Colloquia

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 891 of 2684
About 3 talks on applied statistics.

See how statistical methods are applied in practice.

There will be about 3 talks on how statistical methods are applied in practice.

This is no lecture. There is no exam and no credit points will be awarded. The current program can be found on the web: http://stat.ethz.ch/events/zukost

Course language is English or German and may depend on the speaker.

Subject-specific Competencies

- Techniques and Theories
- Decision-making
- Creative Thinking

Method-specific Competencies

- Problem-solving
- Critical Thinking

Personal Competencies

- Decision-making
- Problem-solving
- Creative Thinking
- Critical Thinking

No seminar. No exam and no credit points will be awarded.

This seminar takes place as part of the joint seminar of several theory groups.

Intended participation is for students with excellent performance only. Formal restriction is: prior successful participation in a master level seminar in theoretical computer science.

Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days.

Participants need to present either a poster or a talk at this occasion.

Only for doctoral students.

Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days.

Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days.

Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days.

Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days.

Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.
Transferable Skills Course II (1-3 days, with Poster or Talk)  
Only for doctoral students.

Abstract  
Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days. Participants need to present either a poster or a talk at this occasion.

Objective  
Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days. Participants need to present either a poster or a talk at this occasion.

Transferable Skills Course III (1-3 days, with Poster or Talk)  
Only for doctoral students.

Abstract  
Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days. Participants need to present either a poster or a talk at this occasion.

Objective  
Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days. Participants need to present either a poster or a talk at this occasion.

Transferable Skills Course I (1 week)  
Only for doctoral students.

Abstract  
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week.

Objective  
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week.

Transferable Skills Course II (1 week)  
Only for doctoral students.

Abstract  
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week.

Objective  
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week.

Transferable Skills Course III (1 week)  
Only for doctoral students.

Abstract  
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week.

Objective  
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week.

Transferable Skills Course I (1 week, with Poster or Talk)  
Only for doctoral students.

Abstract  
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

Objective  
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

Transferable Skills Course II (1 week, with Poster or Talk)  
Only for doctoral students.

Abstract  
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

Objective  
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

Transferable Skills Course III (1 week, with Poster or Talk)  
Only for doctoral students.

Abstract  
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

Objective  
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.
**Abstract**
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

**Objective**
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

Autumn Semester 2024

Page 897 of 2684
Throughout the past 20 years the realm of quantum physics has entered the domain of information technology in more and more prominent ways. Enormous progress in the physical sciences and in engineering and technology has allowed us to build novel types of information processors based on the concepts of quantum physics. In these processors information is stored in the quantum state of physical systems forming quantum bits (qubits). The interaction between qubits is controlled and the resulting states are read out on the level of single quanta in order to process information. Realizing such challenging tasks is believed to allow constructing an information processor much more powerful than a classical computer. This task is taken on by academic labs, startups and major industry. The aim of this class is to give a thorough introduction to physical implementations pursued in current research for realizing quantum information processors. The field of quantum information science is one of the fastest growing and most active domains of research in modern physics.

<td><strong>Quantum Technologies for Searches of New Physics</strong></td>
</tr>
<tr>
<td>Abstract</td>
<td>Recent years have witnessed incredible progress in the development of new quantum technologies driven by their application in quantum information, metrology, high precision spectroscopy and quantum sensing. This course will present how these emerging technologies are powerful tools to address open questions of the Standard Model in a complementary way to what is done at the high energy frontier.</td>
</tr>
<tr>
<td>Objective</td>
<td>The aim of this course is to equip students of different backgrounds with a solid base to follow this rapidly developing and exciting multi-disciplinary field.</td>
</tr>
<tr>
<td>Content</td>
<td>The first lectures will be dedicated to review the open questions of the Standard Model and the different Beyond Standard Model extensions which can be probed with quantum technologies. This will include searches for dark sector, dark matter, axion and axion-like particles, new gauge bosons (e.g. Dark photons) and extra short-range forces. The main part of the course will introduce the following (quantum) technologies and systems, and how they can be used for probing New Physics.</td>
</tr>
<tr>
<td></td>
<td>- Cold atoms</td>

402-0468-15L | Nanomaterials for Photonic Devices | W | 6 credits | 2V+1U | R. Grange, E. Bailly, R. Chapman, V. Falcone, A. Morandi

Abstract
The lecture describes various nanomaterials (semiconductor, metal, dielectric, carbon-based...) for photonic applications (optoelectronics, plasmonics, photonic integrated circuits, ordered and disordered structures...). It starts with concepts of light-matter interactions, fabrication and characterization, the description of the properties and the state-of-the-art applications and devices.

Objective
The students will acquire theoretical and experimental knowledge about the different types of nanomaterials (semiconductors, metals, dielectric, carbon-based, ...) and their use as building blocks for advanced applications in photonics (optoelectronics, plasmonics, photonic crystal, ...). Together with the exercises, the students will learn (1) to read, summarize and discuss scientific articles related to the lecture, (2) to estimate order of magnitudes with calculations using the theory seen during the lecture, (3) to prepare a short oral presentation and report about one topic related to the lecture, and (4) to imagine an original photonic device.

Content
1. Introduction to nanophotonics
2. Wave physics for nanophotonics
3. Characterization of nanomaterials
4. Semiconductors
5. Nonlinear crystals
6. Photonic integrated circuits
7. Optical quantum devices
8. Plasmonics
9. Metasurfaces
10. Graphene & 2D Materials
11. Nanocomposites

Lecture notes
Slides and book chapter will be available for downloading

402-0475-00L | Terahertz Science and Applications | W | 6 credits | 2V+1U | E. Abreu

Abstract
The Terahertz (THz) range (0.1 – 10 THz), lies between the infrared and microwave spectral regions and has become accessible in the past few years. This new capability has had great impact in scientific research, and has led to technological advances and to the development of a variety of applications and devices. This course provides an introduction to THz science, technology and applications.

Objective
The goal of this course is to enable students to determine whether a THz solution can be applied to a particular scientific or technological problem. Armed with the fundamentals of THz science and of current THz technologies, covered in this introductory course, students will be able to weigh the capabilities, advantages and limitations of THz tools to address topics ranging from phonons in solid state systems and molecular vibrations in solutions to medical imaging and wireless communications.

Lecture notes
Will be distributed via moodle.

Literature
Yun-Shik Lee, Principles of Terahertz Science and Technology, Springer 2009

Additional references distributed via moodle.

Prerequisites / notice
Basic knowledge in physics, especially in electromagnetism, is required. No formal prerequisites.

402-0492-00L | Experimental Techniques in Quantum and Electro- | W | 6 credits | 2V+1U | D. Kienzler,
Creative Thinking

By the end of this course, students will develop the ability to utilize quantum mechanics concepts to estimate the strength of atomic interactions in modern physics, since light and electronics are the primary methods by which measurements are made across the field.

Objective

I aim to give an in-depth understanding of experimental issues for students wishing to work on experimental science. The methods covered are widely applicable in modern physics, and light and electronics are the primary methods by which measurements are made across the field.

Content

The course will cover a number of different areas of experimental physics, including:

- Optical elements and propagation
- Electronics and Electronic Noise
- Optical Detection
- Control Theory

Examples from a modern quantum information laboratory will be discussed and illustrated through active devices in the lecture.

402-0526-00L Ultrafast Processes in Solids

Abstract

Ultrafast processes in solids are of fundamental interest as well as relevant for modern technological applications. The dynamics of the electron gas as well as the spin system of a solid are discussed. The focus is on time resolved experiments which provide insight into pico- and femtosecond dynamics.

Objective

After attending this course you understand the dynamics of essential excitation processes which occur in solids and you have an overview over state of the art experimental techniques used to study fast processes.

Content

1. Experimental techniques, an overview

   - Dynamics of the electron gas
   - First experiments on electron dynamics and lattice heating
   - The finite lifetime of excited states
   - Detection of lifetime effects
   - Dynamical properties of reactions and adsorbents

2. Dynamics of the lattice

   - Phonons
   - Non-thermal melting

3. Dynamics of the spin system

   - Laser induced ultrafast demagnetization
   - Ultrafast spin currents generated by lasers
   - Landau-Lifschitz-Dynamics
   - Laser induced switching

4. Correlated materials

5. Laser induced switching

Lecture notes

will be distributed

Literature

relevant publications will be cited

Prerequisites / notice

The lecture can also be followed by interested non-physics students as basic concepts will be introduced.

Competencies

Subject-specific Competencies

402-0535-00L Introduction to Magnetism

Abstract

This course tackles the fundamental question of why only a few materials exhibit magnetism in Nature. The origin of atomic magnetic moments and the key mechanisms that govern their interactions are justified starting from fundamental principles. In addition, the influence of thermal fluctuations on magnetic ordering is discussed as well as the formalism to describe magnetic resonance phenomena.

Objective

By the end of this course, students will develop the ability to utilize quantum mechanics concepts to estimate the strength of atomic interactions and understand their reciprocal interactions. They will gain proficiency in interpreting experimental measurements on model systems in terms of material composition and an appropriate, phenomenological spin Hamiltonian. For instance, students will be able to recognize whether the magnetic hysteresis observed in some samples arises from slow dynamics or from a phase transition. Lastly, they will be capable of interpreting the occurrence of abrupt transitions or the emergence of characteristic length scales as resulting from the interplay between competing interactions. Altogether, students will acquire the basic knowledge needed to develop a research project in the field of magnetism or to attend effectively more advanced courses on this topic.

Content

The lecture “Introduction to Magnetism” aims at letting students familiarize themselves with the basic principles of quantum and statistical mechanics that determine the behavior of real magnets. Understanding why only a few materials are magnetic at finite temperature will be the leitmotiv of the course. We will see that defining in a formal way what “being magnetic” means is essential to address this question properly. Theoretical concepts will be applied to a few selected nano-sized magnets, which will serve as clean reference systems. Topics:

- Magnetism in atoms (quantum-mechanical origin of atomic magnetic moments, intra-atomic exchange interaction)
- Magnetism in solids (mechanisms producing inter-atomic exchange interaction in solids, crystal field)
- Magnetic order at finite temperatures (Ising, XY, and Heisenberg models, low-dimensional magnetism)
- Spin precession and relaxation (Larmor precession, resonance phenomena, quantum tunneling, Bloch equation, superparamagnetism)

Lecture notes

Learning material will be made available through Moodle and through the ETH JupyterHub.

Prerequisites / notice

Students are assumed to possess a basic background knowledge in quantum mechanics, solid-state and statistical physics as well as classical electromagnetism.

Students will have the opportunity to self-assess their understanding through quizzes and interactive tutorials, mostly inspired by topics of current research in nanoscale magnetism.
At the end of the lecture the student should understand four key phenomena of electron transport in semiconductor nanostructures:
1. Coulomb blockade in quantum dots
2. The integer quantum Hall effect
3. Electrons in a magnetic field, Shubnikov-de Haas effect
4. The Aharonov-Bohm effect

The seminar provides the participants an overview about newest trends and developments of accelerator mass spectrometry (AMS) and fostered assessed.

The course covers the foundations of semiconductor nanostructures, e.g., materials, band structures, bandgap engineering and doping, field-effect transistors. The physics of the quantum Hall effect and of common nanostructures based on two-dimensional electron gases will be discussed, i.e., quantum point contacts, Aharonov-Bohm rings and quantum dots.

The seminar is aimed at all students who, during their studies, are confronted with age determination methods based on long-living radionuclides 10Be, 26Al, 36Cl, and anthropogenic nuclides 129I, 236U and other actinides.

In addition to the lecture notes, the following supplementary books can be recommended:

The lecture is suitable for all physics students, students of Quantum Engineering, and students of Micro- and Nanosystems beyond the bachelor of science degree. Basic knowledge of solid state physics is a prerequisite. Very ambitioned students in the third year of Physics may be able to follow. The lecture can be chosen as part of the PhD-program. The course is taught in English.

In addition to the lecture notes, the following supplementary books can be recommended:

The seminar provides the participants an overview about newest trends and developments of accelerator mass spectrometry (AMS) and related applications. In their talks and subsequent discussions the participants learn intensively about the newest trends in the field of AMS and its applications, i.e., quantum point contacts, Aharonov-Bohm rings and quantum dots.

The seminar is aimed at all students who, during their studies, are confronted with age determination methods based on long-living radionuclides found in nature. Basic methodology, the latest developments, and special examples from a wide range of applications will be discussed.

The seminar provides the participants an overview about newest trends and developments of accelerator mass spectrometry (AMS) and related applications. In their talks and subsequent discussions the participants learn intensively about the newest trends in the field of AMS and its applications, i.e., quantum point contacts, Aharonov-Bohm rings and quantum dots.

The course gives an introduction into Accelerator Mass Spectrometry (AMS), the most sensitive method for measuring long-lived radionuclides in natural samples. Students learn the basic concepts of Accelerator Mass Spectrometry. Based on the underlying physics of ion matter interaction they learn the measurement methods and interpretation of the results for most of the important AMS radionuclides, e.g. radiocarbon (14C), the cosmogenic radionuclides 10Be, 26Al, 36Cl, and anthropogenic nuclides 129I, 236U and other actinides.
Introduction into the physics of ion matter interaction: ion stopping, ion scattering and charge exchange.

Ion optics and ion acceleration.

Mass separation, molecular destruction and isobar separation.

Ion detection and identification.

The measurement methods for all the important radionuclides and the interpretation of their results are discussed on a few examples from the application:

- 14C – radiocarbon dating and environmental studies
- 10Be, 26Al, 36Cl – cosmogenic dating and ice core research
- 129I, 236U, actinides – anthropogenic tracers in the environment
- 14C, 41Ca – biomedical studies
- 60Fe, 244Pu – astrophysics

Alternative methods: ICP-MS, RIMS, ATTA

A visit to the Tandem accelerator and AMS facilities at ETH Hönggerberg is organized as part of lectures and exercises.
Content

Topics covered include:
- Review of probability theory:
  - Independence, joint and conditional probabilities
  - Univariate and multivariate probability distributions
  - Change of variables
- Bayesian statistics:
  - Bayes’ theorem
  - Priors
  - Bayesian reasoning
- Posterior distributions, model checking, and model comparison Tools for statistical inference:
  - Various sampling methods, such as Markov chain Monte Carlo (Metropolis Hastings, slice sampling, Hamiltonian Monte Carlo) and
  - Simulation-based inference
  - PCA, bootstrap
  - Gaussian processes and Gaussian random fields
- Machine learning and probabilistic programming

The lectures are accompanied with code examples, both to illustrate the covered topics and to demonstrate how the theoretical concepts can be implemented in practical computational inference problems.

The students complete a project on a statistical analysis, using the tools covered in the course.

Prerequisites / notice

Prior knowledge of probability theory and statistics would be useful but not required. Since most of the course makes use of computational methods, some knowledge of scientific computing with Python (e.g. numpy, scipy) will be assumed.

Competencies

402-0767-00L Neutrino Physics W 6 credits 2V+1U A. Rubbia, D. Sgalaberna

Abstract

Theoretical basis and selected experiments to determine the properties of neutrinos and their interactions (mass, spin, helicity, chirality, oscillations, charge-parity violation, interactions with leptons and quarks) and implications on physics beyond the Standard Model of elementary particles as well as on Cosmology.

Objective

Critically analyze and elaborate the neutrino production and detection techniques. Derive the theory of neutrino scattering and analyze its implications in neutrino experiments. Analyze the phenomenology of neutrino oscillations and its implication on the physics Beyond the Standard Model of particles. Derive the main concepts of the theory of neutrino masses within and beyond the Standard Model of particles and analyze the experimental techniques related to the measurement of the neutrino masses. Describe the role of neutrinos in Cosmology and make connections with current and future neutrino experiments. Review the experimental configurations and analyze the challenges in searches for leptonic Charge-Parity symmetry violation and the measurement of the neutrino mass hierarchy.

Content

1. Introduction to Neutrinos and Neutrino Sources;
2. Neutrino Detectors
3. Neutrino Interactions
4. Neutrino Oscillations
5. Nature of Neutrino masses
6. Neutrinos in Cosmology
7. Search for leptonic Charge Parity violation and precision measurement of the neutrino oscillation probability

402-0831-67L Advanced Topics in General Relativity and Gravitational Waves (University of Zurich) W 6 credits 2V+1U P. Jetzer

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.

UZH Module Code: PHYS29

Mind the enrolment deadlines at UZH: https://www.uzh.ch/cmsssl/en/studies/application/deadlines.html
Abstract
The aim of this lecture is to discuss some advanced topics in general relativity, which are useful to understand the present research activities in the field. A list of possible topics is given below. A basic knowledge of general relativity is required (ideally having followed the lecture on General Relativity). The course is particularly suited for master and PhD students.

In this course, a basic understanding and overview of the concepts and notions employed in string theory shall be given. More this might be also useful in view of doing afterwards a master thesis in the field of general relativity.

Subject-specific Competencies
- Effective Field Theories for Particle Physics
- String theory is an attempt to quantise gravity and unite it with the other fundamental forces of nature. It is related to numerous interesting topics and questions in quantum field theory. In this course, an introduction to the basics of string theory is provided.

Content
Possible content:
- General relativistic stellar structure equations (Neutron stars)
- Tetrad formalism
- Spins in GR
- Klein-Gordon & Dirac eqs. in GR
- Thermodynamics of black holes and Hawking radiation
- Topics in gravitational waves: GW generation by PN sources, GW from elliptic, hyperbolic binaries
- Tests of the equivalence principle

Prerequisites / notice
QFT-I (mandatory) and QFT-II (highly recommended)

Literature
M.B. Green, J.H. Schwarz, E. Witten, Superstring Theory I, CUP (1987).

402-0836-16L Quantum Simulations of Gauge Theories
Does not take place this semester.

Abstract
Divided into three parts, the course introduces various aspects of lattice quantum field theory (QFT), gauge symmetries, quantum simulato

Objective
After acquiring the foundations on lattice formulation of gauge theories, and challenges of conventional Monte Carlo simulation approaches, the students will learn about different strategies for quantum simulation of gauge theories and their implementation on digital and analog quantum devices.

Content
1. Background and Motivation
   1.1 From Quantum Field Theories to Lattice field theories;
   1.2 Lattice Gauge Theories - Lagrangian formulation, gauge symmetries, observables;
   1.3 Monte Carlo simulations, sign problems, and complex actions.
2. Road-map for Quantum Simulation of Gauge Theories
   2.1 Hamiltonian formulation, Wilson’s formulation, and the infinite Hilbert spaces;
   2.2 Finite Hilbert spaces: Z(N) gauge theories. Dualizing the Ising model and relation with the toric code;
   2.3 Finite Hilbert spaces: Quantum link models for Abelian gauge theories;
   2.4 Finite Hilbert spaces: Quantum link models for non-Abelian gauge theories;
   2.5 Exploring the physics of gauge theories - phases, dynamics, and thermalization;
   2.6 Exploring methods for gauge theories - exact diagonalization, tensor networks, Monte Carlo.
3. Quantum Simulation Approaches and Platforms
   3.1 Digital vs. analog quantum simulations;
   3.2 Proposals for simulations of gauge theories, realization, and perspectives.

Literature
Quantum chromodynamics on the lattice (Christof Gattringer, Christian B. Lang. Series Title: Lecture Notes in Physics. DOI: https://doi.org/10.1007/978-3-642-01850-3)

402-0845-61L Effective Field Theories for Particle Physics
Special Students UZH must book the module PHY578 directly at UZH.

Abstract
The focus of the course is on Effective Field Theories (EFTs) and their interplay with dispersion theory. These topics will be discussed both in general terms and with specific phenomenological applications in the context of physics beyond the Standard Model, effective description of the weak interaction, as well as the description of non-perturbative strong interaction at low energies.

Objective
This course covers the basic concepts of effective field theories (EFTs) and dispersion theory. We will start by introducing the core concept of constructing EFTs and apply them to the low-energy description of the weak interaction and the effective description of heavy physics beyond the Standard Model.

In the next part of the course, we will discuss Chiral Perturbation Theory (ChPT), the low-energy effective theory of Quantum Chromodynamics (QCD). We will briefly discuss the application of this concept to describe a class of theories beyond the SM in which the SM Higgs arises as a composite state of a new confining sector.

The second focus of the course is on dispersion theory and its interplay with EFTs. We will discuss how to make use of the constraints from unitarity of the S-matrix and analyticity of scattering amplitudes, in order to extend the range of validity of the theoretical description compared to pure EFT methods. We will also discuss how to obtain constraints on EFT parameters from unitarity and analyticity. We will discuss the application of these methods both in the context of low-energy strong interaction and physics beyond the Standard Model.

Content
- Introduction to Effective Field Theories
- Decoupling and matching
- Renormalization group resummation
- The Standard Model Effective Field Theory (SMEFT)
- Chiral Lagrangians
- Unitarity of the S-matrix
- Analyticity and dispersion relations

Prerequisites / notice
QFT-I (mandatory) and QFT-II (highly recommended)

402-0897-00L Introduction to String Theory

Abstract
String theory is an attempt to quantise gravity and unite it with the other fundamental forces of nature. It is related to numerous interesting topics and questions in quantum field theory. In this course, an introduction to the basics of string theory is provided.

Objective
Within this course, a basic understanding and overview of the concepts and notions employed in string theory shall be given. More advanced topics will be touched upon towards the end of the course briefly in order to foster further research.

Content
- mechanics of point particles and extended objects
- string modes and their quantisation; higher dimensions, supersymmetry
- critical dimension and no-ghost theorem
- D-branes, T-duality
- two-dimensional conformal field theories

Literature
M.B. Green, J.H. Schwarz, E. Witten, Superstring Theory I, CUP (1987).
Introduction:

C. D. Herzog

Finite group theory, including representation theory and character methods; applications to crystallography and solid state physics. The symmetric group and the structure of its representations; applications to identical particles. Clifford algebras; application to relativistic wave equations equations. Simple Lie algebras and their finite-dimensional representations. Description of representations of SU(N) in terms of Young diagrams; applications in particle physics.

The "IT at D-PHYS" introduction provides a good understanding of how IT works at D-PHYS and presents an overview of the IT services and their providers. It is recommended for everyone joining the department.

The "IT and Information Security" crash course will address the most common threats you’ll encounter when using the internet and teach you how to fend them off.

The remainder is structured into individual modules which can be attended separately. They give practical insights into everyday research-related IT challenges.

The "Linux Basics" modules offer an introduction to the Linux landscape and show how to work on the shell by using command line tools. The first part provides a basic understanding of Linux systems and their components. It introduces commands essential to working with local and remote machines. The second part focuses on more advanced tools and workflows and provides guidelines to scripting, automation and customization.

The "Python Ecosystem" modules present various aspects of the environment around Python. Without teaching the Python programming language itself, it aims at providing understanding of various concepts surrounding it. The first part focuses on getting ready to run code. It discusses the management of Python interpreters, packages and virtual environments. The second part presents tools for writing Python code and interacting with strings. From development environments (IDE, Jupyter), over code formatters and linters, to string formatting and parsing with regular expressions. The third part sits at the interface between Python code and external data files. We explain how to read or write files, discuss data types and file formats. We show how to handle configuration parameters and mention tools to automate the data analysis.

The "System Aspects" module deals with the hardware-related side of scientific computing. To get the best performance out of your scientific code, you have to be aware of the underlying hardware and adapt to it.

Use the dedicated web page https://www.lehrbetrieb.ethz.ch/laborpraktika to register. Enrolled students are eligible for an attestation of attendance after visiting at least 3 out of the 5 modules. Refer to https://compenv.phys.ethz.ch for the detailed contents.

Introduction:

IT at D-PHYS (IT service providers and IT services at D-PHYS)
IT and Information Security

Modules:

Linux Basics I (system components, basic shell usage)
Linux Basics II (advanced tools, scripting)
Python Ecosystem I (interpreters, packages, virtual environments)
Python Ecosystem II (development environments, formatter and linter, string formatting, regexp)
Python Ecosystem III (external data files, config parameters and automation)
System Aspects (how the hardware affects your scientific code and vice versa)

Abstract

The course gives an introduction to symmetry groups in physics. It explains the relevant mathematical background (finite groups, Lie groups and algebras as well as their representations), and illustrates their important role across modern physics.

Objective

The aim of the course is to give a self-contained introduction into finite group theory as well as Lie theory from a physicists point of view. Abstract mathematical constructions will be illustrated with examples from physics.

Content

Finite group theory, including representation theory and character methods; applications to crystallography and solid state physics. The symmetric group and the structure of its representations; applications to identical particles. Clifford algebras; application to relativistic wave equations equations. Simple Lie algebras and their finite-dimensional representations. Description of representations of SU(N) in terms of Young diagrams; applications in particle physics.

Objective

The aim of the course is to give a self-contained introduction into finite group theory as well as Lie theory from a physicists point of view. Abstract mathematical constructions will be illustrated with examples from physics.

Content

Finite group theory, including representation theory and character methods; applications to crystallography and solid state physics. The symmetric group and the structure of its representations; applications to identical particles. Clifford algebras; application to relativistic wave equations equations. Simple Lie algebras and their finite-dimensional representations. Description of representations of SU(N) in terms of Young diagrams; applications in particle physics.
The course gives an introduction to human and comparative neuroanatomy, molecular, cellular and systems neuroscience.

Objective
The course gives an introduction to the development and anatomical structure of nervous systems. Furthermore, it discusses the basics of cellular neurophysiology and neuropharmacology. Finally, the nervous system is described on a system level.

Content
1) Human Neuroanatomy I&II
2) Comparative Neuroanatomy
3) Building a central nervous system I,II
4) Synapses I,II
5) Glia and more
6) Excitability
7) Circuits underlying Emotion
8) Visual System
9) Auditory & Vestibular System
10) Somatosensory and Motor Systems
11) Learning in artificial and biological neural networks

Prerequisites / notice
For doctoral students of the Neuroscience Center Zurich (ZNZ).

227-0671-00L Nanodevices and Circuits for the Beyond-Moore Era W 3 credits 2V M. Csontos, I. Shorubalko

Abstract
Big Data, AI and the Internet of Things demand new hardware which overcomes the limitations of von Neumann architectures. The lecture gives an insight how the fundamental physics and the resulting complex functionalities of nanodevices and circuits offer viable alternatives. Their increased computational power and energy efficiency are demonstrated through neuromorphic computing applications.

Objective
The students will gain a firm understanding in the theory and pioneering experiments of electronic and heat transport at atomic- to nanometer length-scales. Advanced device functionalities enabled by recently discovered material systems will be covered. The students will learn how to exploit such phenomena for designing nanodevices and circuits to energy-efficiently implement neuromorphic algorithms for a sustainable future of information technologies.

Lecture notes
The presentation slides and further material will be provided every week.

Prerequisites / notice
Basic knowledge of solid state physics and semiconductors.

Competencies
- Subject-specific Competencies
  - Concepts and Theories
  - Techniques and Technologies
- Method-specific Competencies
  - Analytical Competencies
  - Problem-solving
- Social Competencies
  - Communication
- Personal Competencies
  - Critical Thinking

227-0654-00L Carbon-based Nanoelectronics W 6 credits 2V+1U+1A M. Perrin, G. Borin Barin

Abstract
This course explores the exciting realm of carbon-based nanoelectronics, where the remarkable quantum properties of materials like graphene, carbon nanotubes, graphene nanoribbons, and single molecules are used for building electronic devices.

Objective
The objective of this course is to understand how the electronic properties of carbon-based materials can be exploited for fabricating quantum devices. We will delve into both the theoretical and experimental aspects, discussing how these materials' unique properties can be translated into device functionality.

Content
- The course will cover the following carbon-based materials:
  - Single-molecule
  - Graphene (single layer, bilayer, twisted bilayer)
  - Graphene nanoribbons
  - Carbon nanotubes

  For each material, we will discuss:
  - Electronic structure and charge transport properties
  - Material synthesis and characterization
  - Device integration and characterization

  The course also includes a presentation by each student in which a related scientific publication is discussed. This presentation is compulsory and accounts for 30% of the grade.

Lecture notes
Lecture slides are distributed every week. In addition, relevant scientific articles and book chapters will be provided for self-study.

Prerequisites / notice
A basic knowledge of solid-state physics and quantum mechanics is required. The course is taught in English.

Competencies
- Subject-specific Competencies
  - Concepts and Theories
  - Techniques and Technologies
- Method-specific Competencies
  - Analytical Competencies
  - Media and Digital Technologies
  - Problem-solving
- Social Competencies
  - Communication
  - Cooperation and Teamwork
  - Self-presentation and Social Influence
- Personal Competencies
  - Creative Thinking
  - Critical Thinking
  - Self-awareness and Self-reflection
  - Self-direction and Self-management

**Abstract**
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

**Objective**
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.
Abstract
This course sensitises doctoral students to ethical issues that may occur during their doctorate. After an introduction to ethics and good scientific practice, students are familiarised with resources that can assist them with ethical decision-making. Students get the chance to apply their knowledge in a context specific to research in physics.

Objective
Doctoral students learn how to identify, analyse and address ethical issues in their own scientific research. In addition, they will reflect on their professional role as scientific researchers.

Content
Part I: A self-paced e-learning course in Moodle consisting of several modules on the foundations of ethics in research:
- introduction to moral theory
- introduction to ethical issues that occur within scientific research (authorship, cooperation, data use and sharing as well as other aspects that are subject to scientific integrity and good scientific practice).
- collecting resources: presentation of a variety of tools and resources that help identify ethical issues
- setting up a strategy: example examination of a case regarding its ethical scope
- making decisions: presentation of different ways of addressing ethical issues by making hard choices, solving ethical dilemmas and seeking advice.

Part II: Two face-to-face workshops focus on applications and physics-specific aspects providing an interactive learning environment. Participants get to apply their knowledge, and they are encouraged to reflect on ethical problems and to critically discuss them with fellow doctoral students. The workshops consist of several modules on:
- ethics introduction
- dilemma discussions
- case analyses
- group work and discussions
- role plays
- sustainability aspects
- dialogues with supervisor

Prerequisites / notice
For doctoral students of D-PHYS only.

Competencies
Method-specific Competencies
Analytical Competencies  fostered
Decision-making  fostered
Problem-solving  fostered
Social Competencies
Communication  fostered
Cooperation and Teamwork  fostered
Leadership and Responsibility  fostered
Sensitivity to Diversity  fostered
Negotiation  fostered
Personal Competencies
Adaptability and Flexibility  fostered
Critical Thinking  fostered
Integrity and Work Ethics  assessed
Self-awareness and Self-reflection  fostered
Self-direction and Self-management  fostered

Learning to Teach
This programme is designed for ETH Doctoral Teaching Assistants with current teaching responsibilities.

Abstract
This course imparts a variety of teaching skills which will help Doctoral Teaching Assistants with their teaching tasks.

Objective
In this course Doctoral Teaching Assistants will ...

- discuss learning science and teaching techniques with peers.
- design the introduction of their course/lecture/exercise class.
- develop learning activities according to learning objectives.
- practice classroom assessment techniques in order to measure student learning.
- engage in peer feedback in order to improve own teaching.

Content
We will meet for the mandatory kick-off meeting online in October. You will get detailed information together with the invitation email in the first week of the semester. The online phase, where you work through 6 modules in the Moodle course page will end in November. We will meet also face-to-face for the Consolidation workshop. You will find more information on the course page in Moodle.

Prerequisites / notice
This programme is designed for ETH Doctoral Teaching Assistants with current teaching responsibilities (exercises, excursions, supervision of practicals, lectures, etc.) or those who will assume teaching tasks in the semester following the programme. No previous teacher training is required.

Competencies
Subject-specific Competencies
Concepts and Theories  fostered

Compositional Data Analysis (CODA)

Participants of PhD Program in Plant Sciences have priority - open to other PhD students if places are available.

Please register additionally to the registration in ETHZ course catalogue here: https://ethz.ch/staffnet/en/service/courses-continuing-education.html (select Plant Sciences)

Abstract

Compositional data analysis is a methodology used to describe the parts/compounds of a whole, conveying relative information. Typical examples in different fields are: geology (geochemical elements), medicine (body composition: fat, bone, lean), food industry (food composition: fat, sugar, etc), chemistry (chemical composition), ecology (abundance of different species), agriculture (nutrient balance).

Objective

Students will be able to:
- decide where (and where not) methods for analyzing compositional data can be used
- describe what their properties are and what challenges are associated with them, and to decide which method to choose for their research task
- critically evaluate the model results of a compositional data approach in the context of plant science.

Content

The objective of this course is to introduce students with a basic programming background to compositional data analysis. We will discuss topics like the geometric properties of compositional data in plant science including the representation of data in so-called log-ratio coordinates, exploratory data analysis and visualization, location and covariance measures, application to multivariate analysis (e.g. cluster analysis), linear models and we give an outline on problems for high-dimensional data. In addition, problems with missing values, zeros and outliers are discussed. The course will consist of 50% lectures and 30% hands-on programming in R, where students will directly apply methods in software to help solve problems in plant sciences, and 20% is spent on a given task.

Literature

Prerequisites / notice

Participants should bring their laptops to the exercises with the R software environment and a suitable editor (e.g. RStudio) installed. It is assumed that students enrolling in this course have successfully completed a fundamentals of data science or statistics course and are familiar with programming (preferably in R).

Participants of PhD Program in Plant Sciences have priority.

### Aerosols I: Physical and Chemical Principles

**Type:** W  
**ECTS:** 4 credits  
**Hours:** 2V+1U  
**Lecturers:** M. Gysel Beer, D. Bell, E. Weingartner

**Abstract**
Aerosols I deals with basic physical and chemical properties of aerosol particles. The importance of aerosols in the atmosphere and in other fields is discussed.

**Objective**
- Physical and chemical principles:
  - The students will...
  - know the processes and physical laws of aerosol dynamics.
  - understand the thermodynamics of phase equilibria and chemical equilibria.
  - know the photo-chemical formation of particulate matter from inorganic and organic precursor gases.

- Experimental methods:
  - The students will...
  - know the most important chemical and physical measurement instruments.
  - understand the underlying chemistry and physics.

- Environmental impacts:
  - The students will...
  - know the major sources of atmospheric aerosols, their chemical composition and key physical properties.
  - know the most important climate impacts of atmospheric aerosols.
  - are aware of the health impacts of atmospheric aerosols.

---

### Cloud Microphysics

**Type:** W  
**ECTS:** 4 credits  
**Hours:** 2V+1U  
**Lecturers:** Z. A. Kanji, J. Chen, C. Zhang

**Abstract**
Clouds are a fascinating atmospheric phenomenon central to the hydrological cycle and the Earth’s climate. Interactions between cloud particles can result in precipitation, glaciation or evaporation of the cloud depending on its microstructure and microphysical processes.

---

**Competencies**
- Subject-specific Competencies: Concepts and Theories assessed  
  Techniques and Technologies assessed
- Method-specific Competencies: Analytical Competencies assessed  
  Decision-making fostered  
  Media and Digital Technologies fostered  
  Problem-solving assessed  
  Project Management fostered
- Social Competencies: Communication fostered  
  Cooperation and Teamwork fostered  
  Customer Orientation fostered  
  Leadership and Responsibility fostered  
  Self-presentation and Social Influence fostered  
  Sensitivity to Diversity fostered  
  Negotiation fostered
- Personal Competencies: Adaptability and Flexibility fostered  
  Creative Thinking assessed  
  Critical Thinking fostered  
  Integrity and Work Ethics fostered  
  Self-awareness and Self-reflection fostered  
  Self-direction and Self-management fostered

---

**Priority given to:** PhD students majoring in Atmospheric and Climate Sciences, and remaining open spaces will be offered to the following groups:
- MSc in Atmospheric and Climate Science  
- MSc in Environmental Sciences  
- Fachstudent, University of Bern / MSc in Climate Sciences, University of Bern  
- Mobility-Students: Earth and Climate Sciences  
- Mobility-Students: Environmental Sciences

All participants will be on the waiting list at first. All students will be informed on September 16th, 2024, if they can participate in the lecture. Students still on the waiting list on September 16, are nonetheless encouraged to come to the introductory lecture on September 17. If more spaces become available later in the week due to dropouts, waitlisted students will be accepted into the course.

**Content**

Analytical Competencies
Understanding of dynamic processes of large-scale atmospheric flow and their mathematical-physical formulation.

Self-awareness and Self-reflection
Dynamical Meteorology is concerned with the dynamical processes of the earth’s atmosphere. The fundamental equations of motion in the atmosphere will be discussed along with the dynamics and interactions of synoptic system - i.e. the low and high pressure systems that determine our weather. The motion of such systems can be understood in terms of quasi-geostrophic theory. The lecture course provides a derivation of the mathematical basis along with some interpretations and applications of the concept.

Lecture notes
Dynamics of large-scale atmospheric flow

Prerequisites / notice

701-1221-00L
Dynamics of Large-Scale Atmospheric Flow

Abstract
This lecture course is about the fundamental aspects of the dynamics of extratropical weather systems (quasi-geostrophic dynamics, potential vorticity, Rossby waves, baroclinic instability). The fundamental concepts are formally introduced, quantitatively applied and illustrated with examples from the real atmosphere. Exercises (quantitative and qualitative) should be an essential part of the course.

Objective
Understanding of dynamic processes of large-scale atmospheric flow and their mathematical-physical formulation.

Content
- Pichler H., Dynamik der Atmosphäre, Bibliographisches Institut, 456 pp. 1997

Lecture notes
Dynamics of large-scale atmospheric flow

Prerequisites / notice
Physics I, II, Environmental Fluid Dynamics

Competencies
Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies
- Analytical Competencies
- Problem-solving
- Cooperation and Teamwork
- Creative Thinking
- Critical Thinking

701-1251-00L
Land-Climate Dynamics

Abstract
The purpose of this course is to provide a fundamental background in the role of land surface processes (vegetation, soil moisture dynamics, land energy, water and carbon balances) in the climate system. The course consists of 2 contact hours per week, including lectures, group projects and computer exercises.

Objective
- The students can understand the role of land processes and associated feedbacks in the climate system.

Lecture notes
Powerpoint slides will be made available

Prerequisites / notice
Prerequisites: Introductory lectures in atmospheric and climate science

701-1211-01L
Master's Seminar: Atmosphere and Climate 1

Abstract
- In this seminar, the process of writing a scientific proposal will be introduced. The essential elements of a proposal, including the peer review process, will be outlined and class exercises will train scientific writing skills. Knowledge exchange between class participants is promoted through the preparation of a master thesis proposal and evaluation of each other's work.

Objective
- Training scientific writing skills.

Content
- In this seminar, the process of writing a scientific proposal will be introduced. The essential elements of a proposal, including the peer review process, will be outlined and class exercises will train scientific writing skills. Knowledge exchange between class participants is promoted through the preparation of a master thesis proposal and evaluation of each other's work.

Prerequisites / notice
Attendance is mandatory.

Subject-specific Competencies
- Concepts and Theories
- Decision-making
- Project Management
- Self-awareness and Self-reflection
- Self-direction and Self-management

651-4095-01L
Colloquium Atmosphere and Climate 1

Abstract
The colloquium is a series of scientific talks by prominent invited speakers assembling interested students and researchers from around Zürich. Students take part in the scientific discussions.

Objective
- The students are exposed to different atmospheric science topics and learn how to take part in scientific discussions.

Competencies
Subject-specific Competencies
- Concepts and Theories

Data: 06.08.2024 12:40 Autumn Semester 2024 Page 916 of 2684
Analysis of Climate and Weather Data

**Number**: 701-1253-00L

**Title**: Analysis of Climate and Weather Data

**Type**: W

**ECTS**: 3 credits

**Hours**: 2G

**Lecturers**: F. Isotta, R. Jnglin Wills, to be announced

---

**Abstract**

An introduction to methods of statistical data analysis in meteorology and climatology. Applications of hypothesis testing, extreme value analysis, evaluation of predictions, principal component analysis.

**Course goals**

Participants understand the theoretical concepts and purpose of methods, can apply them independently, and know how to interpret results professionally.

**Objectives**

- Students understand the theoretical foundations and probabilistic concepts of advanced analysis tools in meteorology and climatology.
- They can conduct such analyses independently, and they develop an attitude of scrutiny and an awareness of uncertainty when interpreting results. Participants improve skills in understanding technical literature that uses modern statistical data analyses.

**Content**

The course introduces several advanced methods of statistical data analysis frequently used in meteorology and climatology. It introduces the theoretical background of the methods, illustrates their application with example datasets, and discusses complications from assumptions and uncertainties. Generally, the course shall empower students to conduct data analysis thoughtfully and to interpret results critically.

**Topics covered**

- exploratory methods, hypothesis testing, analysis of climate trends, measuring the skill of deterministic and probabilistic predictions, analysis of extremes, principal component analysis and maximum covariance analysis, detection and attribution.

The course is divided into lectures and computer workshops. Hands-on experimentation with example data shall encourage students in the practical application of methods and train professional interpretation of results.

**Prerequisites**

R (a free software environment for statistical computing) will be used during the workshop. A short introduction into R will be provided during the course.

**Lecture notes**

Documentation and supporting material:
- Slides used during the lecture
- Exercise sets and solutions
- R-packages with software and example datasets for workshop sessions

All material is made available via the lecture web-page.

**Literature**

For complementary reading:

**Prerequisites / notice**

**Competencies**

**Subject-specific Competencies**

- Concepts and Theories
- Techniques and Technologies

**Method-specific Competencies**

- Analytical Competencies
- Problem-solving

**Social Competencies**

**Biogeochemistry and Pollutant Dynamics**

**Number**: 701-1313-00L

**Title**: Isotopes and Biomarkers in Biogeochemistry

**Type**: W

**ECTS**: 3 credits

**Hours**: 2G

**Lecturers**: C. Schubert, N. Casacuberta Arola, R. Kipfer

---

**Abstract**

The course introduces the scientific concepts and typical applications of tracers in biogeochemistry. The course covers stable and radioactive isotopes, geochemical tracers and biomarkers and their application in biogeochemical processes as well as regional and global cycles. The course provides essential theoretical background for the lab course "Isotopic and Organic Tracers Laboratory".

**Objective**

The course aims at understanding the fractionation of stable isotopes in biogeochemical processes. Students learn to know the origin and decay modes of relevant radiogenic isotopes. They discover the spectrum of possible geochemical tracers and biomarkers, their potential and limitations and get familiar with important applications.

**Content**

Geogenic and cosmogenic radionuclides (sources, decay chains); stable isotopes in biogeochemistry (natural abundance, fractionation); geochemical tracers for processes such as erosion, productivity, redox fronts; biomarkers for specific microbial processes.

**Lecture notes**

Handouts will be provided for every chapter

**Literature**

A list of relevant books and papers will be provided

**Prerequisites / notice**

Students should have a basic knowledge of biogeochemical processes (BSc course on Biogeochemical processes in aquatic systems or equivalent)

---

**Biogeochemistry of Trace Elements**

**Number**: 701-1315-00L

**Title**: Biogeochemistry of Trace Elements

**Type**: W

**ECTS**: 3 credits

**Hours**: 2G

**Lecturers**: A. Voegelin, D. Janssen, L. Winkel

---

**Abstract**

The course addresses the biogeochemical classification and behavior of trace elements, including key processes driving the cycling of important trace elements in aquatic and terrestrial environments and the coupling of abiotic and biotic transformation processes of trace elements. Examples of the role of trace elements in natural or engineered systems will be presented and discussed in the course.

**Objective**

The students are familiar with the chemical characteristics, the environmental behavior and fate, and the biogeochemical reactivity of different groups of trace elements. They are able to apply their knowledge on the interaction of trace elements with geosphere components and on abiotic and biotic transformation processes of trace elements to discuss and evaluate the behavior and impact of trace elements in aquatic and terrestrial systems.

**Content**

(i) Definition, importance and biogeochemical classification of trace elements. (ii) Key biogeochemical processes controlling the cycling of different trace elements (base metals, redox-sensitive and chalcophile elements, volatile trace elements) in natural and engineered environments. (iii) Abiotic and biotic processes that determine the environmental fate and impact of selected trace elements.

**Lecture notes**

Selected handouts (lecture notes, literature, exercises) will be distributed during the course.

---

**Climate Change Mitigation: Carbon Dioxide Removal**

**Number**: 701-1346-00L

**Title**: Climate Change Mitigation: Carbon Dioxide Removal

**Type**: W

**ECTS**: 3 credits

**Hours**: 2G

**Lecturers**: N. Gruber, C. Brunner

---

**Abstract**

The lecture 701-1315-00L Biogeochemistry of Trace Elements is a prerequisite for attending the laboratory course 701-1331-00L Trace Elements Laboratory, or students must be concurrently enrolled in 701-1315-00L Biogeochemistry of Trace Elements in the same semester.
Future climate change can only be kept within reasonable bounds when CO2 emissions are drastically reduced. In this course, we will discuss a portfolio of options involving the alteration of natural carbon sinks and carbon sequestration. The course includes introductory lectures, presentations from guest speakers from industry and the public sector, and final presentations by the students.

The goal of this course is to investigate, as a group, a particular set of carbon mitigation/sequestration options and to evaluate their potential, their cost, and their consequences.

From the large number of carbon sequestration/mitigation options, a few options will be selected and then investigated in detail by the students. The results of this research will then be presented to the other students, the involved faculty, and discussed in detail by the whole group.

None

Exam: No final exam. Pass/No-Pass is assigned based on the quality of the presentation and ensuing discussion.

Students of this course will discuss current topics from the field of infectious disease biology. From a list of publications, each student chooses some themes that he/she is going to explain and discuss with all other participants and under supervision. The actual topics will change from year to year corresponding to the progress and new results occurring in the field.

This is an advanced course that will require significant student participation. Students will learn how to evaluate and present scientific literature and trace the development of ideas related to understanding the ecology and evolutionary biology of infectious diseases.

A core set of ~10 classic publications encompassing unifying themes in infectious disease ecology and evolution, such as virulence, resistance, metapopulations, networks, and competition will be presented and discussed. Pathogens will include bacteria, viruses and fungi. Hosts will include animals, plants and humans.

Publications and class notes can be downloaded from a web page announced during the lecture.

Papers will be assigned and downloaded from a web page announced during the lecture.

The course provides methods and tools for ecological evaluations dealing with nature conservation or landscape planning. It covers census methods, ecological criteria, indicators, indices and critically appraises objectivity and accuracy of the available methods, tools and procedures. Birds and plants are used as main example guiding through different case studies.

Students will be able to:
1) critically consider biological data books and local, regional, and national inventories;
2) evaluate the validity of ecological criteria used in decision making processes;
3) critically appraise the handling of ecological data and criteria used in the process of evaluation
4) perform an ecological evaluation project from the field survey up to the decision making and planning.

Powerpoint slides are available on the moodle page. Additional documents are handed out as copies.

Basic literature and references are listed on the webpage.

The course structure changes between lecture parts, seminars and discussions. The didactic atmosphere is intended as working group.

Suggested prerequisites for attending this course are skills and knowledge equivalent to those taught in the following ETH courses:
- Pflanzen- und Vegetationsökologie
- Systematische Botanik
- Raum- und Regionalentwicklung
- Naturschutz und Naturschutzbiologie
This five-day winter school aims at teaching advanced Master students, PhD students and postdoctoral researchers on aspects of the genomics of environmental adaptation. It provides both theoretical background and hands-on exercises on major topics of contemporary environmental genomics such as signatures of selection, outlier analysis, genotype-environment associations, or GWAS.

It is strongly recommended that participants have in advance successfully participated in the course Evolutionary Genetics (701-2413-00) or Ecological Genetics (701-1413-01).

**Competencies**

**Prerequisites:** good knowledge in population genetics and some experience in using GIS and R is required.

**Objective**

The genomics of environmental adaptation is an evolving scientific field of both basic and applied interest. Researchers make increasing use of diverse methodological approaches built on concepts from ecology, evolutionary biology and population genomics. This five-day winter school introduces students to some major concepts and methods of environmental genomics, i.e., (i) how the environment and adaptive genetic variation are related and (ii) how signatures of genomic adaptation can be detected in natural populations. The winter school focuses on current methods and hands-on exercises, emphasizing an understanding of the underlying concepts and a discussion of benefits, limitations and pitfalls of environmental genomics. It is specifically aimed at the needs of advanced Master students, PhD students and early postdoctoral researchers.

**Content**

Topics:

1. Molecular markers and next generation sequencing techniques; neutral and adaptive genetic variation, genetic drift and genetic population structure.

2. Outlier analysis: concept, methodology and types of outlier analyses.

3. Environmental data: which environmental data are available and used to identify signatures of adaptation; data limitations; collinearity.

4. Genotype-environment associations (landscape genomics); concept and types of genotype-environment associations; false discovery rates; genomic offset.

5. Genotypes and phenotypes: GWAS; follow-up analyses.

**Lecture notes**

Hand-outs will be distributed.

**Prerequisites / notice**

Grading will be according to a written report (8-10 pages), in which students will have to design a complete study in environmental genomics, and according to student contributions during the course.

Prerequisites: students must have good knowledge in population genetics and evolutionary biology and some experience with R.
Zürich Ecology and Evolution Interaction Seminar

**Objective**

Interaction seminar. Student-led presentations, guests and discussions on current themes in ecology, evolution and population biology.

**Prerequisites / notice**

For information, location and details: https://pe.ethz.ch/education/zis.html

Environmental Governance

**Abstract**

The course addresses environmental policies, focusing on new steering approaches, which are generally summarized as environmental governance. The course also provides students with tools to analyze environmental policy processes and assesses the key features of environmental governance by examining various practical environmental policy examples.

**Objective**

To understand how an environmental problem may (not) become a policy and explain political processes, using basic concepts and techniques from political science. To analyze the evolution as well as the key elements of environmental governance.

To be able to identify the main challenges and opportunities for environmental governance and to critically discuss them with reference to various practical policy examples.

**Content**

Improvements in environmental quality and sustainable management of natural resources cannot be achieved through technical solutions alone. The quality of the environment and the achievement of sustainable development strongly depend on human behavior and specifically the human uses of nature. To influence human behavior, we rely on public policies and other societal rules, which aim to steer the way humans use natural resources and their effects on the environment. Such steering can take place through government intervention alone. However, this often also involves governance, which includes the interplay between governmental and non-governmental actors, the use of diverse tools such as emission standards or financial incentives to steer actors' behavior and can occur at the local, regional, national or international level.

In this course, we will address both the practical aspects of as well as the scientific debate on environmental governance. The course gives future environmental experts a strong basis to position themselves in the governance debate, which does not preclude government but rather involves a spectrum from government to governance.

Key questions that this course seeks to answer: What are the core characteristics of environmental challenges from a policy perspective? What are key elements of 'environmental governance' and how legitimate and effective are these approaches in addressing persistent environmental challenges?

Furthermore, we encourage the development of soft skills by engaging students in activities such as moderating discussions in class, presenting own proposals, giving regular peer feedback, as well as critically reflecting on various relevant publications in the environmental governance domain.

**Lecture notes**

Lecture slides, a script and additional course material will be provided on Moodle.

**Prerequisites / notice**

A detailed course schedule will be made available at the beginning of the semester. During the lecture we will work with Moodle. We ask that all students register themselves on this platform before the lecture.

We recommend that students have (a) three-years BSc education of a (technical) university; (b) successfully completed Bachelor introductory course to environmental policy (Entwicklungen nationaler Umweltpolitik (or equivalent)) and (c) familiarity with key issues in environmental policy and some fundamental knowledge of one social science or humanities discipline (political science, economics, sociology, history, psychology, philosophy)

Abstract

This course introduces the broad variety of conflicts that arise in projects focusing on sustainable management of natural resources. It explores case studies of ecosystem management approaches and considers their practicability, their achievements and possible barriers to their uptake.

Objective

- Students should be able to
  a) propose appropriate and realistic solutions to ecosystem management problems that integrate ecological, economic and social dimensions across relevant temporal and spatial scales,
  b) identify important stakeholders, their needs and interests, and the main conflicts that exist among them in the context of land and resource management.

Content

Traditional management systems focus on extraction of natural resources, and their manipulation and governance. However, traditional management systems have frequently resulted in catastrophic failures such as, for example, the collapse of fish stocks and biodiversity loss. These failures have stimulated the development of alternative ecosystem management approaches that emphasise the functionality of human-dominated systems. Inherent to such approaches are system-wide perspectives and a focus on ecological processes and services, multiple spatial and temporal scales, as well as the need to incorporate diverse stakeholder interests in decision making. Thus, ecosystem management is the science and practice of managing natural resources, biodiversity and ecological processes, to meet multiple demands of society. It can be local, regional or global in scope, and addresses critical issues in developed and developing countries relating to economic and environmental security and sustainability.

This course provides an introduction to ecosystem management, and in particular the importance of integrating ecology into management systems to meet multiple societal demands. The course explores the extent to which human-managed terrestrial systems depend on underlying ecological processes, and the consequences of degradation of these processes for human welfare and environmental well-being. Building upon a theoretical foundation, the course will tackle issues in resource ecology and management, notably forests, agriculture and wild resources within the broader context of sustainability, biodiversity conservation and poverty alleviation or economic development. Case studies from tropical and temperate regions will be used to explore these issues. Dealing with ecological and economic uncertainty, and how this affects decision making, will be discussed. Strategies for conservation and management of terrestrial ecosystems will give consideration to landscape ecology, protected area systems, and community management, paying particular attention to alternative livelihood options and marketing strategies of common pool resources.

Abstract
The course is to provide the fundamental knowledge about earth observation sensors, techniques and methods for bio/geophysical environmental parameter estimation.

Objective
The course is to provide the fundamental knowledge about earth observation sensors, techniques and methods for bio/geophysical environmental parameter estimation. Students should know at the end of the course:
1. Basics of measurement principle
2. Fundamentals of image acquisition
3. Basics of the sensor-specific geometries
4. Sensor-specific determination of environmental parameters

Content
The course covers basic Python language concepts such as data types, control structures and functions. These concepts are then used to foster
1. Einführung in die Fernerkundung von Luft- und Weltraum gestützten Systemen
2. Einführung in das Elektromagnetische Spektrum
3. Einführung in optische Systeme (optisch und hyperspektoral)
4. Einführung in Mikrowellen-Technik (aktiv und passiv)
5. Einführung in atmosphärische Systeme (meteo und chemisch)
6. Einführung in die Techniken und Methoden zur Bestimmung von Umweltparametern
7. Einführung in die Anwendungen zur Bestimmung von Umweltparametern in der Hydrologie, Glaziologie, Forst und Landwirtschaft, Geologie und Topographie

Lecture notes
Folien zu jedem Vorlesungsblock werden zur Verfügung gestellt.

Literature
Ausgewählte Literatur wird am Anfang der Vorlesung vorgestellt.

701-1776-00L Geographic Data Processing with Python and ArcGIS W 1 credit 2U A. Baltensweiler

Abstract
The course communicates the basics of the Python programming language and provides a general introduction to the ArcGIS Pro Python scripting framework. It also introduces several Python libraries (pandas, numpy, scipy, statsmodels, geopandas, rasterio) that greatly extend the capabilities of spatial data analysis and modelling.

Objective
Students will learn the basics of geographic data processing using the Python programming language and ArcGIS Pro (arcpy). They will be able to implement their own geoprocessing scripts for spatial data analysis and modelling. Students will be able to integrate open source libraries into their Python scripts and know how to apply the libraries to geospatial datasets.

Content
The course covers basic Python language concepts such as data types, control structures and functions. These concepts are then used to gain a deeper understanding of ArcGIS Pro's geoprocessing framework (arcpy). This includes vector data processing functions as well as geoprocessing functions for raster data analysis. It also introduces the use of key Python libraries in conjunction with geospatial datasets.

Lecture notes
Lecture notes, exercises and worked-out solutions will be provided.

Literature

Prerequisites / notice
Basic knowledge of ArcGIS is assumed.

Competencies
Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

701-1682-00L Dendroecology W 3 credits 3G C. Bigler, K. Treydte, G. von Arx

Abstract
The course dendroecology offers theoretical and practical aspects of dendrochronology. The impact of different environmental influences on tree-ring characteristics will be shown. The students learn various methods to date tree rings and they understand how ecological and environmental processes and patterns can be reconstructed using tree rings.

Objective
The students...
- understand, how wood is configured and how tree-ring structures are formed.
- are able to identify and describe different tree-ring structures.
- understand the theoretical and practical aspects of the dating of tree rings.
- know the effects of different abiotic and biotic environmental influences (climate, site, competition, insects, fire, physical-mechanical influences) on trees and tree rings.
- discover a tool for understanding and reconstructing global change processes.
- get to know software to date, standardize and analyze tree rings.
- get hands-on experience based on the demonstration of wood (increment cores, stem discs, wedges), sampling in the field, and measuring and dating of tree rings in the tree-ring lab.
- solve R-based exercises (R tutorial will be provided) and answer questions in Moodle.
- work out an independent research question related to a dendroecological topic and write a short literature review based on scientific papers.

Content
- Overview and history of dendrochronology
- Principles of dendrochronology
- Formation and structure of wood and tree rings
- Wood anatomy and intra-seasonal tree-ring growth
- Continuous and discontinuous tree-ring characteristics
- Sampling and measuring of tree rings
- Crossdating methods (visual, skeleton plots, quantitative)
- Detrending and standardization of tree-ring series
- Development of tree-ring chronologies
- Water transport in trees
- Stable isotopes in tree rings
- Climate influences, climate-growth relationships, climate reconstructions
- Reconstruction of forest dynamics (regeneration, growth, competition, mortality)
- Disturbance ecology (fire, insects, blowdown)
- Application of tree-ring research in practice and in interdisciplinary research projects
- Field and lab day (date will be searched together with the students in the beginning of the semester): discussion of different dendroecological questions in the forest; sampling of trees; insight into different tree-ring projects in the lab (Swiss Federal Institute for Forest, Snow and Landscape Research WSL)
The lecture notes and further documents (papers, software) can be downloaded from Moodle (https://moodle-app2.let.ethz.ch) following registration for the course.

The class language is English, by mutual request only German.

Requirements:
- Basics of biology, ecology and forest ecology

Competencies
- Subject-specific Competencies: Concepts and Theories
- Techniques and Technologies
- Method-specific Competencies: Analytical Competencies
- Problem-solving
- Project Management

ECTS
- 2 credits
- 1S

Prerequisites / notice
- Participation in the course requires participants to be working on their own research project.

Abstract
Invited external speakers present their research on current issues in the field of soil science and discuss their results with the participants.

Objective
Master and PhD students are introduced to current areas of research in soil sciences and get first-hand experience in scientific discussion.

Content
The lecture covers the following topics:
1. Theories and concepts of inter- and transdisciplinary research
2. The specific challenges of inter- and transdisciplinary research
3. Collaborating between different disciplines
4. Engaging with stakeholders
5. Steps to make participants' research projects more societally relevant

Throughout the whole course, scientific literature will be read and discussed as well as practical tools explored in class to address concrete challenges.

Literature
Further, this collection of tools will be used:
- https://naturalsciences.ch/topics/co-producing_knowledge
- https://www.shapeidtoolkit.eu

The following open access article builds a core element of the course:
available at (open access): http://www.ingentaconnect.com/content/one/oekom/gaia/2017/00000026/00000001/art00011

The lecture will be made available to the participants.

Abstract
Technological innovation and emerging technologies may enable or disrupt environmental, economic or societal improvements. A responsible way forward considers values in the development of the technologies. The blended-learning course with face-to-face block course elements, self-learning phases and case studies is at the intersection between technology ethics and value-sensitive design.
**Objective**
Students will
- Be informed about the ethical considerations associated with the use and development of new and emerging technologies in different settings of our society.
- Learn how ethical reflection and value statements can provide guidance for future research and design decisions.
- Apply a value-based design process to emerging technologies and applications in their research.
- Get to know the value-based design approach.

**Content**
**Block 1 (8 hours)**
Day 1 (face-to-face): An introduction to the notions of ethics and values in the context of technological innovation. An introduction to the value-sensitive design framework (VSD) will conclude the first session.

Day 2 (face-to-face): An introduction to the value-based design approach (VBD).

In between:
Self-study session (20 hours): Self-guided in the OLAT environment: webinars and online course material on key knowledge points.
Group work (20 hours): Participants will apply the value-based design approach to a technology application or an innovation project of their choice in a small group.

Final Half-Day (4 hours)
Day 3: Individual presentation of own project, using the tools and approaches introduced and exercised during the course in a pitch to a jury.

**Prerequisites / notice**
Good English Skills are necessary.

### Basic and Scientific Skills

**Abstract**
This course introduces students to foundational texts that led to the emergence of the environment as a subject of scientific importance, and shaped its relevance to society. Above all, the course seeks to give confidence and raise enthusiasm among students to read more widely around the broad subject of environmental sciences and management both during the course and beyond.

**Objective**
The course will provide students with opportunities to read, discuss, evaluate and interpret key texts that have shaped the environmental movement and, more specifically, the environmental sciences. Students will gain familiarity with the foundational texts, but also understand the historical context within which their academic and future professional work is based. More directly, the course will encourage debate and discussion of each text that is studied, from both the original context as well as the modern context. In so doing students will be forced to consider and justify the current societal relevance of their work.

**Content**
The course will be run as a book reading club. The first session will provide a short introduction as to how to explore a particular text (that is not a scientific paper) to identify the key points for discussion.

Thereafter, in each week a text (typically a chapter from a book or a paper) considered to be seminal or foundational will be assigned by a course lecturer. The lecturer will introduce the selected text with a brief background of the historical and cultural context in which it was written, with some additional biographical information about the author. He/she will also briefly explain the justification for selecting the particular text.

The students will read the text, with two to four students (depending on class size) being assigned to present it at the next session.

Presentation of the text requires the students to prepare by, for example:
- identifying the key points made within the text
- identifying issues of particular personal interest and resonance
- evaluating the impact of the text at the time of publication, and its importance now considering the impact of the text from the perspective of our current societal and environmental position

Such preparation would be supported by a mid-week tutorial discussion (about 1 hour) with the assigning lecturer.

These students will then present the text (for about 15 minutes) to the rest of the class during the scheduled class session, with the lecturer facilitating the subsequent class discussion (about 45 minutes). Towards the end of the session the presenting students will summarise the emerging points (5 minutes) and the lecturer will finish with a brief discussion of how valuable and interesting the text was (10 minutes). In the remaining 15 minutes the next text will be presented by the assigning lecturer for the following week.

**Literature**
The specific texts selected for discussion will vary, but examples include:

- Leopold (1949) A Sand County Almanach
- Carson (1962) Silent Spring
- Jared Diamond (2005) Collapse

**Competencies**
Discussions might also encompass films or other forms of media and communication about nature.

Students are introduced to a typical data science workflow using various examples from environmental systems. They learn common methods and key aspects for each step through practical application. The course enables students to plan their own data science project in their specialization and to acquire more domain-specific methods independently or in further courses.

The students are able to:
- frame a data science problem and build a hypothesis
- describe the steps of a typical data science project workflow
- conduct selected steps of a workflow on specifically prepared datasets, with a focus on choosing, fitting and evaluating appropriate algorithms and models
- critically think about the limits and implications of a method
- visualise data and results throughout the workflow
- access online resources to keep up with the latest data science methodology and deepen their understanding

The data science workflow:
- Access and handle (large) datasets
- Prepare and clean data
- Analysis: data exploratory steps
- Analysis: machine learning and computational methods
- Evaluate results and analyse uncertainty
- Visualisation and communication

This course sensitises doctoral students to ethical issues that may arise during their doctorate. After an introduction to ethics and good scientific practice, students are familiarised with resources that can assist them with ethical decision-making. Students are given the opportunity to apply their knowledge and train their newly acquired skills in an interactive, discipline-specific context.

Doctoral students learn how to identify, analyse and address ethical issues in their own scientific research. Furthermore, they are encouraged to reflect on their professional role as scientific researchers.

The self-paced e-learning course consists of 5 modules:

Module 1: Ethics
Introduction to moral theory (with emphasis on practical guidance regarding decision making)

Module 2: Ethics in scientific research
Introduction to ethical issues that occur within scientific research (i.e. regarding authorship, cooperation, data use and sharing, and other aspects that are subject to scientific integrity and good scientific practice).

Module 3: Collecting resources
A variety of tools and resources that help identify ethical issues are presented and explained

Module 4: Setting up a strategy
Example examination of a case regarding its ethical scope (students develop their own strategy to examine situations for their ethical implications).

Module 5: Making decisions
Different ways of addressing ethical issues are presented and explained (i.e. how to make hard choices or solve ethical dilemmas).

The second, face-to-face part of this course focuses on discipline-specific aspects in the general area of Environmental Sciences. It provides an interactive learning environment. Students get to apply their knowledge, and they are encouraged to reflect on ethical problems and to critically discuss them with fellow doctoral students.

401-0151-00L Linear Algebra O 5 credits 3V+2U V. C. Gradinaru

Abstract Contents: Linear systems - the Gaussian algorithm, matrices - LU decomposition, determinants, vector spaces, least squares - QR decomposition, linear maps, eigenvalue problem, normal forms - singular value decomposition; numerical aspects.

Objective You can:
+ solve linear systems of equations with the Gauss elimination;
+ interpret and appropriately use the standard operations with vectors and matrices;
+ compute and properly apply various matrix decompositions;
+ compute eigenvalues, eigenvectors and the determinant of a matrix;
+ use the properties of vector spaces and linear operators;
+ formulate and solve linear least squares problems with the appropriate methods;
+ understand and apply the singular value decomposition.

Content + linear systems of equations, matrices, Gauss-Elimination, LU and QR decomposition
+ linear spaces, first part of the fundamental theorem of linear algebra, choice of basis and change of coordinates
+ linear operators and change of variables
+ norm and scalar product in a linear space, Gram-Schmidt orthogonalisation, projectors
+ linear least squares problems
+ determinants
+ eigenvalues, eigenvectors, symmetric matrices
+ singular value decomposition, second part of the fundamental theorem of linear algebra, applications

227-0001-00L Networks and Circuits I O 4 credits 2V+2U C. Franck

Abstract This course introduces the students into the basics of electric circuits, the underlying physical phenomena and required mathematical methods.

Objective Voltage, current and properties of basic elements of electric circuits, i.e. capacitors, resistors and inductors should be understood in relation to electric and magnetic fields. Furthermore, the students should be able to mathematically describe, analyze and finally design technical realizations of circuit elements. Students should also be familiar with the calculation of voltage and current distributions of DC circuits. The effect and the mathematical formulation of magnetic induction should be known for technical applications.

Content Electrostatic field; Stationary electric current flow; Basic electric circuits; current conduction mechanisms; time variant electromagnetic field.
Abstract
Introduction to engineering mechanics: kinematics, statics and dynamics of rigid bodies and systems of rigid bodies.

Objective
By learning the basics of kinematics, statics and dynamics, students should gain a basic understanding of the subject matter with which simple problems in engineering mechanics can be analyzed and solved. Based on this, further lectures, which require knowledge of mechanics, can be attended.

Content
Basic notions: position and velocity of particles, rigid bodies, planar motion, kinematics of rigid bodies, force, torque, power. Statics: static equivalence, center of forces, centroid, principle of virtual power, equilibrium, constraints, analytical statics, friction. Dynamics: acceleration, inertial forces, d'Alembert's Principle, Newton's Second Law, principles of linear and angular momentum, equations of planar motion of rigid bodies.

Lecture notes
yes, in German

Literature
Digital Circuits Laboratory

Abstract
Digital and analogue signals and their representation. Combinational and sequential circuits and systems, boolean algebra, Karnaugh-maps. Finite state machines. Memory and computing building blocks in CMOS technology, programmable logic circuits.

Objective
Deepen and extend the knowledge from lecture and exercises, usage of design software Quartus II as well as an oscilloscope.

Content
The contents of the digital circuits laboratory will deepen and extend the knowledge of the correspondent lecture and exercises. With the help of the logic device design software Quartus II different circuits will be designed and then tested on an evaluation board. You will build up the control for a 7-digit display as well as an adder and you will create different types of latches and flip-flops. At the end of the laboratory a small synthesizer will be programmed that is able to play self-created melodies. At the same time the usage of a modern oscilloscope will be taught in order to analyse the programmed circuits through the digital and analogue inputs.

Lecture notes
Lecture notes for all experiments.

Preparatory Course in Computer Science

Abstract
The course provides an elementary introduction to programming with C++. Prior programming experience is not required.

Objective
Establish an understanding of basic concepts of imperative programming and how to systematically approach programming problems. Students are able to read and write simple C++ programs.

Content
This course introduces you to the basics of programming with C++. Programming means instructing a computer to execute a series of commands that ultimately solve a particular problem.

The course comprises the following:
- General introduction to computer science: development, goals, fundamental concepts
- Interactive self-study tutorial that provides an introduction to C++ and covers the following topics: variables, data types, conditional statements and loops
- Introduction to stepwise refinement as an approach to systematically solving programming problems
- Two small programming projects, to practically apply the studied fundamentals

Lecture notes
All teaching material is available online; an online development environment is used for the programming projects.

Critical Thinking assessed

Analysis 3

Abstract
In this lecture we treat problems in applied analysis. The focus lies on the solution of quasilinear first order PDEs with the method of characteristics, and on the study of three fundamental types of partial differential equations of second order: the Laplace equation, the heat equation, and the wave equation.

Objective
The aim of this class is to provide students with a general overview of first and second order PDEs, and teach them how to solve some of these equations using characteristics and/or separation of variables.

Content
1.) General introduction to PDEs and their classification (linear, quasilinear, semilinear, nonlinear / elliptic, parabolic, hyperbolic)

2.) Quasilinear first order PDEs
- Solution with the method of characteristics
- Conservation laws

3.) Hyperbolic PDEs
- wave equation
- d'Alembert formula in (1+1)-dimensions
- method of separation of variables

4.) Parabolic PDEs
- heat equation
- maximum principle
- method of separation of variables

5.) Elliptic PDEs
- Laplace equation
- maximum principle
- method of separation of variables
- variational method

Literature

Prerequisites / notice
Prerequisites: Analysis I and II, Fourier series (Complex Analysis)
The goal of the Physics II class is an introduction to quantum mechanics. To work effectively in many areas of modern engineering, such as renewable energy and nanotechnology, students must possess a basic understanding of quantum mechanics. The aim of this course is to provide this knowledge while making connections to applications of relevance to engineers. After completing this course, students will understand the basic postulates of quantum mechanics and be able to apply mathematical methods for solving various problems including atoms, molecules, and solids. Additional examples from engineering disciplines will also be integrated.

**Method-specific Competencies**

* Asymptotic runtime (algorithmic complexity)
* Postulates and formalism of Quantum Mechanics
* First application: the quantum well and the harmonic Oscillator
* QM in three dimension: the Hydrogen atom
* Identical particles: Pauli's principle
* Crystalline Systems and band structures
* Quantum statistics
* Approximation Methods
* Applications in Engineering
* Entanglement and superposition

**Prerequisites / notice**

Prerequisites: Physics I.

**Literature**

**Competencies**

- Subject-specific Competencies: Concepts and Theories
- Analytical Competencies: Problem-solving
- Personal Competencies: Creative Thinking

**Lecture notes**

Lecture notes (hand-written) will be distributed via the Moodle interface.

**Content**

- Wave mechanics: the old quantum theory
- Postulates and formalism of Quantum Mechanics
- First application: the quantum well and the harmonic Oscillator
- QM in three dimension: the Hydrogen atom
- Identical particles: Pauli's principle
- Crystalline Systems and band structures
- Quantum statistics
- Approximation Methods
- Applications in Engineering
- Entanglement and superposition

**Method-specific Competencies**

* Parallel programming: (in)dependence of computations, parallelism and concurrency, shared memory, races, mutual exclusion, communication and synchronisation

**Personal Competencies**

- Creative Thinking
- Critical Thinking

**Prerequisites / notice**

Prerequisite: Computer Science I

**Literature**

* B. Stroustrup, A Tour of C++, 3rd Edition, Addison-Wesley, 2022

**Competencies**

- Subject-specific Competencies: Concepts and Theories
- Analytical Competencies: Problem-solving
- Personal Competencies: Creative Thinking

**Lecture notes**

Lecture notes, problem set with solutions.

**Content**

- Asymptotic runtime (algorithmic complexity)
- Fundamental algorithmic problems, e.g. searching, sorting, shortest paths, spanning trees
- Classical data structures, e.g. search trees, balanced trees, heaps, hash tables
- Graph theory and graph problems
- Problem solving strategies as design patterns for algorithms, e.g. induction, divide and conquer, backtracking, dynamic programming
- Generic programming: C++ templates higher-order functions, lambdas, closures
- Parallel programming: (in)dependence of computations, parallelism and concurrency, shared memory, races, mutual exclusion, communication and synchronisation

**Prerequisites / notice**

Prerequisite: Computer Science I

**Literature**

All material (slides, lecture recordings, examples, exercises, etc.) will be published on the course website.

* B. Stroustrup, A Tour of C++, 3rd Edition, Addison-Wesley, 2022
Modern, transistor-based electronics has transformed our lives and plays a crucial role in our economy since the 2nd half of last century. The main objective of this course in electronic circuits is to introduce the concept of the active device, including operational amplifiers, and their use in amplification, signal conditioning, switching and filtering to students. In addition to gaining experience with typical electronic circuits that are found in common applications, including their own Gruppenarbeit and Fachpraktikum projects, students sharpen their understanding of linear circuits based on nonlinear devices, imperfections of electronic circuits and the concept of design (as opposed to analysis). The course is a prerequisite for higher semester subjects such as analog integrated circuits, RF circuits for wireless communications, A/D and D/A converters and optoelectronics.

The course covers the following areas of discrete mathematics:
- You can apply set theory and its axioms as the foundation of mathematics.
- You can explain fundamental graph types and their properties.
- You can determine the solution of classical graph problems (e.g. flows in networks).
- You can use elementary number theory for applications in information theory.
- You can describe the basic algebraic structures and use them to implement error correction methods.

- Graph theory: properties, types (networks, trees, ...), colouring, flows & cuts, and matchings
- Combinatorics: elementary counting methods, counting principles, and special counting problems
- Algebra: elementary number theory (divisibility, congruence, ...), introduction to cryptography, groups, fields, and rings.

Introduction to the foundations of discrete mathematics: set theory, combinatorics, graph theory and algebra. The foundations are demonstrated with applications from information technology.

The course covers the following areas of discrete mathematics:

Objective

Ultra Low Power Microcontroller (MCU) – Firmware Programming and Sensors Interfacing using Arm Cortex-M (STM32) Microcontrollers

P&S: Microprocessors are used to execute extensive and generic applications. In contrast to that, microcontrollers (MCUs) are low-cost and low-power embedded chips with program memory and data memory built into the device. They are widely used to execute simple tasks within one specific application domain (i.e., sensor devices, wearable systems, and IoT devices). Microcontrollers demand precise and resource-saving programming. Therefore, it is necessary to know the processor architecture, relevant hardware peripherals (clocks, timers, interrupts, ADC, serial interfaces, etc.), and their implementation in the targeted device.

The STM32 family from STMicroelectronics has gained popularity in the industry due to its large product portfolio, solid documentation, and ease of use. This course aims to develop a basic understanding of hard and software concepts for embedded systems and their application in real-world problems. A combination of theory (20%) and practical implementation (80%) should enable students to conduct high-level firmware programming for microcontrollers. Besides programming the MCU, this includes the interaction with analog and digital sensors, data management, on-device processing, and wireless data exchange. More advanced topics, such as hardware-accelerated digital signal processing (DSP), machine learning, and real-time operating systems, will be discussed as part of individual projects if needed. The main programming language will be C.

The course will be taught in English.

Objective

Artifical Intelligence and in particular neural networks are inspired by biological systems, such as the human brain. Through the combination of powerful computing resources and novel architectures for neurons, neural networks have achieved state-of-the-art results in many domains such as computer vision. FPGAs are one of the most powerful platform to implement neural networks as they can handle different algorithms in computing, logic, and memory resources in the same device. Faster performance comparing to competitive implementations as the user can hardcode operations into the hardware. This course will give to the student the basis of Machine Learning to understand how they work and how they can be trained and giving hand-on experiences with the training tools such as Keras. Moreover the course will focus in deploy algorithms in low power FPGA such as the Lattice sensAI platform to have energy efficient running algorithms. The course will provide to the students the tools and know-how to implement neural network on an FPGA, and the student will challenge himself in a 5 weeks practical project that they will present at the end of the course. Experience in FPGA programming is desirable but not mandatory.

The course will be taught in English.
The category of "Laboratory Courses, Projects, Seminars" includes courses and laboratories in various formats designed to impart practical knowledge and skills. Moreover, these classes encourage independent experimentation and design, allow for explorative learning and teach the methodology of project work.

Objective

Compared to the "traditional" artificial neural network, the spiking neural network (SNN) can provide both latency and energy efficiency. Moreover, SNN has demonstrated in previous works a better performance in processing physiological information of small sample size, and thereby the output layer of the spiking neural network needs to be trained, which results in a fast training rate. This course focuses on giving the bases of spiking neural networks and neuromorphic processors. Students will learn the tools to implement SNN algorithm in both academic processors and Intel Loihi using data from Event-based Vision camera and biomedical sensors (i.e. ECG and EEG). The course will end with 4 weeks project where the students can target a specific application scenario.

The course will be taught in English.

P&S: Electronic Circuits & Signals Exploration

W  2 credits  3P  H.-A. Loeliger

Abstract

The goal of this lab course is for the students to enhance their understanding on how basic analog electronic circuits work, or perhaps don't work, and provide enough practical experience for the students to feel at ease using transistors, resistors, capacitors, diodes, etc., to create working circuits.

For example, students create circuits that make physical quantities audible. Students are encouraged to realize their own circuit ideas.

P&S: Assembling and Controlling a Tuning-Fork AFM

W  3.5 credits  3.5P  T. Zambelli

Abstract

Invented in the 1980s in Zurich and awarded with the Kavli prize in 2016, the atomic force microscope (AFM) has enabled us to visualize surfaces at the single atom level, and to measure single molecule and cell-cell interactions, deepening our understanding of material science and biology. This is achieved by controlling micromechanical piezo actuators with nanometer precision and processing noisy signals in order to achieve meaningful results.

In order to introduce you to the capabilities of modern AFMs in biomedical sensing, you will build your own setups in groups of two. You will be introduced to an AFM's functionality, control, and signal read-out using LabView. A signal of an oscillating tuning-fork will be used as feedback for the self-built AFM. In order to better understand the working principle of a tuning fork, you will also build your own frequency sweeper and analyze it with self-built low-pass filters.

After you have implemented your own setup, you will have the chance to characterize different biomedical samples on state-of-the-art setups. This data will then be analyzed using Python.

The focus of this P&S seminar is to enable you to transfer your theoretical knowledge into practice and at the same time get to know how electrical engineering can be used in biomedical research.

The course requires active participation during the practical sessions, a 10-15 min presentation and a short written report on the acquired results. The course will be given in English.

IMPORTANT: Laptops with WINDOWS are compulsory (because Labview runs NEITHER on Macs NOR on the Macs' Windows virtual machine!).

Room: GLC F26

W  3 credits  3P  G. Hug

Abstract The category of "Laboratory Courses, Projects, Seminars" includes courses and laboratories in various formats designed to impart practical knowledge and skills. Moreover, these classes encourage independent experimentation and design, allow for explorative learning and teach the methodology of project work.

Objective More and more sustainable and renewable energy technologies are used for electricity generation to cope with climate change. These distributed resources transform the electric power grid and impose major challenges.

In this seminar, students have the opportunity to glance at cutting-edge research in the field of power systems. Possible research questions might be:
- How to integrate distributed energy generation like PV plants and wind turbines into the electricity grid?
- What challenges does the increasing share of electric vehicles and batteries impose on the power grid?
- How to cope for the uncertain generation capacity of renewables and how to forecast it?
- How does the electricity market work and how do the new sources of flexibility transform it?

Students will prepare a presentation and a report on their individual research question, which is based on an assigned paper. The main objectives are to practice literature review, scientific writing and presenting. Students will learn to independently understand specific research results – a crucial skill for academic research including semester and master projects.

The language of instruction is English. Registrations for the seminar are binding.

Objective

Wireless transmission of information is ubiquitous today. Depending on application and frequency range, different types of modulation are used, with digital methods having largely replaced the old analog methods. Software Defined Radio (SDR) tools make it possible to dive into this world and "surf the waves" with relatively little effort. More powerful computers allow for increasingly complex signal processing in transmitters and receivers. At the same time, the signal processing algorithms can be adapted and changed very quickly and flexibly.

In this P&S we will take a closer look at how SDR works. In the first part we will work on the basics of frequencies, spectra, modulation types, and signal processing.

In the second part we will work in groups on different projects with SDR tools. Students can also bring their own ideas. At the end, the projects will be presented in the class.

---

227-0085-21L  P&S: Quad-Rotors: Control and Estimation  

The category of "Laboratory Courses, Projects, Seminars" includes courses and laboratories in various formats designed to impart practical knowledge and skills. Moreover, these classes encourage independent experimentation and design, allow for explorative learning and teach the methodology of project work.

**Objective**

The objective of this P&S is to make a real-world quad-rotor fly autonomously by applying the control and estimation theory taught in class. The simulations will be coded in MATLAB, and the real-world implementation in C++.

**Abstract**

The phenomenon of nuclear magnetic resonance (NMR) and its application for spectroscopy and imaging are introduced. The course starts with a general introduction to NMR, followed by measurements on a clinical MRI scanner. The NMR experiments will be developed and teach the methodology of project work.

**Prerequisites / notice**

You are required to bring your own Laptop for the programming exercises. A basic knowledge of programming in MATLAB, Python, and C++ is required.

**Competencies**

- Subject-specific Competencies: Techniques and Technologies

227-0085-24L  P&S: RoboCup: Learning and Control  

RoboCup is a tournament where teams of autonomous robots compete in soccer matches against each other. The ETH team NomadZ (https://robocup.ethz.ch/) plays in the Standard Platform League with a team of humanoid NAO robots. The focus lies on developing robust and efficient algorithms for vision, control and behavior.

**Objective**

"RoboCup: Learning and Control" is jointly offered by Prof. John Lygeros (IfA), Prof. Luc Van Gool (CVL) and Prof. Fisher Yu (CVL).

**Abstract**

The main objective of this course is for students to become familiar with theoretical aspects currently in the spotlight of RoboCup. This is accomplished by a combination of theory sessions, related student exercise sets and programming projects in MATLAB, Python, and C++.

**Prerequisites / notice**

You are required to bring your own Laptop for the programming exercises. A basic knowledge of programming in MATLAB, Python, and C++ is required.

**Competencies**

- Subject-specific Competencies: Concepts and Theories
  - assessed
- Techniques and Technologies
  - assessed

---

227-0085-25L  P&S: Magnetic Resonance: From Spectrum to Image  

The phenomenon of nuclear magnetic resonance (NMR) and its application for spectroscopy and imaging are introduced. The course starts with a general introduction to NMR, followed by measurements on a clinical MRI scanner. The NMR experiments will be developed and programmed by the students. Starting from a simple spectroscopic experiment, the basics of imaging will be acquired step-by-step. Finally, sectional images of test objects will be obtained.

**Objective**

The course will be conducted only if at least 2 participants show up. In case in-classroom teaching is not allowed, the course must be cancelled.

---

227-0085-26L  P&S: Biosignal Acquisition and Processing for IoT Wearable Devices  

A video showing highlights from HS2018 can be seen here: https://www.youtube.com/watch?v=PEg-XHSXzd8
A video showing how we adapted to the online setting for COVID-19 can be seen here: https://www.youtube.com/watch?v=mHcfb3QprB

**Objective**

The category of "Laboratory Courses, Projects, Seminars" includes courses and laboratories in various formats designed to impart practical knowledge and skills. Moreover, these classes encourage independent experimentation and design, allow for explorative learning and teach the methodology of project work.

**Prerequisites / notice**

Does not take place this semester.
The category of "Laboratory Courses, Projects, Seminars" includes courses and laboratories in various formats designed to impart practical knowledge and skills. Moreover, these classes encourage independent experimentation and design, allow for explorative learning and teach the methodology of project work.

Objective
Biosignal acquisition and processing – Wearable sensor node design and analysis for bio-impedance sensor using an Arm Cortex-M (Nordic nrf52832) Microcontroller

Wearable smart sensor electronics has the potential to revolutionize the medical field. Various body conformal flexible sensors have been used to monitor motion and physiological electrical signals such as electrocardiography (ECG), electroencephalography (EEG) and body composition analysis via body bio-impedance measurements. Smart sensor nodes not only provide accurate and continuous data in time but also automate the process of maintaining medical records, thereby lowering the workload of health worker or clinician. This course offers an avenue for the students to understand the interdisciplinary principles that make it possible to interpret human physiology by utilizing discrete electronic components. Most importantly, participants will get a chance to do hands-on system design specific to electronically tracking a particular physiological phenomenon. In particular, the focus will be laid on programming of micro controllers, interfacing with sensors, acquisition of data and utilizing discrete analog elements for bio-signal processing. The programming will be performed in C.

The course will be taught in English and by the ITET center for project based learning.

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 941 of 2684
Objective

Deep neural networks (DNNs) have become the leading method for a wide range of data analytics tasks, after a series of major victories at the ImageNet Large Scale Visual Recognition Challenge (ILSVRC). For ILSVRC, the task was to classify images into 1000 different classes, many of which are difficult to distinguish (e.g., many classes are different breeds of dogs). All that was given were 1.2 million labelled images. Meanwhile, this recipe for success has taken over many more areas, from image-based tasks like segmenting objects in images, detecting objects, enhancing images using super-resolution and compression artifact reduction, to robotics and reinforcement learning, and a wide range of industrial applications.

DNNs and their subtype convolutional neural networks (CNNs) have not been new in the 2013 when the wave of success has started, but they got this huge boost through the new availability of large-scale dataset and—at least as importantly—the availability of the necessary compute resources by using GPUs to perform the computations required during training. While GPUs were then also used to stem the high computation effort of DNNs during inference (e.g. classifying images directly using a trained DNN rather than training the DNN itself), the high demand, the need for cost efficiency, and the goal of deploying DNNs not just in data centers but pervasively in everyday devices, wearables, and low-latency industrial or interactive applications, has triggered the development of various application-specific processors which are much faster, vastly more energy efficient, and cheaper at the same time—such as the Google TPU, Graphcore, …, and Huawei’s Ascend/Astas platforms.

In this course, you will learn:
1) the basics of deep neural networks, how they work, and what challenges there are for inference,
2) how platforms with specialized hardware accelerators, specifically the Huawei Atlas 200, can be used for running DNN inference and getting a practical application running, and
3) work on your own project using DNNs and hardware accelerators based on your own ideas or on some of our proposals.

The course will be taught in English by the new D-ITET center for Project-Based Learning and a special guest lecturer from Huawei. Individual interactions/help can also be in (Swiss) German.

Most sessions will be around 1 hour of lecture and 2 hours of practical computer exercises. We will start an introduction and then you will have ca. 8 weeks to work on your project, which will concluded with a final presentation of your results.

Abstract

The category of "Laboratory Courses, Projects, Seminars" includes courses and laboratories in various formats designed to impart practical knowledge and skills. Moreover, these classes encourage independent experimentation and design, allow for explorative learning and teach the methodology of project work.

Objective

Computer Vision beschäftigt sich unter anderem damit, Maschinen zu befähigen ihre Umwelt zu sehen und das wahrgenommene Bild zu verarbeiten. In unserem Projekt soll ein System entwickelt werden, das Spielkarten erkennen kann und, einer guten Strategie folgend, erfolgreich Black-Jack spielen kann. Die Teilnehmer des Projektes werden kleine Teams bilden und gemeinsam mit einem Assistenten die Aufgabe erarbeiten und eine Implementierung erstellen. Am Ende des Semesters sollen die Programme im öffentlichen Wettstreit gegeneinander antreten!

Als Voraussetzungen sollte Interesse an Computer Vision mitgebracht werden und die Bereitschaft, sich in einem Team von Mitsstudierenden einzubringen. Kenntnisse in C++ sind notwendig.

Der Kurs wird von Prof. Fisher Yu mitbegutachtet.

Dieses P&S wird in englischer Sprache durchgeführt.

Abstract

The category of "Laboratory Courses, Projects, Seminars" includes courses and laboratories in various formats designed to impart practical knowledge and skills. Moreover, these classes encourage independent experimentation and design, allow for explorative learning and teach the methodology of project work.

Objective

Magnetic fields can be found everywhere but are rarely directly perceptible. This also leads to sometimes irrational fears, such as electrosmog. The power supply with direct current, 16.67 Hz and 50 Hz alternating current is indispensable today. Wherever electricity flows, magnetic fields are generated. That is why magnetic fields are omnipresent. But where do particularly high fields occur? How high can these fields be before they cause damage to health? Many studies have already dealt with this question and country-specific guidelines have been defined on this basis. But are these actually adhered to? Where are the legal limits exceeded? What are the consequences? The P&S will deal with this topic and an invited guest will speak.

The participants of the P&S will pursue small research projects of their own. To do this, they will be equipped with mobile measuring devices that can be connected to a smartphone to search for and characterise various magnetic field sources. How strong are the magnetic fields in our environment really? Can they pose a danger? How can they be shielded? These questions will be systematically investigated.

At the end of the P&S, the individual groups present the findings.

Moreover, these classes encourage independent experimentation and design, allow for explorative learning and teach the methodology of project work.
Objective
Genome analysis is a cornerstone for groundbreaking scientific and medical advancements, including personalized healthcare. However, the field faces significant computational challenges, such as algorithmic bottlenecks and the handling of large datasets. This course aims to provide a comprehensive understanding of these computational facets, spanning across the computing stack from algorithms, software & tools, to microarchitecture & hardware accelerators.

The course will cover how advanced hardware solutions like FPGAs and GPUs can expedite genome analysis by reducing computational time and energy consumption. In parallel, it will delve into the use and development of heuristic algorithms & tools for accelerating genome analysis across various computational platforms. These algorithms, for example, can offer tradeoffs between computational intensity and accuracy. Students will engage in hands-on projects focused on optimizing existing methods or innovating new solutions for genome analysis. The curriculum's dual emphasis on hardware solutions and versatile algorithmic strategies offers students a holistic view of the current challenges and potential resolutions within the realm of genome analysis.

The course is conducted in English.

Course website: https://safari.ethz.ch/projects_and_seminars/doku.php?id=bioinformatics

Content
The students carry out a hands-on project under the supervision of their mentors. We also offer the following lectures that the students are encouraged to follow to make impactful progress on their projects.

Lecture 1a: P&S Course Introduction & Scope
Lecture 1b: Project Overview and Q&A
Lecture 2: Introduction to Genome Analysis
Lecture 3: From Molecules to Data: An Overview of DNA Sequencing Technologies
Lecture 4a: Fundamentals of Sequence Alignment: Algorithms and Applications
Lecture 4b: Optimizing Sequence Search: Hashing, Indexing, and Filtering Techniques
Lecture 5a: Building the Blueprint of Life: Genome Assembly
Lecture 5b: Generating Insights from Genome Analysis: Variant Calling and Functional Genomics
Lecture 6a: GateKeeper
Lecture 6b: SneakySnake
Lecture 6c: GRIM-Filter
Lecture 7a: GenASM
Lecture 7b: Scrooge
Lecture 8: SeGraM
Lecture 9: GenStore
Lecture 10a: GenPIP
Lecture 10b: TargetCall
Lecture 11a: BLEND
Lecture 11b: AirLift
Lecture 12a: Raw Nanopore Signal Analysis & RawHash

Learning Materials

1. Overview paper on co-designing hardware and software for genome analysis:
https://people.inf.ethz.ch/omutlu/pub/AcceleratingGenomeAnalysis_dac23.pdf

2. Survey on the main steps in the genome analysis pipeline and their bottlenecks:

5. Example of accelerating genomic sequence matching with FPGAs or GPUs:

6. Example using different computing paradigms for read mapping and alignment, improving energy consumption:

7. Examples of software/hardware co-design for genomic sequence matching:

Prerequisites / notice
- No prior knowledge in bioinformatics or genome analysis is required.
- An interest in optimizing efficiency and solving complex problems is essential.
- Basic to good knowledge in C or C++ programming language is required.
- Previous coursework in Digital Design and Computer Architecture, or an equivalent course, is desirable.
- Experience in either FPGA implementation, GPU programming, or algorithm design is highly beneficial but not mandatory.
The course unit can only be taken once. Repeated enrollment in a later semester is not creditable.

Abstract

The category of "Laboratory Courses, Projects, Seminars" includes courses and laboratories in various formats designed to impart practical knowledge and skills. Moreover, these classes encourage independent experimentation and design, allow for explorative learning and teach the methodology of project work.

Objective

DRAM is predominantly used to build the main memory systems of modern computing devices. Emerging memory technologies (RRAM, PCM, STT-MRAM, FeRAM) provide an exciting opportunity to replace or complement DRAM. Simulation-based experimental studies are key for understanding the complex interactions between DRAM, emerging memory technologies, and modern applications. Ramulator is an extensible main memory simulator providing cycle-accurate performance models for a variety of commercial DRAM standards (e.g., DDR3/4, LPDDR3/4, GDDR5, HBM), emerging memory technologies, and academic proposals. Ramulator has a modular design that enables easy integration of additional standards, technologies and mechanisms. Ramulator is written in C++11 and can be easily integrated to full-system simulators such as gem5.

In this P&S, you will design new memory and memory controller mechanisms for improving overall system performance, energy consumption, reliability, security, scalability and cost. You will extend Ramulator with these new designs and evaluate their performance, energy consumption, and reliability using modern applications.

This will be the right P&S for you if you would like to learn about the state-of-the-art and future memory and memory controller designs and their interaction with modern applications.

This P&S will also enable you to hands-on simulate and understand the memory system behavior of modern workloads such as machine learning, graph analytics, genome analysis.

Objective

Genome analysis is the foundation of many scientific and medical discoveries, and serves as a key enabler of personalized medicine. This analysis is currently limited by the inability of existing technologies to read an organism’s complete genome. Instead, a dedicated machine (called sequencer) extracts a large number of shorter random fragments of an organism’s DNA sequence, known as reads. Small, handheld sequencers such as ONT MinION and Flongle make it possible to sequence bacterial and viral genomes in the field, thus facilitating disease outbreak analyses such as COVID-19, Ebola, and Zika. However, large, capable computers are still needed to perform genome assembly, which tries to reassemble read fragments back into an entire genome sequence. This limits the benefits of mobile sequencing and may pose problems in rapid diagnosis of infectious diseases, tracking outbreaks, and near-patient testing. The problem is exacerbated in developing countries and during crises where access to the internet network, cloud services, or data centers is even more limited.

In this course, we will cover the basics of genome analysis to understand the speed-accuracy tradeoff in using computationally-lightweight heuristics versus accurate computationally-expensive algorithms. Such heuristic algorithms typically operate on a smaller dataset that can fit in the memory of today’s mobile device. Students will experimentally evaluate different heuristic algorithms and observe their effect on the end results. This evaluation will give the students the chance to carry out a hands-on project to implement one or more of these heuristic algorithms in their smartphones and help the society by enabling on-site analysis of genomic data.

The course is conducted in English.

P&S: Memory-Centric Computing —

The course unit can only be taken once. Repeated enrollment in a later semester is not creditable.

Abstract

The category of “Laboratory Courses, Projects, Seminars” includes courses and laboratories in various formats designed to impart practical knowledge and skills. Moreover, these classes encourage independent experimentation and design, allow for explorative learning and teach the methodology of project work.

Autumn Semester 2024
Data movement between the memory units and the compute units of current computing systems is a major performance and energy bottleneck. From large-scale servers to mobile devices, data movement costs dominate computation costs in terms of both performance and energy consumption. For example, data movement between the main memory and the processing cores accounts for 62% of the total system energy in consumer applications. As a result, the data movement bottleneck is a huge burden that greatly limits the energy efficiency and performance of modern computing systems. This phenomenon is an undesired effect of the dichotomy between memory and the processor, which leads to the data movement bottleneck.

Many modern and important workloads such as machine learning, computational biology, graph processing, databases, video analytics, and real-time data analytics suffer greatly from the data movement bottleneck. These workloads are exemplified by irregular memory accesses, relatively low data reuse, low cache line utilization, low arithmetic intensity (i.e., ratio of operations per accessed byte), and large datasets that greatly exceed the main memory size. The computation in these workloads cannot usually compensate for the data movement costs. In order to alleviate this data movement bottleneck, we need a paradigm shift from the traditional processor-centric design, where all computation takes place in the compute units, to a more data-centric design where processing elements are placed closer to or inside where the data resides. This paradigm of computing is known as Processing-in-Memory (PIM).

This is your perfect P&S if you want to become familiar with the main PIM technologies, which represent "the next big thing" in Computer Architecture. You will work hands-on with the first real-world PIM architecture, will explore different PIM architecture designs for important workloads, and will develop tools to enable research of future PIM systems. Projects in this course span software and hardware as well as the software/hardware interface. You can potentially work on developing and optimizing new workloads for the first real-world PIM hardware or explore new PIM designs in simulators, or do something else that can forward our understanding of the PIM paradigm.

Prerequisites of the course:
- Digital Circuits AND Computer Engineering (or equivalent courses)
- Familiarity with C/C++ programming.
- Interest in future computer architectures and computing paradigms.
- Interest in discovering why things do or do not work and solving problems
- Interest in making systems efficient and usable

The course is conducted in English.
The course has two main parts:
1. Weekly lectures on processing-in-memory.
2. Hands-on project: Each student develops his/her own project.

P&S: Controlling Biological Neuronal Networks Using Machine Learning

Autumn Semester 2024

Page 947 of 2684
The category of "Laboratory Courses, Projects, Seminars" includes courses and laboratories in various formats designed to impart practical knowledge and skills. Moreover, these classes encourage independent experimentation and design, allow for explorative learning and teach the methodology of project work.

Abstract

The way memory and learning is achieved in the brain is an unsolved problem. Due to its relative simplicity, in-vitro neuroscience can help us discover the fundamentals of information processing in the brain. For this we can simulate a small number of biological neurons on top of an array of microelectrodes. Such an approach allows us to simulate the electrical activity of the neurons when they get stimulated.

Following this approach, we can investigate biological neural networks, that have about 5-50 neurons and a controlled network architecture. Still, their behavior remains highly unpredictable. Therefore, it is not yet clear how such networks need to be stimulated electrically in order to control their behavior. However, we can use machine learning to find a mapping between a stimulus and a desired response. More specifically, we can use reinforcement learning, since finding the right stimulation pattern is an instance of the so called multi-armed bandit problem.

This P&S consists of two parts. In the first part we will introduce you to the way neurons can be simulated. You will learn how neurons work and how they communicate. The second part will be about machine learning. We will discuss the basics of both artificial neural networks (ANN) and reinforcement learning. As homework exercises you will implement a reward function for a provided reinforcement learner, which will control your biological networks. In addition you will implement an ANN, that replaces unsatisfactorily performing stimulation patterns with new patterns, that this network evaluates to perform better.

If the current situation will allow, the developed ANNs will be tested on real neurons in our laboratory.

This P&S will be given in English. In total, the P&S takes 8 afternoons and about 50 hours of homework (ANN implementation).

P&S: Python for Science & Machine Learning

Does not take place this semester.

Course can only be registered for once. A repeatedly registration in a later semester is not chargeable.

Objective

This beginner course to programming with Python - with a focus on applications in science and technology - is an ideal starting point for later courses. We will start with an introduction to the dev environment and tools for effective development to get you started. Then we will learn the basics of Python with exercises, and discover popular modules for data processing and visualisation that will be useful for your later studies and career. We conclude with an introduction to popular machine learning techniques and some time for you to implement your own small free-style projects.

By the end of the semester, you will
- be familiar with your PC’s command-line interface and know how to use available dev environments effectively.
- have learned the basics of Python and be able to write basic programs that do what you want (most of the time) with the help of modules.
- be able to process, visualize and analyze numerical data, e.g. lab measurements, images, etc.
- have first experience with machine learning techniques.
- maintain your first git repository and know how to collaborate with others on coding projects.

Language: English / German (if necessary)

P&S: Understanding and Designing Modern SSDs (Solid-State Drives)

Does not take place this semester.

Course can only be registered for once. A repeatedly registration in a later semester is not chargeable.

Objective

NAND flash memory is the de facto standard in architecting a storage device in modern computing systems. As modern computing systems process a large amount of data at an unprecedented scale, a storage device needs to meet high requirements on storage capacity and I/O performance. A NAND flash-based SSD can provide an order(s) of magnitude higher I/O performance compared to traditional hard-disk drives (HDDs), with a much lower cost-per-bit value over any other SSDs based on emerging non-volatile memory (NVM) technologies.

NAND flash memory has several unique characteristics, such as the erase-before-write property (i.e., a flash cell needs to be first erased before programming it), limited lifetime (i.e., a cell can reliably store data for a certain number of program/erase cycles), and large operation units (e.g., a NAND flash chip reads/writes data in a page (e.g., 16 KiB) granularity). To achieve high performance and large capacity of the storage system while hiding the unique characteristics of NAND flash memory, it is critical to design efficient SSD firmware, commonly called Flash-Translation Layer (FTL). An FTL is responsible for many critical management tasks, such as address translation, garbage collection, wear-leveling, and I/O scheduling, that significantly affect the performance, reliability, and lifetime of the SSD.

In this P&S, we will cover how a modern NAND flash-based SSD is organized and operates, from the basics of underlying NAND flash devices and various SSD-management tasks at the FTL-level. You will build a practical SSD simulator by refactoring MOSim, a state-of-the-art simulator for high-end SSDs, to support advanced features of modern NAND flash chips and essential SSD-management tasks. This will allow you to have the chance to obtain a comprehensive background of modern storage systems and research experience on system optimization with rigorous evaluation.

Prerequisites of the course:
- No prior knowledge in NAND flash-based storage systems is required.
- Digital Circuits AND Computer Engineering (or equivalent courses)
- Good knowledge in C/C++ programming language is required.
- Interest in system optimizations

227-0085-45L P&S: Robotic Maze Solving with a TI-RSLK Robot

(RMaze)

Does not take place this semester.

Abstract

The category of "Laboratory Courses, Projects, Seminars" includes courses and laboratories in various formats designed to impart practical knowledge and skills. Moreover, these classes encourage independent experimentation and design, allow for explorative learning and teach the methodology of project work.

Objective

Microcontroller programming (C) – Peripherals Interfacing using a MSP433 MCU – Control of a Robot in a maze

The course will focus on teaching how to build and program a Texas Instrument robotic system learning kit (TI-RSLK). It is a robot kit, which includes a 2 wheeled robot, a line sensor to determine lines on the floor as well as sensors to recognize walls. The robot is driven by a MSP432 state of the art ARM Cortex M4 processor.

This course will give the students the opportunity to learn how to program the microcontroller of this robot to navigate in a small maze. For this, the students will learn how to control the motors and, consequently the movement of the robot with the peripherals of the microcontroller. Next to the movement, also the control and readout of the attached sensors will be part of the P&S course.

Once the students are able to read sensor values and control the motors of the robot, this course will conclude with a 4-week project. Within this project the students will design their own algorithm, such that the robot can navigate autonomously within a maze. A small competition at the end of the P&S will find the fastest robot of the group.

The course will be taught in English by the new D-ITET center for Project-based learning, the programming toolchain will be installed on the student’s own laptop. Experience with microcontroller programming (C) is an advantage, however not required. A short introduction will be given during the course.

This course will be taught in English or in German if necessary.

227-0085-46L P&S: Embedded Systems With Drones

Does not take place this semester.

Abstract

The category of "Laboratory Courses, Projects, Seminars" includes courses and laboratories in various formats designed to impart practical knowledge and skills. Moreover, these classes encourage independent experimentation and design, allow for explorative learning and teach the methodology of project work.
Drones can be fun to use but understanding the hardware and software and building and programming them to be intelligent and autonomous is even better. This course gives the basis of the embedded systems having the drones as the primary target. The course will introduce embedded systems and, in particular, the microcontroller ARM Cortex-M, focusing on all the crucial blocks such as Interrupts, GPIO, ADC’s, Timers, and Serial communication protocols. Apart from the core topics, real-time and power-efficient algorithms for attitude and motor control are also discussed, making the drone efficient. Finally, exciting drone exercises are supported in the course to experiment with the development kit. The course will end with a 4.5 weeks project where the students will make the drone fly with some specific goal. It is not required any previous knowledge except C language.

The course will be taught in English and organized by the new Project-Based Learning center.

Objective

Machine with Smart Phone Sensors – Programming Android Phones – Neural Networks – Keras/Tensor Flow- Projects and App on smartphones

Abstract

Smartphones have several sensors that can acquire much useful information, for instance where we are, what we are doing, with whom we are together, what is our constitution, what are our needs. Based on this information our ‘smartphone’ offers us the appropriate computational power to process them in loco without sending the sensor data to the cloud. This course focus on giving the basics of machine learning and embedded systems. The student will learn to implement a machine learning algorithm, such as Tensor Flow and others in their android phones to have an advanced smartphone. The course will end with 4 weeks project where the students can target a specific application scenario. It is not required any previous experience in machine learning. Phyton is a plus but the basis of projects will be given in the course to be able to complete the project.

Objective

Abstract

NAO robots from Softbank are the leading humanoid robot being used in research and education worldwide. Robotics is the fastest growing and most advanced technology used in education and research. The main goal of this course is to introduce and allowing the students to learn how to program an NAO humanoid robot to make him walk, talking, watching objects understanding the human, and reacting to external input. The Nao Robots used in this course are equipped with many sensors: Tactile Sensors, Ultrasonic sensors, A Gyro, An Accelerometer, Force Sensors, Infrared sensors, 2 HD Cameras, 4 Microphones, and high accuracy digital encoders on each joint. It has two processors on board: an Intel Atom 1.6Ghz (The main computer includes SSD drive, WiFi, Bluetooth, and wired network) and an additional ARM-9 processor in its chest. The course will introduce the software package and the full SDK and API. The students will learn how to program (mainly in C and Phyton) the robot to access the full functionality. To improve the hands-on skills of students the course will end with a 5 weeks project where the students in the group will compete in a small soccer game where the robots will play the game following and kicking a red ball. It is not requested any previous knowledge but programming skills are a plus.

Objective

Wearable devices, PCB Design, Firmware developing, multi-sensors, Communication.

The Smart Patch project will design autonomous, low power and mesh enabled multi-sensor wearable smart patches. They will be based on the always-on smart sensing paradigm to continuously acquire process and stream physiological data in real-time. They can be trained to autonomously detect illness symptoms or other physical conditions, such as stress. The students will work in a team to design a sub-block of the smart patch. According to the students’ background, they will be associated with designing the hardware or the firmware. Together in a team, they will learn how to structure problems and identify solutions, system analysis, and simulation, as well as presentation and documentation techniques. They will get access to D-ITET labs and state-of-the-art engineering tools (Matlab, Simulink, Firmware development IDE, PCB Design, etc.)

Objective

Wearable devices, PCB Design, Firmware developing, multi-sensors, Communication.

The Smart Patch project will design autonomous, low power and mesh enabled multi-sensor wearable smart patches. They will be based on the always-on smart sensing paradigm to continuously acquire process and stream physiological data in real-time. They can be trained to autonomously detect illness symptoms or other physical conditions, such as stress. The students will work in a team to design a sub-block of the smart patch. According to the students’ background, they will be associated with designing the hardware or the firmware. They will get access to D-ITET labs and state-of-the-art engineering tools (Matlab, Simulink, Firmware development IDE, PCB Design, etc.)

The projects will be done under the Smart Patches: a flagship project for D-ITET students. (pbl.ee.ethz.ch)
Current MRI scans are limited by patient motion. In clinics, radiologists are often confronted with images with severe motion artefacts in their images. They either have to make a diagnosis although the image artefacts were they could miss crucial information, or they have to send the patient back into the scanner for reacquisition. Such reacquisition might inflict additional costs in the six-figure range per scanner per year.

Further, in research, MRI images from ultra-high field systems are already limited by motion from the cardiobalistic and respiratory movement. Resulting in subpar performance if not addressed appropriately.

The key to overcoming such motion artefacts is estimating the motion and correct for it. Preferably this is done prospective in real-time or otherwise afterwards retrospective in the image reconstruction. Such methods are instrumental in brain imaging since the brain’s movement is well described by the rigid body behaviour of the skull.

To do such motion correction, one needs a motion-sensing technology to measure the movement of the human skull with high precision, accuracy and temporal resolution. All this has to be done while being integrated into an MRI machine where powerful static magnetic fields are present, kW of pulsed RF power and MVA of changing magnetic field gradients are present.

In this P&S we explore different motion sensing technologies suitable for deployment in an MRI machine. What you can expect is that we discuss the theory of multiple sensing technologies and then implement an optical, shortwave RF and NMR phase motion sensor. We will spend most of our time in the lab constructing such sensors and testing them on our robotic test bench. Finally, we would also experiment in our MRI facilities, where we would perform motion correction experiments.

**Objective**

The category of "Laboratory Courses, Projects, Seminars" includes courses and laboratories in various formats designed to impart practical knowledge and skills. Moreover, these classes encourage independent experimentation and design, allow for explorative learning and teach the methodology of project work.

The goal of this P&S is to learn the basics of working with optics and how to assemble optical systems. It is intended to show the practical side to the many optics lectures that are offered at D-ITET. The course will give a very brief introduction on laser safety, basic building blocks for optics and information on how to handle such elements. The following classes allow the students to test very basics properties of lenses and lasers and how the corresponding optomechanics can be used to arrange a simple setup. After this, the different student groups rotate through four different experiments where they get the chance to build and align different optical setups and perform various measurements. No prior knowledge is required.

**Objective**

The category of "Laboratory Courses, Projects, Seminars" includes courses and laboratories in various formats designed to impart practical knowledge and skills. Moreover, these classes encourage independent experimentation and design, allow for explorative learning and teach the methodology of project work.

The course is conducted in English.

- Hands-on experience with Machine Learning frameworks (depends on the topic you choose)
- Interest in making systems efficient and usable
- Interest in discovering why things do or do not work and solving problems
- Interest in future computer architectures and computing paradigms.

**Prerequisites of the course:**
- Digital Circuits AND Computer Engineering (or equivalent courses)
- Familiarity with C/C++ programming and strong coding skills.
- Interest in future computer architectures and computing paradigms.
- Interest in discovering why things do or do not work and solving problems
- Interest in making systems efficient and usable

**Preferable:**
- Hands-on experience with Machine Learning frameworks (depends on the topic you choose)

The course is conducted in English.

P&S: Wearable Ultrasound: Tools and Technologies
W 3 credits 3P A. Cossettini

The course unit can only be taken once. Repeated enrollment in a later semester is not creditable.

Abstract

The category of "Laboratory Courses, Projects, Seminars" includes courses and laboratories in various formats designed to impart practical knowledge and skills. Moreover, these classes encourage independent experimentation and design, allow for explorative learning and teach the methodology of project work.

Objective

Ultrasound is one of the most used medical imaging techniques and it enables many applications, including the monitoring of musculoskeletal activity during movement, the imaging of carotid artery, and the control of prosthetic devices for human-machine interfaces. Recent developments showcased wearable ultrasound probes operating at minimal power consumption, enabling multi-day continuous monitoring of physiological parameters, and many companies and research centers are actively working on the development of the next generation of truly-wearable ultrasound for a number of monitoring and diagnostics applications.

To sustain such recent developments, it is important to be familiar with all sub-components (hardware and software) of such biomedical systems.

The goal of this course is the development of the main skills required for successfully developing a wearable ultrasound probe. The students will learn about ultrasound basics, transducer control, analog front-end/analog-to-digital converter configurations, signal processing for ultrasound, beamforming and generation of images, microcontroller-based wireless communication, and practical procedures for performing ultrasound experiments. The course will also introduce the students to Python (applied to ultrasound signal processing) and will include a crash course on Nordic (nRF52 family) microcontrollers. In the final weeks of the course, the students will work on an assigned project.

The course will be taught in English.

Content

Ultrasound is one of the most used medical imaging techniques and it enables many applications, including the monitoring of musculoskeletal activity during movement, the imaging of carotid artery, and the control of prosthetic devices for human-machine interfaces. Recent developments showcased wearable ultrasound probes operating at minimal power consumption, enabling multi-day continuous monitoring of physiological parameters, and many companies and research centers are actively working on the development of the next generation of truly-wearable ultrasound for a number of monitoring and diagnostics applications.

To sustain such recent developments, it is important to be familiar with all sub-components (hardware and software) of such biomedical systems.

The category of "Laboratory Courses, Projects, Seminars" includes courses and laboratories in various formats designed to impart practical knowledge and skills. Moreover, these classes encourage independent experimentation and design, allow for explorative learning and teach the methodology of project work.

Autonomous mobile robotics is a promising field that spans from food delivery robots to the Perseverance Mars rover. In this P&S you will be introduced to the fundamental building blocks of robotics, by hands on experience in the context of the F1TENTH autonomous racing and the Robot Operating System (ROS)!

Autonomous racing pushes the boundaries in algorithmic design and implementation in the form of perception, planning and control. Thus it inspires researchers as a limits test for autonomous driving and is an important building step in the field of general self driving and AI. F1TENTH is an open-source autonomous racing competition involving a racing car in the scale of 1:10.

This P&S allows you to apply hands-on robotics and is the right fit for you if you want to further delve into this fascinating field of embedded systems, perception, planning and control. Lastly, you will get experience in the widely used ROS framework.

Prerequisites / notice
- Can use the Linux-Terminal (e.g. navigating folder structure and ssh)
- Python (e.g. basic loops, OOP)
- Interest in autonomous driving
- 20GB of free space on your laptop

Objective
To expose students to novel challenges that require both problem solving and technical expertise to solve the task in a practical way. The main objective of the course is to train students in problem solving and to introduce them to finding and applying appropriate technical tools to solve challenges efficiently.

Content
Students learn about various topics such as cryptography, game theory, algorithm design, and Python coding. After attending this course, students will be better equipped to tackle unfamiliar problems - gaining the necessary background and applying the right technical expertise to solve such problems in practice.

Lecture notes
Python Notebooks will be distributed to students before every session.

Prerequisites / notice
Students should be able to write python code. Attending the Computational Thinking lecture is enough.
Objective

Bioinformatics and the computational analysis of next-generation sequencing data are the foundation of many medical discoveries, personalized medicine, high throughput diagnostic techniques, and the early detection of cancer and autoimmune diseases. A dedicated machine (called a sequencer) extracts lots of random fragments of a DNA sequence, known as reads. Small, handheld sequencers such as ONT MinION and Flongle make it possible to sequence bacterial and viral genomes on-site. This enables disease outbreak analyses (i.e., for COVID-19 or Ebola) and the on-site analysis of patient samples. A prominent example is the study of the human microbiome in liquid biopsy samples (i.e., blood samples). The microbiome is strongly related to human health and allows for the early diagnosis of diseases like Parkinson’s, Alzheimer’s, and cancer.

In this course, we will cover the basics of genome analysis for medical applications, high-throughput diagnostics, and the early detection and prevention of diseases.

Students will experimentally evaluate different algorithms and machine-learning techniques to uncover somatic mutations in cancer and develop tools dedicated to microbiome discovery and high-throughput disease diagnostics.

The course is conducted in English.

Content

Course website: https://safari.ethz.ch/projects_and_seminars/fall2024/doku.php?id=clinical_genomics

Prerequisites / notice

- No prior knowledge in bioinformatics or genome analysis is required.
- Proficiency in C/C++ programming and bash scripting is required.
- Interest in clinical applications, human health, and an ambition to make things efficient and to solve new problems.

Abstract: This lab introduces deep learning through the PyTorch framework in a series of hands-on exercises, exploring topics in computer vision, natural language processing, audio processing, graph neural networks, and representation learning.

Objective: This P&S introduces deep learning through the PyTorch framework in a series of hands-on examples, exploring topics in computer vision, natural language processing, graph neural networks, and representation learning.

With the objective to expose students to both common and cutting-edge neural architectures and to build intuition about their inner working by the means of examples.

Students learn about various network structures as building blocks and use them to solve worked examples and course challenges. After attending this course, students will be familiar with multi-layer perceptrons, convolutional neural networks, recurrent neural networks, transformer encoders, graph convolutional/isomorphism/attention networks, and autoencoders.

Content: For information about the lab, please visit https://disco.ethz.ch/courses/hs24/hodl/

Lecture notes: Python Notebooks will be distributed to students before every session.

227-0651-00L | Applied Circuit and PCB-Design        | W    | 2    | 4G    | A. Blanco Fontao        |

Abstract: The student must motivate the reasons that lead him/her to enroll by means of an e-mail to the person in charge of the course (ballfonso@ethz.ch). Failing to do so will result in a registration rejection. Final admission to the course is at the discretion of the lecturer.

Objective: Participants learn how to design a predefined electronic circuit and how to lay out the pertaining circuit board. CAE and CAD activities for design and simulation are carried out with the aid of Altium Designer.

The goal is to become acquainted with all those practical aspects of electronic circuit and PCB design by working through a modest but complete application example. This involves analysis of specifications, the evaluation of electronic parts, efficient testing and failure search, electromagnetic compatibility (EMC), the usage of industrial CAE/CAD tools for circuit simulation and PCB layout, generating production data for the board manufacturer, board mounting, testing and start up.
Content

- Development - from the idea to the final product
- Analysis of given circuit specifications
- Searching the Internet for electronics parts
- Choosing electronic parts: avoiding mistakes
- Setting up the Altium Designer environment
- Structure of component libraries
- Preparing schematic symbols for CAE
- Preparing footprints for CAD
- Linking component libraries and databases
- Introduction to Concord Pro and Supply Chain Management
- Structure of schematic diagrams and circuits
- Assigning schematic functions to physical parts
- Capturing a predefined circuit
- Hints for improved testing and failure analysis
- Checking schematic data
- Simulation of mixed-signal circuits using Spice
- Introduction to PCB manufacturing
- Turning circuit schematics into a workable layout using Altium Designer
- Component placement on the PCB
- Manual and automatic interconnect routing
- Design for EMC and High-Speed
- Preparation of production data for the board manufacturer
- Documentation for manufacturing and assembly
- PCB assembly (component mounting and soldering)
- Final circuit testing and start-up.

Literature

All necessary documents will be available as electronic documents (PDF).

Prerequisites / notice

- The course is recommended to all students who plan to design an electronic circuit or a PCB in an upcoming term project or as part of their master thesis. Attending this course during the term before will ensure they are optimally prepared and will allow them to fully focus on their project.
- The number of participants is limited.
- For their own students and staff, the Department of Information Technology and Electrical Engineering provides electronic components and consumables free of charge. All other participants have to bear a 200 CHF fee for those items.

Abstract

The course is about some fundamental topics of digital signal processing with a bias towards applications in communications: discrete-time linear filters, inverse filters and equalization, DFT, discrete-time stochastic processes, elements of detection theory and estimation theory, LMMSE estimation and LMMSE filtering, LMS algorithm, Viterbi algorithm.

Objective

The course is about some fundamental topics of digital signal processing with a bias towards applications in communications. The two main themes are linearity and probability. In the first part of the course, we deepen our understanding of discrete-time linear filters. In the second part of the course, we review the basics of probability theory and discrete-time stochastic processes. We then discuss some basic concepts of detection theory and estimation theory, as well as some practical methods including LMMSE estimation and LMMSE filtering, the LMS algorithm, and the Viterbi algorithm. A recurrent theme throughout the course is the stable and robust "inversion" of a linear filter.

Content

1. Discrete-time linear systems and filters:
   - state-space realizations, z-transform and spectrum,
   - decimation and interpolation, digital filter design, stable realizations and robust inversion.

2. The discrete Fourier transform and its use for digital filtering.

3. The statistical perspective:
   - probability, random variables, discrete-time stochastic processes;
   - detection and estimation: MAP, ML, Bayesian MMSE, LMMSE;
   - Wiener filter, LMS adaptive filter, Viterbi algorithm.

Abstract

Introduction to discrete event systems. We start out by studying popular models of discrete event systems. Then we analyze discrete event systems from an average-case and from a worst-case perspective, and study verification. Topics include: Automata and Languages, Specification Models, Stochastic Discrete Event Systems, Worst-Case Event Systems, Verification, Petri Nets.
Adaptability and Flexibility

Over the past few decades the rapid evolution of computing, communication, and information technologies has brought about the proliferation of new dynamic systems. A significant part of activity in these systems is governed by operational rules designed by humans. The dynamics of these systems are characterized by asynchronous occurrences of discrete events, some controlled (e.g. hitting a keyboard key, sending a message), some not (e.g. spontaneous failure, packet loss).

The mathematical arsenal centered around differential equations that has been employed in systems engineering to model and study processes governed by the laws of nature is often inadequate or inappropriate for discrete event systems. The challenge is to develop new modeling frameworks, analysis techniques, design tools, testing methods, and optimization processes for this new generation of systems.

In this lecture we give an introduction to discrete event systems. We start out the course by exploring the limits of what is computable and what is not. In doing so, we will consider three distinct models of computation which are often used to model discrete event systems: finite automata, push-down automata and Turing machines (ranked in terms of expressiveness power). In the second part of the course we analyze discrete event systems. We first examine discrete event systems from an average-case perspective: we model discrete events as stochastic processes, and then apply continuous time markov chains and queueing theory for an understanding of the typical behavior of a system. Then we analyze discrete event systems from a worst-case perspective using the theory of online algorithms and adversarial queueing. In the last part of the course we introduce methods that allow to formally verify certain properties of Finite Automata and Petri Nets. These are some typical analysis questions we will look at: Do two given systems behave the same? Does a given system behave as intended? Does the system eventually enter a dangerous state?

Content

1. Regular Languages
2. Non-Regular Languages
3. Markov Chains
4. Stochastic Discrete Event Systems
5. Worst-Case Event Systems
6. Verification of Finite Automata
7. Petri Nets

Control Systems

W 6 credits 2V+2U F. Dörfler

Objective

Study of concepts and methods for the mathematical description and analysis of dynamical systems. The concept of feedback. Design of control systems for single input - single output and multivariable systems.

Content

Fostered concepts and theories related to power electronics, very-large-scale integrated circuits (VLSI chips), application-specific integrated circuits (ASIC), and field-programmable gate-array (FPGA) technologies. Assessment and analysis of the operating behavior and operating range; design criteria and design of main power components.

**227-0113-00L: Power Electronics**

**Abstract**
Fields of application of power electronic converters; basic concept of switch-mode voltage and current conversion; derivation of circuit structures of non-isolated and isolated DC/DC converters, AC/DC- and DC/AC converter structures; analysis procedure and analysis of the operating behavior and operating range; design criteria and design of main power components.

**Objective**
Fields of application of power electronic converters; basic concept of switch-mode voltage and current conversion; derivation of circuit structures of non-isolated and isolated DC/DC converters, AC/DC- and DC/AC converter structures; analysis procedure and analysis of the operating behavior and operating range; design criteria and design of main power components.

**Content**
Fields of application and application examples of power electronic converters, basic concept of switch-mode voltage and current conversion, pulse-width modulation (PWM); derivation and operating modes (continuous and discontinuous current mode) of DC/DC converter topologies, buck / boost / buck-boost converter; extension to DC/AC conversion using differences of unipolar output voltages varying over time; single-phase diode rectifier; boost-type PWM rectifier featuring sinusoidal input current; tolerance band AC current control and cascaded output voltage control with inner constant switching frequency current control; local and global averaging of switching frequency discontinuous quantities for calculation of component stresses; three-phase AC/DC conversion, center-tap rectifier with impressed output current, thyristor function, thyristor center-tap and full-bridge converter, rectifier and inverter operation, control angle and recovery time, inverter operation limit; basics of inductors and single-phase transformers, design based on scaling laws; isolated DCDC converter, flyback and forward converter, single-switch and two-switch circuit; single-phase DC/AC conversion, four-quadrant converter, unipolar and bipolar modulation, fundamental frequency model of AC-side operating behavior; three-phase DC/AC converter with star-connected three-phase load, zero sequence (common-mode) and current forming differential-mode output voltage components, fundamental frequency modulation and PWM with singe triangular carrier and individual carrier signals of the phases.

**Literature**

**MATLAB**
MATLAB is used for system analysis and simulation.

**227-0116-00L: VLSI 1: HDL Based Design for FPGAs**

**Abstract**
This first course in a series that extends over three consecutive terms is concerned with tailoring algorithms and with devising high performance hardware architectures for their implementation as ASIC or with FPGAs. The focus is on front end design using HDLs and automatic synthesis for producing industrial-quality circuits.

**Objective**
Understand Very-Large-Scale Integrated Circuits (VLSI chips), Application-Specific Integrated Circuits (ASIC), and Field-Programmable Gate-Arrays (FPGA). Know their organization and be able to identify suitable application areas. Become fluent in front-end design from architectural conception to gate-level netlists. How to model digital circuits with SystemVerilog. How to ensure they behave as expected with the aid of simulation, testbenches, and assertions. How to take advantage of automatic synthesis tools to produce industrial-quality VLSI and FPGA circuits. Gain practical experience with the hardware description language SystemVerilog and with industrial Electronic Design Automation (EDA) tools.
This course is concerned with system-level issues of VLSI design and FPGA implementations. Topics include:

- Overview on design methodologies and fabrication depths.
- Levels of abstraction for circuit modeling.
- Organization and configuration of commercial field-programmable components.
- FPGA design flows.
- Dedicated and general purpose architectures compared.
- How to obtain an architecture for a given processing algorithm.
- Meeting throughput, area, and power goals by way of architectural transformations.
- Hardware Description Languages (HDL) and the underlying concepts.
- SystemVerilog
- Register Transfer Level (RTL) synthesis and its limitations.
- Building blocks of digital VLSI circuits.
- Functional verification techniques and their limitations.
- Modular and largely reusable testbenches.
- Assertion-based verification.
- Synchronous versus asynchronous circuits.
- Periodic events and the Anceau diagram.
- Case studies, ASICs compared to microprocessors, DSPs, and FPGAs.

During the exercises, students learn how to model FPGAs with SystemVerilog. They write testbenches for simulation purposes and synthesize gate-level netlists for FPGAs. Commercial EDA software by leading vendors is being used throughout.

Lecture notes
Textbook and all further documents in English.

Literature

Prerequisites / notice
Prerequisites:
Basics of digital circuits.

Examination:
In written form following the course semester (spring term). Problems are given in English, answers will be accepted in either English or German.

Further details:
https://iis-students.ee.ethz.ch/lectures/vlsi-i/

227-0121-00L Communication Systems W 6 credits 4G C. Studer, S. M. Moser

Abstract
The course teaches the fundamentals of digital communication systems. The main topics are analog and digital modulation, signals and linear time-invariant systems, baseband and passband representations, continuous-time and discrete-time channels, noise, inter-symbol interference, detection theory, as well as the basics of forward error correction and information theory.

Objective
After attending the lectures, participating in the exercise sessions, and working on the homework problems (which include MATLAB coding assignments), the students will be able to:
- understand the fundamentals of digital communication systems
- explain the principles of modulation, demodulation, detection, and error correction
- analyze error rates of simple digital communication systems
- implement simple MATLAB simulations to calculate error rates

Content
The course focuses on the fundamentals of digital communication systems. The course starts with analog modulation and discusses the main building blocks of modern digital communication systems. The topics include:
- essential components of digital communication systems
- analog and digital modulation
- baseband and passband representation; up- and down-conversion
- communication channels as LTI systems
- discretizing communication systems; sampling and quantization
- error, signal-to-noise ratio (SNR), and interference
- detection theory and error rates
- basics of forward error correction
- basics of information theory
- orthogonal frequency-division multiplexing (OFDM)
- building blocks of modern communication systems
The exercises cover theoretical aspects as well as the basics of software-based communication-system modeling in MATLAB.

227-0124-00L Embedded Systems W 6 credits 4G M. Magno

Abstract
An embedded system is a combination of hardware and software, either fixed in function or programmable, that is designed for a specific application scenario or for a specific task within a larger system. They are part of industrial machines such as agricultural and manufacturing equipment, automotive systems, medical equipment, household appliances, sensor networks, and the Internet of Things.
This lecture focuses on the design of embedded systems using formal models and methods.

Besides the theoretical lecture, the course contains laboratory sessions where students transfer the learned theoretical aspects into praxis by programming a microcontroller and interfacing it with sensors and actuators. Students will be exposed to a commercial microcontroller, and the development board extend with a custom-designed embedded systems educational platform.

Specifically, the following topics will be covered in the course: hardware and software structures of embedded systems, low-level instruction set, memory architecture and memory map, peripherals, hardware-software interfaces, communication between components, firmware design methodologies, firmware design using the C programming language, embedded real-time operating systems, real-time scheduling, shared resources, low-power, and low-energy designs well as computational accelerators.

Lecture notes
Lecture material, publications, exercise sheets, and laboratory documentation will be available on the course’s Moodle page.

Literature

Prerequisites / notice

227-0145-00L Solid State Electronics and Optics W 6 credits 4G N. Yazdani. V. Wood

Abstract
"Solid State Electronics" is an introductory condensed matter physics course covering crystal structure, electron models, classification of metals, semiconductors, and insulators, band structure engineering, thermal and electronic transport in solids, magnetoresistance, and optical properties of solids.

Objective
Understand the fundamental physics behind the mechanical, thermal, electric, magnetic, and optical properties of materials.

Prerequisites / notice
Recommended background:
Undergraduate physics, mathematics, semiconductor devices

227-0166-00L Analog Integrated Circuits W 6 credits 4G T. Jang

Abstract
This course provides a foundation in analog integrated circuit design based on bipolar and CMOS technologies.

Objective
Integrated circuits are responsible for much of the progress in electronics in the last 50 years, particularly the revolutions in the Information and Communications Technologies we witnessed in recent years. Analog integrated circuits play a crucial part in the highly integrated systems that power the popular electronic devices we use daily. Understanding their design is beneficial to both future designers and users of such systems.

Content
Basic elements, design issues and techniques for analog integrated circuits will be taught in this course.

Lecture notes
Handouts of presented slides. No script but an accompanying textbook is recommended.

Literature

227-0311-00L Qubits, Electrons, Photons W 6 credits 3V+2U T. Zambelli

Abstract
In-depth analysis of the quantum mechanics origin of nuclear magnetic resonance (qubits, two-level systems), of LASER (quantization of the electromagnetic field, photons), and of electron transfer (from electrochemistry to photosynthesis).

Objective
Starting from the axioms of quantum mechanics, we will derive the fascinating theory describing spin and qubits, electron transitions and transfer, photons and LASER. quantum mechanics is different because it mocks our daily Euclidean intuition!

In this way, students will work out a robust quantum mechanics (theoretical!!!) basis which will help them in their advanced studies of the following masters: EIT (batteries), Biomedical Engineering (NMR, bioelectronics), Quantum Engineering, Micro- and Nanosystems.

IMPORTANT: "qubits" from the point of view of NMR (and NOT from that of quantum computing!!)
Content

- Lagrangian and Hamiltonian: Symmetries and Poisson Brackets
- Postulates of QM: Hilbert Spaces and Operators
- Heisenberg’s Matrix Mechanics: Hamiltonian and Time Evolution Operator
- Density Operator
- Spin: Qubits, Bloch Equations, and NMR
- Entanglement
- Symmetries and Corresponding Operators
- Schrödinger’s Wave Mechanics: Electrons in a Periodic Potential and Energy Bands
- Harmonic Oscillator: Creation and Annihilation Operators
- Identical Particles: Bosons and Fermions
- Quantization of the Electromagnetic Field: Photons, Absorption and Emission, LASER
- Electron Transfer: Marcus Theory via Born-Oppenheimer, Franck-Condon, Landau-Zener

Lecture notes

No lecture notes because the proposed textbooks together with the provided supplementary material are more than exhaustive!

!!! I am using OneNote. All lectures and exercises will be broadcast via ZOOM, while corresponding videos of the previous years are available in Moodle !!!

Literature

Supplementary material will be uploaded in Moodle.

Prerequisites / notice

The course has been intentionally conceived to be self-consistent with respect to QM for those master students not having encountered it in their track yet. Therefore, a presumably large overlapping has to be expected with a (welcome!) QM introduction course like the D-ITET “Physics II”.

A solid base of Analysis I & II as well as of Linear Algebra is really helpful.

227-0385-10L Biomedical Imaging

W 6 credits 5G S. Kozerke, K. P. Prüsmann

Abstract

Introduction to diagnostic medical imaging based on electromagnetic and acoustic fields including X-ray planar and tomographic imaging, radiotracer based nuclear imaging techniques, magnetic resonance imaging and ultrasound-based procedures.

Objective

Upon completion of the course students are able to:

- Explain the physical and mathematical foundations of diagnostic medical imaging systems
- Characterize system performance based on signal-to-noise ratio, contrast-to-noise ratio and transfer function
- Design a basic diagnostic imaging system chain including data acquisition and data reconstruction
- Identify advantages and limitations of different imaging methods in relation to medical diagnostic applications

Content

- Introduction (intro, overview, history)
- Signal theory and processing (foundations, transforms, filtering, signal-to-noise ratio)
- X-rays (production, tissue interaction, contrast, modular transfer function)
- X-rays (resolution, detection, digital subtraction angiography, Radon transform)
- X-rays (filtered back-projection, spiral computed tomography, image quality, dose)
- Nuclear imaging (radioactive tracer, collimation, point spread function, SPECT/PET)
- Nuclear imaging (detection principles, image reconstruction, kinetic modelling)
- Magnetic Resonance (magnetic moment, spin transitions, excitation, relaxation, detection)
- Magnetic Resonance (plane wave encoding, Fourier reconstruction, pulse sequences)
- Magnetic Resonance (contrast mechanisms, gradient- and spin-echo, applications)
- Ultrasound (mechanical wave generation, propagation in tissue, reflection, transmission)
- Ultrasound (spatial and temporal resolution, phased arrays)
- Ultrasound (Doppler shift, implementations, applications)
- Summary, example exam questions

Lecture notes

Lecture notes and handouts

Literature

Webb A, Smith N.B. Introduction to Medical Imaging: Physics, Engineering and Clinical Applications; Cambridge University Press 2011
227-0393-10L  Bioelectronics and Biosensors  W  6 credits  2V+2U  J. Vörös, M. F. Yanik

Abstract
The course introduces bioelectricity and the sensing concepts that enable obtaining information about neurons and their networks. The sources of electrical fields and currents in the context of biological systems are discussed. The fundamental concepts and challenges of measuring bioelectric signals and the basic concepts to record optogenetically modified organisms are introduced.

Objective
During this course the students will:
- learn the basic concepts in bioelectronics including the sources of bioelectric signals and the methods to measure them
- be able to solve typical problems in bioelectronics
- learn about the remaining challenges in this field

Content
Lecture topics:
1. Introduction
2. Membrane and Transport
3-4. Action potential and Hodgkin-Huxley
5. Detection and Noise
6. Measuring currents in solutions, nanopore sensing and patch clamp pipettes
7. Measuring potentials in solution and core conductance model
8. Measuring electronic signals with wearable electronics, ECG, EEG
9. Measuring mechanical signals with bioelectronics

In vivo stimulation and recording
10. Functional electric stimulation
11. In vivo electrophysiology

Optical recording and control of neurons (optogenetics)
12. Measuring neurons optically, fundamentals of optical microscopy
13. Fluorescent probes and scanning microscopy, optogenetics, in vivo microscopy

14. Measuring biochemical signals

Lecture notes
A detailed script is provided to each lecture including the exercises and their solutions.

Literature
Plonsey and Barr, Bioelectricity: A Quantitative Approach (Third edition)

Prerequisites / notice
The course has an open attitude to the interdisciplinary approach of bioelectronics. In addition, it requires undergraduate entry-level familiarity with electric & magnetic fields/forces, resistors, capacitors, electric circuits, differential equations, calculus, probability calculus, Fourier transformation & frequency domain, lenses / light propagation / refractive index, pressure, diffusion AND basic knowledge of biology and chemistry (e.g. understanding the concepts of concentration, valence, reactants-products, etc.).

- Self-direction and Self-management

5th Semester: Third Year Additional Foundation Courses
Students complete at least two of the Additional Foundation Courses available for selection. Recommendations are available under https://ee.ethz.ch/studies/bachelor/third-year/additional-foundation-courses.html
Computational Thinking

W 4 credits 2V+1U  R. Wattenhofer

Objective

Computational thinking is about understanding machine intelligence: What is computable, and how efficiently?

Understanding computation lies at the heart of many exciting scientific, social and even philosophical developments. Computational thinking is more than programming a computer, it means thinking in abstractions. Consequently, computational thinking has become a fundamental skill for everyone, not just computer scientists. For example, functions which can easily be computed but not inverted are at the heart of understanding data security and privacy. The design of efficient electronic circuits is related to computational complexity. Machine learning on the other hand has given us fascinating new tools to teach machines how to estimate functions. Thanks to clever heuristics, machines now appear to be capable of solving complex cognitive tasks. In this class, we study various problems together with the fundamental theory of computation.

Content

Computational thinking is everywhere, but what is computational actually? In this lecture we will discuss the power and limitations of computation. Computational thinking is about understanding machine intelligence: What is computable, and how efficiently?

Understanding computation lies at the heart of many exciting scientific, social and even philosophical developments. Computational thinking is more than programming a computer, it means thinking in abstractions. Consequently, computational thinking has become a fundamental skill for everyone, not just computer scientists. For example, functions which can easily be computed but not inverted are at the heart of understanding data security and privacy. The design of efficient electronic circuits is related to computational complexity. Machine learning on the other hand has given us fascinating new tools to teach machines how to estimate functions. Thanks to clever heuristics, machines now appear to be capable of solving complex cognitive tasks. In this class, we study various problems together with the fundamental theory of computation.

The course uses Python as a programming language. Python is popular and intuitive, a programming language that looks and feels a bit like human instructions. The lecture will feature weekly exercises.

This course follows the flipped classroom paradigm. Students will self-study all important concepts by reading a chapter in the script, and by watching a few short video clips. The class meets every two weeks to answer questions, and for a quiz on the current topic.

Prerequisites / notice

This script is available here: https://disco.ethz.ch/courses/coti/

For additional Python programming experience we recommend attending the CodeJam lab: https://disco.ethz.ch/courses/codejam/

For practical deep learning experience we recommend attending the HODL lab: https://disco.ethz.ch/courses/hodl/

High-Frequency Design Techniques

W 4 credits 2V+2U C. Bolognesi, T. Popovic

Abstract

Introduction to the basics of high-frequency circuit design techniques used in the realization of high-bandwidth communication systems and devices. Modern society depends on increasingly large data masses that need to be transmitted/processed as rapidly as possible: higher carrier frequencies allow wider bandwidth channels which enable higher data transmission rates.

Objective

Familiarize students with the essential tools and principles exploited in the high-frequency design. Introduction to circuit simulation.

Content

Introduction to wireless, radio spectrum. Overview of vectors and complex numbers, AC circuit analysis, matching networks, distributed circuit design, transmission lines and transmission line equations, reflection coefficients, the Smith Chart and its software, voltage standing wave ratio (VSWR), skin effect, matrix analysis, scattering parameters, electromagnetic fields and waves, amplifier design. Hands-on experience with measurement equipment.

Introduction to Electric Power Transmission: System & Technology

W 4 credits 4G C. Franck, G. Hug

Abstract

A detailed script is provided for each lecture, including the exercises and their solutions.
Abstract
Introduction to theory and technology of electric power transmission systems.

Objective
At the end of this course, the student will be able to: describe the structure of electric power systems, name the most important components and describe what they are needed for, apply models for transformers and overhead power lines, explain the technology of lines, know about electrical safety, calculate electric withstand strength of gas gaps, stationary power flows and other basic parameters in simple power systems.

Content
Structure of electric power systems, transformer and power line models, analysis of and power flow calculation in basic systems, technology and principle of electric power systems.

Lecture notes
Lecture script in English, exercises and sample solutions.

Abstract
Discovering Management offers an introduction to the field of business management and entrepreneurship for engineers and natural scientists. By taking this course, students will enhance their understanding of management principles and the tasks that entrepreneurs and managers deal with. The course consists of theory and practice sessions, presented by a set of area specialists at D-MTEC.

Objective
The general objective of Discovering Management is to introduce students into the field of business management and entrepreneurship.

In particular, the aims of the course are to:
(1) broaden understanding of management principles and frameworks
(2) advance insights into the sources of corporate and entrepreneurial success
(3) develop skills to apply this knowledge to real-life managerial problems

The course will help students to successfully take on managerial and entrepreneurial responsibilities in their careers and / or appreciate the challenges that entrepreneurs and managers deal with.

Content
The course consists of a set of theory and practice sessions, which will be taught on a weekly basis. The course will cover business management knowledge in corporate as well as entrepreneurial contexts.

The course consists of three blocks of theory and practice sessions: Discovering Strategic Management, Discovering Innovation Management, and Discovering HR and Operations Management. Each block consists of two or three theory sessions, followed by one practice session where you will apply the theory to a case.

The theory sessions will follow a "lecture-style" approach and be presented by an area specialist within D-MTEC. Practical examples and case studies will bring the theoretical content to life. The practice sessions will introduce you to some real-life examples of managerial or entrepreneurial challenges. During the practice sessions, we will discuss these challenges in depth and guide your thinking through team coaching.

Through small group work, you will develop analyses of each of the cases. The theory sessions will be assessed via a multiple choice exam.

Lecture notes
All course materials (readings, slides, videos, and worksheets) will be made available to inscribed course participants through Moodle. These course materials will form the point of departure for the lectures, class discussions and team work.
This course is offered complementary to the basis course 351-0778-00L, "Discovering Management". The course offers an additional introduction to microeconomic thinking. Based on the fundamental principles of economic analysis (optimization and equilibrium), the focus lies on understanding key economic concepts relevant for understanding and analyzing the economic behavior of firms and consumers in the context of markets. Market demand and supply are derived from the individual decision-making of economic agents and market outcomes under different assumptions about the market structure and market power (perfect competition, monopoly, oligopoly, game theory) are studied. This introductory course aims at providing essential knowledge from the fields of Economics and Management relevant for economic decision-making in the context of both the private and public sector.

Discovering Management (Exercises) thus focuses on developing the skills and competences to apply management theory to a real-life exercise from practice. Students have the option to either do this alone or in a group of two students.

All course materials (readings, slides, videos, and worksheets) will be made available to inscribed course participants through Moodle. Students following this course should also be enrolled for course 351-0778-00L, "Discovering Management".

Prerequisite: Participation and successful completion of the module Discovering Management (351-0778-00L) is mandatory.

The general objective of Discovering Management (Exercises) is to complement the course "Discovering Management" with one larger additional exercise.

The objective of this course is to provide an introduction to microeconomic thinking. Based on the fundamental principles of economic analysis (optimization and equilibrium), the focus lies on understanding key economic concepts relevant for understanding and analyzing economic behavior of firms and consumers in the context of markets. Market demand and supply are derived from the individual decision-making of economic agents and market outcomes under different assumptions about the market structure and market power (perfect competition, monopoly, oligopoly, game theory) are studied. This introductory course aims at providing essential knowledge from the fields of Economics and Management relevant for economic decision-making in the context of both the private and public sector.

851-0703-00L Introduction to Law
W 2 credits 2V O. Streiff Gnöpff

Abstract
This class introduces students into basic features of the legal system. Fundamental issues of constitutional law, administrative law, private law and the law of the EU are covered. The focus is on legal problems related to space. Active participation is expected in short interactive sequences.

Objective
Students are able to identify basic structures of the legal system. They understand selected topics of public and private law. They are able to apply the fundamentals in more advanced law classes and to recognize the relevance of law in their own field.

Content
Basic concepts of law, sources of law.
Private law: Contract law (particularly contract for work and services), tort law, property law.
Public law: Human rights, administrative law, procurement law, procedural law.
Insights into the law of the EU.

851-0735-10L Startups and Law
Particularly suitable for students of D-ITET, D-MAVT.
W 2 credits 2V P. Peyrot

Abstract
The students shall obtain a basic knowledge about the legal environment of entrepreneurs. They shall be able to recognize and evaluate legal issues connected to an entrepreneurial activity and suggest possible solutions.

Objective
- They shall obtain a working knowledge on the legal aspects involved in setting up and managing an enterprise.
- They shall be able to contribute to the legal management of the company and to discuss legal issues.
- They shall have an understanding of the law as a part of the corporate strategy and as a valuable resource of the company.

Lecture notes
A comprehensive script will be made available online on the moodle platform.

851-0738-01L The Role of Intellectual Property in the Engineering and Technical Sector
Particularly suitable for students of D-BAUG, D-BIOL, D-BSSE, D-CHAB, D-ITET, D-MAVT.
W 2 credits 2V K. Housshang Pour Islam

Abstract
The lecture gives an overview of the fundamental aspects of intellectual property, which plays an important role in the daily routine of engineers and scientists. The lecture aims to make participants aware of the various methods of protection and to put them in a position to use this knowledge in the workplace.

Data: 06.08.2024 12:40 Autumn Semester 2024 Page 966 of 2684
Objective
In recent years, knowledge about intellectual property has become increasingly important for engineers and scientists. Both in production and distribution and in research and development, they are increasingly being confronted with questions concerning the patenting of technical inventions and the use of patent information.

The lecture will acquaint participants with practical aspects of intellectual property and enable them to use the acquired knowledge in their future professional life.

Topics covered during the lecture will include:
- The importance of innovation in industrialised countries
- An overview of the different forms of intellectual property
- The protection of technical inventions and how to safeguard their commercialisation
- Patents as a source of technical and business information
- Practical aspects of intellectual property in day-to-day research, at the workplace and for the formation of start-ups.

Case studies will illustrate and deepen the topics addressed during the lecture.

The seminar will include practical exercises on how to use and search patent information. Basic knowledge of how to read and evaluate patent documents as well as how to use publicly available patent databases to obtain the required patent information will also be provided.

Prerequisites / notice
The lecture addresses students in the fields of engineering, science and other related technical fields.

</tbody>
</table>
Content
- Fundamentals in magnetic circuits and electromechanical energy conversion.
- Force and torque calculation.
- Operating principles, magnetic and electric modelling and design of different electric machine concepts: DC machine, AC machines (permanent magnet synchronous machine, reluctance machine and induction machine).
- Complex space vector notation, rotating coordinate system (dq-transformation).
- Loss components in electric machines, scaling laws of electromechanical actuators.
- Mechanical and thermal modelling.

Abstract
Maxwell’s equations are reinterpreted in the framework of Einstein’s special relativity theory using the Lagrangian formalism in order to discover the deep interconnection between the electric and magnetic field. Its daily relevance is emphasized by pinpointing how GPS atomic clocks in satellites and on the earth are affected by frequency shifts which can be explained only in terms of relativity.

Objective
D-ITET is the depository of the Maxwell’s equations, which are dissected from all perspectives in the courses Physics I, Electromagnetic Fields and Waves, and Advanced Electromagnetic Waves.

Not only its elegance, but also the daily importance of the relativity theory will be finally highlighted explaining how the GPS can work only if the relativistic view of synchronous clocks is taken into account.

Content
- Galileo-Newton, the Ether, Michelson-Morley’s Experiment
- Lorentz Transformations
- 4-Vectors in Minkowski’s Spacetime: Tensor Formalism
- The Lagrangian, the Principle of Stationary Action for Particles and Fields, Noether's Theorem
- Maxwell’s Equations and the Energy-Momentum Tensor
- Waves
- Radiation from Accelerated Charged Particles
- Sagnac's Effect
- GPS

Lecture notes
No lecture notes because the proposed textbooks together with the provided supplementary material are more than exhaustive!

Literature
• (Special Relativity) L. Susskind and A. Friedman, "Special Relativity and Classical Field Theory: The Theoretical Minimum", 2019, Hachette Book Group USA
• (Lagrangian Formalism) L. Susskind and G. Hrabovsky, "Theoretical Minimum: What You Need to Know to Start Doing Physics", 2014, Hachette Book Group USA

Supplementary material will be uploaded in Moodle.

Prerequisites / notice
Furthermore, a solid base of Analysis I & II as well as of Linear Algebra is really helpful.
In the fall semester 2024 we will focus on applying artificial intelligence (AI) and extended reality (XR) to the circular design workflow and.

All the materials will be posted on the course website: https://safari.ethz.ch/architecture_seminar/

The main objective is to learn how to rigorously analyze and present papers and ideas on computer architecture. We will have rigorous presentation and discussion of selected papers during lectures and a written report delivered by each student at the end of the semester. This course is for those interested in computer architecture. Registered students are expected to attend every lecture, participate in the discussion, and create a synthesis report at the end of the course.

Topics will center around computer architecture. We will, for example, discuss papers on hardware security; new execution paradigms like processing in memory; architectural acceleration mechanisms for key applications like machine learning, graph processing and bioinformatics; memory systems; interconnects; various fundamental and emerging paradigms in computer architecture; hardware/software co-design and cooperation; fault tolerance; energy efficiency; heterogeneous and parallel systems; technology scaling; new execution models, etc.

See https://safari.ethz.ch/architecture_seminar for past examples.

All the materials will be posted on the course website: https://safari.ethz.ch/architecture_seminar/

Links to past course materials, including the synthesis report assignment, can be found in this page: https://safari.ethz.ch/architecture_seminar

Key papers and articles, on both fundamentals and cutting-edge topics in computer architecture will be provided and discussed. These will be posted on the course website.

See https://safari.ethz.ch/architecture_seminar for past examples.

Digital Design and Computer Architecture OR Digital Circuits / Computer Engineering

Students should (1) have done very well in Digital Design and Computer Architecture, Digital Circuits or a similar course and (2) show a genuine interest in Computer Architecture.

The course is for those interested in computer architecture. Registered students are expected to attend every lecture, participate in the discussion, and create a synthesis report at the end of the course.

This course is for those interested in computer architecture. Registered students are expected to attend every lecture, participate in the discussion, and create a synthesis report at the end of the course.

Please only register for the course if you really intend to participate on all course dates (see course catalog), otherwise, you will deprive someone else of a place.

The course is about digital innovation towards a circular economy in the built environment. How can we bring together two worlds that are often too distinct: low-impact construction and digital innovation? Bringing digital tools already used in other sectors into the construction sector, students will learn about circular construction (e.g., reuse of materials) through hands-on learning practices.

The course will be taught at the Kunsthalle Zurich as part of an exhibition.

In the fall semester 2024 we will focus on applying artificial intelligence (AI) and extended reality (XR) to the circular design workflow and.

1. Enroll before 05.09.2024
2. Send a short motivation letter (max. 300 words) and a 1-page CV to cea-course@ibi.baug.ethz.ch by 05.09.2024
3. MIBS students: This course is mandatory and there is no need to send your application documents

Please only register for the course if you really intend to participate on all course dates (see course catalog), otherwise, you will deprive someone else of a place.

The course will be taught at the Kunsthalle Zurich as part of an exhibition.

1. Apply circular principles using recovered building materials.
2. Compare different digital technologies applied in circular construction (e.g., LiDARscanning, drone imagery, photogrammetry, computational design, AI, computer vision, XR, LCA tools etc.)
3. Understand the potential and limitations of AI for circular construction, e.g, use machine learning to detect and digitize materials (computer vision) or to support creativity in the early design phases of circular construction (generative AI).
4. Communicate the importance and urgency of circular construction.
5. Assess the environmental impact implications of their design and technology decisions through a preliminary Life Cycle Assessment (LCA).
Content

Students will receive an introduction to circular principles by experts from the building industry and visit of (de-)construction sites where circular construction is exemplified. They will explore how to use digital technologies such as LiDAR scanning, photogrammetry, scan-to-BIM, computer vision, computational design, digital fabrication, blockchain technology and learn about the design implications using reclaimed building materials. This course is meant as an overview/introduction of many digital technologies that could be useful for circularity and gives the tools to students to further study the technologies they are most interested in on their own. Creativity in writing, filmmaking, design, construction, etc. is expected from the students. This course will give the tools to students to learn more on LCA if they wish to deepen their knowledge further.

Lecture notes

Language: English
Courses are on Tuesday afternoons in Kunsthalle or a room at ETH, but also require out-of-the-semester work and significant homework and site visits outside of class hours.

Literature

Prerequisites / notice

Interest in Digitalisation and Construction. Flexibility: This is a hands-on course, where students explore digital technologies and opportunities/challenges of reuse. Flexibility (e.g. adapting to unforeseen circumstances), responsibility (e.g. arriving on time for safety briefing), and spontaneity (e.g. finding innovative solutions) is expected from the students to adapt to the contingencies from demolition and construction sites with reused materials. The course is mandatory for MIBS students. If you are a first year MIBS student, please do not apply, you are automatically accepted. All other students from other departments should apply. Please only register for the course if you really intend to participate on all course dates (see course catalog). Please only register for the course if you are willing to send us a letter of motivation and really intend to participate; otherwise, you will deprive someone else of a place. All non-MIBS students who register go onto a waiting list until 11.09.2024 and up to 25 of them will be selected by the lecturer.

To register:
1. Enroll before 05.09.2024.
2. Send a short letter of motivation (max. 300 words) and a 1-page CV to cea-course@ibi.baug.ethz.ch by 05.09.2024.

Collaborators: Kunsthalle Zürich, ETH AI Center, Design++

151-0723-00L Manufacturing of Electronic Devices W 4 credits 3G A. Kunz, R.-D. Moryson, F. Reichert

Abstract
The lecture follows the value added process sequence of electric and electronic components. It contains: Development of electric and electronic circuits, design of electronic circuits on printed circuit boards as well as in hybrid technology, integrated test technology, planning of production lines, production of highly integrated electronic on a wafer as well as recycling.

Objective
Knowledge about the value added process sequence for electronics manufacturing, planning of electric and electronic product as well as their production, planning of production lines, value added process sequence for photovoltaics.

Content
Nothing works without electronics! Typical products in mechanical engineering such as machine tools, as well as any kind of vehicle contain a significant amount of electronic or electronic components of more than 60%. Thus, it is important to master the value added process sequence for electric and electronic components.

The lecture starts with a brief introduction of electronic components and the planning of integrated circuits. Next, an overview will be provided about electronic functional units assembled from these electronic components, on printed circuit boards as well as in hybrid technology. Value added process steps are shown as well as their quality check and their combination for planning a complete manufacturing line. The lecture further describes the manufacturing of integrated circuits, starting from the wafer via the structuring and bonding to the packaging. As an example, the manufacturing of micro-electromechanic and electro-optical systems and actuators is described. Due to similar processes in the electronic production, the value added process sequence for photovoltaics will described too.

The lecture concludes with an excursion to a large manufacturing company. Here, students can see the application and realization of the manufacturing of electric and electronic devices.

Lecture notes
Lecture notes are handed out during the individual lessons.

Prerequisites / notice
The lecture is partly given by experts from industry.
It is supplemented by an excursion to one of the industry partners.

**W 6 credits 3V+2U**

M. Haluska, C. Hierold

**Abstract**

Students are introduced to the fundamentals of semiconductors, the basics of micromachining and silicon process technology and will learn about the fabrication of microsystems and devices by a sequence of defined processing steps (process flow).

**Objective**

Students are introduced to the basics of micromachining and silicon process technology and will understand the fabrication of microsystem devices by the combination of unit process steps (= process flow).

**Content**

- Introduction to microsystems technology (MST) and micro electro mechanical systems (MEMS)
- Basic silicon technologies: Thermal oxidation, photolithography and etching, diffusion and ion implantation, thin film deposition.
- Specific microsystems technologies: Bulk and surface micromachining, dry and wet etching, isotropic and anisotropic etching, beam and membrane formation, wafer bonding, thin film mechanical properties.

Application of selected technologies will be demonstrated on case studies.

**252-0834-00L Information Systems for Engineers**

**W 4 credits 2V+1U**

G. Fourny

**Abstract**

This course provides the basics of relational databases from the perspective of the user.

**Objective**

Do you want to be able to query your own data productively and efficiently in your future semester projects, bachelor's thesis, master thesis, or PhD thesis? Are you looking for something beyond the Python+Pandas hype? This course teaches you how to do so as well as the dos and don'ts.

This lesson is complementary with Big Data for Engineers as they cover different time periods of database history and practices -- you can take them in any order, even though it might be more enjoyable to take this lecture first.

After visiting this course, you will be capable to:

1. Explain, in the big picture, how a relational database works and what it can do in your own words.
2. Explain the relational data model (tables, rows, attributes, primary keys, foreign keys), formally and informally, including the relational algebra operators (select, project, rename, all kinds of joins, division, cartesian product, union, intersection, etc).
3. Perform non-trivial reading SQL queries on existing relational databases, as well as insert new data, update and delete existing data.
4. Design new schemas to store data in accordance to the real world's constraints, such as relationship cardinality
5. Explain what bad design is and why it matters.
6. Adapt and improve an existing schema to make it more robust against anomalies, thanks to a very good theoretical knowledge of what is called "normal forms".
7. Understand how indices work (hash indices, B-trees), how they are implemented, and how to use them to make queries faster.
8. Access an existing relational database from a host language such as Java, using bridges such as JDBC.
9. Explain what data independence is all about and didn't age a bit since the 1970s.
10. Explain, in the big picture, how a relational database is physically implemented.
11. Know and deal with the natural syntax for relational data, CSV.
12. Explain the data cube model including slicing and dicing.
13. Store data cubes in a relational database.
14. Map cube queries to SQL.
15. Slice and dice cubes in a UI.

And of course, you will think that tables are the most wonderful object in the world.
Content

Using a relational database

1. Introduction
2. The relational model
3. Data definition with SQL
4. The relational algebra
5. Queries with SQL

Taking a relational database to the next level

6. Database design theory
7. Databases and host languages
8. Databases and host languages
9. Indices and optimization
10. Database architecture and storage

Analytics on top of a relational database

12. Data cubes

Outlook

13. Outlook

Literature

- Lecture material (slides).
  (It is not required to buy the book, as the library has it)

Prerequisites / notice

The lecture is hybrid, meaning you can attend with us in the lecture hall, or on Zoom, or watch the recordings on YouTube later. Exercise sessions are in presence.

For non-CS/DS students only, BSc and MSc
Elementary knowledge of set theory and logics
Knowledge as well as basic experience with a programming language such as Pascal, C, C++, Java, Haskell, Python

</tbody>
</table>

Abstract

In general the course explains the main principles of air transport and elaborates on simple interdisciplinary topics. Working on broad 14 different topics like aerodynamics, manufacturers, airport operations, business aviation, business models etc. the students get a good overview in air transportation.

The program is taught in English and we provide 11 different experts/lecturers.

Objective

The goal is to understand and explain basics, principles and contexts of the broader air transport industry. Further, we provide the tools for starting a career in the air transport industry. The knowledge may also be used for other modes of transport. Ideal foundation for Aviation II - Management of Air Transport.

Content

Weekly: 1h independent preparation; 2h lectures and 1 h training with an expert in the respective field

Concept: This course will be taught as Aviation I. A subsequent course - Aviation II - covers the "Management of Air Transport".

Content: Transport as part of the overall transportation scheme; Aerodynamics; Aircraft (A/C) Designs & Structures; A/C Operations; Aviation Law; Maintenance & Manufacturers; Airport Operations & Planning; Aviation Security; ATC & Airspace; Air Freight; General Aviation; Business Jet Operations; Business models within Airline Industry; Military Aviation.

Technical visit: This course includes a guided tour at Zurich Airport and Dubendorf Airfield (baggage sorting system, apron, Tower & Radar Simulator at Skyguide Dubendorf).

Lecture notes and Literature

Preparation materials & slides are provided prior to each class

Bachelor's Project
The Bachelor's Thesis is the final part of the bachelor's program and should therefore only be taken in the semester in which the bachelor's diploma is acquired.

The minimum requirement for enrollment is the successful completion of:
- basic examination (examination blocks A+B) and
- subjects of the second year (examination blocks 1-3)

Number Title Type ECTS Hours Lecturers
227-0100-00L Bachelor's Thesis O 12 credits 26D Supervisors

During the Bachelor's Thesis, students will gain initial experience in the independent solution of a technical-scientific problem by applying the acquired specialist and social skills. A Bachelor's Thesis should take about half of a student's time during one semester, i.e., about 300-400 hours. The thesis includes an oral presentation and a written report, and it is graded.
Prerequisites / notice

A 14 week long Bachelor's Thesis is the final part of the bachelor's program and shall therefore be taken during the semester in which the bachelor's diploma is acquired.

The minimum requirement for enrollment is the successful completion of:
- basic examination (examination blocks A+B)
- subjects of the second year (examination blocks 1-3)

Supervisor must be a professor at D-ITET or associated, see a link to the lists of those at https://ee.ethz.ch/studies/bachelor/third-year/bachelor-project.html

**Abstract**

This four-hour course covers the basics of writing and presenting scientific work. The focus lies on the structure and the main elements of a scientific text. Formatting guidelines, citation rules, good practice of scientific writing and hints to convince the audience are part of the course.

**Objective**

- You can write scientific texts using the correct structure
- You can convincingly present scientific work
- You can differentiate the scientific style from novels and news
- You can adhere to citation rules and scientific integrity

**Content**

The block course covers the following topics:
- Structure of Scientific Texts
- Structure of Scientific Presentations
- Formatting of Scientific Elements (figures, equations, tables)
- Citation Rules and Scientific Integrity

The lecture will be given in two parts on two afternoons. Some exercises will be built into the lecture.

**Literature**

Scientific Integrity, see https://ethz.ch/en/research/ethics-and-animal-welfare/research-integrity.html

**Prerequisites / notice**

You should be writing either a bachelor/semester/master thesis or a scientific publication in the immediate future.

European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
Cognitively Activating Instructions in MINT Subjects

In this class, students will learn concepts and skills for coping with psychosocial demands of teaching.

> Educational Science

General course offerings in the category Educational Science are listed under "Programme: Educational Science for Teaching Diploma and TC". Please note that the course unit number will change as of HS24. This change has no influence on the course units and achievements completed so far and will be recognized for the respective degree.

**Abstract**

This lecture is only apt for students who intend to enrol in the programs "Teaching Diploma" or "Teaching Certificate". It is about learning in childhood and adolescence.

**Objective**

Anyone who wishes to become a successful teacher must first of all understand the learning process. Against this background, theories and findings on the way humans process information and on human behaviour are prepared in such a manner that they can be used for planning and conducting lessons.

**Content**

This course looks into scientific theories and also empirical studies on human learning and relates them to the school.

**Prerequisites / notice**

**Abstract**

In this class, students will learn concepts and skills for coping with psychosocial demands of teaching.

**Objective**

Students possess theoretical knowledge and practical competences to be able to cope with the psychosocial demands of teaching.

**Prerequisites / notice**

(1) They know relevant rules of conversation and conflict management and are able to apply them in an appropriate way in the school context (e.g. in parental talks).
(2) They know core aspects of classroom management and know how to apply it concretely (e.g. promoting a positive learning atmosphere, avoiding disciplinary difficulties) and they are aware of possible contacts (e.g. illegal or psychological services).

**Abstract**

This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)".

**Objective**

This seminar focuses on teaching units in chemistry, physics and mathematics that have been developed at the MINT Learning Center of the ETH Zurich. In the first meeting, the mission of the MINT Learning Center will be communicated. Furthermore, in groups of two, the students will intensively work on, refine and optimize a teaching unit following a goal set in advance.

**Prerequisites / notice**

Für eine reibungslose Semesterplanung wird um frühe Anmeldung und persönliches Erscheinen zum ersten Lehrveranstaltungstermin ersucht.

| Number     | Formation of Knowledge in STEM Fields in Primary and Secondary School | Type | ECTS | Hours | Lecturers       |

**Abstract**

Adresses to students enrolled either in Teaching Diploma* (TD) or Teaching Certificate (TC) (excluding Teaching Diploma Sport).

**Objective**

- Understanding of research methods used in the empirical human sciences
- Getting to know intelligence tests
- Understanding findings relevant for education

---
Subject Didactics and Professional Training

Important: You can only enroll in the courses of this category if you have not more than 12 CP left for possible additional requirements.

Number  Title  Type  ECTS  Hours  Lecturers
227-0857-00L  Subject Didactics I for D-MAVT and D-ITET  O  4 credits  3G  Q. Lohmeyer, R. Büchi

Abstract
Didactics I focuses on teaching techniques as building blocks of typical lessons. This is done on the basis of the findings of teaching and learning research and their implementation in practice. The aim is the planning and implementation of effective teaching sequences as well as

Objective
- The students can plan, conduct and critically reflect single lessons.
- They orient themselves towards the academic goals and take into account existing knowledge, the professional environment and the ambitions of the students.
- They can apply the basic teaching principles meaningfully in their subject and suitably structure the learning phases.
- They can reduce and present complex technical content such that it is in a form suitable for the students to learn.
- They have considered examples of the common conceptual errors encountered by students

Content
- Planning a teaching unit
- Opening a lecture
- Direct Instruction
- Embedded exercises
- Learning objectives
- Practicing teaching
- Excursion Fachhochschule

Lecture notes
Lecture materials are provided via Moodle.

Prerequisites / notice
Prerequisite: Educational science course already completed or at the same time.

Competencies
- Subject-specific Competencies
  - Concepts and Theories
  - Techniques and Technologies
- Method-specific Competencies
  - Analytical Competencies
  - Media and Digital Technologies
  - Project Management
- Social Competencies
  - Communication
  - Customer Orientation
  - Leadership and Responsibility
- Personal Competencies
  - Critical Thinking
  - Self-awareness and Self-reflection

227-0859-10L  Teaching Internship Including Examination Lessons  O  6 credits  13P  R. Büchi

Abstract
The teaching internship can just be visited if all other courses of TC are completed. Repetition of the teaching internship is excluded even if the examination lessons are to be repeated.

Objective
- Students apply the insights, abilities and skills they have acquired within the context of an educational institution. They observe 10 lessons and teach 20 lessons independently. Two of them are as assessed as Examination Lessons.

- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics for their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They learn the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils' work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

Lecture notes
Dokument: schriftliche Vorbereitung für Prüfungslektionen.

Wird von der Praktikumslehrperson bestimmt.

227-0854-00L  Mentored Work Subject Didactics Electrical Engineering and Information Technology

Prerequisites: successful completion of FD I and FD II

Abstract
In their mentored work on subject didactics, students put into practice the contents of the subject-didactics lectures and go into these in greater depth. Under supervision, they compile tuition materials that are conducive to learning and/or analyse and reflect on certain topics from a subject-based and pedagogical angle.

Objective
The objective is for the students:
- to be able to familiarise themselves with a tuition topic by consulting different sources, acquiring materials and reflecting on the relevance of the topic and the access they have selected to this topic from a specialist, subject-didactics and pedagogical angle and potentially from a social angle too.
- to show that they can independently compile a tuition sequence that is conducive to learning and develop this to the point where it is ready for use.

Content

Der abzuliefernde Bericht hat sich an die Richtlinien der vorhandenen Manuals aus den IfV zu halten. Er ist in zwei Teilen zu erstellen, für Studenten/(Benützer), und für den Dozenten/(Entwickler) getrennt.

Typisch soll die Arbeit 3 - 4 Unterrichts-Einheiten à 45 Minuten abdecken (bei Einzelarbeit), bei Arbeit zu zweit mindestens 6 solche Einheiten.

Prerequisites / notice
Die Arbeit sollte vor Beginn des Praktikums abgeschlossen werden.

Lecturers fostered

After attending the lectures, participating in the exercise sessions, and working on the homework problems (which include MATLAB coding), you will gain a deep understanding of the fundamental topics of digital signal processing, with a bias towards applications in communications. The course starts with the basics of linear systems and filters and then progresses to topics such as the discrete Fourier transform, probability, random variables, and discrete-time stochastic processes. The second part of the course covers the fundamentals of all important optical and optoelectronic components in a fiber communication system, including the transmitter, the fiber channel, and the receiver with the electronic digital signal processing elements.

Lecture notes will be distributed electronically at the beginning of the semester. Lecture notes will be assessed electronically at the beginning of the semester. Prerequisites / notice

227-0417-00L Information Theory I

Abstract

This course covers the basic concepts of information theory and of communication theory. Topics covered include the entropy rate of a source, mutual information, typical sequences, the asymptotic equi-partition property, Huffman coding, channel capacity, the channel coding theorem, the source-channel separation theorem, and feedback capacity.

Objective

The fundamentals of Information Theory including Shannon's source coding and channel coding theorems

Content

The entropy rate of a source, Typical sequences, the asymptotic equi-partition property, the source coding theorem, Huffman coding, Arithmetic coding, channel capacity, the channel coding theorem, the source-channel separation theorem, feedback capacity

Literature

227-0102-00L Discrete Event Systems W 6 credits 4G L. Vanbever, L. Josipovic, B. Keller, R. Wattenhofer

Abstract

Introduction to discrete event systems. We start out by studying popular models of discrete event systems. Then we analyze discrete event systems from an average-case and from a worst-case perspective, and study verification. Topics include: Automata and Languages, Specification Models, Stochastic Discrete Event Systems, Worst-Case Event Systems, Verification, Petri Nets.

Objective

Over the past few decades the rapid evolution of computing, communication, and information technologies has brought about the proliferation of new dynamic systems. A significant part of activity in these systems is governed by operational rules designed by humans. The dynamics of these systems are characterized by asynchronous occurrences of discrete events, some controlled (e.g. hitting a keyboard key, sending a message), some not (e.g. spontaneous failure, packet loss).

The mathematical arsenal centered around differential equations that has been employed in systems engineering to model and study processes governed by the laws of nature is often inadequate or inappropriate for discrete event systems. The challenge is to develop new modeling frameworks, analysis techniques, design tools, testing methods, and optimization processes for this new generation of systems.

In this lecture we give an introduction to discrete event systems. We start out the course by exploring the limits of what is computable and what is not. In doing so, we will consider three distinct models of computation which are often used to model discrete event systems: finite automata, push-down automata and Turing machines (ranked in terms of expressiveness power). In the second part of the course we analyze discrete event systems. We first examine discrete event systems from an average-case perspective: we model discrete events as stochastic processes, and then apply continuous time markov chains and queueing theory for an understanding of the typical behavior of a system. Then we analyze discrete event systems from a worst-case perspective using the theory of online algorithms and adversarial queueing. In the last part of the course we introduce methods that allow to formally verify certain properties of Finite Automata and Petri Nets. These are some typical analysis questions we will look at: Do two given systems behave the same? Does a given system behave as intended? Does the system eventually enter a dangerous state?

Content

1. Regular Languages
2. Non-Regular Languages
3. Markov Chains
4. Stochastic Discrete Event Systems
5. Worst-Case Event Systems
6. Verification of Finite Automata
7. Petri Nets

**227-0116-00L**

- VLSI 1: HDL Based Design for FPGAs
  W 6 credits 5G

**Abstract**

This first course in a series that extends over three consecutive terms is concerned with tailoring algorithms and with devising high performance hardware architectures for their implementation as ASIC or with FPGAs. The focus is on front end design using HDLs and automatic synthesis for producing industrial-quality circuits.

**Objective**

Understand Very-Large-Scale Integrated Circuits (VLSI chips), Application-Specific Integrated Circuits (ASIC), and Field-Programmable Gate-Arrays (FPGA). Know their organization and be able to identify suitable application areas. Become fluent in front-end design from architectural conception to gate-level netlists. How to model digital circuits with SystemVerilog. How to ensure they behave as expected with the aid of simulation, testbenches, and assertions. How to take advantage of automatic synthesis tools to produce industrial-quality VLSI and FPGA circuits. Gain practical experience with the hardware description language SystemVerilog and with industrial Electronic Design Automation (EDA) tools.
This course provides a foundation in analog integrated circuit design based on bipolar and CMOS technologies. Handouts of presented slides. No script but an accompanying textbook is recommended.

This third course in our VLSI series is concerned with full-custom digital integrated circuits. The goals include learning the design of digital circuits on the schematic, layout, gate, and register-transfer levels. The use of state-of-the-art CAD software (Cadence Virtuoso) in order to simulate, optimize, and characterize digital circuits is another important topic of this course.

The third VLSI course begins with the basics of metal-oxide-semiconductor (MOS) field-effect transistors (FETs) and moves up the stack towards logic gates and increasingly complex digital circuit structures. The topics of this course include:

- Nanometer MOSFETs
- Static and dynamic behavior of complementary MOS (CMOS) inverters
- CMOS gate design, sizing, and timing
- Full-custom standard-cell design
- Wire models and parasitics
- Latch and flip-flop circuits
- Gate-level timing analysis and optimization
- Static and dynamic power consumption; low-power techniques
- Alternative logic styles (dynamic logic, pass-transistor logic, etc.)
- Arithmetic and logic circuits
- Fixed-point and floating-point arithmetic
- Synchronous and asynchronous design principles
- Memory circuits (ROM, SRAM, and DRAM)
- In- and near-memory processing architectures
- Full-custom accelerator circuits for machine learning

The exercises are concerned with schematic entry, layout, and simulation of digital integrated circuits using a disciplined standard-cell-based approach with Cadence Virtuoso.

Further details: https://iis-students.ee.ethz.ch/lectures/vlsi-i/

Abstract
This third course in our VLSI series is concerned with full-custom digital integrated circuits. The goals include learning the design of digital circuits on the schematic, layout, gate, and register-transfer levels. The use of state-of-the-art CAD software (Cadence Virtuoso) in order to simulate, optimize, and characterize digital circuits is another important topic of this course.

Objective
At the end of this course, you will
- understand the design of the main building blocks of state-of-the-art digital integrated circuits
- be able to design and optimize digital integrated circuits on the schematic, layout, and gate levels
- be able to use standard industry software (Cadence Virtuoso) for drawing, simulating, and characterizing digital circuits
- understand the performance trade-offs between delay, area, and power consumption

Content
The third VLSI course begins with the basics of metal-oxide-semiconductor (MOS) field-effect transistors (FETs) and moves up the stack towards logic gates and increasingly complex digital circuit structures. The topics of this course include:

- Nanometer MOSFETs
- Static and dynamic behavior of complementary MOS (CMOS) inverters
- CMOS gate design, sizing, and timing
- Full-custom standard-cell design
- Wire models and parasitics
- Latch and flip-flop circuits
- Gate-level timing analysis and optimization
- Static and dynamic power consumption; low-power techniques
- Alternative logic styles (dynamic logic, pass-transistor logic, etc.)
- Arithmetic and logic circuits
- Fixed-point and floating-point arithmetic
- Synchronous and asynchronous design principles
- Memory circuits (ROM, SRAM, and DRAM)
- In- and near-memory processing architectures
- Full-custom accelerator circuits for machine learning

The exercises are concerned with schematic entry, layout, and simulation of digital integrated circuits using a disciplined standard-cell-based approach with Cadence Virtuoso.

Further details: https://iis-students.ee.ethz.ch/lectures/vlsi-i/

227-0166-00L  Analog Integrated Circuits  W  6 credits  4G  T. Jang

Abstract
This course provides a foundation in analog integrated circuit design based on bipolar and CMOS technologies.

Objective
Integrated circuits are responsible for much of the progress in electronics in the last 50 years, particularly the revolutions in the Information and Communications Technologies we witnessed in recent years. Analog integrated circuits play a crucial part in the highly integrated systems that power the popular electronic devices we use daily. Understanding their design is beneficial to both future designers and users of such systems.

The basic elements, design issues and techniques for analog integrated circuits will be taught in this course.

Content
Review of bipolar and MOS devices and their small-signal equivalent circuit models; Building blocks in analog circuits such as current sources, active load, current mirrors, supply independent biasing etc; Amplifiers: differential amplifiers, cascode amplifier, high gain structures, output stages, gain bandwidth product of op-amps; stability; comparators; second-order effects in analog circuits such as mismatch, noise and offset; data converters; frequency synthesizers; switched capacitors.

The exercise sessions aim to reinforce the lecture material by well guided step-by-step design tasks. The circuit simulator SPECTRE is used to facilitate the tasks. There is also an experimental session on op-amp measurements.

</table>
This course aims at offering a self-contained account of computer vision and its underlying concepts, including the recent use of deep learning. The first part starts with an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First the interaction of light with matter is considered. The most important hardware components such as cameras and illumination sources are also discussed. The course then turns to image discretization, necessary to process images by computer. The next part describes necessary pre-processing steps, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and 3D shape as two important examples. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed. A major part at the end is devoted to deep learning and AI-based approaches to image analysis. Its main focus is on object recognition, but also other examples of image processing using deep neural nets are given.

### Content

**Prerequisites**
- Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Python and Linux.
- The course language is English.

**227-0468-00L Analog Signal Processing and Filtering**

**Abstract**

This lecture provides a wide overview over analog filters (continuous-time and discrete-time), signal-processing systems, and sigma-delta conversion, and gives examples with sensor interfaces and class-D audio drivers. All systems and circuits are treated using a signal-flow view. The lecture is suitable for both analog and digital designers. The way the exam is done allows for the different interests of the two groups.

The learning goal is that the students can apply signal-flow graphs and can understand the signal flow in such circuits and systems (including non-ideal effects) well enough to gain an understanding of further circuits and systems by themselves.

**Objective**

At the beginning, signal-flow graphs in general and driving-point signal-flow graphs in particular are introduced. We will use them during the whole term to analyze circuits on a system level (analog continuous-time, analog discrete-time, mixed-signal and digital) and understand how signals propagate through them. The theory and CMOS implementation of active Filters is then discussed in detail using the example of Cm-C filters and active-RC filters. The ideal and nonideal behaviour of opamps, current conveyors, and inductor simulators follows. The link to the practical design of circuits and systems is done with an overview over different quality measures and figures of merit used in scientific literature and datasheets. Finally, an introduction to discrete-time and mixed-domain filters and circuits is given, including sensor read-out amplifiers, correlated double sampling, and chopping, and an introduction to sigma-delta A/D and D/A conversion on a system level.

This lecture does not go down to the details of transistor implementations. The lecture "227-0166-00L Analog Integrated Circuits" complements This lecture very well in that respect.

**Lecture notes**

The base for these lectures are lecture notes and two or three published scientific papers. From these papers we will together develop the technical content.

Details: [https://people.ee.ethz.ch/~haschmid/asfwiki/](https://people.ee.ethz.ch/~haschmid/asfwiki/)

The graph methods are also supported with teaching videos: [https://tube.switch.ch/channels/d206c96c?order=episodes](https://tube.switch.ch/channels/d206c96c?order=episodes), and a Python-based open-source tool to manipulate graphs is available on [https://github.com/hanspi42/signalflowgrapher](https://github.com/hanspi42/signalflowgrapher)

Some material is protected by password; students from ETHZ who are interested can write to haschmid@ethz.ch to ask for the password even if they do not attend the lecture.

**Prerequisites / notice**

Knowledge of the Laplace transform and z transform and their interpretation (transfer functions, poles and zeros, bode diagrams, stability criteria ... ) and of the main properties of linear systems is necessary.

**Competencies**

- **Subject-specific Competencies**
  - Concepts and Theories: assessed
  - Techniques and Technologies: assessed
  - Analytical Competencies: assessed
  - Decision-making: fostered
  - Media and Digital Technologies: fostered
  - Problem-solving: assessed
  - Project Management: fostered

- **Method-specific Competencies**
  - Communication: fostered
  - Cooperation and Teamwork: fostered
  - Customer Orientation: fostered
  - Leadership and Responsibility: fostered
  - Self-presentation and Social Influence: fostered
  - Sensitivity to Diversity: fostered
  - Negotiation: fostered
  - Adaptability and Flexibility: fostered
  - Creative Thinking: fostered
  - Critical Thinking: assessed
  - Integrity and Work Ethics: fostered
  - Self-awareness and Self-reflection: fostered
  - Self-direction and Self-management: fostered

**227-0477-00L Acoustics I**

**Abstract**

Introduction to the fundamentals of acoustics in the field of sound field calculations, measurement of acoustical events, outdoor sound propagation and room acoustics of large and small enclosures.

**Objective**

Understanding of the basic acoustical concepts and methods. Ability to understand the technical and scientific literature. Confidence in the use of measuring instruments.
Fundamentals of acoustics, calculation of sound fields, measurement and analysis of acoustical events, anatomy and properties of the ear, outdoor sound propagation, absorption and transmission of sound, room acoustics of large and small enclosures, noise and noise control.

Abstract

Maxwell's equations are reinterpreted in the framework of Einstein's special relativity theory using the Lagrangian formalism in order to discover the deep interconnection between the electric and magnetic field. Its daily relevance is emphasized by pinpointing how GPS atomic clocks in satellites and on the earth are affected by frequency shifts which can be explained only in terms of relativity.

Objective

D-ITET is the depository of the Maxwell's equations, which are dissected from all perspectives in the courses Physics I, Electromagnetic Fields and Waves, and Advanced Electromagnetic Waves.

Content

- Galileo-Newton, the Ether, Michelson-Morley's Experiment
- Lorentz Transformations
- 4-Vectors in Minkowski's Spacetime: Tensor Formalism
- The Lagrangian, the Principle of Stationary Action for Particles and Fields, Noether's Theorem
- Maxwell's Equations and the Energy-Momentum Tensor
- Waves
- Radiation from Accelerated Charged Particles
- Sagnac's Effect
- GPS

Lecture notes

No lecture notes because the proposed textbooks together with the provided supplementary material are more than exhaustive!

Literature

- (Special Relativity) L. Susskind and A. Friedman, “Special Relativity and Classical Field Theory: The Theoretical Minimum”, 2019, Hachette Book Group USA

Supplementary material will be uploaded in Moodle.

---

+ (on the GPS) E.D. Kaplan, C. Hegarty, "Understanding GPS/GNSS", 2017, ARTECH HOUSE USA

Prerequisites / notice

Notions of a course on Electromagnetism like D-ITET "Electromagnetic Fields and Waves" are indispensable. Furthermore, a solid base of Analysis I & II as well as of Linear Algebra is really helpful.
Abstract

Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

Objective

Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real world data.

Content

The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:

- Fundamentals:
  - What is data?
  - Bayesian Learning
  - Computational learning theory

- Supervised learning:
  - Ensembles: Bagging and Boosting
  - Max Margin methods
  - Neural networks

- Unsupervised learning:
  - Dimensionality reduction techniques
  - Clustering
  - Mixture Models
  - Non-parametric density estimation
  - Learning Dynamical Systems

Lecture notes

No lecture notes, but slides will be made available on the course webpage.

Literature

Prerequisites / notice

The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.

Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.
Abstract

Combinatorics is a fundamental mathematical discipline as well as an essential component of many mathematical areas, and its study has experienced an impressive growth in recent years. This course provides a gentle introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to other areas.

Objective

The students will get an overview of various algebraic methods for solving combinatorial problems. We expect them to understand the proof techniques and to use them autonomously on related problems.

Content

One of the main general techniques that played a crucial role in the development of Combinatorics was the application of algebraic methods. The most fruitful such tool is the dimension argument. Roughly speaking, the method can be described as follows. In order to bound the cardinality of a discrete structure A one maps its elements to vectors in a linear space, and shows that the set A is mapped to linearly independent vectors. It then follows that the cardinality of A is bounded by the dimension of the corresponding linear space. This simple idea is surprisingly powerful and has many famous applications.

This course provides a gentle introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to other areas. The topics covered in the class will include (but are not limited to):

- Basic dimension arguments
- Spaces of polynomials and tensor product methods
- Eigenvalues of graphs and their application
- The Combinatorial Nullstellensatz and the Chevalley-Warning theorem
- Applications such as: Solution of Kakeya problem in finite fields, counterexample to Borsuk's conjecture, chromatic number of the unit distance graph of Euclidean space, explicit constructions of Ramsey graphs and many others.

The course website can be found at [https://moodle-app2.let.ethz.ch/course/view.php?id=15757](https://moodle-app2.let.ethz.ch/course/view.php?id=15757)

Lectures will be on the blackboard only, but there will be a set of typeset lecture notes which follow the class closely.

Prerequisites / Notice

Students are expected to have a mathematical background and should be able to write rigorous proofs.

Track: Computers and Networks

The core courses and specialisation courses below are a selection for students who wish to specialise in the area of "Computers and Networks", see [https://www.ee.ethz.ch/studies/main-master/areas-of-specialisation.html](https://www.ee.ethz.ch/studies/main-master/areas-of-specialisation.html).

The individual study plan is subject to the tutor's approval.

Core Courses

These core courses are particularly recommended for the field of "Computers and Networks". You may choose core courses from other fields in agreement with your tutor.

A minimum of 24 credits must be obtained from core courses during the MSc EEIT.

Foundation Core Courses

Fundamentals at bachelor level, for master students who need to strengthen or refresh their background in the area.

Abstract

Introduction to discrete event systems. We start out by studying popular models of discrete event systems. Then we analyze discrete event systems from an average-case and from a worst-case perspective, and study verification. Topics include: Automata and Languages, Specification Models, Stochastic Discrete Event Systems, Worst-Case Event Systems, Verification, Petri Nets.
Objective

Over the past few decades the rapid evolution of computing, communication, and information technologies has brought about the proliferation of new dynamic systems. A significant part of activity in these systems is governed by operational rules designed by humans. The dynamics of these systems are characterized by asynchronous occurrences of discrete events, some controlled (e.g., hitting a keyboard key, sending a message), some not (e.g., spontaneous failure, packet loss).

The mathematical arsenal centered around differential equations that has been employed in systems engineering to model and study processes governed by the laws of nature is often inadequate or inappropriate for discrete event systems. The challenge is to develop new modeling frameworks, analysis techniques, design tools, testing methods, and optimization processes for this new generation of systems.

In this lecture we give an introduction to discrete event systems. We start out the course by exploring the limits of what is computable and what is not. In doing so, we will consider three distinct models of computation which are often used to model discrete event systems: finite automata, push-down automata and Turing machines (ranked in terms of expressiveness power). In the second part of the course we analyze discrete event systems. We first examine discrete event systems from an average-case perspective: we model discrete events as stochastic processes, and then apply continuous time markov chains and queueing theory for an understanding of the typical behavior of a system. Then we analyze discrete event systems from a worst-case perspective using the theory of online algorithms and adversarial queueing. In the last part of the course we introduce methods that allow to formally verify certain properties of Finite Automata and Petri Nets. These are some typical analysis questions we will look at: Do two given systems behave the same? Does a given system behave as intended? Does the system eventually enter a dangerous state?

Content

1. Regular Languages
2. Non-Regular Languages
3. Markov Chains
4. Stochastic Discrete Event Systems
5. Worst-Case Event Systems
6. Verification of Finite Automata
7. Petri Nets

227-0121-00L Communication Systems W 6 credits 4G C. Studer, S. M. Moser

Abstract
The course teaches the fundamentals of digital communication systems. The main topics are analog and digital modulation, signals and linear time-invariant systems, baseband and passband representations, continuous-time and discrete-time channels, noise, inter-symbol interference, detection theory, as well as the basics of forward error correction and information theory.

Objective
After attending the lectures, participating in the exercise sessions, and working on the homework problems (which include MATLAB coding assignments), the students will be able to:
- understand the fundamentals of digital communication systems
- explain the principles of modulation, demodulation, detection, and error correction
- analyze error rates of simple digital communication systems
- implement simple MATLAB simulations to calculate error rates

Data: 06.08.2024 12:40 Autumn Semester 2024 Page 987 of 2684
The course focuses on the fundamentals of digital communication systems. The course starts with analog modulation and discusses the main building blocks of modern digital communication systems. The topics include:
- essential components of digital communication systems
- analog and digital modulation
- baseband and passband representation; up- and down-conversion
- communication channels as LTI systems
- discretizing communication systems; sampling and quantization
- noise, signal-to-noise ratio (SNR), and interference
- detection theory and error rates
- basics of forward error correction
- basics of information theory
- orthogonal frequency-division multiplexing (OFDM)
- building blocks of modern communication systems

The exercises cover theoretical aspects as well as the basics of software-based communication-system modeling in MATLAB.

</table>

Understanding the hardware structure of a microcontroller and an embedded system; memory architecture and memory map, internal and external peripherals, low-power and low-energy design as well as instruction sets and computational accelerators.

Understanding the firmware structure of a microcontroller and an embedded system; low-level instruction set, hardware-software interfaces, communication between components, embedded real-time operating systems, real-time scheduling, shared resources, low-power and low-energy programming as well as computational accelerators.

Using formal models and methods for designing and optimizing embedded systems.

Gaining experience with practical applications of the C programming language, embedded real-time operating systems, and debug functionalities of the associated design environment to design, implement, and verify embedded firmware.

Through project-based activities, students will gain substantial experience in applying the C programming language in the context of embedded systems. Projects will involve developing and implementing firmware, utilizing embedded real-time operating systems, and exploring the debugging functionalities within design environments. This hands-on approach aims to bridge the gap between theoretical knowledge and practical application, allowing students to experience the full lifecycle of embedded system development from design to implementation and verification.

Besides the theoretical lecture, the course contains laboratory sessions where students transfer the learned theoretical aspects into practice by programming a microcontroller and interfacing it with sensors and actuators.

Students will be exposed to a commercial microcontroller, and the development board extend with a custom-designed embedded systems educational platform.

Specifically, the following topics will be covered in the course: hardware and software structures of embedded systems, low-level instruction set, memory architecture and memory map, peripherals, hardware-software interfaces, communication between components, firmware design methodologies, firmware design using the C programming language, embedded real-time operating systems, real-time scheduling, shared resources, low-power, and low-energy designs as well as computational accelerators.

<td>We will learn the fundamental concepts of the different parts of modern computing systems, as well as the latest major research topics in Industry and Academia. We will extensively cover memory systems (including DRAM and new Non-Volatile Memory technologies, memory controllers, flash memory), new paradigms like processing-in-memory, parallel computing systems (including multicore processors, coherence and consistency, GPUs), heterogeneous computing, interconnection networks, specialized systems for major data-intensive workloads (e.g. graph analytics, bioinformatics, machine learning), etc. We will focus on fundamentals as well as cutting-edge research. Significant attention will be given to real-life examples and tradeoffs, as well as critical analysis of modern computing systems.</td>
</tr>
</tbody>
</table>
Content
The principles presented in the lecture are reinforced in the laboratory through 1) the design and implementation of a cycle-accurate simulator, where we will explore different components of a modern computing system (e.g., pipeline, memory hierarchy, branch prediction, prefetching, caches, multithreading), and 2) the extension of state-of-the-art research simulators (e.g., Ramulator) for more in-depth understanding of specific system components (e.g., memory scheduling, prefetching).

See the course website for detailed and complete content of past incarnations of the course: https://safari.ethz.ch/architecture

Lecture notes
All the materials (including lecture slides) will be provided on the course website: https://safari.ethz.ch/architecture/

The video recordings of the lectures are expected to be made available after lectures.

See https://safari.ethz.ch/architecture for past examples.

Literature
We will provide required and recommended readings in every lecture. They will mainly consist of research papers presented in major Computer Architecture and related conferences and journals.

See https://safari.ethz.ch/architecture for past examples.

Prerequisites / notice

227-0575-00L Advanced Topics in Communication Networks W 6 credits 2V+2U L. Vanbever

Abstract
This course covers advanced topics and technologies in computer networks, both theoretically and practically. It is offered each Fall. Repeatition for credit is possible with the consent of the instructor.

Objective
The goals of this course is to provide students with a deeper understanding of the existing and upcoming Internet technologies used in large-scale computer networks such as Internet Service Providers (e.g., Swisscom or Deutsche Telekom), Content Delivery Networks (e.g., Netflix) and Data Centers (e.g., Google). Besides covering the fundamentals, the course will be "hands-on" and will enable students to play with the technologies in realistic network environments.

Content
In 2023, the course will cover advanced topics in communication networks such as:

- Advanced Internet routing (convergence, optimality, scalability, flexibility);
- Network programmability (OpenFlow, P4);
- Traffic engineering / Load Balancing;
- Network verification and synthesis;
- Network measurements;
- Network security;
- Upcoming transport protocols and technologies;
- Adaptive video streaming; and
- Network sustainability.

The course will be composed of lectures and practical exercises (some of which including labs).

Lecture notes
Lecture notes and material will be made available before each course on the course website.

Literature
Relevant references will be made available through the course website.

Prerequisites / notice
Prerequisites: Communication Networks (227-0120-00L) or equivalents / programming skills (in any language) are expected (some of the exercises will involve coding).

227-0579-00L Hardware Security W 8 credits 2V+2U+2A K. Razavi

Abstract
This course covers the security of commodity computer hardware (e.g., CPU, DRAM, etc.) with a special focus on cutting-edge hands-on research. The aim of the course is familiarizing the students with hardware security and more specifically microarchitectural and circuit-level attacks and defenses through lectures and implementing some of these advanced attacks.

Objective
By the end of the course, the students will be familiar with the state of the art in commodity computer hardware attacks and defenses. More specifically, the students will learn about:

- security problems of commodity hardware that we use everyday and how you can defend against them.
- relevant computer architecture and operating system aspects of these issues.
- hands-on techniques for performing hardware attacks.

This is the course where you get credit points by building some of the most advanced exploits on the planet! The luckiest team will collect a Best Demo Award at the end of the course.

Literature
Slides, relevant literature and manuals will be made available during the course.

Prerequisites / notice
Experience with Linux, low-level systems programming and computer architecture.
252-1414-00L  System Security  W  7 credits  2V+2U+2A  S. Capkun, S. Shinde

Abstract
The first part of the course covers general security concepts and hardware-based support for security.

Objective
In this lecture, students learn about the security requirements and capabilities that are expected from modern hardware, operating systems, and other software environments. An overview of available technologies, algorithms and standards is given, with which these requirements can be met.

Content
The first part of the lecture covers hardware-based security concepts. Topics include the concept of physical and software-based side channel attacks on hardware resources, architectural support for security (e.g., memory management and permissions, disk encryption), and trusted execution environments (Intel SGX, ARM TrustZone, AMD SEV, and RISC-V Keystone).

In the second part, the focus is on system design and methodologies for building secure systems. Topics include: common software faults (e.g., buffer overflows, etc.), bug-detection, writing secure software (design, architecture, QA, testing), compiler-supported security (e.g., control-flow integrity), and language-supported security (e.g., memory safety).

Along the lectures, model cases will be elaborated and evaluated in the exercises.

Competencies
Subject-specific Competencies
Concepts and Theories  assessed
Techniques and Technologies  assessed

Method-specific Competencies
Analytical Competencies  assessed
Decision-making  fostered
Media and Digital Technologies  fostered
Problem-solving  assessed
Project Management  fostered

Social Competencies
Cooperation and Teamwork  fostered

Personal Competencies
Adaptability and Flexibility  fostered
Creative Thinking  fostered
Critical Thinking  fostered
Integrity and Work Ethics  fostered
Self-direction and Self-management  fostered

263-4640-00L  Network Security  W  8 credits  2V+2U+3A  P. De Vaere, S. Frei, K. Paterson, A. Perrig

Abstract
Some of today's most damaging attacks on computer systems involve exploitation of network infrastructure, either as the target of attack or as a vehicle to attack end systems.

Objective
- Students are familiar with fundamental network-security concepts.
- Students can assess current threats that Internet services and networked devices face, and can evaluate appropriate countermeasures.
- Students can identify and assess vulnerabilities in software systems and network protocols.
- Students have an in-depth understanding of a range of important state-of-the-art security technologies.
- Students can implement network-security protocols based on cryptographic libraries.

Content
The course will cover topics spanning four broad themes with a focus on the first two themes:
(1) network defense mechanisms such as public-key infrastructures, TLS, VPNs, anonymous-communication systems, secure routing protocols, secure DNS systems, and network intrusion-detection systems;
(2) network attacks such as hijacking, spoofing, denial-of-service (DoS), and distributed denial-of-service (DoS) attacks;
(3) analysis and inference topics such as traffic monitoring and network forensics; and
(4) new technologies related to next-generation networks.

In addition, several guest lectures will provide in-depth insights into specific current real-world network-security topics.

Prerequisites / notice
This lecture is intended for students with an interest in securing Internet communication services and network devices. Students are assumed to have knowledge in networking as taught in a communication networks lecture like 252-0064-00L or 227-0120-00L. Basic knowledge of information security or applied cryptography as taught in 252-0211-00L or 263-4660-00L is beneficial, but an overview of the most important cryptographic primitives will be provided at the beginning of the course.

The course will involve several graded course projects. Students are expected to be familiar with a general-purpose or network programming language such as C/C++, Go, Python, or Rust.
The course is about some fundamental topics of digital signal processing with a bias towards applications in communications. The two main themes are linearity and probability. In the first part of the course, we deepen our understanding of discrete-time linear filters. In the second part of the course, we review the basics of probability theory and discrete-time stochastic processes. We then discuss some basic concepts of detection theory and estimation theory, as well as some practical methods including LMMSE estimation and LMMSE filtering, the LMS algorithm, and the Viterbi algorithm. A recurrent theme throughout the course is the stable and robust "inversion" of a linear filter.

### Content

1. Discrete-time linear systems and filters:
   - state-space realizations, z-transform and spectrum, decimation and interpolation, digital filter design, stable realizations and robust inversion.
2. The discrete Fourier transform and its use for digital filtering.
3. The statistical perspective:
   - probability, random variables, discrete-time stochastic processes; detection and estimation: MAP, ML, Bayesian MMSE, LMMSE; Wiener filter, LMS adaptive filter, Viterbi algorithm.

### Literature

### Prerequisites / notice

MATLAB is used for system analysis and simulation, lecture notes are available online.
This course is concerned with system-level issues of VLSI design and FPGA implementations. Topics include:
- Overview on design methodologies and fabrication depths.
- Levels of abstraction for circuit modeling.
- Organization and configuration of commercial field-programmable components.
- FPGA design flows.
- Dedicated and general purpose architectures compared.
- How to obtain an architecture for a given processing algorithm.
- Meeting throughput, area, and power goals by way of architectural transformations.
- Hardware Description Languages (HDL) and the underlying concepts.

- SystemVerilog
- Register Transfer Level (RTL) synthesis and its limitations.
- Building blocks of digital VLSI circuits.
- Functional verification techniques and their limitations.
- Modular and largely reusable testbenches.
- Assertion-based verification.
- Synchronous versus asynchronous circuits.
- The case for synchronous circuits.
- Periodic events and the Anceau diagram.
- Case studies, ASICs compared to microprocessors, DSPs, and FPGAs.

During the exercises, students learn how to model FPGAs with SystemVerilog. They write testbenches for simulation purposes and synthesize gate-level netlists for FPGAs. Commercial EDA software by leading vendors is being used throughout.

Lecture notes
Textbook and all further documents in English.

Literature

Prequisites / notice
Basics of digital circuits.

Examination:
In written form following the course semester (spring term). Problems are given in English, answers will be accepted in either English or German.

Abstract
Understanding the physics of failures and failure mechanisms enables reliability analysis and serves as a practical guide for electronic devices design, integration, systems development and manufacturing. The field gains additional importance in the context of managing safety, sustainability and environmental impact for continuously increasing complexity and scaling-down trends in electronics.

Objective
Provide an understanding of the physics of failure and reliability. Introduce the degradation and failure mechanisms, basics of failure analysis, methods and tools of reliability testing.

Content
Summary of reliability and failure analysis terminology; physics of failure: materials properties, physical processes and failure mechanisms; failure analysis; basics and properties of instruments; quality assurance of technical systems (introduction); introduction to stochastic processes; reliability analysis; component selection and qualification; maintainability analysis (introduction); design rules for reliability, maintainability, reliability tests (introduction).

Comprehensive copy of transparencies

Literature

Prerequisites
Basics of digital circuits.

Examination:
In written form following the course semester (spring term). Problems are given in English, answers will be accepted in either English or German.

Further details:
https://iis-students.ee.ethz.ch/lectures/vlsi-i/
We discuss the following concepts related to fault-tolerant distributed systems: client-server, serialization, two-phase protocols, three-phase protocols, paxos, two generals problem, crash failures, impossibility of consensus, Byzantine failures, agreement, termination, validity, Byzantine agreement, king algorithm, asynchronous Byzantine agreement, authentication, signatures, reliable and atomic broadcast, eventual consistency, blockchain, cryptocurrencies such as bitcoin and Ethereum, proof-of-work, proof-of-{l}, smart contracts, quorum systems, fault-tolerant protocols such as p2Chain or pbft, distributed storage, distributed hash tables, physical and logical clocks, causality, selfishness, game theoretic models, mechanism design.

A script is available on the web page.

The script is self-contained, but links to additional material are available on the web page.

This lecture takes place in roughly the second half of the semester, as the lecture is the second part of the lecture "Computer Systems" (252-0217-00). Students may attend at most one of the two lectures, NOT both.

**227-0627-00L**  
**Applied Computer Architecture**  
**Abstract**  
This lecture gives an overview of the requirements and the architecture of parallel computer systems, performance, reliability and costs. Understand the function, the design and the performance modeling of parallel computer systems.

**Objective**  
The lecture "Applied Computer Architecture" gives technical and corporate insights into innovative Computer Systems/Architectures (CPU, GPU, FPGA, dedicated processors) and their real implementations and applications. Often the designs have to deal with technical limits. Which computer architecture allows the control of the over 1000 magnets at the Swiss Light Source (SLS) at the PSI? Which architecture is behind the alarm center of the Swiss Railway (SBB)? Which computer architectures are applied for driver assistance systems? Which computer architecture is hidden behind a professional digital audio mixing desk? How can data streams of about 30 Tbps, produced by a proton accelerator, be processed in real time? Can the weather forecast also be processed with GPUs? How could a fast trading system be set up for the stock exchange? How can a good computer architecture be found? Which are the driving factors in successful computer architecture design?

**Lecture notes**  
Script and exercises sheets.

**227-2211-00L**  
**Seminar in Computer Architecture**  
**Abstract**  
In this seminar course, we will cover fundamental and cutting-edge research papers in computer architecture. The course will consist of multiple components that are aimed at improving students' technical skills in computer architecture, critical thinking and analysis on computer architecture concepts, as well as technical presentation of concepts and papers in both spoken and written forms.

**Objective**  
The main objective is to learn how to rigorously analyze and present papers and ideas on computer architecture. We will have rigorous presentation and discussion of selected papers during lectures and a written report delivered by each student at the end of the semester. This course is for those interested in computer architecture. Registered students are expected to attend every lecture, participate in the discussion, and create a synthesis report at the end of the course.

**Content**  
Topics will center around computer architecture. We will, for example, discuss papers on hardware security; new execution paradigms like processing in memory; architectural acceleration mechanisms for key applications like machine learning, graph processing and bioinformatics; memory systems; interconnects; various fundamental and emerging paradigms in computer architecture; hardware/software co-design and cooperation; fault tolerance; energy efficiency; heterogeneous and parallel systems; technology scaling; new execution models, etc.

See [https://safari.ethz.ch/architecture_seminar](https://safari.ethz.ch/architecture_seminar) for past examples.

**Lecture notes**  
All the materials will be posted on the course website: [https://safari.ethz.ch/architecture_seminar/](https://safari.ethz.ch/architecture_seminar/)  
Links to past course materials, including the synthesis report assignment, can be found in this page: [https://safari.ethz.ch/architecture_seminar](https://safari.ethz.ch/architecture_seminar)

**Literature**  
Key papers and articles, on both fundamentals and cutting-edge topics in computer architecture will be provided and discussed. These will be posted on the course website.

See [https://safari.ethz.ch/architecture_seminar](https://safari.ethz.ch/architecture_seminar) for past examples.

**Prerequisites / notice**  
Digital Design and Computer Architecture OR Digital Circuits / Computer Engineering

Students should (1) have done very well in Digital Design and Computer Architecture, Digital Circuits or a similar course and (2) show a genuine interest in Computer Architecture.

VLSI 1: HDL Based Design for FPGAs

W 6 credits 5G F. K. Gürkaynak

Abstract: This first course in a series that extends over three consecutive terms is concerned with tailoring algorithms and with deising high performance hardware architectures for their implementation as ASIC or with FPGAs. The focus is on front end design using HDLs and automatic synthesis for producing industrial-quality circuits.

Objective: Understand Very-Large-Scale Integrated Circuits (VLSI chips), Application-Specific Integrated Circuits (ASIC), and Field-Programmable Gate-Arrays (FPGA). Know their organization and be able to identify suitable application areas. Become fluent in front-end design from architectural conception to gate-level netlists. How to model digital circuits with SystemVerilog. How to ensure they behave as expected with the aid of simulation, testbenches, and assertions. How to take advantage of automatic synthesis tools to produce industrial-quality VLSI and FPGA circuits. Gain practical experience with the hardware description language SystemVerilog and with industrial Electronic Design Automation (EDA) tools.

Content: This course is concerned with system-level issues of VLSI design and FPGA implementations. Topics include:

- Overview of design methodologies and fabrication depths.
- Levels of abstraction for circuit modeling.
- Organization and configuration of commercial field-programmable components.
- FPGA design flows.
- Dedicated and general purpose architectures compared.
- How to obtain an architecture for a given processing algorithm.
- Meeting throughput, area, and power goals by way of architectural transformations.
- Hardware Description Languages (HDL) and the underlying concepts.
- SystemVerilog
- Register Transfer Level (RTL) synthesis and its limitations.
- Building blocks of digital VLSI circuits.
- Functional verification techniques and their limitations.
- Modular and largely reusable testbenches.
- Assertion-based verification.
- Synchronous versus asynchronous circuits.
- The case for synchronous circuits.
- Periodic events and the Anceau diagram.
- Case studies, ASICs compared to microprocessors, DSPs, and FPGAs.

During the exercises, students learn how to model FPGAs with SystemVerilog. They write testbenches for simulation purposes and synthesize gate-level netlists for FPGAs. Commercial EDA software by leading vendors is being used throughout.

Examination: In written form following the course semester (spring term). Problems are given in English, answers will be accepted in either English or German.

Solid State Electronics and Optics

W 6 credits 4G N. Yazdani, V. Wood

"Solid State Electronics" is an introductory condensed matter physics course covering crystal structure, electron models, classification of metals, semiconductors, and insulators, band structure engineering, thermal and electronic transport in solids, magnetoresistance, and optical properties of solids.

Objective: Understand the fundamental physics behind the mechanical, thermal, electric, magnetic, and optical properties of materials.

Prerequisites / notice:

Recommended background:

Undergraduate physics, mathematics, semiconductor devices

Analog Integrated Circuits

W 6 credits 4G T. Jang

Abstract: This course provides a foundation in analog integrated circuit design based on bipolar and CMOS technologies.
Integrated circuits are responsible for much of the progress in electronics in the last 50 years, particularly the revolutions in the Information and Communications Technologies we witnessed in recent years. Analog integrated circuits play a crucial part in the highly integrated systems that power the popular electronic devices we use daily. Understanding their design is beneficial to both future designers and users of such systems.

The basic elements, design issues and techniques for analog integrated circuits will be taught in this course.

Review of bipolar and MOS devices and their small-signal equivalent circuit models; Building blocks in analog circuits such as current sources, active load, current mirrors, supply independent biasing etc; Amplifiers: differential amplifiers, cascode amplifier, high gain structures, output stages, gain bandwidth product of op-amps; stability; comparators; second-order effects in analog circuits such as mismatch, noise and offset; data converters; frequency synthesis and switched-capacitor circuits.

The exercise sessions aim to reinforce the lecture material by well guided step-by-step design tasks. The circuit simulator SPECTRE is used to facilitate the tasks. There is also an experimental session on op-amp measurements.

Handouts of presented slides. No script but an accompanying textbook is recommended.

Abstract
This course provides a thorough treatment of integrated data conversion systems from system level specifications and trade-offs, over architecture choice down to circuit implementation.

Objective
Data conversion systems are substantial sub-parts of many electronic systems, e.g. the audio conversion system of a home-cinema systems or the base-band front-end of a wireless modem. Data conversion systems usually determine the performance of the overall system in terms of dynamic range and linearity. Students will learn the underlying principles of data conversion and be introduced to the different methods and circuit architectures to implement such a conversion. The conversion methods such as successive approximation or algorithmic conversion are explained based on their operation principle accompanied with the appropriate mathematical calculations, including effects of non-idealities in some cases. After successful completion of the course students should understand the concept of an ideal ADC, know all major converter architectures, their principle of operation and what governs their performance.

Content
- Introduction: examples of data conversion architectures; information representation; abstraction, categorization and symbolic representation; basic conversion algorithms; data converter application; tradeoffs among key parameters; ADC taxonomy.
- Dual-slope & successive approximation register (SAR) converters: dual slope principle & converter; SAR ADC operating principle; SAR implementation with a capacitive array; range extension with segment/skip capacitors.
- Algorithmic & pipelined A/D converters: algorithmic conversion principle; sample & hold stage; pipelined converter; multiplying DAC; flash sub-ADC and n-bit MDAC; redundancy for correction of non-idealities, error correction.
- Performance metrics and non-linearity: ideal ADC; offset, gain error, differential and integral non-linearities; capacitor mismatch; impact of capacitor mismatch on SAR ADC's performance.
- Flash, folding an interpolating analog-to-digital converters: flash ADC principle, thermometer to binary coding, sparkle correction; limitations of flash converters; the folding principle, residue extraction; folding amplifiers; cascaded folding; interpolation for folding converters; cascaded folding and interpolation.
- Noise in analog-to-digital converters: types of noise; noise calculation in electronic circuit, kT/C-noise, sampled noise; noise analysis in switched-capacitor circuits; aperture time uncertainty and sampling jitter.
- Delta-sigma A/D-converters: linearity and resolution; from delta-modulation to delta-sigma modulation; first-order delta-sigma modulation, circuit level implementation; clock-jitter & SNR in delta-sigma modulators; second-order delta-sigma modulation, higher-order modulation, design procedure for a single-loop modulator.

Abstract
The path of an analog signal in the transmitter to the digital world in a communication link and back to the analog world at the receiver is discussed. The lecture covers fundamental aspects of all important optical and optoelectronic components in a fiber communication system. This includes the transmitter, the fiber channel and the receiver with the electronic digital signal processing elements. An in-depth understanding on how information is transmitted from source to destination. Also the mathematical framework to describe the important elements will be passed on. Students attending the lecture will further get engaged in critical discussion on societal, economical and environmental aspects related to the on-going exponential growth in the field of communications.

Objective

- Chapter 1: Introduction: Analog/Digital conversion, The communication channel, Shannon channel capacity, Capacity requirements.
- Chapter 4: The Receiver: Photodiodes, Receiver noise, Detector schemes (direct detection, coherent detection), Bit-error ratios and error estimations.
- Chapter 5: Digital Signal Processing Techniques: Digital signal processing in a coherent receiver, Error detection techniques, Error correction coding.
- Chapter 6: Pulse Shaping and Multiplexing Techniques: WDM/FDM, TDM, OFDM, Nyquist Multiplexing, OCDMA.
- Chapter 7: Optical Amplifiers: Semiconductor Optical Amplifiers, Erbium Doped Fiber Amplifiers, Raman Amplifiers.
- Chapter 8: Fiber Optic Communication Systems.

Prerequisites / notice
# 227-0663-00L Nano-Optics

**W** 6 credits  2V+2U  M. Frimmer

*Does not take place this semester.*

**Abstract**
NANO-OPTICS is the study of light-matter interaction at the sub-wavelength scale. It is an emerging field of fundamental and applied research enabled by the rapid advance of nanotechnology. Nano-optics embraces topics such as plasmonics, optical antennas, optical trapping and manipulation, and high/super-resolution imaging and spectroscopy.

**Objective**
Understanding concepts of light localization and light-matter interactions on the sub-wavelength scale.

**Content**
We start with the angular spectrum representation of fields to understand the classical resolution limit. We continue with the theory of strongly focused light, the point spread function, and resolution criteria of conventional microscopy, before turning to super-resolution techniques, based on near- and far-fields. We introduce the local density of states and approaches to control spontaneous emission rate in inhomogeneous environments, including optical antennas. Finally, we touch upon optical forces and their applications in optical tweezers.

**Prerequisites**
- Electromagnetic fields and waves (or equivalent)
- Physics I+II

---

## 227-0147-10L VLSI 3: Full-Custom Digital Circuit Design

**W** 6 credits  2V+3U  C. Studer, O. Castañeda Fernández

*This third course in our VLSI series is concerned with full-custom digital integrated circuits. The goals include learning the design of digital circuits on the schematic, layout, and register-transfer levels. The use of state-of-the-art CAD software (Cadence Virtuoso) in order to simulate, optimize, and characterize digital circuits is another important topic of this course.*

**Abstract**

**Objective**
At the end of this course, you will

- understand the design of the main building blocks of state-of-the-art digital integrated circuits
- be able to design and optimize digital integrated circuits on the schematic, layout, and gate levels
- be able to use standard industry software (Cadence Virtuoso) for simulating, characterizing, and optimizing digital circuits
- understand the performance trade-offs between delay, area, and power consumption

**Content**

The third VLSI course begins with the basics of metal-oxide-semiconductor (MOS) field-effect transistors (FETs) and moves up the stack towards logic gates and increasingly complex digital circuit structures. The topics of this course include:

- Nanometer MOSFETs
- Static and dynamic behavior of complementary MOS (CMOS) inverters
- CMOS gate design, sizing, and timing
- Full-custom standard-cell design
- Wire models and parasitics
- Latch and flip-flop circuits
- Gate-level timing analysis and optimization
- Static and dynamic power consumption; low-power techniques
- Alternative logic styles (dynamic logic, pass-transistor logic, etc.)
- Arithmetic and logic circuits
- Fixed-point and floating-point arithmetic
- Synchronous and asynchronous design principles
- Memory circuits (ROM, SRAM, and DRAM)
- In- and near-memory processing architectures
- Full-custom accelerator circuits for machine learning

The exercises are concerned with schematic entry, layout, and simulation of digital integrated circuits using a disciplined standard-cell-based approach with Cadence Virtuoso.

**Literature**
N. H. E. Weste and D. M Harris, CMOS VLSI Design: A Circuits and Systems Perspective (4th Ed.), Addison-Wesley

**Prerequisites**
VLSI 3 can be taken in parallel with "VLSI 1: HDL-based design for FPGAs" and is designed to complement the topics of this course. Basic analog circuit knowledge is required.

---

### Specialisation Courses

These specialisation courses are particularly recommended for the area of "Electronics and Photonics", but you are free to choose courses from any other field in agreement with your tutor.

A minimum of 40 credits must be obtained from specialisation courses during the Master's Programme.

| 227-0121-00L | Communication Systems | W    | 6 credits | 4G    | C. Studer, S. M. Moser |
| **Abstract** | The course teaches the fundamentals of digital communication systems. The main topics are analog and digital modulation, signals and linear time-invariant systems, baseband and passband representations, continuous-time and discrete-time channels, noise, inter-symbol interference, detection theory, as well as the basics of forward error correction and information theory. |
| **Objective** | After attending the lectures, participating in the exercise sessions, and working on the homework problems (which include MATLAB coding assignments), the students will be able to: |
| - understand the fundamentals of digital communication systems |
| - explain the principles of modulation, demodulation, detection, and error correction |
| - analyze error rates of simple digital communication systems |
| - implement simple MATLAB simulations to calculate error rates |
Semiconductor Devices: Physical Bases and Simulation

Abstract
The course addresses the physical principles of modern semiconductor devices and the foundations of their modeling and numerical simulation. Necessary basic knowledge on quantum-mechanics, semiconductor physics and device physics is provided. Computer simulations of the most important devices and of interesting physical effects supplement the lectures.

Objective
The course aims at the understanding of the principle physics of modern semiconductor devices, of the foundations in the physical modeling of transport and its numerical simulation. During the course also basic knowledge on quantum-mechanics, semiconductor physics and device physics is provided.

Content
The main topics are: transport models for semiconductor devices (quantum transport, Boltzmann equation, drift-diffusion model, hydrodynamic model), physical characterization of silicon (inntrinsic properties, scattering processes), mobility of cold and hot carriers, recombination (Shockley-Read-Hall statistics, Auger recombination), impact ionization, metal-semiconductor contact, metal-insulator-semiconductor structure, and heterojunctions. The exercises are focussed on the theory and the basic understanding of the operation of special devices, as single-electron transistor, resonant tunneling diode, pn-diode, bipolar transistor, MOSFET, and laser. Numerical simulations of such devices are performed with an advanced simulation package (Sentaurus-Synopsys). This enables to understand the physical effects by means of computer experiments.

Lecture notes
Script and exercise sheets. Books will be suggested during the course.

Prerequisites / notice
Prerequisites: C language programming. Basics of Digital Signal Processing. Basics of processor and computer architecture. Some exposure to machine learning concepts is also desirable

Machine Learning on Microcontrollers

Registration in this class requires the permission of the instructors. Preference is given to students in the MSc EEIT.

Abstract
Machine Learning (ML) and artificial intelligence are pervading the digital society. Today, even low power embedded systems are incorporating ML, becoming increasingly "smart". This lecture gives an overview of ML methods and algorithms to process and extract useful near-sensor information in end-nodes of the "internet-of-things", using low-power microcontrollers/processors (ARM-Cortex-M; RISC-V).

Objective
Learn how to Process data from sensors and how to extract useful information with low power microprocessors using ML techniques. We will analyze data coming from real low-power sensors (accelerometers, microphones, ExG bio-signals, cameras...). The main objective is to study in details how Machine Learning algorithms can be adapted to the performance constraints and limited resources of low-power microcontrollers.

Content
The final goal of the course is a deep understanding of machine learning and its practical implementation on single- and multi-core microcontrollers, coupled with performance and energy efficiency analysis and optimization. The main topics of the course include:

- Sensors and sensor data acquisition with low power embedded systems
- Machine Learning: Overview of supervised and unsupervised learning and in particular supervised learning (Bayes Decision Theory, Decision Trees, Random Forests, kNN-Methods, Support Vector Machines, Convolutional Networks and Deep Learning)
- Low-power embedded systems and their architecture. Low Power microcontrollers (ARM-Cortex M) and RISC-V-based Parallel Ultra Low Power (PULP) systems-on-chip.
- Low power smart sensor system design: hardware-software tradeoffs, analysis, and optimization. Implementation and performance evaluation of ML in battery-operated embedded systems.

The laboratory exercised will show how to address concrete design problems, like motion, gesture recognition, emotion detection, image and sound classification, using real sensors data and real MCU boards.

Presentation from Ph.D. students and the visit to the Digital Circuits and Systems Group will introduce current research topics and international research projects.

Lecture notes
Script and exercises. Books will be suggested during the course.

Prerequisites / notice
Prerequisites: C language programming. Basics of Digital Signal Processing. Basics of processor and computer architecture. Some exposure to machine learning concepts is also desirable

Analog Integrated Circuits

Abstract
This course provides a foundation in analog integrated circuit design based on bipolar and CMOS technologies. Integrated circuits are responsible for much of the progress in electronics in the last 50 years, particularly the revolutions in the Information and Communications Technologies we witnessed in recent years. Analog integrated circuits play a crucial part in the highly integrated systems that power the popular electronic devices we use daily. Understanding their design is beneficial to both future designers and users of such systems. The basic elements, design issues and techniques for analog integrated circuits will be taught in this course.

Objective
The course has the following main goals: (a) to give a comprehensive overview of challenges on communication equipment imposed by space missions: scenarios and challenges on flight equipment, and (b) to present the theoretical fundamentals and existing practical solutions of communication technology for space flight missions, (b) to present the theoretical fundamentals and existing practical solutions of communication technology for space flight missions, (b) to present the theoretical fundamentals and existing practical solutions of communication technology for space flight missions, (b) to present the theoretical fundamentals and existing practical solutions of communication technology for space flight missions, (b) to present the theoretical fundamentals and existing practical solutions of communication technology for space flight missions, (b) to present the theoretical fundamentals and existing practical solutions of communication technology for space flight missions, (b) to present the theoretical fundamentals and existing practical solutions of communication technology for space flight missions, (b) to present the theoretical fundamentals and existing practical solutions of communication technology for space flight missions. The exercise sessions aim to reinforce the lecture material by well guided step-by-step design tasks. The circuit simulator SPECTRE is used to facilitate the tasks. There is also an experimental session on op-amp measurements.

227-0377-10L Physics of Failure and Reliability of Electronic Devices and Systems

Abstract
Understanding the physics of failures and failure mechanisms enables reliability analysis and serves as a practical guide for electronic devices design, integration, systems development and manufacturing. The field gains additional importance in the context of managing sustainability, safety and environmental impact for continuously increasing complexity and scaling-down trends in electronics.

Objective
Provide an understanding of the physics of failure and reliability. Introduce the degradation and failure mechanisms, basics of failure analysis, methods and tools of reliability testing.

Content
Summary of reliability and failure analysis terminology; physics of failure: materials properties, physical processes and failure mechanisms; failure analysis; basics and properties of instruments; quality assurance of technical systems (introduction); introduction to stochastic processes; reliability analysis; component selection and qualification; maintainability analysis (introduction); design rules for reliability, maintainability, reliability tests (introduction).

227-0443-00L Space Communications

Abstract
The course has the following main goals: (a) to give a comprehensive overview of challenges on communication equipment imposed by space flight missions, (b) to present the theoretical fundamentals and existing practical solutions of communication technology for space flight missions, and (c) to review existing and future communication technologies for inter-satellite links, inter-spacecraft links, as well as for communication with the ground. After completing this course, a student will understand the challenges of space flight imposed on communication components and systems, the available existing solutions of those problems, the main components of communications systems suitable for a spacecraft, and future technologies capable of enabling ultra-fast RF/mm-Wave, THz, and Laser communication links.

Objective
After completing this course, a student will understand the challenges of space flight imposed on communication components and systems, the available existing solutions of those problems, the main components of communications systems suitable for a spacecraft, and future technologies capable of enabling ultra-fast RF/mm-Wave, THz, and Laser communication links.

Content
- Space missions: scenarios and challenges on flight equipment
- Space communications: architectures, assets, payloads, link budgets, and use cases.
- Electromagnetic waves: radiation, operating principles of antennas, antenna types, and antenna parameters.
- RF electronics and antenna arrays architecture for SATCOM: low-noise amplifiers, beam forming, spatial filtering, and design examples.
- Laser communication links for free-space communication, architectures and implementation
- Microwave photonics for space applications: analog photonic links, optical generation and distribution of RF signals, and advanced RF filtering using photonic techniques.
- Communication channels: channel modeling, including atmospheric effects, Doppler, synchronization tracking, beam forming, tracking and pointing.
- Signal modulation: modulation formats, adaptive optics, phase noise, and quantum key distribution (QKD).
- Outlook for emerging use-cases (ranging, time-, nav- and position-transfer (PNT)).

Literature

227-0468-00L Analog Signal Processing and Filtering

Abstract
This lecture provides a wide overview over analog filters (continuous-time and discrete-time), signal-processing systems, and sigma-delta conversion, and gives examples with sensor interfaces and class-D audio drivers. All systems and circuits are treated using a signal-flow view. The lecture is suitable for both analog and digital designers.

Objective
This lecture provides a wide overview over analog filters (continuous-time and discrete-time), signal-processing systems, and sigma-delta conversion, and gives examples with sensor interfaces and class-D audio drivers. All systems and circuits are treated using a signal-flow view. The lecture is suitable for both analog and digital designers. The way the exam is done allows for the different interests of the two groups.

Content
The learning goal is that the students can apply signal-flow graphs and can understand the signal flow in such circuits and systems (including non-ideal effects) well enough to gain an understanding of further circuits and systems by themselves.

At the beginning, signal-flow graphs in general and driving-point signal-flow graphs in particular are introduced. We will use them during the whole term to analyze circuits on a system level (analog continuous-time, analog discrete-time, mixed-signal and digital) and understand how signals propagate through them. The theory and CMOS implementation of active Filters is then discussed in detail using the example of Op-Amp filters and active-RC filters. The ideal and nonideal behaviour of opamps, current conveyors, and inductor integrators follows. The link to the practical design of circuits and systems is done with an overview over different quality measures and figures of merit used in scientific literature and datasheets. Finally, an introduction to discrete-time and mixed-domain filters and circuits is given, including sensor read-out amplifiers, correlated double sampling, and chopping, and an introduction to sigma-delta A/D and D/A conversion on a system level.

This lecture does not go down to the details of transistor implementations. The lecture "227-0166-00L Analog Integrated Circuits" complements this lecture very well in that respect.
Lecture notes

The base for these lectures are lecture notes and two or three published scientific papers. From these papers we will together develop the technical content.

Details: https://people.ee.ethz.ch/~haschmid/asfwiki/

The graph methods are also supported with teaching videos: https://tube.switch.ch/channels/d206cf96?order=episodes, and a Python-based open-source tool to manipulate graphs is available on https://github.com/hanspi42/signalfowgrapher

Some material is protected by password; students from ETHZ who are interested can write to haschmid@ethz.ch to ask for the password even if they do not attend the lecture.

Prerequisites / notice

Prerequisites: Recommended (but not required): Stochastic models and signal processing, Communication Electronics, Analog Integrated Circuits, Transmission Lines and Filters.

Knowledge of the Laplace transform and z transform and their interpretation (transfer functions, poles and zeros, bode diagrams, stability criteria ...) and of the main properties of linear systems is necessary.

227-0615-00L  Simulation of Photovoltaic Devices - From Materials to Modules - 3 credits  2G  U. Aeberhard

Abstract

The lecture provides an introduction to the theoretical foundations and numerical approaches for the simulation of photovoltaic power conversion, from the microscopic description of component materials to macroscopic continuum modelling of solar cells and network simulation or effective models for performance prediction of entire solar modules.

Objective

Get an overview of the current status of photovoltaic technology. Understand the physics of photovoltaic energy conversion and solar cell device operation. Know how to obtain and assess by simulation the key material properties and device parameters. Be able to use standard device simulation tools to analyze, optimize, and predict the performance of solar cells and modules.

Content

Photovoltaic technology: history and overview; The solar spectrum; Thermodynamics of solar energy conversion; Detailed balance models and efficiency limit; Microscopic rates of charge carrier generation and recombination; Optical simulation of solar cells; Models for charge transport in semiconductor devices; High-efficiency wafer-based (silicon) photovoltaics; Thin film photovoltaics based on disordered materials (amorphous silicon, organic PV); High-efficiency thin film photovoltaics (CIGS, CdTe, metal-halide perovskites); PV beyond the single junction detailed balance (Shockley-Queisser) limit; Simulation of photovoltaic modules; Energy yield and performance modelling for PV systems; Quantum simulation of nanostructure-based solar cell devices (bonus lecture).

Literature

<td>Maxwell's equations are reinterpreted in the framework of Einstein's special relativity theory using the Lagrangian formalism in order to discover the deep interconnection between the electric and magnetic field. Its daily relevance is emphasized by pinpointing how GPS atomic clocks in satellites and on the earth are affected by frequency shifts which can be explained only in terms of relativity. Only one aspect is left over: the fact that they are not invariant with respect to the classical Galilean transformation… On the contrary, Maxwell's equations predict that the light speed is the same for every inertial frame of reference. In this course, we will deepen how Einstein solved this clash elaborating the theory of &quot;special relativity&quot;. Maxwell's equations are thus naturally derived in a breath-taking fashion from the principle of stationary action within the Lagrangian formalism. Not only its elegance, but also the daily importance of the relativity theory will be finally highlighted explaining how the GPS can work only if operational principles of solar cells, batteries, and electrolysers, and (3) understand fundamental limits for each device type. In addition, the students will learn how to simulate these devices during guided exercise sessions and develop an intuitive understanding on how to interpret the most important device characteristics.</td>

227-0627-00L  Applied Computer Architecture  W  6 credits  4G  A. Gunzinger

Abstract
This lecture gives an overview of the requirements and the architecture of parallel computer systems, performance, reliability and costs.

Objective
Understand the function, the design and the performance modeling of parallel computer systems.

Content
The lecture "Applied Computer Architecture" gives technical and corporate insights in innovative Computer Systems/Architectures (CPU, GPU, FPGA, dedicated processors) and their real implementations and applications. Often the designs have to deal with technical limits. Which computer architecture allows the control of the over 1000 magnets at the Swiss Light Source (SLS) at the PSI? Which architecture is behind the alarm center of the Swiss Railway (SBB)? Which computer architectures are applied for driver assistance systems? Which computer architecture is hidden behind a professional digital audio mixing desk? How can data streams of about 30 TB/s, produced by a proton accelerator, be processed in real time? Can the weather forecast also be processed with GPUs? How could a fast trading system be set up for the stock exchange? How can a good computer architecture be found? Which are the driving factors in successful computer architecture design?

Lecture notes
Script and exercises sheets.

227-0653-00L Quantum Measurements and Optomechanics

Quantum Measurements and Optomechanics

W 6 credits 2V+2U M. Frimmer

Abstract

The measurement process is at the heart of both science and engineering. Measurement precision is ultimately limited by the laws of

Quantum mechanics. This course provides the knowledge necessary to understand current state-of-the-art quantum measurement systems

operating at their fundamental limits with a particular focus on optomechanical implementations.

Objective

The goal of this course is to understand the quantum limits of measurement precision together with a formal description of the

measurement process in the framework of quantum mechanics.

Content

The lecture starts with summarizing the relevant fundamentals of the treatment of noisy signals. We familiarize ourselves with the concept

of measurement imprecision in light-based measurement systems. To this end, we consider the process of photodetection and discuss the

statistical fluctuations arising from the quantization of the electromagnetic field into photons. We exemplify our insights at hand of concrete

examples, such as homodyne and heterodyne photodetection. Furthermore, we focus on the process of measurement backaction, the

inevitable result of the interaction of the probe with the system under investigation. We discuss the "standard quantum limit" as it arises

from the balance of measurement imprecision and backaction, before turning to approaches to overcome it and reach the fundamental

"Heisenberg limit". The course emphasizes the connection between the taught concepts and current state-of-the-art research carried out in

the field of optomechanics. Exercises serve to consolidate our understanding and insight.

227-0621-00L Emerging Memory Technologies

W 3 credits 1V+1U M. Yarema

Abstract

This course focuses on the current state and prospects of memory technologies, emerging beyond the silicon transistor era. We explore

resistive PCM and RRAM, magnetic MRAM and ferroelectric FRAM memories, covering physics, device aspects and the latest research in

the field. Through interactive lectures and laboratory sessions, students gain up-to-date knowledge and compare emerging memory techs.

Objective

In this course, students will learn about the leading contenders for post-silicon storage-class and main memory technologies. Decades of

research have yielded several efficient memory device working principles, including phase-change of the structure (PCM), materials

conversion (OxRAM), ion diffusion (CBRAM), magnetic properties (STT-MRAM, MTJ), and ferroelectricity (FRAM, FeFET). Currently, these

memory technologies are transitioning from research to industry, and are predicted to have at least niche applications in the ever-growing

hardware market. Some technologies, such as PCM, may even eventually surpass silicon-based flash memory, providing better

performance and unique features.

Students will have the opportunity to compare emerging memory technologies with state-of-the-art SSD Flash, DRAM, and SRAM, as well

as evaluate their potential. Through critical thinking discussions, students will acquire important skills for assessing the strengths and

limitations of these emerging technologies.
The course is organized as a series of lectures, focusing on selected memory technologies. This class also includes practical laboratory sessions for the PCM research topics. Students will spend 2 hours per week in the class or laboratory and additional 2-3 hours per week to prepare for the exam.

**Content**

The course explores the exciting realm of carbon-based nanoelectronics, where the remarkable quantum properties of materials like graphene, carbon nanotubes, graphene nanoribbons, and single molecules are used for building electronic devices.

**Objective**

The objective of this course is to understand how the electronic properties of carbon-based materials can be exploited for fabricating quantum devices. We will delve into both the theoretical and experimental aspects, discussing how these materials’ unique properties can be translated into device functionality.

On the theoretical side, we’ll cover how the chemical structure of the material and its dimensionality, ranging from 0D to 2D, affects the electronic properties. We’ll also discuss how charge carriers flow through the devices and what charge transport mechanisms are at play.

On the experimental side, we’ll cover how such devices are fabricated, including how the materials are synthesized. We’ll also discuss how to characterize the devices and assess their performance.

**Content**

The course will cover the following carbon-based materials:

- Single-molecule
- Graphene (single layer, bilayer, twisted bilayer)
- Graphene nanoribbons
- Carbon nanotubes

For each material, we will discuss:

- Electronic structure and charge transport properties
- Material synthesis and characterization
- Device integration and characterization

The course also includes a presentation by each student in which a related scientific publication is discussed. This presentation is compulsory and accounts for 30% of the grade.

**Lecture notes**

Lecture slides are distributed every week. In addition, relevant scientific articles and book chapters will be provided for self-study.

In addition to the slides, the following supplementary books can be recommended:

**Prerequisites / notice**

A basic knowledge of solid-state physics and quantum mechanics is required. The course is taught in English.

**Abstract**

Big Data, AI and the Internet of Things demand new hardware which overcomes the limitations of von Neumann architectures. The lecture gives an insight how the fundamental physics and the resulting complex functionalities of nanodevices and circuits offer viable alternatives. Their increased computational power and energy efficiency are demonstrated through neuromorphic computing applications.

The students will gain a firm understanding in the theory and pioneering experiments of electronic and heat transport at atomic- to nanometer length-scales. Advanced device functionalities enabled by recently discovered material systems will be covered. The students will learn how to exploit such phenomena for designing nanodevices and circuits to energy-efficiently implement neuromorphic algorithms for a sustainable future of information technologies.

The presentation slides and further material will be provided every week.

All the materials will be posted on the course website: https://safari.ethz.ch/architecture_seminar/

Prerequisites: Background in basics of semiconductor physics helpful, but not required.

227-2037-00L Physical Modelling and Simulation W 6 credits 4G J. Smajic
Abstract This module consists of (a) an introduction to fundamental equations of electromagnetics, mechanics and heat transfer, (b) a detailed overview of numerical methods for field simulations, and (c) practical examples solved in form of small projects.
Objective Basic knowledge of the fundamental equations and effects of electromagnetics, mechanics, and heat transfer. Knowledge of the main concepts of numerical methods for physical modelling and simulation. Ability (a) to develop own simple field simulation programs, (b) to select an appropriate field solver for a given problem, (c) to perform field simulations, (d) to evaluate the obtained results, and (e) to interactively improve the models until sufficiently accurate results are obtained.
Content The module begins with an introduction to the fundamental equations and effects of electromagnetics, mechanics, and heat transfer. After the introduction follows a detailed overview of the available numerical methods for solving electromagnetic, thermal and mechanical boundary value problems. This part of the course contains a general introduction into numerical methods, differential and integral forms, linear equation systems, Finite Difference Method (FDM), Boundary Element Method (BEM), Method of Moments (MoM), Multiple Multipole Program (MMP) and Finite Element Method (FEM). The theoretical part of the course finishes with a presentation of multiphysics simulations through several practical examples of HF-engineering such as coupled electromagnetic-mechanical and electromagnetic-thermal analysis of MEMS.

In the second part of the course the students will work in small groups on practical simulation problems. For solving practical problems the students can develop and use their own simulation programs or choose an appropriate commercial field solver for their specific problem. This practical simulation work of the students is supervised by the lecturers.

227-2211-00L Seminar in Computer Architecture W 2 credits 2S S. Sadrosadati, Y. Liang, O. Mutlu
Abstract In this seminar course, we will cover fundamental and cutting-edge research papers in computer architecture. The course will consist of multiple components that are aimed at improving students' technical skills in computer architecture, critical thinking and analysis on computer architecture concepts, as well as technical presentation of concepts and papers in both spoken and written forms.
Objective The main objective is to learn how to rigorously analyze and present papers and ideas on computer architecture. We will have rigorous presentation and discussion of selected papers during lectures and a written report presented by each student at the end of the semester. This course is for those interested in computer architecture. Registered students are expected to attend every lecture, participate in the discussion, and create a synthesis report at the end of the course.
Content Topics will center around computer architecture. We will, for example, discuss papers on hardware security; new execution paradigms like processing in memory; architectural acceleration mechanisms for key applications like machine learning, graph processing and bioinformatics; memory systems; interconnects; various fundamental and emerging paradigms in computer architecture; hardware/software co-design and cooperation; fault tolerance; energy efficiency; heterogeneous and parallel systems; technology scaling; new execution models, etc.

Prerequisites / notice Students should (1) have done very well in Digital Design and Computer Architecture, Digital Circuits or a similar course and (2) show a genuine interest in Computer Architecture.

151-0520-00L Embedded MEMS Lab W 5 credits 3P C. Hierold, A. Günther, M. Haluska
Abstract Practical course: Students are introduced to the process steps required for the fabrication of MEMS (Micro Electro Mechanical System) and carry out the fabrication and testing steps in the clean rooms by themselves. Additionally, they learn the requirements for working in clean rooms. Processing and characterization will be documented and analyzed in a final report.
Objective Students learn the individual process steps that are required to make a MEMS (Micro Electro Mechanical System). Students carry out the process steps themselves in laboratories and clean rooms. Furthermore, participants become familiar with the special requirements (cleanliness, safety, operation of equipment and handling hazardous chemicals) of working in the clean rooms and laboratories. The entire production, processing, and characterization of the MEMS is documented and evaluated in a final report.
Content

With guidance from a tutor, the individual silicon microsystem process steps that are required for the fabrication of an accelerometer are carried out:
- Photolithography, dry etching, wet etching, sacrificial layer etching, various cleaning procedures
- Packaging and electrical connection of a MEMS device
- Testing and characterization of the MEMS device
- Written documentation and evaluation of the entire production, processing and characterization

Lecture notes

A document containing theory, background and practical course content is distributed at the Introductory lecture day of the course.

The document provides sufficient information for the participants to successfully participate in the course.

Participants are required to attend all scheduled lectures and meetings of the course.

Participating students are required to provide proof that they have personal accident insurance prior to the start of the laboratory portion of the course.

For safety and efficiency reasons the number of participating students is limited. We regret to restrict access to this course by the following rules:

Priority 1: master students of the master's program in "Micro and Nanosystems"
Priority 2: master students of the master's program in "Mechanical Engineering" with a specialization in Microsystems and Nanoscale Engineering (MAVT-tutors Profs Daraio, Dual, Hierold, Koumoutsakos, Nelson, Norris, Poulikakos, Pratsinis, Stemmer), who attended the bachelor course "151-0621-00L Microsystems Technology" successfully.
Priority 3: master students, who attended the bachelor course "151-0621-00L Microsystems Technology" successfully.
Priority 4: all other students (PhD, bachelor, master) with a background in silicon or Microsystems process technology.

If there are more students in one of these priority groups than places available, we will decide by (in following order) best achieved grade from 151-0621-00L Microsystems Technology, registration to this practicum at previous semester, and by drawing lots.

Students will be notified at the first lecture of the course (introductory lecture) as to whether they are able to participate.

The course is offered in autumn and spring semester.

327-2210-00L Thin Films Technology - From Fundamentals to Oxide Electronics

Students who already took "327-2104-00L Inorganic Thin Films: Processing, Properties and Applications" AND "327-2132-00 Multifunctional Ferroic Materials: Growth and Characterisation" are not allowed to attend this course.

Abstract

Oxide films with a thickness of just a few atoms can now be grown with a precision matching that of semiconductors. This opens up a whole world of functional device concepts and fascinating phenomena that would not occur in the expanded bulk crystal.

We will give an introduction to thin films deposition techniques and applications with a focus on the growth of multifunctional oxide thin films.

Objective

In this course students will obtain an overarching view on thin film deposition techniques with a focus on epitaxial deposition processes.

The main learning objectives are:
- Identification of most relevant deposition technique for a given application.
- Understanding of growth mechanism and growth modes.
- Understanding strategies for engineering the functionalities of the films using the deposition process.
- Selection of the most appropriate characterization technique.
- Understanding device concepts and fundamental limits in the technology relevant ultra-thin limit.
- Assessing the relevance of scientific literature dealing with complex oxide thin films.

Content

A lab visit will be organized and students will participate to the design of thin films with atomic precision.

General description of the leading deposition routes including physical and chemical vapor deposition techniques (PVD and CVD) as well as so called "wet techniques" (e.g. spin coating and spray pyrolysis).

Growth modes and processes.

Part of the course discusses vacuum technologies.

Fundamental characterization techniques for application-relevant thin films as well as state of the art approaches for in situ and ex-situ determination of the structural, chemical and ferroic (ferromagnetic and ferroelectric) properties of films: (XRD for thin films, RHEED, EDX, scanning probe microscopy techniques, laser-optical characterization and many more).

Epitaxy for the advanced design and characterization of high quality thin films for energy efficient oxide electronics.

Types of ferroic order, multiferroics, multifunctional oxide materials, epitaxial strain related effects, oxide thin film based devices and examples.

Regular discussions on preselected scientific literature and mini-seminars will be organized.

Technology and Innovation Management

Abstract
This course focuses on the sources of innovation (with a specific focus on digital technologies), the tools and techniques that organizations deploy to innovate routinely, and the strategic implications of technical change at different levels of analysis: individuals, firms and whole ecosystems.

Objective
This course intends to enable all students to:
- Acquire and understand the basic jargon, concepts and methods necessary to discuss, in a precise and concise manner, innovation processes and their outcomes at different levels of analysis
- Analyze the differences between individual and organizational decision processes and their innovative outcomes
- Evaluate critically the potential of different (digital) technologies to impact business organizations.

Content
Organizations and people are faced with a fundamental decision: they have to allocate resources between well-known tasks that reliably generate positive results; or explore new ways of doing things, new technologies, products and services. The latter is a high risk choice. Its rewards can be high, but the chances of success are small. How do firms organize to take these decisions? What kind of management skills are necessary to take them? What kind of tools and methods are deployed to sustain managerial decision-making in highly volatile environments? These are the central questions on which this course focuses, relying on a combination of lectures, case-based discussion, and guest speakers.

363-0389-00L

Wearable and Mobile Technologies of the Future - Focus on Sports and Health

Abstract
The course introduces concepts about wearable and unobtrusive technologies for sport and health data collection. Tools for analysing this data and evaluating the performance of these systems are introduced. Topics such as monitoring movement and muscle activation, mental focus, stress, and heart health are covered.

Objective
1: Acquire knowledge about wearable and unobtrusive technologies and skills to process data acquired using wearable technologies.

2: Provide students with hands-on experience using various wearable technologies, including textile-based stretchable sensors, electromyography (EMG), electroencephalogram (EEG) and electrocardiogram (ECG).
The course consists of the following modules:

Module 0: Fundamentals
This module briefly reviews time-frequency domains, transforms and filtering.

Module 1: Movement.
This module provides the scientific background needed to understand the principles that current technologies investigating movement rely on. It provides an overview of wearable technologies for monitoring overall body movement as well as for tracking motion parameters (e.g. gait, running, posture). Technologies such as inertial measurement units, electromyography, optical motion capture systems, and others are covered. The latest updates on wearable-related (e.g., textile-based) technologies are also introduced. Students are involved in labs/assignments to put into practice the knowledge and skills acquired during this module.

Module 2: Brain.
This module briefly introduces brain functions and provides an overview of related wearable technologies. Topics covered may include electroencephalograms, transcranial magnetic stimulation, and galvanic vestibular stimulation. Data processing techniques such as common spatial patterns, principal component analysis, and linear discriminant analysis are introduced. Students are given a practical assignment to put into practice the knowledge and skills acquired during this module.

Module 3: Cardiac.
This module focuses on wearable technologies for monitoring cardiac health. The module starts by providing information on cardiac physiology and introduces wearable technologies for the heart. Topics such as electrocardiography, photoplethysmography, light sensing, and contactless psychology monitoring are introduced. Data analysis techniques for cardiac data including heart-rate variability, Poincare plots, and wavelet transforms are discussed. Students will be given an assignment to put into practice the knowledge and skills acquired during this module.

Prerequisites / notice
- Students should be proficient in programming (any language).
- Note: assignments will be in Python. Students are expected to learn Python on their own if not experienced with this programming language.
- Course prerequisites:
   - For Biomedical Engineering Master’s: none
   - For ITET Master’s: none
   - For D-MAVT Master’s: none
   - For D-HEST Master’s and PhD students:
     • If BSc in electrical/mechanical engineering or computer science: none
     • If any other BSc program: 376-0022-00L (Imaging and Computing in Medicine) or 376-1983-00L (Foundations of Data Science)

401-3055-64L Algebraic Methods in Combinatorics

W 5 credits 2V+1U not available

Abstract
Combinatorics is a fundamental mathematical discipline as well as an essential component of many mathematical areas, and its study has experienced an impressive growth in recent years. This course provides a gentle introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to other areas.

Objective
The students will get an overview of various algebraic methods for solving combinatorial problems. We expect them to understand the proof techniques and to use them autonomously on related problems.

Content
Combinatorics is a fundamental mathematical discipline as well as an essential component of many mathematical areas, and its study has experienced an impressive growth in recent years. While in the past many of the basic combinatorial results were obtained mainly by ingenuity and detailed reasoning, the modern theory has grown out of this early stage and often relies on deep, well-developed tools.

One of the main general techniques that played a crucial role in the development of Combinatorics was the application of algebraic methods. The most fruitful such tool is the dimension argument. Roughly speaking, the method can be described as follows. In order to bound the cardinality of a discrete structure A one maps its elements to vectors in a linear space, and shows that the set A is mapped to linearly independent vectors. It then follows that the cardinality of A is bounded by the dimension of the corresponding linear space. This simple idea is surprisingly powerful and has many famous applications.

This course provides a gentle introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to other areas. The topics covered in the class will include (but are not limited to):

Basic dimension arguments, Spaces of polynomials and tensor product methods, Eigenvectors of graphs and their application, the Combinatorial Nullstellensatz and the Chevalley-Warning theorem. Applications such as: Solution of Kakeya problem in finite fields, counterexample to Borsuk’s conjecture, chromatic number of the unit distance graph of Euclidean space, explicit constructions of Ramsey graphs and many others.

The course website can be found at https://moodle-app2.let.ethz.ch/course/view.php?id=15757

Lecture notes
Lectures will be on the blackboard only, but there will be a set of typeset lecture notes which follow the class closely.

Prerequisites / notice
Students are expected to have a mathematical background and should be able to write rigorous proofs.

402-0475-00L Terahertz Science and Applications

W 6 credits 2V+1U E. Abreu

Abstract
The Terahertz (THz) range (0.1 – 10 THz), lies between the infrared and microwave spectral regions and has become accessible in the past few years. This new capability has had great impact in scientific research, and has led to technological advances and to the development of a variety of applications and devices. This course provides an introduction to THz science, technology and applications.
Objective
The goal of this course is to enable students to determine whether a THz solution can be applied to a particular scientific or technological problem. Armed with the fundamentals of THz science and of current THz technologies, covered in this introductory course, students will be able to weigh the capabilities, advantages and limitations of THz tools to address topics ranging from phonons in solid state systems and molecular vibrations in solutions to medical imaging and wireless communications.

Lecture notes
Will be distributed via moodle.

Literature
Yun-Shik Lee, Principles of Terahertz Science and Technology, Springer 2009
Additional references distributed via moodle.

Prerequisites / notice
Basic knowledge in physics, especially in electromagnetism, is required. No formal prerequisites.

Track: Energy and Power Electronics
The core courses and specialisation courses below are a selection for students who wish to specialise in the area of “Energy and Power Electronics”, see https://www.ee.ethz.ch/studies/main-master/areas-of-specialisation.html.

The individual study plan is subject to the tutor's approval.

Core Courses
These core courses are particularly recommended for the field of “Energy and Power Electronics”. You may choose core courses from other fields in agreement with your tutor.

A minimum of 24 credits must be obtained from core courses during the MSc EEIT.

Foundation Core Courses
Fundamentals at bachelor level, for master students who need to strengthen or refresh their background in the area.

Abstract
Fields of application of power electronic converters; basic concept of switch-mode voltage and current conversion; derivation of circuit structures of non-isolated and isolated DC/DC converters, AC/DC- and DC/AC converter structures; analysis procedure and analysis of the operating behaviour and operating range; design criteria and design of main power components.

Objective
Fields of application of power electronic converters; basic concept of switch-mode voltage and current conversion; derivation of circuit structures of non-isolated and isolated DC/DC converters, AC/DC- and DC/AC converter structures; analysis procedure and analysis of the operating behaviour and operating range; design criteria and design of main power components.

Content
Fields of application and application examples of power electronic converters, basic concept of switch-mode voltage and current conversion, pulse-width modulation (PWM); derivation and operating modes (continuous and discontinuous current mode) of DC/DC converter topologies, buck / boost / buck-boost converter; extension to DC/AC conversion using differences of unipolar output voltages varying over time; single-phase diode rectifier; boost-type PWM rectifier featuring sinuousoidal input current; tolerance band AC current control and cascaded output voltage control with inner constant switching frequency current control; local and global averaging of switching frequency discontinuous quantities for calculation of component stresses; three-phase AC/DC conversion, center-tap rectifier with impressed output current, thyristor function, thyristor center-tap and full-bridge converter, rectifier and inverter operation, control angle and recovery time, inverter operation limit; basics of inductors and single-phase transformers, design based on scaling laws; isolated DC/DC converter, flyback and forward converter, single-switch and two-switch circuit; single-phase DC/AC conversion, four-quadrant converter, unipolar and bipolar modulation, fundamental frequency model of AC-side operating behaviour; three-phase DC/AC converter with star-connected three-phase load, zero sequence (common-mode) and current forming differential-mode output voltage components, fundamental frequency modulation and PWM with singe triangular carrier and individual carrier signals of the phases.

Lecture notes
Lecture notes and associated exercises including correct answers, simulation program for interactive self-learning including visualization/animation features.

Prerequisites / notice
Prerequisites: Basic knowledge of electrical engineering / electric circuit analysis and signal theory.

Fundamentals of Electric Machines

227-0517-10L

Abstract
This course introduces different electric machine concepts and provides a deeper understanding of their detailed operating principles. Different aspects arising in the design of electric machines, like dimensioning of magnetic and electric circuits as well as consideration of mechanical and thermal constraints, are investigated. The exercises are used to consolidate the concepts discussed.

Objective
The objective of this course is to convey knowledge on the operating principles of different types of electric machines. Further objectives are to evaluate machine types for given specifications and to acquire the ability to perform a rough design of an electrical machine while considering the versatile aspects with respect to magnetic, electrical, mechanical and thermal limitations. Exercises are used to consolidate the presented theoretical concepts.

Content
- Fundamentals in magnetic circuits and electromechanical energy conversion.
- Force and torque calculation.
- Operating principles, magnetic and electric modelling and design of different electric machine concepts: DC machine, AC machines (permanent magnet synchronous machine, reluctance machine and induction machine).
- Complex space vector notation, rotating coordinate system (dq-transformation).
- Loss components in electric machines, scaling laws of electromechanical actuators.
- Mechanical and thermal modelling.

227-0117-00L High Voltage Engineering W 6 credits 4G C. Franck, U. Straumann

Abstract
High electric fields are used in numerous technological and industrial applications such as electric power transmission and distribution, X-ray devices, DNA sequencers, flue gas cleaning, power electronics, lasers, particle accelerators, copying machines, .... High Voltage Engineering is the art of gaining technological control of high electrical field strengths and high voltages.

Objective
The students know the fundamental phenomena and principles associated with the occurrence of high electric field strengths. They understand the different mechanisms leading to the failure of insulation systems and are able to apply failure criteria on the dimensioning of high voltage components. They have the ability to identify of weak spots in insulation systems and to propose options for improvement. Further, they know the different insulation systems and their dimensioning in practice.

Content
- discussion of the field equations relevant for high voltage engineering.
- analytical and numerical solutions/solving of this equations, as well as the derivation of the important equivalent circuits for the description of the fields and losses in insulations
- introduction to kinetic gas theory
- mechanisms of the breakdown in gaseous, liquid and solid insulations, as well as insulation systems
- methods for the mathematical determination of the electric withstand of gaseous, liquid and solid insulations
- application of the expertise on high voltage components
- excursions to manufacturers of high voltage components

<tr>
<td>Abstract</td>
<td>The course is about some fundamental topics of digital signal processing with a bias towards applications in communications: discrete-time linear filters, inverse filters and equalization, DFT, discrete-time stochastic processes, elements of detection theory and estimation theory, LMMSE estimation and LMMSE filtering, LMS algorithm, Viterbi algorithm.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>The course is about some fundamental topics of digital signal processing with a bias towards applications in communications. The two main themes are linearity and probability. In the first part of the course, we deepen our understanding of discrete-time linear filters. In the second part of the course, we review the basics of probability theory and discrete-time stochastic processes. We then discuss some basic concepts of detection theory and estimation theory, as well as some practical methods including LMMSE estimation and LMMSE filtering, the LMS algorithm, and the Viterbi algorithm. A recurrent theme throughout the course is the stable and robust &quot;inversion&quot; of a linear filter.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Content
1. Discrete-time linear systems and filters:
   - state-space realizations, z-transform and spectrum,
   - decimation and interpolation, digital filter design,
   - stable realizations and robust inversion.

2. The discrete Fourier transform and its use for digital filtering.

3. The statistical perspective:
   - probability, random variables, discrete-time stochastic processes;
   - detection and estimation: MAP, ML, Bayesian MMSE, LMMSE;
   - Wiener filter, LMS adaptive filter, Viterbi algorithm.

### Lecture notes
- Wiener filter, LMS adaptive filter, Viterbi algorithm.

---

### Lecture Notes

#### 227-0103-00L Control Systems

**Abstract**
Study of concepts and methods for the mathematical description and analysis of dynamical systems. The concept of feedback. Design of control systems for single input - single output and multivariable systems.

**Objective**
Study of concepts and methods for the mathematical description and analysis of dynamical systems. The concept of feedback. Design of control systems for single input - single output and multivariable systems.

**Content**

**Literature**

**Prerequisites / notice**
- Prerequisites: Signal and Systems Theory II.
- MATLAB is used for system analysis and simulation.

---

#### 227-0121-00L Communication Systems

**Abstract**
The course teaches the fundamentals of digital communication systems. The main topics are analog and digital modulation, signals and linear time-invariant systems, baseband and passband representations, continuous-time and discrete-time channels, noise, inter-symbol interference, detection theory, as well as the basics of forward error correction and information theory.

**Objective**
After attending the lectures, participating in the exercise sessions, and working on the homework problems (which include MATLAB coding assignments), the students will be able to:
- understand the fundamentals of digital communication systems
- explain the principles of modulation, demodulation, detection, and error correction
- analyze error rates of simple digital communication systems
- implement simple MATLAB simulations to calculate error rates

**Content**
The course focuses on the fundamentals of digital communication systems. The course starts with analog modulation and discusses the main building blocks of modern digital communication systems. The topics include:
- essential components of digital communication systems
- analog and digital modulation
- baseband and passband representation; up- and down-conversion
- communication channels as LTI systems
- discretizing communication systems; sampling and quantization
- noise, signal-to-noise ratio (SNR), and interference
- detection theory and error rates
- basics of forward error correction
- basics of information theory
- orthogonal frequency-division multiplexing (OFDM)
- building blocks of modern communication systems

**Lecture notes**
Lecture notes will be distributed electronically at the beginning of the semester.

**Literature**

**Competencies**
- Subject-specific Competencies
  - Concepts and Theories
  - Techniques and Technologies
- Method-specific Competencies
  - Analytical Competencies
  - Problem-solving
- Personal Competencies
  - Critical Thinking
  - Integrity and Work Ethics

---

#### 227-0225-00L Linear System Theory

**Abstract**
The class is intended to provide a comprehensive overview of the theory of linear dynamical systems, stability analysis, and their use in control and estimation. The focus is on the mathematics behind the physical properties of these systems and on understanding and constructing proofs of properties of linear control systems.

**Objective**
Students should be able to apply the fundamental results in linear system theory to analyze and control linear dynamical systems.

**Content**
- Linear spaces, normed linear spaces and Hilbert spaces.
- Ordinary differential equations, existence and uniqueness of solutions.
- Continuous and discrete-time, time-varying linear systems. Time domain solutions. Time invariant systems treated as a special case.
- Controllability and observability, duality. Time invariant systems treated as a special case.
- Stability and stabilization, observers, state and output feedback, separation principle.

**Lecture notes**
Available on the course Moodle platform.

**Prerequisites / notice**
- Sufficient mathematical maturity, in particular in linear algebra, analysis.
Fundamentals of Electric Machines  

**227-0517-10L**

**W 6 credits 4G**  
D. Bortis

**Abstract**
This course introduces to different electric machine concepts and provides a deeper understanding of their detailed operating principles. Different aspects arising in the design of electric machines, like dimensioning of magnetic and electric circuits as well as consideration of mechanical and thermal constraints, are investigated. The exercises are used to consolidate the concepts discussed.

**Objective**
The objective of this course is to convey knowledge on the operating principles of different types of electric machines. Further objectives are to evaluate machine types for given specifications and to acquire the ability to perform a rough design of an electrical machine while considering the versatile aspects with respect to magnetic, electrical, mechanical and thermal limitations. Exercises are used to consolidate the presented theoretical concepts.

**Content**
- Fundamentals in magnetic circuits and electromechanical energy conversion.
- Force and torque calculation.
- Operating principles, magnetic and electric modelling and design of different electric machine concepts: DC machine, AC machines (permanent magnet synchronous machine, reluctance machine and induction machine).
- Complex space vector notation, rotating coordinate system (dq-transformation).
- Loss components in electric machines, scaling laws of electromechanical actuators.
- Mechanical and thermal modelling.

**Lecture notes**
Lecture notes and associated exercises including correct answers

Railway Systems I  

**227-0523-00L**

**W 6 credits 4G**  
M. Meyer

**Abstract**
Basic characteristics of railway vehicles and their interfaces with the railway infrastructure:
- Transportation tasks and vehicle types
- Running dynamics
- Mechanical part of rail vehicles
- Brakes
- Traction chain and auxiliary supply
- Railway power supply
- Signalling systems
- Standards
- Availability and safety
- Traffic control and maintenance
- Overview of the technical characteristics of railway systems
- Know-how about the design and construction principles of rail vehicles
- Interrelationship between different fields of engineering sciences (mechanics, electro and information technology, transport systems)
- Understanding tasks and opportunities of engineers working in an environment which has strong economical and political boundaries
- Insight into the activities of the railway vehicle industry and railway operators in Switzerland
- Motivation of young engineers to start a career in the railway industry or with railway operators

**Objective**
- Overview of the technical characteristics of railway systems
- Know-how about the design and construction principles of rail vehicles
- Interrelationship between different fields of engineering sciences (mechanics, electro and information technology, transport systems)
- Understanding tasks and opportunities of engineers working in an environment which has strong economical and political boundaries
- Insight into the activities of the railway vehicle industry and railway operators in Switzerland
- Motivation of young engineers to start a career in the railway industry or with railway operators

**Content**
EST I (Herbstsemester) - Begriffen, Grundlagen, Merkmale

1. Einführung:
   1.1 Geschichte und Struktur des Bahnsystems
   1.2 Fahrdynamik

2. Vollbahnfahrzeuge:
   2.1 Mechanik: Kasten, Drehgestelle, Lauftechnik, Adhäsion
   2.2 Bremsen
   2.3 Traktionsantriebssysteme
   2.4 Hilfsbetriebe und Komfortanlagen
   2.5 Steuerung und Regelung

3. Infrastruktur:
   3.1 Fahrweg
   3.2 Bahnstromversorgung
   3.3 Sicherungsanlagen

4. Betrieb:
   4.1 Interoperabilität, Normen und Zulassung
   4.2 RAMS, LCC
   4.3 Anwendungsbeispiele

Voraussichtlich ein oder zwei Gastreferate

Geplante Exkursionen:
- Betriebszentrale SBB, Zürich Flughafen
- Reparatur und Unterhalt, SBB Zürich Altstetten
- Fahrzeugfertigung, Stadler Bussnang

**Lecture notes**
Abgabe der Unterlagen (gegen eine Schutzgebühr) zu Beginn des Semesters. Rechtzeitig eingeschriebene Teilnehmer können die Unterlagen auf Wunsch und gegen eine Zusatzgebühr auch in Farbe beziehen.
Prerequisites / notice

Dozent: Dr. Markus Meyer, Emkamatik GmbH

Voraussichtlich ein oder zwei Gastvorträge von anderen Referenten.

EST I (Herbstsemester) kann als in sich geschlossene einsemestrige Vorlesung besucht werden. EST II (Frühjahrssemester) dient der weiteren Vertiefung der Fahrzeugtechnik und der Integration in die Bahninfrastruktur.

227-0536-00L Multiphysics Simulations for Power Systems W 4 credits 2V+2U J. Smajic

This course is defined so and planned to be an addition to the module "227-0537-00L Technology of Electric Power System Components". However, the students who are familiar with the fundamentals of electromagnetic fields could attend only this course without its 227-0537-00-complement.

Abstract

The goals of this course are a) understanding the fundamentals of the electromagnetic, thermal, mechanical, and coupled field simulations and b) performing effective simulations of primary equipment of electric power systems. The course is understood complementary to 227-0537-00L "Technology of Electric Power System Components", but can also be taken separately.

Objective

The student should learn the fundamentals of the electromagnetic, thermal, mechanical, and coupled fields simulations necessary for modern product development and research based on virtual prototyping. She / he should also learn the theoretical background of the finite element method (FEM) and its application to low- and high-frequency electromagnetic field simulation problems. The practical exercises of the course should be done by using one of the commercially available field simulation software (Infolytica, ANSYS, and / or COMSOL). After completing the course the student should be able to properly and efficiently use the software to simulate practical design problems and to understand and interpret the obtained results.

Content

1. Electromagnetic Fields and Waves: Simulation Aspects (1 lecture, 2 hours)
   a. Short review of the governing equations
   b. Boundary conditions
   c. Initial conditions
   d. Linear and nonlinear material properties
   e. Coupled fields (electro-mechanical and electro-thermal coupling)

2. Finite Element Method for electromagnetic simulations (5 lectures and 3 exercises, 16 hours)
   a. Scalar-FEM in 2-D (electrostatic, magnetostatic, eddy-currents, etc.)
   b. Vector-FEM in 3-D (3-D eddy-currents, wave propagation, etc.)
   c. Numerical aspects of the analysis (convergence, linear solvers, preconditioning, mesh quality, etc.)
   d. Matlab code for 2-D FEM for learning and experimenting

3. Practical applications (5 lectures and 5 exercises, 20 hours)
   a. Dielectric analysis of high-voltage equipment
   b. Nonlinear quasi-electrostatic analysis of surge arresters
   c. Eddy-currents analysis of power transformers
   d. Electromagnetic analysis of electric machines
   e. Very fast transients in gas insulated switchgear (GIS)
   f. Electromagnetic compatibility (EMC)

227-0567-00L Design of Power Electronic Systems W 6 credits 4G F. Krismer

Abstract

Complete design process: from given specifications to a complete power electronic system: selection / design of suitable passive power components; static and dynamic properties of power semiconductors; optimized EMI filter design; heat sink optimization; additional circuitry, e.g. gate driver; system optimization.

Objective

Basic knowledge of design and optimization of a power electronic converter system; furthermore, lecture and exercises thoroughly discuss key subjects of power electronics that are important with respect to a practical realization, e.g. how to select or design suitable power components, to understand switching operations, calculation of high frequency losses, EMI filter design and realization, thermal considerations.

Content

Complete design process: from given specifications to a complete power electronic system.

Selection and / or design of suitable passive power components: specific properties, parasitic components, tolerances, high frequency losses, thermal considerations, reliability.

Static and dynamic characteristics of power semiconductors.

Optimized design of the EMI filter.

Thermal characterization of the converter, optimized heat sink design.

Additional circuitry: gate driver, measurement, control.

Converter start up: typical sequence of events, circuitry required.

Overall system optimization: identifying couplings between different components of the considered power electronic system, optimization targets and issues.

Lecture notes

Lecture notes and complementary exercises including correct answers.

Prerequisites / notice

Prerequisites: Introductory course on power electronics.

227-0617-00L Solar Cells W 4 credits 3G Y. Romanyuk, R. Carron

Abstract

Physics, technology, characteristics and applications of photovoltaic solar cells and systems.

The students will appreciate the potential of solar radiation and photovoltaics, will learn the physics and technology of various solar cells, and will get to know the design basics of PV modules and systems for different applications.
Introduction to photovoltaics and economic aspects, solar radiation, semiconductor physics and operation of solar cells, technology of wafer-based (Si, GaAs, multi-junction) and thin-film (CIGS, CdTe, perovskite) solar cells, emerging technologies, design of PV modules, systems and plants including system components such as inverters and controllers, engineering procedures with software demonstration, integration in buildings and other specific examples such concentrated photovoltaics and power generation for space applications.

Modeling, Characterization and Reliability of Power Semiconductors

W
6 credits
4G

Abstract
This lecture provides theoretical and experimental knowledge on the techniques for the characterization and numerical modeling of power semiconductors, as well as on the related built-in reliability strategies.

Objective
The students shall get acquainted with the most important concepts and techniques for characterization, numerical modeling and built-in reliability of modern power semiconductor devices. This knowledge is intended to provide the future engineer with the theoretical background and tools for the design of dependable power devices and systems.

Content
This lecture consists of a theoretical part (50%) and of laboratory exercises and demonstrations (50%). The theoretical part covers the basic techniques and procedures for characterization, modeling and built-in reliability of modern power semiconductor devices with special attention to MOS and IGBT. The starting part on technology provides an overview on the main device families and includes a review of the most relevant application-oriented aspects of the device physics, thermal management, and packaging. The second section deals with the basic experimental characterization techniques for the definition of the semiconductor material properties, electrical characteristics, safe operating area, and junction temperature of the devices. The final section introduces the basic principles for electrical, thermal, and electro-thermal simulation of power semiconductors by Technology Computer Aided Design (TCAD) and compact modeling. Finally, procedures are presented to implement efficient built-in reliability programs targeted on power semiconductors. They include failure physics, dedicated failure analysis techniques, accelerated testing, defect screening, and lifetime modeling.

During the laboratory activities, selections of the experimental techniques presented in the lecture are demonstrated on the basis of realistic examples. Furthermore, schematic power devices will be simulated by the students with advanced TCAD tools and circuit simulators.

227-0619-00L
Charge Transport in Energy Conversion and Storage Devices

W
6 credits
2V+2U

Abstract
The students will be introduced to the fundamental concepts of charge transport in solar cells, batteries, and electrolysers. Emphasizing analogies between semiconductor physics and electrochemistry, this course is designed to provide a unified modern perspective of energy conversion and storage concepts for students in electrical engineering, materials science, physics, and chemistry.

Objective
By the end of this course, the students will (1) understand the fundamentals of electronic and ionic charge transport, (2) understand the operational principles of solar cells, batteries, and electrolysers, and (3) understand fundamental limits for each device type. In addition, the students will learn how to simulate these devices during guided exercise sessions and develop an intuitive understanding on how to interpret the most important device characteristics.

Literature
R. Huggins, Advanced Batteries, DOI:10.1007/9780387764245

Prerequisites / notice
Be motivated to change the world to renewable energies!

This course is taught simultaneously at ETH Zurich and EPFL. All lectures will be recorded live from ETH Zurich with four lectures taught onsite at EPFL Lausanne.

A visit to Empa's Energy Conversion and Storage Labs will be organized during the semester. Possibility to interact and meet your classmates from EPFL via online lecture platform and during two special lectures with guest lecturers from industry (one guest lecture by ABB at ETH Zurich, one guest lecture by Northvolt at EPFL). Travel expenses for students will be covered.

Elements of calculus will be reviewed during the lectures, where necessary, but we leave the hard work of solving coupled differential charge transport equations to the computer and focus on developing a strong intuition. Prior knowledge in semiconductor physics or electrochemistry is an advantage, but not a prerequisite.

Industrial Process Control

W
4 credits
3G

Abstract
Introduction to industrial automation systems with application to the process industry, power generation as well as discrete manufacturing.

Objective
General understanding of industrial automation systems in different industries. Purpose, architecture, technologies, application examples, current and future trends.

Content
Introduction to process automation: system architecture, data handling, communication (fieldbuses), process visualization, and engineering. Differences and characteristics of discrete and process industries. Analysis and design of open loop control problems: discrete automata, finite state machines, decision tables, and petri-nets. Practical analysis and design of closed-loop control for the process industry.

Automation Engineering: Application programming in IEC 61131-3 (ladder diagrams, function blocks, sequence control, structured text); PLC programming and simulation, process visualization and operation; engineering integration from sensors, cabling, topology design, function, visualization, diagnosis, to documentation; Industry standards (e.g. OPC, Profibus); Ergonomic design, safety (IEC61508) and availability, supervision and diagnosis.

Automation standards: Communication, Architecture, Engineering, dependable systems, functional safety, automation security. Extensive practical examples from different process industries, power generation, gas compressor control, and automotive manufacturing.

Lecture notes
Literature
References will be given at the end of individual lectures.

Prerequisites / notice
Exercises: Tuesdays after the lecture (applies not to all lectures)

Practical exercises will illustrate some topics, e.g. some control software coding using industry standard programming tools based on IEC61131-3.
Track: Systems and Control

The core courses and specialisation courses below are a selection for students who wish to specialise in the area of “Systems and Control”, see https://www.ee.ethz.ch/studies/main-master/areas-of-specialisation.html.

The individual study plan is subject to the tutor’s approval.

Core Courses

These core courses are particularly recommended for the field of “Systems and Control”. You may choose core courses form other fields in agreement with your tutor.

A minimum of 24 credits must be obtained from core courses during the MSc EEIT.

Foundation Core Courses

Fundamentals at bachelor level, for master students who need to strengthen or refresh their background in the area.

- **151-0371-00L** Advanced Model Predictive Control: Subject-specific Competencies are assessed.
- **151-0563-01L** Dynamic Programming and Optimal Control: Lectures notes will be provided.

**Literature**

**Course Details**
- **227-0225-00L** Linear System Theory
  - **Objective**: Students should be able to apply the fundamental results in linear system theory to analyze and control linear dynamical systems.

- **227-0697-00L** Industrial Process Control
  - **Abstract**: Introduction to industrial automation systems with application to the process industry, power generation as well as discrete manufacturing.
  - **Objective**: General understanding of industrial automation systems in different industries. Purpose, architecture, technologies, application examples, current and future trends.
  - **Content**: Analysis and design of open loop control problems: discrete automata, finite state machines, decision tables, and petri-nets. Practical analysis and design of closed-loop control for the process industry. Automation Engineering: Application programming in IEC 61131-3 (ladder diagrams, function blocks, sequence control, structured text); PLC programming and simulation, process visualization and operation; engineering integration from sensors, cabling, topology design, function, visualization, diagnosis, to documentation; Industry standards (e.g. OPC, Profibus); Ergonomic design, safety (IEC61508) and availability, supervision and diagnosis.

- **151-0371-00L** Advanced Model Predictive Control
  - **Abstract**: Model predictive control (MPC) has established itself as a powerful control technique for complex systems under state and input constraints. This course discusses the theory and application of recent advanced MPC concepts, focusing on system uncertainties and safety, as well as data-driven formulations and learning-based control.
  - **Objective**: Design, implement and analyze advanced MPC formulations for robust and stochastic uncertainty descriptions, in particular with data-driven formulations.

- **151-0563-01L** Dynamic Programming and Optimal Control
  - **Abstract**: Introduction to Dynamic Programming and Optimal Control. Covers the fundamental concepts of Dynamic Programming & Optimal Control.
  - **Objective**: Dynamic Programming Algorithm; Deterministic Systems and Shortest Path Problems; Infinite Horizon Problems, Bellman Equation; Deterministic Continuous-Time Optimal Control.

MATLAB is used for system analysis and simulation.
Prerequisites / notice

Requirements: Knowledge of advanced calculus, introductory probability theory, and matrix-vector algebra.

Specialisation Courses

These specialisation courses are particularly recommended for the area of "Systems and Control", but you are free to choose courses from any other field in agreement with your tutor.

A minimum of 40 credits must be obtained from specialisation courses during the Master's Programme.

<td>Discrete Event Systems</td>
<td>W</td>
<td>6</td>
<td>4G</td>
<td>L. Vanbever, L. Josipovic, B. Keller, R. Wattenhofer</td>
</tr>
</tbody>
</table>

Abstract

Introduction to discrete event systems. We start out by studying popular models of discrete event systems. Then we analyze discrete event systems from an average-case and from a worst-case perspective, and study verification. Topics include: Automata and Languages, Specification Models, Stochastic Discrete Event Systems, Worst-Case Event Systems, Verification, Petri Nets.

Objective

Over the past few decades the rapid evolution of computing, communication, and information technologies has brought about the proliferation of new dynamic systems. A significant part of activity in these systems is governed by operational rules designed by humans. The dynamics of these systems are characterized by asynchronous occurrences of discrete events, some controlled (e.g. hitting a keyboard key, sending a message), some not (e.g. spontaneous failure, packet loss).

The mathematical arsenal centered around differential equations that has been employed in systems engineering to model and study processes governed by the laws of nature is often inadequate or inappropriate for discrete event systems. The challenge is to develop new modeling frameworks, analysis techniques, design tools, testing methods, and optimization processes for this new generation of systems.

In this lecture we give an introduction to discrete event systems. We start out the course by exploring the limits of what is computable and what is not. In doing so, we will consider three distinct models of computation which are often used to model discrete event systems: finite automata, push-down automata and Turing machines (ranked in terms of expressiveness power). In the second part of the course we analyze discrete event systems from an average-case perspective: we model discrete events as stochastic processes, and then apply continuous time markov chains and queueing theory for an understanding of the typical behavior of a system. Then we analyze discrete event systems from a worst-case perspective using the theory of online algorithms and adversarial queueing. In the last part of the course we introduce methods that allow to formally verify certain properties of Finite Automata and Petri Nets. These are some typical analysis questions we will look at: Do two given systems behave the same? Does a given system behave as intended? Does the system eventually enter a dangerous state?

Content

1. Regular Languages
2. Non-Regular Languages
3. Markov Chains
4. Stochastic Discrete Event Systems
5. Worst-Case Event Systems
6. Verification of Finite Automata
7. Petri Nets

[schickinger] Diskrete Strukturen (Band 2: Wahrscheinlichkeitstheorie und Statistik)
T. Schickinger, A. Steger
Springer, Berlin, 2001

[sipser] Introduction to the Theory of Computation
Michael Sipser.
The course includes the development of stationary models of the electrical network, their mathematical representation and special characteristics and solution methods of large linear and non-linear systems of equations related to electrical power networks.

Objectives:
- Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

Content:
- This course aims at offering a self-contained account of computer vision and its underlying concepts, including the recent use of deep learning.
- The first part starts with an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First the interaction of light with matter is considered. The most important hardware components such as cameras and illumination sources are also discussed. The course then turns to image discretization, necessary to process images by computer.
- The next part describes necessary pre-processing steps, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and 3D shape as two important examples. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed. A major part at the end is devoted to deep learning and AI-based approaches to image analysis. Its main focus is on object recognition, but also other examples of image processing using deep neural nets are given.

Lecture notes:
- Course material Script, computer demonstrations, exercises and problem solutions
- Prerequisites:
  - Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Python and Linux.
  - The course language is English.
Content

(1) Basic facts about nonlinear systems: Existence, uniqueness, and dependence on initial data.

(2) Near equilibrium dynamics: Linear and Lyapunov stability

(3) Bifurcations of equilibria: Center manifolds, normal forms, and elementary bifurcations

(4) Nonlinear dynamical systems on the plane: Phase plane techniques, limit sets, and limit cycles.

(5) Time-dependent dynamical systems: Floquet theory, Poincaré maps, averaging methods, resonance

Lecture notes

The class lecture notes will be posted electronically after each lecture. Students should not rely on these but prepare their own notes during the lecture.

Prerequisites / notice

- Prerequisites: Analysis, linear algebra and a basic course in differential equations.

Abstract

Introduction to Dynamic Programming and Optimal Control.

Objective

Covers the fundamental concepts of Dynamic Programming & Optimal Control.

Content

Dynamic Programming Algorithm; Deterministic Systems and Shortest Path Problems; Infinite Horizon Problems, Bellman Equation; Deterministic Continuous-Time Optimal Control.

Literature

Prerequisites / notice

- Requirements: Knowledge of advanced calculus, introductory probability theory, and matrix-vector algebra.

Abstract

Rehabilitation Engineering is the application of science and technology to ameliorate the handicaps of individuals with disabilities to reintegrate them into society. The goal is to present classical and new rehabilitation engineering principles applied to compensate or enhance motor, sensory, and cognitive deficits. Focus is on the restoration and treatment of the human sensory and vegetative system.

Objective

Provide knowledge on the anatomy and physiology of the human sensory system, related dysfunctions and pathologies, and how rehabilitation engineering can provide sensory restoration and substitution.

Content

Introduction, problem definition, overview
- Rehabilitation of visual function
  - Anatomy and physiology of the visual sense
  - Technical aids (glasses, sensor substitution)
  - Retina and cortex implants
- Rehabilitation of hearing function
  - Anatomy and physiology of the auditory sense
  - Hearing aids
  - Cochlea Implants
- Rehabilitation and use of kinesthetic and tactile function
  - Anatomy and physiology of the kinesthetic and tactile sense
  - Tactile/haptic displays for motion therapy (incl. electrical stimulation)
  - Role of displays in motor learning
- Rehabilitation of vestibular function
  - Anatomy and physiology of the vestibular sense
  - Rehabilitation strategies and devices (e.g. BrainPort)
- Rehabilitation of vegetative Functions
  - Cardiac Pacemaker
  - Phrenic stimulation, artificial breathing aids
  - Bladder stimulation, artificial sphincter
- Brain stimulation and recording
  - Deep brain stimulation for patients with Parkinson, epilepsy, depression
  - Brain-Computer Interfaces
Literature

Introductory Books:

Selected Journal Articles and Web Links:

Prerequisites / notice
VideoTact, ForeThought Development, LLC. http://my.execpc.com/?dwysocki/videotac.html

Target Group:
- Students of higher semesters and PhD students of
  - D-MAVT, D-ITET, D-INFK, D-HEST
  - Biomedical Engineering, Robotics, Systems and Control
  - Medical Faculty, University of Zurich
- Students of other departments, faculties, courses are also welcome

This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.

Competencies

Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: assessed
- Media and Digital Technologies: fostered
- Problem-solving: assessed

Social Competencies
- Communication: fostered
- Leadership and Responsibility: fostered

Personal Competencies
- Creative Thinking: fostered
- Critical Thinking: assessed
- Integrity and Work Ethics: fostered

Abstract

Introduction to Mathematical Optimization

W 5 credits 2V+1U  D. Adjiashvili

Objective

Introduction to basic techniques and problems in mathematical optimization, and their applications to a variety of problems in engineering.

The goal of the course is to obtain a good understanding of some of the most fundamental mathematical optimization techniques used to solve linear programs and basic combinatorial optimization problems. The students will also practice applying the learned models to problems in engineering.

Content

Topics covered in this course include:
- Linear programming (simplex method, duality theory, shadow prices, ...).
- Basic combinatorial optimization problems (spanning trees, shortest paths, network flows, ...).
- Modelling with mathematical optimization: applications of mathematical programming in engineering.
The goal of this course is to get a thorough understanding of various classical mathematical optimization techniques for linear and combinatorial optimization problems. The students will get an overview of various algebraic methods for solving combinatorial problems. We expect them to understand the adaptability and flexibility fostered by these methods and to use them autonomously on related problems.

**Abstract**

Key topics include:
- Linear programming and polyhedra;
- Flows and cuts;
- Combinatorial optimization problems and polyhedral techniques;
- Equivalence between optimization and separation.

**Literature**

**Prequisites / notice**

Solid background in linear algebra.

**Competencies**

Subject-specific Competencies
- Concepts and Theories assessed
- Techniques and Technologies fostered

Method-specific Competencies
- Analytical Competencies assessed
- Decision-making assessed
- Media and Digital Technologies fostered
- Problem-solving assessed
- Project Management fostered

Social Competencies
- Communication assessed
- Cooperation and Teamwork fostered
- Sensitivity to Diversity fostered

Personal Competencies
- Adaptability and Flexibility fostered
- Creative Thinking assessed
- Critical Thinking assessed
- Integrity and Work Ethics fostered
- Self-awareness and Self-reflection fostered
- Self-direction and Self-management fostered

**Literature**

http://www.csb.ethz.ch/education/lectures.html

Combinatorics is a fundamental mathematical discipline as well as an essential component of many mathematical areas, and its study has experienced an impressive growth in recent years. While in the past many of the basic combinatorial results were obtained mainly by ingenuity and detailed reasoning, the modern theory has grown out of this early stage and often relies on deep, well-developed tools.

One of the main general techniques that played a crucial role in the development of Combinatorics was the application of algebraic methods. The most fruitful such tool is the dimension argument. Roughly speaking, the method can be described as follows. In order to bound the cardinality of a discrete structure $A$ one maps its elements to vectors in a linear space, and shows that the set $A$ is mapped to linearly independent vectors. It then follows that the cardinality of $A$ is bounded by the dimension of the corresponding linear space. This simple idea is surprisingly powerful and has many famous applications.

This course provides a gentle introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to other areas. The topics covered in the class will include (but are not limited to):

- Basic dimension arguments, Spaces of polynomials and tensor product methods, Eigenvalues of graphs and their application, the Combinatorial Nullstellensatz and the Chevalley-Warning theorem. Applications such as: Solution of Kakeya problem in finite fields, counterexample to Borsuk’s conjecture, chromatic number of the unit distance graph of Euclidean space, explicit constructions of Ramsey graphs and many others.

The course website can be found at https://moodle-app2.let.ethz.ch/course/view.php?id=15757

Lectures will be on the blackboard only, but there will be a set of typeset lecture notes which follow the class closely.

Students are expected to have a mathematical background and should be able to write rigorous proofs.

---

**Track: Signal Processing and Machine Learning**

The core courses and specialisation courses below are a selection for students who wish to specialise in the area of "Signal Processing and Machine Learning", see https://www.ee.ethz.ch/studies/main-master/areas-of-specialisation.html.

The individual study plan is subject to the tutor's approval.

**Core Courses**

These core courses are particularly recommended for the field of "Signal Processing and Machine Learning". You may choose core courses from other fields in agreement with your tutor.

A minimum of 24 credits must be obtained from core courses during the MSc EEIT.

**Foundation Core Courses**

Fundamentals at bachelor level, for master students who need to strengthen or refresh their background in the area.

### Abstract
The course is about some fundamental topics of digital signal processing with a bias towards applications in communications: discrete-time linear filters, inverse filters and equalization, DFT, discrete-time stochastic processes, elements of detection theory and estimation theory, LMMSE estimation and LMMSE filtering, LMS algorithm, Viterbi algorithm.

### Objective
The course is about some fundamental topics of digital signal processing with a bias towards applications in communications. The two main themes are linearity and probability. In the first part of the course, we deepen our understanding of discrete-time linear filters. In the second part of the course, we review the basics of probability theory and discrete-time stochastic processes. We then discuss some basic concepts of detection theory and estimation theory, as well as some practical methods including LMMSE estimation and LMMSE filtering, the LMS algorithm, and the Viterbi algorithm. A recurrent theme throughout the course is the stable and robust "inversion" of a linear filter.

### Content
1. Discrete-time linear systems and filters: state-space realizations, z-transform and spectrum, decimation and interpolation, digital filter design, stable realizations and robust inversion.
2. The discrete Fourier transform and its use for digital filtering.
3. The statistical perspective: probability, random variables, discrete-time stochastic processes; detection and estimation: MAP, ML, Bayesian MMSE, LMMSE; Wiener filter, LMS adaptive filter, Viterbi algorithm.

### Overview of the most important concepts of image formation, perception and analysis, and Computer Vision.

#### 227-0423-00L - Neural Network Theory

**Abstract**
The class focuses on fundamental mathematical aspects of neural networks with an emphasis on deep networks: Universal approximation theorems, capacity of separating surfaces, generalization, fundamental limits of deep neural network learning, VC dimension.

**Objective**
After attending this lecture, participating in the exercise sessions, and working on the homework problem sets, students will have acquired a working knowledge of the mathematical foundations of neural networks.

**Content**
1. Universal approximation with single- and multi-layer networks
2. Introduction to approximation theory: Fundamental limits on compressibility of signal classes, Kolmogorov epsilon-entropy of signal classes, non-linear approximation theory
3. Fundamental limits of deep neural network learning
4. Geometry of decision surfaces
5. Separating capacity of nonlinear decision surfaces
6. Vapnik-Chervonenkis (VC) dimension
7. VC dimension of neural networks
8. Generalization error in neural network learning

**Lecture notes**
Detailed lecture notes are available on the course web page [https://www.mins.ee.ethz.ch/teaching/ntn/](https://www.mins.ee.ethz.ch/teaching/ntn/)

**Prerequisites / notice**
This course is aimed at students with a strong mathematical background in general, and in linear algebra, analysis, and probability theory in particular.

### 227-0447-00L - Image Analysis and Computer Vision

**Abstract**

**Objective**
Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

**Content**
This course aims at offering a self-contained account of computer vision and its underlying concepts, including the recent use of deep learning. The first part starts with an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First the interaction of light with matter is considered. The most important hardware components such as cameras and illumination sources are also discussed. The course then turns to image discretization, necessary to process images by computer. The next part describes necessary pre-processing steps, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and 3D shape as two important examples. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed. The course language is English.

252-0535-00L Advanced Machine Learning W 10 credits 3V+2U+4A J. M. Buhmann, C. Cotrini Jimenez

Abstract
Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

Objective
Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real world data.

Content
The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. This course is accompanied by practical machine learning projects. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:

- Fundamentals:
  - What is data?
  - Bayesian Learning
  - Computational learning theory
- Supervised learning:
  - Ensembles: Bagging and Boosting
  - Max Margin methods
  - Neural networks
- Unsupervised learning:
  - Dimensionality reduction techniques
  - Clustering
  - Mixture Models
  - Non-parametric density estimation
  - Learning Dynamical Systems

Lecture notes
No lecture notes, but slides will be made available on the course webpage.

Literature

Prerequisites / notice
The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments. Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

263-3210-00L Deep Learning W 8 credits 3V+2U+2A T. Hofmann

Abstract
Deep learning is an area within machine learning that deals with algorithms and models that automatically induce multi-level data representations.

Objective
In recent years, deep learning and deep networks have significantly improved the state-of-the-art in many application domains such as computer vision, speech recognition, and natural language processing. This class will cover the mathematical foundations of deep learning and provide insights into model design, training, and validation. The main objective is a profound understanding of why these methods work and how. There will also be a rich set of hands-on tasks and practical projects to familiarize students with this emerging technology.

Prerequisites / notice
This is an advanced level course that requires some basic background in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments. Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

The participation in the course is subject to the following condition:
- Students must have taken the exam in Advanced Machine Learning (252-0535-00) or have acquired equivalent knowledge, see exhaustive list below:

  - Advanced Machine Learning

401-4944-20L Mathematics of Data Science W 8 credits 3V+2U+0T A. Bandeira

Abstract
Mostly self-contained, but fast-paced, introductory masters level course on various theoretical aspects of algorithms that aim to extract information from data.

Data: 06.08.2024 12:40 Autumn Semester 2024 Page 1025 of 2684
Introduction to various mathematical aspects of Data Science.

These topics lie in overlaps of Mathematics with: Computer Science, Electrical Engineering, Statistics, and/or Operations Research. Most lectures will feature Mathematical Open Problems. The main mathematical tools used will be Probability and Linear Algebra, and a basic familiarity with these subjects is required. There will also be some (although knowledge of these tools is not assumed) Graph Theory, Representation Theory, Applied Harmonic Analysis, among others. The topics treated will include Dimension reduction, Manifold learning, Sparse recovery, Random Matrices, Approximation Algorithms, Community detection in graphs, and several others.

The main mathematical tools used will be Probability, Linear Algebra (and real analysis), and a working knowledge of these subjects is required. In addition to these prerequisites, this class requires a certain degree of mathematical maturity—including abstract thinking and the ability to understand and write proofs.

We encourage students who are interested in mathematical data science to take both this course and “227-0434-10L Mathematics of Information” taught by Prof. H. Bölcskei. The two courses are designed to be complementary.

A. Bandeira and H. Bölcskei

Abstract

This first course in a series that extends over three consecutive terms is concerned with tailoring algorithms and with devising high performance hardware architectures for their implementation as ASIC or with FPGAs. The focus is on front end design using HDLs and automatic synthesis for producing industrial-quality circuits.

Objectives

Understand Very-Large-Scale Integrated Circuits (VLSI chips), Application-Specific Integrated Circuits (ASIC), and Field-Programmable Gate-Arrays (FPGA). Know their organization and be able to identify suitable application areas. Become fluent in front-end design from architectural conception to gate-level netlists. How to model digital circuits with SystemVerilog. How to ensure they behave as expected with the aid of simulation, testbenches, and assertions. How to take advantage of automatic synthesis tools to produce industrial-quality VLSI and FPGA circuits. Gain practical experience with the hardware description language SystemVerilog and with industrial Electronic Design Automation (EDA) tools.

Content

This course is concerned with system-level issues of VLSI design and FPGA implementations. Topics include:

- Overview on design methodologies and fabrication depths.
- Levels of abstraction for circuit modeling.
- Organization and configuration of commercial field-programmable components.
- FPGA design flows.
- Dedicated and general purpose architectures compared.
- How to obtain an architecture for a given processing algorithm.
- Meeting throughput, area, and power goals by way of architectural transformations.
- Hardware Description Languages (HDL) and the underlying concepts.
- SystemVerilog.
- Register Transfer Level (RTL) synthesis and its limitations.
- Building blocks of digital VLSI circuits.
- Functional verification techniques and their limitations.
- Modular and largely reusable testbenches.
- Assertion-based verification.
- Synchronous versus asynchronous circuits.
- The case for synchronous circuits.
- Periodic events and the Anceau diagram.
- Case studies, ASICs compared to microprocessors, DSPs, and FPGAs.

During the exercises, students learn how to model FPGAs with SystemVerilog. They write testbenches for simulation purposes and synthesize gate-level netlists for FPGAs. Commercial EDA software by leading vendors is being used throughout.

Lecture notes

Textbook and all further documents in English.

Literature

Prerequisites / notice

Prerequisites:
Basics of digital circuits.

Examination:
In written form following the course semester (spring term). Problems are given in English, answers will be accepted in either English or German.

Deep-learning a brain-inspired weak form of AI allows training of large artificial neuronal networks (ANNs) that, like humans, can learn real-world tasks such as recognizing objects in images. However, DL is far from being understood and investigating learning in biological networks might serve again as a compelling inspiration to think differently about state-of-the-art ANN training methods. The main goal of this lecture is to provide a comprehensive overview into the learning principles neuronal networks as well as to introduce a diverse skill set (e.g. simulating a spiking neuronal network) that is required to understand learning in large, hierarchical neuronal networks. To achieve this the lectures and exercises will merge ideas, concepts and methods from machine learning and neuroscience. These will include training basic ANNs, simulating spiking neuronal networks as well as being able to read and understand the main ideas presented in today's neuroscience papers.

After this course students will be able to:
- read and understand the main ideas and methods that are presented in today's neuroscience papers
- explain the basic ideas and concepts of plasticity in the mammalian brain
- implement alternative ANN learning algorithms to ‘error backpropagation’ in order to train deep neuronal networks.
- use a diverse set of ANN regularization methods to improve learning
- simulate spiking neuronal networks that learn simple (e.g. digit classification) tasks in a supervised manner.

Deep-learning a brain-inspired weak form of AI allows training of large artificial neuronal networks (ANNs) that, like humans, can learn real-world tasks such as recognizing objects in images. The origins of deep hierarchical learning can be traced back to early neuroscience research by Hubel and Wiesel in the 1960s, who first described the neuronal processing of visual inputs in the mammalian neocortex. Similar to their neocortical counterparts ANNs seem to learn by interpreting and structuring the data provided by the external world. However, while on specific tasks such as playing (video) games deep ANNs outperform humans (Minh et al., 2015, Silver et al., 2018), ANNs are still not performing on par when it comes to recognizing actions in movie data and their ability to act as generalizable problem solvers is still far behind of what the human brain seems to achieve effortlessly. Moreover, biological neuronal networks can learn far more effectively with fewer training examples, they achieve a much higher performance in recognizing complex patterns in time series data (e.g. recognizing actions in movies), they dynamically adapt to new tasks without losing performance and they achieve unmatched performance to detect and integrate out-of-domain data examples (data they have not been trained with). In other words, many of the big challenges and unknowns that have emerged in the field of deep learning over the last years are already mastered exceptionally well by biological neuronal networks in our brain. On the other hand, many facets of typical ANN design and training algorithms seem biologically implausible, such as the non-local weight updates, discrete processing of time, and scalar communication between neurons. Recent evidence suggests that learning in biological systems is the result of the complex interplay of diverse error feedback signaling processes acting at multiple scales, ranging from single synapses to entire networks.

Lecture notes

The lecture slides will be provided as a PDF after each lecture.
This advanced level lecture requires some basic background in machine/deep learning. Thus, students are expected to have a basic mathematical foundation, including linear algebra, multivariate calculus, and probability. The course is not to be meant as an extended tutorial of how to train deep networks in PyTorch or Tensorflow, although these tools used.

The participation in the course is subject to the following conditions:

1. The number of participants is limited to 120 students (MSc and PhDs).
2. Students must have taken the exam in Deep Learning (263-3210-00L) or have acquired equivalent knowledge.

**227-0477-00L Acoustics I**

**Abstract**
Introduction to the fundamentals of acoustics in the field of sound field calculations, measurement of acoustical events, outdoor sound propagation and room acoustics of large and small enclosures.

**Objective**
Understanding of the basic acoustical concepts and methods. Ability to understand the technical and scientific literature. Confidence in the use of measuring instruments.

**Content**
Fundamentals of acoustics, calculation of sound fields, measurement and analysis of acoustical events, anatomy and properties of the ear, outdoor sound propagation, absorption and transmission of sound, room acoustics of large and small enclosures, noise and noise control.

**Prerequisites / notice**
This advanced level lecture requires some basic background in machine/deep learning. Thus, students are expected to have a basic mathematical foundation, including linear algebra, multivariate calculus, and probability. The course is not to be meant as an extended tutorial of how to train deep networks in PyTorch or Tensorflow, although these tools used.

The participation in the course is subject to the following conditions:

1. The number of participants is limited to 120 students (MSc and PhDs).
2. Students must have taken the exam in Deep Learning (263-3210-00L) or have acquired equivalent knowledge.

**227-0560-00L Computer Vision and Artificial Intelligence for Autonomous Cars**

**Abstract**
This course introduces the core computer vision techniques and algorithms that autonomous cars use to perceive the semantics and geometry of their driving environment, localize themselves in it, and predict its dynamic evolution. Emphasis is placed on techniques tailored for real-world settings, such as multi-modal fusion, domain-adaptive and outlier-aware architectures, and multi-agent methods.

**Objective**
Students will learn about the fundamentals of autonomous cars and of the computer vision models and methods these cars use to analyze their environment and navigate themselves in it. Students will be presented with state-of-the-art representations and algorithms for semantic, geometric and temporal visual reasoning in automated driving and will gain hands-on experience in developing computer vision algorithms and architectures for solving such tasks.

After completing this course, students will be able to:
1. understand the operating principles of visual sensors in autonomous cars
2. differentiate between the core architectural paradigms and components of modern visual perception models and describe their logic and the role of their parameters
3. systematically categorize the main visual tasks related to automated driving and understand the primary representations and algorithms which are used for solving them
4. critically analyze and evaluate current research in the area of computer vision for autonomous cars
5. practically reproduce state-of-the-art computer vision methods in automated driving
6. independently develop new models for visual perception

**Content**
The content of the lectures consists in the following topics:

1. Fundamentals
   (a) Fundamentals of autonomous cars and their visual sensors
   (b) Fundamental computer vision architectures and algorithms for autonomous cars

2. Semantic perception
   (a) Semantic segmentation
   (b) Object detection
   (c) Instance segmentation and panoptic segmentation

3. Geometric perception and localization
   (a) Depth estimation
   (b) 3D reconstruction
   (c) Visual localization
   (d) Unimodal visual/lidar 3D object detection

4. Robust perception: multi-modal, multi-domain and multi-agent methods
   (a) Multi-modal 2D and 3D object detection
   (b) Visual grounding and verbo-visual fusion
   (c) Domain-adaptive and outlier-aware semantic perception
   (d) Vehicle-to-vehicle communication for perception

5. Temporal perception
   (a) Multiple object tracking
   (b) Motion prediction

The practical projects involve implementing complex computer vision architectures and algorithms and applying them to real-world, multi-modal driving datasets. In particular, students will develop models and algorithms for:

1. Semantic segmentation and depth estimation
2. Sensor calibration for multi-modal 3D driving datasets
3. 3D object detection using lidars

**Lecture notes**
Lecture slides are provided in PDF format.

**Prerequisites / notice**
Students are expected to have a solid basic knowledge of linear algebra, multivariate calculus, and probability theory, and a basic background in computer vision and machine learning. All practical projects will require solid background in programming and will be based on Python and libraries of it such as PyTorch.

263-5210-00L Probabilistic Artificial Intelligence

Abstract
This course introduces core modeling techniques and algorithms from machine learning, optimization and control for reasoning and decision making under uncertainty, and study applications in areas such as robotics.

Objective
How can we build systems that perform well in uncertain environments? How can we develop systems that exhibit "intelligent" behavior, without prescribing explicit rules? How can we build systems that learn from experience in order to improve their performance? We will study core modeling techniques and algorithms from statistics, optimization, planning, and control and study applications in areas such as robotics. The course is designed for graduate students.

Content
Topics covered:
- Probability
- Probabilistic inference (variational inference, MCMC)
- Bayesian learning (Gaussian processes, Bayesian deep learning)
- Probabilistic planning (MDPs, POMDPs)
- Multi-armed bandits and Bayesian optimization
- Reinforcement learning

Prerequisites / notice
Solid basic knowledge in statistics, algorithms and programming.

Competencies
Subject-specific Competencies
Concepts and Theories assessed
Techniques and Technologies assessed

Method-specific Competencies
Analytical Competencies assessed
Decision-making assessed
Media and Digital Technologies assessed

263-5300-00L Guarantees for Machine Learning

Abstract
This course is aimed at advanced master and doctorate students who want to conduct independent research on theory for modern machine learning (ML). It teaches standard methods in statistical learning theory commonly used to prove theoretical guarantees for ML algorithms. The knowledge is then applied in independent project work to understand and follow-up on recent theoretical ML results.

Objective
By the end of the semester students should be able to
- understand a good fraction of theory papers published in the typical ML venues. For this purpose, students will learn common mathematical techniques from statistical learning in the first part of the course and apply this knowledge in the project work
- critically examine recently published work in terms of relevance and find impactful (novel) research problems. This will be an integral part of the project work and involves experimental as well as theoretical questions
- outline a possible approach to prove a conjectured theorem by e.g. reducing to more solvable subproblems. This will be practiced in in-person exercises, homeworks and potentially in the final project
- effectively communicate and present the problem motivation, new insights and results to a technical audience. This will be primarily learned via the final presentation and report as well as during peer-grading of peer talks.

Content
This course touches upon foundational methods in statistical learning theory aimed at proving theoretical guarantees for machine learning algorithms. It touches on the following topics
- concentration bounds
- uniform convergence and empirical process theory
- regularization for non-parametric statistics (e.g. in RKHS, neural networks)
- high-dimensional learning
- computational and statistical learnability (information-theoretic, PAC, SQ)
- overparameterized models, implicit bias and regularization

The project work focuses on current theoretical ML research that aims to understand modern phenomena in machine learning, including but not limited to
- how overparameterized models generalize (statistically) and converge (computationally)
- complexity measures and approximation theoretic properties of randomly initialized and trained neural networks
- generalization of robust learning (adversarial or distribution-shift robustness)
- private and fair learning

Prerequisites / notice
Students should have a very strong mathematical background (real analysis, probability theory, linear algebra) and solid knowledge of core concepts in machine learning taught in courses such as "Introduction to Machine Learning", "Regression"/"Statistical Modelling". In addition to these prerequisites, this class requires a high degree of mathematical maturity—including abstract thinking and the ability to understand and write proofs.

Students have usually taken a subset of Fundamentals of Mathematical Statistics, Probabilistic AI, Neural Network Theory, Optimization for Data Science, Advanced ML, Statistical Learning Theory, Probability Theory (D-MATH)

### 401-3054-14L Probabilistic Methods in Combinatorics

**W 5 credits 2V+1U B. Sudakov**

**Abstract**
This course provides a gentle introduction to the Probabilistic Method, with an emphasis on methodology. We will try to illustrate the main ideas by showing the application of probabilistic reasoning to various combinatorial problems.

**Content**
The topics covered in the class will include (but are not limited to): linearity of expectation, the second moment method, the local lemma, correlation inequalities, martingales, large deviation inequalities, Janson and Talagrand inequalities and pseudo-randomness.

**Literature**
- Graph Coloring and the Probabilistic Method, by M. Molloy and B. Reed, Springer, 2002.

### 401-3055-64L Algebraic Methods in Combinatorics

**W 5 credits 2V+1U not available**

**Abstract**
Algebraic methods is a fundamental mathematical discipline as well as an essential component of many mathematical areas, and its study has experienced an impressive growth in recent years. This course provides a gentle introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to other areas.

**Objective**
The students will get an overview of various algebraic methods for solving combinatorial problems. We expect them to understand the proof techniques and to use them autonomously on related problems.

**Content**
Combinatorics is a fundamental mathematical discipline as well as an essential component of many mathematical areas, and its study has experienced an impressive growth in recent years. While in the past many of the basic combinatorial results were obtained mainly by ingenuity and detailed reasoning, the modern theory has grown out of this early stage and often relies on deep, well-developed tools.

One of the main general techniques that played a crucial role in the development of Combinatorics was the application of algebraic methods. The most fruitful such tool is the dimension argument. Roughly speaking, the method can be described as follows. In order to bound the cardinality of of a discrete structure A one maps its elements to vectors in a linear space, and shows that the set A is mapped to linearly independent vectors. It then follows that the cardinality of A is bounded by the dimension of the corresponding linear space. This simple idea is surprisingly powerful and has many famous applications.

This course provides a gentle introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to other areas. The topics covered in the class will include (but are not limited to):

- Basic dimension arguments, Spaces of polynomials and tensor product methods, Eigenvalues of graphs and their application, the Combinatorial Nullstellensatz and the Chevalley-Warning theorem. Applications such as: Solution of Kakeya problem in finite fields, counterexample to Borsuk's conjecture, chromatic number of the unit distance graph of Euclidean space, explicit constructions of Ramsey graphs and many others.

**Lecture notes**
The course website can be found at https://moodle-app2.let.ethz.ch/course/view.php?id=15757

**Prerequisites / notice**
Lectures will be on the blackboard only, but there will be a set of typeset lecture notes which follow the class closely. Students are expected to have a mathematical background and should be able to write rigorous proofs.

### 401-3621-00L Fundamentals of Mathematical Statistics

**W 9 credits 4V+1U J. Ziegel**

**Abstract**
In this course we study the basics of theoretical statistics. The course includes methods for designing estimators, confidence intervals and tests, and various ways to evaluate the accuracy of estimators, confidence intervals and tests. We consider optimality criteria such as admissibility and minimaxity, as well as Bayesian criteria. We will also present the asymptotic point of view.

**Objective**
The aim of this course is to gain insight into the main statistical ideas and concepts. The course considers classical low-dimensional models, with pointers towards today's highly complex models.

### 401-3901-00L Linear & Combinatorial Optimization

**W 10 credits 4V+2U R. Zenklusen**

**Abstract**
Mathematical treatment of optimization techniques for linear and combinatorial optimization problems.

**Objective**
The goal of this course is to get a thorough understanding of various classical mathematical optimization techniques for linear and combinatorial optimization problems, with an emphasis on polyhedral approaches. In particular, we want students to develop a good understanding of some important problem classes in the field, of structural mathematical results linked to these problems, and of solution approaches based on such structural insights.

**Content**
Key topics include:
- Linear programming and polyhedra;
- Flows and cuts;
- Combinatorial optimization problems and polyhedral techniques;
- Equivalence between optimization and separation.

**Literature**

**Prerequisites / notice**
Solid background in linear algebra.
The course targets both Bachelor and Master students. No prior knowledge in the areas of Economics and Management is required.

**Prerequisites / notice**

Basic courses in control, advanced course in optimal control, basic MPC course (e.g. 151-0660-00L Model Predictive Control in Spring Semester) strongly recommended. Background in linear algebra and stochastic systems recommended.

**Number** 351-0511-00L

**Title** Managerial Economics

**Type** W

**ECTS** 4 credits

**Hours** 3V

**Lecturers** O. Krebs, P. Egger, M. Köthenbürger

**Abstract** "Managerial Economics" provides an introduction to the theories and methods from Economics and Management Science to analyze economic decision-making in the context of markets. The course targets students with no prior knowledge in Economics and Management.

**Objective**

The general objective of Discovering Management is to introduce students into the field of business management and entrepreneurship.

In particular, the aims of the course are to:

1. broaden understanding of management principles and frameworks
2. advance insights into the sources of corporate and entrepreneurial success
3. develop skills to apply this knowledge to real-life managerial problems

The course will help students to successfully take on managerial and entrepreneurial responsibilities in their careers and / or appreciate the challenges that entrepreneurs and managers deal with.

**Compencies**

- Subject-specific Competencies: Concepts and Theories assessed
- Method-specific Competencies: Analytical Competencies assessed
- Social Competencies: Communication assessed
- Personal Competencies: Adaptability and Flexibility assessed

**Tracks (all): Electives**

This is only a short selection. Other courses from the ETH course catalogue may be chosen in agreement with your tutor.

As an alternative to the elective courses, students may do a second semester project or an internship in industry. Please consult your tutor.
The course consists of a set of theory and practice sessions, which will be taught on a weekly basis. The course will cover business management knowledge in corporate as well as entrepreneurial contexts.

The course consists of three blocks of theory and practice sessions: Discovering Strategic Management, Discovering Innovation Management, and Discovering HR and Operations Management. Each block consists of two or three theory sessions, followed by one practice session where you will apply the theory to a case.

The theory sessions will follow a "lecture-style" approach and be presented by an area specialist within D-MTEC. Practical examples and case studies will bring the theoretical content to life. The practice sessions will introduce you to some real-life examples of managerial or entrepreneurial challenges. During the practice sessions, we will discuss these challenges in depth and guide your thinking through team coaching.

Through small group work, you will develop analyses of each of the cases. The theory sessions will be assessed via a multiple choice exam.

**Lecture notes**

All course materials (readings, slides, videos, and worksheets) will be made available to inscribed course participants through Moodle. These course materials will form the point of departure for the lectures, class discussions and team work.

**351-0778-01L Discovering Management (Pitch)**

*W* 1 credit 1U B. Clarysse

*Does not take place this semester.*

*Complementary exercises for the module Discovering Management.*

*Prerequisite: Participation and successful completion of the module Discovering Management (351-0778-00L) is mandatory.*

**Abstract**

This course is offered complementary to the basis course 351-0778-00L, "Discovering Management". The course offers an additional exercise.

**Objective**

The general objective of Discovering Management (Exercises) is to complement the course "Discovering Management" with one larger additional exercise.

Discovering Management (Exercises) thus focuses on developing the skills and competences to apply management theory to a real-life exercise from practice.

**Content**

The exercise consists of delivering and submitting a "pitch" with a clear recommendation for one of the selected cases amongst those seen in Discovering Management, using your insights from Discovering Management, and an extra session on pitching.

Students have the option to either do this alone or in a group of two students.

**Literature**

All course materials (readings, slides, videos, and worksheets) will be made available to inscribed course participants through Moodle. Students following this course should also be enrolled for course 351-0778-00L, "Discovering Management".

**363-0790-00L Technology Entrepreneurship**

*W* 2 credits 2V F. Hacklin

**Abstract**

Technology ventures are significantly changing the global economic picture. Technological skills increasingly need to be complemented by entrepreneurial understanding.

This course offers the fundamentals in theory and practice of entrepreneurship in new technology ventures. Main topics covered are success factors in the creation of new firms, including founding, financing and growing a venture.

**Objective**

This course provides theory-grounded knowledge and practice-driven skills for founding, financing, and growing new technology ventures. A critical understanding of dos and don'ts is provided through highlighting and discussing real life examples and cases.

**Content**

Weekly sessions - recorded.

10+ sessions carried out by guest lecturers: experts in the broad field of technology entrepreneurship (e.g., serial entrepreneurs, venture capitalists, (E)MBA professors, company builders, patent experts, scale-up executives, …). Final session: multiple choice semester assignment (100% of grade).

**Typical lecture format (2h):**

15': Introduction
60': Guest testimonial
15': Discussion related to topic (in groups)
10': Plenary discussion
20': Q&A with (guest) lecturer

**Lecture notes**

Lecture slides and case material

Abstract

This elective is relevant for students who have developed a technology and are keen to evaluate the steps in starting a startup. This is also relevant for students who would like to start a startup but do not have a technology, but are clear on a specific market and the impact they would like to create.

Objective

Students have technology competence or an idea that they would like to convert into a startup. They are now in the process of evaluating the steps necessary to do so. In summary:

1. Students want to become entrepreneurs.
2. The students can be from business or science & technology.
3. The course will enable the students to identify the relevance of their technology or idea from the market relevance perspective and thereby create a business case to take it to market.
4. The students will have exposure to investors and entrepreneurs (with a focus on ETH spin-offs) through the course, to gain insight to commercialise their idea.

Content

The students would cover the following topics, as the build their idea into a business case:

1. Technology excellence: This assumes that the student has achieved a certain degree of competence in the area of technology that he or she expects to bring to the market
2. Market need and market relevance: The student would then be expected to identify the possible markets that may find the technology of relevance. Market relevance implies the process of identification of how relevant the market perceives the technology, and whether this can sustain over a longer period of time
3. IP and IP strategy: Intellectual property, whether in the form of a patent or a trade secret, implies the secret ingredient that enables the student to achieve certain results that competitors are unable to copy. This enables the student (and subsequently the startup) to hold on to the market that they create with customers
4. Team including future capabilities required: A startup requires multiple people with complementary capabilities. They also need to be motivated while at the same time protecting the interests of the startup
5. Financials: There is a need of funding to achieve milestones. This includes funding for salaries and running of the company
6. Investors and funding options: There are multiple funding options for a startup. They all come with different advantages and limitations. It's important for a startup to recognise its needs and find the investors that fit these needs and are best aligned with the vision of the founders
7. Preparation of business case: The students will finally prepare the business case that can help them to articulate the link of the technology with the market need and its willingness to pay
8. Legal overview, company forms and shareholders' agreements (including pitfalls)

The seminar includes talks from invited investors, entrepreneurs and legal experts regarding the importance of the various elements being covered in content, workshops and teamwork. There is a particular emphasis on market validation on each step of the journey, to ensure relevance.

Lecture notes

Since the course will revolve around the ideas of the students, the notes will be for the sole purpose of providing guidance to the students to help convert their technologies or ideas into business cases for the purpose of forming startups. Theoretical subject matter will be kept to a minimum and is not the focus of the course.

Literature

Book
Sethi, A., "From Science to Startup"
ISBN 978-3-319-30422-9

Prerequisites / notice

This course is relevant for those students who aspire to become entrepreneurs.

Students applying for this course are requested to submit a 1 page business idea or, in case they don't have a business idea, a brief motivation letter stating why they would like to do this course.

If you are unsure about the readiness of your idea or technology to be converted into a startup, please drop me a line to schedule a call or meeting to discuss.
Introduction to Law

**Abstract**
This class introduces students into basic features of the legal system. Fundamental issues of constitutional law, administrative law, private law and the law of the EU are covered. The focus is on legal problems related to space. Active participation is expected in short interactive sequences.

**Objective**
Students are able to identify basic structures of the legal system. They understand selected topics of public and private law. They are able to apply the fundamentals in more advanced law classes and to recognize the relevance of law in their own field.

**Content**
Basic concepts of law, sources of law.
Private law: Contract law (particularly contract for work and services), tort law, property law.
Public law: Human rights, administrative law, procurement law, procedural law.
Insights into the law of the EU.

Startups and Law

**Abstract**
The students shall obtain a basic knowledge about the legal environment of entrepreneurs. They shall be able to recognize and evaluate legal issues connected to an entrepreneurial activity and suggest possible solutions.

**Objective**
The students shall obtain the following competence:
- They shall obtain a working knowledge on the legal aspects involved in setting up and managing an enterprise.
- They shall be able to contribute to the legal management of the company and to discuss legal issues.
- They shall have an understanding of the law as a part of the corporate strategy and as a valuable resource of the company.

**Lecture notes**
A comprehensive script will be made available online on the moodle platform.

The Role of Intellectual Property in the Engineering and Technical Sector

**Abstract**
The lecture gives an overview of the fundamental aspects of intellectual property, which plays an important role in the daily routine of engineers and scientists. The lecture aims to make participants aware of the various methods of protection and to put them in a position to use this knowledge in the workplace.
Title

Subject-specific Competencies

The students will gain insights into the concept and mechanics of Creative Thinking. They will trace the historical roots of creativity and its external organisers.

In recent years, knowledge about intellectual property has become increasingly important for engineers and scientists. Both in production and distribution and in research and development, they are increasingly being confronted with questions concerning the patenting of technical inventions and the use of patent information.

The lecture will acquaint participants with practical aspects of intellectual property and enable them to use the acquired knowledge in their future professional life.

Topics covered during the lecture will include:
- The importance of innovation in industrialised countries
- An overview of the different forms of intellectual property
- The protection of technical inventions and how to safeguard their commercialisation
- Patents as a source of technical and business information
- Practical aspects of intellectual property in day-to-day research, at the workplace and for the formation of start-ups.

Case studies will illustrate and deepen the topics addressed during the lecture.

The seminar will include practical exercises on how to use and search patent information. Basic knowledge of how to read and evaluate patent documents as well as how to use publicly available patent databases to obtain the required patent information will also be provided.

Prerequisites / notice

The lecture addresses students in the fields of engineering, science and other related technical fields.

227-0811-00L Creative Thinking Seminar

Abstract

This seminar aims to understand better what creativity and creative thinking is by looking at the history of the creativity dispositive we are embedded in. We will look, learn and apply creative artistic practices to find innovative solutions. And we will also look beyond the artistic practices, into the creative potential of today’s technologies, especially Generative AI.

Objective

The students will gain insights into the concept and mechanics of Creative Thinking. They will trace the historical roots of creativity and its contemporary significance, explore how Creative Thinking intersects with modern innovations and technologies.

Content

In the business world Creative Thinking is considered to be one of the “top ten skills” or “most In-Demand skill” in 2024. With Creative Thinking innovative solutions to problems are developed and not only a large number of ideas but also a variety and range of them are brainstormed. It seems that in today’s dynamic world, creativity isn’t just an asset – but actually necessity.

But what exactly is Creative Thinking? In the above mentioned business context it is assumed everybody knows. And what is creativity? And how can we use it. Or not.

Originally, connected to artistic practice, creativity is nowadays a skill and practice that can be found in all work areas, especially in innovation andmaybe even in technological applications themselves. Today, not only because of creative economy, creative cities or innovation, but also because of generative AI creativity has gained new and broad attention. In the seminar we go back in history to the invention of the genius and look at different social subsystems like art, psychology, economy as well as field as fashion, advertisement and arts and crafts, how our understanding of creativity has emerged till today.

Internship in Industry

Type

W

ECTS

12 credits

Hours

external organisers

Lecturers

Objective

The main objective of the 12-week internship (full-time) is to expose master’s students to the industrial work environment. During this period, students have the opportunity to be involved in on-going projects at the host institution.

Master Studies (Programme Regulations 2008)

Major Courses

A total of 42 CP must be achieved during the Master Programme. The individual study plan is subject to the tutor’s approval.

Communication

Core Subjects

These core subjects are particularly recommended for the field of “Communication”.

Lecturers

J. Leuthold

Abstract

The path of an analog signal in the transmitter to the digital world in a communication link and back to the analog world at the receiver is discussed. The lecture covers the fundamentals of all important optical and optoelectronic components in a fiber communication system.

This includes the transmitter, the fiber channel and the receiver with the electronic digital signal processing elements.

Objective

An in-depth understanding on how information is transmitted from source to destination. Also the mathematical framework to describe the important elements will be passed on. Students attending the lecture will further get engaged in critical discussion on societal, economical and environmental aspects related to the on-going exponential growth in the field of communications.

Data: 06.08.2024 12:40 Autumn Semester 2024 Page 1036 of 2684
Content

* Chapter 1: Introduction: Analog/Digital conversion, The communication channel, Shannon channel capacity, Capacity requirements.
* Chapter 4: The Receiver: Photodiodes, Receiver noise, Detector schemes (direct detection, coherent detection), Bit-error ratios and error estimations.
* Chapter 5: Digital Signal Processing Techniques: Digital signal processing in a coherent receiver, Error detection techniques, Error correction coding.
* Chapter 6: Pulse Shaping and Multiplexing Techniques: WDM/FDM, TDM, OFDM, Nyquist Multiplexing, OCDMA.

Information Theory I

W 6 credits 4G A. Lapidoth

Abstract

This course covers the basic concepts of information theory and of communication theory. Topics covered include the entropy rate of a source, mutual information, typical sequences, the asymptotic equi-partition property, Huffman coding, channel capacity, the channel coding theorem, the source-channel separation theorem, and feedback capacity.

Objective

The fundamentals of Information Theory including Shannon's source coding and channel coding theorems

Content

The entropy rate of a source, Typical sequences, the asymptotic equi-partition property, the source coding theorem, Huffman coding, Arithmetic coding, channel capacity, the channel coding theorem, the source-channel separation theorem, feedback capacity

Literature

227-0102-00L Discrete Event Systems W 6 credits 4G L. Vanbever, L. Josipovic, B. Keller, R. Wattenhofer

Abstract

Introduction to discrete event systems. We start out by studying popular models of discrete event systems. Then we analyze discrete event systems from an average-case and from a worst-case perspective, and study verification. Topics include: Automata and Languages, Specification Models, Stochastic Discrete Event Systems, Worst-Case Event Systems, Verification, Petri Nets.

Objective

Over the past few decades the rapid evolution of computing, communication, and information technologies has brought about the proliferation of new dynamic systems. A significant part of activity in these systems is governed by operational rules designed by humans. The dynamics of these systems are characterized by asynchronous occurrences of discrete events, some controlled (e.g. hitting a keyboard key, sending a message), some not (e.g. spontaneous failure, packet loss).

The mathematical arsenal centered around differential equations that has been employed in systems engineering to model and study processes governed by the laws of nature is often inadequate or inappropriate for discrete event systems. The challenge is to develop new modeling frameworks, analysis techniques, design tools, testing methods, and optimization processes for this new generation of systems.

In this lecture we give an introduction to discrete event systems. We start out the course by exploring the limits of what is computable and what is not. In doing so, we will consider three distinct models of computation which are often used to model discrete event systems: finite automata, push-down automata and Turing machines (ranked in terms of expressiveness power). In the second part of the course we analyze discrete event systems. We first examine discrete event systems from an average-case perspective: we model discrete events as stochastic processes, and then apply continuous time markov chains and queueing theory for an understanding of the typical behavior of a system. Then we analyze discrete event systems from a worst-case perspective using the theory of online algorithms and adversarial queueing. In the last part of the course we introduce methods that allow to formally verify certain properties of Finite Automata and Petri Nets. These are some typical analysis questions we will look at: Do two given systems behave the same? Does a given system behave as intended? Does the system eventually enter a dangerous state?

Content

1. Regular Languages
2. Non-Regular Languages
3. Markov Chains
4. Stochastic Discrete Event Systems
5. Worst-Case Event Systems
6. Verification of Finite Automata
7. Petri Nets

Lecture notes

Abstract
Study of concepts and methods for the mathematical description and analysis of dynamical systems. The concept of feedback. Design of control systems for single input - single output and multivariable systems.

Objective
Study of concepts and methods for the mathematical description and analysis of dynamical systems. The concept of feedback. Design of control systems for single input - single output and multivariable systems.

Content

Literature

Prerequisites
Prerequisites: Signal and Systems Theory II.

MATLAB is used for system analysis and simulation.

Abstract
This first course in a series that extends over three consecutive terms is concerned with tailoring algorithms and with devising high performance hardware architectures for their implementation as ASIC or with FPGAs. The focus is on front end design using HDLs and automatic synthesis for producing industrial-quality circuits.

Objective
Understand Very-Large-Scale Integrated Circuits (VLSI chips), Application-Specific Integrated Circuits (ASIC), and Field-Programmable Gate-Arrays (FPGA). Know their organization and be able to identify suitable application areas. Become fluent in front-end design from architectural conception to gate-level netlists. How to model digital circuits with SystemVerilog. How to ensure they behave as expected with the aid of simulation, testbenches, and assertions. How to take advantage of automatic synthesis tools to produce industrial-quality VLSI and FPGA circuits. Gain practical experience with the hardware description language SystemVerilog and with industrial Electronic Design Automation (EDA) tools.
This course is concerned with system-level issues of VLSI design and FPGA implementations. Topics include:

- Overview on design methodologies and fabrication depths.
- Levels of abstraction for circuit modeling.
- Organization and configuration of commercial field-programmable components.
- FPGA design flows.
- Dedicated and general purpose architectures compared.
- How to obtain an architecture for a given processing algorithm.
- Meeting throughput, area, and power goals by way of architectural transformations.
- Hardware Description Languages (HDL) and the underlying concepts.
- SystemVerilog
- Register Transfer Level (RTL) synthesis and its limitations.
- Building blocks of digital VLSI circuits.
- Functional verification techniques and their limitations.
- Modular and largely reusable testbenches.
- Assertion-based verification.
- Synchronous versus asynchronous circuits.
- The case for synchronous circuits.
- Periodic events and the Aneceu diagram.
- Case studies, ASICs compared to microprocessors, DSPs, and FPGAs.

During the exercises, students learn how to model FPGAs with SystemVerilog. They write testbenches for simulation purposes and synthesize gate-level netlists for FPGAs. Commercial EDA software by leading vendors is being used throughout.

The class focuses on fundamental mathematical aspects of neural networks with an emphasis on deep networks: Universal approximation theorems, capacity of separating surfaces, generalization, fundamental limits of deep neural network learning, VC dimension.

Does not take place this semester.

The basic elements, design issues and techniques for analog integrated circuits will be taught in this course.

Review of bipolar and MOS devices and their small-signal equivalent circuit models; Building blocks in analog circuits such as current sources, active load, current mirrors, supply independent biasing etc.; Amplifiers: differential amplifiers, cascode amplifier, high gain structures, output stages, gain bandwidth product of op-amps; stability; comparators; second-order effects in analog circuits such as mismatch, noise and offset; data converters; frequency synthesizers; switched capacitors.

The exercise sessions aim to reinforce the lecture material by well guided step-by-step design tasks. The circuit simulator SPECTRE is used to facilitate the tasks. There is also an experimental session on op-amp measurements.

Does not take place this semester.

Analog Integrated Circuits

| W | 6 credits | 4G | T. Jang |

Abstract
This course provides a foundation in analog integrated circuit design based on bipolar and CMOS technologies. Integrated circuits are responsible for much of the progress in electronics in the last 50 years, particularly the revolutions in the Information and Communications Technologies we witnessed in recent years. Analog integrated circuits play a crucial part in the highly integrated systems that power the popular electronic devices we use daily. Understanding their design is beneficial to both future designers and users of such systems.

Content
The basic elements, design issues and techniques for analog integrated circuits will be taught in this course.

Lecture notes
Textbook and all further documents in English.

Literature

Prerequisites

Neural Network Theory

| W | 4 credits | 2V+1U | H. Bölcskei |

Abstract
The class focuses on fundamental mathematical aspects of neural networks with an emphasis on deep networks: Universal approximation theorems, capacity of separating surfaces, generalization, fundamental limits of deep neural network learning, VC dimension.

Objective
After attending this lecture, participating in the exercise sessions, and working on the homework problem sets, students will have acquired a working knowledge of the mathematical foundations of neural networks.

Does not take place this semester.

Further details:
https://is-students.ee.ethz.ch/lectures/vlsi-1/

Prerequisites

Prerequisites /
Content
1. Universal approximation with single- and multi-layer networks
2. Introduction to approximation theory: Fundamental limits on compressibility of signal classes, Kolmogorov epsilon-entropy of signal classes, non-linear approximation theory
3. Fundamental limits of deep neural network learning
4. Geometry of decision surfaces
5. Separating capacity of nonlinear decision surfaces
6. Vapnik-Chervonenkis (VC) dimension
7. VC dimension of neural networks
8. Generalization error in neural network learning

Lecture notes
Detailed lecture notes are available on the course web page
https://www.mins.ee.ethz.ch/teaching/ntn/

Prerequisites / notice
This course is aimed at students with a strong mathematical background in general, and in linear algebra, analysis, and probability theory in particular.

<td>Light and perception. Digital image formation. Image enhancement and feature extraction. Unitary transformations. Color and texture. Image segmentation. Motion extraction and tracking. 3D data extraction. Invariant features. Specific object recognition and object class recognition. Deep learning and Convolutional Neural Networks.</td>
<td>Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.</td>
<td>The first part starts with an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First the interaction of light with matter is considered. The most important hardware components such as cameras and illumination sources are also discussed. The course then turns to image discretization, necessary to process images by computer. The next part describes necessary pre-processing steps, that enhance image quality and/ or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and 3D shape as two important examples. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed. A major part at the end is devoted to deep learning and AI-based approaches to image analysis. Its main focus is on object recognition, but also other examples of image processing using deep neural nets are given.</td>

<td>Analog Signal Processing and Filtering</td>
<td>Suitable for Master Students as well as Doctoral Students.</td>
<td>This lecture provides a wide overview over analog filters (continuous-time and discrete-time), signal-processing systems, and sigma-delta conversion, and gives examples with sensor interfaces and class-D audio drivers. All systems and circuits are treated using a signal-flow view. The lecture is suitable for both analog and digital designers.</td>
<td>At the beginning, signal-flow graphs in general and driving-point signal-flow graphs in particular are introduced. We will use them during the whole term to analyze circuits on a system level (analog continuous-time, analog discrete-time, mixed-signal and digital) and understand how signals propagate through them. The theory and CMOS implementation of active Filters is then discussed in detail using the example of GaAs filters and active-RC filters. The ideal and nonideal behaviour of opamps, current conveyors, and inductor simulators follows. The link to the practical design of circuits and systems is done with an overview over different quality measures and figures of merit used in scientific literature and datasheets. Finally, an introduction to discrete-time and mixed-domain filters and circuits is given, including sensor read-out amplifiers, correlated double sampling, and chopping, and an introduction to sigma-delta A/D and D/A conversion on a system level.</td>

- Self-direction and Self-management: fostered

### 227-0477-00L  
**Acoustics I**
**W 3 credits 2G**
J. Pieren

**Abstract**
Introduction to the fundamentals of acoustics in the field of sound field calculations, measurement of acoustical events, outdoor sound propagation and room acoustics of large and small enclosures.

**Objective**
Understanding of the basic acoustical concepts and methods. Ability to understand the technical and scientific literature. Confidence in the use of measuring instruments.

**Content**
Fundamentals of acoustics, calculation of sound fields, measurement and analysis of acoustical events, anatomy and properties of the ear, outdoor sound propagation, absorption and transmission of sound, room acoustics of large and small enclosures, noise and noise control.

### 252-0535-00L  
**Advanced Machine Learning**
**W 10 credits 3V+2U+4A**
J. M. Buhmann, C. Cotrini Jimenez

**Abstract**
Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

**Objective**
Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real world data.

**Content**
The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

**Topics covered in the lecture include:**
- Fundamentals:
  - What is data?
- Bayesian Learning
- Computational learning theory

**Supervised learning:**
- Ensembles: Bagging and Boosting
- Max Margin methods
- Neural networks

**Unsupervised learning:**
- Dimensionality reduction techniques
- Clustering
- Mixture Models
- Non-parametric density estimation
- Learning Dynamical Systems

**Lecture notes**
No lecture notes, but slides will be made available on the course webpage.

**Literature**
The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments. Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

**263-4640-00L Network Security**

**Abstract**
Some of today's most damaging attacks on computer systems involve exploitation of network infrastructure, either as the target of attack or as a vehicle to attack end systems. This course provides an in-depth study of network attack techniques and methods to defend against them.

**Objective**
- Students are familiar with fundamental network-security concepts.
- Students can assess current threats that Internet services and networked devices face, and can evaluate appropriate countermeasures.
- Students can identify and assess vulnerabilities in software systems and network protocols.
- Students have an in-depth understanding of a range of important state-of-the-art security technologies.
- Students can implement network-security protocols based on cryptographic libraries.

**Content**
The course will cover topics spanning four broad themes with a focus on the first two themes:
1. network defense mechanisms such as public-key infrastructures, TLS, VPNs, anonymous-communication systems, secure routing protocols, secure DNS systems, and network intrusion-detection systems;
2. network attacks such as hijacking, spoofing, denial-of-service (DoS), and distributed denial-of-service (DDoS) attacks;
3. analysis and inference topics such as traffic monitoring and network forensics; and
4. new technologies related to next-generation networks.

In addition, several guest lectures will provide in-depth insights into specific current real-world network-security topics.

**Prerequisites / notice**
This lecture is intended for students with an interest in secure Internet communications services and network devices. Students are assumed to have knowledge in networking as taught in a communication networks lecture like 252-0064-00L or 227-0120-00L.

Basic knowledge of information security or applied cryptography as taught in 252-0211-00L or 263-4660-00L is beneficial, but an overview of the most important cryptographic primitives will be provided at the beginning of the course.

The course will involve several graded course projects. Students are expected to be familiar with a general-purpose or network programming language such as C/C++, Go, Python, or Rust.

**401-3055-64L Algebraic Methods in Combinatorics**

*Does not take place this semester.*

**Abstract**
Combinatorics is a fundamental mathematical discipline as well as an essential component of many mathematical areas, and its study has experienced an impressive growth in recent years. This course provides a gentle introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to other areas.

**Objective**
The students will get an overview of various algebraic methods for solving combinatorial problems. We expect them to understand the proof techniques and to use them autonomously on related problems.

**Content**
Combinatorics is a fundamental mathematical discipline as well as an essential component of many mathematical areas, and its study has experienced an impressive growth in recent years. While in the past many of the basic combinatorial results were obtained mainly by ingenuity and detailed reasoning, the modern theory has grown out of this early stage and often relies on deep, well-developed tools.

One of the main general techniques that played a crucial role in the development of Combinatorics was the application of algebraic methods. The most fruitful such tool is the dimension argument. Roughly speaking, the method can be described as follows. In order to bound the cardinality of a discrete structure A one maps its elements to vectors in a linear space, and shows that the set A is mapped to linearly independent vectors. It then follows that the cardinality of A is bounded by the dimension of the corresponding linear space. This simple idea is surprisingly powerful and has many famous applications.

This course provides a gentle introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to other areas. The topics covered in the class will include (but are not limited to):

Basic dimension arguments, Spaces of polynomials and tensor product methods, Eigenvalues of graphs and their application, the Combinatorial Nullstellensatz and the Chevalley-Warning theorem. Applications such as: Solution of Kakeya problem in finite fields, counterexample to Borsuk's conjecture, chromatic number of the unit distance graph of Euclidean space, explicit constructions of Ramsey graphs and many others.

The course website can be found at https://moodle-app2.let.ethz.ch/course/view.php?id=15757

**Lecture notes**
Lectures will be on the blackboard only, but there will be a set of typset lecture notes which follow the class closely.

**Prerequisites / notice**
Students are expected to have a mathematical background and should be able to write rigorous proofs.

**227-0147-10L VLSI 3: Full-Custom Digital Circuit Design**

**Abstract**
This course provides a gentle introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to other areas. The topics covered in the class will include (but are not limited to):

Basic dimension arguments, Spaces of polynomials and tensor product methods, Eigenvalues of graphs and their application, the Combinatorial Nullstellensatz and the Chevalley-Warning theorem. Applications such as: Solution of Kakeya problem in finite fields, counterexample to Borsuk's conjecture, chromatic number of the unit distance graph of Euclidean space, explicit constructions of Ramsey graphs and many others.

The course website can be found at https://moodle-app2.let.ethz.ch/course/view.php?id=15757

**Prerequisites / notice**
Lectures will be on the blackboard only, but there will be a set of typset lecture notes which follow the class closely.

### Abstract

This third course in our VLSI series is concerned with full-custom digital integrated circuits. The goals include learning the design of digital circuits on the schematic, layout, gate, and register-transfer levels. The use of state-of-the-art CAD software (Cadence Virtuoso) in order to simulate, optimize, and characterize digital circuits is another important topic of this course.

### Objective

At the end of this course, you will
- understand the design of the main building blocks of state-of-the-art digital integrated circuits
- be able to design and optimize digital integrated circuits on the schematic, layout, and gate levels
- be able to use standard industry software (Cadence Virtuoso) for drawing, simulating, and characterizing digital circuits
- understand the performance trade-offs between delay, area, and power consumption

### Content

The third VLSI course begins with the basics of metal-oxide-semiconductor (MOS) field-effect transistors (FETs) and moves up the stack towards logic gates and increasingly complex digital circuit structures. The topics of this course include:

- Nanometer MOSFETs
- Static and dynamic behavior of complementary MOS (CMOS) inverters
- CMOS gate design, sizing, and timing
- Full-custom standard-cell design
- Wire models and parasitics
- Latch and flip-flop circuits
- Gate-level timing analysis and optimization
- Static and dynamic power consumption; low-power techniques
- Alternative logic styles (dynamic logic, pass-transistor logic, etc.)
- Arithmetic and logic circuits
- Fixed-point and floating-point arithmetic
- Synchronous and asynchronous design principles
- Memory circuits (ROM, SRAM, and DRAM)
- In- and near-memory processing architectures
- Full-custom accelerator circuits for machine learning

### Literature

N. H. E. Weste and D. M Harris, CMOS VLSI Design: A Circuits and Systems Perspective (4th Ed.), Addison-Wesley

### Prerequisites / notice

VLSI 3 can be taken in parallel with "VLSI 1: HDL-based design for FPGAs" and is designed to complement the topics of this course. Basic analog circuit knowledge is required.

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 1043 of 2684
The goals of this course is to provide students with a deeper understanding of the existing and upcoming Internet technologies used in large-scale computer networks such as Internet Service Providers (e.g., Swisscom or Deutsche Telekom), Content Delivery Networks (e.g., Netflix and Data Centers (e.g., Google). Besides covering the fundamentals, the course will be "hands-on" and will enable students to play with the technologies in realistic network environments.

In 2023, the course will cover advanced topics in communication networks such as:

- Advanced Internet routing (convergence, optimality, scalability, flexibility);
- Network programmability (OpenFlow, P4);
- Traffic engineering / Load Balancing;
- Network verification and synthesis;
- Network measurements;
- Network security;
- Upcoming transport protocols and technologies;
- Adaptive video streaming; and
- Network sustainability.

The course will be composed of lectures and practical exercises (some of which including labs).

Lecture notes and material will be made available before each course on the course website.

Relevant references will be made available through the course website.

Prerequisites: Communication Networks (227-0120-00L) or equivalents / programming skills (in any language) are expected (some of the exercises will involve coding).

227-0579-00L

Hardware Security

W 8 credits 2V+2U+2A K. Razavi

Abstract
This course covers the security of commodity computer hardware (e.g., CPU, DRAM, etc.) with a special focus on cutting-edge hands-on research. The aim of the course is familiarizing the students with hardware security and more specifically microarchitectural and circuit-level attacks and defenses through lectures and implementing some of these advanced attacks.

By the end of the course, the students will be familiar with the state of the art in commodity computer hardware attacks and defenses. More specifically, the students will learn about:

- security problems of commodity hardware that we use everyday and how you can defend against them.
- relevant computer architecture and operating system aspects of these issues.
- hands-on techniques for performing hardware attacks.

This is the course where you get credit points by building some of the most advanced exploits on the planet! The luckiest team will collect a Best Demo Award at the end of the course.

Experience with Linux, low-level systems programming and computer architecture.

252-1414-00L

System Security

W 7 credits 2V+2U+2A S. Capkun, S. Shinde

Abstract
The first part of the course covers general security concepts and hardware-based support for security. In the second part, the focus is on system design and methodologies for building secure systems.

In this lecture, students learn about the security requirements and capabilities that are expected from modern hardware, operating systems, and other software environments. An overview of available technologies, algorithms and standards is given, with which these requirements can be met.

The first part of the lecture covers hardware-based security concepts. Topics include the concept of physical and software-based side channel attacks on hardware resources, architectural support for security (e.g., memory management and permissions, disk encryption), and trusted execution environments (Intel SGX, ARM TrustZone, AMD SEV, and RISC-V Keystone).

In the second part, the focus is on system design and methodologies for building secure systems. Topics include: common software faults (e.g., buffer overflows, etc.), bug-detection, writing secure software (design, architecture, QA, testing), compiler-supported security (e.g., control-flow integrity), and language-supported security (e.g., memory safety).

Along the lectures, model cases will be elaborated and evaluated in the exercises.
Some of today's most damaging attacks on computer systems involve exploitation of network infrastructure, either as the target of attack or as a vehicle to attack end systems.

This course provides an in-depth study of network attack techniques and methods to defend against them.

- Students are familiar with fundamental network-security concepts.
- Students can assess current threats that Internet services and networked devices face, and can evaluate appropriate countermeasures.
- Students can identify and assess vulnerabilities in software systems and network protocols.
- Students have an in-depth understanding of a range of important state-of-the-art security technologies.
- Students can implement network-security protocols based on cryptographic libraries.

The course will cover topics spanning four broad themes with a focus on the first two themes:

1. Network defense mechanisms such as public-key infrastructures, TLS, VPNs, anonymous-communication systems, secure routing protocols, secure DNS systems, and network intrusion-detection systems;
2. Network attacks such as hijacking, spoofing, denial-of-service (DoS), and distributed denial-of-service (DDoS) attacks;
3. Analysis and inference topics such as traffic monitoring and network forensics; and

In addition, several guest lectures will provide in-depth insights into specific current real-world network-security topics.

This course provides an in-depth study of network attack techniques and methods to defend against them.

- Students are familiar with fundamental network-security concepts.
- Students can implement network-security protocols based on cryptographic libraries.
- Students can assess current threats that Internet services and networked devices face, and can evaluate appropriate countermeasures.
- Students can identify and assess vulnerabilities in software systems and network protocols.
- Students have an in-depth understanding of a range of important state-of-the-art security technologies.
- Students can implement network-security protocols based on cryptographic libraries.

These courses are recommended, but you are free to choose courses from any other special field. Please consult your tutor.

- The course is about some fundamental topics of digital signal processing with a bias towards applications in communications: discrete-time linear filters, inverse filters and equalization, DFT, discrete-time stochastic processes, elements of detection theory and estimation theory, LMMSE estimation and LMMSE filtering, LMS algorithm, Viterbi algorithm.

- The course provides an in-depth study of network attack techniques and methods to defend against them. The main themes are linearity and probability. In the first part of the course, we deepen our understanding of discrete-time linear filters. In the second part of the course, we review the basics of probability theory and discrete-time stochastic processes. We then discuss some basic concepts of detection theory and estimation theory, as well as some practical methods including LMMSE estimation and LMMSE filtering, the LMS algorithm, and the Viterbi algorithm. A recurrent theme throughout the course is the stable and robust "inversion" of a linear filter.
227-0103-00L Control Systems

Abstract
Study of concepts and methods for the mathematical description and analysis of dynamical systems. The concept of feedback. Design of control systems for single input - single output and multivariable systems.

Objective
Study of concepts and methods for the mathematical description and analysis of dynamical systems. The concept of feedback. Design of control systems for single input - single output and multivariable systems.

Content

Literature

Prerequisites / notice
Prerequisites: Signal and Systems Theory II.
MATLAB is used for system analysis and simulation.

227-0116-00L VLSI 1: HDL Based Design for FPGAs

Abstract
This first course in a series that extends over three consecutive terms is concerned with tailoring algorithms and with devising high performance hardware architectures for their implementation as ASIC or with FPGAs. The focus is on front end design using HDLs and automatic synthesis for producing industrial-quality circuits.

Objective
Understand Very-Large-Scale Integrated Circuits (VLSI chips), Application-Specific Integrated Circuits (ASIC), and Field-Programmable Gate-Arrays (FPGA). Know their organization and be able to identify suitable application areas. Become fluent in front-end design from architectural conception to gate-level netlists. How to model digital circuits with SystemVerilog. How to ensure they behave as expected with the aid of simulation, testbenches, and assertions. How to take advantage of automatic synthesis tools to produce industrial-quality VLSI and FPGA circuits. Gain practical experience with the hardware description language SystemVerilog and with industrial Electronic Design Automation (EDA) tools.

Content
This course is concerned with system-level issues of VLSI design and FPGA implementations. Topics include: - Overview on design methodologies and fabrication depths. - Levels of abstraction for circuit modeling. - Organization and configuration of commercial field-programmable components. - FPGA design flows. - Dedicated and general purpose architectures compared. - How to obtain an architecture for a given processing algorithm. - Meeting throughput, area, and power goals by way of architectural transformations. - Hardware Description Languages (HDL) and the underlying concepts. - SystemVerilog - Register Transfer Level (RTL) synthesis and its limitations. - Building blocks of digital VLSI circuits. - Functional verification techniques and their limitations. - Modular and largely reusable testbenches. - Assertion-based verification. - Synchronous versus asynchronous circuits. - The case for synchronous circuits. - Periodic events and the Anceau diagram. - Case studies, ASICs compared to microprocessors, DSPs, and FPGAs.

Lecture notes
Textbook and all further documents in English.

Literature

Prerequisites / notice
Prerequisites:
Basics of digital circuits.
Examination:
In written form following the course semester (spring term). Problems are given in English, answers will be accepted in either English oder German.

227-0377-10L Physics of Failure and Reliability of Electronic Devices and Systems

Abstract
Understanding the physics of failures and failure mechanisms enables reliability analysis and serves as a source guide for electronic devices design, integration, systems development and manufacturing. The field gains additional importance in the context of managing safety, sustainability and environmental impact for continuously increasing complexity and scaling-down trends in electronics.

Objective
Provide an understanding of the physics of failure and reliability. Introduce the degradation and failure mechanisms, basics of failure analysis, methods and tools of reliability testing.

Content
Summary of reliability and failure analysis terminology; physics of failure: materials properties, physical processes and failure mechanisms; failure analysis; basics and properties of instruments; quality assurance of technical systems (introduction); introduction to stochastic processes; reliability analysis; component selection and qualification; maintainability analysis (introduction); design rules for reliability, maintainability, reliability tests (introduction).

Lecture notes
Comprehensive copy of transparencies

Literature

227-0447-00L Image Analysis and Computer Vision

Abstract
We will learn the fundamental concepts of the different parts of modern computing systems, as well as the latest major research topics in

Content

We discuss the following concepts related to fault-tolerant distributed systems: client-server, serialization, two-phase protocols, three-phase

Abstract

The objective of the course is for students to understand the theoretical principles and practical considerations of distributed systems.

Objective

The course takes a hardware/software cooperative approach to understanding and designing computing systems.

Content

The principles presented in the lecture are reinforced in the laboratory through 1) the design and implementation of a cycle-accurate simulator, where we will explore different components of a modern computing system (e.g., pipeline, memory hierarchy, branch prediction, prefetching, caches, multithreading), and 2) the extension of state-of-the-art research simulators (e.g., Ramulator) for more in-depth understanding of specific system components (e.g., memory scheduling, prefetching).

Lecture notes

All the materials (including lecture slides) will be provided on the course website: https://safari.ethz.ch/architecture/

Literature

We will provide required and recommended readings in every lecture. They will mainly consist of research papers presented in major Computer Architecture and related conferences and journals.

This course provides a comprehensive overview of embedded control systems. The concepts introduced are implemented and verified on a microprocessor-controlled haptic device.

Objective

Familiarize students with main architectural principles and concepts of embedded control systems.
Content

An embedded system is a microprocessor used as a component in another piece of technology, such as cell phones or automobiles. In this intensive two-week block course the students are presented the principles of embedded digital control systems using a haptic device as an example for a mechatronic system. A haptic interface allows for a human to interact with a computer through the sense of touch.

Subjects covered in lectures and practical lab exercises include:
- The application of C-programming on a microprocessor
- Digital I/O and serial communication
- Quadrature decoding for wheel position sensing
- Queued analog-to-digital conversion to interface with the analog world
- Pulse width modulation
- Timer interrupts to create sampling time intervals
- System dynamics and virtual worlds with haptic feedback
- Introduction to rapid prototyping

Lecture notes

Lecture notes, lab instructions, supplemental material

Prerequisites / notice

Prerequisite courses are Control Systems I and Informatics I.

This course is restricted to 33 students due to limited lab infrastructure. Interested students please contact Marianne Schmid Daners (E-Mail: marischm@ethz.ch)

After your reservation has been confirmed please register online at www.mystudies.ethz.ch.

Detailed information can be found on the course website

252-1411-00L Security of Wireless Networks

6 credits

W

2V+1U+2A

S. Capkun, K. Kostiainen

Abstract

This course discusses physical layer aspects of wireless communication and a wide range of security-related topics in the domain of wireless technologies. It mainly targets computer science students. Though useful, a background in signal processing or physical layer concepts is not required. A basic understanding of security (e.g. as taught in 252-0211.00L Information Security) is recommended.

Objective

After this course, students should be able to describe and classify security goals of and attacks on various wireless networks and technologies, with an emphasis on physical layer aspects.

Content

- Introduction to wireless communication
- Physical layer security schemes
- Spreading techniques and their application in jamming-resilient communication and Global Navigation Satellite Systems (GNSSs)
- Secure ranging with Ultra-Wide Band (UWB)
- Security aspects of cellular networks, WiFi, and Bluetooth Low Energy (BLE)

401-3055-64L Algebraic Methods in Combinatorics

5 credits

W

2V+1U

not available

Abstract

Combinatorics is a fundamental mathematical discipline as well as an essential component of many mathematical areas, and its study has experienced an impressive growth in recent years. This course provides a gentle introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to other areas.

Objective

The students will get an overview of various algebraic methods for solving combinatorial problems. We expect them to understand the proof techniques and to use them autonomously on related problems.

Content

Combinatorics is a fundamental mathematical discipline as well as an essential component of many mathematical areas, and its study has experienced an impressive growth in recent years. While in the past many of the basic combinatorial results were obtained mainly by ingenuity and detailed reasoning, the modern theory has grown out of this early stage and often relies on deep, well-developed tools.

One of the main general techniques that played a crucial role in the development of Combinatorics was the application of algebraic methods. The most fruitful such tool is the dimension argument. Roughly speaking, the method can be described as follows. In order to bound the cardinality of a discrete structure A one maps its elements to vectors in a linear space, and shows that the set A is mapped to linearly independent vectors. It then follows that the cardinality of A is bounded by the dimension of the corresponding linear space. This simple idea is surprisingly powerful and has many famous applications.

This course provides a gentle introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to other areas. The topics covered in the class will include (but are not limited to):

- Basic dimension arguments, Spaces of polynomials and tensor product methods, Eigenvalues of graphs and their application, the Combinatorial Nullstellensatz and the Chevalley-Waring theorem. Applications such as: Solution of Kakeya problem in finite fields, counterexample to Borsuk’s conjecture, chromatic number of the unit distance graph of Euclidean space, explicit constructions of Ramsey graphs and many others.

Lecture notes

Lectures will be on the blackboard only, but there will be a set of typeset lecture notes which follow the class closely.

Prerequisites / notice

Students are expected to have a mathematical background and should be able to write rigorous proofs.

Matching Core Subjects

These core subjects are particularly recommended for the field of “Electronics and Photonics”.

Abstract

This course provides a thorough treatment of integrated data conversion systems from system level specifications and trade-offs, over architecture choice down to circuit implementation.

Data: 06.08.2024 12:40

Autumn Semester 2024

Page 1048 of 2684
Objective
Data conversion systems are substantial sub-parts of many electronic systems, e.g. the audio conversion system of a home-cinema systems or the base-band front-end of a wireless modem. Data conversion systems usually determine the performance of the overall system in terms of dynamic range and linearity. Students will learn the underlying principles of data conversion and be introduced to the different methods and circuit architectures to implement such a conversion. The conversion methods such as successive approximation or algorithmic conversion are explained based on their operation principle along with the appropriate mathematical calculations, including effects of non-idealities in some cases. After successful completion of the course students should understand the concept of an ideal ADC, know all major converter architectures, their principle of operation and what governs their performance.

Content
- Introduction: examples of data conversion architectures; information representation; abstraction, categorization and symbolic representation; basic conversion algorithms; data converter application; tradeoffs among key parameters; ADC taxonomy
- Dual-slope & successive approximation register (SAR) converters: dual slope principle & converter; SAR ADC operating principle; SAR implementation with a capacitive array; range extension with segmented array.
- Algorithmic & pipelined A/D converters: algorithmic conversion principle; sample & hold stage; pipe-lined converter; multiplying DAC; flash sub-ADC and n-bit MDAC; redundancy for correction of non-idealities, error correction.
- Performance metrics and non-linearity: ideal ADC; offset; gain error, differential and integral non-linearities; capacitor mismatch; impact of capacitor mismatch on SAR ADC's performance.
- Flash, folding an interpolating analog-to-digital converters: flash ADC principle, thermometer to binary coding, sparkle correction; limitations of flash converters: the folding principle, residue extraction; folding amplifiers; cascaded folding; interpolation for folding converters; cascaded folding and interpolation.
- Noise in analog-to-digital converters: types of noise; noise calculation in electronic circuit, kT/C-noise, sampled noise; noise analysis in switched-capacitor circuits; aperture time uncertainty and sampling jitter.
- Delta-sigma A/D-converters: linearity and resolution; from delta-modulation to delta-sigma modulation; first-order delta-sigma modulation, circuit level implementation; clock-jitter & SNR in delta-sigma modulators; second-order delta-sigma modulation, higher-order modulation, design procedure for a single-loop modulator.

Data: 06.08.2024 12:40 Autumn Semester 2024 Page 1050 of 2684
Machine Learning (ML) and artificial intelligence are pervading the digital society. Today, even low power embedded systems are incorporating ML, becoming increasingly “smart”. This lecture gives an overview of ML methods and algorithms to process and extract useful near-sensor information in end-nodes of the “internet-of-things”, using low-power microcontrollers/processors (ARM-Cortex-M; RISC-V).

Objective
Learn how to Process data from sensors and how to extract useful information with low power microprocessors using ML techniques. We will analyze data coming from real low-power sensors (accelerometers, microphones, ExG bio-signals, cameras…). The main objective is to study in details how Machine Learning algorithms can be adapted to the performance constraints and limited resources of low-power microcontrollers.

Content
Neuromorphic circuits are inspired by the organizing principles of biological neural circuits. Their computational primitives are based on physics of semiconductor devices. Neuromorphic architectures often rely on collective computation in parallel networks. Adaptation, learning and memory are implemented locally within the individual computational elements. Transistors are often operated in weak inversion (below threshold), where they exhibit exponential I-V characteristics and low currents. These properties lead to the feasibility of high-density, low-power implementations of functions that are computationally intensive in other paradigms. Application domains of neuromorphic circuits include silicon retinas and cochleas for machine vision and audition, real-time emulations of networks of biological neurons, and the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS transistor, phototransducers), static circuits (differential pair, current mirror, transconductance amplifiers, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silicon neuron, silicon retina and cochlea) and an introduction to multi-chip systems that communicate events analogous to spikes. The lectures are accompanied by weekly laboratory sessions on the characterization of neuromorphic circuits, from elementary devices to systems.

Literature
S.-C. Liu et al.: Analog VLSI Circuits and Principles; various publications.

Prerequisites
Particular: The course is highly recommended for those who intend to take the spring semester course ‘Neuromorphic Engineering II’, that teaches the conception, simulation, and physical layout of such circuits with chip design tools.

Prerequisites: Background in basics of semiconductor physics helpful, but not required.

Recommended Subjects
These courses are recommended, but you are free to choose courses from any other special field. Please consult your tutor.
The final goal of the course is a deep understanding of machine learning and its practical implementation on single- and multi-core microcontrollers, coupled with performance and energy efficiency analysis and optimization. The main topics of the course include:

- Sensors and sensor data acquisition with low power embedded systems
- Machine Learning: Overview of supervised and unsupervised learning and in particular supervised learning (Bayes Decision Theory, Decision Trees, Random Forests, kNN-Methods, Support Vector Machines, Convolutional Networks and Deep Learning)
- Low-power embedded systems and their architecture. Low Power microcontrollers (ARM-Cortex M) and RISC-V-based Parallel Ultra Low Power (PULP) systems-on-chip.
- Low power smart sensor system design: hardware-software tradeoffs, analysis, and optimization. Implementation and performance evaluation of ML in battery-operated embedded systems.

The laboratory exercised will show how to address concrete design problems, like motion, gesture recognition, emotion detection, image and sound classification, using real sensors data and real MCU boards.

Presentations from Ph.D. students and the visit to the Digital Circuits and Systems Group will introduce current research topics and international research projects.

Prerequisites:

Literature:

The script (in book style) can be downloaded from: https://iis-students.ee.ethz.ch/lectures/
The base for these lectures are lecture notes and two or three published scientific papers. From these papers we will together develop the technical content.

Details: https://people.ee.ethz.ch/~haschmid/asfwiki/

The graph methods are also supported with teaching videos: https://tube.switch.ch/channels/d206c96c?order=episodes, and a Python-based open-source tool to manipulate graphs is available on https://github.com/hanspi42/signalflowgrapher

Some material is protected by password; students from ETHZ who are interested can write to haschmid@ethz.ch to ask for the password even if they do not attend the lecture.

Prerequisites / notice

Knowledge of the Laplace transform and z transform and their interpretation (transfer functions, poles and zeros, bode diagrams, stability criteria ...) and of the main properties of linear systems is necessary.
Analytical Competencies
The students will appreciate the potential of solar radiation and photovoltaics, will learn the physics and technology of various solar cells, and will get to know the design basics of PV modules and systems for different applications.

Communication
Cooperation and Teamwork
Customer Orientation
Leadership and Responsibility
Self-presentation and Social Influence
Sensitivity to Diversity
Negotiation

Adaptability and Flexibility
Creative Thinking
Critical Thinking
Integrity and Work Ethics
Self-awareness and Self-reflection
Self-direction and Self-management

Simulation of Photovoltaic Devices - From Materials to Modules

Abstract
The lecture provides an introduction to the theoretical foundations and numerical approaches for the simulation of photovoltaic power conversion, from the microscopic description of component materials to macroscopic continuum modelling of solar cells and network simulation or effective models for performance prediction of entire solar modules.

Objective
Get an overview of the current status of photovoltaic technology. Understand the physics of photovoltaic energy conversion and solar cell device operation. Know how to obtain and assess by simulation the key material properties and device parameters. Be able to use standard device simulation tools to analyze, optimize, and predict the performance of solar cells and modules.

Content
Photovoltaic technology; history and overview; The solar spectrum; Thermodynamics of solar energy conversion; Detailed balance models and efficiency limit; Microscopic rates of charge carrier generation and recombination; Optical simulation of solar cells; Models for charge transport in semiconductor devices; High-efficiency wafer-based (silicon) photovoltaics; Thin film photovoltaics based on disordered materials (amorphous silicon, organic PV); High-efficiency thin film photovoltaics (CIGS, CdTe, metal-halide perovskites); PV beyond the single junction detailed balance (Shockley-Queisser) limit; Simulation of photovoltaic modules; Energy yield and performance modelling for PV systems; Quantum simulation of nanostructure-based solar cell devices (bonus lecture)

Literature
- M. A. Green, „Solar cells: operating principles, technology, and system applications“, Prentice Hall, 1982.

Prerequisites / notice
Undergraduate physics (including basic quantum mechanics), mathematics, semiconductor devices, optics. Knowledge of some scripting language (e.g. python) is of advantage.

The students shall get acquainted with the most important concepts and techniques for characterization, numerical modeling and built-in reliability of modern power semiconductor devices. This knowledge is intended to provide the future engineer with the theoretical background and tools for the design of dependable power devices and systems.

During the laboratory activities, selections of the experimental techniques presented in the lecture are demonstrated on the base of realistic examples. Furthermore, schematic power devices will be simulated by the students with advanced TCAD tools and circuit simulators.

Lecture notes
Handouts to the lecture (approx. 250 pp.)

Literature
Eiichi Ohno: “Introduction to Power Electronics”
B. Murari et al.: “Smart Power ICs”
B. J. Baliga; “Physics Modern Power Devices”
S. K. Ghandi; “Semiconductor Power Devices”

Prerequisites / notice
Be motivated to change the world to renewable energies!

This course is taught simultaneously at ETH Zurich and EPFL. All lectures will be recorded by zoom and made available to the students. Lectures will be streamed live from ETH Zurich with four lectures taught onsite at EPFL Lausanne.

A visit to Empa’s Energy Conversion and Storage Labs will be organized during the semester. Possibility to interact and meet your classmates from EPFL via online lecture platform and during two special lectures with guest lecturers from industry (one guest lecture by ABB at ETH Zurich, one guest lecture by Northvolt at EPFL). Travel expenses for students will be covered.

Elements of calculus will be reviewed during the lectures, where necessary, but we leave the hard work of solving coupled differential charge transport equations to the computer and focus on developing a strong intuition. Prior knowledge in semiconductor physics or electrochemistry is an advantage, but not a prerequisite.

Students are required to bring a windows-compatible computer with a common data analysis software to the exercises. Apps for simulating devices under different operating conditions will be made available to the students.

Abstract
The students will be introduced to the fundamental concepts of charge transport in solar cells, batteries, and electrolysers. Emphasizing analogies between semiconductor physics and electrochemistry, this course is designed to provide a unified modern perspective of energy conversion and storage concepts for students in electrical engineering, materials science, physics, and chemistry.

Objective
By the end of this course, the students will (1) understand the fundamentals of electronic and ionic charge transport, (2) understand the operational principles of solar cells, batteries, and electrolysers, and (3) understand fundamental limits for each device type. In addition, the students will learn how to simulate these devices during guided exercise sessions and develop an intuitive understanding on how to interpret the most important device characteristics.

Competencies
Subject-specific Competencies: Concepts and Theories

Quantum Measurements and Optomechanics

Abstract
The measurement process is at the heart of both science and engineering. Measurement precision is ultimately limited by the laws of quantum mechanics. This course provides the knowledge necessary to understand current state-of-the-art quantum measurement systems operating at their fundamental limits with a particular focus on optomechanical implementations.

Objective
The goal of this course is to understand the quantum limits of measurement precision together with a formal description of the measurement process in the framework of quantum mechanics.

Content
The lecture starts with summarizing the relevant fundamentals of the treatment of noisy signals. We familiarize ourselves with the concept of measurement imprecision in light-based measurement systems. To this end, we consider the process of photodetection and discuss the statistical fluctuations arising from the quantization of the electromagnetic field into photons. We exemplify our insights at hand of concrete examples, such as homodyne and heterodyne photodetection. Furthermore, we focus on the process of measurement backaction, the inevitable result of the interaction of the probe with the system under investigation. We discuss the “standard quantum limit” as it arises from the balance of measurement imprecision and backaction, before turning to approaches to overcome it and reach the fundamental “Heisenberg limit”. The course emphasizes the connection between the taught concepts and current state-of-the-art research carried out in the field of optomechanics. Exercises serve to consolidate our understanding and insight.

Prerequisites / notice
1. Electrodynamics
2. Physics 1.2
3. Introduction to quantum mechanics
The seminar topics are simulation of nanoelectronic processes and devices, and the optical as well as electronic simulation of quantum devices. We will delve into both the theoretical and experimental aspects, discussing how these materials' unique properties can be translated into device functionality.

On the theoretical side, we'll cover how the chemical structure of the material and its dimensionality, ranging from 0D to 2D, affects the electronic properties. We'll also discuss how charge carriers flow through the devices and what charge transport mechanisms are at play.

On the experimental side, we'll cover how such devices are fabricated, including how the materials are synthesized. We'll also discuss how to characterize the devices and assess their performance.

The course also includes a presentation by each student in which a related scientific publication is discussed. This presentation is compulsory and accounts for 30% of the grade.

227-0654-00L Carbon-based Nanoelectronics

Abstract
This course explores the exciting realm of carbon-based nanoelectronics, where the remarkable quantum properties of materials like graphene, carbon nanotubes, graphene nanoribbons, and single molecules are used for building electronic devices.

Objective
The objective of this course is to understand how the electronic properties of carbon-based materials can be exploited for fabricating quantum devices. We will delve into both the theoretical and experimental aspects, discussing how these materials' unique properties can be translated into device functionality.

Content
The course will cover the following carbon-based materials:
- Single-molecule
- Graphene (single layer, bilayer, twisted bilayer)
- Graphene nanoribbons
- Carbon nanotubes

For each material, we will discuss:
- Electronic structure and charge transport properties
- Material synthesis and characterization
- Device integration and characterization

The course includes a presentation by each student in which a related scientific publication is discussed. This presentation is compulsory and accounts for 30% of the grade.

Lecture slides are distributed every week. In addition, relevant scientific articles and book chapters will be provided for self-study.

Prerequisites / notice
A basic knowledge of solid-state physics and quantum mechanics is required. The course is taught in English.

Compared to other nanomaterials, carbon-based materials give an insight on how the fundamental physics and the resulting complex functionalities of nanodevices and circuits offer viable alternatives.

For each material, we will discuss:
- Electronic structure and charge transport properties
- Material synthesis and characterization
- Device integration and characterization

The seminar aims at instructing graduate and PhD students in the basics of presentation techniques, i.e. "how to give a professional talk". Attendees have the possibility to become acquainted with a current topic by a literature study, and to present the results thereof in a 20 minutes talk in English. The participation at the seminar gives also an overview on current problems in modern nano- and opto-electronics.

The seminar topics are simulation of nanoelectronic processes and devices, and the optical as well as electronic simulation of optoelectronic devices as lasers, photodiodes, etc.

The students learn how to find the right literature for a certain topic quickly, as well as how to prepare a talk for a scientific conference, i.e. presentation techniques.

Lecture notes
Presentation material

227-0659-00L Integrated Systems Seminar

Abstract
In the "Fachseminar IIS" the students learn to communicate topics, ideas or problems of scientific research by listening to more experienced authors and by presenting scientific work in a conference-like situation for a specific audience.

Objective
The seminar aims at instructing graduate and PhD students in the basics of presentation techniques, i.e. "how to give a professional talk". Presentation material

227-0671-00L Nanodevices and Circuits for the Beyond-Moore Era

Abstract
Big Data, AI and the Internet of Things demand new hardware which overcomes the limitations of von Neumann architectures. The lecture gives an insight how the fundamental physics and the resulting complex functionalities of nanodevices and circuits offer viable alternatives.

Objective
The students will gain a firm understanding in the theory and pioneering experiments of electronic and heat transport at atomic- to nanometer length-scales. Advanced device functionalities enabled by recently discovered material systems will be covered. The students will learn how to exploit such phenomena for designing nanodevices and circuits to energy-efficiently implement neuromorphic architectures for a sustainable future of information technologies.

Lecture notes
The presentation slides and further material will be provided every week.

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 1056 of 2684
Critical Thinking
This course intends to enable all students to:

- Acquire and understand the basic jargon, concepts and methods necessary to discuss, in a precise and concise manner, innovation processes and their outcomes at different levels of analysis.
- Analyze the differences between individual and organizational decision processes and their innovative outcomes.
- Evaluate critically the potential of different (digital) technologies to impact business organizations.

Organizations and people are faced with a fundamental decision: they have to allocate resources between well-known tasks that reliably generate positive results; or explore new ways of doing things, new technologies, products and services. The latter is a high risk choice. Its rewards can be high, but the chances of success are small. How do firms organize to take these decisions? What kind of management skills are necessary to take them? What kind of tools and methods are deployed to sustain managerial decision-making in highly volatile environments? These are the central questions on which this course focuses, relying on a combination of lectures, case-based discussion, and guest speakers.
Adaptability and Flexibility

Slides will be available on the Moodle page

Readings will be available on the Moodle page

The course content and methods are designed for students with some background in management and/or economics

Subject-specific Competencies
- Concepts and Theories assessed
- Techniques and Technologies assessed

Method-specific Competencies
- Analytical Competencies assessed
- Decision-making fostered
- Media and Digital Technologies fostered
- Problem-solving fostered

Social Competencies
- Communication fostered
- Leadership and Responsibility fostered
- Sensitivity to Diversity fostered

Personal Competencies
- Adaptability and Flexibility fostered
- Creative Thinking fostered
- Critical Thinking assessed
- Integrity and Work Ethics fostered
- Self-awareness and Self-reflection assessed
- Self-direction and Self-management fostered

**Prerequisites / notice**

**Competencies**

**402-0475-00L** Terahertz Science and Applications  
**W** 6 credits  **2V+1U**  
E. Abreu

**Abstract**

The Terahertz (THz) range (0.1 – 10 THz), lies between the infrared and microwave spectral regions and has become accessible in the past few years. This new capability has had great impact in scientific research, and has led to technological advances and to the development of a variety of applications and devices. This course provides an introduction to THz science, technology and applications.

**Objective**

The goal of this course is to enable students to determine whether a THz solution can be applied to a particular scientific or technological problem. Armed with the fundamentals of THz science and of current THz technologies, covered in this introductory course, students will be able to weigh the capabilities, advantages and limitations of THz tools to address topics ranging from phonons in solid state systems and molecular vibrations in solutions to medical imaging and wireless communications.

**Lecture notes**

Will be distributed via moodle.

**Literature**

Yun-Shik Lee, Principles of Terahertz Science and Technology, Springer 2009

Additional references distributed via moodle.

**Prerequisites / notice**

Basic knowledge in physics, especially in electromagnetism, is required. No formal prerequisites.

**Competencies**

- Concepts and Theories assessed
- Techniques and Technologies assessed
- Analytical Competencies assessed
- Decision-making fostered
- Media and Digital Technologies fostered

**Algebraic Methods in Combinatorics**

Does not take place this semester.

**Abstract**

Combinatorics is a fundamental mathematical discipline as well as an essential component of many mathematical areas, and its study has experienced an impressive growth in recent years. This course provides a gentle introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to other areas.

**Objective**

The students will get an overview of various algebraic methods for solving combinatorial problems. We expect them to understand the proof techniques and to use them autonomously on related problems.

**Content**

Combinatorics is a fundamental mathematical discipline as well as an essential component of many mathematical areas, and its study has experienced an impressive growth in recent years. While in the past many of the basic combinatorial results were obtained mainly by ingenuity and detailed reasoning, the modern theory has grown out of this early stage and often relies on deep, well-developed tools.

One of the main general techniques that played a crucial role in the development of Combinatorics was the application of algebraic methods. The most fruitful such tool is the dimension argument. Roughly speaking, the method can be described as follows. In order to bound the cardinality of a discrete structure A one maps its elements to vectors in a linear space, and shows that the set A is mapped to linearly independent vectors. It then follows that the cardinality of A is bounded by the dimension of the corresponding linear space. This simple idea is surprisingly powerful and has many famous applications.

This course provides a gentle introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to other areas. The topics covered in the class will include (but are not limited to):

- Basic dimension arguments
- Spaces of polynomials and tensor product methods
- Eigenvalues of graphs and their application
- The Combinatorial Nullstellensatz and the Chevalley-Warning theorem
- Applications such as: Solution of Kakeya problem in finite fields, counterexample to Borsuk's conjecture, chromatic number of the unit distance graph of Euclidean space, explicit constructions of Ramsey graphs and many others.

The course website can be found at https://moodle-app2.let.ethz.ch/course/view.php?id=15757

---

**Energy and Power Electronics**
The goal of this course is understanding the stationary dependencies in electrical power systems. The course includes the development of stationary models of the electrical network, their mathematical representation and special characteristics and solution methods of large linear and non-linear systems of equations related to electrical power networks. The course includes the development of stationary models of the electrical network, their mathematical representation and special characteristics and solution methods of large linear and non-linear systems of equations related to electrical power networks. Approaches such as the Newton-Raphson algorithm applied to power flow equations, superposition technique for short-circuit analysis and symmetrical components are discussed as well as power flow computation techniques for distribution grids and state estimation.

<tr>
<td>Objective</td>
<td>The course is about some fundamental topics of digital signal processing with a bias towards applications in communications. The two main themes are linearity and probability. In the first part of the course, we deepen our understanding of discrete-time linear filters. In the second part of the course, we review the basics of probability theory and discrete-time stochastic processes. We then discuss some basic concepts of detection theory and estimation theory, as well as some practical methods including LMMSE estimation and LMMSE filtering, and Wiener filter, LMS adaptive filter, Viterbi algorithm. A recurrent theme throughout the course is the stable and robust &quot;inversion&quot; of a linear filter.</td>

227-0523-00L Railway Systems I
W 6 credits 4G M. Meyer

Abstract
Basic characteristics of railway vehicles and their interfaces with the railway infrastructure:
- Transportation tasks and vehicle types
- Running dynamics
- Mechanical part of rail vehicles
- Brakes
- Traction chain and auxiliary supply
- Railway power supply
- Signalling systems
- Standards
- Availability and safety
- Traffic control and maintenance

Objective
- Overview of the technical characteristics of railway systems
- Know-how about the design and construction principles of rail vehicles
- Interrelationship between different fields of engineering sciences (mechanics, electro and information technology, transport systems)
- Understanding tasks and opportunities of engineers working in an environment which has strong economical and political boundaries
- Insight into the activities of the railway vehicle industry and railway operators in Switzerland
- Motivation of young engineers to start a career in the railway industry or with railway operators

Content
EST I (Herbstsemester) - Begriffen, Grundlagen, Merkmale

1 Einführung:
1.1 Geschichte und Struktur des Bahnsystems
1.2 Fahrdynamik

2 Vollbahnfahrzeuge:
2.1 Mechanik: Kasten, Drehgestelle, Lauftechnik, Adhäsion
2.2 Bremsen
2.3 Traktionsantriebsysteme
2.4 Hilfsbetriebe und Komfortanlagen
2.5 Steuerung und Regelung

3 Infrastruktur:
3.1 Fahrweg
3.2 Bahnstromversorgung
3.3 Sicherungsanlagen

4 Betrieb:
4.1 Interoperabilität, Normen und Zulassung
4.2 RAMS, LCC
4.3 Anwendungsbeispiele

Lecture notes
Abgabe der Unterlagen (gegen eine Schutzgebühr) zu Beginn des Semesters. Rechtzeitig eingeschriebene Teilnehmer können die Unterlagen auf Wunsch und gegen eine Zusatzgebühr auch in Farbe beziehen.

Prerequisites / notice
Dozent:
Dr. Markus Meyer, Emkamatik GmbH

Voraussichtlich ein oder zwei Gastvorträge von anderen Referenten.

EST I (Herbstsemester) kann als in sich geschlossene einsemestrige Vorlesung besucht werden. EST II (Frühjahrssemester) dient der weiteren Vertiefung der Fahrzeugtechnik und der Integration in die Bahninfrastruktur.

227-0536-00L Multiphysics Simulations for Power Systems
W 4 credits 2V+2U J. Smajic

Abstract
This course is defined so and planned to be an addition to the module "227-0537-00L Technology of Electric Power System Components". However, the students who are familiar with the fundamentals of electromagnetic fields could attend only this course without its 227-0537-00-complement.

The goals of this course are a) understanding the fundamentals of the electromagnetic, thermal, mechanical, and coupled field simulations and b) performing effective simulations of primary equipment of electric power systems. The course is understood complementary to 227-0537-00L "Technology of Electric Power System Components", but can also be taken separately.

Objective
The student should learn the fundamentals of the electromagnetic, thermal, mechanical, and coupled fields simulations necessary for modern product development and research based on virtual prototyping. She / he should also learn the theoretical background of the finite element method (FEM) and its application to low- and high-frequency electromagnetic field simulation problems. The practical exercises of the course should be done by using one of the commercially available field simulation software (Infolytica, ANSYS, and / or COMSOL). After completing the course the student should be able to properly and efficiently use the software to simulate practical design problems and to understand and interpret the obtained results.
## 227-0567-00L Design of Power Electronic Systems

**Abstract**
Complete design process: from given specifications to a complete power electronic system; selection / design of suitable passive power components; static and dynamic properties of power semiconductors; optimized EMI filter design; heat sink optimization; additional circuitry, e.g. gate driver; system optimization.

**Objective**
Basic knowledge of design and optimization of a power electronic converter system; furthermore, lecture and exercises thoroughly discuss key subjects of power electronics that are important with respect to a practical realization, e.g. how to select or design suitable power components, to understand switching operations, calculation of high frequency losses, EMI filter design and realization, thermal considerations.

**Content**
Complete design process: from given specifications to a complete power electronic system. Selection and / or design of suitable passive power components: specific properties, parasitic components, tolerances, high frequency losses, thermal considerations, reliability. Static and dynamic characteristics of power semiconductors. Optimized design of the EMI filter. Thermal characterization of the converter, optimized heat sink design. Additional circuitry: gate driver, measurement, control. Converter start up: typical sequence of events, circuitry required. Overall system optimization: identifying couplings between different components of the considered power electronic system, optimization targets and issues.

**Lecture notes**
Lecture notes and complementary exercises including correct answers.

**Prerequisites / notice**
Prerequisites: Introductory course on power electronics.

**227-0561-00L Solar Cells**

**Abstract**
Physics, technology, characteristics and applications of photovoltaic solar cells and systems.

**Objective**
The students will appreciate the potential of solar radiation and photovoltaics, will learn the physics and technology of various solar cells, and will get to know the design basics of PV modules and systems for different applications.

**Content**
Introduction to photovoltaics and economic aspects, solar radiation, semiconductor physics and operation of solar cells, technology of wafer-based (Si, GaAs, multi-junction) and thin-film (CIGS, CdTe, perovskite) solar cells, emerging technologies, design of PV modules, systems and plants including system components such as inverters and controllers, engineering procedures with software demonstration, integration in buildings and other specific examples such concentrated photovoltaics and power generation for space applications.

**Lecture notes**
Lecture slides (PDF files in English) will be available on Moodle and lecture recordings will be available on the ETH video portal.

**Prerequisites / notice**
Prerequisites: Basic knowledge of semiconductors.

**227-0568-00L Modeling, Characterization and Reliability of Power Semiconductors**

*Does not take place this semester.*

**Abstract**
This lecture provides theoretical and experimental knowledge on the techniques for the characterization and numerical modeling of power semiconductors, as well on the related built-in reliability strategies.

**Objective**
The students shall get acquainted with the most important concepts and techniques for characterization, numerical modeling and built-in reliability of modern power devices. This knowledge is intended to provide the future engineer with the theoretical background and tools for the design of dependable power devices and systems.

**Content**
This lecture consists of a theoretical part (50%) and of laboratory exercises and demonstrations (50%). The theoretical part covers the basic techniques and procedures for characterization, modeling and built-in reliability of modern power semiconductor devices with special attention to MOS and IGBT. The starting point on technology provides an overview on the main device families and includes a review of the most relevant application-oriented aspects of the device physics, thermal management, and packaging. The second section deals with the basic experimental characterization techniques for the definition of the semiconductor material properties, electrical characteristics, safe operating area, and junction temperature of the devices. The following section introduces the basic principles for electrical, thermal, and electro-thermal simulation of power semiconductor devices. The objective is to provide the student with efficient TCAD tools and compact modeling. Finally, procedures are methods are presented to implement efficient built-in reliability programs targeted on power semiconductors. They include failure physics, dedicated failure analysis techniques, accelerated testing, defect screening, and lifetime modeling.

During the laboratory activities, selections of the experimental techniques presented in the lecture are demonstrated on the base of realistic examples. Furthermore, schematic power devices will be simulated by the students with advanced TCAD tools and circuit simulators.
227-0619-00L  Charge Transport in Energy Conversion and Storage  W  6 credits  2V+2U  C. Battaglia, A. Senocrate

**Abstract**
The students will be introduced to the fundamental concepts of charge transport in solar cells, batteries, and electrolyzers. Emphasizing analogies between semiconductor physics and electrochemistry, this course is designed to provide a unified modern perspective of energy conversion and storage concepts for students in electrical engineering, materials science, physics, and chemistry.

**Objective**
By the end of this course, the students will (1) understand the fundamentals of electronic and ionic charge transport, (2) understand the operational principles of solar cells, batteries, and electrolyzers, and (3) understand fundamental limits for each device type. In addition, the students will learn how to simulate these devices during guided exercise sessions and develop an intuitive understanding on how to interpret the most important device characteristics.

**Literature**
- R. Huggins, Advanced Batteries, DOI:10.1007/9780387764245

**Prerequisites / notice**
This course is taught simultaneously at ETH Zurich and EPFL. All lectures will be recorded by zoom and made available to the students. Lectures will be streamed live from ETH Zurich with four lectures taught on-site at EPFL Lausanne. A visit to Empa’s Energy Conversion and Storage Labs will be organized during the semester. Possibility to interact and meet your classmates from EPFL via online lecture platform and during two special lectures with guest lecturers from industry (one guest lecture by ABB ETH Zurich, one guest lecture by Northvolt at EPFL). Travel expenses for students will be covered.

Elements of calculus will be reviewed during the lectures, where necessary, but we leave the hard work of solving coupled differential charge transport equations to the computer and focus on developing a strong intuition. Prior knowledge in semiconductor physics or electrochemistry is an advantage, but not a prerequisite.

Students are required to bring a windows-compatible computer with a common data analysis software to the exercises. Apps for simulating devices under different operating conditions will be made available to the students.

**Competencies**
- Subject-specific Competencies: assessed
- Concepts and Theories: assessed

227-0697-00L  Industrial Process Control  W  4 credits  3G  A. Horch, L. Dominguez Palomeque

**Abstract**
Introduction to industrial automation systems with application to the process industry, power generation as well as discrete manufacturing. Analysis and design of open loop control problems: discrete automata, finite state machines, decision tables, and petri-nets. Practical analysis and design of closed-loop control for the process industry.

**Objective**
General understanding of industrial automation systems in different industries. Purpose, architecture, technologies, application examples, current and future trends.

**Content**
Introduction to process automation: system architecture, data handling, communication (fieldbuses), process visualization, and engineering. Differences and characteristics of discrete and process industries. Automation Engineering; Application programming in IEC 61131-3 (ladder diagrams, function blocks, sequence control, structured text); PLC programming and simulation, process visualization and operation; engineering integration from sensors, cabling, topology design, function, visualization, diagnosis, to documentation; Industry standards (e.g. OPC, Profibus); Ergonomic design, safety (IEC61508) and availability, supervision and diagnosis.

Automation standards: Communication, Architecture, Engineering, dependable systems, functional safety, automation security. Extensive practical examples from different process industries, power generation, gas compressor control, and automotive manufacturing.

**Lecture notes**
Slides will be available as .PDF documents, see “Learning materials” (for registered students only)

**Prerequisites / notice**
Exercises: Tuesdays after the lecture (applies not to all lectures)

Practical exercises will illustrate some topics, e.g. some control software coding using industry standard programming tools based on IEC61131-3. These exercises are a prerequisite for the exam.

**Competencies**
- Subject-specific Competencies: assessed
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

227-0731-00L  Power Market I - Portfolio and Risk Management  W  6 credits  4G  D. Reichelt, G. A. Koeppe

**Abstract**
Portfolio and risk management in the electrical power business, Pan-European power market and trading, futures and forward contracts, hedging, options and derivatives, performance indicators for the risk management, modelling of physical assets, cross-border trading, ancillary services, balancing power market, Swiss market model.

**Objective**
Content

1. Pan-European power market and trading
   1.1. Power trading
   1.2. Development of the European power markets
   1.3. Energy economics
   1.4. Spot and OTC trading
   1.5. European energy exchange EEX

2. Market model
   2.1. Market place and organisation
   2.2. Balance groups / balancing energy
   2.3. Ancillary services
   2.4. Market for ancillary services
   2.5. Cross-border trading
   2.6. Capacity auctions

3. Portfolio and Risk management
   3.1. Portfolio management 1 (introduction)
   3.2. Forward and futures contracts
   3.3. Risk management 1 (m2m, VaR, hpfc, volatility, cVaR)
   3.4. Risk management 2 (PaR)
   3.5. Contract valuation (HPFC)
   3.6. Portfolio management 2
   2.8. Risk Management 3 (enterprise wide)

4. Energy & Finance I
   4.1. Options 1 basics
   4.2. Options 2 hedging with options
   4.3. Introduction to derivatives (swaps, cap, floor, collar)
   4.4. Financial modelling of physical assets
   4.5. Trading and hydro power
   4.6. Incentive regulation

Lecture notes
Handouts of the lecture
Prerequisites / notice
Case studies and ML exercise for Power Market can give bonus points for the exam. Guest speakers for specific topics.

Dynamic Programming and Optimal Control

W
4 credits
2V+1U
R. D’Andrea

Abstract
- Introduction to Dynamic Programming and Optimal Control.

Objective
- Covers the fundamental concepts of Dynamic Programming & Optimal Control.

Content
- Dynamic Programming Algorithm; Deterministic Systems and Shortest Path Problems; Infinite Horizon Problems, Bellman Equation;
- Deterministic Continuous-Time Optimal Control.

Literature

Prerequisites / notice
- Requirements: Knowledge of advanced calculus, introductory probability theory, and matrix-vector algebra.

227-0102-00L Discrete Event Systems W 6 credits 4G L. Vanbever, L. Josipovic, B. Keller, R. Wattenhofer

Abstract
- Introduction to discrete event systems. We start out by studying popular models of discrete event systems. Then we analyze discrete event systems from an average-case and from a worst-case perspective, and study verification. Topics include: Automata and Languages, Specification Models, Stochastic Discrete Event Systems, Worst-Case Event Systems, Verification, Petri Nets.

Objective
- Over the past few decades the rapid evolution of computing, communication, and information technologies has brought about the proliferation of new dynamic systems. A significant part of activity in these systems is governed by operational rules designed by humans. The dynamics of these systems are characterized by asynchronous occurrences of discrete events, some controlled (e.g. hitting a keyboard key, sending a message), some not (e.g. spontaneous failure, packet loss).

The mathematical arsenal centered around differential equations that has been employed in systems engineering to model and study processes governed by the laws of nature is often inadequate or inappropriate for discrete event systems. The challenge is to develop new modeling frameworks, analysis techniques, design tools, testing methods, and optimization processes for this new generation of systems.

In this lecture we give an introduction to discrete event systems. We start out the course by exploring the limits of what is computable and what is not. In doing so, we will consider three distinct models of computation which are often used to model discrete event systems: finite automata, push-down automata and Turing machines (ranked in terms of expressiveness power). In the second part of the course we analyze discrete event systems. We first examine discrete event systems from an average-case perspective: we model discrete events as stochastic processes, and then apply continuous time markov chains and queueing theory for an understanding of the typical behavior of a system. Then we analyze discrete event systems from a worst-case perspective using the theory of online algorithms and adversarial queueing. In the last part of the course we introduce methods that allow to formally verify certain properties of Finite Automata and Petri Nets. These are some typical analysis questions we will look at: Do two given systems behave the same? Does a given system behave as intended? Does the system eventually enter a dangerous state?

Content
- 1. Regular Languages
- 2. Non-Regular Languages
- 3. Markov Chains
- 4. Stochastic Discrete Event Systems
- 5. Worst-Case Event Systems
- 6. Verification of Finite Automata
- 7. Petri Nets

Image Analysis and Computer Vision

Abstract

Objective
Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

Content
This course aims at offering a self-contained account of computer vision and its underlying concepts, including the recent use of deep learning. The first part starts with an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First the interaction of light with matter is considered. The most important hardware components such as cameras and illumination sources are also discussed. The course then turns to image discretization, necessary to process images by computer. The next part describes necessary pre-processing steps, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and 3D shape as two important examples. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed. A major part at the end is devoted to deep learning and AI-based approaches to image analysis. Its main focus is on object recognition, but also other examples of image processing using deep neural nets are given.

Power System Analysis

Abstract
The goal of this course is understanding the stationary dependencies in electrical power systems. The course includes the development of stationary models of the electrical network, their mathematical representation and special characteristics and solution methods of large linear and non-linear systems of equations related to electrical power networks.

Objective
The goal of this course is understanding the stationary dependencies in electrical power systems and the application of analysis tools in normal but also in faulty state.

Content
The course includes the development of stationary models of the electrical network, their mathematical representation and special characteristics and solution methods of large scale and non-linear systems of equations related to electrical power grids. Approaches such as the Newton-Raphson algorithm applied to power flow equations, superposition technique for short-circuit analysis and symmetrical components are discussed as well as power flow computation techniques for distribution grids and state estimation.

Abstract
Theory and techniques for the identification of dynamic models from experimentally obtained system input-output data.

Objective
To provide a series of practical techniques for the development of dynamical models from experimental data, with the emphasis being on the development of models suitable for feedback control design purposes. To provide sufficient theory to enable the practitioner to understand the trade-offs between model accuracy, data quality and data quantity.

Content
Introduction to modeling: Black-box and grey-box models; Parametric and non-parametric models; ARX, ARMAX (etc.) models.

Predictive, open-loop, black-box identification methods. Time and frequency domain methods. Subspace identification methods.

Optimal experimental design, Cramer-Rao bounds, input signal design.

Parametric identification methods. On-line and batch approaches.

Closed-loop identification strategies. Trade-off between controller performance and information available for identification.

Prerequisites / notice
Control systems (227-0216-00L) or equivalent.

Nonlinear Dynamics and Chaos I W 4 credits 4G G. Haller

Abstract
Basic facts about nonlinear systems; stability and near-equilibrium dynamics; bifurcations; dynamical systems on the plane; non-autonomous dynamical systems; chaotic dynamics.

Objective
This course is intended for Masters and Ph.D. students in engineering sciences, physics and applied mathematics who are interested in the behavior of nonlinear dynamical systems. It offers an introduction to the qualitative study of nonlinear physical phenomena modeled by differential equations or discrete maps. We discuss applications in classical mechanics, electrical engineering, fluid mechanics, and biology. A more advanced Part II of this class is offered every other year.

Content
(1) Basic facts about nonlinear systems: Existence, uniqueness, and dependence on initial data.
(2) Near equilibrium dynamics: Linear and Lyapunov stability
(3) Bifurcations of equilibria: Center manifolds, normal forms, and elementary bifurcations
(4) Nonlinear dynamical systems on the plane: Phase plane techniques, limit sets, and limit cycles.
(5) Time-dependent dynamical systems: Floquet theory, Poincare maps, averaging methods, resonance

Lecture notes
- Prerequisites: Analysis, linear algebra and a basic course in differential equations.

Dynamic Programming and Optimal Control W 4 credits 2V+1U R. D'Andrea

Abstract
Introduction to Dynamic Programming and Optimal Control.

Objective
Covers the fundamental concepts of Dynamic Programming & Optimal Control.

Content
Dynamic Programming Algorithm; Deterministic Systems and Shortest Path Problems; Infinite Horizon Problems, Bellman Equation; Deterministic Continuous-Time Optimal Control.

Literature

Prerequisites / notice
Requirements: Knowledge of advanced calculus, introductory probability theory, and matrix-vector algebra.

Rehabilitation Engineering II: Rehabilitation of Sensory and Vegetative Functions W 3 credits 2V R. Riener, O. Lambercy

Abstract
Rehabilitation Engng is the application of science and technology to ameliorate the handicaps of individuals with disabilities to reintegrate them into society. The goal is to present classical and new rehabilitation engineering principles applied to compensate or enhance motor, sensory, and cognitive deficits. Focus is on the restoration and treatment of the human sensory and vegetative system.

Objective
Provide knowledge on the anatomy and physiology of the human sensory system, related dysfunctions and pathologies, and how rehabilitation engineering can provide sensory restoration and substitution.

This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.
Content

Introduction, problem definition, overview
- Rehabilitation of visual function
  - Anatomy and physiology of the visual sense
  - Technical aids (glasses, sensor substitution)
  - Retina and cortex implants
- Rehabilitation of hearing function
  - Anatomy and physiology of the auditory sense
  - Hearing aids
  - Cochlea Implants
- Rehabilitation and use of kinesthetic and tactile function
  - Anatomy and physiology of the kinesthetic and tactile sense
  - Tactile/haptic displays for motion therapy (incl. electrical stimulation)
  - Role of displays in motor learning
- Rehabilitation of vestibular function
  - Anatomy and physiology of the vestibular sense
  - Rehabilitation strategies and devices (e.g. BrainPort)
- Rehabilitation of vegetative Functions
  - Cardiac Pacemaker
  - Phrenic stimulation, artificial breathing aids
  - Bladder stimulation, artificial sphincter
  - Brain stimulation and recording
  - Deep brain stimulation for patients with Parkinson, epilepsy, depression
  - Brain-Computer Interfaces

Literature

Introductory Books:

Selected Journal Articles and Web Links:

Prerequisites / notice

Target Group:
Students of higher semesters and PhD students of
- D-MAVT, D-ITET, D-INFK, D-HEST
- Biomedical Engineering, Robotics, Systems and Control
- Medical Faculty, University of Zurich

Students of other departments, faculties, courses are also welcome

This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 1068 of 2684

<tr>
<td>Content</td>
<td>Biology has witnessed an unprecedented increase in experimental data and, correspondingly, an increased need for computational methods to analyze this data. The explosion of sequenced genomes, and subsequently, of bioinformatics methods for the storage, analysis and comparison of genetic sequences provides a prominent example. Recently, however, an additional area of research, captured by the label &quot;Systems Biology&quot;, focuses on how networks, which are more than the mere sum of their parts' properties, establish biological functions. This is essentially a task of reverse engineering. The aim of this course is to provide an introductory overview of corresponding computational methods for the modeling, simulation and analysis of biological networks. We will start with an introduction into the basic units, functions and design principles that are relevant for biology at the level of individual cells. Making extensive use of example systems, the course will then focus on methods and algorithms that allow for the investigation of biological networks with increasing detail. These include (i) graph theoretical approaches for revealing large-scale network organization, (ii) probabilistic (Bayesian) network representations, (iii) structural network analysis based on reaction stoichiometries, (iv) qualitative methods for dynamic modeling and simulation (Boolean and piece-wise linear approaches), (v) mechanistic modeling using ordinary differential equations (ODEs) and finally (vi) stochastic simulation methods.</td>

Algebraic Methods in Combinatorics

The students will get an overview of various algebraic methods for solving combinatorial problems. We expect them to understand the

Abstract
Combinatorics is a fundamental mathematical discipline as well as an essential component of many mathematical areas, and its study has
experienced an impressive growth in recent years. This course provides a gentle introduction to Algebraic methods, illustrated by examples
and focusing on basic ideas and connections to other areas.

Content
Combinatorics is a fundamental mathematical discipline as well as an essential component of many mathematical areas, and its study has
experienced an impressive growth in recent years. While in the past many of the basic combinatorial results were obtained mainly by
ingenuity and detailed reasoning, the modern theory has grown out of this early stage and often relies on deep, well-developed tools.

One of the main general techniques that played a crucial role in the development of Combinatorics was the application of algebraic
methods. The most fruitful such tool is the dimension argument. Roughly speaking, the method can be described as follows. In order to
bound the cardinality of of a discrete structure A one maps its elements to vectors in a linear space, and shows that the set A is mapped to
linearly independent vectors. It then follows that the cardinality of A is bounded by the dimension of the corresponding linear space. This
simple idea is surprisingly powerful and has many famous applications.

This course provides a gentle introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to
other areas. The topics covered in the class will include (but are not limited to):

Basic dimension arguments, Spaces of polynomials and tensor product methods, Eigenvalues of graphs and their application, the
Combinatorial Nullstellensatz and the Chevalley-Warning theorem. Applications such as: Solution of Kakeya problem in finite fields,
counterexample to Borsuk’s conjecture, chromatic number of the unit distance graph of Euclidean space, explicit constructions of Ramsey
graphs and many others.

Lecture notes
Lectures will be on the blackboard only, but there will be a set of typeset lecture notes which follow the class closely.

Prerequisites / notice
Students are expected to have a mathematical background and should be able to write rigorous proofs.

Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

This course aims at offering a self-contained account of computer vision and its underlying concepts, including the recent use of deep learning. The first part starts with an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First the interaction of light with matter is considered. The most important hardware components such as cameras and illumination sources are also discussed. The course then turns to image discretization, necessary to process images by computer. The next part describes necessary pre-processing steps, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and 3D shape as two important examples. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed. A major part at the end is devoted to deep learning and AI-based approaches to image analysis. Its main focus is on object recognition, but also other examples of image processing using deep neural nets are given.

Course material Script, computer demonstrations, exercises and problem solutions

The course language is English.

Prerequisites: Course material Script, computer demonstrations, exercises and problem solutions

Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Python and Linux.

252-0535-00L Advanced Machine Learning W 10 credits 3V+2U+4A J. M. Buhmann, C. Cotrini Jimenez

Objective Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real world data.

Content The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:

- Fundamentals:
  - What is data?
  - Bayesian Learning
  - Computational learning theory

- Supervised learning:
  - Ensembles: Bagging and Boosting
  - Max Margin methods
  - Neural networks

- Unsupervised learning:
  - Dimensionality reduction techniques
  - Clustering
  - Mixture Models
  - Non-parametric density estimation
  - Learning Dynamical Systems

Lecture notes No lecture notes, but slides will be made available on the course webpage.

Prerequisites:

The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.

Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

Abstract The course is about some fundamental topics of digital signal processing with a bias towards applications in communications: discrete-time linear filters, inverse filters and equalization, DFT, discrete-time stochastic processes, elements of detection theory and estimation theory, LMMSE estimation and LMMSE filtering, LMS algorithm, Viterbi algorithm.

Objective The course is about some fundamental topics of digital signal processing with a bias towards applications in communications. The two main themes are linearity and probability. In the first part of the course, we deepen our understanding of discrete-time linear filters. In the second part of the course, we review the basics of probability theory and discrete-time stochastic processes. We then discuss some basic concepts of detection theory and estimation theory, as well as some practical methods including LMMSE estimation and LMMSE filtering, the LMS algorithm, and the Viterbi algorithm. A recurrent theme throughout the course is the stable and robust "inversion" of a linear filter.
**Content**

1. Discrete-time linear systems and filters: state-space realizations, z-transform and spectrum, decimation and interpolation, digital filter design, stable realizations and robust inversion.

2. The discrete Fourier transform and its use for digital filtering.

3. The statistical perspective: probability, random variables, discrete-time stochastic processes; detection and estimation: MAP, ML, Bayesian MMSE, LMMSE; Wiener filter, LMS adaptive filter, Viterbi algorithm.

**VLSI 1: HDL Based Design for FPGAs**

<table>
<thead>
<tr>
<th>W</th>
<th>6 credits</th>
<th>5G</th>
<th>F. K. Gürkaynak</th>
</tr>
</thead>
</table>

**Abstract**

This first course in a series that extends over three consecutive terms is concerned with tailoring algorithms and with devising high performance hardware architectures for their implementation as ASIC or with FPGAs. The focus is on front end design using HDLs and automatic synthesis for producing industrial-quality circuits.

**Objective**

Understand Very-Large-Scale Integrated Circuits (VLSI chips), Application-Specific Integrated Circuits (ASIC), and Field-Programmable Gate-Arrays (FPGA). Know their organization and be able to identify suitable application areas. Become fluent in front-end design from architectural conception to gate-level netlists. How to model digital circuits with SystemVerilog. How to ensure they behave as expected with the aid of simulation, testbenches, and assertions. How to take advantage of automatic synthesis tools to produce industrial-quality VLSI and FPGA circuits. Gain practical experience with the hardware description language SystemVerilog and with industrial Electronic Design Automation (EDA) tools.

**Content**

This course is concerned with system-level issues of VLSI design and FPGA implementations. Topics include:

- Overview on design methodologies and fabrication depths.
- Levels of abstraction for circuit modeling.
- Organization and configuration of commercial field-programmable components.
- FPGA design flows.
- Dedicated and general purpose architectures compared.
- How to obtain an architecture for a given processing algorithm.
- Meeting throughput, area, and power goals by way of architectural transformations.
- Hardware Description Languages (HDL) and the underlying concepts.
- SystemVerilog
- Register Transfer Level (RTL) synthesis and its limitations.
- Building blocks of digital VLSI circuits.
- Functional verification techniques and their limitations.
- Modular and largely reusable testbenches.
- Assertion-based verification.
- Synchronous versus asynchronous circuits.
- The case for synchronous circuits.
- Periodic events and the Anceau diagram.
- Case studies, ASICs compared to microprocessors, DSPs, and FPGAs.

**Lecture notes**

Literature

Textbook and all further documents in English.

Prerequisites / notice

Prerequisites:
Basics of digital circuits.

**Examination:**
In written form following the course semester (spring term). Problems are given in English, answers will be accepted in either English or German.

**Communication Systems**

<table>
<thead>
<tr>
<th>W</th>
<th>6 credits</th>
<th>4G</th>
<th>C. Studer, S. M. Moser</th>
</tr>
</thead>
</table>

**Abstract**

The course teaches the fundamentals of digital communication systems. The main topics are analog and digital modulation, signals and linear time-invariant systems, baseband and passband representations, continuous-time and discrete-time channels, noise, inter-symbol interference, detection theory, as well as the basics of forward error correction and information theory.

**Objective**

After attending the lectures, participating in the exercise sessions, and working on the homework problems (which include MATLAB coding assignments), the students will be able to:
- understand the fundamentals of digital communication systems
- explain the principles of modulation, demodulation, detection, and error correction
- analyze error rates of simple digital communication systems
- implement simple MATLAB simulations to calculate error rates

**Content**

The course focuses on the fundamentals of digital communication systems. The course starts with analog modulation and discusses the main building blocks of modern digital communication systems. The topics include:

- essential components of digital communication systems
- analog and digital modulation
- baseband and passband representation; up- and down-conversion
- communication channels as LTI systems
- discretizing communication systems; sampling and quantization
- noise, signal-to-noise ratio (SNR), and interference
- detection theory and error rates
- basics of forward error correction
- basics of information theory
- orthogonal frequency-division multiplexing (OFDM)
- building blocks of modern communication systems

The exercises cover theoretical aspects as well as the basics of software-based communication-system modeling in MATLAB.

**Lecture notes**

Lecture notes will be distributed electronically at the beginning of the semester.

**Literature**

Concepts and Theories fostered

Deep-Learning (DL) a brain-inspired weak form of AI allows training of large artificial neuronal networks (ANNs) that, like humans, can learn useful near-sensor information in end-nodes of the “internet-of-things”, using low-power microcontrollers/processors (ARM-Cortex-M; RISC-V); networks might serve again as a compelling inspiration to think differently about state-of-the-art ANN training methods.

Abstract

Deep-Learning (DL) a brain-inspired weak form of AI allows training of large artificial neuronal networks (ANNs) that, like humans, can learn real-world tasks such as recognizing objects in images. However, DL is far from being understood and investigating learning in biological networks might serve again as a compelling inspiration to think differently about state-of-the-art ANN training methods.
Deep-learning a brain-inspired weak form of AI allows training of large artificial neuronal networks (ANNs) that, like humans, can learn real-world tasks such as recognizing objects in images. The origins of deep hierarchical learning can be traced back to early neuroscience research by Hubel and Wiesel in the 1960s, who first described the neuronal processing of visual inputs in the mammalian neocortex. Similar to their neocortical counterparts ANNs seem to learn by interpreting and structuring the data provided by the external world. However, while on specific tasks such as playing (video) games deep ANNs outperform humans (Minh et al., 2015, Silver et al., 2018), ANNs are still not performing on par when it comes to recognizing actions in movie data and their ability to act as generalizable problem solvers is still far behind of what the human brain seems to achieve effortlessly. Moreover, biological neuronal networks can learn far more effectively with fewer training examples, they achieve a much higher performance in recognizing complex patterns in time series data (e.g. recognizing actions in movies), they dynamically adapt to new tasks without losing performance and they achieve unmatched performance to detect and integrate out-of-domain data examples (data they have not been trained with). In other words, many of the big challenges and unknowns that have emerged in the field of deep learning over the last years are already mastered exceptionally well by biological neuronal networks in our brain. On the other hand, many facets of typical ANN design and training algorithms seem biologically implausible, such as the non-local weight updates, discrete processing of time, and scalar communication between neurons. Recent evidence suggests that learning in biological systems is the result of the complex interplay of diverse error feedback signaling processes acting at multiple scales, ranging from single synapses to entire networks.

The lecture slides will be provided as a PDF after each lecture.

The participation in the course is subject to the following conditions:

1) The number of participants is limited to 120 students (MSc and PhDs).
2) Students must have taken the exam in Deep Learning (263-3210-00L) or have acquired equivalent knowledge.
This course is aimed at advanced master and doctorate students who want to conduct independent research on theory for modern machine learning (ML). It teaches standard methods in statistical learning theory commonly used to prove theoretical guarantees for ML algorithms. The knowledge is then applied in independent project work to understand and follow-up on recent theoretical ML results.

By the end of the semester students should be able to

- understand a good fraction of theory papers published in the typical ML venues. For this purpose, students will learn common mathematical techniques from statistical learning in the first part of the course and apply this knowledge in the project work
- critically examine recently published work in terms of relevance and find impactful (novel) research problems. This will be an integral part of the project work and involves experimental as well as theoretical questions
- outline a possible approach to prove a conjectured theorem by e.g. reducing to more solvable subproblems. This will be practiced in in-person exercises, homeworks and potentially in the final project
- effectively communicate and present the problem motivation, new insights and results to a technical audience. This will be primarily learned via the final presentation and report as well as during peer-grading of peer talks.

This course touches upon foundational methods in statistical learning theory aimed at proving theoretical guarantees for machine learning algorithms. It touches on the following topics:

- concentration bounds
- uniform convergence and empirical process theory
- regularization for non-parametric statistics (e.g. in RKHS, neural networks)
- high-dimensional learning
- computational and statistical learnability (information-theoretic, PAC, SQ)
- overparameterized models, implicit bias and regularization

The project work focuses on current theoretical ML research that aims to understand modern phenomena in machine learning, including but not limited to:
- how overparameterized models generalize (statistically) and converge (computationally)
- complexity measures and approximation theoretic properties of randomly initialized and trained neural networks
- generalization of robust learning (adversarial or distribution-shift robustness)
- private and fair learning

Students should have a very strong mathematical background (real analysis, probability theory, linear algebra) and solid knowledge of core concepts in machine learning taught in courses such as “Introduction to Machine Learning”, “Regression”/“Statistical Modelling”. In addition to these prerequisites, this class requires a high degree of mathematical maturity—including abstract thinking and the ability to understand and write proofs.

This course provides a gentle introduction to the Probabilistic Method, with an emphasis on methodology. We will try to illustrate the main ideas by showing the application of probabilistic reasoning to various combinatorial problems.

The topics covered in the class will include (but are not limited to): linearity of expectation, the second moment method, the local lemma, correlation inequalities, martingales, large deviation inequalities, Janson and Talagrand inequalities and pseudo-randomness.

- Graph Coloring and the Probabilistic Method, by M. Molloy and B. Reed, Springer, 2002.

This course provides a gentle introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to other areas.

The students will get an overview of various algebraic methods for solving combinatorial problems. We expect them to understand the proof techniques and to use them autonomously on related problems.

Algebraic methods is a fundamental mathematical discipline as well as an essential component of many mathematical areas, and its study has experienced an impressive growth in recent years. This course provides a gentle introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to other areas. The topics covered in the class will include (but are not limited to):

- Basic dimension arguments, Spaces of polynomials and tensor product methods, Eigenvalues of graphs and their application, the Combinatorial Nullstellensatz and the Chevalley-Warning theorem. Applications such as: Solution of Kakeya problem in finite fields, counterexample to Borsuk’s conjecture, chromatic number of the unit distance graph of Euclidean space, explicit constructions of Ramsey graphs and many others.

The course website can be found at https://moodle-app2.let.ethz.ch/course/view.php?id=15757

Lectures will be on the blackboard only, but there will be a set of typeset lecture notes which follow the class closely.
Students are expected to have a mathematical background and should be able to write rigorous proofs.

**Fundamentals of Mathematical Statistics**

- **Number**: 401-3621-00L
- **Title**: Fundamentals of Mathematical Statistics
- **Type**: W
- **ECTS Credits**: 9
- **Hours**: 4V+1U
- **Lecturer**: J. Ziegel

**Abstract**

In this course we study the basics of theoretical statistics. The course includes methods for designing estimators, confidence intervals and tests, and various ways to evaluate the accuracy of estimators, confidence intervals and tests. We consider optimality criteria such as admissibility and minimaxity, as well as Bayesian criteria. We will also present the asymptotic point of view.

**Objective**

The aim of this course is to gain insight into the main statistical ideas and concepts. The course considers classical low-dimensional models, with pointers towards today's highly complex models.

**Competencies**

- Subject-specific Competencies: Concepts and Theories - assessed
- Method-specific Competencies: Analytical Competencies - assessed
- Problem-solving - assessed
- Personal Competencies: Creative Thinking - assessed

**Linear & Combinatorial Optimization**

- **Number**: 401-3901-00L
- **Title**: Linear & Combinatorial Optimization
- **Type**: W
- **ECTS Credits**: 10
- **Hours**: 4V+2U
- **Lecturer**: R. Zenklusen

**Abstract**

Mathematical treatment of optimization techniques for linear and combinatorial optimization problems.

**Objective**

The goal of this course is to get a thorough understanding of various classical mathematical optimization techniques for linear and combinatorial optimization problems, with an emphasis on polyhedral approaches. In particular, we want students to develop a good understanding of some important problem classes in the field, of structural mathematical results linked to these problems, and of solution approaches based on such structural insights.

**Content**

Key topics include:
- Linear programming and polyhedra;
- Flows and cuts;
- Combinatorial optimization problems and polyhedral techniques;
- Equivalence between optimization and separation.

**Literature**

**Prerequisites / notice**

Solid background in linear algebra.

**Competencies**

- Subject-specific Competencies: Concepts and Theories - assessed
- Techniques and Technologies - fostered
- Method-specific Competencies: Analytical Competencies - assessed
- Decision-making - assessed
- Media and Digital Technologies - fostered
- Problem-solving - assessed
- Project Management - fostered
- Social Competencies: Communication - assessed
- Cooperation and Teamwork - fostered
- Sensitivity to Diversity - fostered
- Personal Competencies: Adaptability and Flexibility - fostered
- Creative Thinking - assessed
- Critical Thinking - assessed
- Integrity and Work Ethics - fostered
- Self-awareness and Self-reflection - fostered
- Self-direction and Self-management - fostered

---

**Subjects of General Interest**

These courses are suitable for several special fields. Please consult your tutor.

--- | --- | --- | --- | --- | ---
227-0377-10L | Physics of Failure and Reliability of Electronic Devices and Systems | W | 3 credits | 2V | I. Shorubalko, M. Held

**Abstract**

Understanding the physics of failures and failure mechanisms enables reliability analysis and serves as a practical guide for electronic devices design, integration, systems development and manufacturing. The field gains additional importance in the context of managing safety, sustainability and environmental impact for continuously increasing complexity and scaling-down trends in electronics.

**Objective**

Provide an understanding of the physics of failure and reliability. Introduce the degradation and failure mechanisms, basics of failure analysis, methods and tools of reliability testing.

**Content**

Summary of reliability and failure analysis terminology; physics of failure: materials properties, physical processes and failure mechanisms; failure analysis; basics and properties of instruments; quality assurance of technical systems (introduction); introduction to stochastic processes; reliability analysis; component selection and qualification; maintainability analysis (introduction); design rules for reliability, maintainability, reliability tests (introduction).

**Lecture notes**

Comprehensive copy of transparencies

**Literature**

**363-0790-00L** Technology Entrepreneurship

**Abstract**

Technology ventures are significantly changing the global economic picture. Technological skills increasingly need to be complemented by entrepreneurial understanding.

This course offers the fundamentals in theory and practice of entrepreneurship in new technology ventures. Main topics covered are success factors in the creation of new firms, including founding, financing and growing a venture.

**Objective**

This course provides theory-grounded knowledge and practice-driven skills for founding, financing, and growing new technology ventures. A critical understanding of dos and don'ts is provided through highlighting and discussing real life examples and cases.

---

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 1076 of 2684
Content
Weekly sessions - recorded.
10+ sessions carried out by guest lecturers: experts in the broad field of technology entrepreneurship (e.g., serial entrepreneurs, venture capitalists, (E)MBA professors, company builders, patent experts, scale-up executives, ...). Final session: multiple choice semester assignment (100% of grade).

Typical lecture format (2h):
15': Introduction
60': Guest testimonial
15': Discussion related to topic (in groups)
10': Plenary discussion
20': Q&A with (guest) lecturer

Lecture notes

151-0317-00L Visualization, Simulation and Interaction - Virtual Reality II
W 4 credits 3G A. Kunz

Abstract
This lecture provides deeper knowledge on the possible applications of virtual reality, its basic technology, and future research fields. The goal is to provide a strong knowledge on Virtual Reality for a possible future use in business processes.

Objective
Virtual Reality can not only be used for the visualization of 3D objects, but also offers a wide application field for small and medium enterprises (SME). This could be for instance an enabling technology for net-based collaboration, the transmission of images and other data, the interaction of the human user with the digital environment, or the use of augmented reality systems. The goal of the lecture is to provide a deeper knowledge of today’s VR environments that are used in business processes. The technical background, the algorithms, and the applied methods are explained more in detail. Finally, future tasks of VR will be discussed and an outlook on ongoing international research is given.

Content
Introduction into Virtual Reality; basics of augmented reality; interaction with digital data, tangible user interfaces (TUI); basics of simulation; compression procedures of image-, audio-, and video signals; new materials for force feedback devices; introduction into data security; cryptography; definition of free-form surfaces; digital factory; new research fields of virtual reality

Lecture notes
The handout is available in German and English.

Prerequisites / notice
Prerequisites: “Visualization, Simulation and Interaction - Virtual Reality I” is recommended, but not mandatory.

Didactical concept:
The course consists of lectures and exercises.

Internship in Industry
Number Title Type ECTS Hours Lecturers
227-1550-00L Internship in Industry Z 0 credits external organisers

Abstract
The main objective of the 12-week internship (full-time) is to expose master's students to the industrial work environment. During this period, students have the opportunity to be involved in on-going projects at the host institution.

Semester Projects
Number Title Type ECTS Hours Lecturers
227-1101-00L How to Write Scientific Texts E- 0 credits U. Koch

Abstract
This four-hour course covers the basics of writing and presenting scientific work. The focus lies on the structure and the main elements of a scientific text. Formatting guidelines, citation rules, good practice of scientific writing and hints to convince the audience are part of the course.

Objective
- You can write scientific texts using the correct structure
- You can convincingly present scientific work
- You can differentiate the scientific style from novels and news
- You can adhere to citation rules and scientific integrity

Content
The block course covers the following topics:
- Structure of Scientific Texts
- Structure of Scientific Presentations
- Formatting of Scientific Elements (figures, equations, tables)
- Citation Rules and Scientific Integrity

The lecture will be given in two parts on two afternoons. Some exercises will be built into the lecture.

Literature
Scientific Integrity, see https://ethz.ch/en/research/ethics-and-animal-welfare/research-integrity.html

Prerequisites / notice
You should be writing either a bachelor/semester/master thesis or a scientific publication in the immediate future.
227-1572-01L Semester Project (Nr 1)  
Registration in myStudies required!
Supervisor must be a professor at D-ITET or associated, see https://ee.ethz.ch/studies/master-s-programmes/main-master/projects-and-master-thesis.html

The first semester project is compulsory both for students enrolled in the MSc EEIT under the 2008 regulations and for students enrolled under the 2018 regulations.

Abstract  
Semester projects are designed to train the students for independent scientific work. A project uses the student's technical and social skills acquired during the master's program. The semester project comprises 280 hours of work and is supervised by a professor.

Objective  
see above

Prerequisites / notice  
Supervisor must be a professor at D-ITET or associated, see https://www.ee.ethz.ch/studies/main-master/projects-and-master-thesis.html

227-1572-02L Semester Project (Nr 2)  
Registration in myStudies required!
Supervisor must be a professor at D-ITET or associated, see https://ee.ethz.ch/studies/master-s-programmes/main-master/projects-and-master-thesis.html

The second semester project is compulsory for students enrolled in the MSc EEIT under the 2008 regulations, it is optional for students enrolled under the 2018 regulations. Students enrolled in the MSc EEIT under the 2018 regulations must consult their tutor before enrolling for semester project 2.

Integrated circuits are responsible for much of the progress in electronics in the last 50 years, particularly the revolutions in the Information and Communications Technologies we witnessed in recent years. Analog integrated circuits play a crucial part in the highly integrated systems that power the popular electronic devices we use daily. Understanding their design is beneficial to both future designers and users of such systems.

This course provides a foundation in analog integrated circuit design based on CMOS technologies. Review of bipolar and MOS devices and their small-signal equivalent circuit models; Building blocks in analog circuits such as current sources, active load, current mirrors, supply independent biasing etc; Amplifiers: differential amplifiers, cascode amplifier, high gain structures, output stages, gain bandwidth product of op-amps; stability; comparators; second-order effects in analog circuits such as mismatch, noise and offset; data converters; frequency synthesizers; switched capacitors. The basic elements, design issues and techniques for analog integrated circuits will be taught in this course.

The students know the fundamental phenomena and principles connected with the occurrence of extensive electric field strengths. They comprehend the different mechanisms leading to the failure of insulation systems and are able to apply failure criteria on the dimensioning of high voltage components. They have the ability to identify of weak spots in insulation systems and to name possibilities for improvement. Further they know the different insulation systems and their dimensioning in practice.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

MATLAB is used for system analysis and simulation.

High electric fields are used in numerous technological and industrial applications such as electric power transmission and distribution, X-ray devices, DNA sequencers, flue gas cleaning, power electronics, lasers, particle accelerators, copying machines, ... High Voltage Engineering is the art of gaining technological control of high electrical field strengths and high voltages.

The students know the fundamental phenomena and principles associated with the occurrence of high electric field strengths. They understand the different mechanisms leading to the failure of insulation systems and are able to apply failure criteria on the dimensioning of high voltage components. They have the ability to identify weak spots in insulation systems and to propose options for improvement.

Further, they know the different insulation systems and their dimensioning in practice.

Content
- discussion of the field equations relevant for high voltage engineering.
- analytical and numerical solutions/solving of these equations, as well as the derivation of the important equivalent circuits for the description of the fields and losses in insulations
- introduction to kinetic gas theory
- mechanisms of the breakdown in gaseous, liquid and solid insulations, as well as insulation systems
- methods for the mathematical determination of the electric withstand of gaseous, liquid and solid insulations
- application of the expertise on high voltage components
- excursions to manufacturers of high voltage components

Literature

This course is intended for students outside of D-MAVT.

This course provides the students with an introduction to thermodynamics and energy conversion. Students shall gain basic understanding of energy and energy interactions as well as their link to energy conversion technologies.

Thermodynamics is key to understanding and use of energy conversion processes in Nature and technology. Main objective of this course is to give a compact introduction into basics of Thermodynamics: Thermodynamic states and thermodynamic processes; Work and Heat; First and Second Laws of Thermodynamics. Students shall learn how to use energy balance equation in the analysis of power cycles and shall be able to evaluate efficiency of internal combustion engines, gas turbines and steam power plants. The course shall extensively use thermodynamic charts to building up students' intuition about opportunities and restrictions to increase useful work output of energy conversion. Thermodynamic functions such as entropy, enthalpy and free enthalpy shall be used to understand chemical and phase equilibrium. The course also gives introduction to refrigeration cycles, combustion and refrigeration. The course compactly covers the standard course of thermodynamics for engineers, with additional topics of a general physics interest (nonideal gas equation of state and Joule Thomson effect) also included.

In the course "Energy Conversion", the competencies of process understanding and system understanding are applied and examined and the competencies process understanding and modeling are taught.

1. Thermodynamic systems, states and state variables
2. Properties of substances: Water, air and ideal gas
3. Energy conservation in closed and open systems: work, internal energy, heat and enthalpy
4. Second law of thermodynamics and entropy
5. Energy analysis of steam power cycles
6. Energy analysis of gas power cycles
7. Refrigeration and heat pump cycles
8. Nonideal gas equation of state and Joule-Thomson effect
9. Maximal work and exergy
10. Mixtures
11. Chemical reactions and combustion systems; chemical and phase equilibrium

Lecture slides and supplementary documentation will be available online.

This course is intended for students outside of D-MAVT.

Students are assumed to have an adequate background in calculus, physics, and engineering mechanics.
The learning objectives of the course are:

1. Understand the thermodynamic, fluid-dynamic and chemical kinetics fundamentals of combustion processes.
2. Predict relevant parameters for combustion systems, such as laminar and turbulent flame speeds, adiabatic flame temperature or quenching distance.
3. Understand the causal relations of relevant combustion parameters such as the pressure influence on the laminar flame speed.
4. Analyze the challenges of developing sustainable combustion technologies based on carbon-neutral synthetic fuels.
5. Recognize the potential and limitations of renewable energy technologies and their contribution towards sustainable energy utilization.
6. Describe firm and consumer behaviour.
7. Identify market failures such as externalities related to market activities and illustrate how these affect the economy as a whole.
8. Recognize behavioural failures within a market and discuss basic concepts related to behavioural economics.
9. Apply simple mathematical concepts on economic problems.
10. Contrast different market structures and their implications for market outcomes.

The main learning objectives of this course are:

1. Understand the thermodynamic, fluid-dynamic and chemical kinetics fundamentals of combustion processes.
2. Predict relevant parameters for combustion systems, such as laminar and turbulent flame speeds, adiabatic flame temperature or quenching distance.
3. Understand the causal relations of relevant combustion parameters such as the pressure influence on the laminar flame speed.
4. Analyze the challenges of developing sustainable combustion technologies based on carbon-neutral synthetic fuels.
5. Recognize the potential and limitations of renewable energy technologies and their contribution towards sustainable energy utilization.
6. Describe firm and consumer behaviour.
7. Identify market failures such as externalities related to market activities and illustrate how these affect the economy as a whole.
8. Recognize behavioural failures within a market and discuss basic concepts related to behavioural economics.
9. Apply simple mathematical concepts on economic problems.
10. Contrast different market structures and their implications for market outcomes.

The course introduces basic principles, problems and approaches of microeconomics. This provides the students with reflective and contextual knowledge on how societies use scarce resources to produce goods and services and ensure a (fair) distribution.
The resources on our planet are finite. The discipline of microeconomics therefore deals with the question of how society can use scarce resources to produce goods and services and ensure a (fair) distribution. In particular, microeconomics deals with the behaviour of consumers and firms in different market forms. Economic considerations and discussions are not part of classical engineering and science study programme. Thus, the goal of the lecture “Principles of Microeconomics” is to teach students how economic thinking and argumentation works. The course should help the students to look at the contents of their own studies from a different perspective and to be able to critically reflect on economic problems discussed in the society.

Topics covered by the course are:

- Supply and demand
- Consumer demand: neoclassical and behavioural perspective
- Cost of production: neoclassical and behavioural perspective
- Welfare economics, deadweight losses
- Governmental policies
- Market failures, common resources and public goods
- Public sector, tax system
- Market forms (competitive, monopolistic, monopolistic competitive, oligopolistic)
- International trade

Lecture notes
Lecture notes, exercises and reference material can be downloaded from Moodle.

Literature

For students taking only the course ‘Principles of Microeconomics’ there is a shorter version of the same book:

Prerequisites / notice
GESS (Science in Perspective): This lecture is for MSc students only. BSc students register for 363-1109-00L Einführung in die Mikroökonomie.

Abstract
This course will allow the students to get an interdisciplinary overview of the "Energy" topic. It will explore the challenges to build a sustainable energy system for the future. This will be done through the means of case studies that the students have to work on. These case studies will be provided by industry partners.

Objective
The students will understand the different aspects involved in designing solutions for a sustainable future energy system. They will have experience in collaborating in interdisciplinary teams. They will have an understanding on how industry is approaching new solutions.

Lecture notes
Descriptions of case studies.

**Abstract**
This four-hour course covers the basics of writing and presenting scientific work. The focus lies on the structure and the main elements of a scientific text. Formatting guidelines, citation rules, good practice of scientific writing and hints to convince the audience are part of the course.

**Objective**
- You can write scientific texts using the correct structure
- You can convincingly present scientific work
- You can differentiate the scientific style from novels and news
- You can adhere to citation rules and scientific integrity

---

**Electives**

These courses are particularly recommended, other ETH-courses from the field of Energy Science and Technology at large may be chosen in accordance with your tutor.

**Abstract**
Fields of application of power electronic converters; basic concept of switch-mode voltage and current conversion; derivation of circuit structures of non-isolated and isolated DC/DC converters, AC/DC- and DC/AC converter structures; analysis procedure and analysis of the operating behaviour and operating range; design criteria and design of main power components.

**Objective**
Fields of application of power electronic converters; basic concept of switch-mode voltage and current conversion; derivation of circuit structures of non-isolated and isolated DC/DC converters, AC/DC- and DC/AC converter structures; analysis procedure and analysis of the operating behaviour and operating range; design criteria and design of main power components.
Content

Fields of application and application examples of power electronic converters, basic concept of switch-mode voltage and current conversion, pulse-width modulation (PWM); derivation and operating modes (continuous and discontinuous current mode) of DC/DC converter topologies, buck / boost / buck-boost converter; extension to DC/AC conversion using differences of unipolar output voltages varying over time; single-phase diode rectifier; boost-type PWM rectifier featuring sinusoidal input current; tolerance band AC current control and cascaded output voltage control with inner constant switching frequency current control; local and global averaging of switching frequency discontinuous quantities for calculation of component stresses; three-phase AC/DC conversion, center-tap rectifier with impressed output current, thyristor function, thyristor center-tap and full-bridge converter, rectifier and inverter operation, control angle and recovery time, inverter operation limit; basics of inductors and single-phase transformers, design based on scaling laws; Isolated DC/DC converter, flyback and forward converter, single-switch and two-switch circuit; single-phase DC/AC conversion, four-quadrant converter, unipolar and bipolar modulation, fundamental frequency model of AC-side operating behaviour; three-phase DC/AC converter with star-connected three-phase load, zero sequence (common-mode) and current forming differential-mode output voltage components, fundamental frequency modulation and PWM with singe triangular carrier and individual carrier signals of the phases.

Lecture notes

Lecture notes and associated exercises including correct answers, simulation program for interactive self-learning including visualization/animation features.

Prerequisites

Prerequisites: Basic knowledge of electrical engineering / electric circuit analysis and signal theory.

Abstract

Basics of the switching behavior, gate drive and snubber circuits of power semiconductors are discussed. Soft-switching and resonant DC/DC converters are analyzed in detail and high frequency loss mechanisms of magnetic components are explained. Space vector modulation of three-phase inverters is introduced and the main power components are designed for typical industry applications.

Objective

Detailed understanding of the principle of operation and modulation of advanced power electronics converter systems, especially of zero voltage switching and zero current switching non-isolated and isolated DC/DC converter systems and three-phase voltage DC link inverter systems. Furthermore, the course should convey knowledge on the switching frequency related losses of power semiconductors and inductive power components and introduce the concept of space vector calculus which provides a basis for the comprehensive discussion of three-phase PWM converters systems in the lecture Power Electronic Systems II.

Content

Basics of the switching behavior and gate drive circuits of power semiconductor devices and auxiliary circuits for minimizing the switching losses are explained. Furthermore, zero voltage switching, zero current switching, and resonant DC/DC converters are discussed in detail; the operating behavior of isolated full-bridge DC/DC converters is detailed for different secondary side rectifier topologies; high frequency loss mechanisms of magnetic components of converter circuits are explained and approximate calculation methods are presented; the concept of space vector calculus for analyzing three-phase systems is introduced; finally, phase-oriented and space vector modulation of three-phase inverter systems are discussed related to voltage DC link inverter systems and the design of the main power components based on analytical calculations is explained.

Lecture notes

Lecture notes and associated exercises including correct answers.

Prerequisites

Prerequisites: Introductory course on power electronics is recommended.

Abstract

In-depth analysis of the quantum mechanics origin of nuclear magnetic resonance (qubits, two-level systems), of LASER (quantization of the electromagnetic field, photons), and of electron transfer (from electrochemistry to photosynthesis).

Objective

Beside electronics nanodevices, D-ITET is pushing its research in the fields of NMR (MRI), electrochemistry, bioelectronics, nano-optics, and quantum information, which are all rationalized in terms of quantum mechanics.

Starting from the axioms of quantum mechanics, we will derive the fascinating theory describing spin and qubits, electron transitions and transfer, photons and LASER: quantum mechanics is different because it mocks our daily Euclidean intuition!

In this way, students will work out a robust quantum mechanics (theoretical!!!) basis which will help them in their advanced studies of the following masters: EEIT (batteries), Biomedical Engineering (NMR, bioelectronics), Quantum Engineering, Micro- and Nanosystems.

IMPORTANT: "qubits" from the point of view of NMR (and NOT from that of quantum computing!).
Content

- Lagrangian and Hamiltonian: Symmetries and Poisson Brackets
- Postulates of QM: Hilbert Spaces and Operators
- Heisenberg’s Matrix Mechanics: Hamiltonian and Time Evolution Operator
- Density Operator
- Spin: Qubits, Bloch Equations, and NMR
- Entanglement
- Symmetries and Corresponding Operators
- Schrödinger’s Wave Mechanics: Electrons in a Periodic Potential and Energy Bands
- Harmonic Oscillator: Creation and Annihilation Operators
- Identical Particles: Bosons and Fermions
- Quantization of the Electromagnetic Field: Photons, Absorption and Emission, LASER
- Electron Transfer: Marcus Theory via Born-Oppenheimer, Franck-Condon, Landau-Zener

Lecture notes

No lecture notes because the proposed textbooks together with the provided supplementary material are more than exhaustive!

!!! I am using OneNote. All lectures and exercises will be broadcast via ZOOM, while corresponding videos of the previous years are available in Moodle !!!

Literature

Supplementary material will be uploaded in Moodle.

---

+ (as rigorous and profound presentation of the mathematical framework) G. Dell’Antonio, “Lectures on the Mathematics of Quantum Mechanics I”, 2015, Springer
+ (as account of those formidable years) G. Gamow, “Thirty Years that Shook Physics”, 1985, Dover Publications Inc.

Prerequisites / notice

The course has been intentionally conceived to be self-consistent with respect to QM for those master students not having encountered it in their track yet. Therefore, a presumably large overlapping has to be expected with a (welcome!) QM introduction course like the D-ITET “Physics II”.

A solid base of Analysis I & II as well as of Linear Algebra is really helpful.

227-0523-00L Railway Systems I W 6 credits 4G M. Meyer

Abstract

Basic characteristics of railway vehicles and their interfaces with the railway infrastructure:
- Transportation tasks and vehicle types
- Running dynamics
- Mechanical part of rail vehicles
- Brakes
- Traction chain and auxiliary supply
- Railway power supply
- Signalling systems
- Standards
- Availability and safety
- Traffic control and maintenance

Objective

- Overview of the technical characteristics of railway systems
- Know-how about the design and construction principles of rail vehicles
- Interrelationship between different fields of engineering sciences (mechanics, electro and information technology, transport systems)
- Understanding tasks and opportunities of engineers working in an environment which has strong economical and political boundaries
- Insight into the activities of the railway vehicle industry and railway operators in Switzerland
- Motivation of young engineers to start a career in the railway industry or with railway operators
Portfolio and Risk Management

The student should learn the fundamentals of the electromagnetic, thermal, mechanical, and coupled fields simulations necessary for

Analytical Competencies

The goals of this course are a) understanding the fundamentals of the electromagnetic, thermal, mechanical, and coupled field simulations

1. Concepts and Theories

G. A. Koeppel

2. Volleisenfahrzeuge:

2.3 Mechanik: Kasten, Drehgestelle, Lauftechnik, Adhäsion

2.2 Bremsen

2.3 Traktionsantriebsysteme

2.4 Hilfsbetriebe und Komfortanlagen

2.5 Steuerung und Regelung

3. Infrastruktur:

3.1 Fahrweg

3.2 Bahnstromversorgung

3.3 Sicherungsanlagen

4. Betrieb:

4.1 Interoperabilität, Normen und Zulassung

4.2 RAMS, LCC

4.3 Anwendungsbeispiele

Voraussichtlich ein oder zwei Gastreferate

Geplante Exkursionen:

Betriebszentrale SBB, Zürich Flughafen

Reparatur und Unterhalt, SBB Zürich Alstetten

Fahrzeugfertigung, Stadler Bussnang

Lecture notes

Abgabe der Unterlagen (gegen eine Schutzgebühr) zu Beginn des Semesters. Rechtzeitig eingeschriebene Teilnehmer können die

Unterlagen auf Wunsch und gegen eine Zusatzgebühr auch in Farbe beziehen.

Prerequisites / notice

Dozent:

Dr. Markus Meyer, Emkamatik GmbH

Voraussichtlich ein oder zwei Gastvorträge von anderen Referenten.

EST I (Herbstsemester) kann als in sich geschlossene einsemestrige Vorlesung besucht werden. EST II (Frühjahrssemester) dient der

weiteren Vertiefung der Fahrzeugtechnik und der Integration in die Bahninfrastruktur.

Subject-specific Competencies

Method-specific Competencies

227-0536-00L Multiphysics Simulations for Power Systems

W 4 credits 2V+2U J. Smajic

This course is defined so and planned to be an addition to the module "227-0537-00L Technology of Electric Power System Components". However, the students who are familiar with the fundamentals of electromagnetic fields could attend only this course without its 227-0537-00-complement.

Abstract

The goals of this course are a) understanding the fundamentals of the electromagnetic, thermal, mechanical, and coupled field simulations and b) performing effective simulations of primary equipment of electric power systems. The course is understood complementary to 227-0537-00L "Technology of Electric Power System Components", but can also be taken separately.

Objective

The student should learn the fundamentals of the electromagnetic, thermal, mechanical, and coupled fields simulations necessary for modern product development and research based on virtual prototyping. She / he should also learn the theoretical background of the finite element method (FEM) and its application to low- and high-frequency electromagnetic field simulation problems. The practical exercises of the course should be done by using one of the commercially available field simulation software (Infolytica, ANSYS, and / or COMSOL). After completing the course the student should be able to properly and efficiently use the software to simulate practical design problems and to understand and interpret the obtained results.

Content

1. Electromagnetic Fields and Waves: Simulation Aspects (1 lecture, 2 hours)

a. Short review of the governing equations

b. Boundary conditions

c. Initial conditions

d. Linear and nonlinear material properties

e. Coupled fields (electro-mechanical and electro-thermal coupling)

2. Finite Element Method for electromagnetical simulations (5 lectures and 3 exercises, 16 hours)

a. Scalar-FEM in 2-D (electrostatic, magnetostatic, eddy-currents, etc.)

b. Vector-FEM in 3-D (3-D eddy-currents, wave propagation, etc.)

c. Numerical aspects of the analysis (convergence, linear solvers, preconditioning, mesh quality, etc.)

d. Matlab code for 2-D FEM for learning and experimenting

3. Practical applications (5 lectures and 5 exercises, 20 hours)

a. Dielectric analysis of high-voltage equipment

b. Nonlinear quasi-electrostatic analysis of surge arresters

c. Eddy-currents analysis of power transformers

d. Electromagnetic analysis of electric machines

e. Very fast transients in gas insulated switchgears (GIS)

f. Electromagnetic compatibility (EMC)

227-0731-00L Power Market I - Portfolio and Risk Management

W 6 credits 4G D. Reichelt, G. A. Koeppe

Portfolio and risk management in the electrical power business, Pan-European power market and trading, futures and forward contracts, hedging, options and derivatives, performance indicators for the risk management, modelling of physical assets, cross-border trading, ancillary services, balancing power market, Swiss market model.

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 1090 of 2684
Content
1. Pan-European power market and trading
   1.1. Power trading
   1.2. Development of the European power markets
   1.3. Energy economics
   1.4. Spot and OTC trading
   1.5. European energy exchange EEX

2. Market model
   2.1. Market place and organisation
   2.2. Balance groups / balancing energy
   2.3. Ancillary services
   2.4. Market for ancillary services
   2.5. Cross-border trading
   2.6. Capacity auctions

3. Portfolio and Risk management
   3.1. Portfolio management 1 (introduction)
   3.2. Forward and futures contracts
   3.3. Risk management 1 (m²m, VaR, hpcf, volatility, cVaR)
   3.4. Risk management 2 (P&R)
   3.5. Contrad valuation (HPFC)
   3.6. Portfolio management 2

4. Energy & Finance I
   4.1. Options 1 basics
   4.2. Options 2 hedging with options
   4.3. Introduction to derivatives (swaps, cap, floor, collar)
   4.4. Financial modelling of physical assets
   4.5. Trading and hydro power
   4.6. Incentive regulation

Lecture notes
Handouts of the lecture

Prerequisites / notice
Case studies and ML exercise for Power Market can give bonus points for the exam. Guest speakers for specific topics.

Module: Simulation of Photovoltaic Devices - From Materials to Modules
- 3 credits
- 2G
- U. Aeberhard

Abstract
The lecture provides an introduction to the theoretical foundations and numerical approaches for the simulation of photovoltaic power conversion, from the microscopic description of component materials to macroscopic continuum modelling of solar cells and network simulation or effective models for performance prediction of entire solar modules.

Objective
Get an overview of the current status of photovoltaic technology. Understand the physics of photovoltaic energy conversion and solar cell device operation. Know how to obtain and assess by simulation the key material properties and device parameters. Be able to use standard device simulation tools to analyze, optimize, and predict the performance of solar cells and modules.

Content
Photovoltaic technology: history and overview; The solar spectrum; Thermodynamics of solar energy conversion; Detailed balance models and efficiency limit; Microscopic rates of charge carrier generation and recombination; Optical simulation of solar cells; High-efficiency wafer-based (silicon) photovoltaics; Thin film photovoltaics based on disordered materials (amorphous silicon, organic PV); High-efficiency thin film photovoltaics (CIGS, CdTe, metal-halide perovskites); PV beyond the single junction detailed balance (Shockley-Queisser) limit; Simulation of photovoltaic modules; Energy yield and performance modelling for PV systems; Quantum simulation of nanostructure-based solar cell devices (bonus lecture)

Literature

227-0617-00L Solar Cells W 4 credits 3G Y. Romanyuk, R. Carron

Abstract
Physics, technology, characteristics and applications of photovoltaic solar cells and systems.

Objective
The students will appreciate the potential of solar radiation and photovoltaics, will learn the physics and technology of various solar cells, and will get to know the design basics of PV modules and systems for different applications.

Content
Introduction to photovoltaics and economic aspects, solar radiation, semiconductor physics and operation of solar cells, technology of wafer-based (Si, GaAs, multi-junction) and thin-film (CIGS, CdTe, perovskite) solar cells, emerging technologies, design of PV modules, systems and plants including system components such as inverters and controllers, engineering procedures with software demonstration, integration in buildings and other specific examples such concentrated photovoltaics and power generation for space applications.

Lecture notes
Lecture slides (PDF files in English) will be available on Moodle and lecture recordings will be available on the ETH video portal.

Prerequisites /
notice
Prerequisites: Basic knowledge of semiconductors.

151-0123-00L Experimental Methods for Engineers Does not take place this semester.

W 4 credits 2V+2U D. J. Norris, F. Coletti, M. Lukatskaya, A. Manera, O. Supponen, M. Tibbitt

Abstract
The course presents an overview of measurement tasks in engineering environments. Different concepts for the acquisition and processing of typical measurement quantities are introduced. Following an initial in-class introduction, laboratory exercises from different application areas (especially in thermofluidics, energy, and process engineering) are attended by students in small groups.

Objective
Introduction to various aspects of measurement techniques, with particular emphasis on thermo-fluidic, energy, and process-engineering applications.

Understanding of various sensing technologies and analysis procedures.

Exposure to typical experiments, diagnostics hardware, data acquisition, and processing.

Study of applications in the laboratory. Fundamentals of scientific documentation and reporting.

Content
In-class introduction to representative measurement techniques in the research areas of the participating institutes (fluid dynamics, energy technology, and process engineering).

Student participation in ~6 laboratory experiments (study groups of ~3 students, dependent on the number of course participants and available experiments).

Lecture notes
Lab reports for all attended experiments have to be submitted by the study groups.

Literature

Prerequisites / notice
Basic understanding in the following areas:
- fluid mechanics, thermodynamics, heat and mass transfer
- electrical engineering / electronics
- numerical data analysis and processing (e.g. using MATLAB)

Introductory (advanced Bachelor or beginner Master level) course on Energy Systems Analysis, providing an overview of the field and economics of wind energy. These subjects are introduced through a discussion of the basic principles of wind energy generation and conversion, and a detailed description of the broad range of relevant technical, economic and environmental topics.

Objective
- The objective of this course is to introduce the students to the fundamentals, technologies, modern day application, and economics of wind energy.

Content
- This mechanical engineering course focuses on the technical aspects of wind turbines; non-technical issues are not within the scope of this technically oriented course. On completion of this course, the student shall be able to conduct the preliminary aerodynamic and structural design of the wind turbine blades. The student shall also be more aware of the broad context of drivetrains, dynamics and control, electrical systems, and meteorology, relevant to all types of wind turbines.

Lecture notes
- Hand-outs will be distributed. Additional literature and information on the website of the lab: https://www.ethz.ch/content/specialinterest/mav/energy-technology/lab-of-nuclear-energy-systems/en/studium/teaching-materials/151-0163-00l-nuclear-energy-conversion.html

151-0221-00L Introduction to Modeling and Optimization of Sustainable Energy Systems W 4 credits 4G G. Sansavini, A. Barlow, S. Moret

Abstract
- This course introduces the fundamentals of energy system modeling for the analysis and the optimization of the energy system design and operations.

Objective
- At the end of this course, students will be able to:
  - define and quantify the key performance indicators of sustainable energy systems;
  - select and apply appropriate models for conversion, storage and transport of energy;
  - develop mathematical models for the analysis, design and operations of multi-energy systems and solve them with appropriate mathematical tools;
  - select and apply methodologies for the uncertainty analysis on energy systems models;
  - apply the acquired knowledge to tackle the challenges of the energy transition.

Content
- In the course "Introduction to Modeling and Optimization of Sustainable Energy Systems", the competencies of process understanding, system understanding, modeling, concept development, data analysis & interpretation and measurement methods are taught, applied and examined. Programming is applied.

Lecture notes
- Lecture slides and supplementary documentation will be available online. Reference to appropriate book chapters and scientific papers will be provided.

151-0245-00L Energy Systems Analysis: an Introduction and Overview with Applications W 4 credits 2V+2U R. McKenna, P. Burgherr, E. Panos, R. Sacchi

Abstract
- Introductory (advanced Bachelor or beginner Master level) course on Energy Systems Analysis, providing an overview of the field and methods. After an introduction to systems thinking and characterisation of technologies, three main blocks cover with Lifecycle Assessment (LCA, 5 units), bottom-up linear optimisation models (5 units) and Multi-Criteria Decision Analysis (MCDA, 3 units).

Objective
- Analyse energy technologies with respect to different criteria/characteristics;
- Discuss and debate the pros and cons of different ESA models/approaches (for specific applications);
- Explain the system-level interdependencies/interconnections within the energy system;
- Evaluate the effect of uncertainties and "the human dimension" on ESA and scenarios;
- Introduce and explore the most well-established models and methods of energy systems analysis, in each case introducing students to the theory and assumptions of the method, strengths and weaknesses of the specific approach, and case studies for exemplary energy technologies and systems. The students are taught to understand and will be able to apply the basic principles of these methods in the context of targeted assignments relating to real-world energy systems.

Lecture notes
- No but slides are provided before the lectures and videos recorded.

Literature
- Will be provided during the course.

Prerequisites / notice
- No specific prerequisites, some background in energy-related topics in the Bachelor would be beneficial.

Principles, Efficiency Optimization and Future Applications of IC Engines

Abstract

Objective
The students get familiar with operating characteristics and efficiency maximizing methods of IC engines for propulsion and decentralized electricity (and heat) generation. To this end, they learn about simulation methods and related experimental techniques for performance assessment in a combination of lectures and exercises.

Content
This lecture aims at introducing the students to the working principles and efficiency optimization methods for Internal Combustion (IC) engines which are expected to continue to play a very important role in transportation (long-haul heavy duty, marine) and decentralized combined heat and power generation. Following an overview of different applications and powertrains, the course will focus on the following topics: First, a generic overview of the history of IC-Engines is given, and the basic dimensions and specific engine-relevant terminology are introduced. Next, operating maps for different duty cycles are discussed, highlighting the benefits of individual powertrain configurations for different usage scenarios. The high-pressure thermodynamic process and combustion-induced heat release are analyzed in detail and the design of the combustion processes is discussed in view of further optimization of the energy conversion efficiency. The concept of boosting, its challenges and potential are also presented. In addition, flow field characteristics, convective and radiative heat transfer and combustion modes (Otto, Diesel and “multi-mode” cycles) will be discussed along with possible simulation methods. The course consists of lectures combined with exercises. In addition, several invited guest talks will be held by representatives from Swiss industrial companies active in this field. Provided the pandemic measures allow, visits to different engine test facilities are further envisioned.

Literature

Prerequisites / notice
This course provides background for the course 151-0254-00L “Environmental Aspects of Future Mobility” held in the Spring Semester, where the focus is on emission formation and minimization, exhaust gas after treatment systems and potentials of future synthetic/e-fuels in IC engines; all given in the broader context of a future mobility/transportation options (battery electric, hybrids, fuel cells etc.) and transformation pathways towards sustainability.

Engine Systems

Abstract
Introduction to current and future engine systems and their control systems.

Objective
Introduction to methods of control and optimization of dynamic systems. Application to real engines. Understand the structure and behavior of drive train systems and their quantitative descriptions.

Content
Physical description and mathematical models of components and subsystems (mixture formation, load control, supercharging, emissions, drive train components, etc.). Case studies of model-based optimal design and control of engine systems with the goal of minimizing fuel consumption and emissions.

Lecture notes
Introduction to Modeling and Control of Internal Combustion Engine Systems
Guzzella Lino, Onder Christopher H.
ISBN: 978-3-642-10774-0

Prerequisites / notice
Combined homework and testbench exercise (air-to-fuel-ratio control or idle-speed control) in groups

151-0569-00L
Vehicle Propulsion Systems

Abstract
Introduction to current and future propulsion systems and the electronic control of their longitudinal behavior.

Objective
Introduction to methods of system optimization and controller design for vehicles. Understanding the structure and working principles of conventional and new propulsion systems. Quantitative descriptions of propulsion systems.

Content
Understanding of physical phenomena and mathematical models of components and subsystems (manual, automatic and continuously variable transmissions, energy storage systems, electric drive trains, batteries, hybrid systems, fuel cells, road/wheel interaction, automatic braking systems, etc.).

Presentation of mathematical methods, CAE tools and case studies for the model-based design and control of propulsion systems with the goal of minimizing fuel consumption and emissions.

Lecture notes
Vehicle Propulsion Systems.
Introduction to Modeling and Optimization
Guzzella Lino, Scaiarratta Antonio
ISBN: 978-3-642-35912-5

Prerequisites / notice
Lectures of Prof. Dr. Ch. Onder and Dr. Ph. Elbert are also possible to be held in German.

529-0613-01L
Process Simulation and Flowsheeting

Abstract
This course encompasses the theoretical principles of chemical process simulation and optimization, as well as its practical application in process analysis. The techniques for simulating stationary and dynamic processes are presented, and illustrated with case studies. Commercial software packages (Aspen) are introduced for solving process flowsheeting and optimization problems.

Objective
This course aims to develop the competency of chemical engineers in process flowsheeting, process simulation and process optimization. Specifically, students will develop the following skills:
- Deep understanding of chemical engineering fundamentals: the acquisition of new concepts and the application of previous knowledge in the area of chemical process systems and their mechanisms are crucial to intelligently simulate and evaluate processes.
- Modeling of general chemical processes and systems: students should be able to identify the boundaries of the system to be studied and develop the set of relevant mathematical relations, which describe the process behavior.
- Mathematical reasoning and computational skills: the familiarization with mathematical algorithms and computational tools is essential to be capable of achieving rapid and reliable solutions to simulation and optimization problems. Hence, students will learn the mathematical principles necessary for process simulation and optimization, as well as the structure and application of process simulation software. Thus, they will be able to develop criteria to correctly use commercial software packages and critically evaluate their results.
- Process optimization: the students will learn how to formulate optimization problems in mathematical terms, the main type of optimization problems that exist (i.e., LP, NLP, MILP and MINLP) and the fundamentals of the optimization algorithms implemented in commercial solvers.

Data: 06.08.2024 12:40 Autumn Semester 2024 Page 1094 of 2684
Overview of process simulation and flowsheeting:
- Definition and fundamentals
- Fields of application
- Case studies

Process simulation:
- Modeling strategies of process systems
- Mass and energy balances and degrees of freedom of process units and process systems

Process flowsheeting:
- Flowsheet partitioning and tearing
- Solution methods for process flowsheeting
- Simultaneous methods
- Sequential methods

Process optimization and analysis:
- Classification of optimization problems
- Linear programming, LP
- Non-linear programming, NLP
- Mixed-integer linear programming, MILP
- Mixed-integer nonlinear programming, MINLP

Commercial software for simulation (Aspen Plus):
- Thermodynamic property methods
- Reaction and reactors
- Separation / columns
- Convergence, optimisation & debugging

An exemplary literature list is provided below:
- Smith, R. Chemical process design and integration, Wiley (2005).

A basic understanding of material and energy balances, thermodynamic property methods and typical unit operations (e.g., reactors, flash separations, distillation/absorption columns etc.) is required.

In 2015, the UN Conference in Paris shaped future world objectives to tackle climate change. This decarbonization strategy is additional to Sustainable Development goals formulated the same year by the UN general assembly.

What does that mean for the built environment?
This course provides an introduction to the notion of sustainable development when applied to our built environment.

At the end of the semester, the students have an understanding of the term of sustainable development, its history, the current political and scientific discourses and its relevance for our built environment.

In order to address current challenges of climate change mitigation and resource depletion, students will learn a holistic approach of sustainable development. Ecological, economical and social constraints will be presented and students will learn about methods for argumentation and tools for assessment (i.e. life cycle assessment).

For this purpose an overview of sustainable development is presented with an introduction to the history of sustainability and its today definition as well as the role of cities, urbanisation and material resources (i.e. energy, construction material) in social economic and environmetal aspects.

The course aims to promote an integral view and understanding of sustainability and describing different spheres (social/cultural, ecological, economical, and institutional) that influence our built environment.

Students will acquire critical knowledge and understand the role of involved stakeholders, their motivations and constraints, learn how to evaluate challenges, identify deficits and define strategies to promote a more sustainable construction.

After the course students should be able to define the relevance of specific local, regional or territorial aspects to achieve coherent and applicable solutions toward sustainable development.

The course offers an environmental, socio-economic and socio-technical perspective focussing on buildings, cities and their transition to resilience with sustainable development. Students will learn on theory and application of current scientific pathways towards sustainable development.
The following topics give an overview of the themes that are to be worked on during the lecture.

- Overview on the history and emergence of sustainable development
- Overview on the current understanding and definition of sustainable development and beyond

Methods
- Method 1: Life cycle assessment (planning, construction, operation/use, deconstruction)
- Method 2: Life Cycle Costing
- Method 3: Labels and certification
- Method 4: Material Flow Analysis

Main issues:
- Operation energy at building, urban and national scale
- Mobility and density questions
- Embodied energy for developing and developed world

- Synthesis: Transition to sustainable development

Lecture notes
All relevant information will be online available before the lectures. For each lecture slides of the lecture will be provided.

Literature
A list of the basic literature will be offered on a specific online platform, that could be used by all students attending the lectures.

102-0317-00L Advanced Environmental Assessments
Master students in Environmental Engineering choosing module Ecological Systems Design are not allowed to enrol 102-0317-00 Advanced Environmental Assessments (3KP) as already included in 102-0307-01 Advanced Environmental, Social and Economic Assessments (5KP).

Abstract
This course deepens students' knowledge of the environmental assessment methodologies and their various applications.

Objective
This course has the aim of deepening students' knowledge of the environmental assessment methodologies and their various applications. In particular, students completing the course should have the
- Ability to judge the scientific quality and reliability of environmental assessment studies, the appropriateness of inventory data and modelling, and the adequacy of life cycle impact assessment models and factors
- Knowledge about the current state of the scientific discussion and new research developments
- Ability to properly plan, conduct and interpret environmental assessment studies
- Knowledge of how to use LCA as a decision support tool for companies, public authorities, and consumers

Content
- Inventory developments, transparency, data quality, data completeness, and data exchange formats
- Allocation (multoutput processes and recycling)
- Hybrid LCA methods.
- Consequential and marginal analysis
- Recent development in impact assessment
- Spatial differentiation in Life Cycle Assessment
- Workplace and indoor exposure in Risk and Life Cycle Assessment
- Uncertainty analysis
- Subjectivity in environmental assessments
- Multicriteria analysis
- Case Studies

Lecture notes
No script. Lecture slides and literature will be made available on Moodle.

Literature
Literature will be made available on Moodle.

Prerequisites / notice
Basic knowledge of environmental assessment tools is a prerequisite for this class. Students that have not done classwork in this topic before are required to read an appropriate textbook before or at the beginning of this course (e.g. Jolliet, O et al. 2016: Environmental Life Cycle Assessment. CRC Press, Boca Raton - London - New York. ISBN 978-1-4398-8766-0 (Chapters 2-5.2)).

102-0317-04L Advanced Environmental Assessment (Computer Lab II)
Not for master students in Environmental Engineering choosing module Ecological System Design as already included in Environment and Computer Laboratory I (Year Course): 102-0527-00 and 102-0528-00.

Abstract
Not for master students in Environmental Engineering choosing module Ecological System Design as already included in Environment and Computer Laboratory I (Year Course): 102-0527-00 and 102-0528-00.

Objective
Not for master students in Environmental Engineering choosing module Ecological System Design as already included in Environment and Computer Laboratory I (Year Course): 102-0527-00 and 102-0528-00.
Abstract
Technical systems are investigated in projects, based on the software and tools introduced in the course 102-0317-03L Advanced Env. Assessment (Computer Lab I). The projects are created around a complete but simplified LCA study, where the students will learn how to answer a given question with target oriented methodologies using various software programs and data sources for env. assessment

Objective
Become acquainted with utilizing various software programs for environmental assessment to perform a Life Cycle Assessment and learn how to address the challenges when analyzing a complex system with available data and software limitations.

Prerequisites / notice
Prerequisite is enrollment of 102-0317-00 Advanced Environmental Assessments (Computer Lab I) in parallel or in advance (both courses in HS).

102-0327-01L Implementation of Environmental and Other Sustainability Goals

Abstract
This course teaches approaches and methods to identify, assess and manage environmental (mainly) and societal (to some extent) aspects in organisations. The course contains an introduction to the global ISO 14001 standard on environmental management, into the concept of ecobalance of organisations, and supply chain management, and a general view on how such approaches fit into a management system.

Objective
Students will learn to
- describe key sustainability problems of the current economic system and measuring units.
- describe the management system of an organisation and how to develop a sustainability orientation
- discuss approaches to measure environmental performance of an organisation, including ‘organisational LCA’ (Ecobalance)
- explain the pros and cons of single score environmental assessment methods
- apply life cycle costing
- interpret stakeholder relations of an organisation
- (if time allows) describe sustainable supply chain management and stakeholder management
- Sustainability problems of the current economic system and its measuring units;
- The structure of a management system, and elements to integrate environmental management (ISO 14001) and social management (SA8000), especially into strategy development, planning, controlling and communication;
- Sustainability Opportunities and Innovation for companies
- The concept of ‘continuous Improvement’, and its application to environmental management
- Life Cycle Costing, as part of Life Cycle Management
- environmental performance measurement of an organisation, including ‘organisational LCA’ (Ecobalance), incl. practical examples of companies
- single score environmental assessment methods, with a focus on the ‘ecopoints’ method
- stakeholder management and sustainability oriented communication
- an intro into sustainability issues of supply chain management

Lecture notes
Documents will be available on Ilias

Literature
Will be made available.

Prerequisites / notice
This course is meant for any interested student.
(Students of ESD Ecological Systems Design should choose the combined "AESEA" course (102-0307-01), which is specifically offered and mandatory for their module and includes this course.

Basic knowledge of environmental assessment tools is a prerequisite for this class. Students who have not yet had classwork in this topic will profit more from this course after reading an appropriate textbook before or at the beginning of this course, e.g. Jolliet, O et al. (2016). Environmental Life Cycle Assessment. CRC Press, Boca Raton - London - New York. ISBN 978-1-4398-8766-0 (Chapters 2-5.2).

363-0537-00L Resource and Environmental Economics

Abstract
Relationship between economy and environment, market failures, external effects and public goods, contingent valuation, internalisation of externalities, economics of non-renewable resources, economics of renewable resources, environmental cost-benefit analysis, sustainability economics, and international resource and environmental problems.
Objective A successful completion of the course will enable a thorough understanding of the basic questions and methods of resource and environmental economics and the ability to solve typical problems using appropriate tools consisting of concise verbal explanations, diagrams or mathematical expressions. Concrete goals are first of all the acquisition of knowledge about the main questions of resource and environmental economics and about the foundation of the theory with different normative concepts in terms of efficiency and fairness. Secondly, students should be able to deal with environmental externalities and internalisation through appropriate policies or private negotiations, including knowledge of the available policy instruments and their relative strengths and weaknesses. Thirdly, the course will allow for in-depth economic analysis of renewable and non-renewable resources, including the role of stock constraints, regeneration functions, market power, property rights and the impact of technology. A fourth objective is to successfully use the well-known tool of cost-benefit analysis for environmental policy problems, which requires knowledge of the benefits of an improved natural environment. The last two objectives of the course are the acquisition of sufficient knowledge about the economics of sustainability and the application of environmental economic theory and policy at international level, e.g. to the problem of climate change.

Content The course covers all the interactions between the economy and the natural environment. It introduces and explains basic welfare concepts and market failure; external effects, public goods, and environmental policy; the measurement of externalities and contingent valuation; the economics of non-renewable resources, renewable resources, cost-benefit analysis, sustainability concepts; international aspects of resource and environmental problems; selected examples and case studies. After a general introduction to resource and environmental economics, highlighting its importance and the main issues, the course explains the normative basis, utilitarianism, and fairness according to different principles. Pollution externalities are a deep core topic of the lecture. We explain the governmental internalisation of externalities as well as the private internalisation of externalities (Coase theorem). Furthermore, the issues of free rider problems and public goods, efficient levels of pollution, tax vs. permits, and command and control instruments add to a thorough analysis of environmental policy. Turning to resource supply, the lecture first looks at empirical data on non-renewable natural resources and then develops the optimal price development (Hotelling-rule). It deals with the effects of explorations, new technologies, and market power. When treating the renewable resources, we look at biological growth functions, optimal harvesting of renewable resources, and the overuse of open-access resources. A next topic is cost-benefit analysis with the environment, requiring measuring environmental benefits and measuring costs. In the chapter on sustainability, the course covers concepts of sustainability, conflicts with optimality, and indicators of sustainability. In a final chapter, we consider international environmental problems and in particular climate change and climate policy.

363-0387-00L Corporate Sustainability W 3 credits 2G V. Hoffmann, C. Bening-Bach, B. Girod, L. Miehé

Abstract The lecture explores current challenges of corporate sustainability and prepares students to become champions for sustainable business practices. The course integrates asynchronous videos, live sessions, with group work phases between weeks 5-10 of semester during which students deep-dive into one of 10 sustainability challenges.

Objective Students - assess the limits and the potential of corporate sustainability for sustainable development - develop competencies that are useful in the context of corporate sustainability and beyond (analytical competency, critical thinking, problem solving) - recognize and realize opportunities through team work for corporate sustainability in a business environment - present strategic recommendations in teams

Content Corporate Sustainability is the flagship course of the Group for Sustainability and Technology at D- MTEC. In this course, students learn about key concepts in corporate sustainability and develop skills to implement them in the real world. The course prepares students for making well-informed sustainability decisions in their future careers.

The course uses constructive alignment to bring the various innovative teaching and learning elements (e.g., case-based experiential learning, reflective thinking and blended learning with videos and quizzes) into a coherent transformational journey. Students can now flexibly, efficiently, and effectively acquire the conceptual foundations that are essential for a substantial understanding of corporate sustainability.

For part of the course, students work in groups to complete a set of graded assignments designed to guide them into a deep dive on a selected corporate sustainability challenge. Please note that full participation in this part is essential, so make sure you are available. Furthermore, these group assignments count towards the overall grade for the course.

For further details on the course structure etc. visit the following link: http://www.sustec.ethz.ch/teaching/lectures/corporate-sustainability.html

Lecture notes Presentation slides will be made available on Moodle after lectures.

Literature Literature recommendations will be distributed via Moodle, and are available from the start of the course.

Prerequisites / notice TEACHING FORMAT/ ATTENDANCE: The course includes several mandatory sessions that participants must attend to successfully earn credit points. It is not possible to take the class purely online.

Competences Subject-specific Competencies Concepts and Theories assessed
Method-specific Competencies Analytical Competencies assessed

Social Competencies Communication assessed
Cooperation and Teamwork fostered
Negotiation fostered

Personal Competencies Creative Thinking fostered
Critical Thinking assessed
Self-awareness and Self-reflection fostered

Science in Perspective Only courses offered under "GESS Science in Perspective" count in this category. See "Offered in" tab in course view. For more information, please refer to https://gess.ethz.ch/en/studies/science-in-perspective/SIP-FAQs.html

Recommended Science in Perspective (Type B) for D-ITET

Master's Thesis
How to Write Scientific Texts

*Strongly recommended prerequisite for Semester Projects and Master Theses at D-ITET (MSc BME, MSc EEIT, MSc EST).*

**Abstract**

This four-hour course covers the basics of writing and presenting scientific work. The focus lies on the structure and the main elements of a scientific text. Formatting guidelines, citation rules, good practice of scientific writing and hints to convince the audience are part of the course.

**Objective**

- You can write scientific texts using the correct structure
- You can convincingly present scientific work
- You can differentiate the scientific style from novels and news
- You can adhere to citation rules and scientific integrity

**Content**

The block course covers the following topics:

- Structure of Scientific Texts
- Structure of Scientific Presentations
- Formatting of Scientific Elements (figures, equations, tables)
- Citation Rules and Scientific Integrity

The lecture will be given in two parts on two afternoons. Some exercises will be built into the lecture.

**Literature**

**Prerequisites / notice**

You should be writing either a bachelor/semester/master thesis or a scientific publication in the immediate future.

**Competencies**

**Subject-specific Competencies**

- Concepts and Theories
  - assessed

**Method-specific Competencies**

- Media and Digital Technologies
  - fostered

**Social Competencies**

- Communication
  - fostered

**Personal Competencies**

- Critical Thinking
  - assessed
- Self-awareness and Self-reflection
  - fostered

---

**Master's Thesis**

*Only students who fulfill the following criteria are allowed to enrol for and start with their master thesis:

- a. successful completion of the bachelor program;
- b. any additional requirements necessary to gain admission to the master program EST have been successfully completed;
- c. both the semester project and the internship have been successfully completed.*

*Registration in mystudies required!*

**Abstract**

The master program in Energy Science and Technology culminates in a six months research project which addresses a scientific research question on one's chosen area of specialization. The masters thesis is supervised by a program-affiliated faculty member and the topic must be approved in advance by the tutor.

**Objective**

Abstract

In the course "Chemistry I", the competencies of process understanding, system understanding, modeling, concept development and data analysis & interpretation are taught and examined.

Objective

Introduction to general and inorganic chemistry. Basics of the composition and the change of the material world. Introduction to the thermodynamically controlled physico-chemical processes. Macroscopic phenomena and their explanation through atomic and molecular properties. Using the theories to solve qualitatively and quantitatively chemical and ecologically relevant problems.

Content

1. Stoichiometry
   - Amount of substance and mass. Composition of chemical compounds. Reaction equation. Ideal gas law.
   - Atoms
   - 4. Basics of chemical thermodynamics
     - System and surroundings. Description of state and change of state of chemical systems.
   - 5. First law of thermodynamics
   - 6. Second law of thermodynamics
     - Entropy. Change of entropy in chemical systems and universe. Reaction entropy.
   - 7. Gibbs energy and chemical potential.
   - 8. Chemical equilibrium
   - 9. Acids and bases
   - 10. Dissolution and precipitation.
     - Heterogeneous equilibrium. Dissolution and solubility product. Carbon dioxide-carbonic acid-carbonate equilibrium.

Abstract

This course covers mathematical concepts and techniques necessary to model, solve and discuss scientific problems - notably through ordinary differential equations.

Objective

Mathematics is of ever increasing importance to the Natural Sciences and Engineering. The key is the so-called mathematical modelling cycle, i.e. the translation of problems from outside of mathematics into mathematics, the study of the mathematical problems (often with the help of high level mathematical software packages) and the interpretation of the results in the original environment.

The goal of Mathematics I and II is to provide the mathematical foundations relevant for this paradigm. Differential equations are by far the most important tool for modelling and are therefore a main focus of both of these courses.

Content

2. Linear Algebra and Complex Numbers:
   - Introduction to linear algebra, Gauss-Jordan elimination, matrices, determinants, eigenvalues and eigenvectors, cartesian and polar forms for complex numbers, complex powers, complex roots, fundamental theorem of algebra.
   - 3. Ordinary Differential Equations:
     - separable ordinary differential equations (ODEs), integration by substitution, 1st and 2nd order linear ODEs, homogeneous systems of linear ODEs with constant coefficients, introduction to 2-dimensional dynamical systems.

Literature

- Bretscher, O.: Linear Algebra with Applications (Pearson Prentice Hall).
Prerequisites / notice

---

**651-3001-00L Dynamic Earth I**

**Abstract**

Provides a basic introduction into Earth Sciences, emphasizing different rock-types and the geological rock-cycle, as well as introduction into geophysics, plate tectonics and planetology.

**Objective**

Understanding basic geological and geophysical processes

**Content**

Overview of the Earth as a system, with emphasis on plate tectonic theory and the geological rock-cycle. Provides a basic introduction to crystallography and minerals and different rock-types. Lectures include processes in the Earth's interior, physics of the earth, planetology, introduction to magmatic, metamorphic and sedimentary rocks. Exercises are conducted in small groups to provide more in depth understanding of concepts and content of the lectures.

**Literature**

Grotzinger, J., Jordan, T.H., 2020, Understanding Earth, Macmillan Learning, 8th Ed.

[https://doi.org/10.1007/978-3-662-48342-8](https://doi.org/10.1007/978-3-662-48342-8)

**Prerequisites / notice**

Exercises and short excursions in small groups (10-15 students) will be lead by student assistants. Specific topics in earth sciences will be discussed using examples and case studies. Hand samples of the major rock types will be described and interpreted. Short excursions in the region of Zurich will permit direct experience with earth science processes (e.g. earth surface processes) and recognition of earth science problems and solutions relevant for modern society (e.g. building materials, water resources). Working in small groups will allow for discussion and examination of actual earth science themes.

**Abstract**

This practical course provides an introduction to elementary laboratory techniques. The experiments cover a wide range of techniques, including analytical and synthetic techniques (e.g. investigation of soil and water samples or the preparation of simple compounds). Furthermore, the handling of gaseous substances is practised.

**Objective**

This course is intended to provide an overview of experimental chemical methods. The handling of chemicals and proper laboratory techniques represent the main learning targets. Furthermore, the description and recording of laboratory processes is an essential part of this course.

**Content**

The classification and analysis of natural and artificial compounds is a key subject of this course. It provides an introduction to elementary laboratory techniques, and the experiments cover a wide range of analytic and synthetic tasks:

- Selected samples (e.g. soil and water) will be analysed with various methods, such as titrations, spectroscopy or ion chromatography. The chemistry of aqueous solutions (acid-base equilibria and solvatation or precipitation processes) is studied.
- The synthesis of simple inorganic complexes or organic molecules is practised.
- Furthermore, the preparation and handling of environmentally relevant gaseous species like carbon dioxide or nitrogen oxides is a central subject of the Praktikum.

**Lecture notes**

The instructions to the experiments will be published on Moodle.

**Literature**

A thorough study of all script materials is requested before the course starts.

**Competencies**

- Subject-specific Competencies
  - Concepts and Theories
  - Techniques and Technologies
  - Fostered

- Social Competencies
  - Cooperation and Teamwork

**Abstract**

Please make an enrolment in mystudies. Register the experiments here: https://www.lehrbetrieb.ethz.ch/laborpraktika. For further information visit: https://ap.phys.ethz.ch

Only students from 3rd Semester BSc Earth Sciences on are admitted to this Laboratory Course.

**Objective**

The central aim is to provide an individual experience of the physical phenomena and the basic principles of the experiment. By conducting simple physical experiments the student will learn how to properly use physical instruments and how to evaluate the results correctly.

- The practical structure of the experiment and the knowledge of the measuring methods
- The use and handling of measuring instruments
- The correct evaluation and assessment of the observations
- Deepening the knowledge in some areas of elementary physics
- Physics as a personal experience.

**Content**

Lab safety; error calculation and report writing; 6 selected experiments on a variety of topics. Selection of experiments may vary between courses.

**Lecture notes**

Manuals for the experiments in the physics lab; additional material is provided on the course website.

**Abstract**

- Physics II: Introduction to the way physicists think and work with the help of concept questions, demonstration experiments and problem solving. Wherever possible, applications from thermodynamics, electricity and magnetism are taught from the areas of the degree programmes.
- Geochemistry I: Introduction to geochemistry and its application to the study of the origin and evolution of the Earth and planets.
- Atmosphere: Basic principles of the atmosphere, physical structure and chemical composition, trace gases, atmospheric cycles, circulation, stability, radiation, condensation, clouds, oxidation capacity and ozone layer.

**Objective**

- Physics II: Development of his/her capability to turn physical observations into mathematical models, and to solve them.
- Geochemistry I: Gain an overview of geochemical methods used in various fields of Earth Sciences and how they can be applied to study geological processes in the Earths mantle, crust, oceans and atmosphere.
- Atmosphere: Students are able to explain the physical structure and chemical composition of the atmosphere, to quantitatively describe and understand the fundamental physical and chemical processes in the atmosphere, to explain the interactions and feedbacks between atmosphere - ocean - land surface, troposphere - stratosphere and weather - climate.

**Content**

- Physics II: Thermodynamics with first and second law, phase transformations, transport phenomena. Introduction to electricity and magnetism, as well as waves and modern physics.
- Geochemistry I: This course is an introduction into geochemistry with a special focus on the basic concepts used in this rapidly evolving field. The course deals with the geochemist's toolbox: the basic chemical and nuclear properties of elements from the periodic table and how these elements can be used to ask fundamental questions in Earth Sciences. The important concepts used in solid-solution-gas equilibria are introduced. The concepts of chemical reservoirs and geochemical cycles are discussed with examples from the carbon cycle in the Earth. The course also addresses geological applications in low- and high-temperature geochemistry, including the formation of continents, the differentiation of the Earth, the geochemistry of ocean and continental waters.
- Atmosphere: Basic principles of the atmosphere, physical structure and chemical composition, trace gases, atmospheric cycles, circulation, stability, radiation, condensation, clouds, oxidation capacity and ozone layer.

Abstract
The objective of the systems analysis course is to deepen and illustrate the mathematical concepts on the basis of a series of very concrete examples. Topics covered include: linear box models with one or several variables, non-linear box models with one or several variables, time-discrete models, and continuous models in time and space.

Objective
Learning and applying concepts (models) and quantitative methods to address concrete problems of environmental relevance. Understanding and applying the systems-analytic approach, i.e., Recognizing the core of the problem - simplification - quantitative approach - prediction.

Students registering for the course confirm having read and accepted the terms and conditions for excursions and field courses of D-EAPS:

Autumn Semester 2024
Abstract
We will study traces in the lithosphere that have been left behind by organisms during the course of Earth history and mineral components, which were built through biological processes or used as sources of energy and nutrients by organisms. Traces of life from the past will be compared with the development of the diversity of today’s organisms.

Objective
The course will allow you to ask questions about the origin and the evolution of life on Earth, to understand contemporary hypotheses and create new methods of developing them further. Theory is supplemented with observations in the field, exercises and the application of simple mathematical models. The course will enable you to integrate geobiological knowledge into topics that will be taught in subsequent earth science courses and into the current understanding of Earth history. You will learn to better understand modern geological settings and, if necessary, to recommend biogeochemically well-founded and responsible interventions or protective measures.

Content
The course focuses on (a) geobiological attempts at understanding the evolution of the Earth's life and of the origin, (b) biosynthetic and metabolic processes, which are essential for life, (c) organisms which regulate and maintain geobiological cycles, and (d) chemical signals of past life in the geological record.

Accordingly, we must understand:
- how biological cells and its components are built from essential elements and molecules,
- how cells function and which life styles organisms developed,
- where organisms can exist and which factors select for their presence,
- where biologically usable forms of energy come from, and under which conditions they can be exploited,
- how biological metabolism can change environmental conditions and composition,
- which biological products can lead to signals preserved in the rock record, and how biomolecules and elements are altered in sedimentary deposits,
- how organic and inorganic components are cycled through the biosphere, and how biogeochemical cycles function,
- how "biological innovations" evolved and changed in response to environmental changes.

Applied Case Studies, which supplement and illustrate the contents:
- Scientific applications of geobiological knowledge are found in fields like Microbial Ecology, Geochemistry, Palaeontology, Sedimentology, Petrology, Ocean Research, Environmental Sciences, Astrobiology and Archaeology.
- Practical applications of geobiological knowledge are needed in fields like stabilisation of existing and design of safe waste repositories, surveilling ground water resources, sewage treatment, exploitation of and prospecting for fossil carbon sources, soil remediation, mineral exploration and leaching, forensic science and medicine.

Prerequisites / notice
Mit der Belegung akzeptieren die Studierenden die Allgemeinen Geschäftsbedingungen für Exkursionen und Feldkurse des D-EAPS: https://www.ethz.ch/content/dam/ethz/special-interest/erdw/department/dokumente/studium/exkursionen/AGB_ERDW_Exkursionen_dt.pdf

651-3301-00L Crystals and Minerals O 4 credits 2V+3U M. Murakami, P. Saha, to be announced

Abstract
In the lecture part, the objective of this course is to understand the basic concepts needed to understand the evolution, structure, and dynamics of the Earth from the perspectives of the mineralogy and crystallography.

Objective
In the exercise part, the students familiarize with about 70 minerals and their macroscopic properties.

Content
Lecture part:
- formation processes of the solar system, the earth, and the moon.
- structure of the earth
- some important experimental approaches to determine the structure of the earth
- some important phase transformations observed in the Earth’s deep interior.
- some important crystal structures observed in the Earth’s deep interior.
- mineralogy of the upper mantle, transition zone, lower mantle, and the core.
- chemical composition of the mantle and core.

At the end of the lecture part, students should be able to explain the following:
- high-pressure and high temperature experiments
- X-ray diffraction
- laser spectroscopy
- phase transformation in deep planetary interiors
- chemical composition of the earth
- mineralogy of the upper mantle
- mineralogy of the mantle transition zone
- mineralogy of the lower mantle
- mineralogy of the Core-Mantle-Boundary (CMB)
- mineralogy of the core

Exercise part:
About 70 of the most important rock-forming and ore minerals and their properties

Lecture notes
Tabellen zum Mineralbestimmungen, W.F. Oberholzer und V.Dietrich
Integrated Earth Systems

Number | Title | Type | ECTS | Hours | Lecturers
---|---|---|---|---|---
651-4180-02L | Integrated Earth Systems II | 5 credits | 4G+1U | M. W. Schmidt, J.-C. Storck

Abstract
The surface Earth is often thought of as a set of interacting systems, with feedbacks between them. These interacting systems control the tectonics, geomorphology, climate, and biology of the surface Earth. To fully understand the nature of the Earth System, including the controls on its past evolution, its present state, and its future, an integrated perspective is required.

Objective
To introduce students to an integrated view of the surface Earth, unifying perspectives from different disciplines of the earth sciences.

Content
- The Earth System: an integrated view
- The surface Earth: an introduction
- The Earth’s interior: an introduction
- The Earth’s interior: an overview
- The Earth’s atmosphere: an introduction
- The Earth’s hydrosphere: an introduction
- The Earth’s biosphere: an introduction

Prerequisites
- Basic knowledge of Earth System Science
- Familiarity with basic concepts of geology, geophysics, and environmental science

Literature

The end-of-term examination will take place in the two weeks scheduled in January.

Majors

Major: Geology and Geophysics

### Earth Science Mapping Exercises II

**Objective**

All participants are able to:

- Read and understand complex geological maps;
- Assess, select, and project information from real case studies;
- Make tectonic overview sketches and construct meaningful cross-sections;

**Content**

Advanced analysis of geological maps and construction of geological sections. Special points: normal faults of the Rheintal graben, Val de Ruz, Helvetic nappes of the Säntis area. Reconstruction of the geological history of the map areas. References to the Geology of Switzerland.

**Lecture notes**

Exercises and instructions are handed out.

**Prerequisites / notice**

Requirement: Earth science mapping exercises I

Comprehensive understanding of evolution, mechanics, and rheology of divergent, convergent and wrenching tectonic systems from the lithospheric scale to local shallow crustal and outcrop-scales. Evaluation of plate tectonic and other orogenic processes through the study of reference examples of taken in Alps-Himalaya orogenic system.
Objective
Comprehensive understanding of evolution, mechanics, and rheology of divergent, convergent and wrenching tectonic systems from the lithospheric scale to local shallow crustal and outcrop-scales. Assessment of mechanisms responsible for plate movements (the Earth as a heat transfer machine, dynamics of earth mantle, plate driving forces) and subsequent large-scale structures (oceanic basins and cycle of the oceanic lithosphere, convergence and mountain systems and continental growth, etc) through theoretical and experimental information.

Evaluation of plate tectonic and other orogenic processes through the study of reference examples of taken in Alps-Himalaya orogenic system.

Content
Plate tectonic frame work: earth cooling and mantle-plume interaction, three kinds of plate boundaries and their roles and characteristics, cycle of oceanic lithosphere, longevity and growth of continents, supercontinents.
Rheology of layered lithosphere and upper mantle.

Obduction systems
Collisions systems
Extensional systems
Basin evolution
Passive and active continental margin evolution

Literature

651-3501-00L Geochemistry II W+ 3 credits 2G S. Bernasconi, M. Schön bächler

Abstract
The course focuses on the most important systems of radioactive and stable isotopes used in geochemistry and geology. Applications of isotope geochemistry for solving fundamental geological problems are discussed on the basis of case studies.

Objective
Development of a basic knowledge and understanding of the applications of the most important systems of stable and radiogenic isotopes.

Content
The following methods will be discussed in detail: the radioactive-radioisotopic systems Rb-Sr, Sm-Nd, U-Th-Pb and K-Ar, as well as the stable isotope systems of oxygen, carbon, nitrogen, sulfur and hydrogen.

We will discuss how these methods are used in the following research fields: geochemistry of the earth, age dating, palaeotemperature reconstructions, evolution of the crust and mantle reservoirs, sediment diagenesis, fluid rock interactions, hydrothermal activity, paleoceanography, biogeochemical cycles.

Lecture notes
Slides are provided online.

651-3440-02L Geophysics III W+ 4 credits 3G A. Jackson, M.-A. Meier, P. Tackley

Abstract
This course builds on Geophysik I and Geophysik II, broadening the students' education in seismology, geodynamics and geodynamics theory, by considering various specific topics of particular interest.

Objective
To teach students the basics of observational seismology, earthquake source seismology, seismotectonics and the principle of seismic tomography, mantle convection over Earth history, structure of the oceanic and continental lithosphere, plate tectonics, hotspots, global heat flux, dynamo operation and magnetic field generation in Earth, planets, the Sun and stars and electromagnetism to probe the mantle.

Content
Observational seismology, earthquake source seismology, seismotectonics and the principle of seismic tomography. Mantle convection over Earth history, structure of the oceanic and continental lithosphere, plate tectonics, hotspots, global heat flux. Dynamo operation and magnetic field generation in Earth, planets, the Sun and stars; electromagnetism to probe the mantle.

---

Applied

Number Title Type ECTS Hours Lecturers
651-3525-00L Introduction to Engineering Geology W+ 4 credits 2V+1U J. Aaron, L. de Palézieux dit Falconnet, M. Ziegler

Abstract
This introductory course starts from a descriptions of the behavior and phenomena of soils and rocks under near surface loading conditions and their key geotechnical properties. Lab and field methods for the characterization of soils, rocks and rock masses are introduced. Finally practical aspects of ground engineering, including tunneling and landslide hazards are presented.

Objective
Understanding the basic geotechnical and geomechanical properties and processes of rocks and soils. Understanding the interaction of rock and soil masses with technical systems. Understanding the fundamentals of geological hazards.

Content

Lecture notes
Written course documentation available on moodle.
Literature

Prerequisites / notice

Lectures held by Prof. J. Aaron will be conducted in English. The lecture slides for these lectures will be available in both German and English. All other lecture material will be provided in German. The exam is held in German.

651-3541-00L Exploration and Environmental Geophysics W+ 4 credits 3V P. Edme, H. Maurer, A. Shakas

Abstract

Overview and understanding of the most important geophysical methods: Potential field methods (Gravimetrics and Magnetics), Electrical and electromagnetic methods, Refraction and reflection seismics, Georadar. Discussion of survey design, sources and receivers and data processing.

Objective

Overview and understanding of the most important geophysical methods. Proposed solutions to assess and observe problems relevant to exploration and environmental geophysics in soil, ice and lithosphere at different scales. Getting familiar with measuring- and interpretation procedures. Pointing out the possibilities and limitations of geophysical methods.

Content

Lecture notes

Available through Moodle / eDoz.

Additional material will be provided by the lecturers.

651-4903-00L Quaternary Geology and Geomorphology W+ 3 credits 2G S. Ivy Ochs, M. Luetscher, H. Stoll

Abstract

In this course the student is familiarized with the manner in which glacial, periglacial, fluvial, gravitational, karst, coastal and aeolian processes produce characteristic landforms and sedimentary deposits. The student is introduced to subdivisions of the Quaternary, with a focus on climatic changes in the Alps. Competency in these themes is gained through practical exercises and discussion.

Evaluates

The electives listed are recommended.

Additional courses can be chosen from the complete offerings of the ETH Zurich and University of Zurich.

#### Principles of Natural Hazard Management

**Abstract**
This course provides an overview of the main natural hazards and their importance in a national and international context. The probability, risk and implications of various natural hazards will be discussed, along with potential management options. The course consists of introductory lectures and exercises, seminars with guest lectures by experts and a field trip.

**Objective**
By the end of the course, students will be able to:

- explain the main natural hazards, their processes and their importance in different contexts.
- describe the likelihood, risk, and consequences of natural hazards and their management options.
- identify and discuss the development of natural hazards in the context of climate change.

**Literature**
will be distributed and available on Moodle

#### Atmospheric Chemistry

**Abstract**
This course covers the chemical and physical processes controlling the composition of the troposphere and stratosphere and introduces the relevant fundamentals for processes in the gas phase, in aerosols and clouds. These concepts are explored in the context of key environmental issues, such as urban air pollution, stratospheric ozone depletion, and air quality connections to climate change.

**Objective**
At the end of this course, students are able to:

1. describe the structure of the atmosphere and list atmospheric components and their main properties
2. define and describe the chemical and physical processes in the stratosphere and troposphere, follow reaction mechanisms, and apply rate laws
3. describe the physical and chemical principles of air pollution and summarize the most important legislative measures
4. discuss the local, regional, and global aspects of interactions between air quality, ecosystem health, and climate

**Content**
- Origin and properties of the atmosphere: composition (gases and aerosols), atmospheric structure, UV radiation, transport timescales
- Kinetics of gas phase reactions: rate laws, mechanisms of bimolecular and termolecular reactions.
- Stratospheric chemistry: Chapman cycle, catalytic ozone destruction cycles, polar ozone hole, Montreal protocol
- Tropospheric chemistry: oxidizing capacity of the troposphere and the role of OH, oxidation and global budgets of CO and CH4, role of NOx, and the global tropospheric O3 budget
- Surface ozone chemistry: HOx-NOx cycle, role of VOCs, O3 isopleth, ozone production efficiency
- Aerosols: primary and secondary sources, composition, quantities and measures, connections to climate
- Multiphase chemistry: solubility of gases, Raoult’s Law and hygroscopicity, kinetics of gas to particle transfer, N2O5 chemistry, aqueous phase sulfur chemistry, secondary organic aerosol formation
- Air quality: role of planetary boundary layer, deposition processes, summer- versus winter-smog, environmental problems, legislation, long-term trends
- Global aspects: air quality - climate interactions

**Lecture notes**
Lecture materials (slides) are provided continuously during the semester, at least 2 days before each lecture. Annotations and corrections are provided at the latest within the same week.

**Prerequisites / notice**
Attendance of the lecture "Atmosphäre" LV 701-0023-00L or equivalent knowledge is a pre-requisite, and basic courses in physics and chemistry are expected. On Mondays (or upon agreement) a tutorial is offered. This allows the students to discuss unresolved issues from the lecture or to discuss the problems of the exercise series and their solution. Participation is recommended.

Abstract
This course covers the basics of atmospheric physics, which consist of: cloud and precipitation formation, especially prediction of showers and severe convective storms, and optical phenomena.

Objective
Students are able
- to explain the mechanisms of convective storm formation using knowledge of thermodynamics and cloud microphysics.
- to interpret precipitation radar images.
- to evaluate the significance of clouds and aerosol particles for artificial weather modification.

Content
In the course "Atmospheric Physics", the competencies of process understanding, system understanding and data analysis & interpretation are taught, applied and examined. Measurement methods are taught as well.

Students also learn to use thermodynamic charts (tephigrams) and to identify cloud base, cloud top, available convective energy in radiosonde ascents. Atmospheric mixing processes are introduced as a basis for fog formation. The concept of an air parcel is used to understand convection.

Aerosol particles are introduced in terms of their physical properties and their role in cloud formation based on Köhler theory. Thereafter cloud microphysical processes including ice nucleation are discussed.

With these basics, the different forms of precipitation (convective vs. stratiform) are discussed and how they can be identified in radar images. Students will also learn under which conditions severe convective storms (especially supercells with tornadoes) can form.

The concepts are applied to understand and judge the validity of different proposed artificial weather modification ideas.

Lecture notes
Powerpoint slides and chapters from the textbook will be made available on moodle: https://moodle-app2.let.ethz.ch/course/view.php?id=22731

Further literature will be indicated during the lecture.

pdf-files of the revised book will be provided on moodle on a chapter-by-chapter basis.

Prerequisites / notice
We offer a lab tour, in which we demonstrate how some of the processes discussed in the lectures are measured with instruments.

There is an additional tutorial right after each lecture to give you the chance to ask further questions and discuss the exercises. The participation is recommended but voluntary.

Competencies
- Assess the significance of clouds and aerosol particles for artificial weather modification.
- Interpret precipitation radar images.
- Explain the mechanisms of convective storm formation using knowledge of thermodynamics and cloud microphysics.
- Evaluate the significance of clouds and aerosol particles for artificial weather modification.

Lecture notes
There will be a lab tour, in which we demonstrate how some of the processes discussed in the lectures are measured with instruments.

Attention is also given to the role of clouds in the climate system. Various different and severe cases of cloud formation will be demonstrated, including the role of aerosol particles.

Further literature will be indicated during the lectures.

Analytical Competencies

This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning "good practice" that can be applied in every student's own projects and daily work life. A special focus will be laid in the use of the statistical software package R for regression analysis.

Objective

The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.

Content

The course starts with the basics of linear modeling, and then proceeds to parameter estimation, tests, confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, multicollinearity problems and model interpretation, as well as general modeling strategies.

The last third of the course is dedicated to an introduction to generalized linear models: this includes the generalized additive model, logistic regression for binary response variables, binomial regression for grouped data and poisson regression for count data.

Lecture notes

A script will be available.

Literature

- Fox (2008): Applied Regression Analysis and GLMs
- Faraway (2005): Linear Models with R
- Montgomery et al. (2006): Introduction to Linear Regression Analysis
- Draper & Smith (1998): Applied Regression Analysis

Prerequisites / notice

The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L "Applied Statistical Regression" and 401-3622-00L "Statistical Modelling" are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

Competencies

- Subject-specific Competencies
  - Concepts and Theories
  - Techniques and Technologies

- Method-specific Competencies
  - Analytical Competencies
  - Problem-solving

- Social Competencies
  - Cooperation and Teamwork

- Personal Competencies
  - Creative Thinking
  - Critical Thinking

Electives

The electives listed are recommended.

Additional courses can be chosen from the complete offerings of the ETH Zurich and University of Zurich.

701-0535-00L | Environmental Soil Physics/Vadose Zone Hydrology | W | 3 credits | 2V+1U | A. Carminati.

Abstract

The course provides theoretical and practical foundations for understanding and characterizing physical soil properties and processes and their relevance for terrestrial ecosystems, plant growth, hydrological processes and atmospheric-land gas exchange, across all relevant scales.
Objective

Students are able to:
- Characterize the different soils based on their key textural and structural properties.
- Simulate and predict soil water retention and flow under varying environmental conditions and understand the key driving forces (capillarity, gravity, friction) and related water properties (surface tension and viscosity).
- Predict soil hydraulic properties for varying soil textural classes.
- Predict solute transport in soils for varying environmental conditions.
- Predict energy balance and temperature dynamics in soils.
- Predict conditions for plant water stress.
- Estimate the impact of soil properties on the hydrological cycle and on plant growth.

Content

INTRODUCTION
Week 1 (September 18)
Presentation of the role of soil physics in environmental sciences and terrestrial ecosystems: soils in the water cycle; soils and vegetation; soils and solute transport. Survey on students’ interests and expectations. Presentation of course structure and learning objectives.

BASIC SOIL PROPERTIES
Week 2 (September 25) and Week 3 (October 02)
soil texture, particle size distribution, soil structure, soil surface area, porosity and bulk density
Pore scale consideration (water in a single pore), pore sizes and shapes; surface tension; Young-Laplace equation; capillary rise; contact angle
Friction and laminar flow; Hagen-Poiseuille’s law; Washburn equation; numerical lab (REPORT 1)

SOIL HYDRAULIC PROPERTIES
Week 4 October 09) and Week 5 (October 16)
Soil water content and soil water potential - The energy state of soil water; total water potential and its components; volumetric and gravimetric water contents; field capacity and wilting point
Soil water characteristics and pore size distribution
Saturated water flow in soils - Laminar flow in tubes (Poiseuille’s Law); Darcy’s Law, conditions and states of flow; permeability and hydraulic conductivity, measurement and theoretical concepts; effective conductivity; unsaturated hydraulic conductivity; Buckingham law.
Unsaturated water flow in soils - Unsaturated hydraulic conductivity models and applications

TOOLBOX – MEASUREMENTS AND MODELING
Week 6 October 23) and Week 7 (October 30)
Measuring soil hydraulic properties, fitting and interpretation; Lab tour - demonstration of soil physical methods; lecture on HYPROP method; report on Hyprop data (REPORT 2)
Modelling unsaturated water flow based on Richards equation - Using Hydrus1D for simulation of unsaturated flow; simulating HYPROP measurements (REPORT 3)

SOIL IN THE WATER CYCLE
Week 8 (November 06) – Week 9 (November 13)
Water infiltration - steady state solutions for infiltration; approximate solutions to infiltration (Green-Ampt, Philip); infiltration rate and ponding; outlook to preferential flow
Water evaporation - Energy balance and land atmosphere interactions - potential and actual evaporation, evaporation stages;

SOIL PLANT INTERACTIONS
Week 10 (November 20) Week 11 (November 27)
Root water uptake and transpiration – Theory and mechanisms controlling root water uptake; hydraulic properties of rhizosphere; plant and stomatal conductance.
Modelling root water uptake and transpiration; analytical approaches and modeling using Hydrus (REPORT 4)

SOLUTE TRANSPORT
Week 12 (December 04) Week 13 (December 11)
Transport mechanisms of solutes in porous media; breakthrough curves; convection-dispersion equation; solutions for pulse and step solute application
Transport of reactive substances, preferential flow, simulations with Hydrus

CLOSURE
Week 14 (December 18)
Summary, course synthesis, connections between the different topics, questions, exam preparation

Literature

Supplemental textbook (not mandatory) - Introduction to Environmental Soil Physics, by: D. Hillel

701-0479-00L Environmental Fluid Dynamics W 3 credits 2G H. Wernli, L. Papritz
This course covers the basic physical concepts and mathematical equations used to describe environmental fluid systems on the rotating Earth. Fundamental concepts (e.g. vorticity dynamics and waves) are formally introduced, applied quantitatively and illustrated using examples. Exercises help to deepen knowledge of the material.
Objective
Students are able
- to name the basics, concepts and methods of environmental fluid dynamics.
- to understand and discuss the components of the basic physical equations
- to mathematically solve basic equations for simple problems of environmental fluid dynamics.
The competencies of process understanding and system understanding are taught, applied and examined.

Content
Basic physical terminology and mathematical laws:
Continuum hypothesis, forces, constitutive laws, state equations and basic principles of thermodynamics, kinematics, laws of mass and momentum on rotating earth.
Concepts and illustrative flow systems: vorticity dynamics, boundary layers, instability, turbulence - with respect to environmental fluid systems.
Scale analysis: dimensionless variables and dynamical similarity, simplification of the fluid system, e.g. shallow water assumption, geostrophic flow.
Waves in environmental fluid systems.

Lecture notes
In English language

Literature
Will be presented in class.

401-0624-00L Mathematics IV: Statistics W 4 credits 2V+1U N. Meinshausen

Objective
Capacity to learn from data; good practice when dealing with data and recognizing possible fraud in statistics; basic knowledge about the laws of randomness and stochastic thinking (thinking in probabilities); application of simple methods in inferential statistics (e.g., several hypothesis tests will be introduced), i.e. also using the statistical software R. The lecture will be held in German.

Content

Lecture notes
Ausführliches Skript zur Vorlesung ist erhältlich.

Literature

An Introduction to R. http://stat.ethz.ch/CRAN/doc/contrib/Lam-IntroductionToR_LHL.pdf

3 credits

401-0621-00L Using R for Data Analysis and Graphics (Part I) W 1.5 credits 1G A. Hauser

Objective
The course provides the first part an introduction to the statistical/graphical/data science software R (https://www.r-project.org/) for scientists. Topics covered are data generation and selection, graphical and basic statistical functions, creating simple functions, basic types of objects.

Content
The students will be able to use the software R for simple data analysis and graphics.
The course provides the first part of an introduction to the statistical software R for scientists. R is free software that contains a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

Part I of the course covers the following topics:
- What is R?
- R Basics: reading and writing data from/to files, creating vectors & matrices, selecting elements of dataframes, vectors and matrices, arithmetics;
- Types of data: numeric, character, logical and categorical data, missing values;
- Simple (statistical) functions: summary, mean, var, etc., simple statistical tests;
- Writing simple functions;
- Introduction to graphics: scatter-, boxplots and other high-level plotting functions, embellishing plots by title, axis labels, etc., adding elements (lines, points) to existing plots.

The course focuses on practical work at the computer with R. We will make use of the graphical user interface RStudio: www.rstudio.org

Lecture notes
An Introduction to R. http://stat.ethz.ch/CRAN/doc/contrib/Lam-IntroductionToR_LHL.pdf

Prerequisites / notice
The course resources will be provided via the Moodle web learning platform.
Subscribing via Mystudies "automatically" makes you a student participant of the Moodle course of this lecture, which is at https://moodle-app2.let.ethz.ch/course/view.php?id=20847

401-0625-00L Using R for Data Analysis and Graphics (Part II) W 1.5 credits 1G A. Hauser

Objective
The course provides the second part of an introduction to the statistical/graphical/data science software R (https://www.r-project.org/) for scientists. Topics covered in Part II are more advanced and focus on more complex functions and more complex data analysis.

Content
The students will be able to use the software R for more complex data analysis.
The course provides the second part of an introduction to the statistical software R for scientists. R is free software that contains a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

Part II of the course covers the following topics:
- Advanced R Basics: more advanced data manipulation, including data frames, factors, and matrices;
- Advanced data analysis: linear models, regression, analysis of variance, and mixed effects models;
- Advanced graphics: more advanced graphical functions, creating custom graphical panels, and interactive graphics;
- Advanced programming: more advanced R functions, including user-defined functions and packages;
- Advanced data visualization: creating and customizing interactive data visualizations using R packages like ggplot2.

The course focuses on practical work at the computer with R. We will make use of the graphical user interface RStudio: www.rstudio.org

Laboratory Course
The practical takes place in spring semester.

Bachelor's Seminar

Number Title Type ECTS Hours Lecturers
701-0459-00L Seminar for Bachelor Students: Atmosphere and Climate O 3 credits 2S M. Windisch, S. I. Seneviratne, O. Stebler
Abstract
The seminar brings together students in the field of atmosphere and climate. Based on classic and current scientific articles, presentation techniques (presentations, poster presentations) are practised and students get a first insight into research in the field of atmosphere and climate.

Objective
In this seminar, students learn how to read scientific publications and how to transfer the scientific knowledge to a broader audience by means of oral and poster presentations. Students also get insight into the different research areas at the Institute for Atmospheric and Climate Science.

Content
1st week: course organisation and presentation of the institute
2nd and 3rd week: introduction to oral presentation technique
4th week: students talks
11th week: introduction to poster presentation technique
12th and 13th week: poster design
14th week: concluding poster presentation

Lecture notes
Documents are offered via the course’s web page.

Literature
Documents are offered via the course’s web page.

Prerequisites / notice
This course can only be offered to a limited number of students, however, in any case for everybody having to attend it compulsory. We beg you to sign in to this course early.

Abstract

- Repetition of methods using optic properties of crystals and the polarising microscope.
- Identification of minerals and metamorphic parageneses.
- Description and interpretation of microstructures.
- Age relationship of crystallisation and deformation.
- Estimation of metamorphic grade.

Objective

- Advanced knowledge in optical mineralogy
- Application of methods to determine minerals in thin sections
- Identification and characterisation of metamorphic minerals
- Description of rocks. Derive correct petrographic rock name, based on modal abundance and microstructure/texture
- Interpretation of rock fabric/microstructure, parageneses and mineral reactions

Content

- Repetition of principal optical properties and of microscopic methods to identify minerals. Emphasis on interpretation of interference figures.
- Study typical metamorphic rocks in thin sections
- Description and interpretation of parageneses and texture/microstructures. Study the age relationship of crystallisation and deformation.
- Estimation of metamorphic grade
- Quantification: To determine volume percentage of rock components
- Scientific documentation: Descriptions, drawings, photomicrography using different kinds of illumination and using plane- or circular-polarised light.

Lecture notes

handouts with additional information on theory and for exercises, in English.

Literature

- Nesse, W.D.: Introduction to optical mineralogy. 3. Ed. (2004). Figures from this book will be used in lectures. Besides the theory, this book describes all optical properties of important minerals. Petrographers working on varying types of silicate rocks should have a look at this book.
- Also available in the D-EAPS library, NO building, on D-floor.

Prerequisites / notice

Number of participants 24.

Other microscopy courses at department D-EAPS are on:
- magmatic rocks, following this course in second half of semester (P. Ulmer, IGP; Inst. for Geochemistry and Petrology)
- sedimentary rocks (Geol. Institute)
- ore minerals (reflected light microscopy, Th. Driesner, IGP)
- microstructures, deformed rocks (Geol. Institute)

651-4047-00L Microscopy of Magmatic Rocks W 2 credits 2G R.-G. Popa

Abstract

This course provides practical knowledge in magmatic microscopy. It includes the identification of common igneous minerals in thin section and in crystal separates, but also aims at providing a deeper understanding of mineral equilibrium assemblages and disequilibrium textures. These are useful skills in studying magmatic processes and reconstructing igneous conditions.

Objective

The main objectives are to acquire expertise in:

1. Optical determination of minerals in igneous rocks;
2. Identification of igneous rocks and their emplacement history based on mineralogy, structure and texture;
3. Identifying the igneous processes that are revealed by the rock record, and understanding how to use the minerals to reconstruct magma chamber physical-chemical conditions;
4. Application of phase diagrams to natural rocks.

Content

In this class, we’ll look together at how to identify plutonic and volcanic rocks and at what their minerals and textures can tell us about the igneous conditions and styles of eruption. We’ll follow different magmatic lines of descent to understand the evolution of magmas formed in different conditions and tectonic settings, focusing on the tholeiitic, calc-alkaline and alkaline series. We’ll look at how magmatic conditions affect the order of crystallization and the chemistry of minerals, and how we can use this knowledge to reconstruct magmatic processes. We’ll learn about equilibrium assemblages, which allow us to see which minerals grew together and record the same magmatic conditions (this is key for petrology and mineral geochemistry), but we’ll also learn to interpret disequilibrium textures, which relate to processes commonly responsible for volcanic eruptions.

Lecture notes

For the optical determination of (igneous) minerals using the polarizing microscope, the tables of Tröger (‘Optische Bestimmung der gesteinsbildenden Minerale’, Optical determination of rock-forming minerals, 1982) are particularly useful. These are available in sufficient number in the class room.

Literature

This class requires basic knowledge of optical mineralogy and the use of the polarizing microscope, which is taught in the previous class: ‘Microscopy of metamorphic rocks’ (A. Galli). For external students, an equivalent course is required to follow this practical course. Delivering 3 acceptably solved homework assignments results in an increase of the final grade by 0.25 (in other words, we give goodies).

Other microscope courses taught at ETH Zürich at the D-EAPS are:
- Basics of optical mineralogy and petrography (M.W. Schmidt, BSc-course in German)
- Microscopy of metamorphic rocks (A. Galli)
- Sedimentary petrography and microscopy (V. Picotti & M.G. Fellin)
- Reflected Light Microscopy and Ore Deposits Practical (T. Driesner)

Critical Thinking fostered

651-4051-00L Reflected Light Microscopy and Ore Deposits W 2 credits 2P T. Driesner

Practical

Abstract

Introduction to reflected light microscopy. Use of the microscope. Identification of opaque minerals through the use of determination tables. Description of textures and paragenetic sequences. Taking the course in parallel with Ore Deposits I (651-4037-00L) is recommended but not mandatory.

Objective

Recognition of the most important ore minerals in polished section, interpretation of ore mineral textures from important ore deposit types (of hydrothermal, magmatic, sedimentary and metamorphic origin) in geological context.

Content

Introduction to reflected light microscopy as a petrographic technique. Leaning main diagnostic criteria. Study of a small selection of important and characteristic ore minerals. Interpreting polished (thin) sections from the most important ore deposit types.

Lecture notes

Lecture ppt’s and determination tables are handed out in class

Literature

(Hands on table book with optical and other properties of most important ore minerals in reflected light. Reprints can still be obtained from the SEG online bookstore. Copies of this book will be used in the course throughout.)

Good graduate level introductory textbook, covers principles of reflected-light microscopy, interpretation of ore textures and most common ore mineral assemblages. Still available.

---

(Good german equivalent of the Craig & Vaughan book.)

(Advances series of papers linking classical microscopical techniques with modern state-of-the-art microanalytical approaches (LA-ICP-MS, SIMS, PIXE etc.))

(The technical part is a good german equivalent of Craig & Vaughan while the sections on textures and their interpretation is much less systematic.)

(Largest monograph about ore minerals and their textures, excellent reference book for assemblages and textures, but not useful for determination of common and typical minerals, interpretation of textures often outdated. Only available in the library.)

(Comprehensive collection of photomicrographs of ore minerals in reflected light. Not very helpful for determination purposes but instructive for comparison with own samples.)

(Extensive and well organized tables for practical determination of common and less abundant ore minerals. Only available in the library.)

---

Prerequisites / notice

Credits and mark based on an independent description of one selected polished section at the end of the course

651-4113-00L Sedimentary Petrography and Microscopy W 2 credits 2G V. Picotti, M. G. Fellin

Abstract

Microscopy of carbonate (1st half of semester) and siliciclastic rocks (2nd half) rocks as well as siliceous, phosphatic and evaporitic sediments.

Objective

Description of grains and cement/matrix, texture, classification of the main sedimentary rocks. Discussion and interpretation of the environment of sedimentation. Diagenetic Processes.

Content

Microscopy of carbonate and siliciclastic rocks, siliceous and phosphatic rocks, their origin and classification. Diagenesis.

Lecture notes

Literature

Prerequisites / notice

The earlier attendance of other MSc microscopy courses (e.g. magmatic and metamorphic rocks) is not required if during the BSc a general course on microscopy of rocks was completed.

Part B: Methods

Number Title Type ECTS Hours Lecturers

651-4055-00L Practical work in Petrology and Geology W 3 credits 2G J. Allaz, S. Bernasconi, M. Guillong, N. Seibel

---

**651-4117-00L  Sediment Analysis**

**Prerequisite:** Successful completion of the MSc-course "Sedimentology I" (651-4041-00L).

**Abstract**
Theoretical background and application of some basic methods for sediment analysis.

**Objective**
The main goal is to learn how to apply the analysis of the texture and grain-size of sediments to constrain the sedimentary processes and environments.

**Content**
A one-day fieldtrip to a local outcrop to learn how to describe sediments in the field and to collect samples for grain-size and compositional analysis. Application of the same analytical techniques on samples of unknown origin: the sampling sites will be revealed at the end of the course. Discussion of the theoretical background and of the results in class. At the end of the course, the student will have to hand in a report with the presentation and discussion of all the data produced during the course.

**Lecture notes**
For the various analytical methods English texts will be provided in class.

**Literature**
- Introduction to clastic sedimentology. R.J. Cheel, Brock University
- A one-day fieldtrip to a local outcrop to learn how to describe sediments in the field and to collect samples for grain-size and compositional analysis. Application of the same analytical techniques on samples of unknown origin: the sampling sites will be revealed at the end of the course.

**Prerequisites / notice**
Prerequisite: Successful completion of the MSc-course "Sedimentology I" (651-4041-00L).

**Competencies**

**Subject-specific Competencies**
- Concepts and Theories
- Techniques and Technologies

**Method-specific Competencies**

**651-0046-00L  Electron Microscopy Course (SEM and EPMA)**

**Prerequisite:** Successful completion of the MSc-course "Sedimentology I" (651-4041-00L).

**W** 3 credits 3G J. Allaz, L. Grafulha Morales

**Abstract**
Theory and lab demo of scanning electron microscope (SEM) and electron microprobe analysis (EPMA) applied to geological materials:

- introduction to the instruments, interaction of electron with matter, electron imaging (SE, BSE, CL), electron backscatter diffraction (EBSD),
- X-ray analysis for the chemical characterisation of solid material at the micron-scale.

**Objective**
Understand how the instrument works, why it is used, and how the different signals are being generated and analysed. Ability to treat and present analytical results, such as calculating a mineral formula from a mineral analysis.

**Content**
Physical principles of electron microscopy: electron optics, interaction of electrons with matter, production of X-rays, interaction of X-rays with matter, X-rays detection and analysis. The second part of the course includes several demonstrations on various SEMs (at EAPS and ScopeM) and one EPMA at D-EAPS.

**Lecture notes**
Script will be provided, along with copies of the course presentations.

**[Highly recommended]**

- Critical Thinking

---

**651-4063-00L  X-Ray Powder Diffraction**

**W** 3 credits 2G M. Plötze

**Abstract**
In the course the students learn to measure X-ray diffraction patterns of minerals and to evaluate these using different software for qualitative and quantitative mineral composition as well as crystallographic parameters.

**Objective**
Upon successful completion of this course students are able to:
- describe the principle of X-ray diffraction analysis
- carry out a qualitative and quantitative mineralogical analysis independently,
- critically assess the data,
- communicate the results in a scientific report.

The competencies of system understanding, concept development, and measurement methods are taught and examined.
Content

- Fundamental principles of X-ray diffraction
- Setup and operation of X-ray diffractometers
- Interpretation of powder diffraction data
- Qualitative and quantitative phase analysis of crystalline powders (e.g. with Rietveld analysis)

Lecture notes

Selected handouts will be made available in the lecture

Literature

Prerequisites /

The course includes a high portion of practical exercises in sample preparation as well as measurement and evaluation of X-ray powder diffraction data.

Own sample will be analysed qualitatively and quantitatively. Knowledge in mineralogy of this system is essential.

Software will be provided for future use on own Laptop.

Competencies

Subject-specific Competencies

- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies

- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management

Social Competencies

- Communication
- Cooperation and Teamwork
- Customer Orientation
- Leadership and Responsibility

Personal Competencies

- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

Restricted Choice Modules Geology

A minimum of two restricted choice modules must be completed for the major Geology.

Biogeochemistry: Compulsory Courses

The compulsory courses of the module take place in spring semester.

Biogeochemistry: Courses of Choice

Abstract

The course will focus on biological and chemical aspects of sedimentation in marine environments. Marine sedimentation will be traced from coast to deep-sea. The use of stable isotopes, palaeoceanography will be discussed. Neritic, hemipelagic and pelagic sediments will be used as proxies for environmental change during times of major perturbations of climate and oceanography.

Objective

- You will understand chemistry and biology of the marine carbonate system
- You will be able to relate carbonate mineralogy with facies and environmental conditions
- You will see carbonate and organic-carbon rich sediments as part of the global carbon cycle
- You will be able to recognize links between climate and marine carbonate systems (e.g. acidification of oceans and reef growth)
- You will be able to use geological archives as source of information on global change
- You will have an overview of marine sedimentation through time

Content

- carbonates, chemistry, mineralogy, biology
- carbonate sedimentation from the shelf to the deep sea
- carbonate facies
- cool-water and warm-water carbonates
- organic-carbon and black shales
- C-cycle, carbonates, Corg : CO2 sources and sink
- Carbonates: their geochemical proxies for environmental change: stable isotopes, Mg/Ca, Sr
- marine sediments through geological time
- carbonates and evaporites
- lacustrine carbonates
- economic aspects of limestone

Lecture notes

no script. scientific articles will be distributed during the course

Literature

We will read and critically discuss scientific articles relevant for "biological and chemical processes in marine and lacustrine systems"

Prerequisites / notice

The grading of students is based on in-class exercises and end-semester examination.

</tr>
</tbody>
</table>

Abstract

Climate history and paleoclimatology explores how the major features of the earth's climate system have varied in the past, and the driving forces and feedbacks for these changes. The major topics include the earth's CO2 concentration and mean temperature, the size and stability of ice sheets and sea level, the amount and distribution of precipitation, and the ocean heat transport.
The student will be able to describe the natural factors that lead to variations in the earth's mean temperature, the growth and retreat of ice sheets, and variations in ocean and atmospheric circulation patterns, including feedback processes. Students will be able to interpret evidence of past climate changes from the main climate indicators or proxies recovered in geological records. Students will be able to use data from climate proxies to test if a given hypothesized mechanism for the climate change is supported or refuted. Students will be able to compare the magnitudes and rates of past changes in the carbon cycle, ice sheets, hydrological cycle, and ocean circulation, with predictions for climate changes over the next century to millennia.

The course spans 5 thematic modules:

1. Cyclic variation in the earth's orbit and the rise and demise of ice sheets. Ice sheets and sea level - What do expansionist glaciers want? What is the natural range of variation in the earth's ice sheets and the consequent effect on sea level? How do cyclic variations in the earth's orbit affect the size of ice sheets under modern climate and under past warmer climates? What conditions the mean size and stability or fragility of the large polar ice caps and is their evidence that they have dynamic behavior? What rates and magnitudes of sea level change have accompanied past ice sheet variations? How stable or fragile is the ocean heat conveyor, past and present? Feedbacks on climate cycles from CO2 and methane. What drives CO2 and methane variations over glacial cycles? What are the feedbacks with ocean circulation and the terrestrial biosphere? Atmospheric circulation and variations in the earth's hydrological cycle - How variable are the earth's precipitation regimes? How large are the orbital scale variations in global monsoon systems?

2. Century-scale droughts and civil catastrophes. Will mean climate change El Nino frequency and intensity? What factors drive change in mid and high-latitude precipitation systems? Is there evidence that changes in water availability have played a role in the rise, demise, or dispersion of past civilizations?

3. How sensitive is Earth's long term climate to CO2 and cloud feedbacks? What regulates atmospheric CO2 over long tectonic timescales of millions to tens of millions of years?

The weekly two hour lecture periods will feature lecture on these themes interspersed with short interactive tasks to apply new knowledge. Over the semester, student teams will each present in class one debate based on two scientific articles of contrasting interpretations. With flexible scheduling, students will participate in a laboratory activity to generate a new paleoclimatic record from stalagmites. Student teams will be supported by an individual tutorial meeting to assist in debate preparation and another to assist in the interpretation of the lab activity data.

**Abstract**

Sediments preserved a record of past landscapes. This course focuses on understanding the processes that modify sedimentary landscapes with time and how we can read this changes in the sedimentary record.

**Objective**

- The students learn basic concepts of modern sedimentology and stratigraphy in the context of sequence stratigraphy and sea level change. They discuss the advantages and pitfalls of the method and look beyond. In particular we pay attention to introducing the importance of considering entire sediment routing systems and understanding their functioning.

**Content**

- carbonates, chemistry, mineralogy, biology
- carbonate sedimentation from the shelf to the deep sea
- carbonate facies
- cool-water and warm-water carbonates

651-4901-00L  Quaternary Dating Methods  W  2 credits  1G  I. Hajdas, M. Christl

Abstract
Reconstruction of time scales is critical for all Quaternary studies in Geology and Archeology. Various methods are applied depending on the time range of interest and the archive studied. In this lecture, we focus on the last 50 ka and the methods that are most frequently used for dating Quaternary sediments and landforms in this time range.

Objective
Students will be made familiar with the details of the six dating methods through lectures on basic principles, analysis of case studies, solving of problem sets for age calculation and visits to dating laboratories.

Content
1. Introduction: Isotopes and decay
2. Radiocarbon dating: principles and applications
3. AMS technique and its application in Quaternary geochronology
4. U-series disequilibrium dating
5. Luminescence dating
6. Introduction to incremental: varve counting, dendrochronology, and ice cores chronologies
7. Dating anthropogenic records

Prerequisites / notice
Visit to radiocarbon lab, cosmogenic nuclide lab, and accelerator (AMS) facility.

Required: attending the lecture, visiting laboratories, handing back solutions for problem sets, short presentations or written report

Optional (individual): 1-5 days of hands-on radiocarbon dating at the 14C lab, ETH Hoenggerberg

Competencies
Subject-specific Competencies
- Concepts and Theories: fostered
- Techniques and Technologies: fostered

Method-specific Competencies
- Analytical Competencies: fostered
- Problem-solving: fostered

651-4063-00L  X-Ray Powder Diffraction  W  3 credits  2G  M. Plötze

Abstract
In the course the students learn to measure X-ray diffraction patterns of minerals and to evaluate these using different software for qualitative and quantitative mineral composition as well as crystallographic parameters.

Objective
Upon successful completion of this course students are able to:
- describe the principle of X-ray diffraction analysis
- carry out a qualitative and quantitative mineralogical analysis independently,
- critically assess the data,
- communicate the results in a scientific report.

The competencies of system understanding, concept development, and measurement methods are taught and examined.

Content
Fundamental principles of X-ray diffraction
Setup and operation of X-ray diffractometers
Interpretation of powder diffraction data
Qualitative and quantitative phase analysis of crystalline powders (e.g. with Rietveld analysis)

Lecture notes
Selected handouts will be made available in the lecture

Literature

Prerequisites / notice
The course includes a high portion of practical exercises in sample preparation as well as measurement and evaluation of X-ray powder diffraction data.

Software will be provided for future use on own Laptop.

Own sample will be analysed qualitatively and quantitatively. Knowledge in mineralogy of this system is essential.

Competencies
Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: fostered
- Media and Digital Technologies: assessed
- Problem-solving: fostered
- Project Management: fostered

Social Competencies
- Communication: assessed
- Cooperation and Teamwork: assessed
- Customer Orientation: fostered
- Leadership and Responsibility: fostered

Personal Competencies
- Adaptability and Flexibility: fostered
- Creative Thinking: assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: fostered
- Self-awareness and Self-reflection: fostered
- Self-direction and Self-management: fostered

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 1121 of 2684
This course will integrate several Earth-science disciplines (geology, geomorphology, and biogeochemistry) to provide a holistic understanding of the physical and biogeochemical processes that control sediment and (organic) carbon production and mobilization along geomorphic cascades. The primary objective is to track the evolution of a particle as it is produced by rock weathering, transformed during soil development, eroded and transported by fluvial processes, and eventually buried in depositional systems. In doing so, students will learn how to “see a world through a grain of sand.”

This course will comprise three main components:

(i) Lectures will introduce the main “source to sink” concepts and will focus on both physical and biogeochemical processes from uplands, sediment-producing regions to lowland, sediment-depositing regions (i.e., erosion and mass movements; hillslopes, soil development, and the “critical zone”); transport and storage in rivers and floodplains; and deposition in sedimentary archives.

(ii) A three-day field excursion from the Rhône Glacier to the Rhône Delta in Lake Geneva (Sept. 27-29, 2024) will provide hands-on examples of these concepts within the upper Rhône Basin. During the excursion, students will present a summary of an assigned relevant scientific paper and will sample solid- and dissolved-phase materials (soils, sediments, river water) from different geomorphic settings and upstream to downstream fluvial environments; these samples will form the basis of two laboratory-based practical exercises.

(iii) Practicals will comprise two group exercises: (1) an assessment of Rhône river chemical weathering, including its erosional and lithological controls, using dissolved river-water samples; and (2) an investigation of Alpine soil formation and erosion, including its lithological and environmental controls, using solid-phase soil and sediment samples. For both practicals, students will learn relevant analytical instrumentation; generate data using samples collected in the field; and write a scientific report on their findings, environmental context, and interpretation within the “source to sink” concept.

Grading will be distributed as: 30% field excursion participation and literature review, 35% Practical 1, 35% Practical 2.

Lecture notes
Lecture notes will be provided online during the course. These will provide necessary theoretical background, summarize relevant “source to sink” topics, and serve as the basis for knowledge to be incorporated into both Practical assignments.

Literature
Prior knowledge on the fundamentals of geomorphology, (bio)geochemistry, and/or soil science is highly encouraged. While not strictly required, additional suggested literature includes:

- "Sediment routing systems: the fate of sediments from Source to Sink" by Philip A. Allen (Cambridge University Press)
- "Principles of soilscape and landscape evolution" by Garry Willgoose (Cambridge University Press)
- "Geomorphology, the mechanics and chemistry of landscapes" by Robert S. Anderson & Suzanne P. Anderson (Cambridge University Press)

651-4243-00L Seismic Stratigraphy and Facies

Objective
The course teaches the techniques of seismic interpretation for solving geological and environmental problems. A special focus is given to the seismic facies analysis and seismic sequence stratigraphy of different depositional systems. In addition, examples are presented how seismic data can be integrated into research projects in basin analysis, paleoceanography and paleoclimatology.

Content
The four day course consists of lectures that are accompanied by a variety of exercises.

Day 1:
Introduction seismic facies analysis with exercise
Seismic resolution
Seismic facies of contourite drift systems and their value as physical indicators of global current changes.

Day 2:
Seismic attributes and seismic geomorphology
Siliciclastic deltas, shelves and turbidite systems, 2D-3D
Exercise: Seismic section Tarragon Basin and reconstructing the basin evolution with respect to the climate conditions at the end of the Miocene.
Seismic facies carbonate systems
Carbonates as recorders of sea level and paleoclimate
Deepwater environments, including cold-water coral habitats

Day 3:
Carbonates versus volcanic seismic facies
Introduction seismic attributes
Faults and structures on seismic sections
Seismic facies of mixed systems with
Exercises from Canada and the Paradox Basin

Day 4:
Sea level and sedimentation
Telling ages on seismic section
Seismic stratigraphy and sequence stratigraphy
Exercise: Sequence analysis Straits of Andros
Final discussion

Lecture notes
An original script (110 pages) designed for the class will be distributed at the beginning of the course.
We illustrate some physical properties, deformation mechanisms, and define flow laws. We show the fundamental techniques for the measurement in laboratory of density, permeability, elastic properties and deformation. We presented actual case studies and discuss upscaling from laboratory to field.

Prerequisites

Basic knowledge in sedimentology and stratigraphy

Literature

Books Seismic Interpretation of Depositional Systems:

Methods to combine laboratory experiments with geophysical data.

The course is at Master student level, but will be useful for PhDs students who want to begin to work in experimental deformation or who want to know the meaning and the limitation of laboratory flow-laws for geodynamic modelling.

For rock deformation we will illustrate how to determined flow-laws of rocks from experiments and how to extrapolate to natural conditions. Since the time scale of laboratory experiments is several orders of magnitude faster than nature, we will compare the microstructure of natural rocks with that produced during the experiments to prove that the same mechanisms are operating. For this purpose, the fundamental techniques of experimental rock deformation will be illustrated and test on natural rock samples in the lab, to acquire the data, to correct for calibration and to process the data and finally interpret the data.
The course will focus on research-based term project, lectures will alternate with laboratory demonstrations.

We will illustrate how intrinsic properties of rocks (mineral composition, porosity, pore fluids, crystallographic orientation, microstructures) are connected to the following physical properties:

- permeability;
- elastic properties for seismic interpretations;
- anisotropy of the above physical properties.

We will measure some of those parameters in laboratory and discuss real case studies and applications.

Principles of deformation mechanisms, flow laws, and deformation mechanism maps will be presented in lectures.

In laboratory we will show:

- Experimental deformation rigs (gas, fluid and solid confining media);
- Main part of the apparatus (mechanical, hydraulic, heating system, data logging);
- Calibration of an apparatus (distortion of the rig; transducers calibration);
- Various types of tests (axial deformation; diagonal cut and torsion; deformation; constant strain rate tests; creep tests; stepping tests);

Prerequisites / notice

The course of Structural Geology (651-3422-00L) is highly recommended before attending this course.

Moreover the students should have basic knowledge in geophysics and mineralogy/crystallography.

In doubt, please contact the course responsible beforehand.

**Abstract**

Transfer and redistribution of material on Earth's surface is controlled by myriad processes. To investigate these, this course will address the production, transport, and deposition of sediments and will probe their interactions with biogeochemical cycles. We will integrate catchment-scale sediment dynamics with associated (organic) carbon cycling at all stages of the "source to sink" continuum.

**Objective**

This course will integrate several Earth-science disciplines (geology, geomorphology, and biogeochemistry) to provide a holistic understanding of the physical and biogeochemical processes that control sediment and (organic) carbon production and mobilization along geomorphic cascades. The primary objective is to track the evolution of a particle as it is produced by rock weathering, transformed during soil development, eroded and transported by fluvial processes, and eventually buried in depositional systems. In doing so, students will learn how to "see a world through a grain of sand."

**Content**

This course will comprise three main components:

(i) Lectures will introduce the main "source to sink" concepts and will focus on both physical and biogeochemical processes from uplands, sediment-producing regions to lowland, sediment-depositing regions (i.e., erosion and mass movements; hillslopes, soil development, and the "critical zone"; transport and storage in rivers and floodplains; and deposition in sedimentary archives).

#### Abstract
The course teaches the techniques of seismic interpretation for solving geological and environmental problems. A special focus is given to the seismic facies analysis and seismic sequence stratigraphy of different depositional systems. In addition, examples are presented how seismic data can be integrated into research projects in basin analysis, paleoceanography and paleoclimatology.

#### Objective
1. Acquire techniques for a comprehensive interpretation of seismic sections for solving geologic, stratigraphic and environmental problems
2. Correlation of seismic facies and seismic attributes to lithologic facies in different sedimentary systems
3. Learn the principles and techniques of seismic sequence stratigraphy and the differences between lithostratigraphy and sequence stratigraphy
4. Learn to integrate seismic data into paleoceanographic and paleoclimatic research.

#### Content
The four day course consists of lectures that are accompanied by a variety of exercises.

**Day 1:**

### Abstract
This course is a general introduction to the methods of seismic hazard analysis. It provides an overview of the input data and the tools in deterministic and probabilistic seismic hazard assessment, and discusses the related uncertainties.

### Objective
This course is a general introduction to the methods of seismic hazard analysis.

### Content
In the course it is explained how the disciplines of seismology, geology, strong-motion geophysics, and earthquake engineering contribute to the evaluation of seismic hazard. It provides an overview of the input data and the tools in deterministic and probabilistic seismic hazard assessment, and discusses the related uncertainties. The course includes the discussion related to intensity and macroseismic scales, historical seismicity and earthquake catalogues, ground motion parameters used in earthquake engineering, definitions of the seismic source, ground motion attenuation, site effects and microzonation, and the use of numerical tools to estimate ground motion parameters, both in a deterministic and probabilistic sense.

During the course recent earthquakes and their impacts are discussed and related to existing hazard assessments for the areas of interest.

---

## Earthquake Seismology: Compulsory Courses

One additional elective course of at least 3KP has to be completed for this Module according to prior agreement with the Subject Advisor (Autumn or Spring Semester).

### Geographic Information Systems

The courses of this module are offered by UZH and must be registered at UZH.

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: GEO372

Mind the enrolment deadlines at UZH:

---
The course provides an introduction into the various components of the cryosphere: snow, glaciers, ice sheets, sea ice and lake ice, and permafrost - and their roles in the climate system. Essential physical aspects are emphasized for each subsystem: e.g. the material properties of ice, mass balance and dynamics of glaciers, or the energy balance of sea ice.

In the course "Cryosphere", the competencies of process understanding, modeling, data analysis & interpretation and measurement methods are taught, applied and examined. System understanding is taught and examined.

Further literature will be indicated during the lecture.

Literature
Seminar in Glaciology

W 3 credits 2S  A. Bauder, M. Jacquemart

Abstract
Introduction to classic and modern literature of research in Glaciology. Active participation is expected and participants are mentored by PhD students of Glaciology.

Objective
In-depth knowledge of selected topics of research in Glaciology. Introduction to different types of scientific presentation. Improve ability of the discussion of scientific topics.

Content
Selected topics of scientific research in Glaciology

Lecture notes
Copies/pdf of scientific papers will be distributed during the course (moodle interface)

Prerequisites / notice
Active participation is expected with presence at the sessions. Only a limited number of participants can be accepted. One of the following courses should be taken as preparation:
- 651-3561-00L  Kryosphäre
- 101-0289-00L  Applied Glaciology
- 651-4101-00L  Physics of Glaciers

Quantification and Modeling of the Cryosphere: Dynamic Processes (University of Zurich)

W 3 credits 1V  University lecturers

Abstract
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: GEO815

Mind the enrolment deadlines at UZH:

Objective
This course introduces quantitative approaches and models to processes of the cryosphere in high mountain areas. The main focus are dynamic and thermal processes related to glaciers and permafrost. During the course, simple simple mathematical and numerical models will be used to investigate ground temperature profiles as well as glacier evolution and dynamics in relation to climate.

Content
This course combines lectures providing the background on the physical processes and methods with computer practicals in which quantitative methods are applied to glaciers and permafrost processes. These lectures and practicals run as 2-hour blocks per week and are combined with group and individual exercesises. Topics indicative for the content of this course are:

- Heat flow processes in the ground and in glaciers, and their solution with numerical models.
- Glacier dynamics and evolution in relation to climate change.
- Simple and reduced mathematical models for glaciers flow.
- Numerical models for glacier dynamics.

Physics of Glaciers

W 3 credits 3G  M. Lüthi, F. T. Walter, M. Werder

Abstract
Understanding glaciers and ice sheets with simple physical concepts. Topics include the reaction of glaciers to the climate, flow of glacier ice, temperature in glaciers and ice sheets, glacier hydrology, glacier seismology, basal motion and calving glaciers. A special focus is the current development of the ice sheets of Greenland and Antarctica.

Objective
After the course the students are able understand and interpret measurements of ice flow, subglacial water pressure and ice temperature. They will have an understanding of glaciology-related physical concepts sufficient to understand most of the contemporary literature on the topic. The students will be well equipped to work on glacier-related problems by numerical modeling, remote sensing, and field work.

Content
The dynamics of glaciers and polar ice sheets is the key requisite to understand their history and their future evolution. We will take a closer look at ice deformation, basal motion, heat flow and glacier hydraulics. The specific dynamics of tide water and calving glaciers is investigated, as is the reaction of glaciers to changes in mass balance (and therefore climate).

Lecture notes
Will be provided on Moodle

Literature
A list of relevant literature is available on Moodle

Prerequisites / notice
High-school mathematics and physics knowledge required.
Applied Glaciology

Abstract
The course transmits fundamental knowledge for treating applied glaciological problems. Topics include climate-glacier interactions, glacier ice flow, glacier hydrology, ice avalanches, and lake ice.

Objective
The objectives of the courses are to:
- learn about fundamental glaciological processes, including glacier mass balance, ice dynamics, and glacier-related hazards;
- apply the above knowledge to some case studies inspired by contract-works performed at ETH's Glaciology section;
- generate the own computer code to solve the above case studies, and interpret the results;
- understand, both in class and in the field, the practical relevance of glaciology, with a focus on the Swiss applications.

Content
The course will develop along the following outline:
- How glaciology became a scientific discipline
- Glaciology and hydropower
- Glacier mechanics and ice flow
- Gravitational glacier instabilities
- Glacier hydrology and glacier lake outbursts
- Lake ice and ice bearing capacity
- Field excursion to Jungfraujoch
- Discussion of the exercises performed during the semester

Lecture notes
Digital lecture handouts will be distributed prior to each class.

Literature
Links to relevant literature will be provided during the classes.

Prerequisites / notice
Completed BSc studies. Basic knowledge in computer scripting in any language (e.g. Python, R, Julia, Matlab, IDL, ...) will be advantageous for solving the exercises. The exercises will be performed in groups. A minimal level of fitness is required for the field excursion.

Lithosphere Structure and Tectonics

Abstract
Comprehensive understanding of evolution, mechanics, and rheology of divergent, convergent and wrenching tectonic systems from the lithospheric scale to local shallow crustal and outcrop-scales. Evaluation of plate tectonic and other orogenic processes through the study of reference examples of taken in Alps-Himalaya orogenic system.

Objective
Comprehensive understanding of evolution, mechanics, and rheology of divergent, convergent and wrenching tectonic systems from the lithospheric scale to local shallow crustal and outcrop-scales.
Assessment of mechanisms responsible for plate movements (the Earth as a heat transfer machine, dynamics of earth mantle, plate driving forces) and subsequent large-scale structures (oceanic basins and cycle of the oceanic lithosphere, convergence and mountain systems and continental growth, etc) through theoretical and experimental information.
Evaluation of plate tectonic and other orogenic processes through the study of reference examples of taken in Alps-Himalaya orogenic system.

Content
Plate tectonic frame work: earth cooling and mantle-plate interaction, three kinds of plate boundaries and their roles and characteristics, cycle of oceanic lithosphere, longfife and growth of continents, supercontinents.
Rheology of layered lithosphere and upper mantle.
Obduction systems
Collisions systems
Exstensional systems
Basin evolution
Passive and active continental margin evolution
Lecture notes
Course notes will be made available on a designated course web site. Most of the topics discussed in the course are available in the book mentioned below.

Literature

Prerequisites / notice
Basic knowledge of continuum mechanics and rock mechanics, as well as notion of tensor analysis is strongly suggested. We recommend to have taken the course Continuum Mechanics (generally taught during the Fall semester).

The course will be taught in fall 2017 and it will be followed by Earthquakes 2: Source Physics in Spring 2018.

The course will be evaluated in a final written test covering the topics discussed during the lectures.

The course will be worth 3 credit points, and a satisfactory total grade (4 or better) is needed to obtain 3 ECTS.

The course will be given in English.

Abstract
This course focuses on the fundamentals (foundations) and basic concepts of rock mechanics and rock engineering (e.g. tunnelling, rock slope stability).

Objective
The course aims to introduce the fundamentals and basic concepts of rock mechanics and generic rock engineering. The student shall understand how rocks behave at different scales, under various artificial loads and in the shallow subsurface (a few km below ground). The link between rock mechanics, geology, hydrogeology and tectonics (i.e. the conditions under which the rock formed) will be clearly established.

The student shall understand basic principles of rock mechanics and rock engineering. In addition, the student shall learn how to apply the results from lab and field investigations to simple engineering problems. This knowledge is required for subsequent integration courses (Landslide Analysis and Hazard Mitigation; Engineering Geology of Underground Excavations).

Content
This course focuses on the fundamentals (foundations) and basic concepts of rock mechanics and generic rock engineering. The course is compulsory for the MSc Eng Geol. The applications of rock mechanical principles and rock engineering methods are extensively covered in subsequent courses.

Lecture notes
Written course documentation available on our homepage: https://www.ethz.ch/content/specialinterest/erdw/geological-institute/engineering-geology/en/teaching/msc/fall/rock_mechanics.html

651-4033-00L | Soil Mechanics and Foundation Engineering | W    | 4 credits | 3V   | J. Aaron, L. de Palézieux dit Falconnet, S. Montani |

Abstract
The course presents the principles of soil mechanics and soil behaviour characteristics and its applications in geotechnical structures and systems. It is based on more descriptive courses on Engineering Geology within the BSc Geol. Program and is a compulsory prerequisite for other courses within the MSc Eng. Geol. program.

Objective
Understanding the principles of soil behaviour and the fundamentals of geotechnical practices in soils.

Ability to communicate with geotechnical engineers.

Content
Soil Mechanics:
Fundamental concepts of strength and deformation of different soils. Introduction to geotechnical calculations

Geotechnical Engineering in Soils:
Evaluation of geotechnical scenarios, handling of forecast uncertainties, relation of soil properties and soil composition, interactions between soil and building, standard construction methods in soils (foundations, slopes, dams and levees), requirements for the geotechnical prognosis

Lecture notes
This lecture is supported by the textbook: "Geotechnical Engineering" by Donald P. Coduto, 2nd edition, 2011; ISBN-13: 978-0-13-135425-8

Prerequisites / notice
Courses must be completed:
Introduction to Engineering Geology (BSc level)
Introduction to Groundwater
Sedimentology and Quaternary deposits
Principles of Physics

Courses recommended:
Eng Geol Site Investigations
Eng Geol Field Course 1 (soils)
Clay Mineralogy

651-4023-00L | Groundwater | W    | 4 credits | 4G   | X.-Z. Kong, B. Marti |

Abstract
The course provides an introduction into quantitative analysis of groundwater flow and solute transport. It is focused on understanding, formulating, and solving groundwater flow and solute transport problems.

Objective
a) Students understand the basic concepts of groundwater flow and solute transport processes, and boundary conditions.

b) Students are able to formulate simple, practical groundwater flow and solute transport problems.

c) Students are able to understand and apply simple analytical and/or numerical solutions to fluid flow and solute transport problems.
In the Soil Mechanics Lab, the following seven laboratory tests are performed: Sieve Analysis, Hydrometer Analysis, Atterberg Limits, Proctor Compaction, (Direct Shear Test/Triaxial test), Falling Head Permeability and Consolidation Test. Through performing these tests, students gain an understanding of the relationship between index properties and soil behavior, as well as the strength, deformability and hydraulic characteristics of soils.

In the Rock Mechanics lab, the following laboratory tests are performed: Point load test, Brazilian tensile test, Uniaxial compression test, and Triaxial compression test. Through performing these experiments, students will get familiar with stress-strain curves, tensile, unconfined, and confined compressive strength of rocks, Young's modulus and Poisson ratio, and finally cohesion and friction angle of intact rocks.

Abstract: This course introduces students to the methods used in characterising, developing or monitoring geotechnical engineering project sites. Measurements, tools and analyses are described that are relevant to determining the geologic conditions at a site as well as deformations that occur under natural or construction conditions.

Objective: This course aims at introducing the general procedures taken during an engineering geological site investigation. Students who complete the course should be able to design a site investigation program of measurements based on information from initial desk studies, and to analyse, integrate and interpret data from the measurement program.

Content: The methods that are routinely employed in site investigations will be described focusing on their applicability in different geologic environments. The limitations of the data in constraining the parameters of interest will be addressed together with problems of interpretation and cost-versus-information value. Specific topics addressed include drilling, coring, sampling, borehole testing, geophysical methods used in engineering geology, satellite, air- and ground-based surface and displacement monitoring (photogrammetry, LIDAR and Radar), and in-situ deformation measurement methods.

Lecture notes: Lecture notes will be available for download 1-2 days before each class.

**Prerequisites:** successful participation in all 3 compulsory modules of the Major in Engineering Geology (Fundamentals, Methods and Integration).

The Industrial Internship of the Eng Geol Major takes place in the second MSc year after consultation with Dr. Heike Willenberg. Detailed regulations of this practical are published on the Engineering Geology Website.

**Abstract**

The industry practical is supervised both from the industry partner and ETH and consists of technically and/or scientifically challenging work in the engineering geology domain. The regular duration of the practical is 10 weeks. The practical is pre-defined in a work plan and concluded with a report written by the student.

**Objective**

The goals of the industry practical are to become familiar with technical, economic, legal and communication issues of real-life work in private industry or technical administration.

**Abstract**

This course presents fundamental digital signal processing and filter theory with a focus on geophysical applications.

**Objective**

The goal of the course is to provide an understanding of the fundamental principles of digital signal processing and filter theory for application in geophysics and seismology. Form: two hours lecture and two hours of computer aided exercises per week.

**Content**

Seismic station; noise; digitisation; the seismometer; Laplace transform; Z-Transform; digital filters design and application; inverse filters design and application; appendices (e.g., response spectra).

**Lecture notes**

Lecture notes will be made available for download from the website of the course.

**Literature**

The class follows no single book. A list of relevant texts will be given in class.

**Prerequisites / notice**

(a) time series, discrete systems, Fourier transform, Fourier and power spectra, convolution, correlation, stochastic time series (a course dealing with these topics is “Analysis of Time Series in Environmental Physics and Geophysics”);

(b) Python, Jupyter.

Students must bring their own laptop in class for computer exercises based on Python / Jupyter.
Numerical Modelling I and II: Theory and Applications

In this 13-week sequence, students learn how to write programs from scratch to solve partial differential equations that are useful for Earth science applications. Programming will be done in MATLAB and will use the finite-difference method and marker-in-cell technique. The course will emphasise a hands-on learning approach rather than extensive theory.

The goal of this course is for students to learn how to program numerical applications from scratch. By the end of the course, students should be able to write state-of-the-art MATLAB codes that solve systems of partial-differential equations relevant to Earth and Planetary Science applications using finite-difference method and marker-in-cell technique. Applications include Poisson equation, buoyancy driven variable viscosity flow, heat diffusion and advection, and state-of-the-art thermomechanical code programming. The emphasis will be on commonality, i.e., using a similar approach to solve different applications, and modularity, i.e., re-use of code in different programs. The course will emphasise a hands-on learning approach rather than extensive theory, and will begin with an introduction to programming in MATLAB.

A provisional week-by-week schedule (subject to change) is as follows:

Week 1: Introduction to the finite difference approximation to differential equations. Introduction to programming in Matlab. Solving of 1D Poisson equation.

Week 3: Solving momentum and continuity equations in case of constant viscosity with stream function/vorticity formulation.

Weeks 5: Conservative finite differences for the momentum equation. "Free slip" and "no slip" boundary conditions. Solving momentum and continuity equations in case of variable viscosity using pressure-velocity formulation with staggered grid.

Week 7: Advection in 2-D with Marker-in-cell method. Combining flow calculation and advection for buoyancy driven flow.

Week 9: Solving 2D heat conservation equation in case of constant thermal conductivity with explicit and implicit approaches.

Week 10: Solving 2D heat conservation equation in case of variable thermal conductivity with implicit approach. Temperature advection with markers. Creating thermomechanical code by combining mechanical solution for 2D buoyancy driven flow with heat diffusion and advection based on marker-in-cell approach.

Week 11: Implementation of radioactive, adiabatic and shear heating to the thermomechanical code.

Week 12: Programming of solution of coupled solid-fluid momentum and continuity equations for the case of melt percolation in a rising mantle plume.

Week 14: Final project description for slab breakoff modeling.

GRADING will be based on weekly programming homeworks (50%) and a term project (50%) to develop an application of their choice to a more advanced level.

The course guides students in learning the mathematical machinery used to solve various physical problems. Special attention is paid to

The goal of this course is to refresh and deepen students' knowledge of mathematical methods relevant to the problems arising in solid

A provisional week-by-week schedule (subject to change) is as follows:

Week 1-2: The continuity equation
Exercise: Computing the divergence of velocity field.

Weeks 3-4: Density and gravity
Exercises: Computing density, thermal expansion and compressibility from an equation of state. Derivation of gravitational acceleration and its divergence from gravitational potential.

Weeks 5-6: Stress and strain

Weeks 7,8: The momentum equation
Deriving momentum equation. Computing velocity for magma flow in a channel.

Week 9: Viscous rheology of rocks
Theory: Solid-state creep of minerals and rocks as the major mechanism of deformation of the Earth's interior. Dislocation and diffusion creep mechanisms. Rheological equations for minerals and rocks. Effective viscosity and its dependence on temperature, pressure and strain rate. Formulation of the effective viscosity from empirical flow laws.
Exercise: Deriving viscous rheological equations for computing effective viscosities from empirical flow laws.

Weeks 10: The heat conservation equation

Week 11,12: Elasticity and plasticity
Exercise: computing viscoelastic stress evolution.

GRADING will be based on homeworks (1/3) and oral exam (2/3).

The course guides students in learning the mathematical machinery used to solve various physical problems. Special attention is paid to

The goal of this course is to refresh and deepen students' knowledge of mathematical methods relevant to the problems arising in solid

Mathematical Concepts in Geophysics

The goal of this course is to refresh and deepen students’ knowledge of mathematical methods relevant to the problems arising in solid Earth physics.
The provisional subjects covered in this course are as follows:

(i) Vectors, tensors, matrices, eigenvalue problems
(ii) Single-variable calculus
(iii) Vector calculus
(iv) Fourier analysis
(v) Partial Differential Equations
(vi) Special functions

Note: the actual content of the course may have slight deviations from the stated list.

Current lecture notes and homeworks will be found during the course on the course Moodle page.

This course provides an overview on the most widely used seismological methods to image the Earth's interior with a focus on crustal and upper-mantle structures. Topics include controlled source methods such as refraction and wide-angle reflection, as well as passive body-wave and surface-wave based methods. The course will discuss the strengths and weaknesses of each method.

Understand the strengths and weaknesses of various active and passive tomographic methods to image the structure of the Earth.

The course features a series of 14 meetings, in which we review some fundamentals of continuum mechanics and tensor analysis required for a complete understanding of the relation between earthquakes and plate tectonics. Our goal is to help you understand deformation from seismic, geologic, and geodetic observations; seismic moment and moment tensors; earthquake source representations of varying complexity; explain the statistical behaviour of global earthquakes; describe and connect the ingredients for a seismotectonic study.

The course features a series of 14 meetings, in which we review some fundamentals of continuum mechanics and tensor analysis required for a complete understanding of the relation between earthquakes and plate tectonics. Our goal is to help you understand deformation from seismic, geologic, and geodetic observations; seismic moment and moment tensors; earthquake source representations of varying complexity; explain the statistical behaviour of global earthquakes; describe and connect the ingredients for a seismotectonic study.

If you're interested in knowing more about the relationship between seismicity and plate tectonics, this is the course for you. (If you're not interested, but your program of study requires that you complete this course, this is also the course for you.)

If you're interested in knowing more about the relationship between seismicity and plate tectonics, this is the course for you. (If you're not interested, but your program of study requires that you complete this course, this is also the course for you.)

Computer notes will be available on a designated course web site. Most of the topics discussed in the course are available in the book S. Stein and M. Wyssession, An introduction to seismology, earthquakes and earth structure, Blackwell Publishing, Malden, USA, 2003.

The goal of this course is to provide students with quantitative understanding of planetary science. The emphasis in this course will be on assessed Analytical Competencies Adaptability and Flexibility, M. Koroni C. Gillmann.

In the course it is explained how the disciplines of seismology, geology, strong-motion geophysics, and earthquake engineering contribute to the evaluation of seismic hazard. It provides an overview of the input data and the tools in deterministic and probabilistic seismic hazard assessment, and discusses the related uncertainties. The course includes the discussion related to Intensity and macroseismic scales, historical seismicity and earthquake catalogues, ground motion parameters used in earthquake engineering, definitions of the seismic source, ground motion attenuation, site effects and microzonation, and the use of numerical tools to estimate ground motion parameters, both in a deterministic and probabilistic sense.

During the course recent earthquakes and their impacts are discussed and related to existing hazard assessments for the areas of interest.

Abstract

This course aims to give a physical understanding of the formation, structure, dynamics and evolution of planetary bodies in our solar system and also apply it to ongoing discoveries regarding planets around other stars.

Objective

The main topics covered are: Orbital dynamics and Tides, Solar heating and Energy transport, Planetary atmospheres, Planetary surfaces, Planetary interiors, Asteroids and Meteorites, Comets, Planetary rings, Magnetic fields and Magnetospheres, The Sun and Stars, Planetary formation, Exoplanets and Exobiology.

Lecture notes

Slides and scripts will be posted on Moodle.

Literature

It is recommended but not mandatory to buy one of these books:

Abstract

Planetary science encompasses the study of the physical and chemical nature of planetary bodies both in the Solar System and in extrasolar systems. The formation of planets, the forces that shaped their orbits and the processes that molded their interiors are part of planetary science. Understanding these complex phenomena requires knowledge from various geo- and astrophysically-related fields.

Objective

The goal of this course is to enable students to understand current knowledge and uncertainties regarding the formation, structure, dynamics and evolution of planets and moons in our solar system, as well as ongoing discoveries regarding planets around other stars. Students will practice making quantitative calculations relevant to various aspects of these topics through weekly homeworks.

Compilations 

1. Elasticity
2. Equations of state
3. Thermodynamics applied to mantle materials
4. Harmonicity and anharmonicity
5. Tidal potential, gravity and figure of a planet
6. Planetary rotation, precession and nutation
7. Orbital evolution and tidal dissipation
8. Heat
9. Free oscillations of a planet

Prerequisites / notice

Completion of "651-4130-00 Mathematical Methods" is required.
Completion of "651-4013-00L Potential Field Theory" is required. Completion of "651-4096-00L Inverse Theory for Geophysics I: Basics" would be helpful.

Applied Geophysics

Applied Geophysics: Compulsory Courses
The compulsory courses take place in spring semester.

 Applied Geophysics: Courses of Choice
The compulsory courses take place in spring semester.

Major in Mineralogy and Geochemistry

Compulsory Module in Analytical Methods in Earth Sciences
Students have to complete 6 credits in part A (microscopy courses), and 6 credits in part B (methods).

Microscopy Courses

Analytical Methods Courses

Restricted Choice Modules Mineralogy and Geochemistry
A minimum of two restricted choice modules must be completed in the major Mineralogy and Geochemistry.

Mineralogy and Petrology

Mineralogy and Petrology: Compulsory Courses

Number | Title | Type | ECTS | Hours | Lecturers
--- | --- | --- | --- | --- | ---
651-4028-00L | Physical Properties of Minerals | W | 3 credits | 2G | P. Saha, to be announced

Abstract
Physical properties of minerals, e.g. electrical properties, elasticitcal properties are discussed. The effect of the crystal symmetry on the symmetry of physical properties as well as the mathematical formulation of the physical properties are major topics.

Analytical Methods Courses

Mineralogy and Petrology: Courses of Choice

Number | Title | Type | ECTS | Hours | Lecturers
--- | --- | --- | --- | --- | ---
651-4063-00L | X-Ray Powder Diffraction | W | 3 credits | 2G | M. Plötze

Abstract
In the course the students learn to measure X-ray diffraction patterns of minerals and to evaluate these using different software for qualitative and quantitative mineral composition as well as crystallographic parameters.

Objective
Upon successful completion of this course students are able to:
- describe the principle of X-ray diffraction analysis
- carry out a qualitative and quantitative mineralogical analysis independently,
- critically assess the data,
- communicate the results in a scientific report.

The competencies of system understanding, concept development, and measurement methods are taught and examined.

Content
Fundamental principles of X-ray diffraction
Setup and operation of X-ray diffractometers
Interpretation of powder diffraction data
Qualitative and quantitative phase analysis of crystalline powders (e.g. with Rietveld analysis)

Lecture notes
Selected handouts will be made available in the lecture.
Prerequisites / notice
The course includes a high portion of practical exercises in sample preparation as well as measurement and evaluation of X-ray powder diffraction data. Own sample will be analysed qualitatively and quantitatively. Knowledge in mineralogy of this system is essential. Software will be provided for future use on own Laptop.

Composition and Evolution of the Earth and Planets
Number: 651-4233-00L
Type: W
ECTS: 3
Hours: 2V
Lecturers: P. A. Sossi, S. Flemetakis, E. Schettino, M. A. Thompson

Abstract
In this Masters-level course, we address the formation and evolution of the rocky planets with a particular focus on the chemical and isotopic make-up of the Earth and its mantle. This is achieved through analysis of its partial melting products in different tectonic settings and through time.

Objective
Students will gain an insight into cutting-edge research in planetary science and the geochemical evolution of Earth's mantle. The objective is to be able to synthesise scientific studies whose conclusions differ, and, eventually, to form a coherent opinion by debating and scrutinising the available data. This will be achieved by weekly lectures and exercises throughout the semester, culminating in a debate on a topical subject in Earth and planetary science.

Petrology and Volcanology

Petrology and Volcanology: Compulsory Courses
The compulsory courses take place in spring semester.

Petrology and Volcanology: Courses of Choice

Number: 651-4063-00L
Title: X-Ray Powder Diffraction
Type: W
ECTS: 3
Hours: 2G
Lecturers: M. Plötze

Abstract
In the course the students learn to measure X-ray diffraction patterns of minerals and to evaluate these using different software for qualitative and quantitative mineral composition as well as crystallographic parameters.

Objective
Upon successful completion of this course students are able to:
- describe the principle of X-ray diffraction analysis
- carry out a qualitative and quantitative mineralogical analysis independently,
- critically assess the data,
- communicate the results in a scientific report.

The competencies of system understanding, concept development, and measurement methods are taught and examined.

Content
- Fundamental principles of X-ray diffraction
- Setup and operation of X-ray diffractometers
- Interpretation of powder diffraction data

Lecture notes
Selected handouts will be made available in the lecture

Literature
(http://pubs.rsc.org/en/Content/eBook/978-0-85404-231-9)

Prerequisites / notice
The course includes a high portion of practical exercises in sample preparation as well as measurement and evaluation of X-ray powder diffraction data. Own sample will be analysed qualitatively and quantitatively. Knowledge in mineralogy of this system is essential. Software will be provided for future use on own Laptop.

Autumn Semester 2024
Understanding the fundamental processes of hydrothermal, magmatic and supergene ore formation, recognising and interpreting Concepts and Theories Composition and Evolution of the Earth and Planets

Mineral Resources I

Can be chosen as an elective course within the Bachelor. Prospective MSc-Students attending the module "Mineral Resources" should attend Mineral Resources I and II in the first year of their MSc studies.

Abstract

Principles of hydrothermal ore formation, using base metal deposits (Cu, Pb, Zn) in sedimentary basins to explain the interplay of geological, chemical and physical factors from global scale to sample scale. Introduction to orthomagmatic ore formation (mostly Cr, Ni, PGE). Introduction to supergene residual deposits (Ni, Al)

Objective

Understanding the fundamental processes of hydrothermal, magmatic and supergene ore formation, recognising and interpreting mineralised rocks in geological context

Content

(a) Principles of hydrothermal ore formation: base metal deposits in sedimentary basins. Practical classification of sample suites by genetic ore deposit types

Mineral solubility and ore deposition, principles & thermodynamic prediction using activity diagrams. Driving forces and structural focussing of hydrothermal fluid flow

(b) Introduction to orthomagmatic ore formation. Chromite, Ni-Cu sulphides and PGE in layered mafic intrusions. Distribution coefficients between silicate and sulphide melts. Carbonatites and pegmatite deposits.

(c) Introduction to supergene residual deposits with emphasis on Ni laterites and bauxites

Lecture notes

Notes handed out during lectures

Prerequisites / notice

2 contact hours per lecture / week including lectures, exercises and practical study of samples, and small literature-based student presentations. Supplementary contact for sample practicals and exercises as required. Credits and mark based on participation in course (exercises, 50%) and 1h30 written exam in the last lecture of the semester (50%).

651-4233-00L Composition and Evolution of the Earth and Planets W 3 credits 2V P. A. Sossi, S. Flemetakis, E. Schettino, M. A. Thompson

Abstract

In this Masters-level course, we address the formation and evolution of the rocky planets with a particular focus on the chemical and isotopic make-up of the Earth and its mantle. This is achieved through analysis of its partial melting products in different tectonic settings and through time.

Objective

Students will gain an insight into cutting-edge research in planetary science and the geochemical evolution of Earth's mantle. The objective is to be able to synthesise scientific studies whose conclusions differ, and, eventually, to form a coherent opinion by debating and scrutinising the available data. This will be achieved by weekly lectures and exercises throughout the semester, culminating in a debate on a topical subject in Earth and planetary science.

Mineral Resources: Courses of Choice

Fluid and Melt Inclusions: Theory and Practice

Block course involving lectures, exercises and practical application of inclusion petrography, microthermometry, Raman and LA-ICPMS microanalysis

Objective

Practical ability to carry out a meaningful fluid or melt inclusion study in the fields of geochemistry, petrology or resource geology, involving problem definition, research planning, quantitative measurements using a combination of techniques, critical interpretation and correct documentation of results.

Lecture notes

Handouts with extensive list of primary literature available

Literature

Goldstein and Reynolds (1994): CD available for in-house use
Introduction to computer tools for the simulation of hydrothermal fluid flow and hydrothermal reactions. The computer programs are handed out to the students and can be run on normal laptop PCs (Windows operating system; MAC or Linux users will have to install a virtual machine or team up with a colleague with a Window computer). No programming knowledge is necessary.

Learn how to use the simulation programs HYDROTHERM and Geochemist's Workbench to explore how hydrothermal ore deposition works. In addition, you'll learn how natural geothermal systems work and what controls their energy content.

This block course in will comprise 4 half-day lectures and a series of practical exercises from selection of a mineral property to discovery of mineral resources. This drill program is presented in a report prior to drilling. Drilling in the tri-dimensional matrix of the property is simulated using the software FOREUR, until budget lapse. The companies must select drill intervals for chemical analysis to document the extent and composition of the discovered mineralization. Portions of the mineral rights can be traded for capital between the companies. An estimate of the tonnage and grade of the discovered resource is prepared using geometric methods and GIS software (ex. Arc GIS). The program are presented in a comprehensive report.

The highest bidder purchases the selected property, property offered during an auction. Each company has the same nominal budget. The highest bidder purchases the selected property, others need to purchase the remaining properties during an auction. Justification for selecting the property is justified in a report. The companies must interpret the geology of their mineral property to prepare a diamond drill program to discover and, eventually, delineate the mineral resources. This drill program is presented in a report prior to drilling. Drilling in the tri-dimensional matrix of the property is simulated using the software FOREUR, until budget lapse. The companies must select drill intervals for chemical analysis to document the extent and composition of the discovered mineralization. Portions of the mineral rights can be traded for capital between the companies. An estimate of the tonnage and grade of the discovered resource is prepared using geometric methods and GIS software (ex. Arc GIS). The ground value of the resource is estimated by a computation of the Net Smelter Return at current metal prices. The results of the exploration program are presented in a comprehensive report. 

Interested ETH students please register through myStudies by second semester week.

This course is co-organised by ETH Zurich (Prof. C. Chelle-Michou) and University of Geneva (Prof. R. Moritz)
Prerequisite: Successful completion of the BSc-course “Geochemistry” (651-3400-00L).

Abstract
This course will introduce some of the main quantitative methods available for the quantitative treatment of geochemical data, as well as the main modelling tools. Emphasis will both be on conceptual understanding of these methods as well as on their practical application, using key software packages to analyse real geochemical datasets.

Objective
Development of a basic knowledge and understanding of the main tools available for the quantitative analysis of geochemical data.

Content
The following approaches will be discussed in detail: major and trace element modelling of magmas, with application to igneous systems; methods and statistics for calculation of isochrons and model ages; reservoir dynamics and modelling of ocean (biogeo)chemistry.

We will discuss how these methods are applied in a range of Earth Science fields, from cosmochemistry, through mantle and crustal geochemistry, volcanology and igneous petrology, to chemical oceanography.

A special emphasis will be put on dealing with geochemical problems through modeling. Where relevant, software packages will be introduced and applied to real geochemical data.

Lecture notes
Slides of lectures will be available.

Pre-requisite: Geochemie I and II

Competencies
- Subject-specific Competencies: Concepts and Theories, Techniques and Technologies (assessed)
- Method-specific Competencies: Analytical Competencies, Media and Digital Technologies, Problem-solving (assessed)
- Social Competencies: Communication (assessed)
- Personal Competencies: Creative Thinking (fostered)

651-4227-00L Planetary Sciences: a Chemical Perspective

Abstract
Formation and evolution of the solar system and its planets from a geochemical perspective.

Objective
To understand the formation and evolution of the solar system and its planets from a geochemical perspective.

Content
The Sun and solid objects in the solar system (planets, comets, asteroids, meteorites, interplanetary dust) are discussed from a geochemical perspective. What does their present-day composition tell us about the origin, formation and evolution of the solar system? The lectures introduce the basics of the terrestrial and giant planets, comets and asteroids, gained from modern space missions and the study of extraterrestrial materials. The chemical and isotopic composition of meteorites, being the most primitive material available for study, is a further major topic.

Lecture notes
Slides and additional materials are available electronically.

Competencies
- Subject-specific Competencies: Concepts and Theories (fostered)
- Method-specific Competencies: Analytical Competencies (fostered)
- Personal Competencies: Creative Thinking (fostered)

651-4233-00L Composition and Evolution of the Earth and Planets

Abstract
In this Masters-level course, we address the formation and evolution of the rocky planets with a particular focus on the chemical and isotopic make-up of the Earth and its mantle. This is achieved through analysis of its partial melting products in different tectonic settings and through time.

Objective
Students will gain an insight into cutting-edge research in planetary science and the geochemical evolution of Earth's mantle. The objective is to be able to synthesize scientific studies whose conclusions differ, and, eventually, to form a coherent opinion by debating and scrutinising the available data. This will be achieved by weekly lectures and exercises throughout the semester, culminating in a debate on a topical subject in Earth and planetary science.

651-4057-00L Climate History and Palaeoclimatology

Abstract
Climate history and palaeoclimatology explores how the major features of the earth's climate system have varied in the past, and the driving forces and feedbacks for these changes. The major topics include the earth's CO2 concentration and mean temperature, the size and stability of ice sheets and sea level, the amount and distribution of precipitation, and the ocean heat transport.

Objective
The student will be able to describe the natural factors that lead to variations in the earth's mean temperature, the growth and retreat of ice sheets, and variations in ocean and atmospheric circulation patterns, including feedback processes. Students will be able to interpret evidence of past climate changes from the main climate indicators or proxies recovered in geological records. Students will be able to use data from climate proxies to test if a given hypothesized mechanism for the climate change is supported or refuted. Students will be able to compare the magnitudes and rates of past changes in the carbon cycle, ice sheets, hydrological cycle, and ocean circulation, with predictions for climate changes over the next century to millennia.
Content

The course spans 5 thematic modules:

1. Cyclic variation in the earth's orbit and the rise and demise of ice sheets. Ice sheets and sea level - What do expansionist glaciers want? What is the natural range of variation in the earth's ice sheets and the consequent effect on sea level? How do cyclic variations in the earth's orbit affect the size of ice sheets under modern climate and under past warmer climates? What conditions the mean size and stability or fragility of the large polar ice caps and is there evidence that they have dynamic behavior? What rates and magnitudes of sea level change have accompanied past ice sheet variations? How stable or fragile is the ocean heat conveyor, past and present?

2. Feedbacks on climate cycles from CO2 and methane. What drives CO2 and methane variations over glacial cycles? What are the feedbacks with ocean circulation and the terrestrial biosphere?

3. Atmospheric circulation and variations in the earth's hydrological cycle - How variable are the earth's precipitation regimes? How large are the orbital scale variations in global monsoon systems?

4. Century-scale droughts and civil catastrophes. Will mean climate change El Nino frequency and intensity? What factors drive change in mid and high-latitude precipitation systems? Is there evidence that changes in water availability have played a role in the rise, demise, or dispersion of past civilizations?

5. How sensitive is Earth's long term climate to CO2 and cloud feedbacks? What regulates atmospheric CO2 over long tectonic timescales of millions to tens of millions of years?

The weekly two hour lecture periods will feature lecture on these themes interspersed with short interactive tasks to apply new knowledge. Over the semester, student teams will each present in class one debate based on two scientific articles of contrasting interpretations. With flexible scheduling, students will participate in a laboratory activity to generate a new paleoclimate record from stalagmites. Student teams will be supported by an individual tutorial meeting to assist in debate preparation and another to assist in the interpretation of the lab activity data.

651-4225-00L Topics in Geochemistry

Abstract

In this course we present and discuss advanced topics in geochemistry based on the critical reading of research papers. Themes include hydrothermal geochemistry, isotopes in meteorites, low temperature geochemistry and biogeochemistry.

Objective

The goal of the course is discuss topics in advanced geochemistry which were not covered in other general and specialized geochemistry courses. In addition, we aim at training the student's ability to critically evaluate research papers and to summarize the findings concisely in an oral presentation.

Content

Themes will vary from year to year and suggestions from students are welcome. Some possible topics are:

- Organic geochemistry
- Isotope geochemistry of organic matter: carbon, hydrogen and nitrogen
- Clumped isotopes
- Mass-independent isotope fractionation
- Mass transfer and isotopes in modern and ancient ocean-floor hydrothermal systems and subduction zone environments
- Noble gas geochemistry: terrestrial and extraterrestrial applications
- Metal isotopes as tracers for global geochemical cycles

Lecture notes

None

651-4010-00L Planetary Sciences: a Physical Perspective

Abstract

This course aims to give a physical understanding of the formation, structure, dynamics and evolution of planetary bodies in our solar system and also apply it to ongoing discoveries regarding planets around other stars.

Objective

The goal of this course is to enable students to understand current knowledge and uncertainties regarding the formation, structure, dynamics and evolution of planets and moons in our solar system, as well as ongoing discoveries regarding planets around other stars. Students will practice making quantitative calculations relevant to various aspects of these topics through weekly homeworks.

Lecture notes

Slides and scripts will be posted on Moodle. It is recommended but not mandatory to buy one of these books:

Abstract
This lecture gives an overview of methods and applications of geochronology across a wide range of Earth Science disciplines. Several in their field specialized lecturers cover the principles and methods and will give insight into recent applications and research projects.

Objective
The purpose of this lecture is to provide a comprehensive overview of: a) the different radiometric methods in Geology, the different dating tasks and the constraints put by the complexity of natural systems, including dating by cosmogenic nuclides, b) the various analytical tools available today for radiometric dating, their advantages and disadvantages, c) the use of noble gases in Geochemistry and d) detailed description of case studies, as examples of approach of a number of geological problems and interpretation of the data.

At the end students know the different methods, systems, methods and their application. Understand literature and critical reading and interpretation of published data is possible. For simple geochronological questions they can describe a scientific approach and possible solution. They can plot and interpret data using IsoplotR for different applications.

Content
1. Introduction and overview, Data visualization and statistics in IsoplotR, Principles of U-Pb geochronology
2. In situ U-Pb geochronology 1 (LA-ICPMS/SIMS principles, zircon)
3. In situ U-Pb geochronology 2 (calcite, garnet, other minerals)
4. High-precision ID-TIMS U-Pb geochronology (principles and applications)
5. High-precision U-series geochronology (carbonates, silicates)
6. In situ U-series geochronology (zircon, garnet etc.)
7. K-Ar and 40Ar/39Ar geochronology, Principles and Applications
8. Fission Track dating
9. U-Th/He dating
10. Thermochronology applications/lab visit
11. Noble gases - basics, reservoirs, geo/cosmochem. applications: mainly chronology
12. Cosmogenic nuclides (stable and radionuclides) - basics, geo/cosmochem. applications, C14

Lecture notes
Script (for part of the lecture), partly power point presentations (in the web)

Abstract

Objective
Ability to operate the Electron Microprobe with minimal assistance, optimise the analysis setup in order to obtain excellent results, identify possible source of error (troubleshooting) and fix them, data treatment (and interpretation).

Content
Physical principles of electron optics, interaction of electrons with matter, production of X-rays, interaction of X-rays with matter. Detection of X-rays. Laboratory work in the field of Earth sciences.

Lecture notes
Script and User Manual will be provided.

Literature
- Reed S.J.B. (1993, second ed.): Electron Microprobe Analysis

Prerequisites / notice
- 4 full days.
- Prerequisite: Analytical methods in Petrology and Geology (651-4055-00L) and 651-0046-00 Electron Microprobe Course 1 - Theory
- Restricted attendance, max. 8 students (incl. Doctoral students and external participants). Contact J. Allaz.
This course introduces the most common experimental methods employed in petrology. Such methods can be used to determine thermodynamic data, physical properties and phase equilibria of minerals, magmas and fluids. The course consists of about 1/3 theory combined with 2/3 hands-on lab-work to demonstrate how experiments are performed in practice.

The principal goal is to gain knowledge on experimental techniques, and on the principle setup to obtain quantitative data on e.g. phase relations, thermodynamic, kinetic and rheological properties of Earth materials. At the end of the course, participants should be able to evaluate experimental data independently, and design appropriate experiments on their own.
Among other aspects 'Experimental methods in petrology' covers the following subjects:

1. Introduction and historical development of experimental petrology.
2. Experimental methods at ambient pressure (1 bar) with practical exercise to determine basic thermodynamic data.
3. Starting and capsule materials; techniques to buffer chemical activities.
4. Experimental methods at moderate pressures: externally and internally heated gas-pressure devices.
5. High-pressure solid-media experimental techniques (piston cylinders).
7. Evaluation of petrologic experiments (preparation of run products, analytical and spectroscopic methods of examination and quantification).

The experiments performed during lab-work will be evaluated in the context of a small research project, which is introduced during the course.

Lecture notes
A summary of the material presented in the lectures is distributed weekly.

Literature
There is no comprehensive book available that summarizes the most important aspects of experimental petrology; key publications on individual subjects are referred to during the lectures.

Prerequisites / notice
This course is aimed at MSc and PhD students, who are interested in experimental methods. No foreknowledge on this is required but basic understanding of petrology and chemical thermodynamics is expected.

651-4114-00L Illustrations in Natural History (University of Zürich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: BIO271

Mind the enrolment deadlines at UZH:

Abstract
The general introduction to scientific graphics is followed by explanations and practical exercises with the use of important techniques of drawing: line drawing, hatching, stippling, shading with ink and pencil. Fossils and recent organisms serve as models. In addition basic knowledge in digital image processing will be taught (Photoshop).

Objective
By the end of the module, students are able to:
- apply the most important conventional drawing techniques
- use PhotoShop or GIMP
- communicate scientific information in clearly designed illustrations using these techniques

651-4273-00L Numerical Modelling in Fortran

This course gives an introduction to programming in Fortran, and is suitable for students who have only minimal programming experience. The focus will be on Fortran 95-2018, but differences to Fortran 77 will be mentioned for those working with already-existing codes. A hands-on approach will be emphasized rather than abstract concepts.

Objective
Fortran is a modern programming language that is updated every few years (most recently in 2018) and is specifically designed for scientific and engineering applications. This course gives an introduction to programming in this language, and is suitable for students who have only minimal programming experience, for example with MATLAB scripts. The focus will be on Fortran 95-2018, but differences to Fortran 77 will be mentioned for those working with already-existing codes. A hands-on approach will be emphasized rather than abstract concepts, using example scientific problems relevant to Earth science.

Lecture notes
See http://jupiter.ethz.ch/~pjt/FORTRAN/FortranClass.html

651-4273-01L Numerical Modelling in Fortran (Project)

Prerequisite: 651-4273-00L Numerical Modelling in Fortran.

Abstract
This course gives an introduction to programming in Fortran, and is suitable for students who have only minimal programming experience. The focus will be on Fortran 95-2018, but differences to Fortran 77 will be mentioned for those working with already-existing codes. A hands-on approach will be emphasized rather than abstract concepts.

Objective
Fortran is a modern programming language that is updated every few years (most recently in 2018) and is specifically designed for scientific and engineering applications. This course gives an introduction to programming in this language, and is suitable for students who have only minimal programming experience, for example with MATLAB scripts. The focus will be on Fortran 95-2018, but differences to Fortran 77 will be mentioned for those working with already-existing codes. A hands-on approach will be emphasized rather than abstract concepts, using example scientific problems relevant to Earth science.

Content
The project consists of writing a Fortran program to solve a problem agreed upon between the instructor and student; the topic is often related to (and helps to advance) the student's Masters or PhD research. The project is typically started towards the end of the end of the main Fortran class when the student has acquired sufficient programming skills, and is due by the end of Semesterprüfung week.

651-1392-00L Palaeontological Colloquium (University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: BIO571

Mind the enrolment deadlines at UZH:

Abstract
 Talks and discussion on current topics in Palaeontology (Palaeobotany, Palaeozoology and Micropalaeontology).

651-4101-00L Physics of Glaciers

Understanding glaciers and ice sheets with simple physical concepts. Topics include the reaction of glaciers to the climate, flow of glacier ice, temperature in glaciers and ice sheets, glacier hydrology, glacier seismology, basal motion and calving glaciers. A special focus is the current development of the ice sheets of Greenland and Antarctica.

Prerequisites / notice
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: BIO271

Mind the enrolment deadlines at UZH:

Abstract
Talks and discussion on current topics in Palaeontology (Palaeobotany, Palaeozoology and Micropalaeontology).
Objective
After the course the students are able understand and interpret measurements of ice flow, subglacial water pressure and ice temperature. They will have an understanding of glaciology-related physical concepts sufficient to understand most of the contemporary literature on the topic. The students will be well equipped to work on glacier-related problems by numerical modeling, remote sensing, and field work.

Content
The dynamics of glaciers and polar ice sheets is the key requisite to understand their history and their future evolution. We will take a closer look at ice deformation, basal motion, heat flow and glacier hydraulics. The specific dynamics of tide water and calving glaciers is investigated, as is the reaction of glaciers to changes in mass balance (and therefore climate).

Lecture notes

651-0254-00L Seminar Geochemistry and Petrology
E- 0 credits 2S
O. Bachmann, M. Schönbächler, C. Chelle-Michou, M. W. Schmidt, D. Vance

Abstract
Seminar series with external and occasional internal speakers addressing current research topics. Changing programs announced via D-EAPS homepage (Veranstaltungskalender)

Objective
Presentations on isotope geochemistry, cosmochemistry, fluid processes, economic geology, petrology, mineralogy and experimental studies. Mostly international speakers provide students, department members and interested guests with insight into current research topics in these fields.

651-1692-00L Seminar in Applied and Environmental Geophysics
E- 0 credits 1S
H. Maurer, J. Robertsson

101-0317-00L Tunnelling I
W 3 credits 2G
G. Anagnostou, A. Nordas, E. Pimentel

Abstract
Basic aspects of design and analysis of underground structures. Conventional tunnel construction methods. Auxiliary measures (ground improvement and drainage, forepoling, face reinforcement). Numerical analysis methods.

Objective
Basic aspects of design and analysis of underground structures. Conventional tunnel construction methods. Auxiliary measures (ground improvement and drainage, forepoling, face reinforcement). Numerical analysis methods.

Content
Numerical analysis methods in tunnelling. Conventional excavation methods (full face, top heading and bench, side drift method, ...)

Auxiliary measures:
- Injections
- Jet grouting
- Ground freezing
- Drainage
- Forepoling
- Face reinforcement

Prerequisites / notice
This course will continue to be offered in German up to and including HS24.

651-1091-00L Colloquium Department Earth and Planetary Sciences
E- Dr
1K
Speakers

Abstract
Invited speakers from the entire range of Earth, Climate and Planetary Sciences.

Content
According to variable program.

651-2613-00L Human Geography III (Geographies of Difference)
(Wissenschaftlich-künstlerische Integration)

W 5 credits 1G+2S
University lecturers

Abstract
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: GEO232

Recommended prerequisite: Human Geography II (UZH Module Code: GEO122)

Mind the enrolment deadlines at UZH:

This course enables students to think through and about difference geographically: multi-scalar, critically, spatially. Students learn to understand selected theoretical perspectives in human geography. Focusing on a chosen thematic area of human geography, they train using these perspectives to interpret empirical phenomena and raise questions about them.
Objective
— To understand selected theoretical perspectives in human geography that problematize questions of difference; — To use these theoretical perspectives to interpret empirical phenomena of social difference and inequality and raise questions about them. — To deepen knowledge on empirical phenomena of social difference in one specific topic of human geography. — To write a seminar paper, using theoretical and empirical material.

Content
Following an introductory lecture, students will split into four smaller seminar groups, focused on different thematic areas from urban, political and economic geography. Seminars will be based on a close reading of selected material and designed for interactive participation and discussion.

Each seminar consists of theory-oriented sessions, where students will gather first insights into selected theoretical perspectives of human geography. Using these perspectives, students develop their knowledge of each seminar group’s thematic area of focus and practice applying theory to empirical fields of research.

Prerequisites / notice
After the introductory lecture in week 1, students must enroll in one of four seminar groups via OLAT. Attendance of the introductory lecture is a prerequisite for the first group session.

Radiocarbon Dating is the most eminent dating tool for carbon containing samples younger than ~50 kyr and a useful tracer of the carbon cycle. Within this lab course, the sample preparation and 14C analysis of wood samples (or upon agreement other samples) will be performed.

Dendrochronology is the study of the growth rings of trees to determine their age and the conditions under which they grew. By examining the age of trees, we can gain insights into past climates and environments. This lab course will provide an overview of the techniques and measurements used in dendrochronology and their applications in various environmental compartments, including oceans, atmosphere, and terrestrial environments.

To assess the consolidation of their knowledge, students will be required to submit exercises, participate in in-class activities and work on a semester project, which will become part of the online learning resources.

To understand the applications of long-lived radionuclides in various environmental compartments, students will explore the applications of long-lived radionuclides in various environmental compartments, including oceans, atmosphere, and terrestrial environments.

Throughout the course, students will gain knowledge and understanding of natural and artificial radionuclides and their detection with AMS technology. Using case studies, they will explore the applications of long-lived radionuclides in various environmental compartments, including oceans, atmosphere, and terrestrial environments.

To assess the consolidation of their knowledge, students will be required to submit exercises, participate in in-class activities and work on a semester project, which will become part of the online learning resources.

By the end of the course, students will have gained a comprehensive understanding of radionuclides and their applications in different environmental settings.
Objective
In this hands-on block course, students will have the opportunity to perform radiocarbon analysis of wood samples. This will include understanding the theoretical background of radiocarbon dating and its importance within Earth Sciences and related fields. Participants will gain know-how on the preparation of wood samples for AMS analysis. They will learn about the importance of suitable reference materials when performing AMS analysis. Data evaluation for C-14 measurements will be performed and discussed.

Content
- Sampling of tree ring layers.
- Preparation of reference materials and samples for AMS measurement, including chemical pre-treatment and graphitisation.
- Assisting the AMS measurement.
- Data evaluation and interpretation of results.

Prerequisites / notice
This is a block course for D-EAPS or D-USYS master or PhD students.

Recommended (but not a prerequisite 651-4191-00L) Radionuclides as Environmental Tracers (in Autumn Semester)
OR
651-4901-00L Quaternary Dating Methods (in Autumn Semester)

Seminar on Precambrian Geobiology and Biogeochemical Cycles

651-4145-00L

Abstract
The Precambrian Earth experienced several environmental states—all drastically different from today—that are recorded in sedimentological, fossil, and genetic records. We will review "classic" and more recent scientific literature on the evolution of chemical and biological processes to critically evaluate what we do and don't know about how our planet's biogeochemistry has changed through time.

Objective
For decades, researchers have attempted to reconstruct Precambrian environmental states and their relative timing using tracers recorded in the sedimentological, fossil, and genetic records. Here, by reading and discussing "classic" and more recently published scientific papers, students will learn about influential discoveries related to Earth history within the fields of geobiology and geochemistry.

In completing the course, students will specifically learn:
- Why Earth's surface chemical composition evolved from anoxic to oxic environments
- How life evolved from simple prokaryotic metabolisms to multicellular eukaryotes
- The importance of geological, chemical, and biological feedback mechanisms
- How to discern between biologic innovation and environmental importance
- How to summarize, interpret, and discuss current evidence for what is and isn't known about Earth's geochemical and biogeochemical evolution

* How to assess opposing scientific viewpoints and outstanding questions in the literature

Content
Each lecture period will consist of a presentation and discussion—to be led by 1-2 students (depending on class size)—covering a given paper or set of papers. All students are expected to read the relevant papers before class and come prepared for discussion. Lecture periods will be divided between "review" presentations aimed at introducing the background and fundamentals of each topic and "debate" or "comparison"-style presentations, in which two (sometimes opposing) views of a given topic will be discussed and assessed.

Lecture notes
Where available, presentations and notes will be provided online during the course.

Literature
All required and recommended scientific publications will be provided online during the course.

Competencies
Subject-specific Competencies

- Critical Thinking

Fracture Mechanics

651-4147-00L

Abstract
The course provides an introduction to the concepts of fracture mechanics and its application to the Earth's crust. Theoretical concepts, practical applications, and computational methods are covered. The course has a particular focus on solid Earth applications.

Objective
To acquire the theoretical background of fracture mechanics and to be able to apply them to the solution of relevant problems in geosciences.

Content
5. Additional: dynamic (inertial) effects, fracture and breakdown energy, coupling between elastodynamics and shear heating, computational methods in fracture mechanics

Prerequisites / notice
Lecture notes and relevant reading materials will be provided. Students are encouraged to take their own notes.

Semester Research Project (large)

651-2002-00L

Abstract
Small individual research project supervised by a lecturer of D-EAPS that builds on the skills acquired during the BSc or MSc studies. The project consists of research activity in a selected scientific topic aimed at producing new scientific results and/or data.

Objective
Students deepen their knowledge in a specific topic. They familiarize with research procedures and scientific methods that are used in current research. They gain experience in writing scientific reports/papers.

Content
The content of the project consists of research activity aimed at producing new scientific results and/or data. It does not reduce to literature work.

Prerequisites / notice
The project must be approved in advance by the study advisor.

The semester research project is determined by student and supervisor. The topic of each project is unique and not related to the BSc or MSc Thesis.

Only one project (small or large) is allowed per study degree.

Lecture Series: Space Research and Exploration

402-0368-07L

Abstract
Lecture Series about selected topics of space research and exploration consisting of individual talks given by different leading experts from academia and industry.

Objective
Attending students will
- experience the interdisciplinarity of space research and exploration spanning physics, engineering, geosciences, biology and more
- get familiar with the Swiss space research and industry landscape
- enhance their communication skills by broadening their research horizon
- have the opportunity for direct learning by posing questions to experts
The field of space research and exploration is intrinsically interdisciplinary. Cutting edge space activities are dominated by an interplay between the scientifically desirable and the technologically possible. The 'Lecture Series: Space Research and Exploration' aims to shed light on key questions engaged by leading scientists and engineers today. It consists of weekly lectures, given by different speakers with vast experience in their respective field (e.g., Human Spaceflight, System Engineering of Spacecraft, Space Life Sciences, Space-based astrophysics). Subsequent to the talk, the student will have the opportunity to deepen their understanding by asking questions to the presenter in a moderated Q&A.

Confirmed speakers will be announced by the start of the semester (see lecture from last year for previous speakers).

651-4044-01L Geomicrobiology and Biogeochemistry Lab Practical
Prerequisites: “Geomicrobiology and Biogeochemistry Field Course” (651-4044-02L). The attendance of “Micropalaeontology and Molecular Palaeontology” (651-4044-04L) or “The Global Carbon Cycle - Reduced” (651-4004-00L) is recommended but not mandatory.

Abstract
1. Analysis of organic molecules in extracts from soils of different ages in glacial flood fields, in altitudinal gradients from different bedrocks, from sediments, from Cryoconites in glacial ice and from living biofilms in high altitude aquatic ecosystems, and from mineral springs.
2. Analysis of matrix components of the ecosystems: dissolved compounds, minerals, clays, trace metals.

Objective
- to design strategies for collecting samples in the field suitable for subsequent analyses in the laboratory
- to critically evaluate his/her own analytical data and put it into a scientific context.

Content
1. Preparing field work based on research hypotheses.
2. Designing field sampling strategies, proper sampling collection and preservation.
3. Documenting environmental conditions and observations at the sampling sites.
4. Extracting organic molecules from environmental samples with different matrices.
5. Working under clean conditions and handling samples without contaminating them.
6. Discussing the results and documenting the outcomes in a scientific report.

Procedures for sampling, sample preparation and processing (extraction, analyses) will be defined on the first day of the field course.

Prerequisites: “Geomicrobiology and Biogeochemistry Field Course” (651-4044-02L). The lecture course “651-4004-00L The Carbon Cycle - Reduced” is recommended but not mandatory.

651-4199-00L Professional Internship
Prior clarification with the study advisor of the chosen specialization/major is mandatory for taking this internship.

Abstract
Im Rahmen des Praktikums erhalten die Studierenden einen Einblick in zukünftige Berufstätigkeit-ten der Erd- und Klimawissenschaften. Sie erlernen dabei unter welchen wissenschaftlichen, ad-ministrativen, planerischen und sozialen Bedingungen Projekte in der Praxis bearbeitet und abge-schlossen werden.

Prerequisites / notice
Die vorgängige Abklärung mit dem/den Fachberater/in der gewählten Vertiefungsrichtung/Major ist zwingend für eine Belegung dieses Berufspraktikums.

651-4292-00L Planetary Crusts: Composition, Origin and Evolution
Primary objectives are to provide students with:
1. general understanding of comparative planetology using the diverse nature of planetary crusts as an example;
2. detailed understanding of the extreme diversity of planetary crustal evolution within our solar system and the causes of that diversity;
3. the ability to critically assess how the nature of planetary crusts within our solar system may inform any evaluation of the nature and significance of extrasolar planets.

Confirmed speakers will be announced by the start of the semester (see lecture from last year for previous speakers).
The course consists of 9 sections, each constituting one 2-hour class:

1. Introduction and overview
2. Formation and differentiation of terrestrial planets
3. Primary Crusts: Required but rarely observed
4. Secondary Crusts: The ubiquitous but diverse planetary crust
5. Tertiary Crusts: Is Earth's continental crust the only example?
6. Icy Crusts: Just special cases?
7. Crustal evolution: As diverse as the crusts themselves
8. Looking for unifying themes: Are there more variables than planetary bodies?
9. Exoplanets: Lessons from (or for?) our solar system

Prerequisites / notice

The course will be organised in the form of 9x2 hour lectures. The course will be either pass or fail based on performance in take-home exercises, written assignments and in-class participation.

101-0307-00L Design and Construction in Geotechnical Engineering W 4 credits 3G I. Anastasopoulos, K. Kassas, A. Marin, L. Sakellaridis

Abstract

This lecture deals with the practical application of the knowledge gained in the fundamental lectures from the Bachelor degree. The basics of planning and design of geotechnical structures will be taught for the main topics geotechnical engineers are faced to in practice.

Objective

Transfer of the fundamental knowledge taught in the Bachelor degree to practical application. Ability to plan and design geotechnical structures based on the state of the art.

Content

Introduction to Swisscode SIA
Foundations and settlements
Pile foundations
Excavations
Slopes
Soil nailing
Reinforced geosystems
Ground improvement
River levees

Lecture notes

Script in the form of chapters and powerpoint overheads with web support (moodle-app2.let.ethz.ch)
Exercises

Literature

Relevant literature will be stated during the lectures

Prerequisites / notice

Pre-condition: Successful examinations (pass) in the geotechnical studies (soil mechanics and ground engineering, each 5 credits) in the Bachelor degree of Civil Engineering (ETH), or equivalent for new students.

The lecture contains at least one presentation from practice.

The introductory lecture on conduct as a scientist is an integral part of the course.

Abstract

The main purpose of the Master Project Proposal is to help students organize ideas, material and objectives for their Master Thesis, and to begin development of communication skills.

Objective

The main objectives of the Master Project Proposal are to demonstrate the following abilities:
- to formulate a scientific question
- to present scientific approach to solve the problem
- to interpret, discuss and communicate scientific results in written form
- to gain experience in writing a scientific proposal
### Master’s Thesis

Only students who fulfill the following criteria are allowed to begin with their master thesis:

a. successful completion of the bachelor programme;
b. fulfilling of any additional requirements necessary to gain admission to the master programme;
c. have successfully completed the MSc Project Proposal

**Abstract**

The master programme will be completed by a master thesis on a topic selected from the subject range of the chosen major programme. Students are to prove their skills in working autonomously on a scientific project.

**Objective**

Students are to prove their skills in working autonomously on a scientific project. They document their work in a scientific report.

### Course Units for Additional Admission Requirements

The courses below are only available for MSc students with additional admission requirements.

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

**Abstract**

Self-study course. This course is only available for those who got it as an additional requirement in their MSc admission.

**Objective**

The course is intended to let the student learn fundamentals of geochemistry that were found lacking in his/her studies prior to entering the MSc in Earth Sciences at ETH. Contents of the course will be defined based on text books and/or scientific papers.

<table>
<thead>

**Abstract**

Mathematical tools for the engineer

**Objective**

Mathematics as a tool to solve engineering problems. Basic mathematical knowledge for engineers. Mathematical formulation of technical and scientific problems.

**Content**

- Complex numbers.
- Calculus for functions of one variable with applications.
- Simple Mathematical models in engineering.

**Literature**

- Textbooks in German:
  - M. Akveld, R. Sperb: Analysis I, vdf
  - M. Akveld, R. Sperb: Analysis II, vdf

Fundamentals in Geophysics II: Dynamics of the Earth

Subject-specific Competencies

Self-direction and Self-management assessed

For English speakers study chapters 1-3 of Part I of the book "Geological Engineering" (Gonzalez de Vallejo & Ferrer 2011, CRC Press), L. de Palézieux dit Falconnet.

The course is based on the book "Fundamentals in Geophysics" 3rd edition by W. Lowrie available online from the ETH library. The list of Lecture Material as defined in German PPT Slides of the German Course "651-3525-00L Ingenieurgeologie", T. Gerya.

651-3525-AAL Introduction to Engineering Geology E- 4 credits 6R L. de Palézieux dit Falconnet

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract

This introductory course starts from a description of the behavior and phenomena of soils and rocks under near surface loading conditions and their key geotechnical properties. Lab and field methods for the characterization of soils, rocks and rock masses are introduced. Finally practical aspects of ground engineering, including tunneling and landslide hazards are presented.

Objective

Understanding the basic geotechnical and geomechanical properties and processes of rocks and soils. Understanding the interaction of rock and soil masses with technical systems. Understanding the fundamentals of geological hazards.

Content

Lecture notes

Lecture Material as defined in German PPT Slides of the German Course “651-3525-00L Ingenieurgeologie”. Moodle Course Materials available.

Literature

For English speakers study chapters 1-3 of Part I of the book “Geological Engineering” (Gonzalez de Vallejo & Ferrer 2011, CRC Press), without groundwater flow, consolidation time, geophysical methods, details of triaxial tests in soils and rocks, details of clay mineralogy.

Prerequisites / notice

Participate on all exercises of “651-3525-00L Ingenieurgeologie”, Tuesday 13-14 pm.

Participate in Written Exam together with students of the German Course

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract

The course is self taught and covers the following topics of fundamentals in geophysics:

- Seismology
- Tomography
- Gravimetry
- Geodesy
- Paleomagnetism

Objective

The course is an admission requirement given to students lacking fundamentals in geophysics related to the structure and evolution of the planet Earth. It will allow the student to acquire the necessary knowledge to pursue a Master in Geophysics, the student will learn the basics of seismology, tomography, gravimetry, geodesy and paleomagnetism and how these can be used to constrain the structure and evolution of the Earth.

Content

The course is based on the book “Fundamentals in Geophysics” 3rd edition by W. Lowrie available online from the ETH library. The list of chapters to read will be determined in an initial individual meeting with the student.

Prerequisites / notice

Enrollment ONLY for MSc students with an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

651-3052-AAL Fundamentals in Geophysics II: Dynamics of the Earth E- 3 credits 6R J. A. R. Noir, T. Gerya

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.
Abstract
The course is self taught and covers the following topics of fundamentals in geophysics:
- Mantle dynamics
- Plate tectonics
- Core dynamics
- Earth's magnetic field
- Earth's rotation

Objective
The course is an admission requirement given to students lacking fundamentals in geophysics related to the structure and evolution of the planet Earth. It will allow the student to acquire the necessary knowledge to pursue a Master in Geophysics, the student will learn the basics of seismology, tomography, gravimetry, geodesy and paleomagnetism and how these can be used to constrain the structure and evolution of the Earth.

Content
The course is based on the book “Fundamentals in Geophysics” 3rd edition by W. Lowrie available online from the ETH library and from the Treatise of geophysics available online. The list of chapters to read will be determined in an initial individual meeting with the student.

Prerequisites / notice
Enrollment ONLY for MSc students with an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enroll for this course unit.

651-3071-AAL
Fundamentals of Geology I: Earth’s Interior
Enrollment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
The Planet Earth, its interior and the plate tectonics as unifying theory. The rock cycle and the minerals and rocks. Igneous, Metamorphic and Sedimentary rocks. Deformation and earthquakes. Exploration of the earth interior.

Objective
Understanding the Earth System and the multi-disciplinary approach to the Earth Sciences. Framing the various minerals and rocks into plate tectonics and the rock cycle. Discussing the main tools for exploring the earth interior and understanding the deformation of rocks at various depths. Earthquakes and volcanoes and associated danger.
Content

Chapters 1, 2, 3, 4, 5, 6, 7, 8, 10 and 11 of the Book: Understanding Earth (8th Edition, 2020), By John Grotzinger and Thomas Jordan.

CH 1 THE EARTH SYSTEM
The Scientific Method
Geology as a Science
Earth's Shape and Surface
Peeling the Onion: Discovery of a Layered Earth
Earth as a System of Interacting Components
An Overview of Geologic Time

CH 2 PLATE TECTONICS: THE UNIFYING THEORY
The Discovery of Plate Tectonics
The Plates and Their Boundaries
Rates and History of Plate Movements
The Grand Reconstruction
Mantle Convection: The Engine of Plate Tectonics
The Theory of Plate Tectonics and the Scientific Method

CH 3 EARTH MATERIALS: MINERALS AND ROCKS
What Are Minerals?
The Structure of Matter
The Formation of Minerals
Classes of Rock- Forming Minerals
Physical Properties of Minerals
What Are Rocks?
The Rock Cycle: Interactions Between the Plate Tectonic and Climate Systems
Concentrations of Valuable Mineral Resources

CH 4 IGNEOUS ROCKS: SOLIDS FROM MELTS
How Do Igneous Rocks Differ from One Another?
How Do Magmas Form?
Magmatic Differentiation
Forms of Igneous Intrusions
Igneous Processes and Plate Tectonics

CH 5 VOLCANOES
Volcanoes as Geosystems
Lavas and Other Volcanic Deposits
Eruptive Styles and Landforms
Interactions of Volcanoes with Other Geosystems
The Global Pattern of Volcanism
Volcanism and Human Affairs

CH 6 SEDIMENTATION: ROCKS FORMED BY SURFACE PROCESSES
Surface Processes of the Rock Cycle
Sedimentary Basins: The Sinks for Sediments
Sedimentary Environments
Sedimentary Structures
Burial and Diagenesis: From Sediment to Rock
Classification of Siliciclastic Sediments and Sedimentary Rocks
Classification of Chemical and Biological Sediments and Sedimentary Rocks

CH 7 METAMORPHISM: ALTERATION OF ROCKS BY TEMPERATURE AND PRESSURE
Causes of Metamorphism
Types of Metamorphism
Metamorphic Textures
Regional Metamorphism and Metamorphic Grade
Plate Tectonics and Metamorphism

CH 8 DEFORMATION: MODIFICATION OF ROCKS BY FOLDING AND FRACTURING
Plate Tectonic Forces
Mapping Geologic Structure
How Rocks Deform
Basic Deformation Structures
Styles of Continental Deformation
Unraveling Geologic History

CH 10 EARTHQUAKES
What Is an Earthquake?
How Do We Study Earthquakes?
Earthquakes and Patterns of Faulting
Earthquake Hazards and Risks
Can Earthquakes Be Predicted?

CH 11 EXPLORING EARTH'S INTERIOR
Exploring Earth's Interior with Seismic Waves
Layering and Composition of Earth's Interior
Earth's Internal Temperature
Visualizing Earth's Three-Dimensional Structure
Earth's Magnetic Field and the Geodynamo

Abstract
The surface of the Planet Earth, main processes and formation of Sedimentary rocks in various environments. Time in Geology, stratigraphy and fossils, relative and absolute ages. Surface processes, water in the surface and subsurface, ice and glaciers. Climate systems, Carbon cycle. Impact of human activities, anthropogenic climate change. Geobiology and early history of Planet Earth.
Objective

Understanding the processes and environments of Planet Earth. The peculiar way of reading the fossil record in Geology: understanding stratigraphy and time in the frame of the actual sedimentary environments. Mineral/life interactions and the impact of anthropic activities.

CH 6 SEDIMENTATION: ROCKS FORMED BY SURFACE PROCESSES
Surface Processes of the Rock Cycle
Sedimentary Basins: The Sinks for Sediments
Sedimentary Environments
Sedimentary Structures
Burial and Diagenesis: From Sediment to Rock
Classification of Siliciclastic Sediments and Sedimentary Rocks
Classification of Chemical and Biological Sediments and Sedimentary Rocks

CH 12 THE CLIMATE SYSTEM
What Is Climate?
Components of the Climate System
The Greenhouse Effect
Climate Variation
The Carbon Cycle

CH 13 CIVILIZATION AS A GLOBAL GEOSYSTEM
Growth and Impact of Civilization
Fossil-Fuel Resources
Alternative Energy Resources
Our Energy Future

CH 14 ANTHROPOGENIC GLOBAL CHANGE
Rise of Carbon Dioxide in the Atmosphere: The Keeling Curve
Types of Anthropogenic Global Change: Chemical, Physical, and Biological
Climate Change
Ocean Acidification
Loss of Biodiversity
Managing the Carbon Crisis

CH 15 GLACIERS: THE WORK OF ICE
Types of Glaciers
How Glaciers Form
How Glaciers Move
Isostasy and Sea Level Change
Glacial Landscapes
Glacial Cycles and Climate Change

CH 16 EARTH SURFACE PROCESSES AND LANDSCAPE DEVELOPMENT
Controls on Weathering
Chemical Weathering
Physical Weathering
Soils: The Residue of Weathering
Erosion and Formation of Stream Valleys
Mass Wasting
Classification of Mass Movements
Geomorphology and Landscape Development

CH 17 THE HYDROLOGIC CYCLE AND GROUNDWATER
The Geologic Cycling of Water
Hydrology and Climate
The Hydrology of Groundwater
Erosion by Groundwater
Water Quality
Water Deep in the Crust

CH 18 STREAM TRANSPORT: FROM MOUNTAINS TO OCEANS
The Form of Streams
Where Do Channels Begin? How Running Water Erodes Soil and Rock
How Currents Flow and Transport Sediment
Deltas: The Mouths of Rivers
Streams as Geosystems

CH 19 COASTLINES AND DESERTS
Coastal Processes
The Shaping of Shorelines
Hurricanes and Coastal Storm Surges
Desert Processes
Windblown Sand and Dust
The Desert Environment
Tectonic, Climatic, and Human Controls on Deserts

CH 20 EARLY HISTORY OF THE TERRESTRIAL PLANETS
Origin of the Solar System
Early Earth: Formation of a Layered Planet
Diversity of the Planets
What’s in a Face? The Age and Complexion of Planetary Surfaces
Mars Rocks!
Exploring the Solar System and Beyond

CH 22 GEOBIOLOGY: LIFE INTERACTS WITH EARTH
The Biosphere as a System
Microorganisms: Nature’s Tiny Chemists
Geobiological Events in Earth’s History
Evolutionary Radiations and Mass Extinctions
Astrobiology: The Search for Extraterrestrial Life
Abstract
Fundamentals of Geochemistry I is designed as self-study course for new MSc students who have gaps in geochemical education. The topics of this course are related to the chemistry of the Earth and the Solar System.

Objective
Understanding of the fundamental concepts related to the chemistry of the Earth and the Solar System. Study material and specific content is provided as a Moodle course.

Content
1) Chemistry of the Earth
   • structure of the Earth and chemical characteristics of its main units: crust, mantle, core
   • the silicate Earth: oceanic and continental crust, and major rock-forming minerals of crust and mantle
   • seismic discontinuities and mineral phase transitions

2) Chemistry of the Solar System
   • classification of the elements: atmophile, lithophile, chalcophile, siderophile; volatile, refractory
   • relation between composition of the solar photosphere and CI chondrites
   • relation between CI and other chondrites and Earth

Prerequisites / notice
Enrollment ONLY for MSc students with an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Fundamentals of Geochemistry II is designed as self-study course for new MSc students who have gaps in geochemical education. Topics are related to generation of magmas and their chemical and isotopic signatures.

Objective
Understanding of the fundamental concepts related to the generation of magmas and their chemical and isotopic signatures. Study material and specific content is provided as a Moodle course.

Content
Generation of magmas and their chemical and isotopic signatures:
• partial melting and differentiation of magmas, element compatibility and the significance of trace elements
• divergent plate boundaries, decompression melting and mid ocean ridge basalts
• convergent plate boundaries, subduction and dehydration melting
• intraplate volcanism, ocean island basalts
• basics of isotope geochemistry, parent-daughter relations, e.g. Sm-Nd, W-Hf as example
• geochemical mantle reservoirs and signatures of recycled crust

Prerequisites / notice
Enrollment ONLY for MSc students with an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enroll for this course unit.

<td>2V</td>
<td>E. Stern, M. Rau</td>
</tr>
</tbody>
</table>

**Abstract**
- This lecture is only apt for students who intend to enrol in the programs "Teaching Diploma" or "Teaching Certificate". It is about learning in childhood and adolescence.

**Objective**
- Anyone wishing to be a successful teacher must first of all understand the learning process. Against this background, theories and findings on the way humans process information and on human behaviour are prepared in such a manner that they can be used for planning and conducting lessons. Students additionally gain an understanding of what is going on in learning and behavioural research so that teachers are put in a position where they can further educate themselves in the field of research into teaching and learning.

**Content**
- Thematik: Learning as behavior change and as information processing; The human memory with special consideration of symbolic information processing; Learning as knowledge construction and skill acquisition with special consideration of knowledge transfer; Learning through instruction and explanations; The role of emotion and motivation in learning; Inter-individual differences in learning ability and their causes: Intelligence theories, sex differences in learning; Learning forms:

**Lecture notes**
- Folien werden zur Verfügung gestellt.

**Literature**

**Prerequisites / notice**
- This lecture is only apt for students who intend to enrol in the programs "Lehrdiplom" or "Didaktisches Zertifikat". It is about learning in childhood and adolescence.

</table>

**Abstract**
- In this seminar students learn advanced techniques to support and to diagnose knowledge acquisition processes in school.

**Objective**
- The main goals are:
  1. You have a deep understanding about the cognitive mechanisms of knowledge acquisition.
  2. You have a basic understanding about psychological test theory and can appropriately administer tests.
  3. You know various techniques of formative assessment and can apply these to uncover students' misconceptions.

**Competencies**
- **Subject-specific Competencies**
  - Concepts and Theories assessed
  - Techniques and Technologies assessed
- **Method-specific Competencies**
  - Analytical Competencies assessed
  - Decision-making fostered
  - Media and Digital Technologies fostered
  - Problem-solving fostered
- **Social Competencies**
  - Communication fostered
  - Cooperation and Teamwork fostered
  - Leadership and Responsibility fostered
  - Sensitivity to Diversity fostered
- **Personal Competencies**
  - Creative Thinking fostered
  - Critical Thinking fostered

Students conduct a series of "classical" biological school experiments and therefore gain practice and experience in this area. The Specialized Biology Course with an Educational Focus can be acknowledged, in agreement with the advisor of the respective elective major, as one of the two obligatory research projects. In such a case, additional 3 CP must be obtained in another course.

Performance is assessed during the course of the entire module. Active participation in the course is required.

In case of overbooking of the course, students enrolled in the Teaching Diploma in Biology will have priority.

<tr>
<td><strong>Abstract</strong></td>
<td>Students conduct a series of &quot;classical&quot; biological school experiments and therefore gain practice and experience in this area. Implementation of Subject Didactics I and II with the focus on conducting biological experiments in schools. This includes finding, testing and further developing suitable protocols for different subject areas of school biology. Working out how to didactically embed the experiments in lessons. Students can perform, off the cuff, 12 school experiments (which they have tested themselves), from the different subject areas, and conduct these correctly in technical terms. They can incorporate these experiments in their tuition in a didactically meaningful manner. Comments: By contrast to the Subject Specialisation 1 and 2 course units, these are &quot;basic tests&quot; and do not involve the implementation of current research topics. The students' compilations are available in a data archive. By the end of the course, students should be able to assess the quality of their compilation.</td>

| **Objective** | Students can discuss and put into practice in their teaching work the conditions and objectives set out in the regulations governing the school-leaving examination (Matura), the framework curriculum and the conditions and objectives specified by their school. They are in a position to select learning objectives and formulate these on the basis of the target level model. They can plan and prepare lessons and can also develop appropriate learning assignments. Students can reconstruct specialist contents in didactic terms and develop teaching modules suitable for the different levels from these on the basis of the subject structure and learner requirements. They can reduce the complexity of subject-based specialist contents and present them in such a way that they are comprehensible and meaningful for learners. They can select appropriate media for their work (e.g. school books) and use these. They can employ appropriate experiments. The students can use different forms of examination for monitoring performance. Students are in a position to implement and discuss the concepts of biology teaching and learning on the basis of specific topics covered in school biology. |      |      |       |                  |

#### Abstract

Selected topics in general chemistry:
1) The language of chemistry
2) Chirality and stereochemistry
3) Chemistry and sustainability.

#### Objective

In this course, participants acquire extended and more in-depth knowledge of selected chemistry topics. The selection is based to a large extent on the partial aspects of chemistry that are typically taught at high school. By gaining a broader understanding, teachers are put in a position where they can comprehend the topics that are to be taught in a wider and, to some extent, unconventional context and critically process these in respect of their teachability and learnability. At the same time, interrelationships between the classical sub-disciplines of chemistry are highlighted, along with the unique features of chemistry as one of the central natural sciences.

#### Content

The FV primarily conveys basic subject knowledge. Didactic aspects or even concrete suggestions for the design of grammar school lessons are possible, but not central.

Learning format: Lecture.

Thematic focus of FV I:
- The language of chemistry: Concepts, formulas, aesthetics, and philosophical aspects
- Stereochemistry: The Coupe du Roi and its chemical meaning, Cyclostereoisomerism, Origin of biomolecular homochirality
- Chemistry and sustainability. The link between chemical products and energy consumption, life cycle assessments and chemical energy storage

#### Lecture notes

Slides and selected literature will be provided.

#### Literature

Selected articles from the primary literature are presented, commented on and recommended reading.

#### Prerequisites / notice

FV I (fall semester) and FV II (spring semester) do not build upon each other. The order in which they are taken is therefore indifferent.

#### Abstract

Implementing findings from research into teaching and learning for chemistry lessons and coverage of subject-specific teaching and learning specialities.

#### Objective

The students have basic subject didactic knowledge for teaching chemistry at a secondary school. They are able to design lessons that are effective for learning, actively involve students in lessons, explain challenging concepts simply, use experiments for theory and reflect on teaching.
Schwerpunkte im ersten Studiensemester bilden die folgenden Themen:
- Auswahl gymnasiumsrelevanter Lerninhalte
- Didaktische Vereinfachung
- Modelle und chemischen Formeln zur Beschreibung von Aufbau und Umwandlung der Substanzen
- Wechselwirkung zwischen Beobachtung in der realen Welt und Deutung auf Modell-Ebene
- Skizzen entwerfen und zur Erklärung von Reaktionen nutzen
- Chemie im 8. Schuljahr: Das Teilchenmodell erklärt viele Phänomene im Anfangsunterricht
- Atommodelle und chemische Bindung
- Radioaktivität und Kernspaltung
- Struktur und Eigenschaft
- Auswahl, Konzeption, Durchführung, Einbettung und Auswertung von Demonstrations-Experimenten

Die Unterlagen sind auf der Plattform http://fdchemie.pbworks.com zugänglich

Prerequisites / notice

Anhand der Diskussion bewährter Beispiele und dem Entwurf eigener Unterrichtsbausteine soll die zukünftige Lehrperson befähigt werden, einen den spezifischen Rahmenbedingungen angepassten Unterricht zu entwickeln, der diesem hohen Qualitätsanspruch genügt.

402-0091-00L   Teaching Science in Higher Education ■

W  3 credits
1V
G. Schiltz

Abstract
This course imparts fundamental didactic concepts that are relevant to teaching science in a Higher Education context.

Objective
Students are able to characterize and to discuss the model of outcomes based education. Students need to be able to transfer the basic concepts of this model (ILC, TLA, assessment, constructive alignment) to science education.

Number   Title                           Type  ECTS  Hours  Lecturers
402-0737-00L Energy and Sustainability in the 21st Century (Part I) W  6 credits 2V+1U  P. Morf

Abstract
Part I of this course covers the energy-related topics in this two-semester course. The importance of energy to life and our modern culture is explored and placed in the perspective of the ongoing energy transition in the context of necessary and urgent decarbonization efforts. How much energy do we need and how can it be provided in a way that enables a sustainable existence?

Objective
- Why is energy important for life, economy and our society?
- How did energy use change over time? Which effects did these changes have on the environment?
- What are the physical basics of energy technologies?
- When, why and how did technology and science of energy come together?
- What are the limits and benefits of all the various energy technologies?
- How can different energy technologies be compared?
- Can we understand the changes in the current energy systems?
- How will the energy systems of the future look like?
- How fast can we and should we enforce the current energy transition?
- Which could be the overall guidelines for a working and sustainable energy system of the future?
1. Introduction to Energy – what is it all about
2. Energy and making use of it – a short history of energy use and an overview on energy technologies
3. Coal, oil and natural gas – fossil fuels
4. Renewables I: Biomass, Hydropower, and Wind Energy – from traditional use to the modern concepts
5. Renewables II: Geothermal, Tidal power and Solar Technologies – new renewables lead the change
6. Nuclear power, radioactivity and ultimate storage – the quest for a safe technology
7. Breeding and Nuclear Fusion – can it work at all?
8. Energy Storage – the need to increase capacity and for new technologies
9. Climate Change and Decarbonisation of the Energy Mix – how much time do we have?
11. Energy Systems – how everything can play together
12. Life Cycle Assessment of Energy Technologies – problems and possibilities
14. The Actual Energy Transition and Decarbonisation – How is your 2040, 2050?

Literature
The Physics of Energy, R.L. Jaffe, W. Taylor, 2018
Clean Disruption of Energy and Transportation, T. Seba 2014
Energy and Civilization: A History, V. Smil, 2018

Prerequisites / notice
Basics of Physics applied to Energy and Energy Technology.
Investigation on current problems (and possible solutions) related to the energy system and the environmental interactions.

Contents
- Analytical Competencies
- Decision-making
- Problem-solving
- Project Management

Objective
Die Studierenden verfügen über fachdidaktisches Grundwissen für den Physikunterricht an einer Mittelschule. Sie können eigene Lektionen unter Berücksichtigung der vielfältigen Rahmenbedingungen planen, durchführen und evaluieren. Sie reflektieren ihren Unterricht und sind bestrebt, ihn didaktisch und pädagogisch weiter zu entwickeln.
Die Studierenden kennen die Einsatzmöglichkeiten, Chancen und Schwierigkeiten verschiedener Unterrichtsmethoden und Hilfsmittel. Sie können die Eignung von Unterrichtsformen im Hinblick auf eine Lernsituation beurteilen. Sie bemühen sich in ihrem Unterricht, geeignete Methoden und Medien angepasst an die Klasse und das Thema einzusetzen.

Content
Thematical Schwerpunkte

Fachspezifisches: Sachstrukturen der gängigen Unterrichtsthemen, Alltagsbezüge, Fehlvorstellungen, Demonstrations- und Schülerexperimente, Arbeitsmittel zu physikalischen Themen des Grundlagen- und Schwerpunkttunterrichts
- Einsat verschiedener Unterrichtsmaterialien: Experimente, Computer, Taschenrechner, Video, Simulation
- Unterrichtsformen: Lernaufgabe, Werkstatt, Puzzle, Projekt, Gruppenarbeit, Praktikum
- Lernformen
- Interaktive Lehr-Lernveranstaltung mit Vorträgen und Demonstrationen des Dozenten, studentischer Einzel- und Kleingruppenarbeit
- kurzen Präsentationen der Studierenden, Vertiefung der Inhalte durch Bearbeitung von Aufträgen ausserhalb der Kontaktsstunden

Abstract

Provides a basic introduction into Earth Sciences, emphasizing different rock-types and the geological rock-cycle, as well as introduction into geophysics, plate tectonics and planetology.

Objective

Understanding basic geological and geophysical processes

Content

Overview of the Earth as a system, with emphasis on plate tectonic theory and the geological rock-cycle. Provides a basic introduction to crystals and minerals and different rock-types. Lectures include processes in the Earth's interior, physics of the earth, planetology, introduction to magmatic, metamorphic and sedimentary rocks. Exercises are conducted in small groups to provide more in depth understanding of concepts and content of the lectures.

Literature

Grotzinger, J., Jordan, T.H., 2020, Understanding Earth, Macmillan Learning, 8th Ed.
https://doi.org/10.1007/978-3-662-48342-8

Prerequisites / notice

Exercises and short excursions in small groups (10-15 students) will be lead by student assistants. Specific topics in earth sciences will be discussed using examples and case studies. Hand samples of the major rock types will be described and interpreted. Short excursions in the region of Zurich will permit direct experience with earth science processes (e.g. earth surface processes) and recognition of earth science problems and solutions relevant for modern society (e.g. building materials, water resources). Working in small groups will allow for discussion and examination of actual earth science themes.

Coaching Students

The course "Coaching Students" enhance Student Teaching Assistants (Student TAs) in their role as student coaches to develop basic knowledge about coaching methodology and the mindset of a coach.

Objective

In this course Student Teaching Assistants will...

- understand the basics of coaching and the role as student coaches.
- develop the mindset of a coach and reflect on their attitude towards guiding student learning processes.
- acquire coaching skills and build knowledge and know-how about coaching methods.
- design the coaching session and feel confident to use coaching methods.
- give and get feedback from peers and self-reflect on their coaching practice.

Content

The course starts with a Kick-off meeting in the first lesson to provide an overview of the role as student coach and the course in general.

Participation in the Kick-off (1st live session) is essential, since during this session the groups are formed in which the students will work throughout the semester.

The further 4 live sessions will provide a range of relevant topics for developing coaching competencies:

- Overview about coaching: Based on this, participants reflect on their role as student coaches in order to develop the mindset of a coach,
- Introduction into coaching methodology,
- Coaching skills training: active listening, asking questions and giving/getting feedback.

During the last live session, course participants will be able to apply their knowledge and the coaching skills learned during the course in a role play. The last meeting is also mandatory for the participants.

Further, the course also consists of an online part. The online part offers a short theoretical overview of each live session and the possibility to conduct a learning journal.

This course takes place on the campus of ETH Zurich. The room for our meetings will be HG D18.1.

We will meet 6 times on Wednesdays. Overview of course topics sorted according to the live sessions on Wednesdays from 4:15pm-6pm (16:15-18h):

- Kick-off: Information about the course, role as a student coach
- Teambuilding & Psychological Safety
- Active listening
- GROW & Asking questions
- Feedback
- Role play: practice the skills you have learned during the semester

Dates will be released soon.
This course is open to Student Teaching Assistants (students with teaching duties in exercises, practicals etc.) from all departments and chairs.

Abstract

This is an online course that participants can work through at their own pace. The course is in English and takes about 6 hours to complete. Participants who successfully complete the quiz in the course will receive a verification of completion.

Objective

- Reflecting on your teaching role
- Finding out about your students
- Introducing your course and class
- Planning student engagement

Prerequisites / notice

REQUIREMENT: teaching duties in the current semester

851-0372-00L Ready, Set, Go! Z 0 credits K. Brown, B. Volk

This course is designed for ETH Doctoral Teaching Assistants with current teaching responsibilities.

Abstract

This course imparts a variety of teaching skills which will help Doctoral Teaching Assistants with their teaching tasks.

Objective

In this course Doctoral Teaching Assistants will...

- discuss learning science and teaching techniques with peers.
- design the introduction of their course/lecture/exercise class.
- develop learning activities according to learning objectives.
- practice classroom assessment techniques in order to measure student learning.
- engage in peer feedback in order to improve own teaching.

Content

We will meet for the mandatory kick-off meeting online in October. You will get detailed information together with the invitation email in the first week of the semester. The online phase, where you work through 6 modules in the Moodle course page will end in November. We will meet also face-to-face for the Consolidation workshop. You will find more information on the course page in Moodle.

Prerequisites / notice

This programme is designed for ETH Doctoral Teaching Assistants with current teaching responsibilities (exercises, excursions, supervision of practicals, lectures, etc.) or those who will assume teaching tasks in the semester following the programme. No previous teacher training is required.

</tbody>
</table>

Abstract

Examine the fundamentals of the two sciences and establish links with military life. Discuss various schools of thought in psychology and focus on content and process theories of motivation. Explore characteristics of pedagogical thinking and discuss the values of military education with reference to the young adult serving in the armed forces.

Objective

- Becoming acquainted with basic psychological views of human behaviour and experience
- Knowing content- and process theories of motivation and being able to transfer them to the military context
- Knowing the possibilities and limitations of military education and deriving consequences

Content

Overall, the objective is to become acquainted with the basics of both scientific areas and to make references to military practice. Military psychology is a branch of applied psychology; consequently selected aspects of psychological principles will be covered. Military pedagogy hasn't yet established itself firmly as an independent scientific discipline, it nevertheless can draw on a deep-seated tradition in Switzerland. Thus, the great importance that has been attached to the discussion of education in Swiss society and academia will be taken into account. Subjects:

- History of military psychology
- Introduction to psychological thinking
- Motivational theories
- Defence-, service-, operational- and combat motivation
- Swiss military pedagogy
- Education as defining feature of pedagogic thinking and acting

Literature

- Annen, H., Steiger, R. & Zwygart, U.: Gemeinsam zum Ziel, Huber, Frauenfeld 2004 (provided as pdf)
- Stadelmann, J.: Führung unter Belastung, Huber, Frauenfeld 1998 (provided as pdf)

The lecture is supported by a virtual learning environment containing relevant documents (presentations and texts) and information to further literature.
The purpose of the lecture is to outline the development of the armed forces (assets regarding manpower, technology and armament), the concepts of warfare and the actual warfare in the 19th and 20th century.

Based on the "Military Revolution" approach, the lecture examines the structural changes regarding the armed forces and the development of warfare from the 18th to the 20th century. Special emphasis will be put on how the battlefield was revolutionized due to the Napoleonic wars, the industrialization in the 19th century, the First World War, the mechanization and totalization during the Second World War and the period of the Cold War.

Literature

Militärgeschichte

Beside of the most important terms of sociology, demographic changes and the related value and structure change will be analysed. The purpose of the lecture is to outline the development of the armed forces (assets regarding manpower, technology and armament), the concepts of warfare and the actual warfare in the 19th and 20th century.

The lecture is structured along the lines of the concept of "Military Revolution" and starts with the formation of modern, European armed forces after the Oranian Army reform in the 17th century. Based on the "Military Revolution" approach, the lecture examines the structural changes regarding the armed forces and the development of warfare from the 18th to the 20th century. Special emphasis will be put on how the battlefield was revolutionized due to the Napoleonic wars, the industrialization in the 19th century, the First World War, the mechanization and totalization during the Second World War and the period of the Cold War.

853-0063-02L Military History I (Without Exercises) Z 3 credits 2V M. Olsansky, T. Cubito, A. Wettstein

Abstract

The purpose of the lecture is to outline the development of the armed forces (assets regarding manpower, technology and armament), the concepts of warfare and the actual warfare in the 19th and 20th century.

Objective

- Distinguish between military history as a subject and historiography as a way of describing events;
- Analyse the modern developments regarding armed forces and warfare in the context of socio-economic changes;
- Based on the approach regarding revolution in military affairs, describe the evolution of the armed forces and of warfare;
- Exemplify the issues regarding the evolution of the combat (First and Second World War, Vietnam War and Algerian War).

Content

The lecture first examines the bases of the science of (military) history. It focuses on how military history developed from war history, on specific similarities and differences between military history and general historiography, the different ways of dealing with history in Switzerland, Germany, France and in the Anglo-Saxon cultural area (different approaches) as well as on institutions which deal with military history such as universities, military academies, national and international commissions and associations etc.

The lecture is structured along the lines of the concept of "Military Revolution" and starts with the formation of modern, European armed forces after the Oranian Army reform in the 17th century. Based on the "Military Revolution" approach, the lecture examines the structural changes regarding the armed forces and the development of warfare from the 18th to the 20th century. Special emphasis will be put on how the battlefield was revolutionized due to the Napoleonic wars, the industrialization in the 19th century, the First World War, the mechanization and totalization during the Second World War and the period of the Cold War.

Literature

853-0064-00L Military Sociology I Z 3 credits 2V T. Szvircsev Tresch, S. De Rosa, T. Ferst

Abstract

Beside of the most important terms of sociology, demographic changes and the related value and structure change will be analysed. The second part focuses on organizational sociology. Thirdly, the course examines to which extent armed forces can be considered as organizations like any other and to which extent they constitute a special case from an organizational and normative point of view.

Objective

- Recognize and explain current changes (social change) in modern society (individualisation, pluralisation); describe demographic changes in Switzerland; explain the structures of societies; define issues and fields of research in modern military sociology and explain the foundations of organisational sociology; explain the military in terms of organisational sociology and identify specific traits of the military as an organisation.

Content

Societal change, organizations as societal phenomena; aims, structures, environments of organizations; specifics of the military as an organization; impacts of technological and societal changes on the armed forces in modern societies.

Literature
- A reader with a set of texts will be handed out.

Competencies

Subject-specific Competencies

853-0101-02L Defense Economics I Z 3 credits 2V M. M. Keupp, M. Bader, F. Muhly, C. Schulze

Abstract

In terms of structure and content, the event follows the lecturer's book "Militärökonomie" (Military Economics), which is available in two language versions:
- German language: ISBN 978-3-658-06146-3

Objective

* Recognizing parallels and contrasts between business and military thinking;
* Understand the link between institutions, human action and economic results.
The semester program of the course is divided into 14 modules of 90 minutes each, which combine lecture (teaching of analytical techniques) and exercise (application by means of concrete case studies).

The contents correspond to sections 1 to 2.2.5 of the above book. The following will be discussed:

1. fundamental military economic problems including historical introduction to the topic
2. the institutional foundations of a military organisation
3. the modern military as a planned economy system
4. actors and stakeholders in the system

Lecture notes
Lecture slides are given to the participants before the first lecture. In addition, the above mentioned book will be handed over to the participants. Participants of the lecture who are not professional officer candidates are requested to obtain the book from the library or bookstore.

Geprüft werden:
Fähigkeit, Geografie-Unterricht mit Bezug zur eigenen Praxis kritisch und unter verschiedenen Blickwinkeln (inhaltlich, methodisch-didaktisch) zu betrachten. Lernarrangements mit Bezug zum heutigen Bildungs- und Schulfachverständnis zu gestalten und kritisch zu hinterfragen sowie deren möglichen erzielten Wirkungen zu diskutieren und zu begründen; Unterrichtssituationen zu reflektieren und zu evaluieren.

Lecture notes
Unterlagen aus der Fachdidaktik

Literature

Prerequisites / notice
The Examination Didactics is completed at the end of studies and must be fulfilled together with both examination lessons I and II (651-2520-01 und 651-2520-02). The responsible lecturers must be informed in advance so that the examination date (and place) can be organized.

All of the following courses must be successfully completed: Geography Didactics I, II, III and the specialised courses in respective subjects I, II and III as well as the Introductory Internship and Internship.

The examination didactics is an 15-minutes oral exam that takes place at the same day together with the examination lessons I and II.

651-4120-00L Subject Didactics Geography IV: Mentored Project

Prerequisites: successful participation in Geography Didactics of Geography Teaching I, II, III

Abstract
Mentorierte Arbeit mit Bezug zur fachdidaktischen Ausbildung.

Objective
sich in einem themenbezogenen Projekt selbständig und kooperationsorientiert weiterzuentwickeln

Content
selbständige, mentorierte Arbeit zu einem Thema aus der Fachdidaktik mit direktem Bezug zur Lehrpraxis im Fach Geografie (z.B. zu eigenen Übungslektionen und Praktikum oder zur Unterrichtsforschung).

Literature

Prerequisites / notice
May be completed together with didactics III at the earliest.

651-4118-00L Subject Didactics Geography III (University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: 090GG3

Limited number of participants. In addition to the course enrollment a registration by email is required no later than September 1 for autumn semester, February 1 for spring
On the basis of a specified topic, the candidate shows that they are in a position
Examination Lesson I Geography
University lecturers
Sie lernen ...

- die Bedeutung von Medienkompetenz im Geographieunterricht kennen und gewinnbringend einzusetzen
- wie Medien zur Veranschaulichung von Inhalten im Geographieunterricht eingesetzt und lernwirksam genutzt werden können

- Unterrichtsssequenzen effizient zu planen, lernwirksam umzusetzen und kritisch zu reflektieren

Die Fachdidaktik Geographie III ermöglicht eine vertiefte, anwendungsorientierte Auseinandersetzung in Bezug auf den Geographie-Unterricht. In der Veranstaltung liegt der Fokus auf ausgewählten Fallbeispielen, die von den Studierenden geplant, durchgeführt und evaluiert werden.

Prerequisites / notice

Geography Didactics III may be completed in parallel with Geography Didactics II, but only after successful completion of Geography Didactics I.

Professional Training in Geography

Important: You can only enrol in the courses of this category if you have not more than 12 CP left for possible additional requirements.

Abstract

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: 090BPEP

The Lesson Shadowing is part of the practical education of the teacher training for Upper Secondary Schools and must be completed at the beginning of studies.

Prerequisites / notice

The Lesson Shadowing is part of the practical training in the study program "Teaching Diploma for Matura Schools". It must be completed at the beginning of the course - if possible in the 1st semester.

The Lesson Shadowing must be completed together with the practice lessons for didactics.

The Lesson Shadowing can only be completed together with an accredited internship teacher of ETH Zurich (https://cmsgauthor.ethz.ch/content/dam/ethz/special-interest/erdw/department/dokumente/cug/Praktikumslehrpersonen_LD_Geographie.pdf).

| 651-2519-02L | Lessons Training (University of Zürich) | O | 2 credits | 4P | University lecturers |

Abstract

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: 090BUE

The practice lessons help students to gain first experiences in teaching and is completed together with the didactics courses.

The practice lessons for didactics must be completed within the didactic courses.

Students register for the module at UZH ideally together with didactics II. ECTS will be assigned after having handed in all relevant documents to the lecturers, at the earliest upon completion of didactics II.

The Practice Lessons can only be completed together with an accredited internship teacher of ETH Zurich (https://cmsgauthor.ethz.ch/content/dam/ethz/special-interest/erdw/department/dokumente/cug/Praktikumslehrpersonen_LD_Geographie.pdf).

Abstract

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: 090BP1

The Introductory Internship can only be completed together with an accredited internship teacher of ETH Zurich (https://cmsgauthor.ethz.ch/content/dam/ethz/special-interest/erdw/department/dokumente/cug/Praktikumslehrpersonen_LD_Geographie.pdf).

| 651-2520-01L | Examination Lesson I Geography | O | 1 credit | 2P | J. Rafflenbeul |

Abstract

In the context of an examination lesson conducted and graded at a high school, the candidates provide evidence of the subject-matter-based and didactic skills they have acquired in the course of their training.

Objective

On the basis of a specified topic, the candidate shows that they are in a position
- to develop and conduct teaching that is conducive to learning at high school level, substantiating it in terms of the subject-matter and from the didactic angle
- to analyze the tuition they have given with regard to its strengths and weaknesses, and outline improvements.

- **Hours**: 4P
- **ECTS**: Lecturers

International Environmental Politics

- **Hours**: 6G
- **ECTS**: T. Bernauer

The internship can only be completed together with an accredited internship teacher of ETH Zurich (https://cms-author.ethz.ch/content/dam/ethz/special-interest/erdw/department/dokumente/cug/Praktikumslehrpersonen_LD_Geographie.pdf).

The teaching internship II has to be completed after the teaching internship I at the end of the program in the same semester. Prerequisite

is the successful completion of all courses of the teaching diploma program.

Successful completion of Geography Didactics I (651-4239-00L).

Further course offerings from the category Educational Science are listed under "Programme: Educational Science for Teaching Diploma and TC".

Using Outdoor Education

- **Hours**: 1S
- **ECTS**: 1 credit
- **Lecturers**: R. Schumacher, P. Faller

Excursions at the Swiss Federal Institute for Forest, Snow and Landscape Research (WSL) in Birmensdorf:

- Dendrochronology: What annual rings tell
- Forest Soil: The soil in the focus of the climate
- Photosynthesis/Climate change: The tracks in the forest
- Forest Soil: The soil in the focus of the climate

International Environmental Politics

- **Hours**: 2V
- **ECTS**: T. Bernauer

This course deals with how and why international problem-solving efforts (cooperation) in environmental politics emerge and evolve, and
under what circumstances such efforts are effective. Based on concepts, theories, and methods of political economy, political science, and
public policy, various examples of international environmental policy-making are examined.

**Abstract**

In the context of their first teaching practice, students compile a portfolio in which they analyse and document selected aspects of their
teaching experience.

**Prerequisites / notice**

Only for students of the Geography Teaching Diploma.

The semester paper must be completed together with the first teaching internship, the registration is therefore in the same semester.
Objectives
The objectives in this course are to (1): gain an overview of important questions in international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions in this policy area and how to address them in a conceptually and methodologically meaningful and insightful way; (3) gain an overview of important global and regional environmental problems and how they are or could be solved.

Content
This course deals with how and why international problem-solving efforts (cooperation) in environmental politics emerge and evolve, and under what circumstances such efforts are effective. Based on concepts, theories, and methods of political economy, political science, and public policy, various examples of international environmental policy-making are examined, for example international efforts to reduce air pollution, manage international water resources, mitigate and adapt to global warming, protect the stratospheric ozone layer, address biodiversity challenges, deal with plastic waste, and prevent pollution of the oceans.

Lecture notes
Reading materials and slides will be available via Moodle.

Literature

Prerequisites / notice
The course is open to all ETH students and visiting students from other universities. Participation does not require previous coursework in the social sciences or environmental policy. Most meetings in this course will take place on campus (ETH Main Building, HG F3). There will be no live-streaming, and the course is not in hybrid (on-campus plus online) format. However, the lecture will be recorded (slides and voice, no video) and the recordings will be made available via the Moodle platform for this course a few days after the respective lecture for students who are unable to attend in person. All electronic correspondence will take place via the ETH mystudies system and Moodle, so please make sure you are properly registered there with a functioning email address/account.

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Following an introductory lecture, students will split into four smaller seminar groups, focused on different thematic areas from urban, political and economic geography. Seminars will be based on a close reading of selected material and designed for interactive participation and discussion.

Each seminar consists of theory-oriented sessions, where students will gather first insights into selected theoretical perspectives of human geography; Using these perspectives, students develop their knowledge of each seminar group’s thematic area of focus and practice applying theory to empirical fields of research.

After the introductory lecture in week 1, students must enroll in one of four seminar groups via OLAT. Attendance of the introductory lecture is a prerequisite for participation in the first group session.

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

Mind the enrolment deadlines at UZH:

Abstract
The course aims are twofold. First, students will discuss urgent societal challenges (e.g. biodiversity loss, climate change, migration, urbanization, water scarcity) and outline how Geography as a whole can contribute tackling these challenges. Second, students are encouraged to reflect their individual interdisciplinary curricula.

Objective
The course aims to prepare students for their potentially next career step of entering the job market.

Content
The thematic bracket opened at the beginning of the curriculum and introducing the interdisciplinary approach of geography will be closed. Practical guidance is provided allowing students to identify matching job advertisements, to develop and communicate own strengths, and to prepare application documents.

Basics for line transport systems and networks

Public Transport Design and Operations

The course provides the necessary knowledge to develop models supporting the solution of given planning problems and also introduces cost-benefit analysis as a decision-making supporting tool. Examples of such planning problems are the estimation of traffic volumes, prediction of estimated utilization of new public transport lines, and evaluation of effects (e.g. change in emissions of a city) triggered by building new infrastructure and changes to operational regulations.

To cope with that, the problem is divided into sub-problems, which are solved using various statistical models (e.g. regression, discrete choice analysis) and algorithms (e.g. iterative proportional fitting, shortest path algorithms, method of successive averages).

The course is composed of a lecture part, providing the theoretical knowledge, and an applied part in which students develop their own models in order to evaluate a transport project/policy by means of cost-benefit analysis. Interim lab session take place regularly to guide and support students with the applied part of the course.

Objective
- Knowledge and understanding of statistical methods and algorithms commonly used in transport planning
- Comprehend the reasoning and capabilities of transport models
- Ability to independently develop a transport model able to solve/answer planning problems
- Getting familiar with cost-benefit analysis as a decision-making supporting tool

Content
The course aims at analyzing, designing, improving public transport systems, as part of the overall transport system. Public transport is a key driver for making our cities more livable, clean and accessible, providing safe, and sustainable travel options for millions of people around the globe. Proper planning of public transport system also ensures that the system is competitive in terms of speed and cost. Public transport is a crucial asset, whose social, economic and environmental benefits extend beyond those who use it regularly; it reduces the amount of cars and road infrastructure in cities; reduces injuries and fatalities associated to car accidents, and gives transport accessibility to very large demographic groups.

Goal of the course:
- Goal of the class is to understand the main characteristics and differences of public transport networks.
- Their various performance criteria based on various perspective and stakeholders.
- The most relevant decision making problems in a planning tactical and operational point of view
- At the end of this course, students can critically analyze existing networks of public transport, their design and use; consider and substantiate possible improvements to existing networks of public transport and the management of those networks; optimize the use of resources in public transport.

General structure:
- general introduction of transport, modes, technologies, system design and line planning for different situations,
- mathematical models for design and line planning timetabling and tactical planning, and related mathematical approaches operations, and quantitative support to operational problems, evaluation of public transport systems.

Planning process, from demand evaluation to line planning to timetables to operations Matching demand and modes Line planning techniques Timetabling principles Allocation of resources Management of operations Measures of realized operations Improvements of existing services

### Application Development in Cartography

**W** 6 credits  4G  A. Neumann

**Abstract**

This course introduces concepts and techniques in 3D cartography and web application development. Practical experience will be gained in a map project.

**Objective**

Students acquire general knowledge about the foundations and best practices in 3D cartography and modern web application development. They learn to plan, design and implement an interactive and animated 3D web map.

**Content**

- 3D cartography
- Web mapping
- Data processing
- Animations and interactions
- Map and UI design
- Web application development
- Programming (JavaScript).

**Lecture notes**

Handouts of the lectures and exercise documents are available on Moodle.

**Prerequisites / notice**

Cartography II or Introduction to Web Cartography Part 1+2 (MOOC) or similar knowledge in mapping with JavaScript.

### Image-based Mapping

**W** 6 credits  2G  T. Peters

**Abstract**

Application of photogrammetry and remote sensing methods for mapping and Earth observation.

**Objective**

Learn how to apply photogrammetry, image analysis and machine learning to mapping tasks; hands-on experience in implementing automatic image analysis methods, and in judging their results.

**Content**

- Preprocessing of satellite images, atmospheric correction
- Extraction of features (radiometric indices, texture descriptors, etc.) from raw image intensities
- Semantic image segmentation (e.g., cloud masking)
- Physical parameter estimation (e.g., vegetation height)
- Practical deployment of geometric and semantic computer vision and image analysis methods for mapping; assessment of prediction results

**Prerequisites / notice**

basic knowledge of photogrammetry, image processing and machine learning

### Basics and Principles of Radar Remote Sensing for Environmental Applications

**W** 3 credits  2G  I. Hajnsek

**Abstract**

The course will provide the basics and principles of Radar Remote Sensing (specifically Synthetic Aperture Radar (SAR)) and its imaging techniques for the use of environmental parameter estimation.

**Objective**

The course should provide an understanding of SAR techniques and the use of the imaging tools for bio/geophysical parameter estimation.

At the end of the course the student has the understanding of:

1. SAR basics and principles,
2. SAR polarimetry,
3. SAR interferometry and
4. environmental parameter estimation from multi-parametric SAR data
Handouts for each topic will be provided.

The course provides an introduction to processing and interpreting radar and synthetic aperture radar (SAR) remote sensing data. Additional reading material:

- Cadastral Systems
- Objectives: Understand the concepts and techniques required to process and to adequately interpret interferometric radar/SAR data for topographic mapping and surface displacement applications.

At the end of the course, the student is able to read, display, process, and interpret interferometric radar/SAR data using MATLAB.

The course starts with the real-aperture radar case and a first introduction to the concept of radar interferometry with applications to topographic mapping and mapping of surface displacements.

Based on that, the 2-D imaging concept used in synthetic aperture radar imaging is treated.

Then, we expand further on radar and SAR interferometric (InSAR) concepts and processing steps for single interferograms and stacks of interferograms also using persistent scatterer interferometry (PSI) to measure deformation based on time series of interferometric SAR data.

Finally, the 3-D radar imaging case (SAR tomography) is put into context with PSI/InSAR time series as an extension of the more classical interferometric approaches thereby closing the circle around the strongly related concepts of SAR imaging and interferometry.

Lecture notes

Additional reading material:
- ISBN: 978-0-306-47633-4
- https://doi.org/10.1007/0-306-47633-9

Prequisites / notice

It is highly recommended that the student has previously taken the following courses:
- 102-0617-00L: Basics and Principles of Radar Remote Sensing
- 102-0617-01L: Methodologies for Image Processing of Remote Sensing Data

Cadastral Systems

Conception, structure and impact of cadastral systems such as property cadastre, PLR-cadastre, digital twin and related spatial data infrastructures (SDI) as well as their importance for civil society.

Students will get an understanding of the conception, structure and impact of cadastral systems and related concepts such as land administration, land registry, PLR-cadastre, spatial data infrastructures and Digital Twins. The link between cadastral systems, gender equality, economic prosperity and the contribution of property cadastre to achieving the United Nation Sustainable Development Goals (UN SDG) is discussed. The Swiss cadastral system ("Amtliche Vermessung") as well as a number of international systems in developed as well as in developing countries are discussed. The importance of the data from the property cadastre for the National Spatial Data Infrastructure (NSDI) and digital transformation will be investigated using various examples.

Basic concepts of cadastral systems (legal basis, conceptual principles, types of property, real estate types)
Importance of cadastral systems for societal prosperity due to the impact on the economy, society and the environment.
Contribution of the cadastre to the achievement of the UN SDGs on gender equality, poverty and food security.

Swiss cadastral system
- legal basis
- organisation
- Technical implementation
- Quality and integrity assurance
- profession
- Embedding cadastral data in the national spatial data infrastructure

Contribution of cadastral systems as spatial reference data to the digital transformation of the society,
International trends, developments and initiatives to strengthen property rights, 3D cadastral system (above and below ground)

### Real Estate Property Law

**851-0724-01L**

**W 3 credits 3V**  
S. Stucki, R. Müller-Wyss

**Particularly suitable for students of D-ARCH, D-BAUG, D-USYS.**

**Abstract**
Real estate property law (esp. content, acquisition, restrictions under private and public law, transmission and loss). Legal presentation: land register, surveying, cadastre. Basic questions of contract and tax law.

**Objective**
The legal principles of real estate property law can be correctly interpreted and applied in daily life.

**Content**
Real estate property law (esp. content, acquisition, restrictions under private and public law, transmission and loss). Legal presentation: land register, surveying, cadastre. Basic questions of contract and tax law.

### Space Geodesy

**103-0187-01L**

**W 6 credits 4G**  
B. Soja

**Abstract**

**Objective**
After this course, the students should be able to

- Describe the major observation techniques in space geodesy
- Describe the necessary modeling and analysis approaches to derive geodetic products of highest quality
- Select the appropriate space geodetic data for scientific investigations
- Analyze the space geodetic data for scientific purposes
- Interpret the scientific results

**Content**
Overview of GNSS, Very Long Baseline Interferometry (VLBI), Satellite and Lunar Laser Ranging (SLR/LLR), Satellite Radar Altimetry with the basic principles, the instruments and observation equations.

Modelling of the station motions and the estimation of station coordinates. Basics of wave propagation in the atmosphere. Signal propagation in the ionosphere and troposphere for the different observation techniques and the determination of atmospheric parameters.

Equation of motion of the unperturbed and perturbed satellite orbit. Osculating and mean orbital elements. General and special perturbation theory and the determination of satellite orbits.

**Lecture notes**

</tr>
</tbody>
</table>

**Abstract**

This course deepens the understanding of two main interoperability principles used in Geographic Information Science. Students will expand their knowledge of databases and the Swiss standard INTERLIS and will learn to use different tools and mechanisms to transform geodata between different systems: file-based, by web services, or using a model-based approach to define data meaning semantically.

**Objective**

1. Develop a comprehensive understanding of the key principles of integrability in Geographic Information Science and apply them to geospatial data.
2. Explore the principles of syntactic and semantic interoperability and apply them to geospatial data using a variety of tools.
3. Gain an in-depth understanding of geodatabases, UML, INTERLIS, and of the model-driven data transfer with restructuring and apply this knowledge to geodata.
4. Analyze the ontological spectrum of interoperability principles with varying levels of semantic expressiveness and different formalisms.
5. Examine the historical development of Geographic Information Systems interoperability, including the evolution of different approaches used across different countries.
6. Apprehend and foster research skills and improve competences in scientific writing and communication through completion of a voluntary project work.

**Content**

The aim of this course is to provide students with a deep understanding of two key interoperability principles in Geographic Information Science. Throughout the course, students will be exposed to a range of tools and mechanisms used to transform geospatial content across different file structures and databases. In particular, we will focus on the Conceptual Schema Language INTERLIS, which is used in Swiss surveying, while developing students’ abilities of interpreting, defining, and working with such models, also by using free and open-source tools.

Furthermore, we will explore the concept of integrability, which is fundamental to establishing higher levels of interoperability. We will examine how interoperability can span an ontological spectrum from OGC Web Services to semantic transformation, which may one day be understood by machines. By the end of this course, students will have gained a comprehensive understanding of the principles of interoperability and their applications in Geographic Information Science.

**Prerequisites / notice**

Prerequisites: Completed Bachelor course in GIS II or Geoinformationstechnologien und -analysen (GTA) and familiarity of working with a GIS and with geodatabases. Since we will primarily be using QGIS and PostgreSQL (pgAdmin), it would be beneficial if you could bring your own device with both applications pre-installed. Although not compulsory, it may also be useful to have Python/Anaconda and certain geospatial processing libraries installed.

| 103-0778-00L | GIS and Geoinformatics Lab | W    | 4    | 4P    | P. Kiefer |

**Abstract**

Independent study project with novel geoinformation technologies. Information on past projects: http://gis-lab.ethz.ch/

**Objective**

This lab focuses on presenting spatial, temporal, and open data in tangible ways. Students will learn how to work with novel geoinformation technologies such as virtual/mixed reality or mobile applications. They will engage in teamwork, application design, programming and presenting their results.
The goal of this course is an introduction and hands-on experience on latest mixed reality technology at the cross-section of 3D computer graphics and vision, human machine interaction, as well as gaming technology.

After attending this course, students will:
1. Understand the foundations of 3D graphics, Computer Vision, and Human-Machine Interaction
2. Have a clear understanding on how to build mixed reality apps
3. Have a good overview of state-of-the-art Mixed Reality
4. Be able to critically analyze and asses current research in this area.

The course introduces latest mixed reality technology and provides introductory elements for a number of related fields including:
- Introduction to Mixed Reality / Augmented Reality / Virtual Reality
- Introduction to 3D Computer Graphics, 3D Computer Vision
- This will take place in the form of short lectures, followed by student presentations discussing the current state-of-the-art. The main focus of this course is student projects on mixed reality topics, where small groups of students will work on a particular project with the goal to design, develop and deploy a mixed reality application. The project topics are flexible and can reach from proof-of-concept vision graphics/HMI research, to apps that support teaching with interactive augmented reality, or game development. The default platform will be Microsoft HoloLens in combination with C# and Unity3D - other platforms are also possible to use, such as tablets and phones.

Prerequisites / notice
- Good programming skills (C# / C++ / Java etc.)
- Computer graphics/vision experience: Students should have taken, at a minimum, Visual Computing. Higher level courses are recommended, such as Introduction to Computer Graphics, 3D Vision, Computer Vision.

Technology ventures are significantly changing the global economic picture. Technological skills increasingly need to be complemented by entrepreneurial understanding.

This course offers the fundamentals in theory and practice of entrepreneurship in new technology ventures. Main topics covered are success factors in the creation of new firms, including founding, financing and growing a venture. A critical understanding of dos and don'ts is provided through highlighting and discussing real life examples and cases.

Weekly sessions - recorded.
- 10+ sessions carried out by guest lecturers: experts in the broad field of technology entrepreneurship (e.g., serial entrepreneurs, venture capitalists, (E)MBA professors, company builders, patent experts, scale-up executives, …). Final session: multiple choice semester assignment (100% of grade).

Typical lecture format (2h):
- 15': Introduction
- 60': Guest testimonial
- 15': Discussion related to topic (in groups)
- 10': Plenary discussion
- 20': Q&A with (guest) lecturer
- 60': Lecture slides and case material

Lecture slides and case material

Subject-specific Competencies
- Concepts and Theories
- Analytical Competencies
- Problem-solving
- Communication
- Cooperation and Teamwork
- Customer Orientation
- Self-direction and Self-management

Personal Competencies
- Creative Thinking

The task assignments and selected documentation will be provided as PDF.

The course provides theory-grounded knowledge and practice-driven skills for founding, financing, and growing new technology ventures.

This course offers the fundamentals in theory and practice of entrepreneurship in new technology ventures. Main topics covered are success factors in the creation of new firms, including founding, financing and growing a venture. A critical understanding of dos and don'ts is provided through highlighting and discussing real life examples and cases.

Typical lecture format (2h):
- 15': Introduction
- 60': Guest testimonial
- 15': Discussion related to topic (in groups)
- 10': Plenary discussion
- 20': Q&A with (guest) lecturer
- 60': Lecture slides and case material

Before starting the Master's thesis, students must have
a. obtained the Bachelor's degree;
 b. fulfilled all specified admission conditions, if any;
c. acquired at least 90 credits in the Master's programme, including 12 credits in the area of the interdisciplinary project.

Abstract

The Master Programme concludes with the Master Thesis, which has to be done in one of the chosen Majors and has to be completed within 16 weeks. The Master Thesis is supervised by a professor and shall attest the students ability to work independently and to produce scientifically structured work.

Objective

To work independently and to produce a scientifically structured work.

Content

The topics of the Master Thesis are published by the professors. The Topic can be set also in consultation between the student and the professor.

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract

Introduction to the most important sensors, operation and calculation methods of Geodetic Metrology

Objective

Getting to know the most important sensors, operation and calculation methods of Geodetic Metrology

Content

Overview on the different domains of geodetic metrology
Geodetic instruments and sensors
Determination of 3D-coordinates with GNSS, total station and levelling
Calculation methods of geodetic metrology
Survey and staking-out methods

Lecture notes

Slides and additional material used in the associated regular course Geodätische Messtechnik GZ (in German) are provided in electronic form.

</tr>
</tbody>
</table>

**Objective**

- Acquire basic knowledge about communication with spatial information by using plans and maps, about the most important design rules and production methods for map graphics.
- Ability to assess existing products with respect to their content-related and design quality. Ability to design proper plans and well designed legends for basic maps.

**Content**

- Definitions "map" and "cartography", map types, current tasks and situation of cartography, map history, spatial reference systems, map projections, map conception and workflow planning, map design, analog and digital map production technology, prepress technology, printing technology, topographic maps, map critiques.

**Lecture notes**

Will be distributed module by module.

**Literature**

**Prerequisites / notice**

<tr>
<td></td>
<td>Social Competencies</td>
<td>Customer Orientation</td>
<td>assessed</td>
</tr>
<tr>
<td></td>
<td>Personal Competencies</td>
<td>Creative Thinking</td>
<td>assessed</td>
</tr>
</tbody>
</table>

**Abstract**

This course provides basic knowledge on parameter estimation and data processing. The necessary mathematical and statistical methods are developed and are applied to actual examples in geomatics.

**Objective**

The students are capable of analyzing measurements with appropriate methods. They can optimally extract model parameters from real measurements and are able to analyze and to retrieve additional information from time series. They understand the underlying algorithms of different geodetic analysis tools and processing methods.

**Abstract**

Introduction to programming in Java. Procedural foundations of programming and outlook to object oriented programming. Variables, types, assignments, control structures (branch, loop), data structures, algorithms, line graphics, graphical user interface. Writing small programs. Working with a professional programming environment (Eclipse).

**Objective**

In the course "Computer Science II", the competencies of programming, modeling and data analysis & interpretation are taught, applied and examined. The students will be able to write simple programs and to modify existing programs.

**Content**

This course offers an introduction to variables, control structures (branch, loop), algorithms and data structures, as well as an outlook to modularisation and object oriented techniques.

**Prerequisites / notice**

Prerequisites:
252-0845-00 Computer Science I (D-BAUG)

</tr>
</tbody>
</table>

**Objective**

- In the exercises students train programming skills (in the programming language JAVA), Students can solve the exercises on their own laptop or in the computer labs at ETH. The software used in this course runs on MS Windows, MacOS X and Linux.

---

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 1191 of 2684
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract

Introduction to Linear Algebra

Objective

Basic knowledge of linear algebra as a tool for solving engineering problems.

Understanding of abstract mathematical formulation of technical and scientific problems.

Content

Introduction and linear systems of equations, matrices, quadratic matrices, determinants and traces, general vector spaces, linear mappings, bases, change of basis, diagonalization, eigenvalues and eigenvectors, orthogonal transformations, scalar-product, inner product spaces.

406-0242-AAL Analysis II

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract

Mathematical tools of an engineer

Objective

Mathematics as a tool to solve engineering problems, mathematical formulation of problems in science and engineering. Basic mathematical knowledge of an engineer.

Content

Literature

Textbooks in English:
- J. Stewart: Multivariable Calculus, Thomson Brooks/Cole
- V. I. Smirnov: A course of higher mathematics. Vol. II. Advanced calculus
- M. Akveld, R. Sperb, Analysis II, vdf
- L. Papula: Mathematik für Ingenieure 2, Vieweg Verlag

406-0243-AAL Analysis I and II

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract

Mathematical tools for the engineer

Objective

Mathematics as a tool to solve engineering problems. Mathematical formulation of technical and scientific problems. Basic mathematical knowledge for engineers.

Content

Complex numbers.

Calculus for functions of one variable with applications.

Simple Mathematical models in engineering.

Literature

Textbooks in English:

Textbooks in German:
- M. Akveld, R. Sperb: Analysis I, vdf

406-0603-AAL Stochastics (Probability and Statistics)

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract

Introduction to basic methods and fundamental concepts of statistics and probability theory for non-mathematicians. The concepts are presented on the basis of some descriptive examples. Learning the statistical program R for applying the acquired concepts will be a central theme.

Objective

The objective of this course is to build a solid fundament in probability and statistics. The student should understand some fundamental concepts and be able to apply these concepts to applications in the real world. Furthermore, the student should have a basic knowledge of the statistical programming language "R".
From "Statistics for research" (online)
Ch 1: The Role of Statistics
Ch 2: Populations, Samples, and Probability Distributions
Ch 3: Binomial Distributions
Ch 5: One- and two-sample tests
Ch 6: Regression and correlation

From "Introductory Statistics with R" (online)
Ch 1: Basics
Ch 2: The R Environment
Ch 3: Probability and distributions
Ch 5: One- and two-sample tests
Ch 6: Regression and correlation

Competencies

Declarations of course unit 406-0062-AAL E- Physics I
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Introduction to the concepts and tools in physics: mechanics of point-like and rigid bodies, elasticity theory, elements of hydrostatics and hydrodynamics, periodic motion and mechanical waves.

Objective
Introduction to the scientific methodology. The student should develop his/her capability to turn physical observations into mathematical models, and to solve the latter.

Content
Book:
Chapters:
1, 2, 3, 4, 5, 6 (without 6-5, 6-6, 6-8), 7, 8 (without 8-9), 9, 10 (without 10-10), 11 (without 11-7), 13 (without 13-13, 13-14), 14 (without 14-6).

Competencies
- Subject-specific Competencies
  - Concepts and Theories: assessed

**252-0856-AAL Computer Science**  
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Abstract  
The course covers the fundamental concepts of computer programming with a focus on systematic algorithmic problem solving. Taught language is C++. No programming experience is required.

Objective  
Primary educational objective is to learn programming with C++. After having successfully attended the course, students have a good command of the mechanisms to construct a program. They know the fundamental control and data structures and understand how an algorithmic problem is mapped to a computer program. They have an idea of what happens "behind the scenes" when a program is translated and executed. Secondary goals are an algorithmic computational thinking, understanding the possibilities and limits of programming and to impart the way of thinking like a computer scientist.

Content  
The course covers fundamental data types, expressions and statements, (limits of) computer arithmetic, control statements, functions, arrays, structural types and pointers. The part on object orientation deals with classes, inheritance and polymorphism; simple dynamic data types are introduced as examples. In general, the concepts provided in the course are motivated and illustrated with algorithms and applications.

Lecture notes  
Lecture slides and all other material will be made available for download on the course web page.

Literature  
Bjarne Stroustrup: Einführung in die Programmierung mit C++, Pearson Studium, 2010

### Literature

Satellite Geodesy

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract

Objective
Understanding the major observation techniques in space geodesy as modern methods applied in Earth system monitoring (geometry, rotation and gravity field of the Earth and the atmosphere), in national surveying and navigation.

Content
Overview of GPS, VLBI, Satellite and Lunar Laser Ranging (SLR/LLR), Satellite Radar Altimetry with the basic principles, the instruments and observation equations. Modelling of the station motions and the estimation of station coordinates. Basics of wave propagation in the atmosphere. Signal propagation in the ionosphere and troposphere for the different observation techniques and the determination of atmospheric parameters.

Equation of motion of the unperturbed and perturbed satellite orbit. Osculating and mean orbital elements. General and special perturbation theory and the determination of satellite orbits.

Literature
Script M. Rothacher "Space Geodesy"

Analysis III

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Introduction to partial differential equations. Differential equations which are important in applications are classified and solved. Elliptic, parabolic and hyperbolic differential equations are treated. The following mathematical tools are introduced: Laplace transforms, Fourier series, separation of variables, methods of characteristics.

Objective
Mathematical treatment of problems in science and engineering. To understand the properties of the different types of partial differential equations.

Content
Laplace Transforms:
- Laplace Transform, Inverse Laplace Transform, Linearity, s-Shifting
- Transforms of Derivatives and Integrals, ODEs
- Unit Step Function, t-Shifting
- Short Impulses, Dirac's Delta Function, Partial Fractions
- Convolution, Integral Equations
- Differentiation and Integration of Transforms

Fourier Series, Integrals and Transforms:
- Fourier Series
- Functions of Any Period p=2L
- Even and Odd Functions, Half-Range Expansions
- Forced Oscillations
- Approximation by Trigonometric Polynomials
- Fourier Integral
- Fourier Cosine and Sine Transform

Partial Differential Equations:
- Basic Concepts
- Modeling: Vibrating String, Wave Equation
- Solution by separation of variables; use of Fourier series
- D'Alembert Solution of Wave Equation, Characteristics
- Heat Equation: Solution by Fourier Series
- Heat Equation: Solutions by Fourier Integrals and Transforms
- Modeling Membrane: Two Dimensional Wave Equation
- Laplacian in Polar Coordinates: Circular Membrane, Fourier-Bessel Series
- Solution of PDEs by Laplace Transform

Earth Observation

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.
Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
The aim of the course is to provide the fundamental knowledge about earth observation sensors, techniques and methods for bio/geophysical environmental parameter estimation.

Objective
The aim of the course is to provide the fundamental knowledge about earth observation sensors, techniques and methods for bio/geophysical environmental parameter estimation. Students should know at the end of the course:
1. Basics of measurement principle
2. Fundamentals of image acquisition
3. Basics of the sensor-specific geometries
4. Sensor-specific determination of environmental parameters

Abstract
Introduction to statistical modelling and machine learning.

Objective
The goal is to familiarise students with the principles and tools of machine learning, and to enable them to apply them for practical data analysis.

Content
- Multivariate probability distributions; comparison of distributions; regression; classification; model selection and cross-validation; clustering and density estimation; mixture models; neural networks

Literature
- Hastie, Tibshirani, Friedman: The Elements of Statistical Learning, Springer 2009
- Duda, Hart, Stork: Pattern Classification, Wiley 2012

Abstract

The interdisciplinary seminar is aimed exclusively at students of the master's program "History and Philosophy of Knowledge". It is designed to give students an insight into the subjects represented in the degree program and their specific requirements, procedures, questions and working techniques.

Prerequisites / notice

Dates: Thursday, 10-12

Lecture notes

Power Point Slides and references will be made available in digital form during the course of the semester.

Trailing notes

Mandatory and further reading will be listed on the course plan that is made available as from the first session.

Competencies

Subject-specific Competencies
- Concepts and Theories - Fostered
- Techniques and Technologies - Fostered
- Analytical Competencies - Fostered
- Media and Digital Technologies - Fostered
- Communication - Fostered
- Self-presentation and Social Influence - Fostered
- Sensitivity to Diversity - Fostered
- Critical Thinking - Fostered
- Creative Thinking - Fostered
- Critical Thinking - Fostered
- Integrity and Work Ethics - Fostered
- Self-awareness and Self-reflection - Fostered

Method-specific Competencies
- Analysis of concepts and theories - Fostered
- Communication - Fostered
- Critical Thinking - Fostered
- Creativity - Fostered
- Problem-solving - Fostered
- Adaptability - Fostered
- Media and Digital Technologies - Fostered
- Self-awareness and Self-reflection - Fostered

Social Competencies
- Communication - Fostered
- Self-presentation and Social Influence - Fostered
- Sensitivity to Diversity - Fostered
- Critical Thinking - Fostered
- Integrity and Work Ethics - Fostered
- Self-awareness and Self-reflection - Fostered

Personal Competencies
- Communication - Fostered
- Self-presentation and Social Influence - Fostered
- Sensitivity to Diversity - Fostered
- Critical Thinking - Fostered
- Integrity and Work Ethics - Fostered
- Self-awareness and Self-reflection - Fostered

Objective

Students will get an overview of different historical and contemporary approaches in bioethics. They are enabled to further developing their abilities to understand complex theories, to critically reflect on them and to put them up for discussion.
Bioethics is a very broad field, encompassing ethical issues relating to life and death, e.g. reproductive technology, euthanasia, organ transplantation, genetic engineering, human enhancement, animal welfare, biodiversity and our relation to nature more generally. Bioethics is addressed in various contexts and disciplines, in politics, in law, in religious contexts, in the social sciences, religious studies, medicine and the biosciences. The focus in this course is on the fundamental debates in ethics as a philosophical discipline. In addition, topics are selected for discussion depending on the students' interests.

851-0201-00L Literature and History W 3 credits 2V

Abstract

Literature and history have often coexisted, "dialogued". History is a recurring theme in many literary works. In this seminar, we will explore the relationship between literature and history.

Objective

The aim is to evoke History as a source of creation for writers. The aim is to identify the bridges built by this transdisciplinary, and to question the way in which History is "rewritten" by literature, after having been at its origin.

Content

Literature and history have often coexisted, "dialogued". History is a recurring theme in many literary works. In this seminar, we will explore the relationship between literature and history. We'll look at several periods of world history, from America to Europe and Africa. The aim is to evolve History as a source of creation for writers. The aim is to identify the bridges built by this transdisciplinary, and to question the way in which History is "rewritten" by literature, after having been at its origin. To illustrate our points, we will draw on 20th- and 21st-century novels by French, Haitian and Algerian authors...

- Rosalie L’infâme, Évelyne Trouillot
- Le Manuscrit de Port-Èbène, Dominique Bona
- L’Affaire de l’esclave Furcy, Mohammed Alssaaou
- Cris, Laurent Gaudé (First World War)
- Sigmaringen, Pierre Assouline (World War II)
- Avant que les leçons s’effacent, Louis-Philippe Dalember (Second World War)
- Où j’ai laissé mon âme, Jérôme Ferrari (Second World War & Algerian War)

851-0101-55L From Cotton to Cocaine: Commodities That Made History (c.1700-1950) W 3 credits 2V H. Fischer-Tiné

Abstract

Each session focuses on a particular commodity and explores how its production, trade and consumption was entangled with important political, social and cultural developments. Taken together, the case studies (ranging from agricultural crops, via chemically produced drugs to mechanical marvels such as the gramophone) provide a picture of major global transformations in the past 300 years.

Objective

On one level, the course aims to familiarise students with a currently much debated approach to the writing of global history, namely the history of commodities. Each case study is used to deepen the participants' understanding of complex historical developments by telling seemingly simple stories in a global frame. Thus, for instance, the session on sugar explores plantation economies in the Caribbean and the transatlantic slave trade as well as shifting patterns of diet and consumption in Europe. The session on rubber focuses on botanical expeditions in Latin America, the deployment of Chinese coolies on Malaysian Rubber farms and the rise of the automobile mass production in the USA. By linking the familiar to the unfamiliar and 'exotic' the inter-cultural sensitivity of the students will be enhanced.

On a second level, the analysis and understanding of these complex interconnections, it is hoped, will help students to get a more nuanced understanding of the historical process that is currently referred to as 'globalisation' and overcome the eurocentric perspective that still structures many scholarly and media writings on this topic.

851-0407-00L The Philosophy of Physics: Complex Systems W 3 credits 2V H. Atmanspacher

Abstract

Short description: The course deals with the description and understanding of complex systems in physics and related fields, as well as selected applications.

Objective

Participants should acquire knowledge about how to characterize complex systems adequately, to be aware of the problems involved in their prediction and control, and to apply their knowledge in an interdisciplinary context.

Content

Basic concepts for the treatment of complex systems are state spaces, observables, partitions, dynamics, stability, and information. They are introduced in general and concretized by means of examples. Furthermore, various definitions of complexity are introduced, which are linked to concepts such as emergence, meaning, non-commutative observables, and scaling laws. Finally, different types of networks are discussed, as well as learning processes and other types of dynamics in such networks.

Literature

Wird am ersten Termin vorgestellt und dient als begleitendes Material.

Prerequisites / notice

Elementare Kenntnisse der formalen Darstellung von Systemen, sowie grundlegendes Interesse an deren konzeptuelem Verstaedndnis.

851-0125-65L A Sampler of Histories and Philosophies of Mathematics W 3 credits 2V R. Wagner

Abstract

This course will review several case studies from the ancient, medieval and modern history of mathematics. The case studies will be analyzed from various philosophical perspectives, while situating them in their historical and cultural contexts.

Objective

The course aims are:
1. To introduce students to the history of mathematics
2. To make sense of mathematical practices that appear unreasonable from a contemporary point of view
3. To develop critical reflection concerning the nature of mathematical objects
4. To introduce various theoretical approaches to the philosophy and history of mathematics
5. To open the students' horizons to the plurality of mathematical cultures and practices

Competencies

- Subject-specific Competencies: Concepts and Theories assessed
- Method-specific Competencies: Analytical Competencies assessed
- Personal Competencies: Critical Thinking assessed

851-0541-00L Truth and Historical Injustice: The Production of W 3 credits 2V S. M. Scheuzger

Abstract

This course will review several case studies from the ancient, medieval and modern history of mathematics. The case studies will be analyzed from various philosophical perspectives, while situating them in their historical and cultural contexts.

Objective

The course aims are:
1. To introduce students to the history of mathematics
2. To make sense of mathematical practices that appear unreasonable from a contemporary point of view
3. To develop critical reflection concerning the nature of mathematical objects
4. To introduce various theoretical approaches to the philosophy and history of mathematics
5. To open the students' horizons to the plurality of mathematical cultures and practices

Competencies

- Subject-specific Competencies: Concepts and Theories assessed
- Method-specific Competencies: Analytical Competencies assessed
- Personal Competencies: Critical Thinking assessed
Knowledge about Past Mass Atrocities

Abstract
The course deals with the scientific production of knowledge about past mass atrocities. It looks at the interplay of different disciplines, methods and technological means that have been involved in this production over time. Further, it poses the question of what truth can mean in this context.

Objective
The students a) know the main features of the discussion about the truth in the reconstruction of past events; b) have an understanding of the interplay, but also the coexistence of different scientific methods and technological means in the multidisciplinary production of knowledge about past mass crimes; c) have knowledge of important processes of dealing with mass crimes from the second half of the 20th century onwards.

Content
When discussing the truthfulness of the academic study of the past, politically and ideologically motivated mass crimes are often cited as historical events in order to substantiate the necessity of a claim to truth. In doing so, moral arguments can be made or historical truth can be asserted as a prerequisite for living together in a democratic society under constitutional conditions.

The production of knowledge about past atrocities has always been an endeavour in which various scientific disciplines have been involved. The multidisciplinary character of the production of knowledge about mass crimes has become even more accentuated since the second half of the 20th century, not least due to the emergence of new technological possibilities.

The course offers a brief introduction to the discussion about the meaning of truth at past events. It looks at how different scientific approaches - from the humanities to the natural sciences - have been involved in coming to terms with mass crimes and how they have been related to each other. It deals with the question of what role certain techniques and technologies have played in the production of knowledge about past atrocities and how this has changed over time. These techniques and technologies range from the evaluation of documents and the taking of testimonies to specialised database programs, genetic analysis or imaging techniques, to digital technologies for the procurement of information on social media and the internet or for the modelling of past events.

In addressing these questions, the course looks at processes of dealing with the past from the middle of the 20th century to the 21st century in Europe, Latin America and Africa.

851-0020-00L Gender and Science

Abstract
This lecture series offers an introduction to the relationship between gender and science, with a focus on the specific intersections with the sciences taught at ETH.

Objective
This lecture series is designed to acquaint students from all levels and departments with the various ways in which gender perspectives matter for specific scientific disciplines, as well as for science in general. Students will learn to recognize and analyze the specific ways in which scientific theories and methods are gendered. They will be able to discuss and reflect how these topics are connected to their own scientific disciplines.

Content
There is agreement across academic disciplines today that gender influences and structures the production of knowledge and that scientific knowledge production in turn shapes gender notions. Even within "hard" sciences such as mathematics, physics, engineering, etc., gender is a significant factor in determining what counts as "objective" knowledge, who can know it, what kind of knowledge is produced, or how this knowledge is acquired and justified. Feminist research aims to reveal how dominant conceptions of science and knowledge practices disadvantage women, and other subordinate groups, with the goal of reforming these practices. An important part of feminist critique is to show that such efforts substantially improve the overall quality of research.

The semester will start with two introductory lectures acquainting students with research questions in the field of Gender and Science by summarizing its key concepts and methods. It will then continue as a series of weekly guest lectures by scholars from different scientific disciplines that provide accessible insights into the intersection between gender studies and the guest lecturer's research field. Students will thereby be encouraged to learn from concrete examples rather than abstract theory. The goal is for students to understand how to apply concepts and methods of gender studies to their particular disciplines. Intermediate discussions with the students will provide a forum for critically reflecting the content of the lectures and the connections to their own academic fields and practices.

All lectures by the guest speakers will also be open to the broader ETH public, while the introductory and discussion sessions are only for registered course participants.

851-0157-2BL Life and Death

Abstract
This course explores the relation between the scientific investigation of life and cultural notions of death from a historical perspective (assuming there is no such thing as the scientific investigation of death). While the course covers the times from antiquity up to the present, the main emphasis will be placed on the modern life sciences since the 19th century.

Objective
There is only one certainty in life: death. This brute fact has animated much thought and work in theology, art and philosophy - but also in the natural sciences, such as biology and medicine. Questions regarding health and social issues, evolution, extinction and immortality have played a crucial role in this connection. This course aims to explore above relations - the relations between the scientific investigation of life and cultural notions of death - from a historical perspective (assuming there is no such thing as the scientific investigation of death). While the course covers the times from antiquity up to the present, the main emphasis will be placed on the modern life sciences since the 19th century.

851-0202-00L Digital Humanities: Methods, Challenges, Perspectives

Abstract
In the 21st century, the humanities and the social sciences are undergoing a ground-breaking transformation: Data-driven, collaborative projects open up new opportunities. Which are the promises and the challenges of digital methods? The lecture series provides an overview of the latest developments.

Objective
- exploring the most important theoretical and methodological approaches since 2000
- understanding terms and procedures
- using digital texts, images and metadata
- reflecting on the conditions, opportunities and problems of digital methods

Content
The possibilities (Franco Moretti, Graphs, Maps, Trees, Verso 2005; Andrew Piper, Enumerations, Chicago UP 2018) and pitfalls (Franco Moretti, The Wrong Move, Konstanz UP 2022) of cultural history under digital conditions require critical reflection and evaluation. The lecture will explore showcases and pioneering work, annotated texts, images, metadata and interfaces provided by libraries, archives and museums. Research approaches and practical applications will be presented and evaluated.

851-0527-00L Introduction to the History of Technology: Concepts, and Current Debates

Abstract
Technology and society cannot be separated; No society functions without technology. The seminar offers a problem-oriented introduction to basic questions of the history of technology, introduces approaches to the history of technology and discusses selected, ongoing debates.

Objective
The course seeks to provide a critical introduction to the issues, methods, and selected areas of research in the history of technology.
History of technology investigates technological developments that arise in specific historical contexts. These developments are perceived by social groups or entire societies as a means of social change and ultimately find use or are forgotten. The questions that history of technology poses derive from the technological and social change that are a product of contemporary orientation and thinking; current historiographical methods provide the tools for answering these questions.

851-0453-00L  Artificial Intelligence and Human Values  W  3 credits  2G  M. Boenig-Liptsin, K. Wodajo

Abstract
This course introduces students to the ethical, political and legal debates in relation to Artificial Intelligence and provides students with concepts and methods from the constructivist and interpretive social sciences to work towards responsible and democratic human-technology futures.

Objective
The main objectives of the course are to enable students to 1) identify the ways in which human values and developments of AI technologies are entangled, 2) articulate what is significant about contemporary transformations in AI and society, and 3) participate and shape the relationship between human values and AI as citizens and professionals.

Content
The growing presence of AI tools for public use, for public administration, inside corporations and in scientific research raises many questions about the ethical, political, legal consequences of these technologies. This course is built around multiple sites of encounter among human values and AI, including bodies, persons, cities, labs, law, and environment. In each site, we inquire about what and whose values are being prioritized and with what consequences. The course also investigates existing best-practices around how to “align” human values with AI (e.g., human-centric design, alignment, reproducibility, transparency, explainability) and introduces students to regimes of ethics and governance of AI being proposed in jurisdictions around the world. Students learn to unpack the values and assumptions in existing techniques and frameworks for the design and governance of AI and to engage constructively with diverse stakeholders to shape the human-technology future towards aims that are reflexive, responsible, and democratic.

851-0297-00L  Manipulation in Literature and Cultural History  W  3 credits  2V  S. S. Leuenberger

Abstract
This lecture focuses on the manipulation and control of individuals and the masses. The power of manipulation is based on subtle use of persuasive linguistic elements and knowledge of the desires and fears of the intended audience. In addition to a theoretical overview, the lecture concentrates on the literary and discursive texts that dispute the control of protagonists.

Objective
Students will learn about manipulation as a linguistic and narrative phenomenon steeped in myth and classical rhetoric. Against the backdrop of cultural-historical developments, particularly with regard to major changes in media technology, we will examine how the reach of manipulation was extended from the individual to the masses. Students will be able to refine their critical discourse analysis skills and interdisciplinary abilities by studying texts from literature, politics, sociology, philosophy and psychoanalysis which reflect this shift in emphasis.

Content
Since the dawn of time mankind has tried to exert influence over others through the utilisation of certain techniques: initially for self-preservation – for example the interpretation of Sigmund Freud in Totem und Tabu. Later, desire became the driving force – centre stage: the desire for pleasure, power and control. Manipulation manifests itself in the form of characters and words, it is an authentically linguistic occurrence: classical antiquity, with the rhetoric, develops a system of verbal power of persuasion and, already then, questions were being raised in literary and discursive texts about how people could, or even should, manipulate. The exertion of influence and its impact will be clearly described, propagated, commented upon, criticised and ironised.

In contrast to oppressive overpowering, the power of manipulation (in Latin, manus hand, plere fill) is on the one hand, based on the subtle use of persuasive linguistic elements – it is always a (literary) discourse, too – and on the other, on knowing precisely what the fantasies, desires and fears of the manipulated are. The discourse of manipulation has its beginnings in the age of sophists and their belief in an omnipotence of language and rhetoric. It underwent further transformation under political and psychological signs in the early modern period through Giordano Bruno and Niccolò Machiavelli and culminated in the 20th century in a critique of the deception strategies of the “culture industry” (T.W Adorno) and “psychotechnology” (B. Stiegler) in global capitalism. Nowadays social media is the “radicalisation machine” (J. Eber) that present new challenges for society. Written in the 19th century, the Protocols of the Elders of Zion already gave indications of how present-day conspiracy theorists would manipulate their audience, and its impact can still be felt today. Since manipulation is a linguistic, narrative and also literary phenomenon, the central theme of the lecture is how in literature itself this often politically controversial and manipulative behaviour is picked up and reflected through poetry: such as in Tristan from Gottfried von Strassburg, Goethe’s Wilhelm Meister, Friedrich Schiller’s Die Verschwörung des Fiesco zu Genua or Heinrich von Kleist’s Der zerbrochne Krug, the works of Edgar Allan Poe and Thomas Mann (Mario und der Zauberer) and, most recently in Eckhart Nickel’s novel, Hysteria.

</tr>
</tbody>
</table>

Abstract
This course introduces students to foundational texts that led to the emergence of the environment as a subject of scientific importance, and shaped its relevance to society. Above all, the course seeks to give confidence and raise enthusiasm among students to read more widely around the broad subject of environmental sciences and management both during the course and beyond.

Objective
The course will provide students with opportunities to read, discuss, evaluate and interpret key texts that have shaped the environmental movement and, more specifically, the environmental sciences. Students will gain familiarity with the foundational texts, but also understand the historical context within which their academic and future professional work is based. More directly, the course will encourage debate and discussion of each text that is studied, from both the original context as well as the modern context. In so doing students will be forced to consider and justify the current societal relevance of their work.
The course will be run as a book reading club. The first session will provide a short introduction as to how to explore a particular text (that is not a scientific paper) to identify the key points for discussion.

Thereafter, in each week a text (typically a chapter from a book or a paper) considered to be seminal or foundational will be assigned by a course lecturer. The lecturer will introduce the selected text with a brief background of the historical and cultural context in which it was written, with some additional biographical information about the author. He/she will also briefly explain the justification for selecting the particular text.

The students will read the text, with two to four students (depending on class size) being assigned to present it at the next session. Presentation of the text requires the students to prepare by, for example:
- identifying the key points made within the text
- identifying issues of particular personal interest and resonance considering the impact of the text at the time of publication, and its importance now
- evaluating the text from the perspective of our current societal and environmental position

Such preparation would be supported by a mid-week tutorial discussion (about 1 hour) with the assigning lecturer.

These students will then present the text (for about 15 minutes) to the rest of the class during the scheduled class session, with the lecturer facilitating the subsequent class discussion (about 45 minutes). Towards the end of the session the presenting students will summarise the emerging points (6 minutes) and the lecturer will finish with a brief discussion of how valuable and interesting the text was (10 minutes). In the remaining 15 minutes the next text will be presented by the assigning lecturer for the following week.

The specific texts selected for discussion will vary, but examples include:
- Leopold (1949) A Sand County Almanach
- Carson (1962) Silent Spring
- Jared Diamond (2005) Collapse

Discussions might also encompass films or other forms of media and communication about nature.

851-0039-00L **Plural Perspectives on Rationality**

**W** 3 credits 2S B. Wang

**Abstract**

Rationality has been treated as a “universal” character of human beings. But such understandings, though dominant, also came under androcentric and Eurocentric critiques. They point out that exclusion of women and people of color is not aberrant bad scientific practices, but rather constituent of the principle modern science based on. This seminar offers plural perspectives on rationality.

**Objective**

Students will be introduced to theories of rationality from different philosophical traditions. Their ways of thinking shall be enriched and their sensibilities towards diversity improved. Students will participate in discussions, gain and sharpen their ability to understand complicated texts and identify arguments.

**Content**

Understood as a distinctive human attribute, rationality has been treated as a “universal” character of human beings. But the course of philosophy has witnessed how dominant understandings of rationality came under androcentric and Eurocentric critique. Such reflections argue that exclusion of women and people of color is constituent of the principle modern science is based on rather than aberrant bad scientific practices.

What counts as reasonable? What is rational? These questions seem quotidian. We deal with them every day. Telling right from wrong, true from false is considered a basic ability of reasoning. For example, clarity and consistency are what we almost always strive for, while contradictions and ambiguities are what we try our best to avoid. Such tendency, which is to be found not only in everyday life but also in science of different kinds, seems to suggest that there is nothing valuable, nothing worth learning from ways of reasoning that do not share these standards – or even deny that they can count as rationality at all. Nevertheless, when taking into consideration the androcentric and Eurocentric critiques modernity has been receiving so far, it is questionable whether the standard of rationality can really (or justifiably) be so impoverished. How can we think about rationality otherwise? Can we learn anything valuable from, for example, contradictions and ambiguities? If so, how to think about these unconventional ways of reasoning? In this seminar we will read and discuss theories of rationality from diverse philosophical traditions.

851-0622-00L **Inequality and Injustice: Economic and Philosophical Perspectives**

**Does not take place this semester.**

**Abstract**

Globalization and technological progress in recent decades have on the one hand reduced inequality and led to new forms of inequality on the other hand. The question is whether these new forms of inequality lead to more inequality. This course provides an overview of the current philosophical and economic discourse on inequality and injustice.

**Objective**

Using philosophical and economic texts and discussions, students develop an understanding of the concepts, developments, causes, and consequences of inequality. Students will acquire the ability to participate in an informed discourse on the issues of inequality and injustice and to critically reflect on their actions and position in the world.
In this seminar we will explore the issues of inequality and injustice. In doing so, we will explore the following questions: What is meant by inequality and injustice? Under what circumstances are inequalities unjust? Have inequalities and injustices increased or decreased over the last 50 years? What are the causes of increasing or decreasing inequality? What do these inequalities and injustices mean for our society? And what public and private measures are needed for more inclusive societies?

- Concepts of inequality and injustice
- Development of inequality over the last 50 years based on different dimensions of inequality: income, wealth, education, health, CO2 emissions, political participation
- Discrimination of women, people with physical disabilities, people of the "Global South"
- Causes of inequality: globalization, technological progress, political systems and institutions, economic system, social discrimination, stereotypes and norms.
- Consequences of inequality: justice, dignity, inefficiency
- Towards more inclusive societies: the role of policies, civil society, social movements and individual behavior.

The seminar is based on readings of economic and philosophical texts and is complemented by short presentations and discussions with scholars of philosophy and economics. In some cases, practitioners will also be invited to the seminar. Students will apply the concepts, theories and knowledge covered in the course to practical issues related to inequality and inequity.

**Objectives**

- Towards more inclusive societies: the role of policies, civil society, social movements and individual behavior.
- Concepts of inequality and injustice
- Development of inequality over the last 50 years based on different dimensions of inequality: income, wealth, education, health, CO2 emissions, political participation
- Discrimination of women, people with physical disabilities, people of the "Global South"
- Causes of inequality: globalization, technological progress, political systems and institutions, economic system, social discrimination, stereotypes and norms.
- Consequences of inequality: justice, dignity, inefficiency

**Competencies**

- Sensitivity to Diversity
- Adaptability and Flexibility
- Sensitivity to Diversity
- Self-presentation and Social Influence
- Leadership and Responsibility
- Communication
- Project Management
- Analytical Competencies
- Concepts and Theories

The seminar is based on readings of economic and philosophical texts and is complemented by short presentations and discussions with scholars of philosophy and economics. In some cases, practitioners will also be invited to the seminar. Students will apply the concepts, theories and knowledge covered in the course to practical issues related to inequality and inequity.
The value of science for social and economic development has been an issue of debate since the 20th century. At the same time, science became a subject of research in its own right: the sociology of science in the 1930s dealt with the social benefits (“Science for Social Needs”) and the organization of science. Since the 1950s, the research field of the “Science of Science” has quantified scientific publications (“Science Citation Index”) and attempted to measure the relationship between research and innovation, between education and economic growth (OECD studies). Science seemed to promise scientific and technological progress, innovation and economic growth - both in the industrialized countries and, with the help of “technology transfer”, to the then so-called “developing countries”. At the same time, in the field of “technology assessment”, the sciences were criticized for causing risks and damages to humans and nature (e.g. through pesticides or biotechnology) or entailing effects of social inequality.

The fact that the sciences have been the subject of debate since the 20th century is not only a matter of general public interest. It is also the effect of the development and funding of research fields that deal with measures to increase innovation or with the benefits and risks of science. The Seminar deals with the history of this research in its political and economic contexts as well as in its applied and critical function. It examines the knowledge on which historical and current expectations of science in politics and society are based.

### Competencies

**Comprehension and Application**

- The Knowledge of Poetry, conceptual and method-specific competencies.

**Concepts and Theories**

- Analytical Competencies: fostered
- Communication: fostered
- Cooperation and Teamwork: fostered
- Sensitivity to Diversity: fostered

**Personal Competencies**

- Adaptability and Flexibility: fostered
- Creative Thinking: fostered
- Critical Thinking: fostered
- Integrity and Work Ethics: fostered
- Self-awareness and Self-reflection: fostered

### Content

**The Knowledge of Poetry**

- The seminar explores poetry as “the mind's inherent way of acting”. Thinking takes place in verses and images, rather than concepts and formulas. If this were true, every spontaneous cognition would amount to poetry and each thought essentially to a poem – a structure combining and concentrating ideas, perceptions, and emotions. Knowledge and poetry would be one.

### Objective

- Such is the promise literature has made since its inception, a promise we will examine in this class by considering mainly lyrical compositions in verse, from the beginnings to the present. The central question is: What do poems know and what is the relationship between thinking in verse and technical and scientific knowledge?

### Abstract

Novalis once described poetry as “the mind's inherent way of acting”. Thinking takes place in verses and images, rather than concepts and formulas. If this were true, every spontaneous cognition would amount to poetry and each thought essentially to a poem – a structure combining and concentrating ideas, perceptions, and emotions. Knowledge and poetry would be one.

### Objective

- The fact that the sciences have been the subject of debate since the 20th century is not only a matter of general public interest. It is also the effect of the development and funding of research fields that deal with measures to increase innovation or with the benefits and risks of science. The Seminar deals with the history of this research in its political and economic contexts as well as in its applied and critical function. It examines the knowledge on which historical and current expectations of science in politics and society are based.

### 851-0281-00L

**Philosophy of War**

- Does not take place this semester.

### Objective

- In the course we read classical texts from the field of philosophy of war (Clausewitz, Sun Tzu, Tolstoy, Machiavelli, Kant) and focus on questions such as: what is war? Strategy and tactics in war? Ethics of war? War and Politics?

### Content

- The seminar explores insects as historical actors and their interactions with human societies over time and space. It offers an overview of recent approaches in environmental history and multispecies ethnography while providing an analytical framework to understand global processes of natural resource exploitation, knowledge formation, and imperialism.

### Objective

- Students learn about the different types of argumentative texts and their historical, social, political and ethical context. They learn to understand the descriptive and critical value of texts in regard to the topic of war.

### 851-0019-00L

**Insect Histories: Bugs that Made the Modern World**

- Does not take place this semester.

### Objective

- The objective is to analyze human-insect interactions by identifying key historical factors (economic, scientific, political). Students will integrate current frameworks in the study of environmental history through the combination of primary sources and interdisciplinary research. They will develop skills rooted in their interest in insects and learn to translate them into feedback to peers.

### Content

- Scholars typically approach Nature-related histories by focusing on environmental change, the commodification of resources, and the legacy of natural history collections. Examples of this approach include studies on deforestation, dam constructions, the rubber boom, and the colonial history of European museums. In contrast to these commonly explored topics, insects are often underrepresented in historical research, both as living creatures and metaphors. Addressing this gap, the seminar explores human-insect interactions from a global historical perspective between 1600 and 2000. This exploration encompasses a critical and relational understanding of the history of the scientific study of insects (entomology) and the processes of imperial expansion and of global territorialization. To achieve this, students will learn how human-insect interactions led to radical transformations in diverse environments, reflecting a particular modern conception of nature influenced by control anxieties related to economic profit and tropical diseases. Moreover, students will examine how ways of knowing about insects and the environment were influenced by broader correlated economic and imperial factors. Focusing on insect (hi)stories, the aim of this seminar is to apply new methodologies for non-human agencies and source analysis on both micro and macro scales in global and environmental histories.

### 851-0304-00L

**Science Fiction**

- Literature in general can be seen as fundamentally concerned with the forms and functions of knowledge and (sometimes scientific) understanding, but the genre of science fiction is unique in that it literalises this approach in a far-reaching fashion as the future of science and technology. We will explore knowledge, and the “science of literature” through a diverse range of science fiction texts.

### Objective

- Concept and history of science fiction
- Theory of science fiction and related forms (e.g. utopia, fantasy)
- Contexts of the history of knowledge and technology in the 19th and 20th centuries.
- Potential of science fiction to criticise technology and society
Content

This course introduces students to the various forms and functions of knowledge and science in literature, particularly within the realm of science fiction, the genre that most directly epitomises this fundamental connection within literary texts.

In analysing how it shifts our understanding of ourselves and of supposedly inalterable facts about the reality we inhabit, we will examine how science fiction demonstrates that fiction is neither fundamentally in conflict with scientific knowledge, as previously supposed, nor a mere vehicle for its celebration, as still commonly presumed of science fiction. Instead, the genre, with its radical investigations into other forms of being, fearing and hoping, plays a crucial role in the social formation, order and negotiation of knowledge. As such, science fiction also represents a vital thought experiment regarding the “science of fiction”, i.e. the development of a body of knowledge and the many fascinating ways in which it helps us to know our own world better, in turn.

In this course, we will take a systematic and theory-based approach to a deeper understanding of science fiction, particularly concerning its historical background, unique aesthetic/narrative tools, and relationship with the critical and technological contexts that shape it.

Employing contemporary theoretical approaches, we will discuss a variety of themes within primary texts alongside diverse critical sources, all of which ultimately relate to knowledge and knowability. Particular areas of focus may include: other worlds and alien existences; altered forms of being, fearing and hoping, plays a crucial role in the social formation, order and negotiation of knowledge. As such, science fiction also represents a vital thought experiment regarding the “science of fiction”, i.e. the development of a body of knowledge and the many fascinating ways in which it helps us to know our own world better, in turn. In this course, we will take a systematic and theory-based approach to a deeper understanding of science fiction, particularly concerning its historical background, unique aesthetic/narrative tools, and relationship with the critical and technological contexts that shape it.

The objective of the course is to provide students doing their own research on topics in science, technology and society with focused peer-feedback and tailored theoretical and methodological discussions to support the development of their projects.

Content

The course is focused on content from STS and moral and political theory and develops empirical, qualitative, and interpretive social science methods, such as ethnography/participant observation, historical archival research, discourse and document analysis, and semi-structured interviews. Specific thematic, reading, methodological foci are determined by the group to meet the specific needs of each participant.

Competencies

Subject-specific Competencies
- Concepts and Theories: assessed
- Analytical Competencies: assessed
- Communication: fostered
- Cooperation and Teamwork: fostered
- Adaptable and Flexible: fostered
- Critical Thinking: assessed
- Self-awareness and Self-reflection: fostered

- Social Competencies
- Personal Competencies

Objective

Research in Ethics, Technology and Society

851-0456-00L

Abstract

Through thematic discussions of readings, presentation and workshop of writing-in-progress, and discussions with invited guests, this course brings together advanced students doing research in science, technology and society to develop their knowledge and projects in structured community with peers, postdoctoral fellows, and faculty.

Objective

The objective of the course is to provide students doing their own research on topics in science, technology and society with focused peer-feedback and tailored theoretical and methodological discussions to support the development of their projects.

Content

The course is focused on content from STS and moral and political theory and develops empirical, qualitative, and interpretive social science methods, such as ethnography/participant observation, historical archival research, discourse and document analysis, and semi-structured interviews. Specific thematic, reading, methodological foci are determined by the group to meet the specific needs of each participant.

- Personal Competencies

Objective

Science, Trust and Politics

851-0455-00L

Abstract

The seminar aims to inspire a nuanced understanding of the dynamics of expertise in society. Cross-fertilizing literature from science and technology studies (STS) and from activist movements, it focuses on contemporary controversies around emerging technologies and climate policy, where trust in science is said to be undermined (e.g. climate skepticism or anti-vaccine movements).

Objective

1) Introduce to the role and functions of expertise in democratic societies. 2) Familiarize with assumptions about science and society embedded in contemporary controversies. 3) Inspire critical perspectives on (dis)trust in science through activists’ movements on contested environmental and technological issues. 4) Develop a creative position on the relations between science, trust and politics.

Content

Engineers and scientists often pursue their studies and research in the hope that their knowledge can contribute to make a better world, inform democratic deliberation and help public understanding of complex issues. Yet this special status of science and technology is being increasingly contested by marginalized publics, lobbies, exposed populations, and by members of the scientific communities themselves. Climate skepticism or vaccine hesitancy are some of the most vivid examples of this confusing situation. In this seminar, students will learn to reflect on expertise as a form of scientific engagement in the messiness of democratic deliberation and public life, beyond the noble but outdated ideal of “speaking truth to power”.

The exercise of expertise is stumbling upon several conundrums. Which knowledge is relevant in which situation? How to make sure that some crucial perspectives are not left in the shadows? How to identify representative experts and make sure that they speak on behalf of a structured community? Whose voices are being silenced? On the other side of the spectrum, the public is often said to lack proper understanding of science and thus in need of being educated or disciplined. Or it is suspected of being manipulated by lobbies or foreign hostile powers, or of being too attached to its own privileges and unwilling to act in favor of the common good. Whose agency is being acknowledged in sociotechnical controversies and whose agency is being denied and why? The seminar will provide a deep understanding of these perspectives, by putting them in a broader historical and epistemological context. Students will thus learn to critically assess their strengths as well as their blind spots.

Whereas opposing technological developments (anti 5G or anti-vaccine activists) or pushing to act accordingly to science (pro climate movements such as Extinction Rebellion or Scientist Rebellion), activists’ movements make up for a rich field of investigation on the dynamics of expertise and of how various publics can make sense of scientific knowledge. Cross-fertilizing activist’s texts and experiences with literature in science and technology studies and anthropology, this class will be organized as a structured conversation and a collective mapping of actors and key concepts of sociotechnical controversies. Over the course of the semester, students will learn not only to navigate some of the most heated contemporary debates, but also to articulate their own position on an issue of their choice.

Objective

AI Personhood, Social Justice, and Cross-Cultural Dialogues in the Digital Age

851-0454-00L

Abstract

The course fosters critical, culturally conscious reflection on AI development and regulation by 1) exploring cross-cultural assessment of the concept of personhood and collective in digital society and how these concepts are reflected in AI development and regulation. 2) Inspring reflection on social justice issues stemming from major (mis)conceptions of personhood in AI development and governance

Objective

- Understand and differentiate various concepts of personhood and collective in digital societies
- Critically evaluate emerging regulations in the field of AI
- Examine the implications of these regulatory frameworks and their conception of personhood for the AI human future
- Develop creative & culturally conscious analytical skill on issues of social justice in
Content

On 13 March 2024, the European Parliament voted in favour of the long-awaited EU AI Act. On October 30, 2023, the US passed an Executive Order on the safe, secure, and trustworthy development and use of AI. Meanwhile, China has been adopting regulations: the 2021 regulation on recommendation algorithms, 2022 rules for deep synthesis (synthetically generated content), and draft rules on generative AI on August 15, 2023. In the face of this race to develop and regulate AI across various legal, regulatory, and cultural settings, this course exposes students to the overarching question: How can we envision an AI-human future that accommodates a pluriverse and ensures a just future?

In everyday life, from education, policy deliberation, planning and prediction, governance of the human behavior and the beyond human, to social and private life, and entertainments, AI systems and AI-enabled products play a significant role. At the very center of this sociotechnical system is the human, often referred to as the ‘data subject’. This raises foundational questions: Who or what is this ‘data subject’? What warrants its protection or what makes it worthy of protection – is it the human dignity, autonomy, rationality, legally protected rights or something beyond and within all these? Who is what is considered a protected ‘data subject’, and who/what is not? While these questions might seem new, they revisit old ethical dilemmas.

However, there is no one-fits-all answer to these questions. Responses vary greatly depending on local and cultural contexts across different jurisdictions and societies. The way AI development and regulatory practices conceptualize the subject of protection – that is, the human and its environment diverges, leading to varied interpretations of personhood and what warrants protection. What personhood means and what is protected and not are not only matters of policy or legislative interpretations and standardization but a matter of social justice.

With this consideration, the course invites and encourages students to explore the concept of personhood from a cross-cultural perspective, incorporating epistemologies from the ‘South’, including Afro-communitarianism, pluriverse theories, and Confucianism. Students are then guided to critically examine personhood and community within the context of competing AI regulatory frameworks, such as those in the EU, China, Brazil, and the US, as well as in their own interactions with AI systems. By identifying conceptual limitations in current understandings of personhood and the centrality of the collective within contemporary AI regulation and practice, students can address core social justice issues. These include the overemphasis on individualism, which overlooks the communal and relational aspects of existence (including human and the beyond human), the instrumentalization of the environment, and exploitative business models.

Abstract

This seminar deals with writings by Walter Benjamin. On the one hand, his most famous and influential essays and fragments on critique, history and experience will be read and discussed, and on the other, a special focus will be placed on his thinking on architectural themes.

Objective

On the one hand, students learn to know Walter Benjamin’s most influential ideas, such as his views on art criticism, history and culture, as diverse as wood, concrete, ceramics and polymers become objects of a single discipline? How did social imaginaries and technical conditions affect scientific work with and on materials? As those in the EU, China, Brazil, and the US, as well as in their own interactions with AI systems. By identifying conceptual limitations in current understandings of personhood and the centrality of the collective within contemporary AI regulation and practice, students can address core social justice issues. These include the overemphasis on individualism, which overlooks the communal and relational aspects of existence (including human and the beyond human), the instrumentalization of the environment, and exploitative business models.

Abstract

First, the relevant literature on moral justifications in trolley cases will be discussed (Foot, Thomson, Kamm, Otsuka, Kagan). Second, neuropsychological research on trolley cases (Greene, Haidt, Berkner, Kamm) and third, applications of such moral reasoning in cases potentially arising in autonomous robots (Rahwan, Nyholm and Smids, Wolkenstein) will be considered.

Objective

Students will gain an overview of the current ethical debates surrounding the legitimacy of homicide-rescue-cases in specific types of situations. They will be enabled to interpret complex texts, identify the argumentation, to reflect it critically and to put it up for discussion.
Killing innocents is generally thought to be morally impermissible – or so it seems from an intuitive point of view. However, there are situations where people can only be saved if less others are killed, for example in some traffic cases, in some cases in natural disasters, medical emergencies, terrorist attacks or humanitarian interventions. In some of these situations our intuitions stay clear and disapproving: it is not permissible to kill, even in order to save many lives, for example, to take the vital organs of one patient in order to save many more other patients. In other scenarios, the intuitions are less clear or even revert for most of us, like in the famous trolley-bystander case, in which a bystander can divert an out-of-control trolley heading towards five to a track where one person is trapped. How are these moral intuitions to be justified, if they are? In this seminar the relevant literature on moral justifications in such trolley cases will be reviewed as well as on methodological problems pertaining to the role of intuitions in moral justifications. Neuropsychological research on such cases as well as critique of the methods and normative presuppositions used in that research will be debated. Finally, attempts to apply such moral reasoning on allegedly analogous cases arising in autonomous robots will be discussed.

Abstract: This course teaches the basic principles of evolution, cell biology, molecular biology, genetics and developmental biology using the example of humans. 

Objective: 
1) Students can explain the importance of evolution for the development of humans and diseases. 
2) The students know the cell as the smallest unit of the body. They can explain how the functions of the cell are disturbed in certain diseases and where therapies intervene. They can describe the multiplication of cells in the body and show how errors in this multiplication can lead to diseases. 
3) The students know DNA as the basis of life. They can explain how the DNA information is stored and how this information can be reproduced and protected from damage. They can describe how the information is read and translated into proteins. They can explain which mechanisms at the level of DNA, RNA and proteins can cause diseases. 
4) Students can explain which technologies can be used to diagnose and treat diseases. 
5) Students can explain how people differ genetically and know the molecular basis of these differences. They can explain how these differences can lead to diseases and why some of these differences do not affect diseases. 
6) The students know the molecular causes of the most common hereditary diseases and can determine the probability of occurrence and transmission to offspring. 
7) Students can explain the biochemical and molecular basis of human reproduction and know the basic principles of human embryonic development. The students can explain which mechanisms can be disturbed by a faulty development. 

Lecture notes: See Moodle 

Prerequisites / notice: The course is accompanied by exercises on Moodle (BYOD: http://www.ethz.ch/byod), group projects and mid-terms (learning elements). Upon successful completion of the learning elements (at least 80% of the total possible points must be achieved), students can receive bonus points, which can be credited towards the grade of the final examination. Acquiring points from the group projects and the mid-terms requires on-site participation (no online participation possible). Acquiring bonus points is not a prerequisite for taking part in the final exam.

Competencies: Subject-specific Competencies, Method-specific Competencies, Social Competencies, Personal Competencies

Literature: Further literature includes: 
- "Biology - How life works", Morris et al. 
- "Evolutionary Analysis", Herron & Freeman 
- "Genetics: From Genes To Genomes", Goldberg & Fischer 
- "Molecular Biology of the Cell", Alberts et al. 

Weiterführende Literatur: 
Objective
Students learn to...

- encode a problem into a program, test the program, and correct errors.
- understand and improve existing code.
- deal with the complexity of real data.
- store data in a suitable data structure.
- query databases and understand and evaluate the corresponding database model.
- implement models from the natural sciences as a simulation.
- run random experiments and interpret the results.
- explain and apply standard algorithms and evaluate their efficiency.

Content
1. Variables, data types
2. Control structures, logic
3. Sequential data types, search- and sort algorithms, sequence analysis
4. Functions, modules, simulation and animation
5. Manage data with a relational database
6. Matrices, random experiments, cellular automata

Lecture notes
All materials for the lecture are available at www.gdi.ethz.ch

Literature

Prerequisites / notice
This course is based on application-oriented learning. The students spend most of their time working through projects with data from natural science and discussing their results with teaching assistants. To learn the computer science basics there are electronic tutorials available.

C. Thilgen

Abstract
Fundamentals of Organic Chemistry: molecular structure. Bonding and functional groups; nomenclature; resonance and aromaticity; stereochemistry; conformation; bond strength; organic acids and bases; basic reaction thermodynamics and kinetics; reactive intermediates: carbanions, carbenium ions and radicals.

Objective
Understanding the basic concepts and definitions of organic chemistry. Knowledge of the functional groups and classes of compounds that are important in biological systems. Foundations for the understanding of the relationship between structure and reactivity.

Content

Lecture notes
Lecture notes are available (pdf file). Exercises, answer keys and other handouts can be downloaded from the Moodle course "Organic Chemistry I" of the current semester (https://moodle-app2.let.ethz.ch).

Literature

Prerequisites / notice
The course consists of lectures (36 hours) and problem-solving lessons (20 hours, groups of ca. 25 people). In addition, online exercises are available in the e-learning environment Moodle (Course OC I).
# Mathematics I

**Abstract**
Mathematics I/II is an introduction to one- and multidimensional calculus and linear algebra emphasizing on applications.

**Objective**
Students understand mathematics as a language for modeling and as a tool for solving practical problems in natural sciences.

Students can analyze models, describe solutions qualitatively or calculate them explicitly if need be. They can solve examples as well as their practical applications manually and using computer algebra systems.

**Content**

### Eindimensionale diskrete Entwicklungen ###
- linear, exponentiell, begrenzt, logistisch
- Fixpunkte, diskrete Veränderungsrate
- Folgen und Grenzwerte

### Funktionen in einer Variablen ###
- Reproduktion, Fixpunkte
- Periodizität
- Stetigkeit

### Differentialrechnung (I) ###
- Veränderungsrate/-geschwindigkeit
- Differentialquotient und Ableitungsfunktion
- Anwendungen der Ableitungsfunktion

### Integralrechnung (I) ###
- Stammfunktionen
- Integrationstechniken

### Gewöhnliche Differentialgleichungen (I) ###
- Qualitative Beschreibung an Beispielen: Beschränkt, Logistisch, Gompertz
- Stationäre Lösungen
- Lineare DGL 1. Ordnung
- Trennung der Variablen

### Lineare Algebra ###
- Erste Arithmetische Aspekte
- Matrizenrechnung
- Eigenwerte / -vektoren
- Quadratische LGS und Determinante

**Lecture notes**
In Ergänzung zu den Vorlesungskapiteln der Lehrveranstaltungen fassen wir wichtige Sachverhalte, Formeln und weitere Ausführungen jeweils in einem Vademecum zusammen.

Dabei gilt:

* Die Skripte ersetzen nicht die Vorlesung und/oder die Übungen!
* Ohne den Besuch der Lehrveranstaltungen verlieren die Ausführungen ihren Mehrwert.
* Details entwickeln wir in den Vorlesungen und den Übungen, um die hier bestehenden Lücken zu schliessen.
* Prüfungsrelevant ist, was wir in der Vorlesung und in den Übungen behandeln.

**Literature**
Siehe auch Lernmaterial > Literatur

**Abstract**

Dieser Kurs vermittelt die Grundlagen der Physiologie und Anatomie des menschlichen Körpers.

**Objective**

- Der Schwerpunkt dieses Kurses liegt auf dem Verständnis der physiologischen Mechanismen des menschlichen Körpers. Im Mittelpunkt steht dabei der gesunde Mensch, ergänzt um Beispiele für klinisch wichtige Funktionsstörungen/Krankheiten. Im Sinne einer integrativen Betrachtungsweise wird bezüglich Funktion jeweils der Bogen von den molekularen Mechanismen bis zum komplexen Zusammenspiel der Organe im Gesamtkörper gespannt. Die Anatomie wird dort speziell besprochen, wo sie für das Verständnis der Funktion notwendig oder hilfreich ist.

Der Kurs umfasst das Herbst- (Teil I) und das Frühjahrsemester (Teil II). Im Teil I werden Kern-Konzepte der Physiologie vermittelt, also die grundlegenden Mechanismen, die für das Verständnis aller physiologischen Prozesse notwendig sind. Im Teil I werden zudem die allgemeinen Aspekte des Nervensystems und des endokrinen Systems eingeführt, da alle Organfunktionen letztlich unter nervaler und endokriner Kontrolle stehen.

**Content**

Humanphysiologie I (HS)

- «Kern-Konzepte» in der Physiologie
  1. Struktur und Funktion
  2. Energieübergang, -speicherung und -nutzung
  3. Informationsfluss, -speicherung und -nutzung
  4. Homöostase
  5. Evolution
- Allgemeine Endokrinologie und endokrines System
- Allgemeine Neurophysiologie und Neuroanatomie
- Die chemischen Sinne, Geschmack und Geruch
- Empfindung und Verdauung
- Leber und Stoffwechsel
- Energiehomöostase
- Flüssigkeits- und Stoffwechsel und Niere
- Reproduktion, Entwicklung und Altern

Humanphysiologie II (FS)

- Sinnesphysiologie
- Muskelphysiologie
- Neuronale Kontrolle von Haltung und Bewegung
- Höhere zentralnervöse Hirnfunktionen
- Atmung und Lunge
- Herz und Kreislauflauf
- Blut
- Immunologie
- Thermoregulation/Fieber
- Stress

**Lecture notes**

Online-Material wird im Laufe des Kurses zur Verfügung gestellt.

**Abstract**

Vertiefung der mehrdimensionalen Analysis mit Schwerpunkt in der Anwendung der partiellen Differentialgleichungen, Vertiefung der linearen Algebra und Einführung in die Systemanalyse und Modellbildung.

**Objective**

- verstehen Mathematik als Sprache zur Modellbildung und als Werkzeug zur Lösung angewandter Probleme in den Naturwissenschaften.
- können anspruchsvolle Modelle analysieren, Lösungen qualitativ beschreiben oder allenfalls explizit berechnen: diskret/kontinuierlich in Zeit, Ebene und Raum.
- können Beispiele und konkrete arithmetische und geometrische Situationen aus Anwendungen mit Methoden der höheren Mathematik interpretieren und bearbeiten.

402-0083-00L Physics I O 4 credits 3V+1U K. S. Kirch

Abstract

This course is an introduction to classical physics, with special focus on applications in medicine.

Objective

Obtain an understanding of basic concepts in classical physics and their application (using mathematical preknowledge) to the solution of simple problems, including certain applications in medicine.

Obtain an understanding of relevant quantities and of orders of magnitude.

Content

General introduction; Positron-Emission-Tomography as appetizer, including ionising radiation; kinematics of a point mass; dynamics of a point mass (Newton’s axioms and forces); physical work, power and energy; conservation of linear and angular momentum; oscillations and waves; mechanics of a rigid body; fluid mechanics; introduction to electricity.

Lecture notes

Will be distributed at the start of the semester.

#### Abstract

This practical course is designed to give students hands on experience in CAD, FEM, product optimization, mechanical load testing, software development and hardware utilization in robotics.

#### Objective

The course aims at teaching and solidifying following topics:

- CAD
- FEM
- Product optimization
- Mechanical testing
- Software development
- Hardware usage in robotics

#### Content

The course is aimed at improving the students knowledge on certain topics such as programming in python and biomechanics, but also teaches new skills such as using CAD software, FEM and mechanical testing. The course is split into 6 sessions, which will be completed in groups. The students will be assigned to groups at the beginning of the semester. 4 of the experiments will be geared towards the use case of designing a bone plate to bridge a critical size gap of a femur. The experiments are therefore 1) using CAD to reconstruct the initial condition and the bone plate 2) running a FEM in order to analyze the performance of the bone plate 3) with the knowledge of the FEM, optimizing the bone plate and 4) testing of the designed bone plate, the bone plate will be 3D printed. The remaining 2 experiments will 1) focus on programming a robotic arm used in rehabilitation engineering and 2) on the hardware usage of the robotic arm including force sensors and EMG.

#### Abstract

- Learning to view the human body as a (bio-) mechanical system. Making the connections between everyday movements and sports activity with injury, discomfort, prevention and rehabilitation.

- Students are able to describe the human body as a mechanical system. They analyse and describe human movement according to the laws of mechanics.

#### Objective

- Movement- and sports biomechanics deals with the attributes of the human body and their link to mechanics. The course includes topics such as functional anatomy, biomechanics of daily activities (gait, running, etc.) and looks at movement in sport from a mechanical point of view. Furthermore, simple reflections on the loading analysis of joints in various situations are discussed. Additionally, questions covering the statics and dynamics of rigid bodies, and inverse dynamics, relevant to biomechanics are investigated.

#### Content

- They analyse and describe human movement according to the laws of mechanics.

#### Competencies

- Subject-specific Competencies
  - Concepts and Theories: assessed
  - Techniques and Technologies: fostered

Rehabilitation and Inclusion  
W  3 credits  2G  R. Riener

Abstract
This course presents origins and prevention of different physical, sensory, mental impairments, their treatments, and methods of assistance in public and home environments. Rehabilitation is put into a larger context providing insights into healthcare systems, health economy, accessibility, barrier-free architecture, para-sports, legal & regulatory aspects, disability policy, and inclusion.

Objective
With this lecture, we want to not only transfer a broad knowledge about rehabilitation and inclusion, but also raise awareness about the challenges and needs of people with impairments, the economy and the overall society. Students should learn about the complex and multi-faceted interaction of care, treatment, assistance, reimbursement, accessibility, legal regulation, and social inclusion. This knowledge and awareness should be presented in a multi-modal way using interactive tools and organizing group/plenary discussions.

Content
The course will cover the following topics:

- Introduction: definition of terms, historical and legal background, role of the UNO, WHO, ICRC
- Origins: reasons and origins of physical, sensory and mental impairments; surgical and pharmaceutical treatments
- Therapy: physical therapy, occupational therapy, speech therapy, psychotherapy
- Technological support: Robot-aided therapy, Virtual Reality, muscle stimulation, Brain-Computer Interfaces (BCIs)
- Home therapy: personal assistance, mobile health systems, tele-monitoring, tele-therapy
- Assistive technologies: gait assistance, prosthesis, orthoses, seeing/hearing aids, etc.
- Social inclusion: definition of normality and belongingness, social behaviours, UN-BRK, etc.
- Accessibility: national and international aspects of accessibility
- Health economy in rehabilitation: public and private cost models, health insurance, SUVA, IV
- Barrier-free building and living: environmental obstacles, norms in architecture, inclusive design
- Parasports: history of Olympics and Paralympics, Special Olympics, Deaflympics, Cybathlon
- Policy: health, social, equal opportunity, disability
- Regulatory affairs: ethics committees, Swissmedic, Bundesamt für Gesundheit (BAG), law and disability
- Prevention: primary and secondary prevention, social prevention

Competencies

Subject-specific Competencies
- Concepts and Theories
  - Techniques and Technologies
  - Analytical Competencies
  - Decision-making
  - Media and Digital Technologies
  - Problem-solving

Method-specific Competencies
- Social Competencies
  - Communication
  - Cooperation and Teamwork
  - Leadership and Responsibility
  - Sensitivity to Diversity

Personal Competencies
- Adaptability and Flexibility
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

Focus-Project Human Movement Science and Sport  
W  10 credits  21A  Supervisors

Abstract
Develop and realize a project from A-Z in a team! Applying and deepening existing knowledge, working in teams and independently, learning to structure problems, identifying solutions, system analysis and simulations, as well as presentation and documentation techniques.

Objective
- Synthesizing and deepening the theoretical knowledge from the basic courses of semesters 1-4
- Team organization, working in teams, improvement of interpersonal skills
- Independence, initiative, independent learning of new topic contents
- Problem structuring, solution identification in indistinct problems definitions, searching for information
- System description and simulation
- Presentation techniques, creating documentation
- Decision-making ability, implementation skills
- Expanding and recess of special knowledge

Content
Prerequisites / notice
In teams of 3-8 students, the students are integrated into a research group at D-HEST, where they work independently on a project.

Focus-Project Human Movement Science and Sport  
W  20 credits  43A  Supervisors

Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The focus is on learning the basic vocabulary of biomedical engineering and getting familiar with concepts that govern common medical instruments and the most important organs from an engineering point of view.

Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The course provides an overview of the various topics of the different tracks of the biomedical engineering master course and helps orienting the students in selecting their specialized classes and project locations. It also serves as an introduction to the field for students of the ITET, MAVT, HEST and other bachelor programs.

In addition, the most recent achievements and trends of the field of biomedical engineering are also outlined.

History of BME and the role of biomedical engineers. Ethical issues related to BME. Biomedical sensors both wearable and also biochemical sensors.

Bioelectronicso: Nernst equation, Donnan equilibrium, equivalent circuits of biological membranes and bioelectronic devices.

Bioinformatics: genonomic and proteomic tools, databases and basic calculations.

Equations describing basic reactions and enzyme kinetics.

Medical optics: Optical components and systems used in hospitals.

Basic concepts of tissue engineering and organ printing.

Biomaterials and their medical applications.

Function of the heart and the circulatory system.

Transport and exchange of substances in the human body, compartment modeling.

The respiratory system.

Bioimaging.

Orthopedic biomechanics.

Lectures (2h), discussion of practical exercises (1h) and homework exercises.

AND

moodle page of the course

No specific requirements, BUT

ITET, MAVT, PHYS students will have to learn a lot of new words related to biochemistry, biology and medicine, while HEST and BIOL students will have to grasp basic engineering concepts (circuits, equations, etc.).

No specific requirements, BUT

moodle page of the course

Materials and Mechanics in Medicine

Abstract

Understanding of physical and technical principles in biomechanics, biomaterials, and tissue engineering as well as a historical perspective.

Mathematical description and problem solving. Knowledge of biomedical engineering applications in research and clinical practice.

Understanding of physical and technical principles in biomechanics, biomaterials, tissue engineering. Mathematical description and problem solving. Knowledge of biomedical engineering applications in research and clinical practice.

Biocompatible Materials

Abstract

Introduction into natural and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering, drug delivery and for medical devices are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated. Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed.

A link between academic research and industrial entrepreneurship is demonstrated by external guest speakers, who present their current research topics.
**Rehabilitation and Inclusion**

**Abstract**
This course presents origins and prevention of different physical, sensory, mental impairments, their treatments, and methods of assistance in public and home environments. Rehabilitation is put into a larger context providing insights into healthcare systems, health economy, accessibility, barrier-free architecture, para-sports, legal & regulatory aspects, disability policy, and inclusion.

**Objective**
With this lecture, we want to not only transfer a broad knowledge about rehabilitation and inclusion, but also raise awareness about the challenges and needs of people with impairments, the economy and the overall society. Students should learn about the complex and multi-faceted interaction of care, treatment, assistance, reimbursement, accessibility, legal regulation, and social inclusion. This knowledge and awareness should be presented in a multi-modal way using interactive tools and organizing group/plenar discussions.

**Content**
- Synthesizing and deepening the theoretical knowledge from the basic courses of semesters 1-4
- Expanding and recess of special knowledge
- Decision-making ability, implementation skills
- System description and simulation
- Problem structuring, solution identification in indistinct problems definitions, searching for information
- Team organization, working in teams, improvement of interpersonal skills
- Independence, initiative, independent learning of new topic contents
- Presentation techniques, creating documentation
- Decision-making ability, implementation skills
- Expanding and recess of special knowledge

**Prerequisites / notice**
- First year examinations successfully passed
- Blocks A, B and C successfully passed by project start

---

**Focus-Project Medical Technology 1/2**

**Abstract**
Develop and realize a project from A-Z in a team! Applying and deepening existing knowledge, working in teams and independently, learning to structure problems, identifying solutions, system analysis and simulations, as well as presentation and documentation techniques.

**Objective**
- Synthesizing and deepening the theoretical knowledge from the basic courses of semesters 1-4
- Team organization, working in teams, improvement of interpersonal skills
- Independence, initiative, independent learning of new topic contents
- Problem structuring, solution identification in indistinct problems definitions, searching for information
- System description and simulation
- Presentation techniques, creating documentation
- Decision-making ability, implementation skills
- Expanding and recess of special knowledge

**Prerequisites / notice**
- In teams of 3-8 students, the students are integrated into a research group at D-HEST, where they work independently on a project.
- First year examinations successfully passed
- Blocks A, B and C successfully passed by project start

---

**Focus-Project Medical Technology 1/1**

**Abstract**
Develop and realize a project from A-Z in a team! Applying and deepening existing knowledge, working in teams and independently, learning to structure problems, identifying solutions, system analysis and simulations, as well as presentation and documentation techniques.

**Objective**
- Synthesizing and deepening the theoretical knowledge from the basic courses of semesters 1-4
- Team organization, working in teams, improvement of interpersonal skills
- Independence, initiative, independent learning of new topic contents
- Problem structuring, solution identification in indistinct problems definitions, searching for information

Cells undergo major functional alterations as we age. In this course, we will discuss the basic molecular and cell biological mechanisms of cellular ageing. We will also discuss diseases related to cellular ageing and current rejuvenation and therapeutic strategies for cellular ageing in health and disease.

Objective
- Basic molecular and cell biological mechanisms of cellular ageing;
- Diseases related to cellular ageing;
- Current rejuvenation and therapeutic strategies for cellular ageing in health and disease.

Content
Lecture-1: Hallmarks of cellular ageing
Lecture-2: Cellular microenvironment & extra-cellular matrix
Lecture-3: Cell morphometric changes & cytoskeletal remodeling
Lecture-4: Proteostasis
Lecture-5: Mitochondrial dysfunction
Lecture-6: Endo-membrane signaling
Lecture-7: Nuclear signaling & epigenetic alternations
Lecture-8: Chromatin remodeling & gene expression
Lecture-9: Genomic integrity
Lecture-10: Ageing cell secretome and cellular homeostasis
Lecture-11: Diseases associated with cellular ageing
Lecture-12: Cellular rejuvenation strategies
Lecture-13: Therapeutic interventions to cellular ageing
Lecture-14: Concluding lecture

Supervisors
In teams of 3-8 students, the students are integrated into a research group at D-HEST, where they work independently on a project. Concepts in Modern Genetics

Focus-Project Molecular Health Sciences 1/2

Abstract
Develop and realize a project from A-Z in a team! Applying and deepening existing knowledge, working in teams and independently, learning to structure problems, identifying solutions, system analysis and simulations, as well as presentation and documentation techniques.

Objective
- Synthesizing and deepening the theoretical knowledge from the basic courses of semesters 1-4
- Team organization, working in teams, improvement of interpersonal skills
- Independence, initiative, independent learning of new topic contents
- Problem structuring, solution identification in indistinct problems definitions, searching for information
- System description and simulation
- Presentation techniques, creating documentation
- Decision-making ability, implementation skills
- Expanding and recess of special knowledge

Content
In teams of 3-8 students, the students are integrated into a research group at D-HEST, where they work independently on a project.

Prerequisites / notice
Prerequisites for the focus projects:
- a. First year examinations successfully passed
- b. Blocks A, B and C successfully passed by project start

Focus-Project Molecular Health Sciences 1/1

Abstract
Develop and realize a project from A-Z in a team! Applying and deepening existing knowledge, working in teams and independently, learning to structure problems, identifying solutions, system analysis and simulations, as well as presentation and documentation techniques.

Concepts in Modern Genetics

Information for UZH students: Enrolment to this course unit only possible at ETH. No enrolment to module BIO348 at UZH.

Please mind the ETH enrolment deadlines for UZH students: https://www.ethz.ch/en/studies/non-degree-courses/special-students/special-students-university-of-zurich.html

Abstract
Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Objective
This course focuses on the concepts of classical and modern genetics and genomics.

Content
The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Lecture notes
Scripts and additional material will be provided during the semester.
Competencies

Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Immunology I

W 3 credits 2V M. Kopf, A. Oxenius

Abstract
Introduction into structural and functional aspects of the immune system. Basic knowledge of the mechanisms and the regulation of an immune response.

Objective
Introduction into structural and functional aspects of the immune system. Basic knowledge of the mechanisms and the regulation of an immune response.

Content
- Introduction and historical background
- Innate and adaptive immunity, Cells and organs of the immune system
- B cells and antibodies
- Generation of diversity
- Antigen presentation and Major Histoincompatibility (MHC) antigens
- Thymus and T cell selection
- Autoimmunity
- Cytotoxic T cells and NK cells
- Th1 and Th2 cells, regulatory T cells
- Allergies
- Hypersensitivities
- Vaccines, immune-therapeutic interventions

Lecture notes
Electronic access to the documentation will be provided. The link can be found at "Lernmaterialien"

Literature
- Kuby, Immunology, 9th edition, Freeman + Co., New York, 2020

Prerequisites / notice
For D-BIOL students Immunology I (WS) and Immunology II (SS) will be examined as one learning entity in a “Sessionsprüfung”. All other students write separate exams for Immunology I and Immunology II. All exams (combined exam Immunology I and II, individual exams) are offered in each exam session.

Neurosciences

Advanced Neuroanatomy and Neurophysiology

W 4 credits 2G M. Willecke, S. Meissner, D. P. Wolfer

Study Regulations 2017: Not useful for students who have already taken the course "Neuroanatomy and Neurophysiology" in the 3rd semester.

Abstract
Advanced knowledge of anatomy and physiology of the nervous system.

Objective
The course equips students with advanced knowledge of the anatomical structure and function of the most important structures of the central nervous system. They will understand pathophysiological mechanisms and identify explanations for the occurrence of specific symptoms in neurological diseases. They will also be able to apply their knowledge to describe the mechanism of action of drugs. In addition, they learn the most important methods for analyzing the functions of the nervous system and will be able to use this knowledge to evaluate experimental data.

Content
1. Anatomy: How is the central nervous system structured?
2. Motor control: which structures are involved in voluntary and involuntary movements?
3. Sensory, somatosensory and sensorimotor integration: how is information from different systems integrated and interpreted by the brain?
4. Higher brain functions: What specializations enable us to speak and process emotions and feelings?

Prerequisites / notice

### Development of the Nervous System (University of Zurich)

- **Abstract**: The lecture will cover molecular and cellular processes underlying the development of the nervous system (neurogenesis, cell death, cell migration and differentiation, axon guidance and synapse formation). The importance of these processes in the context of developmental diseases is discussed.

- **Objective**: On successful completion of the module the student should be able to:
  - relate structure and function of the nervous system to its development
  - apply principles of molecular, cellular, and developmental biology to the development of the nervous system
  - identify key steps in development underlying neurological syndromes and diseases

- **Key skills**: On successful completion of the module the student should be able to:
  - interpret and critically evaluate original research reports
  - apply knowledge and relate experimental approaches from molecular, cellular and developmental biology to the developing nervous system.

- **Content**: The lecture will cover molecular and cellular processes underlying the development of the nervous system. After an introduction to structure and function of the nervous system, we will discuss neurogenesis, cell death, cell migration and differentiation, axon guidance and synapse formation. The importance of these processes in the context of developmental diseases will be discussed.

- **Literature**: The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on OLAT.

- **Prerequisites / notice**: BIO142 Developmental Biology, BIO143 Neurobiology

### Molecular Neurophysiology: From Molecules to Systems

- **Abstract**: The course covers the physiology of nerve cells, from the single cell through the neuronal network to the systemic level. The focus is on molecular and cellular mechanisms – synaptic transmission, signal transduction, gene expression, synaptic plasticity.

- **Objective**: Based on an understanding of molecular and cellular mechanisms, the aim is to provide a deepened insight into neurophysiological processes underlying complex brain functions – learning/memory, sleep, sensory.

- **Content**: First, basic molecular and cellular mechanisms in nerve cells (excitability, neurotransmission, signal transduction, gene expression, synaptic plasticity) are introduced. Afterwards, their significance for selected neurophysiological processes (learning/memory, sleep, sensory) will be illuminated.

- **Literature**: The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on Moodle.

- **Competencies**: The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on Moodle.

### Focus-Project Neurosciences 1/2

- **Abstract**: Develop and realize a project from A-Z in a team! Applying and deepening existing knowledge, working in teams and independently, learning to structure problems, identifying solutions, system analysis and simulations, as well as presentation and documentation techniques.
Objective
- Synthesizing and deepening the theoretical knowledge from the basic courses of semesters 1-4
- Team organization, working in teams, improvement of interpersonal skills
- Independence, initiative, independent learning of new topic contents
- Problem structuring, solution identification in indistinct problems definitions, searching for information
- System description and simulation
- Presentation techniques, creating documentation
- Decision-making ability, implementation skills
- Expanding and recess of special knowledge

Content
In teams of 3-8 students, the students are integrated into a research group at D-HEST, where they work independently on a project.

Prerequisites / notice
Prerequisites for the focus projects:
- First year examinations successfully passed
- Blocks A, B and C successfully passed by project start

Abstract
Dieser Kurs vermittelt die Grundlagen der Physiologie und Anatomie des menschlichen Körpers

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 1221 of 2684
Objective

Der Schwerpunkt dieses Kurses liegt auf dem Verständnis der physiologischen Mechanismen des menschlichen Körpers. Im Mittelpunkt steht dabei der gesunde Mensch, ergänzt um Beispiele für klinisch wichtige Funktionsstörungen/Krankheiten. Im Sinne einer integrativen Betrachtungsweise wird bezüglich Funktion jeweils der Bogen von den molekularen Mechanismen bis zum komplexen Zusammenspiel der Organe im Gesamtkörper gespannt. Die Anatomie wird dort speziell besprochen, wo sie für das Verständnis der Funktion notwendig oder hilfreich ist.

Der Kurs umfasst das Herbst- (Teil I) und das Frühjahrsemester (Teil II). Im Teil I werden Kern-Konzepte der Physiologie vermittelt, also die grundlegenden Mechanismen, die für das Verständnis aller physiologischen Prozesse notwendig sind. Die Studierenden werden dadurch befähigt, diese allgemeinen Prinzipien auf die Funktionen aller Organsysteme und deren Zusammenspiel anzuwenden. Im Teil I werden zudem die allgemeinen Aspekte des Nervensystems und des endokrinen Systems eingeführt, da alle Organfunktionen letztlich unter nervaler und endokriner Kontrolle stehen.

Content

Humanphysiologie I (HS)

- "Kern-Konzepte" in der Physiologie
  1. Struktur und Funktion
  2. Energietransfer, -speicherung und -nutzung
  3. Informationsfluss, -speicherung und -nutzung
  4. Homöostase
  5. Evolution
- Allgemeine Endokrinologie und endokrines System
- Allgemeine Neurophysiologie und Neuroanatomie
- Die chemischen Sinne, Geschmack und Geruch
- Ernährung und Verdauung
- Leber und Stoffwechsel
- Energiehomöostase
- Flüssigkeits- und Elektrolythaushalt und Niere
- Reproduktion, Entwicklung und Altern

Humanphysiologie II (FS)

- Sinnesphysiologie
- Muskelphysiologie
- Neuronale Kontrolle von Haltung und Bewegung
- Höhere zentralnervöse Hirnfunktionen
- Atmung und Lunge
- Herz und Kreislauf
- Blut
- Immunologie
- Thermoregulation/Fieber
- Stress

Lecture notes

Online-Material wird im Laufe des Kurses zur Verfügung gestellt.

Literature

Competencies

Subject-specific Competencies

Concepts and Theories assessed

Method-specific Competencies

Analytical Competencies fostered

401-0293-00L Mathematics III O 5 credits 3V+2U A. Caspar, N. Hungerbühler

Abstract

Vertiefung der mehrdimensionalen Analysis mit Schwerpunkt in der Anwendung der partiellen Differentialgleichungen, Vertiefung der Linearen Algebra und Einführung in die Systemanalyse und Modellbildung.

Objective

Die Studierenden

- verstehen Mathematik als Sprache zur Modellbildung und als Werkzeug zur Lösung angewandter Probleme in den Naturwissenschaften.
- können anspruchsvolle Modelle analysieren, Lösungen qualitativ beschreiben oder allenfalls explizit berechnen: diskret/kontinuierlich in Zeit, Ebene und Raum.
- können Beispiele und konkrete arithmetische und geometrische Situationen aus Anwendungen mit Methoden der höheren Mathematik interpretieren und bearbeiten.
Einführung Modellbildung

- SIR-Modelle: Ausbreitung von Krankheiten bei Epidemien
- Pocken-Modell: Was ist der Effekt von Impfungen?

Lineare Modelle

- Vektorräume
- Lösungsraum eines Linearen DGL-Systems
- Diagonalisierbarkeit und Normalformen
- Exponential einer Matrix

Fourier-Reihen

- Euklidische Vektorräume
- Orthogonale Projektion
- Anwendungen

Nichtlineare Modelle

- Stationäre Lösungen, Qualitative Aussagen
- Mehrdimensionale Modelle: Räuber-Beute, Lotka-Volterra

Partielle Differentialgleichungen: Vorgänge, die von Raum und Zeit abhängen

- Einführung, Repetition, Beispiele
- Fourier-Methoden: Wärmeleitung, Laplace, Wellengleichung, Filter, Computertomographie

Laplace-Transformation

- Definition und Notation
- Rechenregeln
- Anwendungsbeispiele

Abstract

Vertiefung von Statistikmethoden. Nach dem detaillierten Fundament aus Statistik I liegt nun der Fokus auf konzeptueller Breite und konkreter Problemlösungsfähigkeit mit der Statistiksoftware R.

Objective

Movement and Sport Biomechanics

**Objective**
Students are able to describe the human body as a mechanical system. They analyse and describe human movement according to the laws of mechanics.

**Content**
Movement- and sports biomechanics deals with the attributes of the human body and their link to mechanics. The course includes topics such as functional anatomy, biomechanics of daily activities (gait, running, etc.) and looks at movement in sport from a mechanical point of view. Furthermore, simple reflections on the loading analysis of joints in various situations are discussed. Additionally, questions covering the statics and dynamics of rigid bodies, and inverse dynamics, relevant to biomechanics are investigated.

**Lecture notes**
Is available within the Moodle

**Exercise Physiology**

**Objective**
The aim of this course is to understand molecular and systemic aspects of neuromuscular, cardiovascular and respiratory adaptations to acute and chronic exercise as well as the interaction of the different systems regarding health-relevant aspects and performance in healthy people and persons with selected diseases. Furthermore, students will understand the influence of genetics, gender, age, altitude/depth, heat and cold on the named factors.

**Content**
History of Exercise Physiology, research methods, fibertype heterogeneity and its functional significance, neural control of muscle force, molecular and cellular mechanisms of muscle adaptation to resistance, endurance and stretching exercise, interindividual variability in the response to training, cardiorespiratory and metabolic responses to acute and chronic exercise, sex differences relevant to exercise performance, exercise in hot and cold environment, children and adolescents in sport and exercise, exercise at altitude and depth, aging and exercise performance, exercise for health, exercise in the context of disease.

**Lecture notes**
Online material is provided during the course.

**Literature**
Wird in der Vorlesung bekannt gegeben.

**Prerequisites / notice**
Anatomy and Physiology I + II

Rehabilitation and Inclusion

**Objective**
With this lecture, we want to not only transfer a broad knowledge about rehabilitation and inclusion, but also raise awareness about the challenges and needs of people with impairments, the economy and the overall society. Students should learn about the complex and multi-faceted interaction of care, treatment, assistance, reimbursement, accessibility, legal regulation, and social inclusion. This knowledge and awareness should be presented in a multi-modal way using interactive tools and organizing group/plenary discussions.

**Content**
The course will cover the following topics:
- Introduction: definition of terms, historical and legal background, role of the UNO, WHO, ICRC
- Origins: reasons and origins of physical, sensory and mental impairments; surgical and pharmaceutical treatments
- Therapy: physical therapy, occupational therapy, speech therapy, psychotherapy
- Technological support: Robot-aided therapy, Virtual Reality, muscle stimulation, Brain-Computer Interfaces (BCIs)
- Home therapy: personal assistance, mobile health systems, tele-monitoring, tele-therapy
- Assistive technologies: gait assistance, prosthesis, orthoses, seeing/hearing aids, etc.
- Social inclusion: definition of normality and belongingness, social behaviours, UN-BRK, etc.
- Accessibility: national and international aspects of accessibility
- Health economy in rehabilitation: public and private cost models, health insurance, SUVA, IV
- Barrier-free building and living: environmental obstacles, norms in architecture, inclusive design
- Parapastics: history of Olympics and Paralympics, Special Olympics, Deaflympics, Cybathlon
- Policy: health, social, equal opportunity, disability
- Regulatory affairs: ethics committees, Swiss medic, Bundesamt für Gesundheit (BAG), law and disability
- Prevention: primary and secondary prevention, social prevention

This course focuses on the concepts of classical and modern genetics and genomics.

**Content**  
The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

**Lecture notes**  
Scripts and additional material will be provided during the semester.

**551-0317-00L Immunology I**

**Abstract**  
Introduction into structural and functional aspects of the immune system. Basic knowledge of the mechanisms and the regulation of an immune response.

**Objective**  
Introduction into structural and functional aspects of the immune system. Basic knowledge of the mechanisms and the regulation of an immune response.

**Content**  
- Innate and adaptive immunity, Cells and organs of the immune system
- B cells and antibodies
- Generation of diversity
- Antigen presentation and Major Histoincompatibility (MHC) antigens
- Thymus and T cell selection
- Autoimmunity
- Cytotoxic T cells and NK cells
- TH1 and TH2 cells, regulatory T cells
- Allergies
- Hypersensitivities
- Vaccines, immune-therapeutic interventions

**Lecture notes**  
Electronic access to the documentation will be provided. The link can be found at “Lernmaterialien”

**Literature**  
- Kuby, Immunology, 9th edition, Freemen + Co., New York, 2020

**Prerequisites / notice**  
For D-BIOL students Immunology I (WS) and Immunology II (SS) will be examined as one learning entity in a “Sessionsprüfung”. All other students write separate exams for Immunology I and Immunology II. All exams (combined exam Immunology I and II, individual exams) are offered in each exam session.

**376-1348-00L Cellular Ageing**

**Abstract**  
Cells undergo major functional alterations as we age. In this course, we will discuss the basic molecular and cell biological mechanisms of cellular ageing. We will also discuss diseases related to cellular ageing and current rejuvenation and therapeutic strategies for cellular ageing in health and disease.

**Objective**  
- Basic molecular and cell biological mechanisms of cellular ageing;
- Diseases related to cellular ageing;
- current rejuvenation and therapeutic strategies for cellular ageing in health and disease.
### Medical Technology

227-0386-00L | Biomedical Engineering | W | 4 credits | 3G | J. Vörös, S. J. Ferguson, S. Kozerke, M. P. Wolf, M. Zenobi-Wong

**Abstract**
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The focus is on learning the basic vocabulary of biomedical engineering and getting familiar with concepts that govern common medical instruments and the most important organs from an engineering point of view.

**Objective**
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The course provides an overview of the various topics of the different tracks of the biomedical engineering master course and helps orienting the students in selecting their specialized classes and project locations. It also serves as an introduction to the field for students of the ITET, MAVT, HEST and other bachelor programs. In addition, the most recent achievements and trends of the field of biomedical engineering are also outlined.

**Content**
- History of BME and the role of biomedical engineers. Ethical issues related to BME.
- Biomedical sensors both wearable and also biochemical sensors.
- Bioelectronics: Nernst equation, Donnan equilibrium, equivalent circuits of biological membranes and bioelectronic devices.
- Bioinformatics: genomic and proteomic tools, databases and basic calculations.
- Equations describing basic reactions and enzyme kinetics.
- Medical optics: Optical components and systems used in hospitals.
- Basic concepts of tissue engineering and organ printing.
- Biomaterials and their medical applications.
- Function of the heart and the circulatory system.
- Transport and exchange of substances in the human body, compartment modeling.
- The respiratory system.
- Bioimaging.
- Orthopedic biomechanics.

**Lecture notes**
Introduction to Biomedical Engineering by Enderle, Banchard, and Bronzino

AND
moodle page of the course

**Prerequisites / notice**
No specific requirements, BUT ITET, MAVT, PHYS students will have to learn a lot of new words related to biochemistry, biology and medicine, while HEST and BIOL students will have to grasp basic engineering concepts (circuits, equations, etc.).

Data: 06.08.2024 12:40 Autumn Semester 2024 Page 1226 of 2684
Introduction into biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the

Subject-specific Competencies

Handouts are deposited online (moodle).

Concepts and Theories

Advanced Neuroanatomy and Neurophysiology

Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.

Objective

The course covers the following topics:

1. Introduction into molecular characteristics of molecules involved in the materials-biology interface. Molecular design of biomaterials.
2. The concept of biocompatibility.
3. Introduction into methodology used in biomaterials research and application.
4. Introduction to different material classes in use for medical applications.

Content

Introduction into natural and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering, drug delivery and for medical devices are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated. Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed.

A link between academic research and industrial entrepreneurship is demonstrated by external guest speakers, who present their current research topics.

Lecture notes

Handouts and references therein.

Literature

(available online via ETH library)

376-1220-00L  Rehabilitation and Inclusion  W  3 credits  2G  R. Rienzi

Abstract

This course presents origins and prevention of different physical, sensory, mental impairments, their treatments, and methods of assistance in public and home environments. Rehabilitation is put into a larger context providing insights into healthcare systems, health economy, accessibility, barrier-free architecture, para-sports, legal & regulatory aspects, disability policy, and inclusion.

Objective

With this lecture, we want to not only transfer a broad knowledge about rehabilitation and inclusion, but also raise awareness about the challenges and needs of people with impairments, the economy and the overall society. Students should learn about the complex and multi-faceted interaction of care, treatment, assistance, reimbursement, accessibility, legal regulation, and social inclusion. This knowledge and awareness should be presented in a multi-modal way using interactive tools and organizing group/plenary discussions.

Content

The course will cover the following topics:

- Introduction: definition of terms, historical and legal background, role of the UNO, WHO, ICRC
- Origins: reasons and origins of physical, sensory and mental impairments; surgical and pharmaceutical treatments
- Therapy: physical therapy, occupational therapy, speech therapy, psychotherapy
- Technological support: Robot-aided therapy, Virtual Reality, muscle stimulation, Brain-Computer Interfaces (BCIs)
- Home therapy: personal assistance, mobile health systems, tele-monitoring, tele-therapy
- Assistive technologies: gait assistance, prosthesis, orthoses, seeing/hearing aids, etc.
- Social inclusion: definition of normality and belongingness, social behaviours, UN-BRK, etc.
- Accessibility: national and international aspects of accessibility
- Health economy in rehabilitation: public and private cost models, health insurance, SUVA, IV
- Barrier-free building and living: environmental obstacles, norms in architecture, inclusive design
- Parasports: history of Olympics and Paralympics, Special Olympics, Deaflympics, Cybathlon
- Policy: health, social, equal opportunity, disability
- Regulatory affairs: ethics committees, Swissmedic, Bundesamt für Gesundheit (BAG), law and disability
- Prevention: primary and secondary prevention, social prevention

Competencies

- Subject-specific Competencies: Concepts and Theories (assessed)
- Method-specific Competencies: Analytical Competencies (assessed), Decision-making (assessed), Media and Digital Technologies (fostered), Problem-solving (assessed)
- Social Competencies: Communication (fostered), Cooperation and Teamwork (fostered), Leadership and Responsibility (fostered), Sensitivity to Diversity (fostered)
- Personal Competencies: Adaptability and Flexibility (fostered), Creative Thinking (assessed), Critical Thinking (assessed), Integrity and Work Ethics (fostered), Self-awareness and Self-reflection (fostered), Self-direction and Self-management (fostered)

Neurosciences

Number  Title  Type  ECTS  Hours  Lecturers

376-0007-01L  Advanced Neuroanatomy and Neurophysiology  W  4 credits  2G  M. Willecke, S. Meissner, D. P. Wolfer

Abstract

Advanced knowledge of anatomy and physiology of the nervous system.
Objective

The course equips students with advanced knowledge of the anatomical structure and function of the most important structures of the central nervous system. They will understand pathophysiological mechanisms and identify explanations for the occurrence of specific symptoms in neurological diseases. They will also be able to apply their knowledge to describe the mechanism of action of drugs. In addition, they learn the most important methods for analyzing the functions of the nervous system and will be able to use this knowledge to evaluate experimental data.

Content

1. Anatomy: How is the central nervous system structured?

2. Motor control: which structures are involved in voluntary and involuntary movements?

3. Sensory, somatosensory and sensorimotor integration: how is information from different systems integrated and interpreted by the brain?

4. Higher brain functions: What specializations enable us to speak and process emotions and feelings?

Prerequisites / notice

Während der Grundvorlesung (Anatomie und Physiologie 1) haben Sie bereits viele der in dieser Vorlesung behandelten Themen kennengelernt, allerdings nicht so detailliert. In dieser Vorlesung wird der Stoff der Grundvorlesung vertieft und erweitert. Es wird vorausgesetzt, dass Sie die in der Grundvorlesung besprochenen Inhalte bereits kennen. Der Stoff aus der Grundvorlesung wird nur teilweise repetiert.

Die Lektionen zur Neurophysiologie enthalten Einheiten des Selbststudiums. Dabei bearbeiten Sie Arbeitsaufträge in einem Polybook, um ein konzeptionelles Verständnis für die behandelten Themen zu entwickeln.

Prerequisites / notice

UZH Module Code: BIO344

Abstract

The lecture will cover molecular and cellular processes underlying the development of the nervous system (neurogenesis, cell death, cell migration and differentiation, axon guidance and synapse formation). The importance of these processes in the context of developmental diseases is discussed.

Objective

On successful completion of the module the student should be able to

- relate structure and function of the nervous system to its development - apply principles of molecular, cellular, and developmental biology to the development of the nervous system - apply knowledge and relate experimental approaches from molecular, cellular and developmental biology to the developing nervous system.

Key skills

On successful completion of the module the student should be able to

- interpret and critically evaluate original research reports
- apply knowledge and relate experimental approaches from molecular, cellular and developmental biology to the developing nervous system.

Content

The lecture will cover molecular and cellular processes underlying the development of the nervous system. After an introduction to structure and function of the nervous system, we will discuss neurogenesis, cell death, cell migration and differentiation, axon guidance and synapse formation. The importance of these processes in the context of developmental diseases will be discussed.

Lecture notes

Must be downloaded from OLAT: https://www.olat.uzh.ch/olat/dmz/as BIO344

Literature

The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on OLAT.

Prerequisites / notice

376-1305-00L Development of the Nervous System (University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: BIO344

Mind the enrolment deadlines at UZH: https://www.uzh.ch/cmssssl/en/studies/application/deadline s.html

Prerequisites / notice

376-1305-01L Molecular Neurophysiology: From Molecules to Systems

Information for UZH students:

Enrolment to this course unit only possible at ETH. Please mind the ETH enrolment deadlines for UZH students: https://ethz.ch/en/studies/non-degree-courses/special-students/special-students-university-of-zurich.html

Abstract

The course covers the physiology of nerve cells, from the single cell through the neuronal network to the systemic level. The focus is on molecular and cellular mechanisms – synaptic transmission, signal transduction, gene expression, synaptic plasticity.
Objective

Based on an understanding of molecular and cellular mechanisms, the aim is to provide a deepened insight into neurophysiological processes underlying complex brain functions – learning/memory, sleep, sensory.

Content

First, basic molecular and cellular mechanisms in nerve cells (excitability, neurotransmission, signal transduction, gene expression, synaptic plasticity) are introduced. Afterwards, their significance for selected neurophysiological processes (learning/memory, sleep, sensory) will be illuminated.

Literature

The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on Moodle.

Abstract

Signals arise in most engineering applications. They contain information about the behavior of physical systems. Systems respond to signals and produce other signals. In this course, we explore how signals can be represented and manipulated, and their effects on systems. We further explore how we can discover basic system properties by exciting a system with various types of signals.

Objective

Master the basics of signals and systems. Apply this knowledge to problems in the homework assignments and programming exercise.

Content

Lecture notes

Lecture notes available on course website.

151-0604-00L Microrobotics

Abstract

Microrobotics is an interdisciplinary field that combines aspects of robotics, micro and nanotechnology, biomedical engineering, and materials science. The aim of this course is to expose students to the fundamentals of this emerging field. Throughout the course, the students apply these concepts in assignments. The course concludes with an end-of-semester examination.

Objective

The objective of this course is to expose students to the fundamental aspects of the emerging field of microrobotics. This includes a focus on physical laws that predominate at the microscale, technologies for fabricating small devices, bio-inspired design, and applications of the field.

Content

Main topics of the course include:
- Scaling laws at micro/nano scales
- Electrostatics
- Electromagnetism
- Low Reynolds number flows
- Observation tools
- Materials and fabrication methods
- Applications of biomedical microrobots

Lecture notes

The powerpoint slides presented in the lectures will be made available as pdf files. Several readings will also be made available electronically.

Prerequisites / notice

The lecture will be taught in English.

151-0917-00L Mass Transfer

Abstract

This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore, the application of these principles to important engineering problems is demonstrated.

Objective

This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore, the application of these principles to important engineering problems is demonstrated.
**Fostered Competencies**

- Concepts and Theories
- Techniques and Technologies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Communication
- Cooperation and Teamwork
- Sensitivity to Diversity
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

---

### Objective

Students attending this highly-demanding course are expected to allocate sufficient time within their weekly schedule to successfully conduct the exercises.

### Abstract

### Content

- Atomic structure
- Crystalline structure and defects
- Thermodynamics, phase diagrams and phase transformations
- Diffusion
- Mechanical and thermal properties of materials

### Literature

---

### Objective

Students are able to:

- name the basic concepts of materials science. (remember, 1)
- describe simple relations between atomic structure and macroscopic properties. (understand, 2)
- calculate basic material-specific quantities. (apply, 3)
- read and interpret phase diagrams, material characteristic (e.g. stress-strain) diagrams and Ashby plots (analyse, 4)

### Competencies

- Concepts and Theories
- Techniques and Technologies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Communication
- Cooperation and Teamwork
- Creative Thinking
- Critical Thinking
- Self-awareness and Self-reflection
- Self-direction and Self-management

---

### Objective

Conduct physical performance tests and measurements that are typically used to assess performance of athletes and/or patients and that deepen the understanding of physiological processes in response to physical exertion.

### Abstract

Gain hands-on experience in exercise physiology and consolidate knowledge on physiological adaptations to different types and degrees of physical activity and climatic influences. Learn fundamental assessment techniques of the muscular system, the cardio-respiratory system and of whole-body performance, learn scientifically correct data analysis and interpretation of results. Insight into today's Sports Medicine.
## Content

Various exercise tests assessing human performance and assessments of physiological responses to activity (examples are VO2max-test, Conconi-Tests, Determination of anaerobic threshold, Cooper-Test, 1-repetition maximum test, lactate minimum test), dynamometry, mechanography, body composition etc.). Insight into measurements in Sports Medicine.

## Lecture notes

Tutorial on Laboratory Experiments in Exercise Physiology
(Editor: Exercise Physiology Lab)

## Literature

Schmidt/Lang/Heckmann: Physiologie des Menschen, Springer-Verlag, Heidelberg

Kenney/Wilmore/Costill: Physiology of Sport and Exercise, Human Kinetics

## Prerequisites / notice

Anatomy and physiology classes and lab course in physiology successfully completed (BWS students please contact C. M. Spengler)

Desirable:
Exercise Physiology Lecture (concomitantly or passed; is selection criterion in case of more applications than lab spaces)

<tr>
<td><strong>Abstract</strong></td>
<td>This lecture is intended as an introduction to sport psychology and imparts knowledge on selected areas of the subject. Students are given insight into different work areas of sport psychology. In order to understand what «sport psychology» is, it is necessary to explain the essence and tasks of sport psychology and what it relates to, and to work out an underlying basis for key topics, such as cognition and emotions. Students' expertise is furthered by presenting and providing more in-depth treatment of additional topics of sport psychology. Selected intervention forms are intended to provide insight into applied sport psychology and ensure that mental processes and their impact in sport can be recognised. Case studies and practical exercises (e.g. objective training) are intended to prompt students to reflect to a greater extent on the forms in which sport psychology can be applied in their practice of sports and to integrate these in their teaching.</td>

Content
From a public health perspective, there are a number of social circumstances that have a high potential for disease and even increased risk of mortality for the affected populations.

These major social health risks include the following:
- unemployment and social decline
- poverty and social deprivation
- loneliness and social isolation
- migration and social discrimination
- overindebtedness and social marginalization
- risky behavior and unhealthy social lifestyles

Such living conditions and behaviors have been shown to cause increased health risks, but do not necessarily mean that all those affected have comparatively poor health or low life expectancy.

Potentially affected individuals, however, do fundamentally represent health risk groups, which include the following groups of people:
- (long-term) unemployed, disenrolled, welfare recipients, etc.
- those at risk of and affected by poverty, including homeless, low-income, working poor, single parents, etc.
- lonely or solitary people and the socially disintegrated
- immigrants, refugees, etc.
- heavily indebted, insolvent people, people affected by wage garnishment, private bankruptcy, etc.
- addicts (incl. drug, alcohol, gambling and work addicts), underweight or overweight and obese, sedentary and physically inactive people, etc.

Prerequisites / notice
Willingness to regularly attend and actively participate in the course.

<thead>
<tr>
<th>376-1127-00L</th>
<th>Sociology of Sport</th>
<th>W</th>
<th>2 credits</th>
<th>2V</th>
<th>R. Bürgi</th>
</tr>
</thead>
</table>
| Objective    | The lectures set out to:  
- present the different dimensions, functions and interrelationships of present-day sport  
- provide an introduction to the central theories and models of (sport) sociology  
- show how far sport reflects society and how it changes and becomes more differentiated in the process  
- take current examples to highlight the sociological view of sport. |
| Content      | Sport and social change: developments and trends  
The economy and the media: commercialisation, logic, dependencies  
Social inequalities and distinctions: social impact, health and sport, sport and gender  
Conflicts and politics: sports organizations, doping, violence |
| Lecture notes | Selected materials for the lecture are available on the Moodle platform. |
| Competencies | Subject-specific Competencies: Concepts and Theories  
Method-specific Competencies: Analytical Competencies  
Social Competencies: Sensitivity to Diversity  
Personal Competencies: Critical Thinking |

A detailed program with additional references will be delivered at the beginning of the lecture.

<th>2 credits</th>
<th>2G</th>
<th>H. Nägeli</th>
</tr>
</thead>
<tbody>
<tr>
<td>Objective</td>
<td>Students are able to describe selected chemicals, biological and molecular processes that occur in cells spontaneously or after physical or chemical exposure and resulting in a tumor. They are able to list important cancer-inducing agents and explain the respective mechanism of action. They have knowledge of significant risk factors for cancer diseases. They are confronted with the basics of toxicology and they can explain the principle of the most common therapeutic strategies.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| Content      | The lecture deals with problems of tumor epidemiology (causes, mortality, incidence). Cancer is delineated as a multi-step process. Classes of chemical compounds that induce cancer are discussed as well as the reactive metabolites that may be built from. Covalent binding to DNA is discussed and different types of mutations resulting thereof. A selection of proto-oncogenes and tumor suppressor genes is presented. Their function will be discussed as well as the changes which are found in these genes in tumor cells, starting from single nucleotide exchanges up to large deletions.  
The reason for genetic predisposition to cancer will be discussed as well as cancer relevant aspects of cell cycle regulation. The role of tumor microenvironments and phenomenons like angiogenesis and metastasis are presented as well as the mechanisms that protect the genome from mutagenic damage. Further subjects address old and new strategies of cancer treatment. Personalised cancer treatment. |
| Lecture notes | Handouts with reproductions of all presented transparencies will be distributed. |
| Prerequisites / notice | The lecture requires an active participation of the students. All students will participate in individual or group work focussing on specific subject of the lecture. Students will have ample time for preparation during lecture time. |

376-1661-00L Ethics of Life Sciences and Biotechnology W 3 credits 2V A. Blasimme, E. Vayena

Abstract

This semester course enables students to recognize, anticipate and address ethical issues in the domain of health sciences and their assessed

Objective

This course is tailored to students who want to become familiar with the analysis of ethical issues in all the different domains of life sciences and biotechnology. The course aims at equipping students with the necessary knowledge and analytic skills to understand, discuss and address the ethical aspects of science and technology in the domain of human health. The specific learning objectives of this course are:

A. Identify ethical issues in life sciences and biotechnology.
B. Analyze and critically discuss ethical issues in life sciences and biotechnology.
C. Become aware of relevant legal and public policy frameworks.
D. Distinguish different ethical approaches and argumentative strategies in applied ethics.
E. Recognize how ethical issues relate to different accounts of technology and innovation.
F. Develop a personal and critical attitude towards the ethical aspects of life sciences and their technological application.
G. Autonomous anticipate ethical issues.
H. Propose and communicate solutions to ethical challenges and dilemmas.

Content

The course starts off with an introductory lecture on ethics as a discipline and an overview of the most relevant approaches in the domain of assessed

Data: 06.08.2024 12:40 Autumn Semester 2024 Page 1233 of 2684
Objective: This course is tailored to D-HEST students who want to become familiar with pharmaceutical development and its ethical implications. By the end of this course, students will have developed a comprehensive understanding of the ethical complexities and challenges in drug development. They will be equipped with the knowledge and analytical skills to navigate ethical reasoning and contribute to the responsible advancement of pharmaceutical research. The specific learning objectives of the course are:

- Discuss relevant legal and public policy frameworks in drug development, ensuring an understanding of the broader regulatory context within which policy and regulatory decisions are made.
- Recognize and identify ethical dilemmas inherent to drug development, fostering a heightened awareness of ethical considerations across various stages of the process.
- Identify and discuss ethical issues in drug development in light of recent advances in the field of artificial intelligence.
- Critically analyze ethical challenges within drug development, enabling them to discuss complex issues, evaluate competing ethical perspectives, and form reasoned judgments.
- Understand the ethical theories and principles that underpin drug regulation.
- Evaluate the ethical implications of alternative pathways, such as Accelerated Approval and Compassionate Use, equipping students to assess potential benefits, risks, and societal consequences.
- Assess the ethical dimensions of drug pricing decisions and their impact on equity and accessibility, encouraging thoughtful reflection on the broader societal implications of pricing strategies.

Content:

- Principles of biomedical ethics and how they relate pharmaceutical innovation
  - Introduction to drug development, with a focus on the Swiss regulatory ecosystem
  - Current trends and impediments to effective drug development, including the use of AI in drug discovery
  - Translational medicine and its ethical implications
  - Ethical Aspects of pre-clinical research, including animal replacement technologies like organoids and organ chips
  - Ethical aspects of clinical research
  - Special regulatory pathways: expanded access / compassionate use
  - Special regulatory pathways: accelerated approval
  - Drug development and public health. emergency use of new drugs
  - Drug pricing: introduction to its regulatory and ethical aspects

Abstract:

- Basics of Exercise Therapy: A: diagnostic, anamnesis, diagnostic of movement and function, assessments in exercise therapy, diagnostic of experience and behavior in relation to movement
- Biological-medical basics, pathophysiological Basics (internal, orthopedic and psychological deseases.

Objective:

- Students learn the assessments to plan an exercise-therapy-treatment.

Content:

- Grundlagen der Diagnostik, Anamnese, Bewegungsdagnostik, Funktionsdiagnostik
- Sport- und Bewegungstherapeutische Testverfahren
- Motorische Basisdiagnostik
- Diagnostik bewegungsbezogenen Erlebens und Verhaltens
- Biologisch-medicinische Grundlagen
- Biomechanik (v.a. Gelenke), Pathophysiologische Grundlagen, Modelle der Methodik und Didaktik, Lektionsplanung

Literature:

- Schüle / Huber: Grundlagen der Sporttherapie, Deutscher Ärzteverlag, Köln 2012
- Deimel et al.: Neue aktive Wege in Prävention und Rehabilitation, Deutscher Arztverlag, Köln 2007

Prerequisites / notice:

- The courses “Exercise and Sports Therapy 1 and 2” have been completed successfully.
- 90% of the lections students must be present.
- open-book-test in the last sessions at 20.12.2017

Prerequisites:

- 1715-00L “Introduction to Exercise Therapy” passed.
- Prerequisite: Anatomy and Physiology.

Objective

The following issues will be discussed: Epidemiology and etiology of spinal cord injury; complications and consequences of spinal cord injury; trainability/exercise physiology and spinal cord injury; history and organisation of wheelchair sports; elite sport and spinal cord injury

Content

- Intensive discussion concerning complications of a spinal cord injury and their consequences on trainability and exercise performance of persons sitting in a wheelchair. Overview on the clinical application of exercise testing as well as on the implementation of sport scientific findings to optimise performance of individuals with spinal cord injury in rehabilitation and elite sports.
- The participants know different aspects of relationship formation (therapist/client) in therapeutic work.
- Communication and conversation: client-centered forms of conversation in theory and practice
- Psychoregulative Methods: Theoretical and practical insight into various psychoregulative methods
- Some seminar day in an institution/company specialized in reintegration of clients into the workforce.

Prerequisites:

- One seminar day in an institution/company specialized in reintegration of clients into the workforce.
- Does not take place this semester.
- Open-book-test in the last sessions at 20.12.2017

Assignment:

• Discuss relevant legal and public policy frameworks in drug development, ensuring an understanding of the broader regulatory context within which policy and regulatory decisions are made.
• Discuss relevant legal and public policy frameworks in drug development, ensuring an understanding of the broader regulatory context within which policy and regulatory decisions are made.
• Assess the ethical dimensions of drug pricing decisions and their impact on equity and accessibility, encouraging thoughtful reflection on the broader societal implications of pricing strategies.

Abstract
Introduction to Python Programming provides an overview of the basic programming blocks needed to translate a problem, stated in textual form, into an algorithm that solves it. The course provides an introduction to python programming and covers basics but also Bash scripting, version controlling and an introduction to the use of computer infrastructure such as EULER.

Objective
- understand and use variables
- work with common Python data types like integers, floats, strings, characters, lists, dictionaries, as well as pandas DataFrames
- use and implement basic flow control, including for loops and conditionals
- write Python code according to standard style guidelines
- use common python packages and set-up of a coding environment
- manipulate and extract data from pandas DataFrames
- interpret and handle simple error messages with the help of online resources
- have a general understanding of the coding workflow and typical code blocks, data and contained types

Content
- General Introduction, installation, IDEs, (virtual) environment setup
- Interpreting and handling error messages, debugging, using online documentation
- Data types, data containers and basic mathematical computations
- Branching and looping
- Writing and reading files
- Writing and using functions
- Data manipulation in pandas
- Data visualization (seaborn, matplotlib)

Prerequisites / notice
Students should bring a laptop
The lectures provide a comprehensive survey of pharmacology and toxicology. Special emphasis is placed on the interrelationship between Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines.

Recommended reading:

Prerequisites / notice

For Pharmacy and non-Pharmacy students, Medicinal Chemistry I and II are examined in a SINGLE examination (Jahresprüfung).

**Abstract**

The lectures give an overview of selected drugs and the molecular mechanisms underlying their therapeutic effects in disease. The historical and modern-day methods by which these drugs were discovered and developed are described. Structure-function relationships and the biophysical rules underlying ligand-target interactions will be discussed and illustrated with examples.

**Objective**

Basic understanding of therapeutic agents with respect to molecular, pharmacological and pharmaceutical properties.

**Content**

Molecular mechanisms of action of drugs. Structure function and biophysical basis of ligand-target interactions

**Lecture notes**

Will be provided in parts before each individual lecture.

**Literature**

**Prerequisites / notice**

Attendance of Medicinal Chemistry II in the spring semester.

For Pharmacy and non-Pharmacy students, Medicinal Chemistry I and II are examined in a SINGLE examination (Jahresprüfung).

**Abstract**

This two-semester lecture course provides a detailed understanding of the fundamentals of drug action and the therapeutic use of important classes of drugs. The lectures are intended for students of pharmaceutical sciences.

**Objective**

The lectures provide a comprehensive survey of pharmacology and toxicology. Special emphasis is placed on the interrelationship between pharmacological, pathological and clinical aspects.

**Content**

Topics include disease-relevant macroscopic, microscopic, pathobiochemical and functional disturbances of specific organs and organ systems. The lectures integrate disease pathology with mechanisms of drug action, usage, metabolism, pharmacokinetics, side effects, toxicity, contraindications and dosage of relevant drugs. Basic principles of clinical pharmacology and pharmacotherapy will be covered.

**Lecture notes**

A script is provided for each lecture. Scripts define important course contents but do not replace the lectures.

Gene Technology

Abstract
The course gives a description and summary of the field of gene technology and its pharmaceutical applications. The course focuses on important methods and technologies and their application for genomic, transcriptomic and proteomic analyses in human biology.

Objective
The course gives an overview of current state-of-the-art and advancement in the fields of gene technology. Herein, the course focuses on genomic, transcriptomic and proteomic analysis and their uses in drug discovery and biomedical applications. The course is structured into lectures and practical examples drawn from the research field. Upon completion, the students are familiar and know current state-of-the-art of methods and applications, but are also able to classify, contrast and apply different strategies and methods within the field of gene technology. The course is suited for advanced undergraduate and early graduate students in pharmaceutical sciences or related fields.

Content

I) Genomics and transcriptomics
Methods and Techniques:
- Recombinant DNA technology
- Next generation sequencing methods, sequencing of genomes
- CRISPR technology

Application to human biology:
- Functional genomics/transcriptomics
- Principles of cancer, genetic diseases
- Therapies: cell-based therapies/gene therapies/DNA and RNA vaccination

II) Proteomics
Methods and Techniques:
- Protein cloning and expression
- The antibody molecule
- Measurement and determination of biomolecular interactions
- Protein characterization and engineering
- Modifications and radioactive labelling

Application to human biology:
- Protein therapeutics
- Proteomic approaches for identification of novel disease-related targets and biomarkers

III) Drug discovery: Protein-based libraries

- Immune repertoire mining
- Display and selection technologies
  1. antibody phage display
  2. other polypeptide display technologies
  3. small-molecules display: DNA-encoded chemical libraries

Lecture notes
The lecture series follows the above-described content, and the students are provided with the lecture slides and additional notes. The additional notes are needed for the in-depth study of the individual topics, and to set the frame and content of the in-class group work of the chosen examples.

**551-0319-00L Cellular Biochemistry (Part I)**

**Abstract**
Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

**Objective**
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

**Content**
Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalization of biochemical processes.

**Lecture notes**
Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biolog.ethz.ch)

**Literature**
Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

**Prerequisites / notice**
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

**376-1987-00L Physiology of Eating**

**Abstract**
Introduction to the basic knowledge necessary for an understanding of the physiology and pathology of hunger, satiation, satiety, and body weight regulation, how this knowledge is generated, and how it helps improve nutritional advice for healthy people as well as nutritional guidelines for patients.

**Objective**
This course requires basic knowledge in physiology. The course covers psychological and physiological determinants of food selection and amount eaten. The aim is to introduce the students to (a) the basic knowledge necessary for an understanding of the physiology and pathology of hunger, satiation, satiety, and body weight regulation, (b) how new scientific knowledge in this area is generated, (c) how this basic knowledge helps improve nutritional advice for healthy people as well as nutritional guidelines for patients. Major topics are: Basic scientific concepts for the physiological study of eating in animals and humans; the psychopharmacology of reward; endocrine and metabolic controls of eating; the neural control of eating; psychological aspects of eating; eating behavior and energy balance; exercise, eating and body weight; popular diets and their critical evaluation; epidemiology: clinical features and the treatment of psychiatric eating disorders; epidemiology, clinical features and the treatment of obesity, including related aspects of non-insulin dependent diabetes; mechanisms of cachexia and anorexia during illness; exogenous factors that influence eating, including pharmaceutical drugs, alcohol, coffee, etc.

**Lecture notes**
Handouts will be provided.

**752-4005-00L Food Microbiology I**

**Abstract**
This lecture is the first part of a one-year course. It offers insights into the fundamentals and applications of Food Microbiology. Contents include basic microbiology of the different bacteria, yeasts and molds present in foods, as well as the occurrence and control of foodborne pathogens and spoilage organisms.

**Objective**
The lecture offers insights into the fundamentals and applications of Food Microbiology. Contents include basic microbiology of the different bacteria, yeasts, molds and protozoa in foods, as well as the occurrence and control of foodborne pathogens and spoilage organisms. The focus of this first part of the two part lecture (Food Micro II is offered in the FS) will be on the organisms, but also on the factors which determine spoilage and foodborne disease.
Introduction to Nutritional Science

W 3 credits 2V  I. Herter-Aeberli, K. Giller, C. Wolfrum

Abstract
This course introduces basic concepts of micro- and macronutrient nutrition. Micronutrients studied include fat-soluble and water-soluble vitamins, minerals and trace elements. Macronutrients include proteins, fat and carbohydrates. Special attention is given to nutrient digestion, bioavailability, metabolism and excretion with some focus on energy metabolism.

Objective
To introduce the students to the both macro- and micronutrients in relation to food and metabolism.

Content
The course is divided into two parts: Micronutrients and macronutrients. The micronutrient part includes fat-soluble vitamins, water-soluble vitamins, minerals and trace elements. The macronutrient part introduces basic nutritional aspects of proteins, fats, carbohydrates and energy metabolism. The nutrients are described in relation to digestion, absorption and metabolism. Special aspects of homeostasis and homeorhesis are emphasized.

Lecture notes
There is no script. Powerpoint presentations will be made available.

Nutrition-Related Physiology

W 3 credits 2V  F. von Meyenn, E. Gasser

Abstract
Gives the students background knowledge necessary for a basic understanding of the complex relationships between food composition and nutrition on one hand and the functioning, as well as the malfunctioning, of major organ systems on the other hand.

Objective
Some basic knowledge in physiology is recommended for this course, which revisits important physiological topics, emphasizing their relation to nutrition. The aim is to give the students background knowledge necessary for a basic understanding of the complex relationships between food composition and nutrition on one hand and the functioning, as well as the malfunctioning, of major organ systems on the other hand. For students with a background in medicine, pharmacy or biology, the course is useful as a review of previously acquired knowledge. Major topics are basic neuroanatomy and neurophysiology; general endocrinology; the physiology of taste and smell; nutrient digestion and absorption; intermediary metabolism and energy homeostasis; and some aspects of cardiovascular physiology and water balance.

Lecture notes
Handouts for each lecture will be uploaded to Moodle every week.
Abstract
The course introduces basic concepts of the interaction between nutrition and exercise performance.

Objective
To understand the potential effects of nutrition on exercise performance, with a focus on concepts and principles of nutrition before, during and after exercise.

Content
The course will cover elementary aspects of sports nutrition physiology, including carbohydrate, glycogen, fat, protein and energy metabolism. A main focus will be to understand nutritional aspects before exercise to be prepared for intensive exercise bouts, how exercise performance can be supported by nutrition during exercise and how recovery can be assisted by nutrition after exercise. Although this is a scientific course, it is a goal of the course to translate basic sports nutrition science into practical sports nutrition examples.

Lecture notes
Lecture slides and required handouts will be available on the ETH website (moodle).

Literature
Information on further reading will be announced during the lecture. There will be some mandatory as well as voluntary readings.

Prerequisites / notice
General knowledge about nutrition, human biology, physiology and biochemistry is a prerequisite for this course. The course builds on basic nutrition and biochemistry knowledge to address exercise and performance related aspects of nutrition.

The course is designed for 3rd year Bachelor students, Master students and postgraduate students (MAS/CAS).
Anyone wishing to be a successful teacher must first of all understand the learning process. Against this background, theories and findings on how humans process information and on human behaviour are prepared in such a manner that they can be used for planning and conducting lessons. Students additionally gain an understanding of what is going on in learning and behavioural research so that teachers are in a position where they can further educate themselves in the field of research into teaching and learning.

Lernformen:

Coping with Psychosocial Demands of Teaching (EW4)

This course focuses on psychosocial demands of teaching. It is about learning in childhood and adolescence.

Abstract

This course looks into scientific theories and also empirical studies on human learning and relates them to the school.

Objective

Anyone wishing to be a successful teacher must first of all understand the learning process. Against this background, theories and findings on how humans process information and on human behaviour are prepared in such a manner that they can be used for planning and conducting lessons. Students additionally gain an understanding of what is going on in learning and behavioural research so that teachers are in a position where they can further educate themselves in the field of research into teaching and learning.

Content

Thematical Schwerpunkte:

Lernen als Verhaltensänderung und als Informationsverarbeitung; Das menschliche Gedächtnis unter besonderer Berücksichtigung der Verarbeitung symbolischer Information; Lernen als Wissenskonstruktion und Kompetenzerwerb unter besonderer Berücksichtigung des Wissentransfers; Lernen durch Instruktion und Erklärungen; Die Rolle von Emotion und Motivation beim Lernen; Interindividuelle Unterschiede in der Lernfähigkeit und ihre Ursachen; Intelligenztheorien, Geschlechtsunterschiede beim Lernen

Lernformen:

Coping with Psychosocial Demands of Teaching (EW4 W)

The successful participation in EW1 ("Human Learning") and EW2 ("Designing Learning Environments for Schools") is recommended, but not a mandatory prerequisite.

Abstract

In this class, students will learn concepts and skills for coping with psychosocial demands of teaching

Objective

Students possess theoretical knowledge and practical competences to be able to cope with the psychosocial demands of teaching.

(1) They know relevant rules of conversation and conflict management and are able to apply them in an appropriate way in the school context (e.g. in parental talks).

(2) They know core aspects of classroom management and know how to apply it concretely (e.g. promoting a positive learning atmosphere, avoiding disciplinary difficulties) and they are aware of possible contacts (e.g. illegal or psychological services).

Cognitively Activating Instructions in MINT Subjects (EW2 DZ)

This seminar focuses on teaching units in chemistry, physics and mathematics that have been developed at the MINT Learning Center of the ETH Zurich. In the first meeting, the mission of the MINT Learning Center will be communicated. Furthermore, in groups of two, the students will intensively work on, refine and optimize a teaching unit following a goal set in advance.

Objective

- Get to know cognitively activating instructions in MINT subjects
- Get information about recent literature on learning and instruction

Prerequisites / notice

Für eine reibungslose Semesterplanung wird früh Anmeldung und persönliches Erscheinen zum ersten Lehrveranstaltungstermin empfohlen.
Course promotes exchange between student teachers and elementary school teachers in STEM teaching with 3 parts: 1) block seminar (ca. 16 h), 2) collaboration with elementary school teacher in a class (ca. 34 h, with approx. 50% spent in the elementary or middle school class and ca. 50% for preparation), and 3) final report (ca. 10 h). Registration implies participation in all 3 parts.

Students learn more about the potential and challenges of pupils. They get to know the early stages of knowledge as well as the development of pre-concepts of students in their subject area. The seminar with a phase of cooperation consists of three phases: In the block seminar, pre-concepts are discussed in their own subject as well as theoretical inputs from developmental and cognitive psychology. During the cooperation phase, a teaching task defined by the primary and secondary school teachers is actively undertaken in a class. Finally, a final report is written, which contains a description of the students' level of knowledge. This seminar is only suitable for students who can adapt flexibly to the needs of pupils from lower class levels.

In this course students learn the principles and techniques of teaching singular lessons, based on scientific knowledge about learning. The aim is to plan, realize, evaluate and reflect lessons effectively and efficiently.

Students take the learning goals as a starting point considering previous knowledge as well as the professional environment and the ambitions of the learners.

Students apply the basic teaching techniques of their subject area in a sensible way and know how to appropriately arrange the phases of learning.

Students know how to simplify and present complex technical contents of their subject area.

The teaching internship can just be visited if all other courses of TC are completed. Repetition of the teaching internship is excluded even if the examination lessons are to be repeated.

Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.

- They are able to assess the significance of tuition topics for their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They learn the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils' work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.
The mentored paper is designed to bring together the findings from the FD1 and the FD2. By using various teaching techniques and methods a semester plan, which is based on various curricula will be elaborated for a given topic.

1. The students have planned a curriculum for a semester course.
2. Students reflect on formative and summative ways such a teaching unit to examine and implement parts of it.
3. The students have implemented parts of the semester curriculum.
4. The students deal with the question to what extend teaching techniques, teaching methods but also sequences of self-study must be involved in the planning.

**Abstract**
Translational science is a cross-disciplinary scientific research that is motivated by the need for practical applications that help people (e.g. medicines). The course should help to clarify basics of translational science, illustrate successful applications and enable students to integrate key features into their future projects.

**Objective**
After completing this course, students will be able to understand:
- Principles of translational science including medical device development, intellectual property, regulatory environment and project management

Students should be able to apply this knowledge in drug development programs in Pharma, Biotech or their own spin-off.

**Content**
- What is translational science and what is not including:
  - How to identify need?
  - How to choose the appropriate research type and methodology
  - How to measure success?
  - How are medical devices developed?
  - How to handle IP in the development process?
  - How does the regulatory environment impact innovation?
  - How to manage complex development projects?
  - Positive and negative examples will be illustrated by distinguished guest speakers.

**Literature**
- Principles of Biomedical Sciences and Industry
- Translating Ideas into Treatments
  [https://doi.org/10.1002/9783527824014](https://doi.org/10.1002/9783527824014)

**Prerequisites / notice**
4x online input lecture followed by case preparation and symposium

**Competencies**
- Subject-specific Competencies: Concepts and Theories - assessed
- Method-specific Competencies: Analytical Competencies - assessed
- Social Competencies: Communication - fostered
- Personal Competencies: Adaptability and Flexibility - fostered

**Abstract**
The basic course in “Good Clinical Practice” (GCP) contains two full-time training days (Module 1 and Module 2) and addresses elementary aspects for the appropriate conduct of clinical trials and non-clinical research projects involving human beings. Successful participation will be confirmed by a certificate that is recognized by the Swiss authorities.

**Objective**
Students will get familiar with:
- Key Ethics documents
- (International) Guidelines and Laws (e.g. ICH-GCP, DIN EN ISO 14155, TPA, HRA)
- Sequence of research projects and project-involved parties
- Planning of research projects (statistics, resources, study design, set-up of the study protocol)
- Approval of research projects by Authorities (SwissEthics, Swissmedic, FOPH)
- Roles and responsibilities of project-involved parties

Students will learn how to:
- Classify research projects according the risk-based approach of the HRA
- Write a study protocol
- Inform participating patients/study subjects
- Obtain consent by participating patients/study subjects
- Classify, document and report Adverse Events
- Handle projects with biological material from humans and/or health-related personal data

**Content**

Module 1:
- Research and Research Ethics, Guidelines, (International) Legislation, Development of therapeutic products, Methodology (Study Design), Study documents (Study protocol, Investigator’s Brochure, Patient Information Leaflet, Informed Consent Form)

Module 2:
- Roles and Responsibilities, Approval procedures, Notification and Reporting, Study documentation, Research with biological material and health-related data, data protection, data retention
Abstract
This course provides hands-on experience with measurement and analysis methods relevant for Humans Systems Neuroscience and Motor control (nerve/brain stimulation, EMG, EEG, psycho-physical paradigms etc). Students read scientific material, set up experiments, perform measurements in the lab, analyse data, apply statistics and write short reports or essays.

Objective
This course will prepare students for experimental work as it is typically done during the master thesis. The goal is to gain hands-on experience with measurement and analysis methods relevant for Humans Systems Neuroscience and Motor control (for example peripheral nerve stimulation, electrical and magnetic brain stimulation, EMG, EEG, psycho-physical paradigms etc). Students will learn how to perform small scientific projects in this area. Students will work individually or in small groups and solve scientific problems which require them to perform measurements in human participants, extract relevant readouts from the data, apply appropriate statistics and interpret the results. They will also be required to write small essays and reports and they will get feedback on their writing throughout the course.

Prerequisites / notice
Students are required to have successfully completed the course "Neural control of movement and motor learning" and to have basic knowledge of applied statistics.

376-0223-00L Advanced Topics in Exercise Physiology ■ W 4 credits 2S C. Spengler, G. D'Hulst, F. Gabe Beltrami

Abstract
In this course, students read, present and discuss seminal papers in the area of exercise physiology. The focus lies on critical analysis of scientific content, conceptual as well as ethical aspects of publications. Students are trained in the most common scientific presentation techniques such as oral and poster presentations.

Objective
Students gain further knowledge and a deeper understanding of concepts in exercise physiology. Emphasis is put on critical analysis and discussion of scientific publications as well as on improving scientific presentation skills.

Content
About two third of the semester will be spent discussing structure and content of 2-3 scientific papers per double-lecture. This includes a student presenting the paper orally first, followed by the group discussion. Each student will also prepare and present a poster on a self-selected, scientific publication, participate in a poster discussion session and lead another discussion session as a facilitator. Students groups will prepare a scientific study design to a given, applied exercise physiology question. Furthermore, students will compare an article published in the lay press to the scientific publication the article is based on.

Literature
Material will be provided in moodle.

376-0225-00L Critical Appraisal of Evidence for Exercise in Health W 3 credits 2V E. Giannouli, E. de Bruin, R. Knols and Disease

Abstract
This course will discuss the mechanisms and latest evidence-based recommendations of physical activity and exercise for a series of conditions and populations. In the second part of each lecture session, published randomized controlled trials of the respective lecture's topic will be discussed and critically appraised based on established tools.

Objective
On completion of this course students will be able to:
1. understand the role of physical activity and sedentary behavior in the maintenance of health and the etiology, prevention and treatment of disease
2. synthesize effective physical activity and exercise interventions for the prevention and management of several diseases and populations
3. evaluate recent evidence regarding physical activity and exercise interventions

Content
New trends in physical activity for prevention and rehabilitation
Introduction to critical appraisal tools
Exercise for Cancer Rehabilitation
Exercise for Musculoskeletal Rehabilitation (Focus on Osteoarthritis and Low Back Pain)
Exercise in Parkinson's disease
Exercise for Rehabilitation of Metabolic Disorders (Focus on Obesity and Diabetes type 2)
Exercise for age-related diseases and disorders, Part A (Focus on Frailty and Falls)
Exercise for Stroke Rehabilitation
Exercise in Dementia and Mild Cognitive Impairment
Exercise for Children's Rehabilitation (focus on Cerebral Palsy)
Exercise for age-related diseases and disorders, Part B (Focus on Sarcopenia and Osteoporosis)
Exercise in Multiple Sclerosis
Exercise for Cardiovascular Rehabilitation (Focus on Heart Failure)

Literature

Competencies
- Subject-specific Competencies
  - Concepts and Theories assessed
  - Techniques and Technologies fostered
- Method-specific Competencies
  - Analytical Competencies fostered
  - Decision-making fostered
  - Problem-solving fostered
- Personal Competencies
  - Critical Thinking assessed
  - Integrity and Work Ethics fostered

376-1651-00L Clinical and Movement Biomechanics W 4 credits 3G D. K. Ravi, S. H. Hosseini Nasab, R. List, further lecturers

Abstract
This course includes an introduction to study design, measurement techniques, signal processing, as well as musculoskeletal modeling with regards to human movement and its clinical applications.

Objective
The students are able to analyse the human movement from a technical point of view, to process the data and perform modelling with a focus towards clinical application.

Competencies
- Subject-specific Competencies
  - Concepts and Theories assessed
  - Techniques and Technologies assessed

752-6101-00L Nutrition and Chronic Disease W 3 credits 2V F. von Meyenn, M. Andersson

Abstract
To have the student gain understanding of the links between the diet and the etiology and progression of chronic diseases, including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

Objective
To examine and understand the protective effect of foods and food ingredients in the maintenance of health and the prevention of chronic disease, as well as the progression of complications of the chronic diseases.

Content
The course evaluates food and food ingredients in relation to primary and secondary prevention of chronic diseases including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

Lecture notes
There is no script. Powerpoint presentations will be made available on-line to students.

Prerequisites / notice
No compulsory prerequisites, but prior completion of the courses "Introduction to Nutritional Science" and "Advanced Topics in Nutritional Science" is strongly advised.

|             | No specific requirements, BUT ITET, MAVT, PHYs students will have to learn a lot of new words related to biochemistry, biology and medicine, while HEST and BIOL students will have to grasp basic engineering concepts (circuits, equations, etc.). |
## Competencies

### Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

### Method-specific Competencies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving

### Social Competencies
- Communication
- Cooperation and Teamwork
- Customer Orientation
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation

### Personal Competencies
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

### Image Analysis and Computer Vision

**W 6 credits 3V+1U**  
E. Konukoglu, E. Erdil, F. Yu

**Abstract**

**Objective**
Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

**Content**
This course aims at offering a self-contained account of computer vision and its underlying concepts, including the recent use of deep learning.

The first part starts with an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First the interaction of light with matter is considered. The most important hardware components such as cameras and illumination sources are also discussed. The course then turns to image discretization, necessary to process images by computer.

The next part describes necessary pre-processing steps, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and 3D shape as two important examples. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed. A major part at the end is devoted to deep learning and AI-based approaches to image analysis. Its main focus is on object recognition, but also other examples of image processing using deep neural nets are given.

**Lecture notes**
Course material Script, computer demonstrations, exercises and problem solutions

**Prerequisites / notice**
Prerequisites: Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Python and Linux. The course language is English.

### From Publication to the Doctor's Office

**W 3 credits 2S+1A**  
O. Demler

**Abstract**
This seminar course is designed to provide students with an opportunity to review and critically evaluate recent publications in medical field focusing on examples when CS method or bioinformatics/statistical technique has lead to an instrumentation, technique or drug approved for clinical practice use.

**Objective**
Throughout the course, students will read and analyze recent publications that demonstrate successful applications and sometimes failures in medicine. Promising research applications will also be discussed. The publications will cover a wide range of topics, including drug discovery, image analysis, prognostic models, and learning healthcare.
The course will be structured as half lecture content and half seminar content. Lectures will review state of the medical practice prior to the discovery, obstacles in moving the field forward, and the need for improvement. Lectures will be followed by the seminar part where students will take turns presenting the assigned publications and leading the discussions. Students' presentations will focus on the main findings, and specific steps taken to translate the finding into clinical practice.

Publications will include examples of:
- specific CS/bioinformatics/statistics applications that has been brought to „bedside“ – has been approved by European Medicines Agency / Food and Drug Administration (USA) for clinical use or are widely used in medical research;
- examples of failures of how a discovery did not translate into an endproduct and why;
- current active research areas.

Covered topics will include some of the following:
- Drug discovery: Computer-aided drug discovery has become an integral part of the drug development process, enabling researchers
to design and screen large libraries of molecules in silico (i.e., using computer simulations) before synthesizing and testing them in the lab.
This has led to the discovery of new drug candidates for a wide range of diseases, including cancer, Alzheimer’s disease, and HIV/AIDS.
- Genomics: Advances in computational genomics have enabled researchers to analyze and interpret large-scale genomic data, including
DNA sequencing data, to identify disease-causing mutations, genetic risk factors, and drug targets. Examples of the development of
personalized medicine, where treatments are tailored to an individual’s genetic makeup. Examples when drug target identified by genetics
has led to approved treatment.
- Imaging: Computer vision and image processing techniques have revolutionized medical imaging, enabling researchers to extract
quantitative information from medical images that were previously inaccessible. This has led to the development of new diagnostic and
prognostic tools for a wide range of diseases, including cancer, cardiovascular disease, and neurological disorders.
- Real-world data applications: emulation of clinical trials using electronic health records data.
- Large language models: Generating clinical trial protocols using large language models. Natural Language Processing for information
extraction and interpretation.
- Learning healthcare systems: Advances in data analytics and information technology have enabled the development of learning
healthcare systems, which use real-time data from electronic health records, medical devices, and other sources to improve patient
outcomes and reduce healthcare costs. This has the potential to transform the way healthcare is delivered, making it more personalized,
efficient, and effective.

In addition to the presentations, students will also be required to write critical reviews of the assigned publications throughout the course.
The reviews will be evaluated based on the students’ ability to identify the strengths and weaknesses of the publications and to provide
insightful and constructive feedback.

Prerequisites / notice
The course is intended for advanced undergraduate and graduate students with a background in computer science, bioinformatics, or a
related field and interest in applying their skills to medical research.

This course assumes a working knowledge of R/Python and intermediate statistical analysis, including linear, logistic, survival regressions or
ability and interest to learn them outside of the class.

For PhD students, postdocs and others, a fee will be charged (https://scopem.ethz.ch/education/MTP.html).

All applicants must additionally register on this form: https://docs.google.com/forms/d/1Xw8L_3yXTE9qVxWtC6mnKMqvdVlx5jEa--9CwDXkd0/edit

The selected applicants will be contacted and asked for confirmation a few weeks before the course date.

Abstract
This introductory course on Scanning Electron Microscopy (SEM) emphasizes hands-on learning. Using ScopeM SEMs, students have the
opportunity to study their own samples (or samples provided) and solve practical problems by applying knowledge acquired during the
lectures. At the end of the course, students will be able to apply SEM for their (future) research projects.

Objective
- Set-up, align and operate a SEM successfully and safely;
- Understand important operational parameters of SEM and optimize microscope performance;
- Explain different signals in SEM and obtain secondary electron (SE) and backscatter electron (BSE) images.
- Operate the SEM in low-vacuum mode;
- Make use of EDX for semi-quantitative elemental analysis;
- Prepare samples with different techniques and equipment for imaging and analysis by SEM.
Content

During the course, students learn through lectures, demonstrations, and hands-on sessions how to setup and operate SEM instruments, including low-vacuum and low-voltage applications. This course gives basic skills for students new to SEM. At the end of the course, students are able to align an SEM, to obtain secondary electron (SE) and backscatter electron (BSE) images and to perform energy dispersive X-ray spectroscopy (EDX) semi-quantitative analysis. Emphasis is put on procedures to optimize SEM parameters in order to best solve practical problems and deal with a wide range of materials.

Lectures:
- Introduction on Electron Microscopy and instrumentation
- electron sources, electron lenses and probe formation
- beam/specimen interaction, image formation, image contrast and imaging modes.
- sample preparation techniques for EM
- X-ray micro-analysis (theory and detection), qualitative and semi-quantitative EDX and point analysis, linescan and spectral mapping

Practicals:
- Brief description and demonstration of the SEM microscope
- Practice on image formation, image contrast (and image processing)
- Student participation on sample preparation techniques
- Scanning Electron Microscopy lab exercises: setup and operate the instrument under various imaging modalities
- Practice on real-world samples and report results

Lecture notes

Lecture notes will be distributed.

Literature

Prerequisites / notice

No mandatory prerequisites.

327-2126-00L Microscopy Training TEM I - Introduction to TEM

W 2 credits

P. Zeng, E. J. Barthazy Meier, A. G. Bittermann, F. Gramm, A. Sologubenko

Abstract

The introductory course on Transmission Electron Microscopy (TEM) provides theoretical and hands-on learning for beginners who are interested in using TEM for their Master or PhD thesis. TEM sample preparation techniques are also discussed. During hands-on sessions at different TEM instruments, students will have the opportunity to examine their own samples if time allows.

Objective

Understanding of
1. the set-up and individual components of a TEM
2. the basics of electron optics and image formation
3. the basics of electron beam – sample interactions
4. the contrast mechanism
5. various sample preparation techniques

Learning how to
1. align and operate a TEM
2. acquire data using different operation modes of a TEM instrument, i.e. Bright-field and Dark-field imaging
3. record electron diffraction patterns and index diffraction patterns
4. interpret TEM data

Content

Lectures:
- basics of electron optics and the TEM instrument set-up
- TEM imaging modes and image contrast
- STEM operation mode
- Sample preparation techniques for hard and soft materials

Practicals:
- Demo, practical demonstration of a TEM: instrument components, alignment, etc.
- Hands-on training for students: sample loading, instrument alignment and data acquisition.
- Sample preparation for different types of materials
- Practical work with TEMs
- Demonstration of advanced Transmission Electron Microscopy techniques

Lecture notes

Lecture notes will be distributed.

Literature

Prerequisites / notice

No mandatory prerequisites. Please consider the prior attendance to EM Basic lectures (551-1618-00V; 227-0390-00L; 327-0703-00L) as suggested prerequisite.

363-0301-00L Work Design and Organizational Change

W 3 credits

G. Grote

Abstract

Good work design is crucial for individual and company effectiveness and a core element to be considered in organizational change. Meaning of work, organization-technology interaction, and uncertainty management are discussed with respect to work design and sustainable organizational change. As course project, students learn and apply a method for analyzing and designing work in business settings.

Objective

- Know effects of work design on competence, motivation, and well-being
- Understand links between design of individual jobs and work processes
- Know basic processes involved in systematic organizational change
- Understand the interaction between organization and technology and its impact on organizational change
- Understand relevance of work design for company performance and strategy
- Know and apply methods for analyzing and designing work

Data: 06.08.2024 12:40 Autumn Semester 2024 Page 1249 of 2684
The course is organized in a highly interactive fashion, where discussion in class is as important as the input by the lecturer. Understanding the dynamics in organizations is helped enormously by concrete examples, which will be provided by the lecturer, by talks by guest lecturers, and also the students themselves based on their prior experience from working in various roles (as employees, volunteers, student assistants etc.). Through class discussion we aim to deepen the understanding of the themes covered in the course. The current changes in organizations brought about by Covid-19 will also be an important example which allows to illustrate and discuss many of the key concepts of the course.

Specifically, the course will cover the following topics:
- Work design: From Adam Smith to job crafting
- Effects of work design on performance and well-being
- Approaches to analyzing and designing work
- Modes of organizational change and change methods
- Balancing stability and flexibility in organizations as design criterium
- The organization-technology interaction and its impact on work design and organizational change
- Example Flexible working arrangements (e.g. home office)
- Strategic choices for work design

All through the course, students will be guided to work on their projects also, with about 25% of class time devoted to the projects. In the final session, students will present the main results of their projects and discuss main insights also across projects.

A list of required readings will be provided at the beginning of the course.

The course includes the completion of a course project to be conducted in groups of four students. The project entails applying a particular method for analyzing and designing work processes and is carried out by means of interviews and observations in companies chosen by the students.

### Competencies

**Subject-specific Competencies**
- Concepts and Theories assessed
- Techniques and Technologies assessed
- Analytical Competencies assessed
- Problem-solving fostered
- Decision-making fostered
- Project Management assessed
- Communication assessed
- Cooperation and Teamwork assessed
- Self-presentation and Social Influence fostered
- Adaptable and Flexible assessed
- Critical Thinking assessed
- Creativity fostered
- Integrity and Work Ethics fostered
- Self-Reflection fostered
- Self-direction and Self-management assessed

**Method-specific Competencies**
- Analytical Competencies assessed
- Decision-making fostered
- Problem-solving fostered
- Project Management assessed
- Communication assessed
- Cooperation and Teamwork assessed
- Self-presentation and Social Influence fostered
- Adaptable and Flexible assessed
- Critical Thinking assessed
- Creativity fostered
- Integrity and Work Ethics fostered
- Self-Reflection fostered
- Self-direction and Self-management assessed

**Personal Competencies**
- Critical Thinking assessed
- Creativity fostered
- Integrity and Work Ethics fostered
- Self-Reflection fostered
- Self-direction and Self-management assessed

363-0790-00L **Technology Entrepreneurship**  

**Abstract**  
Technology ventures are significantly changing the global economic picture. Technological skills increasingly need to be complemented by entrepreneurial understanding.

This course offers the fundamentals in theory and practice of entrepreneurship in new technology ventures. Main topics covered are success factors in the creation of new firms, including founding, financing and growing a venture.

**Objective**  
This course provides theory-grounded knowledge and practice-driven skills for founding, financing, and growing new technology ventures. A critical understanding of dos and don'ts is provided through highlighting and discussing real life examples and cases.

**Content**  
Weekly sessions - recorded.
10+ sessions carried out by guest lecturers: experts in the broad field of technology entrepreneurship (e.g., serial entrepreneurs, venture capitalists, (E)MBA professors, company builders, patent experts, scale-up executives, ...). Final session: multiple choice semester assignment (100% of grade).

**Typical lecture format (2h):**  
15': Introduction
60': Guest testimonial
15': Discussion related to topic (in groups)
10': Plenary discussion
20': Q&A with (guest) lecturer

**Lecture notes**  
Lecture slides and case material

**Competencies**  

**Subject-specific Competencies**
- Concepts and Theories assessed
- Techniques and Technologies assessed
- Analytical Competencies assessed
- Problem-solving assessed
- Communication fostered
- Cooperation and Teamwork fostered
- Sensitivity to Diversity fostered
- Critical Thinking assessed

**Method-specific Competencies**
- Analytical Competencies assessed
- Decision-making fostered
- Problem-solving fostered
- Communication assessed
- Cooperation and Teamwork assessed
- Sensitivity to Diversity fostered
- Critical Thinking assessed

**Social Competencies**

**Personal Competencies**
- Critical Thinking assessed
- Creativity fostered
- Integrity and Work Ethics fostered
- Self-Reflection fostered
- Self-direction and Self-management assessed

363-1163-00L **Developing Digital Biomarkers**  

**Abstract**  
Particularly suitable for students with a technical background who are interested in healthcare.

The course gives an introduction to digital biomarkers and provides students with the foundations to develop their own digital biomarkers. More specifically, the course will cover fundamental topics such as designing observational studies, collecting, and exploring data generated by consumer-centric devices, and applying analytical methods to predict health-related outcomes.
Objective

The widespread use of mobile technologies (e.g., wearable sensors, mobile applications, social media, and location-tracking technologies) has the potential to meet the health monitoring needs of the world’s aging population and the ever-growing number of chronic patients. However, this premise is based on the application of Machine Learning algorithms that allow us to use this data in many different ways. In this course we will analyze systematic ways to collect data, review the most relevant methods and applications in healthcare, discuss the main challenges they present and apply the newly gained knowledge in practical assignments.

The course has four core learning objectives. Students should:

- understand the anatomy of digital biomarkers
- understand the potential and applications of digital biomarkers
- be able to critically reflect and assess existing digital biomarkers
- be able to design and implement a digital biomarker

Content

The course will consist of four topic clusters that will allow the discussion of the most relevant digital biomarker applications in healthcare:

1) Digital Biomarkers: From biological to digital biomarkers. How are they motivated, defined and how can they be leveraged for monitoring? Prognostic vs. diagnostic vs. predictive biomarkers. Passive sensing vs. active sensing. Digital biomarker vs. Digital therapeutics.

2) Consumer-centric device data: Today, vast amount of physiological, environmental, and behavioral observations can be collected with consumer centric devices. To derive clinical meaningful information from this data is, however, difficult. We will analyze strategies for extracting knowledge from those measurements.

3) Methodology: In the last decade, neural networks (also known as “deep learning”) have helped push the boundaries of the state-of-the-art in a myriad of domains. They have also uncovered a number of different problems. We will discuss advantages and disadvantage as well as alternative methods for their application to digital biomarker data.

4) Applications: Digital biomarkers are still an emerging subfield, but given that longitudinal in digital biomarker data are arguably easy to acquire in large quantities, it is expected that many relevant Machine Learning applications will emerge in the near future. We will review and discuss current applications and challenges.

Literature

Prerequisites

Some prior experience in Python is required, and some experience in Machine Learning is highly recommended.

376-0121-00L

Objectives

The seminar provides state-of-the-art insight to the biomechanical function of bone from molecules, to cells, tissue and up to the organ. Multiscale imaging and simulation allows linking different levels of hierarchy, where systems biology helps understanding the mechanobiological response of bone to loading and injury in scenarios relevant for personalized health and translational medicine.

The learning objectives include:

1. advanced knowledge of the state-of-the-art in multiscale bone biomechanics;
2. basic understanding of the biological principles governing bone in health, disease and treatment from molecules, to cells, tissue and up to the organ;
3. good understanding of the prevalent biomechanical testing and imaging techniques on the various levels of bone hierarchy;
4. practical implementation of state-of-the-art multiscale simulation techniques;
5. improved programming skills through the use of python;
6. hands on experience in designing solutions for clinical and industrial problems;
7. encouragement of critical thinking and creating an environment for independent and self-directed studying.
Bone is one of the most investigated biological materials due to its primary function of providing skeletal stability. Bone is susceptible to different local stimuli including mechanical forces and has great capabilities in adapting its mechanical properties to the changes in its environment. Nevertheless, aging or hormonal changes can make bone lose its ability to remodel appropriately, with loss of strength and increased fracture risk as a result, leading to devastating diseases such as osteoporosis.

To better understand the biomechanical function of bone, one has to understand the hierarchical organization of this fascinating material down from the molecules, to the cells, tissue and up to the organ. Multiscale imaging and simulation allow to link these different levels of hierarchy. Incorporating systems biology approaches, not only biomechanical strength of the material can be assessed but also the mechanobiological response of the bone triggered by loading and injury in scenarios relevant for personalized health. Watching cells working together to build and repair bone in a coordinated fashion is a spectacle, which will need dynamic image content and deep discussions in the lecture room to probe the imagination of the individual student interested in the topic. Lastly, state-of-the-art developments in tissue engineering and regeneration, 3D bioprinting and bio-manufacturing and organoid technology will be highlighted towards personalized health.

For the seminar, concepts of video lectures will be used in a flipped classroom setup, where students can study the basic biology, engineering, and mathematical concepts in video tutorials online (TORQUES). All videos and animations will be incorporated in Moodle and PolyBook allowing studying and interactive course participation online. It is anticipated that the students need to prepare 2x45 minutes for the study of the actual lecture material. The course is structured as a seminar in three parts of 45 minutes with video lectures and a flipped classroom setup. In the first part (TORQUES: Tiny, Open-with-Restrictions courses focused on Quality and Effectiveness), students study the basic concepts in short, interactive video lectures on the online learning platform Moodle. Students are able to post questions at the end of each video lecture or the Moodle forum that will be addressed in the second part of the lectures using a flipped classroom concept. For the flipped classroom, the lecturers may prepare additional teaching material to answer the posted questions (Q&A).

Following the Q&A, the students will have to form small groups to try to solve such problems and to present their solutions for advanced multiscale investigation of bone ranging from basic science to clinical application. Towards the end of the semester, students will have to present self-selected publications associated with the different topics of the lecture identified through PubMed or the Web of Science.
This course provides an overview over molecular and systemic aspects of neuromuscular, cardiovascular and respiratory adaptations to acute and chronic exercise as well as the interaction of the different systems regarding health-relevant aspects and performance in healthy people and persons with selected diseases. Furthermore, students will understand the influence of genetics, gender, age, altitude/deep, heat and cold on the named factors.

Content

- History of Exercise Physiology, research methods, fibertype heterogeneity and its functional significance, neural control of muscle force, molecular nad cellular mechanisms of muscle adaptation to resistance, endurance and stretching exercise, interindividual variability in the response to training, cardiorespiratory and metabolic responses to acute and chronic exercise, sex differences relevant to exercise performance, exercise in hot and cold environment, children and adolescents in sport and exercise, exercise at altitude and depth, aging and exercise performance, exercise for health, exercise in the context of disease.

Lecture notes

Online material is provided during the course.

Literature

Wird in der Vorlesung bekannt gegeben.

376-0208-00L Molecular and Cellular Biology of Exercise and Muscle Regeneration - Practical Aspects

Abstract

The skeletal muscle biology field purposes to understand how muscles coordinate movement, regenerate following injury and adapt to exercise stimuli. In this course, the students will acquire insights into the molecular aspects of muscle biology and exercise, in addition to gaining hands-on experience in experimental techniques that are commonly used to research muscle regeneration and exercise.

Objective

The objective of this course is to introduce students into current research topics and outstanding questions in skeletal muscle biology. Also, the course will give students hands-on experience in respect to the tools needed to perform basic molecular biology research in the field of exercise and skeletal muscle biology. Students will learn how to translate a scientific question in muscle biology into a small scientific project. They will learn how to design an experiment and to analyze and critically interpret experimental data.

Content

The course will consist of 4 main research themes and the anticipated 16 students will be divided into 4 subgroups of 4 students each, one will focus on one of the following research topics:

- Topic 1: Molecular pathways that control muscle stem cell self-renewal and differentiation
- Topic 2: Genome engineering to correct genetic mutations that cause muscle diseases
- Topic 3: Muscle fiber composition, force production and insulin sensitivity
- Topic 4: Amino acid sensitivity in skeletal muscle following exercise

The course will be organized into 7 sessions, each approx. 4 hours: the first 2 sessions will be theoretical and include an introductory lectures by the professors in addition to a journal club presentation by the students. This journal club aims to provide theoretical and scientific background that will be used to identify outstanding research questions. This will be followed by 4 practical sessions (hands-on experience) and 1 final evaluation session.

For the journal club, each group of students will receive a peer-review article that is highly relevant to the respective group's research topic. Each of the 4 groups will present and discuss the article in a journal club format to the rest of the participants the following week. During the four practical sessions, students will gain hands-on experiences and learn different lab techniques related to molecular biology of exercise and muscle regeneration. Each group will be presented with a research objective that is related to their topic, and perform in collaboration with teaching assistants a set of experiments that aim to address the research objective. At the final evaluation session, each group of students will present their results and identify follow-up research questions and hypothesis based on their experimental achievements.

Select practical methods that the proposed course will teach include:

- i. Group 1: tissue culture, isolation of muscle stem cells via FACs, differentiation of muscle stem cell into muscle fibers, small molecules screens, quantitative analysis of muscle cell proliferation and fusion, Immunofluorescence.
- ii. Group 2: tissue culture, differentiation of muscle stem cells into muscle fibers, guide RNA design and Crispr-Cas9 gene editing of genetic mutations that cause muscle diseases in muscle stem cells and fibers. Immunofluorescence and PCR.
- iii. Group 3: ex vivo assessment of muscle force characteristics, cryosectioning of muscle tissue, immunofluorescence and western blot.
- iv. Group 4: culture of muscle stem cells, isolation of muscle stem cells and differentiation into muscle fibers, amino acid stimulation of muscle fibers, Western blot.

Prerequisites:

- Prerequisites: 376-0006-02L Laboratory Course in Molecular biology

376-0816-00L Applied Human Research Project Management

Abstract

This course equips the students with several key principles such as good clinical practice, ethical study requirements, reproducible data management and effective oral, graphical, and written communication to design and manage good quality, ethically sound human research studies and represents a 101-toolkit of transferable research management skills/digital tools.

Objective

- The overall goal of this course is to integrate transferable principles of human research project management into preparation, conduction, and dissemination of own/future research projects and beyond. The following objectives are part of this course:
  - Create/select well-founded research hypotheses and study designs for a specific research topic
  - Apply universal good clinical practice guidelines in future research projects
  - Integrate well-documented data management and open science principles into future research projects
  - Integrate principles of effective communication in speaking, writing and graphical illustrations of future research idea/output

Content

The course will cover the following topics:

- Introduction to different study designs and ethical requirements thereof in Switzerland
- Introduction to literature search and searching platforms
- How to collect and sort publications/ keep up to date on research topic
- Inputs on critically evaluating papers
- How to pre-define study requirements to "future-proof" the research (hypothesis, sample size definition, pre-registration)
- Correct conduction of fundamental human research procedures (e.g., screening, consent process, CRP) and identification/prevention of deviations and emergencies (e.g., SAE/EC: protocol violation, research misconduct)
- Principles of reproducible and integral study documentation and data management (e.g., definition of source files, SOP/WI, Master Trial File, metatiles)
- FAIR principles and open science
- Design principles and free digital tools for graphical illustrations
- Effective summarizing of research output/topic in an abstract and pitch presentation

376-1033-00L History of Sports

Abstract

Comprehension for development and changes of sports from the ancient world to the present. Description of sports in services of national idea, from education and health promotion from the middle of the 18th century till this day.

Objective

Understanding for the development and adaptation of sports from the ancient world to present times.
In the course, students are introduced to the current changes in society and sport and provided with an overview of the many different problems and perspectives of sport sociology. The lectures set out to present the different dimensions, functions, and interrelationships of present-day sport, to show how far sport reflects society and how it changes and becomes more differentiated in the process, and to take current examples to highlight the sociological view of sport.

The teacher-student interaction presents a complex psychosocial event, demonstrating the need for a psychological extension of the classical social science/sports pedagogical perspective. Therefore, this lecture will be focused on "pedagogical-psychological aspects of competence development in the context of a multi-perspective physical education".

The course introduces concepts about wearable and unobtrusive technologies for sport and health data collection. Tools for analysing this data and evaluating the performance of these systems are introduced. Topics such as monitoring movement and muscle activation, mental focus, stress, and heart health are covered.

Teaching materials for the individual lectures are provided to the students via Moodle. The teachers' expectations are critical in directing the students' thought processes and to integrate these in their teaching.
### Content

The course consists of the following modules:

#### Module 0: Fundamentals
This module briefly reviews time-frequency domains, transforms and filtering.

#### Module 1: Movement
This module provides the scientific background needed to understand the principles that current technologies investigating movement rely on. It provides an overview of wearable technologies for monitoring overall body movement as well as for tracking motion parameters (e.g., gait, running, posture). Technologies such as inertial measurement units, electromyography, optical motion capture systems, and others are covered. The latest updates on wearable-related (e.g., textile-based) technologies are also introduced. Students are involved in labs/assignments to put into practice the knowledge and skills acquired during this module.

#### Module 2: Brain
This module briefly introduces brain functions and provides an overview of related wearable technologies. Topics covered may include electroencephalograms, transcranial magnetic stimulation, and galvanic vestibular stimulation. Data processing techniques such as common spatial patterns, principal component analysis, and linear discriminant analysis are introduced. Students are given a practical assignment to put into practice the knowledge and skills acquired during this module.

#### Module 3: Cardiac
This module focuses on wearable technologies for monitoring cardiac health. The module starts by providing information on cardiac physiology and introduces wearable technologies for the heart. Topics such as electrocardiography, photoplethysmography, light sensing, and contactless physiology monitoring are introduced. Data analysis techniques for cardiac data including heart-rate variability, Poincare plots, and wavelet transforms are discussed. Students will be given an assignment to put into practice the knowledge and skills acquired during this module.

### Prerequisites

- Students should be proficient in programming (any language).
- Note: assignments will be in Python. Students are expected to learn Python on their own if not experienced with this programming language.
- Course prerequisites:
  - For Biomedical Engineering Master's: none
  - For ITET Master's: none
  - For D-MAVT Master's: none
  - For D-HEST Master's and PhD students:
    - If BSc in electrical/mechanical engineering or computer science: none
    - If any other BSc program: 376-0022-00L (Imaging and Computing in Medicine) or 376-1983-00L (Foundations of Data Science)

#### Module 0: Fundamentals

**376-1177-00L Human Factors I**  
**W** 3 credits  
**M. Menozzi Jäckli**

**Abstract**  
Strategies of human-system-interaction, individual needs, physical & mental abilities, and system properties are key factors affecting the quality and performance in interaction processes. In the lecture, factors are investigated by basic scientific approaches. Discussed topics are important for optimizing people's health, well-being, and satisfaction as well as the overall system performance.

**Objective**  
The goal of the lecture is to empower students in better understanding the applied theories, principles, and methods in various applications. Students are expected to learn about how to enable an efficient and qualitatively high standing interaction between human and the environment, considering costs, benefits, health, and safety as well. Thus, an ergonomic design and evaluation process of products, tasks, and environments may be promoted in different disciplines. The goal is achieved in addressing a broad variety of topics and embedding the discussion in macroscopic factors such as the behavior of consumers and objectives of economy.

**Content**
- Physiological, physical, and cognitive factors in sensation, perception, and action  
- Body spaces and functional anthropometry, Digital Human Models  
- Experimental techniques in assessing human performance, well-being, and comfort  
- Usability engineering in system designs, product development, and innovation  
- Human information processing and biological cybernetics  
- Interaction among consumers, environments, behavior, and tasks

**Literature**
- Gavriel Salvendy, Handbook of Human Factors and Ergonomics, 4th edition (2012), is available on NEBIS as electronic version and for free to ETH students  
- Further textbooks are introduced in the lecture  
- Brouchures, checklists, key articles etc. are uploaded in ILIAS

#### Module 1: Movement

**376-1179-00L Applications of Cybernetics in Ergonomics**  
**W** 1 credit  
**1U**

**Abstract**
Cybernetics systems have been studied and applied in various research fields, such as for applications in ergonomics. Topics discussed in this lecture (man-machine-interaction, performance in multi-modal interactions, quantification in gestalt principles for the use in product development, information processing) are deepened with exercises conducted at our labs.

**Objective**
To learn and practice cybernetics principles in interface designs and product development.
- Fitt's law applied in manipulation tasks
- Hick-Hyman law applied in design of the driver assistance systems - Vigilance applied in quality inspection
- Accommodation/vergence crosslink function
- Cross-link models in neurobiology - the ocular motor control system
- Human performance in optimization of production lines

**Literature**

**376-1219-00L** Rehabilitation Engineering II: Rehabilitation of Sensory and Vegetative Functions

**Abstract**
Rehabilitation Engng is the application of science and technology to ameliorate the handicaps of individuals with disabilities to reintegrate them into society. The goal is to present classical and new rehabilitation engineering principles applied to compensate or enhance motor, sensory, and cognitive deficits. Focus is on the restoration and treatment of the human sensory and vegetative system.

**Objective**
Provide knowledge on the anatomy and physiology of the human sensory system, related dysfunctions and pathologies, and how rehabilitation engineering can provide sensory restoration and substitution.

This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.

**Content**
Introduction, problem definition, overview
Rehabilitation of visual function
- Anatomy and physiology of the visual sense
- Technical aids (glasses, sensor substitution)
- Retina and cortex implants
Rehabilitation of hearing function
- Anatomy and physiology of the auditory sense
- Hearing aids
- Cochlea Implants
Rehabilitation and use of kinesthetic and tactile function
- Anatomy and physiology of the kinesthetic and tactile sense
- Tactile/haptic displays for motion therapy (incl. electrical stimulation)
- Role of displays in motor learning
Rehabilitation of vestibular function
- Anatomy and physiology of the vestibular sense
- Rehabilitation strategies and devices (e.g. BrainPort)
Rehabilitation of vegetative Functions
- Cardiac Pacemaker
- Phrenic stimulation, artificial breathing aids
- Bladder stimulation, artificial sphincter
Brain stimulation and recording
- Deep brain stimulation for patients with Parkinson, epilepsy, depression
- Brain-Computer Interfaces
Literature

Introductory Books:

Selected Journal Articles and Web Links:

Target Group:

Students of higher semesters and PhD students of
- D-MAVT, D-ITET, D-INFK, D-HEST
- Biomedical Engineering, Robotics, Systems and Control
- Medical Faculty, University of Zurich

Students of other departments, faculties, courses are also welcome

This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.

Competencies

Subject-specific Competencies         Concepts and Theories assessed
                                        Techniques and Technologies assessed
                                        Analytical Competencies assessed
                                        Decision-making assessed
                                        Media and Digital Technologies fostered
                                        Problem-solving assessed

Method-specific Competencies

Social Competencies                   Communication fostered
                                        Leadership and Responsibility fostered

Personal Competencies                 Creative Thinking fostered
                                        Critical Thinking assessed
                                        Integrity and Work Ethics fostered

Rehabilitation and Inclusion W 3 credits 2G R. Riener

Abstract

This course presents origins and prevention of different physical, sensory, mental impairments, their treatments, and methods of assistance in public and home environments. Rehabilitation is put into a larger context providing insights into healthcare systems, health economy, accessibility, barrier-free architecture, para-sports, legal & regulatory aspects, disability policy, and inclusion.

With this lecture, we want to not only transfer a broad knowledge about rehabilitation and inclusion, but also raise awareness about the challenges and needs of people with impairments, the economy and the overall society. Students should learn about the complex and multi-faceted interaction of care, treatment, assistance, reimbursement, accessibility, legal regulation, and social inclusion. This knowledge and awareness should be presented in a multi-modal way using interactive tools and organizing group/plenar discussions.

Autumn Semester 2024
The course will cover the following topics:

- **Introductions**: definition of terms, historical and legal background, role of the UN, WHO, ICRC
- **Origins**: reasons and origins of physical, sensory and mental impairments; surgical and pharmaceutical treatments
- **Therapy**: physical therapy, occupational therapy, speech therapy, psychotherapy
- **Technological support**: Robot-aided therapy, Virtual Reality, muscle stimulation, Brain-Computer Interfaces (BCIs)
- **Home therapy**: personal assistance, mobile health systems, tele-monitoring, tele-therapy
- **Assistive technologies**: gait assistance, prosthesis, orthoses, seeing/hearing aids, etc.
- **Social inclusion**: definition of normality and belongingness, social behaviours, UN-BrK, etc.
- **Accessibility**: national and international aspects of accessibility
- **Health economy in rehabilitation**: public and private cost models, health insurance, SUVA, IV
- **Barrier-free building and living**: environmental obstacles, norms in architecture, inclusive design
- **Parasports**: history of Olympics and Paralympics, Special Olympics, Deaflympics, Cybathlon
- **Policy**: health, social, equal opportunity, disability
- **Regulatory affairs**: ethics committees, Swissmedic, Bundesamt für Gesundheit (BAG), law and disability
- **Prevention**: primary and secondary prevention, social prevention

### Competencies

#### Subject-specific Competencies

- Concepts and Theories: assessed
- Techniques and Technologies: assessed

#### Method-specific Competencies

- Analytical Competencies: assessed
- Decision-making: assessed
- Media and Digital Technologies: fostered
- Problem-solving: assessed

#### Social Competencies

- Communication: fostered
- Cooperation and Teamwork: fostered
- Leadership and Responsibility: fostered
- Sensitivity to Diversity: fostered

#### Personal Competencies

- Adaptability and Flexibility: fostered
- Creative Thinking: assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: fostered
- Self-awareness and Self-reflection: fostered
- Self-direction and Self-management: fostered

### Lecture notes

- Handouts provided during the classes and references therein as well as primary literature as case studies will be posted to the course website

### Prerequisites / notice

- course "Introduction to Toxicology"

### Competencies

#### Subject-specific Competencies

### Abstract

**Nanostructured Materials Safety**

- **W 2 credits**
- **1V**
- **P. Wick, T. Bürki-Thurnherr**

**Objective**

Understanding the potential side effects of nanomaterials in a context-specific way, enabling to evaluate nanomaterial safety and provide knowledge to design safer materials.

**Content**

Building upon new technologies to engineer and functionalize well-defined nanostructured materials, a plethora of exciting discoveries were made and found their way in our daily live. These customized nanomaterials provides extraordinary properties and make them attractive for many innovative applications. Exactly these new properties may have the potential to be responsible for unforeseen side effects, which hamper a straightforward translation into new products. Therefore, the safety research provide the evidence for a responsible and sustainable use of nanomaterials.

The lecture will focus on basic principles of nanotoxicology, provide the understanding of the potential side effects of nanomaterial in a context-specific way addressing the main exposure routes such as inhalation, ingestion, topical applications and intravenous injections as well as it will provide impulses for safer material designs.

**Structure of the planed lecture (2 x 45 min)**

1. Introduction: the principles of nanotoxicology
2. Lung - particles interactions: two disease scenarios and their molecular mechanism
3. GI – particles interactions: intendent and unintendent particle exposure via food
4. Skin – particles interactions: body care products and their influence on skin physiology
5. Intravenous injection: colloidal stability, protein corona and cellular effects
6. Micro-/ Nanoplastics and development of a safety research plan
7. End of semester exam

**Lecture notes**

- Handouts provided during the classes and references therein as well as primary literature as case studies will be posted to the course website

**Prerequisites / notice**

- course "Introduction to Toxicology"

**Ethics of Life Sciences and Biotechnology**

- **W 3 credits**
- **2V**
- **A. Blasimme, E. Vayena**

This semester course enables students to recognize, anticipate and address ethical issues in the domain of health sciences and their technological application. The students will acquire the necessary theoretical and analytic resources to develop critical thinking skills in the field of applied ethics and will practice how to use such resources to address concrete ethical issues in health sciences.
Objective
This course is tailored to students who want to become familiar with the analysis of ethical issues in all the different domains of life sciences and biotechnology. The course aims at equipping students with the necessary knowledge and analytic skills to understand, discuss and address the ethical aspects of science and technology in the domain of human health. The specific learning objectives of this course are:

A. Identify ethical issues in life sciences and biotechnology.
B. Analyze and critically discuss ethical issues in life sciences and biotechnology.
C. Become aware of relevant legal and policy frameworks.
D. Distinguish different ethical approaches and argumentative strategies in applied ethics.
E. Recognize how ethical issues relate to different accounts of technology and innovation.
F. Develop a personal and critical attitude towards the ethical aspects of life sciences and their technological application.
G. Autonomously anticipate ethical issues.
H. Propose and communicate solutions to ethical challenges and dilemmas.

Content
The course starts off with an introductory lecture on ethics as a discipline and an overview of the most relevant approaches in the domain of applied ethics. The students will also be introduced to current theoretical accounts of technology and will start to appreciate the relevance of ethics especially with respect to new and emerging technologies. Usable analytic tools will also be provided, thus enabling the students to engage with the discipline in a practical way from the very onset of the semester.

The course will continue with thematic sessions covering a broad variety of topics all of which are relevant to the different study tracks offered by the department. In particular, the course will cover the following domains: digital health technologies and medical AI; food, nutrition and healthy longevity; biomedical engineering; genetics; neuroscience and Neurotechnologies; medical robotics; disability and rehabilitation; environmental ethics. The course will also include sessions on cross-cutting ethically relevant aspects of health sciences and technologies, namely: access to innovation, translational research, and the relation between science and public policy.

All the topics of the course will be illustrated and interactively discussed through many case studies, offering the students the opportunity to prepare and present them, and to use them in individual as well as group exercises. Throughout the course, the students will have multiple opportunities to experiment with ethical argumentation and to practice their evolving skills.

Competencies
Subject-specific Competencies
- Concepts and Theories
  - Techniques and Technologies
  - Media and Digital Technologies
  - Problem-solving

Method-specific Competencies
- Analytical Competencies
- Media and Digital Technologies
- Problem-solving

Social Competencies
- Communication
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity

Personal Competencies
- Adaptability and Flexibility
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection

376-1664-00L Ethics in Drug Development

W 3 credits
2V

A. Blasimme, E. Vayena, to be announced

Abstract
This course provides a thorough exploration of drug development and involved ethical issues as well as critical analysis of ethical challenges and practical skills to resolve them. It includes elements of drug discovery, preclinical and clinical research ethics, alternative regulatory pathways and ethics of drug pricing and develops a solid grasp of ethical complexity as well as practical skills.

Objective
This course is tailored to D-HEST students who want to become familiar with pharmaceutical development and its ethical implications. By the end of this course, students will have developed a comprehensive understanding of the ethical complexities and challenges in drug development. They will be equipped with the knowledge and analytical skills to navigate ethical reasoning and contribute to the responsible advancement of pharmaceutical research. The specific learning objectives of the course are:

- Discuss relevant legal and public policy frameworks in drug development, ensuring an understanding of the broader regulatory context within which policy and regulatory decisions are made.
- Recognize and identify ethical dilemmas inherent to drug development, fostering a heightened awareness of ethical considerations across various stages of the process.
- Identify and discuss ethical issues in drug development in light of recent advances in the field of artificial intelligence.
- Critically analyze ethical challenges within drug development, enabling them to discuss complex issues, evaluate competing ethical perspectives, and form reasoned judgments.
- Understand the ethical theories and principles that underpin drug regulation.
- Evaluate the ethical implications of alternative pathways, such as Accelerated Approval and Compassionate Use, equipping students to assess potential benefits, risks, and societal consequences.
- Assess the ethical dimensions of drug pricing decisions and their impact on equity and accessibility, encouraging thoughtful reflection on the broader societal implications of pricing strategies.

Content
- Principles of ethical and biomedical ethics, and how they relate to drug pricing
- Introduction to drug development, with a focus on the Swiss regulatory ecosystem
- Current trends and impediments to effective drug development, including the use of AI in drug discovery
- Translational medicine and its ethical implications
- Ethical Aspects of pre-clinical research, including animal replacement technologies like organoids and organ chips
- Ethical aspects of clinical research
- Special regulatory pathways: expanded access / compassionate use
- Special regulatory pathways: accelerated approval
- Drug development and public health: emergency use of new drugs
- Drug pricing: introduction to its regulatory and ethical aspects

376-1714-00L Biocompatible Materials

W 4 credits
3V

K. Maniura, M. Rotmar, M. Zenobi-Wong

Abstract
Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.

Objective
The course covers the following topics:
1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
2. The concept of biocompatibility.
3. Introduction into methodology used in biomaterials research and application.
4. Introduction to different material classes in use for medical applications.
Introduction into natural and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering, drug delivery and for medical devices are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with the implant material are elucidated. Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed.

A link between academic research and industrial entrepreneurship is demonstrated by external guest speakers, who present their current research topics.

**Literature:**

(available online via ETH library)

**Handouts and references therin.**

### 376-1720-00L Application of MATLAB in the Human Movement Sciences

**Abstract**
Students will learn to import, process and graphically present experimental data using the MATLAB computing environment. Both the data and the methods of analysis will be typical for experiments in Human Movement Science (i.e., kinematics, kinetics and electromyography).

**Objective**
Students will acquire the ability to independently load, plot, and process kinematic, kinetic and electromyographical data using the MATLAB computing environment.

**Content**
Drawbacks of Excel; Possibilities in MATLAB; Import of several data formats; Plot of one and more signals; Removing of an offset and filtering of data based on self-written functions; Normalisation and parametrisation of data; Reliability; Interpolation, Differentiation and Integration in MATLAB.

**Literature**
During the lecture, several electronically available MATLAB introductions are indicated. Course-specific scripts will be provided by the lecturer.

**Prequisites / Notice**
A Laptop with MATLAB installed (v2009 or higher) and wireless internet access is mandatory. Two students can share a laptop if necessary. A MATLAB student version can be obtained at Stud-IDES for free.

### 376-1721-00L Bone Biology: Basics, Research and Clinics

**Abstract**
The course gives an introduction into bone biology and provides an overview on current research methods and clinical approaches. Emphasis is put on skeletal development and metabolism, osteoporosis as well as fracture healing. Each topic is structured into three parts: basics, research and clinics.

**Objective**
After completing the Bone Biology course, students will be able to:
1. Remember and apply basics in bone biology and disease
2. Remember clinical features and surgical approaches
3. Select adequate research methods and approaches
4. Evaluate publications on topics presented in the lecture

**Content**
The course provides an overview of bone biology including cellular mechanism, metabolism and mechanoregulation. The acquired knowledge is applied to clinically-relevant topics such as skeletal development, osteoporosis and fracture healing. For each topic, we will share examples from our research and clinical experience combined with interactive sessions. Two site visits will provide insight into translational aspects concerning implant design and surgical application.

**Competencies**

#### Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: fostered

#### Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: fostered
- Media and Digital Technologies: fostered
- Problem-solving: fostered
- Project Management: fostered

#### Social Competencies
- Communication: fostered
- Cooperation and Teamwork: assessed
- Leadership and Responsibility: fostered
- Self-presentation and Social Influence: fostered
- Sensitivity to Diversity: fostered

#### Personal Competencies
- Adaptability and Flexibility: fostered
- Creative Thinking: fostered
- Critical Thinking: assessed
- Integrity and Work Ethics: assessed
- Self-awareness and Self-reflection: fostered
- Self-direction and Self-management: fostered

### 376-1722-00L Spinal Cord Injury and Exercise

**Prerequisites:** Anatomy and Physiology

**Abstract**
Intensive discussion concerning complications of a spinal cord injury and their consequences on trainability and exercise performance of persons sitting in a wheelchair. Overview on the clinical application of exercise testing as well as on the implementation of sport scientific findings to optimise performance of individuals with spinal cord injury in rehabilitation and elite sports.

**Objective**
Knowledge of the pathophysiology and the concomitant complications of a spinal cord injury and the consequences for physical exercise and trainability during rehabilitation as well as in recreational and elite sport.

**Content**
The following issues will be discussed: Epidemiology and etiology of spinal cord injury; complications and consequences of spinal cord injury; trainability/exercise physiology and spinal cord injury; history and organisation of wheelchair sports; elite sport and spinal cord injury.

Abstract
Current topics in biomechanics presented by speakers from academia and industry.

Objective
Getting insight into actual areas and problems of biomechanics.

Abstract
Trauma biomechanics in an interdisciplinary research field investigating the biomechanics of injuries and related subjects such as prevention. The lecture provides an introduction to the basic principles of trauma biomechanics.

Objective
Introduction to the basic principles of trauma biomechanics.

Content
This lecture serves as an introduction to the field of trauma biomechanics. Emphasis is placed on the interdisciplinary nature of impact biomechanics, which combines the use of fundamental engineering principles and advanced medical technologies to develop injury prevention measures. Topics include: accident statistics and accident reconstruction, biomechanical response of the human to impact loading, injury mechanisms and injury criteria, test methods (including crash tests), computer simulations, aspects of vehicle safety. Real world examples mainly from automobile safety are used to augment lecture material.

Lecture notes
Handouts will be made available.

Literature
Within the scope of this lecture you will learn the basic principles of trauma biomechanics. Based on examples from sports, you will get to know different mechanisms that can possibly result in injury. Investigating the background and cause of injury should allow you to assess the injury risk for sports activities. Furthermore you should be able to develop measures to prevent such injury.

Focusing on sports injuries, this lecture introduces the basic principles of injury mechanics and rehabilitation. Mechanisms that can result in injury are presented. Furthermore possibilities to prevent injuries are discussed. Thereby the lecture focuses on sports injuries.

This course covers the main methods used in Biostatistics. It starts by revising Linear Models (Regression, Anova), then moves to Generalised Linear Models (logistic regression and methods for count data) and finally introduces more advanced topics (Linear Mixed-Effects Models and Generalised Additive Models). The course strongly focuses on applied aspects of data analysis.

The objective of this course is to highlight the link between human physiology, product sensory, nutritional functions, and engineering approaches to facilitate the design of food matrices reflecting the requirements for the beforementioned properties. To identify and manipulate these properties, the pathways that control the interaction of food structures and their physiological action will be introduced. Students are introduced to a skill set that will encompass basic digestion, sensory physiology knowledge, and food structures. Students will be exposed to the interplay along the gastrointestinal tract including taste, aroma, and texture perception, swallowing mechanics, and gastrointestinal digestion with an engineering or physical sciences angle.
The module Epidemiology and prevention describes the process of scientific discovery from the detection of a disease and its causes, to the development and evaluation of preventive and treatment interventions and to improved population health.

At the end of this module students are able:
- to interpret the results of epidemiological studies
- to critically assess scientific literature
- to know the definition, dimensions and determinants of health
- to plan public health interventions and health promotion projects
- to draw a bridge from evidence to policies and politics

In addition, method-specific competencies include:
- to recognize the definition, dimensions and determinants of health
- to interpret the results of epidemiological studies
- to critically assess scientific literature
- to evaluate the results of epidemiological studies
- to plan public health interventions and health promotion projects
- to use epidemiological data for prevention purposes

Social competencies include:
- to know the definition, dimensions and determinants of health
- to interpret the results of epidemiological studies
- to critically assess scientific literature
- to interpret the results of epidemiological studies
- to plan public health interventions and health promotion projects
- to use epidemiological data for prevention purposes

Personal competencies include:
- to know the definition, dimensions and determinants of health
- to interpret the results of epidemiological studies
- to critically assess scientific literature
- to interpret the results of epidemiological studies
- to plan public health interventions and health promotion projects
- to use epidemiological data for prevention purposes

At the end of this module students are able:
- to know the definition, dimensions and determinants of health
- to interpret the results of epidemiological studies
- to critically assess scientific literature
- to interpret the results of epidemiological studies
- to plan public health interventions and health promotion projects
- to use epidemiological data for prevention purposes

The course is designed for 3rd year Bachelor students, Master students and postgraduate students (MAS/CAS).
Abstract
Writing of a review paper of scientific quality on a topic in the domain of Human Health, Nutrition and Environment based on critical evaluation of scientific literature.

Objective
- Acquisition of knowledge in the field of the review paper
- Assessment of original literature as well as synthesis and analysis of the findings
- Practising of academic writing in English
- Giving an oral presentation with discussion on the topic of the review paper

Content
Topics are offered in the domains of the major ‘Human Health, Nutrition and Environment’ covering ‘Public Health’, ‘Infectious Diseases’, ‘Nutrition and Health’ and ‘Environment and Health’.

Lecture notes
Guidelines will be handed out in the beginning.

Literature
Literature will be identified based on the topic chosen.

376-0300-00L Essentials in Translational Science O 3 credits 2G J. Goldhahn

Abstract
Translational science is a cross disciplinary scientific research that is motivated by the need for practical applications that help people (e.g. Medicines). The course should help to clarify basics of translational science, illustrate successful applications and enable students to integrate key features into their future projects.

Objective
After completing this course, students will be able to understand:
- Principles of translational science including medical device development, intellectual property, regulatory environment and project management

Content
What is translational science and what is it not including:
- How to identify need?
- How to choose the appropriate research type and methodology
- How to measure success?
- How are medical devices developed?
- How to handle IP in the development process?
- How does the regulatory environment impact innovation?
- How to manage complex development projects?

Positive and negative examples will be illustrated by distinguished guest speakers.

376-0302-01L GCP Basic Course (Modules 1 and 2) O 1 credit 1G G. Senti, C. Fila, R. Grossmann

Abstract
The basic course in “Good Clinical Practice” (GCP) contains of two full-time training days (Module 1 and Module 2) and addresses elementary aspects for the appropriate conduct of clinical trials and non-clinical research projects involving human beings. Successful participation will be confirmed by a certificate that is recognized by the Swiss authorities.

Objective
Students will get familiar with:
- Key Ethics documents
- (International) Guidelines and Laws (e.g. ICH-GCP, DIN EN ISO 14155, TPA, HRA)
- Sequence of research projects and project-involved parties
- Planning of research projects (statistics, resources, study design, set-up of the study protocol)
- Approval of research projects by Authorities (SwissEthics, Swissmedic, FOPH)
- Roles and responsibilities of project-involved parties

Students will learn how to:
- Classify research projects according the risk-based approach of the HRA
- Write a study protocol
- Inform participating patients/study subjects
- Obtain consent by participating patients/study subjects
- Classify, document and report Adverse Events
- Handle projects with biological material from humans and/or health-related personal data
The module Epidemiology and prevention describes the process of scientific discovery from the detection of a disease and its causes, to public health research. Students will also become aware on how epidemiological facts are used in prevention, practice and politics. The statistical software R will be used in the exercises. If you are unfamiliar with R, it is highly recommend to view the online R course "etutoR". Analyses will be carried out using the statistical software R. Finally, in the third part of the course students will be analysing real-world datasets to put into practice the knowledge and skills acquired during the first two parts. Students majoring in Human Health, Nutrition and Environment: At least one of the courses listed in this module must be selected. Examples from nutrition, chronic and infectious diseases will be used in order to show the underlying concepts and methods.
This course provides a detailed understanding of:
- development of T and B cells
- the dynamics of an immune response during acute and chronic infection
- mechanisms of immunopathology
- modern vaccination strategies

Key experimental results will be shown to help understanding how immunological textbook knowledge has evolved.

Obtain a detailed understanding of:
- the development, activation, and differentiation of different types of T cells and their effector mechanisms during immune responses,
- recognition of pathogenic microorganisms by the host cells and molecular events thereafter,
- events and signals for maturation of naive B cells to antibody producing plasma cells and memory B cells.
- optimization of B cell responses by intelligent design of new vaccines

Content:
- Development and selection of CD4 and CD8 T cells, natural killer T cells (NKT), and regulatory T cells (Treg)
- NK T cells and responses to lipid antigens
- Differentiation, characterization, and function of CD4 T cell subsets such as Th1, Th2, and Th17
- Overview of cytokines and their effector functions
- Co-stimulation (signals 1-3)
- Dendritic cells
- Evolution of the "Danger" concept
- Cells expressing Pattern Recognition Receptors and their downstream signals
- T cell function and dysfunction in acute and chronic viral infections

Documents of the lectures are available for download at:
https://moodle-app2.let.ethz.ch/course/view.php?id=2581

Prerequisites / notice
Immunology I and II recommended but not compulsory

Abstract
Students of this course will discuss current topics from the field of infectious disease biology. From a list of publications, each student chooses some themes that he/she is going to explain and discuss with all other participants and under supervision. The actual topics will change from year to year corresponding to the progress and new results occurring in the field.

Objective
This is an advanced course that will require significant student participation. Students will learn how to evaluate and present scientific literature and trace the development of ideas related to understanding the ecology and evolutionary biology of infectious diseases.

Content
- A core set of ~10 classic publications encompassing unifying themes in infectious disease ecology and evolution, such as virulence, resistance, metapopulations, networks, and competition will be presented and discussed. Pathogens will include bacteria, viruses and fungi. Hosts will include animals, plants and humans.
- The course will not take place fall semester 2024.
- Does not take place this semester.

Lecture notes
Papers will be assigned and downloaded from a web page announced during the lecture.

Literature
Papers and class notes can be downloaded from a web page announced during the lecture.

Autumn Semester 2024
Students will learn to (i) identify evolutionary explanations for the origins and characteristics of infectious diseases in a range of organisms and (ii) evaluate ways of integrating evolutionary thinking into improved strategies for treating infections of humans and animals. This will incorporate principles that apply across any host-pathogen interaction, as well as system-specific mechanistic information, with particular emphasis on bacteria and viruses.

We will cover several topics where evolutionary thinking is relevant to understanding or treating infectious diseases. This includes: (i) determinants of pathogen host range and virulence, (ii) dynamics of host-parasite coevolution, (iii) pathogen adaptation to evade or suppress immune responses, (iv) antimicrobial resistance, (v) evolution-proof medicine. For each topic there will be a short (< 20 minutes) introductory lecture, before students independently research the primary literature and develop discussion points and questions, followed by interactive discussion in class.

The focus is on primary literature, but for some parts the following text books provide good background information:

Schimd Hempel 2011 Evolutionary Parasitology
Stearns & Medzhitov 2016 Evolutionary Medicine

A basic understanding of evolutionary biology, microbiology or parasitology will be advantageous but is not essential.

Module: Nutrition and Health

Students majoring in Human Health, Nutrition and Environment: At least one of the courses listed in this module must be selected.
Food and Consumer Behaviour

This course focuses on food consumer behavior, consumer’s decision-making processes and consumer’s attitudes towards food products. Students will be able to:
- to describe heuristics that influence consumer behavior in the food domain
- to explain the consumer led food product development
- to summarise how consumers perceive the environmental impact and the healthiness of foods
- to assess the cultural, the environmental and the food policy impact on consumer behavior
- to explain psychological factors influencing eating behavior

Competencies
Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies
Method-specific Competencies
- Analytical Competencies
- Decision-making
- Problem-solving
Social Competencies
- Communication
- Customer Orientation
- Sensitivity to Diversity
Personal Competencies
- Critical Thinking

Nutrition and Chronic Disease

To have the student gain understanding of the links between the diet and the etiology and progression of chronic diseases, including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

Competencies
Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies
Method-specific Competencies
- Analytical Competencies
- Decision-making
- Problem-solving
Social Competencies
- Communication
- Customer Orientation
- Sensitivity to Diversity

Module: Environment and Health

Students majoring in Human Health, Nutrition and Environment: At least one of the courses listed in this module must be selected.

Nanostructured Materials Safety

Fundamentals in nanostructured material - living system interactions focusing on the main exposure routes, lung, gastrointestinal tract, skin and intravenous injection.

Competencies
Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies
Method-specific Competencies
- Analytical Competencies
- Decision-making
- Problem-solving
Social Competencies
- Communication
- Cooperation and Teamwork

Essentials in Translational Science

Translational science is a cross disciplinary scientific research that is motivated by the need for practical applications that help people (e.g. Medicines). The course should help to clarify basics of translational science, illustrate successful applications and enable students to integrate key features into their future projects.
Objective
After completing this course, students will be able to understand:
Principles of translational science including medical device development, intellectual property, regulatory environment and project
management
Students should be able to apply this knowledge in drug development programs in Pharma, Biotech or their own spin-off.

Content
What is translational science and what is it not Including:
How to identify need?
How to choose the appropriate research type and methodology
How to measure success?
How are medical devices developed?
How to handle IP in the development process?
How does the regulatory environment impact innovation?
How to manage complex development projects?
Positive and negative examples will be illustrated by distinguished guest speakers.

Abstract
Microrobotics is an interdisciplinary field that combines aspects of robotics, micro and nanotechnology, biomedical engineering, and
materials science. The aim of this course is to expose students to the fundamentals of this emerging field. Throughout the course, the
students apply these concepts in assignments. The course concludes with an end-of-semester examination.

Objective
The objective of this course is to expose students to the fundamental aspects of the emerging field of microrobotics. This includes a focus
on physical laws that predominate at the microscale, technologies for fabricating small devices, bio-inspired design, and applications of the
field.

Content
Main topics of the course include:
- Scaling laws at micro/nano scales
- Electrostatics
- Electromagnetism
- Low Reynolds number flows
- Observation tools
- Materials and fabrication methods
- Applications of biomedical microrobots

Abstract
The basic course in “Good Clinical Practice” (GCP) contains of two full-time training days (Module 1 and Module 2) and addresses
elementary aspects for the appropriate conduct of clinical trials and non-clinical research projects involving human beings. Successful
participation will be confirmed by a certificate that is recognized by the Swiss authorities.

Objective
Students will get familiar with:
- Key Ethics documents
- (Inter)national Guidelines and Laws (e.g. ICH-GCP, DIN EN ISO 14155, TPA, HRA)
- Sequence of research projects and project-involved parties
- Planning of research projects (statistics, resources, study design, set-up of the study protocol)
- Approval of research projects by Authorities (SwissEthics, Swissmedic, FOPH)
- Roles and responsibilities of project-involved parties
Students will learn how to:
- Classify research projects according the risk-based approach of the HRA
- Write a study protocol
- Inform participating patients/study subjects
- Obtain consent by participating patients/study subjects
- Classify, document and report Adverse Events
- Handle projects with biological material from humans and/or health-related personal data

Content
Module 1:
Research and Research Ethics, Guidelines, (inter)national Legislation, Development of therapeutic products, Methodology (Study Design),
Study documents (Study protocol, Investigator's Brochure, Patient Information Leaflet, Informed Consent Form)
Module 2:
Roles and Responsibilities, Approval procedures, Notification and Reporting, Study documentation, Research with biological material and
health-related data, data protection, data retention
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The focus is on
communication, subject-specific competencies assessed, S. J. Ferguson, W. Webb A, Smith N.B. Introduction to Medical Imaging: Physics, Engineering and Clinical Applications; Cambridge University Press 2011

Lecture notes and handouts fostered assessed

The powerpoint slides presented in the lectures will be made available as pdf files. Several readings will also be made available electronically.

The lecture will be taught in English.

Lecture notes notice

Content

Introduction to diagnostic medical imaging based on electromagnetic and acoustic fields including X-ray planar and tomographic imaging, radio-tracer based nuclear imaging techniques, magnetic resonance imaging and ultrasound-based procedures.

Upon completion of the course students are able to:

- Explain the physical and mathematical foundations of diagnostic medical imaging systems
- Characterize system performance based on signal-to-noise ratio, contrast-to-noise ratio and transfer function
- Design a basic diagnostic imaging system chain including data acquisition and data reconstruction
- Identify advantages and limitations of different imaging methods in relation to medical diagnostic applications

- Introduction (intro, overview, history)
- Signal theory and processing (foundations, transforms, filtering, signal-to-noise ratio)
- X-rays (production, tissue interaction, contrast, modular transfer function)
- X-rays (resolution, detection, digital subtraction angiography, Radon transform)
- X-rays (filtered back-projection, spiral computed tomography, image quality, dose)
- Nuclear imaging (radioactive tracer, collimation, point spread function, SPECT/PET)
- Nuclear imaging (detection principles, image reconstruction, kinetic modelling)
- Magnetic Resonance (magnetic moment, spin transitions, excitation, relaxation, detection)
- Magnetic Resonance (plane wave encoding, Fourier reconstruction, pulse sequences)
- Magnetic Resonance (contrast mechanisms, gradient- and spin-echo, applications)
- Ultrasound (mechanical wave generation, propagation in tissue, reflection, transmission)
- Ultrasound (spatial and temporal resolution, phased arrays)
- Ultrasound (Doppler shift, implementations, applications)
- Summary, example exam questions

Objective

Abstract

227-0385-10L Biomedical Imaging W 6 credits 3G S. Kozerke, K. P. Prüssmann

227-0386-00L Biomedical Engineering W 4 credits 3G J. Várós, S. J. Ferguson, S. Kozerke, M. P. Wolf, M. Zenobi-Wong

Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The focus is on learning the basic vocabulary of biomedical engineering and getting familiar with concepts that govern common medical instruments and the most important organs from an engineering point of view.

In addition, the most recent achievements and trends of the field of biomedical engineering are also outlined.

Objective

Abstract

Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The course provides an overview of the various topics of the different tracks of the biomedical engineering master course and helps orienting the students in selecting their specialized classes and project locations. It also serves as an introduction to the field for students of the ITET, MAVT, HEST and other bachelor programs.

In addition, the most recent achievements and trends of the field of biomedical engineering are also outlined.

Content

- History of BME and the role of biomedical engineers. Ethical issues related to BME.
- Biomedical sensors both wearable and also biochemical sensors.
- Bioelectronics: Nernst equation, Donnan equilibrium, equivalent circuits of biological membranes and bioelectronic devices.
- Bioinformatics: genomic and proteomic tools, databases and basic calculations.
- Equations describing basic reactions and enzyme kinetics.
- Medical optics: Optical components and systems used in hospitals.
- Basic concepts of tissue engineering and organ printing.
- Biomaterials and their medical applications.
- Function of the heart and the circulatory system.
- Transport and exchange of substances in the human body, compartment modeling.
- The respiratory system.
- Bioimaging.
- Orthopedic biomechanics.
- Lectures (2h), discussion of practical exercises (1h) and homework exercises.

Lecture notes

Introduction to Biomedical Engineering by Enderle, Banchard, and Bronzino

AND

Lecture notes notice

The lecture notes will be made available electronically.

Prerequisites / notice

No specific requirements, BUT

ITET, MAVT, PHYS students will have to learn a lot of new words related to biochemistry, biology and medicine, while HEST and BIOL students will have to grasp basic engineering concepts (circuits, equations, etc.).
Abstract
The course introduces bioelectricity and the sensing concepts that enable obtaining information about neurons and their networks. The sources of electrical fields and currents in the context of biological systems are discussed. The fundamental concepts and challenges of measuring bioelectronic signals and the basic concepts to record optogenetically modified organisms are introduced.

Objective
During this course the students will:
- learn the basic concepts in bioelectronics including the sources of bioelectronic signals and the methods to measure them
- be able to solve typical problems in bioelectronics
- learn about the remaining challenges in this field

Content
Lecture topics:
1. Introduction
2. Membrane and Transport
3-4. Action potential and Hodgkin-Huxley
5. Detection and Noise
6. Measuring currents in solutions, nanopore sensing and patch clamp pipettes
7. Measuring potentials in solution and core conductance model
8. Measuring electronic signals with wearable electronics, ECG, EEG
9. Measuring mechanical signals with bioelectronics
10. Functional electric stimulation
11. In vivo electrophysiology
12. Measuring neurons optically, fundamentals of optical microscopy
13. Fluorescent probes and scanning microscopy, optogenetics, in vivo microscopy
14. Measuring biochemical signals

Lecture notes
A detailed script is provided to each lecture including the exercises and their solutions.

Literature
Plonsey and Barr, Bioelectricity: A Quantitative Approach (Third edition)

Prerequisites / notice
The course requires an open attitude to the interdisciplinary approach of bioelectronics. In addition, it requires undergraduate entry-level familiarity with electric & magnetic fields/forces, resistors, capacitors, electric circuits, differential equations, calculus, probability calculus, Fourier transformation & frequency domain, lenses / light propagation / refractive index, pressure, diffusion AND basic knowledge of biology and chemistry (e.g. understanding the concepts of concentration, valence, reactants-products, etc.).
Image Analysis and Computer Vision

**Abstract**

**Objective**
This course aims at offering a self-contained account of computer vision and its underlying concepts, including the recent use of deep learning.

The first part starts with an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First the interaction of light with matter is considered. The most important hardware components such as cameras and illumination sources are also discussed. The course then turns to image discretization, necessary to process images by computer.

The next part describes necessary pre-processing steps, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and 3D shape as two important examples. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed. A major part at the end is devoted to deep learning and AI-based approaches to image analysis. Its main focus is on object recognition, but also other examples of image processing using deep neural nets are given.

**Lecture notes**
Course material Script, computer demonstrations, exercises and problem solutions

**Prerequisites / notice**
Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Python and Linux. The course language is English.

---

Cell Biophysics

**Abstract**
Applying two fundamental principles of thermodynamics (entropy maximization and Gibbs energy minimization), an analytical model is derived for a variety of biological phenomena at the molecular as well as cellular level, and critically compared with the corresponding experimental data in the literature.

**Objective**
Objective of this course is to show that biological phenomena despite their variety can be analytically described using only two principles from statistical mechanics: maximization of the entropy and minimization of the Gibbs free energy.

Starting point of the course is the probability theory, which enables to derive step-by-step the two pillars of thermodynamics from the perspective of statistical mechanics: the maximization of entropy according to the Boltzmann’s law as well as the minimization of the Gibbs free energy. Then, an assortment of biological phenomena at the molecular and cellular level (e.g. cytoskeletal polymerization, action potential, photosynthesis, gene regulation, morphogen patterning) will be examined at the light of these two principles with the aim to derive a quantitative expression describing their behavior. Each analytical model is finally validated by comparing it with the corresponding experimental results from the literature.

By the end of the course, students will also learn to critically evaluate the concepts of making an assumption and making an approximation.

**Content**
- Basics of theory of probability
- Boltzmann’s law
- Entropy maximization and Gibbs free energy minimization
- Ligand-receptor: two-state systems and the MWC model
- Random walks, diffusion, crowding
- Electrostatics for salty solutions
- Elasticity: fibers and membranes
- Molecular motors
- Action potential: Hodgkin-Huxley model
- Photosynthesis and vision
- Gene regulation
- Development: Turing patterns

**Lecture notes**
No lecture notes because the two proposed textbooks are more than exhaustive!

I am willingly available Mondays 17.00 o’clock - 18.00 in my office GLC F12.2 for whatever discussion about the lessons and the exercises.

!!! I am using OneNote. All lectures will be broadcast via ZOOM, while corresponding videos of the previous years (lectures and exercises) are available in Moodle !!!

---

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 1272 of 2684
Literature

As further deepening:

Prerequisites / notice

- Participants need a good command of:
  - differentiation and integration of a function with one or more variables (basics of Analysis),
  - Newton's and Coulomb's laws (basics of Mechanics and Electrostatics).

227-0965-00L Micro and Nano-Tomography of Biological Tissues

Abstract

The lecture introduces the physical and technical know-how of X-ray tomographic microscopy. Several X-ray imaging techniques (absorption-, phase- and darkfield contrast) will be discussed and their use in daily research, in particular biology, is presented. The course discusses the aspects of quantitative evaluation of tomographic data sets like segmentation, morphometry and statistics.

Objective

Introduction to the basic concepts of X-ray tomographic imaging, image analysis and data quantification at the micro and nano scale with particular emphasis on biological applications.

Content

Synchrotron-based X-ray micro- and nano-tomography is today a powerful technique for non-destructive, high-resolution investigations of a broad range of materials. The high-brilliance and high-coherence of third generation synchrotron radiation facilities allow quantitative, three-dimensional imaging at the micro and nanometer scale and extend the traditional absorption imaging technique to edge-enhanced and phase-sensitive measurements, which are particularly suited for investigating biological samples.

The lecture includes a general introduction to the principles of tomographic imaging from image formation to image reconstruction. It provides the physical and engineering basics to understand how imaging beamlines at synchrotron facilities work, looks into the recently developed phase contrast methods, and explores the first applications of X-ray nano-tomographic experiments.

The course finally provides the necessary background to understand the quantitative evaluation of tomographic data, from basic image analysis to complex morphometrical computations and 3D visualization, keeping the focus on biomedical applications.

Lecture notes

Available online

227-0969-00L Methods & Models for fMRI Data Analysis

Abstract

This course teaches methods and models for fMRI data analysis, covering all aspects of statistical parametric mapping (SPM), incl. preprocessing, the general linear model, statistical inference, multiple comparison corrections, event-related designs, and Dynamic Causal Modelling (DCM), a Bayesian framework for identification of nonlinear neuronal systems from neurophysiological data.

Objective

To obtain in-depth knowledge of the theoretical foundations of SPM and DCM and of their practical application to empirical fMRI data.

Content

This course teaches state-of-the-art methods and models for fMRI data analysis in lectures and exercises. It covers all aspects of statistical parametric mapping (SPM), incl. preprocessing, the general linear model, frequentist and Bayesian inference, multiple comparison corrections, and event-related designs, and Dynamic Causal Modelling (DCM), a Bayesian framework for identification of nonlinear neuronal systems from neurophysiological data. A particular emphasis of the course will be on methodological questions arising in the context of clinical studies in psychiatry and neurology. Practical exercises serve to consolidate the skills taught in lectures.

Lecture notes

Available online

263-5057-00L From Publication to the Doctor’s Office

Abstract

This seminar course is designed to provide students with an opportunity to review and critically evaluate recent publications in medical field focusing on examples when CS method or bioinformatics/statistical technique has lead to an instrumentation, technique or drug approved for clinical practice use.

Objective

Throughout the course, students will read and analyze recent publications that demonstrate successful applications and sometimes failures in medicine. Promising research applications will also be discussed. The publications will cover a wide range of topics, including drug discovery, image analysis, prognostic models, and learning healthcare.
The course will be structured as half lecture content and half seminar content. Lectures will review state of the medical practice prior to the discovery, obstacles in moving the field forward, and the need for improvement. Lecture will be followed by the seminar part where students will take turns presenting the assigned publications and leading the discussions. Students’ presentations will focus on the main findings, and specific steps taken to translate the finding into clinical practice.

Publications will include examples of:
- specific CS/bioinformatics/statistics applications that has been brought to "bedside" – has been approved by European Medicines Agency / Food and Drug Administration (USA) for clinical use or are widely used in medical research;
- examples of failures of how a discovery did not translate into an endproduct and why;
- current active research areas.

Covered topics will include some of the following:
- Drug discovery: Computer-aided drug discovery has become an integral part of the process, enabling researchers to design and screen large libraries of molecules in silico (i.e., using computer simulations) before synthesizing and testing them in the lab. This has led to the discovery of new drug candidates for a wide range of diseases, including cancer, Alzheimer’s disease, and HIV/AIDS.
- Genomics: Advances in computational genomics have enabled researchers to analyze and interpret large-scale genomic data, including DNA sequencing data, to identify disease-causing mutations, genetic risk factors, and drug targets. Examples of the development of personalized medicine, where treatments are tailored to an individual’s genetic makeup. Examples when drug target identified by genetics has led to approved treatment.
- Imaging: Computer vision and image processing techniques have revolutionized medical imaging, enabling researchers to extract quantitative information from medical images that were previously inaccessible. This has led to the development of new diagnostic and prognostic tools for a wide range of diseases, including cancer, cardiovascular disease, and neurological disorders.
- Real-world data applications: emulation of clinical trials using electronic health records data.
- Large language models: Generating clinical trial protocols using large language models. Natural Language Processing for information extraction and interpretation.
- Learning healthcare systems: Advances in data analytics and information technology have enabled the development of learning healthcare systems, which use real-time data from electronic health records, medical devices, and other sources to improve patient outcomes and reduce healthcare costs. This has the potential to transform the way healthcare is delivered, making it more personalized, efficient, and effective.

In addition to the presentations, students will also be required to write critical reviews of the assigned publications throughout the course. The reviews will be evaluated based on the students’ ability to identify the strengths and weaknesses of the publications and to provide insightful and constructive feedback. In addition to the presentations, students will also be required to write critical reviews of the assigned publications throughout the course.

Prerequisites / notice
The course is intended for advanced undergraduate and graduate students with a background in computer science, bioinformatics, or a related field and interest in applying their skills to medical research.

This course assumes a working knowledge of R/Python and intermediate statistical analysis, including linear, logistic, survival regressions or ability and interest to learn them outside of the class.

327-0505-00L Surfaces and Interfaces I: Fundamentals, Analytics and Applications

Extended course starting HS23. Old title: Surfaces, Interfaces and their Applications I. Students who obtained credit points for the old course cannot retake it.

Abstract
This course teaches the basics of surface and interface science and technology, including surface modifications and forces. It covers various analytical techniques to study surface and interface properties, and explores phenomena of applied relevance like friction, lubrication, phoresis, and wetting where surfaces play a crucial role.

Objective
Students are able to:
- describe the physical and chemical properties of surfaces and interfaces.
- analyze and compare analytical tools for surfaces.
- choose and combine appropriate surface-analytical approaches for solving problems connected to applications.
- understand and explain the importance of surfaces and interfaces in a broad range of phenomena and applications.

Content
- Introduction to surfaces and interfaces
- Structure of surfaces over different length scales: from macroscopic roughness to atomic structure
- Surface modifications
- Adsorption and adsorption models
- Surface forces
- Basic physical concepts
- Thermodynamics of surfaces and interfaces
- Measurement of intermolecular and surface forces
- Dynamics and history effects
- Surface analytics: X-ray Photoelectron Spectroscopy (XPS) – principles and modern developments
- Surface analytics: Secondary Ion Mass Spectroscopy (SIMS) and IR Spectroscopy – Principles and examples
- Atomic Force Microscopy (AFM): Principles and modes of operation
- Tribology: Adhesion, Friction and Lubrication
- Contact mechanics
- Micro and macroscale friction
- Boundary lubrication
- Wetting
- Contact angles
- Phoretic phenomena
- Electric double layer and electrophoresis
- Electro-osmosis
- Other types of phoresis
- Case studies
Analytical Competencies

Script Download: https://moodle-app2.let.ethz.ch/course/view.php?id=17455

Prerequisites / notice

Chemistry:
General undergraduate chemistry including basic chemical kinetics and thermodynamics

Physics:
General undergraduate physics including basic theory of interatomic and intermolecular forces, atomic and crystalline structure of materials and their mechanical and electronic properties

Competencies

Subject-specific Competencies
Concepts and Theories assessed
Techniques and Technologies assessed

Method-specific Competencies
Analytical Competencies assessed
Decision-making assessed
Problem-solving assessed

Personal Competencies
Creative Thinking assessed
Critical Thinking assessed

327-2125-00L Microscopy Training SEM I - Introduction to SEM  

The number of participants is limited. In case of overbooking, the course will be repeated once. All registrations will be recorded on the waiting list.

For PhD students, postdocs and others, a fee will be charged (https://scopem.ethz.ch/education/MTP.html).

All applicants must additionally register on this form:
https://docs.google.com/forms/d/1Xw8L_2yXTEG9XxW9CcbmJKMVqVxJxESa9cWDXKX/edit

The selected applicants will be contacted and asked for confirmation a few weeks before the course date.

Abstract

This introductory course on Scanning Electron Microscopy (SEM) emphasizes hands-on learning. Using ScopeM SEMs, students have the opportunity to study their own samples (or samples provided) and solve practical problems by applying knowledge acquired during the lectures. At the end of the course, students will be able to apply SEM for their (future) research projects.

Objective

- Set-up, align and operate a SEM successfully and safely.
- Understand important operational parameters of SEM and optimize microscope performance.
- Examine different signals in SEM and obtain secondary electron (SE) and backscatter electron (BSE) images.
- Operate the SEM in low-vacuum mode.
- Make use of EDX for semi-quantitative elemental analysis.
- Prepare samples with different techniques and equipment for imaging and analysis by SEM.

Content

During the course, students learn through lectures, demonstrations, and hands-on sessions how to set up and operate SEM instruments, including low-vacuum and low-voltage applications. This course gives basic skills for students new to SEM. At the end of the course, students are able to align an SEM, to obtain secondary electron (SE) and backscatter electron (BSE) images and to perform energy dispersive X-ray spectroscopy (EDX) semi-quantitative analysis. Emphasis is put on procedures to optimize SEM parameters in order to best solve practical problems and deal with a wide range of materials.

Lectures:
- Introduction on Electron Microscopy and instrumentation
- electron sources, electron lenses and probe formation
- beam/specimen interaction, image formation, image contrast and imaging modes.
- sample preparation techniques for EM
- X-ray micro-analysis (theory and detection), qualitative and semi-quantitative EDX and point analysis, linescan and spectral mapping

Practicals:
- Brief description and demonstration of the SEM microscope
- Practice on image formation, image contrast (and image processing)
- Student participation on sample preparation techniques
- Scanning Electron Microscopy lab exercises: setup and operate the instrument under various imaging modalities
- Practice on real-world samples and report results

Lecture notes

Lecture notes will be distributed.

Literature

No mandatory prerequisites.

327-2126-00L Microscopy Training TEM I - Introduction to TEM  

The number of participants is limited. In case of overbooking, the course will be repeated once. All registrations will be recorded on the waiting list.

For PhD students, postdocs and others, a fee will be charged (https://scopem.ethz.ch/education/MTP.html).

All applicants must additionally register on this form:
https://docs.google.com/forms/d/1nrDTHjPySCB7XkZiNxfwFW7/fsvJ9carEAO28/edit

The selected applicants will be contacted and asked for confirmation a few weeks before the course date.

Abstract

The introductory course on Transmission Electron Microscopy (TEM) provides theoretical and hands-on learning for beginners who are interested in using TEM for their Master or PhD thesis. TEM sample preparation techniques are also discussed. During hands-on sessions at different TEM instruments, students will have the opportunity to examine their own samples if time allows.
Objective

Understanding of
1. the set-up and individual components of a TEM
2. the basics of electron optics and image formation
3. the basics of electron beam – sample interactions
4. the contrast mechanism
5. various sample preparation techniques

Learning how to
1. align and operate a TEM
2. acquire data using different operation modes of a TEM instrument, i.e. Bright-field and Dark-field imaging
3. record electron diffraction patterns and index diffraction patterns
4. interpret TEM data

Content

Lectures:
- basics of electron optics and the TEM instrument set-up
- TEM imaging modes and image contrast
- STEM operation mode
- Sample preparation techniques for hard and soft materials

Practicals:
- Demo, practical demonstration of a TEM: instrument components, alignment, etc.
- Hands-on training for students: sample loading, instrument alignment and data acquisition.
- Sample preparation for different types of materials
- Practical work with TEMs
- Demonstration of advanced Transmission Electron Microscopy techniques

Lecture notes

Lecture notes will be distributed.

Literature

Prerequisites / notice

No mandatory prerequisites. Please consider the prior attendance to EM Basic lectures (551-1618-00V; 227-0390-00L; 327-0703-00L) as suggested prerequisite.

363-0790-00L  Technology Entrepreneurship  W  2 credits  2V  F. Hacklin

Abstract

Technology ventures are significantly changing the global economic picture. Technological skills increasingly need to be complemented by entrepreneurial understanding.

This course offers the fundamentals in theory and practice of entrepreneurship in new technology ventures. Main topics covered are success factors in the creation of new firms, including founding, financing and growing a venture.

Objective

A critical understanding of dos and don'ts is provided through highlighting and discussing real life examples and cases.

Content

Weekly sessions - recorded.

10+ sessions carried out by guest lecturers: experts in the broad field of technology entrepreneurship (e.g., serial entrepreneurs, venture capitalists, (E)MBA professors, company builders, patent experts, scale-up executives, …). Final session: multiple choice semester assignment (100% of grade).

Typical lecture format (2h):
15': Introduction
60': Guest testimonial
15': Discussion related to topic (in groups)
10': Plenary discussion
20': Q&A with (guest) lecturer

Lecture notes

Lecture slides and case material

363-1163-00L  Developing Digital Biomarkers  W  3 credits  2V  F. Da Conceição Barata

Abstract

Particularly suitable for students with a technical background who are interested in healthcare.

The course gives an introduction to digital biomarkers and provides students with the foundations to develop their own digital biomarkers. More specifically, the course will cover fundamental topics such as designing observational studies, collecting, and exploring data generated by consumer-centric devices, and applying analytical methods to predict health-related outcomes.

Objective

The widespread use of mobile technologies (e.g., wearable sensors, mobile applications, social media, and location-tracking technologies) has the potential to meet the health monitoring needs of the world’s aging population and the ever-growing number of chronic patients. However, this premise is based on the application of Machine Learning algorithms that allow us to use this data in many different ways. In this course we will analyze systematic ways to collect data, review the most relevant methods and applications in healthcare, discuss the main challenges they present and apply the newly gained knowledge in practical assignments.

The course has four core learning objectives. Students should:
• understand the anatomy of digital biomarkers
• understand the potential and applications of digital biomarkers
• be able to critically reflect and assess existing digital biomarkers
• be able to design and implement a digital biomarker

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 1276 of 2684
The course will consist of four topic clusters that will allow the discussion of the most relevant digital biomarker applications in healthcare:

1) Digital Biomarkers: From biological to digital biomarkers. How are they motivated, defined and how can they be leveraged for monitoring? Prognostic vs. diagnostic vs. predictive biomarkers. Passive sensing vs. active sensing. Digital biomarker vs. Digital therapeutics.

2) Consumer-centric device data: Today, vast amount of physiological, environmental, and behavioral observations can be collected with consumer centric devices. To derive clinical meaningful information from this data is, however, difficult. We will discuss strategies for extracting knowledge from those measurements.

3) Methodology: In the last decade, neural networks (also known as “deep learning”) have helped push the boundaries of the state-of-the-art in a myriad of domains. They have also uncovered a number of different problems. We will discuss advantages and disadvantage as well as alternative methods for their application to digital biomarker data.

4) Applications: Digital biomarkers are still an emerging subfield, but given that longitudinal in digital biomarker data are arguably easy to acquire in large quantities, it is expected that many relevant Machine Learning applications will emerge in the near future. We will review and discuss current applications and challenges.

**Prerequisites / notice**

Some programming experience in Python is required, and some experience in Machine Learning is highly recommended.
Content
Bone is one of the most investigated biological materials due to its primary function of providing skeletal stability. Bone is susceptible to different local stimuli including mechanical forces and has great capabilities in adapting its mechanical properties to the changes in its environment. Nevertheless, aging or hormonal changes can make bone lose its ability to remodel appropriately, with loss of strength and increased fracture risk as a result, leading to devastating diseases such as osteoporosis.

To better understand the biomechanical function of bone, one has to understand the hierarchical organization of this fascinating material down from the molecules, to the cells, tissue and up to the organ. Multiscale imaging and simulation allow to link these different levels of hierarchy. Incorporating systems biology approaches, not only biomechanical strength of the material can be assessed but also the mechanobiological response of the bone triggered by loading and injury in scenarios relevant for personalized health. Watching cells working together to build and repair bone in a coordinated fashion is a spectacle, which will need dynamic image content and deep discussions in the lecture room to probe the imagination of the individual student interested in the topic. Lastly, state-of-the-art developments in tissue engineering and regeneration, 3D bioprinting and bio-manufacturing and organoid technology will be highlighted towards personalized health.

For the seminar, concepts of video lectures will be used in a flipped classroom setup, where students can study the basic biology, engineering, and mathematical concepts in video tutorials online (TORQUES). All videos and animations will be incorporated in Moodle and PolyBook allowing studying and interactive course participation online. It is anticipated that the students need to prepare 2x45 minutes for the study of the actual lecture material. The course is structured as a seminar in three parts of 45 minutes with video lectures and a flipped classroom setup. In the first part (TORQUES: Tiny, Open-with-Restrictions courses focused on Quality and Effectiveness), students study the basic concepts in short, interactive video lectures on the online learning platform Moodle. Students are able to post questions at the end of each video lecture or the Moodle forum that will be addressed in the second part of the lectures using a flipped classroom concept. For the flipped classroom, the lecturers may prepare additional teaching material to answer the posted questions (Q&A). Following the Q&A, the students will have to form small groups to try to solve such problems and to present their solutions for advanced multiscale investigation of bone ranging from basic science to clinical application. Towards the end of the semester, students will have to present self-selected publications associated with the different topics of the lecture identified through PubMed or the Web of Science.

Lecture notes
Material will be provided on Moodle and eColab.

Prerequisites / notice
Prior experience with the programming language python is beneficial but not mandatory. ETH offers courses for practical programming with python.

376-0208-00L Molecular and Cellular Biology of Exercise and Muscle Regeneration - Practical Aspects

W 3 credits
2G O. Bar-Nur, K. De Bock

Abstract
The skeletal muscle biology field purposes to understand how muscles coordinate movement, regenerate following injury and adapt to exercise stimuli. In this course, the students will acquire insights into the molecular aspects of muscle biology and exercise, in addition to gaining hands-on experience in experimental techniques that are commonly used to research muscle regeneration and exercise.

Objective
The objective of this course is to introduce students into current research topics and outstanding questions in skeletal muscle biology. Also, the course will give students hands-on experience in respect to the tools needed to perform basic molecular biology research in the field of exercise and skeletal muscle biology. Students will learn how to translate a scientific question in muscle biology into a small scientific project. They will learn how to design an experiment and to analyze and critically interpret experimental data.

Content
The course will consist of 4 main research themes and the anticipated 16 students will be divided into 4 subgroups of 4 students- each one will focus on one of the following research topics:

- Topic 1: Molecular pathways that control muscle stem cell self-renewal and differentiation
- Topic 2: Genome engineering to correct genetic mutations that cause muscle diseases
- Topic 3: Muscle fiber composition, force production and insulin sensitivity
- Topic 4: Amino acid sensitivity in skeletal muscle following exercise

The course will be organized into 7 sessions, each approx. 4 hours: the first 2 sessions will be theoretical and include an introductory lectures by the professors in addition to a journal club presentation by the students. This journal club aims to provide theoretical and scientific background that will be used to identify outstanding research questions. This will be followed by 4 practical sessions (hands-on experience) and 1 final evaluation session.

For the journal club, each group of students will receive a peer-review article that is highly relevant to the respective group’s research topic. Each of the 4 groups will present and discuss the article in a journal club format to the rest of the participants the following week. During the four practical sessions, students will gain hands-on experiences and learn different lab techniques related to molecular biology of exercise and muscle regeneration. Each group will be presented with a research objective that is related to their topic, and perform in collaboration with teaching assistants a set of experiments that aim to address the research objective. At the final evaluation session, each group of students will present their results and identify follow-up research questions and hypothesis based on their experimental achievements.

Select practical methods that the proposed course will teach include:
- i. Group 1: tissue culture, isolation of muscle stem cells via FACCTS, differentiation of muscle stem cell into muscle fibers, small molecules screens, quantitative analysis of muscle cell proliferation and fusion, Immunofluorescence.
- ii. Group 2: tissue culture, differentiation of muscle stem cells into muscle fibers, guide RNA design and Crispr-Cas9 gene editing of genetic mutations that cause muscle diseases in muscle stem cells and fibers. Immunofluorescence and PCR.
- iii. Group 3: ex vivo assessment of muscle force characteristics, cryosectioning of muscle tissue, immunofluorescence and western blot.
- iv. Group 4: tissue culture of muscle stem cells, isolation of muscle stem cells and differentiation into muscle fibers, amino acid stimulation of muscle fibers. Western blot.

Prerequisites
376-0006-02L Laboratory Course in Molecular biology
The course will cover the following topics:

- Introduction to different study designs and ethical requirements thereof in Switzerland
- How to collect and sort publications/ keep up to date on research topic
- How to publish
- How to present research findings
- Correct conduction of fundamental human research procedures (e.g., screening, consent process, CRF) and identification/prevention of deviations and emergencies
- Principles of reproducible and integral study documentation and data management (e.g., definition of source files, SOP/WI, Master Trial File, Data Dictionary)
- FAIR principles and open science
- Design principles and free digital tools for graphical illustrations
- Effective summarizing of research output/topic in an abstract and pitch presentation

This module briefly reviews time-frequency domains, transforms and filtering.

This module briefly introduces brain functions and provides an overview of related wearable technologies. Topics covered may include electrophysiological (EMG, EOG, EEG) and electrocardiogram (ECG). Provide students with hands-on experience using various wearable technologies, including textile-based stretchable sensors, electroencephalogram (EEG) and electrocardiogram (ECG).

This module introduces concepts about wearable and unobtrusive technologies for sport and health data collection. Tools for analysing this data and evaluating the performance of these systems are introduced. Topics such as monitoring movement and muscle activation, mental focus, stress, and heart health are covered.

The course briefly covers the following:

- Objective 1: Acquire knowledge about wearable and unobtrusive technologies and skills to process data acquired using wearable technologies.

- Objective 2: Provide students with hands-on experience using various wearable technologies, including textile-based stretchable sensors, electromyography (EMG), electroencephalogram (EEG) and electrocardiogram (ECG).

The course consists of the following modules:

Module 0: Fundamentals
This module briefly reviews time-frequency domains, transforms and filtering.

Module 1: Movement.
This module provides the scientific background needed to understand the principles that current technologies investigating movement rely on. It provides an overview of wearable technologies for monitoring overall body movement as well as for tracking motion parameters (e.g. gait, running, posture). Technologies such as inertial measurement units, electromyography, and wearable motion capture systems, and others are covered. The latest updates on wearable-related (e.g., textile-based) technologies are also introduced. Students are involved in labs/assignments to put into practice the knowledge and skills acquired during this module.

Module 2: Brain.
This module briefly introduces brain functions and provides an overview of related wearable technologies. Topics covered may include electroencephalograms, transcranial magnetic stimulation, and galvanic vestibular stimulation. Data processing techniques such as common spatial patterns, principal component analysis, and linear discriminant analysis are introduced. Students are given a practical assignment to put into practice the knowledge and skills acquired during this module.

Module 3: Cardiac.
This module focuses on wearable technologies for monitoring cardiac health. The module starts by providing information on cardiac physiology and introduces wearable technologies for the heart. Topics such as electrocardiography, photoplethysmography, light sensing, and contactless physiology monitoring are introduced. Data analysis techniques for cardiac data including heart-rate variability, Poincare plots, and wavelet transforms are discussed. Students will be given an assignment to put into practice the knowledge and skills acquired during this module.
**Prerequisites / notice**
- Students should be proficient in programming (any language).
- Note: assignments will be in Python. Students are expected to learn Python on their own if not experienced with this programming language.
- Course prerequisites:
  - For Biomedical Engineering Master’s: none
  - For ITET Master’s: none
  - For D-MAVT Master’s: none
  - For D-HEST Master’s and PhD students:
    - If BSc in electrical/mechanical engineering or computer science: none
    - If any other BSc program: 376-0022-00L (Imaging and Computing in Medicine) or 376-1983-00L (Foundations of Data Science)

**Competencies**

**Subject-specific Competencies**
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

**Method-specific Competencies**
- Analytical Competencies: assessed
- Decision-making: fostered
- Media and Digital Technologies: fostered
- Problem-solving: assessed

**Social Competencies**
- Communication: fostered
- Cooperation and Teamwork: fostered

**Personal Competencies**
- Adaptability and Flexibility: fostered
- Creative Thinking: assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: fostered
- Self-direction and Self-management: fostered

**376-1177-00L Human Factors I**

**Abstract**
Strategies of human-system-interaction, individual needs, physical & mental abilities, and system properties are key factors affecting the quality and performance in interaction processes. In the lecture, factors are investigated by basic scientific approaches. Discussed topics are important for optimizing people’s health, well-being, and satisfaction as well as the overall system performance.

**Objective**
The goal of the lecture is to empower students in better understanding the applied theories, principles, and methods in various applications. Students are expected to learn about how to enable an efficient and qualitatively high standing interaction between human and the environment, considering costs, benefits, health, and safety as well. Thus, an ergonomic design and evaluation process of products, tasks, and environments may be promoted in different disciplines. The goal is achieved in addressing a broad variety of topics and embedding the discussion in macroscopic factors such as the behavior of consumers and objectives of economy.

**Content**
- Physiological, physical, and cognitive factors in sensation, perception, and action
- Body spaces and functional anthropometry, Digital Human Models
- Experimental techniques in assessing human performance, well-being, and comfort
- Usability engineering in system designs, product development, and innovation
- Human information processing and biological cybernetics
- Interaction among consumers, environments, behavior, and tasks

**Literature**
- Gavriel Salvendy, Handbook of Human Factors and Ergonomics, 4th edition (2012), is available on NEBIS as electronic version and for free to ETH students
- Further textbooks are introduced in the lecture
- Brochures, checklists, key articles etc. are uploaded in ILIAS

**376-1177-00L Applications of Cybernetics in Ergonomics**

**Abstract**
Cybernetics systems have been studied and applied in various research fields, such as for applications in ergonomics. Topics discussed in this lecture (man-machine-interaction, performance in multi-modal interactions, quantification in gestalt principles for the use in product development, information processing) are deepened with exercises conducted at our labs.

**Objective**
To learn and practice cybernetics principles in interface designs and product development.

**Content**
- Fitt’s law applied in manipulation tasks
- Hick-Hyman law applied in design of the driver assistance systems - Vigilance applied in quality inspection
- Accommodation/vergence crosslink function
- Cross-link models in neurobiology - the ocular motor control system
- Human performance in optimization of production lines

**Literature**

**376-1219-00L Rehabilitation Engineering II: Rehabilitation of Sensory and Vegetative Functions**

**Abstract**
Rehabilitation Engineering is the application of science and technology to ameliorate the handicaps of individuals with disabilities to reintegrate them into society. The goal is to present classical and new rehabilitation engineering principles applied to compensate or enhance motor, sensory, and cognitive deficits. Focus is on the restoration and treatment of the human sensory and vegetative system.

**Objective**
Provide knowledge on the anatomy and physiology of the human sensory system, related dysfunctions and pathologies, and how rehabilitation engineering can provide sensory restoration and substitution.

This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.
Introduction, problem definition, overview
Rehabilitation of visual function
- Anatomy and physiology of the visual sense
- Technical aids (glasses, sensor substitution)
- Retina and cortex implants
Rehabilitation of hearing function
- Anatomy and physiology of the auditory sense
- Hearing aids
- Cochlea Implants
Rehabilitation and use of kinesthetic and tactile function
- Anatomy and physiology of the kinesthetic and tactile sense
- Tactile/haptic displays for motion therapy (incl. electrical stimulation)
- Role of displays in motor learning
Rehabilitation of vestibular function
- Anatomy and physiology of the vestibular sense
- Rehabilitation strategies and devices (e.g. BrainPort)
Rehabilitation of vegetative Functions
- Cardiac Pacemaker
- Phrenic stimulation, artificial breathing aids
- Bladder stimulation, artificial sphincter
Brain stimulation and recording
- Deep brain stimulation for patients with Parkinson, epilepsy, depression
- Brain-Computer Interfaces

Literature
Introductory Books:

Selected Journal Articles and Web Links:

Prerequisites / notice
Target Group:
Students of higher semesters and PhD students of
- D-MAVT, D-ITET, D-INFK, D-HEST
- Biomedical Engineering, Robotics, Systems and Control
- Medical Faculty, University of Zurich
Students of other departments, faculties, courses are also welcome
This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.

Data: 06.08.2024 12:40 Autumn Semester 2024 Page 1281 of 2684
Building upon new technologies to engineer and functionalize well-defined nanostructured materials, a plethora of exciting discoveries were assessed. Communication fostered. Concepts and Theories assessed.

Micro/Nanotechnology and Microfluidics for Biomedical Applications

376-1351-00L

W 2 credits 2V E. Delamarche

Abstract

This course is an introduction to techniques in micro/nanotechnology and to microfluidics. It reviews how many familiar devices are built and can be used for research and biomedical applications. Transistors for DNA sequencing, beamers for patterning proteins, hard-disk technology for biosensing and microfluidics for point-of-care diagnostics are just a few examples of the covered topics.

Objective

The main objective of the course is to introduce micro/nanotechnology and microfluidics to students having any technical background. The course is multi-disciplinary and covers a broad range of techniques. For each lecture, a brief historical perspective is given to illustrate by whom and how the techniques were invented.

The course should familiarize the students with the techniques used in micro/nanotechnology, cleanroom microfabrication, and show them how micro/nanotechnology pervades throughout life sciences. Microfluidics will be emphasized due to their increasing importance in research and for medical applications.

The second objective is to have life sciences students less intimidated by micro/nanotechnology and make them able to link instruments and techniques to specific problems that they might have in their projects/studies. This will also help students getting access to the ETHZ/IBM Nanotech Center infrastructure if needed.

Content

Mostly formal lectures (2 × 45 min), with few specific guest lectures on topics of particular relevance. For example, an introduction to cleanroom and micro/nanotechnology instruments and 3D printing will be provided. Last 3 weeks would be dedicated to the presentation and evaluation of projects by students (2 to 3 students per team). For this, about 12 recent technologies are listed and each team picks a technology and makes a short report and presentation describing how it works, its strengths and weaknesses, and describes what problem it solves.

In terms of technical content, the lectures will cover:

- an overview of the microelectronic industry, Moore’s law, field-effect transistors, next-generation DNA sequencing
- liquid crystal displays, organic light emitting diodes, electrophotonic displays, micromirrors and beamers, photopatternning of proteins and cells, optogenetics, and flexible displays and electronics
- hard disk drives and the giant magnetoresistance effect, magnetic nanoparticles, photonicics, magnetic sensing and optical biosensing
- biosensors and instruments, from design to microfabrication of simple devices and microfluidics, examples of DNA microarrays
- the principles of microfluidics, microfluidic functions and fabrication, from microfluidics for research to point-of-care diagnostics, and the (infamous) history of Theranos, as well as some discussions on diagnostics for COVID, R0, and (im)precision of diagnostic devices and why it matters
- 2 × 45 min will be covered by Yuksel Temiz, a master of Arduino programming and do-it-yourself electronics, who will present how to make 20$ electronic components that are synergistic to microfluidic devices and that can be controlled using a smartphone

Competencies

376-1353-00L Nanostructured Materials Safety

W 2 credits 1V P. Wick, T. Bürki-Thurnherr

Abstract

Fundamentals in nanostructured material - living system interactions focusing on the main exposure routes, lung, gastrointestinal tract, skin and intravenous injection.

Objective

Understanding the potential side effects of nanomaterials in a context-specific way, enabling to evaluate nanomaterial safety and provide knowledge to design safer materials.

Content

Building upon new technologies to engineer and functionalize well-defined nanostructured materials, a plethora of exciting discoveries were made and found their way in our daily life. These customized nanomaterials provide extraordinary properties and make them attractive for many innovative applications. Exactly these new properties may have the potential to be responsible for unforeseen side effects, which hamper a straightforward translation into new products. Therefore, the safety research provide the evidence for a responsible and sustainable use of nanomaterials. The lecture will focus on basic principles of nanotoxicology, provide the understanding of the potential side effects of nanomaterial in a context-specific way addressing the main exposure routes such as inhalation, ingestion, topical applications and intravenous injections as well as it will provide impulses for safer material designs.

Structure of the planned lecture (2 × 45 min)

1. Introduction; the principles of nanotoxicology
2. Lung - particles interactions: two disease scenarios and their molecular mechanism
3. GI - particles interactions: intendent and unintendent particle exposure via food
4. Skin - particles interactions: body care products and their influence on skin physiology
5. Intravenous injection: colloidal stability, protein corona and cellular effects
6. Micro- / Nanoplastics and development of a safety research plan
7. End of semester exam

Lecture notes

Handouts provided during the classes and references therein as well as primary literature as case studies will be posted to the course website.

Prerequisites / notice

course "Introduction to Toxicology"
This course focuses on the emerging, interdisciplinary field of physical human-robot interaction, bringing together themes from robotics, real-time control, human factors, haptics, virtual environments, interaction design and other fields to enable the development of human-oriented robotic systems.

The objective of this course is to give an introduction to the fundamentals of physical human robot interaction, through lectures on the underlying theoretical/mechatronics aspects and application fields, in combination with a hands-on lab tutorial. The course will guide students through the design and evaluation process of such systems.

By the end of this course, you should understand the critical elements in human-robot interactions - both in terms of engineering and human factors - and use these to evaluate and de-sign safe and efficient assistive and rehabilitative robotic systems. Specifically, you should be able to:

1) identify critical human factors in physical human-robot interaction and use these to derive design requirements;
2) compare and select mechatronic components that optimally fulfill the defined design requirements;
3) derive a model of the device dynamics to guide and optimize the selection and integration of selected components into a functional system;
4) design control hardware and software and implement and test human-interactive control strategies on the physical setup;
5) characterize and optimize such systems using both engineering and psychophysical evaluation metrics;
6) investigate and optimize one aspect of the physical setup and convey and defend the gained insights in a technical presentation.

This course provides an introduction to fundamental aspects of physical human-robot interaction. After an overview of human haptic, visual and auditory sensing, neurophysiology and psychophysics, principles of human-robot interaction systems (kinematics, mechanical transmissions, robot sensors and actuators used in these systems) will be introduced. Throughout the course, students will gain knowledge of interaction control strategies including impedance/admittance and force control, haptic rendering basics and issues in device design for humans such as transparency and stability analysis, safety hardware and procedures. The course is organized into lectures that aim to bring students up to speed with the basics of these systems, readings on classical and current topics in physical human-robot interaction, laboratory sessions and lab visits. Students will attend periodic laboratory sessions where they will implement the theoretical aspects learned during the lectures. Here the salient features of haptic device design will be identified and theoretical aspects will be implemented in a haptic system based on the haptic paddle (https://relab.ethz.ch/downloads/open-hardware/haptic-paddle.html), by creating simple dynamic haptic virtual environments (https://haptics-avlab.github.io/demos.html) and understanding the performance limitations and causes of instabilities (direct/virtual coupling, friction, damping, time delays, sampling rate, sensor quantization, etc.) during rendering of different mechanical properties.

Will be distributed on Moodle before the lectures.

The goal of this course is to teach MSc students the necessary skills for doing research in the fields of tissue engineering and regenerative medicine. Practical exercises on topics including sterile cell culture, light microscopy and histology, and biomaterials are covered. In addition to practical lab work, the course will teach skills in data acquisition/analysis.

Prerequisites / notice
A laptop is needed with the below Systems Requirements:
- Memory: 16 GB
- Processor: 3rd gen i7
- DirectX® 11.0 compliant AMD Radeon/NVIDIA® GeForce® card with 2 GB RAM
- Storage: 15 GB

Mac computer can be used by pre-installing Windows through bootcamp (older Macs) or Parallels Desktop (14d trial license, 35 CHF license purchasable in the IT shop of ETH).

Abstract
This course includes an introduction to study design, measurement techniques, signal processing, as well as musculoskeletal modeling.

Objective
The students are able to analyse the human movement from a technical point of view, to process the data and perform modeling with a focus towards clinical application.

Content
The course starts off with an introductory lecture on ethics as a discipline and an overview of the most relevant approaches in the domain of human health. The specific learning objectives of this course are:

A. Identify ethical issues in in life sciences and biotechnology.
B. Analyze and critically discuss ethical issues in life sciences and biotechnology.
C. Become aware of relevant legal and public policy frameworks.
D. Distinguish different ethical approaches and argumentative strategies in applied ethics.
E. Recognize how ethical issues relate to different accounts of technology and innovation.
F. Develop a personal and critical attitude towards the ethical aspects of life sciences and their technological application.
G. Autonomously anticipate ethical issues.
H. Propose and communicate solutions to ethical challenges and dilemmas.

The course will continue with thematic sessions covering a broad variety of topics all of which are relevant to the different study tracks offered by the department. In particular, the course will cover the following domains: digital health technologies and medical AI; food, nutrition and healthy longevity; biomedical engineering; genetics; neuroscience and Neurotechnologies; medical robotics; disability and rehabilitation; environmental ethics. The course will also include sessions on cross-cutting ethically relevant aspects of health sciences and technologies, namely: access to innovation, translational research, and the relation between science and public policy.

Notice:
- The registration is limited to 26 students
- There are 4 credit points for this course.
- The lecture will be held in English.
- The students are expected to have basic control knowledge from previous classes.

Ethics in Drug Development

**Abstract**
This course provides a thorough exploration of drug development and involved ethical issues as well as critical analysis of ethical challenges and practical skills to resolve them. It includes elements of drug discovery, preclinical and clinical research ethics, alternative regulatory pathways and ethics of drug pricing and develops a solid grasp of ethical complexity as well as practical skills.

**Objective**
This course is tailored to D-HEST students who want to become familiar with pharmaceutical development and its ethical implications. By the end of this course, students will have developed a comprehensive understanding of the ethical complexities and challenges in drug development. They will be equipped with the knowledge and analytical skills to navigate ethical reasoning and contribute to the responsible advancement of pharmaceutical research. The specific learning objectives of the course are:

- Discuss relevant legal and public policy frameworks in drug development, ensuring an understanding of the broader regulatory context within which policy and regulatory decisions are made.
- Recognize and identify ethical dilemmas inherent to drug development, fostering a heightened awareness of ethical considerations across various stages of the process.
- Identify and discuss ethical issues in drug development in light of recent advances in the field of artificial intelligence.
- Critically analyze ethical challenges within drug development, enabling them to discuss complex issues, evaluate competing ethical perspectives, and form reasoned judgments.
- Understand the ethical theories and principles that underpin drug regulation.
- Evaluate the ethical implications of alternative pathways, such as Accelerated Approval and Compassionate Use, equipping students to assess potential benefits, risks, and societal consequences.
- Assess the ethical dimensions of drug pricing decisions and their impact on equity and accessibility, encouraging thoughtful reflection on the broader societal implications of pricing strategies.

**Content**
- Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues).
- The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.
- Principles of biomedical ethics and how they relate pharmaceutical innovation.
- Introduction to drug development, with a focus on the Swiss regulatory ecosystem.
- Current trends and impediments to effective drug development, including the use of AI in drug discovery.
- Translational medicine and its ethical implications.
- Ethical Aspects of pre-clinical research, including animal replacement technologies like organoids and organ chips.
- Ethical aspects of clinical research.
- Special regulatory pathways: expanded access / compassionate use.
- Special regulatory pathways: accelerated approval.
- Drug development and public health. emergency use of new drugs.
- Drug pricing: introduction to its regulatory and ethical aspects.

**376-1714-00L Biocompatible Materials**

**Abstract**
Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.

**Objective**
The course covers the following topics:

1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
2. The concept of biocompatibility.
3. Introduction into methodology used in biomaterials research and application.
4. Introduction to different material classes.

**Content**
- Introduction into natural and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering, drug delivery and for medical devices are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated. Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed.
- A link between academic research and industrial entrepreneurship is demonstrated by external guest speakers, who present their current research topics.

**376-1721-00L Bone Biology: Basics, Research and Clinics**

**Abstract**
The course gives an introduction into bone biology and provides an overview on current research methods and clinical approaches. Emphasis is put on skeletal development and metabolism, osteoporosis as well as fracture healing. Each topic is structured into three parts: basics, research and clinics.
Objective

After completing the Bone Biology course, students will be able to:

1. Remember and apply basics in bone biology and disease
2. Remember clinical features and surgical approaches
3. Select adequate research methods and approaches
4. Evaluate publications on topics presented in the lecture

Content

The course provides an overview of bone biology including cellular mechanism, metabolism and mechanoregulation. The acquired knowledge is applied to clinically-relevant topics such as skeletal development, osteoporosis and fracture healing. For each topic, we will share examples from our research and clinical experience combined with interactive sessions. Two site visits will provide insight into translational aspects concerning implant design and surgical application.

Competencies

376-1985-00L Trauma Biomechanics

Objective

Introduction to the basic principles of trauma biomechanics.

Content

This lecture serves as an introduction to the field of trauma biomechanics. Emphasis is placed on the interdisciplinary nature of impact biomechanics, which uses the combination of fundamental engineering principles and advanced medical technologies to develop injury prevention measures. Topics include: accident statistics and accident reconstruction, biomechanical response of the human to impact loading, injury mechanisms and injury criteria, test methods (including crash tests), computer simulations, aspects of vehicle safety. Real world examples mainly from automobile safety are used to augment lecture material.

376-1974-00L Colloquium in Biomechanics

Abstract

Current topics in biomechanics presented by speakers from academia and industry.

Objective

Getting insight into actual areas and problems of biomechanics.

401-0629-00L Applied Biostatistics

Abstract

This course covers the main methods used in Biostatistics. It starts by revising Linear Models (Regression, Anova), then moves to Generalised Linear Models (logistic regression and methods for count data) and finally introduces more advanced topics (Linear Mixed-Effects Models and Generalised Additive Models). The course strongly focuses on applied aspects of data analysis.

Objective

After this course students:

- revised Linear Models
- revised or got introduced to Generalised Linear Models
- got introduced to Linear Mixed-Effects Models
- got introduced to Generalised Additive Models
- are able to select among these methods to solve an applied problem in Biostatistics
- can perform the data analysis using the statistical software R
- can interpret the results of such an analysis and draw valid "biological" conclusions
This course is structured into three parts. The first part focuses on Linear and Generalised Linear Models. The second part introduces more advanced methodologies such as Linear Mixed-Effects Models and Generalised Additive Models. Both, part one and two will include the following topics: exploratory data analysis, model fitting, model "selection", residual diagnostics, model validation and results interpretation. Analyses will be carried out using the statistical software R. Finally, in the third part of the course students will be analysing real-world datasets to put into practice the knowledge and skills acquired during the first two parts.

The statistical software R will be used in the exercises. If you are unfamiliar with R, it is highly recommend to view the online R course "eutoR".

**Physics in Medical Research: From Atoms to Cells**

| W | 6 credits | 2v+1U | B. K. R. Müller |

**Abstract**

Scanning probe and diffraction techniques allow studying activated atomic processes during early stages of epitaxial growth. For quantitative description, rate equation analysis, mean-field nucleation and scaling theories are applied on systems ranging from simple metallic to complex organic materials. The knowledge is expanded to optical and electronic properties as well as to proteins and cells.

**Objective**

The lecture series is motivated by an overview covering the skin of the crystals, roughness analysis, contact angle measurements, protein absorption/activity and monocyte behaviour.

As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting, oxidic and organic surfaces are introduced.

The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure's shapes, which are based on the strain relieving mechanisms and kinetic growth processes.

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to plasmon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. Recently, ellipsometry has been introduced to on-line monitor film thickness, and roughness with sub-nanometer precision. These characterisation techniques are vital for optimising the preparation of medical implants.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.

X-rays are more and more often used to characterise the human tissues down to the nanometer level. The combination of highly intense beams only some micrometers in diameter with scanning enables spatially resolved measurements and the determination of tissue's anisotropies of biopsies.

**529-0041-00L**

**Modern Mass Spectrometry, Hyphenated Methods, and Chemometrics**

| W | 6 credits | 3G | R. Zenobi, B. Hattendorf, P. Sinués Martinez-Lozano |

**Abstract**

Modern mass spectrometry, hyphenated analytical methods, speciation, chemometrics.

**Objective**

Comprehensive knowledge about the analytical methods introduced in this course and their practical applications.

**Content**

Hyphenation of separation with identification methods such as GC-MS, LC-MS, GC-IR, LC-IR, LC-NMR etc.; importance of speciation.

**Lecture notes**

Lecture notes will be made available online.

**Prerequisites / notice**

**Literature**

Information about relevant literature will be available in the lecture & in the lecture notes.

**Exercises are an integral part of the lecture.**

**Prerequisites:**

529-0051-00 "Analytische Chemie I (3. Semester)"
529-0058-00 "Analytische Chemie II (4. Semester)"
(or equivalent)

**Drug Delivery and Drug Targeting**

| W | 2 credits | 1.5V | J.-C. Leroux |

**Abstract**

The students gain an overview on current principles, methodologies and systems for controlled delivery and targeting of drugs. This enables the students to understand and evaluate the field in terms of scientific criteria.
Objective

The students dispose of an overview on current principles and systems for the controlled delivery and targeting of drugs. The focus of the course lies on developing a capacity to understand the involved technologies and methods, as well as an appreciation of the chances and constraints of their therapeutic usage, with prime attention on anticancer drugs, therapeutic peptides, proteins, nucleic acids and vaccines.

Content

The course covers the following topics: drug targeting and delivery principles, macromolecular drug carriers, liposomes, micelles, micro/nanoparticles, gels and implants, administration of vaccines, targeting at the gastrointestinal level, synthetic carriers for nucleic acid drugs, ophthalmic devices, novel trends in transdermal and nasal drug delivery and 3D printing of drug delivery systems.

Lecture notes

Selected lecture notes, documents and supporting material will be directly provided or may be downloaded from the course website.

551-0319-00L Cellular Biochemistry (Part I) W 3 credits 2V U. Kutay, F. Allain, T. Kleele, I. Zemp

Abstract

Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.
Objective
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry. The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Content
Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.
Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

Lecture notes
Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

Literature
Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

Prerequisites / notice
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

636-0108-00L Biological Engineering and Biotechnology

Objective
Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

Content

Lecture notes
Handout during the course.

752-3105-00L Physiology Guided Food Structure and Process Design

Objective
A sound understanding of physiological implications of food design will allow to shape new products, which feature health as well as environmental benefits and on the other side do not compromise on organoleptic qualities, formulation and manufacturing, and quality and safety. The course links the physiological driven requirements with food structure design and subsequent engineering steps.

Content
The objective of this course is to highlight the link between human physiology, product sensory, nutritional functions, and engineering approaches to facilitate the design of food matrices reflecting the requirements for the beforementioned properties. To identify and manipulate these properties, the pathways that control the interaction of food structures and their physiological action will be introduced. Students are introduced to a skill set that will encompass basic digestion, sensory physiology knowledge, and food structures. Students will be exposed to the interplay along the gastrointestinal tract including taste, aroma, and texture perception, swallowing mechanics, and gastrointestinal digestion with an engineering or physical sciences angle.

Lecture notes
Lecture notes are available at Moodle.

What is translational science and what is it not Including:
- How to identify need?
- How to choose the appropriate research type and methodology?
- How to measure success?
- How are medical devices developed?
- How to handle IP in the development process?
- How does the regulatory environment impact innovation?
- How to manage complex development projects?
Positive and negative examples will be illustrated by distinguished guest speakers.

Literature
- Principles of Biomedical Sciences and Industry

- Personal Competencies: Adaptability and Flexibility fostered
- Creative Thinking fostered
- Critical Thinking assessed
- Integrity and Work Ethics fostered
- Self-awareness and Self-reflection fostered
- Self-direction and Self-management fostered

Abstract
The basic course in "Good Clinical Practice" (GCP) contains of two full-time training days (Module 1 and Module 2) and addresses elementary aspects for the appropriate conduct of clinical trials and non-clinical research projects involving human beings. Successful participation will be confirmed by a certificate that is recognized by the Swiss authorities.

Objective
Students will get familiar with:
- Key Ethics documents
- (Inter)national Guidelines and Laws (e.g. ICH-GCP, DIN EN ISO 14155, TPA, HRA)
- Sequence of research projects and project-involved parties
- Planning of research projects (statistics, resources, study design, set-up of the study protocol)
- Approval of research projects by Authorities (SwissEthics, Swissmedic, FOPH)
- Roles and responsibilities of project-involved parties

Students will learn how to:
- Classify research projects according the risk-based approach of the HRA
- Write a study protocol
- Inform participating patients/study subjects
- Obtain consent by participating patients/study subjects
- Classify, document and report Adverse Events
- Handle projects with biological material from humans and/or health-related personal data

Content
Module 1:
Research and Research Ethics, Guidelines, (inter)national Legislation, Development of therapeutic products, Methodology (Study Design), Study documents (Study protocol, Investigator's Brochure, Patient Information Leaflet, Informed Consent Form)

Module 2:
Roles and Responsibilities, Approval procedures, Notification and Reporting, Study documentation, Research with biological material and health-related data, data protection, data retention

Abstract
Applying two fundamental principles of thermodynamics (entropy maximization and Gibbs energy minimization), an analytical model is derived for a variety of biological phenomena at the molecular as well as cellular level, and critically compared with the corresponding experimental data in the literature.

Objective
Engineering uses the laws of physics to predict the behavior of a system. Biological systems are so diverse and complex prompting the question whether we can apply unifying concepts of theoretical physics coping with the multiplicity of life’s mechanisms.

Objective of this course is to show that biological phenomena despite their variety can be analytically described using only two principles from statistical mechanics: maximization of the entropy and minimization of the Gibbs free energy.

Starting point of the course is the probability theory, which enables to derive step-by-step the two pillars of thermodynamics from the perspective of statistical mechanics: the maximization of entropy according to the Boltzmann’s law as well as the minimization of the Gibbs free energy. Then, an assortment of biological phenomena at the molecular and cellular level (e.g. cytoskeletal polymerization, action potential, photosynthesis, gene regulation, morphogen patterning) will be examined at the light of these two principles with the aim to derive a quantitative expression describing their behavior. Each analytical model is finally validated by comparing it with the corresponding experimental results from the literature.

By the end of the course, students will also learn to critically evaluate the concepts of making an assumption and making an approximation.
Content

- Basics of theory of probability
- Boltzmann's law
- Entropy maximization and Gibbs free energy minimization
- Ligand-receptor: two-state systems and the MWC model
- Random walks, diffusion, crowding
- Electrostatics for salty solutions
- Elasticity: fibers and membranes
- Molecular motors
- Action potential: Hodgkin-Huxley model
- Photosynthesis and vision
- Gene regulation
- Development: Turing patterns

Theory and corresponding exercises are merged together during the classes.

Lecture notes

No lecture notes because the two proposed textbooks are more than exhaustive!

I am willingly available Mondays 17.00 o'clock - 18.00 in my office GLC F12.2 for whatever discussion about the lessons and the exercises.

I am using OneNote. All lectures will be broadcast via ZOOM, while corresponding videos of the previous years (lectures and exercises) are available in Moodle!!!

Literature

As further deepening:

Prerequisites / notice

Participants need a good command of

- differentiation and integration of a function with one or more variables (basics of Analysis),
- Newton's and Coulomb's laws (basics of Mechanics and Electrostatics).

Notions of vectors in 2D and 3D are beneficial.

263-5057-00L From Publication to the Doctor’s Office

W 3 credits 2S+1A O. Demler

The deadline for deregistering expires at the end of the second week of the semester. Students who are still registered after that date, but do not attend the seminar, will officially fail the seminar.

Abstract

This seminar course is designed to provide students with an opportunity to review and critically evaluate recent publications in medical field focusing on examples when CS method or bioinformatics/statistical technique has lead to an instrumentation, technique or drug approved for clinical practice use.

Objective

Throughout the course, students will read and analyze recent publications that demonstrate successful applications and sometimes failures in medicine. Promising research applications will also be discussed. The publications will cover a wide range of topics, including drug discovery, image analysis, prognostic models, and learning healthcare.

Data: 06.08.2024 12:40  Autumn Semester 2024  Page 1291 of 2684
### Content

The course will be structured as half lecture content and half seminar content. Lectures will review state of the medical practice prior to the discovery, obstacles in moving the field forward, and the need for improvement. Lecture will be followed by the seminar part where students will take turns presenting the assigned publications and leading the discussions. Students' presentations will focus on the main findings, and specific steps taken to translate the finding into clinical practice.

Publications will include examples of:

- specific CS/bioinformatics/statistics applications that has been brought to „bedside“ – has been approved by European Medicines Agency / Food and Drug Administration (USA) for clinical use or are widely used in medical research;
- examples of failures of how a discovery did not translate into an endproduct and why; current active research areas.

Covered topics will include some of the following:

- Drug discovery: Computer-aided drug discovery has become an integral part of the drug development process, enabling researchers to design and screen large libraries of molecules in silico (i.e., using computer simulations) before synthesizing and testing them in the lab. This has led to the discovery of new drug candidates for a wide range of diseases, including cancer, Alzheimer’s disease, and HIV/AIDS.
- Genomics: Advances in computational genomics have enabled researchers to analyze and interpret large-scale genomic data, including DNA sequencing data, to identify disease-causing mutations, genetic risk factors, and drug targets. Examples of the development of personalized medicine, where treatments are tailored to an individual's genetic makeup. Examples when drug target identified by genetics has led to approved treatment.
- Imaging: Computer vision and image processing techniques have revolutionized medical imaging, enabling researchers to extract quantitative information from medical images that were previously inaccessible. This has led to the development of new diagnostic and prognostic tools for a wide range of diseases, including cancer, cardiovascular disease, and neurological disorders.
- Real-world data applications: emulation of clinical trials using electronic health records data.
- Large language models: Generating clinical trial protocols using large language models. Natural Language Processing for information extraction and interpretation.
- Learning healthcare systems: Advances in data analytics and information technology have enabled the development of learning healthcare systems, which use real-time data from electronic health records, medical devices, and other sources to improve patient outcomes and reduce healthcare costs. This has the potential to transform the way healthcare is delivered, making it more personalized, efficient, and effective.

In addition to the presentations, students will also be required to write critical reviews of the assigned publications throughout the course. The reviews will be evaluated based on the students’ ability to identify the strengths and weaknesses of the publications and to provide insightful and constructive feedback.

### Prerequisites / notice

The course is intended for advanced undergraduate and graduate students with a background in computer science, bioinformatics, or a related field and interest in applying their skills to medical research.

This course assumes a working knowledge of R/Python and intermediate statistical analysis, including linear, logistic, survival regressions or ability and interest to learn them outside of the class.

### Objective

- Set-up, align and operate a SEM successfully and safely.
- Understand important operational parameters of SEM and optimize microscope performance.
- Explain different signals in SEM and obtain secondary electron (SE) and backscatter electron (BSE) images.
- Operate the SEM in low-vacuum mode.
- Make use of EDX for semi-quantitative elemental analysis.
- Prepare samples with different techniques and equipment for imaging and analysis by SEM.
Content
During the course, students learn through lectures, demonstrations, and hands-on sessions how to setup and operate SEM instruments, including low-vacuum and low-voltage applications.

This course gives basic skills for students new to SEM. At the end of the course, students are able to align an SEM, to obtain secondary electron (SE) and backscatter electron (BSE) images and to perform energy dispersive X-ray spectroscopy (EDX) semi-quantitative analysis. Emphasis is put on procedures to optimize SEM parameters in order to best solve practical problems and deal with a wide range of materials.

Lectures:
- Introduction on Electron Microscopy and instrumentation
- electron sources, electron lenses and probe formation
- beam/specimen interaction, image formation, image contrast and imaging modes.
- sample preparation techniques for EM
- X-ray micro-analysis (theory and detection), qualitative and semi-quantitative EDX and point analysis, linescan and spectral mapping

Practicals:
- Brief description and demonstration of the SEM microscope
- Practice on image formation, image contrast (and image processing)
- Student participation on sample preparation techniques
- Scanning Electron Microscopy lab exercises: setup and operate the instrument under various imaging modalities
- Practice on real-world samples and report results

Lecture notes
Lecture notes will be distributed.

Literature

Prerequisites / notice
No mandatory prerequisites.

327-2126-00L Microscopy Training TEM I - Introduction to TEM W 2 credits 3P P. Zeng, E. J. Barthazy Meier, A. G. Bittermann, F. Gramm, A. Sologubenko

Abstract
The introductory course on Transmission Electron Microscopy (TEM) provides theoretical and hands-on learning for beginners who are interested in using TEM for their Master or PhD thesis. TEM sample preparation techniques are also discussed. During hands-on sessions at different TEM instruments, students will have the opportunity to examine their own samples if time allows.

Objective
Understanding of
1. the set-up and individual components of a TEM
2. the basics of electron optics and image formation
3. the basics of electron beam – sample interactions
4. the contrast mechanism
5. various sample preparation techniques

Learning how to
1. align and operate a TEM
2. acquire data using different operation modes of a TEM instrument, i.e. Bright-field and Dark-field imaging
3. record electron diffraction patterns and index diffraction patterns
4. interpret TEM data

Content
Lectures:
- basics of electron optics and the TEM instrument set-up
- TEM imaging modes and image contrast
- STEM operation mode
- Sample preparation techniques for hard and soft materials

Practicals:
- Demo, practical demonstration of a TEM: instrument components, alignment, etc.
- Hands-on training for students: sample loading, instrument alignment and data acquisition.
- Sample preparation for different types of materials
- Practical work with TEMs
- Demonstration of advanced Transmission Electron Microscopy techniques

Lecture notes
Lecture notes will be distributed.

Literature

Prerequisites / notice
No mandatory prerequisites. Please consider the prior attendance to EM Basic lectures (551-1618-00V; 227-0390-00L; 327-0703-00L) as suggested prerequisite.

363-1163-00L Developing Digital Biomarkers W 3 credits 2V F. Da Conceição Barata

Abstract
The course gives an introduction to digital biomarkers and provides students with the foundations to develop their own digital biomarkers. More specifically, the course will cover fundamental topics such as designing observational studies, collecting, and exploring data generated by consumer-centric devices, and applying analytical methods to predict health-related outcomes.
Creative Thinking

The seminar provides state-of-the-art insight into the biomechanical function of bone from molecules, to cells, tissue and up to the organ.

The course will consist of four topic clusters that will allow the discussion of the most relevant digital biomarker applications in healthcare:

1) Digital Biomarkers: From biological to digital biomarkers. How are they motivated, defined and how can they be leveraged for monitoring? Prognostic vs. diagnostic vs. predictive biomarkers. Passive sensing vs. active sensing. Digital biomarker vs. Digital therapeutics.

2) Consumer-centric device data: Today, vast amount of physiological, environmental, and behavioral observations can be collected with consumer centric devices. To derive clinical meaningful information from this data is, however, difficult. We will analyze strategies for extracting knowledge from those measurements.

3) Methodology: In the last decade, neural networks (also known as “deep learning”) have helped push the boundaries of the state-of-the-art in a myriad of domains. They have also uncovered a number of different problems. We will discuss advantages and disadvantage as well as alternative methods for their application to digital biomarker data.

4) Applications: Digital biomarkers are still an emerging subfield, but given that longitudinal digital biomarker data are arguably easy to acquire in large quantities, it is expected that many relevant Machine Learning applications will emerge in the near future. We will review and discuss current applications and challenges.

Literature

Prerequisites / notice

Some programming experience in Python is required, and some experience in Machine Learning is highly recommended.

376-0121-00L Multiscale Bone Biomechanics W 6 credits 3S R. Müller, X.-H. Qin

Objective

The learning objectives include:

1. advanced knowledge of the state-of-the-are in multiscale bone biomechanics;
2. basic understanding of the biological principles governing bone in health, disease and treatment from molecules, to cells, tissue and up to the organ;
3. good understanding of the prevalent biomechanical testing and imaging techniques on the various levels of bone hierarchy;
4. practical implementation of state-of-the-art multiscale simulation techniques;
5. improved programing skills through the use of python;
6. hands on experience in designing solutions for clinical and industrial problems;
7. encouragement of critical thinking and creating an environment for independent and self-directed studying.

Abstract

The seminar provides state-of-the-art insight to the biomechanical function of bone from molecules, to cells, tissue and up to the organ. Multiscale imaging and simulation allows linking different levels of hierarchy, where systems biology helps understanding the mechanobiological response of bone to loading and injury in scenarios relevant for personalized health and translational medicine.

The seminar has four core learning objectives. Students should:

- understand the anatomy of digital biomarkers
- understand the potential and applications of digital biomarkers
- be able to critically reflect and assess existing digital biomarkers
- be able to design and implement a digital biomarker

The course will consist of four topic clusters that will allow the discussion of the most relevant digital biomarker applications in healthcare:

1) Digital Biomarkers: From biological to digital biomarkers. How are they motivated, defined and how can they be leveraged for monitoring? Prognostic vs. diagnostic vs. predictive biomarkers. Passive sensing vs. active sensing. Digital biomarker vs. Digital therapeutics.

2) Consumer-centric device data: Today, vast amount of physiological, environmental, and behavioral observations can be collected with consumer centric devices. To derive clinical meaningful information from this data is, however, difficult. We will analyze strategies for extracting knowledge from those measurements.

3) Methodology: In the last decade, neural networks (also known as “deep learning”) have helped push the boundaries of the state-of-the-art in a myriad of domains. They have also uncovered a number of different problems. We will discuss advantages and disadvantage as well as alternative methods for their application to digital biomarker data.

4) Applications: Digital biomarkers are still an emerging subfield, but given that longitudinal digital biomarker data are arguably easy to acquire in large quantities, it is expected that many relevant Machine Learning applications will emerge in the near future. We will review and discuss current applications and challenges.

Literature

Bone is one of the most investigated biological materials due to its primary function of providing skeletal stability. Bone is susceptible to different local stimuli including mechanical forces and has great capabilities in adapting its mechanical properties to the changes in its environment. Nevertheless, aging or hormonal changes can make bone lose its ability to remodel appropriately, with loss of strength and increased fracture risk as a result, leading to devastating diseases such as osteoporosis.

To better understand the biomechanical function of bone, one has to understand the hierarchical organization of this fascinating material down from the molecules, to the cells, tissue and up to the organ. Multiscale imaging and simulation allow to link these different levels of hierarchy. Incorporating systems biology approaches, not only biomechanical strength of the material can be assessed but also the mechanobiological response of the bone triggered by loading and injury in scenarios relevant for personalized health. Watching cells working together to build and repair bone in a coordinated fashion is a spectacle, which will need dynamic image content and deep discussions in the lecture room to probe the imagination of the individual student interested in the topic. Lastly, state-of-the-art developments in tissue engineering and regeneration, 3D bioprinting and bio-manufacturing and organoid technology will be highlighted towards personalized health.

For the seminar, concepts of video lectures will be used in a flipped classroom setup, where students can study the basic biology, engineering, and mathematical concepts in video tutorials online (TORQUES). All videos and animations will be incorporated in Moodle and PolyBook allowing studying and interactive course participation online. It is anticipated that the students need to prepare 2x45 minutes for the study of the actual lecture material. The course is structured in three parts of 45 minutes with video lectures and a flipped classroom setup. In the first part (TORQUES: Tiny, Open-with-Restrictions courses focused on QAlity and Effectiveness), students study the basic concepts in short, interactive video lectures on the online learning platform Moodle. Students are able to post questions at the end of each video lecture or the Moodle forum that will be addressed in the second part of the lectures using a flipped classroom concept. For the flipped classroom, the lecturers may prepare additional teaching material to answer the posted questions (Q&A).

Following the Q&A, the students will have to form small groups to try to solve such problems and to present their solutions for advanced multiscale investigation of bone ranging from basic science to clinical application. Towards the end of the semester, students will have to present self-selected publications associated with the different topics of the lecture identified through PubMed or the Web of Science.
Colloquium in Translational Science (Autumn Semester)

Does not take place this semester.

Abstract
Current topics in translational medicine presented by speakers from academia and industry.

Objective
Getting insight into actual areas and problems of translational medicine.

Content
Timely and concise presentations of postgraduate students, post-docs, senior scientists, professors, as well as external guests from both academics and industry will present topics of their interest related to translational medicine.

Prerequisites / notice
No compulsory prerequisites, but student should have basic knowledge about biomedical research.

376-1533-00L

Nanostructured Materials Safety

Abstract
Fundamentals in nanostructured material - living system interactions focusing on the main exposure routes, lung, gastrointestinal tract, skin and intravenous injection

Objective
Understanding the potential side effects of nanomaterials in a context-specific way, enabling to evaluate nanomaterial safety and provide knowledge to design safer materials

Content
Building upon new technologies to engineer and functionalize well-defined nanostructured materials, a plethora of exciting discoveries were made and found their way in our daily live. These customized nanomaterials provides extraordinary properties and make them attractive for many innovative applications. Exactly these new properties may have the potential to be responsible for unforeseen side effects, which hamper a straightforward translation into new products. Therefore, the safety research provide the evidence for a responsible and sustainable use of nanomaterials.

The lecture will focus on basic principles of nanotoxicology, provide the understanding of the potential side effects of nanomaterial in a context-specific way addressing the main exposure routes such as inhalation, ingestion, topical applications and intravenous injections as well as it will provide impulses for safer material designs. Structure of the planned lecture (2 x 45 min)

1. Introduction: the principles of nanotoxicology
2. Lung- particles interactions: two disease scenarios and their molecular mechanism
3. GI – particles interactions: intendent and unintendent particle exposure via food
4. Skin – particles interactions: body care products and their influence on skin physiology
5. Intravenous injection: colloidal stability, protein corona and cellular effects
6. Micro- / Nanoplastics and development of a safety research plan
7. End of semester exam

Handouts provided during the classes and references therein as well as primary literature as case studies will be posted to the course website

Lecture notes

Prerequisites / notice
course “Introduction to Toxicology”

Competencies

Practical Methods in Tissue Engineering

Abstract
The goal of this course is to teach MSc students the necessary skills for doing research in the fields of tissue engineering and regenerative medicine.

Objective
Practical exercises on topics including sterile cell culture, light microscopy and histology, and biomaterials are covered. Practical work on manufacturing and evaluating hydrogels and scaffolds for tissue engineering will be performed in small groups. In addition to practical lab work, the course will teach skills in data acquisition/analysis.

Prerequisites / notice
A laptop is needed with the below Systems Requirements:

- Memory: 16 GB
- Processor: 3rd gen i7
- DirectX® 11.0 compliant AMD Radeon/ NVIDIA® GeForce® card with 2 GB RAM
- Storage: 15 GB

Mac computer can be used by pre-installing Windows through bootcamp (older Macs) or Parallels Desktop (14d trial license, 35 CHF license purchasable in the IT shop of ETH+).

376-1661-00L

Ethics of Life Sciences and Biotechnology

Abstract
This semester course enables students to recognize, anticipate and address ethical issues in the domain of health sciences and their technological application. The students will acquire the necessary theoretical and analytic resources to develop critical thinking skills in the field of applied ethics and will practice how to use such resources to address concrete ethical issues in health sciences

Objective
This course is tailored to students who want to become familiar with the analysis of ethical issues in all the different domains of life sciences and biotechnology. The course aims at equipping students with the necessary knowledge and analytic skills to understand, discuss and address the ethical aspects of science and technology in the domain of human health. The specific learning objectives of this course are:

A. Identify ethical issues in life sciences and biotechnology.
B. Analyze and critically discuss ethical issues in life sciences and biotechnology.
C. Become aware of relevant legal and public policy frameworks.
D. Distinguish different ethical approaches and argumentative strategies in applied ethics.
E. Recognize how ethical issues relate to different accounts of technology and innovation.
F. Develop a personal and critical attitude towards the ethical aspects of life sciences and their technological application.
G. Autonomous anticipate ethical issues.
H. Propose and communicate solutions to ethical challenges and dilemmas.
Content

The course starts off with an introductory lecture on ethics as a discipline and an overview of the most relevant approaches in the domain of applied ethics. The students will also be introduced to current theoretical accounts of technology and will start to appreciate the relevance of ethics especially with respect to new and emerging technologies. Usable analytic tools will also be provided, thus enabling the students to engage with the discipline in a practical way from the very onset of the semester.

The course will continue with thematic sessions covering a broad variety of topics all of which are relevant to the different study tracks offered by the department. In particular, the course will cover the following domains: digital health technologies and medical AI; food, nutrition and healthy longevity; biomedical engineering; genetics; neuroscience and Neurotechnologies; medical robotics; disability and rehabilitation; environmental ethics. The course will also include sessions on cross-cutting ethically relevant aspects of health sciences and technologies, namely: access to innovation; translational research, and the relation between science and public policy.

All the topics of the course will be illustrated and interactively discussed through many case studies, offering the students the opportunity to prepare and present them, and to use them in individual as well as group exercises. Throughout the course, the students will have multiple opportunities to experiment with ethical argumentation and to practice their evolving skills.

Competencies

Subject-specific Competencies
- Concepts and Theories
- Analytical Competencies
- Media and Digital Technologies
- Problem-solving

Method-specific Competencies
- Techniques and Technologies
- Communication
- Cooperation and Teamwork
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity

Social Competencies
- Adaptability and Flexibility
- Critical Thinking
- Integrity and Work Ethics

Personal Competencies
- Creative Thinking
- Self-awareness and Self-reflection

Abstract

This course provides a thorough exploration of drug development and involved ethical issues as well as critical analysis of ethical challenges and practical skills to resolve them. It includes elements of drug discovery, preclinical and clinical research ethics, alternative regulatory pathways and ethics of drug pricing and develops a solid grasp of ethical complexity as well as practical skills.

Objective

This course is tailored to D-HEST students who want to become familiar with pharmaceutical development and its ethical implications. By the end of this course, students will have developed a comprehensive understanding of the ethical complexities and challenges in drug development. They will be equipped with the knowledge and analytical skills to navigate ethical reasoning and contribute to the responsible advancement of pharmaceutical research. The specific learning objectives of the course are:

- Discuss relevant legal and public policy frameworks in drug development, ensuring an understanding of the broader regulatory context within which policy and regulatory decisions are made.
- Recognize and identify ethical dilemmas inherent to drug development, fostering a heightened awareness of ethical considerations across various stages of the process.
- Identify and discuss ethical issues in drug development in light of recent advances in the field of artificial intelligence.
- Critically analyze ethical challenges within drug development, enabling them to discuss complex issues, evaluate competing ethical perspectives, and form reasoned judgments.
- Understand the ethical theories and principles that underpin drug regulation.
- Evaluate the ethical implications of alternative pathways, such as Accelerated Approval and Compassionate Use, equipping students to assess potential benefits, risks, and societal consequences.
- Assess the ethical dimensions of drug pricing decisions and their impact on equity and accessibility, encouraging thoughtful reflection on the broader societal implications of pricing strategies.

Content

- Principles of biomedical ethics and how they relate pharmaceutical innovation
- Introduction to drug development, with a focus on the Swiss regulatory ecosystem
- Current trends and impediments to effective drug development, including the use of AI in drug discovery
- Translational medicine and its ethical implications
- Ethical Aspects of pre-clinical research, including animal replacement technologies like organoids and organ chips
- Ethical aspects of clinical research
- Special regulatory pathways: expanded access / compassionate use
- Special regulatory pathways: accelerated approval
- Drug development and public health; emergency use of new drugs
- Drug pricing; introduction to its regulatory and ethical aspects
- Discussion of the broader societal implications of pricing strategies

Modern Mass Spectrometry, Hyphenated Methods, and Chemometrics

Modern mass spectrometry, hyphenated analytical methods, speciation, chemometrics.

Comprehensive knowledge about the analytical methods introduced in this course and their practical applications.

Lecture notes
- Lecture notes will be made available online.

Literature
- Information about relevant literature will be available in the lecture & in the lecture notes.

Exercises
- Experiments are an integral part of the lecture.
- Prerequisites:
  - 529-0051-00 "Analytische Chemie I (3. Semester)"
  - 529-0058-00 "Analytische Chemie II (4. Semester)" (or equivalent)
Competencies

Self-presentation and Self-influence fostered
Sensitivity to Diversity fostered
Negotiation fostered

Abstract

This course provides a detailed understanding of
- development of T and B cells
- the dynamics of an immune response during acute and chronic infection
- mechanisms of immunopathology
- modern vaccination strategies

Key experimental results will be shown to help understanding how immunological text book knowledge has evolved.

Objective

Obtain a detailed understanding of
- the development, activation, and differentiation of different types of T cells and their effector mechanisms during immune responses,
- recognition of pathogenic microorganisms by the host cells and molecular events thereafter,
- events and signals for maturation of naive B cells to antibody producing plasma cells and memory B cells.
- Optimization of B cell responses by intelligent design of new vaccines

Content

- Development and selection of CD4 and CD8 T cells, natural killer T cells (NKT), and regulatory T cells (Treg)
- NK T cells and responses to lipid antigens
- Differentiation, characterization, and function of CD4 T cell subsets such as Th1, Th2, and Th17
- Overview of cytokines and their effector function
- Co-stimulation (signals 1-3)
- Dendritic cells
- Evolution of the “Danger” concept
- Cells expressing Pattern Recognition Receptors and their downstream signals
- T cell function and dysfunction in acute and chronic viral infections

Literature

Documents of the lectures are available for download at:
https://moodle-app2.let.ethz.ch/course/view.php?id=2581&notifyeditingon=1

Prerequisites / notice

Immunology I and II recommended but not compulsory
Abstract
Introduction into structural and functional aspects of the immune system.

Objective
Introduction into structural and functional aspects of the immune system.

Content
- Introduction and historical background
- Innate and adaptive immunity. Cells and organs of the immune system
- B cells and antibodies
- Generation of diversity
- Antigen presentation and Major Histoincompatibility (MHC) antigens
- Thymus and T cell selection
- Autoimmunity
- Cytotoxic T cells and NK cells
- Th1 and Th2 cells, regulatory T cells
- Allergies
- Hypersensitivities
- Vaccines, immune-therapeutic interventions

Lecture notes
Electronic access to the documentation will be provided. The link can be found at "Lernmaterialien"

Literature
- Kuby, Immunology, 9th edition, Freemen + Co., New York, 2020

Prerequisites / notice
For D-BIOL students Immunology I (WS) and Immunology II (SS) will be examined as one learning entity in a "Sessionsprüfung". All other students write separate exams for Immunology I and Immunology II. All exams (combined exam Immunology I and II, individual exams) are offered in each exam session.

UZH Module Code: BIO336

Does not take place this semester.

Abstract
The course is a literature seminar or "journal club". Each Friday a student, or a member of the Suter Lab in the Institute of Molecular Health Sciences, will present a paper from the recent literature.

Objective
The course introduces you to recent developments in the fields of cellular and molecular neurobiology. It also supports you to develop your skills in critically reading the scientific literature. You should be able to grasp what the authors wanted to learn i.e. their goals, why the authors chose the experimental approach they used, the strengths and weaknesses of the experiments and the data presented, and how the work fits into the wider literature in the field. You will present one paper yourself, which provides you with practice in public speaking.

Content
You will present one paper yourself. Give an introduction to the field of the paper, then show and comment on the main results (all the papers we present are available online, so you can show original figures with a beamer). Finish with a summary of the main points and a discussion of their significance.

Lecture notes
Presentations will be made available after the seminars.

Prerequisites / notice
You are expected to take part in the discussion and to ask questions. To prepare for this you should read all the papers beforehand (they will be announced a week in advance of the presentation).

Mind the enrolment deadlines at UZH:
https://www.uzh.ch/cmsssl/en/studies/application/deadline s.html

Objective
By the end of this module, each student should be able to
- recognize the universal principles underlying the development of different animal body plans.
- explain how the genes encoding the molecular toolkit have evolved to create animal diversity.
- relate changes in gene structure or function to evolutionary changes in animal development.

Key skills:
By the end of this module, each student should be able to
- present and discuss a relevant evolutionary topic in an oral presentation
- select and integrate key concepts in animal evolution from primary literature
- participate in discussions on topics presented by others

Literature
- Kuby, Immunology, 9th edition, Freemen + Co., New York, 2020

Prerequisites / notice
You must attend at least 80% of the journal clubs, and give a presentation of your own. At the end of the semester there will be a 30 minute oral exam on the material presented during the semester. The grade will be based on the exam (45%), your presentation (45%), and a contribution based on your active participation in discussion of other presentations (10%).

Objective
The evolution of the various body-plans is investigated by means of comparison of developmentally essential control genes of molecularly analysed model organisms.

Content
You will present one paper yourself. Give an introduction to the field of the paper, then show and comment on the main results (all the papers we present are available online, so you can show original figures with a beamer). Finish with a summary of the main points and a discussion of their significance.

Abstract
Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.
**Objective**
Develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology.

**Content**
The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics. For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

**Lecture notes**
Script and original publications will be supplied during the course.

**Prerequisites / notice**
The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.

---

**551-1177-00L**  **Immunology: From Milestones to Current Topics**  **W**  **4 credits**  **2S**  **B. Ludewig, N. Pikor, University lecturers**

**Abstract**
Milestones in Immunology: on old concepts and modern experiments

**Objective**
The course will cover the current grand topics in immunology: B cells, innate immunity, antigen presentation, tumor immunity, T cells, myeloid cells and stromal cells. For each topic two or four hours will be allocated. Historical milestone papers will be presented by the tutor/lecturer providing an overview on the development of the theoretical framework and critical technological advances. The students will read the historical milestone papers and contribute to the discussion. In the second part of the lecture, students will present recent high impact research papers that have emerged from the landmark achievements of the previously discussed milestone concepts.

**Content**
Milestones and current topics of innate immunity, antigen presentation, B cells, thymus and T cells, cytotoxic T cells, NK cells, stromal cells, CNS immunity and tumor immunology.

**Lecture notes**
Original and review articles will be distributed by the respective lecturer.

**Literature**
Literaturunterlagen werden vor Beginn des Kurses auf folgender website zugänglich sein: https://moodle-app2.let.ethz.ch/course/view.php?id=15568

---

**551-1303-00L**  **Current Research Topics in Cellular Biochemistry**  **W**  **4 credits**  **2S**  **T. Kleele, V. Korkhov, G. Neurohr, V. Panse, M. Peter, A. E. Smith, F. van Drogen**

**Abstract**
During this Masters level seminar style course, students will explore current research topics in cellular biochemistry focused on the structure, function and regulation of selected cell components, and the consequences of dysregulation for pathologies.

**Objective**
Students will work with experts toward a critical analysis of cutting-edge research in the domain of cellular biochemistry, with emphasis on normal cellular processes and the consequences of their dysregulation. At the end of the course, students will be able to evaluate, critically discuss and write about scientific articles in the research area of cellular biochemistry, and they will identify open testable research questions.

**Content**
Guided by an expert in the field, students will engage in classical round-table style discussions of current literature with frontal presentations. Guided by a faculty expert, students develop domain knowledge of the research area associated with a primary paper, and alternate as discussion leaders to present the research topic. By the end of the semester, students will formulate their ideas about open testable research questions that extend from the published work.

**Literature**
The literature will be provided during the course.

**Prerequisites / notice**
The course will be taught in English.

---

**636-0017-00L**  **Computational Biology**  **W**  **6 credits**  **3G+2A**  **T. Vaughan, C. Magnus, T. Stadler**

**Abstract**
The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Computational algorithms extracting biological information from genetic sequence data are discussed, and statistical tools to understand testable research questions that extend from the published work.

**Objective**
Attendees will learn which information is contained in genetic sequencing data and how to extract information from this data using computational tools. The main concepts introduced are:
- stochastic models in molecular evolution
- phylogenetic & phylodynamic inference
- maximum likelihood and Bayesian statistics

Attendees will apply these concepts to a number of applications yielding biological insight into:
- epidemiology
- pathogen evolution
- macroevolution of species

**Content**
The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods for direct alignment analysis using approaches such as BLAST and GWAS. Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. Lastly, we introduce the field of phylodynamics, the aim of which is to understand and quantify population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

**Lecture notes**
Lecture slides will be available on moodle.
The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:

- Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.

Prerequisites / notice
Basic knowledge in linear algebra, analysis, and statistics will be helpful. Programming in R will be required for the project work (compulsory continuous performance assessments). In case you do not have any previous experience with R, we strongly recommend to get familiar with R prior to the semester start. For the D-BSE students, we highly recommend the voluntary course „Introduction to Programming“, which takes place in Basel before the start of the semester.

636-0108-00L Biological Engineering and Biotechnology

W 4 credits 3V M. Fussenegger

Abstract
Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

Objective
Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

Content

Lecture notes
Handout during the course.

701-1703-00L Evolutionary Medicine for Infectious Diseases

W 3 credits 2G A. Hall

Abstract
This course explores infectious disease from both the host and pathogen perspective. Through short lectures, reading and active discussion, students will identify areas where evolutionary thinking can improve our understanding of infectious diseases and, ultimately, our ability to treat them effectively.

Objective
Students will learn to (i) identify evolutionary explanations for the origins and characteristics of infectious diseases in a range of organisms and (ii) evaluate ways of integrating evolutionary thinking into improved strategies for treating infections of humans and animals. This will incorporate principles that apply across any host-pathogen interaction, as well as system-specific mechanistic information, with particular emphasis on bacteria and viruses.

Content
We will cover several topics where evolutionary thinking is relevant to understanding or treating infectious diseases. This includes: (i) determinants of pathogen host range and virulence, (ii) dynamics of host-parasite coevolution, (iii) pathogen adaptation to evade or suppress immune responses, (iv) antimicrobial resistance, (v) evolution-proof medicine. For each topic there will be a short (<20 minutes) introductory lecture, before students independently research the primary literature and develop discussion points and questions, followed by interactive discussion in class.

Literature
The focus is on primary literature, but for some parts the following text books provide good background information:

- Schmid Hempel 2011 Evolutionary Parasitology
- Stearns & Medzhidov 2016 Evolutionary Medicine

Prerequisites / notice
A basic understanding of evolutionary biology, microbiology or parasitology will be advantageous but is not essential.

752-3105-00L Physiology Guided Food Structure and Process Design

W 3 credits 2V P. A. Fischer

Abstract
A sound understanding of physiological implications of food design will allow to shape new products, which feature health as well as environmental benefits and on the other side do not compromise on organoleptic qualities, formulation and manufacturing, and quality and safety. The course links the physiological driven requirements with food structure design and subsequent engineering steps.

Objective
The objective of this course is to highlight the link between human physiology, product sensory, nutritional functions, and engineering approaches to facilitate the design of food matrices reflecting the requirements for the beformentioned properties. To identify and manipulate these properties, the pathways that control the interaction of food structures and their physiological action will be introduced. Students are introduced to a skill set that will encompass basic digestion, sensory physiology knowledge, and food structures. Students will be exposed to the interplay along the gastrointestinal tract including taste, aroma, and texture perception, swallowing mechanics, and gastrointestinal digestion with an engineering or physical sciences angle.

Content
Chapter 1: Introduction - The need for physiology guided structure and process design in the context of personalized nutrition (Peter Fischer)
Chapter 2: Food Oral Processing: the impact of food oral breakdown on sensory perception (Marine Devezeaux de Lavergne)
Chapter 3: Chewing and swallowing across the lifespan, from infants to elderly (Marine Devezeaux de Lavergne)
Chapter 4: Perception physiology in humans and other species (Benoit von der Weid)
Chapter 5: Biophysics of food digestion & how it can be exploited in the development of strategies for delivery (Timothy J. Wooster)
Chapter 6: Numerical and experimental modelling of the intestinal system (Peter Fischer)

Lecture notes
Lecture notes are available at Moodle
Molecular Biology of Foodborne Pathogens

**Abstract**
The course offers detailed information on selected foodborne pathogens and toxin producing organisms; the focus lies on relevant molecular biological aspects of pathogenicity and virulence, as well as on the occurrence and survival of these organisms in foods.

**Objective**
Detailed and current status of research and insights into the molecular basis of foodborne diseases, with focus on interactions of the microorganism or the toxins they produce with the human system. Understanding the relationship between specific types of food and the associated pathogens and microbial risks. Another focus lies on the currently available methods and techniques useful for the various purposes, i.e., detection, differentiation (typing), and antimicrobial agents.

**Content**
Molecular biology of infectious foodborne pathogens (Listeria, E. coli, Campylobacter, Salmonella, etc) and toxin-producing organisms (Bacillus, Clostridium, Staphylococcus). How and under which conditions will toxins and virulence factors be produced, and how do they work? How is the interaction between the human host and the microbial pathogen? What are the roles of food and the environment? What can be done to interfere with the potential risks? Which methods are best suited for what approach? Last, but not least, the role of bacteriophages in microbial pathogenicity will be highlighted, in addition to various applications of bacteriophage for both diagnostics and antimicrobial intervention.

**Lecture notes**
Electronic copies of the presentation slides (PDF) and additional material will be made available for download to registered students.

**Literature**
Recommendations will be given in the first lecture.

**Prerequisites / notice**
Lectures (2 hours) will be held as a single session of approximately 60+ minutes (10:15 until approx. 11:15 h), without a break!

**Nutrition and Chronic Disease**

**Abstract**
To have the student gain understanding of the links between the diet and the etiology and progression of chronic diseases, including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

**Objective**
To examine and understand the protective effect of foods and food ingredients in the maintenance of health and the prevention of chronic disease, as well as the progression of complications of the chronic diseases.

**Content**
The course evaluates food and food ingredients in relation to primary and secondary prevention of chronic diseases including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

**Lecture notes**
There is no script. Powerpoint presentations will be made available on-line to students.

**Literature**
To be provided by the individual lecturers, at their discretion.

**Prerequisites / notice**
No compulsory prerequisites, but prior completion of the courses “Introduction to Nutritional Science” and “Advanced Topics in Nutritional Science” is strongly advised.

**Epidemiology and Prevention**

**Abstract**
The module Epidemiology and prevention describes the process of scientific discovery from the detection of a disease and its causes, to the development and evaluation of preventive and treatment interventions and to improved population health.

**Objective**
The overall goal of the course is to introduce students to epidemiological thinking and methods, which are critical pillars for medical and public health research. Students will also become aware on how epidemiological facts are used in prevention, practice and politics.

**Content**
The module Epidemiology and prevention follows an overall framework that describes the course of scientific discovery from the detection of a disease to the development of prevention and treatment interventions and their evaluation in clinical trials and real world settings. We will discuss study designs in the context of existing knowledge and the type of evidence needed to advance knowledge. Examples from nutrition, chronic and infectious diseases will be used in order to show the underlying concepts and methods.

**Essentials in Translational Science**

**Abstract**
Translational science is a cross disciplinary scientific research that is motivated by the need for practical applications that help people (e.g. Medicines). The course should help to clarify basics of translational science, illustrate successful applications and enable students to integrate key features into their future projects.

**Number**

376-0300-00L

**Title**
Essentials in Translational Science

**Type**
O

**ECTS**
3 credits

**Hours**
2G

**Lecturers**
J. Goldhahn
Objective
After completing this course, students will be able to understand:
- Principles of translational science including medical device development, intellectual property, regulatory environment and project management
- Students should be able to apply this knowledge in drug development programs in Pharma, Biotech or their own spin-off.

Content
What is translational science and what is it not Including:
- How to identify need?
- How to choose the appropriate research type and methodology
- How to measure success?
- How are medical devices developed?
- How to handle IP in the development process?
- How does the regulatory environment impact innovation?
- How to manage complex development projects?
- Positive and negative examples will be illustrated by distinguished guest speakers.

Literature
- Principles of Biomedical Sciences and Industry
- Translating Ideas into Treatments
- https://doi.org/10.1002/9783527824014

Prerequisites / notice
4x online input lecture followed by case preparation and symposium

376-0302-01L GCP Basic Course (Modules 1 and 2)
Objective
The basic course in "Good Clinical Practice" (GCP) contains of two full-time training days (Module 1 and Module 2) and addresses elementary aspects for the appropriate conduct of clinical trials and non-clinical research projects involving human beings. Successful participation will be confirmed by a certificate that is recognized by the Swiss authorities.

Content
Module 1:
- Research and Research Ethics, Guidelines, (inter)national Legislation, Development of therapeutic products, Methodology (Study Design), Study documents (Study protocol, Investigator's Brochure, Patient Information Leaflet, Informed Consent Form)
Module 2:
- Roles and Responsibilities, Approval procedures, Notification and Reporting, Study documentation, Research with biological material and health-related data, data protection, data retention

Abstract

Objective
Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.
This seminar course is designed to provide students with an opportunity to review and critically evaluate recent publications in the medical field. The course provides an introduction to the functional properties of neurons, particularly the description of membrane electrical properties. We display articles pertaining to the issues we cover in the class on the course's webpage.

Objective
- Understanding computation by neurons and neuronal circuits is one of the great challenges of science. Many different disciplines can contribute their tools and concepts to solving mysteries of neural computation. The goal of this introductory course is to introduce the monochromes of physics, maths, computer science, engineering, biology, psychology, and even philosophy and history, to discover the enchantments and challenges that we all face in taking on this major 21st century problem and how each discipline can contribute to discovering solutions.

Content
- This course considers the structure and function of biological neural networks at different levels. The function of neural networks lies fundamentally in their wiring and in the electro-chemical properties of nerve cell membranes. Thus, the biological structure of the nerve cell needs to be understood if biologically-realistic models are to be constructed. These simpler models are used to estimate the electrical current flow through dendritic cables and explore how a more complex geometry of neurons influences this current flow. The active properties of nerves are studied to understand both sensory transduction and the generation and transmission of nerve impulses along axons. The concept of local neuronal circuits arises in the context of the rules governing the formation of nerve connections and topographic projections within the nervous system. Communication between neurons in the network can be thought of as information flow across synapses, which can be modified by experience. We need an understanding of the action of inhibitory and excitatory neurotransmitters and neuromodulators, so that the dynamics and logic of synapses can be interpreted. Finally, simple neural architectures focusing on examples when CS method or bioinformatics/statistical technique has lead to an instrumentation, technique or drug approved for clinical practice use.

Literature
- Connections to computer science and artificial intelligence are discussed, but the main focus of the course is on establishing the biological basis of computations in neurons.

Lecture notes
- Course material Script, computer demonstrations, exercises and problem solutions

Prerequisites / notice
- Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Python and Linux. The course language is English.

Content
- From Publication to the Doctor’s Office

Objective
- Throughout the course, students will read and analyze recent publications that demonstrate successful applications and sometimes failures in medicine. Promising research applications will also be discussed. The publications will cover a wide range of topics, including drug discovery, image analysis, prognostic models, and learning healthcare.

Literature
- We display articles pertaining to the issues we cover in the class on the course's webpage.

Prerequisites / notice
- Since we are all experts on consciousness, we expect active participation and discussions!

Content
- The course provides an introduction to the functional properties of neurons. Particularly the description of membrane electrical properties (action potentials, channels), neuronal anatomy, synaptic structures, and neuronal networks. Simple models of computation, learning, and behavior will be explained. Some artificial systems (robot, chip) are presented.

Objective
- Emphasis is placed on students developing their own thinking through a discussion-centered course structure.

Content
- This seminar reviews the philosophical and phenomenological as well as the neurobiological aspects of consciousness. The subjective features of consciousness are explored, and modern research into its neural substrate, particularly in the visual domain, is explained. Emphasis is placed on students developing their own thinking through a discussion-centered course structure.

Objective
- The course's goal is to give an overview of the contemporary state of consciousness research, with emphasis on the contributions brought by modern cognitive neuroscience. We aim to clarify concepts, explain their philosophical and scientific backgrounds, and to present experimental protocols that shed light on a variety of consciousness related issues.

Content
- The course includes discussions of scientific as well as philosophical articles. We review current schools of thought, models of consciousness, and proposals for the neural correlate of consciousness (NCC).

Prerequisites / notice
- Since we are all experts on consciousness, we expect active participation and discussions!
The course will be structured as half lecture content and half seminar content. Lectures will review state of the medical practice prior to the discovery, obstacles in moving the field forward, and the need for improvement. Lecture will be followed by the seminar part where students will take turns presenting the assigned publications and leading the discussions. Students’ presentations will focus on the main findings, and specific steps taken to translate the finding into clinical practice.

Publications will include examples of:
- specific CS/bioinformatics/statistics applications that has been brought to „bedside” – has been approved by European Medicines Agency / Food and Drug Administration (USA) for clinical use or are widely used in medical research;
- examples of failures of how a discovery did not translate into an endproduct and why;
- current active research areas.

Covered topics will include some of the following:
- Drug discovery: Computer-aided drug discovery has become an integral part of the drug development process, enabling researchers to design and screen large libraries of molecules in silico (i.e., using computer simulations) before synthesizing and testing them in the lab. This has led to the discovery of new drug candidates for a wide range of diseases, including cancer, Alzheimer’s disease, and HIV/AIDS.
- Genomics: Advances in computational genomics have enabled researchers to analyze and interpret large-scale genomic data, including DNA sequencing data, to identify disease-causing mutations, genetic risk factors, and drug targets. Examples of the development of personalized medicine, where treatments are tailored to an individual’s genetic makeup. Examples when drug target identified by genetics has led to approved treatment.
- Imaging: Computer vision and image processing techniques have revolutionized medical imaging, enabling researchers to extract quantitative information from medical images that were previously inaccessible. This has led to the development of new diagnostic and prognostic tools for a wide range of diseases, including cancer, cardiovascular disease, and neurological disorders.
- Real-world data applications: emulation of clinical trials using electronic health records data.
- Large language models: Generating clinical trial protocols using large language models. Natural Language Processing for information extraction and interpretation.
- Learning healthcare systems: Advances in data analytics and information technology have enabled the development of learning healthcare systems, which use real-time data from electronic health records, medical devices, and other sources to improve patient outcomes and reduce healthcare costs. This has the potential to transform the way healthcare is delivered, making it more personalized, efficient, and effective.

In addition to the presentations, students will also be required to write critical reviews of the assigned publications throughout the course. The reviews will be evaluated based on the students’ ability to identify the strengths and weaknesses of the publications and to provide insightful and constructive feedback.

Prerequisites / notice
The course is intended for advanced undergraduate and graduate students with a background in computer science, bioinformatics, or a related field and interest in applying their skills to medical research.

This course assumes a working knowledge of R/Python and intermediate statistical analysis, including linear, logistic, survival regressions or ability and interest to learn them outside of the class.

For PhD students, postdocs and others, a fee will be charged (https:// scopem.ethz.ch/education/MITP.html).

All applicants must additionally register on this form:
https://docs.google.com/forms/d/1Xw8L_2yXTE9qXxW/c6mjKMKmVdVxJae-9c9wD3k0/edit

The selected applicants will be contacted and asked for confirmation a few weeks before the course date.

Abstract
This introductory course on Scanning Electron Microscopy (SEM) emphasizes hands-on learning. Using ScopeM SEMs, students have the opportunity to study their own samples (or samples provided) and solve practical problems by applying knowledge acquired during the lectures. At the end of the course, students will be able to apply SEM for their (future) research projects.

Objective
- Set-up, align and operate a SEM successfully and safely.
- Understand important operational parameters of SEM and optimize microscope performance.
- Explain different signals in SEM and obtain secondary electron (SE) and backscatter electron (BSE) images.
- Operate the SEM in low-vacuum mode.
- Make use of EDX for semi-quantitative elemental analysis.
- Prepare samples with different techniques and equipment for imaging and analysis by SEM.
Content

During the course, students learn through lectures, demonstrations, and hands-on sessions how to setup and operate SEM instruments, including low-vacuum and low-voltage applications. This course gives basic skills for students new to SEM. At the end of the course, students are able to align an SEM, to obtain secondary electron (SE) and backscatter electron (BSE) images and to perform energy dispersive X-ray spectroscopy (EDX) semi-quantitative analysis. Emphasis is put on procedures to optimize SEM parameters in order to best solve practical problems and deal with a wide range of materials.

Lectures:
- Introduction on Electron Microscopy and instrumentation
- electron sources, electron lenses and probe formation
- beam/specimen interaction, image formation, image contrast and imaging modes.
- sample preparation techniques for EM

Practicals:
- Brief description and demonstration of the SEM microscope
- Practice on image formation, image contrast (and image processing)
- Student participation on sample preparation techniques
- Scanning Electron Microscopy lab exercises: setup and operate the instrument under various imaging modalities
- Practice on real-world samples and report results

Prerequisites

No mandatory prerequisites.

Literature

Prerequisites / notice

No mandatory prerequisites. Please consider the prior attendance to EM Basic lectures (551-1618-00V; 227-0390-00L; 327-0703-00L) as suggested prerequisite.
Cybernetic systems have been studied and applied in various research fields, such as for applications in ergonomics. Topics discussed in the lecture will cover molecular and cellular processes underlying the development of the nervous system (neurogenesis, cell death, cell migration and differentiation, axon guidance and synapse formation). The importance of these processes in the context of developmental diseases will be discussed.
This seminar will consider how the human brain understands and organises social behaviour. The approach will focus on exploring molecular and cellular mechanisms – synaptic transmission, signal transduction, gene expression, synaptic plasticity.

Based on an understanding of molecular and cellular mechanisms, the aim is to provide a deepened insight into neurophysiological processes underlying complex brain functions – learning/memory, sleep, sensory.

First, basic molecular and cellular mechanisms in nerve cells (excitability, neurotransmission, signal transduction, gene expression, synaptic plasticity) are introduced. Afterwards, their significance for selected neurophysiological processes (learning/memory, sleep, sensory) will be illuminated.

In this course students will learn about specialized topics and novel methods in neuroscience by critically reading and presenting scientific journal articles. The articles will focus on the "Neurobiology of Stress" topic and cover relevant preclinical neuroscience techniques (behavior, molecular, omics, brain imaging, circuit manipulations, genetic manipulations, electrophysiology, etc.).

By the end of the course, students will be able to critically evaluate theories and data relating to Social Cognition and Social Neuroscience. Students will critically review scientific papers published in top neuroscience journals. Specifically, students will be able to (1) identify strengths & weaknesses, useful techniques and take-home messages; (2) Prepare and structure slides to distill a complex scientific subject into a clear presentation; (3) Analyse and review the scientific techniques used in a peer-review research publication; (4) Perform a literature search within a scientific area; (5) Describe the scientific background for a new topic of research; (6) Summarize key points of a paper, from experimental details to big picture questions.

Active participation: Each week, students that are not presenting are expected to read the article in its entirety in a critical manner and submit questions about the article online ahead of class, participation in class will be assessed.

Workload: 2h of class per week (attendance in person required), plus 8h for preparing your own journal club (1-2 per semester), plus 2h for reading other group’s paper and asking questions (1/week, 13 in total).
We recommend that students have a solid background in neuroscience.

Recommended ETH classes are:
- Neuroanatomy & Neurophysiology (376-0007-00L) (or similar)
- Anatomy and Physiology 1 & 2 (376-0151-00L + 376-0152-00L) (or similar)

**Abstract**
Different national and international scientific guests are invited to present and discuss their actual scientific results.

**Objective**
To exchange scientific knowledge and data and to promote communication and collaborations among researchers.

For students: Critical discussion of current research. Students aiming at getting a credit point for this colloquium choose one topic and write a critical essay on the presented research topic.

**Content**
Different scientific guests working in the field of molecular cognition, neurochemistry, neuromorphology and neurophysiology present their latest scientific results.

**Lecture notes**
no handout

**Literature**
no literature

Some of the seminars will be shared with the Institute of Neuroinformatics (INI) of UZH.

**Abstract**
This course focuses on the emerging, interdisciplinary field of physical human-robot interaction, bringing together themes from robotics, real-time control, human factors, haptics, virtual environments, interaction design and other fields to enable the development of human-oriented robotic systems.

**Objective**
The objective of this course is to give an introduction to the fundamentals of physical human robot interaction, through lectures on the underlying theoretical/mechatronics aspects and application fields, in combination with a hands-on lab tutorial. The course will guide students through the design and evaluation process of such systems.

By the end of this course, you should understand the critical elements in human-robot interactions - both in terms of engineering and human factors - and use these to evaluate and de-sign safe and efficient assistive and rehabilitative robotic systems. Specifically, you should be able to:

1) identify critical human factors in physical human-robot interaction and use these to derive design requirements;
2) compare and select mechatronic components that optimally fulfill the defined design requirements;
3) derive a model of the device dynamics to guide and optimize the selection and integration of selected components into a functional system;
4) design control hardware and software and implement and test human-interactive control strategies on the physical setup;
5) characterize and optimize such systems using both engineering and psychophysical evaluation metrics;
6) investigate and optimize one aspect of the physical setup and convey and defend the gained insights in a technical presentation.

**Content**
This course provides an introduction to fundamental aspects of physical human-robot interaction. After an overview of human haptic, visual and auditory sensing, neurophysiology and psychophysics, principles of human-robot interaction systems (kinematics, mechanical transmissions, robot sensors and actuators used in these systems) will be introduced. Throughout the course, students will gain knowledge of interaction control strategies including impedance/admittance and force control, haptic rendering basics and issues in device design for humans such as transparency and stability analysis, safety hardware and procedures. The course is organized into lectures that aim to bring students up to speed with the basics of these systems, readings on classical and current topics in physical human-robot interaction, laboratory sessions and lab visits.

Students will attend periodic laboratory sessions where they will implement the theoretical aspects learned during the lectures. Here the salient features of haptic device design will be identified and theoretical aspects will be implemented in a haptic system based on the haptic paddle (https://relab.ethz.ch/downloads/open-hardware/haptic-paddle.html), by creating simple dynamic haptic virtual environments and understanding the performance limitations and causes of instabilities (direct/virtual coupling, friction, damping, time delays, sampling rate, sensor quantization, etc.) during rendering of different mechanical properties.

**Lecture notes**
Will be distributed on Moodle before the lectures.
Analytical Competencies
This semester course enables students to recognize, anticipate and address ethical issues in the domain of health sciences and their technological application. The specific learning objectives of this course are:

- **A.** Identify ethical issues in life sciences and biotechnology.
- **B.** Analyze and critically discuss ethical issues in life sciences and biotechnology.
- **C.** Become aware of relevant legal and public policy frameworks.
- **D.** Distinguish different ethical approaches and argumentative strategies in applied ethics.
- **E.** Recognize how ethical issues relate to different accounts of technology and innovation.
- **F.** Develop a personal and critical attitude towards the ethical aspects of life sciences and their technological application.
- **G.** Autonomously anticipate ethical issues.
- **H.** Propose and communicate solutions to ethical challenges and dilemmas.

**Prerequisites / notice**
The registration is limited to 26 students. There are 4 credit points for this lecture. The lecture will be held in English. The students are expected to have basic control knowledge from previous classes.

**Literature**

**376-1661-00L**
**Ethics of Life Sciences and Biotechnology**

**Prerequisites / notice**
The registration is limited to 26 students. There are 4 credit points for this lecture. The lecture will be held in English. The students are expected to have basic control knowledge from previous classes.

**Literature**
http://www.relab.ethz.ch/education/courses/phri.html
The course starts off with an introductory lecture on ethics as a discipline and an overview of the most relevant approaches in the domain of applied ethics. The students will also be introduced to current theoretical accounts of technology and will start to appreciate the relevance of ethics especially with respect to new and emerging technologies. Usable analytic tools will also be provided, thus enabling the students to engage with the discipline in a practical way from the very onset of the semester.

The course will continue with thematic sessions covering a broad variety of topics all of which are relevant to the different study tracks offered by the department. In particular, the course will cover the following domains: digital health technologies and medical AI; food, nutrition and healthy longevity; biomedical engineering; genetics; neuroscience and Neurotechnologies; medical robotics; disability and rehabilitation; environmental ethics. The course will also include sessions on cross-cutting ethically relevant aspects of health sciences and technologies, namely: access to innovation, translational research, and the relation between science and public policy.

All the topics of the course will be illustrated and interactively discussed through many case studies, offering the students the opportunity to prepare and present them, and to use them in individual as well as group exercises. Throughout the course, the students will have multiple opportunities to experiment with ethical argumentation and to practice their evolving skills.

**Abstract**

Introduction into structural and functional aspects of the immune system. Basic knowledge of the mechanisms and the regulation of an immune response.

**Objective**

Basic knowledge of the mechanisms and the regulation of an immune response.

**Content**

- Introduction and historical background
- Innate and adaptive immunity, Cells and organs of the immune system
- B cells and antibodies
- Generation of diversity
- Antigen presentation and Major Histoincompatibility (MHC) antigens
- Thymus and T cell selection
- Autoimmunity
- Cytotoxic T cells and NK cells
- Th1 and Th2 cells, regulatory T cells
- Allergies
- Hypersensitivities
- Vaccines, immune-therapeutic interventions

**Lecture notes**

**Abstract**

Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

**Objective**

The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

**Content**

Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

**Lecture notes**

Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

**Literature**

Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

**Prerequisites / notice**

To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

**Abstract**

The course offers detailed information on selected foodborne pathogens and toxin producing organisms; the focus lies on relevant molecular biological aspects of pathogenicity and virulence, as well as on the occurrence and survival of these organisms in foods.

**Objective**

Detailed and current status of research and insights into the molecular basis of foodborne diseases, with focus on interactions of the microorganism or the toxins they produce with the human system. Understanding the relationship between specific types of food and the associated pathogens and microbial risks. Another focus lies on the currently available methods and techniques useful for the various purposes, i.e., detection, differentiation (typing), and antimicrobial agents.
Content
Molecular biology of infectious foodborne pathogens (Listeria, E. coli, Campylobacter, Salmonella, etc) and toxin-producing organisms (Bacillus, Clostridium, Staphylococcus). How and under which conditions will toxins and virulence factors be produced, and how do they work? How is the interaction between the human host and the microbial pathogen? What are the roles of food and the environment? What can be done to interfere with the potential risks? Which methods are best suited for what approach? Last, but not least, the role of bacteriophages in microbial pathogenicity will be highlighted, in addition to various applications of bacteriophage for both diagnostics and antimicrobial intervention.

Prerequisites / notice
Lectures (2 hours) will be held as a single session of approximately 60+ minutes (10:15 until approx. 11:15 h), without a break!

752-6403-00L Nutrition and Performance

Abstract
The course introduces basic concepts of the interaction between nutrition and exercise performance.

Objective
To understand the potential effects of nutrition on exercise performance, with a focus on concepts and principles of nutrition before, during and after exercise.

Content
The course will cover elementary aspects of sports nutrition physiology, including carbohydrate, glycogen, fat, protein and energy metabolism. A main focus will be to understand nutritional aspects before exercise to be prepared for intensive exercise bouts, how exercise performance can be supported by nutrition during exercise and how recovery can be assisted by nutrition after exercise. Although this is a scientific course, it is a goal of the course to translate basic sports nutrition science into practical sports nutrition examples.

Literature
Information on further reading will be announced during the lecture. There will be some mandatory as well as voluntary readings.

Prerequisites / notice
General knowledge about nutrition, human biology, physiology and biochemistry is a prerequisite for this course. The course builds on basic nutrition and biochemistry knowledge to address exercise and performance related aspects of nutrition.

The course is designed for 3rd year Bachelor students, Master students and postgraduate students (MAS/CAS).

Abstract
Translational science is a cross disciplinary scientific research that is motivated by the need for practical applications that help people (e.g. Medicines). The course should help to clarify basics of translational science, illustrate successful applications and enable students to integrate key features into their future projects.

Objective
After completing this course, students will be able to understand:
Principles of translational science including medical device development, intellectual property, regulatory environment and project management

Content
What is translational science and what is it not Including:
How to identify need?
How to choose the appropriate research type and methodology
How to measure success?
How are medical devices developed?
How to handle IP in the development process?
How does the regulatory environment impact innovation?
How to manage complex development projects?
Positive and negative examples will be illustrated by distinguished guest speakers.

The basic course in "Good Clinical Practice" (GCP) contains two full-time training days (Module 1 and Module 2) and addresses elementary aspects for the appropriate conduct of clinical trials and non-clinical research projects involving human beings. Successful participation will be confirmed by a certificate that is recognized by the Swiss authorities.

**Objective**

Students will get familiar with:
- Key Ethics documents
- (Inter)national Guidelines and Laws (e.g. ICH-GCP, DIN EN ISO 14155, TPA, HRA)
- Sequence of research projects and project-involved parties
- Planning of research projects (statistics, resources, study design, set-up of the study protocol)
- Approval of research projects by Authorities (SwissEthics, Swissmedic, FOPH)
- Roles and responsibilities of project-involved parties

Students will learn how to:
- Classify research projects according the risk-based approach of the HRA
- Write a study protocol
- Inform participating patients/study subjects
- Obtain consent by participating patients/study subjects
- Classify, document and report Adverse Events
- Handle projects with biological material from humans and/or health-related personal data

**Content**

**Module 1:**
- Research and Research Ethics
- Guidelines, (inter)national Legislation
- Development of therapeutic products
- Methodology (Study Design)
- Study documents (Study protocol, Investigator's Brochure, Patient Information Leaflet, Informed Consent Form)

**Module 2:**
- Roles and Responsibilities
- Approval procedures
- Notification and Reporting
- Study documentation
- Research with biological material and health-related data
- Data protection, data retention

**Electives**

**Rehabilitation Technology**

Students majoring in Rehabilitation and Inclusion: At least 3 CP of the courses in this focus area must be selected.

**Abstract**

The course provides an introduction to the field of human-computer interaction and focuses on role of the user in system design. Methods used to analyze the user experience will be introduced to show how they inform the design of new interfaces, systems, and technologies. Emerging methods and tools in computational interaction and optimization for UI design will also be introduced.

**Objective**

The goal of the course is for students to understand the principles of user-centered design and be able to apply these in practice. Another goal is to understand the basic notions of Computational Design in a HCI context.

**Content**

The course will introduce students to several methods of analysing the user experience, showing how these can be used at different stages of system development from requirements analysis through to usability testing.

Students will get experience of designing and carrying out user studies as well as analysing results. The course will also cover the basic principles of interaction design. Practical exercises related to touch and gesture-based interaction will be used to reinforce the concepts introduced in the lecture. To get students to further think beyond traditional system design, we will discuss issues related to ambient information and awareness.

**Abstract**

Technology ventures are significantly changing the global economic picture. Technological skills increasingly need to be complemented by entrepreneurial understanding.

This course offers the fundamentals in theory and practice of entrepreneurship in new technology ventures. Main topics covered are success factors in the creation of new firms, including founding, financing and growing a venture.

**Objective**

This course provides theory-grounded knowledge and practice-driven skills for founding, financing, and growing new technology ventures.

A critical understanding of dos and don'ts is provided through highlighting and discussing real life examples and cases.
Weekly sessions - recorded.
10+ sessions carried out by guest lecturers: experts in the broad field of technology entrepreneurship (e.g., serial entrepreneurs, venture capitalists, (E)MBA professors, company builders, patent experts, scale-up executives, ...). Final session: multiple choice semester assignment (100% of grade).

Typical lecture format (2h):
15': Introduction
60': Guest testimonial
15': Discussion related to topic (in groups)
10': Plenary discussion
20': Q&A with (guest) lecturer

Wearable and Mobile Technologies of the Future - Focus on Sports and Health

W 4 credits 3G C. Menon, C. Ahmadizadeh, C. Otesteanu

Abstract
The course introduces concepts about wearable and unobtrusive technologies for sport and health data collection. Tools for analysing this data and evaluating the performance of these systems are introduced. Topics such as monitoring movement and muscle activation, mental focus, stress, and heart health are covered.

Objective
Objective 1: Acquire knowledge about wearable and unobtrusive technologies and skills to process data acquired using wearable technologies.

Objective 2: Provide students with hands-on experience using various wearable technologies, including textile-based stretchable sensors, electromyography (EMG), electroencephalogram (EEG) and electrocardiogram (ECG).

Content
The course consists of the following modules:

Module 0: Fundamentals
This module briefly reviews time-frequency domains, transforms and filtering.

Module 1: Movement
This module provides the scientific background needed to understand the principles that current technologies investigating movement rely on. It provides an overview of wearable technologies for monitoring overall body movement as well as for tracking motion parameters (e.g. gait, running, posture). Technologies such as inertial measurement units, electromyography, optical motion capture systems, and others are covered. The latest updates on wearable-related (e.g., textile-based) technologies are also introduced. Students are involved in labs/assignments to put into practice the knowledge and skills acquired during this module.

Module 2: Brain
This module briefly introduces brain functions and provides an overview of related wearable technologies. Topics covered may include electroencephalograms, transcranial magnetic stimulation, and galvanic vestibular stimulation. Data processing techniques such as common spatial patterns, principal component analysis, and linear discriminant analysis are introduced. Students are given a practical assignment to put into practice the knowledge and skills acquired during this module.

Module 3: Cardiac
This module focuses on wearable technologies for monitoring cardiac health. The module starts by providing information on cardiac physiology and introduces wearable technologies for the heart. Topics such as electrocardiography, photoplethysmography, light sensing, and contactless physiology monitoring are introduced. Data analysis techniques for cardiac data including heart-rate variability, Poincare plots, and wavelet transforms are discussed. Students will be given an assignment to put into practice the knowledge and skills acquired during this module.

Prerequisites
- Students should be proficient in programming (any language).
- Note: assignments will be in Python. Students are expected to learn Python on their own if not experienced with this programming language.

Course prerequisites:
For Biomedical Engineering Master’s: none
For ITET Master’s: none
For D-MAVT Master’s: none
For D-HEST Master’s and PhD students:
• If BSc in electrical/mechanical engineering or computer science: none
• If any other BSc program: 376-0022-00L (Imaging and Computing in Medicine) or 376-1983-00L (Foundations of Data Science)

376-1219-00L
Rehabilitation Engineering II: Rehabilitation of Sensory and Vegetative Functions

W 3 credits 2V R. Rienner, O. Lambercy

Aims of the course
The aims of the course are to provide students with a solid theoretical and practical basis of modern rehabilitation engineering technologies. The course is organized as a combination of lecture and laboratory sessions.

Content
The course consists of the following modules:

Module 0: Fundamentals
This module briefly reviews time-frequency domains, transforms and filtering.

Module 1: Movement
This module provides the scientific background needed to understand the principles that current technologies investigating movement rely on. Abstract
Rehabilitation Engng is the application of science and technology to ameliorate the handicaps of individuals with disabilities to reintegrate them into society. The goal is to present classical and new rehabilitation engineering principles applied to compensate or enhance motor, sensory, and cognitive deficits. Focus is on the restoration and treatment of the human sensory and vegetative system.

Objective
Provide knowledge on the anatomy and physiology of the human sensory system, related dysfunctions and pathologies, and how rehabilitation engineering can provide sensory restoration and substitution.

This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.

Content
Introduction, problem definition, overview
Rehabilitation of visual function
- Anatomy and physiology of the visual sense
- Technical aids (glasses, sensor substitution)
- Retina and cortex implants
Rehabilitation of hearing function
- Anatomy and physiology of the auditory sense
- Hearing aids
- Cochlea Implants
Rehabilitation and use of kinesthetic and tactile function
- Anatomy and physiology of the kinesthetic and tactile sense
- Tactile/haptic displays for motion therapy (incl. electrical stimulation)
- Role of displays in motor learning
Rehabilitation of vestibular function
- Anatomy and physiology of the vestibular sense
- Rehabilitation strategies and devices (e.g. BrainPort)
Rehabilitation of vegetative Functions
- Cardiac Pacemaker
- Phrenic stimulation, artificial breathing aids
- Bladder stimulation, artificial sphincter
Brain stimulation and recording
- Deep brain stimulation for patients with Parkinson, epilepsy, depression
- Brain-Computer Interfaces

**376-1229-00L Artificial Intelligence in Rehabilitation and Healthcare**

**Abstract**

Students will delve into AI fundamentals (e.g., regression, classification, and deep neural networks) and their role in patient monitoring & personalized rehab. Collaborative projects offered by MedTech companies provide hands-on experience in developing and evaluating AI-driven solutions. This course will emphasize AI's explainability and ethical dimensions fostering its critical analysis.

**Objective**

1. Evaluate the effectiveness of AI tools and algorithms in the context of rehabilitation and healthcare, and suggest modifications or improvements as needed.
2. Understand the ethical and legal considerations surrounding the use of AI in rehabilitation and healthcare and apply this knowledge to ensure patient privacy and data security.
3. Identify potential limitations and risks of using AI in rehabilitation and healthcare and propose strategies to mitigate these challenges.
4. Collaborate effectively with other students on group projects that involve developing and implementing AI-based rehabilitation and healthcare solutions.

**Content**

In the class 'Artificial Intelligence (AI) in Rehabilitation and Healthcare', we will explore the integration of advanced technology in the field of rehabilitation. The class consists of both theoretical and practical components. In the theoretical part, students are introduced to the fundamental concepts of artificial intelligence, including regressions and classification in machine learning, deep neural networks, and large language models. They will explore the applications of AI in rehabilitation and healthcare, including patient monitoring, personalized treatment plans, and predictive analytics.

In the practical component, each student will work with one of the clinics or technology companies to identify real-world problems and gain hands-on experience in developing AI in rehabilitation and healthcare. The practical work will be done in the course room with student assistants and experts from the companies. They will use Python as main language on their own laptops with ready to use Jupiter notebooks that could have access to our lab's server if needed for computational resources. They will directly start using programming languages and tools to build models, analyze data, and create algorithms that can be used to improve patient outcomes.

Throughout the class, students are encouraged to think critically about the ethical implications of using AI in rehabilitation. They examine the potential benefits and risks of using advanced technology in patient care and explore ways to mitigate potential negative outcomes.

**Prerequisites / notice**

Required classes:
- 401-0643-00L Statistik I
- 401-0643-13L Statistik II
- 376-1983-00L Foundations of Data Science

Recommended courses:
- 252-0842-00L Programmieren und Problemlösen
This course provides a holistic, clinical view on the in- and outpatient rehabilitation process of neurological diseases with a special focus on new trends in physical activity for prevention and rehabilitation. Students are expected to:

- develop a holistic, clinical view on the different phases of neurorehabilitation
- understand how motor deficits develop, which pathology to the central nervous system causes which type of deficit and how each deficit can be treated
- discuss and interpret the impact of clinical trial findings for rehabilitation

The course provides a condensed overview on physical medicine and different rehabilitation types (geriatric, internistic and oncological, cardiovascular, musculoskeletal, neurological, pediatric, paraplegiologic, psychosomatic, pulmonal), as well as main challenges and future trends from a clinical perspective. Students will have opportunity to gain insight into rehabilitation clinics on-site.

- understand how the Swiss rehabilitation landscape is built and financed
- get to know the different rehabilitation types, their specific challenges and discuss potential solutions
- comprehend future trends in rehabilitation and identify required actions
- gain insight into rehabilitation clinics and hands-on experience
- discuss and interpret the impact of clinical trial findings for rehabilitation
- understand different patient journeys in dependence on the underlying deficits and individual personal and environmental factors
- develop a holistic, clinical view on the different phases of neurorehabilitation

Abstract
This course provides a holistic, clinical view on the in- and outpatient rehabilitation process of neurological diseases with a special focus on movement deficits. Pharmacological, training and medical device-supported interventions with their potential and limitations are discussed from a clinical perspective along the patient journey – covering the different phases of inpatient rehab.

Objective
Students are expected to:

- develop a holistic, clinical view on the different phases of neurorehabilitation
- understand how motor deficits develop, which pathology to the central nervous system causes which type of deficit and how each deficit can be treated
- discuss and interpret the impact of clinical trial findings for rehabilitation

Content
- Symptomatology: Motor deficits in clinical practice
- Disorders leading to motor deficits 1: Stroke and brain trauma
- Disorders leading to motor deficits 2: Spinal cord injury
- Disorders leading to motor deficits 3: Peripheral nerve injury and muscle diseases
- Disorders leading to motor deficits 4: Movement disorders
- Brain plasticity in the motor system
- Training interventions 1: Strength and endurance
- Training interventions 2: Stance and gait
- Training interventions 3: Arm and fine motor control
- Pharmacological support for recovery
- Brain stimulation to support motor recovery
- Movement and cognition & vision
- Motor learning based training interventions
- Clinical importance of motivation for movement recovery
- Future trends in rehabilitation

Prerequisites / notice
Basic knowledge on anatomy and physiology of the central nervous system required.

Abstract
The course provides a condensed overview on physical medicine and different rehabilitation types (geriatric, internistic and oncological, cardiovascular, musculoskeletal, neurological, pediatric, paraplegiologic, psychosomatic, pulmonal), as well as main challenges and future trends from a clinical perspective. Students will have opportunity to gain insight into rehabilitation clinics on-site.

Objective
Students will

- understand how the Swiss rehabilitation landscape is built and financed
- get to know the different rehabilitation types, their specific challenges and discuss potential solutions
- comprehend future trends in rehabilitation and identify required actions
- gain insight into rehabilitation clinics and hands-on experience

Content
- Introduction into the rehabilitation landscape
- Introduction into physical medicine
- Rehabilitation types
- Geriatric Rehabilitation
- Internistic and Oncological Rehabilitation
- Cardiovascular Rehabilitation
- Musculoskeletal Rehabilitation
- Neurological Rehabilitation
- Pediatric Rehabilitation
- Paraplegiologic Rehabilitation
- Psychosomatic Rehabilitation
- Pulmonal Rehabilitation
- Challenges in rehabilitation from a clinical perspective
- Future trends in rehabilitation
Abstract

This lecture introduces the basic principles of injury mechanics and rehabilitation focusing on sports injuries.

Objective

Within the scope of this lecture you will learn the basic principles of trauma biomechanics. Based on examples from sports, you will get to know different mechanisms that can possibly result in injury. Investigating the background and causes of injury should allow you to assess the injury risk for sports activities. Furthermore, you should be able to develop measures to prevent such injuries.

Content

This lecture deals with the basic principles of injury mechanics and rehabilitation. Mechanisms that can result in injury are presented. Furthermore, possibilities to prevent injuries are discussed. Thereby, the lecture focuses on sports injuries.

Lecture notes

Handouts will be made available.

Literature

Prerequisites / notice

A course work is required. The mark of this course work contributes to the final credits for this lecture. Details will be given during the first lecture.

Inclusion

Students majoring in Rehabilitation and Inclusion: At least 3 CP of the courses in this focus area must be selected.

Economic and Regulatory Principles of Rehabilitation

Medical healthcare in Switzerland is diverse and includes somatic and psychological prevention, treatment, rehabilitation, and professional reintegration. The lecture deals with the economic and regulatory principles of medical rehabilitation and reintegration. It introduces these areas of healthcare and places them in the context of the entire healthcare system.

The students know the economic and regulatory framework conditions of medical rehabilitation and occupational and social reintegration in the Swiss healthcare system.

The students are familiar with the market participants and their strategies and intentions.

The students are aware of the importance of associations which, as representatives of the sector, express their views on quality and tariffs and deal with political issues. Interfaces, dependencies, and cooperations between the individual actors are known.

The students will analyze the strengths and weaknesses of the Swiss healthcare system, also in comparison with foreign models, and will develop solutions to overcome the current problems with a focus on rehabilitation and reintegration.

The market participants such as service providers, financiers, suppliers or authorities are introduced and the mutual dependencies are shown. The market mechanisms are presented and the range of services, financial flows, tariff situations, consolidations, and regulation are discussed.

Special attention is paid to megatrends such as cost pressure, shortage of skilled workers, ambulantization, digitalization, or technologization and the influence of demographic change.
This semester course enables students to recognize, anticipate and address ethical issues in the domain of health sciences and their technological application. The students will acquire the necessary theoretical and analytic resources to develop critical thinking skills in the field of applied ethics and will practice how to use such resources to address concrete ethical issues in health sciences.

Objective
This course is tailored to students who want to become familiar with the analysis of ethical issues in all the different domains of life sciences and biotechnology. The course aims at equipping students with the necessary knowledge and analytic skills to understand, discuss and address the ethical aspects of science and technology in the domain of human health. The specific learning objectives of this course are:

A. Identify ethical issues in in life sciences and biotechnology.
B. Analyze and critically discuss ethical issues in life sciences and biotechnology.
C. Become aware of relevant legal and public policy frameworks.
D. Distinguish different ethical approaches and argumentative strategies in applied ethics.
E. Recognize how ethical issues relate to different accounts of technology and innovation.
F. Develop a personal and critical attitude towards the ethical aspects of life sciences and their technological application.
G. Autonomously anticipate ethical issues.
H. Propose and communicate solutions to ethical challenges and dilemmas.

Content
The course starts off with an introductory lecture on ethics as a discipline and an overview of the most relevant approaches in the domain fostered. Analytical Competencies: Knowledge of the pathophysiology and the concomitant complications of a spinal cord injury and the consequences for physical exercise fostered. This course is tailored to students who want to become familiar with the analysis of ethical issues in all the different domains of life sciences and biotechnology. The course will continue with thematic sessions covering a broad variety of topics all of which are relevant to the different study tracks offered by the department. In particular, the course will cover the following domains: digital health technologies and medical AI; food, nutrition and healthy longevity; biomedical engineering; genetics; neuroscience and Neurotechnologies; medical robotics; disability and rehabilitation; environmental ethics. The course will also include sessions on cross-cutting ethically relevant aspects of health sciences and technologies, namely: access to innovation, translational research, and the relation between science and public policy.

All the topics of the course will be illustrated and interactively discussed through many case studies, offering the students the opportunity to prepare and present them, and to use them in individual as well as group exercises. Throughout the course, the students will have multiple opportunities to experiment with ethical argumentation and to practice their evolving skills.

Competencies
Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: fostered

Method-specific Competencies
- Analytical Competencies: assessed
- Media and Digital Technologies: fostered
- Problem-solving: fostered

Social Competencies
- Communication: assessed
- Cooperation and Teamwork: fostered
- Leadership and Responsibility: fostered
- Self-presentation and Social Influence: fostered
- Sensitivity to Diversity: fostered

Personal Competencies
- Adaptability and Flexibility: fostered
- Critical Thinking: assessed
- Integrity and Work Ethics: assessed
- Self-awareness and Self-reflection: assessed

Literature
- 376-1722-00L Spinal Cord Injury and Exercise W 2 credits 2V C. Perret

Prerequisite: Anatomy and Physiology.

Abstract
Intensive discussion concerning complications of a spinal cord injury and their consequences on trainability and exercise performance of persons sitting in a wheelchair. Overview on the clinical application of exercise testing as well as on the implementation of sport scientific findings to optimise performance of individuals with spinal cord injury in rehabilitation and elite sports.

Objective
Knowledge of the pathophysiology and the concomitant complications of a spinal cord injury and the consequences for physical exercise and trainability during rehabilitation as well as in recreational and elite sport.

Content
The following issues will be discussed: Epidemiology and etiology of spinal cord injury; complications and consequences of spinal cord injury; trainability/exercise physiology and spinal cord injury; history and organisation of wheelchair sports; elite sport and spinal cord injury

Public Health Concepts (752-6151-00L)

**Abstract**
The module "public health concepts" offers an introduction to key principles of public health. Students get acquainted with the concepts and methods of epidemiology. Students also learn to use epidemiological data for prevention and health promotion purposes. Public health concepts and intervention strategies are presented, using examples from infectious and chronic diseases.

**Objective**
At the end of this module students are able:
- to interpret the results of epidemiological studies
- to critically assess scientific literature
- to know the definition, dimensions and determinants of health
- to plan public health interventions and health promotion projects
- to draw a bridge from evidence to policies and politics

**Content**
Concepts of descriptive and analytical epidemiology, study designs, measures of effect, confounding and bias, screening, surveillance, definition of health and health promotion, health dimensions and health determinants, prevention strategies, public health interventions, public health action cycle, epidemiology and prevention of infectious and chronic diseases (HIV, COVID-19, Obesity, Iodine/PH nutrition).

**Lecture notes**
Handouts are provided to students in the classroom.

</tr>
<tr>
<td>Abstract</td>
<td>Mathematics I covers mathematical concepts and techniques necessary to model, solve and discuss scientific problems, notably through linear algebra and calculus, with an emphasis on differential equations. The main focus of Mathematics II is multivariable calculus. Mathematics is of ever increasing importance to the Natural Sciences and Engineering. The key is the so-called mathematical modelling cycle, i.e. the translation of problems from outside of mathematics into mathematics, the study of the mathematical problems (often with the help of high level mathematical software packages) and the interpretation of the results in the original environment. The goal of Mathematics I and II is to provide the mathematical foundations relevant for this paradigm. Differential equations are by far the most important tool for modelling and are therefore a main focus of these courses.</td>

Autumn Semester 2024

Data: 06.08.2024 12:40  Page 1322 of 2684
Abstract
Learning to view the human body as a (bio-) mechanical system. Making the connections between everyday movements and sports activity with injury, discomfort, prevention and rehabilitation.

Objective
"Students are able to describe the human body as a mechanical system. They analyse and describe human movement according to the laws of mechanics."

Content
Movement- and sports biomechanics deals with the attributes of the human body and their link to mechanics. The course includes topics such as functional anatomy, biomechanics of daily activities (gait, running, etc.) and looks at movement in sport from a mechanical point of view. Furthermore, simple reflections on the loading analysis of joints in various situations are discussed. Additionally, questions covering the statics and dynamics of rigid bodies, and inverse dynamics, relevant to biomechanics are investigated.

406-0062-AAL  Physics I  E-  5 credits  11R  A. Vaterlaus
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Introduction to the concepts and tools in physics: mechanics of point-like and rigid bodies, elasticity theory, elements of hydrostatics and hydrodynamics, periodic motion and mechanical waves.

Objective
Introduction to the scientific methodology. The student should develop his/her capability to turn physical observations into mathematical models, and to solve the latter. The student should acquire an overview over the basic concepts in mechanics.

Content
Book:

Chapters:
1, 2, 3, 4, 5, 6 (without: 6-5, 6-6, 6-8), 7, 8 (without 8-9), 9, 10 (without 10-10), 11 (without 11-7), 13 (without 13-13, 13-14), 14 (without 14-6).

**Abstract**

This course discusses the quantisation of fields in order to introduce a coherent formalism for the combination of quantum mechanics and special relativity. Topics include:

- Relativistic quantum mechanics
- Quantisation of bosonic and fermionic fields
- Interactions in perturbation theory
- Scattering processes and decays
- Elementary processes in QED
- Radiative corrections

**Objective**

The goal of this course is to provide a solid introduction to the formalism, the techniques, and important physical applications of quantum field theory. Furthermore, it prepares students for the advanced course in quantum field theory (Quantum Field Theory II), and for work on research projects in theoretical physics, particle physics, and condensed-matter physics.

**Lecture notes**

Will be provided as the course progresses

**Competencies**

**Abstract**

The course focuses on the connection between particle physics theory and experimental results to provide a comprehensive modern view of the Standard Model. The covered topics are quantum electrodynamics (QED) and quantum chromodynamics (QCD).

**Objective**

The students will deepen the knowledge on particle physics acquired during their bachelor studies. They will be able to apply the basics of relativistic quantum field theory (QFT) to derive the Feynman rules and to apply those to compute QED and QCD processes. They will be able to explain and discuss the connection between theory and experiments.

**Content**

Topics to be covered in Phenomenology of Particle Physics I:

- Relativistic kinematics
- Decay rates and cross sections
- Quantisation of Klein-Gordon (boson) and Dirac (fermion)'s fields
- From the S-matrix to the Feynman rules of QED
- Scattering processes in QED/QCD and running of alpha and alpha_s
- Experimental tests of QED and QCD

This course unit can only be booked together with a research project (402-0218-MS). This extension is not available for the options Proseminars, Particle Physics at PSI, Medical Physics and Experimental Foundations of Particle Physics. The extension is only possible with the agreement of the supervising professor. The extension must be booked at the same time as the research project.
Abstract

Extension of the Research Project

Objective

Students are enabled to:
• expand their knowledge in a specific area of physics,
• conduct a project (a) in a research laboratory or (b) on a specific topic of theoretical physics,
• discuss their project results and conclusions in a team,
• present their findings in written and oral form.

The extension allows for a more in-depth research experience.

402-0457-00L Quantum Technologies for Searches of New Physics

Abstract

Recent years have witnessed incredible progress in the development of new quantum technologies driven by their application in quantum information, metrology, high precision spectroscopy and quantum sensing. This course will present how these emerging technologies are powerful tools to address open questions of the Standard Model in a complementary way to what is done at the high energy frontier.

Objective

The aim of this course is to equip students of different backgrounds with a solid base to follow this rapidly developing and exciting multi-disciplinary field.

Content

The first lectures will be dedicated to review the open questions of the Standard Model and the different Beyond Standard Model extensions which can be probed with quantum technologies. This will include searches for dark sector, dark matter, axion and axion-like particles, new gauge bosons (e.g. Dark photons) and extra short-range forces.

The main part of the course will introduce the following (quantum) technologies and systems, and how they can be used for probing New Physics.
- Cold atoms
- Trapped ions
- Atoms interferometry
- Atomic clocks
- Cold molecules and molecular clocks
- Exotic Atoms
- Anti-matter
- Quantum Sensors

Prerequisites / notice

The preceding attendance of introductory particle physics, quantum mechanics and quantum electronics courses at the bachelor level is recommended.

402-0713-00L Astro-Particle Physics I

Abstract

This lecture gives an overview of the present research in the field of Astro-Particle Physics, including the different experimental techniques. In the first semester, main topics are the charged cosmic rays including the antimatter problem. The second semester focuses on the neutral components of the cosmic rays as well as on some aspects of Dark Matter.

Objective

Successful students know:
- experimental methods to measure cosmic ray particles over full energy range
- current knowledge about the composition of cosmic ray
- possible cosmic acceleration mechanisms
- correlation between astronomical object classes and cosmic accelerators
- information about our galaxy and cosmology gained from observations of cosmic ray

Content

First semester (Astro-Particle Physics I):
- definition of 'Astro-Particle Physics'
- important historical experiments
- chemical composition of the cosmic rays
- direct observations of cosmic rays
- indirect observations of cosmic rays
- 'extended air showers' and 'cosmic muons'
- 'knee' and 'ankle' in the energy spectrum
- the 'anti-matter problem' and the Big Bang
- 'cosmic accelerators'

Low Energy Particle Physics

402-0715-00L

Abstract
Low energy particle physics provides complementary information to high energy physics with colliders. In this lecture, we will concentrate on flagship experiments which have significantly improved our understanding of particle physics today, concentrating mainly on precision experiments with neutrons, muons, and exotic atoms.

Objective
You will be able to present and discuss:
- the principle of the experiments
- the underlying technique and methods
- the context and the impact of these experiments on particle physics

Content
Low energy particle physics provides complementary information to high energy physics with colliders. At the Large Hadron Collider one directly searches for new particles at energies up to the TeV range. In a complementary way, low energy particle physics indirectly probes the existence of such particles and provides constraints for "new physics", making use of high precision and high intensities.

Besides the sensitivity to effects related with new physics (e.g. lepton flavor violation, symmetry violations, CPT tests, search for electric dipole moments, new low mass exchange bosons etc.), low energy physics provides the best test of QED (electron g-2), the best tests of bound-state QED (atomic physics and exotic atoms), precise determinations of fundamental constants, information about the CKM matrix, precise information on the weak and strong force even in the non-perturbative regime etc.

Starting from a general introduction on high intensity/high precision particle physics and the main characteristics of muons and neutrons and their production, we will then focus on the discussion of fundamental problems and ground-breaking experiments:

- search for rare decays and charged lepton flavor violation
- electric dipole moments and CP violation
- spectroscopy of exotic atoms and symmetries of the standard model
- what atomic physics can do for particle physics and vice versa
- neutron decay and primordial nucleosynthesis
- atomic clock
- Penning traps
- Ramsey spectroscopy
- Spin manipulation
- neutron-matter interaction
- ultra-cold neutron production
- various techniques: detectors, cryogenics, particle beams, laser cooling....

Literature
Golub, Richardson & Lamoreaux: "Ultra-Cold Neutrons"
Rauch & Werner: "Neutron Interferometry"
Carlile & Willis: "Experimental Neutron Scattering"
Byrne: "Neutrons, Nuclei and Matter"
Klapdor-Kleingrothaus: "Non Accelerator Particle Physics"

Experimental Methods and Instruments of Particle Physics

402-0725-00L

Abstract

Objective
Acquire an in-depth understanding and overview of the essential elements of experimental methods in particle and astroparticle physics.

Content
1. Examples of modern experiments
2. Introduction to particle sources and accelerators
4. Detailed analysis of non-electronic, noble element, solid state, scintillator-based and Cherenkov particle detectors
5. Experimental techniques for particle tracking, calorimetry and identification
6. Monte Carlo simulations, trigger and data acquisition system readout

Lecture notes
Slides are handed out regularly

Literature

G.F.Knoll, "Radiation Detection and Measurements".

Neutrino Physics

402-0767-00L

Abstract
Theoretical basis and selected experiments to determine the properties of neutrinos and their interactions (mass, spin, helicity, chirality, oscillations, charge-parity violation, interactions with leptons and quarks) and implications on physics beyond the Standard Model of elementary particles as well as on Cosmology.
**Objective**
Critically analyze and elaborate the neutrino production and detection techniques.
Derive the theory of neutrino scattering and analyze its implications in neutrino experiments.
Analyze the phenomenology of neutrino oscillations and its implication on the physics beyond the Standard Model of particles.
Derive the main concepts of the theory of neutrino masses within and beyond the Standard Model of particles and analyze the experimental techniques related to the measurement of the neutrino masses.
Describe the role of neutrinos in Cosmology and make connections with current and future neutrino experiments.
Review the experimental configurations and analyze the challenges in searches for leptonic Charge-Parity symmetry violation and the measurement of the neutrino mass hierarchy.

**Content**
1. Introduction to Neutrinos and Neutrino Sources;
2. Neutrino Detectors;
3. Neutrino Interactions;
4. Neutrino Oscillations;
5. Nature of Neutrino masses;
6. Neutrinos in Cosmology;
7. Search for leptonic Charge Parity violation and precision measurement of the neutrino oscillation probability.

**Literature**

**Abstract**
This is the first of two courses, introducing particle accelerators from a theoretical point of view and covers state-of-the-art modelling techniques.

**Objective**
You obtain a theoretical understanding of the building blocks of particle accelerators. Modern numerical analysis tools allow you to model state-of-the-art particle accelerators. We will develop a Julia simulation tool (JuliAccel.jl) that reflects the theory from the lecture.

**Content**
Here is the rough plan of the topics, however the actual pace may vary relative to this plan.

- Recap of Relativistic Classical Mechanics and Electrodynamics
- Building Blocks of Particle Accelerators
- Lie Algebraic Structure of Classical Mechanics and Application to Particle Accelerators
- Symplectic Maps & Analysis of Maps
- Symplectic Particle Tracking
- Collective Effects
- Linear & Circular Accelerators

**Lecture notes**
Lecture notes

**Prerequisites / notice**
Physics, Computational Science (RW) at MSc. Level

In exceptional cases students at BSc level can attend.

This lecture is also suited for PhD. students

**Abstract**
Divided into three parts, the course introduces various aspects of lattice quantum field theory (QFT), gauge symmetries, quantum simulators, and implementation schemes. Other than highlighting the strengths and weaknesses of the lattice formulation of QFTs suitable for Monte Carlo simulations, the course discusses practical realization of quantum simulators for gauge theories.

**Objective**
After acquiring the foundations on lattice formulation of gauge theories, and challenges of conventional Monte Carlo simulation approaches, the students will learn about different strategies for quantum simulation of gauge theories and their implementation on digital and analog quantum devices.

**Content**

1. Background and Motivation
   1.1 From Quantum Field Theories to Lattice field theories;
   1.2 Lattice Gauge Theories - Lagrangian formulation, gauge symmetries, observables;
   1.3 Monte Carlo simulations, sign problems, and complex actions.
   2. Road-map for Quantum Simulation of Gauge Theories
   2.1 Hamiltonian formulation, Wilson’s formulation, and the infinite Hilbert spaces;
   2.2 Finite Hilbert spaces: Z(N) gauge theories. Dualizing the Ising model and relation with the toric code;
   2.3 Finite Hilbert spaces: Quantum link models for Abelian gauge theories;
   2.4 Finite Hilbert spaces: Quantum link models for non-Abelian gauge theories;
   2.5 Exploring the physics of gauge theories - phases, dynamics, and thermalization;
   2.6 Exploring methods for gauge theories - exact diagonalization, tensor networks, Monte Carlo.
   3. Quantum Simulation Approaches and Platforms
   3.1 Digital vs. analog quantum simulations;
   3.2 Proposals for simulations of gauge theories, realization, and perspectives.

**Literature**
Quantum chromodynamics on the lattice (Christof Gattringer, Christian B. Lang. Series Title: Lecture Notes in Physics. DOI: https://doi.org/10.1007/978-3-642-01850-3)

**Abstract**
Introduction to the theory of general relativity. The course puts a strong focus on the mathematical foundations of the theory as well as the underlying physical principles and concepts. It covers selected applications, such as the Schwarzschild solution and gravitational waves.
Introduction to Quantum Electrodynamics

Introduction to Effective Field Theories

Introduction to the theory of general relativity. The course puts a strong focus on the mathematical foundations, such as differentiable manifolds, the Riemannian and Lorentzian metric, connections, and curvature. It discusses the underlying physical principles, e.g., the equivalence principle, and concepts, such as curved spacetime and the energy-momentum tensor. The course covers some basic applications and special cases, including the Newtonian limit, post-Newtonian expansions, the Schwarzschild solution, light deflection, and gravitational waves.

Parts of the lecture are based on the book "General Relativity" by R. Wald.

Other suggested textbooks:
- "Gravitation" by C. Misner, K. Thorne and J. Wheeler
- "Spacetime and Geometry: An Introduction to General Relativity" by S. Carroll
- "Gravitation and Cosmology" by S. Weinberg

A. Lazopoulos

QCD: Theory and Experiment

This course covers the basic concepts of effective field theories (EFTs) and dispersion theory. We will start by introducing the core concept of constructing EFTs and apply them to the low-energy description of the weak interaction and the effective description of heavy physics beyond the Standard Model.

In the next part of the course, we will discuss Chiral Perturbation Theory (ChPT), the low-energy effective theory of Quantum Chromodynamics (QCD). We will briefly discuss the application of this concept to describe a class of theories beyond the SM in which the SM Higgs arises as a composite state of a new confining sector.

The second focus of the course is on dispersion theory and its interplay with EFTs. We will discuss how to make use of the constraints from unitarity of the S-matrix and analyticity of scattering amplitudes, in order to extend the range of validity of the theoretical description compared to pure EFT methods. We will also discuss how to obtain constraints on EFT parameters from unitarity and analyticity. We will discuss the application of these methods both in the context of low-energy strong interaction and physics beyond the Standard Model.

- Introduction to Effective Field Theories
- Decoupling and matching
- Renormalization group resummation
- The Standard Model Effective Field Theory (SMEFT)
- Chiral Lagrangians
- Unitarity of the S-matrix
- Analyticity and dispersion relations

A. Signer

Effective Field Theories for Particle Physics

This course will cover the application of these concepts directly at UZH.

Will be given as block course, language: English.

Special Students UZH must book the module PHY578 directly at UZH.

QFT-I (mandatory) and QFT-II (highly recommended)

A. Gehrmann-De Ridder

QCD: Theory and Experiment

Does not take place this semester.

QCD Lagrangian and Feynman Rules

QCD running coupling

Parquet model

DGLAP

Basic processes

Experimental tests at lepton and hadron colliders

Measurements of the strong coupling constant

2) R. K. Ellis, W. J. Stirling, B. R. Webber; "QCD and Collider Physics" (Cambridge Monographs on Particle Physics, Nuclear Physics & Cosmology)

A. Gehrmann-De Ridder

Introduction to Quantum Electrodynamics

This course provides a pedagogical introduction to Quantum Electrodynamics.

The course will cover
- an introduction to QED as the quantum theory of interactions of light and matter.
- Feynman rules for QED
- Amplitudes and cross sections for simple processes in QED
- Gauge invariance and the Ward identity
- Ultraviolet singularities and Renormalization
- Infrared singularities and their cancelation
- The Ueling potential and the Lamb shift
- Anomalous magnetic moments

A. Lazopoulos

### Symmetries in Physics

**402-0883-63L**

**Abstract**
The course gives an introduction to symmetry groups in physics. It explains the relevant mathematical background (finite groups, Lie groups and algebras as well as their representations), and illustrates their important role across modern physics.

**Objective**
The aim of the course is to give a self-contained introduction into finite group theory as well as Lie theory from a physicists point of view. Abstract mathematical constructions will be illustrated with examples from physics.

**Content**
Finite group theory, including representation theory and character methods; applications to crystallography and solid state physics. The symmetric group and the structure of its representations; applications to identical particles. Clifford algebras; application to relativistic wave equations equations. Simple Lie algebras and their finite-dimensional representations. Description of representations of SU(N) in terms of Young diagrams; applications in particle physics.

**QCD and Scattering Amplitudes**

**Abstract**
The course presents the quantum field theory of the strong interaction (quantum chromodynamics, QCD) and discusses its applications to particle physics observables.

**Objective**
The course aims to familiarize the students with the concepts and applications of QCD and to introduce them to modern techniques for computations in QCD.

**Content**
- Review of non-Abelian gauge theories
- Renormalization of QCD and running coupling constant
- Jet observables in $e^+e^-$ annihilation
- QCD at lepton-proton colliders
- Multiparticle production
- Spinor-helicity formalism
- Perturbation theory techniques: loops and phase space

**Prerequisites / notice**
The course assumes prior knowledge of the content of the quantum field theory 1+2 lectures.

**Introduction to String Theory**

**Abstract**
String theory is an attempt to quantise gravity and unite it with the other fundamental forces of nature. It is related to numerous interesting topics and questions in quantum field theory. In this course, an introduction to the basics of string theory is provided.

**Objective**
Within this course, a basic understanding and overview of the concepts and notions employed in string theory shall be given. More advanced topics will be touched upon towards the end of the course briefly in order to foster further research.

**Content**
- mechanics of point particles and extended objects
- string modes and their quantisation; higher dimensions, supersymmetry
- critical dimension and no-ghost theorem
- D-branes, T-duality
- two-dimensional conformal field theories

Abstract
Introduction to differential manifolds and differential geometry.

Introduce the language, tools, and basic results of differentiable manifolds, tensors, Riemannian geometry, and related geometric structures. Relate geometric intuition to formulas involving curvature, derivatives and tensors.

Objective
Learn to compute, describe, prove, and solve problems in the language of differential geometry.

Content
Submanifolds of $\mathbb{R}^n$, immersions, submersions, and embeddings, Sard's Theorem, abstract differentiable manifolds, charts, vector fields and flows, vector bundles, tensor fields, covariant derivatives, parallel transport, Riemannian metrics, geodesics, Riemann curvature tensor. Complete manifolds, Hopf-Rinow theorem. Many examples including curves, surfaces, hyperbolic space, $S^3$, the unit quaternions, the Gauss-Bonnet theorem, etc.

Literature
John M. Lee: Introduction to Smooth Manifolds
John M. Lee: Introduction to Riemannian Manifolds

This following books were inherited from before. The only one I know is DoCarmo.
- Manfredo P. do Carmo: Differential Geometry of Curves and Surfaces
- S. Montiel, A. Ros: Curves and Surfaces
- S. Kobayashi: Differential Geometry of Curves and Surfaces
- Wolfgang Kühnel: Differentialgeometrie. Kurven-Flächen-Mannigfaltigkeiten
- Dennis Barden & Charles Thomas: An Introduction to Differentiable Manifolds

Competencies

401-3461-00L Functional Analysis I
3 credits
4V+1U
W. Rudin

Abstract
Baire category; Banach and Hilbert spaces, bounded linear operators; basic principles: Uniform boundedness, open mapping/closed graph theorem, Hahn-Banach; convexity; dual spaces; weak and weak* topologies; Bananch-Alaoglu; reflexive spaces; compact operators and Fredholm theory; spectral theory of self-adjoint operators in Hilbert spaces. Basics of Sobolev spaces.

Objective
Acquire a good degree of fluency with the fundamental concepts and tools belonging to the realm of linear Functional Analysis, with special emphasis on the geometric structure of Banach and Hilbert spaces, and on the basic properties of linear maps.

Literature
Recommended references include the following:

Prerequisites / notice
Solid background on the content of all Mathematics courses of the first two years of the undergraduate curriculum at ETH. Most importantly: fluency with point set topology and measure theory, in part. Lebesgue integration and $L^p$ spaces.

Abstract
Students conduct a small research project within a research group or carry out a guided self-study of original papers on a given theoretical topic. The results are submitted in a written report and an oral presentation.

Objective
Students are enabled to:
- expand their knowledge in a specific area of physics,
- conduct a project (a) in a research laboratory or (b) on a specific topic of theoretical physics,
- discuss their project results and conclusions in a team,
- present their findings in written and oral form.

Abstract
The Master's thesis is normally conducted in the fourth semester and concludes the degree programme. With the Master's thesis students verify their ability to undertake independent and scientifically structured work in the area of high energy physics.
Objective

Students are enabled to:
- solve a complex problem by applying theoretical and experimental methods and skills,
- articulate their beliefs and thoughts on a scientific subject, appreciate the positions of others and revisit their own positions based on new insights,
- contribute constructively to the projects of a diverse research team,
- actively participate in a scientific discourse on a specific area of physics and present positions based on scientific arguments.

Prerequisites / notice

The time limit for completing the Master's thesis is six months.

Abstract
Structure and function of the human musculoskeletal system including its major disorders (acute and chronic).

Objective
- The students are able to participate in team discussions with correct technical language in the clinical daily routine.
- The students are able to describe the function of the musculoskeletal system of healthy people in a physiologically correct way.
- The students are able to contribute to a therapy plan based on their knowledge of the regenerative capacity of the different tissues in the musculoskeletal system.
- The students recognize pain as a leading symptom in diagnostics and successful therapy.
- The students can assign and compare treatment methods for the most common acute and chronic clinical pictures.

Content
The students learn about the structure and function of the musculoskeletal system and important disorders on the basis of exemplary clinical pictures. They also learn:
- About its tissue types as well as its function and regeneration.
- Important acute and chronic clinical pictures and their therapeutic principles.

In addition, further clinical pictures are presented in the form of seminars.

Abstract
Structure and function of the central and peripheral nervous system including its major disorders.

Objective
Upon successful completion of this module, students should be able to:
1. distinguish important cell types of the nervous system (neurons, glial cells) on the basis of their structure and function;
2. correctly describe neurophysiological basics of stimulus conduction and processing in the peripheral and central nervous system;
3. correctly name the organ structures and circuits involved in the development of the peripheral and central nervous system;
4. associate the different brain areas with corresponding functions in homeostasis, sensory, motor and cognitive functions;
5. identify clinical pictures associated with the loss of function of certain structures of the central and peripheral nervous system and to understand the mode of action of current therapeutic approaches.

Content
In this module, students get an overview of the structure (anatomy) and function (physiology) of the peripheral and central nervous system as well as selected neurological diseases (pathophysiology). The module is subdivided into a total of six subject areas:
1. basics of neurophysiology, stimulus conduction and processing using the example of the motor end plate, peripheral nervous system, associated clinical pictures (myasthenia gravis)
2. structure, circuits and pathways in the spinal cord, spinal nerves, motor stimulus conduction in the spinal cord, spinal cord lesions and pain
3. anatomy and function of the brain stem and cranial nerves and their significance for motor and sensory functions, lesions (brain stem syndromes)
4. anatomy and function of basal ganglia, thalamus and hypothalamus, control of the autonomic nervous system (homeostasis, food and water intake), basal ganglia defects using Parkinson’s disease as an example
5. anatomy and function of the cerebellum and vestibular system, fine control of motor functions, associative learning, cerebellar symptoms (ataxias), organ of equilibrium
6. anatomy and function of the cerebrum, sensory and motor processing, cognition, learning and memory, neurodegenerative (Alzheimer) and neuropsychiatric (schizophrenia) disorders

Abstract
This course teaches the basic principles of evolution, cell biology, molecular biology, genetics and developmental biology using the example of humans.

Objective
1) Students can explain the importance of evolution for the development of humans and diseases.
2) The students know the cell as the smallest unit of the body. They can explain how the functions of the cell are disturbed in certain diseases and where therapies intervene. They can describe the multiplication of cells in the body and show how errors in this multiplication can lead to diseases.
3) The students know DNA as the basis of life. They can explain how the DNA information is stored and how this information can be reproduced and protected from damage. They can describe how the information is read and translated into proteins. They can explain which mechanisms at the level of DNA, RNA and proteins can cause diseases.
4) Students can explain which mechanisms can be used to diagnose and treat diseases.
5) Students can explain how people differ genetically and know the molecular basis of these differences. They can explain how these differences can lead to diseases and why some of these differences do not affect diseases.
6) The students know the molecular causes of the most common hereditary diseases and can determine the probability of occurrence and transmission to offspring.
7) Students can explain the biochemical and molecular basis of human reproduction and know the basic principles of human embryonic development. The students can explain which mechanisms can be disturbed by a faulty development.

Lecture notes/Literature
See Moodle
"Biology - how life works", Morris et al.
"Evolutionary Analysis", Herron & Freeman
"Genetics: From Genes To Genomes", Goldberg & Fischer
"Molecular Biology of the Cell", Alberts et al.

Prerequisites/notice
The lecture is accompanied by exercises on Moodle (BYOD: http://www.ethz.ch/byod), group projects and mid-terms (learning elements). Upon successful completion of the learning elements (at least 80% of the total possible points must be achieved), students can receive bonus points, which can be credited towards the grade of the final examination. Acquiring points from the group projects and the mid-terms requires on-site participation (no online participation possible). Acquiring bonus points is not a prerequisite for taking part in the final exam.
### Competencies

**Subject-specific Competencies**
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

**Method-specific Competencies**
- Analytical Competencies: assessed
- Problem-solving: assessed

**Social Competencies**
- Communication: assessed
- Cooperation and Teamwork: fostered

**Personal Competencies**
- Creative Thinking: fostered
- Critical Thinking: assessed
- Self-awareness and Self-reflection: fostered
- Self-direction and Self-management: fostered

---

### 529-5000-00L Chemistry (for Medical Students)

**Abstract**
The lecture teaches the most important fundamental concepts in chemistry (atomic structure, chemical bonds, thermodynamics and kinetics of chemical reactions, acid-base equilibria, types and reactivity of organic compounds, stereochemistry, biomolecules). Connections of chemical processes with medically important biochemical, physiological, and pharmacological questions are highlighted.

**Objective**
Understanding of the basic concepts of chemistry. Understanding the importance of chemical processes in human physiology and in the diagnosis and treatment of human disease.

**Content**
The lecture elaborates the fundamental concepts of chemistry. The organization of the lecture is guided by the two textbooks "Chemie für Mediziner" by Zeeck et al. and Schmuck et al., respectively, referred to below. Accordingly, the following major subject areas will be covered: Atomic structure, periodic table of the elements, types of chemical bonds, states of matter, heterogeneous equilibria, thermodynamics and kinetics of chemical reactions, salt solutions, acids and bases, oxidation and reduction, metal complexes, fundamentals of organic chemistry, important classes of organic compounds and their reactivities, stereochemistry, amino acids and peptides, carbohydrates, lipids, heterocycles, spectroscopy in chemistry and medicine.

**Lecture notes**
Scripts for individual subject areas will be provided electronically prior to the corresponding lectures.

**Literature**
There are no English translations of these textbooks.

**Prerequisites / notice**
There are no specific requirements.

**Abstract**
Introduction of mathematics as the universal language for scientific facts: The lecture aims on one hand at learning and exercising the mathematical trade and in the other hand at applying the learnt concept to medical, biological, chemical and mechanical problems.

**Objective**
Simple and complex facts can be described and analysed using mathematical tools. Introduction to calculus in one dimension. Used concepts: the notion of a function, of the derivative and the integral, the idea of a differential equation, complex numbers, Taylor polynomials and Taylor series. Applications e.g. to prognoses, modeling action and dosage of drugs or tumor growth.

**Content**
Functions of one variable; the notion of a function, of the derivative, the idea of a differential equation, complex numbers, Taylor polynomials and Taylor series. The integral of a function of one variable.

**Abstract**
Fundamental principles of human medicine, Basic Life Support (BLS) and introduction to histology and microscopy.
After completion of the course, the students:
- have a basic understanding of elementary building blocks and processes as a basis for human medicine, e.g. cell structure and cycle.
- know basic terminology of anatomy.
- understand the process of medical care from first aid to rehabilitation.
- understand the advantages and disadvantages of emergency diagnostics, especially ultrasound.
- know the basics of microscopy and histology.
- have learned the basics of Basic Life Support:
- recognize the symptoms of cardiovascular arrest.
- alarm in an emergency according to the situation.
- If available, they organize an AED and use it correctly as and quickly as possible.
- perform sufficient chest compressions on the phantom.
- perform effective ventilation on the phantom using a pocket mask.
- will identify possible ventilation complications. Under certain circumstances, they will not attempt further ventilation.
- will identify the limits of cardiopulmonary resuscitation.
- under stress, they do not risk their own or other "helpers"’ lives.

Mixed teaching methods, including lectures and training in groups with real patients and simulated patients.

Interviewing techniques to acquire medically relevant information and building an adequate physician-patient relationship.

The students complete the Basic Life Support course. After this training sequence, all participants should be able to initiate resuscitation measures in private and in-hospital settings.

The students experience learning, teaching and working in the hospital sector as a social process and teamwork in which all senses and a wide range of skills are needed.

In addition, the students experience in three workshops the basic process of a physiotherapeutic intervention with the concepts of clinical reasoning, therapeutic aspects and therapy progression.

An intensive course in microscopy/histology enables students to perform microscopy independently and to understand histological sections of a histological sample, but also online.

**Abstract**

This course will focus on the components and functions of the hematopoietic and the immune systems and on diseases affecting or caused by these systems.

**Objective**

1. The organization and development of hematopoiesis including hematopoietic stem cell development; the role of hematopoietic growth and transcription factors in hematopoiesis; the role of hemoglobin in health and disease; erythrocyte physiology and iron metabolism; the principles of blood groups and blood transfusions; the principles of coagulation and the pharmacology of coagulation; the role of platelets and pharmacological platelet inhibition; to define thrombophilia and to understand thrombotic events; the role of leukocytes in health and disease; the analysis of blood samples: the principles of hematopoietic stem cell transplantation.

2. The development of the immune system; the structure and function of primary and secondary lymphoid organs; the cellular and molecular mechanisms of the innate and adaptive immune systems; the effector mechanisms of immune responses against pathogens; basic concepts of immune-mediated diseases (allergy and autoimmunity), tumor immunology, immunodeficiency, organ transplantation; basic knowledge of therapies.

**Content**

1. Introduction to hematopoiesis, hematopoietic growth factors, hematopoietic transcription factors, erythrocyte physiology, blood groups, blood transfusion, iron metabolism, platelets, coagulation cascade, fibrinolysis, hemoglobin, hemoglobinopathies, leukocytes (granulocytes, monocytes), clinical presentation of neutropenia, pharmacology of hemostasis, clinical presentation of thrombophilia, basics of hematopoietic stem cell transplantation, some aspects of laboratory medicine in hematology, virtual microscopy of blood and bone marrow smears.

2. Structure and anatomical position of primary and secondary lymphoid organs, cells and molecules of the innate immune system, T and B cell development and receptor diversity, major histocompatibility complex (MHC) and antigen presentation, effector B cells and antibodies, effector T cells, regulatory T cells and cytokines, allergy and hypersensitivities, autoimmunity and anti-inflammatory drugs, transplantation and immunosuppressive drugs, immunodeficiency, immune response in cancer and immunotherapies.

**Lecture notes**

The course is supported by a Moodle page through which students have access to all necessary documentation.

**Literature**

The essential course material will be available on the course’s Moodle Page in the form of lesson handouts

Suggested reference books include:

- Blood: Hoffbrand's Essential Haematology
- Immune system: Herbert Hoff, Rüdiger Dörries; unter Mitarbeit von: Gernot Geginat, Dirk Schlüter and Constanze Wendt Medizinische Mikrobiologie Thieme 2017

**Prerequisites / notice**

The immune system part of this course builds on the content of the "Infection" course.

**Abstract**

This module imparts basic knowledge about the morphology and function of the digestive system and the importance of nutrition for health.

One focus is on the understanding of the relationships among food intake, digestion, nutrient absorption and metabolism including the disturbances of these processes and the related diseases.
Objective
The aim of this module is that the students know and understand the morphology and function of the digestive system including its associated glands as well as the importance of nutrition for health. In particular, the students shall understand the relationships between food intake and digestion as well absorption and metabolism of particular nutrients. This knowledge shall enable the students to deduce the pathophysiology and pathology of the most important diseases of the digestive system and shall give them an idea of the pertinent diagnostics and therapy.

Abstract
This course is an introduction to classical physics, with special focus on applications in medicine.

Objective
Obtain an understanding of basic concepts in classical physics and their application (using mathematical pre-knowledge) to the solution of simple problems, including certain applications in medicine. Obtain an understanding of relevant quantities and of orders of magnitude.

Content
General introduction; Positron-Emission-Tomography as appetizer, including ionising radiation; kinematics of a point mass; dynamics of a point mass (Newton's axioms and forces); physical work, power and energy; conservation of linear and angular momentum; oscillations and waves; mechanics of a rigid body; fluid mechanics; introduction to electricity.

Lecture notes
Will be distributed at the start of the semester.

Literature

I. Amrein, W. Many disciplines are meeting at the nanoscale, from physics, chemistry to engineering, from the life sciences to medicine. The course will cover the following topics. Building upon advanced technologies to create, visualize, analyze and manipulate nano-structures, as well as to probe their nano-mechanics and other properties within manmade and living systems, many exciting discoveries are currently made. They change the way we do science and result in so many new technologies.  

Abstract

Topographical Anatomy and Radioanatomy of the head, skull, central nervous system, neck and neck organs, upper and lower extremities, thoracic wall and organs, abdominal wall and organs, pelvis and pelvic organs, dorsal muscles, vessels, nerves, functions, clinical aspects.

Objective

Learning and understanding of the detailed composition and function of the healthy human body and its components. Learning of selected examples of relevant radiographic anatomy and their implication in clinical medical work.

Content

Topographic – and radiographic anatomy of selected anatomical regions. Students dissect these regions and discuss important clinical content with aid of assistants.

Abstract

Many disciplines are meeting at the nanoscale, from physics, chemistry to engineering, from the life sciences to medicine. The course will prepare students to communicate more effectively across disciplinary boundaries, and will provide them with deep insights into the various frontiers. Building upon advanced technologies to create, visualize, analyze and manipulate nano-structures, as well as to probe their nano-chemistry, nano-mechanics and other properties within manmade and living systems, many exciting discoveries are currently made. They change the way we do science and result in so many new technologies.

Objective

The goal of the course is to give Master and Graduate students from all interested departments an overview of what nanotechnology is all about, from analytical techniques to nanosystems, from physics to biology. Students will start to appreciate the extent to which scientific communities are meeting at the nanoscale. They will learn about the specific challenges and what is currently sizzling in the respective fields, and learn the vocabulary that is necessary to communicate effectively across departmental boundaries.

Content

Starting with the fabrication and analysis of nanoparticles and nanostructured materials that enable a variety of scientific and technical applications, we will transition to discussing biological nanosystems, how they work and what bioinspired engineering principles can be derived, to finally discussing biomedical applications and potential health risk issues. Scientific aspects as well as the many of the emerging frontiers.

Lecture notes

All the enrolled students will get access to a password protected website where they can find pdf files of the lecture notes, and typically 1-2 journal articles per lecture that cover selected topics.

Data: 06.08.2024 12:40
Autumn Semester 2024
Page 1337 of 2684
Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.

The course covers the following topics:
1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
2. The concept of biocompatibility.
3. Introduction into methodology used in biomaterials research and application.
4. Introduction to different material classes in use for medical applications.

Introduction into natural and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering, drug delivery and for medical devices are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated. Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed.

A link between academic research and industrial entrepreneurship is demonstrated by external guest speakers, who present their current research topics.

The course gives an introduction into bone biology and provides an overview on current research methods and clinical approaches. Emphasis is put on skeletal development and metabolism, osteoporosis as well as fracture healing. Each topic is structured into three parts: basics, research and clinics.

After completing the Bone Biology course, students will be able to:
1. Remember and apply basics in bone biology and disease
2. Remember clinical features and surgical approaches
3. Select adequate research methods and approaches
4. Evaluate publications on topics presented in the lecture

The course provides an overview of bone biology including cellular mechanism, metabolism and mechanoregulation. The acquired knowledge is applied to clinically-relevant topics such as skeletal development, osteoporosis and fracture healing. For each topic, we will share examples from our research and clinical experience combined with interactive sessions. Two site visits will provide insight into translational aspects concerning implant design and surgical application.

Handouts are deposited online (moodle).

(available online via ETH library)

This course includes an introduction to study design, measurement techniques, signal processing, as well as musculoskeletal modeling with regards to human movement and its clinical applications.

The students are able to analyse the human movement from a technical point of view, to process the data and perform modeling with a focus towards clinical application.

This course provides an introduction to computer applications in medicinal chemistry. The topics cover molecular representations and similarity, ligand-based virtual screening, and structure-based virtual screening. All theoretical concepts and algorithms presented are illustrated by practical applications and case studies.

The students will learn how molecules can be represented in computers and how molecular similarity is calculated. They will learn the concepts of ligand-based and structure-based virtual screening to identify potential drug candidates, and understand possibilities and limitations of computer-assisted drug design in pharmaceutical chemistry. As a result, they are prepared for professional assessment of computer-assisted drug design studies in medicinal chemistry projects.

The lecture series provides an introduction to computer applications in medicinal chemistry. The topics cover molecular representations and similarity, ligand-based virtual screening, and structure-based virtual screening. 535-0250-00L Biotransformation of Drugs and Xenobiotics
W 1 credit 1V S.-D. Krämer
Abstract
Knowledge of the major reactions of biotransformation in drug therapy, prediction of possible metabolites of drugs and xenobiotics, recognition of structure elements and reactions which can lead to toxic metabolites. Knowledge of inter- and intraindividual factors influencing metabolism.
Objective
Goals: knowledge of the major reactions of biotransformation in drug therapy, prediction of possible metabolites of drugs and xenobiotics, recognition of structure elements and reactions which can lead to toxic metabolites. Knowledge of inter- and intraindividual factors influencing metabolism.
Content
Major reactions of biotransformation. Major enzymes and reaction partners involved in the biotransformation of drugs and xenobiotics.

535-0310-00L Glycobiology in Drug Development
W 1 credit 1V V. I. Otto
Abstract
Protein-based drugs constitute around 25% of new approvals and most of them are glycoproteins. Using selected examples of prominent glycoprotein drugs, the course aims at providing insight into glycosylation-activity relationships and into biotechnological production and analytics.
Objective
Students gain basic knowledge in "pharmaceutical glycobiology". This implies knowing and understanding:
- major mechanisms underlying the roles of glycosylation for the biological/therapeutic actions of glycoproteins (glycosylation-function relationships) using prominent examples of glycoprotein drugs.
- the major types of protein-linked glycans and the biosynthetic pathways for their formation
- how glycoprotein drugs are produced (including the most important expression systems used), glycoengineered and analysed (quality control).
Students are able to apply this knowledge in solving simple problems in glycoprotein drug development (on paper).
Content
Students gain the ability to reflect on roles of glycosylation in various biological contexts.

Lecture notes
The slides used for the lectures will be provided online

535-0423-00L Drug Delivery and Drug Targeting
W 2 credits 1.5V J.-C. Leroux
Abstract
The students gain an overview on current principles, methodologies and systems for controlled delivery and targeting of drugs. This enables the students to understand and evaluate the field in terms of scientific criteria.
Objective
The students dispose of an overview on current principles and systems for the controlled delivery and targeting of drugs. The focus of the course lies on developing a capacity to understand the involved technologies and methods, as well as an appreciation of the chances and constraints of their therapeutic usage, with prime attention on anticancer drugs, therapeutic peptides, proteins, nucleic acids and vaccines.
Content
The course covers the following topics: drug targeting and delivery principles, macromolecular drug carriers, liposomes, micelles, micro/nanoparticles, gels and implants, administration of vaccines, targeting at the gastrointestinal level, synthetic carriers for nucleic acid drugs, ophthalmic devices, novel trends in transdermal and nasal drug delivery and 3D printing of drug delivery systems.

W  6 credits  4V

Y. Barral, A. Hajnal, O. Voinnet, University lecturers

Abstract

Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Objective

This course focuses on the concepts of classical and modern genetics and genomics.

Content

The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Lecture notes

Scripts and additional material will be provided during the semester.

Competencies

Subject-specific Competencies

Concepts and Theories  assessed
Techniques and Technologies  assessed

Method-specific Competencies

Analytical Competencies  assessed
Problem-solving  assessed

Social Competencies

Communication  fostered
Cooperation and Teamwork  fostered
Self-presentation and Social Influence  fostered

Personal Competencies

Creative Thinking  assessed
Critical Thinking  fostered
Self-awareness and Self-reflection  fostered
Self-direction and Self-management  fostered

551-0313-00L  Microbiology (Part I)

W  3 credits  2V

W.-D. Hardt, L. Eberl, B. Nguyen, J. Piel, M. Pilhofer, A. Vagstad

Abstract

Advanced lecture class providing a broad overview on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Objective

This concept class will be based on common concepts and introduce to the enormous diversity among bacteria and archaea. It will cover the current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Content

Advanced class covering the state of the research in bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Lecture notes

Updated handouts will be provided during the class.

Literature

Current literature references will be provided during the lectures.

Prerequisites / notice

English
The lecture "Grundlagen der Biologie II: Mikrobiologie" is the basis for this advanced lecture.
551-0319-00L  Cellular Biochemistry (Part I)  W  3 credits  2V  U. Kutay, F. Allain, T. Kleele, I. Zemp

Abstract  Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

Objective  The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry. The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Content  Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

Lecture notes  Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

Literature  Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

Prerequisites / notice  To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

Competencies  Subject-specific Competencies  Concepts and Theories  assessed  Techniques and Technologies  assessed

701-2413-00L  Evolutionary Genetics  W  6 credits  4V  T. Städler, A. Widmer, S. Fior, M. Fischer, J. Stapley

Abstract  The concept course 'Evolutionary Genetics' consists of two lectures that jointly provide an introduction to the fields of population and quantitative genetics (emphasis on basic concepts) and ecological genetics (more emphasis on evolutionary and ecological processes of adaptation and speciation).

Objective  The aim of the course is to provide students with a solid introduction to the fields of population genetics, quantitative genetics, and ecological genetics. The concepts and research methods developed in these fields have undergone profound transformations; they are of fundamental importance in our understanding of evolutionary processes, both past and present. Students should gain an appreciation for the concepts, methods and explanatory power of evolutionary genetics.

Content  Population genetics - Types and sources of genetic variation; randomly mating populations and the Hardy-Weinberg equilibrium; effects of inbreeding; natural selection; random genetic drift and effective population size; gene flow and hierarchical population structure; molecular population genetics: neutral theory of molecular evolution and basics of coalescent theory.

Quantitative genetics - Continuous variation; measurement of quant. characters; genes, environments and their interactions; measuring their influence; response to selection; inbreeding and crossbreeding, effects on fitness; Fisher's fundamental theorem.

Ecological Genetics - Concepts and methods for the study of genetic variation and its role in adaptation, reproductive isolation, hybridization and speciation.

Lecture notes  Handouts

Competencies  Subject-specific Competencies  Concepts and Theories  assessed  Techniques and Technologies  assessed

752-4009-00L  Molecular Biology of Foodborne Pathogens  W  3 credits  2V  M. Loessner, A. Harms, M. Schmelcher, M. Schuppler, E. Slack

Abstract  The course offers detailed information on selected foodborne pathogens and toxin producing organisms; the focus lies on relevant molecular biological aspects of pathogenicity and virulence, as well as on the occurrence and survival of these organisms in foods.

Objective  Detailed and current status of research and insights into the molecular basis of foodborne diseases, with focus on interactions of the microorganisms or the toxins they produce with the human system. Understanding the relationship between specific types of food and the associated pathogens and microbial risks. Another focus lies on the currently available methods and techniques useful for the various purposes, i.e., detection, differentiation (typing), and antimicrobial agents.

Content  Molecular biology of infectious foodborne pathogens (Listeria, E. coli, Campylobacter, Salmonella, etc) and toxin-producing organisms (Bacillus, Clostridium, Slaphtylococcus). How and under which conditions will toxins and virulence factors be produced, and how do they work? How is the interaction between the human host and the microbial pathogen? What are the roles of food and the environment? What can be done to interfere with the potential risks? Which methods are best suited for what approach? Last, but not least, the role of bacteriofages in microbial pathogenicity will be highlighted, in addition to various applications of bacteriophage for both diagnostics and antimicrobial intervention.

Lecture notes  Electronic copies of the presentation slides (PDF) and additional material will be made available for download to registered students.

Literature  Recommendations will be given in the first lecture

Prerequisites / notice  Lectures (2 hours) will be held as a single session of approximately 60+ minutes (10:15 until approx. 11:15 h), without a break !

Competencies  Subject-specific Competencies  Concepts and Theories  assessed  Techniques and Technologies  assessed

777-0501-00L  Reproduction  O  4 credits  5V  P. Imesch, G. Hasenberg,
In this module we lay the anatomical and physiological foundations for the subject of "reproduction". The associated clinical challenges are conveyed from different points of view and with different actors. The content is chronologically prepared and shows the normal female cycle and her disorders as well as the pregnancy and related issues to the obstetrics. Students will have the opportunity to work with prospective midwives to learn basic skills of normal birth through a simulation.

**Objective**
- Anatomy
  - Knowledge of the function of the female and male sexual organs
  - Explaining the development of the maternal and fetal parts of the placenta
  - Explaining the anatomy of the pelvis and the pelvic floor
- Gynecology
  - Recognizing gynecological emergencies
  - Listing of the various types of bleeding an irregularities
  - Overview of the benign tumors of the uterus and ovaries as well as the malignant tumors of the cervix and the endometrium
- Reproductive Endocrinology
  - Outlining of the main regulatory hormones of the female cycle and explaining their effects
  - Listing of the most important fertility factors
  - Discussing the main contraceptive methods with their mechanisms of action and contraceptive safety
- Physiological situations in obstetrics
  - Knowledge of the physiological processes and adaptation processes during pregnancy
  - Determination of birth process
  - Being aware of the meaning of the puerperium

**Content**
This module gives the anatomical and physiological foundations for the subject of "reproduction". The associated clinical challenges are conveyed from different points of view and with different actors. The content is chronologically prepared and shows the normal female cycle and her disorders as well as the pregnancy and related issues to the obstetrics.

**Prerequisites / notice**
Voraussetzungen: Voraussetzungen:
LE 377-0105-00L Bewegungsapparat
LE 377-0107-00L Nervensystem
LE 377-0201-00L Herz-Kreislauf-System
LE 377-0203-00L Atmungs-System

**377-0503-01L Geriatrics**

**Abstract**
Fundamentals and relevance of the aging process, as well as its biochemical, physiological and evolutionary basis. Insights into its individual as well as economic impact, including interventional and pharmacological treatment options.

**Objective**
Upon successful completion of the module, students should be able to
1. correctly describe the biological bases of the aging process;
2. derive physical and pharmacological choices to modulate the aging process;
3. understand the social and psychological implication of aging;
4. describe the specificities of geriatric medicine in the stationary setting;
5. identify the age-specific differences in both diagnostics and therapeutics.

**Content**
Fundamentals and relevance of the aging process, as well as its biochemical, physiological and evolutionary basis. Insights into its individual as well as economic impact, including interventional and pharmacological treatment options.

**Prerequisites / notice**

**377-0503-02L Rheumatology**

**Abstract**
Disease patterns from the field of rheumatology. The main focus is on inflammatory diseases, including soft tissue and bone diseases.

**Objective**
At the end of the module, students should be able to do the following:
- list the typical symptoms and manifestations of the disease patterns;
- list the clinical examinations of the clinical pictures and explain the findings;
- list and justify further clarifications (such as laboratory tests, imaging, etc.) of the clinical pictures;
- recognize the respective clinical pictures of this topic block based on the symptoms, clinical examinations, findings and further clarifications;
- list the possible treatment options for the disease patterns and explain the indication, prevention and risk factors;
- early detection of clinical pictures that require rapid therapy, identification of further steps for clarification and therapy;
- describe the causes and pathophysiological basis of the disease patterns.

**Content**
Overview Rheumatology, Rheumatoid Arthritis, M. Still, Spondyloarthritis, SAPHO Syndrome, Infectious and Crystal Arthritis, Juvenile Idiopathic Arthritis, CRPS, Soft Tissue Diseases, Myopathies, Bone Diseases, Vasculitis, Collagenosis, Drug Therapy in Rheumatology, Ergonomics, Occupational Reintegration.
### Prerequisites / Notice

Prerequisites:
- LE 377-0105-00L Bewegungsapparat
- LE 377-0107-00L Nervensystem
- LE 377-0201-00L Herz-Kreislauf-System

### Abstract

The module Paediatrics describes the peculiarities of the paediatric anamnesis as well as selected topics of the healthy and sick child. The focus is on the newborn, development in the first years of life and adolescence. Infections, congenital heart and the most common respiratory diseases are described throughout the different age stages.

### Objective

- Knowledge of the paediatric aspects of the medical history
- Knowledge of the enormous variety of child development (inter- and intra-individual variability)
- Milestone concept: Assessment of the stage of development of a child in the first years of life
- Landmark concept: first knowledge of the demilitation on normality versus disorder
- Getting to know frequent developmental pediatric disorders
- Knowledge of the most common congenital heart defects
- Getting to know and recognize respiratory diseases of the upper and lower respiratory tract

### Prerequisites / Notice

Prerequisites:
- LE 377-0105-00L Bewegungsapparat
- LE 377-0107-00L Nervensystem
- LE 377-0201-00L Herz-Kreislauf-System
- LE 377-0203-00L Atmungs-System
- LE 377-0205-00L Nieren und Homöostase

### Abstract

Pathology is the study of causes and effects of disease. This module pathology describes the pathogenetic processes and pathomorphological changes that occur in healthy and diseased tissues and cells of the human body. The module covers basic anatomical and surgical pathology and will cover the current and future possibilities of diagnostic practice in pathology.

### Objective

After successfully completing the «General Pathology» module, students should be able to

1. to describe the goals and methods of pathoanatomical diagnostics and in reference to clinical practice,
2. to name the general causes and mechanisms of disease development and the associated pathomorphological changes in cells and tissues,
3. to fundamentally link the general causes and mechanisms of disease development with the therapeutic approaches that arise from them,
4. to describe the mechanisms of general inflammation, cell damage and circulatory pathology and relate them to the pathogenesis of specific diseases,
5. to explain the basics of the classification of benign and malignant tumors,
6. to describe the value of pathoanatomical and molecular diagnostics for the predictive and prognostic stratification of patients and to fundamentally relate them to clinical therapy decisions.

After successfully completing the «Surgical Pathology» module, students should be able to
