision making processes;
3) critically appraise the handling of ecological data and criteria used in the process of evaluation
4) perform an ecological evaluation project from the field survey up to the decision making and planning.

Lecture notes

Powerpoint slides are available on the moodle page. Additional documents are handed out as copies.

Literature

Basic literature and references are listed on the webpage.

Prerequisites / notice

The course structure changes between lecture parts, seminars and discussions. The didactic atmosphere is intended as working group.

Suggested prerequisites for attending this course are skills and knowledge equivalent to those taught in the following ETH courses:
- Pflanzen- und Vegetationsökologie
- Systematische Botanik
- Raum- und Regionalentwicklung
- Naturschutz und Naturschutzbiologie

Abstract

The discipline of Forest operations is constantly challenged to find solutions for unique problems. Each forest site requires specific technological approaches and machinery based on given management goals and ecological and environmental circumstances. Various terrain types and soil conditions, harvesting costs and taking care of the workforce by creating safe working conditions are some of the aspects to consider.

Objective

In this course, students will learn to use a wide variety of approaches grounded in the natural sciences, engineering and technology to develop solutions tailored to unique challenges from the field of forest operations. The course is aimed at students who either plan an academic or professional career in the field of forest operations, or who will work at the interface between forest operations and the various related disciplines, such as forest ecosystem management and forestry in the wider sense.

After participating in this course students will have acquired foundational knowledge of a wide variety of core elements in the field of forest operations:
• The course will provide students with the ability to describe and differentiate site and stand conditions from an engineering perspective.
• Students will gain an overview and good working knowledge of current technology used in forest operations in Switzerland and around the world.
• Students will acquire the ability to assess the strength and weaknesses of the most commonly used equipment and analyze their suitability for a given set of environmental, economic and social factors.
• Students will be able to combine different types of technology to create an optimal harvesting system for a given task, and assess a given system for its task specific suitability.
• Participants will be able to assess the sustainability and potential short- and long-term impacts of harvesting systems under ecological, economic and social constraints.
Introduction
• Historic overview
• Scope of operation
• Site and stand characteristics

Timber harvesting
• Logging methods
• Felling methods
• Motor-Manual felling methods
  o Falling and processing
• Forest machine structure and function
• Harvester Technology
  o Felling heads
  o Carriers for felling heads
• Bunching
• Mechanical processing
• Loading equipment
• Operating techniques

Primary Transport Systems
• Ground based
  o Common features
  o Skidder
  o Forwarder
  o Loader Forwarder
• Cable yarding
  o Common features
  o Wire rope
  o Cable yarding systems
  o Operating techniques
• Aerial
  o Common features
  o Operating techniques

Winch-Assisted Harvesting Operations
• Harvesting
• Primary transport

Loading Equipment

Secondary transport
• Truck configurations
• Soil compaction and contamination
• Riparian areas

Forest Operations management
• Ergonomics
• Work Safety
• Economic Aspects
• Environmental impact assessment
• Equipment selection

Forest operations across the globe
• New Zealand
• North America
  o British Columbia, Canada
  o South-eastern U.S.A

Specialized equipment for small scale forest operations

Outlook into the future of forest operations

Abstract
Environmental DNA (eDNA) allows the detection of organisms from traces of their DNA sampled from water, air or soil. Sampling eDNA instead of organisms makes monitoring fast, non-invasive, scalable and inexpensive. In this lecture, students will learn about eDNA and how it can be sampled, sequenced and analysed for biodiversity discovery and monitoring.

Objective
At the end of this course, participants should be able to:
- describe what eDNA is and how to harness the information in eDNA to turn it into a survey method for biodiversity
- describe the eDNA analytical steps, from the sampling, laboratory, data analysis and interpretation.
- summarise the common software and analytical tools for analysing eDNA data and be able to interpret the results.
- apply eDNA methods to design programs for monitoring in conservation and restoration through case studies.

Additionally, participants should be able to:
- provide constructive feedback to peers and learn from feedback,
- integrate concepts within and among disciplines of science.
The course is consisting of two pillars:
Pillar 1: Theoretical background. The first pillar offers general theoretical knowledge about the nature of eDNA and its use in biodiversity science. It is structured into theoretical blocks with video content about sampling design, laboratory and data processing, which offer fundamental knowledge to solve the practical case studies of pillar 2.
Pillar 2: Data application on applied Case Studies. Each theory block will be associated with an exercise in which students are challenged to apply their knowledge from the theory. Students will collaborate on planning eDNA sampling design, visit the laboratory, run eDNA analysis (in R) following the best guidelines and interpret the results of analyses. These exercises will happen in person in the classroom.

Prerequisites / notice
- Basic understanding of genetics and molecular analyses.
- Basic knowledge of R and Geographic Information Systems (GIS).
- The analytic part of the lecture will rely on skills from "Environmental Systems Data Science".

<td>Dendroecology</td>
<td>3 credits</td>
<td>3G</td>
</tr>
</tbody>
</table>

Objective
The course dendroecology offers theoretical and practical aspects of dendrochronology. The impact of different environmental influences on tree-ring characteristics will be shown. The students learn various methods to date tree rings and they understand how ecological and environmental processes and patterns can be reconstructed using tree rings.

Prerequisites / notice
- Good knowledge of general ecology, ideally of vegetation dynamics and forest systems
- Basic knowledge of programming, ideally in R
- Ideally basic experiences in modelling and systems analysis
- Knowledge of vegetation dynamics or forest systems

Lecture notes
- Lecture notes (in English) will be handed out in the class.

Literature
- Literature lists will be handed out in the class.
The students are introduced to advanced data science where environmental data are analyzed using state of the art machine learning methods. Starting from known statistical approaches, they learn the principle of more advanced machine learning methods with practical application. The course enables students to plan their own data science project in their specialization and to apply machine learning methods. Starting from known statistical approaches, they learn the principle of more advanced machine learning methods with practical application. The course enables students to plan their own data science project in their specialization and to apply machine learning methods.

The students are able to:
- select an appropriate model related to a research question and dataset
- describe the steps from data preparation to running and evaluating models
- prepare data for running machine learning with dependent and independent variable
- build and validate regressions and neural network models
- understand convolution and deep learning models
- access online resources to keep up with the latest data science methodology and deepen their understanding

The class language is English, by mutual request only German.
Content
- The data science workflow
- Data preparation for running and validating machine learning models
- Get to know machine learning approaches including regression, random forest and neural network
- Model complexity and hyperparameters
- Model parameterization and loss
- Model evaluations and uncertainty
- Deep learning with convolutions

Literature
Building on existing data science resources

Prerequisites / notice
Math IV, VI (Statistics); R, Python; ESDS I

401-0627-00L Smoothing and Nonparametric Regression with Examples

Abstract
Starting with an overview of selected results from parametric inference, kernel smoothing will be introduced along with some asymptotic theory, optimal bandwidth selection, data driven algorithms and some special topics. Selected numerical examples will be used for motivation. The presented methods will also be applicable elsewhere.

Objective
The students will learn about methods of kernel smoothing and application of concepts to data. The aim will be to build sufficient interest in the topic and intuition as well as the ability to implement the methods to various different datasets.

Content
Rough Outline:
- Parametric estimation methods: selection of important results
  o Method of Least squares: regression & diagnostics
- Nonparametric curve estimation
  o Density estimation, Kernel regression, Local polynomials, Bandwidth selection, various theoretical results related to consistency
  o Selection of special topics (as time permits, we will discuss some of the following): rapid change points, mode estimation, partial linear models, probability and quantile curve estimation, etc.
- Applications: potential areas of applications will be discussed such as, change assessment, trend and surface estimation and others.

Lecture notes
Summaries or outlines of some of the lecture material may be communicated to registered students by Email at irregular intervals.

Note: These summaries/outlines will tend to be brief, likely to be incomplete & may have typos. Only in-class lessons will contain complete information.

Literature
References:
- Statistical Inference, by S.D. Silvey, Chapman & Hall.
- Density Estimation, by B.W. Silverman, Chapman and Hall.
- Nonparametric Simple Regression, by J. Fox, Sage Publications.

Additional references will be given out in the lectures.

Prerequisites / notice
Prerequisites: A background in Linear Algebra, Calculus, Probability & Statistical Inference including Estimation and Testing.

Major in Human Health, Nutrition and Environment

Public Health
The module Public Health is compulsory for all students in the major Human Health, Nutrition and Environment.

**Applied Biostatistics**

<table>

<td>Applied Biostatistics</td>
<td>W</td>
<td>4 credits</td>
<td>3G</td>
<td>M. Tananini</td>
</tr>
</tbody>
</table>

**Abstract**
This course covers the main methods used in Biostatistics. It starts by revising Linear Models (Regression, Anova), then moves to Generalised Linear Models (logistic regression and methods for count data) and finally introduces more advanced topics (Linear Mixed-Effects Models and Generalised Additive Models). The course strongly focuses on applied aspects of data analysis.

**Objective**

After this course students:
- revised Linear Models
- revised or got introduced to Generalised Linear Models
- got introduced to Linear Mixed-Effects Models
- are able to select among these methods to solve an applied problem in Biostatistics
- can perform the data analysis using the statistical software R
- can interpret the results of such an analysis and draw valid "biological" conclusions

**Content**
This course is structured into three parts. The first part focuses on Linear and Generalised Linear Models. The second part introduces more advanced methodologies such as Linear Mixed-Effects Models and Generalised Additive Models. Both, part one and two will include the following topics: exploratory data analysis, model fitting, model "selection", residual diagnostics, model validation and results interpretation. Analyses will be carried out using the statistical software R. Finally, in the third part of the course students will be analysing real-world datasets to put into practice the knowledge and skills acquired during the first two parts.

**Prerequisites / notice**
The statistical software R will be used in the exercises. If you are unfamiliar with R, it is highly recommend to view the online R course "etutoR".

</tr>
</tbody>
</table>

**Abstract**
The module Epidemiology and Prevention describes the process of scientific discovery from the detection of a disease and its causes, to the development and evaluation of preventive and treatment interventions and to improved population health.

**Objective**
The overall goal of the course is to introduce students to epidemiological thinking and methods, which are critical pillars for medical and public health research. Students will also become aware of how epidemiological facts are used in prevention, practice and politics.

**Content**
The module Epidemiology and Prevention follows an overall framework that describes the course of scientific discovery from the detection of a disease to the development of prevention and treatment interventions and their evaluation in clinical trials and real world settings. We will discuss study designs in the context of existing knowledge and the type of evidence needed to advance knowledge. Examples from nutrition, chronic and infectious diseases will be used in order to show the underlying concepts and methods.

**Public Health Concepts**

<td>W</td>
<td>3 credits</td>
<td>2V</td>
<td>R. Heusser</td>
</tr>
</tbody>
</table>

**Abstract**
The module "public health concepts" offers an introduction to key principles of public health. Students get acquainted with the concepts and methods of epidemiology. Students also learn to use epidemiological data for prevention and health promotion purposes. Public health concepts and intervention strategies are presented, using examples from infectious and chronic diseases.

**Objective**

At the end of this module students are able:
- to interpret the results of epidemiological studies
- to critically assess scientific literature
- to know the definition, dimensions and determinants of health
- to plan public health interventions and health promotion projects
- to draw a bridge from evidence to policies and politics

**Content**
Concepts of descriptive and analytical epidemiology, study designs, measures of effect, confounding and bias, screening, surveillance, definition of health and health promotion, health dimensions and health determinants, prevention strategies, public health interventions, public health action cycle, epidemiology and prevention of infectious and chronic diseases (HIV, COVID-19, Obesity, Iodine/PH nutrition).

**Abstract**
This course focuses on food consumer behavior, consumer’s decision-making processes and consumer’s attitudes towards food products.

**Objective**

Students will be able...
- to describe heuristics that influence consumer behavior in the food domain
- to explain the consumer-led food product development
- to summarise how consumers perceive the environmental impact and the healthiness of foods
- to assess the cultural, the environmental and the food policy impact on consumer behavior
- to explain psychological factors influencing eating behavior

Abstract
To have the student gain understanding of the links between the diet and the etiology and progression of chronic diseases, including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

Objective
To examine and understand the protective effect of foods and food ingredients in the maintenance of health and the prevention of chronic disease, as well as the progression of complications of the chronic diseases.

Content
The course evaluates food and food ingredients in relation to primary and secondary prevention of chronic diseases including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

Lecture notes
There is no script. Powerpoint presentations will be made available on-line to students.

Literature
To be provided by the individual lecturers, at their discretion.

Prerequisites / notice
No compulsory prerequisites, but prior completion of the courses "Introduction to Nutritional Science" and "Advanced Topics in Nutritional Science" is strongly advised.

### Environment and Health

</tbody>
</table>

**Abstract**
Fundamentals in nanostructured material - living system interactions focusing on the main exposure routes, lung, gastrointestinal tract, skin and intravenous injection.

**Objective**
Understanding the potential side effects of nanomaterials in a context-specific way, enabling to evaluate nanoparticles safety and provide knowledge to design safer materials.

**Content**
Building upon new technologies to engineer and functionalize well-defined nanostructured materials, a plethora of exciting discoveries were made and found their way in our daily live. These customized nanomaterials provide extraordinary properties and make them attractive for many innovative applications. Exactly these new properties may have the potential to be responsible for unforeseen side effects, which hamper a straightforward translation into new products. Therefore, the safety research provide the evidence for a responsible and sustainable use of nanomaterials.

The lecture will focus on basic principles of nanotoxicology, provide the understanding of the potential side effects of nanomaterial in a context-specific way addressing the main exposure routes such as inhalation, ingestion, topical applications and intravenous injections as well as it will provide impulses for safer material designs.

- Structure of the planned lecture (2 x 45 min)
  1. Introduction: the principles of nanotoxicology
  2. Lung - particles interactions: two disease scenarios and their molecular mechanism
  3. GI - particles interactions: intendent and unintentend particle exposure via food
  4. Skin - particles interactions: body care products and their influence on skin physiology
  5. Intravenous injection: colloidal stability, protein corona and cellular effects
  6. Micro-/ Nanoplastics and development of a safety research plan
  7. End of semester exam

**Lecture notes**
Handouts provided during the classes and references therein as well as primary literature as case studies will be posted to the course website.

**Prerequisites / notice**
Course "Introduction to Toxicology".

**Competencies**

**Abstract**
Students of this course will discuss current topics from the field of infectious disease biology. From a list of publications, each student chooses some themes that he/she is going to explain and discuss with all other participants and under supervision. The actual topics will change from year to year corresponding to the progress and new results occurring in the field.

**Objective**
This is an advanced course that will require significant student participation. Students will learn how to evaluate and present scientific literature and trace the development of ideas related to understanding the ecology and evolutionary biology of infectious diseases.

**Content**
A core set of ~10 classic publications encompassing unifying themes in infectious disease ecology and evolution, such as virulence, resistance, metapopulations, networks, and competition will be presented and discussed. Pathogens will include bacteria, viruses and fungi. Hosts will include animals, plants and humans.

**Lecture notes**
Publications and class notes can be downloaded from a web page announced during the lecture.

**Literature**
Papers will be assigned and downloaded from a web page announced during the lecture.

**Competencies**

Does not take place this semester.
Abstract
The course will not take place fall semester 2024.

Course focuses on the ecology and evolution of macroparasites and their hosts. Through lectures and practical work, students learn about diversity and natural history of parasites, adaptations of parasites, ecology of host-parasite interactions, applied parasitology, and human macroparasites in the modern world.

Objective
1. Identify common macroparasites in invertebrates.
2. Understand ecological and evolutionary processes in host-parasite interactions.
3. Conduct parasitological research

Content
Lectures:
1. Diversity and natural history of parasites (i.e. systematic groups and life-cycles).
2. Adaptations of parasites (e.g. evolution of life-cycles, host manipulation).
3. Ecology of host-parasite interactions (e.g. parasite communities, effects of environmental changes).
4. Ecology and evolution of parasitoids and their applications in biocontrol
5. Human macroparasites (schistosomiasis, malaria).

Practical exercises:
1. Examination of parasites in molluscs (identification and examination of host exploitation strategies).
2. Examination of parasites in amphipods (identification and examination of effects on hosts).
3. Examination of parasitoids of aphids.

Prerequisites / notice
The three practicals will take place at the 03.10.2023, the 17.10.2023 and the 07.11.2023 at Eawag Dübendorf from 08:15 - 12:00. Note that each practical takes 2 hours longer than the weekly lecture.
Objectives
- Obtain a detailed understanding of the development, activation, and differentiation of different types of T cells and their effectormechanisms during immune responses.
- Recognition of pathogenic microorganisms by the host cells and molecular events thereafter.
- Events and signals for maturation of naïve B cells to antibody producing plasma cells and memory B cells.
- Optimization of B cell responses by intelligent design of new vaccines.

Content
- Development and selection of CD4 and CD8 T cells, natural killer T cells (NKT), and regulatory T cells (Treg).
- NK T cells and responses to lipid antigens.
- Differentiation, characterization, and function of CD4 T cell subsets such as Th1, Th2, and Th17.
- Overview of cytokines and their effector function.
- Co-stimulation (signals 1-3).
- Dendritic cells.
- Evolution of the "Danger" concept.
- Cells expressing Pattern Recognition Receptors and their downstream signals.
- T cell function and dysfunction in acute and chronic viral infections.

Literature
Documents of the lectures are available for download at:
https://moodle-app2.let.ethz.ch/course/view.php?id=2581&noticeid=1

Prerequisites / notice
Immunology I and II recommended but not compulsory.

752-4009-00L Molecular Biology of Foodborne Pathogens W 3 credits 2V

M. Loessner, A. Harms, M. Schmelcher, M. Schuppler, E. Slack

Abstract
The course offers detailed information on selected foodborne pathogens and toxin producing organisms; the focus lies on relevant molecular biological aspects of pathogenicity and virulence, as well as on the occurrence and survival of these organisms in foods.

Objective
Detailed and current status of research and insights into the molecular basis of foodborne diseases, with focus on interactions of the microorganism or the toxins they produce with the human system. Understanding the relationship between specific types of food and the associated pathogens and microbial risks. Another focus lies on the currently available methods and techniques useful for the various purposes, i.e., detection, differentiation (typing), and antimicrobial agents.

Content
Molecular biology of infectious foodborne pathogens (Listeria, E. coli, Campylobacter, Salmonella, etc) and toxin-producing organisms (Bacillus, Clostridium, Staphylococcus). How and under which conditions will toxins and virulence factors be produced, and how do they work? How is the interaction between the human host and the microbial pathogen? What are the roles of food and the environment? What can be done to interfere with the potential risks? Which methods are best suited for what approach? Last, but not least, the role of bacteriophages in microbial pathogenicity will be highlighted, in addition to various applications of bacteriophage for both diagnostics and antimicrobial intervention.

Lecture notes
Electronic copies of the presentation slides (PDF) and additional material will be made available for download to registered students.

Literature
Recommendations will be given in the first lecture.

Prerequisites / notice
Lectures (2 hours) will be held as a single session of approximately 60+ minutes (10:15 until approx. 11:15 h), without a break!

Competencies
- Subject-specific Competencies
  - Concepts and Theories

Semester Paper and Seminar
The compulsory course 701-1701-00L Human Health, Nutrition and Environment: Term Paper is offered in the autumn semester only.

Number Title Type ECTS Hours Lecturers

Abstract
Writing of a review paper of scientific quality on a topic in the domain of Human Health, Nutrition and Environment based on critical evaluation of scientific literature.

Objective
- Acquisition of knowledge in the field of the review paper.
- Assessment of original literature as well as synthesis and analysis of the findings.
- Practising of academic writing in English.
- Giving an oral presentation with discussion on the topic of the review paper.

Content
Topics are offered in the domains of the major 'Human Health, Nutrition and Environment' covering 'Public Health', 'Infectious Diseases', 'Nutrition and Health' and 'Environment and Health'.

Literature
Guidelines will be handed out in the beginning.

Competencies
- Subject-specific Competencies
  - Concepts and Theories
  - Techniques and Technologies
- Method-specific Competencies
  - Analytical Competencies

Electives

Number Title Type ECTS Hours Lecturers
701-3001-00L Environmental Systems Data Science: Data Processing W 2 credits 2G L. Pellissier, C. P. Alouby, M. Volpi
**Abstract**

Students are introduced to a typical data science workflow using various examples from environmental systems. They learn common methods and key aspects for each step through practical application. The course enables students to plan their own data science project in their specialization and to apply more domain-specific methods independently or in further courses.

**Objective**

The students are able to

- frame a data science problem and build a hypothesis
- describe the steps of a typical data science project workflow
- conduct selected steps of a workflow on specifically prepared datasets, with a focus on choosing, fitting and evaluating appropriate algorithms and models
- critically think about the limits and implications of a method
- visualise data and results throughout the workflow
- access online resources to keep up with the latest data science methodology and deepen their understanding

**Content**

- The data science workflow
- Access and handle (large) datasets
- Prepare and clean data
- Analysis: data exploratory steps
- Analysis: machine learning and computational methods
- Evaluate results and analyse uncertainty
- Visualisation and communication

**Environmental Systems Data Science: Machine Learning**

**W 3 credits 2G**  L. Pellissier, C. P. Albouy, M. Volpi

**Abstract**

Students are introduced to advanced data science where environmental data are analyzed using state of the art machine learning methods. Starting from known statistical approaches, they learn the principle of more advanced machine learning methods with practical application. The course enables students to plan their own data science project in their specialization and to apply machine learning methods.

**Objective**

The students are able to

- select an appropriate model related to a research question and dataset
- describe the steps from data preparation to running and evaluating models
- prepare data for running machine learning with dependent and independent variable
- build and validate regressions and neural network models
- understand convolution and deep learning models
- access online resources to keep up with the latest data science methodology and deepen their understanding

**Content**

- The data science workflow
- Data preparation for running and validating machine learning models
- Get to know machine learning approaches including regression, random forest and neural network
- Model complexity and hyperparameters
- Model parameterization and loss
- Model evaluations and uncertainty
- Deep learning with convolutions

**Literature**

Building on existing data science resources

**Prerequisites / notice**

Math IV, VI (Statistics); R, Python; ESDS I

| 701-0967-00L | Project Development in Renewable Energies | W | 2 credits | 2G | R. Rechsteiner, A. Appenzeller |

**Abstract**

The focus is on the implementation of projects:
- photovoltaics
- wind energy
- hydropower

You will learn about new business models, including storage and sector coupling, discuss framework conditions, economic efficiency, security of supply, market organization and business risks. Guidance from experts with many years of political and project experience.

**Objective**

You will receive a practice-oriented introduction to the regulatory and economic requirements for renewable energy projects.

You will be familiar with the options for integrating fluctuating energy production in an environment of volatile prices.

You will be familiar with the opportunities and risks and strategies for economic security.

**Content**

Detailed program

https://www.rechsteiner-basel.ch/lehrmittel?no_cache=1#c273

**Lecture notes**

PPT presentation will be distributed (in German)
From the large number of carbon sequestration/mitigation options, a few options will be selected and then investigated in detail by the students. Future climate change can only be kept within reasonable bounds when CO₂ emissions are drastically reduced. In this course, we will discuss potential, their cost, and their consequences.

The goal of this course is to investigate, as a group, a particular set of carbon mitigation/sequestration options and to evaluate their potential, their cost, and their consequences. The results of this research will then be presented to the other students, the involved faculty, and discussed in detail by the whole group.

Exam: No final exam. Pass/No-Pass is assigned based on the quality of the presentation and ensuing discussion. For group exercise and presentation reasons the number of participants is limited to 30 students.

227-0731-00L Power Market I - Portfolio and Risk Management W 6 credits 4G
D. Reichelt, G. A. Koeppe

Abstract

Portfolio and risk management in the electrical power business, Pan-European power market and trading, futures and forward contracts, hedging, options and derivatives, performance indicators for the risk management, modelling of physical assets, cross-border trading, ancillary services, balancing power market, Swiss market model.
Objective
Knowlege on the worldwide liberalisation of electricity markets, pan-european power trading and the role of power exchanges. Understand financial products (derivatives) based on power. Manage a portfolio containing physical production, contracts and derivatives. Evaluate trading and hedging strategies. Apply methods and tools of risk management.

Content
1. Pan-European power market and trading
   1.1. Power trading
   1.2. Development of the European power markets
   1.3. Energy economics
   1.4. Spot and OTC trading
   1.5. European energy exchange EEX

2. Market model
   2.1. Market place and organisation
   2.2. Balance groups / balancing energy
   2.3. Ancillary services
   2.4. Market for ancillary services
   2.5. Cross-border trading
   2.6. Capacity auctions

3. Portfolio and Risk management
   3.1. Portfolio management 1 (introduction)
   3.2. Forward and futures contracts
   3.3. Risk management 1 (m2m, VaR, hpfc, volatility, cVaR)
   3.4. Risk management 2 (PaR)
   3.5. Contract valuation (HPFC)
   3.6. Portfolio management 2
   2.8. Risk Management 3 (enterprise wide)

4. Energy & Finance I
   4.1. Options 1 basics
   4.2. Options 2 hedging with options
   4.3. Introduction to derivatives (swaps, cap, floor, collar)
   4.4. Financial modelling of physical assets
   4.5. Trading and hydro power
   4.6. Incentive regulation

Lecture notes
Handouts of the lecture

Prerequisites / notice
Case studies and ML exercise for Power Market can give bonus points for the exam. Guest speakers for specific topics.

</tr>
</tbody>
</table>

Abstract
The course transmits fundamental knowledge for treating applied glaciological problems. Topics include climate-glacier interactions, glacier ice flow, glacier hydrology, ice avalanches, and lake ice.

Objective
- learn about fundamental glaciological processes, including glacier mass balance, ice dynamics, and glacier-related hazards;
- apply the above knowledge to some case studies inspired by contract-works performed at ETH's Glaciology section;
- generate the own computer code to solve the above case studies, and interpret the results;
- understand, both in class and in the field, the practical relevance of glaciology, with a focus on the Swiss applications.

Content
The course will develop along the following outline:
- How glaciology became a scientific discipline
- Glaciology and hydropower
- Glacier mechanics and ice flow
- Gravitational glacier instabilities
- Glacier hydrology and glacier lake outbursts
- Lake ice and ice bearing capacity
- Field excursion to Jungfraujoch
- Discussion of the exercises performed during the semester

Lecture notes
Digital lecture handouts will be distributed prior to each class.

Literature
Links to relevant literature will be provided during the classes.

Prerequisites / notice
Completed BSc studies. Basic knowledge in computer scripting in any language (e.g. Python, R, Julia, Matlab, IDL, ...) will be advantageous for solving the exercises. The exercises will be performed in groups. A minimal level of fitness is required for the field excursion.
Seminar in Glaciology

**Abstract**
Introduction to classic and modern literature of research in Glaciology. Active participation is expected and participants are mentored by PhD students of Glaciology.

**Objective**
In-depth knowledge of selected topics of research in Glaciology. Introduction to different types of scientific presentation. Improve ability of the discussion of scientific topics.

Quantification and Modeling of the Cryosphere: Dynamic Processes (University of Zurich)

**Abstract**
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.
UZH Module Code: GEO815

Mind the enrolment deadlines at UZH:

**Objective**
This course introduces quantitative approaches and models to processes of the cryosphere in high mountain areas. The main focus are dynamic and thermal processes related to glaciers and permafrost. During the course, simple simple mathematical and numerical models will be used to investigate ground temperature profiles as well as glacier evolution and dynamics in relation to climate.

**Content**
For the modeling and project parts of the course, programs written in the Python programming language are used. Prior Python or programming knowledge is not necessary, and introductory tutorials are given.

The course starts with lectures introducing the basic concepts of the different topics. The main focus lies on extensive computer practicals in which the related quantitative methods and models are applied and explored. Extensive group work on a topic of choice, using the quantitative models, will give a deep understanding how computer models are used in applied science.

Physics of Glaciers

**Abstract**
Understanding glaciers and ice sheets with simple physical concepts. Topics include the reaction of glaciers to the climate, flow of glacier ice, temperature in glaciers and ice sheets, glacier hydrology, glacier seismology, basal motion and calving glaciers. A special focus is the current development of the ice sheets of Greenland and Antarctica.
Objective

After the course the students are able understand and interpret measurements of ice flow, subglacial water pressure and ice temperature. They will have an understanding of glaciology-related physical concepts sufficient to understand most of the contemporary literature on the topic. The students will be well equipped to work on glacier-related problems by numerical modeling, remote sensing, and field work.

Content

The dynamics of glaciers and polar ice sheets is the key requisite to understand their history and their future evolution. We will take a closer look at ice deformation, basal motion, heat flow and glacier hydraulics. The specific dynamics of tide water and calving glaciers is investigated, as is the reaction of glaciers to changes in mass balance (and therefore climate).

Lecture notes

Will be provided on Moodle

Literature

A list of relevant literature is available on Moodle

Prerequisites / notice

High-school mathematics and physics knowledge required.

101-1250-00L | Transport Processes in Torrents | W | 3 | 2V | I. Schalko

Abstract

This course focuses on the various transport processes in torrents. This includes discharge, bedload, debris flow, and large wood. Differences between transport processes in rivers versus torrents will be discussed. Special focus will be put on the (1) analysis of the interaction between the transport processes (cascading processes) and the (2) design of countermeasures.

Objective

At the end of the course, the students will be able to:

(1) Describe the different transport processes in torrents, such as flow discharge or bedload transport,
(2) discuss how cascading processes affect the resulting natural hazard, and
(3) derive solutions for a sustainable hazard management.

Content

The first part of the lecture introduces the different transport processes in torrents such as discharge, bedload, debris flow, and large wood. This will include methods to determine and calculate the discharge, characterize debris flow, and quantify wood load.

In the second part of the lecture, special focus will be put on the cascading effects (what happens if multiple transport processes occur at once) and their implications on the resulting natural hazards.

The last part of the lecture focuses on the design of countermeasures such as check dams and will include examples from selected catchments in Switzerland.

Lecture notes

Lecture slides can be downloaded via Moodle.

Abstract
The discipline of Forest operations is constantly challenged to find solutions for unique problems. Each forest site requires specific technological approaches and machinery based on given management goals and ecological and environmental circumstances. Various terrain types and soil conditions, harvesting costs and taking care of the workforce by creating safe working conditions are some of the a

Objective
In this course, students will learn to use a wide variety of approaches grounded in the natural sciences, engineering and technology to develop solutions tailored to unique challenges from the field of forest operations.

The course is aimed at students who either plan an academic or professional career in the field of forest operations, or who will work at the interface between forest operations and the various related disciplines, such as forest ecosystem management and forestry in the wider sense.

After participating in this course students will have acquired foundational knowledge of a wide variety of core elements in the field of forest operations:
• The course will provide students with the ability to describe and differentiate site and stand conditions from an engineering perspective.
• Students will gain an overview and good working knowledge of current technology used in forest operations in Switzerland and around the world.
• Students will acquire the ability to assess the strength and weaknesses of the most commonly used equipment and analyze their suitability for a given set of environmental, economic and social factors.
• Students will be able to combine different types of technology to create an optimal harvesting system for a given task, and assess a given system for its task specific suitability.
• Participants will be able to assess the sustainability and potential short- and long-term impacts of harvesting systems under ecological, economic and social constraints.
Content

Introduction
- Historic overview
- Scope of operation
- Site and stand characteristics

Timber harvesting
- Logging methods
- Felling methods
- Motor-Manual felling methods
  - Falling and processing
- Forest machine structure and function

Literature

Prerequisites / notice

701-1544-00 Forest Access and Transportation

101-0637-10L Wood Structure and Function
- The course Wood structure and function conveys basic knowledge on the microstructure of softwoods and hardwoods as well as general and species-specific relationships between growth processes, wood properties and wood function in the living tree.

Objective
- Learning target is a basic understanding of the anatomy of wood and the related impact of endogenous and exogenous factors. The students can learn how to distinguish common central European wood species at the macroscopic and microscopic level. A deeper insight will be given by wood identification exercises for softwood species. Further, the students will gain insight into the relationships between tree growth and wood properties with a specific focus on the wood function in the living tree.

Content
- In an introduction to wood anatomy, the general structural features of softwoods and hardwoods will be explained and factors of diversity and variability will be discussed. A specific focus is laid on common central European tree species with relevance in the wood sector, which will be studied in macro-and microstructural investigations. In the following, relationships between wood structure, properties and function in the living tree will be in the focus of the lectures. Topics covered are water transport, trends in wood anatomy within trees, environmental impact on wood anatomy, wood defects and their causes, tools to study wood properties over time, secondary changes in wood, and tree biomechanics.

101-0637-20L Wood Processing
- The course Wood Processing conveys knowledge on the technological properties of wood and wood-based materials as well as on industrial processes for the fabrication of a vast variety of wood products and covers new developments in the field of digital technologies.

Objective
- The learning target is a fundamental understanding of the dominating wood processing chains, which are applied to fabricate common wood products. Students will be introduced to the economic relevance of the renewable resource wood and are trained in its technological properties. The students will learn to identify the relationships between wood species and their properties as well as the suitable wood machining processes to fabricate targeted wood products. Finally, the digital transformation process, which will affect all sectors of the wood industry with an impact on the entire value chain and business models will be covered. It will be illustrated how production processes can become more flexible, efficient and less resource-demanding.
The general introduction shows the economic relevance of the resource wood in a global, European, and Swiss context and reflects aspects of sustainability in wood production. In terms of bulk wood products, a specific focus is laid on sawn timber production and drying processes. Concerning wood veneer production, steam, veneer cutting, and assembly to veneer lumber products are presented. Further, the common technologies for the production of particle boards and fibre boards will be discussed. Topics related to wood gluing and wood protection as well as potentials and limitations in the application of wood and wood-based products are covered. In a further part, the lecture deals with the most important digital technologies, e.g. Internet of Things, artificial intelligence, and their impact on the wood industry based on illustrative examples.

We will review common narratives in agri-food systems informed by a range of different theories and assisted by different analytical tools. For this purpose, we will start from different concepts of nature, power and interests, explore different ontologies and epistemologies through a set of topics such as hunger, obesity, agrobiodiversity and seeds, forests and deforestation, climate change and food production. Students will explain one concept in each course to the groups and practice their argumentative and writing skills in a final essay, applying the acquired tools to a topic of their choice. While specific inputs from external lecturers broaden our perspective, enough time for critical discussion and reflection will be granted.

The selected students will be notified until 9 September. Questions regarding the application to johanna.jacobi@usys.ethz.ch.

While specific inputs from external lecturers broaden our perspective, enough time for critical discussion and reflection will be granted.

The selected students will be notified until 9 September. Questions regarding the application to johanna.jacobi@usys.ethz.ch.

The general introduction shows the economic relevance of the resource wood in a global, European, and Swiss context and reflects aspects of sustainability in wood production. In terms of bulk wood products, a specific focus is laid on sawn timber production and drying processes. Concerning wood veneer production, steam, veneer cutting, and assembly to veneer lumber products are presented. Further, the common technologies for the production of particle boards and fibre boards will be discussed. Topics related to wood gluing and wood protection as well as potentials and limitations in the application of wood and wood-based products are covered. In a further part, the lecture deals with the most important digital technologies, e.g. Internet of Things, artificial intelligence, and their impact on the wood industry based on illustrative examples.

We will review common narratives in agri-food systems informed by a range of different theories and assisted by different analytical tools. For this purpose, we will start from different concepts of nature, power and interests, explore different ontologies and epistemologies through a set of topics such as hunger, obesity, agrobiodiversity and seeds, forests and deforestation, climate change and food production. Students will explain one concept in each course to the groups and practice their argumentative and writing skills in a final essay, applying the acquired tools to a topic of their choice. While specific inputs from external lecturers broaden our perspective, enough time for critical discussion and reflection will be granted.

The selected students will be notified until 9 September. Questions regarding the application to johanna.jacobi@usys.ethz.ch.

Abstract
In politics, society, and science, it can seem that the values and practices of agricultural production and environmental protection are in conflict. This tension is often described as “protection versus use” of natural resources. We will explore ways to move beyond the apparent conflict. We will apply this learning to field trips and transdisciplinary projects.

Objective
Students are able to:

- Define different kinds and categories of values.
- Relate value concepts to their own studies, life, and experiences through reflective journaling.
- Infer the underlying values in a text or policy about agri-environmental topics.
- Collaboratively develop a transdisciplinary project for an agri-environmental case study from the field trips.

Content
The course consists of interactive seminars alongside fieldtrips to farms that have found innovative solutions to balancing protection and production.

Seminars will cover topics such as the relationship between values and behavior and how people perceive value trade-offs. We will also discuss environmental ethics, environmental valuation and its critiques, the interplay of facts and values in agri-environmental decision-making, cultural ecosystem services, and relational values.

This class requires active participation. Learning is based on in-class activities, group work and fieldtrips.
The general theme of this course is the effect of environmental factors (such as light, temperature, relative humidity, CO2 concentrations, etc.) on plant physiology: water uptake and transport, transpiration, CO2 gas exchange of plants (photosynthesis, respiration), growth and C allocation, yield and production, stress physiology. Working with measurement data and Jupyter Notebooks is included.

The students will understand the impact of environmental factors on plant physiology and will learn the theoretical basis and terminology of plant ecophysiology. Students will check and implement their knowledge and understanding of ecophysiology using measurement data.
Few crops dominate the crop rotations worldwide. Following the goal of an increased agricultural biodiversity, species such as buckwheat and different measures to control weeds. Weeds are understood to be rather part of a habitat or a cropping system than just unwanted plants in crops. Accordingly, this knowledge will be imparted during the course and will be required to understand the mechanisms of integrated weed control strategies.

Research results in agro- and forest ecosystem sciences will be presented by experienced researchers as well as by doctoral and graduate students. Citation classics as well as recent research results will be discussed. Topics will range from plant ecophysiology, biodiversity and biogeochemistry to management aspects in agro- and forest ecosystems.

This class conveys current topics and methods of agroecological and food systems research through selected case studies from ongoing research of the Sustainable Agroecosystems group. Students will be encouraged to develop critical thinking competencies, through individual and group work, on major agricultural and food system challenges and paths towards agricultural and food system transformation.

The course is based on basics of plant identification and plant physiology. It is the basis for the courses Plant Production, Part Forage Production and Grassland Systems.
Content

The course will address a wide range of agricultural and food system challenges (e.g., food security, climate crisis, soil degradation, etc.) in both temperate and tropical contexts. In class we will address topics like building food system resilience through innovative measures, improving soil fertility management or understanding the effects of agroforestry systems.

Case studies from the on-going research in the Sustainable Agroecosystems Group (saе.ethz.ch) will be presented, covering different scales (e.g., food value-chains, farm dynamics and soil management).

The class is complemented by practical group work conducted with the CSA Meh Al S Gumus in Zurich on Measuring and monitoring Agroecological performance.

Students will gain an overview on institutions and actors' roles in the field of sustainable agricultural development. Throughout the group work, students will learn to engage directly with various stakeholders, monitor agroecological transition and communicate their research to a wider audience. Ultimately, this class should provide an overview on methods, tools, innovations and platforms that support a sustainable food transformation.

Prerequisites / notice

Prior participation in the lecture Nachhaltige Agrarökosysteme I (Sustainable Agroecosystems I) 751-5000-00G (spring term) recommended.

Number Title Type ECTS Hours Lecturers

363-0537-00L Resource and Environmental Economics W 3 credits 2G A. Miftakhova, A. Minabutdinov

Abstract

Relationship between economy and environment, market failures, external effects and public goods, contingent valuation, internalisation of externalities, economics of non-renewable resources, economics of renewable resources, environmental cost-benefit analysis, sustainability economics, and international resource and environmental problems.

Objective

A successful completion of the course will enable a thorough understanding of the basic questions and methods of resource and environmental economics and the ability to solve typical problems using appropriate tools consisting of concise verbal explanations, diagrams or mathematical expressions. Concrete goals are first of all the acquisition of knowledge about the main questions of resource and environmental economics and about the foundation of the theory with different normative concepts in terms of efficiency and fairness. Secondly, students should be able to deal with environmental externalities and internalisation through appropriate policies or private negotiations, including knowledge of the available policy instruments and their relative strengths and weaknesses. Thirdly, the course will allow for in-depth economic analysis of renewable and non-renewable resources, including the role of stock constraints, regeneration functions, market power, property rights and the impact of technology. A fourth objective is to successfully use the well-known tool of cost-benefit analysis for environmental policy problems, which requires knowledge of the benefits of an improved natural environment. The last two objectives of the course are the acquisition of sufficient knowledge about the economics of sustainability and the application of environmental economic theory and policy at international level, e.g. to the problem of climate change.

Content

The course covers all the interactions between the economy and the natural environment. It introduces and explains basic welfare concepts and market failure; external effects, public goods, and environmental policy; the measurement of externalities and contingent valuation; the economics of non-renewable resources, renewable resources, cost-benefit-analysis, sustainability concepts; international aspects of resource and environmental problems; selected examples and case studies. After a general introduction to resource and environmental economics, highlighting its importance and the main issues, the course explains the normative basis, utilitarianism, and fairness according to different principles. Pollution externalities are a deep core topic of the lecture. We explain the governmental internalisation of externalities as well as the public private internalisation of externalities (Coase theorem). Furthermore, the issues of free rider problems and public goods, efficient levels of pollution, tax vs. permits, and command and control instruments add to a thorough analysis of environmental policy. Turning to resource supply, the lecture first looks at empirical data on non-renewable natural resources and then develops the optimal price development (Hotelling-rule). It deals with the effects of explorations, new technologies, and market power. When treating the renewable resources, we look at biological growth functions, optimal harvesting of renewable resources, and the overuse of open-access resources. A next topic is cost-benefit analysis with the environment, requiring measuring environmental benefits and measuring costs. In the chapter on sustainability, the course covers concepts of sustainability, conflicts with optimality, and indicators of sustainability. In a final chapter, we consider international environmental problems and in particular climate change and climate policy.

Abstract

Agricultural production is exposed to various risks and risk management is indispensable. This course introduces modern concepts on farmers' decision making under risk and risk management. We present innovative insights, empirical example from European agriculture. You gain hands-on experience using R.
Objective
- to develop a better understanding of decision making under uncertainty and risk;
- gain hands-on experience in risk analysis and management using R;
- to gain experience in different approaches to analyze risky decisions;
- to develop an understanding for different sources of risk in agricultural production;
- to understand the crucial role of subjective perceptions and preferences for risk management decisions;
- get an overview on risk management in the agricultural sector, with a particular focus on insurance solutions;
- to get insights in the role of big data and machine learning for agricultural risk management.

Content
- Quantification and measurement of risk
- Risk preferences, Expected Utility Theory, Cumulative Prospect Theory
- Production and input use decisions under risk
- Portfolio Theory and Farm Diversification
- Forwards, Futures, Crop Insurance
- Weather Index Insurance and Satellite Imagery
- Big data and machine learning for agricultural risk management
- Empirical Applications using R

751-0903-00L Microeconomics of the Agriculture and Food Sector

Abstract
In this course, we will explore the economic characteristics of the agriculture and food sector and compare them with other sectors. The focus is on the food industry in Switzerland and the EU. We will examine microeconomic relationships, especially price and quantity formation in different competitive models, using case studies from the agricultural and food sector.

Objective
The goal of this course is to understand microeconomic models and their applicability to the agriculture and food sector. Upon successful completion of the course, students will be able to differentiate the economic consequences of various competitive situations and derive recommendations for management and policy.

Content
- Agricultural and food sector in the EU and Switzerland
- Price elasticities of supply and demand in the food sector
- Profit maximization
- Foundations of game theory
- Monopoly / Monopolistic competition
- Oligopoly (Stackelberg, Cournot, Bertrand)
- Monopson
- Product differentiation
- Price discrimination
- Cartels

Abstract
Introduction to Agricultural Management

Objective
Participants in the course will i) structure and analyze fundamental business decisions, ii) apply various analysis and planning tools for planning, investment, and financing, iii) analyze decisions under uncertainty and risk management, iv) use specific tools for decision support in the agricultural and food sector.

Content
The course covers the following topics, with specific applications in the agricultural and food sectors:

- Supply chain management
- Forest management
- Investment planning and financial management
- Risk management and decision support
- Environmental and sustainable management

Lecture notes
Handouts will be distributed in the lecture and available on the moodle.

### Dynamic Simulation in Agricultural and Regional Economics

**W** 3 credits  **2V**

**B. Kopainsky**

**Abstract**

In this class, students learn the basics of system dynamics and its application to agricultural and regional economic questions. In the second half of the class, students develop their own simulation model, with which they evaluate potential interventions for improving the economic as well as the ecological sustainability of food systems.

**Objective**

- Students learn the basic theory and practice of dynamic simulation
- Students can develop, analyze and extend a dynamic simulation model and interpret its results.
- By applying the developed simulation model, students gain insights into food system issues. They also learn to recognize the benefits and pitfalls of dynamic simulation, both from a theoretical and an applied perspective.

**Lecture notes**

Slides (will be provided during the class)

**Literature**

Articles and papers (will be provided during the class)

### Socioeconomics of Agriculture

**W** 2 credits  **2V**

**S. Mann**

**Abstract**

The main part of this lecture will examine constellations where hierarchies, markets or cooperation have been observed and described in the agricultural sector. On a more aggregated level, different agricultural systems will be evaluated in terms of main socioeconomic parameters like social capital or perceptions.

**Objective**

Students should be able to describe the dynamics of hierarchies, markets and cooperation in an agricultural context.

**Content**

Introduction to Sociology

Introduction to Socioeconomics

Agricultural Administration: Path dependencies and efficiency issues

Power in the Chain

The farming family

Occupational Choices

Market segregation

The issue of meat demand

Common Resource Management in Alpine Farming

Agricultural Cooperatives

Societal perceptions of agriculture

Perceptions of farming from within

Varieties of agricultural systems and policies

**Lecture notes**

**Prerequisites / notice**

Basic economic knowledge is expected.

### Political Ecology of Food and Agriculture

**W** 3 credits  **2G**

**J. Jacobi**

**Abstract**

In this seminar, students are introduced to the multi-disciplinary field of political ecology to investigate human-environment relationships in food and agricultural systems.

**Objective**

- Being able to provide an overview of the multi-disciplinary field of political ecology for investigating the relationships of humans to our environment
- Learn to identify how power and interest influence social-ecological systems and to distinguish symptoms from systemic root causes
- Become enabled to analyse complex and sometimes distant human-ecology relationships choosing from a broad range of methods

**Content**

We will review common narratives in agri-food systems informed by a range of different theories and assisted by different analytical tools. For this purpose, we will start from different concepts of nature, power and interests, explore different ontologies and epistemologies through a set of topics such as hunger, obesity, agrobiodiversity and seeds, forests and deforestation, climate change and food production. Students will explain one concept in each course to the groups and practice their argumentative and writing skills in a final essay, applying the acquired tools to a topic of their choice. While specific inputs from external lecturers broaden our perspective, enough time for critical discussion and reflection will be granted.

Abstract

This course introduces students to foundational texts that led to the emergence of the environment as a subject of scientific importance, and shaped its relevance to society. Above all, the course seeks to give confidence and raise enthusiasm among students to read more widely around the broad subject of environmental sciences and management both during the course and beyond.

Objective

The course will provide students with opportunities to read, discuss, evaluate and interpret key texts that have shaped the environmental movement and, more specifically, the environmental sciences. Students will gain familiarity with the foundational texts, but also understand the historical context within which their academic and future professional work is based. More directly, the course will encourage debate and discussion of each text that is studied, from both the original context as well as the modern context. In so doing students will be forced to consider and justify the current societal relevance of their work.
The course will be run as a book reading club. The first session will provide a short introduction to how to explore a particular text (that is not a scientific paper) to identify the key points for discussion.

Thereafter, in each week a text (typically a chapter from a book or a paper) will be assigned by a course lecturer. The lecture will then introduce the selected text with a brief background of the historical and cultural context in which it was written, with some additional biographical information about the author. He/she will also briefly explain the justification for selecting the particular text.

The students will read the text, with two to four students (depending on class size) being assigned to present it at the next session. Presentation of the text requires the students to prepare by, for example:

identifying the key points made within the text
identifying issues of particular personal interest and resonance
considering the impact of the text at the time of publication, and its importance now

evaluating the text from the perspective of our current societal and environmental position

Such preparation would be supported by a mid-week tutorial discussion (about 1 hour) with the assigning lecturer.

These students will then present the text (for about 15 minutes) to the rest of the class during the scheduled class session, with the lecturer facilitating the subsequent class discussion (about 45 minutes). Towards the end of the session the presenting students will summarise the emerging points (5 minutes) and the lecturer will finish with a brief discussion of how valuable and interesting the text was (10 minutes). In the remainder of the 15 minutes the next text will be presented by the assigning lecturer for the following week.

The specific texts selected for discussion will vary, but examples include:

- Leopold (1949) A Sand County Almanach
- Carson (1962) Silent Spring
- Jared Diamond (2005) Collapse

Discussions might also encompass films or other forms of media and communication about nature.

701-3001-00L Environmental Systems Data Science: Data Processing

Abstract

Students are introduced to a typical data science workflow using various examples from environmental systems. They learn common methods and key aspects for each step through practical application. The course enables students to plan their own data science project in their specialization and to acquire more domain-specific methods independently or in further courses.

Objective

- The students are able to:
  - frame a data science problem and build a hypothesis
  - describe the steps of a typical data science project workflow
  - conduct selected steps of a workflow on specifically prepared datasets, with a focus on choosing, fitting and evaluating appropriate algorithms and models
  - critically think about the limits and implications of a method
  - visualise data and results throughout the workflow
  - access online resources to keep up with the latest data science methodology and deepen their understanding
  - evaluate results and analyse uncertainty
  - critically think about the limits and implications of a method
  - visualise data and results throughout the workflow
  - access online resources to keep up with the latest data science methodology and deepen their understanding
  - visualisation and communication

Content

- The data science workflow
- Access and handle (large) datasets
- Prepare and clean data
- Analysis: data exploratory steps
- Analysis: machine learning and computational methods
- Evaluate results and analyse uncertainty
- Visualisation and communication

701-3003-00L Environmental Systems Data Science: Machine Learning

Abstract

Students are introduced to advanced data science where environmental data are analyzed using state of the art machine learning methods. Starting from known statistical approaches, they learn the principle of more advanced machine learning methods with practical application. The course enables students to plan their own data science project in their specialization and to apply machine learning mode

Objective

- The students are able to:
  - select an appropriate model related to a research question and dataset
  - describe the steps from data preparation to running and evaluating models
  - prepare data for running machine learning with dependent and independent variable
  - build and validate regressions and neural network models
  - understand convolution and deep learning models
  - access online resources to keep up with the latest data science methodology and deepen their understanding
Robots are becoming a key technology in the transition to smart farming and in supporting the agricultural needs of the 21st century. For example, robots enable site-specific fertilization, automated weeding, or livestock herding. Autonomous robots are quickly becoming a key player in the transition to precision agriculture. In this course, students will learn theoretical and practical aspects of robotics. Lectures will introduce how robots operate and analyse their application to precision agriculture. In hands-on laboratories, students will apply concepts learned in class on educational robots to simulate a weeding task. After the course, students will be able to critically examine and select appropriate robotic solutions for agricultural applications. The learning objectives of the course are: (i) illustrate the principle of operation of the main components of a robotic system, (ii) analyse how the different robotic components are integrated and contribute to the functioning of a robotic system, and (iii) solve problems in the field of agriculture using robotic principles.

The course gives an overview of robotic systems, beginning with their fundamental components (e.g., sensors, actuators, locomotion strategies) and gradually scaling up to the system level, illustrating the concepts of perception, robot control, obstacle avoidance and navigation. Exercises performed with an educational robot (Thymio) will complement the theoretical lectures providing a hands-on practical experience of the challenges of using these machines. During the course, students will gradually apply the theoretical and practical knowledge they are learning. To this end, students will work in teams to develop a robotic solution for an agricultural task of their choice. Students will learn to translate the task into meaningful requirements for a robotic system and critically select the most appropriate components to achieve the required robotic functions. Students will periodically present and discuss the development of this "robot design" exercise during presentations and in a journal report.

Abstract

In the internship outside of ETH Zürich, the students in Environmental Sciences learn about how environmental issues are handled professionally through their own practical work and by applying the knowledge they acquired. They will analyse complex environmental problems on scientific, technical and social levels and develop solutions in conjunction with social actors.

Abstract

The study programme is completed by a Master’s thesis. The Master’s thesis is an independent, scientific work. A topic within the field of specialization is chosen. It lasts 6 months.

Objective

This component is designed to enable the students to explore how the course content can be applied to an actual scientific problem. The thesis also provides an opportunity for the students to exercise initiative and to demonstrate that they are capable of working independently and in a scientifically structured manner.

Competencies

Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies
- Analytical Competencies

Abstract

Students understand basic microeconomics and macroeconomics problems and theories. They are able to argue along economic principles and to judge policy measures.
Objective
Upon successful completion of the course, you will be able to:
- Describe the basic microeconomic and macroeconomic problems and theories.
- Make economic arguments to a given topic.
- Evaluate economic measures.

Content
Households, firms, supply and demand: How are household preferences and consumption behavior formed? How does a household react to price changes? How are goods prices formed? At what prices are firms willing to offer goods? How do we make economic decisions?
Markets: What is "perfect competition" and how does a competitive market work? Are monopolies always a bad thing? How can governments influence the market?
Market failure: What happens when prices give wrong signals?
Labor market: How do supply and demand work in the labor market? What influences unemployment?
National Accounts: How big is the Swiss economy?
Foreign trade: Why do countries trade with each other? What are the consequences for the domestic market?
Money and inflation: What exactly is money? How does money creation work, and what happens when there is too much (or too little) money on the market?

Students will be asked to apply these concepts to issues in their own field of study and to current issues in society.

406-0062-AAL  Physics I  E-  5 credits  11R  A. Vaterlaus
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Abstract
Introduction to the concepts and tools in physics: mechanics of point-like and rigid bodies, elasticity theory, elements of hydrostatics and hydrodynamics, periodic motion and mechanical waves.

Objective
Introduction to the scientific methodology. The student should develop his/her capability to turn physical observations into mathematical models, and to solve the latter.

Content
Book:

Chapters:
- 1, 2, 3, 4, 5, 6 (without: 6-5, 6-6, 6-8), 7, 8 (without 8-9), 9, 10 (without 10-10), 11 (without 11-7), 13 (without 13-13, 13-14), 14 (without 14-6).

406-0064-AAL  Physics I and II  E-  10 credits  21R  A. Vaterlaus
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.
Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract

Objective
Introduction to the scientific methodology. The student should develop his/her capability to turn physical observations into mathematical models, and to solve the latter.

The student should acquire an overview over the basic concepts used in mechanics, in the theory of heat and electricity.

Content

Abstract
This course covers mathematical concepts and techniques necessary to model, solve and discuss scientific problems - notably through ordinary differential equations.

Objective
Mathematics is of ever increasing importance to the Natural Sciences and Engineering. The key is the so-called mathematical modelling cycle, i.e. the translation of problems from outside of mathematics into mathematics, the study of the mathematical problems (often with the help of high level mathematical software packages) and the interpretation of the results in the original environment.

The goal of Mathematics I and II is to provide the mathematical foundations relevant for this paradigm. Differential equations are by far the most important tool for modelling and are therefore a main focus of these courses.

Content

1. Linear Algebra and Complex Numbers:
   - systems of linear equations, Gauss-Jordan elimination, matrices, determinants, eigenvalues and eigenvectors, cartesian and polar forms for complex numbers, complex powers, complex roots, fundamental theorem of algebra.

2. Single-Variable Calculus:
   - review of differentiation, linearisation, Taylor polynomials, maxima and minima, antiderivative, fundamental theorem of calculus, integration methods, improper integrals.

3. Ordinary Differential Equations:
   - separable ordinary differential equations (ODEs), integration by substitution, 1st and 2nd order linear ODEs, homogeneous systems of linear ODEs with constant coefficients, introduction to 2-dimensional dynamical systems.

Literature
- Bretscher, O.: Linear Algebra with Applications (Pearson Prentice Hall).

Prerequisites / notice
familiarity with the basic notions from Calculus, in particular those of function, derivative and integral.

Schedule and location of the assistance hours (Mathe-Lab) may be found on the Moodle webpages for the parallel courses in German:
- 401-0251-00L Mathematik I in the Fall semester and
- 401-0252-00L Mathematik II in the Spring semester.

Competencies

Abstract
Continuation of the topics of Mathematics I, with main focus on multivariable calculus.
Mathematics is of ever increasing importance to the Natural Sciences and Engineering. The key is the so-called mathematical modelling cycle, i.e. the translation of problems from outside of mathematics into mathematics, the study of the mathematical problems (often with the help of high level mathematical software packages) and the interpretation of the results in the original environment.

The goal of Mathematics I and II is to provide the mathematical foundations relevant for this paradigm. Differential equations are by far the most important tool for modelling and are therefore a main focus of these courses.

**406-0253-AAL**

Mathematik I & II  
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

**Objective**

Mathematics I covers mathematical concepts and techniques necessary to model, solve and discuss scientific problems, notably through linear algebra and calculus, with an emphasis on ordinary differential equations. The main focus of Mathematics II is multivariable calculus.

Mathematics is of ever increasing importance to the Natural Sciences and Engineering. The key is the so-called mathematical modelling cycle, i.e. the translation of problems from outside of mathematics into mathematics, the study of the mathematical problems (often with the help of high level mathematical software packages) and the interpretation of the results in the original environment.

The goal of Mathematics I and II is to provide the mathematical foundations relevant for this paradigm. Differential equations are by far the most important tool for modelling and are therefore a main focus of these courses.

**Content**

1. Linear Algebra and Complex Numbers:
   - systems of linear equations, Gauss-Jordan elimination, matrices, determinants, eigenvalues and eigenvectors, cartesian and polar forms for complex numbers, complex powers, complex roots, fundamental theorem of algebra.

2. Single-Variable Calculus:
   - review of differentiation, linearisation, Taylor polynomials, maxima and minima, antiderivative, fundamental theorem of calculus, integration methods, improper integrals.

3. Ordinary Differential Equations:
   - separable ordinary differential equations (ODEs), integration by substitution, 1st and 2nd order linear ODEs, homogeneous systems of linear ODEs with constant coefficients, introduction to 2-dimensional dynamical systems.

4. Multivariable Differential Calculus:
   - functions of several variables, partial differentiation, curves and surfaces in space, scalar and vector fields, gradient, curl and divergence.

5. Multivariable Integral Calculus:
   - multiple integrals, line and surface integrals, work and flux, Green, Gauss and Stokes theorems, applications.

6. Introduction to Partial Differential Equations:
   - separation of variables, heat equation, wave equation, Laplace equation.

**Lecture notes**

See literature

**Literature**

**406-0603-AAL**

Stochastics (Probability and Statistics)  
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

**Objective**

Introduction to basic methods and fundamental concepts of statistics and probability theory for non-mathematicians. The concepts are presented on the basis of some descriptive examples. Learning the statistical program R for applying the acquired concepts will be a central theme.
Objective
The objective of this course is to build a solid fundament in probability and statistics. The student should understand some fundamental concepts and be able to apply these concepts to applications in the real world. Furthermore, the student should have a basic knowledge of the statistical programming language "R".

529-0234-AAL Chemistry I E- 4 credits 11R J. Cvengros
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Chemistry I: Chemical bonding and molecular structure, chemical thermodynamics and kinetics, chemical equilibrium.
### Objective
Acquiring the basics for describing the structure, composition and transformations of the material world. Introduction to thermodynamically determined chemical-physical processes. Use modeling to show how macroscopic phenomena can be understood in terms of atomic and molecular properties. Applications of theory to quantitatively and qualitatively solve simple chemical and environmental problems.

### Content
1. **Stoichiometry**
2. **Atomic structure**
3. **Chemical bond and its representation**
   - Spatial structure of molecules. Molecular orbitals.
4. **Basics of chemical thermodynamics**
   - System and environment. Description of the state and changes of state of chemical systems.
5. **First law of thermodynamics**
   - Internal energy, heat and work. Enthalpy and enthalpy of reaction. Standard thermodynamic conditions.
6. **Second law of thermodynamics**
   - Entropy. Entropy changes in the system and in the universe. Reaction entropy due to heat of reaction and due to changes in matter.
7. **Gibbs energy and chemical potential**
8. **Chemical equilibrium**
   - Mass action law, reaction quotient and equilibrium constant. Equilibrium in phase transitions.
9. **Acids and bases**
10. **Dissolution and precipitation**
    - Heterogeneous equilibrium. Dissolution process and solubility constant. Speciation diagrams. The carbon dioxide-carbonate equilibrium in the environment.

### Abstract
Erweitern der allgemeinen Grundlagen und Erarbeiten einer Basis, um Prozesse in komplexeren Umwelt systemen (Wasser / Luft / Boden) in ihrem zeitlichen und quantitativen Ablauf verstehen und beurteilen zu können.

### Objective
1. **Redox reactions**
   - Rules for nomenclature of inorganic compounds. Systematic description of the groups of elements in the periodical system and the most important compounds of these elements. Formation of compounds as a consequence of the electronoc structure of the elements.

2. **Introduction to organic chemistry**
   - Description of the most important classes of compounds and of the functional groups. Principal reactivity of these functional groups. Stereochemistry. Recton mechanisms: SN1- and SN2-reactions, electrophilic aromatic substitutions, eliminations (E1 and E2), addition reactions (C=C and C=O double bonds). Chemistry of carboxy and carboxyl groups. Rules for nomenclature of inorganic compounds. Systematic description of the groups of elements in the periodical system and the most important compounds of these elements. Formation of compounds as a consequence of the electronoc structure of the elements.

Abstract
Organismic biology to teach the basic principles of classical and molecular genetics, evolutionary biology and phylogeny.

Objective
The understanding of basic principles of biology (inheritance, evolution and phylogeny) and an overview of the diversity of life.

Content
The first semester focuses on the organismal biology aspects of genetics, evolution and diversity of life in the Campbell chapters 12-34.

Week 1-7 by Alex Widmer, Chapters 12-25
12 Cell biology Mitosis
13 Genetics Sexual life cycles and meiosis
14 Genetics Mendelian genetics
15 Genetics Linkage and chromosomes
20 Genetics Evolution of genomes
21 Evolution How evolution works
22 Evolution Phylogenetic reconstructions
23 Evolution Microevolution
24 Evolution Species and speciation
25 Evolution Macroevolution

Week 8-14 by Oliver Martin, Chapters 26-34
26 Diversity of Life Introduction to viruses
27 Diversity of Life Prokaryotes
28 Diversity of Life Origin & evolution of eukaryotes
29 Diversity of Life Nonvascular/seedless vascular plants
30 Diversity of Life Seed plants
31 Diversity of Life Introduction to fungi
32 Diversity of Life Overview of animal diversity
33 Diversity of Life Introduction to invertebrates
34 Diversity of Life Origin & evolution of vertebrates

Lecture notes
No script

Literature

Prerequisites / notice
This is a virtual self-study lecture for non-german speakers of the *Allgemeine Biology I (551-0001-00L) lecture. The exam will be written jointly with the participants of this lecture.

Example exam questions will be discussed during the lectures, and old exam questions are kept by the various student organisations. If necessary, please contact Prof. Uwe Sauer (sauer@ethz.ch) for details regarding the exam.

551-0003-AAL General Biology I+II E- 7 credits 13R U. Sauer, K. Bomblies, O. Y. Martin, A. Widmer
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Abstract
General Biology I: Organismic biology to teach the basic principles of classical and molecular genetics, evolutionary biology and phylogeny.

General Biology II: Molecular biology approach to teach the basic principles of biochemistry, cell biology, cogenetics, evolutionary biology and form and function of vascular plants.

Objective
General Biology I: The understanding of basic principles of biology (inheritance, evolution and phylogeny) and an overview of the diversity of life.

General Biology II: The understanding basic concepts of biology: the hierarchy of the structural levels of biological organisation, with particular emphasis on the cell and its molecular functions, the fundamentals of metabolism and molecular genetics, as well as form and function of vascular plants.
General Biology I focuses on the organismal biology aspects of genetics, evolution and diversity of life in the Campbell chapters 12-34.

Week 1-7 by Alex Widmer, Chapters 12-25
12 Cell biology Mitosis
13 Genetics Sexual life cycles and meiosis
14 Genetics Mendelian genetics
15 Genetics Linkage and chromosomes
20 Genetics Evolution of genomes
21 Evolution How evolution works
22 Evolution Phylogenetic reconstructions
23 Evolution Microevolution
24 Evolution Species and speciation
25 Evolution Macroevolution

Week 8-14 by Oliver Martin, Chapters 26-34
26 Diversity of Life Introduction to viruses
27 Diversity of Life Prokaryotes
28 Diversity of Life Origin & evolution of eukaryotes
29 Diversity of Life Nonvascular&seedless vascular plants
30 Diversity of Life Seed plants
31 Diversity of Life Introduction to fungi
32 Diversity of Life Overview of animal diversity
33 Diversity of Life Introduction to invertebrates
34 Diversity of Life Origin & evolution of vertebrates

Specifically the following Campbell chapters will be covered:
3 Biochemistry Chemistry of water
4 Biochemistry Carbon: the basis of molecular diversity
5 Biochemistry Biological macromolecules and lipids
7 Cell biology Cell structure and function
8 Cell biology Cell membranes
10 Cell biology Respiration: introduction to metabolism
11 Cell biology Cell respiration
12 Cell biology Photosynthetic processes
16 Genetics Nucleic acids and inheritance
17 Genetics Expression of genes
18 Genetics Control of gene expression
19 Genetics DNA Technology
35 Plant structure&function Plant Structure and Growth
36 Plant structure&function Transport in vascular plants
37 Plant structure&function Plant nutrition
38 Plant structure&function Reproduction of flowering plants
39 Plant structure&function Plants signal and behavior

This is a virtual self-study lecture for non-German speakers of the "Allgemeine Biology I (551-0001-00L)" and "Allgemeine Biology II (551-0002-00L)" lectures. The exam will be written jointly with the participants of this lecture.

701-0023-AAL Atmosphere E- 3 credits 6R E. Fischer
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.
Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Basic principles of the atmosphere, physical structure and chemical composition, trace gases, atmospheric cycles, circulation, stability, radiation, condensation, clouds, oxidation capacity and ozone layer.

Objective
Understanding of basic physical and chemical processes in the atmosphere. Understanding of mechanisms of and interactions between: weather - climate, atmosphere - ocean - continents, troposphere - stratosphere. Understanding of environmentally relevant structures and processes on vastly differing scales. Basis for the modelling of complex interrelations in the atmosphere.

Content
Basic principles of the atmosphere, physical structure and chemical composition, trace gases, atmospheric cycles, circulation, stability, radiation, condensation, clouds, oxidation capacity and ozone layer.

Lecture notes
Written information will be supplied.

Literature

701-0071-AAL Mathematics III: Systems Analysis E- 4 credits 9R R. Knutti, H. Wernli
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.
Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
The objective of the systems analysis course is to deepen and illustrate the mathematical concepts on the basis of a series of very concrete examples. Topics covered include: linear box models with one or several variables, non-linear box models with one or several variables, time-discrete models, and continuous models in time and space.

Objective
Learning and applying of concepts (models) and quantitative methods to address concrete problems of environmental relevance. Understanding and applying the systems-analytic approach, i.e., Recognizing the core of the problem - simplification - quantitative approach - prediction.
Content
Introduction to principles of models; one-dimensional linear box models; multi-dimensional linear box models; nonlinear box models; models in space and time

Lecture notes
Teaching material: book (see literature).

Literature

701-0106-AAL Mathematics V: Applied Deepening of Mathematics I - III
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Abstract
Selected mathematical topics are presented for later use in more specialised lectures. Part of the topics were already discussed in the lectures Mathematics I-III. Here, they should be shortly recapitulated and most importantly applied to practical problems. If necessary, new mathematical concepts and methods will be introduced in order to solve challenging and inspiring problems from practice.

Objective
The aim of this lecture is to prepare the students for the more specialised lectures. They should become more familiar with the mathematical background, the mathematical concepts and most of all with their application and interpretation.

Content
Practical examples from the following areas will be discussed: ordinary differential equations; eigenvalue problems from linear algebra; systems of linear and nonlinear differential equations; partial differential equations (diffusion, transport, waves).

701-0243-AAL Biology III: Essentials of Ecology
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Abstract
This course assigns reading for students needing further background for understanding ecological processes. Central problems in ecology, including population growth and regulation, the dynamics of species interactions, the influence of spatial structure, the controls over species invasions, and community responses to environmental change will be explored from basic and applied perspectives.

Objective
Students will understand how ecological processes operate in natural communities. They will appreciate how mathematical theory, field experimentation, and observational studies combine to generate a predictive science of ecological processes.

Upon completing the course, students will be able to:
Understand the factors determining the outcome of species interactions in communities, and how this information informs management.
Apply theoretical knowledge on species interactions to predict the potential outcomes of novel species introductions.
Understand the role of spatial structure in mediating population dynamics and persistence, species interactions, and patterns of species diversity.
Use population and community models to predict the stability of interactions between predators and prey and between different competitors.
Understand the conceptual basis of predictions concerning how ecological communities will respond to climate change.

Content
Readings from a text book will focus on understanding central processes in community ecology. Topics will include demographic and spatial structure, consumer resource interactions, food webs, competition, invasion, and the maintenance of species diversity. Each of these more conceptual topics will be discussed in concert with their applications to the conservation and management of species and communities in a changing world.

701-0401-AAL Hydrosphere
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Abstract
In this self-study course, students learn about relevant processes that control the water cycle on earth. Energy and mass exchange, mixing and transport processes are described and the coupling of the hydrosphere with the atmosphere and the solid Earth are discussed.

Objective
Qualitative and quantitative understanding on how physical (and geochemical) processes control the natural dynamics in groundwater, lakes ans oceans and constrain the exchange of mass and energy.
Content

Topics of the course.
- Physical properties of water (i.e. density and equation of state)
- Global water resources
- Exchange at boundaries
- Energy (thermal & kinetic), gas exchange
- Mixing and transport processes in open waters
- Vertical stratification, large scale transport
- Turbulence and mixing
- Mixing and exchange processes in rivers
- Groundwater and its dynamics
- Ground water as part of the terrestrial water cycle
- Ground water hydraulics, Darcy’s law
- Aquifers and their properties
- Hydrochemistry and tracer
- Ground water use

Case studies
- 1. Water as resource
- 2. Water and climate

Lecture notes
In addition to the self-learning literature handouts are distributed.

Literature
Textbooks for self-studying.

Surface water:
  Chapter 4: Imboden, D.M., and Wüest, A. ‘Mixing Mechanisms in Lakes’
  Chapter 6.4: Air-Water Partitioning
  Chapter 19.2: Bottleneck Boundaries

Groundwater:
  Chapters 1 - 6, 8, 10, 11.

Optional additional readers.

701-0473-AAL Weather Systems E- 3 credits 6R M. A. Sprenger, I. Thurnherr
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Abstract
The students learn about the dynamical features of the Earth's atmosphere. They interpret satellite imagery and learn about basic concepts in dynamical meteorology. The global circulation is briefly discussed, before introducing the Eulerian and the Lagrangian perspective, which are used to study air streams in extratropical cyclones and to investigate basic aspects in mountain meteorology.

Objective
The students are able to
- explain basic measurement and analysis techniques that are relevant in atmospheric dynamics
- to discuss the mathematical basics of atmospheric dynamics, based on selected atmospheric flow phenomena
- to explain the basic dynamics of the global circulation and of synoptic- and meso-scale flow features
- to explain how mountains influence the atmospheric flow on different scales
- basic understanding of the role of moist adiabatic processes for weather systems and why stable water isotopes are useful in this context

Content
Satellite observations; analysis of vertical soundings; geostrophic and thermal wind; cyclones at mid-latitude; global circulation; north-Atlantic oscillation; atmospheric blocking situations; Eulerian and Lagrangian perspective; potential vorticity; Alpine dynamics (storms, orographic wind); planetary boundary layer

701-0475-AAL Atmospheric Physics E- 3 credits 6R U. Lohmann
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Abstract
This course is a self-study course for MSc students, who like to learn something about Atmospheric Physics but for cannot follow the course Atmospärephysis, because that is taught in German. However, the slides and the textbook of the course Atmospärephysis, and they form the basis also for this course.

Objective
See entry under LV 701-0475-00L Atmospärephysis

Content
See entry under LV 701-0475-00L Atmospärephysis

Lecture notes
Powerpoint slides and script from LV 701-0475-00L Atmospärephysis will be made available

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Introduction to the formation and properties of soils as a function of parent rock, landscape position, climate, and soil organisms. Complex relationships between soil forming processes, physical and chemical soil properties, soil biota, and ecological soil properties.

Objective
Understanding of soils as integral parts of ecosystems, development and distribution of soils as a function of environmental factors, and processes leading to soil degradation.

Content
Definition of the pedosphere, soil functions, rocks as parent materials, minerals and weathering, soil organisms, soil organic matter, physical soil properties and functions, chemical soil properties and functions, soil formation, principles of soil classification, global soil regions, soil fertility, land use and soil degradation.

Literature

Prerequisites / notice
Prerequisites: Basic knowledge in chemistry, biology and geology.

701-0721-AAL Psychology

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
This self-study course is an introductory course in psychology. This course will emphasize cognitive psychology and the psychological experiment.

Objective
Knowledge of key concepts and exemplary theories of psychology and their relation to “daily” psychology. Comprehension of relation between theory and experiment in psychology.

Goals: Learning how psychologists are thinking, a side change from the ETH natural science perspective to psychological thinking.

Domains of psychology:
- Psychology fields
- Concept definitions of psychology
- Theories of psychology
- Methods of psychology
- Results of psychology

Capability:
Be able to define a psychological research question
Basics understanding of role of psychology

Comprehension:
Psychology as a science of experience and behavior of the human

Content
Einführung in die psychologische Forschung und Modellbildung unter besonderer Berücksichtigung der kognitiven Psychologie und des psychologischen Experiments. Themen sind u.a.: Wahrnehmung; Lernen und Entwicklung; Denken und Problemlösen; Kognitive Sozialpsychologie; Risiko und Entscheidung.

Literature
- English book of Zimbardo (http://www.amazon.de/Psychology-Life-Discovering-Psych-Lab/dp/0205654770/ref=sr_1_2?s=books-intl-de&ie=UTF8&qid=1317208260&sr=1-2)

Prerequisites / notice
Determine with Prof. Dr. Michael Siegrist the chapters in "Zimbardo" which are compulsory reading
Read the two Psychology chapters (6 + 7) from the book of Prof. Roland W. Scholz

752-4001-AAL Microbiology

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Self-study course in microbiology.

Objective
Teaching of basic knowledge in microbiology.

Content
This is a self-study course for students with microbiology as an admission requirement. The goal of the course is that students acquire basics in microbiology, including bacterial cell biology, genetics, growth and physiology, metabolism, phylogeny and microbial diversity, and applications of microbiology.

Literature
This self-study course is based on the book ‘Brock, Biology of Microorganisms’.

<tr>
<td>Abstract</td>
<td>This course builds on the foundations of fluid dynamics to describe hydrodynamic flows and provides an introduction to cavitation. The main learning objectives of this course are: 1. Identify and describe dominant effects in liquid fluid flows through physical modelling. 2. Identify and predict the onset of hydrodynamic instabilities. 3. Describe acoustic wave behaviour in liquids. 4. Explain tension, nucleation and phase-change in liquids. 5. Predict the behaviour of a gas bubble subject to changes in surrounding liquid pressure. 6. Describe hydrodynamic cavitation and its consequences in physical terms. 7. Recognise experimental techniques and industrial and medical applications for cavitation. 8. Read and evaluate research papers on recent research on cavitation and bubble dynamics and communicate the content orally to a multidisciplinary audience.</td>

<td>Fluid Dynamics with the Lattice Boltzmann Method</td>
<td>W</td>
<td>4</td>
<td>3G</td>
<td>I. Karlin</td>
</tr>
<tr>
<td>Abstract</td>
<td>The course provides an introduction to theoretical foundations and practical usage of the Lattice Boltzmann Method for fluid dynamics simulations. Methods like molecular dynamics, DSMC, lattice Boltzmann etc are being increasingly used by engineers all over and these methods require knowledge of kinetic theory and statistical mechanics which are traditionally not taught at engineering departments. The goal of this course is to give an introduction to ideas of kinetic theory and non-equilibrium thermodynamics with a focus on developing simulation algorithms and their realizations. During the course, students will be able to develop a lattice Boltzmann code on their own. Practical issues about implementation and performance on parallel machines will be demonstrated hands on. The central element of the course is the completion of a lattice Boltzmann code (using the framework specifically designed for this course). The course will also include a review of topics of current interest in various fields of fluid dynamics, such as multiphase flows, reactive flows, microflows among others. Optionally, we offer an opportunity to complete a project of student's choice as an alternative to the oral exam. Samples of projects completed by previous students will be made available.</td>
<td></td>

</tbody>
</table>
The course builds upon three parts:
I. Elementary kinetic theory and lattice Boltzmann simulations introduced on simple examples.
II. Theoretical basis of statistical mechanics and kinetic equations.
III. Lattice Boltzmann method for real-world applications.

The content of the course includes:

1. Background: Elements of statistical mechanics and kinetic theory:
   - Particle's distribution function, Liouville equation, entropy, ensembles; Kinetic theory: Boltzmann equation for rarefied gas, H-theorem, hydrodynamic limit and derivation of Navier-Stokes equations, Chapman-Enskog method, Grad method, boundary conditions; mean-field interactions, Vlasov equation;
   - Kinetic models: BGK model, generalized BGK model for mixtures, chemical reactions and other fluids.

2. Basics of the Lattice Boltzmann Method and Simulations:
   - Minimal kinetic models: lattice Boltzmann method for single-component fluid, discretization of velocity space, time-space discretization, boundary conditions, forcing, thermal models, mixtures.

3. Hands on:
   - Development of the basic lattice Boltzmann code and its validation on standard benchmarks (Taylor-Green vortex, lid-driven cavity flow etc).

4. Practical issues of LBM for fluid dynamics simulations:
   - Lattice Boltzmann simulations of turbulent flows; numerical stability and accuracy.

5. Microflow:
   - Rarefaction effects in moderately dilute gases; Boundary conditions, exact solutions to Couette and Poiseuille flows; micro-channel simulations.

6. Advanced lattice Boltzmann methods:
   - Entropic lattice Boltzmann scheme, subgrid simulations at high Reynolds numbers; Boundary conditions for complex geometries.

7. Introduction to LB models beyond hydrodynamics:
   - Relativistic fluid dynamics; flows with phase transitions.

Lecture notes
Lecture notes on the theoretical parts of the course will be made available.
Selected original and review papers are provided for some of the lectures on advanced topics.
Handouts and basic code framework for implementation of the lattice Boltzmann models will be provided.

Prerequisites / notice
The course addresses mainly graduate students (MSc/Ph D) but BSc students can also attend.

Abstract
This course will provide you with the fundamentals of the new and exciting field of ultrasound-based microrobots to treat various diseases. Furthermore, we will explore how ultrasound can be used in additive manufacturing for tissue constructs and robotics.

Objective
The course is designed to equip students with skills in the design and development of ultrasound-based manipulation devices and microrobots for applications in medicine and additive manufacturing.

Content
Linear and nonlinear acoustics, foundations of fluid and solid mechanics and piezoelectricity, Gorkov potential, numerical modelling, acoustic streaming, applications from ultrasonic microrobotics to surface acoustic wave devices

Lecture notes

Literature
Solid and fluid continuum mechanics. Notice: The exercise part is a mixture of presentation, lab sessions (both compulsory) and hand in homework.
### Medical Technology Innovation - From Concept to Clinics

**W 4 credits 3G I. Herrmann**

**Abstract**
Project-oriented learning on how to develop technological solutions to address unmet clinical needs.

**Objective**
After completing the course, you will be able to effectively collaborate with medical doctors in order to identify important unmet clinical needs. You will be able to ideate and develop appropriate engineering solutions and implementation strategies for real-world clinical problems. This lecture aims to prepare you for typical engineering challenges in the real-world where - in addition to the development of an elegant solution - interdisciplinary teamwork and effective communication play a key role.

**Lecture notes** will be available on the moodle.

**Literature** will be available on the moodle.

**Prerequisites / notice**
On site presence during (most) of the lectures highly encouraged!
Graded innovation project will require on-site presence.

**Competencies**

#### Subject-specific Competencies
- Concepts and Theories assessed
- Techniques and Technologies assessed

#### Method-specific Competencies
- Analytical Competencies assessed
- Decision-making fostered
- Media and Digital Technologies fostered
- Problem-solving assessed
- Project Management fostered

#### Social Competencies
- Communication assessed
- Cooperation and Teamwork assessed
- Customer Orientation fostered
- Leadership and Responsibility fostered
- Self-presentation and Social Influence assessed
- Sensitivity to Diversity fostered
- Negotiation fostered

#### Personal Competencies
- Critical Thinking assessed
- Integrity and Work Ethics assessed
- Self-direction and Self-management assessed

### Introduction to Photonics

**W 4 credits 2V+2U R. Quidant, J. Ortega Arroyo**

**Abstract**
This course introduces students to the main concepts of optics and photonics. Specifically, we will describe the laws obeyed by optical waves and discuss how to use them to manipulate light.

**Objective**
Photonics, the science of light, has become ubiquitous in our lives. Control and manipulation of light is what enables us to interact with the screen of our smart devices and exchange large amounts of complex information. Photonics has also taken a preponderant role in cutting-edge science, allowing for instance to image nanospecimens, detect diseases or sense very tiny forces. The purpose of this course is three-fold: (i) We first aim to provide the fundamentals of photonics, establishing a solid basis for more specialised courses. (ii) Beyond theoretical concepts, our intention is to have students develop an intuition on how to manipulate light in practise. (iii) Finally, the course highlights how the taught concepts apply to modern research as well as to everyday life technologies (LCD screens, polarisation sun glasses, anti-reflection coating etc...). Content, including videos of laboratory experiments, has been designed to be approachable by students from a diverse set of science and engineering backgrounds.

Autumn Semester 2024 Page 2570 of 2680
Content

I- BASICS OF WAVE THEORY
1) General concepts
2) Differential wave equation
3) Wavefront
4) Plane waves and Fourier decomposition of optical fields
5) Spherical waves and Huygens-Fresnel principle

II- ELECTROMAGNETIC WAVES
1) Maxwell equations
2) Wave equation for EM waves
3) Dielectric permittivity
4) Refractive index
5) Nonlinear optics
6) Polarisation and polarisation control

III- PROPAGATION OF LIGHT
1) Waves at an interface
2) The Fresnel coefficients
3) Total internal reflection
4) Evanescent waves
5) Dispersion diagram

IV- INTERFERENCES
1) General considerations
2) Temporal and spatial coherence
3) The Young double slit experiment
4) Diffraction gratings
5) The Michelson interferometer
6) Multi-wave interference
7) Antireflecting coating and interference filters
8) Optical holography

V- LIGHT MANIPULATION
1) Optical waveguides
2) Photonic crystals
3) Metamaterials and metasurfaces
4) Optical cavities

VI- OPTICAL FORCES AND OPTICAL TWEEZERS
1) History of optical forces
2) Theory of optical trapping
3) Atom cooling
4) Optomechanics
5) Applications of optical tweezers

VII- INTRODUCTION TO OPTICAL MICROSCOPY
1) Basic concepts
2) Direct and Fourier imaging
3) Image formation
4) Fluorescence microscopy
5) Scattering-based microscopy
6) Digital holography
7) Computational imaging

151-0917-00L  Mass Transfer  W  4 credits  2V+2U  M. Tibbitt, V. Mavrantzas, C.-J. Shih

Abstract
This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore, the application of these principles to important engineering problems is demonstrated.

Objective
This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore, the application of these principles to important engineering problems is demonstrated.

Content
Fick's laws; application and significance of mass transfer; comparison of Fick's laws with Newton's and Fourier's laws; derivation of Fick's 2nd law; diffusion in dilute and concentrated solutions; rotating disk; dispersion; diffusion coefficients, viscosity and heat conduction (Pr and Sc numbers); Brownian motion; Stokes-Einstein equation; mass transfer coefficients (Nu and Sh numbers); mass transfer across interfaces; Analogies for mass-, heat-, and momentum transfer in turbulent flows; film-, penetration-, and surface renewal theories; simultaneous mass, heat and momentum transfer (boundary layers); homogeneous and heterogeneous reversible and irreversible reactions; diffusion-controlled reactions; mass transfer and first order heterogeneous reaction. Applications.

Literature

Prerequisites / notice
Students attending this highly-demanding course are expected to allocate sufficient time within their weekly schedule to successfully conduct the exercises.

151-0927-00L  Rate-Controlled Separations in Fine Chemistry  W  6 credits  3V+1U  M. Mazzotti, V. Becattini, N. Casas, F. Kiefer

Abstract
The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.

Objective
The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.

Content
The class covers separation techniques that are central in the purification and downstream processing of chemicals and biopharmaceuticals. Examples from both areas illustrate the utility of the methods: 1) Adsorption and chromatography; 2) Membrane processes; 3) Crystallization and precipitation.

Lecture notes
Handouts during the class

Literature
Recommendations for text books will be covered in the class

Prerequisites / notice
Requirements (recommended, not mandatory): Thermal separation Processes I (151-0926-00) and Modelling and mathematical methods in process and chemical engineering (151-0940-00)

Competencies

Subject-specific Competencies
Concepts and Theories  assessed
Techniques and Technologies  fostered

Method-specific Competencies
Analytical Competencies  assessed
Decision-making  fostered
Media and Digital Technologies  fostered
Problem-solving  assessed

Social Competencies
Communication  fostered
Cooperation and Teamwork  fostered
Sensitivity to Diversity  fostered

Personal Competencies
Adaptability and Flexibility  fostered

151-0951-00L  Process Design and Safety  W  4 credits  2V+1U  F. Trachsel, C. Hutter

Abstract
The lecture Process Design and Saftey deals with the fundamentals of project management, scale-up, dimensioning and safety of chemical process equipment and plants.

Objective
The objective of the lecture is to expound the engineering design approach of important elements in chemical plant design.

Content
Fundamentals in Chemical engineering Design;
Project Management,
Cost estimate,
Materials and Corrosion,
Piping and Armatures,
Pumps,
Reactors and Scale-up,
Safety of chemical processes,
Patents

Lecture notes
The lecture slides will be distributed.

Literature

Prerequisites / notice
A 1-day excursion including a visit of a chemical plant will be part of the lecture.

151-0957-00L  Practica in Process Engineering I  W  2 credits  2P  D. J. Norris, M. Tibbitt

Abstract
Practical training at pilot facilities for fundamental processing steps, typical laboratory and pilot facility experiments.

Objective
Getting acquainted with unit operations, measuring tools and data processing
Content
4 modules in total (3 from Prof. Norris, 1 from Prof. Mark Tibbitt)
Details and dates will be communicated at the beginning of the semester.

Residence Time Distribution
Tibbitt
Perovskite Nanocrystals - Synthesis and Characterization
Norris
ICP Elemental Analysis
Norris
Scanning Electron Microscope Imaging (SEM)
Norris

Lecture notes
Scripts of the specific practice will be available shortly before the modules.

Literature

529-0613-01L Process Simulation and Flowsheeting W 6 credits 3G G. Guillén Gosálbez

Abstract
This course encompasses the theoretical principles of chemical process simulation and optimization, as well as its practical application in process analysis. The techniques for simulating stationary and dynamic processes are presented, and illustrated with case studies.

Objective
This course aims to develop the competency of chemical engineers in process flowsheeting, process simulation and process optimization. Specifically, students will develop the following skills:
- Deep understanding of chemical engineering fundamentals: the acquisition of new concepts and the application of previous knowledge in the area of chemical process systems and their mechanisms are crucial to intelligently simulate and evaluate processes.
- Modeling of general chemical processes and systems: students should be able to identify the boundaries of the system to be studied and develop the set of relevant mathematical relations, which describe the process behavior.
- Mathematical reasoning and computational skills: the familiarization with mathematical algorithms and computational tools is essential to be capable of achieving rapid and reliable solutions to simulation and optimization problems. Hence, students will learn the mathematical principles necessary for process simulation and optimization, as well as the structure and application of process simulation software. Thus, they will be able to develop criteria to correctly use commercial software packages and critically evaluate their results.
- Process optimization: the students will learn how to formulate optimization problems in mathematical terms, the main type of optimization problems that exist (i.e., LP, NLP, MILP and MINLP) and the fundamentals of the optimization algorithms implemented in commercial solvers.

Content
Overview of process simulation and flowsheeting:
- Definition and fundamentals
- Fields of application
- Case studies

Process simulation:
- Modeling strategies of process systems
- Mass and energy balances and degrees of freedom of process units and process systems

Process flowsheeting:
- Flowsheet partitioning and tearing
- Solution methods for process flowsheeting
- Simultaneous methods
- Sequential methods

Process optimization and analysis:
- Classification of optimization problems
- Linear programming, LP
- Non-linear programming, NLP
- Mixed-integer linear programming, MILP
- Mixed-integer nonlinear programming, MINLP

Commercial software for simulation (Aspen Plus):
- Thermodynamic property methods
- Reaction and reactors
- Separation / columns
- Convergence, optimisation & debugging

Literature
An exemplary literature list is provided below:
- Smith, R. Chemical process design and integration, Wiley (2005).

Prerequisites / notice
A basic understanding of material and energy balances, thermodynamic property methods and typical unit operations (e.g., reactors, flash separations, distillation/absorption columns etc.) is required.

▲ Multidisciplinary Courses

The students are free to choose individually Master’s courses from the Course Catalogue of ETH Zurich, ETH Lausanne and the Universities of Zurich (https://www.uzh.ch/cmsssl/en/studies/application/chmobilityin.html) and St. Gallen.

The subject of the Master Thesis and the choice of the supervisor (ETH-professor) are to be approved in advance by the tutor.

Abstract

The semester project is designed to train the students in the solution of specific engineering problems. This makes use of the technical and social skills acquired during the master’s program. Tutors propose the subject of the project, elaborate the project plan, and define the roadmap together with their students, as well as monitor the overall execution.

Objective

The semester project is designed to train the students in the solution of specific engineering problems. This makes use of the technical and social skills acquired during the master's program.

Students who fulfill the following criteria are allowed to begin with their Master’s Thesis:

a. successful completion of the bachelor program;
b. fulfilling of any additional requirements necessary to gain admission to the master programme;
c. successful completion of the semester project and industrial internship;
d. achievement of 28 ECTS in the category "Core Courses".

The Master’s Thesis must be approved in advance by the tutor and is supervised by a professor of ETH Zurich.

Abstract

Master's programs are concluded by the master's thesis. The thesis is aimed at enhancing the student's capability to work independently toward the solution of a theoretical or applied problem. The subject of the master's thesis, as well as the project plan and roadmap, are proposed by the tutor and further elaborated with the student.

Objective

The thesis is aimed at enhancing the student's capability to work independently toward the solution of a theoretical or applied problem.

ECTS European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
Science in Perspective

In “Science in Perspective”-courses students learn to reflect on ETH’s STEM subjects from the perspective of humanities, political and social sciences.

Only the courses listed below will be recognized as “Science in Perspective” courses.

► Type A: Enhancement of Reflection Competence

SiP courses are recommended for bachelor students after their first-year examination and for all master- or doctoral students. All SiP courses are listed in Type A.

Courses listed under Type B are only recommendations for enrollment for specific departments.

Adaptability and Flexibility

Subject-specific Competencies
Science has become a subject of research in its own right since the 20th century: the field of "science studies" examines the organization of science, its social benefits, its contribution to economic growth or its impact on people and nature. The seminar introduces the history of this research and sheds light on its applied and critical dimensions.

At the end of the term, students will be able to:
- reflect concepts and theories that capture the socio-technical nature of data
- assess the implications of data practices for social and political ordering
- identify key actors, sites, and domain contexts of data practices

</thead>
<tbody>
<tr>
<td>Abstract</td>
<td>The seminar explores insects as historical actors and their diverse interactions with human societies over time and space. It offers an overview of recent approaches in environmental history and multispecies ethnography while providing an analytical framework to understand global processes of natural resource exploitation, knowledge formation, and imperialism.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>The objective is to analyze human-insect interactions by identifying key historical factors (economic, scientific, political). Students will integrate current frameworks in the study of environmental history through the combination of primary sources and interdisciplinary research. They will develop skills rooted in their interest in insects and learn to translate them into feedback to peers.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Abstract

In the course we read classical texts from the field of philosophy of war (Clausewitz, Sun Tzu, Tolstoy, Machiavelli, Kant) and focus on questions such as: what is war? Strategy and tactics in war? Ethics of war? War and Politics?

Objective

Students learn about the different types of argumentative texts and their historical, social, political and ethical context. They learn to integrate current frameworks in the study of environmental history through the combination of primary sources and interdisciplinary research. They will develop skills rooted in their interest in insects and learn to translate them into feedback to peers.
851-0201-00L  Literature and History  W  3 credits  2V  
**Abstract**
Literate history and history have often coexisted, “dialogued”. History is a recurring theme in many literary works. In this seminar, we will explore the relationship between literature and history.  
**Objective**
The aim is to evoke History as a source of creation for writers. The aim is to identify the bridges built by this transdisciplinarity, and to question the way in which History is “rewritten” by literature, after having been at its origin. 
**Content**
Literature and history have often coexisted, “dialogued”. History is a recurring theme in many literary works. In this seminar, we will explore the relationship between literature and history. We’ll look at several periods of world history, from America to Europe and Africa. The aim is to evoke History as a source of creation for writers. The aim is to identify the bridges built by this transdisciplinarity, and to question the way in which History is “rewritten” by literature, after having been at its origin. To illustrate our points, we will draw on 20th- and 21st-century novels by French, Haitian and Algerian authors:  
- Rosalie L’intâme, Evelyne Trouillot  
- Le Manuscrit de Port-Èbène, Dominique Bona  
- L’Affaire de l’esclave Furcy, Mohammed Alissoâui  
- Cris, Laurent Gaudé (First World War)  
- Sigmarigen, Pierre Assouline (World War II)  
- Avant que les ombres s’eﬀacent, Louis-Philippe Dalembert (Second World War)  
- Où j’ai laissé mon âme, Jérôme Ferrari (Second World War & Algerian War)  

851-0101-56L  From Cotton to Cocaine: Commodities That Made History (c.1700-1950)  W  3 credits  2V  H. Fischer-Tiné

**Abstract**
Each session focuses on a particular commodity and explores how its production, trade and consumption was entangled with important political, social and cultural developments. Taken together, the case studies (ranging from agricultural crops, via chemically produced drugs to mechanical marvels such as the gramophone) provide a picture of major global transformations in the past 300 years.  
**Objective**
On one level, the course aims to familiarise students with a currently much debated approach to the writing of global history, namely the history of commodities. Each case study is used to deepen the participants’ understanding of complex historical developments by telling seemingly simple stories in a global frame. Thus, for instance, the session on sugar explores plantation economies in the Caribbean and the transatlantic slave trade as well as shifting patterns of diet and consumption in Europe. The session on rubber focuses on botanical expeditions in Latin America, the deployment of Chinese coolies on Malaysian Rubber farms and the rise of the automobile mass production in the USA. By linking the familiar to the unfamiliar and ‘exotic’ the inter-cultural sensitivity of the students will be enhanced. On a second level, the analysis and understanding of these complex interconnections, it is hoped, will help students to get a more nuanced understanding of the historical process that is currently referred to as ‘globalization’ and overcome the eurocentric perspective that still structures many scholarly and media writings on this topic.

851-0125-65L  A Sampler of Histories and Philosophies of Mathematics  W  3 credits  2V  R. Wagner

**Abstract**
This course will review several case studies from the ancient, medieval and modern history of mathematics. The case studies will be analyzed from various philosophical perspectives, while situating them in their historical and cultural contexts.  
**Objective**
The course aims:  
1. To introduce students to the historicity of mathematics  
2. To make sense of mathematical practices that appear unreasonable from a contemporary point of view  
3. To develop critical reflection concerning the nature of mathematical objects  
4. To introduce various theoretical approaches to the philosophy of and history of mathematics  
5. To open the students’ horizons to the plurality of mathematical cultures and practices

851-0453-00L  Artificial Intelligence and Human Values  W  3 credits  2G  M. Boenig-Liptsin, K. Wodajo

**Abstract**
This course introduces students to the ethical, political and legal debates and transformations in relation to Artificial Intelligence and provides students with concepts and methods from the constructivist and interpretive social sciences to work towards responsible and democratic human-technology futures.  
**Objective**
The main objectives of the course are to enable students to 1) identify the ways in which human values and developments of AI technologies are entangled, 2) articulate what is significant about contemporary transformations in AI and society, and 3) participate and shape the relationship between human values and AI as citizens and professionals.  
**Content**
The growing presence of AI tools for public use, for public administration, inside corporations and in scientific research raises many questions about the ethical, political, legal consequences of these technologies. This course is built around multiple sites of encounter among human values and AI, including bodies, persons, cities, labs, law, and environment. In each site, we inquire about what and whose values are being prioritized and with what consequences. The course also investigates existing best-practices around how to “align” human values with AI (e.g. human-centric design, alignment, reproducibility, transparency, explainability) and introduces students to regimes of ethics and governance of AI being proposed in jurisdictions around the world. Students learn to unpack the values and assumptions in existing techniques and frameworks for the design and governance of AI and to engage constructively with diverse stakeholders to shape the human-technology future towards aims that are reflexive, responsible, and democratic.  

851-0157-28L  Life and Death  W  3 credits  2V  M. Hagner

**Abstract**
This course explores the relation between the scientific investigation of life and cultural notions of death from a historical perspective (assuming there is no such thing as the scientific investigation of death). While the course covers the times from antiquity up to the present, the main emphasis will be placed on the modern life sciences since the 19th century.
There is only one certainty in life: death. This brute fact has animated much thought and work in theology, art and philosophy - but also in the natural sciences, such as biology and medicine. Questions regarding health and disease, evolution, extinction and mortality have played a crucial role in this connection. This course aims to explore above relations - the relations between the scientific investigation of life and cultural notions of death - from a historical perspective (assuming there is no such thing as the scientific investigation of death). While the course covers the times from antiquity up to the present, the main emphasis will be placed on the modern life sciences since the 19th century.

**Objective**

- Students a) know the main features of the discussion about the truth in the reconstruction of past events; b) have an understanding of how diverse as wood, concrete, ceramics and polymers become objects of a single discipline? How did social imaginaries and technical conditions affect scientific work and on materials?

**Content**

- The seminar discusses the socio-technical conditions and effects of materials research from a historical perspective in the 20th century. We observe physicists, chemists and engineers, as well as concrete, foams and electron microscopes, in research laboratories and materials testing institutes, in articles and patents.

**Competencies**

- Subject-specific Competencies
  - Concepts and Theories: fostered
  - Analytical Competencies: fostered
  - Communication: fostered
  - Cooperation and Teamwork: fostered
  - Creative Thinking: fostered
  - Critical Thinking: fostered

---

851-0541-00L

**Truth and Historical Injustice: The Production of Knowledge about Past Mass Atrocities**

- **Objective**
  - Students a) know the main features of the discussion about the truth in the reconstruction of past events; b) have an understanding of knowledge about past mass crimes; c) have knowledge of important processes of dealing with past mass crimes from the second half of the 20th century onwards.

- **Content**
  - The production of knowledge about past atrocities has always been an endeavour in which various scientific disciplines have been involved. The multidisciplinary character of the production of knowledge about mass crimes has become even more accentuated since the second half of the 20th century, not least due to the emergence of new technological possibilities.

**Competencies**

- Subject-specific Competencies
  - Concepts and Theories: assessed
  - Techniques and Technologies: assessed
  - Analytical Competencies: fostered
  - Critical Thinking: fostered

---

851-0202-00L

**Digital Humanities: Methods, Challenges, Perspectives**

- **Objective**
  - exploring the most important theoretical and methodological approaches since 2000
  - understanding terms and procedures
  - using digital texts, images and metadata
  - reflecting on the conditions, opportunities and problems of digital methods

- **Content**
  - The possibilities (Franco Moretti, Graphs, Maps, Trees, Verso 2005; Andrew Piper, Enumerations, Chicago UP 2018) and pitfalls (Franco Moretti, The Wrong Move, Konstanz UP 2022) of cultural history under digital conditions require critical reflection and evaluation. The lecture will explore showcases and pioneering work, annotated texts, images, metadata and interfaces provided by libraries, archives and museums. Research approaches and practical applications will be presented and evaluated.

---

851-0297-00L

**Manipulation in Literature and Cultural History**

- **Objective**
  - Students will learn about manipulation as a linguistic and narrative phenomenon steeped in myth and classical rhetoric. Against the backdrop of cultural-historical developments, particularly with regard to major changes in media technology, we will examine how the reach of manipulation was extended from the individual to the masses. Students will be able to refine their critical discourse analysis skills and interdisciplinary abilities by studying texts from literature, politics, sociology, philosophy and psychoanalysis which reflect this shift in emphasis.
Since the dawn of time mankind has tried to exert influence over others through the utilisation of certain techniques: initially for self-preservation – for example the interpretation of Sigmund Freud in Totem und Tabu. Later, desire became the driving force – centre stage: the desire for pleasure, power and control. Manipulation manifests itself in the form of characters and words, it is an authentically linguistic occurrence; classical antiquity, with the rhetoric, develops a system of verbal power of persuasion and, already then, questions were being raised in literary and discursive texts about how people could, or even should, manipulate. The exertion of influence and its impact will be clearly described, propagated, commented upon, criticised and ironised.

In contrast to oppressive overpowering, the power of manipulation (in Latin, manus hand, plere fill) is on the one hand, based on the subtle use of persuasive linguistic elements – it is always a (literary) discourse, too – and on the other, on knowing precisely what the fantasies, desires and fears of the manipulated are. The discourse of manipulation has its beginnings in the age of sophists and their belief in an omnipotence of language and rhetoric. It underwent further transformation under political and psychological signs in the early modern period through Giordano Bruno and Nicolò Machiavelli and culminated in the 20th century in a critique of the deception strategies of the ‘culture industry’ (T.W Adorno) and ‘psychotechnology’ (B. Stiegler) in global capitalism. Nowadays social media is the ‘radicalisation machine’ (J. Ebner) that present new challenges for society. Written in the 19th century, the Protocols of the Elders of Zion already gave indications of how present-day conspiracy theorists would manipulate their audience, and its impact can still be felt today. Since manipulation is a linguistic, narrative and also literary phenomenon, the central theme of the lecture is how in literature itself this often politically controversial and manipulative behaviour is picked up and reflected through poetry: such as in Tristan von Gottfried von Strassburg, Goethe’s Wilhelm Meister, Friedrich Schiller’s Die Verschwörung des Fiesco zu Genoa or Heinrich von Kleist’s Der zerbrochne Krug, the works of Edgar Allan Poe and Thomas Mann (Mario und der Zauberer) and, most recently in Eckhart Nickel’s novel, Hysteria.

851-0527-00L Introduction to the History of Technology: Concepts, and Current Debates

Does not take place this semester.

Abstract

Technology and society cannot be separated: No society functions without technology. The seminar offers a problem-oriented introduction to basic questions of the history of technology, introduces approaches to the history of technology and discusses selected, ongoing debates.

Objective

The course seeks to provide a critical introduction to the issues, methods, and selected areas of research in the history of technology.

Content

History of technology investigates technological developments that arise in specific historical contexts. These developments are perceived by social groups or entire societies as a means of social change and ultimately find use or are forgotten. The questions that history of technology poses derive from the technological and social change that are a product of contemporary orientation and thinking; current historiographical methods provide the tools for answering these questions.

851-0226-00L Postcolonial Readings

Abstract

The history of colonialism in the modern age begins with Christopher Columbus who, as Todrov has well told us, did not “discover” anything, but crossed the Ocean in search of riches, bringing with him a baggage of violence, stereotypes and violent conquest of resources and bodies. And from here, from that 1492, the story became one of blood and struggle.

Objective

The course will be based on case studies, linked to national realities (Brazil, Senegal, Eritrea, Great Britain, Italy, Peru, Somalia, etc.) and to physical places (the front, the museum, the field, the street, the body), to see how in different contexts, despite the peculiarity of the context, the dilemmas that are attempted to be answered are in fact very similar.

Content

WE are here, because YOU have been there, have you ever heard that phrase? In a university lecture hall? In an anti-racist demonstration? In a play? In a discussion on the bus? The YOU represents Europe and in a broader sense the West, the WE the peoples who suffered colonization by the very West that portrayed itself as a beacon of civilization. The history of colonialism in the modern age begins with Christopher Columbus who, as Todrov has well told us, did not “discover” anything, but crossed the Ocean in search of riches, bringing with him a baggage of violence, stereotypes and violent conquest of resources and bodies. And from here, from that 1492, the story became one of blood and struggle. It is a story that has covered a time span from precisely 1492 to the present, ranging from human trafficking to the extractive, and accumulation, policies of our contemporary times. The consequences of all this violence are sadly still visible on the body of the world, open wounds that bleed. Wounds in which lurk prejudice, systemic racism and murder.

To examine these consequences, to understand how contemporary societies in the global north and south, are still torn apart by this history that never seems to pass; we will rely on literature, on “postcolonial” texts that will show us the complexity of what exists. The course will be based on case studies, linked to national realities (Brazil, Senegal, Eritrea, Great Britain, Italy, Peru, Somalia, etc.) and to physical places (the front, the museum, the field, the street, the body), to see how in different contexts, despite the peculiarity of the context, the dilemmas that are attempted to be answered are in fact very similar.

The lecture will examine the body of the colonized/migrant as a field of battle and resistance in real and metaphorical wars. Place where the stereotype is overthrown through a will for personal agency. Colonial space and the consequent postcolonial space is a hierarchical space where instruments of violence and oppression do not provide for the agency of the colonized subject or in the contemporary case of the migrant subject placed by power structures in a space of subalternity. But subjects are born free and through in a confined space seek their own path to freedom and awareness. In ways that are perhaps paradoxical in our eyes, but certainly effective in a very limited space granted. In the three lectures, through literary texts, three case studies related to as many books will be examined to understand precisely this tension between enclosed space and the search for freedom. A tension between (unjust) rules imposed, malevolent looks imposed and one’s own body, one’s own moral integrity.

851-0549-00L WebClass Introductory Course History of Technology

Abstract

Technology stands for innovation and catastrophes; it works as a dream machine and is associated with the most diverse ways of utilization. In WebClass Introductory Course History of Technology students become familiar with explanations for how technology works within complex economic, political and cultural contexts, by interpreting and researching texts and authoring a student manual.
Students are introduced into how technological innovations take place within complex economic, political and cultural contexts. They get to know basic theories and practices of the field by acquiring the skills to interpret texts, to compare arguments, to research additional sources and complementary material and to author a common essay. All of this will yield into a student manual on the four core topics: technology and innovation, technology and catastrophes, technology as a dream machine and technology and association. The course language is German, and even if many texts will be in English, the ability to read and understand German is mandatory.

851-0281-00L | The Knowledge of Poetry ■                           | W    | 3    | 2V    | C. Jany  
| Abstract    | Novalis once described poetry as “the mind’s inherent way of acting”. Thinking takes place in verses and images, rather than concepts and formulas. If this were true, every spontaneous cognition would amount to poetry and each thought essentially to a poem -- a structure combining and concentrating ideas, perceptions, and emotions. Knowledge and poetry would be one. |
| Objective   | Such is the promise literature has made since its inception, a promise we will examine in this class by considering mainly lyrical compositions in verse, from the beginnings to the present. The central question is: What do poems know and what is the relationship between thinking in verse and technical and scientific knowledge? |

851-0077-00L | Philosophy of War                                   | W    | 3    | 2S    |          |
| Abstract    | Does not take place this semester.                  |
| Objective   | In the course we read classical texts from the field of philosophy of war (Clausewitz, Sun Tzu, Tolstoy, Machiavelli, Kant) and focus on questions such as: what is war? Strategy and tactics in war? Ethics of war? War and Politics? |

851-0201-00L | Literature and History                              | W    | 3    | 2V    |          |
| Abstract    | Literature and history have often coexisted, “dialogued”. History is a recurring theme in many literary works. In this seminar, we will explore the relationship between literature and history. |
| Objective   | The aim is to evoke History as a source of creation for writers. The aim is to identify the bridges built by this transdisciplinary, and to question the way in which History is "rewritten" by literature, after having been at its origin. |
Since the dawn of time mankind has tried to exert influence over others through the utilisation of certain techniques: initially for self-preservation – for example the interpretation of Sigmund Freud in Totem und Tabu. Later, desire became the driving force – centre stage: the desire for pleasure, power and control. Manipulation manifests itself in the form of characters and words, it is an authentically linguistic occurrence: classical antiquity, with the rhetoric, develops a system of verbal power of persuasion and, already then, questions were being raised in literary and discursive texts about how people could, or even should, manipulate. The exertion of influence and its impact will be clearly described, propagated, commented upon, criticised and ironised. In contrast to oppressive overpowering, the power of manipulation (in Latin, manus hand, pler fill) is on the one hand, based on the subtle use of persuasive linguistic elements – it is always a (literary) discourse, too – and on the other, on knowing precisely what the fantasies, desires and fears of the manipulated are. The discourse of manipulation has its beginnings in the age of sophists and their belief in an omnipotence of language and rhetoric. It underwent further transformation under political and psychological signs in the early modern period through Giordano Bruno and Niccolò Machiavelli and culminated in the 20th century in a critique of the deception strategies of the “culture industry” (T.W Adorno) and “psychotechnology” (B. Stiegler) in global capitalism. Nowadays social media is the “radicalisation machine” (J. Ebner) that present new challenges for society. Written in the 19th century, the Protocols of the Elders of Zion already gave indications of how present-day conspiracy theorists would manipulate their audience, and its impact can still be felt today. Since the desire for pleasure, power and control was extended from the individual to the masses. Students will be able to refine their critical discourse analysis skills and interdisciplinary abilities by studying texts from literature, politics, sociology, philosophy and psychoanalysis which reflect this shift in emphasis.

Contents
- Krug, the works of Edgar Allan Poe and Thomas Mann (Mario und der Zauberer) and, most recently in Eckhart Nickel's novel, Hysteria.
- Politically controversial and manipulative behaviour is picked up and reflected through poetry: such as in Tristan from Gottfried von Strassburg. Goethe's Wilhelm Meister, Friedrich Schiller's Die Verschwörung des Fiesco zu Genua or Heinrich von Kleist's Der zerbrochne Krug, the works of Edgar Allan Poe and Thomas Mann (Mario and der Zauberer) and, most recently in Eckhart Nickel's novel, Hysteria.
- In analysing how it shapes the understanding of ourselves and of supposedly inalterable facts about the reality we inhabit, we will examine how science fiction demonstrates that fiction is neither fundamentally in conflict with scientific knowledge, as previously supposed, nor a mere vehicle for its celebration, as still commonly presumed of science fiction. Instead, the genre, with its radical investigations into other forms of being, fear and hope, plays a crucial role in the social formation, order and negotiation of knowledge. As such, science fiction also represents a vital thought experiment regarding the "science of fiction", i.e. the development of a knowledge of literature and the many fascinating ways in which it helps us to know our own world better, in turn. In this course, we will take a systematic and theory-based approach to a deeper understanding of science fiction, particularly its historical background, unique aesthetic/narrative tools, and relationship with the critical and technocultural contexts that shape it. Employing contemporary theoretical approaches, we will discuss a variety of themes within primary texts alongside diverse critical sources, all of which ultimately relate to knowledge and knowability. Particular areas of focus may include: other worlds and alien existences; altered temporality and alternate history; utopia and dystopia; climate fiction and the Anthropocene; trans-, posthumanist and cyborg identities; robots and AI; and alternative futurisms. Moreover, the course will thereby also engage with the fundamental (and at times overlooked) role of order and presentation of knowledge, i.e. its aesthetic and narrative forms, within science and literature.

Objectives
- Students will learn about manipulation as a linguistic and narrative phenomenon steeped in myth and classical rhetoric. Against the backdrop of cultural-historical developments, particularly with regard to major changes in media technology, we will examine how the reach of manipulation was extended from the individual to the masses. Students will be able to refine their critical discourse analysis skills and interdisciplinary abilities by studying texts from literature, politics, sociology, philosophy and psychoanalysis which reflect this shift in emphasis.

Competencies
- Subject-specific Competencies: Concepts and Theories fostered
- Method-specific Competencies: Analytical Competencies fostered
- Social Competencies: Communication fostered
- Personal Competencies: Adaptability and Flexibility fostered

Format
- Lecture: Concentrates on the literary and discursive texts that dispute the control of protagonists.
- Exercises: Students will experiment with different forms of manipulation and control, focusing on concrete case studies from literature and history.

Data: 26.07.2024 12:39
Autumn Semester 2024
Page 2581 of 2680
The history of colonialism in the modern age begins with Christopher Columbus, who, as Todorov has well told us, did not "discover" anything, but crossed the Ocean in search of riches, bringing with him a baggage of violence, stereotypes and violent conquest of resources and bodies. And from here, from that 1492, the story became one of blood and struggle.

The lecture will examine the body of the colonized/migrant as a field of battle and resistance in real and metaphorical wars. Place where the stereotype is overthrown through a will for personal agency. Colonial space and the consequent postcolonial space is a hierarchical space where instruments of violence and oppression do not provide for the agency of the colonized subject or in the contemporary case of the migrant subject placed by power structures in a space of subalternity. But subjects are born free and though in a confined space seek their own path to freedom and awareness. In ways that are perhaps paradoxical in our eyes, but certainly effective in a very limited space granted. In the three lectures, through literary texts, three case studies related to as many books will be examined to understand precisely this tension between enclosed space and the search for freedom. A tension between (unjust) rules imposed, malevolent looks imposed and one's own body, one's own moral integrity.

Abstract
- The course will be based on case studies, linked to national realities (Brazil, Senegal, Eritrea, Great Britain, Italy, Peru, Somalia, etc.) and to physical places (the front, the museum, the field, the street, the body), to see how in different contexts, despite the peculiarity of the context, the dilemmas that are attempted to be answered are in fact very similar.

Objective
- To examine these consequences, to understand how contemporary societies in the global north and south, are still torn apart by this history that never seems to pass; we will rely on literature, on "postcolonial" texts that will show us the complexity of what exists. The course will be based on case studies, linked to national realities (Brazil, Senegal, Eritrea, Great Britain, Italy, Peru, Somalia, etc.) and to physical places (the front, the museum, the field, the street, the body), to see how in different contexts, despite the peculiarity of the context, the dilemmas that are attempted to be answered are in fact very similar.

Content
- WE are here, because YOU have been there, have you ever heard that phrase? In a university lecture hall? In an anti-racist demonstration? In a play? In a discussion on the bus? The YOU represents Europe and in a broader sense the West, the WE the peoples who suffered colonization by the very West that portrayed itself as a beacon of civilization. The history of colonialism in the modern age begins with Christopher Columbus who, as Todorov has well told us, did not "discover" anything, but crossed the Ocean in search of riches, bringing with him a baggage of violence, stereotypes and violent conquest of resources and bodies. And from here, from that 1492, the story became one of blood and struggle. It is a story that has covered a time span from precisely 1492 to the present, ranging from human trafficking to the extractive, and accumulation, policies of our contemporary times. The consequences of all this violence are sadly still visible on the body of the world, open wounds that bleed. Wounds in which lurk prejudice, systemic racism and murder.
- To examine these consequences, to understand how contemporary societies in the global north and south, are still torn apart by this history that never seems to pass; we will rely on literature, on "postcolonial" texts that will show us the complexity of what exists. The course will be based on case studies, linked to national realities (Brazil, Senegal, Eritrea, Great Britain, Italy, Peru, Somalia, etc.) and to physical places (the front, the museum, the field, the street, the body), to see how in different contexts, despite the peculiarity of the context, the dilemmas that are attempted to be answered are in fact very similar.

The lecture notes will be uploaded to a course website.

Prerequisites / notice
- This course is particularly suited for students of the following programmes: MA Comparative International Studies; MSc Energy Science & Technology; MSc Environmental Sciences; MSc Management, Technology & Economics; MSc Science, Technology & Policy; ETH & UZH PhD programmes.
Corporate Sustainability is the flagship course of the Group for Sustainability and Technology at D-MTEC. In this course, students learn about key concepts in corporate sustainability and develop skills to implement them in the real world. The course prepares students for making well-informed sustainability decisions in their future careers.

The course uses constructive alignment to bring the various innovative teaching and learning elements (e.g., case-based experiential learning, reflective thinking and blended learning with videos and quizzes) into a coherent transformational journey. Students can now flexibly, efficiently, and effectively acquire the conceptual foundations that are essential for a substantial understanding of corporate sustainability.

For part of the course, students work in groups to complete a set of graded assignments designed to guide them into a deep dive on a selected corporate sustainability challenge. Please note that full participation in this part is essential, so make sure you are available. Furthermore, these group assignments count towards the overall grade for the course.

For further details on the course structure etc. visit the following link: http://www.sustec.ethz.ch/teaching/lectures/corporate-sustainability.html

Lecture notes
Presentation slides will be made available on Moodle after lectures.

Literature
Literature recommendations will be distributed via Moodle, and are available from the start of the course.

Prerequisites / notice
TEACHING FORMAT/ ATTENDANCE: The course includes several mandatory sessions that participants must attend to successfully earn credit points. It is not possible to take the class purely online.

363-0565-00L Principles of Macroeconomics

Abstract
This course examines the behaviour of macroeconomic variables, such as gross domestic product, unemployment and inflation rates. It tries to answer questions like: How can we explain fluctuations of national economic activity? What can economic policy do against unemployment and inflation?

Objective
This lecture will introduce the fundamentals of macroeconomic theory and explain their relevance to every-day economic problems.

Content
This course helps you understand the world in which you live. There are many questions about the macroeconomy that might spark your curiosity. Why are living standards so meagre in many African countries? Why do some countries have high rates of inflation while others have stable prices? Why have some European countries adopted a common currency? These are just a few of the questions that this course will help you answer.

Furthermore, this course will give you a better understanding of the potential and limits of economic policy. As a voter, you help choose the policies that guide the allocation of society's resources. When deciding which policies to support, you may find yourself asking various questions about economics. What are the burdens associated with alternative forms of taxation? What are the effects of free trade with other countries? How does the government budget deficit affect the economy? These and similar questions are always on the minds of policy makers.

Lecture notes
The course Moodle page contains announcements, course information and lecture slides.

Literature

This book can also be used for the course ‘363-0503-00L Principles of Microeconomics’ (Filippini).

Besides this textbook, the slides, lecture notes and problem sets will cover the content of the lecture and the exam questions.

351-0555-00L Open- and User Innovation

Abstract
The course introduces the students to the long-standing tradition of actively involving users of technology and other knowledge-intensive products in the development and production process, and through own cases they develop an entrepreneurial understanding of product development under distributed, user-centered, or open innovation strategies.
The course introduces basic economic concepts and theories. Beginning with microeconomics, the course starts with the topics of supply and demand, markets, and behavioral economics before moving on to the key macroeconomic concepts of national accounts, the labor market, trade, and monetary policy.

Objective

- Describe the basic macro- and macroeconomic problems and theories.
- Introduce economic reasoning appropriately to a given topic.
- Evaluate economic measures.

Content

This course on user innovation extends courses on knowledge management and innovation as well as marketing. The students are introduced to the long-standing tradition of actively involving users of technology and other knowledge-intensive products in the development and production process, and through own cases they develop an entrepreneurial understanding of product development under distributed, user-centered, or open innovation strategies. Theoretical underpinnings taught in the course include models of innovation, the structuration of technology, and an introduction to entrepreneurship.

Competencies

Subject-specific Competencies: Concepts and Theories assessed
Method-specific Competencies: Analytical Competencies assessed
Social Competencies: Cooperation and Teamwork assessed
Personal Competencies: Critical Thinking assessed

Literature

Relevant literature for the course includes slides and reading assignments. Papers will be made available through a corresponding Moodle group.

Subject-specific Competencies

- Evaluate economic measures.
- Introduce economic reasoning appropriately to a given topic.
- Describe the basic macro- and macroeconomic problems and theories.
- Evaluate economic measures.
Content
Households, firms, supply and demand: How are household preferences and consumption patterns formed? How does a household react to price changes? How are goods prices formed? At what prices are companies willing to offer goods? How do we make economic decisions?

Markets: What is “perfect competition” and how does a competitive market work? Are monopolies always a bad thing? How can the state influence the market?

Market failure: What happens when prices give wrong signals?

Labour market: How do supply and demand work in the labour market? What influences unemployment?

National accounts: How big is the Swiss economy?

Foreign trade: Why do countries trade with each other? What are the consequences for the domestic market?

Money and inflation: What exactly is money? How does money creation work and what happens when there is too much (or too little) money on the market?

Students will be asked to apply these concepts to issues in their own field of study and to current issues in society. This goal will be achieved through participation in exercises, class discussions and reading material from current media. By the end of the course, students should be able to apply economic analysis confidently and independently.

351-1109-00L Introduction to Microeconomics

GESS (Science in Perspective):
This course is only for students enrolled in a Bachelor’s degree programme.

Students enrolled in a Master’s degree programme may attend “Principles of Microeconomics” (LE 363-0503-00L) instead.

Note for D-MAVT students: If you have already successfully completed “Principles of Microeconomics” (LE 363-0503-00L), then you will not be permitted to attend it again.

Abstract
The course introduces basic principles, problems and approaches of microeconomics. It describes economic decisions of households and firms, and their coordination through perfectly competitive markets.

Objective
Students acquire a deeper understanding of basic microeconomic models.

They acquire the ability to apply these models in the interpretation of real world economic contexts.

Students acquire a reflective and contextual knowledge on how societies use scarce resources to produce goods and services and distribute them among themselves.

Content
Market, budget constraint, preferences, utility function, utility maximisation, demand, technology, profit function, cost minimisation, cost functions, perfect competition, information and communication technologies

Lecture notes
Course material in e-learning environment https://moodle-app2.let.ethz.ch/auth/shibboleth/login.php

Literature

Prerequisites / notice
This course “Einführung in die Mikroökonomie” (363-1109-00L) is intended for Bachelor students and LE 363-0503-00 “Principles of Microeconomics” for Master students.

Postcolonial Readings
Type Using philosophical and economic texts and discussions, students develop an understanding of the concepts, developments, causes, and consequences of inequality. Students will acquire the ability to participate in an informed discourse on the issues of inequality and injustice and to critically reflect on their actions and position in the world.

Content In this seminar we will explore the issues of inequality and injustice. In doing so, we will explore the following questions: What is meant by inequality and injustice? Under what circumstances are inequalities unjust? Have inequalities and injustices increased or decreased over the last 50 years? What are the causes of increasing or decreasing inequality? What do these inequalities and injustices mean for our society? What and public and private measures are needed for more inclusive societies?

- Concepts of inequality and injustice
- Development of inequality over the last 50 years based on different dimensions of inequality: income, wealth, education, health, CO2 emissions, political participation.
- Discrimination of women, people with physical disabilities, people of the "Global South".
- Causes of inequality: globalization, technological progress, political systems and institutions, economic system, social discrimination, stereotypes and norms.
- Consequences of inequality: justice, dignity, inefficiency
- Towards more inclusive societies: the role of policies, civil society, social movements and individual behavior.

The seminar is based on readings of economic and philosophical texts and is complemented by short presentations and discussions with scholars of philosophy and economics. In some cases, practitioners will also be invited to the seminar. Students will apply the concepts, theories and knowledge covered in the course to practical issues related to inequality and inequity.

851-0226-00L Postcolonial Readings

Objective The history of colonialism in the modern age begins with Christopher Columbus who, as Todorov has well told us, did not "discover" anything, but crossed the Ocean in search of riches, bringing with him a baggage of violence, stereotypes and violent conquest of resources and bodies. And from here, from that 1492, the story became one of blood and struggle.

Content Local and national realities (Brazil, Senegal, Eritrea, Great Britain, Italy, Peru, Somalia, etc.) and to physical places (the front, the museum, the field, the street, the body), to examine the consequences, to understand how contemporary societies in the global north and south, are still torn apart by this history that never seems to pass; we will rely on literature, on "postcolonial" texts that will show us the complexity of what exists. The course will be based on case studies, linked to national realities (Brazil, Senegal, Eritrea, Great Britain, Italy, Peru, Somalia, etc.) and to physical places (the front, the museum, the field, the street, the body), to see how in different contexts, despite the peculiarity of the context, the dilemmas that are attempted to be answered are in fact very similar.

The lecture will examine the body of the colonized/migrant as a field of battle and resistance in real and metaphorical wars. Place where the stereotype is overthrown through a will for personal agency. Colonial space and the consequent postcolonial space is a hierarchical space where instruments of violence and oppression do not provide for the agency of the colonized subject or in the contemporary case of the migrant subject placed by power structures in a space of subalternity. But subjects are born free and though in a confined space seek their own path to freedom and awareness. In ways that are perhaps paradoxical in our eyes, but certainly effective in a very limited space granted. In the three lectures, through literary texts, three case studies related to as many books will be examined to understand precisely this tension between enclosed space and the search for freedom. A tension between (unjust) rules imposed, malevolent looks imposed and one's own body, one's own moral integrity.

Perspectives

Does not take place this semester.

Abstract Globalization and technological progress in recent decades have on the one hand reduced inequality and led to new forms of inequality on the other hand. The question is whether these new forms of inequality lead to more inequality. This course provides an overview of the current philosophical and economic discourse on inequality and injustice.

Objective Using philosophical and economic texts and discussions, students develop an understanding of the concepts, developments, causes, and consequences of inequality. Students will acquire the ability to participate in an informed discourse on the issues of inequality and injustice and to critically reflect on their actions and position in the world.

Content In this seminar we will explore the issues of inequality and injustice. In doing so, we will explore the following questions: What is meant by inequality and injustice? Under what circumstances are inequalities unjust? Have inequalities and injustices increased or decreased over the last 50 years? What are the causes of increasing or decreasing inequality? What do these inequalities and injustices mean for our society? What and public and private measures are needed for more inclusive societies?

- Concepts of inequality and injustice
- Development of inequality over the last 50 years based on different dimensions of inequality: income, wealth, education, health, CO2 emissions, political participation.
- Discrimination of women, people with physical disabilities, people of the "Global South".
- Causes of inequality: globalization, technological progress, political systems and institutions, economic system, social discrimination, stereotypes and norms.
- Consequences of inequality: justice, dignity, inefficiency
- Towards more inclusive societies: the role of policies, civil society, social movements and individual behavior.

The seminar is based on readings of economic and philosophical texts and is complemented by short presentations and discussions with scholars of philosophy and economics. In some cases, practitioners will also be invited to the seminar. Students will apply the concepts, theories and knowledge covered in the course to practical issues related to inequality and inequity.

851-0226-00L Postcolonial Readings

Objective The history of colonialism in the modern age begins with Christopher Columbus who, as Todorov has well told us, did not "discover" anything, but crossed the Ocean in search of riches, bringing with him a baggage of violence, stereotypes and violent conquest of resources and bodies. And from here, from that 1492, the story became one of blood and struggle.

Content Local and national realities (Brazil, Senegal, Eritrea, Great Britain, Italy, Peru, Somalia, etc.) and to physical places (the front, the museum, the field, the street, the body), to examine the consequences, to understand how contemporary societies in the global north and south, are still torn apart by this history that never seems to pass; we will rely on literature, on "postcolonial" texts that will show us the complexity of what exists. The course will be based on case studies, linked to national realities (Brazil, Senegal, Eritrea, Great Britain, Italy, Peru, Somalia, etc.) and to physical places (the front, the museum, the field, the street, the body), to see how in different contexts, despite the peculiarity of the context, the dilemmas that are attempted to be answered are in fact very similar.

The lecture will examine the body of the colonized/migrant as a field of battle and resistance in real and metaphorical wars. Place where the stereotype is overthrown through a will for personal agency. Colonial space and the consequent postcolonial space is a hierarchical space where instruments of violence and oppression do not provide for the agency of the colonized subject or in the contemporary case of the migrant subject placed by power structures in a space of subalternity. But subjects are born free and though in a confined space seek their own path to freedom and awareness. In ways that are perhaps paradoxical in our eyes, but certainly effective in a very limited space granted. In the three lectures, through literary texts, three case studies related to as many books will be examined to understand precisely this tension between enclosed space and the search for freedom. A tension between (unjust) rules imposed, malevolent looks imposed and one's own body, one's own moral integrity.
This semester course enables students to recognize, anticipate and address ethical issues in the domain of health sciences and their technological application. The students will acquire the necessary theoretical and analytic resources to develop critical thinking skills in the field of applied ethics and will practice how to use such resources to address concrete ethical issues in health sciences.

Objective

The pressing environmental challenges of today demand a critical reflection. Ethics is an important tool for doing so. This lecture introduces the basics of ethics and provides in-depth knowledge of environmental ethics and its debates. This theoretical background will be applied and critically reflected using examples of current environmental challenges.

Content

The course starts off with an introductory lecture on ethics as a discipline and an overview of the most relevant approaches in the domain of applied ethics. The students will also be introduced to current theoretical and analytic technologies that are relevant to the different study tracks offered by the department. In particular, the course will cover the following domains: digital health technologies and medical AI; food, nutrition and healthy longevity; biomedical engineering; genetics; neuroscience and Neurotechnologies; medical robotics; disability and rehabilitation; environmental ethics. The course will also include sessions on cross-cutting ethically relevant aspects of health sciences and technologies, namely: access to innovation, translational research, and the relation between science and public policy.

All the topics of the course will be illustrated and interactively discussed through many case studies, offering the students the opportunity to prepare and present them, and to use them in individual as well as group exercises. Throughout the course, the students will have multiple opportunities to experiment with ethical argumentation and to practice their evolving skills.
At the end of the term, students will be able to:

- assessed Using philosophical and economic texts and discussions, students develop an understanding of the concepts, developments, causes, and consequences of inequality. Students will acquire the ability to participate in an informed discourse on the issues of inequality and injustice.
- Communication
- Cooperation and Teamwork
- Sensitivity to Diversity

Psychedelic Science: Psychology Pharmacology
Physiology Psychotherapy Philosophy Religion
Politics

Abstract
This lecture series covers psychedelic science mainly scientifically, and additionally pharmaco- logically, psychologically, philosophically, religiously, and politically. All contributions will also be reflected from the viewpoint of the humanities and psychology. The psychedelic studies treated in this course that involve humans focus on controlled and ethically approved studies where these substances are administered to medically screened, prepared, and supported participants. This course is in no way intended to encourage the private/illegal use of psychedelic substances.

Objective
To provide students with a multidisciplinary introduction to psychedelic science, and to also comprehensively embed this in a reflection from a humanities/psychedelic viewpoint.

Content
Psychelic science is a multidisciplinary field of study that involves scholars of the human sciences, the natural sciences, and the humanities. In this course, psychedelic science is presented mainly from the point of view of psychology, but will additionally also be considered from the viewpoints of pharmacology, physiology, psychotherapy, philosophy, religion, and politics. All contributions will also be reflected from the viewpoint of the humanities and psychology. The psychedelic studies treated in this course that involve humans focus on controlled and ethically approved studies where these substances are administered to medically screened, prepared, and supported participants. This course is in no way intended to encourage the private/illegal use of psychedelic substances.

A psychedelic experience is occasioned by classic (serotonergic) psychedelics such as lysergic acid diethylamide (LSD), psilocybin, mescaline, and N,N-dimethyltryptamine (DMT). Psychologically, the psychedelic experience can be characterized as a temporary nonordinary state of consciousness (NSC) that basically differs from everyday waking consciousness in terms of all three traditionally identified components of the mind: cognition (perception and thought), affect (emotions and mood), and conation (volition, willpower).

Psychedelic nonordinary cognition may for instance involve visions of geometric patterns or the perception of a subject-object transcending oneness; psychedelic nonordinary affect may for instance involve great anxiety, deepest sadness, or highest bliss; and psychedelic nonordinary conation may for instance involve themes such as surrendering to the psychedelic experience or letting go of emotionally difficult aspects of one’s life.

Studying the psychedelic experience is a worthwhile endeavor. While psychedelic experiences can also be challenging/confrontational, they are often deeply meaningful to the individual experiencing them. Studies have shown that such experiences are often associated with enduring positive effects on attitudes, mood, and behavior in healthy individuals and—in conjunction with psychotherapy—with sustained symptom reductions in individuals suffering from depression, anxiety, and addiction (also showing some first promise for a number of other mental conditions, such as obsessive-compulsive and eating disorders).

Psychelic science is overall a large multidisciplinary effort that requires collaboration of scholars of the human sciences, the natural sciences, and the humanities to advance the scientific knowledge of it. In this spirit, this course involves—besides the main lecturer (PD Dr. Kurt Stocker, a psychologist)—also further psychedelic-scientific scholars doing primary lectures in their respective field of expertise: psychology (PD Dr. phil. Katrin Preller, University of Zurich & Yale University), pharmacology (Dr. phil. nat. Dino Luethi, University Hospital Basel; Dr. phil. nat. Deborah Rudin, University Hospital Basel; Prof. Dr. phil. Linda Simmler, University of Basel), physiology (PD Dr. sc. nat. Felix Scholkmann, University of Zurich & University of Bern), psychotherapy (Prof. Dr. med. Gregor Hasler, University of Fribourg; Dr. med. Dr. sc. ETH Milan Schiedegger, University of Exeter), religion (TBA), and politics (Dr. phil Claudia G. Schwarz, Karl Landsteiner University of Health Sciences, Krems). By incorporating all these disciplines, the curricular goal of this ETH course is to cover psychedelic science from the large variety of major academic disciplines that are involved in this field, and to thus introduce psychedelic science to the students as broadly and comprehensively as possible within a single course.

Inequality and Injustice: Economic and Philosophical Perspectives

Abstract
Globalization and technological progress in recent decades have given rise to new forms of inequality on the other hand. The question is whether these new forms of inequality lead to more inequality. This course provides an overview of the current philosophical and economic discourse on inequality and injustice.

Objective
Using philosophical and economic texts and discussions, students develop an understanding of the concepts, developments, causes, and consequences of inequality. Students will acquire the ability to participate in an informed discourse on the issues of inequality and injustice and to critically reflect on their actions and position in the world.

Content
In this seminar we will explore the issues of inequality and injustice. In doing so, we will explore the following questions: What is meant by inequality and injustice? Under what circumstances are inequalities unjust? Have inequalities and injustices increased or decreased over the last 50 years? What are the causes of increasing or decreasing inequality? What do these inequalities and injustices mean for our society? And what public and private measures are needed for more inclusive societies?

- Concepts of inequality and injustice
- Development of inequality over the last 50 years based on different dimensions of inequality: income, wealth, education, health, CO2 emissions, political participation.
- Discrimination of women, people with physical disabilities, people of the “Global South”.
- Causes of inequality: globalization, technological progress, political systems and institutions, economic system, social discrimination, stereotypes and norms.
- Consequences of inequality: justice, dignity, inefficiency
- Towards more inclusive societies: the role of policies, civil society, social movements and individual behavior.

The seminar is based on readings of economic and philosophical texts and is complemented by short presentations and discussions with scholars of philosophy and economics. In some cases, practitioners will also be invited to the seminar. Students will apply the concepts, theories and knowledge covered in the course to practical issues related to inequality and inequity.

Data and Society

Abstract
This lecture series explores the multifaceted role of data in shaping contemporary society, governance, and individual lives. The course equips students with a critical understanding of how data is made, managed, and preserved, and its implications for societal norms and individual rights.

Objective
At the end of the term, students will be able to:

- reflect concepts and theories that capture the performativity of data
- reflect concepts and theories that capture the socio-technical nature of data
- assess the implications of data practices for social and political ordering
- identify key actors, sites, and domain contexts of data practices
Bioethics is a very broad field, encompassing ethical issues relating to life and death, e.g. reproductive technology, euthanasia, organ transplantation, genetic engineering, animal and nature conservation, human enhancement, animal welfare, nature conservation, biodiversity and our relation to nature more generally.

Adaptability and Flexibility
Communication
Analytical Competencies
Problem-solving
Sensitivity to Diversity
Adaptability and Flexibility
Creative Thinking
Critical Thinking
Self-awareness and Self-reflection

Students will get an overview of different historical and contemporary approaches in bioethics. They are enabled to further developing their abilities to understand complex theories, to critically reflect on them and to put them up for discussion.

Content

Bioethics is a very broad field, encompassing ethical issues relating to life and death, e.g. reproductive technology, euthanasia, organ transplantation, genetic engineering, human enhancement, animal welfare, biodiversity and our relation to nature more generally. Bioethics is addressed in various contexts and disciplines, in politics, in religious contexts, in social sciences, medicine, and the biosciences. The focus in this course is on the fundamental debates in ethics as a philosophical discipline. In addition, topics are selected for discussion depending on the students' interests.

851-0077-00L Philosophy of War

Does not take place this semester.

Abstract

In the course we read classical texts from the field of philosophy of war (Clausewitz, Sun Tzu, Tolstoy, Machiavelli, Kant) and focus on questions such as: what is war? Strategy and tactics in war? Ethics of war? War and Politics?

Objective

Students learn about the different types of argumentative texts and their historical, social, political and ethical context. They learn to understand the descriptive and critical value of texts in regard to the topic of war.

---

W 3 credits 2V

H. Atmanspacher

The Philosophy of Physics: Complex Systems

Short description: The course deals with the description and understanding of complex systems in physics and related fields, as well as selected applications.

Objective

Participants should acquire knowledge about how to characterize complex systems adequately, to be aware of the problems involved in their prediction and control, and to apply their knowledge in an interdisciplinary context.

Content

Basic concepts for the treatment of complex systems are state spaces, observables, partitions, dynamics, stability, and information. They are introduced in general and concretized by means of examples. Furthermore, various definitions of complexity are introduced, which are linked to concepts such as emergence, meaning, non-commutative observables, and scaling laws. Finally, different types of networks are discussed, as well as learning processes and other types of dynamics in such networks.

A Sampler of Histories and Philosophies of Mathematics

Particularly suitable for students D-CHAB, D-INFK, D-ITET, D-MATH, D-PHYS

Abstract

The course will read several case studies from the ancient, medieval and modern history of mathematics. The case studies will be analyzed from various philosophical perspectives, while situating them in their historical and cultural contexts.

Objective

The course aims are:

1. To introduce students to the historicity of mathematics
2. To make sense of mathematical practices that appear unreasonable from a contemporary point of view
3. To develop critical reflection concerning the nature of mathematical objects
4. To introduce various theoretical approaches to the philosophy and history of mathematics
5. To open the students' horizons to the plurality of mathematical cultures and practices

Artificial Intelligence and Human Values

Objective

The main objectives of the course are to enable students to 1) identify the ways in which human values and developments of AI technologies are entangled, 2) articulate what is significant about contemporary transformations in AI and society, and 3) participate and shape the relationship between human values and AI as citizens and professionals.

Content

The growing presence of AI tools for public use, for public administration, inside corporations and in scientific research raises many questions about the ethical, political, legal consequences of these technologies. This course is built around multiple sites of encounter among human values and AI, including bodies, persons, cities, labs, law, and environment. In each site, we inquire about what and whose values are being prioritized and with what consequences. The course also investigates existing best-practices around how to "align" human values with AI (e.g. human-centric design, alignment, reproducibility, transparency, explainability) and introduces students to regimes of ethics and governance of AI being proposed in jurisdictions around the world. Students learn to unpack the values and assumptions in existing techniques and frameworks for the design and governance of AI and to engage constructively with diverse stakeholders to shape the human-technology future towards aims that are reflexive, responsible, and democratic.

Science, Trust and Politics

Abstract

The seminar aims to nuance understanding of the dynamics of expertise in society. Cross-fertilizing literature from science and technology studies (STS) and from activists' movements, it focuses on contemporary controversies around emerging technologies and climate policy, where trust in science is said to be undermined (e.g. climate skepticism or anti-vaccine movements).

Objective

1) Introduce to the role and functions of expertise in democratic societies. 2) Familiarize with assumptions about science and society embedded in contemporary controversies. 3) Inspire critical perspectives on (dis)trust in science through activists' movements on contested environmental and technological issues. 4) Develop a creative position on the relations between science, trust and politics.
Engineers and scientists often pursue their studies and research in the hope that their knowledge can contribute to make a better world, inform democratic deliberation and help public understanding of complex issues. Yet this special status of science and technology is being increasingly contested by marginalized publics, lobbies, exposed populations, and by members of the scientific communities themselves. Climate skepticism or vaccine hesitancy are some of the most vivid examples of such confusing situations. In this seminar, students will learn to reflect on expertise as a form of scientific engagement in the messiness of democratic deliberation and public life, beyond the noble but outdated ideal of “speaking truth to power”.

The exercise of expertise is stumbling upon several conundrums. Which knowledge is relevant in which situation? How to make sure that some crucial perspectives are not left in the shadows? How to identify representative experts and make sure that they speak on behalf of a structured community? Whose voices are being silenced? On the other side of the story, the public is often said to lack proper understanding of science and thus in need of being educated or disciplined. Or is it suspected of being manipulated by lobbies or foreign hostile powers, or of being too attached to its own privileges and unwilling to act in favor of the common good. Whose agency is being acknowledged in sociotechnical controversies and whose agency is being denied and why? The seminar will provide a deep understanding of these perspectives, by putting them in a broader historical and epistemological context. Students will thus learn to critically assess their strengths as well as their blind spots.

Whereas opposing technological developments (anti-5G or anti-vaccine activists) or pushing to act accordingly to science (pro climate movements such as Extinction Rebellion or Scientist Rebellion), activists’ movements make up for a rich field of investigation on the dynamics of expertise’s texts and sense of scientific justifications. This seminar will be organized as a structured conversation and a collective mapping of actors and key concepts of sociotechnical controversies. Over the course of the semester, students will learn not only to navigate some of the most heated contemporary debates, but also to articulate their own position on an issue of their choice.

- **851-0040-00L: Can it Be Permissible to Kill a Few in Order to Save Many?**
  - **Abstract**
    - First, the relevant literature on moral justifications in trolley cases will be discussed (Foot, Thomson, Kamm, Otsuka, Kagan). Second, neuropsychological research on trolley cases (Greene, Haidt, Berker, Kamm) and third, applications of such moral reasoning in cases of medical emergencies, terrorist attacks or humanitarian interventions. In some of these situations our intuitions stay clear and disapproving: it is not permissible to kill, even in order to save many lives, for example, to take the vital organs of one patient in order to save many more other patients. In other scenarios, the intuitions are less clear or even revert for most of us, like in the famous trolley-bystander case, in which a bystander can divert an out-of-control trolley heading towards five to a track where one person is trapped. How are these moral intuitions to be justified, if they are? In this seminar the relevant literature on moral justifications in trolley cases (Greene, Haidt, Berker, Kamm) and third, applications of such moral reasoning in cases of medical emergencies, terrorist attacks or humanitarian interventions. In some of these situations our intuitions stay clear and disapproving: it is not permissible to kill, even in order to save many lives, for example, to take the vital organs of one patient in order to save many more other patients. In other scenarios, the intuitions are less clear or even revert for most of us, like in the famous trolley-bystander case, in which a bystander can divert an out-of-control trolley heading towards five to a track where one person is trapped. How are these moral intuitions to be justified, if they are? In this seminar the relevant literature on moral justifications. Cross-ethical debates will be represented as well as on methodological problems pertaining to the role of intuitions in moral justifications. Neuropsychological research on such cases as well as critique of the methods and normative presuppositions used in that research will be debated. Finally, attempts to apply such moral reasoning on allegedly analogous cases arising in autonomous robots will be discussed.

- **851-0193-00L: Understanding in Science and Mathematics: A**
  - **Abstract**
    - Students will gain an overview of the current ethical debates surrounding the legitimacy of homicide-rescue-cases in specific types of medical emergencies, terrorist attacks or humanitarian interventions. In some of these situations our intuitions stay clear and disapproving: it is not permissible to kill, even in order to save many lives, for example, to take the vital organs of one patient in order to save many more other patients. In other scenarios, the intuitions are less clear or even revert for most of us, like in the famous trolley-bystander case, in which a bystander can divert an out-of-control trolley heading towards five to a track where one person is trapped. How are these moral intuitions to be justified, if they are? In this seminar the relevant literature on moral justifications in trolley cases (Greene, Haidt, Berker, Kamm) and third, applications of such moral reasoning in cases of medical emergencies, terrorist attacks or humanitarian interventions. Understanding is a central goal of science and mathematics: scientists seek to understand various phenomena in the natural world, while

**Abstract**

Understanding is a central goal of science and mathematics, but what exactly is the nature of scientific and mathematical understanding? In this seminar, we will read and discuss a number of key philosophical contributions on understanding in philosophy of science, philosophy of mathematics, and epistemology. You will also practice your skills in giving clear and engaging oral presentations.

The main objective of this seminar is to gain an in-depth understanding of the recent literature on understanding in philosophy of science, the philosophy of mathematics, and epistemology. Another practical objective is to increase your skills in giving clear and engaging oral presentations.

To this end, we will read a number of key philosophical contributions on understanding in philosophy of science, philosophy of mathematics, and epistemology. Along the way, we will address general issues on understanding such as: What is the relation between understanding and knowledge? Does understanding necessarily require explanation? How can understanding be transmitted? What exactly is the value of understanding? We will also look into specific case studies of scientific and mathematical understanding.

Each session will be decomposed into three blocks. In blocks 1 and 2, we will have a short presentation (~15 minutes) of a contribution in the philosophy of understanding followed by a discussion. Block 3 will be methodological and will be concerned with how to give good oral presentations, an essential skill in academia. We will use this block to debrief on the presentations of the day and see how they could be improved. We will also discuss resources on best practices in oral communication.

**Philosophical Perspective**

**Does not take place this semester.**

**Content**

WE are here, because YOU have been there, have you ever heard that phrase? In a university lecture hall? In an anti-racist demonstration? In a play? In a discussion on the bus? The YOU represents Europe and in a broader sense the West, the WE the peoples who suffered colonialism by the very West that portrayed itself as a beacon of civilization. The history of colonialism in the modern age begins with Christopher Columbus who, as Todorov has well told us, did not "discover" anything, but crossed the Ocean in search of riches, bringing with him a bag of violence, stereotypes and violent conquest of resources and bodies. And from here, from that 1492, the story became one of blood and struggle.

To examine these consequences, to understand how contemporary societies in the global north and south, are still torn apart by this history that never seems to pass; we will rely on literature, on "postcolonial" texts that will show us the complexity of what exists. The course will be based on case studies, linked to national realities (Brazil, Senegal, Eritrea, Great Britain, Italy, Peru, Somalia, etc.) and to physical places (the front, the museum, the field, the street, the body), to see how in different contexts, despite the peculiarity of the context, the dilemmas that are attempted to be answered are in fact very similar.

The lecture will examine the body of the colonized/migrant as a field of battle and resistance in real and metaphorical wars. Place where the stereotype is overthrown through a will for personal agency. Colonial space and the consequent postcolonial space is a hierarchical space where instruments of violence and oppression do not provide for the agency of the colonized subject or in the contemporary case of the migrant subject placed by power structures in a space of subalternity. But subjects are born free and though in a confined space seek their own path to freedom and awareness. In ways that are perhaps paradoxical in our eyes, but certainly effective in a very limited space where instruments of violence and oppression do not provide for the agency of the colonized subject or in the contemporary case of the migrant subject placed by power structures in a space of subalternity. But subjects are born free and though in a confined space seek their own path to freedom and awareness. In ways that are perhaps paradoxical in our eyes, but certainly effective in a very limited space. The consequences of all this violence are sadly still visible on the body of the world, open wounds that bleed. Wounds in which lurk prejudice, systemic racism and murder.

To this end, we will read a number of key philosophical contributions on understanding in philosophy of science, philosophy of mathematics, and epistemology. Another practical objective is to increase your skills in giving clear and engaging oral presentations.

This course deals with how and why international problem-solving efforts (cooperation) in environmental politics emerge and evolve, and assessed

By the end of the semester, participants should have a solid knowledge of the history and theoretical foundations of International Relations since the end of the Second World War.

Subject-specific Competencies

Die Literatur wird auf Moodle bereitgestellt.

This lecture series provides students with an overview of the development of international relations since the end of World War II. The first part of the series deals with the development of and changes in Cold War security policy structures. The second part deals with the period after the transformation of 1989/91; the focus here is on current issues in international security policy.

Competencies

C. Freudlsperger

The objectives in this course are to (1) gain an overview of important questions pertaining to international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions pertaining to international environmental politics from a social sciences viewpoint; (3) learn how to identify interesting/innovative questions pertaining to international environmental politics from a social sciences viewpoint; (4) develop innovative and creative policy ideas; (5) foster a sense of responsibility and leadership; (6) foster a sensitivity to diversity; (7) foster a critical thinking; (8) foster an understanding of the role of negotiation in international environmental policy-making.

Prerequisites / notice

The lecture is being supported by a website on Moodle. If you have any questions, please contact Fabio Schmocker (fabio.schmocker@sipo.gess.ethz.ch)

853-0015-01L Conflict Research I: Political Violence  
W 3 credits 2V A. Juon

Abstract

Introduction to research on political violence in domestic and international politics. This course covers the causes and solutions to different types of political violence including interstate wars, civil wars, terrorism or social protests.

Objective

Knowledge on different types of political violence and their causes.

Content

This course offers an introduction to research on the causes and solutions to political violence in domestic and international politics. First, we discuss the definitions and concepts used in conflict research, the data and methods commonly applied and their historical development. Second, we focus on interstate wars and examine in this context state formation, nationalism and democracy. The third part of the course focuses on different types of political violence, including civil war, terrorism or social protests.

Prerequisites / notice

The course «Conflict Research II» in the following semester further examines civil wars.

853-0302-01L European Integration (Seminar without Tutorial)  
W 2 credits 2S C. Freudlsperger

Abstract

The lecture course covers the theory, development, and core policy fields of European integration as well as structures and processes of the EU as a decision- and policy-making system.

Objective

The seminar is designed to help students understand the European Union as a particular kind of political system that differs both from the nation-state and from other international organizations. It imparts basic knowledge on the development, institutions, procedures, and policies of the EU and provides an introduction to major approaches to integration theory and political science research on the EU.

Content

1. Introduction
2. Theories of European integration
3. Institutional development of European integration
4. Development of political integration
5. Internal market and monetary union
6. Internal and external security policies
7. Constitutionalization
8. Widening and differentiation
9. European integration in crisis
10. Institutions
11. Law-making and law enforcement
12. Statehood and democracy
13. Switzerland, the EEA and Neighbourhood Policies

Lecture notes

The seminar covers the theory, development, and core policy fields of European integration as well as structures and processes of the EU as a decision- and policy-making system.

Literature

Die Literatur wird auf Moodle bereitgestellt.

The grade is based on a written exam.

Competencies

Critical Thinking fostered

860-0023-00L International Environmental Politics  
W 3 credits 2V T. Bernauer

Abstract

This course deals with how and why international problem-solving efforts (cooperation) in environmental politics emerge and evolve, and under what circumstances such efforts are effective. Based on concepts and theories of political economy, political science, and public policy, various examples of international environmental policy-making are examined.

Objective

The objectives in this course are to (1) gain an overview of important questions pertaining to international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions in this policy area and how to address them in a conceptually and methodologically meaningful and insightful way; (3) gain an overview of important global and regional environmental problems and how they are or could be solved.

Content

This course deals with how and why international problem-solving efforts (cooperation) in environmental politics emerge and evolve, and under what circumstances such efforts are effective. Based on concepts and theories of political economy, political science, and public policy, various examples of international environmental policy-making are examined, for example international efforts to reduce air pollution, manage international water resources, mitigate and adapt to global warming, protect the stratospheric ozone layer, address biodiversity challenges, deal with plastic waste, and prevent pollution of the oceans.

Lecture notes

Reading materials and slides will be available via Moodle.

Literature

Reading materials and slides will be available via Moodle.
The course is open to all ETH students and visiting students from other universities. Participation does not require previous coursework in the social sciences or environmental policy. This course will take place on campus (ETH Main Building, HG F.3). There will be no live-streaming, and the course is NOT in hybrid (on-campus plus online) format. However, the lecture will be recorded and the recordings will be made available via the Moodle platform for this course a few days after the respective lecture for students who are unable to attend in person. All electronic correspondence will take place via the ETH mystudies system and Moodle, so please make sure you are properly registered there with a functioning email address/account.

Credits and Exam
After passing a written test at the end of the course (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test). Visiting students (e.g., from the University of Zurich, exchange students) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory. Students who obtain a grade of < 4.0 for the test will have a second chance (see table below). Students who did not participate in the test on 18 December 2023 will not have access to the repeat test unless they submit compelling and documented (e.g. medical, other exam in parallel at ETH) reasons for why they were unable to participate in the first test. It covers all contents of the lectures and the reading assignments. Visiting students (e.g., from the University of Zurich or other universities) are subject to the same conditions. Registration for the course in the mystudies system of ETH is compulsory. No separate registration for the exam is required. Registration for the course as such covers everything. The exam will take place on campus, either in the F3 lecture hall or in a computer room. That is, you must be present in person at ETH Zurich on the exam date/time.

Competencies
- Subject-specific Competencies: Concepts and Theories
- Method-specific Competencies: Analytical Competencies, Problem-solving
- Personal Competencies: Critical Thinking

Literature
- Literature for the individual sessions will be available on Moodle.
- The lecture is being supported by a website on Moodle.
### Abstract
In this course students deepen their knowledge about global development and sustainability issues. We will show five movies each of them linked to one of the five P’s (Planet, People, Prosperity, Peace and Partnerships) reflecting the topics of the 2030 Agenda. Afterwards the movie will be critically discussed with researchers and relevant stakeholders from the broader society.

### Objective
- Students get a broad understanding of some of the most important issues and discussions related to sustainable development.
- Students get exposed to diverse realities of young people in developing countries.
- Students can critically reflect upon the information that is presented to them in the movies and relate it to the broader discussions around sustainable development.
- Students reflect on issues concerning communicating research and the realities of low-income settings to a wider public.

### Content
The aim of the course is to deepen student’s knowledge about global issues and to inspire them to reflect critically upon complex topics, which are related to the broader discourse on sustainable development. In each class, we show a documentary film, which is linked to one of the five critical areas of the 2030 Agenda (Planet, People, Prosperity, Peace and Partnerships), putting specific focus on realities in developing countries. Following the movie screenings, we will discuss the topic of the film in the light of sustainable development with an expert from academia and/or a practitioner from the field of development cooperation. In preparation for each class, the students read an academic paper, which will also be considered in the discussion. The idea of “Bridging Art and Science” is to expose an interdisciplinary group of students to artistic and scientific perspectives alike and to challenge them to deal with bias and polarization, and the role that the media and films play in that regard. The participants of the course will be given the chance to embrace the complexity of sustainable global development.

1) Introduce to the role and functions of expertise in democratic societies. 2) Familiarize with assumptions about science and society embedded in contemporary controversies. 3) Inspire critical perspectives on (dis)trust in science through activists' movements on contested environmental and technological issues. 4) Develop a creative position on the relations between science, trust and politics.

**Objective**

Engineers and scientists often pursue their studies and research in the hope that their knowledge can contribute to make a better world, inform democratic deliberation and help public understanding of complex issues. Yet this special status of science and technology is being increasingly contested by marginalized publics, lobbyists, experts and themselves. Climate skepticism or vaccine hesitancy are some of the most vivid examples of this confusing situation. In this seminar, students will learn to reflect on expertise as a form of scientific engagement in the messiness of democratic deliberation and public life, beyond the noble but outdated ideal of "speaking truth to power".

The exercise of expertise is stumbling upon several conundrums. Which knowledge is relevant in which situation? How to make sure that some crucial perspectives are not left in the shadows? How to identify representative experts and make sure that they speak on behalf of a structured community? Whose voices are being silenced? On the other side of the spectrum, the public is often said to lack proper understanding of science and thus in need of being educated or disciplined. Or is it suspected of being manipulated by lobbyists or foreign hosts or of being too aware of its own privileges and rights to act to its own privileges and rights. When is an agency and acknowledged in sociotechnical controversies and whose agency is being denied and why? The seminar will provide a deep understanding of these perspectives, by putting them in a broader historical and epistemological context. Students will thus learn to critically assess their strengths as well as their blind spots.

Whereas opposing technological developments (anti 5G or anti-vaccine activists) or pushing to act accordingly to science (pro climate movements such as Extinction Rebellion or Scientist Rebellion), activists' movements make up for a rich field of investigation on the dynamics of expertise and of how various publics can make sense of scientific knowledge. Cross-fertilizing activist's texts and experiences with literature in science and technology studies and anthropology, this class will be organized as a structured conversation and a collective mapping of actors and key concepts of sociotechnical controversies. Over the course of the semester, students will learn not only to navigate some of the most heated contemporary debates, but also to articulate their own position on an issue of their choice.

---

**Competencies**

Subject-specific Competencies
- Concepts and Theories: assessed
- Analytical Competencies: assessed
- Communication: fostered
- Cooperation and Teamwork: fostered
- Sensitivity to Diversity: fostered
- Negotiation: fostered
- Adaptability and Flexibility: fostered
- Creative Thinking: fostered
- Critical Thinking: assessed
- Self-awareness and Self-reflection: assessed

Method-specific Competencies
- Digital Technologies and Armed Conflict

**Content**

Digital technologies are increasingly present in the context of armed conflicts, and they are primarily provided by private technology companies. This course presents current trends, analysing the risks involved in the digitisation of conflicts, both for civilians (as means and victims) and for private technology companies as the main actors of this transformation.

Students will learn how digital technologies are impacting modern conflicts and what are the actual and future trends in this domain. Students will focus on the implications for tech companies, understanding the new challenges from a technological, policy and legal perspective.

**Objective**

Students will learn how digital technologies are impacting modern conflicts and what are the actual and future trends in this domain. Students will focus on the implications for tech companies, understanding the new challenges from a technological, policy and legal perspective.

**Content**

1. Introduction: International Humanitarian Law IHL 101; International Committee of the Red Cross ICRC's perspective; Terminology.
2. Digital Capabilities in Armed Conflict: Overview; Established cyber capabilities; The cyber weapons dilemma; Attribution and self- attribution; Other digital means during armed conflicts.
3. Connectivity in Crisis: No connectivity: the connectivity gap; Loss or limitation of connectivity; Stable connectivity: connected in crisis.
4. Hybrid and Unconventional Warfare: Kinetic and cyber offensive operation coordination; Disruption of digital services; The dual-use dilemma; The public-private partnership dilemma; Civilianization of digital warfare, Total offense and whole-of-societies: a digital perspective of society's active participation; The cognitive warfare: a digital perspective of modern low-intensity constant warfare.
5. The Potential Human Cost of Cyber Operations.
7. Case Studies (based on scenarios).

Human Learning (EW1)

This lecture is only apt for students who intend to enrol in the programs "Teaching Diploma" or "Teaching Certificate". It is about learning in childhood and adolescence.

Abstract
This course looks into scientific theories and also empirical studies on human learning and relates them to the school.

Objective
Anyone wishing to be a successful teacher must first of all understand the learning process. Against this background, theories and findings on the way humans process information and on human behaviour are prepared in such a manner that they can be used for planning and conducting lessons. Students additionally gain an understanding of what is going on in learning and behavioural research so that teachers are put in a position where they can further educate themselves in the field of research into teaching and learning.

Content
Thematische Schwerpunkte:

1. Lernen als Verhaltensänderung und als Informationsverarbeitung: Das menschliche Gedächtnis unter besonderer Berücksichtigung der Verarbeitung symbolischer Information; Lernen als Wissenskonstruktion und Kompetenzerwerb unter besonderer Berücksichtigung des Wissenstransfers; Lernen durch Instruktion und Erklärungen; Die Rolle von Emotion und Motivation beim Lernen; Interindividuelle Unterschiede in der Lernfähigkeit und ihre Ursachen; Intelligenztheorien, Geschlechtsunterschiede beim Lernen

Lernformen:

Lecture notes
Folien werden zur Verfügung gestellt.

Literature

Prerequisites / notice
This lecture is only apt for students who intend to enrol in the programs "Lehrdipлом" or "Didaktisches Zertifikat". It is about learning in childhood and adolescence.

Support and Diagnosis of Knowledge Acquisition Processes (EW3)

Enrolment only possible with matriculation in Teaching Diploma (except for students of Sport Teaching Diploma, who complete the sport-specific course unit EW3) and for students who intend to enrol in the "Teaching Diploma".

Prerequisites: successful participation in 871-0240-00L "Human Learning (EW1)"

Abstract
In this seminar students learn advanced techniques to support and to diagnose knowledge acquisition processes in school.

Objective
The main goals are:
1) You have a deep understanding about the cognitive mechanisms of knowledge acquisition.
2) You have a basic understanding about psychological test theory and can appropriately administer tests.
3) You know various techniques of formative assessment and can apply these to uncover students’ misconceptions.

Competencies
Subject-specific Competencies
Concepts and Theories assessed
Techniques and Technologies assessed

Method-specific Competencies
Analytical Competencies assessed
Decision-making fostered
Media and Digital Technologies fostered
Problem-solving fostered

Social Competencies
Communication fostered
Cooperation and Teamwork fostered
Leadership and Responsibility fostered
Sensitivity to Diversity fostered

Personal Competencies
Creative Thinking fostered
Critical Thinking fostered

Human-Computer Interaction: Cognition and Usability

Particularly suitable for students of D-ARCH, D-INFK, D-ITET.

Abstract
This seminar will introduce key topics, theories and methodology in human-computer interaction (HCI) and usability, with a focus on applying them to real situations.

Objective
Presentations will cover the basics of human-computer interaction and selected topics:
- History of HCI
- Research ethics
- Literature reviews
- Participant-free methods: cognitive walkthrough and heuristic evaluation
- Card sorting and information architecture
- Usability studies
- Unmoderated research and diary studies
- Surveys
- User Logs and metric frameworks

On a weekly basis, students will conduct authentic research in class covering the topics above. They will submit their in-class research results regularly and also present their findings to the class once per semester.

The final project demonstrates classic topic adoption by deeply exploring one HCI problem using the covered methods and tools. Students will choose a research topic and execute their research plan. They will individually write a formal report including problem definition, literature review, methodology, findings and discussion.

Psychological Aspects of Risk Management and Technology

Using uncertainty management by organizations and individuals as conceptual framework, risk management and risk implications of new technologies are treated. Three components of risk management (risk identification/evaluation, risk mitigation, risk communication) and underlying psychological and organizational processes are discussed, using company case studies to promote in-depth understanding.
Objective

- You know how risk and risk management is defined and applied in different industries
- You know the challenges of decision making under risk and uncertainty and its effects on organisations
- Know about and (partially) apply some risk management tools
- Gain some more in-depth knowledge in a selected field within risk management through the semester project (e.g. transport systems, IT, insurance)

This course consists of three main elements:

A) Attendance of lectures that provide the theoretical foundations of “Psychological Aspects of Risk Management and Technology” together with reading assignments for each lecture.

B) Attendance of guest lectures that provide a rich source of practical insights and enable the transfer of theory into practice by discussing real-life cases with experts from various industries.

C) Furthermore, this course enables you to apply what you have learned in the classroom into practice by participating in a group assignment in which you gain insights into various risk industries (e.g., aviation, healthcare, insurance) and topics (e.g., risks in cyber-attacks, mountaineering, autonomous vehicles). These projects help students understand key aspects through in-depth application of the course material on real-life topics. Each group project will be mentored and graded by one of the lecturers (70% of course grade). To round off the course at the end of the year, you will have the opportunity to present your group’s findings to the lecturers and to your peers (30% of course grade).

Content

The course is organized into fourteen sessions. Sessions comprise a mixture of (guest) lectures, case discussions, and presentations. Through class discussion we will further deepen understanding of the topics and themes of the class. For each session you are required to prepare by reading the assigned literature or case material provided on the Moodle e-learning platform. Topics covered include:

- Elements of risk management:
  - Risk identification and evaluation
  - Risk mitigation
  - Risk communication

- Psychological and organizational concepts relevant in risk management
  - Decision-making under uncertainty
  - Risk perception
  - Resilient organizational processes for managing uncertainty

- Case studies on different elements of risk management (e.g., rule-making, training, managing project risks, automation)

- Group projects related to company case studies

Lecture notes

There is no script, but slides will be made available before the lectures.

Literature

There are texts for each of the course topics made available before the lectures.

Prerequisites / notice

The course is restricted to 40 participants who will work closely with the lecturers on case studies prepared by the lecturers on topics relevant in their own companies (SWICA, SWISS, University Hospital Zurich).

Competencies

Subject-specific Competencies

- Concepts and Theories
- Analytical Competencies
- Decision-making
- Problem-solving
- Project Management

- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

Personal Competencies

- Decision-making fostered
- Problem-solving fostered
- Project Management assessed
- Communication assessed
- Cooperation and Teamwork assessed
- Self-presentation and Social Influence fostered
- Sensitivity to Diversity fostered
- Adaptability and Flexibility fostered
- Creative Thinking fostered
- Critical Thinking assessed
- Integrity and Work Ethics fostered
- Self-awareness and Self-reflection fostered
- Self-direction and Self-management fostered

701-0721-00L Psychology W 3 credits 2V R. Hansmann, A. Bearth, M. Siegrist

Abstract

This course provides an introduction to psychological research and modelling, focusing on cognitive psychology and the psychological experiment. Participants learn to formulate problems for psychological investigation and apply basic forms of psychological experiment.

Objective

Students are able to
- describe the areas, concepts, theories, methods and findings of psychology.
- differentiate scientific psychology from "everyday" psychology.
- structure the conclusions and significance of an experiment. according to a theory of psychology.
- formulate a problem for psychological investigation.
- apply basic forms of psychological experiment.

Content

Einführung in die psychologische Forschung und Modellbildung unter besonderer Berücksichtigung der kognitiven Psychologie und des psychologischen Experiments. Themen sind u.a.: Wahrnehmung; Lernen und Entwicklung; Denken und Problemlösen; Kognitive Sozialpsychologie; Risiko und Entscheidung.
Students are taught a variety of analytic techniques that can be used to evaluate architectural design. The concept of evidence-based design is introduced, and complemented with theoretical background on space syntax and spatial cognition. This is a project-oriented course, students implement a range of methods on a sample project. The course is tailored for architecture design students.

Objective:
The course aims to teach students how to evaluate a design project from the perspective of the end user. The concept of evidence-based design is introduced through a series of case studies. Students are given a theoretical background in space syntax and spatial cognition, with a view to applying this knowledge during the design process. The course covers a range of methods including visibility analysis, network analysis, conducting real-world observations, and virtual reality for architectural design. Students apply these methods to a case study of their choice, which can be at building or urban scale. For students taking a B-ARCH or M-ARCH degree, this can be a completed or ongoing design studio project. The course gives students the chance to implement the methods iteratively and explore how best to address the needs of the eventual end-user during the design process.

The course is tailored for students studying for B-ARCH and M-ARCH degrees. As an alternative to obtaining D-GESS credit, architecture students can obtain course credit in "Vertiefungsfach" or "Wahlfach".
Psychedelic science is a multidisciplinary field of study that involves scholars of the human sciences, the natural sciences, and the humanities to advance the scientific knowledge of it. In this spirit, this course involves—besides the main lecturer (PD Dr. phil. Kurt Stocker, a psychologist)—also further psychedelic-scientific scholars giving individual lectures in their respective field of disciplines that are involved in this field, and to thus introduce psychedelic science to the students as broadly and comprehensively as possible in the category "Educational Science"!!!

Enrolment possible with matriculation in Master HST. This course unit can only be enrolled after successful participation in, or during enrolment in the course "Human Learning (EW 1)". Teaching Diploma Sports: allocation of the ECTS only possible in the category "Educational Science"!!!
Abstract
In this seminar, we consider how the human brain processes social information. The approach focuses on exploring the neural bases of social cognition in healthy individuals, as well as providing case studies from atypical populations, whose pathologies are typified by dysfunction in social information processing, such as autism spectrum disorder and schizophrenia.

Objective
- To familiarise students with forms of social cognition in humans, as well as the neural systems that support social cognition.
- To critically evaluate theories and data relating to Social Cognition and Social Neuroscience.
- To relate how knowledge of typical brain function can inform our understanding of individuals who process social information differently, and vice versa.
- To develop effective scientific communication skills in oral and written formats.

Content
This seminar will consider how the human brain understands and organises social behaviour. The approach will focus on exploring the neural bases of social cognition in healthy individuals, as well as providing case studies from atypical populations, whose pathologies are typified by dysfunction in social information processing. Examples of such pathologies include autism spectrum disorder, schizophrenia and attention deficit hyperactivity disorder. By examining healthy and atypical populations, this module will highlight how disorders of social cognition can inform the understanding of healthy brain function, as well as how understanding healthy brain function can inform disorders of social cognition.

851-0392-00L Privacy Quantification and Usable Protection

Abstract
Students will gain an overview of the main privacy metrics that are used to evaluate privacy risks related to the use of a given technology. They will also be introduced to the concepts of privacy/utility balance and usable security. Practical exercises and reading of recently published scientific articles will be used to present practical cases of the theoretical tools presented in class.

Objective
This course aims to provide the students with a global knowledge of the concepts related to privacy, and the methodology and tools to identify, analyze, and address threats while taking the user into account in the process. They will adopt a "privacy mindset", thus enabling them to automatically take privacy into account, in a usable way, when designing or analyzing a system.

Content
First, the course will introduce the different definitions and approaches of privacy (e.g., privacy by control, privacy by design) as well as the ethical concerns and considerations related to information security and privacy research (e.g., responsible disclosure, full disclosure).

Second, the students will be introduced to the different methods, properties, and metrics to assess and/or guarantee a certain level of privacy. They will be introduced to the properties and metrics related to anonymization (e.g., k-anonymity, l-diversity), data aggregation (e.g., randomized responses, ε-differential privacy), as well as other privacy assessment methodologies (e.g., inferential privacy).

Third, the course will address usability issues and the role of individuals (i.e., users) in privacy management (i.e., usable security and privacy) and the design of privacy-enhancing technologies. In this context, we will analyze the main concepts seen during the course and discuss their advantages and disadvantages in terms of usability, as well as their implementation for mass-market and large-scale technologies.

Across all three parts of the course, practical exercises, as well as recent research articles reading, and presentations will be used as a complement to support the concepts seen in class, as well as to provide concrete examples of methodologies related to the assessment of privacy in general.

851-0271-00L Neuroaesthetics - Exploring the Science of Aesthetic Experience

Abstract
This seminar introduces students to theory and research, challenges, and opportunities in neuroaesthetics, with a clear emphasis on the interdisciplinary nature of the discipline situated at the intersection of neuroscience, psychology, and art appreciation. Foundational empirical methods and critical perspectives of research approaches in neuroaesthetics are considered.

Objective
- To familiarize students with concepts, models, methods, brain and behavioral findings related to aesthetic experience.
- To develop a critical understanding in evaluating the theoretical and empirical findings in neuroaesthetics.
- To integrate the acquired knowledge to critically debate and discuss the conceptual and empirical issues related to the science of aesthetic experience.

Content
In this seminar, students will learn about the foundational principles of neuroaesthetics, which explores the cognitive and brain processes involved in aesthetic experience. A key focus will be placed on developing an appreciation of the interdisciplinary methods used in the neuroaesthetics field – ranging from neuroscience, psychology, philosophy, and art history. The seminar is based on the active engagement of students in reading, presenting, and critically discussing selected papers in the field. In a final small-group assignment, students are expected to incorporate and elaborate upon the content covered in the seminar by presenting and discussing a novel research proposal for tackling a timely research question related to aesthetic experience.

Data: 26.07.2024 12:39 Autumn Semester 2024 Page 2601 of 2680
This seminar introduces the fundamentals and latest research developments of brain imaging in real-world contexts. We explore topics from imaging multiple people's brains simultaneously as they interact to neuro-ethics and neuro-art, while maintaining a strong focus on critical evaluation of research practices and applications of brain imaging of and during social interaction.

Rapid advances in the technologies and empirical approaches used in imaging the human brain have opened exciting windows into how the human brain coordinates social interaction. These advances include imaging the brain's function during real social interactions, training behaviours with feedback based on real-time brain activity, and even generating art directly from brain signals. With them, these advances have brought novel ethical implications regarding their implementation in research and potentially, their use by the public, for both therapeutic and possible “neurohacking” applications. In this seminar, students will be introduced to various neuroimaging approaches for social neuroscience generally, as well as to approaches for measuring social brain function in real life, and will gain insights into related ethical considerations.

The seminar builds on the active participation of students in reading, presenting, and critically discussing selected papers in the field. In a final small-group assignment, students are required to integrate and elaborate upon topics covered in the seminar by presenting and debating a novel research proposal for addressing a timely research question related to the use of brain imaging in the context of social interactions. No prior experience or knowledge in brain imaging is required.

### Course Information

- **Title**: The Cutting Edge of Social Brain Imaging
- **Type**: Workshop & Lecture Series
- **ECTS**: 2
- **Hours**: 2S
- **Lecturers**: E. Cross, R. Moffat

### Abstract

This series is a joint project by ETH Zurich and the Universities of St. Gallen and Zurich. It provides an overview of interdisciplinary research on intellectual property, innovation, antitrust, privacy & technology policy. Scholars from law, economics, management and related fields present their current research. All speakers are internationally well-known experts from Europe, the U.S. & beyond.

### Objective

After the workshop and lecture series, participants should be acquainted with interdisciplinary approaches towards intellectual property, innovation, antitrust, privacy and technology policy research. They should also have an overview of current topics of international research in these areas.

### Content

The workshop and lecture series will present a mix of speakers who represent the wide range of current social science research methods applied to intellectual property, innovation, antitrust, privacy and technology policy issues. In particular, theoretical models, empirical and experimental research as well as legal research methods will be represented.

### Lecture notes

Papers discussed in the workshop and lecture series are posted in advance on the course web page.
Contract Design I is taught by Professor Stremitzer and aims to bridge the gap between economic contract theory, contract law, and the application in real-world transactions. It is offered through the Science in Perspective (SiP) Program of D-GESS and is particularly relevant for students interested in contract law.

**Competencies**

- **Subject-specific Competencies**
  - Concepts and Theories
  - Analytical Competencies
  - Problem-solving

- **Method-specific Competencies**
  - Communication
  - Creative Thinking
  - Critical Thinking

**Literature**

- Suzanne Scotchmer, Innovation and Incentives, 2004
- Bronwyn Hall / Nathan Rosenberg, Handbook of the Economics of Innovation, 2 volumes, Amsterdam 2010
- Bronwyn Hall / Dietmar Harhoff, Recent Research on the Economics of Patents, 2011

**Subject-specific Competencies**

- Students are able to identify basic structures of the legal system. They understand selected topics of public and private law. They are able to apply the fundamentals in more advanced law classes and to recognize the relevance of law in their own field.

- Insights into the law of the EU.

- Concepts and Theories

- Analytical Competencies

- Problem-solving

- Communication

- Critical Thinking

**Content**

- Basic concepts of law, sources of law.
- Private law: Contract law (particularly contract for work and services), tort law, property law.
- Public law: Human rights, administrative law, procurement law, procedural law.

**Competencies**

- Subject-specific Competencies
  - Concepts and Theories
  - Analytical Competencies
  - Problem-solving

- Method-specific Competencies
  - Communication
  - Creative Thinking
  - Critical Thinking

**Abstract**

- This class introduces students into basic features of the legal system. Fundamental issues of constitutional law, administrative law, private law and the law of the EU are covered. The focus is on legal problems related to space. Active participation is expected in short interactive sequences.

- Students are able to identify basic structures of the legal system. They understand selected topics of public and private law. They are able to apply the fundamentals in more advanced law classes and to recognize the relevance of law in their own field.

- Basic concepts of law, sources of law.
- Private law: Contract law (particularly contract for work and services), tort law, property law.
- Public law: Human rights, administrative law, procurement law, procedural law.

**Introduction to Law**

- Students are able to identify basic structures of the legal system. They understand selected topics of public and private law. They are able to apply the fundamentals in more advanced law classes and to recognize the relevance of law in their own field.

- Insights into the law of the EU.

- Concepts and Theories

- Analytical Competencies

- Problem-solving

- Communication

- Critical Thinking

**Contract Design I**

- You can find all course materials and the most recent announcements on Moodle. Please log in to Moodle using your ETH or UZH credentials. Then search for "Contract Design I (851-0742-00L; Fall 2023)" and enroll. The password is "ContractDesign01".

- It is NOT a legal drafting class focused on contractual language.

- Number of participants limited to 160.
- Max 80 ETHZ and 80 UZH Students

- Contract Design I is taught by Professor Stremitzer and aims to bridge the gap between economic contract theory, contract law, and the application in real-world transactions. In this course, we take a systematic approach to contract design. This means we first analyze the economic environment in which a transaction takes place and then engineer contracts that achieve the desired outcome.

- Contracts are agreements between parties to engage in transactions. A good contract creates value by giving parties the right incentives to meet their objectives. A good contract designer scrutinizes the economic situation in which parties find themselves and tailors the contract to the challenges at hand. To help you become sophisticated contract designers, we draw from insights for which more than half a dozen Nobel Prizes were awarded in the past two decades and transfer them to the art of writing real-world contracts. In other words, Contract Design will provide you with analytical tools to design contracts that help you be better lawyers, business leaders, and startup founders.

- We will cover topics such as moral hazard, adverse selection, elicitation mechanisms, relationship-specific investments, and relational contracting and apply the theoretical insights to real-life case studies ranging from purchases & sales of assets, oil & gas exploration, movie financing, production & distribution, construction & development, M&A deals, venture capital financing, to executive compensation and many other types of transactions.

- The course follows a flipped-classroom model: You will watch learning videos specifically produced for this course ahead of class. We will use class time to discuss real-world case studies. The videos will be made available before the lecture each week and need to be watched ahead of coming to class. Computer-graded quizzes at the beginning of each class will test students' understanding of the concepts introduced in the videos.

- As the emphasis of this class is on class discussion, attendance is mandatory. Absent important reasons, you cannot miss class more than twice.

- The lectures will be recorded but only made available to those who miss lectures with excused absence.

- For ETH students: Your grade will consist of two parts:
  1. You will take weekly computer-based quizzes during class time. Thus, it is important that you attend the lectures to be able to finish the quizzes and pass this course.
  2. You compose short responses to take-home questions on case studies we assign and upload them ahead of class (Pass/Fail).

- Note that UZH and UNISG students enrolling in this course need to earn more ECTS for completing this course than ETH students (due to curricula reasons). This is why UZH and UNISG students must complete a written assignment in addition to the weekly quizzes and take-home questions. UZH students also have to complete an additional group project.

- UZH and UNISG students should check out the description of the class at their respective home institutions.

- Attendance is mandatory. You are only allowed to miss two lectures unless there are special circumstances.

- Contract Design I is available to ETH students through the Science in Perspective (SiP) Program of D-GESS. This course is particularly suitable for students of D-ARCH, D-BAUG, D-CHAB, DMATH, D-MTEC, D-INFK, and D-MAVT.

- If you have any questions regarding the course, please write an email to the teaching assistants, Lucas Gericke (lucas.gericke@gess.ethz.ch) or Serge von Steiger (serge.vonsteiger@gess.ethz.ch).

**Data:** 26.07.2024 12:39

**Autumn Semester 2024**
Students recognize the interplay between legal structures and urban space. They can describe legal concepts with spatial impact.

Using the term «lawscape» (Philippopoulos-Mihalopoulos), we initially discuss general aspects of the interplay between legal rules and urban space. Legal rules are tied to urban space. Illustrative is the relation between land ownership and urban morphology. Legal concepts with spatial impact can be described by analyzing specific cases.

Working tools are theoretical texts, legal rules, court decisions as well as site analyses. Students prepare the texts for joint discussions and undertake a case study in small groups. Selected case studies are presented and discussed in a final meeting.

Teaching of the principles of law, particularly private law. Introduction to law.

The course Private Law focuses on the Swiss Code of Obligations (contracts, torts) and on Property Law (ownership, mortgage and easements). In addition, the course will provide a short overview of Civil Procedure and Enforcement.

System of Swiss planning law, Constitutional and statutory provisions, Space planning and fundamental rights, Instruments, Application, legal protection, enforcement, Practical training.

Basic understanding of nature and function of space planning from a legal point of view. Basic knowledge of space planning instruments, relationship between space planning and constitutional law (especially property rights), solving of practical cases.

Haller, Walter/Karlen, Peter, Raumplanung-, Bau- und Umweltrecht, 3.A., Zürich 1999

Hangi, Peter, Planungs-, Bau- und besonderes Umweltchutzrecht, 7.A., Bern 2021

Documents will be available online (see https://moodle-app2.let.ethz.ch/course/view.php?id=20128).

See Literature.

Documents will be available online (see https://moodle-app2.let.ethz.ch/course/view.php?id=20128).

Number of participants limited to: 40

Sont conseillés:
- le Code civil et le Code des obligations;
- Nef, Urs Ch.: Le droit des obligations à l'usage des ingénieurs et des architectes, trad. Bovay, J., éd. Payot, Lausanne

Sont indispensables:
- le Code civil et le Code des obligations;

Particularly suitable for students of D-ARCH, D-BAUG, D-USYS.

Particularly suitable for students of D-ARCH, D-BAUG, D-USYS.

Particularly suitable for students of D-ARCH, D-BAUG, D-USYS.
### Objective

The objective is knowing and understanding key legal concepts relevant for doing e-business, in particular how e-business is regulated by law nationally and internationally, how contracts are concluded and performed electronically, which rules have to be obeyed in particular in the Internet with regard to third party and own content and client data, the concept of liability applied in e-business and the role of the law in the practical implementation and operation of e-business applications.

### Content

Vorgesehene Strukturierung der Vorlesung:

1. Welches Recht gilt im E-Business?
   - Internationalität des Internets
   - Regulierte Branchen

2. Gestaltung und Vermarktung von E-Business-Angeboten
   - Verwendung fremder und Schutz der eigenen Inhalte
   - Haftung im E-Business (und wie sie beschränkt werden kann)
   - Domain-Namen

3. Beziehung zu E-Business-Kunden
   - Verträge im E-Business, Konsumentenschutz
   - Elektronische Signaturen
   - Datenschutz
   - Spam

4. Verträge mit E-Business-Providern

Änderungen, Umstellungen und Kürzungen bleiben vorbehalten. Der aktuelle Termin- und Themenplan ist zu gegebener Zeit über Moodle abrufbar.

### Lecture notes

Es wird mit Folien gearbeitet, die als PDF über Moodle vorgängig abrufbar sind. Auf dem Termin- und Themenplan (ebenfalls online abrufbar) sind Links zu Gesetzestexten und weiteren Unterlagen abrufbar. Schliesslich wird jede Vorlesung auch als Podcast aufgezeichnet, der jedoch nur für die Studierenden mit einem Passwort (erhältlich beim Dozenten) zugänglich sind.

### Literature

Weiterführende Materialien, Links und Literatur sind auf dem Termin- und Themenplan aufgeführt (zu gegebener Zeit abrufbar via Moodle).

Data: 26.07.2024 12:39  Autumn Semester 2024  Page 2605 of 2680
The lecture gives an overview of the fundamental aspects of intellectual property, which plays an important role in the daily routine of engineers and scientists. The lecture aims to make participants aware of the various methods of protection and to put them in a position to use this knowledge in the workplace.

In recent years, knowledge about intellectual property has become increasingly important for engineers and scientists. Both in production and distribution and in research and development, they are increasingly being confronted with questions concerning the patenting of technologies force us to think carefully about notions of fairness and justice and how they should be applied.

The focus is on legal prediction problems. Given the evidence and briefs in this case, how will a judge probably decide? How likely is a criminal defendant to commit another crime? How much additional revenue will this new tax law collect? Students will investigate and implement the relevant machine learning tools for making these types of predictions, including regression, classification, and deep neural networks models.

We then use these predictions to better understand the operation of the legal system. Under what conditions do judges tend to make errors? Against which types of defendants do parole boards exhibit bias? Which jurisdictions have the most tax loopholes? Students will be introduced to emerging applied research in this vein. In a semester paper, students (individually or in groups) will conceive and implement an applied data-science research project.

The seminar will include practical exercises on how to use and search patent information. Basic knowledge of how to read and evaluate patent documents as well as how to use publicly available patent databases to obtain the required patent information will also be provided.

The lecture addresses students in the fields of engineering, science and other related technical fields.

Subject-specific Competencies: Concepts and Theories

Method-specific Competencies: Problem-solving

Personal Competencies: Critical Thinking

Self-awareness and Self-reflection

Particularly suitable for students of D-ARCH, D-BAUG, D-MTEC.

Particularly suitable for students of D-INFK, D-ITET, D-MTEC.

Does not take place this semester. Particularly suitable for students of D-ARCH, D-BAUG, D-USYS.

This course introduces students to scientific and technological developments that require regulation or enable legal innovation. We focus particularly on the challenges to current law posed by prominent near-future technologies.

Objective

The course is designed for a wide range of ETH students as well as for law students who are keen to deepen their understanding of cutting-edge technology. It offers an overview of key legal areas important for technology regulation, complemented by guest lectures on emerging technological trends.

In previous years, the course has featured esteemed speakers from various sectors, including industry leaders like Google, NGOs such as Digital Society Switzerland and The European Consumer Organization, regulatory bodies like the Swiss Competition Commission, and noted academics.

The course is open to ETH students through the Science in Perspective program of the Department of Humanities, Social and Political Sciences.

Content

The planned course outline is below.

- Overview of Law and Technology
- Fundamental Rights
- AI & Discrimination
- Landmark Big Tech Cases
- Regulation of Digital Platforms & Content Moderation
- Online Consumer Protection
- Law and Tech Scholarship Series

A number of recent regulations will be discussed, including the EU's AI Act, the Digital Services Act (DSA), and the Digital Markets Act (DMA), as well as emerging internet phenomena, like ChatGPT.

Prerequisites / notice

You can find all course materials and the most recent announcements on Moodle. Please log in to Moodle using your ETH or UZH credentials. Then search for "Law & Tech (851-0732-06L, HS 2024)" and enroll.

851-0763-00L Supervised Research (Law, Economics, and Data Science) Does not take place this semester.
### Abstract
This is a supervised student project for 3 ECTS, supervised by the professorship of Elliott Ash (D-GESS). Students will adapt tools from econometrics and machine learning to questions in law, data science, and social science.

### Objective
Students must have some data science and/or statistics experience. Some programming experience in Python, Stata, or R is required.

### Prerequisites / notice
Apply tools from data science and social science to a new project, potentially in a group, to develop a paper or app. Some programming experience in Python, Stata, or R is required. Some experience with data science or statistics is required.

#### 851-0567-00L Digital Technologies and Armed Conflict

</tbody>
</table>

**Abstract**
Digital technologies are increasingly present in the context of armed conflicts, and they are primarily provided by private technology companies. This course presents current trends, analysing the risks involved in the digitisation of conflicts, both for civilians (as means and victims) and for private technology companies as the main actors of this transformation.

**Objective**
Students will learn how digital technologies are impacting modern conflicts and what are the actual and future trends in this domain.

**Content**
1. Introduction: International Humanitarian Law IHL 101; International Committee of the Red Cross ICRC’s perspective; Terminology.
2. Digital Capabilities in Armed Conflict: Overview; Established cyber capabilities; The cyber weapons dilemma; Attribution and self-attribution; Other digital means during armed conflicts.
3. Connectivity in Crisis: No connectivity; the connectivity gap; Loss or limitation of connectivity; Stable connectivity: connected in crisis.
4. Hybrid and Unconventional Warfare: Kinetic and cyber offensive operation coordination; Disruption of digital services; The dual-use dilemma; The public-private partnership dilemma; Civilianization of digital warfare. Total offense and whole-of-societies: a digital perspective of society’s active participation; The cognitive warfare: a digital perspective of modern low-intensity constant warfare.
5. The Potential Human Cost of Cyber Operations.
7. Case Studies (based on scenarios).

<td>Project in Behavioural Finance</td>
<td>W</td>
<td>3 credits</td>
<td>2S</td>
<td>S. Andraszewicz, C. Hölscher, A. C. Roberts</td>
</tr>
</tbody>
</table>

**Abstract**
In this seminar, students will study cognitive processes, behaviour and the underlying biological response to financial decisions. Research methods such as asset market experiments, lottery games, risk preference assessment, psychometrics, neuroimaging and psychophysiology of decision processes will be discussed. Financial bubbles and crashes will be the core interest.

**Objective**
This course has four main goals:
1) To learn about the most important topics within Behavioural Finance
2) To learn to effectively select, review and present information using modern telecommunication tools
3) To practice working on group projects in hybrid working conditions (online + in-person)
4) To solve an applied behavioral finance business case stemming from an industry partner

**Content**
The course does not contain mandatory reading. Instead, it offers suggested literature that provides guidance to the students who, prepare a presentation on core topics in behavioral finance. The point of this exercise is to critically select the most relevant information on a given topic and present to non-expert educated colleagues. At the same time, the audience learns about the key topics in behavioral finance.

Throughout the semester, students work on solutions to real business cases stemming from a company partner. They can receive feedback and guidance from project leaders of the industry partner and from the academic supervisors. In the final meeting of the semester, students pitch solutions to their business cases.

The course takes place entirely online. The objective is to prepare the students for the future work in online and hybrid arrangements.

**Prerequisites / notice**
Students from all domains of ETH and all levels of education are welcome in the course.

**Abstract**
Social Network Science is a distinct domain of data science that focuses on relational systems. Various models have been proposed to describe structures and dynamics of networks, including statistical and mathematical methods. In this course, the emphasis is placed on the statistical analysis of (social) systems and their connection to social theories and data sources.
Objective

The following topics will be covered:

- Introduction to network models and their applications
- Stylized models:
  * uniform random graph models
  * small world models
  * preferential attachment models
- Models for testing hypotheses while controlling for the network structure:
  * Quadratic assignment procedure regression (QAP regression)
- Models for testing hypotheses on the network structure:
  * Models for one single observation of a network: exponential random graph models (ERGMs)
  * Models for panel network data: stochastic actor-oriented models (SAOMs)

The application of these models is illustrated through examples and practical sessions involving the analysis of network data using the software R.

Content

</tr>
</tbody>
</table>

Abstract

Network science is a distinct domain of data science that is characterized by a specific kind of data being studied. While areas of application range from archaeology to zoology, we concern ourselves with social networks for the most part. Emphasis is placed on descriptive and analytic approaches rather than theorizing, modeling, or data collection.

Objective

Students will be able to identify and categorize research problems that call for network approaches while appreciating differences across application domains and contexts. They will master a suite of mathematical and computational tools, and know how to design or adapt suitable methods for analysis. In particular, they will be able to evaluate such methods in terms of appropriateness and efficiency.

Content

The following topics will be covered with an emphasis on structural and computational approaches and frequent reference to their suitability with respect to substantive theory:

* Empirical Research and Network Data
* Macro and Micro Structure
* Centrality
* Roles
* Cohesion
* Influence

Lecture notes

Slides and lecture notes are distributed via the associated course moodle.

Literature

Abstract
The seminar aims at three-fold integration: (1) bringing modeling and computer simulation of techno-socio-economic processes and phenomena together with related empirical, experimental, and data-driven work, (2) combining perspectives of different scientific disciplines (e.g., sociology, computer science, physics, complexity science, engineering), (3) bridging between fundamental and applied work.

Objective
Participants of the seminar should understand how tightly connected systems lead to networked risks, and why this can imply systems we do not understand and cannot control well, thereby causing systemic risks and extreme events.

They should also be able to explain how systemic instabilities can be understood by changing the perspective from a component-oriented to an interaction- and network-oriented view, and what fundamental implications this has for the proper design and management of complex dynamical systems.

Computational Social Science and Global Systems Science serve to better understand the emerging digital society with its close co-evolution of information and communication technology (ICT) and society. They make current theories of crises and disasters applicable to the solution of global-scale problems, taking a data-based approach that builds on a serious collaboration between the natural, engineering, and social sciences, i.e. an interdisciplinary integration of knowledge.

### Applied Network Science: Sports Networks

**Code**: 851-0586-03L  
**Credit**: 3 credits  
**Semester**: Autumn Semester 2024  
**Instructor**: U. Brandes

**Abstract**  
We study applications of network science methods, this semester in the domain of sports. Topics are selected for diversity in sports, research questions, and techniques with applications such as passing networks, team rankings, or career trajectories. Student teams present results from the recent literature, possibly with replication, in a conference format.

**Objective**  
Network science as a paradigm is entering domains from engineering to the humanities but application is tricky. By examples from recent research on sports analytics, students learn to appreciate that, and how, context matters. They will be able to assess the appropriateness of approaches for substantive research problems, and especially when and why quantitative approaches are or are not suitable.

**Competencies**

- **Subject-specific Competencies**  
  - Concepts and Theories: assessed  
  - Techniques and Technologies: assessed  

- **Method-specific Competencies**  
  - Analytical Competencies: assessed

  - Critical Thinking: assessed  
  - Integrity and Work Ethics: assessed  
  - Self-awareness and Self-reflection: assessed  
  - Self-direction and Self-management: assessed

### Ethics Workshop: The Impact of Digital Life on Society

**Code**: 851-0745-00L  
**Credit**: 2 credits  
**Semester**: Autumn Semester 2024  
**Instructor**: E. Vayena, A. Blasimme, J. Sleigh

**Abstract**  
This workshop focuses on understanding and managing the ethical and social issues arising from the integration of new technologies in various aspects of daily life.

**Objective**  
- Explain relevant concepts in ethics.  
- Evaluate the ethical dimensions of new technology uses.  
- Identify impacted stakeholders and who is ethically responsible.  
- Engage constructively in the public discourse relating to new technology impacts.  
- Review tools and resources currently available that facilitate resolutions and ethical practice.  
- Work in a more ethically reflective way.

**Content**  
The workshop offers students an experience that trains their ability for critical analysis and develops awareness of responsibilities as a researcher, consumer and citizen. Learning will occur in the context of three intensive workshop days, which are highly interactive and focus on the development and application of reasoning skills.

The workshop will begin with some fundamentals: the nature of ethics, of consent and big data, of AI ethics, public trust and health ethics. Students will then be introduced to key ethical concepts such as fairness, autonomy, trust, accountability, justice, as well different ways of reasoning about the ethics of digital technologies.

A range of practical problems and issues in the domains of education, media, society, digital health and justice will be then considered. These domains are represented respectively by unique and interesting case studies. Each case study has been selected not only for its timely and engaging nature, but also for its relevance. Through the analysis of these case studies key ethical questions (such as fairness, accountability, explainability, access etc.) will be highlighted and questions of responsibility and tools for ethical practice will be explored. Throughout, the emphasis will be on learning to make sound arguments about the ethical aspects of policy, practice and research.

**Competencies**

- **Subject-specific Competencies**

  - Critical Thinking: assessed  
  - Integrity and Work Ethics: fostered  
  - Self-awareness and Self-reflection: fostered
Advanced Topics in Evidence-Based Design for Architecture

Course requirements: Completion of the course Evidence-Based Design: Methods and Tools For Evaluating Architectural Design (851-0252-08L).

Abstract
Students will gain advanced knowledge and practical hands-on experience with agent-based simulations and spatial analysis tools to evaluate hospital layouts from the perspective of end-users.

Objective
Students will build on their previous projects as part of the course “Evidence-Based Design: Methods and Tools For Evaluating Architectural Design” (851-0252-08L). Students enrolled will participate in an international workshop with GSAPP at Columbia University Designing the post-pandemic hospital with evidence for people. The course is funded by an ETH Innovendum project entitled cogARCH: linking cognition and architecture to design resilient hospitals architecture.

Complex Social Systems: Modeling Agents, Learning, and Games

Prerequisites: Basic programming skills, elementary probability and statistics.

Abstract
This course introduces mathematical and computational models to study techno-socioeconomic systems and the process of scientific research. Students develop a significant project to tackle techno-socio-economic challenges in application domains of complex systems. They are expected to implement a model and to communicate their results through a project report and a short oral presentation.

Objective
See your own field of study in a wider context (“Science in Perspective”), e.g. see the psychological, social, economic, environmental, historical, ethical or philosophical connections and implications. Learn to think critically and out of the box. Question what you believe you know for sure. Get to know surprising, counterintuitive properties of complex (non-linearly interacting, networked, multi-component) systems. Learn about collaboration.

Content
By the end of the course, the students should be able to better understand the literature on complex social systems, develop their own models for studying specific phenomena and report results according to the standards of the relevant scientific literature by presenting their results both numerically and graphically.

At the end of the course, the students will deliver a report, computer code and a short oral presentation. To collect credit points, students will have to actively contribute and give a circa 30 minutes presentation in the course on a subject agreed with the lecturers, after which the presentation will be discussed. The presentation will be graded.

Students are expected to implement themselves models of techno-socio-economic processes and systems, particularly agent-based models, complex networks models, decision making, group dynamics, human crowds, or game-theoretical models. Credit points are finally earned for the implementation of a mathematical or empirical model from the complexity science literature, its presentation, and documentation by a project report.

Lecture notes
The lecture slides will be presented on the course Moodle after each lecture.

Prerequisites / notice
The number of participants is limited to the size of the available computer teaching room. The source code related to the seminar thesis should be well enough documented.

Good programming skills and a good understanding of probability & statistics and calculus are expected.

Students need to present a new subject, for which they have not earned any credit points before.

Good scientific practices, in particular citation and quotation rules, must be properly complied with.

Chatham House rules apply to this course. Materials may not be shared without previous written permission.
Abstract

This seminar will present speakers who discuss the challenges and opportunities arising for our cities and societies with the digital revolution.

Objective

To collect credit points, students must actively contribute and give an individual, circa 20-minute presentation in the seminar on a subject agreed upon with the lecturer. After the presentation, it will be discussed and graded.

Content

This seminar will present speakers who discuss the challenges and opportunities arising for our cities and societies with the digital revolution. Besides discussing questions of automation using Big Data, AI and other digital technologies, we will also reflect on the question of how democracy could be digitally upgraded, and how citizen participation could contribute to innovation, sustainability, resilience, and quality of life. This includes questions around collective intelligence and digital platforms that support creativity, engagement, coordination and cooperation.

Humans and Social Networks in the Digital Age

Abstract
The digital transformation profoundly impacts humans and how they behave online and offline. Interactions in online social networks offer new opportunities (e.g., political movements, global cultural diffusion) and risks (e.g., fake news). In this seminar, we examine recent sociological and psychological research on how the digital transformation affects individuals and their social behaviors.

Objective
By the end of this seminar, students will be able to identify and compare different approaches in (online) social network research. They will be familiar with recent publications in the fields of social networks and computational social science and be able to critically participate in a number of open debates in these fields. Among others, these debates are centered around the types and measurement of social behavior in online and offline settings, ethical challenges in conducting social networks research, the effects of the digital transformation on people’s feelings, thoughts, preferences, and behaviors (e.g., digital mental health), and how online social and cultural phenomena emerge (e.g., the diffusion of culture and the spread of social movements).

Data and Society

Abstract
This lecture series explores the multifaceted role of data in shaping contemporary society, governance, and individual lives. The course equips students with a critical understanding of how data is made, managed, and preserved, and its implications for societal norms and individual rights.

Objective
At the end of the term, students will be able to:
• reflect concepts and theories that capture the performativity of data
• reflect concepts and theories that capture the socio-technical nature of data
• assess the implications of data practices for social and political ordering
• identify key actors, sites, and domain contexts of data practices

AI Personhood, Social Justice, and Cross-Cultural Dialogues in the Digital Age

Abstract
The course fosters critical, culturally conscious reflection on AI development and regulation by 1) exploring cross-cultural assessment of the concept of personhood and collective in digital society and how these concepts are reflected in AI development and governance. 2)inspiring reflection on social justice issues stemming from major (mis)conceptions of personhood in AI development and governance.

Objective
• Understand and differentiate various concepts of personhood and collective in digital societies
• Critically evaluate emerging regulations in the field of AI
• Examine the implications of these regulatory frameworks and their conception of personhood for the AI human future
• Develop creative & culturally conscious analytical skill on issues of social justice in
On 13 March 2024, the European Parliament voted in favour of the long-awaited EU AI Act. On October 30, 2023, the US passed an Executive Order on the safe, secure, and trustworthy development and use of AI. Meanwhile, China has been adopting regulations: the 2021 regulation on recommendation algorithms, 2022 rules for deep synthesis (synthetically generated content), and draft rules on generative AI on August 15, 2023. In the face of this race to develop and regulate AI across various legal, regulatory, and cultural settings, this course exposes students to the overarching question: How can we envision an AI-human future that accommodates a pluriverse and ensures a just future?

In everyday life, from education, policy deliberation, planning and prediction, governance of the human behavior and the beyond human, to social and private life center and AI-enabled products play a significant role. At the very center of this sociotechnical system is the human, often referred to as the ‘data subject’. This raises foundational questions: Who or what is this ‘data subject’? What warrants its protection or what makes it worthy of protection – is it the human dignity, autonomy, rationality, legally protected rights or something beyond and within all these? Who/what is considered a protected ‘data subject’, and who/what is not? While these questions might seem new, they revisit old ethical dilemmas.

However, there is no one-fits-all answer to these questions. Responses vary greatly depending on local and cultural contexts across different jurisdictions and societies. The way AI development and regulatory practices conceptualize the subject of protection – that is, the human and its environ diverges, leading to varied interpretations of personhood and what warrants protection. What personhood means and what is protected and not are not only matters of policy or legislative interpretations and standardization but a matter of social justice.

With this consideration, the course invites and encourages students to explore the concept of personhood from a cross-cultural perspective, incorporating epistemologies from the ‘South’, including Afro-communitarianism, pluriverse theories, and Confucianism. Students are then guided to critically examine personhood and community within the context of competing AI regulatory frameworks, such as those in the EU, China, Brazil, and the US, as well as in their own interactions with AI systems. By identifying conceptual limitations in current understandings of personhood and the centrality of the collective within contemporary AI regulation and practice, students can address core social injustices. These include the overrepresentation on individualism, which overlooks the communal and relational aspects of existence (including human and the beyond human), the instrumentalization of the environment, and exploitative business models.

### 851-0455-00L Science, Trust and Politics

**W** 3 credits 2S G. Dorthe

**Abstract**
The seminar aims to inspire a nuanced understanding of the dynamics of expertise in society. Cross-fertilizing literature from science and technology studies (STS) and from activists’ movements, it focuses on contemporary controversies around emerging technologies and climate policy, where trust in science is said to be undermined (e.g. climate skepticism or anti-vaccine movements).

**Objective**
1. Introduce to the role and functions of expertise in democratic societies.
2. Familiarize with assumptions about science and society embedded in contemporary controversies.
3. Inspire critical perspectives on (dis)trust in science through activists’ movements on contested environmental and technological issues.
4. Develop a creative position on the relations between science, trust and politics.

**Content**
Engineers and scientists often pursue their studies and research in the hope that their knowledge can contribute to make a better world, inform democratic deliberation and help public understanding of complex issues. Yet this special status of science and technology is being increasingly contested by marginalized publics, lobbies, exposed populations, and by members of the scientific communities themselves. Climate skepticism or vaccine hesitancy are some of the most vivid examples of this confusing situation. In this seminar, students will learn to reflect on expertise as a form of scientific engagement in the messiness of democratic deliberation and public life, beyond the noble but outdated ideal of “speaking truth to power.”

The exercise of expertise is stumbling upon several conundrums. Which knowledge is relevant in which situation? How to make sure that some crucial perspectives are not left in the shadows? How to identify representative experts and make sure that they speak on behalf of the public? What personhood means and what is protected and not are not only matters of policy or legislative interpretations and standardization but a matter of social justice. Climate skepticism or vaccine hesitancy are some of the most vivid examples of this confusing situation. In this seminar, students will learn to reflect on expertise as a form of scientific engagement in the messiness of democratic deliberation and public life, beyond the noble but outdated ideal of “speaking truth to power.”

### 701-0786-00L Mediation in Environmental Planning: Theory and Case Studies

**W** 2 credits 2G K. Siegwart

### Data: 26.07.2024 12:39 Autumn Semester 2024 Page 2615 of 2680
This course is intended to demonstrate how environmental decisions can be optimized and conflicts better dealt by using mediation. Case studies will focus on construction of windmills for electricity purpose, landfills, sustainable city-planning or Human-Wildlife Conflict and Coexistence.

Objective
- Develop comprehension of legal and social responses to environmental conflicts
- Recognize the most important participative techniques and their ranges
- Develop concepts for doing and evaluating mediation processes
- Estimate the potential and limitations of cooperative environmental planning
- Train communicative skills (presentation, moderation, discussion design, negotiation), especially by participating at a mediation

Content
To this end, we will look at the most important techniques of mediation and put them into the context of today's legislation, participation and conflict culture. The potential and limitations of the individual techniques will be discussed using current Swiss and international case studies, namely in the field of windenergy as well as of landfills and Human-Wildlife Conflict and Coexistence (wolves, bears, elephants). Students can do conflict analyses, for instance, as part of individual and group analyses and a half-day mediation-simulation, develop technique concepts and train their own communicative and negotiation skills.

Lecture notes
A reader will be handed out.

Science Research

Type B: Reflection About Subject-Specific Methods and Contents
Subject-specific courses. Particularly relevant for students interested in those subjects.

All these courses are also listed under the category “Typ A”, and every student can enroll in these courses.

D-ARCH

Number Title Type ECTS Hours Lecturers
851-0020-00L Gender and Science W 2 credits 2V E. Valdameri

Abstract
This lecture series offers an introduction to the relationship between gender and science, with a focus on the specific intersections with the sciences taught at ETH.

Objective
This lecture series is designed to acquaint students from all levels and departments with the various ways in which gender perspectives matter for specific scientific disciplines, as well as for science in general. Students will learn to recognize and analyse the specific ways in which scientific theories and methods are gendered. They will be able to discuss and reflect how these topics are connected to their own scientific disciplines.

Content
There is agreement across academic disciplines today that gender influences and structures the production of knowledge and that scientific knowledge production in turn shapes gender notions. Even within “hard” sciences such as mathematics, physics, engineering, etc., gender is a significant factor in determining what counts as “objective” knowledge, who can know it, what kind of knowledge is produced, or how this knowledge is acquired and justified. Feminist research aims to reveal how dominant conceptions of science and knowledge practices disadvantage women*, and other subordinate groups, with the goal of reforming these practices. An important part of feminist critique is to show that such efforts substantially improve the overall quality of research.

The semester will start with two introductory lectures acquainting students with research questions in the field of Gender and Science by summarizing its key concepts and methods. It will then continue as a series of weekly guest lectures by scholars from different scientific disciplines that provide accessible insights into the intersection between gender studies and the guest lecturer’s research field. Students will thereby be encouraged to learn from concrete examples rather than abstract theory. The goal is for students to understand how to apply concepts and methods of gender studies to their particular disciplines. Intermediate discussions with the students will provide a forum for critically reflecting the content of the lectures and the connections to their own academic fields and practices.

All lectures by the guest speakers will also be open to the broader ETH public, while the introductory and discussion sessions are only for registered course participants.

Number Title Type ECTS Hours Lecturers
851-0703-00L Introduction to Law W 2 credits 2V O. Streiff Gnöpff

Abstract
This class introduces students into basic features of the legal system. Fundamental issues of constitutional law, administrative law, private law and the law of the EU are covered. The focus is on legal problems related to space. Active participation is expected in short interactive sequences.

Objective
Students are able to identify basic structures of the legal system. They understand selected topics of public and private law. They are able to apply the fundamentals in more advanced law classes and to recognize the relevance of law in their own field.

Content
Basic concepts of law, sources of law, private law: Contract law (particularly contract for work and services), tort law, property law. Public law: Human rights, administrative law, procurement law, procedural law. Insights into the law of the EU.

851-0742-00L Contract Design I

You can find all course materials and the most recent announcements on Moodle. Please log in to Moodle using your ETH or UZH credentials. Then search for “Contract Design I (851-0742-00L; Fall 2023)” and enroll. The
Contract Design I is taught by Professor Stremitzer and aims to bridge the gap between economic contract theory, contract law, and the writing of real-world contracts. In this course, we take a systematic approach to contract design. This means we first analyze the economic environment in which a transaction takes place and then engineer contracts that achieve the desired outcome.

We will cover topics such as moral hazard, adverse selection, elicitation mechanisms, relationship-specific investments, and relational contracting and apply the theoretical insights to real-life case studies ranging from purchases & sales of assets, oil & gas exploration, movie financing, production & distribution, construction & development, M&A deals, venture capital financing, to executive compensation and many other types of transactions.

The course follows a flipped-classroom model: You will watch learning videos specifically produced for this course ahead of class. We will use class time to discuss real-world case studies. The videos will be made available before the lecture each week and need to be watched ahead of coming to class. Computer-graded quizzes at the beginning of each class will test students’ understanding of the concepts introduced in the videos.

As the emphasis of this class is on class discussion, attendance is mandatory. Absent important reasons, you cannot miss class more than twice.

The lectures will be recorded but only made available to those who miss lectures with excused absence.

For ETH students: Your grade will consist of two parts:
1) You will take weekly computer-based quizzes during class time. Thus, it is important that you attend the lectures to be able to finish the quizzes and pass this course.
2) You compose short responses to take-home questions on case studies we assign and upload them ahead of class (Pass/Fail).

Note that UZH and UNISG students enrolling in this course need to earn more ECTS for completing this course than ETH students (due to curricula reasons). This is why UZH and UNISG students must complete a written assignment in addition to the weekly quizzes and take-home questions. UZH and UNISG students should check out the description of the class at their respective home institutions.

Lecture notes
Handouts, prerecorded videos, slides, case studies, and other materials available on a dedicated webpage: contractdesign.org. Access to this webpage is free of charge for ETH students as ETH purchased a license for ETH students.

Prerequisites / notice
Attendance is mandatory. You are only allowed to miss two lectures unless there are special circumstances.

851-0703-04L Law and Urban Space
- W 2 credits
- 2V
- O. Streiff Gnöpff

Abstract
Legal rules are tied to urban space. Illustrative is the relation between land ownership and urban morphology. Legal concepts with spatial impacts are introduced and related to the theory of urban design. Moreover, it is discussed how these concepts shape specific places. The course includes interactive sequences for which active participation is expected.

Objective
Students recognize the interplay between legal structures and urban space. They can describe legal concepts with spatial impact. Moreover, they are able to compare legally binding targets with theoretical approaches in urban design. By analysing a specific place, students learn to find relevant norms, to analyse and to judge them with regard to urban design theories. Thereby, they are able to distinguish design and policy questions.

Content
Using the the term «lawscape» (Philippopoulos-Mihalopoulos), we initially discuss general aspects of the interplay between legal rules and urban space. In the following weeks we consider the interplay with reference to different dimensions of urban space (e.g. morphological, social, functional dimension).

Human-Computer Interaction: Cognition and Usability  
**W 3 credits 2S  C. Hölscher**

**Abstract**
This seminar will introduce key topics, theories and methodology in human-computer interaction (HCI) and usability, with a focus on applying them to real situations.

**Objective**
Presentations will cover the basics of human-computer interaction and selected topics:
- History of HCI
- Research ethics
- Literature reviews
- Participant-free methods: cognitive walkthrough and heuristic evaluation
- Card sorting and information architecture
- Usability studies
- Unmoderated research and diary studies
- Surveys
- User Logs and metric frameworks

On a weekly basis, students will conduct authentic research in class covering the topics above. They will submit their in-class research results regularly and also present their findings to the class once per semester.

The final project demonstrates class topic adoption by deeply exploring one HCI problem using the covered methods and tools. Students will choose a research topic and execute their research plan. They will individually write a formal report including problem definition, literature review, methodology, findings and discussion.

---

Evidence-Based Design: Methods and Tools for Evaluating Architectural Design  
**W 3 credits 2S  M. Gath Morad, C. Hölscher**

**Abstract**
Students are taught a variety of analytic techniques that can be used to evaluate architectural design. The concept of evidence-based design is introduced, and complemented with theoretical background on space syntax and spatial cognition. This is a project-oriented course, students implement a range of methods on a sample project. The course is tailored for architecture design students.

**Objective**
The course aims to teach students how to evaluate a design project from the perspective of the end user. The concept of evidence-based design is introduced through a series of case studies. Students are given a theoretical background in space syntax and spatial cognition, with a view to applying this knowledge during the design process. The course covers a range of methods including visibility analysis, network analysis, conducting real-world observations, and virtual reality for architectural design. Students apply these methods to a case study of their choice, which can be at building or urban scale. For students taking a B-ARCH or M-ARCH degree, this can be a completed or ongoing design studio project. The course gives students the chance to implement the methods iteratively and explore how best to address the needs of the eventual end-user during the design process.

The course is tailored for students studying for B-ARCH and M-ARCH degrees. As an alternative to obtaining D-GESS credit, architecture students can obtain course credit in “Vertiefungsfach” or “Wahlfach”.

---

Real Estate Property Law  
**W 3 credits 3V  S. Stucki, R. Müller-Wyss**

**Abstract**
Real estate property law (esp. content, acquisition, restrictions under private and public law, transmission and loss). Legal presentation: land register, surveying, cadastral. Basic questions of contract and tax law.

**Objective**
The legal principles of real estate property law can be correctly interpreted and applied in daily life.

**Content**
Real estate property law (esp. content, acquisition, restrictions under private and public law, transmission and loss). Legal presentation: land register, surveying, cadastral. Basic questions of contract and tax law.

**Lecture notes**

- Techniques and Technologies assessed

Method-specific Competencies
- Analytical Competencies assessed
- Decision-making assessed
- Media and Digital Technologies fostered
- Problem-solving assessed
- Project Management fostered

Social Competencies
- Communication fostered
- Cooperation and Teamwork assessed
- Customer Orientation assessed
- Leadership and Responsibility fostered
- Self-presentation and Social Influence fostered
- Sensitivity to Diversity assessed
- Negotiation assessed

Personal Competencies
- Adaptability and Flexibility fostered
- Creative Thinking assessed
- Critical Thinking assessed
- Integrity and Work Ethics assessed
- Self-awareness and Self-reflection assessed
- Self-direction and Self-management fostered

Abstract
This seminar will present speakers who discuss the challenges and opportunities arising for our cities and societies with the digital revolution.

Objective
To collect credit points, students must actively contribute and give an individual, circa 20-minute presentation in the seminar on a subject agreed upon with the lecturer. After the presentation, it will be discussed and graded.

Content
This seminar will present speakers who discuss the challenges and opportunities arising for our cities and societies with the digital revolution. Besides discussing questions of automation using Big Data, AI and other digital technologies, we will also reflect on the question of how democracy could be digitally upgraded, and how citizen participation could contribute to innovation, sustainability, resilience, and quality of life. This includes questions around collective intelligence and digital platforms that support creativity, engagement, coordination and cooperation.

Literature
Dirk Helbing
An Analytical Theory of Traffic Flow (collection of papers)
Michael Batty, Kay Axhausen et al.
Smart cities of the future

Books by Michael Batty:
- How social influence can undermine the wisdom of crowd effect
- Evidence for a collective intelligence factor in the performance of human groups
- Optimal incentives for collective intelligence
- Collective Intelligence: Creating a Prosperous World at Peace
- Big Mind: How Collective Intelligence Can Change Our World
- Programming Collective Intelligence
- Urban architecture as connective-collective intelligence. Which spaces of interaction?

Build digital democracy
- How to make democracy work in the digital age
- Digital Democracy: How to make it work?
- Proof of witness presence: Blockchain consensus for augmented democracy in smart cities
- Iterative Learning Control for Multi-agent Systems Coordination
- Decentralized Collective Learning for Self-managed Sharing Economies

Students need to present a new subject, for which they have not earned any credit points before.

Good scientific practices, in particular citation and quotation rules, must be properly complied with.

Chatham House rules apply to this course. Materials may not be shared without previous written permission.
This course introduces students to the ethical, political and legal debates and transformations in relation to Artificial Intelligence and Human Values. It provides students with concepts and methods from the constructivist and interpretive social sciences to work towards responsible and democratic human-technology futures.

The main objectives of the course are to enable students to 1) identify the ways in which human values and developments of AI technologies are entangled, 2) articulate what is significant about contemporary transformations in AI and society, and 3) participate and shape the relationship between human values and AI as citizens and professionals.

The growing presence of AI tools for public use, for public administration, inside corporations and in scientific research raises many questions about the ethical, political, legal consequences of these technologies. This course is built around multiple sites of encounter among human values and AI, including bodies, persons, cities, labs, law, and environment. In each site, we inquire about what and whose values are being prioritized and with what consequences. The course also investigates existing best-practices around how to “align” human values with AI (e.g. human-centric design, alignment, reproducibility, transparency, explainability) and introduces students to regimes of ethics and governance of AI being proposed in jurisdictions around the world. Students learn to unpack the values and assumptions in existing techniques and frameworks for the design and governance of AI and to engage constructively with diverse stakeholders to shape the human-technology future towards aims that are reflexive, responsible, and democratic.

Abstract
Students will gain advanced knowledge and practical hands-on experience with agent-based simulations and spatial analysis tools to evaluate hospital layouts from the perspective of end-users.

Objective
Students will build on their previous projects as part of the course "Evidence-Based Design: Methods and Tools For Evaluating Architectural Design" (851-0252-08L). Students enrolled will participate in an international workshop with GSAPP at Columbia University. Designing the post-pandemic hospital with evidence, for people. The course is funded by an ETH Innovendum project entitled cogARCH: linking cognition and architecture to design resilient hospitals architecture.

851-0037-00L
Ethics of Building

Abstract
Building practices have often been associated with utopian visions and promises of a more just way of living together. But to what extent can the built environment contribute to a better society? What role can mathematical models or data analyses play in questions of distributive justice in the city? Is it ever possible to build sustainably, or is building always also destroying the environment?

Objective
Students will learn about contemporary debates in architectural and urban planning ethics. We will discuss the positions against the background of their historical predecessors and current contexts. Students will work on small case studies in which they will ethically analyze the construction of a building, a district or a city. The seminar includes a student-co-led expedition through Zurich.

Content
Throughout history, there have always been utopian visions and promises tied to construction, be it of individual objects, such as towers, or of entire cities. For example, thanks to their geometric shapes, modern cities are supposed to enable more equality among people, even the equal distribution of sunshine, as Le Corbusier once dreamed. But to what extent is it even possible to create more equality by designing living spaces? A wall automatically excludes by protecting the interior. Building cities always means defining the far and the near, the center and the periphery, the upper and the lower. These orientations translate into social relations for example of those who have to commute far and those who are at the center of the action. How determines how and what is built and whose perspective is not taken into account? To whom does a built landscape afford agency and to whom not? Mathematical models can predict the probabilities of encounters in space, which also can have an impact on social relationships. What is the relevance of such models as well as the more recent data analyses in questions of distributive justice? Is it possible to distribute social participation in the city? Does construction always have to destroy and replace the underlying nature? How do our building practices affect coexistence with other species? We will not be able to solve these problems in one semester, but we will intensively grapple with the overarching question implied in all of them. The question is on the extent to which the built environment takes on ethical significance for human (and other) forms of life, and how are we to understand ethics in general if it is to respond to such questions.
851-0271-00L  Neuroaesthetics - Exploring the Science of Aesthetic Experience  W  2 credits  2S  E. Cross, I. Bara

Abstract
This seminar introduces students to theory and research, challenges, and opportunities in neuroaesthetics, with a clear emphasis on the interdisciplinary nature of the discipline situated at the intersection of neuroscience, psychology, and art appreciation. Foundational empirical methods and critical perspectives of research approaches in neuroaesthetics are considered.

Objective
- to familiarize students with concepts, models, methods, brain and behavioral findings related to aesthetic experience.
- to develop a critical understanding in evaluating the theoretical and empirical findings in neuroaesthetics.
- to integrate the acquired knowledge to critically debate and discuss the conceptual and empirical issues related to the science of aesthetic experience.

Content
In this seminar, students will learn about the foundational principles of neuroaesthetics, which explores the cognitive and brain processes involved in aesthetic experience. A key focus will be placed on developing an appreciation of the interdisciplinary methods used in the neuroaesthetics field – ranging from neuroscience, psychology, philosophy, and art history. The seminar is based on the active engagement of students in reading, presenting, and critically discussing selected papers in the field. In a final small-group assignment, students are expected to incorporate and elaborate upon the content covered in the seminar by presenting and discussing a novel research proposal for tackling a timely research question related to aesthetic experience.

851-0738-01L  The Role of Intellectual Property in the Engineering and Technical Sector  W  2 credits  2V  K. Houshang Pour Islam

Abstract
The lecture gives an overview of the fundamental aspects of intellectual property, which plays an important role in the daily routine of engineers and scientists. The lecture aims to make participants aware of the various methods of protection and to put them in a position to use this knowledge in the workplace.

Objective
In recent years, knowledge about intellectual property has become increasingly important for engineers and scientists. Both in production and distribution and in research and development, they are increasingly being confronted with questions concerning the patenting of technical inventions and the use of patent information. The lecture will acquaint participants with practical aspects of intellectual property and enable them to use the acquired knowledge in their future professional life.

Topics covered during the lecture will include:
- The importance of innovation in industrialised countries
- An overview of the different forms of intellectual property
- The protection of technical inventions and how to safeguard their commercialisation
- Patents as a source of technical and business information
- Practical aspects of intellectual property in day-to-day research, at the workplace and for the formation of start-ups.

Case studies will illustrate and deepen the topics addressed during the lecture.

The seminar will include practical exercises on how to use and search patent information. Basic knowledge of how to read and evaluate patent documents as well as how to use publicly available patent databases to obtain the required patent information will also be provided.

Prerequisites / notice
The lecture addresses students in the fields of engineering, science and other related technical fields.
Contract Design I

You can find all course materials and the most recent announcements on Moodle. Please log in to Moodle using your ETH or UZH credentials. Then search for “Contract Design I (851-0742-00L; Fall 2023)” and enroll. The password is “ContractDesign01”.

It is NOT a legal drafting class focused on contractual language.

Number of participants limited to 160.
Max 80 ETHZ and 80 UZH Students

Abstract

Contracts are agreements between parties to engage in transactions. A good contract creates value by giving parties the right incentives to meet their objectives. A good contract designer scrutinizes the economic situation in which parties find themselves and tailors the contract to the challenges at hand. To help you become sophisticated contract designers, we draw from insights for which more than half a dozen Nobel Prizes were awarded in the past two decades and transfer them to the art of writing real-world contracts. In other words, Contract Design will provide you with analytical tools to design contracts that help you be better lawyers, business leaders, and startup founders.

We will cover topics such as moral hazard, adverse selection, elicitation mechanisms, relationship-specific investments, and relational contracting and apply the theoretical insights to real-life case studies ranging from purchases & sales of assets, oil & gas exploration, movie financing, production & distribution, construction & development, M&A deals, venture capital financing, to executive compensation and many other types of transactions.

The course follows a flipped-classroom model: You will watch learning videos specifically produced for this course ahead of class. We will use class time to discuss real-world case studies. The videos will be made available before the lecture each week and need to be watched ahead of coming to class. Computer-graded quizzes at the beginning of each class will test students' understanding of the concepts introduced in the videos.

As the emphasis of this class is on class discussion, attendance is mandatory. Absent important reasons, you cannot miss class more than twice.

The lectures will be recorded but only made available to those who miss lectures with excused absence.

For ETH students: Your grade will consist of two parts:
1) You will take weekly computer-based quizzes during class time. Thus, it is important that you attend the lectures to be able to finish the quizzes and pass this course.
2) You compose short responses to take-home questions on case studies we assign and upload them ahead of class (Pass/Fail).

Note that UZH and UNISG students enrolling in this course need to earn more ECTS for completing this course than ETH students (due to curricula reasons). This is why UZH and UNISG students must complete a written assignment in addition to the weekly quizzes and take-home questions. UZH students also have to complete an additional group project.

Lecture notes

Handouts, prerecorded videos, slides, case studies, and other materials available on a dedicated webpage: contractdesign.org. Access to this webpage is free of charge for ETH students as ETH purchased a license for ETH students. UZH and UNISG students should check out the description of the class at their respective home institutions.

Prerequisites / notice

Attendance is mandatory. You are only allowed to miss two lectures unless there are special circumstances.

Contract Design I is available to ETH students through the Science in Perspective (SiP) Program of D-GESS. This course is particularly suitable for students of D-ARCH, D-BAUG, D-CHAB, DMATH, D-MTEC, D-INFK, and D-MAVT.

If you have any questions regarding the course, please write an email to the teaching assistants, Lucas Gericke (lucas.gericke@gess.ethz.ch) or Serge von Steiger (serge.vonsteiger@gess.ethz.ch).

The concept of urban design as an independent discipline, which maintains connections with other disciplines, is discussed in the lectures. There are three books that function as main reference literature throughout the course: "Concepts and Theories", "Global History of Urban Design I", and "Global History of Urban Design II". These books will be reserved for consultation in the ETH Baubibliothek, and will not be available for individual loans.

The pressing environmental challenges of today demand a critical reflection. Ethics is an important tool for doing so. This lecture introduces the basics of ethics and provides in-depth knowledge of environmental ethics and its debates. This theoretical background will be applied and critically reflected using examples of current environmental challenges.

The history of urban design will be approached as a cross-cultural field of knowledge that integrates environmental ethics, which you have applied and discussed in smaller exercises.

Please register at: https://www.uzh.ch/cmsssl/de/studies/application/chmobilit yin.html

after you received your logon information you can enrol to courses at: https://studentservices.uzh.ch/uzh/application/#/Logon

Mind the enrolment deadlines at UZH: https://www.uzh.ch/cmsssl/en/studies/application/deadline s.html

On completion of this lecture, you have acquired the ability to identify, analyze, critically reflect and resolve ethical challenges in general and specifically regarding the environment. You know basic concepts, positions and lines of argumentation from the debate in environmental ethics, which you have applied and discussed in smaller exercises.

This course focuses on the history of the design of cities, as well as on the ideas, processes and actors that engender and lead their development and transformation. The history of urban design will be approached as a cross-cultural field of knowledge that integrates scientific, economic and technical innovation as well as social and cultural advances.

The lectures deal mainly with the definition of urban design as an independent discipline, which maintains connections with other disciplines (politics, sociology, geography) that are concerned with the transformation of the city. The aim is to make students conversant with the multiple theories, concepts and approaches of urban design as they were articulated throughout time in a variety of cultural contexts, thus offering a theoretical framework for students' future design work.

In the first semester the genesis of the objects of study, the city, urban culture and urban design, are introduced and situated within their intellectual, cultural and political contexts:

- 08: Garden Cities of Tomorrow: From the Global North to the Global South and Back Again
- 09: Civilized Wilderness and City Beautiful: The Park Movement of Olmsted and The Urban Plans of Burnham
- 10: The Extension of the European City: From the Viennese Ringstrasse to Amsterdam Zuid
- 11: Of Rituals, Water and Mud: The Urban Revolution in Mesopotamia and the Indus
- 12: Of the Idea of the Polis: Rome, Greece and Beyond
- 13: Between Ideal and Laboratory: Of Middle Eastern Grids and European Renaissance Principles
- 14: Of Absolutism and Enlightenment: Baroque, Defense and Colonization
- 15: Between Ideal and Laboratory: Of Middle Eastern Grids and European Renaissance Principles
- 16: The City of Labor: Company Towns as Cross-Cultural Phenomenon

The following books will be used to supplement the lecture material:

These books will be reserved for consultation in the ETH Baubibliothek, and will not be available for individual loans.

A list of further recommended literature will be found within each chapter of the reader (Skript).

851-0763-00L  
**Supervised Research (Law, Economics, and Data Science)**  
*Does not take place this semester.*  

**Objective**  
Students must have some data science and/or statistics experience. Some programming experience in Python, Stata, or R is required. Apply tools from data science and social science to a new project, potentially in a group, to develop a paper or app.

**Prerequisites / notice**  
Some programming experience in Python, Stata, or R is required. Some experience with data science or statistics is required.

851-0549-00L  
**WebClass Introductory Course History of Technology**  
*Particularly suitable for students D-BAUG, D-INFK, D-ITET, D-MATL, D-MAVT.*  

**Objective**  
Students are introduced into how technological innovations take place within complex economic, political and cultural contexts. They get to know basic theories and practices of the field by acquiring the skills to interpret texts, to compare arguments, to research additional sources and complementary material and to author a common essay. All of this will yield into a student manual on the four core topics: technology and innovation, technology and catastrophes, technology as a dream machine and technology and association. The course language is German, and even if many texts will be in English, the ability to read and understand German is mandatory.

**Abstract**
The lecture gives an overview of the fundamental aspects of intellectual property, which plays an important role in the daily routine of engineers and scientists. The lecture aims to make participants aware of the various methods of protection and to put them in a position to use this knowledge in the workplace.

**Objective**

In recent years, knowledge about intellectual property has become increasingly important for engineers and scientists. Both in production and distribution and in research and development, they are increasingly being confronted with questions concerning the patenting of technical inventions and the use of patent information.

The lecture will acquaint participants with practical aspects of intellectual property and enable them to use the acquired knowledge in their future professional life.

Topics covered during the lecture will include:
- The importance of innovation in industrialised countries
- An overview of the different forms of intellectual property
- The protection of technical inventions and how to safeguard their commercialisation
- Patents as a source of technical and business information
- Practical aspects of intellectual property in day-to-day research, at the workplace and for the formation of start-ups.

Case studies will illustrate and deepen the topics addressed during the lecture.

The seminar will include practical exercises on how to use and search patent information. Basic knowledge of how to read and evaluate patent documents as well as how to use publicly available patent databases to obtain the required patent information will also be provided.

**Prerequisites / notice**
The lecture addresses students in the fields of engineering, science and other related technical fields.

**Abstract**
The course introduces students to scientific and technological developments that require regulation or enable legal innovation. We focus particularly on the challenges to current law posed by prominent near-future technologies.

**Objective**
The course is designed for a wide range of ETH students as well as for law students who are keen to deepen their understanding of cutting-edge technology. It offers an overview of key legal areas important for technology regulation, complemented by guest lectures on emerging technological trends.

In previous years, the course has featured esteemed speakers from various sectors, including industry leaders like Google, NGOs such as Digital Society Switzerland and The European Consumer Organization, regulatory bodies like the Swiss Competition Commission, and noted academics.

The course is open to ETH students through the Science in Perspective program of the Department of Humanities, Social and Political Sciences.

**Content**
The planned course outline is below.

- Overview of Law and Technology
- Fundamental Rights
- AI & Discrimination
- Landmark Big Tech Cases
- Regulation of Digital Platforms & Content Moderation
- Online Consumer Protection
- Law and Tech Scholarship Series

A number of recent regulations will be discussed, including the EU's AI Act, the Digital Services Act (DSA), and the Digital Markets Act (DMA), as well as emerging internet phenomena, like ChatGPT.

**Prerequisites / notice**
You can find all course materials and the most recent announcements on Moodle. Please log in to Moodle using your ETH or UZH credentials. Then search for “Law & Tech (851-0732-06L, HS 2024)” and enroll.

Abstract
This semester course enables students to recognize, anticipate and address ethical issues in the domain of health sciences and their technological application. The students will acquire the necessary theoretical and analytic resources to develop critical thinking skills in the field of applied ethics and will practice how to use such resources to address concrete ethical issues in health sciences.

Objective
This course is tailored to students who want to become familiar with the analysis of ethical issues in all the different domains of life sciences and biotechnology. The course aims at equipping students with the necessary knowledge and analytic skills to understand, discuss and address the ethical aspects of science and technology in the domain of human health. The specific learning objectives of this course are:

A. Identify ethical issues in life sciences and biotechnology.
B. Analyze and critically discuss ethical issues in life sciences and biotechnology.
C. Become aware of relevant legal and public policy frameworks.
D. Distinguish different ethical approaches and argumentative strategies in applied ethics.
E. Recognize how ethical issues relate to different accounts of technology and innovation.
F. Develop a personal and critical attitude towards the ethical aspects of life sciences and their technological application.
G. Autonomously anticipate ethical issues.
H. Propose and communicate solutions to ethical challenges and dilemmas.

Content
The course starts off with an introductory lecture on ethics as a discipline and an overview of the most relevant approaches in the domain of applied ethics. The students will also be introduced to current theoretical accounts of technology and will start to appreciate the relevance of ethics especially with respect to new and emerging technologies. Usable analytic tools will also be provided, thus enabling the students to engage with the discipline in a practical way from the very onset of the semester.

The course will continue with thematic sessions covering a broad variety of topics all of which are relevant to the different study tracks offered by the department. In particular, the course will cover the following domains: digital health technologies and medical AI; food, nutrition and healthy longevity; biomedical engineering; genetics; neuroscience and Neurotechnologies; medical robotics; disability and rehabilitation; environmental ethics. The course will also include sessions on cross-cutting ethically relevant aspects of health sciences and technologies, namely: access to innovation, translational research, and the relation between science and public policy.

All the topics of the course will be illustrated and interactively discussed through many case studies, offering the students the opportunity to prepare and present them, and to use them in individual as well as group exercises. Throughout the course, the students will have multiple opportunities to experiment with ethical argumentation and to practice their evolving skills.

Competencies

- **Subject-specific Competencies**
  - Concepts and Theories: assessed
  - Techniques and Technologies: fostered

- **Method-specific Competencies**
  - Analytical Competencies: assessed
  - Media and Digital Technologies: fostered
  - Problem-solving: fostered

- **Social Competencies**
  - Communication: assessed
  - Cooperation and Teamwork: fostered
  - Leadership and Responsibility: fostered
  - Self-presentation and Social Influence: fostered
  - Sensitivity to Diversity: fostered

- **Personal Competencies**
  - Adaptability and Flexibility: fostered
  - Creative Thinking: fostered
  - Critical Thinking: assessed
  - Integrity and Work Ethics: assessed
  - Self-awareness and Self-reflection: assessed

<td>This seminar introduces the fundamentals and latest research developments of brain imaging in real-world contexts. We explore topics from imaging multiple people's brains simultaneously as they interact to neuro-ethics and neuro-art, while maintaining a strong focus on critical evaluation of research practices and applications of brain imaging of and during social interaction.</td>
<td>To develop a critical view of extant findings and the tools for evaluating the quality of evidence and data, as well as ethical implications</td>
</tr>
</tbody>
</table>

Data: 26.07.2024 12:39  Autumn Semester 2024  Page 2626 of 2680
Rapid advances in the technologies and empirical approaches used in imaging the human brain have opened exciting windows into how
the human brain coordinates social interaction. These advances include imaging the brain’s function during real social interactions, training
behaviours with feedback based on real-time brain activity, and even generating art directly from brain signals. With them, these advances
have brought novel ethical implications regarding their implementation in research and potentially, their use by the public, for both
therapeutic and possible "neurohacking" applications. In this seminar, students will be introduced to various neuroimaging approaches for
social neuroscience generally, as well as to approaches for measuring social brain function in real life, and will gain insights into related
ethical considerations.

The seminar builds on the active participation of students in reading, presenting, and critically discussing selected papers in the field. In a
final small-group assignment, students are required to integrate and elaborate upon topics covered in the seminar by presenting and
debating a novel research proposal for addressing a timely research question related to the use of brain imaging in the context of social
interactions. No prior experience or knowledge in brain imaging is required.

**Competencies**

**Subject-specific Competencies**
- Concepts and Theories
- Techniques and Technologies

**Method-specific Competencies**
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management

**Social Competencies**
- Communication
- Cooperation and Teamwork
- Leadership and Responsibility
- Self-presentation and Social Influence

- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

**851-0271-00L Neuroaesthetics - Exploring the Science of Aesthetic Experience**

**Abstract**
This seminar introduces students to theory and research, challenges, and opportunities in neuroaesthetics, with a clear emphasis on the
interdisciplinary nature of the discipline situated at the intersection of neuroscience, psychology, and art appreciation. Foundational
empirical methods and critical perspectives of research approaches in neuroaesthetics are considered.

**Objective**
- to familiarize students with concepts, models, methods, brain and behavioral findings related to aesthetic experience.
- to develop a critical understanding in evaluating the theoretical and empirical findings in neuroaesthetics
- to integrate the acquired knowledge to critically debate and discuss the conceptual and empirical issues related to the science of aesthetic experience

**Content**
In this seminar, students will learn about the foundational principles of neuroaesthetics, which explores the cognitive and brain processes
involved in aesthetic experience. A key focus will be placed on developing an appreciation of the interdisciplinary methods used in the
neuroaesthetics field – ranging from neuroscience, psychology, philosophy, and art history. The seminar is based on the active
engagement of students in reading, presenting, and critically discussing selected papers in the field. In a final small-group assignment,
students are expected to incorporate and elaborate upon the content covered in the seminar by presenting and discussing a novel research
proposal for tackling a timely research question related to aesthetic experience.

<th>The Role of Intellectual Property in the Engineering and Technical Sector</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Title</strong></td>
<td><strong>Type</strong></td>
</tr>
<tr>
<td>The Role of Intellectual Property in the Engineering and Technical Sector</td>
<td>W</td>
</tr>
</tbody>
</table>

**Abstract**
The lecture gives an overview of the fundamental aspects of intellectual property, which plays an important role in the daily routine of
engineers and scientists. The lecture aims to make participants aware of the various methods of protection and to put them in a position to
use this knowledge in the workplace.
In recent years, knowledge about intellectual property has become increasingly important for engineers and scientists. Both in production and distribution and in research and development, they are increasingly being confronted with questions concerning the patenting of technical inventions and the use of patent information.

The lecture will acquaint participants with practical aspects of intellectual property and enable them to use the acquired knowledge in their future professional life.

Topics covered during the lecture will include:
- The importance of innovation in industrialised countries
- An overview of the different forms of intellectual property
- The protection of technical inventions and how to safeguard their commercialisation
- Patents as a source of technical and business information
- Practical aspects of intellectual property in day-to-day research, at the workplace and for the formation of start-ups.

Case studies will illustrate and deepen the topics addressed during the lecture.

The seminar will include practical exercises on how to use and search patent information. Basic knowledge of how to read and evaluate patent documents as well as how to use publicly available patent databases to obtain the required patent information will also be provided.

Some programming experience in Python, Stata, or R is required.

For ETH students: Your grade will consist of two parts:
1) You will take weekly computer-based quizzes during class time. Thus, it is important that you attend the lectures to be able to finish the quizzes and pass this course.
2) You compose short responses to take-home questions on case studies we assign and upload them ahead of class (Pass/Fail).

Note that UZH and UNISG students enrolling in this course need to earn more ECTS for completing this course than ETH students (due to curricula reasons). This is why UZH and UNISG students must comply a written assignment in addition to the weekly quizzes and take-home questions. UZH students also have to complete an additional group project.

UZH and UNISG students should check out the description of the class at their respective home institutions.

Handouts, prerecorded videos, slides, case studies, and other materials available on a dedicated webpage: contractdesign.org. Access to this webpage is free of charge for ETH students as ETH purchased a license for ETH students.
Contract Design I is available to ETH students through the Science in Perspective (SiP) Program of D-GESS. This course is particularly suitable for students of D-ARCH, D-BAUG, D-CHAB, DMATH, D-MTEC, D-INFK, and D-MAVT.

If you have any questions regarding the course, please write an email to the teaching assistants, Lucas Gericke (lucas.gericke@gess.ethz.ch) or Serge von Steiger (serge.vonsteiger@gess.ethz.ch).

**Prerequisites / notice**

Attendance is mandatory. You are only allowed to miss two lectures unless there are special circumstances.

**Abstract**

This lecture series covers psychedelic science mainly psychologically, and additionally pharmacologically, physiologically, psychotherapeutically, philosophically, religiously, and politically. All contributions will also be reflected on from the viewpoint of the humanities and psychology.

**Objective**

To provide students with a multidisciplinary introduction to psychedelic science, and to also comprehensively embed this in a reflection from a humanities/psychology viewpoint.
Psychedelic science is a multidisciplinary field of study that involves scholars of the human sciences, the natural sciences, and the humanities. In this course, psychedelic science is presented mainly from the point of view of psychology, but will additionally also be considered from the viewpoints of pharmacology, physiology, psychotherapy, philosophy, religion, and politics. All contributions will also be reflected from the viewpoint of the humanities and psychology. The psychedelic studies treated in this course that involve humans focus on controlled and ethically approved studies where these substances are administered to medically screened, prepared, and supported participants. This course is in no way intended to encourage the private/illegal use of psychedelic substances. A psychedelic experience is occasioned by classic (serotonergic) psychedelics such as lysergic acid diethylamide (LSD), psilocybin, mescaline, and N,N-dimethyltryptamine (DMT). Psychologically, the psychedelic experience can be characterized as a temporary nonordinary state of consciousness (NSC) that basically differs from everyday waking consciousness in terms of all three traditionally identified components of the mind: cognition (perception and thought), affect (emotions and mood), and conation (volition, willpower). Psychedelic nonordinary cognition may for instance involve visions of geometric patterns or the perception of a subject-object transcending oneness; psychedelic nonordinary affect may for instance involve great anxiety, deepest sadness, or highest bliss; and psychedelic nonordinary conation may for instance involve themes such as surrendering to the psychedelic experience or letting go of emotionally difficult aspects of one’s life. Studying the psychedelic experience is a worthwhile endeavor. While psychedelic experiences can also be challenging/confrontational, they are often deeply meaningful to the individual experiencing them. Studies have shown that such experiences are often associated with enduring positive effects on attitudes, mood, and behavior in healthy individuals and—in conjunction with psychotherapy—with sustained symptom reductions in individuals suffering from depression, anxiety, and addiction (also showing some first promise for a number of other mental conditions, such as obsessive-compulsive and eating disorders).

Psychedelic science is overall a large multidisciplinary effort that requires collaboration of scholars of the human sciences, the natural sciences, and the humanities to advance the scientific knowledge of it. In this spirit, this course involves—besides the main lecturer (PD Dr. phil. Kurt Stocker, a psychologist)—also further psychedelic-scientific scholars giving individual lectures in their respective field of expertise: psychology (PD Dr. phil. Katrin Preller, University of Zurich & Yale University), pharmacology (Dr. phil. nat. Dino Luethi, University Hospital Basel; Dr. phil. nat. Deborah Rudin, University Hospital Basel; Prof. Dr. phil. Linda Simmler, University of Basel), physiology (PD Dr. sc. nat. Felix Schokmann, University of Zurich & University of Bern), psychotherapy (Prof. Dr. med. Gregor Hasler, University of Fribourg; Dr. med. Dr. sc. ETH Milan Scheidegger, University of Zurich), and politics (Dr. phil Claudia G. Schwarz, Karl Landsteiner University of Health Sciences, Krems). By incorporating all these disciplines, the curricular goal of this ETH course is to cover psychedelic science from the large variety of major academic disciplines that are involved in this field, and to thus introduce psychedelic science to the students as broadly and comprehensively as is possible within a single course.

Abstract
The pressing environmental challenges of today demand a critical reflection. Ethics is an important tool for doing so. This lecture introduces the basics of ethics and provides in-depth knowledge of environmental ethics and its debates. This theoretical background will be applied and critically reflected using examples of current environmental challenges.

Objective
On completion of this lecture, you have acquired the ability to identify, analyze, critically reflect and resolve ethical challenges in general and specifically regarding the environment. You know basic concepts, positions and lines of argumentation from the debate in environmental ethics, which you have applied and discussed in smaller exercises.

851-0763-00L Supervised Research (Law, Economics, and Data Science) W 3 credits E. Ash

Abstract
This is a supervised student project for 3 ECTS, supervised by the professorship of Elliott Ash (D-GESS). Students will adapt tools from econometrics and machine learning to questions in law, data science, and social science.

Objective
Students must have some data science and/or statistics experience. Some programming experience in Python, Stata, or R is required.

Prerequisites / notice
Apply tools from data science and social science to a new project, potentially in a group, to develop a paper or app.

851-0765-00L Ethics Workshop: The Impact of Digital Life on Society ■

Abstract
This workshop focuses on understanding and managing the ethical and social issues arising from the integration of new technologies in various aspects of daily life.

Objective
- Explain relevant concepts in ethics.
- Evaluate the ethical dimensions of new technology uses.
- Identify impacted stakeholders and who is ethically responsible.
- Engage constructively in the public discourse relating to new technology impacts.
- Review tools and resources currently available that facilitate resolutions and ethical practice.
- Work in a more ethically reflective way.

Content
The workshop offers students an experience that trains their ability for critical analysis and develops awareness of responsibilities as a researcher, consumer and citizen. Learning will occur in the context of three intensive workshop days, which are highly interactive and focus on the development and application of reasoning skills.

The workshop will begin with some fundamentals: the nature of ethics, of consent and big data, of AI ethics, public trust and health ethics. Students will then be introduced to key ethical concepts such as fairness, autonomy, trust, accountability, justice, as well different ways of reasoning about the ethics of digital technologies.

A range of practical problems and issues in the domains of education, media, society, digital health and justice will be then considered. These domains are represented respectively by unique and interesting case studies. Each case study has been selected not only for its timely and engaging nature, but also for its relevance. Through the analysis of these case studies key ethical questions (such as fairness, accountability, explainability, access etc.) will be highlighted and questions of responsibility and tools for ethical practice will be explored. Throughout, the emphasis will be on learning to make sound arguments about the ethical aspects of policy, practice and research.

851-0391-00L Focus on the Human: Human-Centered Security and Privacy Lab W 3 credits 2S V. Zimmermann, A. Toth

Objective
The course makes students experience an exemplary human-centered design process. They will learn about and practically apply human-centered design and evaluation methods that will allow them to view their solution from the human perspective, e.g., the user, developer or website owner perspective. By taking part in the evaluation of other teams, they will also take the user perspective themselves.
Psychedelic Science: Psychology Pharmacology

Physics Psychotherapy Philosophy Religion Politics

Abstract
This course series covers psychoactive science mainly psychologically, and additionally pharmacologically, physiologically, psychotherapeutically, philosophically, religiously, and politically. All contributions will also be reflected on the viewpoint of the humanities and psychology.

Objective
To provide students with a multidisciplinary introduction to psychedelic science, and to also comprehensively embed this in a reflection from a humanities/psychology viewpoint.

Content
Psychedelic science is a multidisciplinary field of study that involves scholars of the human sciences, the natural sciences, and the humanities. In this course, psychedelic science is presented mainly from the viewpoint of psychology, but will additionally also be considered from the viewpoints of pharmacology, physiology, psychotherapy, philosophy, religion, and politics. All contributions will also be reflected from the viewpoint of the humanities and psychology. The psychedelic studies treated in this course that involve humans focus on controlled and ethically approved studies where these substances are administered to medically screened, prepared, and supported participants. This course is in no way intended to encourage the private/illegal use of psychedelic substances.

A psychedelic experience is occasioned by classic (serotonergic) psychedelics such as lysergic acid diethylamide (LSD), psilocybin, mescaline, and N,N-dimethyltryptamine (DMT). Psychologically, the psychedelic experience can be characterized as a temporary nonordinary state of consciousness (NSC) that basically differs from everyday waking consciousness in terms of all three traditionally identified components of the mind: cognition (perception and thought), affect (emotions and mood), and conation (volition, willpower). Psychedelic nonordinary cognition may for instance involve visions of geometric patterns or the perception of a subject-object transcending oneness; psychedelic nonordinary affect may for instance involve great anxiety, deepest sadness, or highest bliss; and psychedelic nonordinary conation may for instance involve themes such as surrendering to the psychedelic experience or letting go of emotionally difficult aspects of one’s life.

Studying the psychedelic experience is a worthwhile endeavor. While psychedelic experiences can also be challenging/confrontational, they are often deeply meaningful to the individual experiencing them. Studies have shown that such experiences are often associated with enduring positive effects on attitudes, mood, and behavior in healthy individuals and—in conjunction with psychotherapy—with sustained symptom reductions in individuals suffering from depression, anxiety, and addiction (also showing some first promise for a number of other mental conditions, such as obsessive-compulsive and eating disorders).

Psychedelic science is overall a large multidisciplinary effort that requires collaboration of scholars of the human sciences, the natural sciences, and the humanities to advance the scientific knowledge of it. In this spirit, this course involves—besides the main lecturer (PD Dr. phil. Kurt Stocker, a psychologist)—also further psychedelic-scientific scholars giving individual lectures in their respective field of expertise: psychology (PD Dr. phil. Katrina Preller, University of Zurich & Yale University), pharmacology (Dr. phil. nat. Dino Luethi, University Hospital Basel; Dr. phil. nat. Deborah Rudin, University Hospital Basel; Prof. Dr. phil. Linda Simmler, University of Basel), physiology (PD Dr. sc. nat. Felix Scholkmann, University of Zurich & University of Bern), psychotherapy (Prof. Dr. med. Gregor Hasler, University of Fribourg; Dr. med. Dr. sc. ETH Milan Schedegger, University of Zurich), philosophy (Dr. Peter Sjöstedt-Hughes, University of Exeter), religion (TBA), and politics (Dr. phil Claudia G. Schwarz, Karl Landsteiner University of Health Sciences, Krems). By incorporating all these disciplines, the curricular goal of this ETH course is to cover psychedelic science from the large variety of major academic disciplines that are involved in this field, and to thus introduce psychedelic science to the students as broadly and comprehensively as is possible within a single course.

The Cutting Edge of Social Brain Imaging

851-0763-00L

Supervised Research (Law, Economics, and Data Science)

W 3 credits E. Ash

Does not take place this semester.

Abstract

This is a supervised student project for 3 ECTS, supervised by the professorship of Elliott Ash (D-GESS). Students will adapt tools from econometrics and machine learning to questions in law, data science, and social science.

Objective

Students must have some data science and/or statistics experience. Some programming experience in Python, Stata, or R is required.

Prerequisites / notice

Apply tools from data science and social science to a new project, potentially in a group, to develop a paper or app.

851-0453-00L

Artificial Intelligence and Human Values

W 3 credits 2G M. Boenig-Liptsin, K. Wodajo

Abstract

This course introduces students to the ethical, political and legal debates and transformations in relation to Artificial Intelligence and provides students with concepts and methods from the constructivist and interpretive social sciences to work towards responsible and democratic human-technology futures.

Objective

The main objectives of the course are to enable students to 1) identify the ways in which human values and developments of AI technologies are entangled, 2) articulate what is significant about contemporary transformations in AI and society, and 3) participate and shape the relationship between human values and AI as citizens and professionals.

Content

The growing presence of AI tools for public use, for public administration, inside corporations and in scientific research raises many questions about the ethical, political, legal consequences of these technologies. This course is built around multiple sites of encounter among human values and AI, including bodies, persons, cities, labs, law, and environment. In each site, we inquire about what and whose values are being prioritized and with what consequences. The course also investigates existing best-practices around how to "align" human values with AI (e.g. human-centric design, alignment, reproducibility, transparency, explainability) and introduces students to regimes of ethics and governance of AI being proposed in jurisdictions around the world. Students learn to unpack the values and assumptions in existing techniques and frameworks for the design and governance of AI and to engage constructively with diverse stakeholders to shape the human-technology future towards aims that are reflexive, responsible, and democratic.

851-0157-28L

Life and Death

W 3 credits 2V M. Hagner

Particularly suitable for students of D-BIOL, D-HEST, D-CHAB, D-USYS

Abstract

This course explores the relation between the scientific investigation of life and cultural notions of death from a historical perspective (assuming there is no such thing as the scientific investigation of death). While the course covers the times from antiquity up to the present, the main emphasis will be placed on the modern life sciences since the 19th century.

Objective

There is only one certainty in life: death. This brute fact has animated much thought and work in theology, art and philosophy - but also in the natural sciences, such as biology and medicine. Questions regarding health and disease, evolution, extinction and immortality have played a crucial role in this connection. This course aims to explore above relations - the relations between the scientific investigation of life and cultural notions of death - from a historical perspective (assuming there is no such thing as the scientific investigation of death). While the course covers the times from antiquity up to the present, the main emphasis will be placed on the modern life sciences since the 19th century.

851-0272-00L

The Cutting Edge of Social Brain Imaging

W 2 credits 2S E. Cross, R. Moffat

Abstract

This seminar introduces the fundamentals and latest research developments of brain imaging in real-world contexts. We explore topics from imaging multiple people’s brains simultaneously as they interact to neuro-ethics and neuro-art, while maintaining a strong focus on critical evaluation of research practices and applications of brain imaging of and during social interaction.

Objective

- To familiarize students with current concepts, theories, methods, and findings from social brain-imaging sciences
- To develop a critical view of extant findings and the tools for evaluating the quality of evidence and data, as well as ethical implications

Content

Rapid advances in the technologies and empirical approaches used in imaging the human brain have opened exciting windows into how the human brain coordinates social interaction. These advances include imaging the brain’s function during real social interactions, training behaviours with feedback based on real-time brain activity, and even generating art directly from brain signals. With them, these advances have brought novel ethical implications regarding their implementation in research and potentially, their use by the public, for both therapeutic and possible “neurohacking” applications. In this seminar, students will be introduced to various neuroimaging approaches for social neuroscience generally, as well as to approaches for measuring social brain function in real life, and will gain insights into related ethical considerations.

The seminar builds on the active participation of students in reading, presenting, and critically discussing selected papers in the field. In a final small-group assignment, students are required to integrate and elaborate upon topics covered in the seminar by presenting and debating a novel research proposal for addressing a timely research question related to the use of brain imaging in the context of social interactions. No prior experience or knowledge in brain imaging is required.

Competencies

Subject-specific Competencies

- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies

- Analytical Competencies

- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

851-0392-00L

Privacy Quantification and Usable Protection Mechanisms

W 3 credits 2S N. Zufferey, V. Zimmermann

Autumn Semester 2024
Students will gain an overview of the main privacy metrics that are used to evaluate privacy risks related to the use of a given technology. They will also be introduced to the concepts of privacy/utility balance and usable security. Practical exercises and reading of recently published scientific articles will be used to present practical cases of the theoretical tools presented in class.

This course aims to provide the students with a global knowledge of the concepts related to privacy, and the methodology and tools to identify, analyze, and address threats while taking the user into account in the process. They will adopt a “privacy mindset”, thus enabling them to automatically take privacy into account, in a usable way, when designing or analyzing a system.

First, the course will introduce the different definitions and approaches of privacy (e.g., privacy by control, privacy by design) as well as the ethical concerns and considerations related to information security and privacy research (e.g., responsible disclosure, full disclosure).

Second, the students will be introduced to the different methods, properties, and metrics to assess and/or guarantee a certain level of privacy. They will be introduced to the properties and metrics related to anonymization (e.g., k-anonymity, l-diversity), data aggregation (e.g., randomized responses, \(\varepsilon\)-differential privacy), as well as other privacy assessment methodologies (e.g., inferential privacy).

Third, the course will address usability issues and the role of individuals (i.e., users) in privacy management (i.e., usable security and privacy) and the design of privacy-enhancing technologies. In this context, we will analyze the main concepts seen during the course and discuss their advantages and disadvantages in terms of usefulness, as well as their implementation for mass-market and large-scale technologies.

Across all three parts of the course, practical exercises, as well as recent research articles reading, and presentations will be used as a complement to support the concepts seen in class, as well as to provide concrete examples of methodologies related to the assessment of privacy in general.

Contract Design I

This seminar will introduce key topics, theories and methodology in human-computer interaction (HCI) and usability, with a focus on applying them to real situations.

Presentations will cover the basics of human-computer interaction and selected topics:
- History of HCI
- Research ethics
- Literature reviews
- Participant-free methods: cognitive walkthrough and heuristic evaluation
- Card sorting and information architecture
- Usability studies
- Unmoderated research and diary studies
- Surveys
- User Logs and metric frameworks

On a weekly basis, students will conduct authentic research in class covering the topics above. They will submit their in-class research results regularly and also present their findings to the class once per semester.

The final project demonstrates class topic adoption by deeply exploring one HCI problem using the covered methods and tools. Students will choose a research topic and execute their research plan. They will individually write a formal report including problem definition, literature review, methodology, findings and discussion.

Contract Design I (851-0742-00L; Fall 2023)

Abstract
Contract Design I is taught by Professor Stremitzer and aims to bridge the gap between economic contract theory, contract law, and the writing of real-world contracts. In this course, we take a systematic approach to contract design. This means we first analyze the economic environment in which a transaction takes place and then engineer contracts that achieve the desired outcome.

Objective
Contracts are agreements between parties to engage in transactions. A good contract creates value by giving parties the right incentives to meet their objectives. A good contract designer scrutinizes the economic situation in which parties find themselves and tailors the contract to the challenges at hand. To help you become sophisticated contract designers, we draw from insights for which more than half a dozen Nobel Prizes were awarded in the past two decades and transfer them to the art of writing real-world contracts. In other words, Contract Design will provide you with analytical tools to design contracts that help you be better lawyers, business leaders, and startup founders.

We will cover topics such as moral hazard, adverse selection, elicitation mechanisms, relationship-specific investments, and relational contracting and apply the theoretical insights to real-life case studies ranging from purchases & sales of assets, oil & gas exploration, movie financing, production & distribution, construction & development, M&A deals, venture capital financing, to executive compensation and many other types of transactions.

The course follows a flipped-classroom model: You will watch learning videos specifically produced for this course ahead of class. We will use class time to discuss real-world case studies. The videos will be made available before the lecture each week and need to be watched ahead of coming to class. Computer-graded quizzes at the beginning of each class will test students’ understanding of the concepts introduced in the videos.

As the emphasis of this class is on class discussion, attendance is mandatory. Absent important reasons, you cannot miss class more than twice.

The lectures will be recorded but only made available to those who miss lectures with excused absence.

For ETH students: Your grade will consist of two parts:
1) You will take weekly computer-based quizzes during class time. Thus, it is important that you attend the lectures to be able to finish the quizzes and pass this course.
2) You compose short responses to take-home questions on case studies we assign and upload them ahead of class (Pass/Fail).

Note that UZH and UNISG students enrolling in this course need to earn more ECTS for completing this course than ETH students (due to curricula reasons). This is why UZH and UNISG students must check out the description of the class at their respective home institutions.

Lecture notes
Handouts, prerecorded videos, slides, case studies, and other materials available on a dedicated webpage: contractdesign.org. Access to this webpage is free of charge for ETH students as ETH purchased a license for ETH students.

Prerequisites / notice
Attendance is mandatory. You are only allowed to miss two lectures unless there are special circumstances.

Contract Design I is available to ETH students through the Science in Perspective (SiP) Program of D-GESS. This course is particularly suitable for students of D-ARCH, D-BAUG, D-CHAB, DMATH, D-MTEC, D-INFK, and D-MAVT.

If you have any questions regarding the course, please write an email to the teaching assistants, Lucas Gericke (lucas.gericke@gess.ethz.ch) or Serge von Steiger (serge.vonsteiger@gess.ethz.ch).
**851-0727-02L**  
**E-Business-Law**  
*Particularly suitable for students of D-INFK, D-ITET.*  
**W** 2 credits  2V  D. Rosenthal

**Abstract**  
The course deals with the basic legal framework for doing e-business as well as using information technology. It discusses a variety of legal concepts and rules to be taken into account in practice, be it when designing and planning new media business models, be it when implementing online projects and undertaking information technology activities.

**Objective**  
The objective is knowing and understanding key legal concepts relevant for doing e-business, in particularly understanding how e-business is regulated by law nationally and internationally, how contracts are concluded and performed electronically, which rules have to be obeyed in particular in the Internet with regard to third party and own content and client data, the concept of liability applied in e-business and the role of the law in the practical implementation and operation of e-business applications.

**Content**

1) Welches Recht gilt im E-Business?  
- Internationalität des Internets  
- Regulierte Branchen

2) Gestaltung und Vermarktung von E-Business-Angeboten  
- Verwendung fremder und Schutz der eigenen Inhalte  
- Haftung im E-Business (und wie sie beschränkt werden kann)  
- Domain-Namen

3) Beziehung zu E-Business-Kunden  
- Verträge im E-Business, Konsumentenschutz  
- Elektronische Signaturen  
- Datenschutz  
- Spam

4) Verträge mit E-Business-Providern

**Lecture notes**  
Es wird mit Folien gearbeitet, die als PDF über Moodle vorgängig abrufbar sind. Auf dem Termin- und Themenplan (ebenfalls online abrufbar) sind Links zu Gesetzestexten und weiteren Unterlagen abrufbar. Schliesslich wird jede Vorlesung auch als Podcast aufgezeichnet, der jedoch nur für die Studierenden mit einem Passwort (erhältlich beim Dozenten) zugänglich sind.

**Literature**
Weiterführende Materialien, Links und Literatur sind auf dem Termin- und Themenplan aufgeführt (zu gegebener Zeit abrufbar via Moodle).

**851-0252-13L**  
**Network Modeling**  
*Particularly suitable for students of D-MATH, D-INFK and in the MSc Data Science*  
**W** 3 credits  2G  C. Stadtfeld, I. Smokovic, A. Uzaheta Berdugo

**Abstract**  
Social Network Science is a distinct domain of data science that focuses on relational systems. Various models have been proposed to describe structures and dynamics of networks, including statistical and mathematical methods. In this course, the emphasis is placed on the statistical analysis of (social) systems and their connection to social theories and data sources.
Objective

The following topics will be covered:

- Introduction to network models and their applications

- Stylized models:
  * uniform random graph models
  * small world models
  * preferential attachment models

- Models for testing hypotheses while controlling for the network structure:
  * Quadratic assignment procedure regression (QAP regression)

- Models for testing hypotheses on the network structure:
  * Models for one single observation of a network: exponential random graph models (ERGMs)
  * Models for panel network data: stochastic actor-oriented models (SAOMs)

The application of these models is illustrated through examples and practical sessions involving the analysis of network data using the software R.

Content

The following topics will be covered:

- Introduction to network models and their applications

- Stylized models:
  * uniform random graph models
  * small world models
  * preferential attachment models

- Models for testing hypotheses while controlling for the network structure:
  * Quadratic assignment procedure regression (QAP regression)

- Models for testing hypotheses on the network structure:
  * Models for one single observation of a network: exponential random graph models (ERGMs)
  * Models for panel network data: stochastic actor-oriented models (SAOMs)

The application of these models is illustrated through examples and practical sessions involving the analysis of network data using the software R.

Lecture notes

Slides and lecture notes are distributed via the associated course moodle.

Literature

Prerequisites / notice

Students are required to have basic knowledge in inferential statistics and should be familiar with linear and logistic regression models.

Network Analysis

Particularly suitable for students of D-INFK, D-MATH.

Students will be able to identify and categorize research problems that call for network approaches while appreciating differences across application domains and contexts. They will master a suite of mathematical and computational tools, and know how to design or adapt suitable methods for analysis.

The following topics will be covered with an emphasis on structural and computational approaches and frequent reference to their suitability with respect to substantive theory:

* Empirical Research and Network Data
* Macro and Micro Structure
* Centrality
* Roles
* Cohesion
* Influence

Lecture notes

Slides and lecture notes are distributed via the associated course moodle.

**851-0732-06L Law & Tech**

**Abstract**

This course introduces students to scientific and technological developments that require regulation or enable legal innovation. We focus particularly on the challenges to current law posed by prominent near-future technologies.

**Objective**

The course is designed for a wide range of ETH students as well as for law students who are keen to deepen their understanding of cutting-edge technology. It offers an overview of key legal areas important for technology regulation, complemented by guest lectures on emerging technological trends.

In previous years, the course has featured esteemed speakers from various sectors, including industry leaders like Google, NGOs such as Digital Society Switzerland and The European Consumer Organization, regulatory bodies like the Swiss Competition Commission, and noted academics.

The course is open to ETH students through the Science in Perspective program of the Department of Humanities, Social and Political Sciences.

**Content**

The planned course outline is below.

- Overview of Law and Technology
- Fundamental Rights
- AI & Discrimination
- Landmark Big Tech Cases
- Regulation of Digital Platforms & Content Moderation
- Online Consumer Protection
- Law and Tech Scholarship Series

A number of recent regulations will be discussed, including the EU's AI Act, the Digital Services Act (DSA), and the Digital Markets Act (DMA), as well as emerging internet phenomena, like ChatGPT.

**Prerequisites / notice**

You can find all course materials and the most recent announcements on Moodle. Please log in to Moodle using your ETH or UZH credentials. Then search for “Law & Tech (851-0732-06L, HS 2024)” and enroll.

**Competencies**

- Subject-specific Competencies
  - Concepts and Theories
  - Analytical Competencies
  - Media and Digital Technologies

**851-0101-86L Complex Social Systems: Modeling Agents, Learning, and Games**

**Prerequisites:** Basic programming skills, elementary probability and statistics.

**Abstract**

This course introduces mathematical and computational models to study techno-socioeconomic systems and the process of scientific research. Students develop a significant project to tackle techno-socio-economic challenges in application domains of complex systems. They are expected to implement a model and to communicate their results through a project report and a short oral presentation.

**Objective**

See your own field of study in a wider context (“Science in Perspective”), e.g. see the psychological, social, economic, environmental, historical, ethical, or philosophical connections and implications. Learn to think critically and out of the box. Question what you believe you know for sure. Get to know surprising, counterintuitive properties of complex (non-linearly interacting, networked, multi-component) systems. Learn about collaboration.

**Content**

By the end of the course, the students should be able to better understand the literature on complex social systems, develop their own models for studying specific phenomena and report results according to the standards of the relevant scientific literature by presenting their results both numerically and graphically.

At the end of the course, the students will deliver a report, computer code and a short oral presentation. To collect credit points, students will have to actively contribute and give a circa 30 minutes presentation in the course on a subject agreed with the lecturers, after which the presentation will be discussed. The presentation will be graded.

Students are expected to implement themselves models of techno-socio-economic processes and systems, particularly agent-based models, complex networks models, decision making, group dynamics, human crowds, or game-theoretical models. Credit points are finally earned for the implementation of a mathematical or empirical model from the complexity science literature, its presentation, and documentation by a project report.

**Lecture notes**

The lecture slides will be presented on the course Moodle after each lecture.

---

### Prerequisites / notice

The number of participants is limited to the size of the available computer teaching room. The source code related to the seminar thesis should be well enough documented.

Good programming skills and a good understanding of probability & statistics and calculus are expected.

Students need to present a new subject, for which they have not earned any credit points before.

Good scientific practices, in particular citation and quotation rules, must be properly complied with.

Chatham House rules apply to this course. Materials may not be shared without previous written permission.

### Competencies

### 851-0760-00L Building a Robot Judge: Data Science for Decision-Making

*W* 3 credits 2V E. Ash

**Abstract**

This course explores the automation of decisions in the legal system. We delve into the machine learning tools needed to predict judge decision-making and ask whether techniques in model explanation and algorithmic fairness are sufficient to address the potential risks.

**Objective**

This course introduces students to the data science tools that may provide the first building blocks for a robot judge. While building a working robot judge might be far off in the future, some of the building blocks are already here, and we will put them to work.

**Content**

Data science technologies have the potential to improve legal decisions by making them more efficient and consistent. On the other hand, there are serious risks that automated systems could replicate or amplify existing legal biases and rigidities. Given the stakes, these technologies force us to think carefully about notions of fairness and justice and how they should be applied.

The focus is on legal prediction problems. Given the evidence and briefs in this case, how will a judge probably decide? How likely is a criminal defendant to commit another crime? How much additional revenue will this new tax law collect? Students will investigate and implement the relevant machine learning tools for making these types of predictions, including regression, classification, and deep neural networks models.

We then use these predictions to better understand the operation of the legal system. Under what conditions do judges tend to make errors? Against which types of defendants do parole boards exhibit bias? Which jurisdictions have the most tax loopholes? Students will be introduced to emerging applied research in this vein. In a semester paper, students (individually or in groups) will conceive and implement an applied data-science research project.

---

### 851-0467-00L From Traffic Modeling to Smart Cities and Digital Democracies

*W* 3 credits 2S D. Helbing, R. K. Dubey

**Abstract**

This seminar will present speakers who discuss the challenges and opportunities arising for our cities and societies with the digital revolution.

**Objective**

To collect credit points, students must actively contribute and give an individual, circa 20-minute presentation in the seminar on a subject agreed upon with the lecturer. After the presentation, it will be discussed and graded.
Content
This seminar will present speakers who discuss the challenges and opportunities arising for our cities and societies with the digital revolution. Besides discussing questions of automation using Big Data, AI and other digital technologies, we will also reflect on the question of how democracy could be digitally upgraded, and how citizen participation could contribute to innovation, sustainability, resilience, and quality of life. This includes questions around collective intelligence and digital platforms that support creativity, engagement, coordination and cooperation.

851-0391-00L Focus on the Human: Human-Centered Security and Privacy Lab
The course is particularly suitable for all students who have already completed the course “Human-centered IT Security and Privacy” as some of the concepts introduced will practically be applied in this course. However, the relevant literature and necessary material will be provided to all students and basic concepts will be briefly summarized so that all interested students can participate.

Abstract
After an introduction on usable security as the intersection of computer science and psychology, students will form teams and work on exemplary security- or privacy-related research questions. The teams will develop and evaluate a concept for a human-centered solution. Through input sessions and milestone presentations the human perspective will be incorporated and reflected upon.

Objective
The course makes students experience an exemplary human-centered design process. They will learn about and practically apply human-centered design and evaluation methods that will allow them to view their solution from the human perspective, e.g., the user, developer or website owner perspective. By taking part in the evaluation of other teams, they will also take the user perspective themselves.
Content
At the beginning of the course, the students will receive an introduction to usable IT security and privacy and relevant concepts. Afterwards, a selection of current research questions from that area will be presented. The students form teams and select one of the proposed research questions. This question will accompany the students throughout the semester. They will design and evaluate a concept for a human-centered solution to that question. To be able to do so, they will receive input on human-centered design and evaluation tools. Their progress and the inclusion of the human perspective will be subject to feedback in milestone presentations.

The students' human-centered solution can take the form of a concept (e.g., a concept for a product or app), interface (e.g., a visual or tangible interface), or prototype (e.g., sketches, a click-dummy or a built prototype). The solution will then be subject to evaluations. The solutions will be user-tested by members of other teams that thereby take the perspective of a user themselves. In addition, the solutions will be analyzed from different stakeholders' perspectives, such as developers and website owners. Finally, the students will reflect on potential changes that result from the evaluations and their consequences.

Content
Rapid advances in the technologies and empirical approaches used in imaging the human brain have opened exciting windows into how the human brain coordinates social interaction. These advances include imaging the brain’s function during real social interactions, training behaviors with feedback based on real-time brain activity, and even generating art directly from brain signals. With them, these advances have brought novel ethical implications regarding their implementation in research and potentially, their use by the public. For both academic and public healthcare, the possibility of monitoring and manipulating brain processes presents a novel “neurohacking” applications. Applications of these advances to social neuroscience generally, as well as to approaches for measuring social brain function in real life, and will gain insights into related ethical considerations.

The seminar builds on the active participation of students in reading, presenting, and critically discussing selected papers in the field. In a final small-group assignment, students are required to integrate and elaborate upon topics covered in the seminar by presenting and debating a novel research proposal for addressing a timely research question related to the use of brain imaging in the context of social interactions. No prior experience or knowledge in brain imaging is required.

851-0392-00L Privacy Quantification and Usable Protection
Mechanisms

Abstract
Students will gain an overview of the main privacy metrics that are used to evaluate privacy risks related to the use of a given technology. They will also be introduced to the concepts of privacy/utility balance and usable security. Practical exercises and reading of recently published scientific articles will be used to present practical cases of the theoretical tools presented in class.

Objective
This course aims to provide the students with a global knowledge of the concepts related to privacy, and the methodology and tools to identify, analyze, and address threats while taking the user into account in the process. They will adopt a “privacy mindset”, thus enabling them to automatically take privacy into account, in a usable way, when designing or analyzing a system.

Content
First, the course will introduce the different definitions and approaches of privacy (e.g., privacy by control, privacy by design) as well as the ethical concerns and considerations related to information security and privacy research (e.g., responsible disclosure, full disclosure).

Second, the students will be introduced to the different methods, properties, and metrics to assess and/or guarantee a certain level of privacy. They will be introduced to the properties and metrics related to anonymization (e.g., k-anonymity, l-diversity), data aggregation (e.g., randomized responses, ε-differential privacy), as well as other privacy assessment methodologies (e.g., Inferential privacy).

Third, the course will address usability issues and the role of individuals (i.e., users) in privacy management (i.e., usable security and privacy) and the design of privacy-enhancing technologies. In this context, we will analyze the main concepts seen during the course and discuss their advantages and disadvantages in terms of usability, as well as their implementation for mass-market and large-scale technologies.

Across all three parts of the course, practical exercises, as well as recent research articles reading, and presentations will be used as a complement to support the concepts seen in class, as well as to provide concrete examples of methodologies related to the assessment of privacy in general.

851-0271-00L Neuroaesthetics - Exploring the Science of Aesthetic Experience

W 2 credits
E. Cross, I. Bara
Abstract
This seminar introduces students to theory and research, challenges, and opportunities in neuroaesthetics, with a clear emphasis on the interdisciplinary nature of the discipline situated at the intersection of neuroscience, psychology, and art appreciation. Foundational empirical methods and critical perspectives of research approaches in neuroaesthetics are considered.

Objective
- to familiarize students with concepts, models, methods, brain and behavioral findings related to aesthetic experience.
- to develop a critical understanding in evaluating the theoretical and empirical findings in neuroaesthetics
- to integrate the acquired knowledge to critically debate and discuss the conceptual and empirical issues related to the science of aesthetic experience

Content
In this seminar, students will learn about the foundational principles of neuroaesthetics, which explores the cognitive and brain processes involved in aesthetic experience. A key focus will be placed on developing an appreciation of the interdisciplinary methods used in the neuroaesthetics field – ranging from neuroscience, psychology, and art history. The seminar is based on the active engagement of students in reading, presenting, and critically discussing selected papers in the field. In a final small-group assignment, students are expected to incorporate and elaborate upon the content covered in the seminar by presenting and discussing a novel research proposal for tackling a timely research question related to aesthetic experience.

851-0549-00L WebClass Introductory Course History of Technology Particularly suitable for students D-BAUG, D-INFK, D-ITET, D-MATL, D-MAVT.

Abstract
Technology stands for innovation and catastrophes; it works as a dream machine and is associated with the most diverse ways of utilization. In WebClass Introductory Course History of Technology students become familiar with explanations for how technology works within complex economic, political and cultural contexts, by interpreting and researching texts and authoring a student manual.

Objective
Students are introduced into how technological innovations take place within complex economic, political and cultural contexts. They get to know basic theories and practices of the field by acquiring the skills to interpret texts, to compare arguments, to research additional sources and complementary material and to author a common essay. All of this will yield into a student manual on the four core topics: technology and innovation, technology and catastrophes, technology as a dream machine and technology and association. The course language is German, and even if many texts will be in English, the ability to read and understand German is mandatory.

Content

Lecture notes

D-ITET

860-0023-00L International Environmental Politics Particularly suitable for students of D-ITET, D-USYS.

Abstract
This course deals with how and why international problem-solving efforts (cooperation) in environmental politics emerge and evolve, and under what circumstances such efforts are effective. Based on concepts and theories of political economy, political science, and public policy, various examples of international environmental policy-making are examined.

Objective
The objectives in this course are to (1) gain an overview of important questions pertaining to international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions in this policy area and how to address them in a conceptually and methodologically meaningful and insightful way; (3) gain an overview of important global and regional environmental problems and how they are or could be solved.

Content
This course deals with how and why international problem-solving efforts (cooperation) in environmental politics emerge and evolve, and under what circumstances such efforts are effective. Based on concepts and theories of political economy, political science, and public policy, various examples of international environmental policy-making are examined, for example international efforts to reduce air pollution, manage international water resources, mitigate and adapt to global warming, protect the stratospheric ozone layer, address biodiversity challenges, deal with plastic waste, and prevent pollution of the oceans.

Lecture notes
Reading materials and slides will be available via Moodle.

Literature

#### Abstract

The course deals with the basic legal framework for doing e-business as well as using information technology. It discusses a variety of legal concepts and rules to be taken into account in practice, be it when designing and planning new media business models, be it when implementing online projects and undertaking information technology activities.

#### Objective

The objective is knowing and understanding key legal concepts relevant for doing e-business, in particularly understanding how e-business is regulated by law nationally and internationally, how contracts are concluded and performed electronically, which rules have to be obeyed in particular in the Internet with regard to third party and own content and client data, the concept of liability applied in e-business and the role of the law in the practical implementation and operation of e-business applications.

#### Content

Vorgesehene Strukturierung der Vorlesung:

1. Welches Recht gilt im E-Business?
   - Internationalität des Internets
   - Regulierte Branchen

2. Gestaltung und Vermarktung von E-Business-Angeboten
   - Verwendung fremder und Schutz der eigenen Inhalte
   - Haftung im E-Business (und wie sie beschränkt werden kann)
   - Domain-Namen

3. Beziehung zu E-Business-Kunden
   - Verträge im E-Business, Konsumentenschutz
   - Elektronische Signaturen
   - Datenschutz
   - Spam

4. Verträge mit E-Business-Providern

Änderungen, Umstellungen und Kürzungen bleiben vorbehalten. Der aktuelle Termin- und Themenplan ist zu gegebener Zeit über Moodle abrufbar.

#### Literature

Weiterführende Materialien, Links und Literatur sind auf dem Termin- und Themenplan aufgeführt (zu gegebener Zeit abrufbar via Moodle).

#### Prerequisites / notice

Die Semesterendprüfung erfolgt normalerweise in Form eines schriftlichen Kurztests (normalerweise ein MC) in der letzten Doppelstunde. Der Termin- und Themenplan ist zu gegebener Zeit über Moodle abrufbar.

#### Credits and Exam

After passing a written test at the end of the course (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test). Visiting students (e.g., from the University of Zurich, exchange students) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory. Students who obtain a grade of < 4.0 for the test will have a second chance (see table below). Students who did not participate in the test on 18 December 2023 will not have access to the repeat test unless they submit compelling and documented (e.g. medical, other exam in parallel at ETH) reasons for why they were unable to participate in the first test. It covers all contents of the lectures and the reading assignments. Visiting students (e.g., from the University of Zurich or other universities) are subject to the same conditions. Registration for the course in the mystudies system of ETH is compulsory. No separate registration for the exam is required, registration for the course as such covers everything. The exam will take place on campus, either in the F3 lecture hall or in a computer room. That is, you must be present in person at ETH Zurich on the exam date/time.

### Autumn Semester 2024

Data: 26.07.2024 12:39
Objective
Presentations will cover the basics of human-computer interaction and selected topics:
- History of HCI
- Research ethics
- Literature reviews
- Participant-free methods: cognitive walkthrough and heuristic evaluation
- Card sorting and information architecture
- Usability studies
- Unmoderated research and diary studies
- Surveys
- User Logs and metric frameworks

On a weekly basis, students will conduct authentic research in class covering the topics above. They will submit their in-class research results regularly and also present their findings to the class once per semester.

The final project demonstrates class topic adoption by deeply exploring one HCI problem using the covered methods and tools. Students will choose a research topic and execute their research plan. They will individually write a formal report including problem definition, literature review, methodology, findings and discussion.

Abstract
This course introduces mathematical and computational models to study techno-socioeconomic systems and the process of scientific research. Students develop a significant project to tackle techno-socio-economic challenges in application domains of complex systems. They are expected to implement a model and to communicate their results through a project report and a short oral presentation.

Objective
See your own field of study in a wider context ("Science in Perspective"), e.g. see the psychological, social, economic, environmental, historical, ethical or philosophical connections and implications. Learn to think critically and out of the box. Question what you believe you know for sure. Get to know surprising, counterintuitive properties of complex (non-linearly interacting, networked, multi-component) systems. Learn about collaboration.
By the end of the course, the students should be able to better understand the literature on complex social systems, develop their own models for studying specific phenomena and report results according to the standards of the relevant scientific literature by presenting their results both numerically and graphically.

At the end of the course, the students will deliver a report, computer code and a short oral presentation. To collect credit points, students will have to actively contribute and give a circa 30 minutes presentation in the course on a subject agreed with the lecturers, after which the presentation will be discussed. The presentation will be graded.

Students are expected to implement themselves models of techno-socio-economic processes and systems, particularly agent-based models, complex networks models, decision making, group dynamics, human crowds, or game-theoretical models. Credit points are finally earned for the implementation of a mathematical or empirical model from the complexity science literature, its presentation, and documentation by a project report.

The lecture slides will be presented on the course Moodle after each lecture.

851-0760-00L Building a Robot Judge: Data Science for Decision-Making

Objective
This course explores the automation of decisions in the legal system. We delve into the machine learning tools needed to predict judge decision-making and ask whether techniques in model explanation and algorithmic fairness are sufficient to address the potential risks.

This course introduces students to the data science tools that may provide the first building blocks for a robot judge. While building a working robot judge might be far off in the future, some of the building blocks are already here, and we will put them to work.

Abstract
This course does not take place this semester. Particularly suitable for students of D-INFK, D-ITET, D-MTEC.

W 3 credits 2V E. Ash
Content

Data science technologies have the potential to improve legal decisions by making them more efficient and consistent. On the other hand, there are serious risks that automated systems could replicate or amplify existing legal biases and rigidities. Given the stakes, these technologies force us to think carefully about notions of fairness and justice and how they should be applied.

The focus is on legal prediction problems. Given the evidence and briefs in this case, how will a judge probably decide? How likely is a criminal defendant to commit another crime? How much additional revenue will this new tax law collect? Students will investigate and implement the relevant machine learning tools for making these types of predictions, including regression, classification, and deep neural networks models.

We then use these predictions to better understand the operation of the legal system. Under what conditions do judges tend to make errors? Against which types of defendants do parole boards exhibit bias? Which jurisdictions have the most tax loopholes? Students will be introduced to emerging applied research in this vein. In a seminar paper, students (individually or in groups) will conceive and implement an applied data-science research project.

Abstract

This seminar will present speakers who discuss the challenges and opportunities arising for our cities and societies with the digital revolution.

Objective

To collect credit points, students must actively contribute and give an individual, circa 20-minute presentation in the seminar on a subject agreed upon with the lecturer. After the presentation, it will be discussed and graded.

Content

This seminar will present speakers who discuss the challenges and opportunities arising for our cities and societies with the digital revolution. Besides discussing questions of automation using Big Data, AI and other digital technologies, we will also reflect on the question of how democracy could be digitally upgraded, and how citizen participation could contribute to innovation, sustainability, resilience, and quality of life. This includes questions around collective intelligence and digital platforms that support creativity, engagement, coordination and cooperation.

Abstract

This course introduces students to scientific and technological developments that require regulation or enable legal innovation. We focus particularly on the challenges to current law posed by prominent near-future technologies.

Objective

The course is designed for a wide range of ETH students as well as for law students who are keen to deepen their understanding of cutting-edge technology. It offers an overview of key legal areas important for technology regulation, complemented by guest lectures on emerging technological trends.

In previous years, the course has featured esteemed speakers from various sectors, including industry leaders like Google, NGOs such as Digital Society Switzerland and The European Consumer Organization, regulatory bodies like the Swiss Competition Commission, and noted academics.

The course is open to ETH students through the Science in Perspective program of the Department of Humanities, Social and Political Sciences.

Content

The planned course outline is below.

- Overview of Law and Technology
- Fundamental Rights
- AI & Discrimination
- Landmark Big Tech Cases
- Regulation of Digital Platforms & Content Moderation
- Online Consumer Protection
- Law and Tech Scholarship Series

A number of recent regulations will be discussed, including the EU's AI Act, the Digital Services Act (DSA), and the Digital Markets Act (DMA), as well as emerging internet phenomena, like ChatGPT.

Prerequisites / notice

You can find all course materials and the most recent announcements on Moodle. Please log in to Moodle using your ETH or UZH credentials. Then search for "Law & Tech (851-0732-06L, HS 2024)" and enroll.

851-0391-00L Focus on the Human: Human-Centered Security and Privacy Lab

W 3 credits 2S V. Zimmermann, A. Toth

Abstract

After an introduction on usable security as the intersection of computer science and psychology, students will form teams and work on exemplary security- or privacy-related research questions. The teams will develop and evaluate a concept for a human-centered solution. Through input sessions and milestone presentations, the human perspective will be incorporated and reflected upon.

Objective

The course makes students experience an exemplary human-centered design process. They will learn about and practically apply human-centered design and evaluation methods that will allow them to view their solution from the human perspective, e.g., the user, developer or website owner perspective. By taking part in the evaluation of other teams, they will also take the user perspective themselves.

Content

At the beginning of the course, the students will receive an introduction to usable IT security and privacy and relevant concepts. Afterwards, a selection of current research questions from that area will be presented. The students form teams and select one of the proposed research questions. This question will accompany the students throughout the semester. They will design and evaluate a concept for a human-centered solution to that question. To be able to do so, they will receive input on human-centered design and evaluation tools. Their progress and the inclusion of the human perspective will be subject to feedback in milestone presentations. The students' human-centered solution can take the form of a concept (e.g., a concept for a product or app), interface (e.g., a visual or tangible interface), or prototype (e.g., sketches, a click-dummy or a built prototype). The solution will then be subject to evaluations. The solutions will be user-tested by members of other teams that thereby take the perspective of a user themselves. In addition, the solutions will be analyzed from different stakeholders' perspectives, such as developers or website owners.

Finally, the students will reflect on potential changes that result from the evaluations and their consequences.

Literature

Prerequisites / notice

This course is especially recommended after the related lecture "851-0390-00 G Human-Centered IT Security and Privacy". However, previous participation in the lecture is not a requirement and not necessary for succeeding in the course.
### Course: Artificial Intelligence and Human Values

**Abstract**

This course introduces students to the ethical, political and legal debates and transformations in relation to Artificial Intelligence and the growing presence of AI tools for public use, for public administration, inside corporations and in scientific research. Students will gain an overview of the main privacy metrics that are used to evaluate privacy risks related to the use of a given technology. They will also be introduced to the concepts of privacy/utility balance and usable security. Practical exercises and reading of recently published scientific articles will be used to present practical cases of the theoretical tools presented in class.

**Objective**

1. To introduce students to the historicity of mathematics
2. To make sense of mathematical practices that appear unreasonable from a contemporary point of view
3. To develop critical reflection concerning the nature of mathematical objects
4. To introduce various theoretical approaches to the philosophy and history of mathematics
5. To open the students’ horizons to the plurality of mathematical cultures and practices

### Course: Privacy Quantification and Usable Protection Mechanisms

**Abstract**

Students will gain an overview of the main privacy metrics that are used to evaluate privacy risks related to the use of a given technology. They will be introduced to the properties and metrics related to anonymization (e.g., k-anonymity, l-diversity), data aggregation (e.g., randomized responses, ε-differential privacy), as well as other privacy assessment methodologies (e.g., inferential privacy).

**Objective**

This course aims to provide the students with a global knowledge of the concepts related to privacy, and the methodology and tools to assess and/or guarantee a certain level of privacy. The students will be introduced to the concepts of privacy/utility balance and usable security. Practical exercises and reading of recently published scientific articles will be used to present practical cases of the theoretical tools presented in class.

**Content**

First, the course will introduce the different definitions and approaches of privacy (e.g., privacy by control, privacy by design) as well as the ethical concerns and considerations related to information security and privacy research (e.g., responsible disclosure, full disclosure). Second, the students will be introduced to the different methods, properties, and metrics to assess and/or guarantee a certain level of privacy. They will be introduced to the properties and metrics related to anonymization (e.g., k-anonymity, l-diversity), data aggregation (e.g., randomized responses, ε-differential privacy), as well as other privacy assessment methodologies (e.g., inferential privacy). Third, the course will address usability issues and the role of individuals (i.e., users) in privacy management (i.e., usable security and privacy) and the design of privacy-enhancing technologies. In this context, we will analyze the main concepts seen during the course and discuss their advantages and disadvantages in terms of usability, as well as their implementation for mass-market and large-scale technologies.

Across all three parts of the course, practical exercises, as well as recent research articles reading, and presentations will be used as a complement to support the concepts seen in class, as well as to provide concrete examples of methodologies related to the assessment of privacy in general.

D-MATH

Number Title Type ECTS Hours Lecturers
851-0742-00L Contract Design I W 3 credits 2V A. Stremitzer, A. Tacconelli

You can find all course materials and the most recent announcements on Moodle. Please log in to Moodle using your ETH or UZH credentials. Then search for "Contract Design I (851-0742-00L; Fall 2023)" and enroll. The password is "ContractDesign01".

It is NOT a legal drafting class focused on contractual language.

Number of participants limited to 160.
Max 80 ETHZ and 80 UZH Students

The writing of real-world contracts. In this course, we take a systematic approach to contract design. This means we first analyze the economic environment in which a transaction takes place and then engineer contracts that achieve the desired outcome.
Contracts are agreements between parties to engage in transactions. A good contract creates value by giving parties the right incentives to meet their objectives. A good contract designer scrutinizes the economic situation in which parties find themselves and tailors the contract to the challenges at hand. To help you become sophisticated contract designers, we draw from insights for which more than half a dozen Nobel Prizes were awarded in the past two decades and transfer them to the art of writing real-world contracts. In other words, Contract Design will provide you with analytical tools to design contracts that help you be better lawyers, business leaders, and startup founders.

We will cover topics such as moral hazard, adverse selection, elicitation mechanisms, relationship-specific investments, and relational contracting and apply the theoretical insights to real-life case studies ranging from purchases & sales of assets, oil & gas exploration, movie financing, production & distribution, construction & development, M&A deals, venture capital financing, to executive compensation and many other types of transactions.

The course follows a flipped-classroom model: You will watch learning videos specifically produced for this course ahead of class. We will use class time to discuss real-world case studies. The videos will be made available before the lecture each week and need to be watched ahead of coming to class. Computer-graded quizzes at the beginning of each class will test students’ understanding of the concepts introduced in the videos.

As the emphasis of this class is on class discussion, attendance is mandatory. Absent important reasons, you cannot miss class more than twice.

The lectures will be recorded but only made available to those who miss lectures with excused absence.

For ETH students: Your grade will consist of two parts:
1) You will take weekly computer-based quizzes during class time. Thus, it is important that you attend the lectures to be able to finish the quizzes and pass this course.
2) You compose short responses to take-home questions on case studies we assign and upload them ahead of class (Pass/Fail).

Note that UZH and UNISG students enrolling in this course need to earn more ECTS for completing this course than ETH students (due to curricula reasons). This is why UZH and UNISG students must complete a written assignment in addition to the weekly quizzes and take-home questions. UZH students also have to complete an additional group project. UZH and UNISG students should check out the description of the class at their respective home institutions.

Prerequisites / notice
Attendance is mandatory. You are only allowed to miss two lectures unless there are special circumstances.

Contract Design I is available to ETH students through the Science in Perspective (SiP) Program of D-GESS. This course is particularly suitable for students of D-ARCH, D-BAUG, D-CHAB, D-MATH, D-MTEC, D-INFK, and D-MAVT.

If you have any questions regarding the course, please write an email to the teaching assistants, Lucas Gericke (lucas.gericke@gess.ethz.ch) or Serge von Steiger (serge.vonsteiger@gess.ethz.ch).

Competencies

Subject-specific Competencies
- Concepts and Theories assessed
- Techniques and Technologies assessed

Method-specific Competencies
- Analytical Competencies assessed
- Decision-making assessed
- Problem-solving assessed

Social Competencies
- Communication assessed
- Cooperation and Teamwork assessed
- Customer Orientation assessed
- Negotiation assessed

Personal Competencies
- Creative Thinking assessed

Network Analysis

Particularly suitable for students of D-INFK, D-MATH.

Abstract
Network science is a distinct domain of data science that is characterized by a specific kind of data being studied. While areas of application range from archaeology to zoology, we concern ourselves with social networks for the most part. Emphasis is placed on descriptive and analytic approaches rather than theorizing, modeling, or data collection.

Objective
Students will be able to identify and categorize research problems that call for network approaches while appreciating differences across application domains and contexts. They will master a suite of mathematical and computational tools, and know how to design or adapt suitable methods for analysis. In particular, they will be able to evaluate such methods in terms of appropriateness and efficiency.

Content
The following topics will be covered with an emphasis on structural and computational approaches and frequent reference to their suitability with respect to substantive theory:
- Empirical Research and Network Data
- Macro and Micro Structure
- Centrality
- Roles
- Cohesion
- Influence

Lecture notes
Slides and lecture notes are distributed via the associated course moodle.

Literature
Introduction to Cybersecurity Politics

**Objective**
Participants learn to assess the advantages and disadvantages of cyberspace as a domain for strategic military operations. They understand the technical basics of cyber operations and know how technology and politics are interlinked in this area. They understand the security challenges for and the motivations of states to be active in cyberspace offensively and defensively and they are familiar with the consequences for international politics.

**Content**
We start with an overview of cybersecurity issues from 1980 to today and look at events and actors responsible for turning cybersecurity matters into a security political issue with top priority. After familiarizing ourselves with the technical basics, we look at different forms of cyberviolence and trends in cyber conflicts (technique in social and political practice). Then, we turn to countermeasures: we compare national cybersecurity strategies, examine international norms building, and scrutinize concepts such as cyber-power and cyber-deterrence (technique in social and political regulatory contexts).

**Literature**
A script with background information and comments on the literature will be made available at the beginning of the semester.

**Prerequisites / notice**
The lecture is being supported by a website on Moodle. Literature for each session will be available on Moodle.

Understanding in Science and Mathematics: A Philosophical Perspective

Does not take place this semester.

Abstract
Understanding is a central goal of science and mathematics, but what exactly is the nature of scientific and mathematical understanding? In this seminar, we will read and discuss a number of key philosophical contributions on understanding in philosophy of science, philosophy of mathematics, and epistemology. You will also practice your skills in giving clear and engaging oral presentations.

Objective
The main objective of this seminar is to gain an in-depth understanding of the recent literature on understanding in the philosophy of science, the philosophy of mathematics, and epistemology. Another practical objective is to increase your skills in giving clear and engaging oral presentations.

Content
Understanding is a central goal of science and mathematics: scientists seek to understand various phenomena in the natural world, while mathematicians aim to increase our understanding of the mathematical world. But what exactly is the nature of understanding in science and mathematics? This issue has been largely neglected in twentieth century philosophy of science, philosophy of mathematics, and epistemology. Yet, in the past twenty years, there has been a regain of philosophical interest into the notion of understanding, leading to a flourishing literature. The aim of this seminar is to gain an in-depth understanding of these recent philosophical developments.

To this end, we will read a number of key philosophical contributions on understanding in philosophy of science, philosophy of mathematics, and epistemology. Along the way, we will address general issues on understanding such as: What is the relation between understanding and knowledge? Does understanding necessarily require explanation? How can understanding be transmitted? What exactly is the value of understanding? We will also look into specific case studies of scientific and mathematical understanding.

Each session will be decomposed into three blocks. In blocks 1 and 2, we will have a short presentation (~15 minutes) of a contribution in the philosophy of understanding followed by a discussion. Block 3 will be methodological and will be concerned with how to give good oral presentations, an essential skill in academia. We will use this block to debrief on the presentations of the day and see how they could be improved. We will also discuss resources on best practices in oral communication.

Network Modeling

Particularly suitable for students of D-MATH, D-INFK and in the MSc Data Science

Students are required to have basic knowledge in inferential statistics, such as regression models.

Abstract
Social Network Science is a distinct domain of data science that focuses on relational systems. Various models have been proposed to describe structures and dynamics of networks, including statistical and mathematical methods. In this course, the emphasis is placed on the statistical analysis of (social) systems and their connection to social theories and data sources.

Objective
The following topics will be covered:

- Introduction to network models and their applications
  - Stylized models:
    * uniform random graph models
    * small world models
    * preferential attachment models
  - Models for testing hypotheses while controlling for the network structure:
    * Quadratic assignment procedure regression (QAP regression)
  - Models for testing hypotheses on the network structure:
    * Models for one single observation of a network: exponential random graph models (ERGMs)
    * Models for panel network data: stochastic actor-oriented models (SAOMs)

The application of these models is illustrated through examples and practical sessions involving the analysis of network data using the software R.

Content
The following topics will be covered:

- Introduction to network models and their applications
  - Stylized models:
    * uniform random graph models
    * small world models
    * preferential attachment models
  - Models for testing hypotheses while controlling for the network structure:
    * Quadratic assignment procedure regression (QAP regression)
  - Models for testing hypotheses on the network structure:
    * Models for one single observation of a network: exponential random graph models (ERGMs)
    * Models for panel network data: stochastic actor-oriented models (SAOMs)
    * Models for relational event data: dynamic network actor models (DynAMs)

The application of these models is illustrated through examples and practical sessions involving the analysis of network data using the software R.

Prerequisites / notice
Students are required to have basic knowledge in inferential statistics and should be familiar with linear and logistic regression models.

Autumn Semester 2024
### 853-0047-01L World Politics Since 1945: The History of International Relations (Without Exercises)

**Abstract**
This lecture series provides students with an overview of the development of international relations since the end of World War II. The first part of the series deals with the development of and changes in Cold War security policy structures. The second part deals with the period after the transformation of 1989/91; the focus here is on current issues in international security policy.

**Objective**
By the end of the semester, participants should have a solid knowledge of the history and theoretical foundations of International Relations since the end of the Second World War.

**Content**
cf. "Diploma Supplement"

**Prerequisites / notice**
The lecture is being supported by a website on Moodle. If you have any questions, please contact Fabio Schmocker (fabio.schmocker@sipo.gess.ethz.ch)

### 701-0703-00L Environmental Ethics (University of Zurich)

**Abstract**
The pressing environmental challenges of today demand a critical reflection. Ethics is an important tool for doing so. This lecture introduces the basics of ethics and provides in-depth knowledge of environmental ethics and its debates. This theoretical background will be applied and critically reflected using examples of current environmental challenges.

**Objective**
On completion of this lecture, you have acquired the ability to identify, analyze, critically reflect and resolve ethical challenges in general and specifically regarding the environment. You know basic concepts, positions and lines of argumentation from the debate in environmental ethics, which you have applied and discussed in smaller exercises.

### 853-0061-00L Introduction to Cybersecurity Politics

**Abstract**
The lecture is an introduction to global cybersecurity politics. The focus is on the strategic use of cyberspace by state and non-state actors (threats) and different answers to these new challenges (countermeasures).

**Objective**
Participants learn to assess the advantages and disadvantages of cyberspace as a domain for strategic military operations. They understand the technical basics of cyber operations and know how technology and politics are interlinked in this area. They understand the security challenges for and the motivations of states to be active in cyberspace offensively and defensively and they are familiar with the consequences for international politics.

**Content**
We start with an overview of cybersecurity issues from 1980 to today and look at events and actors responsible for turning cybersecurity matters into a security political issue with top priority. After familiarizing ourselves with the technical basics, we look at different forms of cyberviolence and trends in cyber conflicts (technique in social and political practice). Then, we turn to countermeasures: we compare national cybersecurity strategies, examine international norms building, and scrutinize concepts such as cyber-power and cyber-deterrence (technique in social and political regulatory contexts).

**Lecture notes / Literature**
A script with background information and comments on the literature will be made available at the beginning of the semester.

**Prerequisites / notice**
The lecture is being supported by a website on Moodle.

**853-8002-00L**  The Role of Technology in National and International Security Policy  W 3 credits 2G  M. Leese, A. Dossi

**Abstract**  The lecture provides an introduction to the role of security and military technologies in the formulation and implementation of national and international security policies. The focus is on challenges posed by new and developing technologies, the transformation of military capabilities, and the question of regulation.

**Objective**  Participants will gain an in-depth overview of the many ways in which technology is becoming part of security policies and practices, in both civilian and military contexts.

**Literature**  Literatur für die einzelnen Sitzungen wird auf Moodle bereitgestellt.

**Prerequisites / notice**  Particulary suitable for students of D-MTEC.

**Competencies**

- Subject-specific Competencies
  - Concepts and Theories: assessed
  - Analytical Competencies: assessed
  - Decision-making: fostered
  - Media and Digital Technologies: fostered
  - Problem-solving: assessed

---

**851-0763-00L**  Supervised Research (Law, Economics, and Data Science)  W 3 credits  E. Ash

**Abstract**  This is a supervised student project for 3 ECTS, supervised by the professorship of Elliott Ash (D-GESS). Students will adapt tools from econometrics and machine learning to questions in law, data science, and social science.

**Objective**  Students must have some data science and/or statistics experience. Some programming experience in Python, Stata, or R is required.

**Prerequisites / notice**  Some programming experience in Python, Stata, or R is required. Some experience with data science or statistics is required.

---

**851-0549-00L**  WebClass Introductory Course History of Technology  W 3 credits 2V  R. Wichum

**Abstract**  Technology stands for innovation and catastrophes; it works as a dream machine and is associated with the most diverse ways of utilization. In WebClass Introductory Course History of Technology students become familiar with explanations for how technology works within complex economic, political and cultural contexts, by interpreting and researching texts and authoring a student manual.

**Objective**  Students are introduced into how technological innovations take place within complex economic, political and cultural contexts. They get to know basic theories and practices of the field by acquiring the skills to interpret texts, to compare arguments, to research additional sources and complementary material and to author a common essay. All of this will yield into a student manual on the four core topics: technology and innovation, technology and catastrophes, technology as a dream machine and technology and association. The course language is German, and even if many texts will be in English, the ability to read and understand German is mandatory.

---

**D-MTEC**

**Number** 851-0252-10L  **Title** Project in Behavioural Finance  **Type** W 3 credits  **ECTS** 2S  **Lecturers** S. Andraszewicz, C. Hölscher, A. C. Roberts

**Notice** Particularly suitable for students of D-MTEC.
Abstract

In this seminar, students will study cognitive processes, behaviour and the underlying biological response to financial decisions. Research methods such as asset market experiments, lottery games, risk preference assessment, psychometrics, neuroimaging and psychophysiology of decision processes will be discussed. Financial bubbles and crashes will be the core interest.

Objective

This course has four main goals:
1) To learn about the most important topics within Behavioural Finance
2) To learn to effectively select, review and present information using modern telecommunication tools
3) To practice working on group projects in hybrid working conditions (online + in-person)
4) To solve an applied behavioral finance business case stemming from an industry partner

Content

The course does not contain mandatory reading. Instead, it offers suggested literature that provides guidance to the students who, prepare a presentation on core topics in behavioral finance. The point of this exercise is to critically select the most relevant information on a given topic and present to non-expert educated colleagues. At the same time, the audience learns about the key topics in behavioral finance. Every session involves a discussion moderated and supported by the lecturers.

Throughout the semester, students work on solutions to real business cases stemming from a company partner. They can receive feedback and guidance from project leaders of the industry partner and from the academic supervisors. In the final meeting of the semester, students pitch solutions to their business cases.

The course takes place entirely online. The objective is to prepare the students for the future work in online and hybrid arrangements.

Prerequisites / notice

Students from all domains of ETH and all levels of education are welcome in the course.

363-0565-00L Principles of Macroeconomics 3 credits 2V J.-E. Sturm

Abstract

This course examines the behaviour of macroeconomic variables, such as gross domestic product, unemployment and inflation rates. It tries to answer questions like: How can we explain fluctuations of national economic activity? What can economic policy do against unemployment and inflation?

Objective

This lecture will introduce the fundamentals of macroeconomic theory and explain their relevance to everyday economic problems.

Content

This course helps you understand the world in which you live. There are many questions about the macroeconomy that might spark your curiosity. Why are living standards so meagre in many African countries? Why do some countries have high rates of inflation while others have stable prices? Why have some European countries adopted a common currency? These are just a few of the questions that this course will help you answer.

Furthermore, this course will give you a better understanding of the potential and limits of economic policy. As a voter, you help choose the policies that guide the allocation of society's resources. When deciding which policies to support, you may find yourself asking various questions about economics. What are the burdens associated with alternative forms of taxation? What are the effects of free trade with other countries? How does the government budget deficit affect the economy? These and similar questions are always on the minds of policy makers.

Lecture notes

The course Moodle page contains announcements, course information and lecture slides.

Literature

This book can also be used for the course '363-0503-00L Principles of Microeconomics' (Filippini).

Besides this textbook, the slides, lecture notes and problem sets will cover the content of the lecture and the exam questions.

351-1109-00L Introduction to Microeconomics 3 credits 2G M. Wörtler, M. Beck

This course is only for students enrolled in a Bachelor's
degree programme.

Students enrolled in a Master’s degree programme may attend “Principles of Microeconomics” (LE 363-0503-00L) instead.

Note for D-MAVT students: If you have already successfully completed “Principles of Microeconomics” (LE 363-0503-00L), then you will not be permitted to attend it again.

Abstract

The course introduces basic principles, problems and approaches of microeconomics. It describes economic decisions of households and firms, and their coordination through perfectly competitive markets.

Objective

Students acquire a deeper understanding of basic microeconomic models.

They acquire the ability to apply these models in the interpretation of real world economic contexts.

Students acquire a reflective and contextual knowledge on how societies use scarce resources to produce goods and services and distribute them among themselves.

Content

Market, budget constraint, preferences, utility function, utility maximisation, demand, technology, profit function, cost minimisation, cost functions, perfect competition, information and communication technologies

Lecture notes

Course material in e-learning environment https://moodle-app2.let.ethz.ch/auth/shibboleth/login.php

Literature

Prerequisites / notice

This course "Einführung in die Mikroökonomie" (363-1109-00L) is intended for Bachelor students and LE 363-0503-00 "Principles of Microeconomics" for Master students.

851-0742-00L Contract Design I

You can find all course materials and the most recent announcements on Moodle. Please log in to Moodle using your ETH or UZH credentials. Then search for “Contract Design I (851-0742-00L; Fall 2023)” and enroll. The password is “ContractDesign01”.

It is NOT a legal drafting class focused on contractual language.

Number of participants limited to 160.
Max 80 ETHZ and 80 UZH Students

Abstract

Contract Design I is taught by Professor Stremitzer and aims to bridge the gap between economic contract theory, contract law, and the writing of real-world contracts. In this course, we take a systematic approach to contract design. This means we first analyze the economic environment in which a transaction takes place and then engineer contracts that achieve the desired outcome.
Contracts are agreements between parties to engage in transactions. A good contract creates value by giving parties the right incentives to meet their objectives. A good contract designer scrutinizes the economic situation in which parties find themselves and tailors the contract to the challenges at hand. To help you become sophisticated contract designers, we draw from insights for which more than half a dozen Nobel Prizes were awarded in the past two decades and transfer them to the art of writing real-world contracts. In other words, Contract Design will provide you with analytical tools to design contracts that help you be better lawyers, business leaders, and startup founders.

We will cover topics such as moral hazard, adverse selection, elicitation mechanisms, relationship-specific investments, and relational contracting and apply the theoretical insights to real-life case studies ranging from purchases & sales of assets, oil & gas exploration, movie financing, production & distribution, construction & development, M&A deals, venture capital financing, to executive compensation and many other types of transactions.

The course follows a flipped-classroom model: You will watch learning videos specifically produced for this course ahead of class. We will use class time to discuss real-world case studies. The videos will be made available before the lecture each week and need to be watched ahead of coming to class. Computer-graded quizzes at the beginning of each class will test students’ understanding of the concepts introduced in the videos.

As the emphasis of this class is on class discussion, attendance is mandatory. Absent important reasons, you cannot miss class more than twice.

The lectures will be recorded but only made available to those who miss lectures with excused absence.

For ETH students: Your grade will consist of two parts:

1) You will take weekly computer-based quizzes during class time. Thus, it is important that you attend the lectures to be able to finish the quizzes and pass this course.
2) You compose short responses to take-home questions on case studies we assign and upload them ahead of class (Pass/Fail).

Note that UZH and UNISG students enrolling in this course need to earn more ECTS for completing this course than ETH students (due to curricula reasons). This is why UZH and UNISG students must complete a written assignment in addition to the weekly quizzes and take-home questions. UZH students also have to complete an additional group project.

UZH and UNISG students should check out the description of the class at their respective home institutions.

If you have any questions regarding the course, please write an email to the teaching assistants, Lucas Gercke (lucas.gercke@ess.ethz.ch) or Serge von Steiger (serge.vonsteiger@ess.ethz.ch).

Rankings, this webpage is free of charge for ETH students as ETH purchased a license for ETH students. UZH and UNISG students should check out the description of the class at their respective home institutions.

Note that UZH and UNISG students enrolling in this course need to earn more ECTS for completing this course than ETH students (due to curricula reasons). This is why UZH and UNISG students must complete a written assignment in addition to the weekly quizzes and take-home questions. UZH students also have to complete an additional group project.

UZH and UNISG students should check out the description of the class at their respective home institutions.

Attendance is mandatory. You are only allowed to miss two lectures unless there are special circumstances.

Contract Design I is available to ETH students through the Science in Perspective (SiP) Program of D-GESS. This course is particularly suitable for students of D-ARCH, D-BAUG, D-CHAB, D-MATH, D-MTEC, D-INFK, and D-MAVT.

If you have any questions regarding the course, please write an email to the teaching assistants, Lucas Gercke (lucas.gercke@ess.ethz.ch) or Serge von Steiger (serge.vonsteiger@ess.ethz.ch).

851-0391-00L Focus on the Human: Human-Centered Security and Privacy Lab

The course is particularly suitable for all students who have already completed the course "Human-centered IT Security and Privacy" as some of the concepts introduced will practically be applied in this course. However, the relevant literature and necessary material will be provided to all students and basic concepts will be briefly summarized so that all interested students can participate.

Abstract

After an introduction on usable security as the intersection of computer science and psychology, students will form teams and work on exemplary security- or privacy-related research questions. The teams will develop and evaluate a concept for a human-centered solution. Through input sessions and milestone presentations the human perspective will be incorporated and reflected upon.

Objective

The course makes students experience an exemplary human-centered design process. They will learn about and practically apply human-centered design and evaluation methods that will allow them to view their solution from the human perspective, e.g., the user, developer or website owner perspective. By taking part in the evaluation of other teams, they will also take the user perspective themselves.

Content

At the beginning of the course, the students will receive an introduction to usable IT security and privacy and relevant concepts. Afterwards, a selection of current research questions from that area will be presented. The students form teams and select one of the proposed research questions. This question will accompany the students throughout the semester. They will design and evaluate a concept for a human-centered solution to that question. To be able to do so, they will receive input on human-centered design and evaluation tools. Their progress and the inclusion of the human perspective will be subject to feedback in milestone presentations.

The students' human-centered solution can take the form of a concept (e.g., a concept for a product or app), interface (e.g., a visual or tangible interface), or prototype (e.g., sketches, a click-dummy or a built prototype). The solution will then be subject to evaluations. The solutions will be user-tested by members of other teams that thereby take the perspective of a user themselves. In addition, the solutions will be analyzed from different stakeholders' perspectives, such as developers or website owners.

Finally, the students will reflect on potential changes that result from the evaluations and their consequences.

Contract Design I is taught by Professor Stremitzer and aims to bridge the gap between economic contract theory, contract law, and the

Abstract

This is a supervised student project for 3 ECTS, supervised by the professorship of Elliott Ash (D-GESS). Students will adapt tools from
econometrics and machine learning to questions in law, data science, and social science.

Objective

Students must have some data science and/or statistics experience. Some programming experience in Python, Stata, or R is required.

Prerequisites / notice

Apply tools from data science and social science to a new project, potentially in a group, to develop a paper or app.

Some programming experience in Python, Stata, or R is required. Some experience with data science or statistics is required.

851-0392-00L

Privacy Quantification and Usable Protection

Methods

N. Zimmermann

Content

Students will gain an overview of the main privacy metrics that are used to evaluate privacy risks related to the use of a given technology. They will also be introduced to the concepts of privacy/utility balance and usable security. Practical exercises and reading of recently published scientific articles will be used to present practical cases of the theoretical tools presented in class.

Objectives

This course aims to provide the students with a global knowledge of the concepts related to privacy, and the methodology and tools to

to identify, analyze, and address threats while taking the user into account in the process. They will adopt a “privacy mindset”, thus enabling

to automatically take privacy into account, in a usable way, when designing or analyzing a system.

This course will introduce the different definitions and approaches of privacy (e.g., privacy by control, privacy by design) as well as the

ethical concerns and considerations related to information security and privacy research (e.g., responsible disclosure, full disclosure).

Some ethical concerns and considerations related to information security and privacy research (e.g., responsible disclosure, full disclosure).

Second, the students will be introduced to the different methods, properties, and metrics to assess and/or guarantee a certain level of

privacy. They will be introduced to the properties and metrics related to anonymization (e.g., k-anonymity, l-diversity), data aggregation
(e.g., randomized responses, ε-differential privacy), as well as other privacy assessment methodologies (e.g., inferential privacy).

Third, the course will address usability issues and the role of individuals (i.e., users) in privacy management (i.e., usable security and

privacy) and the design of privacy-enhancing technologies. In this context, we will analyze the main concepts seen during the course and
discuss their advantages and disadvantages in terms of usability, as well as their implementation for mass-market and large-scale

technologies.

Across all three parts of the course, practical exercises, as well as recent research articles reading, and presentations will be used as a

complement to support the concepts seen in class, as well as to provide concrete examples of methodologies related to the assessment

of privacy in general.

You can find all course materials and the most recent announcements on Moodle. Please log in to Moodle using

your ETH or UZH credentials. Then search for “Contract Design I (851-0742-00L; Fall 2023)” and enroll. The

password is “ContractDesign01”.

It is NOT a legal drafting class focused on contractual

language.

Number of participants limited to 160.

Max 80 ETHZ and 80 UZH Students

Abstract

Contract Design I is taught by Professor Stremitzer and aims to bridge the gap between economic contract theory, contract law, and the

writing of real-world contracts. In this course, we take a systematic approach to contract design. This means we first analyze the economic

environment in which a transaction takes place and then engineer contracts that achieve the desired outcome.
Contracts are agreements between parties to engage in transactions. A good contract creates value by giving parties the right incentives to meet their objectives. A good contract designer scrutinizes the economic situation in which parties find themselves and tailors the contract to the challenges at hand. To help you become sophisticated contract designers, we draw from insights for which more than half a dozen Nobel Prizes were awarded in the past two decades and transfer them to the art of writing real-world contracts. In other words, Contract Design will provide you with analytical tools to design contracts that help you be better lawyers, business leaders, and startup founders.

We will cover topics such as moral hazard, adverse selection, elicitation mechanisms, relationship-specific investments, and relational contracting and apply the theoretical insights to real-life case studies ranging from purchases & sales of assets, oil & gas exploration, movie financing, production & distribution, construction & development, M&A deals, venture capital financing, to executive compensation and many other types of transactions.

The course follows a flipped-classroom model: You will watch learning videos specifically produced for this course ahead of class. We will use class time to discuss real-world case studies. The videos will be made available before the lecture each week and need to be watched ahead of coming to class. Computer-graded quizzes at the beginning of each class will test students’ understanding of the concepts introduced in the videos.

As the emphasis of this class is on class discussion, attendance is mandatory. Absent important reasons, you cannot miss class more than twice.

The lectures will be recorded but only made available to those who miss lectures with excused absence.

For ETH students: Your grade will consist of two parts:
1) You will take weekly computer-based quizzes during class time. Thus, it is important that you attend the lectures to be able to finish the quizzes and pass this course.
2) You compose short responses to take-home questions on case studies we assign and upload them ahead of class (Pass/Fail).

Note that UZH and UNISG students enrolling in this course need to earn more ECTS for completing this course than ETH students (due to curricula reasons). This is why UZH and UNISG students must complete a written assignment in addition to the weekly quizzes and take-home questions. UZH students also have to complete an additional group project.

UZH and UNISG students should check out the description of the class at their respective home institutions.

The seminar will include practical exercises on how to use and search patent information. Basic knowledge of how to read and evaluate case studies will illustrate and deepen the topics addressed during the lecture.

The protection of technical inventions and how to safeguard their commercialisation.

The importance of innovation in industrialised countries.

Case studies will illustrate and deepen the topics addressed during the lecture.

The seminar will include practical exercises on how to use and search patent information. Basic knowledge of how to read and evaluate patent documents as well as how to use publicly available patent databases to obtain the required patent information will also be provided.

Critical Thinking

This lecture series provides students with an overview of the development of international relations since the end of World War II. The focus lies on the Britain, where these processes took place for the first time.

- They shall obtain a working knowledge on the legal aspects involved in setting up and managing an enterprise.
- They shall be able to contribute to the legal management of the company and to discuss legal issues.
- They shall have an understanding of the law as a part of the corporate strategy and as a valuable resource of the company.

Lecture notes

A comprehensive script will be made available online on the moodle platform.

851-0703-00L Introduction to Law

Abstract

This class introduces students into basic features of the legal system. Fundamental issues of constitutional law, administrative law, private law and the law of the EU are covered. The focus is on legal problems related to space. Active participation is expected in short interactive sequences.

Objective

Students are able to identify basic structures of the legal system. They understand selected topics of public and private law. They are able to apply the fundamentals in more advanced law classes and to recognize the relevance of law in their own field.

Content

Basic concepts of law, sources of law.
Private law: Contract law (particularly contract for work and services), tort law, property law.
Public law: Human rights, administrative law, procurement law, procedural law.
Insights into the law of the EU.

853-0047-01L World Politics Since 1945: The History of International Relations (Without Exercises)

Abstract

This lecture series provides students with an overview of the development of international relations since the end of World War II. The first part of the series deals with the development of and changes in Cold War security policy structures. The second part deals with the period after the transformation of 1989/91; the focus here is on current issues in international security policy.

Objective

By the end of the semester, participants should have a solid knowledge of the history and theoretical foundations of International Relations since the end of the Second World War.

853-0725-00L History Part One: Europe (The Cradle of Modernity, Britain, 1789-1914)

Abstract

A range of fundamental processes have transformed European societies in the course of the 19th and the 20th centuries. This lecture series looks at several key aspects of these modernization processes and asks about their continuing relevance for our times. The regional focus lies on the Britain, where these processes took place for the first time.

Objective

At the end of this lecture course, students can: (a) highlight the most important changes in the "long nineteenth century" in Britain (b) explain their long-term effects (also for other European countries); and (c) relate these changes to global developments today.

Content

The thematic foci include: Industrialization, urban growth, democratisation and mass politics, shifting gender roles and ideals, and the emergence of consumerism and leisure culture.

Lecture notes

Power Point Slides and references will be made available in digital form during the course of the semester.

Literature

Mandatory and further reading will be listed on the course plan that is made available as from the first session.

Prerequisites / notice

This lecture series does not build upon specific previous knowledge by the students.

701-0703-00L Environmental Ethics (University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: 07SMEE266

Please register at:
The pressing environmental challenges of today demand a critical reflection. Ethics is an important tool for doing so. This lecture introduces the basics of ethics and provides in-depth knowledge of environmental ethics and its debates. This theoretical background will be applied and critically reflected using examples of current environmental challenges.

On completion of this lecture, you have acquired the ability to identify, analyze, critically reflect and resolve ethical challenges in general and specifically regarding the environment. You know basic concepts, positions and lines of argumentation from the debate in environmental ethics, which you have applied and discussed in smaller exercises.

Participants learn to assess the advantages and disadvantages of cyberspace as a domain for strategic military operations. They understand the technical basics of cyber operations and know how technology and politics are interlinked in this area. They understand the security challenges for and the motivations of states to be active in cyberspace offensively and defensively and they are familiar with the consequences for international politics.

We start with an overview of cybersecurity issue from 1980 to today and look at events and actors responsible for turning cybersecurity matters into a security political issue with top priority. After familiarizing ourselves with the technical basics, we look at different forms of cyberviolence and trends in cyber conflicts (technique in social and political practice). Then, we turn to countermeasures: we compare national cybersecurity strategies, examine international norms building, and scrutinize concepts such as cyber-power and cyber-deterrence (technique in social and political regulatory contexts).

A script with background information and comments on the literature will be made available at the beginning of the semester.
Abstract

After an introduction on usable security as the intersection of computer science and psychology, students will form teams and work on exemplary security- or privacy-related research questions. The teams will develop and evaluate a concept for a human-centered solution. Through input sessions and milestone presentations the human perspective will be incorporated and reflected upon.

Objective

The course makes students experience an exemplary human-centered design process. They will learn about and practically apply human-centered design and evaluation methods that will allow them to view their solution from the human perspective, e.g., the user, developer or website owner perspective. By taking part in the evaluation of other teams, they will also take the user perspective themselves.

Content

At the beginning of the course, the students will receive an introduction to usable IT security and privacy and relevant concepts. Afterwards, a selection of current research questions from that area will be presented. The students form teams and select one of the proposed research questions. This question will accompany the students throughout the semester. They will design and evaluate a concept for a human-centered solution to that question. To be able to do so, they will receive input on human-centered design and evaluation tools. Their progress and the inclusion of the human perspective will be subject to feedback in milestone presentations. The students’ human-centered solution can take the form of a concept (e.g., a concept for a product or app), interface (e.g., a visual or tangible interface), or prototype (e.g., sketches, a click-dummy or a built prototype). The solution will then be subject to evaluations. The solutions will be user-tested by members of other teams that thereby take the perspective of a user themselves. In addition, the solutions will be analyzed from different stakeholders’ perspectives, such as developers or website owners.

Finally, the students will reflect on potential changes that result from the evaluations and their consequences.

Literature

Literature Recommendations:

However, previous participation in the lecture is not a requirement and not necessary for succeeding in the course.
This course aims to provide the students with a global knowledge of the concepts related to privacy, and the methodology and tools to identify, analyze, and address threats while taking the user into account in the process. They will adopt a "privacy mindset", thus enabling them to automatically take privacy into account, in a usable way, when designing or analyzing a system.

First, the course will introduce the different definitions and approaches of privacy (e.g., privacy by control, privacy by design) as well as the ethical concerns and considerations related to information security and privacy research (e.g., responsible disclosure, full disclosure).

Second, the students will be introduced to the different methods, properties, and metrics to assess and/or guarantee a certain level of privacy. They will be introduced to the properties and metrics related to anonymization (e.g., k-anonymity, l-diversity), data aggregation (e.g., randomized responses, \( \varepsilon \)-differential privacy), as well as other privacy assessment methodologies (e.g., inferential privacy).

Third, the course will address usability issues and the role of individuals (i.e., users) in privacy management (i.e., usable security and privacy) and the design of privacy-enhancing technologies. In this context, we will analyze the main concepts seen during the course and discuss their advantages and disadvantages in terms of usability, as well as their implementation for mass-market and large-scale technologies.

Across all three parts of the course, practical exercises, as well as recent research articles reading, and presentations will be used as a complement to support the concepts seen in class, as well as to provide concrete examples of methodologies related to the assessment of privacy in general.

DATA: 26.07.2024 12:39

Autumn Semester 2024
By the end of the course, the students should be able to better understand the literature on complex social systems, develop their own models for studying specific phenomena and report results according to the standards of the relevant scientific literature by presenting their results both numerically and graphically.

At the end of the course, the students will deliver a report, computer code and a short oral presentation. To collect credit points, students will have to actively contribute and give a circa 30 minutes presentation in the course on a subject agreed with the lecturers, after which the presentation will be discussed. The presentation will be graded.

Students are expected to implement themselves models of techno-socio-economic processes and systems, particularly agent-based models, complex networks models, decision making, group dynamics, human crowds, or game-theoretical models. Credit points are finally earned for the implementation of a mathematical or empirical model from the complexity science literature, its presentation, and documentation by a project report.

The lecture slides will be presented on the course Moodle after each lecture.

Supervised Research (Law, Economics, and Data Science)

W 3 credits  E. Ash

Abstract
This is a supervised student project for 3 ECTS, supervised by the professorship of Elliott Ash (D-GESS). Students will adapt tools from econometrics and machine learning to questions in law, data science, and social science.

Objective
Apply tools from data science and social science to a new project, potentially in a group, to develop a paper or app.

Prerequisites / notice
Some programming experience in Python, Stata, or R is required. Some experience with data science or statistics is required.

A Sampler of Histories and Philosophies of Mathematics

W 3 credits  2V  R. Wagner

Abstract
This course will review several case studies from the ancient, medieval and modern history of mathematics. The case studies will be analyzed from various philosophical perspectives, while situating them in their historical and cultural contexts.
Objective
The course aims are:
1. To introduce students to the historicity of mathematics
2. To make sense of mathematical practices that appear unreasonable from a contemporary point of view
3. To develop critical reflection concerning the nature of mathematical objects
4. To introduce various theoretical approaches to the philosophy and history of mathematics
5. To open the students’ horizons to the plurality of mathematical cultures and practices

Competencies
Subject-specific Competencies: Concepts and Theories
Method-specific Competencies: Analytical Competencies
Social Competencies: Sensitivity to Diversity
Personal Competencies: Critical Thinking

This course deals with how and why international problem-solving efforts (cooperation) in environmental politics emerge and evolve, and under what circumstances such efforts are effective. Based on concepts and theories of political economy, political science, and public policy, various examples of international environmental policy-making are examined.

Content
The objectives in this course are to (1) gain an overview of important questions pertaining to international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions in this policy area and how to address them in a conceptually and methodologically meaningful and insightful way; (3) gain an overview of important global and regional environmental problems and how they or could be solved.

Literature
Haller, Walter/Karlen, Peter, Raumplanung-, Bau- und Umweltrecht, 3.A., Zürich 1999

Prerequisites / notice
This course is particularly suitable for students of D-TET, D-USYS.

Abstract
The course is open to all ETH students and visiting students from other universities. Participation does not require previous coursework in the social sciences or environmental policy. This course will take place on campus (ETH Main Building, HG F.3). There will be no live-streaming, and the course is NOT in hybrid (on-campus plus online) format. However, the lecture will be recorded and the recordings will be made available via the Moodle platform for this course a few days after the respective lecture for students who are unable to attend in person. All electronic correspondence will take place via the ETH mystudies system and Moodle, so please make sure you are properly registered there with a functioning email address/account.

Lecture notes
Reading materials and slides will be available via Moodle.

Credits and Exam
After passing a written test at the end of the course (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test). Visiting students (e.g., from the University of Zurich, exchange students) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory. Students who obtain a grade of < 4.0 for the test will have a second chance (see table below). Students who did not participate in the test on 18 December 2023 will not have access to the repeat test unless they submit compelling and documented (e.g., medical, other exam in parallel at ETH) reasons for why they were unable to participate in the first test. It covers all contents of the lectures and the reading assignments. Visiting students (e.g., from the University of Zurich or other universities) are subject to the same conditions. Registration for the course in the mysteries system of ETH is compulsory. No separate registration for the exam is required, registration for the course as such covers everything. The exam will take place on campus, either in the F3 lecture hall or in a computer room. That is, you must be present in person at ETH Zurich on the exam date/time.

Competencies
Subject-specific Competencies: Concepts and Theories
Method-specific Competencies: Analytical Competencies
Personal Competencies: Critical Thinking

851-0707-00L
Space Planning Law and Environment
Particularly suitable for students of D-ARCH, D-BAUG, D-USYS.

Abstract
System of swiss planning law, Constitutional and statutory provisions, Space planning and fundamental rights, Instruments, Application, legal protection, enforcement, Practical training.

Objective
Basic understanding of nature and function of space planning from a legal point of view. Basic knowledge of space planning instruments, relationship between space planning and constitutional law (especially property rights), solving of practical cases.

### 701-0703-00L Environmental Ethics (University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

**UZH Module Code:** 07SMEE266

Please register at:
https://www.uzh.ch/cmsssl/de/studies/application/chmobilit

...after you received your logon information you can enrol to courses at:
https://studentservices.uzh.ch/uzh/application/#/Logon

**Abstract:**
The legal principles of real estate property law can be correctly interpreted and applied in daily life. Real estate property law (esp. content, acquisition, restrictions under private and public law, transmission and loss). Legal presentation:

**Objective:**
On completion of this lecture, you have acquired the ability to identify, analyze, critically reflect and resolve ethical challenges in general and specifically regarding the environment. You know basic concepts, positions and lines of argumentation from the debate in environmental ethics, which you have applied and discussed in smaller exercises.

### 701-0747-00L Environmental Policy of Switzerland

This course presents the basics of public policy analysis and the specific characteristics of Swiss environmental policy. Policy instruments, actors and processes are addressed from a political science perspective both theoretically as well as by means of current Swiss environmental policy examples.

**Objective:**
Beyond acquiring basic knowledge about public policy analysis, this course teaches students how to analytically address current and concrete questions of environmental policy. Through exercises the students learn about political science concepts and frameworks as well as real-life political decision-making processes. The well-grounded examination of complex political conflict situations is an important precondition for the entry into the (environmental policy) workforce or a future research career.

**Content:**
The processes of change, overuse or destruction of the natural environment through humans have historically placed high demands on social and political institutions. In the interplay between the environment, society and economy, the environmental policy field encompasses the sum of public measures that have the goal to eliminate, reduce or avoid environmental degradation. The course systematically presents the basics of environmental policy instruments, actors, programs and processes as well as their change over time. Invited practitioners will provide us with insight regarding the current developments in forest, water and spatial planning policies. A key aspect is the distinction between politics and political science and specifically environmental policy.

**Lecture notes:**
Reader and additional lecture material on moodle.

**Prerequisites / notice:**
The detailed semester program (syllabus) is made available to the students at the beginning of the semester. During the lecture we will work with Moodle and eduApp. We ask that all students register themselves on these platforms before the lecture and to bring a laptop, tablet or smartphone to class, so that you can complete exercises using Moodle and eduApp.

### 851-0724-01L Real Estate Property Law

Particularly suitable for students of D-ARCH, D-BAUG, D-USYS.

**Abstract:**
Real estate property law (esp. content, acquisition, restrictions under private and public law, transmission and loss). Legal presentation: land register, surveying, cadastre. Basic questions of contract and tax law.

**Objective:**
The legal principles of real estate property law can be correctly interpreted and applied in daily life.

**Content:**
Real estate property law (esp. content, acquisition, restrictions under private and public law, transmission and loss). Legal presentation: land register, surveying, cadastre. Basic questions of contract and tax law.

**Lecture notes:**
Abgegebene Unterlagen: Skript in digitaler Form

**Literature:**
- Adrian Mühlematter / Stephan Stucki: Grundbuchrecht für die Praxis, Zürich 2016
- Wolfgang Ernst / Samuel Zogg: Sachenrecht in a nutshell, Zürich 2020
- Jörg Schmid / Bettina Hürlimann-Kaup: Sachenrecht, Zürich 2017
- Meinrad Huser, Schweizerisches Vermessungsrecht, unter besonderer Berücksichtigung des Geoinformationsrechts und des Grundbuchrechts, Zürich 2014
- Meinrad Huser, Geo-Informationsrecht, Rechtlicher Rahmen für Geographische Informationssysteme, Zürich 2005
- Meinrad Huser, Darstellung von Grenzen zur Sicherung dinglicher Rechte, in ZBGR 2013, 238 ff.
Analytical Competencies
- Develop comprehension of legal and social responses to environmental conflicts

This course explores the relation between the scientific investigation of life and cultural notions of death from a historical perspective. While the course covers the times from antiquity up to the present, the main emphasis will be placed on the modern life sciences since the 19th century.

Life and Death
- Train communicative skills (presentation, moderation, discussion design, negotiation), especially by participating at a mediation and conflict-simulation.
- Estimate the potential and limitations of cooperative environmental planning in the field of windenergy as well of landfills and Human-Wildlife Conflict and Coexistence.

Students must have some data science and/or statistics experience. Some programming experience in Python, Stata, or R is required. Some experience with data science or statistics is required.

Supervised Research (Law, Economics, and Data Science)
- Apply tools from data science and social science to a new project, potentially in a group, to develop a paper or app.
- Foster personal skills and techniques.

Personal Competencies
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

Language Courses of the UZH and ETH Zurich
A maximum of 3 credit points from language courses may be recognised in the category "Science in Context" throughout the entire bachelor's and master's degree program. Moreover, the following restrictions apply: In the case of the European languages English, French, Italian and Spanish, only advanced language courses from level B2 will be credited. German language courses are credited from level C2.
Only the courses listed below will be recognized as "Science in Perspective" courses.

The course helps participants to explore various ways in which they can express complex thoughts and ideas through different types of Italian B2-C1: Language Structure

This course gives participants the opportunity to broaden and intensify their knowledge of complex morphosyntactic structures. The course focuses on improving their proficiency in expressing complex content.

This course allows participants to practice Italian in a real-life situation: At the Zurich art museum (Kunsthaus), participants look at art works while listening to an Italian audio guide; they then discuss the art. The course alternates between seven museum visits and seven in-class lessons. At home, participants study their chosen art works in more depth and prepare oral and written summaries.

The course uses art as a means for participants to practice all four language skills: Reading, writing, speaking, and listening. Further activities enable participants to enhance vocabulary and grammar learning. Participants receive written feedback on their written work, and recurring errors are discussed in class.

The main objective of this course is to improve participants' competence in written French through the mastery of grammatical rules and their practical application; this will ensure the correctness of participants' utterances at text level and help them with some difficult areas of the French language. The course focuses on a descriptive approach of linguistic tools to improve written academic French (reports, abstracts) and business writing in general (covering letters) through targeted exercises.

The course is designed for Bachelor's and Master's students from all disciplines who wish to improve their English from C1 towards C2. This course is open to participants who have already reached C1-level English. The course enhances participants' appreciation and understanding of literature in English. Through the analysis and interpretation of literary texts, participants improve their analytical and English language skills; their grammar skills through writing; and their vocabulary through reading, discussions, and writing.

The main objective of this course is to impart a life-long interest in literature written in English. The course helps participants to explore various ways in which they can express complex thoughts and ideas through different types of subordinate clauses, including consecutive, concessive, and hypothetical sentences, and indirect speech.

The course is designed for Bachelor's and Master's students from all disciplines who wish to improve their English from C1 towards C2 level and train their language skills at mastery level. Selected academic English features are included to add value to the course to meet standard entrance requirements by leading universities and colleges worldwide.

The most important grammar topics of this course are past tense forms, subordinate clauses, linking devices, reported speech, periphrastic verb constructions, and verbs that express change. The course also deals with topics that typically cause problems for higher level learners, including ser/estar, por/para, and indicative and subjunctive forms of verbs.

### Objective
Participants should already have reached C1 level (advanced) as defined in the Common European Framework of Reference for Languages (CEFR). The course is also open to participants whose level is above C1.

The course aims to train and develop linguistic skills at mastery level, with a focus on formal and informal academic lexis, on listening and oral communication skills, and on increasing fluency, accuracy, and complexity of spoken language. Students will work on writing well-structured descriptive texts and argumentative essays, with the aim of fulfilling the language requirements for study at an English-speaking university or following university Master's courses held in English.

Abstract
This course is designed for participants with an A2 level in Portuguese. The course deals with everyday topics. Participants practice forms of communication as these occur in daily life. Lexical and linguistic structures are taught within these contexts. Intercultural and socio-cultural issues relating to Brazil are also taken into consideration.

Objective
Participants can deal with everyday situations; they can talk about their experiences, opinions, wishes, and plans in simple coherent sentences.

Registration dates:
Participants are able to use Swedish adequately in selected areas. The focus is on speaking, listening comprehension, and reading comprehension skills at A2.1 level of the Common European Framework of Reference for Languages, and on developing cultural competence. Special importance is attached to an academic environment and student life. Content areas that are embedded in various communicative tasks include: Talking about your relatives and family; talking about past and future events; expressing your views on things you (don’t) like; expressing your opinion; and requesting information (including about directions and the weather).

**851-0851-00L**  
**Objective**  
Participants are able to use Russian adequately in selected areas. The focus is on speaking, reading comprehension, and listening comprehension skills at A1.1 level of the Common European Framework of Reference for Languages. The course leads to A1.1 level on the Common European Framework of Reference for Languages. The goal of the course is to introduce participants to the Cyrillic alphabet and to Russian phonetics; participants build up a basic vocabulary; learn the basics of Russian grammar, and are introduced to Russian culture and personality (biography, education, and professional career); it also extends participants' grammar skills.

**Abstract**  
Russian I is the first part of a five-semester Russian course. The course leads to A1.1 level on the Common European Framework of Reference for Languages. The goal of the course is to introduce participants to the Cyrillic alphabet and to Russian phonetics; participants build up a basic vocabulary; learn the basics of Russian grammar, and are introduced to Russian culture and personality (biography, education, and professional career); it also extends participants' grammar skills.

**Objective**  
Participants are able to use Russian adequately in selected areas. The focus is on speaking, reading comprehension, and listening comprehension skills at A1.1 level of the Common European Framework of Reference for Languages, and on developing cultural competence. Special importance is attached to an academic environment and student life. The course deals with the following content:  
- Reading and writing Russian script; saying hello and goodbye; introducing yourself; asking for someone’s name; addressing someone; apologizing; indicating your country and place of origin and residence; stating your profession; talking about family; talking about your wellbeing; asking about prices; and ordering items in a café.

**851-0853-00L**  
**Objective**  
Participants are able to use Russian adequately in selected areas. The focus is on speaking, reading comprehension, and listening comprehension skills at A2.1 level of the Common European Framework of Reference for Languages, and on developing cultural competence. Special importance is attached to an academic environment and student life. The course deals with the following content:  
- Talking about the weather; naming the seasons and months; understanding activities offered to tourists; expressing agreement, disagreement, and indifference; making appointments; talking about holiday plans and arrangements; expressing prohibitions; making comparisons; talking about learning; indicating date and year; saying what you are interested in and what you are doing; giving biographical details; saying what you would like to do; making and obtaining recommendations; passing on information.

**851-0855-00L**  
**Objective**  
Participants are able to use Russian adequately in selected areas. The focus is on speaking, reading comprehension, and listening comprehension skills at A2.2+ level of the Common European Framework of Reference for Languages, and on developing cultural competence. Special importance is attached to an academic environment and student life. The course deals with the following content:  
- Talking about the weather; naming the seasons and months; understanding activities offered to tourists; expressing agreement, disagreement, and indifference; making appointments; talking about holiday plans and arrangements; expressing prohibitions; making comparisons; talking about learning; indicating date and year; saying what you are interested in and what you are doing; giving biographical details; saying what you would like to do; making and obtaining recommendations; passing on information.

**851-0861-01L**  
**Objective**  
Participants are able to use Arabic adequately in selected areas. The focus is on speaking, reading comprehension, and the reading and writing of Arabic script.

**Abstract**  
Arabic I is the first part (A1.1 level) of a four-semester Arabic course. The goal of the course is for participants to acquire basic language skills in speaking, listening comprehension, and the reading and writing of Arabic script.

**Objective**
Participants are able to use the Arabic language adequately in selected areas. The focus is on speaking; reading and listening comprehension at A1.1 level on the Common European Framework of Reference for Languages; learning Arabic script; and the development of cultural competence. The following content areas are embedded in various communicative tasks: Greeting each other, introducing yourself and speaking about yourself (personal and professional identity, place of residence), making simple phone calls, requesting information, and making appointments.

**Abstract**
Arabic III leads to A2.1 level on the Common European Framework of Reference for Languages. Arabic III is the third part (A2.1 level) of a four-semester Arabic course. The practice exercises relate to simple discursive situations in daily life. In terms of grammar, special importance is attached to systematically learning the Arabic verbal system.

**Objective**
Participants are able to use the Arabic language adequately in selected areas and can conduct themselves in a culturally appropriate manner. To this end, the following content is dealt with: Talking about your life; daily routines; expressing wishes, commands, and eventualities; and talking about language and language learning (meta-language skills). Culturally, the focus is on useful phrases and appropriate conduct on important occasions such as holidays, weddings, births, and deaths. In terms of grammar, this course attaches particular importance to the systematization of the Arabic verbal system.

**Abstract**
Chinese I leads to A1.1 level on the Common European Framework of Reference for Languages. It is the first part of a five-semester Chinese course. The goal of the course is to introduce participants to standard modern spoken Chinese and to the Chinese script, with a focus on oral skills. The main focus is on communicating in everyday situations.

**Objective**
Participants are able to use the Chinese language appropriately in selected areas and can conduct themselves in a culturally appropriate manner. The focus is on oral language skills at A1.1 level of the Common European Framework of Reference for Languages. There is a special focus on university and student life. Participants are familiar with the basics of pronunciation, Chinese script, and the writing of Chinese characters by hand and digitally. Regarding writing, the focus is on passive skills.

**Abstract**
Chinese III leads to A2.1 level on the Common European Framework of Reference for Languages. It further develops participants' skills in standard modern spoken Chinese and in reading Chinese characters. The goal of the course is for participants to communicate in and deal with more complex everyday situations. There is a special focus on university and student life.

**Objective**
Participants are able to use the Chinese language adequately in selected areas and can conduct themselves in a culturally appropriate manner. The focus is on oral language skills at A2.1 level of the Common European Framework of Reference for Languages; reading and (digital) writing skills are fostered simultaneously. The following topics are integrated into various communicative situations: Talking about food, going to a restaurant, directions, and public transport.

**Abstract**
Japanese I leads to A1.1 level on the Common European Framework of Reference for Languages. It is the first part of a five-semester Japanese course. The goal of the course is for participants to learn the basic vocabulary and sentence structures needed to communicate in everyday situations. This includes an introduction to Hiragana and Katakana syllabic writing and its use in word processing.
Objective
Participants are able to use the Japanese language adequately in selected areas. The focus is equally on fostering speaking, listening, writing, and reading skills at A1.1 level of the Common European Framework of Reference for Languages, as well as on the development of cultural competence. Special importance is attached to an academic environment and student life. In addition, the two syllabic writing systems and the use of Japanese computer word processing are learnt. Content areas that are embedded in various communicative tasks include: Greetings, introducing yourself, and talking about yourself (personal and professional identity, studies, interests, daily life); asking for information; and requesting services.

851-0883-00L Japanese III A2.1
No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zürich".

Course fees: https://www.sprachenzentrum.uzh.ch/en/Sprachkurse/Kursegebuehren1.html

Registration dates: https://www.sprachenzentrum.uzh.ch/en/Sprachkurse.html

Abstract
Japanese III leads to A2.1/A2.2 level on the Common European Framework of Reference for Languages. It is the third part of a five-semester Japanese course. The goal of the course is to give participants the opportunity to practice colloquial Japanese, read texts in Sino-Japanese mixed script, use and extend their basic vocabulary and sentence structures, and practice listening comprehension.

Objective
Participants are able to use the Japanese language adequately in selected areas. The focus is equally on fostering speaking, listening, writing, and reading skills at A1.2/A2.1 level of the Common European Framework of Reference for Languages, as well as on the development of cultural competence. Grammar skills are also reviewed and extended. Participants learn about 60 new Kaniji, thus improving their reading skills. The following content from daily interactions is dealt with: Dealing with everyday interactions, talking about personal problems, giving advice, expressing wishes, and making assumptions.

851-0882-02L Japanese V A2.2 - B1.1
No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zürich".

Course fees: https://www.sprachenzentrum.uzh.ch/en/Sprachkurse/Kursegebuehren1.html

Registration dates: https://www.sprachenzentrum.uzh.ch/en/Sprachkurse.html

Abstract
Japanese V leads to A2.2/B1.1 level on the Common European Framework of Reference for Languages. It is the final part of a five-semester Japanese course. The goal of the course is to give participants the opportunity to practice colloquial Japanese, read texts in Sino-Japanese mixed script, extend their basic vocabulary and sentence structures, and practice listening comprehension.

Objective
Participants are able to communicate orally in specific situations and read everyday texts in Sino-Japanese mixed script. The focus is equally on fostering speaking, listening, writing, and reading skills at A2.1/B1.1 level of the Common European Framework of Reference for Languages, as well as on the development of cultural competence. The following content from daily interactions is dealt with: Various daily activities (logical sequences, expressing regrettable and gratifying events), distinguishing between, and using, deferential and informal language.

851-0856-06L Spanish B2-C1: The Realities of the Hispanic World
Does not take place this semester.

No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zürich".

Course fees: https://www.sprachenzentrum.uzh.ch/en/Sprachkurse/Kursegebuehren1.html

Registration dates: https://www.sprachenzentrum.uzh.ch/en/Sprachkurse.html

Abstract
This course gives participants an initial insight into the contemporary reality of the global Spanish-speaking community through journalistic texts. The skills they practice in this approach include reading, writing, and oral interaction, and the course includes reading and writing activities and oral debates.

Objective
Participants work on two areas: First, due the size of the Hispanic world, each week they focus on a nation or a region, thus gaining a deeper insight into that nation. Second, participants can choose to investigate various aspects of the Hispanic world, according to their own interests. This course gives an overview of the societies that form the Hispanic world in two ways: On the one hand, the course looks at the perspectives of the various nations that comprise this international community, and on the other, it looks at various aspects that define this community, including its politics, news, traditions, and culture.

851-0827-01L French B2.2-C1: Society and Current Issues
Does not take place this semester.

No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zürich".

Course fees: https://www.sprachenzentrum.uzh.ch/en/Sprachkurse/Kursegebuehren1.html

Registration dates: https://www.sprachenzentrum.uzh.ch/en/Sprachkurse.html

Abstract
This course offers participants the opportunity to read, and reflect in class on, challenging texts on societal issues that regularly appear on the French-language news agenda, in order to expand their cultural knowledge, and specifically, to improve their lexical skills in writing and speaking, as well as express complex personal opinions when speaking.
The main objective of this course is to develop participants' written comprehension and expression and, more specifically, to explore the implicit and cultural aspects of a variety of text genres (academic writing, essays, investigative journalism). This course aims to improve participants' language skills through the acquisition of precise and context-specific vocabulary. It also raises their awareness of the argumentative character of written texts, words or expressions used in writing, and various types of discourse and language registers.

**Brazilian Portuguese A2-B2: Urban Popular Music**

No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zürich".

Course fees: https://www.sprachenzentrum.uzh.ch/en/Sprachkurse/Kursegebuehren1.html

Registration dates: https://www.sprachenzentrum.uzh.ch/en/Sprachkurse.html

**Objective**
The aim of this course is to expose participants to the language with a musical approach using linguistic and cultural resources to develop and improve their oral and written learning and communication skills.

**Spanish B2-C1: Language and Cinema**

No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zürich".

Course fees: https://www.sprachenzentrum.uzh.ch/en/Sprachkurse/Kursegebuehren1.html

Registration dates: https://www.sprachenzentrum.uzh.ch/en/Sprachkurse.html

**Objective**
The course aims to visual observation, development of ideas, presentation, and interaction. Some basic elements of movie-making are presented. The participant gets familiarized with images, customs, dialogs and vocabulary, carrying out an observation, analysis, and comment of these elements. Glossaries of different linguistic regions are created.

**Spanish B2-C1: Grammar and Communication**

Does not take place this semester.

No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zürich".

Course fees: https://www.sprachenzentrum.uzh.ch/en/Sprachkurse/Kursegebuehren1.html

Registration dates: https://www.sprachenzentrum.uzh.ch/en/Sprachkurse.html

**Objective**
The main subject matter of this course includes a systematic discussion of the usage of past tenses; subordinate clauses; linking expressions; reported speech; periphrastic verb constructions; and verbs of change. In addition, participants undertake individual reading of various text types, with a particular emphasis on technical subjects and/or subjects related to their fields of study.

**French B2.2-C2: Practising French in Context**

Does not take place this semester.

No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zürich".

Course fees: https://www.sprachenzentrum.uzh.ch/en/Sprachkurse/Kursegebuehren1.html

Registration dates: https://www.sprachenzentrum.uzh.ch/en/Sprachkurse.html

**Objective**
The main objective of this course is to give participants an opportunity to practice and improve the four language skills by developing a fictitious but plausible scenario that requires the use of specific rhetorical, lexical, and pragmatic tools.

**French B2-C1: Language and Cinema**

Does not take place this semester.

No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zürich".

Course fees: https://www.sprachenzentrum.uzh.ch/en/Sprachkurse/Kursegebuehren1.html

Registration dates:
### Objective
The primary objective of this course is to develop participants' listening comprehension skills and more specifically, to improve their understanding of implicit and cultural meanings of the films on the program. It further aims to raise participants' awareness of the history, aesthetics, and contemporary issues of French cinema. The second objective of the course is to improve participants' speaking skills, especially by giving them the opportunity to produce structured presentations and to express their personal, informed, and nuanced opinions.

**Spanish B2: Oral Interaction**

**Registration dates**:
Abstract
Arabic I-III (fast track) is an intensive course that leads to A2.1 level on the Common European Framework of Reference for Languages. The target group are people who: understand or speak an Arabic dialect and wish to learn Standard Arabic; have learnt to read Arabic fluently during a religious education; or have already learnt some basic Arabic and wish to invest time in an intensive course.

Objective
Participants are able to use the Arabic language adequately in selected areas and can conduct themselves in a culturally appropriate manner. To this end, the following content is dealt with: Talking about your life; daily routines; expressing wishes, commands, and eventualities, talking about language and language learning (meta-language skills), writing messages and short texts. In terms of grammar, this course attaches particular importance to the basic principles of the grammar of Standard Arabic and its verbal system. Among the cultural and meta-language skills are the creation of awareness regarding the difference between the Arabic varieties and registers.

Prerequisites / notice
In all cases, knowledge of Arabic script is a prerequisite.

Abstract
Participants improve their skills in
• Expressing their opinions and formulating hypotheses in different sequences and tenses
• Reporting on news, information, and questions from others
• Grammar and vocabulary at B2 level
Texts on everyday topics provide the learning context. Participants gain practice through interacting with others and consolidate their skills through written exercises

Objective
At the end of the course, participants can:
• Express themselves in various ways using formulations and structures appropriate to the given oral, written, and communicative context
• Use current tools such as DeepL and Chat GPT to improve their learning

Abstract
The topic of the course is a wide variety of texts from the Latin classics. The focus will deliberately not be on a single author or genre, but on a wide variety of excerpts from different authors

Objective
Students learn about new content and its different aspects and should be able to place the different aspects in a larger context and contrast them (content focus).

Content
Most of the texts are prepared at home and discussed in class.

Lecture notes
Die im Kurs verwendeten Unterrichtsmaterialien werden den Teilnehmenden zugestellt bzw. in den Stunden verteilt oder auf einer elektronischen Unterrichtsplattform verfügbar gemacht.

Prerequisites / notice
Der Kurs richtet sich an Teilnehmende mit Lateinkenntnissen (Matura, Latinum).

Abstract
This course is the second part of the two-semester course in which the entire content of Japanese I A1.1 is learned.

The goal of the course is for participants to learn the basic vocabulary and sentence structures needed to communicate in everyday situations. This includes an extension of existing knowledge of Hiragana and Katakana syllabic writing and its use in word processing.
Objective
Participants will have adequate language in selected everyday situations. Special consideration is given to an academic environment and student life.

The Japanese I (Part 1) and Japanese I (Part 2) courses aim to cover the entire content of Japanese I A1.1 in two semesters. They are designed so that busy participants who can only attend Japanese classes once a week can slowly but steadily acquire A1.1 proficiency over the course of two semesters.

The focus is equally on fostering speaking, listening, writing, and reading skills at A1.1 level of the Common European Framework of Reference for Languages, as well as on the development of cultural competence. In addition, the two syllabic writing systems and the use of Japanese computer word processing are expanded.

Content areas that are embedded in various communicative tasks include: talking about yourself (personal and professional identity, interests, daily routine, etc.), asking for information, and requesting services.

Prerequisites / notice
Special admission requirement: Attendance of the course Japanese I A1.1 (Part 1) or equivalent knowledge.

---

**851-0819-00L** French B2: Points of View on Current Affairs

*No enrolment to this course at ETH Zurich. Book the corresponding course directly at "Language Center of UZH and ETH Zürich".*

Course fees:

Registration dates:

**Abstract**
In this course, we deal with current affairs from the French-speaking world through various media, both written and audio-visual. Each topic is approached from a different perspective, with an emphasis on group discussion. At the end of the course, participants choose and present one current topic from the French-speaking world and lead a discussion on their topic.

**Objective**
The objectives of this course are to provide the tools (linguistic and cultural) necessary to understand and address francophone current affairs. Participants work on specific vocabulary related to current affairs and communicative competence (expressing opinions; expressing agreement or disagreement; arguing). By the end of the course, participants are able to give a presentation in French on a chosen topic and propose and lead a discussion. The emphasis of the course is on oral interaction skills and written and oral comprehension (newspaper articles, reports, documentaries).
