Script with more than 600 pages with many illustrations will be distributed free of charge.

Literature

3) P. M. Dove, J. J. DeYoreo, S. Weiner (Eds.) Biominalization, Reviews in Mineralogy & Geochemistry Vol. 54, 2003

Prerequisites / notice

No special requirements are needed for attending. Basic knowledge in chemistry and cell biology is expected.

376-1622-00L  Practical Methods in Tissue Engineering  W  5 credits  4P
M. Zenobi-Wong, S. J. Ferguson, S. Grad, S. Schürle-Finke

Abstract

The goal of this course is to teach MSc students the necessary skills for doing research in the fields of tissue engineering and regenerative medicine.

Objective

Practical exercises on topics including sterile cell culture, light microscopy and histology, and biomaterials are covered. Practical work on manufacturing and evaluating hydrogels and scaffolds for tissue engineering will be performed in small groups. In addition to practical lab work, the course will teach skills in data acquisition/analysis.

Prerequisites / notice

A laptop is needed with the below Systems Requirements:
- Memory: 16 GB
- Processor: 3rd gen i7
- DirectX 11.0 compliant AMD Radeon/NVIDIA® GeForce® card with 2 GB RAM
- Storage: 15 GB

Mac computer can be used by pre-installing Windows through bootcamp (older Macs) or Parallels Desktop (14d trial license, 35 CHF license purchasable in the IT shop of ETH).

402-0341-00L  Medical Physics I  W  6 credits  4P
M. Zenobi-Wong, S. J. Ferguson, S. Grad, S. Schürle-Finke

Abstract

Introduction to the fundamentals of medical radiation physics. Functional chain due to radiation exposure from the primary physical effect to the radiobiological and medically manifest secondary effects. Dosimetric concepts of radiation protection in medicine. Mode of action of radiation sources used in medicine and its illustration by means of Monte Carlo simulations.

Objective

Understanding the fundamental chain from primary physical effects of ionizing radiation to clinical radiation effects. Dealing with dose as a quantitative measure of medical exposure. Getting familiar with methods to generate ionizing radiation in medicine and learn how they are applied for medical purposes. Eventually, the lecture aims to show the students that medical physics is a fascinating and evolving discipline where physics can directly be used for the benefits of patients and the society.

Content

The lecture is covering the basic principles of ionizing radiation and its physical and biological effects. The physical interactions of photons as well as of charged particles will be reviewed and their consequences for medical applications will be discussed. The concept of Monte Carlo simulation will be introduced in the excercises and will help the student to understand the characteristics of ionizing radiation in simple and complex situations. Fundamentals in dosimetry will be provided in order to understand the physical and biological effects of ionizing radiation. Deterministic as well as stochastic effects will be discussed and fundamental knowledge about radiation protection will be provided. In the second part of the lecture series, we will cover the generation of ionizing radiation. By this means, the x-ray tube, the clinical linear accelerator, and different radioactive sources in radiology, radiotherapy and nuclear medicine will be addressed. Applications in radiology, nuclear medicine and radiotherapy will be described with a special focus on the physics underlying these applications.

Lecture notes

A script will be provided.

Prerequisites / notice

For students of the MAS in Medical Physics (Specialization A) the performance assessment is offered at the earliest in the second year of the studies.

529-0041-00L  Modern Mass Spectrometry, Hyphenated Methods, and Chemometrics  W  6 credits  3G
R. Zenobi, B. Hattendorf, P. Sinués Martinez-Lozano

Abstract

Modern mass spectrometry, hyphenated analytical methods, speciation, chemometrics.

Objective

Comprehensive knowledge about the analytical methods introduced in this course and their practical applications.

Content

Hyphenation of separation with identification methods such as GC-MS, LC-MS, GC-IR, LC-IR, LC-NMR etc.; importance of speciation. Modern mass spectrometry: time-of-flight, orbitrap and ion cyclotron resonance mass spectrometry, ICP-MS. Soft ionization methods, desorption methods, spray methods. Mass spectrometry imaging.

Use of statistical and computer-assisted methods for processing analytical data (chemometrics).

Lecture notes

Lecture notes will be made available online.

Literature

Information about relevant literature will be available in the lecture & in the lecture notes.

Prerequisites / notice

Exercises are an integral part of the lecture.

Prerequisites:
529-0051-00 "Analytische Chemie I (3. Semester)"
529-0058-00 "Analytische Chemie II (4. Semester)" (or equivalent)
### Competencies

**Subject-specific Competencies**
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

**Method-specific Competencies**
- Analytical Competencies: assessed
- Decision-making: fostered
- Media and Digital Technologies: fostered
- Problem-solving: assessed
- Project Management: fostered

**Social Competencies**
- Communication: fostered
- Cooperation and Teamwork: fostered
- Customer Orientation: fostered
- Leadership and Responsibility: fostered
- Self-presentation and Social Influence: fostered
- Sensitivity to Diversity: fostered
- Negotiation: fostered

**Personal Competencies**
- Adaptability and Flexibility: fostered
- Creative Thinking: assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: fostered
- Self-awareness and Self-reflection: fostered
- Self-direction and Self-management: fostered

### Literature

**529-0240-00L Chemical Biology - Peptides**
- **W 6 credits 3G H. Wennemers**
- **Abstract**
  - An advanced course on the synthesis, properties and function of peptides in chemistry and biology.
- **Objective**
  - Knowledge of the synthesis, properties and function of peptides in chemistry and biology.
- **Content**
  - Advanced peptide synthesis, conformational properties, combinatorial chemistry, therapeutic peptides, peptide based materials, peptides in nanotechnology, peptides in asymmetrical catalysis.
- **Lecture notes**
  - Citations from the original literature relevant to the individual lectures will be assigned weekly.
- **Literature**

**529-0615-01L Biochemical and Polymer Reaction Engineering**
- **W 6 credits 3G P. Arosio, P. Fleckenstein**
- **Abstract**
- **Objective**
  - The aim of the course is to learn how to design polymerization reactors and bioreactors to produce polymers and proteins with the specific product qualities that are required by different applications in chemical, pharmaceutical and food industry. This activity includes the post-treatment of polymer latexes, the downstream processing of proteins and the analysis of their colloidal behavior.
- **Content**
  - We will cover the fundamental processes and the operation units involved in the production of polymeric materials and proteins. In particular, the following topics are discussed: Overview on the different polymerization processes, Kinetics of free-radical polymerization and use and population balance models. Production of polymers with controlled characteristics in terms of molecular weight distribution. Kinetics and control of emulsion polymerization. Surfactants and colloidal stability. Aggregation kinetics and aggregate structure in conditions of diffusion and reaction limited aggregation. Modeling and design of colloid aggregation processes. Physico-chemical characterization of proteins and description of enzymatic reactions. Operation units in bioprocessing: upstream, reactor design and downstream. Industrial production of therapeutic proteins. Characterization and engineering of protein aggregation. Protein aggregation in biology and in biotechnology as functional materials.
- **Lecture notes**
  - Scripts are available on the web page of the Arosio-group: http://www.arosiogroup.ethz.ch/education.html Additional handout of slides will be provided during the lectures.
- **Literature**

**535-0423-00L Drug Delivery and Drug Targeting**
- **W 2 credits 1.5V J.-C. Leroux**
- **Abstract**
  - The students gain an overview on current principles, methodologies and systems for controlled delivery and targeting of drugs. This enables the students to understand and evaluate the field in terms of scientific criteria.
- **Objective**
  - The students dispose of an overview on current principles and systems for the controlled delivery and targeting of drugs. The focus of the course lies on developing a capacity to understand the involved technologies and methods, as well as an appreciation of the chances and constraints of their therapeutic usage, with prime attention on anticancer drugs, therapeutic peptides, proteins, nucleic acids and vaccines.
- **Content**
  - The course covers the following topics: drug targeting and delivery principles, macromolecular drug carriers, liposomes, micelles, micro/nanoparticles, gels and implants, administration of vaccines, targeting at the gastrointestinal level, synthetic carriers for nucleic acid drugs, ophthalmic devices, novel trends in transdermal and nasal drug delivery and 3D printing of drug delivery systems.
- **Lecture notes**
  - Selected lecture notes, documents and supporting material will be directly provided or may be downloaded from the course website.
- **Literature**
  - Further references will be provided in the course.
Competencies

Subject-specific Competencies

- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies

- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management

Social Competencies

- Communication
- Cooperation and Teamwork
- Customer Orientation
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation

Personal Competencies

- Adaptability and Flexibility
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

Immunology III

Abstract

This course provides a detailed understanding of:
- development of T and B cells
- the dynamics of an immune response during acute and chronic infection
- mechanisms of immunopathology
- modern vaccination strategies

Key experimental results will be shown to help understanding how immunological textbook knowledge has evolved.

Objective

Obtain a detailed understanding of:
- the development, activation, and differentiation of different types of T cells and their effector mechanisms during immune responses,
- Recognition of pathogenic microorganisms by the host cells and molecular events thereafter,
- events and signals for maturation of naive B cells to antibody producing plasma cells and memory B cells.
- Optimization of B cell responses by intelligent design of new vaccines

Content

- Development and selection of CD4 and CD8 T cells, natural killer T cells (NKT), and regulatory T cells (Treg)
- NK T cells and responses to lipid antigens
- Differentiation, characterization, and function of CD4 T cell subsets such as Th1, Th2, and Th17
- Overview of cytokines and their effector function
- Co-stimulation (signals 1-3)
- Dendritic cells
- Evolution of the “Danger” concept
- Cells expressing Pattern Recognition Receptors and their downstream signals
- T cell function and dysfunction in acute and chronic viral infections

Literature

Documents of the lectures are available for download at:
https://moodle-app2.let.ethz.ch/course/view.php?id=2581&notifyeditingon=1

Prerequisites / notice

- Immunology I and II recommended but not compulsory
- English

Other Elective Courses

These courses may be suitable for the Molecular Bioengineering track. Please consult your track advisor.

Biology Courses

Number Title Type ECTS Hours Lecturers
551-0313-00L Microbiology (Part I) W 3 credits 2V W.-D. Hardt, L. Eberl, B. Nguyen, J. Piel, M. Pilhofer, A. Vagstad

Abstract

Advanced lecture class providing a broad overview on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Objective

This concept class will be based on common concepts and introduce to the enormous diversity among bacteria and archaea. It will cover the current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Content

Advanced class covering the state of the research in bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Lecture notes

Updated handouts will be provided during the class.

Literature

Current literature references will be provided during the lectures.

Prerequisites / notice

- The lecture "Grundlagen der Biologie II: Mikrobiologie" is the basis for this advanced lecture.

Number Title Type ECTS Hours Lecturers
227-0399-10L Physiology and Anatomy for Biomedical Engineers I W 3 credits 2G M. Wyss

Abstract

Students will be able to identify and enumerate important anatomical structures to describe basic physiological processes of the human body to use ‘anatomical language’ to retrieve anatomical structures to understand basic medical terminology

Objective

To understand basic principles and structure of the human body in consideration of the clinical relevance and the medical terminology used in medical work and research.

Abstract
This four-hour course covers the basics of writing and presenting scientific work. The focus lies on the structure and the main elements of a scientific text. Formatting guidelines, citation rules, good practice of scientific writing and hints to convince the audience are part of the course.

Objective
- You can write scientific texts using the correct structure
- You can convincingly present scientific work
- You can differentiate the scientific style from novels and news
- You can adhere to citation rules and scientific integrity

Content
The block course covers the following topics:
- Structure of Scientific Texts
- Structure of Scientific Presentations
- Formatting of Scientific Elements (figures, equations, tables)
- Citation Rules and Scientific Integrity

Literature
Scientific Integrity, see https://ethz.ch/en/research/ethics-and-animal-welfare/research-integrity.html

Prerequisites / notice
You should be writing either a bachelor/semester/master thesis or a scientific publication in the immediate future.

Abstract
The semester project is designed to train the students in solving specific biomedical engineering problems. This project uses the technical and social skills acquired during the master's program. The semester project is advised by a professor.

Objective
see above
Abstract
The five-weeks (full-time) short research project can be done at a research or non-research institution in Switzerland or abroad, but not in a pure industry setting. The project can be done alone or in groups of students, and it is finished with a report and/or prototype. The project must be finished before the start of the Master project.

Objective
see above

227-1760-20L Research Project (12 credits)
W 12 credits 26A Supervisors

Must be completed before the start of the master's thesis

Abstract
The ten-weeks (full-time) research project can be done at a research or non-research institution in Switzerland or abroad, but not in a pure industry setting. The project can be done alone or in groups of students, and it is finished with a report and/or prototype. The project must be finished before the start of the Master project.

Objective
see above

227-1760-30L Research Project (18 credits)
W 18 credits 39A Supervisors

Must be completed before the start of the master's thesis

Abstract
The fifteen-weeks (full-time) research project can be done at a research or non-research institution in Switzerland or abroad, but not in a pure industry setting. The project can be done alone or in groups of students, and it is finished with a report and/or prototype. The project must be finished before the start of the Master project.

Objective
see above

227-1760-00L Research Project (24 credits)
W 24 credits 51A Supervisors

Must be completed before the start of the master's thesis

Abstract
The aim of the long research project is to perform a larger (exploratory) scientific study or a larger development project in a team. The duration of this project is at least four months (full-time) and it is finished with a report and/or prototype.

Objective
see above

227-1750-00L Internship in Industry
Only for Biomedical Engineering MSc (Programme Regulations 2020).

W 12 credits external organisers

Abstract
The main objective of the 12-week internship (full-time) is to expose master's students to the industrial work environment. During this period, students have the opportunity to be involved in on-going projects at the host institution.

Objective
see above

227-1700-00L Master's Thesis

Admission only if all the following apply:
a. bachelor program successful completed;
b. any additional requirements necessary to gain admission to the master program BME have been successfully completed;
c. both the semester project and (if applicable) the internship successfully completed.

Registration in myStudies required!

Abstract
The masters program culminates in a six months research project which addresses a scientific research questions on one's chosen area of specialization. The masters thesis is supervised by a program-affiliated faculty member and the topic must be approved by the track advisor.

Objective

► Master’s Thesis (ONLY for Programme Regulations 2017)
636-0900-00L Master's Thesis O 40 credits 91D Supervisors

Abstract
In the Master thesis students prove their ability to independent, structured and scientific working. The Master thesis is carried out under the supervision of a professor in a research group of the D-BSSE, usually at the D-BSSE. Students are free to choose the area.

Objective
In the Master Thesis students prove their ability to independent, structured and scientific working.

Practical Training

Students need to acquire a total of 16 ECTS in lab courses.

All listed lab courses are mandatory.

Abstract
The course Methods in Cell Analysis and Laboratory Automation introduces students to high-end cell analysis and sample preparation methods including image analysis. Students will be taught theoretical aspects and skills in Flow Cytometry, Light Microscopy, Image Analysis, and the use of Laboratory Automation.

Objective
- to understand the technical and physical principles of light microscopes and flow cytometers
- to have hands-on experience in the use of these technologies to analyze/image real samples
- to be able to run a basic analysis of the data and images obtained with flow cytometers and microscopes
- to get introduced to liquid handling (pipetting) robotics and learn how to implement a basic workflow

Content
The practical course will have five units at 2 days each (total 10 days):

1. Flow Cytometry:
   a. Introduction to Flow Cytometry
   b. Practical demonstration on flow cytometry analyzers and flow cytometry cell sorters
   c. Flow cytometry sample preparation
   d. Learn how to use flow cytometry equipment to analyze and sort fluorescence-labeled cells
2. Light microscopy
   a. Learn how to build a microscope and understand the underlying physical principles
   b. Learn how to use a modern automated wide field fluorescence microscope
   c. Use this microscope to automatically acquire images of a cell culture assay to analyze the dose-dependent effect of a drug treatment
3. Image Analysis
   a. Introduction to the fundamentals of image analysis
   b. Learn the basics of the image analysis software Fiji/ImageJ
   c. Use Fiji/ImageJ to analyze the images acquired during the microscopy exercise
4. Laboratory Automation
   a. Introduction to the basics of automated liquid handling/ lab robotics
   b. See examples on using lab automation for plasmid library generation and cell cultivation
   c. Learn how to program and execute a basic pipetting workflow including liquid handling and labware transfers on Tecan and Hamilton robotic systems
5. Presentations
   a. Each student will be assigned to an individual topic of the course and will have to prepare a presentation on it.
   b. Presentations and discussion in form of a Colloquium

Lecture notes
You will find further information on the practical course and the equipment at: https://www.bsse.ethz.ch/scf
https://www.bsse.ethz.ch/lab

Literature
Microscopy: Murphy and Davidson, Fundamentals of Light Microscopy and Electronic Imaging, John Wiley & Sons, 2012
Flow Cytometry: Shapiro, Practical Flow Cytometry, John Wiley & Sons, 2005

Prerequisites / notice
The following knowledge is required for the course:
- basic laboratory methods
- basic physics of optics (properties of light, refraction, lenses, fluorescence)
- basic biology of cells (cell anatomy and physiology)

636-0203-00L Lab Course: Microsystems and Microfluidics in Biology O 3 credits 5P P. S. Dittrich, A. Hiertemann

Abstract
This practical course is an introduction to microsystems technology and microfluidics for the life sciences. It includes basic concepts of microsystem design, fabrication, and assembly into an experimental setup. Biological applications include a variety of measurements of cellular and tissue signals and subsequent analysis.

Objective
The students are introduced to the basic principles of microsystems technology. They get acquainted with practical scientific work and learn the entire workflow of (a) understanding the theoretical concept, (b) planning the experiment, (c) engineering of the needed device, (d) execution of the experiment and data acquisition, (e) data evaluation and analysis, and (f) reporting and discussion of the results.

Content
The practical course will consist of a set of 4 experiments.

Lecture notes
Notes and guidelines will be provided at the beginning of the course.

Literature

Prerequisites / notice
The practical course will consist of a set of 4 experiments. For each experiment, the student will be required to:
- understand the theoretical concept behind the experiment
- plan the experiment
- engineer the devices
- execute the experiments and acquire data
- evaluate and analyze the data
- report and discuss the results
A good quality of the final report will be expected and be an important criterion.
### Lab Course: Microbial Biotechnology

**636-0204-00L**

**Type** 2 credits  5P  M. Held

**Abstract**

Students will learn the foundations of monoseptic working practice and create and screen microbial libraries for the identification of strains expressing different fluorescent protein (XFP) levels.

**Objective**

Students will learn the foundations of monoseptic working practice and create and screen microbial libraries for the identification of strains expressing different fluorescent protein (XFP) levels.

**Content**

- Block A: Handling and preparation of microbial libraries
  1. Introduction to microbiological cultures and monoseptic working techniques.
  2. Plasmid-based expression systems and variation of XFP synthesis levels via site-directed RBS mutagenesis.
- Block B: Library screening
  1. In vivo screening for XFP expression levels.
  2. Analysis of XFP levels via SDS-PAGE analysis. RBS-sequencing.
- Block C: Hi recovery and validation
  1. Hi recovery and validation.
  2. In silico analysis of RBS variants.
- Block D: Cellular XFP content for selected variants at different culture conditions.
  1. Data analysis and presentation.
  2. Protein expression analysis. Q&A for reports and presentations.
- Block E: Final presentations and wrap-up.

**Lecture notes**

Material will be provided during the course.

**Literature**

### Advanced Courses

Students need to acquire a minimum of 22 ECTS in this category (MSc Biotechnology Study Programme Regulations 2021). The list of advanced courses is a closed list, no other course can be added to this category.

### Biomolecular-Orientated

**Number** 636-0103-00L  
**Title** Microtechnology  
**Type** W  
**ECTS** 4  
**Hours** 3G  
**Lecturers** A. Hierlemann

**Abstract**

Students are introduced to the basics of microtechnology, cleanroom, semiconductor and silicon process technologies. They will get to know the fabrication of mostly silicon-based microdevices and -systems and all related microfabrication processes.

**Objective**

Students are introduced to the basics of microtechnology, cleanroom, semiconductor and silicon process technologies. They will get to know the different fabrication methods for various microdevices and systems.

**Content**

- Fundamentals of semiconductors and band model
- Fundamentals of devices: transistor and diode.
- Silicon processing and fabrication steps
- Silicon crystal structure and manufacturing
- Thermal oxidation
- Doping via diffusion and ion implantation
- Photolithography
- Thin film deposition: dielectrics and metals
- Wet etching & bulk micromachining
- Dry etching & surface micromachining
- Microtechnological processing and fabrication sequence
- Optional: Packaging

**Lecture notes**

Handouts in English

**Literature**

**Prerequisites / notice**

Fundamentals in physics and physicochemistry (orbital models etc.) are required, a repetitiorium of fundamental physics and quantum theory at the semester beginning can be offered.
636-0104-00L Biophysical Methods W 4 credits 3G D. J. Müller

Abstract
Students will be imparted knowledge in basic and advanced biophysical methods applied to problems in molecular biotechnology. The course is fundamental to applying the methods in their daily and advanced research routines. The students will learn the physical basis of the methods as well as their limitations and possibilities to address existing and future topics in molecular biotechnology.

Objective
Gain of interdisciplinary competence in experimental and theoretical research, which qualifies for academic scientific work (master's or doctoral thesis) as well as for research in a biotechnology or a pharmaceutical company. The module is of general use in courses focused on modern biomolecular technologies, systems biology and systems engineering.

Content
The students will learn basic and advanced knowledge in applying biophysical methods to address problems and overcome challenges in biotechnology, cell biology and life sciences in general. The biological and physical possibilities and limitations of the methods will be discussed and critically evaluated. By the end of the course the students will have assimilated knowledge on a portfolio of biophysical tools widening their research capabilities and aptitude.

The biophysical methods to be taught will include:
- Light microscopy: Resolution limit of light microscopy, fluorescence, GFP, fluorescence microscopy, DIC, phase contrast, difference between wide-field and confocal microscopy
- Electron microscopy: Scanning electron microscopy, transmission electron microscopy, electron tomography, cryo-electron microscopy, single particle analysis and averaging, tomography, sectioning, negative stain
- X-ray, electron and neutron diffraction
- MRI Imaging
- Scanning tunneling microscopy and atomic force microscopy
- Patch clamp technologies: Principles of patch clamp analysis and application. Various patch clamp approaches used in research and industry
- Surface plasmon resonance-based biosensors
- Molecular pore-based sensors and sequencing devices
- Mechanical molecular and cellular assembly devices
- Optical and magnetic tweezers
- CD spectroscopy
- Optogenetics
- Molecular dynamics simulations

Lecture notes
Hand out will be given to students at lecture.

Literature
Methods in Molecular Biophysics (5th edition), Serdyuk et al., Cambridge University Press

Prerequisites / Notice
The module is composed of 3 SWS (3 hours/week): 2-hour lecture, 1-hour seminar. For the in-depth seminars, students will prepare oral presentations on specific in-depth subjects with under the guidance of the teacher.

636-0108-00L Biological Engineering and Biotechnology W 4 credits 3V M. Fussenegger

Abstract
Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

Objective
Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

Content

Lecture notes
Handout during the course.

636-0107-00L Biotechnology of Enzymes W 4 credits 3G S. Panke, A. Bunzel

Abstract
This course covers the role of enzymes in biotechnology, from discovery via engineering to applications in a variety of fields from food to the pharmaceutical industry.

Objective
Students will learn to identify opportunities for utilizing enzymes in biotechnology and develop basic and advanced enzyme engineering skills, informed by the latest research and techniques.

Content
This course offers an in-depth exploration of the use and engineering of enzymes in biotechnology, spanning fundamental enzymology, enzyme engineering, and applied biocatalysis. Topics will include (1) thermodynamic, kinetic, and mechanistic principles of enzyme catalysis, (2) the generation and engineering of enzymes through technologies such as protein design and directed evolution, (3) industrially applied biocatalysis, and (4) future challenges for biocatalysis.

Lecture notes
Notes will be provided in the form of handouts.

Literature
The course will use selected parts of textbooks, original scientific publications, and reviews, which will be shared during the lecture.

Competencies
- Subject-specific Competencies: Concepts and Theories assessed
- Method-specific Competencies: Techniques and Technologies assessed
- Social Competencies: Communication assessed
- Personal Competencies: Self-direction and Self-management assessed

636-0550-00L Biomolecular Nanotechnology W 4 credits 2V+1U M. Nash

Abstract
Biomolecular nanotechnology is a broad field that focuses on the study and science of biological materials including DNA, RNA and proteins at length scales below 10 nm. This is a broad overview of the topic with a focus on current research themes.

Objective
The objective is to familiarise the students with a broad range of topics related to biotechnology, nanotechnology, and biophysics with a focus on current research and reading of scientific literature.

Content
Introduction to biomacromolecules; Measurement techniques for characterisation of biomacromolecules; Fundamentals of molecular recognition; Recombinant DNA; Protein engineering; Directed evolution; Protein folding; Polymers; Elastin-like polypeptides; Intelligent materials; Spatially localized hydrogels; Mechanical properties of proteins and macromolecules; Single-molecule force spectroscopy

Data: 26.07.2024 12:39 Autumn Semester 2024 Page 428 of 2680
Many physical systems are dynamic and are characterized by internal variables that change with time. Describing the quantitative and
tools to explore biochemical reaction dynamics as well as basic concepts from dynamical systems theory. The exercises serve to deepen the understanding of the presented concepts and the mathematical methods, and to train students on numerically solve and simulate mathematical models.

Content
Biochemical Reaction Modelling
Basic Concepts from Linear Algebra & Differential Equations
Mathematical Methods: Linear Stability Analysis, Phase Plane Analysis,
Bifurcation Analysis
Dynamical Systems: Switches, Oscillators, Adaptation Signal Propagation in Signalling Networks
Parameter Estimation

Introduction to Dynamical Systems with Applications
Does not take place this semester.

Many physical systems are dynamic and are characterized by internal variables that change with time. Describing the quantitative and qualitative features of this change is the topic of dynamical systems theory. Dynamical systems arise naturally in virtually all scientific disciplines including physics, biology, chemistry and engineering. This course is a broad introduction to the topic dynamical systems. The goal of this course is to introduce the student to dynamical systems and to develop a solid understanding of their fundamental properties. The theory will be developed systematically, focusing on analytical methods for low dimensional systems, geometric intuition, and application examples from biology. Computer simulations using matlab will be used to demonstrate various concepts and application examples from biology.

Topics will include:
- Embryonic and adult stem cells and their niches
- Induced stem cells by directed reprogramming
- Relevant basic cell biology and developmental biology
- Relevant molecular biology
- Cell culture systems
- Cell fates and their molecular control by transcription factors and signalling pathways
- Cell reprogramming
- Disease modelling
- Tissue engineering
- Bioimaging, Bioinformatics
- Single cell technologies

### 636-0118-00L
**Introduction to Dynamical Systems with Applications to Biology**  
W 4 credits 3G M. H. Khammash

**Abstract**
Many physical systems are dynamic and are characterized by internal variables that change with time. Describing the quantitative and qualitative features of this change is the topic of dynamical systems theory. Dynamical systems arise naturally in virtually all scientific disciplines including physics, biology, chemistry and engineering. This course is a broad introduction to the topic dynamical systems. The goal of this course is to introduce the student to dynamical systems and to develop a solid understanding of their fundamental properties. The theory will be developed systematically, focusing on analytical methods for low dimensional systems, geometric intuition, and application examples from biology. Computer simulations using matlab will be used to demonstrate various concepts.

**Objective**
A dynamical view of the world; the importance of nonlinearity; solutions of differential equations; solving equations on the computer; the phase plane; fixed points and stability; linear stability analysis; classifications of linear systems; Liapunov functions and nonlinear stability; cycles and oscillations; bifurcations and bifurcation diagrams. Many biological examples will be used through the course to demonstrate the concepts.

**Lecture notes**
Will be provided as needed.

**Literature**

**Prerequisites / notice**
Prerequisites: Calculus; a first course in differential equations; basic linear algebra (eigenvectors and eigenvectors). Matlab programming.

### 636-0109-00L
**Stem Cells: Biology and Therapeutic Manipulation**  
W 4 credits 3G T. Schroeder

**Abstract**
Stem cells are central in tissue regeneration and repair, and hold great potential for therapy. We will discuss the role of stem cells in health and disease, and possibilities to manipulate their behavior for therapeutic application. Basic molecular and cell biology, engineering and novel technologies relevant for stem cell research and therapy will be discussed.

**Objective**
Understanding of current knowledge, and lack thereof, in stem cell biology, regenerative medicine and required technologies. Theoretical preparation for practical laboratory experimentation with stem cells.
We will use different diseases to discuss how to potentially model, diagnose or heal them by stem cell based therapies. This will be used as a guiding framework to discuss relevant concepts and technologies in cell and molecular biology, engineering, imaging, bioinformatics, tissue engineering, that are required to manipulate stem cells for therapeutic application.

Topics will include:
- Embryonic and adult stem cells and their niches
- Induced stem cells by directed reprogramming
- Relevant basic cell biology and developmental biology
- Relevant molecular biology
- Cell culture systems
- Cell fates and their molecular control by transcription factors and signalling pathways
- Cell reprogramming
- Disease modelling
- Tissue engineering
- Bioimaging, Bioinformatics
- Single cell technologies

The first half of the course will cover the basics of Probability Theory while the second half will delve into the theory of Stochastic Processes with Applications to Biology.

The aim of this course is to introduce certain topics in Probability Theory and Stochastic Processes that have been specifically selected to have a good grasp of Linear Algebra and Multivariable Calculus. Basic knowledge of set theory will also be needed. Students should be prepared for abstract reasoning.

- Personal Competencies
  - Critical Thinking: fostered
  - Integrity and Work Ethics: fostered

Electives

The electives list in the ETH course catalogue is an open list, and the courses listed in the ETH course catalogue provide just examples for possible elective courses, e.g. a selection of eligible courses. Students are expected to look for relevant courses in the ETH and University of Basel course catalogue and ask their mentor for approval. Courses from the advanced course category may also be taken as electives.

We particularly recommend browsing the University of Basel course catalogue for elective courses of relevant master's degree programs (using the filter "proach programme" on the course catalogue website), such as for example: Biomedical Engineering, Chemistry, Drug Sciences, Epidemiology, Infection Biology, Molecular Biology, Nanosciences.

Number Title Type ECTS Hours Lecturers
636-0015-00L Computational Biology W 6 credits 3G+2A T. Vaughan, C. Magnus, T. Stadler
636-0017-00L An Introduction to Probability Theory and Stochastic Processes with Applications to Biology Does not take place this semester.

Abstract

Biology is becoming increasingly quantitative and mathematical modeling is now an integral part of biological research. In many biological processes, ranging from gene-expression to evolution, randomness plays an important role that can only be understood using stochastic models. This course will provide the students with a theoretical foundation for developing such stochastic models and analyzing random phenomena. Throughout the course, several biological applications will be discussed and students will be encouraged to do additional reading based on their research interests.

Objective

The aim of this course is to introduce certain topics in Probability Theory and Stochastic Processes that have been specifically selected with an eye on biological applications. This course will teach students the tools and techniques for modeling and analyzing random phenomena. Students are expected to have a good grasp of Linear Algebra and Multivariable Calculus. Basic knowledge of set theory will also be needed. Students should be prepared for abstract reasoning.

Content

1. The mathematical representation of random phenomena: The probability space, properties of the probability measure, Independence of events. Conditional probability and Bayes formula, applications to parameter inference.

3. Convergence of Random Variables: Modes of convergence, Laws of large numbers, the central limit theorem, the law of the iterated logarithm, Applications to the analysis of cell population data.

Literature

Students will learn state-of-the-art approaches to modelling spatial effects in dynamical biological systems. The course provides an introduction to dynamical system, and covers the mathematical analysis of pattern formation in growing, developing systems, as well as the description of mechanical effects at the cell and tissue level. The course also provides an introduction to image-based modelling, i.e., the use of microscopy data for model development and testing. The course covers classic as well as current approaches and exposes students to open problems in the field. In this way, the course seeks to prepare students to conduct research in the field. The course prepares students for research in developmental biology, as well as for applications in tissue engineering, and for biomedical research.

**Objective**
Attendees will learn which information is contained in genetic sequencing data and how to extract information from this data using computational tools. The main concepts introduced are:

- stochastic models in molecular evolution
- phylogenetic & phylodynamic inference
- maximum likelihood and Bayesian statistics

Attendees will apply these concepts to a number of applications yielding biological insight into:

- epidemiology
- pathogen evolution
- macroevolution of species

**Content**
The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods for direct alignment analysis using approaches such as BLAST and GWAS. Second, we introduce mechanisms and concepts of molecular evolution, i.e., we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e., we discuss methods to infer genealogies and phylogenies. Lastly, we introduce the field of phylodynamics, the aim of which is to understand and quantify population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g., HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

**Lecture notes**
Lecture slides will be available on moodle.

**Literature**
The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:

- Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.

**Prerequisites / notice**
Basic knowledge in linear algebra, analysis, and statistics will be helpful. Programming in R will be required for the project work (compulsory continuous performance assessments). In case you do not have any previous experience with R, we strongly recommend to get familiar with R prior to the semester start. For the D-BSSE students, we highly recommend the voluntary course „Introduction to Programming“, which takes place in Basel before the start of the semester.

**636-0551-00L Developmental Neuroscience (University of Basel)**

Does not take place this semester.
The course must be registered for directly at Uni Basel. Uni Basel course number: 14467-01

Mind the enrolment deadlines at Uni Basel:
https://www.unibas.ch/en/Studies/Mobility/Mobility-Switzerland/Students-Registering-From-Other-Swiss-Universities.html

**Abstract**
Development of cerebral cortex, hippocampus, motor system, olfactory system, visual system, auditory system, somatosensory system, navigation and memory systems, developmental disorders (autism, stem cells in the developing, adult and diseased brain).

**636-0551-00L Molecular Medicine I (University of Basel)**

The course must be registered for directly at Uni Basel. Uni Basel course number: 22831-01

Mind the enrolment deadlines at Uni Basel:
https://www.unibas.ch/en/Studies/Mobility/Mobility-Switzerland/Students-Registering-From-Other-Swiss-Universities.html

**Abstract**
This lecture series will introduce biologists to the mechanisms that cause human diseases. Emphasis will be on the genetic and environmental factors that lead to diseases, and how this knowledge can be used to develop diagnostic and therapeutic procedures.

**636-0706-00L Spatio-Temporal Modelling in Biology**

The course focuses on modeling spatio-temporal problems in biology, in particular on the cell and tissue level. The main focus is on mechanisms and concepts, but mathematical and numerical techniques are introduced as required. Biological examples discussed in the course provide an introduction to key concepts in developmental biology.

**Objective**
Students will learn state-of-the-art approaches to modelling spatial effects in dynamical biological systems. The course provides an introduction to dynamical system, and covers the mathematical analysis of pattern formation in growing, developing systems, as well as the description of mechanical effects at the cell and tissue level. The course also provides an introduction to image-based modelling, i.e., the use of microscopy data for model development and testing. The course covers classic as well as current approaches and exposes students to open problems in the field. In this way, the course seeks to prepare students to conduct research in the field. The course prepares students for research in developmental biology, as well as for applications in tissue engineering, and for biomedical research.

**Content**
1. Introduction to Modelling in Biology
2. Bioimage Analysis
3. Morphogen Gradients
4. Precision & Robustness of Patterning
5. Mathematical Description of Growing Biological Systems
6. Travelling Waves & Wave Pinning
7. Turing Patterns
8. Chemotaxis
9. Epithelial Organisation
10. Tissue Simulation Frameworks
11. Tissue Mechanics & Fluid Dynamics
12. Growth Control
13. Image-Based Modelling
14. Summary

**Lecture notes**
All lecture material will be made available online via Moodle.
### 636-0119-00L Introduction to Statistics and R

**W** 6 credits 3G+2A J. Kuipers

**Abstract**
This course offers a practical introduction to the fundamentals of data analysis and R.

**Objective**
To acquire the statistical understanding to design an appropriate analysis and the practical skills to implement the analysis in R and present the results.

**Content**
Data analysis is fundamental for arriving at scientific conclusions and testing different hypotheses. This course offers a hands-on introduction to statistical analyses including: exploratory data analysis, testing differences in populations, p-values, power calculations, multiple testing, confounding, linear regression, maximum likelihood, model selection, and logistic regression; along with the fundamentals of R programming including markdown and data handling with the tidyverse.

**Lecture notes**
Lecture slides will be available.

**Prerequisites / notice**
Access to Rstudio with some markdown and tidyverse packages installed.

### 636-0120-00L Introduction to Programming

**Z** 0 credits 1G A. Gupta, T. Vaughan

**Abstract**
Introduction to Programming provides an overview of the basic programming blocks needed to translate a problem, stated in textual form, into an algorithm that solves such problem. The course provides an introduction to the MATLAB programming language and covers Bash scripting and other programming languages such as R and Python.

**Objective**
The goal of this course is to give students, who have no prior programming background, a solid introduction to algorithm development and its successive implementation in a programming language. For students with previously acquired programming skills, the course will serve as a reinforcement of key aspects of structured programming in addition to providing a well-rounded introduction to MATLAB, R and Python.

**Content**
The course is structured in four main pillars:

- **Logical thinking**: Translating a problem into a conceptual sequence of computational steps. For example: [Problem] What is the GC content of a given DNA string?
  
  **[Logical steps]**
  
  1. Iterate through all nucleotides in the DNA string, one by one
  2. Count the Cs or Gs
  3. Divide the count of Cs or Gs by the length of the DNA string
  4. Report the result.

- **Writing code**: Full introduction to the MATLAB programming language. Solutions to all exercises will be provided in MATLAB, R and Python. Creation of programming projects with an integrated development environment (IDE).

- **Primer of Unix commands**: Command-line examples on how to access servers and computing resources at the D-BSSE. Submission of jobs to the EULER cluster.

**Lecture notes**
Available on course website (Moodle)

**Literature**
Publicly available material (links will be posted on the course website)

### 636-0552-00L Metals in Biology (University of Basel)

**W** 3 credits 3G external organisers

**Abstract**
Basics of protein structure Metal cofactors and their interactions with proteins Analysis of key metalloenzymes including: Hydrolases, Oxygenases, Oxidases, Hydrogenases, Nitrogenase, Redox-proteins, Oxygen evolving complex, Photosystem II, Metal trafficking in cells, Metal homeostasis, DNA-binding proteins, Biomimetic chemistry, Artificial Metalloenzymes etc. Metals in medicine

**Objective**
Identify key features of metalloenzymes and enzyme mimics Deduce and draw reasonable reaction mechanisms catalyzed by metalloenzymes Understand the role of metalloenzymes in solving energy-related grand challenges Design functional enzyme mimics Critically analyze the structure and function of metalloproteins

### 636-0553-00L Chemical Biology (University of Basel)

**W** 3 credits 3G external organisers

**Abstract**
The course must be registered for directly at Uni Basel. Uni Basel course number: 27412-01

**Mind the enrolment deadlines at Uni Basel:**

- https://www.unibas.ch/en/Studies/Mobility/Mobility-Switzerland/Students-Registering-From-Other-Swiss-Universities.html

**Objective**
The course must be registered for directly at Uni Basel. Uni Basel course number: 27412-01

- Mind the enrolment deadlines at Uni Basel:
  - https://www.unibas.ch/en/Studies/Mobility/Mobility-Switzerland/Students-Registering-From-Other-Swiss-Universities.html

**Literature**
The course must be registered for directly at Uni Basel. Uni Basel course number: 27412-01

- https://www.unibas.ch/en/Studies/Mobility/Mobility-Switzerland/Students-Registering-From-Other-Swiss-Universities.html

**Abstract**
The modern tools of chemical biology will be discussed and contextualized with a discussion of practical applications with those tools.

### 636-0551-00L Supramolecular Chemistry (University of Basel)

**W** 3 credits 2V K. Tiefenbacher
The course must be registered for directly at Uni Basel.
Uni Basel course number: 46486-01

Mind the enrolment deadlines at Uni Basel:
https://www.unibas.ch/en/Studies/Mobility/Mobility-Switzerland/Students-Registering-From-Other-Swiss-Universities.html

Abstract
This course provides an introduction to supramolecular chemistry. Prior knowledge in supramolecular chemistry is not a prerequisite for this course.

Objective
After this course, the student is expected to understand and be able to apply the basics of supramolecular chemistry: host-guest interactions, host design, self-assembly and simple enzyme mimetics.

Content
This course provides an introduction to supramolecular chemistry. Prior knowledge in supramolecular chemistry is not a prerequisite for this course. We will first cover the basic concepts of supramolecular chemistry: non-covalent interactions, host-guest chemistry, binding constant determination and binding strength. Subsequently, we will take a closer look at how to bind different species: cations, anions and neutral organic molecules. Towards the end of the semester, we will cover self-assembly processes and applications of supramolecular structures as simple enzyme mimetics.

Lecture notes
The lecture slides are provided online via ADAM. No additional literature is required. If additional information is desired, the book "Supramolecular Chemistry" by Jonathan W. Steed and Jerry L. Atwood (John Wiley & Sons) is recommended.

636-0554-00L Modelling and Simulation in Drug Development

W 2 credits 3V H.-M. Kaltenbach

Abstract
This course introduces how Modelling and Simulation (=mathematical modelling) is applied today for the development of novel drugs in the pharmaceutical industry. Background lectures are combined with hands-on exercises on real-world examples.

Objective
The goal of this course is to provide students with a general understanding of drug development and pharmacology and how Modelling and Simulation is used to develop new drugs. Together with the application, the course will provide the background in the statistical methodologies used to model multivariate and time-dependent data with several levels of statistical variability.

Content
Understanding the pharmacology, pharmacokinetics and pharmacodynamics (PK/PD) of novel drugs is key for a successful drug development process. Modelling and Simulation of these data is at the core to gain this understanding. Focusing on the application using real world examples, this course will introduce the statistical methodologies that have been developed to describe complex biological and pharmaceutical data with several levels of statistical variability.

The course will cover the basics of drug development and pharmacology with a focus on the principles of drug absorption, distribution, metabolism and excretion (ADME) and drug pharmacokinetics and pharmacodynamics (PK/PD). The different drug formats (small molecules, biologics, cell-based therapies, gene therapies and oligonucleotide formats) and their pharmacological properties will be introduced. The translation from animal to human to inform first-in-human dose selections will be discussed.

The methodology part will cover compartmental PK/PD modelling, the practical aspects of numerical solutions of ordinary differential equation (ODEs) and the theory on non-linear mixed effects (NLME) modelling, which has become the de-facto standard methodology in the pharmaceutical industry. Practical problems of Modelling and Simulations will be discussed including parameter identifiability, model development and model evaluation and the application (or not) of the Occam’s Razor.

The course will focus on hands-on exercises using contemporary real-world examples from the pharmaceutical industry and provide necessary theoretical and methodological background in accompanying lectures.

Prerequisites / notice
Basics of dynamic systems (e.g., BSSE courses by Iber or Kammash, or CSB course by Stelling)
Basics of statistics and R (e.g., BSSE courses by Kuipers or Kaltenbach)

Science in Perspective
see Science in Perspective: Language Courses ETH/UZH
see Science in Perspective: Type A: Enhancement of Reflection Capability

Recommended Science in Perspective (Type B) for D-BSSE

Biotechnology Master - Key for Type

O Compulsory E- Recommended, not eligible for credits
W+ Eligible for credits and recommended Z Courses outside the curriculum
W Eligible for credits Dr Suitable for doctorate

Key for Hours

V lecture P practical/laboratory course
G lecture with exercise A independent project
U exercise D diploma thesis
S seminar R revision course / private study
K colloquium

ECTS European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
Independently of the building industry, Module 1 initially provides information about the characteristics of digitalisation through its principles
and rules, enabling the participants to independently recognise the short-term and long-term changes that are resulting from it.

How do the experiences of other industries help us? What can be derived from them? Why is BIM only a small part and why is the future of
BIM not BIM?

In Module 2, we break from the theoretical idea of a purely technology-based, better collaboration and look at the situation realistically in
order to be able to understand and develop new solutions and requirements.

The usual approach towards digital transformation is to train people to use new technologies. In contrary, we ask for the specific challenges
and problems people have with change. We learn to understand viewpoints of different partners within building projects and new solutions
to specific problems.

The module offers the opportunity to prepare for the voluntary buildingSMART Professional Certification.

Using specific examples, Module 4 illustrates the foundations and versatility of building information modeling (BIM), enabling participants to
deal with the concepts, applications and mechanisms involved.

We learn to consciously look at the topic of added value and digital transformation from different perspectives. Collision checking and
quantity take-offs (QTO) are very useful. But they are only basics when it comes to real value creation.

As a final module, new business models are discussed and explored. Examples will be used to explore patterns and interfaces and to
analyse what is needed today and in the future for a successful and sustainable development of the sector. How can innovative ideas move
us forward? What can we learn from design thinking? Why is it important for people to have useful and understandable measurable
values? How do the 17 Sustainable Goals influence our industry?

We will analyse the topic on the basis of two concrete examples, familiarise ourselves with them and observe their further development as a result.

The Term Paper is offered in spring semesters only.

<td>Key words: construction and real estate market, micro and macro environment</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>In Module 1, by interpreting the snapshot of one's own enterprise and opportunities and dangers to appreciate.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>Introductory module «Enterprise» considers the role of organizations in the economic network of markets and their identity. It presents the peculiarities of planning offices as a service provider, shows different types of companies and discusses the business cycle from founding to succession planning. In addition, the branch-specific development of leadership and organizational models as well as the problem of access to international markets are examined. Accompanying the basics of a general business model for service companies are taught and key criteria defined.</td>

| Number   | Module 2: State of the Art               | O    | 1    | 2G    | A. Paulus, S. Menz  |
| Abstract | Key words: Bauwerk Schweiz, new construction and renovation, economy |
| Objective| Knowledge about type, extent and change of the building Switzerland and the main questions. |
| Content  | With more than CHF 3'585 billion (excluding land), Switzerland is the largest national capital. It grows by around 4.7 per cent each year, but its value is under-invested. Is there a risk of slippage? Should more be invested in maintenance / repair or more canceled and replaced? |
| Lecture notes | Scripts, documents, studies, dates and addresses are stored on the server of the program. |
| Literature | Literature recommendations at www.bauprozess.arch.ethz.ch and www.kompetenz.arch.ethz.ch |

| Number   | Module 3: Economic Interest             | O    | 1    | 2G    | A. Paulus, S. Menz  |
| Abstract | Key words: intention development, realization operation |
| Objective| The participants understand a property in the context of a life cycle |
| Content  | The importance of a life-cycle-oriented approach has arrived in the Swiss construction and real estate sector. Cumulative management costs can exceed the cost of construction after just a few years. In this module, a systematic consideration of the phases and processes in the life cycle of a property takes place. Study I explores various aspects of life-cycle planning and construction. |
| Lecture notes | Scripts, documents, studies, dates and addresses are stored on the server of the program. |
| Literature | Literature recommendations at www.bauprozess.arch.ethz.ch and www.kompetenz.arch.ethz.ch |

| Number   | Module 4: Course of Action              | O    | 1    | 2G    | A. Paulus, S. Menz  |
| Abstract | Key words: maintenance, change, replacement |
| Objective| Preservation of value, increase in value, destruction of value and replacement construction |
| Content  | The various depths of intervention in dealing with a existing property and their effects are known. |
| Lecture notes | Scripts, documents, studies, dates and addresses are stored on the server of the program. |
| Literature | Literature recommendations at www.bauprozess.arch.ethz.ch and www.kompetenz.arch.ethz.ch |

<td>Autumn Course: Geothermal Usage of the Subsurface</td>
<td>W</td>
<td>2</td>
<td>2G</td>
<td>M. O. Saar</td>
</tr>
</tbody>
</table>

Abstract: The block course focuses on shallow groundwater wells and ground heat exchangers, but also expands the spectrum to include geothermal energy and geostorage potential in Switzerland. The contributions address, among other things, the question of how, with increased use of geothermal resources, conflicts of use due to the growing number of uses can be dealt with.

Objective: The aim of the course is for participants to be able to describe the basic processes of geothermal use and to understand the regulatory framework. They will be able to assess the mutual influence of the uses and know possibilities to take these into account in strategic planning.

#### Modules Geo-Constructions

The Module Geo-Constructions runs over two semesters (FS and HS) and is offered every three years.

*Takes place in FS23 + HS23*

<table>
<thead>
<tr>
<th>Number</th>
<th>Title</th>
<th>Type</th>
<th>ECTS</th>

<td>Fall Course: Characterisation of Rock and Rock Mass Behaviour for Underground Excavations</td>
<td>W</td>
<td>2</td>
<td>2G</td>
<td>J. Aaron</td>
</tr>
</tbody>
</table>

Abstract: The course focuses on the characterization of rock as a basis for describing rock mass behaviour with the help of hazard scenarios that are used in the planning and construction of underground excavations.

Objective: Participants learn the geological, geomechanical and hydrogeological factors necessary for the assessment and are able to estimate the influence of geological conditions on underground excavations.

#### Modules Geo-Risks

The Module Geo-Risks runs over two semesters (FS and HS) and is offered every three years.

*Takes place in FS24 + HS24*

<table>
<thead>
<tr>
<th>Number</th>
<th>Title</th>
<th>Type</th>
<th>ECTS</th>
<th>Hours</th>
<th>Lecturers</th>
</tr>
</thead>
<tbody>

<td>Autumn Course: Landslide Process and Hazards</td>
<td>W</td>
<td>2</td>
<td>2G</td>
<td>J. Aaron, V. Gischig, A. Manconi</td>
</tr>
</tbody>
</table>

Abstract: The autumn course provides current and new knowledge needed for classification, determination of the relevant processes and estimation of the temporal behaviour of geological mass movements.

Objective: The participants learn which investigations and measurements can be used to improve the hazard analysis in a targeted manner, especially for more complex slope instabilities.

<td>Nonparametric Regression</td>
<td>W</td>
<td>1 credit</td>
<td>1G</td>
<td>M. Mächler</td>
</tr>
</tbody>
</table>

Abstract
This course focuses on nonparametric estimation of probability densities and regression functions. These recent methods allow modelling without restrictive assumptions such as 'linear function'. These smoothing methods require a weight function and a smoothing parameter. Focus is on one dimension, higher dimensions and samples of curves are treated briefly. Exercises at the computer.

Objective
Knowledge on estimation of probability densities and regression functions via various statistical methods. Understanding of the choice of weight function and of the smoothing parameter, also done automatically. Practical application on data sets at the computer.
Abstract
In many research fields, spatially referenced data are collected. When analysing such data the focus is either on exploring their structure (dependence on explanatory variables, autocorrelation) and/or on spatial prediction. The course provides an introduction to geostatistical methods that are useful for such purposes.

Objective
The course will provide an overview of the basic concepts and stochastic models that are commonly used to model geostatistical data sets. In addition, the participants will learn a number of geostatistical techniques and acquire some familiarity with software that is useful for analysing spatial data.

Content
After an introductory discussion of the types of problems and the kind of data that arise in environmental research, an introduction into linear geostatistics (models: stationary random processes, modelling large-scale spatial patterns by regression, modelling autocorrelation by variogram; kriging: mean-square prediction of spatial data) will be taught. The lectures will be complemented by data analyses that the participants have to do themselves.

Lecture notes
Slides, descriptions of the problems for the data analyses and worked-out solutions to them will be provided.

Literature

447-6255-00L Analysis of High-Dimensional Data

Abstract
Block course on analysis of high-dimensional data with a focus on prediction and feature assessment.

Objective
The goal of this course is to gain a good understanding of the concepts discussed during the lecture and to apply the new methods on real data examples using the software “R”. The topics covered in the lecture are:

Part 1: Linear regression in the high-dimensional context; Overfitting, prediction and the bias-variance tradeoff; Model selection; Ridge and Lasso regularization

Part 2: Logistic regression and regularization; Classification based on decision trees, Random Forest and AdaBoost; Multiple testing; P-value adjustment and variance shrinkage

Content
Course on Analysis of High-Dimensional Data with focus on Prediction and Feature Assessment.

Lecture notes
The block course is based on lecture notes (https://bookdown.org/staedler_n/highdimstats/).

Literature

Prerequisites / notice
The exercises are done exclusively with the (free, open source) software "R" (http://www.r-project.org). A final exam will also happen at the computers, using R (and your brains!).

- Self-awareness and Self-reflection: fostered
- Self-direction and Self-management: fostered

### Applied Bayesian Statistics

**Course Code:** 447-6273-00L  
**Title:** Applied Bayesian Statistics  
**W 2 credits 2G**  
**Instructor:** S. Robert

**Abstract**  
Introduction to Bayesian statistics: basics of inference, computation with MCMC, linear model, logistic regression, Bayesian hierarchical models. Focus on applications and hands-on programming.

**Objective**  
- Understand the basics of Bayesian inference  
- Use R packages to run MCMC algorithms  
- Fit and understand Bayesian linear models  
- Introduction to hierarchical Bayesian models

**Content**  
We will learn how to describe business/scientific problems as probabilistic models, apply Bayes rules to draw inference from data, and use the probabilistic programming language STAN to obtain samples from posterior distributions. We will learn how to build, fit, and validate Bayesian models of increasing complexity. There will be examples of applications from various fields: insurance, meteorology, marketing, etc.

**Literature**  
*Bayes Rules! An Introduction to Applied Bayesian Modeling*, Alicia A. Johnson, Miles Q. Ott, Mine Dogucu - CRC Press 2022

**Prerequisites / notice**  
- Introductory statistics  
- Applied regression  
- R

### Sampling Surveys

**Course Code:** 447-6289-00L  
**Title:** Sampling Surveys  
**W 2 credits 1G**  
**Instructor:** T. Schoch

**Abstract**  
The elements of a sample survey are explained. The most important classical sample designs (simple random sampling and stratified random sampling) with their estimation procedures and the use of auxiliary information including the Horvitz-Thompson estimator are introduced. Data preparation, non-response and its treatment, variance estimation and analysis of survey data is discussed.

**Objective**  
Knowledge of the elements and the process of a sample survey. Understanding of the paradigm of random samples. Knowledge of simple random sampling and stratified random sampling and capability to apply the corresponding methods. Knowledge of further methods of sampling and estimation as well as data preparation and analysis.

**Lecture notes**  
Introduction to the statistical methods of survey research

### Nonparametric and Resampling Methods

**Course Code:** 447-6201-00L  
**Title:** Nonparametric and Resampling Methods  
**Z 2 credits 2G**  

**Abstract**  
Nonparametric tests, randomization tests, jackknife and bootstrap, as well as asymptotic properties of estimators.
Objective

For classical parametric models there exist optimal statistical estimators and test statistics whose distributions can often be determined exactly. The methods covered in this course allow for finding statistical procedures for more general models and to derive exact or approximate distributions of complicated estimators and test statistics.

Content

Nonparametric tests, randomization tests, jackknife and bootstrap, as well as asymptotic properties of estimators.

Prerequisites / notice

This course is part of the programme for the certificate and diploma in Advanced Studies in Applied Statistics. It is given every second year in the winter semester break.

447-6191-00L Statistical Analysis of Financial Data

Special Students "University of Zurich (UZH)" in the Master Program in Biostatistics at UZH cannot register for this course unit electronically. Forward the lecturer's written permission to attend to the Registrar's Office. Alternatively, the lecturer may also send an email directly to registrar@ethz.ch. The Registrar's Office will then register you for the course.

Abstract

Objective

Getting to know the typical properties of financial data and appropriate statistical models, incl. the corresponding functions in R.

**Abstract**
The initial module offers a practical introduction to some basic concepts and techniques for information processing as well as practical applications of them. The programming language are Python and SQL.

**Objective**
Participants learn...
- how to encode a problem into a program, test the program, and correct errors.
- to understand and improve existing code.
- deal with the complexity of real data.
- store data in a suitable data structure.
- query databases and understand and evaluate the corresponding database model.
- to implement mathematical models as a simulation.

**Content**
The following programming concepts are introduced during this module:

1. Variables, data types
2. Condition check, loops, logics
3. Sequential data types
4. Functions and Modules

In the practical part of the course, students work on small programming projects with a context from natural sciences. Electronic tutorials are available as preparation.

**Prerequisites / notice**
No prior knowledge is required for this course. It is based on application-oriented learning. The students spend most of their time working through programming projects and discussing their results with teaching assistants. To learn the programming basics there are electronic tutorials available.

**Abstract**
In this module, basic paradigms and techniques in working with data will be discussed, especially towards data security, managing data decentrally, and learning from data.

**Objective**
Participants will understand some of the concepts in detail and see the mathematics behind them.

**Content**
The module in particular covers cryptography and digital signatures, networking and distributed algorithms, distributed ledger technology, as well as machine learning (supervised and unsupervised learning). For each topic, there will be a hands-on and in-depth introduction that allows participants to gain a technical understanding of key ideas. This is supported by simple and concrete examples as well as programming assignments.

**Abstract**
This module will cover basic theoretical knowledge on visual recognition systems of the last two decades, mostly focusing on the most recent advancements in deep learning and convolutional neural networks.

**Objective**
Participants understand basic concepts of visual recognition and human-computer interaction systems.

**Content**
The content starts with an introduction to neural networks and then focuses on how they are used for computer vision tasks. The theoretical knowledge will be supported with a practical session that will allow participants to gain hands-on experience with most commonly used tools and deepen their understanding of the key concepts with examples.

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Objective</strong></td>
<td>The aim of this course is to develop the participants’ ability to articulate a coherent plan for R&amp;D activities linked to the business needs of a corporation, and to set the environment to enable an efficient R&amp;D organization.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Content</strong></td>
<td>In most organizations, the R&amp;D organization is the one that delivers the innovation to be brought to the market. In this module, we investigate the inner working of the R&amp;D organization by exploring roles and processes. Since R&amp;D almost always starts with significant uncertainties and unsolved technical problems, governing R&amp;D has to account for these unknowns. As R&amp;D processes take time in which the market environment may change in ways other than predicted at the beginning of a project, external influences have to be continuously monitored as well to enable market success.</td>

**Abstract**
In this course, the goal is to introduce the fundamentals of information/cyber security from a technical point of view. Along with theory, hands-on experiments are an important building block of the course and help to deepen the students' understanding of the theory parts.

**Objective**
Graduates of the course know the technical foundations of information security and understand the difficulty and complexity involved when trying to build secure systems.

**Content**
In this new course, the goal is to introduce the fundamentals of information/cyber security from a technical point of view. Along with theory, hands-on experiments are an important building block of the course and help to deepen the students' understanding of the theory parts.

**Competencies**
- Subject-specific Competencies
  - Concepts and Theories: assessed
  - Techniques and Technologies: assessed
  - Analytical Competencies: fostered
  - Decision-making: fostered
  - Media and Digital Technologies: fostered
  - Problem-solving: fostered

| 268-0201-00L  | Information Security Seminar and Project      | O    | 2    | 2S    | S. Matetic |

**Abstract**
Participants of the seminar are assigned a recent topic in cyber security. They are expected to become acquainted with the assigned issue and to prepare a corresponding presentation in the context of the seminar.

**Objective**
Participants have understood and presented a publication or report on a present topic in information security. By attending other participants presentations students get further introduced to additional current information security related topics/incidents.

**Content**
Participants of the seminar are assigned a recent topic in cyber security. They are expected to become acquainted with the assigned issue and to prepare a corresponding presentation in the context of the seminar.

**268-0202-00L**
Contemporary Topics in Cyber Security

**Abstract**
This course is composed of various sub-modules related to Cyber Security taught by experts on the relevant fields.

**Objective**
Students are expected to see behind the curtain of current research and engineering activities related to Cyber Security. At the same time students are introduced to contemporary challenges in cyber security by renowned experts.

**Content**
The lectures cover contemporary aspects and challenges in Cyber Security. The goal is to present current fields of research/engineering and the latest results. By way of example, Cyber Security Policy is one of sub-modules presented by researchers of the Center for Security Studies at ETH. Besides faculty members of the computer science department, there will be guest lecturers from industry presenting Cyber Security related challenges in their field of activity.

**Literature**
Will be announced during the course.

### Introduction to Programming

**Type:** O  
**ECTS:** 3  
**Hours:** 5A  
**Lecturers:** M. Dahinden, L. E. Fässler

**Abstract:** This module offers a practical introduction to some basic concepts and techniques for information processing and their practical applications. The programming languages are Python and SQL.

**Objective:** Participants learn...
- how to encode a problem into a program, test the program, and correct errors.
- to understand and improve existing code.
- deal with the complexity of real data.
- store data in a suitable data structure.
- query databases and understand and evaluate the corresponding database model.
- to implement mathematical models as a simulation.

**Content:** The following programming concepts are introduced during this module:

1. Variables, data types
2. Condition check, loops, logics
3. Sequential data types
4. Functions and Modules
5. Data management (SQL)

In the practical part of the course, students work on small programming projects with a context from natural sciences. Electronic tutorials are available as preparation.

**Prerequisites / notice:** No prior knowledge is required for this course. It is based on application-oriented learning. The students spend most of their time working through programming projects and discussing their results with teaching assistants. To learn the programming basics there are electronic tutorials available.

### Information, Data & Computers

**Type:** O  
**ECTS:** 2  
**Hours:** 1V  
**Lecturers:** B. Gärtner

**Abstract:** This course provides an introduction to computer science concepts that are foundational for later work in the CAS and MAS programme.

**Objective:** Students understand fundamental notions of computer science: information, data, computation, programming, algorithm. Students learn about computers as a concept, how computers fundamentally work, and how this is shaping modern computing infrastructures. Students can explain the core ingredients of Data Science.

**Content:** We will cover how information is managed as data, and how we use computers to process data and generate new insights. Concrete questions we will address are: what is data, and how does it represent information? What is a computer, and how does it work? What is a computer program? What is a programming language? What is an algorithm? What is the role of AI in computer programming? What kind of computer systems do we have today, and why? What is Data Science? Through this, we will build a fundamental understanding of how computer and data science enable today's information society.

**Literature:** Slides and links to extra material will be distributed during the course.

### Data Science & Machine Learning

**Type:** O  
**ECTS:** 4  
**Hours:** 3V  
**Lecturers:** M. Lüthi, A. Streich

**Abstract:** This course provides a fundamental training in the areas of data science and machine learning. It is intended for managers and leaders who want to understand the typical workflow, fundamental techniques and key challenges of data science and machine learning to drive successful implementations.
Objective: After taking this course the participants
- have a good understanding of the basic methods of data science and machine learning
- know the typical data science workflow and can understand and assess the role and importance of each individual step
- understand the importance of quantifying and communicating uncertainty in the data
- know the importance of basic techniques of cleaning and organizing data and can perform simple data cleaning tasks in pandas.
- can identify suitable algorithms and select the best-suited one for a given task
- can apply machine learning methods as implemented in scikit-learn on tabular data
- understand the basic ideas behind modern deep learning methods and can implement simple deep learning models in tensorflow
- understand some key applications such as natural language processing or computer vision.
- are able to apply the learned methods to practical problems in data science.

Content: We will cover the following topics
- The typical data science workflow
- Cleaning, organizing and preparing data for further analysis
- Exploratory data analysis: Gaining an understanding through visualizing and summarizing data
- Basics of statistical inference and uncertainty quantification
- Correlations and regression.
- Basics of Machine learning, including supervised and unsupervised learning, model evaluation and model selection
- Standard algorithms such as linear regression, decision trees, k-nearest neighbors, k-means, principal component analysis
- Identification of the best-suited algorithm and models for a given dataset and machine learning task
- Foundations of Deep Learning
- Challenges & Considerations: Potential pitfalls, threats, and ethical considerations.

The theoretical parts will be complemented by practical exercises using python, pandas, numpy, matplotlib, scikit-learn, and tensorflow.

The course introduces the concept of digital biomarkers. More specifically, the course will cover fundamental topics such as designing observational studies, collecting and exploring data generated by consumer-centric devices, and applying analytical methods to predict health-related outcomes.

The widespread use of mobile technologies (e.g., wearable sensors, mobile applications, social media, and location-tracking technologies) can meet the health monitoring needs of the world’s aging population and the ever-growing number of chronic patients. However, this premise is based on applying information and communication technologies that allow us to monitor patient data in many different ways. In this course, we will analyze systematic ways to collect data, review the most appropriate methods and applications in healthcare, discuss the main challenges, and apply the newly gained knowledge in a project.

The course has four learning objectives, i.e., to

1. understand the concept of digital biomarkers in general
2. understand the various application areas of digital biomarkers
3. to critically reflect and assess existing digital biomarkers
4. to understand how to design a digital biomarker

The course will cover the following topics:

1. Introduction to digital biomarkers
2. Design of digital biomarker studies
3. Exploration and assessment of digital biomarker candidates
4. Digital biomarker project and critical reflection

This module is assessed based on the participant’s pass/fail status of the group project (including a presentation). The group project is ungraded.

### Literature

### Prerequisites / notice

This module is ungraded.

**Abstract**

The course will cover the following topics:

1. Introduction to digital biomarkers
2. Design of digital biomarker studies
3. Exploration and assessment of digital biomarker candidates
4. Digital biomarker project and critical reflection

**Objective**

The course has four learning objectives, i.e., to

1. understand the concept of digital biomarkers in general
2. understand the various application areas of digital biomarkers
3. to critically reflect and assess existing digital biomarkers
4. to understand how to design a digital biomarker

**Content**

The course will cover the following topics:

1. Introduction to digital biomarkers
2. Design of digital biomarker studies
3. Exploration and assessment of digital biomarker candidates
4. Digital biomarker project and critical reflection

**Literature**

After this module, participants will be able to…

1. understand the importance of just-in-time adaptive interventions (JITAIs), esp. for the prevention of NCDs
2. understand the design, implementation and evaluation of smartphone-based and chatbot-delivered JITAIs
3. discuss opportunities and challenges of JITAIs

"Can medical Alexas make us more healthy?" (The New York Times, April 2021); "Wearables as a tool for measuring therapeutic adherence in behavioral health" (npj Digital Medicine, May 2021); "Improving community healthcare screenings with smartphone-based AI technologies" (The Lancet Digital Health, May 2021); "Predictive analytics and tailored interventions improve clinical outcomes" (npj Digital Medicine, June 2021); "H1 2021 secured $14.7B in digital health funding, already surpassing all of 2020's funding" (Rock Health, 2021)

What are the implications and rationale behind the recent developments in the field of digital health?

Digital Health is the use of information and communication technology for the prevention and treatment of diseases in the everyday life of individuals. It is thus linked to topics such as digital health interventions, digital biomarkers, digital coaches and healthcare chatbots, telemedicine, mobile and wearable computing, self-tracking, personalized medicine, connected health, smart homes, or smart cars.

In the 20th century, healthcare systems specialized in acute care. In the 21st century, we now face the challenge of dealing with the specific characteristics of non-communicable diseases (NCDs). NCDs are now responsible for around 70% of all deaths worldwide and 85% of all deaths in Europe and are associated with an estimated economic loss of $7 trillion between 2011 and 2025. NCDs are characterized in particular by the fact that they require an intervention paradigm that focuses on prevention and lifestyle change. Lifestyle (e.g., diet, physical activity, tobacco, or alcohol consumption) can reduce the risk of suffering from a chronic condition or, if already present, can reduce its burden. A corresponding change in lifestyle is, however, only implemented by a fraction of those affected, partly because of missing or inadequate interventions or health literacy, partly due to socio-cultural influences. Individual personal coaching of these individuals is neither scalable nor financially sustainable.

To this end, the question arises on how to develop evidence-based digital health interventions (DHIs) that allow medical doctors and other caregivers to scale and tailor long-term treatments to individuals in need at sustainable costs. At the intersection of health economics, behavioral medicine, information systems research, and computer science, this CAS module has the objective to help participants interested in the multi-disciplinary field of digital health to better understand the need, design, implementation, and assessment of DHIs, esp. just-in-time adaptive interventions (JITAIs).

After this module, participants will be able to…

1. understand the importance of JITAIs, esp. for the prevention of NCDs
2. understand the design, implementation and evaluation of smartphone-based and chatbot-delivered JITAIs
3. discuss opportunities and challenges of JITAIs

The CAS module is structured in two parts and follows the concept of a blended treatment consisting of live sessions and complementary online material. In the live sessions, participants will learn relevant topics. Complementary learning material (e.g., video clips), multiple-choice questions, and exercises are provided via the online learning platform.

In the second part, participants work in teams and will use their knowledge from the first part of the module to develop a smartphone-based and chatbot-delivered JITA with MobileCoach (www.mobile-coach.eu), an open-source software platform for the development of digital biomarker and digital health interventions. Each team will then present and discuss the resulting JITA and evaluation results with their colleagues who will provide peer reviews. Additional live coaching sessions are offered to support the teams with the design and evaluation of their JITAIs, and with the preparation of the final group project presentations.

Abstract

The course will guide the students through designing a clinical study and introduces established study designs and study elements, as well as modern study concepts and designs to address clinical questions. Another focus is on patient perspectives and patient preference studies.

Objective

After taking this course, participants will be able to

- understand the patient perspective as an integral part of clinical studies and clinical decision-making when planning their own studies
- describe the difference between including versus involving patient and family stakeholders in research studies
- identify ways to involve patient stakeholders in research.
- apply analytical schemes and frameworks to appraise a clinical study
- understand the structure and content of clinical trial documents according to Swissethics and apply the knowledge in creating a study synopsis
- understand and explain study outcomes, their meaning and different hierarchies
- understand the difference between different Clinical Outcome Assessments (COAs) and explain their implications for the results of clinical trials and describe how Patient-Reported Outcomes (PROs) are developed and adapted, tested and applied in a cross-culturally sensitive way
- describe and categorise psychometric properties of measurement instruments (reliability, validity, consistency, responsiveness)
- explain why study participants are randomly selected in randomised controlled trials, what this means in practice for the conduct of a clinical trial and how the results are to be classified
- identify and describe the most common study designs in observational Phase IV drug safety research and discuss the strengths and limitations of each design
- identify and describe advanced study designs in observational research
- identify and overcome different sources of bias
- describe modern alternatives to classic study designs
- understand the concept of decentralised clinical trials and its impact on the statistical planning and organisation of a trial

Content

This first module of the CAS ETH in Digital Clinical Trials (CAS ETH DCT) provides an overview of the fundamentals of clinical studies and new study methods (e.g., involvement of patients as partners, decentralised trials) which will be applied in a study synopsis on a self-selected or assigned topic during the CAS ETH DCT programme. Thus, it serves as a starting point for the subsequent modules, where the knowledge will be deepened, and the application of digital technologies (e.g., digital measures, real-world data and remote monitoring) will be introduced.

The topics are:
1. Critical appraisal of clinical studies using case studies, application of evidence levels, and utilization of checklists
2. Designing clinical studies and involving patients
3. Planning and conducting clinical studies in an ethical way
4. Outcomes in clinical studies, definition, hierarchies, Clinical Outcome Assessments (COA), psychometric methods for validating Patient-Reported Outcomes (PROs), and cross-cultural adaptations
5. Feasibility of clinical studies
6. Decentralised clinical trials
7. Observational studies and their place in clinical research, and pros and cons of different study designs
8. Bias and confounding factors
9. New study designs: adaptive, basket, umbrella, data enriched design, master protocols

Abstract

Precision Medicine is a new approach in health care aiming to deliver personalized prevention and treatment for human diseases, by taking into account individual differences in lifestyle, environment, and biology.

Objective

After taking this course, participants will be able

- to describe the goal of precision medicine;
- to explain different next-generation sequencing technologies;
- to illustrate how to make good use of public biological/clinical repositories;
- to demonstrate basic concepts of big data and machine learning;
- to explain how to genotype biological samples for a genetic disease;
- to describe examples of complicated ethical or clinical situations in personalized medicine.

Abstract

Participants will learn all necessary steps to establish new digital measures for their own clinical research. They will get a comprehensive understanding of this new emerging field, will discuss the newest guidelines with authors from international societies, will have a chance to interact with digital pioneers, and will be enabled to develop a concept for their individual digital measure.

Objective

The course enables participants to...

1. describe why new methods are needed to generate evidence.
2. describe how new (digital) methods for generating evidence are established.
3. explain how the concept of patient-centredness is applied in the development of new methods for evidence generation.
4. analyse sources of bias in basic research.
5. analyse the conditions for the development and validation of new evidence generation tools.
6. understand the framework for the development of new methods for evidence generation and to analyse the advantages and disadvantages of different approaches.
7. develop their own concept for a new digital measure.

Abstract
This module focuses on the development needs for participants' leadership competencies. In this module, experienced leadership coaches will interact regularly with the participants, coach along a personal development plan, and feedback on specific challenges and participants' activities with the goal to strengthen the participants' leader capability and people skills.

Objective
This module enables participants:
- To identify current gaps in the personal management skills and competencies and develop meaningful goals and plans to fill those gaps
- To implement effective exercises and practices to improve the participants' leadership capacity
- To effectively communicate and manage key constituents, notably employees and key advisors in a venture project.

Content
This module focuses on the development needs of participants' leadership competencies. In this module, experienced leadership coaches will interact regularly with the participants, coach them along a personal development plan, and feedback participants on specific challenges and activities with the goal to strengthen the participants' leadership capability and people skills.

Historically, cities have been hubs of innovation, economic activity and rising prosperity. However, the unprecedented speed and scale at which cities are growing today is a huge challenge. As epicenters of migration, environmental degradation, health hazards and unemployment, urban areas are especially vulnerable to disasters, social conflict and inequality. Despite this, some of the most promising initiatives to achieve the SDGs have been implemented by cities. What strategies and processes do successful city- based initiatives pursue? How can development organisations support mainstreaming the SDGs at the local level? What can be learnt from experiences so far? This course draws on good practices in promoting sustainability and equity at the city and local level. Participants gain insights on designing urban- focused development interventions.

### Key Topics:
- Drivers, dynamics and challenges of urbanization
- The urban- rural continuum – why does it matter?
- Localisation of global development and sustainability agendas: challenges and opportunities
- Three to four case studies selected from the following: informal settlements, urban food systems, WASH, children's well- being, circularity, migration.

### Prerequisites / notice
Students of the course must fulfill requirements specified on the homepage of NADEL. Electronic registration may be done only after registration with the NADEL secretariat.

### Competencies
- Subject-specific Competencies: Concepts and Theories assessed
- Method-specific Competencies: Analytical Competencies fostered
- Personal Competencies: Critical Thinking fostered

### Prerequisites / notice

### 865-0004-00L Qualitative and Participatory Research Methods for Development Practitioners

**Abstract**
Qualitative research has much to offer to the practical work of development organizations. This course will provide an overview of the principles and practice of qualitative research and illustrate ways in which qualitative research can be incorporated into the programme cycle. Participants will learn to collect and analyse data, using qualitative methods.

**Objective**
The course aims to demystify qualitative research and build the skills of development practitioners in using qualitative methods confidently, and to communicate findings to different audiences.

**Content**
- Qualitative research methods, including interviews, focus group discussions and participant observation.
- Designing and planning qualitative studies.
- Qualitative data analysis and interpretation.
- Embedding qualitative research within a project cycle.

**Prerequisites / notice**
Students of the course must fulfill requirements specified on the homepage of NADEL. Electronic registration may be done only after registration with the NADEL secretariat.

---

### 865-0044-03L Engaging with Policy Processes: Strategies and Tools

**Abstract**
The course enables participants to understand the significance of the engagement of civil society organisations in policy processes in order to overcome exclusion and foster voice. The course acquaints participants with concepts and practice of civil society participation in shaping policies at micro and macro level and provides practical tools for influencing political processes.

**Objective**
Recognizing that development is inherently political, this course covers political processes and how they intertwine with the goals and strategies of various agents in international cooperation. It discusses the significance and implications of civil society’s efforts to foster voice and inclusion. The course provides a nuanced understanding of different strategic options and approaches to contribute to policy processes and offers tools that have proven to be effective in practical development cooperation work. It provides an opportunity for participants to apply concepts related to the strengthening of civil society to their projects and case studies.

**Content**
- Understanding policy processes: institutions and actors at the macro, meso and micro level
- Political settlements, power distribution and inequalities of access to rights and resources
- Exclusionary conditions, and the influence of dominant coalitions
- Policy in terms of rules and norms emerging from a negotiation process between interdependent actors
- Actor-oriented approaches, methods and tools to analyse, engage with and contribute to policy processes

**Prerequisites / notice**
Students of the course must fulfill requirements specified on the homepage of NADEL. Electronic registration may be done only after registration with NADEL secretariat.

---

### 865-0002-00L Migration and Development

**Abstract**
This course draws out good practices in promoting sustainability development at the city level. Participants gain insights on designing urban- focused development interventions.

**Objective**
The course aims to demystify qualitative research and build the skills of development practitioners in using qualitative methods confidently, and to communicate findings to different audiences.

**Content**
- The qualitative research approach.
- Qualitative research methods, including interviews, focus group discussions and participant observation.
- Designing and planning qualitative studies.
- Qualitative data analysis and interpretation.
- Embedding qualitative research within a project cycle.

**Prerequisites / notice**
Students of the course must fulfill requirements specified on the homepage of NADEL. Electronic registration may be done only after registration with NADEL secretariat.
24 months of practical experience in international cooperation.

ETH doctoral students working on topics related to poverty reduction in low- and middle income countries may also be admitted.

ETH MA/MSc students apply with a letter of motivation to the NADEL administration office.

Registration only through the NADEL administration office.

Abstract
Globally, over 280 million people live outside their countries of origin. While the concept of migration has negative connotations for some, migration can bring significant benefits – to both countries of origin and destination, if the right policies and initiatives are in place. The course explores the role that international cooperation can play in promoting the positive aspects of migration.

Objective
Course participants have improved understanding of the following issues:
- Definition of migration concepts and terms
- International legal frameworks related to migration
- The geography of migration flows
- Major drivers of migration
- The evolving concept of “migration and development”
- International cooperation organisations and their strategies and activities in terms of migration and development.

Content
Globally, over 280 million people are currently living outside their countries of origin, voluntarily and involuntarily; and a further 60 million people live in internal displacement settings within their countries of origin. Migration is multifaceted, and driven by various, often interlinked factors including conflict and violence, economic, social and political factors, as well as environmental and climate related events.

While the concept of migration has negative connotations for some, migration can bring significant benefits – to both countries of origin and destination, if the right policies and initiatives are in place.

The course explores the role that international cooperation can play in promoting the positive aspects of migration and in reducing the potential negative consequences.

This course covers:
- Important terms and concepts related to migration;
- International legal frameworks related to migration;
- The geography of migration flows;
- Major drivers of migration;
- The evolving concept of migration and development;
- Actions, strategies and initiatives of international cooperation actors when it comes to migration and development.

865-0020-00L Social Entrepreneurship – Driving Sustainability in Business

Does not take place this semester.

Only for MAS/CAS in Global Cooperation and Sustainable Development students, as well as specialists with at least 24 months of practical experience in international cooperation.

ETH doctoral students working on topics related to poverty reduction in low- and middle income countries may also be admitted.

Registration only through the NADEL administration office.

Abstract
This course introduces the concept of social entrepreneurship, understanding in which situations and under which conditions the concept can be applied, and the basics of developing a business strategy for a social enterprise.

Objective
This course introduces the concept of social entrepreneurship over three different blocks. The first part is dedicated to the definition, history, context and the successes and blockers of social entrepreneurship, including some real-world examples. In the second part the participants will learn to transform a social business idea into a concrete social business plan. The last block of the course is dedicated to the power of storytelling, where participants learn how to pitch their business ideas convincingly.

Content
- Definitions of “social entrepreneurship” and the difference with “entrepreneurship”
- Get inspired by concrete examples of successful social ventures
- Formulate a social business plan using the business canvas methodology
- Learning to think and act like a social entrepreneur
- The art and power of storytelling in an entrepreneurial context

Competencies

865-0059-00L Storytelling for Systems Change

Only for CAS in Global Cooperation and Sustainable Development students, as well as specialists with at least 24 months of practical experience in international cooperation.

ETH doctoral students working on topics related to poverty reduction in low- and middle income countries may also be admitted.

Registration only through the NADEL administration office.
Abstract
This course provides a foundation in the principles, techniques, and strategies for storytelling in the context of systems change. Key topics include:

- Psychology of Stories
- Key Elements and Techniques of Storytelling
- Ethics & Authenticity
- Using Stories in Project Cycle Management

Objective
By the end of this course, participants will be able to apply and adapt the fundamentals of storytelling to support their work as development practitioners and as proponents of systems change. They will be able to integrate storytelling techniques into activities such as reporting, fundraising, and context analysis. They will be better equipped to construct stories that are engaging and illustrative of the complexity of systems change.

865-0012-00L Gender and Economics

| W | 3 credits | 3G | M. Malefakis |

Only for MAS/CAS in Global Cooperation and Sustainable Development students, as well as specialists with at least 24 months of practical experience in international cooperation.

ETH doctoral students working on topics related to poverty reduction in low- and middle income countries may also be admitted.

ETH MA/MSc students apply with a letter of motivation to the NADEL administration office.

Abstract
This course on gender and economics is intended to provide basic- and intermediate-level training to development practitioners and policy and program staff in international development agencies.

Objective
The overall objective of the course is to strengthen the capacity of technical advisors and program staff on the importance of gender-responsive economic policy. The course conveys basic knowledge about genders aspects in economics. Key elements are:

- Feminist approaches to macroeconomics, microeconomics and international economics
- Critical analysis of global and regional economic trends, including those related to economic crises
- Gender-responsive economic policy for program implementation, policymaking, and advocacy

Content
Economic inequalities between men and women persist in many countries. For example, in many countries, men earn more money and are more likely to own land and control productive assets than women. This course on gender and economics is intended to provide basic- and intermediate-level training to development practitioners and policy and program staff in international development agencies. The overall objective of the course is to strengthen the capacity of technical advisors and program staff on the importance of gender-responsive economic policy. The course is taught in cooperation with SDC and UN women.

Special students and auditors need special permission from the lecturers.
The past two decades witnessed significant advances in the areas of computational design and digital fabrication in architecture. These fostered adaptability and flexibility, and new methods and materials are being discovered all the time. Lecturers S. Langenberg

Subject-specific Competencies

With the help of input lectures and excursions in and around Zurich, participants will explore new types of materials, structural designs, and new building methods. This course will discuss the role and relevance of digitally built architecture as heritage through excursions and input lectures. The students of this seminar will gain insight into different evaluation criteria and value systems within the larger field of preservation.

079-0200-00L Sustainable Development O 3 credits 2G S. Langenberg

Does not take place this semester.

Abstract
In the MAS/CAS seminar, we will critically discuss values and meanings relevant within the field of architecture. This will be done by examining and comparing the values of buildings as well as evaluation criteria of various actors – such as preservation authorities, architects, the real estate industry, or property owners.

Objective
The students of this seminar will gain insight into different evaluation criteria and value systems within the larger field of preservation. Through various exercises, they learn to critically question current approaches to existing buildings, which are all too often characterized by demolition and replacement. The students will gain knowledge about lines of argumentation necessary to standing their ground in discussions with private or institutional clients. In addition to different assessment criteria for the preservation of historical monuments, they will learn the basics of life cycle analysis, calculation methods for determining grey energy and CO2 content, as well as the feasibility and usefulness of reuse and recycling of building materials.

Content
In the evaluation of the existing building stock, approaches vary substantially. While the institutional preservation of historical monuments is oriented towards a broad canon of values, architects evaluate these objects primarily according to shape and design, and more recently also according to resource-economic criteria. For the real estate industry, in turn, what seems to be decisive is primarily the market value (not only of the object, but of the building site above all), and for building owners it is the utility or resale value of a property.

While buildings protected as monuments are widely recognized as cultural heritage, the large building stock of the second half of the 20th century is often considered unattractive and its maintenance or upgrading a costly imposition. However, it is precisely this stock that holds great potential, as it generally allows more possibilities for use and change than protected objects. In case of demolition, individual components of these buildings can possibly be reused.

The discussion about values, protection and preservation of the existing building stock is complex and must be conducted on different levels. In addition to classic protection criteria, ecological and economic considerations, too, must be taken into account.

Does not take place this semester.

Abstract
This course focuses on recent constructions built using innovative computational design and fabrication technologies, and the challenges associated with their repair, maintenance, and preservation.

Objective
With the help of input lectures and excursions in and around Zurich, participants will explore new types of materials, structural designs, construction processes and methods associated with recently completed buildings built using computational methods. They will learn to critically observe existing theories and methods of preservation and discuss in groups the relationship between today’s digitally fabricated objects and future challenges in the discipline of preservation.

Content
The past two decades witnessed significant advances in the areas of computational design and digital fabrication in architecture. These often include the use of advanced fabrication tools such as robotic arms and 3d printers which are computer-controlled via algorithmic scripts for the purpose of manufacturing geometrically complex building parts that are optimized in terms of materials and structural design. The prototypes and buildings which demonstrate such technologies often feature new and experimental composite materials, construction details, planning and fabrication processes. They are the result of unique interdisciplinary science and industry partnerships.

The innovations embedded in such objects offer a preview to building methods which will become commonplace in the production of buildings in the future. As such, it is of critical importance to observe the performance of such novel constructions especially in terms of their durability and repairability, and to document the building processes to foresee the challenges associated with the preservation of the future building stock. Switzerland and especially Zurich has become an important innovation center in the field of digital fabrication in architecture.

This course will discuss the role and relevance of digitally built architecture as heritage through excursions and input lectures. The discussion will be accompanied by a critical observation on the existing preservation theories and practices regarding innovations in architecture and construction.

Preservation in Switzerland

Does not take place this semester.

Abstract
Historic buildings and sites are not per se significant parts of cultural heritage. They only become so when certain values are associated with them. Monument values are as dynamic as the society that produces them. The lecture traces the historical development of monument recognition and preservation in Switzerland since 1798.

Major Courses and Cooperations

Number Title Type ECTS Hours Lecturers
079-0250-00L Preservation in Switzerland O 2 credits 2G S. Langenberg

Does not take place this semester.
**Objective**

Students will be able to name the most important actors in Swiss heritage conservation and describe developments in the field. They know methodological approaches and can place them in their historical context. They can identify the necessary principles and instruments in different situations and use them in their professional environment.

**Content**

In the 20th century, the most important impulses for the theory and practice of restoration came from the Federal Commission for the Preservation of Monuments, whose theoretical discourse and work are traced in detail. However, the activities of the cantons, private-law organisations and universities are also examined within the course. The institutionalisation of monument preservation is analysed in the context of social developments, whereby the evolution of its self-image from a patriotic civic duty in the age of industrialisation to monument preservation as environmental protection in the sustainability discourse of the 21st century is also examined. In the second half of the semester, the theoretical foundations, actors and instruments that are relevant in Switzerland today will be presented and their interaction explained.

Central questions will be examined in greater depth using concrete case studies. Among others, the following will be discussed: the restoration of Chillon Castle from 1897; the mountain village restoration of Vrin in 1944; the restoration of the Augustinian Church in Zurich in 1958; the controversy surrounding the reconstruction of the Predigerchor in Zurich in 1987; the extension of the Stadtcasino Basel (2016-2020); the struggle for the preservation of medieval wooden buildings in the canton of Schwyz (2000-2021).

**Development of the Existing Building Stock**

*Does not take place this semester.*

**Objective**

The course discusses the topic of densification and the future of the existing building stock. By dealing with the qualities of existing buildings within the areas to be densified, students are invited to discuss whether these objects are to be preserved, transformed, and supplemented or whether they have to be demolished.

**Content**

The city of Zurich introduced the densification strategy in the revised spatial planning law, focusing on the existing building stock. As a rule, densification is achieved today through demolitions and replacement. This includes buildings which are still in a good condition. The course thus aims to explore possible alternatives.

Brief general introduction to the real estate market and real estate valuation; introduction to the topic of "densification", well and badly realised examples; discussion of current densification projects and alternative solutions within the framework of two to three workshops.

**Abstract**

A Geographic Information System (GIS) is a system for collecting, managing, analyzing and visualizing spatial data (geodata). This module teaches the fundamental concepts and principles necessary for a comprehensive understanding and effective application of GIS technologies.

**Objective**

After completion of this module, students will be able to understand the fundamentals of Geographic Information Systems (GIS) and be able to retrieve and apply them appropriately in practice. They will be able to describe and apply the essential components and principles of GIS.

**Abstract**

GIS methods and processes represent the basic strategies and processing steps used within a GIS workflow to model, capture, manage, analyze, and visualize geodata. The GIS workflow is a systematic approach that ensures that geospatial data is used effectively to solve problems in various application domains.

**Objective**

The aim of this module is to provide students with a comprehensive understanding and diverse skills in the use of GIS methods and processes. The entire sequence of geodata processing from acquisition to application is to be covered. The goal is to provide students with a structured and systematic approach to effectively process and use geospatial data in a meaningful way.

<tr>
<td></td>
<td>Have a deep understanding of advanced concepts of object-oriented programming and their support through various language features. Be able to understand language concepts on a semantic level and be able to compare and evaluate language designs. Be able to learn new languages more rapidly. Be aware of many subtle problems of object-oriented programming and know how to avoid them.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>The main goal of this course is to convey a deep understanding of the key concepts of sequential object-oriented programming and their support in different object-oriented languages. This is achieved by studying how important challenges are addressed through language features and programming idioms. In particular, the course discusses alternative language designs by contrasting solutions in languages such as C++, C#, Eiffel, Java, Python, and Scala. The course also introduces novel ideas from research languages that may influence the design of future mainstream languages. The topics discussed in the course include among others: The pros and cons of different flavors of type systems (for instance, static vs. dynamic typing, nominal vs. structural, syntactic vs. behavioral typing). The key problems of single and multiple inheritance and how different languages address them. Generic type systems, in particular, Java generics, C# generics, and C++ templates. The situations in which object-oriented programming does not provide encapsulation, and how to avoid them. The pitfalls of object initialization, exemplified by a research type system that prevents null pointer dereferencing. How to maintain the consistency of data structures.</td>

### Abstract

Subject of the class are engineering techniques for developing secure systems. We examine concepts, methods and tools, applied within the different activities of the SW development process to improve security of the system. Topics: security requirements & risk analysis, system modeling & model-based development methods, implementation-level security, and evaluation criteria for secure systems.

### Objective

Security engineering is an evolving discipline that unifies two important areas: software engineering and security. Software Engineering addresses the development and application of methods for systematically developing, operating, and maintaining, complex, high-quality software.

Security, on the other hand, is concerned with assuring and verifying properties of a system that relate to confidentiality, integrity, and availability of data.

The goal of this class is to survey engineering techniques for developing secure systems. We will examine concepts, methods, and tools that can be applied within the different activities of the software development process, in order to improve the security of the resulting systems.

Topics covered include:

* security requirements & risk analysis,
* system modeling and model-based development methods,
* implementation-level security, and
* evaluation criteria for the development of secure systems
Security engineering is an evolving discipline that unifies two important areas: software engineering and security. Software Engineering addresses the development and application of methods for systematically developing, operating, and maintaining, complex, high-quality software.

Security, on the other hand, is concerned with assuring and verifying properties of a system that relate to confidentiality, integrity, and availability of data.

The goal of this class is to survey engineering techniques for developing secure systems. We will examine concepts, methods, and tools that can be applied within the different activities of the software development process, in order to improve the security of the resulting systems.

Topics covered include:
- security requirements & risk analysis,
- system modeling and model-based development methods,
- implementation-level security, and
- evaluation criteria for the development of secure systems

Modules taught:

1. Introduction
   - Introduction of Infsec group and speakers
   - Security meets SW engineering: an introduction
   - The activities of SW engineering, and where security fits in
   - Overview of this class
2. Requirements Engineering: Security Requirements and some Analysis
   - Overview: functional and non-functional requirements
   - Use cases, misuse cases, sequence diagrams
   - Safety and security
3. Modeling in the design activities
   - Structure, behavior, and data flow
   - Class diagrams, statecharts
4. Model-driven security for access control (Part I)
   - SecureUML as a language for access control
   - Combining Design Modeling Languages with SecureUML
   - Semantics, i.e., what does it all mean,
   - Generation
   - Examples and experience
5. Model-driven security (Part II)
   - Continuation of above topics
6. Security patterns (design and implementation)
7. Implementation-level security
   - Buffer overflows
   - Input checking
   - Injection attacks
8. Code scanning
   - Static code analysis basics
   - Theoretical and practical challenges
   - Analysis algorithms
   - Common bug pattern search and specification
   - Dataflow analysis
9. Testing
   - Overview and basics
   - Model-based testing
   - Testing security properties
10. Risk analysis and management
    - "Risk": assets, threats, vulnerabilities, risk
    - Risk assessment: quantitative and qualitative
    - Safeguards
    - Generic risk analysis procedure
    - The OCTAVE approach
    - Example of qualitative risk assessment
11. Threat modeling
    - Overview
    - Safety engineering basics: FMEA and FTA
    - Security impact analysis in the design phase
    - Modeling security threats: attack trees
    - Examples and experience
12. Evaluation criteria
    - NIST special papers
    - ISO/IEC 27000
    - Common criteria
    - BSI baseline protection
13. Guest lecture
    - TBA

Literature
- Further relevant books and journal/conference articles will be announced in the lecture.

Prerequisites / notice
Prerequisite: Class on Information Security

252-0535-00L Advanced Machine Learning W 10 credits 3V+2U+4A C. Cotrini Jimenez

Abstract
Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.
Objective
Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensible to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real world data.

Content
The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:

**Fundamentals:**
- What is data?
- Bayesian Learning
- Computational learning theory

**Supervised learning:**
- Ensembles: Bagging and Boosting
- Max Margin methods
- Neural networks

**Unsupervised learning:**
- Dimensionality reduction techniques
- Clustering
- Mixture Models
- Non-parametric density estimation
- Learning Dynamical Systems

**Lecture notes**
No lecture notes, but slides will be made available on the course webpage.

**Literature**

**Prerequisites / notice**
The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.

Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

**252-0543-01L Computer Graphics**

<table>
<thead>
<tr>
<th>Computer Graphics</th>
<th>W 8 credits</th>
<th>3V+2U+2A M. Gross, M. Papas</th>
</tr>
</thead>
</table>

**Abstract**
This course covers fundamental and advanced concepts of modern computer graphics. Students will learn the fundamentals of digital scene representations, advanced physically-based light transport algorithms for generating photorealistic images from these scene representations, and inverse rendering methods for recovering digital scene representations from captured images.

**Objective**
At the end of the course, the students will be able to build a rendering system based on path-tracing algorithms. The students will learn the principles of physically-based rendering and computer graphics. In addition, the course is intended to stimulate the student's curiosity to explore the field of computer graphics in subsequent classes or on their own.

**Content**
We will begin with an introduction to light emission and radiometric quantities, followed by an exploration of geometry representations and texture mapping.

Next, we will mathematically formulate the physics of light transport and appearance modeling. Subsequently, we will introduce relevant concepts from Monte Carlo integration and develop path-tracing algorithms to solve these equations by simulating light transport for direct and global illumination due to hard surfaces and participating media, such as fog, smoke, and translucent objects.

Moreover, we will present techniques for significantly improving path-tracing efficiency, including importance sampling, multiple importance sampling, stratified sampling, denoising, and acceleration data structures.

The course lectures will conclude with an overview of image-based capture and rendering methods. Topics covered will include geometry reconstruction, material acquisition, differentiable rendering, and image-based rendering.

**Lecture notes**
No

**Literature**
Books:
- Physically Based Rendering: From Theory to Implementation
- High Dynamic Range Imaging: Acquisition, Display, and Image-Based Lighting
- Multiple view geometry in Computer Vision

Prerequisites:
- Fundamentals of calculus and linear algebra, basic concepts of algorithms and data structures, programming skills in C++, and the Visual Computing course are recommended.

The programming assignments will be in C++. This will not be taught in the class.

Communication

Geometry: Combinatorics and Algorithms

Abstract
This lecture provides an introduction to physically-based animation in computer graphics and gives an overview of fundamental concepts and theories. The practical exercises include three assignments which are to be solved in small groups. In an additional course project, topics from the lecture will be implemented into a 3D game or a comparable application.

Objective
This lecture provides an introduction to physically-based animation in computer graphics and gives an overview of fundamental concepts and theories. The practical exercises include three assignments which are to be solved in small groups. In an additional course project, topics from the lecture will be implemented into a 3D game or a comparable application.

Content
The lecture covers topics in physically-based modeling, such as particle systems, mass-spring models, finite difference and finite element methods. These approaches are used to represent and simulate deformable objects or fluids with applications in animated movies, 3D games and medical systems. Furthermore, the lecture covers topics such as rigid body dynamics, collision detection, and character animation.

Prerequisites / notice
Fundamentals of calculus and physics, basic concepts of algorithms and data structures, basic programming skills in C++. Knowledge on numerical mathematics as well as ordinary and partial differential equations is an asset, but not required.

Security of Wireless Networks

Abstract
This course discusses physical layer aspects of wireless communication and a wide range of security-related topics in the domain of wireless technologies. It mainly targets computer science students. Though useful, a background in signal processing or physical layer concepts is not required. A basic understanding of security (e.g. as taught in 252-0211.00L Information Security) is recommended.

Objective
After this course, students should be able to describe and classify security goals and attacks on various wireless networks and technologies, with an emphasis on physical layer aspects.

Content
- Introduction to wireless communication
- Physical layer security schemes
- Spreading techniques and their application in jamming-resistant communication and Global Navigation Satellite Systems (GNSSs)
- Secure ranging with Ultra-Wide Band (UWB)
- Security aspects of cellular networks, WiFi, and Bluetooth Low Energy (BLE)

Competencies
- Subject-specific Competencies
  - Concepts and Theories: assessed
  - Techniques and Technologies: assessed
- Method-specific Competencies
  - Analytical Competencies: assessed
  - Decision-making: assessed
- Social Competencies
  - Cooperation and Teamwork: fostered

  - Critical Thinking: fostered

System Security

Abstract
The first part of the course covers general security concepts and hardware-based support for security. In the second part, the focus is on system design and methodologies for building secure systems.

Objective
In this lecture, students learn about the security requirements and capabilities that are expected from modern hardware, operating systems, and other software environments. An overview of available technologies, algorithms and standards is given, with which these requirements can be met.

Content
The first part of the lecture covers hardware-based security concepts. Topics include the concept of physical and software-based side channel attacks on hardware resources, architectural support for security (e.g., memory management and permissions, disk encryption), and trusted execution environments (Intel SGX, ARM TrustZone, AMD SEV, and RISC-V Keystone).

In the second part, the focus is on system design and methodologies for building secure systems. Topics include: common software faults (e.g., buffer overflows, etc.), bug-detection, writing secure software (design, architecture, QA, testing), compiler-supported security (e.g., control-flow integrity), and language-supported security (e.g., memory safety).

Along the lectures, model cases will be elaborated and evaluated in the exercises.

Competencies
- Subject-specific Competencies
  - Concepts and Theories: assessed
  - Techniques and Technologies: assessed
- Method-specific Competencies
  - Analytical Competencies: fostered
  - Decision-making: fostered
- Social Competencies
  - Communication: fostered
- Personal Competencies
  - Adaptable and Flexibility: fostered
  - Critical Thinking: fostered

Geometry: Combinatorics and Algorithms

Abstract
Geometric structures are useful in many areas, and there is a need to understand their structural properties, and to work with them algorithmically. The lecture addresses theoretical foundations concerning geometric structures. Central objects of interest are triangulations. We study combinatorial (Does a certain object exist?) and algorithmic questions (Can we find a certain object efficiently?)

Objective
The goal is to make students familiar with fundamental concepts, techniques and results in combinatorial and computational geometry, so as to enable them to model, analyze, and solve theoretical and practical problems in the area and in various application domains. In particular, we want to prepare students for conducting independent research, for instance, within the scope of a thesis project.

Content
Planar and geometric graphs, embeddings and their representation (Whitney's Theorem, canonical orderings, DCEL), polygon triangulations and the art gallery theorem, convexity in $\mathbb{R}^d$, planar convex hull algorithms (Jarvis Wrap, Graham Scan, Chan's Algorithm), point set triangulations, Delaunay triangulations (Lawson flips, lifting map, randomized incremental construction). Voronoi diagrams, the Crossing Lemma and incidence bounds, line arrangements (duality, Zone Theorem, ham-sandwich cuts), 3-SUM hardness, counting planar triangulations.

Lecture notes
Yes

Literature

Prerequisites / notice
Prerequisites: The course assumes basic knowledge of discrete mathematics and algorithms, as supplied in the first semesters of Bachelor Studies at ETH.
Outlook: In the following spring semester there is a seminar "Geometry: Combinatorics and Algorithms" that builds on this course. There are ample possibilities for Semester-, Bachelor- and Master Thesis projects in the area.

Natural Language Processing

Abstract
This lecture provides an introduction to physically-based animation in computer graphics and gives an overview of fundamental concepts and theories. The practical exercises include three assignments which are to be solved in small groups. In an additional course project, topics from the lecture will be implemented into a 3D game or a comparable application.

Objective
This lecture provides an introduction to physically-based animation in computer graphics and gives an overview of fundamental concepts and theories. The practical exercises include three assignments which are to be solved in small groups. In an additional course project, topics from the lecture will be implemented into a 3D game or a comparable application.

Content
The lecture covers topics in physically-based modeling, such as particle systems, mass-spring models, finite difference and finite element methods. These approaches are used to represent and simulate deformable objects or fluids with applications in animated movies, 3D games and medical systems. Furthermore, the lecture covers topics such as rigid body dynamics, collision detection, and character animation.

Prerequisites / notice
Fundamentals of calculus and physics, basic concepts of algorithms and data structures, basic programming skills in C++. Knowledge on numerical mathematics as well as ordinary and partial differential equations is an asset, but not required.
Abstract
This course presents topics in natural language processing with an emphasis on modern techniques, primarily focusing on statistical and deep learning approaches. The course provides an overview of the primary areas of research in language processing as well as a detailed exploration of the models and techniques used both in research and in commercial natural language systems.

Objective
The objective of the course is to learn the basic concepts in the statistical processing of natural languages. The course will be project-oriented so that the students can also gain hands-on experience with state-of-the-art tools and techniques.

Content
This course presents an introduction to general topics and techniques used in natural language processing today, primarily focusing on statistical approaches. The course provides an overview of the primary areas of research in language processing as well as a detailed exploration of the models and techniques used both in research and in commercial natural language systems.

Literature
Lectures will make use of textbooks such as the one by Jurafsky and Martin where appropriate, but will also make use of original research and survey papers.

227-2210-00L  Computer Architecture  W  8 credits  6G+1A  S. Sadrosadati, O. Mutlu
Abstract
Computer architecture is the science & art of designing and optimizing hardware components and the hardware/software interface to create a computer that meets design goals. This course covers basic components of a modern computing system (memory, processors, interconnects, accelerators). The course takes a hardware/software cooperative approach to understanding and designing computing systems.

Objective
We will learn the fundamental concepts of the different parts of modern computing systems, as well as the latest major research topics in Industry and Academia. We will extensively cover memory systems (including DRAM and new Non-Volatile Memory technologies, memory controllers, flash memory), new paradigms like processing-in-memory, parallel computing systems (including multicore processors, coherence and consistency, GPUs), heterogeneous computing, interconnection networks, specialized systems for major data-intensive workloads (e.g. graph analytics, bioinformatics, machine learning), etc. We will focus on fundamentals as well as cutting-edge research. Significant attention will be given to real-life examples and tradeoffs, as well as critical analysis of modern computing systems.

Content
The principles presented in the lecture are reinforced in the laboratory through 1) the design and implementation of a cycle-accurate simulator, where we will explore different components of a modern computing system (e.g., pipeline, memory hierarchy, branch prediction, prefetching, caches, multithreading), and 2) the extension of state-of-the-art research simulators (e.g., Ramulator) for more in-depth understanding of specific system components (e.g., memory scheduling, prefetching).

See the course website for detailed and complete content of past incarnations of the course: https://safari.ethz.ch/architecture

Lecture notes
All the materials (including lecture slides) will be provided on the course website: https://safari.ethz.ch/architecture/

The video recordings of the lectures are expected to be made available after lectures.

See https://safari.ethz.ch/architecture for past examples.

Literature
We will provide required and recommended readings in every lecture. They will mainly consist of research papers presented in major Computer Architecture and related conferences and journals.

See https://safari.ethz.ch/architecture for past examples.

263-2400-00L  Reliable and Trustworthy Artificial Intelligence  W  6 credits  2V+2U+1A  M. Vechev
Abstract
Creating reliable, secure, robust, and fair machine learning models is a core challenge in artificial intelligence and one of fundamental importance. The goal of the course is to teach both the mathematical foundations of this new and emerging area as well as to introduce students to the latest and most exciting research in the space.

Objective
Upon completion of the course, the students should have mastered the underlying methods and be able to apply them to a variety of engineering and research problems. To facilitate deeper understanding, the course includes a group coding project where students will build a system based on the learned material.
Robustness of Machine Learning

- Adversarial attacks and defenses on deep learning models.
- Certified training of deep neural networks (combining symbolic and continuous methods).

Privacy of Machine Learning

- Threat models (e.g., stealing data, poisoning, membership inference, etc.).
- Attacking federated machine learning (across vision, natural language and tabular data).
- Differential privacy for defending machine learning.
- AI Regulations and checking model compliance.

Fairness of Machine Learning

- Introduction to fairness (motivation, definitions).
- Enforcing individual fairness (for both vision and tabular data).
- Enforcing group fairness (e.g., demographic parity, equalized odds).

Robustness, Privacy and Fairness of Foundation Models

Prerequisites / notice

While not a formal requirement, the course assumes familiarity with basics of machine learning (especially linear algebra, gradient descent, and neural networks as well as basic probability theory). These topics are usually covered in "Intro to ML" classes at most institutions (e.g., "Introduction to Machine Learning" at ETH).

Formal Foundations of Programming Languages

W 7 credits 2V+1U+2P+1A R. Jung

Abstract

The course covers topics in the theory of programming languages, types, and program verification, and how to construct and validate that theory with machine-checked proofs in the Coq proof assistant.

Objective

Students will learn how to develop machine-checked proofs, how to rigorously define the semantics of a programming language and its type system, and how to analyze and formally establish the guarantees of well-typed programs.

Content

The course will proceed in two parallel tracks:

- The theory track (2V) will introduce operational semantics, type systems, and type soundness proofs, starting with the simply-typed lambda calculus and then continuing with increasingly expressive languages.
- The Coq track (2G) will begin with an introduction to machine-checked proofs and the Coq proof assistant. Afterwards we will mechanize the theory developed in the first track. This is the hands-on part of the course; students will carry out these proofs in Coq themselves with instructions from the lecturer.

Lecture notes

Will be made available on the course website.

Literature

Will be announced in the lecture.

Prerequisites / notice

A basic familiarity with propositional and first-order logic will be assumed. Courses with an emphasis on formal reasoning about programs (such as Formal Methods and Functional Programming) are advantageous background, but are not a requirement.

Design of Parallel and High-Performance Computing

W 9 credits 2V+2U+4A T. Hoeflter

Abstract

Advanced topics in parallel and high-performance computing.

Objective

Understand concurrency paradigms and models from a higher perspective and acquire skills for designing, structuring and developing possibly large parallel high-performance software systems. Become able to distinguish parallelism in problem space and in machine space. Become familiar with important technical concepts and with concurrency folklore.

Content

We will cover all aspects of high-performance computing ranging from architecture through programming up to algorithms. We will start with a discussion of caches and cache coherence in practical computer systems. We will dive into parallel programming concepts such as memory models, locks, and lock-free. We will cover performance modeling and parallel design principles as well as basic parallel algorithms.

Prerequisites / notice

This class is intended for the Computer Science Masters curriculum. Students must have basic knowledge in programming in C as well as computer science theory. Students should be familiar with the material covered in the ETH computer science first-year courses "Parallele Programmierung (parallel programming)" and "Algorithmen und Datenstrukturen (algorithm and data structures)" or equivalent courses.

Abstract
The key challenge of the information society is to turn data into information, information into knowledge, knowledge into value. This has become increasingly complex. Data comes in larger volumes, diverse shapes, from different sources. Data is more heterogeneous and less structured than forty years ago. Nevertheless, it still needs to be processed fast, with support for complex operations.

Objective
Do you want to be able to query your own data productively and efficiently in your future semester projects, master thesis, or PhD thesis? Are you looking for something beyond the Python+Pandas hype? This courses teaches you how to do so as well as the dos and don'ts.

“Big Data” refers to the case when the amount of data is very large (100 GB and more), or when the data is not completely structured (or messy). The Big Data revolution has led to a completely new way to do business, e.g., develop new products and business models, but also to do science -- which is sometimes referred to as data-driven science or the “fourth paradigm”.

Unfortunately, the quantity of data produced and available -- now in the Zettabyte range (that's 21 zeros) per year -- keeps growing faster than our ability to process it. Hence, new architectures and approaches for processing it are needed. Harnessing them must involve a deep understanding of data not only in the large, but also in the small.

The field of databases evolves at a fast pace. In order to be prepared, to the extent possible, to the (r)evolutions that will take place in the next few decades, the emphasis of the lecture will be on the paradigms and core design ideas, while today's technologies will serve as supporting illustrations thereof.

After visiting this lecture, you should have gained an overview and understanding of the Big Data landscape, which is the basis on which one can make informed decisions, i.e., pick and orchestrate the relevant technologies together for addressing each one of your projects efficiently and consistently.

Content
This course gives an overview of database technologies and of the most important database design principles that lay the foundations of the Big Data universe. We take the monolithic, one-machine relational stack from the 1970s, smash it down and rebuild it on top of large clusters: starting with distributed storage, and all the way up to syntax, models, validation, processing, indexing, and querying. A broad range of aspects is covered with a focus on how they fit all together in the big picture of the Big Data ecosystem.

No data is harmed during this course, however, please be psychologically prepared that our data may not always be in third normal form.

- physical storage: distributed file systems (HDFS), object storage(S3), key-value stores
- logical storage: document stores (MongoDB), column stores (HBase), graph databases (neo4j), data warehouses (ROLAP)
- data formats and syntaxes (XML, JSON, RDF, Turtle, CSV,XBRL, YAML, protocol buffers, Avro)
- data shapes and models (tables, trees, graphs, cubes)
- type systems and schemas: atomic types, structured types (arrays, maps), set-based type systems (?, *, +)
- an overview of functional, declarative programming languages across data shapes (SQL, XQuery, JSONiq, Cypher, MDX)
- the most important query paradigms (selection, projection, joining, grouping, ordering, windowing)
- paradigms for parallel processing, two-stage (MapReduce) and DAG-based (Spark)
- resource management (YARN)
- what a data center is made of and why it matters (racks, nodes, ...)
- underlying architectures (internal machinery of HDFS, HBase, Spark, neo4j)
- optimization techniques (functional and declarative paradigms, query plans, rewrites, indexing)
- applications.

Large scale analytics and machine learning are outside of the scope of this course.

Course textbook: https://ghislainfourny.github.io/big-data-textbook/

Literature
Papers from scientific conferences and journals. References will be given as part of the course material during the semester.

Prerequisites / notice
The lecture is hybrid, meaning you can attend with us in the lecture hall, or on Zoom, or watch the recordings on YouTube later. Exercise sessions are in presence.

This course, in the autumn semester, is only intended for:
- Computer Science students
- Data Science students
- CBB students with a Computer Science background

Mobility students in CS are also welcome and encouraged to attend. If you experience any issue while registering, please contact the study administration and you will be gladly added.

For students of all other departements interested in this fascinating topic: I would love to have you visit my lectures as well! So there is a series of two courses specially designed for you:
- “Information Systems for Engineers” (SQL, relational databases): this Fall
- “Big Data for Engineers” (similar to Big Data, but adapted for non Computer Scientists): Spring 2023

There is no hard dependency, so you can either them in any order, but it may be more enjoyable to start with Information Systems for Engineers.

Students who successfully completed Big Data for Engineers are not allowed to enrol in the course Big Data.
The course will first cover fundamental concepts in data management: storage, locality, query optimization, declarative interfaces. This course familiarizes the students with some of the main tools and techniques in modern subareas of algorithm design. It covers a range of topics and techniques in approximation algorithms, sketching and streaming algorithms, and online algorithms. The course requires to have completed the Data Modeling and Data Bases course at the Bachelor level as it assumes knowledge of databases and SQL.

263-3210-00L  Deep Learning  W  8 credits  3V+2U+2A  T. Hofmann

Abstract
Deep learning is an area within machine learning that deals with algorithms and models that automatically induce multi-level data representations.

Objective
In recent years, deep learning and deep networks have significantly improved the state-of-the-art in many application domains such as computer vision, speech recognition, and natural language processing. This class will cover the mathematical foundations of deep learning and provide insights into model design, training, and validation. The main objective is to achieve a profound understanding of why these methods work and why. There will also be a rich set of hands-on tasks and practical projects to familiarize students with this emerging technology.

Prerequisites / notice
This is an advanced level course that requires some basic background in machine learning. More importantly, students are expected to have a very solid mathematical foundation, including linear algebra, multivariate calculus, and probability. The course will make heavy use of mathematics and is not (!) meant to be an extended tutorial of how to train deep networks with tools like Torch or Tensorflow, although that may be a side benefit.

The participation in the course is subject to the following condition:
- Students must have taken the exam in Advanced Machine Learning (252-0535-00) or have acquired equivalent knowledge, see exhaustive list below:
  - Advanced Machine Learning
    https://ml2.inf.ethz.ch/courses/aml/
  - Computational Intelligence Lab
    http://da.inf.ethz.ch/teaching/2019/CIL/
  - Introduction to Machine Learning
    https://las.inf.ethz.ch/teaching/pai-f18
  - Statistical Learning Theory
    http://ml2.inf.ethz.ch/courses/slt/
  - Probabilistic Artificial Intelligence
    https://las.inf.ethz.ch/teaching/pai-f18

263-3845-00L  Data Management Systems  W  8 credits  3V+11U+3A  G. Alonso

Abstract
The course will cover the implementation aspects of data management systems using relational database engines as a starting point to cover the basic concepts of efficient data processing and then expanding those concepts to modern implementations in data centers and the cloud.

Objective
The goal of the course is to convey the fundamental aspects of efficient data management from a systems implementation perspective: storage, access, organization, indexing, consistency, concurrency, transactions, distribution, query compilation vs interpretation, data representations, etc. Using conventional relational engines as a starting point, the course will aim at providing an in-depth coverage of the latest technologies used in data centers and the cloud to implement large scale data processing in various forms.

Content
The course will first cover fundamental concepts in data management: storage, locality, query optimization, declarative interfaces, concurrency control and recovery, buffer managers, management of the memory hierarchy, presenting them in a system independent manner. The course will place an emphasis on understanding these basic principles as they are key to understanding what problems existing systems try to address. It will then proceed to explore their implementation in modern relational engines supporting SQL to then expand the range of systems used in the cloud: key value stores, geo-replication, query as a service, serverless, large scale analytics engines, etc.

Literature
The main source of information for the course will be articles and research papers describing the architecture of the systems discussed. The list of papers will be provided at the beginning of the course.

Prerequisites / notice
The course requires to have completed the Data Modeling and Data Bases course at the Bachelor level as it assumes knowledge of databases and SQL.

Competencies

Subject-specific Competencies
Concepts and Theories  assessed
Techniques and Technologies  assessed

263-4500-00L  Advanced Algorithms  W  9 credits  3V+2U+3A  J. Lengler, B. Häupler, M. Probst

Abstract
This is a graduate-level course on algorithm design (and analysis). It covers a range of topics and techniques in approximation algorithms, sketching and streaming algorithms, and online algorithms.

Objective
This course familiarizes the students with some of the main tools and techniques in modern subareas of algorithm design.

Content
The lectures will cover modern topics in algorithm design and analysis, including the following: graph sparsifications while preserving cuts or distances, various approximation algorithms techniques and concepts, metric embeddings and probabilistic tree embeddings, online algorithms, multiplicative weight updates, streaming algorithms, sketching algorithms.

Lecture notes
https://people.inf.ethz.ch/~aroeyskoe/AA23

Prerequisites / notice
This course is designed for masters and doctoral students and it especially targets those interested in theoretical computer science, but it should also be accessible to last-year bachelor students.

Sufficient comfort with both (A) Algorithm Design & Analysis and (B) Probability & Concentrations. E.g., having passed the course Algorithms, Probability, and Computing (APC) is recommended, though not required formally. If you are not sure whether you're ready for this class or not, please consult the instructor.

Data: 26.07.2024 12:39  Autumn Semester 2024  Page 477 of 2680
Some of today’s most damaging attacks on computer systems involve exploitation of network infrastructure, either as the target of attack or as a vehicle to attack end systems. This course provides an in-depth study of network attack techniques and methods to defend against them.

The course will cover topics spanning four broad themes with a focus on the two first themes:
1. Network defense mechanisms such as public-key infrastructures, TLS, VPNs, anonymous-communication systems, secure routing protocols, secure DNS systems, and network intrusion-detection systems;
2. Network attacks such as hijacking, spoofing, denial-of-service (DoS), and distributed denial-of-service (DDoS) attacks;
3. Analysis and inference topics such as traffic monitoring and network forensics; and

In addition, several guest lectures will provide in-depth insights into specific current real-world network-security topics.

The course will involve several graded course projects. Students are expected to be familiar with a general-purpose or network programming language such as C/C++, Go, Python, or Rust.

This course is intended for students with an interest in securing Internet communication services and network devices. Students are assumed to have knowledge in networking as taught in a communication networks course like 252-0064-00L or 227-0120-00L. Basic knowledge of information security or applied cryptography as taught in 252-0211-00L or 263-4660-00L is beneficial, but an overview of the most important cryptographic primitives will be provided at the beginning of the course.

The later parts of the course will focus on applications to machine learning.

The course will cover statistical notions of privacy, in particular differential privacy, and selected topics in machine learning.

The second half will cover statistical notions of privacy, in particular differential privacy, and selected topics in machine learning privacy.

Lecture notes will be posted on Moodle.

Basic knowledge in cryptography, probability and machine learning is recommended but not required.

The second half will cover statistical notions of privacy, in particular differential privacy, and selected topics in machine learning privacy.

Basic knowledge in cryptography, probability and machine learning is recommended but not required.

Basic knowledge in cryptography, probability and machine learning is recommended but not required.

Basic knowledge in cryptography, probability and machine learning is recommended but not required.
### Prerequisites / notice

There are no prerequisites for this class. However, it will help if the student has taken an undergraduate or graduate level class in statistics, data science or machine learning. This class is appropriate for advanced undergraduates and master students in Computer Science as well as PhD students in other departments.

### 263-5056-00L Applications of Deep Learning on Graphs

<table>
<thead>
<tr>
<th>Content</th>
<th>Objective</th>
<th>Abstract</th>
</tr>
</thead>
<tbody>
<tr>
<td>Introduction to GNN concepts: 1) problem-solving on graphs (node-, edge-, graph-level objectives), structural priors (inductive biases) of graph data; applications for graph learning. 2) Graph Neural Networks: convolutional, attentional, message passing; overview on the zoo of published operators. Relations to Transformers and DeepSets. 3) Expressivity of GNNs. 4) Scalability of Graph Neural Networks: Subsampling, Clustering (Pooling). 5) Augmentations and self-supervised learning on Graphs Application: Drug Discovery, Knowledge graphs, Temporal GNNs, Geometric GNNs, Deep Generative Models for Graphs.</td>
<td>Many established deep learning methods require dense input data with a well-defined structure (e.g. image, a sequence of word embeddings). However, many practical applications deal with sparsely connected and complex data structures, such as molecules, knowledge graphs or social networks. Graph Neural Networks (GNNs) and general representation learning on graphs have recently experienced a surge in popularity because it addresses the challenge to effectively learn representations over said structures. In this course, we aim to understand the fundamental principles of deep (representation) learning on graphs, the similarities and differences to other concepts in deep learning, as well as the unique challenges from a practical point of view. Finally, we provide an overview of recent applications of graph neural networks.</td>
<td>Graphs are an incredibly versatile abstraction to represent arbitrary structures such as molecules, relational knowledge or social and traffic networks. This course provides a practical overview of deep (representation) learning on graphs and their applications.</td>

### 263-5058-00L Technology and Entrepreneurship

<table>
<thead>
<tr>
<th>Content</th>
<th>Objective</th>
<th>Abstract</th>
</tr>
</thead>
<tbody>
<tr>
<td>This course provides theoretical and practical insights into technology entrepreneurship. It focusses on the process of building new ventures from the idea to successfully scaling its business operations. All tasks will lead students to give a complete pitch presentation in front of business experts and investors at the end of the seminar. The course structure will broadly follow the four dimensions of the St.Galler Startup NavigatorTM. - Profiling (Problem-Solution-Fit): Here, students will learn to answer questions such as (1) what is your motivation to start a business? (2) What is the real customer problem? (2) What solution can be identified? (3) Who are the customers? (4) What is the job they need done? etc. - Profiling (Product-Market-Fit): After this section, students will be able to answer questions such as (1) What is the product or service that solves a customer need? (2) What is the value proposition? (3) What is the unique selling proposition? (4) What is the go-to market strategy? (5) Who are the competitors? etc. - Sourcing (Execution-Fit): Here, students will learn to address questions such as (1) What are important team roles? (2) How do we leverage the network and partners? (3) What are the requirements to execute the business? (4) Are there any IP-related challenges? (5) How may we co-create with others? etc. - Scaling (Performance-Fit): In this section, students will reflect their concept in terms of scalability. They will learn to answer questions such as (1) How do we create purpose-driven culture for growth? (2) How do we scale-up revenues? (3) How do we optimize our startup's valuation in Series-X funding? (4) What kind of exit options are there?</td>
<td>Students will develop internationally scalable and technology-based ventures using the Startup Navigator and ScaleUp Navigator Framework. They will learn how to structure and communicate these ideas to business angel and venture capital investors.</td>

(2) How do we leverage the network and partners? (3) What are the requirements to execute the business? (4) Are there any IP-related challenges? (5) How may we co-create with others? etc. - Scaling (Performance-Fit): In this section, students will reflect their concept in terms of scalability. They will learn to answer questions such as (1) How do we create purpose-driven culture for growth? (2) How do we scale-up revenues? (3) How do we optimize our startup's valuation in Series-X funding? (4) What kind of exit options are there?</td>

Communication assessed, C. Magnus, T. Stadler

Subject-specific Competencies

Machine Learning for Genomics assessed, Z. Bauer, F. Yu

W 5 credits fostered

The objectives of this course are:

The goal of this course is to provide students with a good understanding of computer vision and image analysis techniques. The main concepts introduced are:

- Camera models and calibration, invariant features, Multiple-view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition

- Computer graphics/vision experience: Students should have taken, at a minimum, Visual Computing. Higher level courses are recommended, such as Introduction to Computer Graphics, 3D Computer Vision.

- Good programming skills (C# / C++ / Java etc.)

- Computer graphics/vision experience: Students should have taken, at a minimum, Visual Computing. Higher level courses are recommended, such as Introduction to Computer Graphics, 3D Vision, Computer Vision.

- Epidemiology

- Pathogen evolution

- Stochastic models in molecular evolution

- Phylogenetic & phylodynamic inference

- Maximum likelihood and Bayesian statistics

- DNA, genes, genome, central dogma, transcription factors, epigenetic code, DNA methylation, signaling pathways

- Data imputation for single-cell RNA-seq data, clustering and annotation (diffusion and methods on graphs)

- Batch correction (autoencoders, optimal transport)

- Survival analysis (Cox proportional hazard model, regularization penalties, multi-omics, multi-tasking)

- Prediction of transcription factor binding sites, open chromatin, histone marks, promoters, nucleosome positioning (convolutional neural networks, position weight matrices)

- Prediction of variant effects and gene expression (hidden Markov models, topic models)

- Deconvolution of mixed signal (NMF, ICA)

- DNA, RNA and protein folding (RNN, LSTM, transformers)

Prerequisites / notice

Introduction to Machine Learning, Statistics/Probability, Programming in Python, Unix Command Line

263-5351-00L Machine Learning for Genomics W 6 credits 2V+2U+1A V. Boeva

Abstract

The course reviews solutions provided by machine learning to the most challenging questions in human genomics.

Objective

Over the last few years, the parallel development of machine learning methods and molecular profiling technologies for human cells, such as sequencing, created an extremely powerful tool to get insights into the cellular mechanisms in healthy and diseased contexts. In this course, we will discuss the state-of-the-art machine learning methodology solving or attempting to solve common problems in human genomics. At the end of the course, you will be familiar with (1) classical and advanced machine learning architectures used in genomics, (2) bioinformatics analysis of human genomic and transcriptomic data, and (3) data types used in this field.

263-5902-00L Computer Vision W 8 credits 3V+1U+3A M. Pollefeys, S. Tang, F. Yu

Abstract

The goal of this course is to provide students with a good understanding of computer vision and image analysis techniques. The main concepts and techniques will be studied in depth and practical algorithms and approaches will be discussed and explored through the exercises.

Objective

The objectives of this course are:

1. To introduce the fundamental problems of computer vision.
2. To introduce the main concepts and techniques used to solve those.
3. To enable participants to implement solutions for reasonably complex problems.
4. To enable participants to make sense of the computer vision literature.

Content

Camera models and calibration, invariant features, Multiple-view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition

Prerequisites / notice

It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts before taking this course.

263-5905-00L Mixed Reality W 5 credits 3G+1A Z. Bauer, C. Holz, M. Pollefeys

Abstract

The goal of this course is an introduction and hands-on experience on latest mixed reality technology at the cross-section of 3D computer graphics and vision, human machine interaction, as well as gaming technology.

Objective

After attending this course, students will:

1. Understand the foundations of 3D graphics, Computer Vision, and Human-Machine Interaction
2. Have a clear understanding on how to build mixed reality apps
3. Have a good overview of state-of-the-art Mixed Reality
4. Be able to critically analyze and assess current research in this area.

Content

The course introduces latest mixed reality technology and provides introductory elements for a number of related fields including:

- Introduction to Mixed Reality / Augmented Reality / Virtual Reality

- Introduction to 3D Computer Graphics, 3D Computer Vision. This will take place in the form of short lectures, followed by student presentations discussing the current state-of-the-art. The main focus of this course is to provide students with an overview of recent developments in mixed reality, focusing on the latest advances in computer graphics and vision.

- HoloLens in combination with C# and Unity3D - other platforms are also possible to use, such as tablets and phones.

- Research, to apps that support teaching with interactive augmented reality, or game development. The default platform will be Microsoft

Prerequisites / notice

It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts before taking this course.

636-0017-00L Computational Biology W 6 credits 3G+2A T. Vaughan, C. Magnus, T. Stadler

Abstract

The aim of this course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Computational algorithms extracting biological information from sequence data are discussed, and statistical tools to understand this information in detail are introduced.

Objective

Attendees will learn which information is contained in genetic sequencing data and how to extract information from this data using computational tools. The main concepts introduced are:

- stochastic models in molecular evolution
- phylogenetic & phylodynamic inference
- maximum likelihood and Bayesian statistics
- epidemiology
- pathogen evolution
- macroevolution of species
The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods for direct alignment analysis using approaches such as BLAST and GWAS. Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. Lastly, we introduce the field of phylodynamics, the aim of which is to understand and quantify population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

Lecture notes
Lecture slides will be available on moodle.

Literature
The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:
* Yang, Z. 2006. Computational Molecular Evolution.
* Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.

Prerequisites / notice
Basic knowledge in linear algebra, analysis, and statistics will be helpful. Programming in R will be required for the project work (compulsory continuous performance assessments). In case you do not have any previous experience with R, we strongly recommend to get familiar with R prior to the semester start. For the D-BSSE students, we highly recommend the voluntary course „Introduction to Programming“, which takes place in Basel before the start of the semester.

The deadline for deregistering expires at the end of the second week of the semester. Students who are still registered after that date, but do not attend the seminar, will officially fail the seminar.

Abstract
Participants will learn how to analyze and solve IT problems in practice in a systematic way, present findings to decision bodies, and defend their conclusions.

Objective
Participants understand the different viewpoints for IT-decisions in practice, including technical and business aspects, can effectively analyze IT questions from the different viewpoints and facilitate decision making.

Content
Participants learn how to systematically approach an IT problem in practice. They work in groups of three to solve a case from a participating company in depth, studying provided materials, searching for additional information, analyzing all in depth, interviewing members from the company or discussing findings with them to obtain further insights, and presenting and defending their conclusion to company representatives, the lecturer, and all other participants of the seminar. Participants also learn how to challenge presentations from other teams, and obtain an overview of learnings from the cases other teams worked on.

Lecture notes
Methodologies to analyze the cases and create final presentations. Short overview of each case.

Successful completion of Lecture "Information Technology in Practice".

252-4601-00L Current Topics in Information Security

The deadline for deregistering expires at the end of the second week of the semester. Students who are still registered after that date, but do not attend the seminar, will officially fail the seminar.

Abstract
The seminar covers various topics in information security: security protocols (models, specification & verification), trust management, access control, non-interference, side-channel attacks, identity-based cryptography, host-based attack detection, anomaly detection in backbone networks, management for sensor networks.

Objective
The main goals of the seminar are the independent study of scientific literature and assessment of its contributions as well as learning and practicing presentation techniques.

Data: 26.07.2024 12:39 Autumn Semester 2024 Page 481 of 2680
The aim of this seminar is to introduce students to recent research results in the area of programming languages and software engineering. Each student will be asked to study some papers from the recent software engineering literature and review them. This is an exercise in critical review and analysis. Active participation is required (a presentation of a paper as well as participation in discussions).

Selected Topics
- security protocols: models, specification & verification
- trust management, access control and non-interference
- side-channel attacks
- identity-based cryptography
- host-based attack detection
- anomaly detection in backbone networks
- key-management for sensor networks

The reading list will be published on the course web site.

The seminar covers advanced topics in computer vision, such as 3D reconstruction, image understanding, object detection, people tracking, motion prediction, and other related topics. Each time the course is offered, a collection of research papers is selected and each student presents one paper to the class and leads a discussion about the paper and related topics.

Seminar in Advanced Topics in Vision

The seminar will cover a number of recent papers which have emerged as important contributions to the pattern recognition and machine learning literature. The topics will vary from year to year but they are centered on methodological issues in machine learning like new learning algorithms, ensemble methods or new statistical models for machine learning applications. Frequently, papers are selected from computer vision or bioinformatics - two fields, which rely more and more on machine learning methodology and statistical models.

The papers will be presented in the first session of the seminar.

The seminar covers various topics in information security, including network security, cryptography and security protocols. The participants are expected to read a scientific paper and present it in a 35-40 min talk. At the beginning of the semester a short introduction to presentation techniques will be given.

Seminar in Advanced Topics in Machine Learning

The seminar “Advanced Topics in Machine Learning” familiarizes students with recent developments in pattern recognition and machine learning. Original articles have to be presented and critically reviewed. The students will learn how to structure a scientific presentation in English which covers the key ideas of a scientific paper. An important goal of the seminar presentation is to summarize the essential ideas of the paper in sufficient depth while omitting details which are not essential for the understanding of the work. The presentation style will play an important role and should reach the level of professional scientific presentations.

The seminar will cover a number of recent papers which have emerged as important contributions to the pattern recognition and machine learning literature. The topics will vary from year to year but they are centered on methodological issues in machine learning like new learning algorithms, ensemble methods or new statistical models for machine learning applications. Frequently, papers are selected from computer vision or bioinformatics - two fields, which rely more and more on machine learning methodology and statistical models.

The seminars are expected to read a scientific paper and present it in a 35-40 min talk. At the beginning of the semester a short introduction to presentation techniques will be given.

Research Topics in Software Engineering

The term "Research Topics in Software Engineering" introduces students to various areas in the field of software engineering. It will cover topics such as software architecture, development methods, and software testing. Each student will present a paper and lead a discussion about the paper and related topics.

Hardware Acceleration for Data Processing

The seminar will cover topics related to data processing using new hardware in general and hardware accelerators (GPU, FPGA, specialized processors) in particular.

Advanced Topics in Human-Centric Computer Vision

The seminar will cover topics related to data processing using new hardware in general and hardware accelerators (GPU, FPGA, specialized processors) in particular.

The general application areas are big data and machine learning. The systems covered will include systems from computer architecture, high performance computing, data appliances, and data centers.

Students taking this seminar should have the necessary background in systems and low level programming.

The seminars are expected to read a scientific paper and present it in a 35-40 min talk. At the beginning of the semester a short introduction to presentation techniques will be given.

Research Topics in Software Engineering

The term "Research Topics in Software Engineering" introduces students to various areas in the field of software engineering. It will cover topics such as software architecture, development methods, and software testing. Each student will present a paper and lead a discussion about the paper and related topics.

Hardware Acceleration for Data Processing

The seminar will cover topics related to data processing using new hardware in general and hardware accelerators (GPU, FPGA, specialized processors) in particular.

Advanced Topics in Human-Centric Computer Vision

The seminar will cover topics related to data processing using new hardware in general and hardware accelerators (GPU, FPGA, specialized processors) in particular.

The general application areas are big data and machine learning. The systems covered will include systems from computer architecture, high performance computing, data appliances, and data centers.

Students taking this seminar should have the necessary background in systems and low level programming.

The seminars are expected to read a scientific paper and present it in a 35-40 min talk. At the beginning of the semester a short introduction to presentation techniques will be given.
In this seminar we will discuss state-of-the-art literature on human-centric computer vision topics including but not limited to human pose estimation, hand and eye-gaze estimation as well as generative modelling of detailed human activities.

The learning objective is to analyze selected research papers published at top computer vision and machine learning venues. A key focus will be placed on identifying and discussing open problems and novel solutions in this space. The seminar will achieve this via several components: reading papers, technical presentations, writing analysis and critique summaries, class discussions, and exploration of potential research topics.

The goal of the seminar is not only to familiarize students with exciting new research topics, but also to teach basic scientific writing and oral presentation skills. The seminar will have a different structure from regular seminars to encourage more discussion and a deeper learning experience.

We will treat papers as case studies and discuss them in-depth in the seminar. Once per semester, every student will have to take one of the following roles:

Presenter: Give a presentation about the paper that you read in depth.

Reviewer: Perform a critical review of the paper.

All other students: read the paper and submit questions they have about the paper before the presentation.

Participation will be limited subject to available topics. Furthermore, students will have to submit a motivation paragraph. Participants will be selected based on this paragraph.

Seminar on User-Centered Programming Interfaces

Abstract
This course introduces students to research topics around the principles and practices of designing user-centered programming interfaces. We will explore and discuss research topics on understanding programmers from specialized domains, interactive programming paradigms, collaborative interfaces, learning-oriented interfaces, and AI's impact on future programming interfaces.

Objective
The goal of this course is for students to gain a comprehensive understanding of state-of-the-art HCI research on user-centered programming interfaces. Additionally, students will develop skills in reading, presenting, summarizing, and critiquing research papers.

Content
This is a research seminar course where we meet weekly for two-hour discussions on selected papers. Students are expected to lead a presentation on the assigned topic and actively participate in the discussions.

Competition
Method-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

Social Competencies
- Communication: fostered

Personal Competencies
- Adaptability and Flexibility: fostered
- Creative Thinking: fostered
- Critical Thinking: fostered
- Integrity and Work Ethics: fostered
- Self-awareness and Self-reflection: fostered
- Self-direction and Self-management: fostered

Topics in Medical Machine Learning

Abstract
This seminar discusses recent relevant contributions to the fields of medical machine learning and related areas. Each participant will hold a presentation and lead the subsequent discussion.

Objective
Preparing and holding a scientific presentation in front of peers is a central part of working in the scientific domain. In this seminar, the participants will learn how to efficiently summarize the relevant parts of a scientific publication, critically reflect its contents, and summarize it for presentation to an audience. The necessary skills to successfully present the key points of existing research work are the same as those needed to communicate own research ideas. In addition to holding a presentation, each student will both contribute to as well as review and evaluate their peers' presentations.

Content
The topics covered in the seminar are related to recent computational challenges that arise in the medical field, including but not limited to human pose estimation, hand and eye-gaze estimation as well as generative modeling of detailed human activities.

Prerequisites / notice
Knowledge of machine learning and interest in applications in medicine. ML4H is beneficial as a prior course.

Seminar on Digital Humans

Abstract
This seminar covers advanced topic in digital humans with a focus on the latest research results. Topics include estimating human pose and motion from images, human motion synthesis, learning-based human avatar creation, learning neural implicit representations for humans, modeling, animations, artificial intelligence for digital characters, and others. A collection of research papers is selected.

Objective
The goal is to get an overview of actual research topics in the field of digital humans and to improve presentation and critical analysis skills.
Content
This seminar covers advanced topics in digital humans including both seminal research papers as well as the latest research results. A collection of research papers are selected covering topics such as estimating human pose and motion from images, human motion synthesis, learning-based human avatar creation, learning neural implicit representations for humans, modeling, animations, artificial intelligence for digital characters, and others. Each student presents one paper to the class and leads a discussion about the paper. All students read the papers and participate in the discussion.

Literature
Individual research papers are selected each term. See https://vgl.inf.ethz.ch/, https://igl.ethz.ch/, and http://graphics.ethz.ch/ for example papers.

**Abstract**

This module addresses the demand for new business models for future transport systems. Why and in what way do people wish to be mobile? What are the economic, social and legal framework conditions, and how will these develop? What approaches leading to new value propositions will follow?

**Objective**

Participants

- can tell the difference between drivers of mobility which cannot really change and those which can change;
- are able to identify the effects of path dependence on transport systems and future transport systems;
- are familiar with the socio-psychological factors involved in transport vehicle acquisition and transport behaviour, and can apply them in ideas for new business models;
- are able to judge the significance of travel time, driving time and fixed costs and use this knowledge to identify new business models;
- are able to design incentives which will trigger maximum changes in behaviour and/or facilitate cooperative behaviour;
- are able to embed electric mobility conceptually such that its potential is realised and the associated risks are minimised;
- are familiar with the framework conditions and efficient drivers required to replace overland transport with air transport;
- are able to assemble combinations of political and market instruments on the basis of their efficiency profiles and side-effects in order to realise efficiency potentials and changes in behaviour;
- are able to design policy and market measures in such a way that they minimise rebound effects (including those in connection with automatic and fully autonomous vehicles);
- are able to recognise the properties of automatic and fully autonomous vehicles which are particularly suitable for new business models.

**Content**

- Why are people mobile? What resources (time, money, space) do they invest in mobility?
- What are the various qualities of transport services (comfort/stress, risk/safety, plannability, multifunctionality)?
- What are the various resource and quality profiles of current transport services, and what mutual dependencies are there?
- What current mobility demands are unsated? Why are they unsated? What future key technologies might change this?
- What current forms of mobility might be substituted by other transport services? If they were substituted, how would the necessary resources and transport service qualities change?

**Methods**

- Group work (groups of four and groups of two)
- Creative methods for generating value propositions
- Tasks in preparation for the fourth course day: design, implementation and analysis of a small survey of potential target clients regarding a not-yet-existing business model

**Case studies**

- Reciprocal presentation of personally compiled case studies

**Lecture notes**

Distributed at start of module.

**Literature**

Distributed at start of module.

**Prerequisites / notice**

Announced to students of the of the MAS | CAS at the beginning of the term.

**Abstract**

This module addresses the implementation of (digital) strategies and innovative business models of the future and elucidates the drivers, inhibitors and challenges of business model innovation. Using suitable methods and procedures, participants in the module develop, evaluate and refine prototypes of sustainable future business models.

**Objective**

Participants

- are able to understand and explain the core issues, concepts and strategies of business model innovation;
- are able to describe the relevance and the process of business model development;
- are able to translate a personally developed business case into a sustainable business model;
- are able to apply suitable design strategies to optimise a personally developed business model;
- are able to appropriately embed new business models into a corporate or business segment strategy;
- are able to assess the strengths, weaknesses, opportunities and risks of a business model;
- are able to convincingly present their own business case / business model in a structured manner to relevant stakeholder groups (investors, board members, clients, partners);
- are able to engage with and develop various points of view to assess business models;
- are able to shape a modelling process for themselves and reflect on it.
Content

Business model innovation:
• Conceptual foundations of business model innovation
• Drivers, inhibitors and challenges of business model innovation
• Business model innovation in established organisations and structures
• Case study and mini cases in the context of transport system / mobility business model innovation

Business modelling (essentials):
• Business model thinking and modelling
• The Business Model Canvas as a conceptual and methodological tool
  o Customer benefits / value propositions
  o Demand side
  o Supply side
• Business model patterns

Business modelling (application)
• Creation of a real business case for business modelling
• Business model prototyping (basis: Business Model Canvas)
• Evaluation and review/re-prototyping of participants' own business cases / business models

Incorporating new business models into corporate / business segment strategies
• Fit with strategic analysis
• Compliance with corporate or business segment strategy
• Contribution to strategy implementation

Presenting business models convincingly (basics/application)
• Basics of business model presentation
• Development of participants' own storylines and presentation structure (business value concept)
• Pitching of own business case / business model

Methods
• Blended learning elements to prepare for classroom sessions
• Case studies and examples; group work (4-person and 2-person groups)
• Classroom discussions to introduce relevant concepts and instruments
• Homework for the 4th and 5th NG-2 course days: Develop a structured presentation of a personally developed business case (business model) for delivery to relevant stakeholder groups (investors, board members, clients, partners)

Case studies
• Reciprocal presentations of personally developed business cases

166-0302-00L Implementing New Strategies and Business Models for Future Transport Systems
O 3 credits 2G

Abstract
In order to be successful, new strategies / innovative business models have to be implemented in the market as well as in the company itself. This requires proactively managed transition processes. This module deals with such transition processes on three levels: change management theory – best-practice examples – one's own practice.

Objective
Participants:
• know and understand selected classic and current theories regarding change (management) in systems
• know how to design and initiate participative transition processes
• are familiar with / know how to apply selected tools of change management
• have discussed best-practice cases with responsible managers within the mobility/transportation sector
• have reflected theory and best-practice cases in regard to their own practice
• have developed management options and approaches for their own practice

Content
• Classic and current change management approaches
• Communication in transition processes
• Participation: integration of stakeholders
• Dealing with resistances
• Discussions with guests from practice regarding the management of transition processes related to the implementation of new strategies / business models

Methods
• Selected change management methods and tools

Case studies
• Various good/best practice cases within the mobility sector
• Change cases of students

Announced to students of the of the MAS | CAS at the beginning of the term.
Abstract
For companies it is essential to realise products quickly, economically and in a customer-oriented way. In this context approaches to agile and user-centred product development such as Scrum and Design Thinking are increasing in importance. Compared to traditional product development methods, agile methods promise higher quality and customer satisfaction coupled with reduced expenditure.

Objective
Design and realisation of product development projects for future transport systems: Participants are familiar with the methods and procedures of agile and user-centred product development and are able to apply them profitably in their enterprises.

Content
Participants define an innovation theme themselves in groups, and a selection of topics is then drawn from this theme for module group work. The module takes participants through the whole process, from the analysis of target groups and their requirements through project conception and planning to implementation in example form. The course is practical and uses concrete examples. At the end of the module participants will have deployed the methods of agile and user-centred product development to work very practically through a theme they have developed themselves, and will have become familiar with the typical application scenarios, advantages and hurdles associated with these methods.

Abstract
Interrelationships and dynamic change and the impact of these on mobility and transportation are being investigated in this module. The module addresses desirable future development of urban transport systems in Switzerland by covering and critically examining authentic, existing transport scenarios (e.g. ARE) in an exercise setting which deploys backcasting.

Objective
Participants
- understand the complexity of the transport system status quo as a whole, and are able to describe it qualitatively and create an operational and/or working context (K1).
- understand the development of transport systems and future transport scenarios over time, and can infer objectives from the latter (K2).
- understand the dynamics between spatial quality and mobility behavior and can evaluate how measures to promote active mobility can contribute to a more sustainable transport system (K3).
- understand how digitalisation drives new mobility services (mobility as a service), and are able to qualitatively estimate the changes these bring to transport systems as a whole (K4).
- are able to pinpoint the challenges and potential of the transition to autonomous transport forms (K5).

Content
- Deepen understanding of complex transport systems and their dynamics past – status quo – future
- Consolidate a foundation in the dynamics of transport systems: elements and their interrelationships
- Overview and selection of methods/approaches for the development and analysis of scenarios
- Future perspectives (ARE), target scenarios
- Transformation and change in systems
- Transport policy and the potential of regulation
- Excursion: "Infrastructure to support active mobility: Bike capital Bern"

Methods
- System analysis, scenario analysis, foresight, indicators for sustainable mobility, Case studies, reading and discussion of thesis papers and scientific publications

Abstract
This module familiarises participants with current methods of developing and evaluating transport scenarios. These include analysis of the interrelationship of space and traffic; traffic modelling methods; and evaluation according to economic and planning criteria.

Objective
Participants
- are familiar with suitable methods for developing transport scenarios and how to analyse and evaluate them. In particular, they know how to address the challenges of evaluating future forms of transport;
- are able to select a suitable method and determine an evaluation concept with relation to a specific problem.

Content
- Methodological foundations of traffic modelling (44-level model, activity-based model, agent-based simulation)
- Design and evaluation of transport scenarios using MATSim (traffic simulation) with a focus on transport with autonomous vehicles
- Interrelationship of space and traffic (accessibility measurement, settlement density and mixed usage) and what to consider in designing and evaluating transport scenarios
- Approaches to evaluation of traffic scenarios (cost-benefit analyses and their foundations, methodological limits), analysis of effects taking into account user group and space type
- Ecobalancing with Life Cycle Assessment (LCA) in addressing passenger and goods transport issues
- Development of case studies on shared transport and mobility with an activity- and agent-based transport simulation model

Methods
- Aggregated and activity-based transport demand models
- Agent-based simulation
- Cost-benefit analysis
- Accessibility analysis

Abstract

Objective
Participants are able...
- to understand the economic and social-science fundamentals of innovation and change processes in the area of transportation;
- to analyse the foundations, opportunities and challenges of disruption in mobility systems;
- to set this concepts and frameworks in context to pathways towards more sustainable mobility;
- and to set these concepts and frameworks constructively in context to their own work practice.
In this module, innovation, change and transitions in transportation systems on different levels are discussed from different complementary perspectives. Both economic and social science approaches to the analysis, anticipation and governance of innovation processes are presented, discussed and applied to current issues. Topics are:
- Respective theories and methods;
- Innovation as an economic discovery process, measuring innovation;
- Emerging trends as new opportunities for innovation;
- Innovation today in the transportation/mobility system: theoretical basis and concrete examples;
- Transition of socio-technical systems, co-evolution of technical and societal dynamics;
- The relevance of social acceptance and ethical aspects for innovations in mobility.

**166-0103-00L** System Aspects of Air and Shipping Traffic
*Does not take place this semester.*

**Abstract**
Air and shipping traffic cover a substantial part of human mobility, air traffic in passenger as well as freight transport, shipping mainly in freight transport. Students gain an overview, limit modes of mobility and learn to classify air and shipping traffic in the overall system of mobility.

**Objective**
- Participants
  - know the fundamental differences between air, shipping traffic compared to motorized individual transport and public transport.
  - are able to deduce differences between air and shipping traffic.
  - know the possibilities and limits as well as pros and cons of different valuation methods used for air and shipping transport.
  - develop ideas for suitable indicators to evaluate scenarios in air and shipping traffic.
- 
  - Key figures, development and trends in air and shipping traffic.
  - Potentials for holistic improvement in air and shipping traffic.
  - Life Cycle Assessment (LCA) for questions in air and shipping traffic.
  - Overview on technologies and their potentials to improve sustainability in air and shipping transport.
  - Berechnung und Interpretation von Kennzahlen.

**Abstract**
The participants deal with a current problem from the topics of CAS System Aspects.

**Objective**
- Deal with a specific problem from the CAS System Aspects subject area.
- Deepen selected content from module independently
- Be able to work interdisciplinary and across sectors, where appropriate together with relevant other parties.
- Communicate the results appropriately.

**Content**
In der CAS-Arbeit zeigen die Studierenden, dass sie in der Lage sind, eine fundiert aufbereitete Auseinandersetzung mit technischen und nicht-technischen Entwicklungen im Mobilitätsystem und deren mögliche Auswirkungen auf das Schweizer Verkehrssystem oder auf Teilbereiche desselben anzufertigen.

Die Teilnehmenden setzen sich dabei aktiv mit aktuellen und/oder zukünftig erwarteten Entwicklungen im Mobilitätssektor auseinander, übersetzen mögliche Entwicklungen in verkehrliche Parameter (=Zukunft der Mobilität); greifen auf Lerninhalte des Studiums zurück; entwickeln ausgewählte Themen selbständig weiter (bzw. im Rahmen einer Arbeitsgruppe) und setzen sich mit der Relevanz für die Praxis auseinander (Relevanz für Stakeholdergruppen wie z.B. politische Entscheidungsträger, Verkehrsunternehmen, Industrie, Umweltverbände, Energieversorger sowie auch andere gesellschaftliche Gruppen, z.B. für Menschen im Rentenalter).

#### Content

- **Technology Potential: Powertrain, Systems and Energy Carriers**
  - Does not take place this semester.
  - Abstract: The module provides a foundation in the current situation and short- and middle-term development directions of powertrain and automotive engineering in the context of passenger & goods transport. Corresponding energy sources and resulting consequences for the energy system are addressed. Participants will be enabled to identify potentials of these technologies and apply them to concrete problems.
  - Objective: Familiarity with conventional and alternative powertrain and automotive systems for future sustainable mobility, and the ability to identify and deploy their potential to address concrete problems.
  - Content:
    - Drive component efficiency rates and core fields
    - Drive and non-drive energy flow / Vehicle "driving resistance"
    - Energy chains (operating power only) and CO2 emissions to primary energy
  - Lecture notes: Distributed at start of module
  - Literature: Distributed at start of module
  - Prerequisites / notice: Announced to students of the of the MAS / CAS at the beginning of the term

- **Potential of Spatial Information- and Communication Technologies**
  - Does not take place this semester.
  - Abstract: The digital revolution, spatial information and communication systems in particular, have a significant influence on the development of new transport systems. Participants acquire an in-depth understanding of the functionality and application potential of spatial information systems and services and of communication technologies for deployment in future transport systems and applications.
  - Objective: Familiarity with information and communication technologies (ICT) and spatial information technologies, and the ability to identify and utilise their potential to address concrete problems.
  - Content:
    - Functionality and application of geographic information systems (GIS) to represent and analyse transport systems (acquire, model, analyse and visualise geodata)
    - Deployment potentials of GIS and ICT for efficient transport solutions (tangible, non-tangible)
    - Functionality and application of mobile spatial information technologies in future transport systems
    - Methods of spatiotemporal analysis and geodata analysis
    - Technical aspects of information and communication technologies (ICT)
    - Modelling, simulation and assessment of traffic behaviour
    - Basics of autonomous driving
    - Legal aspects of geodata
    - Applications: Traffic behaviour in Switzerland; location based services for energy-efficient behaviour; GIS for the Zurich traffic system (multimodal)
  - Lecture notes: Distributed at start of module
  - Literature: Distributed at start of module
  - Prerequisites / notice: Announced to students of the of the MAS / CAS at the beginning of the term

- **Integrated Assessment of Technologies and Transport Systems**
  - Does not take place this semester.
  - Abstract: The module provides a solid introduction to integrated technology assessment with regard to economic, ecological and social criteria. It introduces life cycle assessment (LCA), cost assessment, risk assessment and multi-criteria decision analysis. It also presents scenario analyses based upon energy-economic models which explicitly represent transport and energy-supply technologies.
  - Objective: An overview of suitable methods for analysing and evaluating technical systems (transport systems) and the ability to choose among them to address concrete problems.
  - Content:
    - (1) Introduction to and overview of integrated assessment
      - Current status of transport in Switzerland and internationally
      - Scope and goals of integrated assessment
      - Sustainability: concept and practical implementation via criteria and indicators
      - Overview of concepts and implementation methods
    - (2) Selected methods for assessing transport technologies and their application to current and future options
      - Ecbalance / life cycle assessment (LCA)
      - Location-specific assessment of health hazards and environmental pollution
      - Risk analysis
      - Internal cost assessment
      - External cost assessment
    - (3) Integrated assessment of transport technologies
      - Overall costs (internal and external)
      - Multi-criteria analysis
    - (4) Analysis of transport scenarios
      - Scenarios, influencing factors, policy and sustainability
      - Approaches to scenario modelling
      - Global mobility scenarios: examples
      - Transport scenarios for Switzerland using energy system models
  - Lecture notes: Distributed at start of module
  - Literature: Distributed at start of module
  - Prerequisites / notice: Announced to students of the of the MAS / CAS at the beginning of the term
The module includes the supply of the road mobility of the future with renewable energy. The generation, transport, processing, transfer of energy to the vehicles (refueling, charging) and the energetic evaluation are presented. Electricity, hydrogen, biogenic and synthetic fuels are considered.

The aim of the module is a detailed energetic and technical understanding of the supply of road vehicles with renewable energy. Graduates know the primary energy production as well as the end energy processing of the different energy carrier concepts. In addition, they know the legal CO2 requirements for vehicle registration and are able to qualitatively assess the impact on the Swiss energy system.

The participants, in heterogeneous teams, deal with a current problem from the topics of the CAS Technology Potentials. 
- Deal with a specific problem from the CAS Technology Potentials subject area.
- Be able to work interdisciplinary and across sectors, where appropriate together with relevant other parties.
- Communicate the results appropriately.

| 752-6403-00L | Nutrition and Performance       | W    | 2 credits | 2V    | S. Mettler |
| Abstract     | The course introduces basic concepts of the interaction between nutrition and exercise performance. |
| Objective    | To understand the potential effects of nutrition on exercise performance, with a focus on concepts and principles of nutrition before, during and after exercise. |
| Content      | The course will cover elementary aspects of sports nutrition physiology, including carbohydrate, glycogen, fat, protein and energy metabolism. A main focus will be to understand nutritional aspects before exercise to be prepared for intensive exercise bouts, how exercise performance can be supported by nutrition during exercise and how recovery can be assisted by nutrition after exercise. Although this is a scientific course, it is a goal of the course to translate basic sports nutrition science into practical sports nutrition examples. |
| Lecture notes| Lecture slides and required handouts will be available on the ETH website (moodle). |
| Literature   | Information on further reading will be announced during the lecture. There will be some mandatory as well as voluntary readings. |
| Prequisites / notice | General knowledge about nutrition, human biology, physiology and biochemistry is a prerequisite for this course. The course builds on basic nutrition and biochemistry knowledge to address exercise and performance related aspects of nutrition. |
| The course is designed for 3rd year Bachelor students, Master students and postgraduate students (MAS/CAS). |

| 752-6301-00L | Nutrition-Related Physiology   | W    | 3 credits | 2V    | F. von Meyenn, E. Gasser |
| Abstract     | Gives the students background knowledge necessary for a basic understanding of the complex relationships between food composition and nutrition on one hand and the functioning, as well as the malfunctioning, of major organ systems on the other hand. |
| Objective    | The aim is to give the students background knowledge necessary for a basic understanding of the complex relationships between food composition and nutrition on one hand and the functioning, as well as the malfunctioning, of major organ systems on the other hand. For students with a background in medicine, pharmacy or biology, the course is useful as a review of previously acquired knowledge. Major topics are basic neuroanatomy and neurophysiology; general endocrinology; the physiology of taste and smell; nutrient digestion and absorption; intermediary metabolism and energy homeostasis; and some aspects of cardiovascular physiology and water balance. |
| Lecture notes| Handouts for each lecture will be uploaded to Moodle every week. |

**Abstract**

This first module of the CAS Nutrition in Medicine will provide an overview of the most important concepts of nutrition. The introduction to nutrition specific physiology, will be followed by a more detailed overview of the macro- and micronutrients as well as their importance to health and disease.

**Objective**

Students can describe the basic concepts of nutrition
Students can name the different macronutrients and can explain how they are metabolized
Students can classify vitamins and minerals and can describe the most important deficiencies

**Competencies**

- **Subject-specific Competencies**
  - Concepts and Theories: assessed
- **Method-specific Competencies**
  - Problem-solving: assessed
- **Social Competencies**
  - Communication: fostered

*Does not take place this semester.*

**Abstract**

This module introduces the basic concepts of classic dietary assessment and of dietary reference values. In addition, novel, digital methods for food monitoring as well as health in general will be introduced. Biomarkers for nutritional assessment will build the last part of this module.

**Objective**

Students can apply classic dietary assessment methods and interpret generated results
Students can describe the general concept of digital health
Students know how to apply methods for digital nutrition monitoring and understand their benefits and limitations

**Competencies**

- **Subject-specific Competencies**
  - Concepts and Theories: assessed
- **Method-specific Competencies**
  - Media and Digital Technologies: fostered
- **Social Competencies**
  - Cooperation and Teamwork: fostered

**Abstract**

The module Nutrition in metabolic disease will cover aspects of endocrinology and physiology in relation to nutrition, as well as specifically focus on nutritional aspects of obesity (including childhood obesity), type 2 diabetes including its therapy as well as muscle and exercise. In addition, different diet forms and their effects will be discussed.

**Objective**

Students understand how nutrition is closely linked to endocrinology.
Students can develop nutritional strategies to improve health of obese patients.
Students can apply nutritional concepts in the support of treatment and prevention of type 2 diabetes.
Students can judge different diet forms in terms of their effect health/specific health aspects.

### ECTS

- European Credit Transfer and Accumulation System
- Special students and auditors need special permission from the lecturers.
An essential basis for the responsible handling of the built heritage is the ability to recognize its characteristics and special features from an architectural-historical perspective and to objectively work out its historical testimonial value. This requires knowledge of scientific methods as well as the ability to undertake targeted research and critically evaluate source material in order to productively incorporate it into the analysis. The first part of the seminar is devoted to an introduction to academic work in the field of architecture and cultural studies. This lays the foundation for the second part which deals with the independent academic appraisal of an individual building.

### Seminar Texts on Preservation

**Title:** Seminar Texts on Preservation

**Number:** 079-0101-00L

**Type:** O

**ECTS:** 3 credits

**Hours:** 2S

**Lecturers:** R. Rehm

**Abstract:** In the seminar, selected texts on architectural theory and monument preservation are read together and discussed in plenary. The focus is on selected writings from John Ruskin, Gottfried Semper and Friedrich Nietzsche to Alois Riegl and Adolf Loos to Walter Benjamin, Aleida Assmann and Peter Zumthor.

**Objective:** Skills in reading complex theoretical and literary writings on architecture and monument preservation are taught. With increasing practice, these enable participants to undertake an independent appropriation of architectural theory and monument preservation content.

**Content:** The writings on architectural theory and historic preservation discussed in the seminar provide an overview of the most important theories and concepts of historic preservation. Ruskin’s narrative of architectural historicity, Semper’s conception of “Bekleidung” and Nietzsche’s transformation of mythology are covered, as are Riegl’s notions of “Erinnerungswert” and “Gegenwartswert”, Loos’ writings on architecture, Benjamin’s notion of aura and Aleida Assmann’s memory space as well as Peter Zumthor’s atmosphere. Each text is discussed in terms of textual structure, conceptual history, visual language, relationship to poetry and literature, strategies of theory, etc. Identifying the levels and intersections that link a theory with other theories characterises one of the main tasks of our seminar.

**Competencies:**

- **Subject-specific Competencies:** Concepts and Theories assessed
- **Method-specific Competencies:** Analytical Competencies assessed
- **Analytical Competencies:** Decision-making assessed
- **Problemsolving:** Media and Digital Technologies assessed
- **Social Competencies:** Cooperation and Teamwork assessed
- **Personal Competencies:** Sensitivity to Diversity assessed
- **Adaptability and Flexibility:** Critical Thinking assessed
- **Integrity and Work Ethics:** Self-awareness and Self-reflection assessed
- **Self-direction and Self-management:** Communication assessed

### Future Monuments

**Title:** Future Monuments

**Number:** 063-0911-24L

**Type:** W

**ECTS:** 2 credits

**Hours:** 2V

**Lecturers:** S. Langenberg

**Abstract:** Heritage conservation is dedicated to the preservation and protection of historical buildings. In this lecture, students will learn about the theoretical positions on historic monuments and the basics of preservation in practice.

**Objective:** In addition to active participation in the discussions, students will be asked to engage with a topic or object of their own choice in order to be able to develop and comprehensively justify their own positions within the context of preservation. Our goal here is to foster students’ communication skills and the culture of discussion.

**Content:** The responsible reconstruction and further development of the existing building stock requires knowledge and an understanding of the theoretical positions conservation and the basics of preservation in practice. The core course of spring semester 2024 conveys this knowledge to students with the help of selected writings and discusses them in the context of various guest lectures.

</table>

**Abstract**
The course elaborates the legal concept of “monument” in its important distinction from the respective scientific concept. It highlights its embeddedness and effect in public building law. Furthermore, it deals with legal protection instruments and procedures.

**Objective**
In addition to elaborating the legal concept of monuments, the course familiarises participants with legal protection instruments and procedures. It is planned to involve the participants by means of practical examples.

**Content**
The first part is devoted to substantive preservation law: legal foundations and qualification of an object as a “monument”, structural-legal aesthetics and architectural monument, scope of protection as well as prerequisites for protection. The second part deals with the procedures: Responsibilities of the various authorities/­bodies, record of objects, provisional and definitive protection (in particular according to the protection objective and effect of the various protection instruments) and appellate proceedings. In accordance with the lecturer’s (Dr. Dominik Bachmann) practical experience, formal preservation law is based on Zurich law, the principles of which, however, also apply in the monument preservation ordinances of the other cantons, which differ in detail. These are referred to selectively and by way of example.

### 079-0151-00L Theory and History of Preservation

<tbody>
<tr>
<td>O</td>
<td>2</td>
<td>2V</td>
<td></td>
</tr>
</tbody>
</table>

**Abstract**
The course provides an overview of theory formation in heritage conservation. The focus is on European history and German-language texts.

**Objective**
The aim of the course is to familiarise students with the essential subject areas, the most important protagonists and lines of argumentation from antiquity to the 21st century, and to contrast the different approaches to thought and their development.

**Content**
In order to get to know the formation of theory, its paths and detours, the most important terms and persons in the history of monument conservation are introduced. Based on various texts, the history of the protection of architectural monuments since antiquity is illuminated. Further focal points in the history of monument preservation were during the Enlightenment, the French Revolution and in the process of the formation of nation states. The discourse on the concept and practice of monument conservation as we understand it today was led by a number of conservators in the German-speaking world around 1900. War-related destruction and the incipient building boom in Europe led to modern debates on the theory of monuments, which are still relevant today. Dealing with monument values is not an end in itself; it can be essential for the preservation of the monument or for historical mediation. Critical positions on the tasks, goals or practices of heritage preservation can only be developed against the background of a knowledge of its historical approaches.

**Prerequisites / notice**
To follow
Abstract
In addition to theory, heritage conservation also plays an important practical role in the current building revolution. In order to make the diverse possibilities in architecture visible, this course develops new strategies for communicating the discipline of monument preservation for an exhibition on this topic at S AM in 2025.

Objective
The aim of the seminar is to develop concepts for communicating and exhibiting heritage-related content and debates that go beyond specialist discourse and address a broader public. As part of the course, participants will acquire in-depth knowledge of various exhibition strategies in the field of architecture and will have the opportunity to develop exhibits for an exhibition organised by the S AM Swiss Architecture Museum (Basel) in collaboration with the Chair of Construction Heritage and Monument Preservation at ETH Zurich and ICOMOS Suisse in spring 2025.

Content
At a time when the maintenance of existing buildings is seen as an essential element of the building revolution, the theory and practice of heritage conservation is taking on an integral role. Nevertheless, heritage conservation still has to contend with image problems: people often misunderstand exactly what its aim is and, unaware of its mission, principles and (still highly topical) theories, the discipline is often assumed to have a purely conservative attitude. 50 years after the European Year of Monument Conservation in 1975, when the whole of Europe was dominated by the question of how to preserve the built heritage, there is no need for a fundamental repositioning, but there is certainly a need for an “update” on issues of monument conservation and its attitude in the face of current challenges. The joint exhibition at the S AM Swiss Architecture Museum in spring 2025 is dedicated to this topic. The course offers the opportunity to deal with architectural exhibition strategies and to participate in the development of various concepts for communicating the theory and practice of heritage conservation. New guiding principles for the future practice of heritage conservation will be jointly derived on the basis of best practice examples. In group work, current examples of successful cooperation between heritage conservation and architecture will be analyzed and documented for presentation in the exhibition in the form of drawings, texts and models. Depending on the number of participants, other parts of the exhibition can also be the subject of the work.

Prerequisites / notice
The course addresses primarily students of the MAS ETH in Denkmalpflege und Konstruktionsgeschichte and the CAS ETH in Future Heritage.

Abstract
In their CAS thesis, participants synthesize their learning and apply their insights to their own institutions or examine a relevant topic employing the course methodologies.

Objective
Practical application of course content and concepts.

Abstract
The programme equips the next generation of leaders in the public sector and other sectors dealing with governance matters with the necessary competencies to tackle complex governance challenges.

Objective
Participants learn to:
- Understand key governance frameworks and international blueprints; comprehend underlying drivers & challenges affecting governance;
- dissect multi-dimensional policy issues; lead effectively across the spectrum of technical, human and conceptual challenges.

Content
The program encompasses a sequence of one or half-day modules, which are organized into three interdisciplinary learning blocks:

I. Contemporary Governance
In this block, participants examine the broad frameworks within which public sector work takes place. Students will explore what governance in the 21st Century means as well as the theoretical and practical nature of organizational, legal, regulatory and financial dimensions of public institutions and processes. With input from multiple disciplines, students gain the ability to contextualize and critically assess the local, national as well as international context of their individual work.

II. Public Management
In this block, students are challenged to expand their management toolbox through lectures providing them with theoretical context and practical insights into various aspects of public management. The goal is for participants to enhance their ability to lead and motivate teams, to negotiate effectively and to communicate with a variety of stakeholders.

III. Policy Domains
This block covers relevant and rapidly changing policy domains. Special attention is paid to interlinkages between specific policy areas. Students gain the big picture knowledge necessary to make informed managerial decisions within complex processes and initiatives.

Abstract

Module I:
Knowledge of the fundamentals of development, preparation, testing and stability of sterile radiopharmaceutical preparations. Acquisition of basic information on European legislation in Radiopharmacy including GMP and Pharmacopoeia. Understanding basics of gene engineering and pharmacokinetics.

Objective

- Good manufacturing practice (GMP) of classical radiopharmaceuticals
- GMP: industrial point of view
- Molecular and cellular aspects of radiobiology
- Pharmacopoeia
- Pharmacopoeia – how to use it
- Design of dosage forms for pharmaceuticals
- Pharmaceutical packaging
- Methods of preparation of sterile products
- Aseptic preparation
- The role of excipients in parenteral radiopharmaceutical preparations
- Sterility testing and endotoxin determination
- Particulate contamination
- Principles of medicinal chemistry
- An overview of modern pharmaceutical analysis
- Genetic engineering
- Stability and shelf-life of pharmaceuticals
- (in)stability of radiopharmaceuticals
- Legislation in radiopharmacy
- European directives – GMP
- Specific radiopharmaceutical legislation
- Clinical trials directive and related documents
- The small scale, non-commercial preparation of radiopharmaceuticals
- GMP of PET radiopharmaceuticals
- Quality assurance and preparation of SOP
- Water for pharmaceutical use
- Practicals: visit to hospital radiopharmacy
- Basic concepts of pharmacokinetics
- Drug regulatory affairs
- Microbiology in Pharmacy
- Visit to pharmaceutical company

Abstract

Knowledge about the fundamentals of pharmacokinetics and pharmacokinetic modelling, the basic concepts of pharmacology and toxicology, radiopharmaceutical monographs in the European pharmacopoeia, radiological imaging modalities and the basics of applied statistics in biomedical research. Understanding the fundamentals of nuclear medicine: Diagnostic applications in neurology and oncology therapy.
Objective

- Students know about:
  - Pharmacokinetics and kinetic-modelling
  - Statistics and practical session
  - Radiotracers in biochemistry and molecular pharmacology
  - Selective modification of peptides and proteins to target GPCRs
  - Demonstration of experimental set up: Peptide and protein modification, radioactive assays in biochemistry
  - Visit ABX Radeberg
  - Nuclear medicine: basics and therapy
  - Immunology
  - Drug interventions/interactions/adverse reactions
  - Pharmacology basics, special aspects, clinical studies
  - Toxicology
  - Testsystems in toxicology and targeted therapeutics and nucleic acids
  - Nuclear medicine: clinical diagnostic applications in neurology
  - Nuclear medicine: visit to SPECT facility and radiopharmaceutical GMP lag (Tc, Ga, therapy)
  - Radiological imaging modalities- technology and applications
  - Radiopharmaceutical monographs in the European pharmacopoeia
  - Practical session, visit: cyclotron, GMP PET production and quality control, PET and PET/CT, therapy unit
  - Radioligand-binding-assays/autoradiography
  - In house tours in groups: radioligand-binding-assays, autoradiography, metabolite analytics with LC-MS, cyclotron and radiochemistry, highlights in Leipzig
  - Biological effects of radiation
  - Radiotracer transport and blood brain barrier
  - Radiotracers for neuroimaging

CAS in Regenerative Materials - Hygrothermal Specialisation
Offered only in the Autumn Semester.

Module Details

**Number**: 136-0201-00L  
**Title**: General Knowledge on Hygrothermal Building Physics  
**Type**: O  
**ECTS**: 2 credits  
**Hours**: 3G  
**Lecturers**: G. Habert

**Abstract**: Regenerative Materials can be used to build high-quality envelopes and high-comfort environments. The course presents the basics of hygrothermal building physics and the state of the art in this field. It gives an overview of the type of earth- and bio-based materials that can be used and their hygrothermal properties.

**Objective**
- Learn the diversity of regenerative materials used for high-quality envelopes and high-comfort environments
- Learn how to distinguish earth- and bio-based materials based on their hygrothermal properties
- Ensure an efficient and durable impact on participants' professional development

**Content**: The course presents which regenerative materials can be used to build high-quality envelopes and high-comfort environments. It details the basics of hygrothermal building physics: Evolution of standards and models; Strength and weaknesses of Regenerative Materials; State of the art and market evolution. It also gives an overview of the diversity of earth-based materials (plasters, blocs, monolith walls); bio-based materials (wool and rigid panels, bulk fibers); and low-impact composites (light mixes combining mineral binder to bio-sourced materials) from resource to implementation, with a synthesis of their hygrothermal properties and their impact on comfort and energy savings.

**Competencies**
- Subject-specific Competencies: Concepts and Theories, Techniques and Technologies
- Method-specific Competencies: Analytical Competencies, Decision-making
- Social Competencies: Self-presentation and Social Influence, Sensitivity to Diversity
- Personal Competencies: Adaptability and Flexibility, Creative Thinking

**Module Details**

**Number**: 136-0202-00L  
**Title**: Constructive Details & Implementation of Regenerative Envelopes  
**Type**: O  
**ECTS**: 2 credits  
**Hours**: 3G  
**Lecturers**: G. Habert

**Abstract**: The course is focused on constructive details for regenerative materials used to build high-quality envelopes and high-comfort environments. The participants are mainly learning through a hands-on workshop during which they will produce different prototypes in small groups.

**Objective**
- Apply knowledge from previous course on high-quality envelopes built with regenerative materials
- Learn how to compare different constructive systems built with regenerative materials to conventional building techniques considering thermal insulation, thermal mass, moisture regulation and air tightness
- Ensure an efficient and durable impact on participants' professional development

**Content**: Small groups producing different prototypes during a hands-on workshop. Each group designs and realizes a prototype to explore a specific constructive technique using regenerative materials and considering thermal insulation, thermal mass, moisture regulation and air tightness. Monitoring devices will be installed in each prototype. These prototypes are compared to reference prototypes built with conventional building techniques.

**Competencies**
- Subject-specific Competencies: Concepts and Theories, Techniques and Technologies
- Method-specific Competencies: Analytical Competencies, Decision-making
- Social Competencies: Cooperation and Teamwork, Self-presentation and Social Influence, Sensitivity to Diversity
- Personal Competencies: Adaptability and Flexibility, Creative Thinking

**Module Details**

**Number**: 136-0203-00L  
**Title**: Advanced Knowledge on Hygrothermal Assessment  
**Type**: O  
**ECTS**: 2 credits  
**Hours**: 3G  
**Lecturers**: G. Habert

**Abstract**: This course offers advanced knowledge on HAM (Heat Air and Moisture) modeling. The most up-to-date simulation models will be presented and used by the participants on real-case projects during simulation workshops.

**Objective**
- Learn how to use the most up-to-date HAM simulation models
- Learn how to analyse the transient hygrothermal behaviour of an envelope
- Ensure an efficient and durable impact on participants' professional development

**Content**: Advanced knowledge on HAM modeling are presented during simulation workshops:
- Transient hygrothermal behaviour:
  - Presentation of relevant software by experts or developers
  - Presentation of a case study by the HVAC engineers in charge of the calculation
- Digital parametric iteration:
  - Presentation of relevant software by experts or developers
  - Presentation of a case study by the HVAC engineers in charge of the calculation

</thead>
<tbody>
<tr>
<td>136-0250-00L</td>
<td>Project Work on Hygrothermal Validation</td>
<td>O</td>
<td>6 credits</td>
<td>3G</td>
<td>G. Habert</td>
</tr>
</tbody>
</table>

**Abstract**

Based on the content of previous courses, the participants are asked to simulate and analyze the hygrothermal behavior of a building built with the same constructive technique as their prototype. In addition, they have to reproduce the monitoring conditions of their prototypes and compare measurements to simulation results. The result and discussion is presented in front of a jury.

**Objective**

- Apply knowledge from previous courses on a case study
- Learn how to compare measurements to simulation results
- Enhance communication skills concerning high-quality envelopes built with regenerative materials

Abstract

This learning module navigates the journey from global crises to local interventions by first emphasizing the significance of resilience in DRRS. It then explores global crises through diverse perspectives in the “Framing nested crises” submodule. The subsequent submodules focus on practical skills at the community level and the societal and individual root causes of crises.

Objective

The “From global crises to local interventions” module is designed to achieve several key learning objectives within the Designing Resilient Regenerative Systems (DRRS) context. Participants will gain a comprehensive understanding of resilience, appreciating its richness and diversity to maximize practical applications within DRRS. The module encourages a multiperspective analysis of global crises, exploring diverse viewpoints influenced by angles, interests, training, geographies, institutions, and worldviews.

Emphasis is placed on developing practical skills at the community level, enabling participants to enhance local resilience and response capabilities within the framework of DRRS. This includes identifying and applying skills crucial for mitigating the impact of disasters and promoting community well-being.

Furthermore, the module delves into the societal and individual root causes contributing to global crises within the paradigm of DRRS. Participants will learn from experts about strategies to understand and address these root causes, fostering effective intervention at both the societal and individual levels.

Content

Centered on the pivotal concept of resilience, the module facilitates a nuanced understanding of its richness and diversity for optimal application in addressing crises. Participants are guided through a multiperspective analysis of global crises, considering various viewpoints influenced by angles, interests, training, geographies, institutions, and worldviews.

A significant focus is placed on practical skills development at the community level within the DRRS paradigm. Participants acquire the necessary tools to enhance local resilience and response capabilities, emphasizing mitigating the impact of disasters and fostering community well-being.

The module delves into the root causes of global crises at both societal and individual levels, aligning with the principles of DRRS. Experts share insights on strategies to understand and address these root causes, fostering effective interventions that resonate with the DRRS approach.

Lecture notes

See Module 1.1 in MOOC#1 Worldviews - From Sustainability to Regeneration: https://www.edx.org/learn/ethics/eth-zurich-worldviews-from-sustainability-to-regeneration

Literature

See Module 1.1 in MOOC#1 Worldviews - From Sustainability to Regeneration: https://www.edx.org/learn/ethics/eth-zurich-worldviews-from-sustainability-to-regeneration

Prerequisites / notice

MOOC#1 Worldviews - From Sustainability to Regeneration is a pathway to CAS#1 Sustainability to Regeneration. To be accepted into the CAS, applicants must have completed the respective MOOC by the time the CAS starts. The content from the MOOC will be supplemented in the CAS by live virtual events with experts from all over the world. In addition, after the first virtual introductory week, a real design excursion to the MonViso Design excursion to the MonViso Institute in Italy. This trip is obligatory.

The final delivery of the CAS should demonstrate the scientific base of our work in evidence-based writing with a foundation in the peer-reviewed literature and graphical, visual, systems-mapping, and spatial ways of designerly expressions. As the main deliverable, the CAS, applicants must submit a framed graphical Quest synthesis process map consisting of two main parts: a graphical synthesis map (pdf format) and a framing text bracket that motivates, introduces, explains, discusses, and concludes the synthesis map.

131-0002-00L Module 2: Sustainability to Regeneration

*Does not take place this semester.*

Abstract

This learning module focuses on exploring sustainability at a deep and critical level, encouraging participants to delve into the fundamental principles of sustainability, reflect on their mental models, and critically examine the Sustainable Development Goals. The module also aims to expand participants’ thinking towards regeneration.

Data: 26.07.2024 12:39 Autumn Semester 2024 Page 510 of 2680
Objective
In this module, participants will explore sustainability comprehensively, delving into core learning objectives. The journey begins with a profound understanding of sustainability fundamentals, prompting reflection on personal mental models. Participants will critically scrutinize the Sustainable Development Goals (SDGs) and navigate sustainability science theories, explicitly focusing on concepts like Planetary Boundaries. The intersection of artificial intelligence (AI) and sustainability will be examined, fostering critical perspectives.

Practical knowledge takes center stage, focusing on soil regeneration and providing tangible insights into sustainable practices. Participants can engage with the content through flexible mediums, including videos, audio files, or transcripts, tailoring the learning experience to personal preferences.

The application of systems thinking is encouraged, prompting participants to analyze and summarize critical arguments and worldviews presented in the content.

Participants are invited to develop their Quests further, facilitating a holistic exploration of sustainability concepts. Sharing written or graphical reflections with learning partners and the DRRS network promotes collaboration, creating a dynamic community of learners committed to advancing sustainability knowledge.

Content
The learning content of this module is rich and multifaceted, offering a deep exploration of sustainability from various perspectives. Participants engage in a thoughtful journey that begins by understanding the fundamental principles of sustainability and reflecting on personal mental models. Critical examination of the Sustainable Development Goals (SDGs) and exploring sustainability science theories, including concepts like Planetary Boundaries, provide a robust theoretical foundation.

The module goes beyond theory to address the practical aspect of sustainability, focusing on soil regeneration. Participants can choose their preferred learning medium, videos, audio files, or transcripts, enhancing accessibility.

Including artificial intelligence (AI) in the sustainability discourse adds a contemporary dimension, prompting participants to develop critical perspectives on the evolving relationship between technology and sustainability.

Module 3: Worldviews
- 131-0003-00L
- 2 credits
- 1G
- to be announced

Does not take place this semester.

Abstract: This learning module titled "Worldviews" delves into the exploration of how individuals perceive the world and construct their understanding of reality. It emphasizes the significance of worldviews, defined as fundamental beliefs and modes of participation in the broader context.

Objective: In this module, participants will embark on a journey to explore the rich tapestry of worldviews, understanding how different cultures and individuals perceive and reason about the world. The learners delve into the intersection of scientific discourse and practical application (praxis), examining the profound impact of scientific perspectives on shaping our collective understanding. A key focus is introducing "warm data," a concept that adds depth to our comprehension of complex systems, demonstrated through real-world examples such as fast fashion dumps and agroforest systems.

The module highlights the role of design, emphasizing both design processes and meta-design—viewing mental maps as dynamic tools that can foster collaborative transformations toward resilient and regenerative systems. Furthermore, the participants explore the potential of artificial intelligence (AI) as a catalyst for regeneration, investigating its role in sustainable practices and contemplating ethical considerations for its responsible integration. Participants are encouraged to engage actively, broaden their perspectives, and contribute to collectively shaping a more sustainable and regenerative future through these objectives.
Adaptability and Flexibility

The module starts by delving into the fundamental concept of worldviews, emphasizing their role as foundational beliefs and modes of participation in the broader context. The inclusion of perspectives from Daniel Wahl and Jeremy Lent, as well as an exploration of indigenous and Eastern philosophies, provides a well-rounded approach to understanding diverse ways of knowing and reasoning.

Incorporating practical examples, such as fast fashion dumps in Chile and agroforestry systems in African countries, adds a tangible dimension to the theoretical discussions. This approach helps participants connect abstract concepts to real-world scenarios, fostering a deeper understanding of the implications of different worldviews on environmental and societal issues.

The emphasis on "warm data" introduces a holistic perspective, encouraging participants to consider interconnected systems and view challenges comprehensively. Including meta-design as a tool for collaborative transition promotes active engagement in shaping resilient and regenerative systems.

Furthermore, the module's exploration of the role of artificial intelligence (AI) in regeneration adds a forward-looking dimension, addressing the potential for technological innovation to contribute to sustainable practices.

Beginning with Eric Berlow's perspective on "The Other Side of Complexity," the module challenges conventional views and introduces a reframed perspective on complexity and encouraging a more nuanced and informed approach to navigating complex living systems.

The module further investigates the role of artificial intelligence in "When is AI Regenerative?"—examining scenarios where AI positively influences the resilience and regeneration of complex systems.

Nora Bateson contributes to the module focusing on "Warm Data," emphasizing the significance of contextual and relational information in understanding complexity. Participants will also grasp the interconnectedness of science, praxis, data types, warm data, and AI in complex systems. The overarching objective is to enable individuals to navigate uncertainty by identifying various access points and weaving diverse perspectives into a holistic understanding of complexity.

Incorporating practical examples, such as fast fashion dumps in Chile and agriforest systems in African countries, adds a tangible dimension to the theoretical discussions. This approach helps participants connect abstract concepts to real-world scenarios, fostering a deeper understanding of the implications of different worldviews on environmental and societal issues.

The module further investigates the role of artificial intelligence in "When is AI Regenerative?"—examining scenarios where AI positively influences the resilience and regeneration of complex systems.

The final delivery of the CAS should demonstrate the scientific base of our work in evidence-based writing with a foundation in the peer-reviewed literature and graphical, visual, systems-mapping, and spatial ways of designerly expressions. As the main deliverable, participants must submit a framed graphical Quest synthesis process map consisting of two main parts: a graphical synthesis map (pdf format) and a framing text bracket that motivates, introduces, explains, discusses, and concludes the synthesis map.
The learning module on "Design as Nature" explores the disconnect between Western cultures and nature. The module emphasizes the need to relearn and cultivate a closer connection with nature. It introduces the concept of "Design as Nature" as a transitional step towards a deeper understanding of nature, its design language, and patterns.

The critical learning goals center around biodiversity, deep ecology, and our intrinsic connection to nature. The module emphasizes understanding and appreciating the vital role of biodiversity in maintaining healthy ecosystems. Participants delve into the concept of deep ecology, fostering a profound recognition of the interconnectedness between humanity and the natural world.

A pivotal aspect of the learning experience involves embracing the notion that humans are not separate from nature but an integral part of it. This realization forms a foundational understanding that guides the exploration of sustainable practices.

The module introduces biomimicry as a practical approach, encouraging participants to learn from and emulate nature's design principles. By doing so, they gain insights into creating sustainable solutions that align with the regenerative patterns observed in the natural world.

Bio-infused communication emerges as a significant aspect, urging participants to explore ways of interacting with the environment inspired by nature. This approach fosters a harmonious relationship with the ecosystems we inhabit.

Finally, the module delves into the realm of nature finance, where economic mechanisms are derived from nature's principles. The goal is to inspire a redesign of financial systems, aligning them with regenerative and sustainable practices. Combining these learning goals, the "Design as Nature" module provides a comprehensive framework for reconnecting with nature, understanding its design language, and actively contributing to a more sustainable and harmonious coexistence.

The "Design as Nature" module unfolds through several key subchapters, each addressing crucial aspects of the relationship between humanity and the natural world.

Beginning with a focus on biodiversity, the module underscores the vital role of diverse life forms in maintaining ecosystem health. It encourages participants to appreciate the intricate interdependence within natural environments.

"Design for Biodiversity" delves into the impact of human designs on biodiversity, urging the development of solutions that actively support and enhance the richness of life rather than compromise it.

The concept of Deep Ecology - connecting with nature is introduced to cultivate a heightened sense of connection and reverence for the environment. Participants are prompted to reflect on their relationship with nature, fostering a holistic perspective.

Moving into the realm of nature-based design, the module explores the principles of biomimicry. Participants are inspired to learn from nature's design to create sustainable and regenerative solutions, with real-world examples highlighting the positive impact of such approaches.

Bio-infused relation building shifts the focus to communication and interaction with the environment. Participants are encouraged to build relationships with nature that are respectful and sustainable and contribute to overall ecological harmony.

Lastly, the module investigates regenerative economics, exploring economic mechanisms derived from nature. The goal is to redesign financial systems in a way that aligns with sustainable practices and contributes positively to the regeneration of ecosystems.

Prerequisites / notice

MOOC#1 Worldviews - From Sustainability to Regeneration is a pathway to CAS#1 Sustainability to Regeneration. To be accepted into the CAS, applicants must have completed the respective MOOC by the time the CAS starts. The content from the MOOC will be supplemented in the CAS by live virtual events with experts from all over the world. In addition, after the first virtual introductory introductory week, a real design excursion to the MonViso Design excursion to the MonViso Institute in Italy. This trip is obligatory.

Literature

See Module 1.5 in MOOC#1 Worldviews - From Sustainability to Regeneration: https://www.edx.org/learn/ethics/eth-zurich-worldviews-from-sustainability-to-regeneration
This learning module on mind and movement focuses on facilitating cultural changes by guiding participants through their own unlearning journeys. The module emphasizes the importance of enduring challenging processes to design for regeneration, build personal resilience, and lead collective co-creation.

The final delivery of the CAS should demonstrate the scientific base of our work in evidence-based writing with a foundation in the peer-reviewed literature and graphical, visual, systems-mapping, and spatial ways of designerly expressions. As the main deliverable, participants must submit a framed graphical Quest synthesis process map consisting of two main parts: a graphical synthesis map (pdf format) and a framing text bracket that motivates, introduces, explains, discusses, and concludes the synthesis map.

The learning objectives revolve around actively cultivating a profound relationship with one's surroundings through movement, fostering a deep connection to place. The module strongly emphasizes immersive experiences, encouraging participants to fully engage and be present, providing a richer understanding of self, others, and the more-than-human world.

Self-discovery takes center stage as participants are prompted to question and challenge their perceived physical and psychological boundaries. The module equips individuals with the tools to build resilience in their engagements with place, self, and others, navigating challenges with adaptability and strength.

Exploring the transformative power of movement, participants learn to mediate their relationships with self through action, understanding, and expressing emotions physically. The curriculum also guides individuals to develop ecologically attuned and reciprocal conversations, fostering a deeper connection with human and non-human entities in their environment.

Redefining adventure becomes a key theme, encouraging participants to move beyond conventional notions and embody their practices. Participants transform routine experiences into meaningful and adventurous engagements by integrating movement and mindfulness into daily activities.

Philosophically grounded in contemporary neuroscience, the module challenges traditional views that separated the mind and body. It underscores the interconnectedness of these elements, recognizing the profound significance of emotions and bodily experiences in the pursuit of self-realization and holistic growth. Through this multifaceted approach, participants are empowered to reframe their relationship with the world, themselves, and the more-than-human aspects of their environment.

Content
This learning module on mind and movement stands out for its holistic approach to personal and collective development. By seamlessly integrating physical movement, mindfulness practices, and ecological awareness, participants are offered a multifaceted exploration of their experiences.

A notable strength lies in the practical application of concepts, focusing on immersive experiences such as cultivating relationships through movement and redefining adventure. This hands-on approach adds a tangible and applicable dimension to the learning journey.

The module emphasizes building resilience in engagements with place, self, and others, recognizing the importance of adaptability and strength in navigating challenges. Additionally, the ecological awareness component, encouraging participants to develop attuned and reciprocal conversations with human and non-human entities, aligns with a contemporary understanding of our interconnectedness with the environment.

131-0006-00L Module 6: Mind and Movement  

Does not take place this semester.

Abstract
This learning module on mind and movement focuses on facilitating cultural changes by guiding participants through their own unlearning journeys. The module emphasizes the importance of enduring challenging processes to design for regeneration, build personal resilience, and lead collective co-creation.

Objective
The learning objectives revolve around actively cultivating a profound relationship with one's surroundings through movement, fostering a deep connection to place. The module strongly emphasizes immersive experiences, encouraging participants to fully engage and be present, providing a richer understanding of self, others, and the more-than-human world.

Self-discovery takes center stage as participants are prompted to question and challenge their perceived physical and psychological boundaries. The module equips individuals with the tools to build resilience in their engagements with place, self, and others, navigating challenges with adaptability and strength.

Exploring the transformative power of movement, participants learn to mediate their relationships with self through action, understanding, and expressing emotions physically. The curriculum also guides individuals to develop ecologically attuned and reciprocal conversations, fostering a deeper connection with human and non-human entities in their environment.

Redefining adventure becomes a key theme, encouraging participants to move beyond conventional notions and embody their practices. Participants transform routine experiences into meaningful and adventurous engagements by integrating movement and mindfulness into daily activities.

Philosophically grounded in contemporary neuroscience, the module challenges traditional views that separated the mind and body. It underscores the interconnectedness of these elements, recognizing the profound significance of emotions and bodily experiences in the pursuit of self-realization and holistic growth. Through this multifaceted approach, participants are empowered to reframe their relationship with the world, themselves, and the more-than-human aspects of their environment.

Content
This learning module on mind and movement stands out for its holistic approach to personal and collective development. By seamlessly integrating physical movement, mindfulness practices, and ecological awareness, participants are offered a multifaceted exploration of their experiences.

A notable strength lies in the practical application of concepts, focusing on immersive experiences such as cultivating relationships through movement and redefining adventure. This hands-on approach adds a tangible and applicable dimension to the learning journey.

The module emphasizes building resilience in engagements with place, self, and others, recognizing the importance of adaptability and strength in navigating challenges. Additionally, the ecological awareness component, encouraging participants to develop attuned and reciprocal conversations with human and non-human entities, aligns with a contemporary understanding of our interconnectedness with the environment.

Lecture notes
See Module 1.6 in MOOC#1 Worldviews - From Sustainability to Regeneration: https://www.edx.org/learn/ethics/eth-zurich-worldviews-from-sustainability-to-regeneration

Literature
See Module 1.6 in MOOC#1 Worldviews - From Sustainability to Regeneration: https://www.edx.org/learn/ethics/eth-zurich-worldviews-from-sustainability-to-regeneration

Prerequisites / notice
MOOC#1 Worldviews - From Sustainability to Regeneration is a pathway to CAS#1 Sustainability to Regeneration. To be accepted into the CAS, applicants must have completed the respective MOOC by the time the CAS starts. The content from the MOOC will be supplemented in the CAS by live virtual events with experts from all over the world. In addition, after the first virtual introductory introductory week, a real design excursion to the MonViso Design excursion to the MonViso Institute in Italy. This trip is obligatory.

The final delivery of the CAS should demonstrate the scientific base of our work in evidence-based writing with a foundation in the peer-reviewed literature and graphical, visual, systems-mapping, and spatial ways of designerly expressions. As the main deliverable, participants must submit a framed graphical Quest synthesis process map consisting of two main parts: a graphical synthesis map (pdf format) and a framing text bracket that motivates, introduces, explains, discusses, and concludes the synthesis map.

<td>Participants will be introduced into regulations and landscape including all stakeholders. The different types of medicinal products are introduced including subsequent regulations. Participants apply the knowledge in different starting scenarios.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| Objective    | Participants | - understand the complexity of the regulatory landscape  
               - know the main characteristics of different medicinal products and subsequent regulatory pathways  
               - identify the different stakeholders and players in this landscape  
               - analyze different regulatory strategies using real-world cases |      |      |       |                 |
| Content      | • The regulatory landscape – a challenge for all players  
               • Different types of medicinal products - different regulatory pathways  
               • Health authorities – friend or foe?  
               • Different countries – different regulations  
               • Successful regulatory strategy – make or break for a medicinal product  
               • From idea to product – do it yourself |      |      |       |                 |

| 395-0201-00L | Regulatory Thinking          | O    | 2    | 4G    | further lecturers |
|              | *Does not take place this semester.* |      |      |       |                 |
| Abstract     | Students gain an overview of how to transform a research idea into a finished healthtech product by confidently navigating different regulatory landscapes and developing compelling certification strategies for various healthtech products. Students learn how to use Regulatory Thinking to turn Regulatory Affairs into a business planning tool. |      |      |       |                 |
| Objective    | Applying of regulatory thinking and translation of this method into practice. |      |      |       |                 |
| Content      | - Applying the different roles and responsibilities of Certification Bodies (CB), Notified Bodies (NB), and other Regulators and/or Reimbursement Agencies, hereafter: Competent Authorities (CAs).  
               - Knowing how to address CAs, including communication and interaction  
               - Awareness of the importance of a quality management system (QMS) and knowing different systems, including, but not limited to ISO 13485:2016, GMP, GLP, GCP  
               - The journey of regulatory thinking - from medical devices (MDs), to in vitro diagnostics (IVDs), to software as a medical device (SaMD), to medicines and advanced therapeutic medicinal products (ATMPs): Commonalities, differences and the search for the lowest common denominator in terms of:  
               - Regulations/Directives/Laws/Guidelines  
               - Interaction with the regulatory authorities  
               - The principles of safety/efficacy/performance/transparency  
               - The requirements for the implementation of a QMS |      |      |       |                 |

| 395-0202-00L | Intended Use / Indication    | O    | 2    | 4G    | further lecturers |
|              | *Does not take place this semester.* |      |      |       |                 |
| Abstract     | From software as a medical device to medicinal products: The intended use of a healthtech product serves as strategic pivotal point from conception to reimbursement strategies: Understanding its importance defines advertising claims and ensures that the product meets the needs of patients. |      |      |       |                 |
| Objective    | Know and understand different definitions: medical need / public health assessment/; personalized medicine, pharmacogenomics/ customized device.  
               Understand the importance of medical and stakeholder needs assessments in medicine / medtech / in-vitro diagnostics / software as medical device / artificial intelligence and among different stakeholders.  
               Understand the relationship between indication / intended use / intended purpose and development, including risk assessment.  
               Define the intended use / intended purpose for a healthtech product and derive user groups, patient groups, indications and contraindications.  
               Understand and derive an overview of the different stakeholders of a healthtech product and their different interests.  
               Overview of different development models, starting with requirements engineering, the classical waterfall model and V-model up to agile methods for software as medical device or AI concepts.  
               ISO 14971: Understanding and applying principles of risk management.  
               IEC 62366: Understanding and applying the principles of usability engineering.  
               Artificial Intelligence: Know the challenges of artificial intelligence in healthtech products, define an AI policy and develop a verification process. |      |      |       |                 |
The intended use is the "linchpin" in the development, approval and reimbursement of medicinal products or medical devices: Whether software as a medical device, artificial intelligence in medical devices, but also in pharmaceuticals or biotechnology, the intended use is the first and last touchstone - alpha and omega - of all healthtech concepts.

- Intended use, user and patient groups I/III: How the intended use of a healthtech product influences its development, safety, performance, marketing strategy and reimbursement possibilities.

- Intended use, user and patient groups II/III: How the intended use of a healthtech product determines the patient population and thus defines indications and contraindications.

- Intended use, user and patient groups III/III: How the intended use of a healthtech product determines the requirements for different user groups.

- Software as a medical device or drug: What is the market missing - what does the patient want? Derive product re-requirements by understanding market requirements and patient needs. (development planning).

- Software as a medical device or drug: Who is interested in the product, who benefits from it, who works with it? Derive concepts for usability and risk management by understanding the different user groups and their interests (verification and validation).

- Software as a medical device: artificial intelligence, digital biomarkers, new biotech concepts: development and marketing in compliance with regulations by applying "existing" standards to future technologies (regulatory compliance / legal compliance).

</table>

Abstract
An overview of the preclinical development of drugs as well as medical devices and in vitro diagnostics is given. The relevant regulations are conveyed in a practice-oriented manner.

Objective
- Understanding the principles and limitations of the preclinical efficacy and safety disciplines in product development - pharmacodynamics, pharmacokinetics and toxicology
- Understanding and apply regulations for drug development, development of medical devices and in vitro diagnostics
- Understanding for which purposes GLP (Good Laboratory Practice) is applied
- Understanding and apply the do's and don'ts of animal experiments in product development
- Understanding the different possibilities and the importance of communicating with the regulatory authority in early product development

Content
The Module 4 "Development Process: Preclinical" includes an overview of preclinical efficacy and safety in drug development as well as in the development of medical devices and in vitro diagnostics. Emphasis will be placed on the applicable regulations and potential interactions with regulatory authorities in early product development. When a preclinical development plan becomes necessary and what is needed to start with will be explained in a practical way. An overview is also given of which preclinical studies and documents are required in order to be able to conduct an early clinical study in humans for the first time.

Abstract
In the CAS Robotics participants are offered a RobotX professor as a mentor together with whom they design their study plan along an individually-specified focus area in the area of Robotics and AI. Based on the individual expertise and interests of the participants, the customised Robotics and AI module consists of a combination of (i) research project, (ii) lectures, (iii) knowledge transfer.

Objective
The CAS Robotics and AI module offers experienced industry individuals the opportunity to undergo research-related training in Robotics and AI, to update their knowledge and to expand their area of expertise in a targeted manner and aims at:
- training skills at the frontiers of the current state of research in Robotics and AI,
- deepening technical know-how with state-of-the-art knowledge in the specified focus area, and
- advancing practical competencies in the impart of expertise and knowledge transfer across disciplines and educational levels.

<td>The objective of this Module is to introduce the principles of Seismic Design of Structures and the Swiss Seismic Code Provisions to Civil Engineers working in Switzerland.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| **Objective** | This module enables participants:  
- To understand the critical points of the Swiss Code Provisions for the seismic design of new structures and the seismic evaluation of existing structures  
- To get an overview in the dynamics and the principles of seismic design of structures |      |       |       |                  |
| **Content** | 1.1 Introduction to seismic hazard and seismic risk, seismic performance objectives, common structural deficiencies and observed damage patterns due to earthquake ground motion excitation  
1.2 Seismic elastic and inelastic response of SDOF systems and earthquake response spectra  
1.3 Seismic elastic and inelastic response of MDOF systems, Response Spectrum Analysis and Pushover Analysis  
1.4 Seismic Design of structures using SIA 261: Presentation and Examples  
1.5 Good practices for the seismic design of new structures  
1.6 Seismic safety of non-structural components  
1.7 Swiss Code Provisions for the seismic evaluation of existing structures SIA 269/8: Presentation and examples, Evaluation of commensurability of seismic retrofitting measures |      |       |       |                  |
| **Prerequisites / notice** | Anwesenheit (mind. 80% pro Präsenzwoche) und aktive Mitarbeit in den Präsenzwochen  
- mindestens genügende Leistungen bei Leistungskontrollen |      |       |       |                  |
| 139-0102-00L | Module 2: Finite Element Modelling and Identification of the Seismic Behavior of Structures | O    | 2 credits | 3G    | B. Stojadinovic |
| **Objective** | This module enables participants:  
- To use the state-of-the-art FEM software and implement the optimal FE modelling techniques for the simulation of the seismic response of existing buildings (concrete, masonry, mixed concrete-masonry) located in Switzerland  
- To obtain knowledge of the FEM software and the modelling techniques for the simulation of soil-structure interaction  
- To understand the current methodologies for the identification and monitoring of the vibration and the seismic behavior of structures located in Switzerland. |      |       |       |                  |
| 139-0103-00L | Module 3: Analysis Methods and Case Study Examples of Seismic Evaluation and Retrofitting | O    | 2 credits | 3G    | B. Stojadinovic |
| **Abstract** | The scope of this Module is to present Analysis Methods and Case Study Examples that illustrate established procedures and practical engineering solutions that are applied in the seismic evaluation and retrofitting of existing structures by Civil Engineers working in Switzerland. |      |       |       |                  |
| **Objective** | This module enables participants:  
- To acquire practical knowledge of the seismic retrofitting techniques commonly used in Switzerland, their implementation and their cost  
- To select the appropriate analysis method for the seismic evaluation of structures located in Switzerland and understanding of the governing factors |      |       |       |                  |
| 139-0104-00L | Module 4: Individual Project Exercise | O    | 4 credits | 2P    | B. Stojadinovic |
| **Objective** | This modules enables participants  
- To conduct independently a seismic evaluation of an existing structure located in Switzerland considering the boundary conditions that influence the seismic behavior of the structure |      |       |       |                  |

Content
In the general chemistry practical course students are introduced to the work in chemistry laboratory. During the course they become familiar with common chemistry glassware and related equipment as well as learn basic experimental procedures, such as distillation, recrystallization, purification, digestion etc. Upon the measurements of pH, conductivity, and potential in the course of reactions, students establish the understanding of the chemical equilibrium concept.

Students work with various classes of inorganic compounds and types of chemical reactions, e.g. acid-base, redox, precipitation. They also obtain first experience with the synthesis of metal complexes as well as learn basics of qualitative analysis of an unknown substance.

Literature
- P. Steinegger

Prerequisites / notice
Compulsory: online enrolment latest one week after start of the semester

By enrolling in the laboratory course, students confirm to study all safety information thoroughly and to follow instructions.

### Mathematics III: Partial Differential Equations

**O 4 credits 2V+1U N. Moshayedi**

#### Abstract

#### Objective
Classical tools to solve the most common linear partial differential equations.

#### Content
1) Examples of partial differential equations
   - Classification of PDEs
   - Superposition principle

2) One-dimensional wave equation
   - D'Alembert's formula
   - Duhamel's principle

3) Fourier series
   - Representation of piecewise continuous functions via Fourier series
   - Examples and applications

4) Separation of variables
   - Solution of wave and heat equation
   - Homogeneous and inhomogeneous boundary conditions
   - Dirichlet and Neumann boundary conditions

5) Laplace equation
   - Solution of Laplace's equation on the rectangle, disk and annulus
   - Poisson formula
   - Mean value theorem and maximum principle

6) Fourier transform
   - Derivation and definition
   - Inverse Fourier transform and inversion formula
   - Interpretation and properties of the Fourier transform
   - Solution of the heat equation

7) Laplace transform (if time allows)
   - Definition, motivation and properties
   - Inverse Laplace transform of rational functions
   - Application to ordinary differential equations

#### Lecture notes
See the course web site (linked under Lernmaterialien)

#### Literature

Additional books:

4) E. Kreyszig, Advanced Engineering Mathematics, John Wiley & Sons (chapters 1,2,11,12,8)

For additional sources, see the course web site (linked under Lernmaterialien)

#### Prerequisites / notice
Required background:
1) Multivariate functions: partial derivatives, differentiability, Jacobian matrix, Jacobian determinant

2) Multiple integrals: Riemann integrals in two or three variables, change of variables

3) Basic knowledge of ordinary differential equations

---

</tr>
</tbody>
</table>

**Abstract**
This course will build upon the basic knowledge of structure and reactivity of organic molecules gained in AC/OCI and AC/OCII. The module aims to provide a wide understanding of the occurrence, synthesis, properties, and reactivity of carbonyl compounds.

**Objective**
The goal of this course is the acquisition of a basic repertoire of synthetic methods including important reactions of aldehydes, ketones, carboxylic acids, and carboxylic acid derivatives. Particular emphasis is placed on the understanding of reaction mechanisms and the correlation between structure and reactivity. A deeper understanding of the concepts presented during the lecture is reached by solving the problems handed out each time and discussed one week later in the exercise class.

**Content**

**Lecture notes**
The lecture slides, problem sets, and additional documents are provided online. Link: https://wennemers.ethz.ch/education.html
Concepts and Theories

**Abstract**
Introduction into the most important spectroscopical methods and their applications to gain structural information.

**Objective**
Knowledge about the necessary theoretical background of spectroscopical methods and their practical applications

**Content**
Application oriented basics of organic and inorganic instrumental analysis and of the empirical employment of structure elucidation methods:
- Mass spectrometry: Ionization methods, mass separation, isotope signals, rules of fragmentation, rearrangements.
- NMR spectroscopy: Experimental basics, chemical shift, spin-spin coupling.
- IR spectroscopy: Revisiting topics like harmonic oscillator, normal vibrations, coupled oscillating systems (in accordance to the basics of the related lecture in physical chemistry); sample preparation, acquisition techniques, law of Lambert and Beer, interpretation of IR spectra; Raman spectroscopy.
- UV/VIS spectroscopy: Basics, interpretation of electron spectra. Circular dichroism (CD) and optical rotation dispersion (ORD).

**Lecture notes**
Script will be for the production price

**Literature**
- M. Hesse, H. Meier, B. Zeeh, Spektroskopische Methoden in der organischen Chemie, 5. überarbeitete Auflage, Thieme, Stuttgart, 1995

**Prerequisites / notice**
Exercises are integrated in the lectures. In addition, attendance in the lecture 529-0289-00 "Instrumental analysis of organic compounds" (4th semester) is recommended.

Homogeneous Catalysis

Abstract
Fundamental aspects of the organometallic chemistry of the transition elements. Mechanistic homogeneous catalysis including oxidative additions, reductive eliminations and insertion reactions. Catalytic hydrogenation, carbonylation, C-C bond-forming and related reactions.

Objective
Towards an understanding of the fundamental coordination-chemical and mechanistic aspects of transition-metal chemistry relevant to homogeneous catalysis.

Content
Fundamental aspects of the organometallic chemistry of the transition elements. Mechanistic homogeneous catalysis including oxidative additions, reductive eliminations and insertion reactions. Catalytic hydrogenation, carbonylation, C-C bond-forming and related reactions.

529-0231-00L
Organic Chemistry III: Introduction to Asymmetric Synthesis

Abstract
Methods of Asymmetric Synthesis

Objective
Understanding of the basic principles of diastereoselective synthesis

Content
Conformational analysis: acyclic and cyclic systems; Diastereoselective sigmatropic rearrangements; Diastereoselective Carbonyl addition reactions; Cram- and Felkin-Anh models, carbonyl Lewis acid interactions, chelate controlled reactions; chemistry of enolates, selective formation; asymmetric enolate alkylation; aldol reactions, allyl- and crotyl-metal chemistry; cyclisations, Baldwin rules; Diastereoselective olefin functionalization: hydroboration, dihydroxylation, epoxidation.

529-0432-00L
Physical Chemistry IV: Magnetic Resonance

Abstract
Theoretical foundations of magnetic resonance (NMR, EPR) and selected applications.

Objective
Introduction to magnetic resonance in isotropic and anisotropic phase.

Content
The course gives an introduction to magnetic resonance spectroscopy (NMR and EPR) in liquid, liquid crystalline and solid phase. It starts from a classical description in the framework of the Bloch equations. The implications of chemical exchange are studied and two-dimensional exchange spectroscopy is introduced. An introduction to Fourier spectroscopy in one and two dimensions is given and simple 'pulse trickery' is described. A quantum-mechanical description of magnetic resonance experiments is introduced and the spin Hamiltonian is derived. The chemical shift term as well as the scalar, dipolar and quadrupolar terms are discussed. The product-operator formalism is introduced and various experiments are described, e.g. polarization transfer. Applications in chemistry, biology, physics and medicine, e.g. determination of 3D molecular structure of dissolved molecules, determination of the structure of paramagnetic compounds and imaging (MRI) are presented.

Abstract
Laboratory experiments to acquire a profound knowledge of spectroscopical methods and techniques in chemistry. Evaluation and visualization of measurement data. Writing lab reports.

Objective
Laboratory experiments to acquire a profound knowledge of spectroscopical methods and techniques in chemistry. Evaluation and visualization of measurement data. Writing lab reports.

Content
Laboratory experiments: UV/VIS spectroscopy, luminescence spectroscopy, FT infrared spectroscopy, light diffraction and refraction, thermal lenses, Raman spectroscopy, reflection spectroscopy, optical polarization phenomena, laser ablation inductively coupled plasma mass spectrometry (LA-ICP-MS), FT nuclear magnetic resonance spectroscopy (NMR), electron paramagnetic resonance spectroscopy (EPR), atomic force microscopy (AFM), Fourier transform methods.

Lecture notes
Detailed documentations to each experiment will be handed out.

Prerequisites / notice
Praktikum Physikalische Chemie (529-0054-00) or Praktikum Physikalische Chemie (529-0054-01).

By enrolling in the laboratory course, students confirm to study all safety information thoroughly and to follow instructions.

Abstract
Introduction into the important methods for structural analysis (solid state NMR), crystal structure analysis and surface analysis techniques and their applications.

Objective
Knowledge in solid state NMR, crystal structure analysis and surface analytical techniques relevant for inorganic materials.

Content
This lecture course consists of three parts 1) Solid-state NMR 2) Surface and direct solid analysis 3) Crystal structure analysis. Most important fundamentals of the individual methods will be presented and details will be explained on most relevant inorganic applications.

Lecture notes
Will be given during the lectures.

Abstract
Modern mass spectrometry, hyphenated analytical methods, speciation, chemometrics.

Objective
Comprehensive knowledge about the analytical methods introduced in this course and their practical applications.

Content
Hyphenation of separation with identification methods such as GC-MS, LC-MS, GC-IR, LC-IR, LC-NMR etc.; importance of speciation. Modern mass spectrometry: time-of-flight, orbitrap and ion cyclotron resonance mass spectrometry, ICP-MS. Soft ionization methods, desorption methods, spray methods. Mass spectrometry imaging. Use of statistical and computer-assisted methods for processing analytical data (chemometrics).

Lecture notes
Lecture notes will be made available online.

Literature
Information about relevant literature will be available in the lecture & in the lecture notes.

Prerequisites / notice
Exercises are an integral part of the lecture.

Content

- Introduction: important quantities & units, terminology;

- Chapter I - Redox reactions, Faraday’s laws;

- Chapter II - Equilibrium electrochemistry: cells, galvanic and electrolytic cells, thermodynamic state functions, theoretical cell voltage, half-cell / electrode potential, hydrogen electrode, the electrochemical series, Nernst equation;

- Chapter III - Electrodes & interfaces: electrochemical potential, phase potentials, work function, Fermi level, the electrified interface, the electrochemical double layer, reference electrodes and laboratory cells;

- Chapter IV - Electrolytes: conductivity, aqueous electrolytes, transference effects, liquid junctions, polymer electrolytes, ion-exchange membranes, Donnan exclusion, solid state ion conductors;

- Chapter V - Dynamic electrochemistry: overpotentials, description of charge-transfer reaction, Butler-Volmer and Tafel equation, exchange current density, mass transport limitations;

- Chapter VI - Industrial electrochemistry: electrochemical engineering, process and reactor types, current density distribution, porous electrodes, chlor-alkali and HCl electrolysis, oxygen depolarized cathode;

- Chapter VII - Energy storage & conversion: important primary and secondary battery chemistries, fuel cells, polymer electrolyte fuel cells, low temperature H2 and O2 electrochemistry, electrocatalysis, triple-phase boundary, solid oxide fuel cell, conversion efficiency;

- Chapter VIII - Electroanalytical methods & sensors: potentiometry, amperometry, cyclic and stripping voltammetry, rotating disc electrode studies, electrochemical sensors;

- Chapter IX - Corrosion: corrosion reactions, Pourbaix diagram, corrosion potential, passivation, corrosion protection

lecture notes, lecture slides, exercise & solutions (PDF files)

Literature

[German version available as well]

Prerequisites / notice

Students should be familiar with the fundamentals of physical chemistry.

Compeencies

Subject-specific Competencies
Concepts and Theories assessed
Techniques and Technologies assessed

Method-specific Competencies
Analytical Competencies fostered
Decision-making fostered
Problem-solving fostered

Social Competencies
Communication assessed
Cooperation and Teamwork fostered
Self-presentation and Social Influence fostered

Personal Competencies
Adaptability and Flexibility fostered
Creative Thinking fostered
Critical Thinking fostered
Integrity and Work Ethics fostered
Self-awareness and Self-reflection fostered
Self-direction and Self-management fostered

Chemical Crystallography

Number Title Type ECTS Hours Lecturers
529-0039-00L Principles of Crystal Structure Determination W 6 credits 3G M. D. Wörle, N. Trapp

Abstract
An introduction to the principles of X-ray diffraction and crystal structure determination as it relates to Chemistry

Objective
To gain an understanding of the principles of crystal structure determination by X-ray diffraction.

Content
Basic crystallographic concepts: Unit cells, Bravais lattices, Laue symmetry, crystal classes (point groups), space groups, crystal growth, instrumentation, diffraction of X-rays by crystals: physical and geometric basics, powder and single crystal methods, structure solution and modelling, interpretation of crystal structure data; internal coordinates for structure description: atom spacing, co-ordination polyhedra, bond angles, torsion angles; intermolecular interactions, absolute configuration determination. Overview of inorganic, organic and macromolecular databases.

Lecture notes
The script and exercises will be distributed weekly in loose form
Introduction to algorithms (special focus on chemistry):

1) The students will be able to recognize different polymer types and associate them with their chemical structure and properties (i.e. rubber elasticity, glass transition temperature, etc.)

2) The students will become familiar with various synthetic methods to produce polymers of different architectures and topologies.

3) The students will understand the mechanism of selected polymerization methodologies.

4) The students will understand the mechanism of selected polymerization methodologies.

5) The students will be introduced to state-of-the-art polymer synthesis and recent literature examples will be critically discussed.

6) The students will be introduced to state-of-the-art polymer synthesis and recent literature examples will be critically discussed.

7) The students will be introduced to state-of-the-art polymer synthesis and recent literature examples will be critically discussed.

8) The students will be introduced to state-of-the-art polymer synthesis and recent literature examples will be critically discussed.

Prerequisites:
C++ programming:

8) 3G

Prerequisites / notice:
Since the exercises on the computer do convey and test essentially different skills as those being conveyed during the lectures and tested at the oral exam, the results of the exercises are taken into account when evaluating the results of the exam.

Competencies:
Subject-specific Competencies:
Concepts and Theories
Techniques and Technologies

Method-specific Competencies:
Analytical Competencies
Media and Digital Technologies
Problem-solving

Personal Competencies:
Adaptability and Flexibility
Creative Thinking
Critical Thinking
Self-direction and Self-management

Teaching methods:
Exercises on the computer

Assessment methods:
At the oral exam, the results of the exercises are taken into account when evaluating the results of the exam.

Methods and tools:
C++ programming:

Lecture notes:
Script (in English) will be available

Literature:
Objective

Students will develop a basic understanding of fate and effects of chemicals in the environment and learn how to use simple quantitative tools for the assessment of chemical behaviour and toxic effects.

Content

Part 1: Partitioning and reactivity
- Physico-chemical description of partitioning behaviour of organic compounds
- Partitioning in environmental media including soil/sediment, air, water
- Chemical and biological transformations

Part 2: Effects
- Test systems for the assessment of ecotoxicological effects of chemicals
- Bioavailability and bioaccumulation
- Metabolisms of organic compounds
- Molecular mechanisms of toxic action

Part 3: Analyses
- Analytical methods for quantification of substances in water, soil, and air
- Sampling, sample preparation and quantification of organic compounds in environmental media

Lecture notes

Handouts/lecture slides will be made available electronically

Does not take place this semester.
Entry level course in management for BSc, MSc and PHD students at all levels not belonging to D-MTEC. This course can be complemented with Discovering Management (Excercises) 351-0778-01.

Abstract

Discovering Management offers an introduction to the field of business management and entrepreneurship for engineers and natural scientists. By taking this course, students will enhance their understanding of management principles and the tasks that entrepreneurs and managers deal with. The course consists of theory and practice sessions, presented by a set of area specialists at D-MTEC.

Objective

The general objective of Discovering Management is to introduce students into the field of business management and entrepreneurship.

In particular, the aims of the course are to:
1. broaden understanding of management principles and frameworks
2. advance insights into the sources of corporate and entrepreneurial success
3. develop skills to apply this knowledge to real-life managerial problems

The course will help students to successfully take on managerial and entrepreneurial responsibilities in their careers and / or appreciate the challenges that entrepreneurs and managers deal with.

Content

The course consists of a set of theory and practice sessions, which will be taught on a weekly basis. The course will cover business management knowledge in corporate as well as entrepreneurial contexts.

The course consists of three blocks of theory and practice sessions: Discovering Strategic Management, Discovering Innovation Management, and Discovering HR and Operations Management. Each block consists of two or three theory sessions, followed by one practice session where you will apply the theory to a case.

The theory sessions will follow a "lecture-style" approach and be presented by an area specialist within D-MTEC. Practical examples and case studies will bring the theoretical content to life. The practice sessions will introduce you to some real-life examples of managerial or entrepreneurial challenges. During the practice sessions, we will discuss these challenges in depth and guide your thinking through team coaching.

Through small group work, you will develop analyses of each of the cases. The theory sessions will be assessed via a multiple choice exam.

Lecture notes

All course materials (readings, slides, videos, and worksheets) will be made available to inscribed course participants through Moodle. These course materials will form the point of departure for the lectures, class discussions and team work.

Competencies

Subject-specific Competencies
- Concepts and Theories: assessed

During the introductory teaching practice, the students sit in on five lessons given by the teacher responsible for their teaching practice.

They are able to design lessons that are effective for learning, actively involve students in lessons, explain challenging concepts simply, use experiments for theory and reflect on teaching.

The students have basic subject didactic knowledge for teaching chemistry at a secondary school.

Scherzpunkte im ersten Studiensemester bilden die folgenden Themen:
- Auswahl gymnasiumsrelevanter Lerninhalte
- Didaktische Vereinfachung
- Modelle und chemischen Formeln zur Beschreibung von Aufbau und Umwandlung der Substanzen
- Wechselspiel zwischen Beobachtung in der realen Welt und Deutung auf Modell-Ebene
- Skizzen entwerfen und zur Erklärung von Reaktionen nutzen
- Chemie im 8. Schuljahr: Das Teilchenmodell erklärt viele Phänomene im Anfangsunterricht
- Atommodelle und chemische Bindung
- Radioaktivität und Kernspaltung
- Struktur und Eigenschaft
- Auswahl, Konzeption, Vorbereitung, Durchführung, Einbettung und Auswertung von Demonstrations-Experimenten

Abstract
During the introductory teaching practice, the students sit in on five lessons given by the teacher responsible for their teaching practice, and teach five lessons themselves. The students are given observation and reflection assignments by the teacher responsible for their teaching practice.

Objective
The students have basic subject didactic knowledge for teaching chemistry at a secondary school.

Content
- Self-direction and Self-management
- Problem-solving
- Media and Digital Technologies
- Analytical Competencies
- Decision-making
- Techniques and Technologies
- Concepts and Theories
- Concepts and Theories

The teaching practice takes in 50 lessons: 30 are taught by the students, and the students sit in on 20 lessons. The teaching practice lasts 4-6 weeks. It gives students the opportunity to implement the contents of their specialist-subject, educational science and subject-didactics training in the classroom. Students also conduct work assignments in parallel to their teaching practice.

Objective
- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics in their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They acquire the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils' work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

**529-0955-00L**
**Professional Exercises: Experiments in Teaching Chemistry**

*O* 2 credits 4V P. Aschwanden

**Abstract**
This course unit introduces students to the technique of conducting experiments in chemistry lessons. It covers didactic, technical, safety-related and presentation aspects.

**Objective**
- Students can demonstrate experiments safely and convincingly
- explain observations in a level-appropriate manner
- use experiments to support theory
- know why experiments need to be tested before demonstration
- know some standard experiments
- develop own experiments

**Content**
- Schwerpunkte bilden die folgenden Themen:
  - Theoretische Einführung
  - Merkmale eines sicheren Experimentieren
  - Die Studierenden erproben und demonstrieren bereitstehende Experimente
  - Experimente mit einer Skizze festhalten
  - Auf der Basis der Literatur ein Experiment selbständig ausarbeiten, dokumentieren und vorführen
  - Experimente in den Unterricht einbetten
  - Aufgaben zur Auswertung entwerfen

**Lecture notes**

**Examination Lesson I Chemistry**

*O* 1 credit 2P P. Aschwanden

*Simultaneous enrolment in “Examination Lesson II Chemistry” (529-0968-02L) is compulsory.*

**Will mark the conclusion of the teacher training program in Chemistry.**

**Abstract**
In the context of an examination lesson conducted and graded at a high school, the candidates provide evidence of the subject-matter-based and didactic skills they have acquired in the course of their training.

**Objective**
- On the basis of a specified topic, the candidate shows that they are in a position
  - to develop and conduct teaching that is conducive to learning at high school level, substantiating it in terms of the subject-matter and from the didactic angle
  - to analyze the tuition they have given with regard to its strengths and weaknesses, and outline improvements.

**Content**
- Die Studierenden erfahren das Lektionsthema in der Regel eine Woche vor dem Prüfungstermin. Von der zuständigen Lehrperson erhalten sie Informationen über den Wissensstand der zu unterrichtenden Klasse und könnten sie vor dem Prüfungstermin besuchen. Sie erstellen eine Vorbereitung gemäss Anleitung und reichen sie bis am Vortag um 12 Uhr den beiden Prüfungsexperten ein. | 529-0962-00L| Fundamental Aspects of Chemistry with an Educational Focus I          | O    | 4    | 2V    | C. Thilgen, R. Grass, A. Togni |
| Abstract    | Selected topics in general chemistry: 1) The language of chemistry; 2) Chirality and stereochemistry; 3) Chemistry and sustainability. |      |      |       |                   |
| Objective   | In this course, participants acquire extended and more in-depth knowledge of selected chemistry topics. The selection is based to a large extent on the partial aspects of chemistry that are typically taught at high school. By gaining a broader understanding, teachers are put in a position where they can comprehend the topics that are to be taught in a wider and, to some extent, unconventional context and critically process these in respect of their teachability and learnability. At the same time, interrelationships between the classical sub-disciplines of chemistry are highlighted, along with the unique features of chemistry as one of the central natural sciences. |      |      |       |                   |
| Content     | The FV primarily conveys basic subject knowledge. Didactic aspects or even concrete suggestions for the design of grammar school lessons are possible, but not central. |      |      |       |                   |
| Learning format: | Lecture.                                                   |      |      |       |                   |
| Thematic focus of FV I: | The language of chemistry: Concepts, formulas, aesthetics, and philosophical aspects |      |      |       |                   |
| Stereochimistry: | The Coupe du Roi and its chemical meaning, Cyclostereoisomerism, Origin of biomolecular homochirality |      |      |       |                   |
| Chemistry and sustainability: | The link between chemical products and energy consumption, life cycle assessments and chemical energy storage |      |      |       |                   |
| Lecture notes| Slides and selected literature will be provided.         |      |      |       |                   |
| Literature  | Selected articles from the primary literature are presented, commented on and recommended reading. |      |      |       |                   |
| Prerequisites / notice | The FV I (fall semester) and FV II (spring semester) do not build upon each other. The order in which they are taken is therefore indifferent. |      |      |       |                   |
| Competencies | Subject-specific Competencies: Concepts and Theories | assessed |      |       |                   |
|              | Method-specific Competencies: Analytical Competencies | assessed |      |       |                   |

| Abstract    | In this course, participants acquire extended and more in-depth knowledge of selected chemistry topics. The selection is based to a large extent on the partial aspects of chemistry that are typically taught at high school. By gaining a broader understanding, teachers are put in a position where they can comprehend the topics that are to be taught in a wider and, to some extent, unconventional context and critically process these in respect of their teachability and learnability. At the same time, interrelationships between the classical sub-disciplines of chemistry are highlighted, along with the unique features of chemistry as one of the central natural sciences. |      |      |       |                   |
| Objective   | The aim is for the students - to familiarise themselves with a new topic by obtaining material and studying the sources, so that they can selectively extend their specialist competence in this way. - to independently develop a text on the topic, with special focus on its mathematical comprehensibility in respect of the level of knowledge of the targeted readership. - To try out different options for specialist further training in their profession. |      |      |       |                   |

Subject with an Educational Focus Chemistry A

Abstract
In the mentored work on their subject specialisation, students link high-school and university aspects of the subject, thus strengthening their teaching competence with regard to curriculum decisions and the future development of the tuition. They compile texts under supervision that are directly comprehensible to the targeted readers - generally specialist-subject teachers at high-school level.

Objective
The aim is for the students
- to familiarise themselves with a new topic by obtaining material and studying the sources, so that they can selectively extend their specialist competence in this way.
- to independently develop a text on the topic, with special focus on its mathematical comprehensibility in respect of the level of knowledge of the targeted readership.
- To try out different options for specialist further training in their profession.

</tr>
<tr>
<td>Objective</td>
<td>During this semester course, methodologies will be taught for biological-chemical enzyme evolution experiments using molecular genetic mutation technologies and in vivo selection in recombinant bacterial strains. The relevant technologies will be taught to the students, such as the preparation of competent cells, production and isolation of DNA fragments, transformation of gene libraries, and DNA sequencing. The course participants will generate a variety of different variants of a chorismate mutase. Individual enzyme catalysts will be purified and subsequently characterized using several different spectroscopic methods. The detailed chemical-physical analyses include determination of the enzymes' kinetic parameters, their molecular mass, and the integrity of the protein structure. The students will present the results obtained from their individual evolution experiments at the end of the semester. We expect that during this lab course we will not only generate novel enzymes, but also gain new mechanistic insights into the investigated catalyst.</td>

Further literature will be indicated in the distributed script.

**Prerequisites / notice**

- The projects of this course are tightly linked to the ones of the Biology BSc course "529-0739-01 Biological Chemistry B: New Enzymes from Directed Evolution Experiments", which takes place as a block course during the month of November. There will be joint lectures for the participants of both courses during that time. The teaching language is English.
- The number of participants for the laboratory class is limited. It is mandatory to sign up for the course directly with P. Kast no later than September 1, prior to the start of the fall semester. Until then it will be decided whether the course will take place.
- A valid registration is considered a commitment for attendance of the entire semester course, as involved material orders and experimental preparations are necessary and, once the class has started, the flow of the experiments must not be interrupted by individual absences. In case of an emergency, please immediately notify P. Kast.
- For more information, see also http://www.kast.ethz.ch/teaching.html or contact P. Kast directly (HCI F 333, Tel. 044 632 29 08, kast@org.chem.ethz.ch).

**Chemical Thermodynamics, Reaction Kinetics, Molecular Quantum Mechanics and Spectroscopy; Mathematical Foundations (Analysis, Combinatorial Relations, Integral and Differential Calculus)**

**Concepts and Theories**

- Introduction to statistical mechanics and thermodynamics. Prediction of thermodynamic and kinetic properties from molecular data.

**Lecture notes / Literature**

- See homepage of the lecture.
This lecture course consists of three parts: 1) Solid-state NMR, 2) Surface and direct solid analysis, 3) Crystal structure analysis. Most primary literature and review articles will be cited during the course.

*Only students who fulfill the following criteria are allowed to begin with their Master's thesis:
  a. successful completion of the Bachelor's programme;
  b. fulfilling of any additional requirements necessary to gain admission to the Master's programme.*

**Duration of the Master's Thesis:** 20 weeks.

**Abstract**
In the Master's thesis students prove their ability to independent, structured and scientific working. The Master's thesis is usually carried out in a core or optional subject area as chosen by the student.

**Objective**
In the Master's Thesis students prove their ability to independent, structured and scientific working.

Detailed discussion of selected modern transition metal catalyzed reactions from a synthetic and mechanistic viewpoint.

**Objective**
Understanding and critical evaluation of current research in transition metal catalysis. Design of mechanistic experiments to elucidate reaction mechanisms. Synthetic relevance of transition metal catalysis. Students will also learn about writing an original research proposal during a workshop.

**Content**
Detailed discussion of selected modern transition metal catalyzed reactions from a synthetic and mechanistic viewpoint. Synthetic applications of these reactions. Introduction and application of tools for the elucidation of mechanisms. Selected examples of topics include: C-H activation, C-O activation, C-C activation, redox active ligands, main group redox catalysis, bimetallic catalysis.

**Lecture notes**
Lecture slides will be provided online. A Handout summarizing important concepts in organometallic and physical organic chemistry will also be provided. Useful references and handouts will also be provided during the workshop.

**Literature**
Primary literature and review articles will be cited during the course.

The following textbooks can provide useful support for the course:

**Prerequisites / notice**
Required level: Courses in organic and physical chemistry (kinetics in particular) of the first and second year as well as ACI and III.

529-0241-10L Selectivity in Organic Synthesis W 6 credits 3G J. W. Bode

Abstract
Fundamentals of selective organic reactions, including current and historical examples of enantioselectivity, regioselectivity, chemoselectivity. Further aspects include recent developments in catalysis, strategies and tools for selective organic synthesis.

Objective
Understanding and explaining the origin of selectivity in organic synthesis and the application of selective organic reactions to the construction of complex organic and biological molecules.

Content
Fundamental concepts and recent advances for the selective synthesis of complex organic molecules, including natural products, pharmaceuticals, and biological molecules. Key concepts include the development of enantioselective and regioselective catalysts, the identification of new reaction mechanisms and pathways, and technological advances for facilitating the synthesis of organic molecules. Analysis of key primarily literature including identification of trends, key precendents, and emerging topics will be emphasized.

529-0240-00L Chemical Biology - Peptides W 6 credits 3G H. Wennemers

Abstract
An advanced course on the synthesis, properties and function of peptides in chemistry and biology.

Objective
Knowledge of the synthesis, properties and function of peptides in chemistry and biology.

Content
Advanced peptide synthesis, conformational properties, combinatorial chemistry, therapeutic peptides, peptide based materials, peptides in nanotechnology, peptides in asymmetric catalysis.

Lecture notes
Citations from the original literature relevant to the individual lectures will be assigned weekly.

Literature

529-0731-00L Nucleic Acids and Carbohydrates W 6 credits 3G K. Lang, M. Frei, P. A. Kast, H. Wennemers

Note for BSc Biology students: Only one of the two concept courses 529-0731-00 Nucleic Acids and Carbohydrates (autumn semester) or 529-0732-00 Proteins and Lipids (spring semester) can be counted for the Bachelor's degree.

Abstract
Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines.

Objective
Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines.
Advanced Physical Chemistry: Statistical

Content
Structure, function and chemistry of nucleic acids and carbohydrates, DNA/RNA structure and synthesis; recombiant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines

Lecture notes
No script; illustrations from the original literature relevant to the individual lectures will be provided weekly (typically as handouts downloadable from the Moodle server).

Literature
Mainly based on original literature, a detailed list will be distributed during the lecture

Data: 26.07.2024 12:39  Autumn Semester 2024  Page 545 of 2680
The course is separated in three well separated parts.

The first part will cover DNP concept and mechanisms, while a special focus will be given in DNP instrumentation, such as MAS technology, and the NMR probe. Several details will be also presented on the development high field NMR magnet.

The second part of the course is dedicated to the microwave theory and technology. This part starts with an introduction of the two different types of microwave sources, such as the solid-state devices and vacuum tubes, which are extensively used in DNP and EPR spectroscopy. A special focus will be given to the vacuum tube’s theory and technology. In this context, the Maxwell equations and the propagation of the transverse electric and transverse magnetic modes in circular waveguides will be taught. This material will be the basis for understanding the resonance theory and the fundamentals of the microwave’s generation in vacuum tubes. Based on the theoretical background gained in the previous lectures it will be possible to understand the operation principle of the slow wave devices, such as Klystron, Traveling Wave Tube (TWT), Backward Wave Oscillator (BWO) and Surface Wave Structure (SWS), as well as, the fast wave devices, such as gyro-devices, Free Electron Laser, etc. Finally, some details on the structure of a real DNP gyrotron will be presented.

The third part of the course will cover CPMAS and homonuclear and heteronuclear recoupling schemes and their use in correlation spectroscopy for structure and molecular interaction determination. Sample preparation with particular emphasis of glassing agents and their relationship to DNP enhancements will be discussed. Resolution under DNP including a discussion about inhomogeneous and homogeneous broadening at cryogenic temperatures. Methods for circumventing low resolution at cryogenic temperatures will be discussed including site specific isotope labeling, bio-orthogonal labeling and site specific radical labeling/targeting. Concepts around the role of spin diffusion in DNP, direct and indirect DNP, paramagnetic broadening, longitudinal T1 and methyl quenching in biological NMR will also be discussed. These concepts will then be tied together through discussions of biomolecular applications of solid-state DNP including membrane proteins, in-cell DNP and viruses.

**Abstract**
Problem-oriented development of analytical strategies and solutions. Ability to create solutions for particular analytical problems.

**Objective**
Individual development of strategies for the optimal application of chemical, biochemical, and physico-chemical methods in analytical chemistry solving predefined problems. Experts from industry and administration present particular problems in their field of activity. Principles of sampling.

**Content**
Design and application of microanalytical systems. Principles of sampling.

**Lecture notes**
Copies of problem sets and solutions will be distributed free of charge.

**Prerequisites / notice**
Prerequisites:  
529-0051-00 “Analytical Chemistry I (3. Semester)”  
529-0058-00 “Analytical Chemistry II (4. Semester)”  
(or equivalent)
Biological Chemistry

Number Title Type ECTS Hours Lecturers
529-0733-02L Chemical Biology and Synthetic Biochemistry W 6 credits 3G K. Lang, M. Fottner

Objective
After taking this course, students should be capable of the following: A) Recall different possibilities for modifying proteins in vitro and in vivo and their applications in a biological context, B) Understand the chemical and biochemical consequences of modifications and assess the different reaction possibilities in the context of in vivo - in vitro, C) Critically analyze and assess current chemical biology articles D) Question the approaches learned and apply them to new biological problems.

Content
- principles of protein labeling and protein modification (fluorescent proteins, enzyme-mediated labeling, bioorthogonal chemistries)
- advanced genetic code expansion methods (amber suppression, orthogonal ribosomes, unnatural base pairs, genome engineering and genome editing)
- directed evolution and protein engineering
- chemical biology of ubiquitin and targeted protein degradation

Literature
Citations from the original literature relevant to the individual lectures will be assigned during the lectures.

Prerequisites / notice
Knowledge provided in the bachelor lectures 'Nucleic Acids and Carbohydrates' and 'Proteins and Lipids' is assumed for this lecture.

Chemical Aspects of Energy

Number Title Type ECTS Hours Lecturers
151-0209-00L Renewable Energy Technologies W 4 credits 3G A. Bardow, E. Casati

Objective
Students learn the potential and limitations of renewable energy technologies and their contribution towards sustainable energy utilization.

Prerequisites / notice
Prerequisite: strong background on the fundamentals of engineering thermodynamics, equivalent to the material taught in the courses Thermodynamics I, II, and III of D-MAVT.
Chemical Crystallography

Abstract
Advanced X-ray crystal structure analysis

Objective
To gain a deeper understanding of crystal structure determination principles and practice by X-ray diffraction and the evaluation of results.

Content
Review of principles of diffraction and instrumentation, unit cells, lattices, and symmetry. Inorganic structural chemistry: sphere packings, ionic crystals, covalent networks, intermetallic compounds. Overview of powder diffraction and application of crystal chemistry for structure analysis of polycrystalline phases. Working safely with X-rays, crystal growth, selection and mounting, data collection strategies, data reduction, corrections for absorption, extinction and Lp, advanced structure solution theory and techniques: Patterson function, heavy atom technique, Fourier methods, direct methods. Structure modeling and refinement, disorder, twinning, false symmetry, interpretation of anisotropic shift parameters. Determination of absolute configuration, interpretation of results and scope of chemically useful information, validation and publication of results, critical evaluation of published crystal structures.

Lecture notes
Information and exercise sheets will be distributed in loose form.

Literature
Main references:

Additional literature:

Prerequisites / notice
Students will conduct the computational exercises and examples of structure solution and refinement on personal computers.

Prerequisite: Principles of Crystal Structure Determination (529-0039-00L).

Data: 26.07.2024 12:39 Autumn Semester 2024 Page 548 of 2680
Abstract
Advanced, but fundamental topics central to the understanding of theory in chemistry and for solving actual chemical problems with a computer. Examples are:
- Operators derived from principles of relativistic quantum mechanics
- Relativistic effects + methods of relativistic quantum chemistry
- Open-shell molecules + spin-density functional theory
- New electron-correlation theories

Objective
The aim of the course is to provide an in-depth knowledge of theory and method development in theoretical chemistry. It will be shown that this is necessary in order to be able to solve actual chemical problems on a computer with quantum chemical methods.

The relativistic re-derivation of all concepts known from (nonrelativistic) quantum mechanics and quantum-chemistry lectures will finally explain the form of all operators in the molecular Hamiltonian - usually postulated rather than deduced. From this, we derive operators needed for molecular spectroscopy (like those required by magnetic resonance spectroscopy). Implications of other assumptions in standard non-relativistic quantum chemistry shall be analyzed and understood, too. Examples are the Born-Oppenheimer approximation and the expansion of the electronic wave function in a set of pre-defined many-electron basis functions (Slater determinants). Overcoming these concepts, which are so natural to the theory of chemistry, will provide deeper insights into many-particle quantum mechanics. Also revisiting the workhorse of quantum chemistry, namely density functional theory, with an emphasis on open-shell electronic structures (radicals, transition-metal complexes) will contribute to this endeavor. It will be shown how these insights allow us to make more accurate predictions in chemistry in practice - at the frontier of research in theoretical chemistry.

Content
1) Introductory lecture: basics of quantum mechanics and quantum chemistry
2) Einstein’s special theory of relativity and the (classical) electromagnetic interaction of two charged particles
3) Klein-Gordon and Dirac equation; the Dirac hydrogen atom
4) Numerical methods based on the Dirac-Fock-Coulomb Hamiltonian, two-component and scalar relativistic Hamiltonians
5) Response theory and molecular properties, derivation of property operators, Breit-Pauli-Hamiltonian
6) Relativistic effects in chemistry and the emergence of spin
7) Spin in density functional theory
8) New electron-correlation theories: Tensor network and matrix product states, the density matrix renormalization group

Lecture notes
A set of detailed lecture notes will be provided, which will cover the whole course.

Literature
2) F. Schwabl, Quantenmechanik für Fortgeschrittene (QM II), Springer-Verlag, 1997
g [english version available: F. Schwabl, Advanced Quantum Mechanics]
3) R. McWeeny: Methods of Molecular Quantum Mechanics, Academic Press, 1992
https://doi.org/10.1063/1.5129672

Note also the standard textbooks:
A) A. Szabo, N.S. Ostlund. Verlag, Dover Publications
B) J. Levi, Quantum Chemistry, Pearson

Prerequisites / notice
Strongly recommended (preparatory) courses are: quantum mechanics and quantum chemistry

Competencies
- Subject-specific Competencies: Concepts and Theories (assessed), Techniques and Technologies (fostered)
- Method-specific Competencies: Analytical Competencies (assessed), Decision-making (fostered), Problem-solving (fostered)
- Social Competencies: Communication (fostered), Cooperation and Teamwork (fostered)
- Personal Competencies: Creative Thinking (fostered), Critical Thinking (fostered), Self-awareness and Self-reflection (assessed, fostered)

529-0004-01L Classical Simulation of (Bio)Molecular Systems

W 6 credits 4G 5P. H. Hünenberger, J. Dolenc, S. Riniker

Abstract
Molecular models, classical force fields, configuration sampling, molecular dynamics simulation, boundary conditions, electrostatic interactions, analysis of trajectories, free-energy calculations, structure refinement, applications in chemistry and biology. Exercises: hands-on computer exercises for learning progressively how to perform an analyze classical simulations (using the package GROMOS). The relativistic re-derivation of all concepts known from (nonrelativistic) quantum mechanics and quantum-chemistry lectures will finally explain the form of all operators in the molecular Hamiltonian - usually postulated rather than deduced. From this, we derive operators needed for molecular spectroscopy (like those required by magnetic resonance spectroscopy). Implications of other assumptions in standard non-relativistic quantum chemistry shall be analyzed and understood, too. Examples are the Born-Oppenheimer approximation and the expansion of the electronic wave function in a set of pre-defined many-electron basis functions (Slater determinants). Overcoming these concepts, which are so natural to the theory of chemistry, will provide deeper insights into many-particle quantum mechanics. Also revisiting the workhorse of quantum chemistry, namely density functional theory, with an emphasis on open-shell electronic structures (radicals, transition-metal complexes) will contribute to this endeavor. It will be shown how these insights allow us to make more accurate predictions in chemistry in practice - at the frontier of research in theoretical chemistry.

Objective
Introduction to classical (atomistic) computer simulation of (bio)molecular systems, development of skills to carry out and interpret these simulations.

Content
Molecular models, classical force fields, configuration sampling, molecular dynamics simulation, boundary conditions, electrostatic interactions, analysis of trajectories, free-energy calculations, structure refinement, applications in chemistry and biology. Exercises: hands-on computer exercises for learning progressively how to perform an analyze classical simulations (using the package GROMOS).

Lecture notes
The powerpoint slides of the lectures will be available on the website in pdf format (on the day preceding each lecture).

Literature
See: www.csms.ethz.ch/education/CSBMS

Prerequisites / notice
Since the exercises on the computer do convey and test essentially different skills than those being conveyed during the lectures and tested at the oral exam, the results of the exercises are taken into account when evaluating the results of the exam (learning component, possible bonus of up to 0.25 points on the exam mark).

For more information about the lecture: www.csms.ethz.ch/education/CSBMS

Competencies
- Subject-specific Competencies: Concepts and Theories (assessed), Techniques and Technologies (assessed)
- Method-specific Competencies: Analytical Competencies (assessed), Media and Digital Technologies (assessed)
- Personal Competencies: Adaptability and Flexibility (fostered), Creative Thinking (fostered)

</tbody>
</table>
Modern polymer synthesis (based on recent development of new organic reactions) is discussed to enable students to develop synthesis schemes for certain target structures. Both chain (ionic, coordination, ROMP, radical, catalyst-transfer) and step-growth polymerizations (transition metal catalysis) including how to achieve living polymerization or improve selectivity will be discussed.

Objective
Students should be able to:
- Identify important polymerization procedures and types of polymerization
- Predict activities of monomers based on the chemical structures
- Devise synthetic pathways to produce a given polymer structure
- Evaluate properties of macromolecules based on structure and synthesis method
- Develop synthesis schemes for target structures and discuss potential applications of polymers.

Content
Polymerization is a series of continuous organic transformations and connects small molecules. The course will give an overview of the following important polymerization procedures:
- Modern Step-growth polymerization
- Living Anionic polymerization
- Group transfer polymerization (GTP)
- Controlled cationic polymerization
- Controlled radical polymerization
- Coordination polymerization: Ziegler-Natta and Metalloocene catalysts
- Olefin metathesis polymerization: ROMP, ADMET and cyclopolymerization
- Synthesis of conjugated polymers based on transition metal catalysis
- Complex macromolecules including brush and dendronized polymers

Students will learn how to deal with chemical structures and reactivities, and be able to suggest reasonable synthetic pathways to a given polymer structure, like conjugated polymers based on transition metal catalysis or complex macromolecules including brush and dendronized polymers. Aspects like controlling molar masses and structure perfection play a role throughout. The course provides the students with a high-level overview of modern methods of polymer synthesis both in theoretical and practical aspects. It should enable them to develop reasonable synthesis schemes for certain target structures and also to predict the properties of given macromolecules. For all polymers presented, potential or real applications will be discussed.

Lecture notes
They will be uploaded on Moodle.

Literature
Lecture notes will be given.

Prerequisites / notice
Strong basic knowledge of Organic Chemistry. Any course on Introductory Polymer Chemistry such as "Advanced Building Blocks for Soft Materials" or "Introduction to Macromolecular Chemistry" or equivalent (bachelor level is also sufficient). Please discuss with the lecturer if one is not certain about the prerequisites.

Objective

This course intends to enable all students to:

- Acquire and understand the basic jargon, concepts and methods necessary to discuss, in a precise and concise manner, innovation processes and their outcomes at different levels of analysis.

- Analyze the differences between individual and organizational decision processes and their innovative outcomes.

- Evaluate critically the potential of different (digital) technologies to impact business organizations.

Content

Organizations and people are faced with a fundamental decision: they have to allocate resources between well-known tasks that reliably generate positive results, or explore new ways of doing things, new technologies, products and services. The latter is a high risk choice. Its rewards can be high, but the chances of success are small. How do firms organize to take these decisions? What kind of management skills are necessary to take them? What kind of tools and methods are deployed to sustain managerial decision-making in highly volatile environments? These are the central questions on which this course focuses, relying on a combination of lectures, case-based discussion, and guest speakers.

Lecture notes

Slides will be available on the Moodle page.

Literature

Readings will be available on the Moodle page.

Prerequisites / notice

The course content and methods are designed for students with some background in management and/or economics.

Competencies

Subject-specific Competencies

- Concepts and Theories: assessed
- Techniques and Technologies: assessed

Method-specific Competencies

- Analytical Competencies: assessed
- Decision-making: fostered
- Media and Digital Technologies: fostered
- Problem-solving: fostered

Social Competencies

- Communication: fostered
- Leadership and Responsibility: fostered
- Sensitivity to Diversity: fostered

Personal Competencies

- Adaptability and Flexibility: fostered
- Creative Thinking: fostered
- Critical Thinking: assessed
- Integrity and Work Ethics: fostered
- Self-awareness and Self-reflection: assessed
- Self-direction and Self-management: fostered

363-0565-00L Principles of Macroeconomics

W 3 credits 2V J.-E. Sturm

Abstract

This course examines the behaviour of macroeconomic variables, such as gross domestic product, unemployment and inflation rates. It tries to answer questions like: How can we explain fluctuations of national economic activity? What can economic policy do against unemployment and inflation?

Objective

This lecture will introduce the fundamentals of macroeconomic theory and explain their relevance to everyday economic problems.

Content

This course helps you understand the world in which you live. There are many questions about the macroeconomy that might spark your curiosity. Why are living standards so meagre in many African countries? Why do some countries have high rates of inflation while others have stable prices? Why have some European countries adopted a common currency? These are just a few of the questions that this course will help you answer.

Furthermore, this course will give you a better understanding of the potential and limits of economic policy. As a voter, you help choose the policies that guide the allocation of society's resources. When deciding which policies to support, you may find yourself asking various questions about economics. What are the burdens associated with alternative forms of taxation? What are the effects of free trade with other countries? How does the government budget deficit affect the economy? These and similar questions are always on the minds of policy makers.

Lecture notes

The course Moodle page contains announcements, course information and lecture slides.

Literature

This book can also be used for the course 363-0503-00L Principles of Microeconomics (Filippini).

Besides this textbook, the slides, lecture notes and problem sets will cover the content of the lecture and the exam questions.

Competencies

Subject-specific Competencies

---|---|---|---|---|---
529-0141-00L | Physical Methods for Inorganic Chemistry | W+ | 6 credits | 3G | M. D. Wörle, D. Günther, J. Koch, R. Verel

Abstract
Introduction into the important methods for structural analysis (solid state NMR), crystal structure analysis and surface analysis techniques and their applications

Objective
Knowledge in solid state NMR, crystal structure analysis and surface analytical techniques relevant for inorganic materials

Content
This lecture course consists of three parts 1) Solid-state NMR 2) Surface and direct solid analysis 3) Crystal structure analysis. Most important fundamentals of the individual methods will be presented and details will be explained on most relevant inorganic applications

Lecture notes
Will be given during the lectures

★★ Physical Chemistry

Number | Title | Type | ECTS | Hours | Lecturers
---|---|---|---|---|---
529-0027-00L | Advanced Magnetic Resonance - Solid State NMR | W+ | 6 credits | 3G | M. Ernst

Abstract
The course is for advanced students and introduces and discusses the theoretical foundations of solid-state nuclear magnetic resonance (NMR).

Objective
The aim of the course is to familiarize the students with the basic concepts of modern high-resolution solid-state NMR. Starting from the mathematical description of spin dynamics, important building blocks for multi-dimensional experiments are discussed to allow students a better understanding of modern solid-state NMR experiments. Particular emphasis is given to achieving high spectral resolution.

Content
The basic principles of NMR in solids will be introduced. After the discussion of basic tools to describe NMR experiments, basic methods and experiments will be discussed, e.g., magic-angle spinning, cross polarization, decoupling, and recoupling experiments. Such basic building blocks allow a tailoring of the effective Hamiltonian to the needs of the experiment. These basic building blocks can then be combined in different ways to obtain spectra that contain the desired information.

Lecture notes
A script which covers the topics will be distributed in the lecture and will be accessible through the web page http://www.ssnmr.ethz.ch/education/

Prerequisites / notice
Prerequisite: A basic knowledge of NMR, e.g. as covered in the Lecture Physical Chemistry IV, or the book by Malcolm Levitt.

529-0130-00L | Advanced Magnetic Resonance - DNP Instrumentation W+ and Applications | 6 credits | 3G | A. Barnes

Abstract
The course is for advanced students and covers selected topics from magnetic resonance spectroscopy. The following topics will be covered:
- DNP theory & instrumentation
- Microwave theory & technology
- Biological applications of solid-state DNP

Objective
The course aims at enabling students to understand the key theoretical points of DNP and to design DNP experiments. Students will be familiarized with the structure of the state-of-the-art DNP instrumentation. Students will be also informed about the technological challenges towards the development of advanced instrumentation for the future DNP experiments. A special focus will be given in the technology of microwave source. Furthermore, students will become familiar with pulse sequences used in biomolecular applications and understand how they are constructed. Students will be able to identify the strengths and weaknesses of biomolecular DNP and how to design DNP experiments for biological applications including sample preparation and choice of NMR experiment and related parameters.

Content
The course is separated in three well separated parts.

The first part will cover DNP concept and mechanisms, while a special focus will be given in DNP instrumention, such as MAS technology, and the NMR probe. Several details will be also presented on the development high field NMR magnet.

The second part of the course is dedicated to the microwave theory and technology. This part starts with an introduction of the two different types of microwave sources, such as the solid-state devices and vacuum tubes, which are extensively used in DNP and EPR spectroscopy. A special focus will be given to the vacuum tube's theory and technology. In this context, the Maxwell equations and the propagation of the transverse electric and transverse magnetic modes in circular waveguides will be taught. This material will be the basis for understanding the resonance theory and the fundamentals of the microwave's generation in vacuum tubes. Based on the theoretical background gained in the previous lectures it will be possible to understand the operation principle of the slow wave devices, such as Klystron, Traveling Wave Tube (TWT), Backward Wave Oscillator (BWO) and Surface Wave Structure (SWS), as well as, the fast wave devices, such as gyro-devices, Free Electron Laser, etc. Finally, some details on the structure of a real DNP gyrotron will be presented.

The third part of the course will cover CPMAS and homonuclear and heteronuclear recoupling schemes and their use in correlation spectroscopy for structure and molecular interaction determination. Sample preparation with particular emphasis of glassing agents and their relationship to DNP enhancements will be discussed. Resolution under DNP including a discussion about inhomogeneous and homogeneous broadening at cryogenic temperatures. Methods for circumventing low resolution at cryogenic temperatures will be discussed including site specific isolation labeling, bio-orthogonal labeling and site specific radical labeling/targeting. Concepts around the role of spin diffusion in DNP, direct and indirect DNP, paramagnetic broadening, longitudinal T1 and methyl quenching in biological NMR will also be discussed. These concepts will then be tied together through discussions of biomolecular applications of solid-state DNP including membrane proteins, in-cell DNP and viruses.

Lecture notes
A script which covers the topics will be accessible through the course Moodle

Prerequisites / notice
Prerequisite: A basic knowledge of Magnetic Resonance, e.g. as covered in the Lecture Physical Chemistry IV, or the book "Spin Dynamics" by Malcolm Levitt.

★★★ Science in Perspective

see Science in Perspective: Language Courses ETH/UZH

see Science in Perspective: Type A: Enhancement of Reflection Capability

Recommended Science in Perspective (Type B) for O-CHAB

★★★★ Course Units for Additional Admission Requirements

The courses below are only available for MSc students with additional admission requirements.

Number | Title | Type | ECTS | Hours | Lecturers
---|---|---|---|---|---
529-0051-AAL | Analytical Chemistry I | E- | 3 credits | 6R | D. Günther, R. Zenobi
Knowledge about the necessary theoretical background of spectroscopical methods and their practical applications. The underlying lecture (529-0051-00L) is offered in autumn semester but only in German.

**Abstract**
Introduction into the most important spectroscopical methods and their applications to gain structural information.

**Objective**
Application oriented basics of organic and inorganic instrumental analysis and of the empirical employment of structure elucidation methods:

- Mass spectrometry: Ionization methods, mass separation, isotope signals, rules of fragmentation, rearrangements.
- NMR spectroscopy: Experimental basics, chemical shift, spin-spin coupling.
- IR spectroscopy: Revisiting topics like harmonic oscillator, normal vibrations, coupled oscillating systems (in accordance to the basics of the related lecture in physical chemistry); sample preparation, acquisition techniques, law of Lambert and Beer, interpretation of IR spectra; Raman spectroscopy.

**Content**

**Lecture notes**
Script will be provided for the production price

**Literature**

- M. Hesse, H. Meier, B. Zeeh, Spektroskopische Methoden in der organischen Chemie, 5. überarbeitete Auflage, Thieme, Stuttgart, 1995

**Prerequisites / notice**
Exercises are integrated in the lectures. In addition, attendance in the lecture 529-0289-00 "Instrumental analysis of organic compounds" (4th semester) is recommended.
assessed

Postulates and theorems of quantum mechanics: operator algebra, Schrödinger's equation, state functions and expectation values. Linear

This is an introductory course in quantum mechanics. The course starts with an overview of the fundamental concepts of quantum

Physical Chemistry III: Molecular Quantum Mechanics

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract

Postulates of quantum mechanics, operator algebra, Schrödinger’s equation, state functions and expectation values, matrix representation of operators, particle in a box, tunneling, harmonic oscillator, molecular vibrations, angular momentum and spin, generalised Pauli principle, perturbation theory, electronic structure of atoms and molecules, Born-Oppenheimer approximation.

Objective

This is an introductory course in quantum mechanics. The course starts with an overview of the fundamental concepts of quantum mechanics and introduces the mathematical formalism. The postulates and theorems of quantum mechanics are discussed in the context of experimental and numerical determination of physical quantities. The course develops the tools necessary for the understanding and calculation of elementary quantum phenomena in atoms and molecules.

Content

Literature

Content

Introduction to magnetic resonance in isotropic and anisotropic phase.

Lecture notes

handed out in the lecture (in english)

Physical Chemistry IV: Magnetic Resonance

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract

Theoretical foundations of magnetic resonance (NMR,EPR) and selected applications.

Objective

Introduction to magnetic resonance in isotropic and anisotropic phase.

Content

The course gives an introduction to magnetic resonance spectroscopy (NMR and EPR) in liquid, liquid crystalline and solid phase. It starts from a classical description in the framework of the Bloch equations. The implications of chemical exchange are studied and two-dimensional exchange spectroscopy is introduced. An introduction to Fourier spectroscopy in one and two dimensions is given and simple 'pulse trickery' is described. A quantum-mechanical description of magnetic resonance experiments is introduced and the spin Hamiltonian is derived. The chemical shift term as well as the scalar, dipolar and quadrupolar terms are discussed. The product-operator formalism is introduced and various experiments are described, e.g. polarization transfer. Applications in chemistry, biology, physics and medicine, e.g. determination of 3D molecular structure of dissolved molecules, determination of the structure of paramagnetic compounds and imaging (MRI) are presented.

Lecture notes

A manual is distributed in the teaching laboratory.

Prerequisites / notice

- Practical Course General Chemistry (1. Semester, 529-0011-04)
- Practical Course Inorg. and Org. Chemistry 1 (2. Sem., 529-0230)
- Attendance of Course Inorg. Chemistry 1 (3. Sem., 529-0121)

If necessary, access priority will be settled according to the results of the first-year examinations.

- Special students and auditors need special permission from the lecturers.
Adaptability and Flexibility

We will investigate the theoretical concepts behind microfluidic device operation, the methods of microfluidic device manufacture and the application of microfluidic architectures to important problems faced in modern day chemical and biological analysis.

A central component of this course is a research project. This will allow students to develop a practical understanding of the benefits of miniaturization in chemical and biological experimentation. Projects will be performed in groups of between four and six students and will include both experimental and simulation aspects. Each group, under the guidance of a mentor, will plan and execute a novel research project. The results of this activity will be disseminated through an "academic-style" research article and a "conference-style" oral presentation. Course grades will be evaluated through both a written exam and the project grade.

Specific topics covered in the course include, but are not limited to:

1. Theoretical Concepts
   Scaling laws, features of thermal/mass transport, diffusion, basic description of fluid flow in small volumes, microfluidic mixing strategies.

2. Microfluidic Device Manufacture
   Basic principles of conventional lithography of rigid materials, 'soft' lithography, polymer machining (injection molding, hot embossing, and 3D-printing).

3. Electrokinetics
   Principles of electrophoresis, electroosmosis, high performance capillary electrophoresis, electrokinetic scaling laws, chip-based electrophoresis and isoelectric focusing.

4. Mass Transfer Phenomena
   Key features of mass transport in microfluidic systems, diffusive transport, diffusion-convection, Péclet number, Taylor-Aris diffusion, chaotic mixing and Damköhler numbers.

5. Heat Transfer Phenomena
   Key features of thermal transport in microfluidic systems, conduction, convection, heat transfer by convection in internal flows, heat transfer processes in microfluidic devices.

6. Microfluidic Systems for Materials Synthesis
   Microfluidic reactors for the controlled synthesis of colloidal nanomaterials, advanced automation for bespoke materials discovery & characterization.

7. Point-of-Care Diagnostics
   Microscale tools for diagnostics, challenges associated with point-of-care (PoC) diagnostic testing, requirements for PoC devices, common PoC device formats, applications of PoC diagnostics in the developing world.

8. Microscale DNA Amplification
   Amplification and analysis of nucleic acids using batch, continuous flow and droplet-based microfluidic reactors.

9. Small volume Molecular Detection
   Spectroscopic approaches for analyte detection in small volumes with a particular focus on single molecule detection.

10. Droplets and Segmented Flows
    Formation, manipulation and use of liquid/liquid segmented flows in chemical and biological experimentation.

11. Single Cell Analysis
    Applications of microfluidic tools in cellular analysis, flow cytometry, enzymatic assays and single cell analysis.

Lecture notes
Lecture handouts, background literature, problem sheets and notes will be provided electronically through the course Moodle site.

Literature
There is no set text for the course. All relevant literature will be provided electronically through the course Moodle site.

529-0837-01L Biomicrofluidic Engineering W+ 6 credits 3G A. de Mello

Abstract
Microfluidics describes the behaviour, control and manipulation of fluids geometrically constrained within sub-uL environments. Microfluidic devices enable physical and chemical processes to be controlled with exquisite precision and in an fast and efficient manner. This course introduces the underlying concepts, features and applications of microfluidic systems in the chemical and life sciences.

Objective
We will investigate the theoretical concepts behind microfluidic device operation, the methods of microfluidic device manufacture and the application of microfluidic architectures to important problems faced in modern day chemical and biological analysis.

Specific topics covered in the course include, but are not limited to:

1. Theoretical Concepts
   Scaling laws, features of thermal/mass transport, diffusion, basic description of fluid flow in small volumes, microfluidic mixing strategies.

2. Microfluidic Device Manufacture
   Basic principles of conventional lithography of rigid materials, 'soft' lithography, polymer machining (injection molding, hot embossing, and 3D-printing).

3. Electrokinetics
   Principles of electrophoresis, electroosmosis, high performance capillary electrophoresis, electrokinetic scaling laws, chip-based electrophoresis and isoelectric focusing.

4. Mass Transfer Phenomena

Lecture notes
Lecture handouts, background literature, problem sheets and notes will be provided electronically through the course Moodle site.

Literature
There is no set text for the course. All relevant literature will be provided electronically through the course Moodle site.
Content
We will cover the fundamental processes and the operation units involved in the production of polymeric materials and proteins. In particular, the following topics are discussed: Overview on the different polymerization processes, kinetics of free-radical polymerization and use of population balance models. Production of polymers with controlled characteristics in terms of molecular weight distribution. Kinetics and control of emulsion polymerization. Surfactants and colloidal stability. Aggregation kinetics and aggregate structure in conditions of diffusion and reaction limited aggregation. Modeling and design of colloid aggregation processes. Physico-chemical characterization of proteins and description of enzymatic reactions. Operation units in bioprocessing: upstream, reactor design and downstream. Industrial production of therapeutic proteins. Characterization and engineering of protein aggregation. Protein aggregation in biology and in biotechnology as functional materials.

Lecture notes
Scripts are available on the web page of the Arosio-group: http://www.arosiogroup.ethz.ch/education.html
Additional handout of slides will be provided during the lectures.

Abstract
The 'Chemical Product Design' course teaches students quantitative concepts to analyze, select and transform theoretical concepts from chemistry and engineering into valuable real-world products. Basic chemistry and chemical engineering knowledge is required (Diffusion, Thermodynamics, Kinetics,...).

Objective
This course starts with analyzing existing chemical needs and unmet technical challenges. We then develop the skills to critically analyze a specific chemical idea for a product, to rapidly test feasibility or chance for success and to eventually realize its manufacturing. The chemical engineering basics are then used to assess performance of products or devices with non-traditional functions based on dynamic properties (e.g. responsive building materials, personal medical diagnostics on paper strips). The course teaches the interface between laboratory and market with a specific focus on evaluating the chemical value of a given process or compound, and the necessary steps to pursue the resulting project within an entrepreneurial environment. We therefore extend the questions of process design ("how do we make something?") to the question of "what should we make?"

Content
Part A: The 'Chemical Product Design' course starts with discussing questions along, 'What is a chemical product, and why do people pay for it? How does a given compound in a specific setting provide a service?' We then learn how to translate new, often ill-defined wishes or ideas into quantifiable specifications.

Part B: Thermodynamic and kinetic data allow sharp selection criteria for successful products. We learn how to deal with insufficient data and development of robust case models to evaluate their technical and financial constraints. How can parameters of a running process in one industry be scaled into another industry? Can dimensionless engineering numbers be applied beyond traditional chemical processes?

Part C: Manufacturing of commodity products, devices and molecular products: Chemical reactors, separation and detection or isolation units as part of a toolbox. Planning of manufacturing and decisions based on hard data. Providing quantitative answers on potential value generated.

Students are expected to actively develop chemical products along the course during the exercise sessions. Contributions will be made in small groups, where a larger topic is studied. The progress of each group will be followed by reports and short presentations during the semester, and one final pitching presentation at the end of the semester. Active participation in the group projects is mandatory for the admission to the oral exam.

Abstract
The course is focused on the design of Chemical Processes, with emphasis on the preliminary stages of the design approach, where process creation and quick selection among many alternatives are important. The main concepts behind more detailed process design and process simulation are also examined.

Objective
The course is focused on the design of Chemical Processes, with emphasis on the preliminary stage of the design approach, where process creation and quick selection among many alternatives are important. The main concepts behind more detailed process design and process simulation are also examined.

Content
Process creation: heuristics vs. mathematical programming.
Heuristics for reaction and separation operations, heat transfer and pressure change.
Introduction to optimization in process engineering and the modeling software GAMS.
Process economic evaluation: equipment sizing and costing, time value of money, cash flow calculations.
Process integration: sequencing of distillation columns using mixed-integer linear programming (MILP), and synthesis of heat exchanger networks using mixed-integer nonlinear programming (MINLP).
Batch processes: scheduling, sizing, and inventories.
Principles of molecular design using mixed-integer programming.

Lecture notes

Overview of process simulation and flowsheeting:

- M. Mazzotti

This course encompasses the theoretical principles of chemical process simulation and optimization, as well as its practical application in process analysis. The techniques for simulating stationary and dynamic processes are presented, and illustrated with case studies. Commercial software packages (Aspen) are introduced for solving process flowsheeting and optimization problems.

Prerequisites / notice

- Process Simulation and Flowsheeting: W+ 6 credits 3G  G. Guillén Gosálbez

Abstract

This course aims to develop the competency of chemical engineers in process flowsheeting, process simulation and process optimization. Specifically, students will develop the following skills:

- Deep understanding of chemical engineering fundamentals: the acquisition of new concepts and the application of previous knowledge in the area of chemical process systems and their mechanisms are crucial to intelligently simulate and evaluate processes.
- Modeling of general chemical processes and systems: students should be able to identify the boundaries of the system to be studied and develop the set of relevant mathematical relations, which describe the process behavior.
- Mathematical reasoning and computational skills: the familiarization with mathematical algorithms and computational tools is essential to be capable of achieving rapid and reliable solutions to simulation and optimization problems. Hence, students will learn the mathematical principles necessary for process simulation and optimization, as well as the structure and application of process simulation software. Thus, they will be able to develop criteria to correctly use commercial software packages and critically evaluate their results.
- Process optimization: the students will learn how to formulate optimization problems in mathematical terms, the main type of optimization problems that exist (i.e., LP, NLP, MILP and MINLP) and the fundamentals of the optimization algorithms implemented in commercial solvers.

Content

- Overview of process simulation and flowsheeting:
  - Definition and fundamentals
  - Fields of application
  - Case studies
- Process simulation:
  - Modeling strategies of process systems
  - Mass and energy balances and degrees of freedom of process units and process systems
- Process flowsheeting:
  - Flowsheet partitioning and tearing
  - Solution methods for process flowsheeting
  - Simultaneous methods
  - Sequential methods
- Process optimization and analysis:
  - Classification of optimization problems
  - Linear programming, LP
  - Non-linear programming, NLP
  - Mixed-integer linear programming, MILP
  - Mixed-integer nonlinear programming, MINLP
- Commercial software for simulation (Aspen Plus):
  - Thermodynamic property methods
  - Reaction and reactors
  - Separation / columns
  - Convergence, optimisation & debugging

Literature

An exemplary literature list is provided below:

Prerequisites / notice

A basic understanding of material and energy balances, thermodynamic property methods and typical unit operations (e.g., reactors, flash separations, distillation/absorption columns etc.) is required.

Abstract

The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.
Objective
The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.

Content
The class covers separation techniques that are central in the purification and downstream processing of chemicals and biopharmaceuticals. Examples from both areas illustrate the utility of the methods: 1) Adsorption and chromatography; 2) Membrane processes; 3) Crystallization and precipitation.

Prerequisites / notice
Requirements (recommended, not mandatory): Thermal separation Processes I (151-0926-00) and Modelling and mathematical methods in process and chemical engineering (151-0940-00)

529-0617-01L Catalysis Engineering W+ 6 credits 3G J. Pérez-Ramírez, S. J. Mitchell

Abstract
Heterogeneous catalysis, an enabling foundation of the chemical industry, spearheads innovation toward key sustainability targets in clean energy, carbon neutrality, and zero waste. The Catalysis Engineering course provides students with concepts bridging from the molecular-level design of catalytic materials to their technical application.

Objective
To accelerate the discovery and implementation of sustainable technologies, this vibrant discipline is constantly refining its design principles, particularly at the nanoscale, a shift facilitated by the availability of increasingly powerful tools that permit the continued development of fundamental knowledge over different time and length scales. During this course, you will learn current concepts for the defossilization of the chemical industry and strategies for achieving this goal from idea to implementation. By introducing topical case studies both in lectures and through a semester project, you will see aspects of catalyst synthesis and characterization, kinetics, mass and heat transport, deactivation and process design, sustainability metrics, and the potential of digital tools to guide catalyst design. Since this area is rapidly advancing and no textbooks are available, the lectures follow slides and journal articles.

Content
The aspects described above will be demonstrated through industrially-relevant examples such as:
- Natural gas valorization
- CO2 conversion to energy vectors
- Plastics upcycling
- Concept for a glycerol biorefinery
- Halogen chemistry on catalytic surfaces
- Ensemble design for selective hydrogenations
- Single-atom catalysis
- Hierarchical zeolite catalysts

A supervised semester project conducted in small groups provides a taster of catalysis research on a timely topic. Students will learn basic skills including critical literature analysis, problem definition and solving, methods of catalyst synthesis, characterization, and testing, and data evaluation and communication through a short talk.

Lecture notes
The course material is based on slides and journal articles.

Prerequisites / notice
It is assumed that students selecting this course are familiar with basic concepts of chemistry and catalysis (chemistry or chemical engineering background). Other students are welcome to contact us to discuss the requirement for prior knowledge.

Case Study

Abstract
The learning objective is to design, simulate and optimize a real (bio-)chemical process from a process systems perspective. Specifically, a commercial process simulation software (Aspen) will be used for the process simulation and optimization. Students have to integrate knowledge and develop engineering thinking and skills acquired in the other courses of the curriculum.

Objective
The learning objective is to design, simulate and optimize a real (bio-)chemical process from a process systems perspective. Specifically, a commercial process simulation software (Aspen) will be used for the process simulation and optimization. Students have to integrate knowledge and develop engineering thinking and skills acquired in the other courses of the curriculum.
Content

Create a model describing the production process
- Students will apply a commercial process simulator systematically for process creation and analysis.
- Students will create a process simulation flowsheet for steady-state simulation.

Evaluate the performance of the production process
- Students will analyse and understand the degrees of freedom in modelling process units and flowsheets.
- Students will understand the role of process simulators in process creation.
- Students will make design specifications and follow the iterations implemented to satisfy them.
- Students will judge the role of process simulators in equipment sizing and costing and profitability analysis.
- Students will assess the economic performance of the process, including operating costs (OPEX), and capital investment (CAPEX), based on the outcome of the simulation model.
- Students will assess the environmental impact of the production process following the Life Cycle Assessment (LCA) methodology.

Optimize the design and operating conditions of the production process
- Students will carry out sensitivity analyses and optimizations considering technical and economic criteria.
- Students will generate process integration alternatives to improve the initial design.
- Students will optimize the production process considering economic and environmental criteria.

Before the case study week, students are encouraged to participate in the exercises of the course "Process Simulation and Flowsheeting" in order to get familiar with the Aspen Plus simulation software (this is highly recommended, but not mandatory).

The problem statement and detailed instructions are provided in the project brief made available at the beginning of the case study week.

During the case study week:
- Students work in teams of 4-6 people.
- Students have to pose and solve process equipment and system design related problems.
- Students have to coordinate the activities, the preparation of the written report and the oral presentation.
- Students get support from project assistants and the course supervisor.

The groups deliver the written report on a predefined date.

The students receive the feedback and are asked to implement some changes in their reports.

A final presentation takes place summarizing the main findings of the project.

Research Project or Industry Internship

**Computational Systems Biology**

**Objective**
The aim of this course is to provide an introductory overview of mathematical and computational tools for the modeling, simulation and analysis of biological networks.

**Content**
Biology has witnessed an unprecedented increase in experimental data and, correspondingly, an increased need for computational methods to analyze this data. The explosion of sequenced genomes, and subsequently, of bioinformatics methods for the storage, analysis and comparison of genetic sequences provides a prominent example. Recently, however, an additional area of research, captured by the label "Systems Biology" focuses on how networks, which are more than the mere sum of their parts' properties, establish biological functions. This is essentially a task of reverse engineering. The aim of this course is to provide an introductory overview of corresponding computational methods for the modeling, simulation and analysis of biological networks.

We will start with an introduction into the basic units, functions and design principles that are relevant for biology at the level of individual cells. Making extensive use of example systems, the course will then focus on methods and algorithms that allow for the investigation of biological networks with increasing detail. These include (i) graph theoretical approaches for revealing large-scale network organization, (ii) probabilistic (Bayesian) network representations, (iii) structural network analysis based on reaction stoichiometries, (iv) qualitative methods for dynamic modeling and simulation (Boolean and piece-wise linear approaches), (v) mechanistic modeling using ordinary differential equations (ODEs) and finally (vi) stochastic simulation methods.

**Literature**
http://www.csb.ethz.ch/education/lectures.html

Objective

We will investigate the theoretical concepts behind microfluidic device operation, the methods of microfluidic device manufacture and the application of microfluidic architectures to important problems faced in modern day chemical and biological analysis.

A central component of this course is a research project. This will allow students to develop a practical understanding of the benefits of miniaturization in chemical and biological experimentation. Projects will be performed in groups of between four and six students and will include both experimental and simulation aspects. Each group, under the guidance of a mentor, will plan and execute a novel research project. The results of this activity will be disseminated through an "academic-style" research article and a "conference-style" oral presentation. Course grades will be evaluated through both a written exam and the project grade.

Content

Specific topics covered in the course include, but are not limited to:

1. Theoretical Concepts
   Scaling laws, features of thermal/mass transport, diffusion, basic description of fluid flow in small volumes, microfluidic mixing strategies.

2. Microfluidic Device Manufacture
   Basic principles of conventional lithography of rigid materials, 'soft' lithography, polymer machining (injection molding, hot embossing, and 3D-printing).

3. Electrokinetics
   Principles of electrophoresis, electroosmosis, high performance capillary electrophoresis, electrokinetic scaling laws, chip-based electrophoresis and isoelectric focusing.

4. Mass Transfer Phenomena
   Key features of mass transport in microfluidic systems, diffusive transport, diffusion-convection, Péclet number, Taylor-Aris diffusion, chaotic mixing and Damköhler numbers.

5. Heat Transfer Phenomena
   Key features of thermal transport in microfluidic systems, conduction, convection, heat transfer by convection in internal flows, heat transfer processes in microfluidic devices.

6. Microfluidic Systems for Materials Synthesis
   Microfluidic reactors for the controlled synthesis of colloidal nanomaterials, advanced automation for bespoke materials discovery & characterization.

7. Point-of-Care Diagnostics
   Microscale tools for diagnostics, challenges associated with point-of-care (PoC) diagnostic testing, requirements for PoC devices, common PoC device formats, applications of PoC diagnostics in the developing world.

8. Microscale DNA Amplification
   Amplification and analysis of nucleic acids using batch, continuous flow and droplet-based microfluidic reactors.

9. Small volume Molecular Detection
   Spectroscopic approaches for analyte detection in small volumes with a particular focus on single molecule detection.

10. Droplets and Segmented Flows
    Formation, manipulation and use of liquid/liquid segmented flows in chemical and biological experimentation.

11. Single Cell Analysis
    Applications of microfluidic tools in cellular analysis, flow cytometry, enzymatic assays and single cell analysis.

Lecture notes

Lecture handouts, background literature, problem sheets and notes will be provided electronically through the course Moodle site.

Literature

There is no set text for the course. All relevant literature will be provided electronically through the course Moodle site.

Abstract

This Master level course delves into the emerging field of biomolecular condensates - membrane-less organelles in cells. Using interdisciplinary concepts from biology, chemistry, biophysics, and soft matter, we will explore the biological properties of these condensates, their functions in health and disease, and their potential as new biomimetic materials for various applications.

551-0357-00L Cellular Matters: Properties, Functions and Applications of Biomolecular Condensates

The number of participants is limited to 30 and will only take place with a minimum of 6 participants.

At the beginning of the course, student groups will be formed and assigned to the milestone papers. To facilitate this, students must confirm their registration by the beginning of the 3rd week of semester.

W 4 credits 2S

Autumn Semester 2024
Objective
In the last decade, a novel type of cell compartments called biomolecular condensates have been discovered. This discovery is radically changing our understanding of the cell, its organization, and dynamics. The emerging picture is that the cytoplasm and nucleoplasm are highly complex fluids that can (meta)stably segregate into membrane-less compartments, similar to emulsions.

This interdisciplinary course encompasses milestone works and cutting-edge research questions in the young field of biomolecular condensates, including their properties, functions, and applications. The course begins with a lecture series that introduces the topic of condensates to an interdisciplinary audience and provides a theoretical foundation for understanding current research questions in the field. The lectures provide a base for student presentations of recent publications in the field, and for research seminars given by course lecturers, who are all active researchers with diverse expertise. Through this exciting interdisciplinary understanding of biomolecular condensates, bridging biology, chemistry, biophysics, and soft matter.

Students will not only learn how to critically read and evaluate scientific literature but will also gain valuable experience in giving scientific presentations to an interdisciplinary audience. Each presentation will require an introduction, critical analysis of the results, and a discussion of their significance, allowing student to substantiate their statements with a critical mindset that considers the pros and cons of chosen approaches and methods, as well as any limitations or possible follow-up experiments. This process will enable student to ask relevant questions and actively participate in class discussions, further enhancing their scientific skills.

Content
The topic of biomolecular condensates goes beyond the boundaries of traditional disciplines and requires a multi-disciplinary approach that leverages and cross-fertilizes biology, physical chemistry, biophysics, and soft matter. This course will explore the properties, functions and potential applications of biomolecular condensates, including their role in neurodegenerative diseases such as Alzheimer's and Parkinson's, as well as their use as smart biomimetic materials.

This course is divided into two parts. The fist part will introduce the basic concepts essential to the study of biomolecular condensates and phase separation. Topics include: fundamental units and scales in soft matter, phase transitions in biology, biopolymers and molecular self-assembly, introduction to active matter. This will establish a foundation for the second part, which will explore milestone works and current research in the field of biomolecular condensates. Each lecture of this second part will consist of:
1) a short literature seminar, where student groups will present and discuss a milestone paper assigned in advance and
2) a research seminar, where one of the course lecturers will present their own state-of-the-art research in the field, building upon the milestone literature.

At the beginning of the course, student groups will be formed and assigned to the milestone papers. To facilitate this, students must confirm their registration by the beginning of the 3rd week of semester.

Lecture notes
Lecture slides and some scripts will be provided.

Literature
No compulsory textbooks. Literature will be provided during the course

<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Objective
The course establishes the fundamentals to understand and describe electrochemical reactions and phenomena related to these. The students are familiarized with key concepts and approaches in electrochemistry and selected aspects of materials science and engineering and how they are put to use in selected applications.

Content
- Introduction: important quantities & units, terminology;
- Chapter I - Redox reactions, Faraday's laws;
  - Chapter II - Equilibrium electrochemistry: cells, galvanic and electrolytic cells, thermodynamic state functions, theoretical cell voltage, half-cell / electrode potential, hydrogen electrode, the electrochemical series, Nernst equation;
  - Chapter III - Electrodes & interfaces: electrochemical potential, phase potentials, work function, Fermi level, the electrified interface, the electrochemical double layer, reference electrodes and laboratory cells;
  - Chapter IV - Electrolytes: conductivity, aqueous electrolytes, transference effects, liquid junctions, polymer electrolytes, ion-exchange membranes, Donnan exclusion, solid state ion conductors;
  - Chapter V - Dynamic electrochemistry: overpotentials, description of charge-transfer reaction, Butler-Volmer and Tafel equation, exchange current density, mass transport limitations;
  - Chapter VI - Industrial electrochemistry: electrochemical engineering, process and reactor types, current density distribution, porous electrodes, chlor-alkali and HCl electrolysis, oxygen depolarized cathode;
  - Chapter VII - Energy storage & conversion: important primary and secondary battery chemistries, fuel cells, polymer electrolyte fuel cells, low temperature H2 and O2 electrochemistry, electrocatalysis, triple-phase boundary, solid oxide fuel cell, conversion efficiency;
  - Chapter VIII - Electroanalytical methods & sensors: potentiometry, amperometry, cyclic and stripping voltammetry, rotating disc electrode studies, electrochemical sensors;
  - Chapter IX - Corrosion: corrosion reactions, Pourbaix diagram, corrosion potential, passivation, corrosion protection

529-0745-01L General and Environmental Toxicology W 6 credits 3V M. Arand, H. Nägeli
Abstract
Toxicokinetic and toxicodynamic aspects of xenobiotic interactions with cellular structures and mechanisms. Toxic responses at the level of organs (immune-, neuro-, reproductive and genotoxicity) and organisms. Introduction into developmental toxicology and ecotoxicology.

Objective
Understanding of the impact of chemicals on biological systems; evaluation of the effects from different biomedical perspectives.

Content
Explanation of important interactions between xenobiotic chemicals and cellular structures such as membranes, enzymes, and nucleic acids. Relevance of intake, distribution, excretion, and biochemical transformation processes. Relevance of mixtures. Explanation of important modes of toxic action such as immuno toxicity, neurotoxicity, reproduction toxicity, genotoxicity based on examples of certain xenobiotics and their effects on important organs.

Lecture notes
Course material will be handed out as the lectures progress

Literature
Textbooks of pharmacology and toxicology (cf. list in course material)

Prerequisites / notice
Educational basis: basic chemistry, biology and biochemistry

529-0180-00L Sustainable Chemistry and Chemical Engineering in Industry W 2 credits 2G S. J. Mitchell, C. Brocklehurst, E. Godineau, L. Lovelle Gomez, A. Nanchen, F. Robvieux
Abstract
This course, led by Swiss chemical industry experts, teaches sustainable chemistry and relevant chemical engineering concepts through hands-on problem-solving. The course will consist of 7 modules in 4 h blocks.

Objective
Students gain a deeper understanding of industry challenges and learn to work towards sustainable solutions.

Organizations and people are faced with a fundamental decision: they have to allocate resources between well-known tasks that reliably generate positive results; or explore new ways of doing things, new technologies, products and services. The latter is a high risk choice. Its rewards can be high, but the chances of success are small. How do firms organize to take these decisions? What kind of management skills are necessary to take them? What kind of tools and methods are deployed to sustain managerial decision-making in highly volatile environments? These are the central questions on which this course focuses, relying on a combination of lectures, case-based discussion, and guest speakers.

  - Self-direction and Self-management

**Literature**

- Slides will be available on the Moodle page
- Readings will be available on the Moodle page
- The course content and methods are designed for students with some background in management and/or economics

**Comptetencies**

- Fostered
- Assessed

**Prerequisites**

- 363-0555-00L Principles of Macroeconomics
- W
- 3 credits
- 2V
- J.-E. Sturm

**Abstract**

This course examines the behaviour of macroeconomic variables, such as gross domestic product, unemployment and inflation rates. It tries to answer questions like: How can we explain fluctuations of national economic activity? What can economic policy do against unemployment and inflation?

**Objective**

This lecture will introduce the fundamentals of macroeconomic theory and explain their relevance to everyday economic problems.

**Content**

- This course helps you understand the world in which you live. There are many questions about the macroeconomy that might spark your curiosity. Why are living standards so meagre in many African countries? Why do some countries have high rates of inflation while others have stable prices? Why have some European countries adopted a common currency? These are just a few of the questions that this course will help you answer.
- Furthermore, this course will give you a better understanding of the potential and limits of economic policy. As a voter, you help choose the policies that guide the allocation of society's resources. When deciding which policies to support, you may find yourself asking various questions about economics. What are the burdens associated with alternative forms of taxation? What are the effects of free trade with other countries? How does the government budget deficit affect the economy? These and similar questions are always on the minds of policy makers.

**Lecture notes**

- The course Moodle page contains announcements, course information and lecture slides.

**Literature**

- This book can also be used for the course '363-0503-00L Principles of Microeconomics' (Filippini).
- Besides this textbook, the slides, lecture notes and problem sets will cover the content of the lecture and the exam questions.

**Competencies**

**Abstract**

The 'Chemical Product Design' course teaches students quantitative concepts to analyze, select and transform theoretical concepts from chemistry and engineering into valuable real-world products. Basic chemistry and chemical engineering knowledge is required (Diffusion, Thermodynamics, Kinetics, ...).
This course starts with analyzing existing chemical needs and unmet technical challenges. We then develop the skills to critically analyze a specific chemical idea for a product, to rapidly test feasibility or chance for success and to eventually realize its manufacturing. The chemical engineering basics are then used to assess performance of products or devices with non-traditional functions based on dynamic properties (e.g. responsive building materials, personal medical diagnostics on paper strips). The course teaches the interface between laboratory and market with a specific focus on evaluating the chemical value of a given process or compound, and the necessary steps to pursue the resulting project within an entrepreneurial environment. We therefore extend the questions of process design ("how do we make something?") to the question of "what should we make?"

Part B: Thermodynamic and kinetic data allow sharp selection criteria for successful products. We learn how to deal with insufficient data and development of robust case models to evaluate their technical and financial constraints. How can parameters of a running process in one industry be scaled into another industry? Can dimensionless engineering numbers be applied beyond traditional chemical processes?

Part C: Manufacturing of commodity products, devices and molecular products: Chemical reactors, separation and detection or isolation units as part of a toolbox. Planning of manufacturing and decisions based on hard data. Providing quantitative answers on potential value generated.

Students are expected to actively develop chemical products along the course during the exercise sessions. Contributions will be made in small groups, where a larger topic is studied. The progress of each group will be followed by reports and short presentations during the semester, and one final pitching presentation at the end of the semester. Active participation in the group projects is mandatory for the admission to the oral exam.

Prerequisites / notice
Prerequisites: Basic chemistry and chemical engineering knowledge (Diffusion, Thermodynamics, Kinetics,...).

327-2145-00L Advanced Polymer Synthesis

Abstract
Modern polymer synthesis (based on recent development of new organic reactions) is discussed to enable students to develop synthesis schemes for certain target structures. Both chain (ionic, coordination, ROMP, radical, catalyst-transfer) and step-growth polymerizations (transition metal catalysis) including how to achieve living polymerization or improve selectivity will be discussed.

Objective
Students should be able to: Identify important polymerization procedures and types of polymerization. Predict reactivities of monomers based on the chemical structures Devise synthetic pathways to produce a given polymer structure. Evaluate properties of macromolecules based on structure and synthesis method. Develop synthesis schemes for target structures and discuss potential applications of polymers.

Content
Polymerization is series of continuous organic transformation and connects small molecules. The course will give an overview of the following important polymerization procedures:
- Morden Step-growth polymerization
- Living Anionic polymerization
- Group transfer polymerization (GTP)
- Controlled cationic polymerization
- Controlled radical polymerization
- Coordination polymerization: Ziegler-Natta and Metallocene catalysts
- Olefin metathesis polymerization: ROMP, ADMET and cyclopolymerization
- Synthesis of conjugated polymers based on transition metal catalysis
- Complex macromolecules including brush and dendronized polymers

Students will learn how to deal with chemical structures and reactivities, and be able to suggest reasonable synthetic pathways to a given polymer structure, like conjugated polymers based on transition metal catalysis or complex macromolecules including brush and dendronized polymers. Aspects like controlling molar masses and structure perfection play a role throughout. The course provides the students with a high-level overview of modern methods of polymer synthesis both in the theoretical and practical aspects. It should enable them to develop reasonable synthesis schemes for certain target structures and also to predict the properties of given macromolecules. For all polymers presented, potential or real applications will be discussed.

Lecture notes
They will be uploaded on Moodle

Literature
Lecture notes will be given

Prerequisites / notice
Strong basic knowledge of Organic Chemistry.Any course on Introductory Polymer Chemistry such as "Advanced Building Blocks for Soft Materials" or "Introduction to Macromolecular Chemistry" or equivalent (bachelor level is also sufficient). Please discuss with the lecturer if one is not certain about the prerequisites.

Competencies
- Subject-specific Competencies: Assessed
- Concepts and Theories: Assessed
- Techniques and Technologies: Assessed
- Analytical Competencies: Assessed
- Decision-making: Assessed
- Problem-solving: Fostered
- Communication: Fostered
- Customer Orientation: Fostered
- Creative Thinking: Fostered
- Critical Thinking: Assessed
- Integrity and Work Ethics: Fostered

 autumn Semester 2024

Objective
The course is focused on the design of Chemical Processes, with emphasis on the preliminary stages of the design approach, where process creation and quick selection among many alternatives are important. The main concepts behind more detailed process design and process simulation are also examined.

Objective
The course is focused on the design of Chemical Processes, with emphasis on the preliminary stage of the design approach, where process creation and quick selection among many alternatives are important. The main concepts behind more detailed process design and process simulation are also examined.
This course aims to develop the competency of chemical engineers in process flowsheeting, process simulation and process optimization.

An exemplary literature list is provided below:

- **Main books**

- **Other references**

**Prerequisites / notice**

- Prerequisite: Basic knowledge on unit operations, mainly reaction engineering and distillation. It is recommended that the student takes the module "Process Simulation and Flowsheeting" before "Process Design and Development", but it is not mandatory.

**Content**

- Process creation: heuristics vs. mathematical programming.
- Heuristics for reaction and separation operations, heat transfer and pressure change.
- Introduction to optimization in process engineering and the modeling software GAMS.
- Process economic evaluation: equipment sizing and costing, time value of money, cash flow calculations.
- Process environmental evaluation: Life Cycle Assessment (LCA).
- Process integration: sequencing of distillation columns using mixed-integer linear programming (MILP), and synthesis of heat exchanger networks using mixed-integer nonlinear programming (MINLP).
- Batch processes: scheduling, sizing, and inventories.
- Principles of molecular design using mixed-integer programming.

**Lecture notes**

- no script

**Literature**

- **Main books**

- **Other references**

**Prerequisites / notice**

- Prerequisite: Basic knowledge on unit operations, mainly reaction engineering and distillation. It is recommended that the student takes the module "Process Simulation and Flowsheeting" before "Process Design and Development", but it is not mandatory.

**Abstract**
The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.

**Objective**
The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.

**Content**
The course covers separation techniques that are central in the purification and downstream processing of chemicals and biopharmaceuticals. Examples from both areas illustrate the utility of the methods: 1) Adsorption and chromatography; 2) Membrane processes; 3) Crystallization and precipitation.

**Lecture notes**
Handouts during the class

**Literature**
Recommendations for test books will be covered in the class

**Prerequisites / notice**
Requirements (recommended, not mandatory): Thermal separation Processes I (151-0926-00) and Modelling and mathematical methods in process and chemical engineering (151-0940-00)

**529-0617-01L Catalysis Engineering**

**Abstract**
Heterogeneous catalysis, an enabling foundation of the chemical industry, spearheads innovation toward key sustainability targets in clean energy, carbon neutrality, and zero waste. The Catalysis Engineering course provides students with concepts bridging from the molecular-level design of catalytic materials to their technical application.

**Objective**
To accelerate the discovery and implementation of sustainable technologies, this vibrant discipline is constantly refining its design principles, particularly at the nanoscale, a shift facilitated by the availability of increasingly powerful tools that permit the continued development of fundamental knowledge over different time and length scales. During this course, you will learn current concepts for the deossilization of the chemical industry and strategies for achieving this goal from idea to implementation. By introducing topical case studies both in lectures and through a semester project, you will see aspects of catalyst synthesis and characterization, kinetics, mass and heat transport, deactivation and process design, sustainability metrics, and the potential of digital tools to guide catalyst design. Since this area is rapidly advancing and no textbooks are available, the lectures follow slides and journal articles.

**Content**
The aspects described above will be demonstrated through industrially-relevant examples such as:
- Natural gas valorization
- CO2 conversion to energy vectors
- Plastics upcycling
- Concept for a glycerol biorefinery
- Halogen chemistry on catalytic surfaces
- Ensemble design for selective hydrogenations
- Single-atom catalysis
- Hierarchical zeolite catalysts

A supervised semester project conducted in small groups provides a taster of catalysis research on a timely topic. Students will learn basic skills including critical literature analysis, problem definition and solving, methods of catalyst synthesis, characterization, and testing, and data evaluation and communication through a short talk.

**Lecture notes**
The course material is based on slides and journal articles.

It is assumed that students selecting this course are familiar with basic concepts of chemistry and catalysis (chemistry or chemical engineering background). Other students are welcome to contact us to discuss the requirement for prior knowledge.

## Science in Perspective

- see Science in Perspective: Language Courses ETH/UZH
- Recommended Science in Perspective (Type A) for D-CHAB

## Course Units for Additional Admission Requirements

The courses below are only available for MSc students with additional admission requirements.

Data: 26.07.2024 12:39  Autumn Semester 2024  Page 570 of 2680
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

The underlying lecture (529-0051-00L) is offered in autumn semester but only in German.

Abstract
Introduction into the most important spectroscopical methods and their applications to gain structural information.

Objective
Knowledge about the necessary theoretical background of spectroscopical methods and their practical applications.

Content
Application oriented basics of organic and inorganic instrumental analysis and of the empirical employment of structure elucidation methods:

- Mass spectrometry: Ionization methods, mass separation, isotope signals, rules of fragmentation, rearrangements.
- NMR spectroscopy: Experimental basics, chemical shift, spin-spin coupling.
- IR spectroscopy: Revisiting topics like harmonic oscillator, normal vibrations, coupled oscillating systems (in accordance to the basics of the related lecture in physical chemistry); sample preparation, acquisition techniques, law of Lambert and Beer, interpretation of IR spectra; Raman spectroscopy.

Lecture notes
Script will be provided for the production price.

Literature
- M. Hesse, H. Meier, B. Zeeh, Spektroskopische Methoden in der organischen Chemie, 5. überarbeitete Auflage, Thieme, Stuttgart, 1995

Prerequisites / notice
Exercises are integrated in the lectures. In addition, attendance in the lecture 529-0289-00 "Instrumental analysis of organic compounds" (4th semester) is recommended.

529-0011-01L | General Chemistry (Physical Chemistry) I | O | 3 | 2V+1U | H. J. Wörner, T. Balcıunas

Abstract
The lecture provides an introduction to some of the physical fundamentals of chemistry, in particular radioactivity, quantum mechanics, the structure of matter and an atom, the periodic table of elements, and chemical bonding.

Objective
After the lecture, students will be able to,
- to calculate physical quantities and their units which are important for chemistry,
- name some properties of chemically relevant particles and propose experimental methods to determine these properties,
- name applications and hazards of radioactivity,
- categorize radioactive decay processes and mathematically represent the time course of simple decay reactions and qualitatively predict and represent them,
- describe wave and particle properties of electromagnetic radiation and matter and propose experimental methods for their detection,
- to explain the basics of quantum mechanics (meaning of the wave function, Heisenberg's uncertainty principle, operators, commutators) and to perform simple calculations with them,
- analyze and calculate absorption and emission spectra of single-electron atoms,
- to set up the Schrödinger equation for a molecular multi-particle system, and
- independently solve the Schrödinger equation for the model systems of particles in a box and harmonic oscillator in one dimension and generalize to higher dimensional non-interacting problems,
- model molecular vibrations of diatomic molecules using the harmonic and anharmonic oscillator model,
- explain the concept of an orbital and represent mathematically and pictorially the qualitative form of the orbitals of the hydrogen atom,
- explain the structure of the periodic table of elements with the help of the orbital concept,
- recognize and use similarities in the electronic structure of atoms to predict chemically relevant properties, and
- establish term symbols for atomic ground states.

Content
Atomic structure and structure of matter: atomic theory, elementary particles, atomic nuclei, radioactivity, nuclear reactions, Atomic orbitals and energy levels: ionisation energies, atomic spectroscopy, term values and symbols. Quantum mechanical atom model: wave-particle duality, the uncertainty principle, Schrödinger's equation, the hydrogen atom, construction of the periodic table of the elements. Chemical bonding: ionic bonding, covalent bonding, molecular orbitals.

402-0043-00L  
**Physics I**  
**Abstract**  
Introduction to the concepts and tools in physics with the help of demonstration experiments: mechanics of point-like and ridged bodies, periodic motion and mechanical waves.  
**Objective**  
The concepts and tools in physics, as well as the methods of an experimental science are taught. The student should learn to identify, communicate and solve physical problems in his/her own field of science.  
**Content**  
Mechanics (motion, Newton's laws, work and energy, conservation of momentum, rotation, gravitation, fluids)  
Periodic Motion and Waves (periodic motion, mechanical waves, acoustics).  
**Lecture notes**  
The lecture follows the book "Physics" by Paul A. Tipler.  
**Literature**  
Paul A. Tipler and Gene P. Mosca, Physics (for Scientists and Engineers), W. H. Freeman and Company  
**Competencies**  
- Subject-specific Competencies  
  - Concepts and Theories  
  - Techniques and Technologies  
  - Method-specific Competencies  
  - Problem-solving  
  - Personal Competencies  
  - Critical Thinking  
  - assessed  
  - fostered  
  
401-0271-00L  
**Mathematical Foundations I: Analysis A**  
**Abstract**  
Introduction to calculus in one dimension. Building simple models and analysing them mathematically. Functions of one variable: the notion of a function, of the derivative, the idea of a differential equation, complex numbers, Taylor polynomials and Taylor series. The integral of a function of one variable.  
**Objective**  
Introduction to calculus in one dimension. Building simple models and analysing them mathematically.  
**Content**  
Functions of one variable: the notion of a function, of the derivative, the idea of a differential equation, complex numbers, Taylor polynomials and Taylor series. The integral of a function of one variable.  
**Literature**  
G. B. Thomas, M. D. Weir, J. Hass: Analysis 1, Lehr- und Übungsbuch, Pearson-Verlag  
R. Sperb/M. Akveld: Analysis I (vdf)  
L. Papula: Mathematik für Ingenieure und Naturwissenschaftler (3 Bände), Vieweg  
**Competencies**

529-0001-00L  
**Introduction to Computer Science**  
**Abstract**  
Introduction to UNIX, introduction to C++ programming, data representation and processing, computational errors, algorithms and scaling, sorting and searching, numerical algorithms, algorithmic strategies, computer simulation, computer architecture, operating systems, programming languages, computer networks, databases, representation of chemical structures, molecular simulation.  
**Objective**  
Acquire a starting package concerning the computational aspects of natural sciences; discuss fundamentals of computer architecture, languages, algorithms and programming with an eye to their application in the area of chemistry, biology and material science.  
**Content**  
Lecture: Introduction to UNIX, introduction to C++ programming, data representation and processing, computational errors, algorithms and scaling, sorting and searching, numerical algorithms, algorithmic strategies, computer simulation, computer architecture, operating systems, programming languages, computer networks, databases, representation of chemical structures, molecular simulation; Exercises: Make students familiar with the UNIX operating system, C++ programming techniques, simple algorithms and computational applications in chemistry by means of exercise series at the computer.  
**Lecture notes**  
Script booklet (copies of powerpoint slides, in English), distributed at first or second lecture.  
**Literature**  
See: www.csms.ethz.ch/education/Infol  
**Prerequisites / notice**  
Since the exercises on the computer do convey and test essentially different skills than those being conveyed during the lectures and tested at the written exam, the results of the exercises are taken into account when evaluating the results of the exam (compulsory performance component, 12% of the exam mark; in case of repetition of the exam, the exercise marks from a previous semester can be kept).  

For more information about the lecture: www.csms.ethz.ch/education/Infol

### Laboratory Courses

#### Number 529-0011-04L  
**Practical Course General Chemistry**  
**Abstract**  
The general chemistry practical course aims at preparing the students for the work in modern chemistry laboratory. The students are trained to behave safely in the laboratory and use chemicals, chemistry glassware, and related equipment to perform and analyze the equilibrium in basic chemical reactions.  
**Objective**  
The students are expected to gain practical experience with as well as establish understanding of the following concepts and phenomena:  
- Safe behavior and safety regulations in chemistry laboratory;  
- Best practices in common techniques (purification, recrystallization, distillation, etc.);  
- Analysis of measured values (measuring error, average value, error analysis);  
- Acid-base-equilibria (strengths of acids and bases, pH- and pKa-values, titrations, buffer systems);  
- Precipitation equilibria (gravimetry, potentiometry, conductivity measurements);  
- Oxidation state and redox reactions (redox-titrations, galvanic elements);  
- Metal complexes (syntheses of complexes, ligand exchange reactions, complexometric titration);  
- Qualitative analysis (cation and anion separation, determination of cations and anions).

Mathematics III: Partial Differential Equations

Abstract

Objective
Classical tools to solve the most common linear partial differential equations.

Content
1) Examples of partial differential equations
   - Classification of PDEs
   - Superposition principle
2) One-dimensional wave equation
   - D'Alembert's formula
   - Duhamel's principle
3) Fourier series
   - Representation of piecewise continuous functions via Fourier series
   - Examples and applications
4) Separation of variables
   - Solution of wave and heat equation
   - Homogeneous and inhomogeneous boundary conditions
   - Dirichlet and Neumann boundary conditions
5) Laplace equation
   - Solution of Laplace's equation on the rectangle, disk and annulus
   - Poisson formula
   - Mean value theorem and maximum principle
6) Fourier transform
   - Derivation and definition
   - Inverse Fourier transformation and inversion formula
   - Interpretation and properties of the Fourier transform
   - Solution of the heat equation
7) Laplace transform (if time allows)
   - Definition, motivation and properties
   - Inverse Laplace transform of rational functions
   - Application to ordinary differential equations

Lecture notes
See the course web site (linked under Lernmaterialien)

Literature

Additional books:
4) E. Kreyszig, Advanced Engineering Mathematics, John Wiley & Sons (chapters 1,2,11,12,6)

Prerequisites
Required background:
1) Multivariate functions: partial derivatives, differentiability, Jacobian matrix, Jacobian determinant
2) Multiple integrals: Riemann integrals in two or three variables, change of variables
3) Sequences and series of numbers and of functions
4) Basic knowledge of ordinary differential equations

📚📚📚 Examination Block II

Number Title Type ECTS Hours Lecturers
529-0221-00L Organic Chemistry I O 3 credits 2V+1U H. Wennemers

Abstract
This course will build upon the basic knowledge of structure and reactivity of organic molecules gained in AC/OCI and AC/OCII. The module aims to provide a wide understanding of the occurrence, synthesis, properties, and reactivity of carbonyl compounds.

Objective
The goal of this course is the acquisition of a basic repertoire of synthetic methods including important reactions of aldehydes, ketones, carboxylic acids, and carboxylic acid derivatives. Particular emphasis is placed on the understanding of reaction mechanisms and the correlation between structure and reactivity. A deeper understanding of the concepts presented during the lecture is reached by solving the problems handed out each time and discussed one week later in the exercise class.

Content

Data: 26.07.2024 12:39 Autumn Semester 2024 Page 575 of 2680
Analytical Chemistry I

Objectives

- Knowledge about the necessary theoretical background of spectroscopical methods and their practical applications.
- Application oriented basics of organic and inorganic instrumental analysis and of the empirical employment of structure elucidation methods:
  - Mass spectrometry: Ionization methods, mass separation, isotope signals, rules of fragmentation, rearrangements.
  - NMR spectroscopy: Revisiting topics like harmonic oscillator, normal vibrations, coupled oscillating systems (in accordance to the basics of the related lecture in physical chemistry); sample preparation, acquisition techniques, law of Lambert and Beer, interpretation of IR spectra; Raman spectroscopy.

Content

- Introduction into the most important spectroscopical methods and their applications to gain structural information.
- Subject-specific Competencies
  - Inorganic and Organic Chemistry II
  - Laboratory Courses

Prerequisites

- Passed Practical Course Inorg. and Org. Chemistry I
- Passed Practical Course BCB III: Organic Chemistry
- Passed Basisprüfung
- Passed Practical Course Inorg. Chemistry

Lecturer

V. Mougé

Introduction to the experimental methods of Inorganic Chemistry

The teaching laboratory offers an insight into different aspects of Inorganic Chemistry, including solid state chemistry, organometallic chemistry, kinetics, etc. The synthesis, characterization and analysis of inorganic compound are a main topic. Special emphasis on the experimental techniques of synthetic inorganic chemistry, in particular the safe handling of reactive and pyrophoric chemical and solvent purification and drying techniques.

Emphasis is given to scientific writing (experiment reports).

Organic synthesis with organometallic compounds and catalysts: Experiments in the framework of a selected specialised project. Possible projects: Rh catalysed asymmetric hydrogenation of enamides, Mn-catalysed epoxidation of olefins, Cu catalysed Diels-Alder reactions, synthesis of organo-boron compounds and Pd catalysed coupling with halides, Ru catalysed transfer hydrogenation.

A manual is distributed in the teaching laboratory.

By enrolling in the laboratory course, students confirm to study all safety information thoroughly and to follow instructions.

Subject-specific Competencies

- Concepts and Theories
- Techniques and Technologies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management

Method-specific Competencies

- Communication
- Cooperation and Teamwork
- Customer Orientation
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation

Social Competencies

- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

Personal Competencies

### Chemical Engineering Thermodynamics (ECTS 529-0557-00L)

**Abstract**
This course introduces the basic principles and concepts of chemical engineering thermodynamics. Whilst providing insights into the meaning and properties of fundamental thermodynamic quantities, the course also has a primary focus on the application of thermodynamic concepts to real chemical engineering problems.

**Objective**
A primary objective of the course is to present a rigorous treatment of classical thermodynamics, whilst retaining a strong engineering perspective. Accordingly, real-world engineering examples will be used to highlight how thermodynamics is applied in engineering practice. The core ideas presented and developed within the course will provide a foundation for subsequent studies in such fields as fluid mechanics, heat transfer and statistical thermodynamics.

**Content**
The first part of the course introduces the basic concepts and language of chemical engineering thermodynamics. This is followed by an analysis of energy and energy transfer, with a specific focus on the concept of work and the first law of thermodynamics. Next, the notion of a pure substance is introduced, with a discussion of the physics of phase-changes being presented. The description of pure substances is further developed through an analysis of the PVT behavior of fluids, equation of states, ideal and non-ideal gas behaviour and compressibility factors.

The second part of the course begins with a discussion of the use of the energy balance relation in closed systems that involve pure substances and then develops relations for the internal energy and enthalpy of ideal gases. Next, the second law of thermodynamics is introduced, with a discussion of why processes occur in certain directions and why energy has quality as well as quantity. Applications to cyclic devices such as thermal energy reservoirs, heat engines and refrigerators are provided. Entropy changes that take place during processes for pure substances, incompressible substances and ideal gases are described.

The third part of the course establishes thermodynamic formulations for the calculation of enthalpy, internal energy and entropy as function of pressure and temperature, Gibbs energy, fugacity and chemical potential. Two-phase systems are introduced as well as the use of equations of state to construct the complete phase diagrams of pure fluid.

The final part of the course focuses on the properties of mixtures and the phase behavior of multicomponent systems. The fundamental equations of phase equilibria in terms of the chemical potential and fugacity are also discussed. The concept of an ideal solution is introduced and developed. This is followed by an assessment of non-ideal behavior and the use of activity coefficients for describing phase diagrams. Particular focus is given to phase equilibria. Finally, concepts relating to chemical equilibria are introduced with the general concepts developed being applied to reacting species. Examples here include the calculation of the Gibbs free energy and the equilibrium constant of a reaction.

**Literature**
Although there is not set text for the course, the following three texts will be used in part and are excellent introductions to Chemical Engineering thermodynamics:

**Prerequisites / notice**
A basic knowledge of chemical thermodynamics is required.

**151-0917-00L Mass Transfer**

**Abstract**
This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore, the application of these principles to important engineering problems is demonstrated.

**Objective**
This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore, the application of these principles to important engineering problems is demonstrated.

**Content**
Fick's laws; application and significance of mass transfer; comparison of Fick's laws with Newton's and Fourier's laws; derivation of Fick's 2nd law; diffusion in dilute and concentrated solutions; rotating disk; dispersion; diffusion coefficients, viscosity and heat conduction (Pr and Sc numbers); Brownian motion; Stokes-Einstein equation; mass transfer coefficients (Nu and Sh numbers); mass transfer across interfaces; Analogies for mass-, heat-, and momentum transfer in turbulent flows; film-, penetration-, and surface renewal theories; simultaneous mass, heat and momentum transfer (boundary layers); homogeneous and heterogeneous reversible and irreversible reactions; diffusion-controlled reactions; mass transfer and first order heterogeneous reaction. Applications.

**Literature**

**Prerequisites / notice**
Students attending this highly-demanding course are expected to allocate sufficient time within their weekly schedule to successfully conduct the exercises.

**351-0778-00L**

**Discovering Management**

*Does not place this semester.*

**Entry level course in management for BSc, MSc and PHD students at all levels not belonging to D-MTEC.** This course can be complemented with Discovering Management (Exercises) 351-0778-01.

**Abstract**

Discovering Management offers an introduction to the field of business management and entrepreneurship for engineers and natural scientists. By taking this course, students will enhance their understanding of management principles and the tasks that entrepreneurs and managers deal with. The course consists of theory and practice sessions, presented by a set of area specialists at D-MTEC.

**Objective**

The general objective of Discovering Management is to introduce students into the field of business management and entrepreneurship.

In particular, the aims of the course are to:

1. broaden understanding of management principles and frameworks
2. advance insights into the sources of corporate and entrepreneurial success
3. develop skills to apply this knowledge to real-life managerial problems

The course will help students to successfully take on managerial and entrepreneurial responsibilities in their careers and/or appreciate the challenges that entrepreneurs and managers deal with.

**Content**

The course consists of three blocks of theory and practice sessions: Discovering Strategic Management, Discovering Innovation Management, and Discovering HR and Operations Management. Each block consists of two or three theory sessions, followed by one practice session where you will apply the theory to a case.

The course consists of three blocks of theory and practice sessions: Discovering Strategic Management, Discovering Innovation Management, and Discovering HR and Operations Management. Each block consists of two or three theory sessions, followed by one practice session where you will apply the theory to a case.

The theory sessions will follow a "lecture-style" approach and be presented by an area specialist within D-MTEC. Practical examples and case studies will bring the theoretical content to life. The practice sessions will introduce you to some real-life examples of managerial or entrepreneurial challenges. During the practice sessions, we will discuss these challenges in depth and guide your thinking through team coaching.

Through small group work, you will develop analyses of each of the cases. The theory sessions will be assessed via a multiple-choice exam.

**Lecture notes**

All course materials (readings, slides, videos, and worksheets) will be made available to inscribed course participants through Moodle. These course materials will form the point of departure for the lectures, class discussions, and team work.

**Competencies**

**Subject-specific Competencies**

  - Critical Thinking
  - Self-direction and Self-management

**351-1159-00L Technology Entrepreneurship for Chemical Engineers**

**3 credits**

**3G**

L. P. T. Vandeweghe

**Abstract**

Technology ventures are significantly changing the global economic picture. Technological skills increasingly need to be complemented by entrepreneurial understanding.

This course offers the fundamentals in theory and practice of entrepreneurship in new technology ventures. Main topics covered are success factors in the creation of new firms, including founding, financing and growing a venture.

**Objective**

This course provides theory-grounded knowledge and practice-driven skills for founding, financing, and growing new technology ventures. A critical understanding of dos and don'ts is provided through highlighting and discussing real-life examples and cases. The project work links technology entrepreneurship with challenges in the chemical industry.

**Content**

Weekly sessions - recorded:

- 10+ sessions carried out by guest lecturers: experts in the broad field of technology entrepreneurship (e.g., serial entrepreneurs, venture capitalists, (E)MBA professors, company builders, patent experts, scale-up executives, …)

Typical lecture format (2h):

- 15': Introduction
- 60': Guest testimonial
- 15': Discussion related to topic (in groups)
- 10': Plenary discussion
- 20': Q&A with (guest) lecturer

Special workshops will complement the course.

**Laboratory Courses and Case Studies**

<table>
<thead>

<th>Number</th>
<th>Title</th>
<th>Type</th>
<th>ECTS</th>
<th>Hours</th>
<th>Lecturers</th>
</tr>
</thead>
</table>

**Abstract**

The focus of part I of the case study course lies on the literature-based comparison of chemical process alternatives. Based on this compilation and selected quantitative as well as qualitative measures, a process assessment and comparison is conducted. A basic flowsheet is then generated, and mass and energy balances are performed to carry out a preliminary economic and environmental assessment.

**Objective**

- to obtain knowledge about different databases and sources of information
- application of the knowledge obtained in lectures to a real problem
- problem-oriented problem solving (application of different methods to the same subject)
- team work
- report writing and presentation techniques
The focus of part I of the case study course lies on the literature-based comparison of chemical process alternatives. For this purpose, relevant substance data (i.e., physico-chemical, toxicological, safety, and environmental data), as well as information about synthesis routes and technical implementations (i.e., on reaction kinetics; possible separation operations; economic, safety, and environmental aspects), are collected from the literature. Based on this compilation and selected quantitative as well as qualitative measures, a process assessment and comparison is conducted and the most promising process alternative is chosen for further evaluation. For this alternative, a basic flowsheet and mass and energy balances are generated.

529-0639-01L Chemical Engineering Laboratory

The internship is exclusively for chemical engineering BSc 05 semester students. For justified exceptions, please contact the teaching staff before the start of the semester.

Abstract
Introduction to various tools of chemical engineering techniques with reference to the lectures. In groups of two, students will conduct experiments in the following areas: thermodynamics and phase equilibria including electrochemistry, transport phenomena, kinetics and selectivity of complex reactions, characterisation of ideal and real reactors.

Objective
Introduction to various tools of chemical engineering techniques with reference to the running lectures.

Content
In groups of two, students will conduct selected experiments in the following areas: thermodynamics and phase equilibria including electrochemistry, transport phenomena, kinetics and selectivity of complex reactions, characterisation of ideal and real reactors.

Prerequisites / notice
Registration for the course unit is only possible for the primary target group (Chemical Engineering Bachelor 05 semester students).

</tbody>
</table>

**Abstract**
The seminar covers basic issues of research design, small-n research, and data collection. It deals with issues of causality, conceptualization, case study design and QCA. Data collection includes interviews, surveys, text analysis, and experimental research.

**Objective**
This MACIS core seminar covers basic issues of research design, small-n research, and data collection. It familiarizes students with general research design problems such as defining research questions, analyzing causality, and designing single and comparative case studies. It then introduces them to basic issues in small-n research. Students acquire an understanding of the specific challenges and design problems in qualitative analysis. Finally, students are introduced to exemplary methods of data collection. By the end of the course, students should be able to use the principal methods of data collection used by political scientists/have a critical understanding of the advantages and disadvantages of the methods, and should be able to reflect on and discuss the methods in light of research questions of their interest.

**Competencies**

**Abstract**
The seminar focuses on seminal books and articles as well as brand new analyses on topical issues of democratic theory and practice. After reviewing theoretical models and different types of democracy, the seminar deals with core problems of democratic governance and with challenges to democracy stemming from globalization and international institutions.

**Objective**
At the end of the seminar, students are familiar with the relevant theoretical and empirical literature on democracy and democratization in national and international contexts. They are able to reflect on contemporary challenges to democracy, in particular those stemming from the internationalization of politics.

<td>Topics in Public Policy: Governing the Energy Transition ■</td>
<td>W</td>
<td>8</td>
<td>2S</td>
<td>L. P. Fesenfeld, T. Schmidt</td>
</tr>
</tbody>
</table>

**Abstract**
This course addresses the role of policy change and its underlying politics in the transformation of the energy and other climate and sustainability-related sectors. It focuses on political perspectives (while also touching on historical and socio-economic perspectives) and applies various theoretical concepts to understand specific aspects of transition governance.

**Objective**
- To gain an overview of the history of the transition of large socio-technical systems
- To recognize challenges for transformative policy change and to understand the theoretical frameworks and concepts for studying transitions
- To develop own research question and address it in research paper that demonstrates knowledge of the role of policy and politics in transitions

**Content**
Climate change, access to energy and other societal challenges are directly linked to the way we use and create energy. Both the recent United Nations Paris climate change agreement and the UN Sustainable Development Goals make a fast and extensive transition of socio-technical systems necessary. This course introduces the social and environmental challenges involved in the energy sector as a key sector in need of transition. It compares the current situation with historical socio-technical transitions and derives the consequences for policy-making. It then focuses on the role of public policy and policy change in governing complex socio-technical transitions, considering the role of political actors, institutions and policy feedback.

**Lecture notes**
Slides and reading material will be made available via moodle.ethz.ch (only for registered students).

**Literature**
A reading list will be provided via moodle.ethz.ch at the beginning of the semester.

---

Prerequisites / notice
This course is intended for the MA Comparative International Studies programme.

857-0104-00L
Topics in Public Policy: The Politics and Policies of International Migration
W 8 credits 2S D. Hangartner

Abstract
This seminar will provide a collaborative and immersive research experience where students work together with the instructor to design and implement a randomised experiment to study topical questions related to the politics or policies of international migration.

Objective
Upon completion, course participants will have first-hand experience with collaborative research including project management, spanning the entire project cycle from ideation, study design and pre-analysis planning, field phase and data collection, statistical analysis and paper writing.

Literature
The reading materials consist of a series of academic papers (see detailed syllabus)

857-0108-00L
Introduction to Security Studies
W 8 credits 2S

Abstract
This seminar introduces students to international security studies research by covering a substantive topic in the field each week (such as war, nuclear weapons, etc.). Students will study the discipline’s fundamental questions and will engage with how scholars generate knowledge as well as the various research designs, inferential strategies, and analytical methods they have used.

Objective
Students will study the discipline’s fundamental questions, such as why wars occur, if there are ways to make the outbreak of war less likely, and what the advent of nuclear weapons and emergent technologies means for international affairs. The course will also expose students to recent debates and research in the field. It will cover how scholars have generated knowledge as well as the various research designs, inferential strategies, and analytical methods they have used. After completing the course, students should have increased familiarity with essential readings in international security studies and the skills to conduct meaningful independent research.

857-0111-00L
Researching Peace and Security
W 8 credits 2S M. Dunn Cavelty, C. Bara, S. Hellmüller, E. Nussio, C. F. Rickard

Abstract
The seminar offers an in-depth exploration of cutting-edge peace and security research. The course is structured around key themes and current developments in the field. It combines theoretical foundations with practical case studies as well as exercises and presentations, aiming to equip students with the knowledge and skills necessary to conduct rigorous research in peace and security studies.

Objective
The aim of this research seminar is to introduce students to cutting-edge research in peace and security studies, have them reflect critically on the development and main focal points, and to give them enough theoretical background so that they can write research papers on a relevant topic of their choice. In each session, senior researchers from the Center for Security Studies will talk about their own research. Several research design sessions cover the entire research process, from identifying compelling research puzzles and questions to matching theoretical frameworks with data and methods, conducting ethical field research, and writing high-quality research papers. Each session will involve introductory lectures, followed by discussions of key texts, and interactive activities to foster a deep understanding of the topics covered. Students will present their own research design in class and will receive feedback how to improve their approach to their chosen research topics.
860-0023-00L  International Environmental Politics  W  3 credits  2V  T. Bernauer

Abstract
This course deals with how and why international problem-solving efforts (cooperation) in environmental politics emerge and evolve, and under what circumstances such efforts are effective. Based on concepts and theories of political economy, political science, and public policy, various examples of international environmental policy-making are examined.

Objective
The objectives in this course are to (1) gain an overview of important questions pertaining to international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions in this policy area and how to address them in a conceptually and methodologically meaningful and insightful way; (3) gain an overview of important global and regional environmental problems and how they are or could be solved.

Content
This course deals with how and why international problem-solving efforts (cooperation) in environmental politics emerge and evolve, and under what circumstances such efforts are effective. Based on concepts and theories of political economy, political science, and public policy, various examples of international environmental policy-making are examined, for example international efforts to reduce air pollution, manage international water resources, mitigate and adapt to global warming, protect the stratospheric ozone layer, address biodiversity challenges, deal with plastic waste, and prevent pollution of the oceans.

Lecture notes
Reading materials and slides will be available via Moodle.

Prerequisites / notice
The course is open to all ETH students and visiting students from other universities. Participation does not require previous coursework in the social sciences or environmental policy. This course will take place on campus (ETH Main Building, HG F.3). There will be no live-streaming, and the course is NOT in hybrid (on-campus plus online) format. However, the lecture will be recorded and the recordings will be made available via the Moodle platform for this course a few days after the respective lecture for students who are unable to attend in person. All electronic correspondence will take place via the ETH management system and Moodle, so please make sure you are properly registered there with a functioning email address/account.

Credit and Exam
After passing a written test at the end of the course (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test). Visiting students (e.g., from the University of Zurich, exchange students) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory. Students who obtain a grade of < 4.0 for the test will have a second chance (see table below). Students who did not participate in the test on 18 December 2023 will not have access to the repeat test unless they submit compelling and documented (e.g. medical, other exam in parallel at ETH) reasons for why they were unable to participate in the first test. It covers all contents of the lectures and the reading assignments. Visiting students student is subject to the same conditions. Registration for the course in the mystudies system of ETH is compulsory. No separate registration for the exam is required, registration for the course as such covers everything. The exam will take place on campus, either in the F3 lecture hall or in a computer room. That is, you must be present in person at ETH Zurich on the exam date/time.

857-0027-00L  International Organizations (Field Trip)  W  2 credits  1S  V. Koubi

Abstract
A two-day field trip to international organizations in Geneva - e.g., the World Trade Organization, the World Health Organization and the International Committee of the Red Cross.

Objective
Become familiar with the work and challenges of international organizations based in Geneva.

Literature

Prerequisites / notice
Teams of 2-3 students prepare a 2-3 page background reading for the group on a specific international organization and lead the discussion with representatives of that organization during the visit.

851-0609-06L  Governing the Energy Transition  W  2 credits  2V  T. Schmidt, L. P. Fesenfeld

Abstract
This course addresses the role of policy and its underlying politics in the transformation of the energy sector. It covers historical, socio-economic, and political perspectives and applies various theoretical concepts to understand specific aspects of the governance of the energy transition.

Objective
- To gain an overview of the history of the transition of large technical systems
- To recognize current challenges in the energy system to understand the theoretical frameworks and concepts for studying transitions
- To gain knowledge on the role of policy and politics in energy transitions

Content
Climate change, access to energy and other societal challenges are directly linked to the way we use and create energy. Both the 2015 United Nations Paris climate change agreement and the UN Sustainable Development Goals make a fast and extensive transition of the energy system necessary. This lecture introduces the social and environmental challenges involved in the energy sector and discusses the implications of these challenges for the rate and direction of technical change in the energy sector. It covers the current situation with historical socio-technical transitions and derives the consequences for policy-making. It introduces theoretical frameworks and concepts for studying innovation and transitions. It then focuses on the role of policy and policy change in governing the energy transition, considering the role of political actors, institutions and policy feedback.

Lecture notes
Slides and reading material will be made available via moodle.ethz.ch (only for registered students).

Prerequisites / notice
This course is particularly suited for students of the following programmes: MA Comparative International Studies; MSc Energy Science & Technology; MSc Environmental Sciences; MSc Management, Technology & Economics; MSc Science, Technology & Policy; ETH & UZH PhD programmes.

865-0024-00L  The SDGs in an Urbanising World  W  1 credit  2G

Abstract
This course is particularly suited for Master and PhD level. Only for MAS/CAS in Global Cooperation and Sustainable Development studies, as well as specialists with at least 24 months of practical experience in international cooperation.

Objective
Doctoral students dealing with empirical research in the area of development and cooperation (EZA) may be admitted "sur Dossier".

Prerequisites / notice
Registration only through the NADEL administration office.
This course draws out good practices in promoting sustainability development at the city level. Participants gain insights on designing urban- focused development interventions.

Historically, cities have been hubs of innovation, economic activity and rising prosperity. However, the unprecedented speed and scale at which cities are growing today is a huge challenge. As epicenters of migration, environmental degradation, health hazards and unemployment, urban areas are especially vulnerable to disasters, social conflict and inequality. Despite this, some of the most promising initiatives to achieve the SDGs have been implemented by cities. What strategies and processes do successful city- based initiatives pursue? How can development organisations support mainstreaming the SDGs at the local level? What can be learnt from experiences so far? This course draws out good practices in promoting sustainability and equity at the city and local level. Participants gain insights on designing urban- focused development interventions.

Key Topics:
- Drivers, dynamics and challenges of urbanization
- The urban- rural continuum – why does it matter?
- Localisation of global development and sustainability agendas: challenges and opportunities
- Three to four case studies selected from the following: informal settlements, urban food systems, WASH, children’s well-being, circularity, migration.

Students of the course must fulfill requirements specified on the homepage of NADEL. Electronic registration may be done only after registration with the NADEL secretariat.

- Migration concepts and terms
- Important terms and concepts related to migration
- International legal frameworks related to migration
- The geography of migration flows
- Major drivers of migration
- The evolving concept of “migration and development”
- International cooperation organisations and their strategies and activities in terms of migration and development.

Registration only through the NADEL administration office.

Course participants have improved understanding of the following issues:
- Definition of migration concepts and terms
- International legal frameworks related to migration
- The geography of migration flows
- Major drivers of migration
- The evolving concept of “migration and development”
- International cooperation organisations and their strategies and activities in terms of migration and development.

Course participants have improved understanding of the following issues:
- Definition of migration concepts and terms
- International legal frameworks related to migration
- The geography of migration flows
- Major drivers of migration
- The evolving concept of “migration and development”
- International cooperation organisations and their strategies and activities in terms of migration and development.

Registration only through the NADEL administration office.

Students of the course must fulfill requirements specified on the homepage of NADEL. Electronic registration may be done only after registration with the NADEL secretariat.

Topics covered:
- Important terms and concepts related to migration
- International legal frameworks related to migration
- The geography of migration flows
- Major drivers of migration
- The evolving concept of “migration and development”
- Actions, strategies and initiatives of international cooperation actors when it comes to migration and development.
Recognizing that development is inherently political, this course covers political processes and how they intertwine with the goals and strategies of various agents in international cooperation. It discusses the significance and implications of civil society’s efforts to foster voice and inclusion. The course provides a nuanced understanding of different strategic options and approaches to contribute to policy processes and offers tools that have proven to be effective in practical development cooperation work. It provides an opportunity for participants to apply concepts related to the strengthening of civil society to their projects and case studies.

865-0010-02L Agriculture, Food and Nutrition Security

MAS ETH in Global Cooperation and Sustainable Development students have priority for admission. Interested students can apply to be placed on the waiting list and will be informed about a possible admission by the program coordinators within the first week after the start of lectures.

Abstract

Food security has been on top of the policy agenda for decades, but still a considerable proportion of the population in developing countries remains hungry and poorly nourished. This lecture series will explore how we produce and distribute food; it analyses the concept of food and nutrition security and discusses ways and means for measuring and achieving it in low-income countries.

Objective

- describe the most important milestones in the history of food and agriculture
- understand the concept of food and nutrition security, and discuss it's impact and causes
- compare different approaches to promote and increase crop- and livestock production in a sustainable manner
- reflect on some of the main economic challenges of the world food system and understand some of the tradeoffs between smallholders' decisions of labor, consumption, and production of food
- give insights on how international organizations work with farmers and governments in low income countries

Competencies

Subject-specific Competencies
- Concepts and Theories
- Fostered

865-0011-01L Water, Sanitation and Waste Management

MAS ETH in Global Cooperation and Sustainable Development students have priority for admission. Interested students can apply to be placed on the waiting list and will be informed about a possible admission by the program coordinators within the first week after the start of lectures.

Abstract

The course provides an overview of the links among sanitation, water supply, waste management and environmental and health aspects. It gives an understanding of the specific challenges and possible solutions in ensuring environmental services and illustrates their impact on the population and settlements.

Data: 26.07.2024 12:39
Autumn Semester 2024
Page 585 of 2680
The participants are able to
- present the global situation and development trends in the sector of sanitation, water supply, waste management and for its main actors;
- discuss the relationships between water supply, sanitation and health;
- explain the principles of technologies for drinking water treatment, the management of sewage and waste, as well as appraise their strengths and weaknesses;
- explain which sustainable concepts are implemented and how they can be inserted into the technical, institutional and social structures so that they are economically, ecologically and socially sustainable;
- provide information where good professional resources are available.

**Economics, Politics, and Markets**

**Objective**

The objective of this course is to introduce students to the formal analysis of politics, via economic models.

After completing this course:
- Students will be able to analyze economic models of politics and interpret the results.
- Students will be able to evaluate economic models of politics.
- Students will be able to interpret real-world political phenomena in terms of economic models.
- Students will be able to develop and create new insights for politics using economic models.

**Content**

This course will introduce students to a variety of foundational economic models of politics and policy making. This includes—but is not limited to—models of electoral competition, political agency, legislative bargaining, and the interaction between political and market outcomes (e.g., via market and business regulations).

The course material will mainly be theoretical and mathematical (primarily using game theory). Real-world examples and empirical research will be discussed to help motivate and evaluate the theoretical material. Most of the content will focus on the United States, for which rich theoretical and empirical literatures exist. However, the key tools, ideas, and insights can be applied more generally and beyond the United States.

The course assumes basic mathematical competencies (e.g., familiarity with algebra, multi-variable calculus, and probability). We will not assume prior knowledge of game theory—the course will introduce game theoretic concept as they are required. However, having previously taken an introductory course in game theory will be an advantage (e.g., D-MTEC courses such as: 363-0558-00L “Introduction to Game Theory: Strategic and Cooperative Thinking” or the recent edition of 363-0515-00L “Decisions, Markets, and Games”).

**Literature**

- Other useful resources:

**Prerequisites / notice**

There are no formal admission requirements. It is expected that students have a basic level of mathematical competence. It will be beneficial if students have taken an undergraduate level course in microeconomics or game theory.

**Master's Thesis**

**Number**

857-0019-00L Master's Thesis Colloquium

Permission to begin master thesis is required to take part in Colloquium.

**Objective**

In this colloquium, students enrolled in the MACIS program first present and discuss research design and methods issues concerning their prospective MA theses. Towards the end of the semester they present preliminary findings from their MA thesis work.

It is the goal of the colloquium to help students with the initial steps of writing their master theses. During the colloquium, they will develop a relevant research question and hypotheses and select appropriate methods and data.

**Number**

857-0021-00L Master's Thesis

Only students who fulfill the following criteria are allowed to begin with their master thesis:
- a. successful completion of the bachelor programme;
- b. fulfilling of any additional requirements necessary to gain admission to the master programme.

The Master Thesis is an independent piece of research on an issue in comparative and international politics. It combines theory, methods, and empirical work.

Data: 26.07.2024 12:39 Autumn Semester 2024 Page 586 of 2680
Objective

The Thesis should demonstrate the students' ability to conduct independent research on the basis of the theoretical and methodological knowledge acquired during the MA program.

ECTS European Credit Transfer and Accumulation System

- Special students and auditors need special permission from the lecturers.
The course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Evolution is the one theory that encompasses all of biology. It provides a single, unifying concept to understand the living systems that we observe today. We will introduce several types of mathematical models of evolution to describe gene frequency changes over time in the context of different biological systems, focusing on asexual populations. Viruses and cancer cells provide the most prominent examples of such systems and they are at the same time of great biomedical interest. The course will cover some classical mathematical population genetics and population dynamics, and also introduce several new approaches. This is reflected in a diverse set of mathematical concepts which make their appearance throughout the course, all of which are introduced from scratch. Topics covered include the quasispecies equation, evolution of HIV, evolutionary game theory, evolutionary stability, evolutionary graph theory, tumor evolution, stochastic tunneling, genetic progression of cancer, diffusion theory, fitness landscapes, branching processes, and evolutionary escape.

Lectures will be available on moodle.

Prerequisites / notice

- * Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.

The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments both on paper and in silico as part of the exercises. Attendees will apply these concepts to a number of applications yielding biological insight into:
- epidemiology
- pathogen evolution
- macroevolution of species

Attendees will learn which information is contained in genetic sequencing data and how to extract information from this data using computational tools. The main concepts introduced are:
- stochastic models in molecular evolution
- phylogenetic & phylodynamic inference
- maximum likelihood and Bayesian statistics

Attendees will apply these concepts to a number of applications yielding biological insight into:
- epidemiology
- pathogen evolution
- macroevolution of species

The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:
- Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.

Basic knowledge in linear algebra, analysis, and statistics will be helpful. Programming in R will be required for the project work (compulsory continuous performance assessments). In case you do not have any previous experience with R, we strongly recommend to get familiar with R prior to the semester start. For the D-BSSE students, we highly recommend the voluntary course „Introduction to Programming“, which takes place in Basel before the start of the semester.

Lecture notes

Lecture slides will be available on moodle.

The course must be registered for directly at Uni Basel. Uni Basel course number: 25600-01
Abstract
Evolutionary genetics covers three important areas of modern evolutionary genetics: bioinformatics, molecular evolution and population genetics. Treating these three areas together in a single course provides an integrated education in evolutionary genetics. A solid understanding of these areas is also central to other fields such as conservation biology or behavioural and evolutionary ecology.

262-6110-00L Bioinformatics Algorithms (University of Basel)
The course must be registered for directly at Uni Basel.
Uni Basel course number: 45401-01

Abstract
In this lecture, an introduction into main bioinformatics algorithms is provided. We will discuss both "classical" topics such as Hidden Markov Models, Markov chains, phylogenetic trees and "modern" approaches based on sophisticated (deep) learning models.

Objective
Students can understand the main algorithmic design principles for problems like sequence alignment, motif finding and phylogenetic inference. Further, students get an overview of modern machine learning methods and their applications to bio-medical problems.

401-6282-00L Statistical Analysis of High-Throughput Genomic and Transcriptomic Data (University of Zurich)
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.
UZH Module Code: STA426

Abstract
A range of topics will be covered, including basic molecular biology, genomics technologies and in particular, a wide range of statistical and computational methods that have been used in the analysis of DNA microarray and high throughput sequencing experiments.

Objective
- Understand the fundamental "scientific process" in the field of Statistical Bioinformatics
- Be equipped with the skills/tools to preprocess genomic data (Unix, Bioconductor, mapping, etc.) and ensure reproducible research (Sweave)
- Have a general knowledge of the types of data and biological applications encountered with microarray and sequencing data
- Have the ability to apply statistical methods/knowledge/software to a collaborative biological project
- Gain the ability to critical assess the statistical bioinformatics literature

Content
Lectures will include: microarray preprocessing; normalization; exploratory data analysis techniques such as clustering, PCA and multidimensional scaling; Controlling error rates of statistical tests (FPR versus FDR versus FWER); limma (linear models for microarray analysis); mapping algorithms (for RNA/ChIP-seq); RNA-seq quantification; statistical analyses for differential count data; isoform switching; epigenomics data including DNA methylation; gene set analyses; classification

Prerequisites / notice
Prerequisites: Basic knowledge of the programming language R, sufficient knowledge in statistics
Former course title: Statistical Methods for the Analysis of Microarray and Short-Read Sequencing Data

Abstract
This course reviews how ideas and concepts from physics have helped understanding biological systems by discussing landmark papers in the field.

636-0104-00L Biophysical Methods

Abstract
Students will be imparted knowledge in basic and advanced biophysical methods applied to problems in molecular biotechnology. The course is fundamental to applying the methods in their daily and advanced research routines. The students will learn the physical basis of the methods as well as their limitations and possibilities to address existing and future topics in molecular biotechnology.

Objective
Gain of interdisciplinary competence in experimental and theoretical research, which qualifies for academic scientific work (master's or doctoral thesis) as well as for research in a biotechnology or a pharmaceutical company. The module is of general use in courses focused on modern biomolecular technologies, systems biology and systems engineering.
The students will learn basic and advanced knowledge in applying biophysical methods to address problems and overcome challenges in biotechnology, cell biology and life sciences in general. The biological and physical possibilities and limitations of the methods will be discussed and critically evaluated. By the end of the course the students will have assimilated knowledge on a portfolio of biophysical tools widening their research capabilities and aptitude.

The biophysical methods to be taught will include:
- Light microscopy: Resolution limit of light microscopy, fluorescence, GFP, fluorescence microscopy, DIC, phase contrast, difference between wide-field and confocal microscopy
- Super resolution optical microscopy: STED, PALM, STORM, other variations
- Electron microscopy: Scanning electron microscopy, transmission electron microscopy, electron tomography, cryo-electron microscopy, single particle analysis and averaging, tomography, sectioning, negative stain
- X-ray, electron and neutron diffraction
- MRI imaging
- Scanning tunneling microscopy and atomic force microscopy
- Patch clamp technologies: Principles of patch clamp analysis and application. Various patch clamp approaches used in research and industry
- Surface plasmon resonance-based biosensors
- Molecular pore-based sensors and sequencing devices
- Mechanical molecular and cellular assembly devices
- Optical and magnetic tweezers
- CD spectroscopy
- Optogenetics
- Molecular dynamics simulations

Prerequisites / notice
The module is composed of 3 SWS (3 hours/week): 2-hour lecture, 1-hour seminar. For the seminar, students will prepare oral presentations on specific in-depth subjects with/under the guidance of the teacher.

636-0007-00L Computational Systems Biology

Abstract
Study of fundamental concepts, models and computational methods for the analysis of complex biological networks. Topics: Systems approaches in biology, biology and reaction network fundamentals, modeling and simulation approaches (topological, probabilistic, stoichiometric, qualitative, linear / nonlinear ODEs, stochastic), and systems analysis (complexity reduction, stability, identification).

Objective
The aim of this course is to provide an introductory overview of mathematical and computational methods for the modeling, simulation and analysis of biological networks.

Content
Biological systems have witnessed an unprecedented increase in experimental data and, correspondingly, an increased need for computational methods to analyze this data. The explosion of sequenced genomes, and subsequently, of bioinformatics methods for the storage, analysis and comparison of genetic sequences provides a prominent example. Recently, however, an additional area of research, captured by the label "Systems Biology", focuses on how networks, which are more than the mere sum of their parts' properties, establish biological functions. This is essentially a task of reverse engineering. The aim of this course is to provide an introductory overview of corresponding computational methods for the modeling, simulation and analysis of biological networks.

Lecture notes
http://www.csb.ethz.ch/education/lectures.html

Spatio-Temporal Modelling in Biology

Abstract
This course focuses on modeling spatio-temporal problems in biology, in particular on the cell and tissue level. The main focus is on mechanisms and concepts, but mathematical and numerical techniques are introduced as required. Biological examples discussed in the course provide an introduction to key concepts in developmental biology.

Objective
Students will learn state-of-the-art approaches to modelling spatial effects in dynamical biological systems. The course provides an introduction to dynamical system, and covers the mathematical analysis of pattern formation in growing, developing systems, as well as the description of mechanical effects at the cell and tissue level. The course also provides an introduction to image-based modelling, i.e. the use of microscopy data for model development and testing. The course covers classic as well as current approaches and exposes students to open problems in the field. In this way, the course seeks to prepare students to conduct research in the field. The course prepares students for research in developmental biology, as well as for applications in tissue engineering, and for biomedical research.

Content
1. Introduction to Modelling in Biology
2. Bioimage Analysis
3. Morphogen Gradients
4. Precision & Robustness of Patterning
5. Mathematical Description of Growing Biological Systems
6. Travelling Waves & Wave Pinning
7. Turing Patterns
8. Chemotaxis
9. Epithelial Organisation
10. Tissue Simulation Frameworks
11. Tissue Mechanics & Fluid Dynamics
12. Growth Control
13. Image-Based Modelling
14. Summary

Lecture notes
All lecture material will be made available online via Moodle.

Literature
The lecture course is not based on any textbook. The following textbooks are related to some of its content. The textbooks may be of interest for further reading, but are not necessary to follow the course:

- Murray, Mathematical Biology, Springer
- Forgacs and Newman, Biological Physics of the Developing Embryo, CUP
- Keener and Sneyd, Mathematical Physiology, Springer
- Fall et al., Computational Cell Biology, Springer
- Szallasi et al., System Modeling in Cellular Biology, MIT Press
- Wolkenhauer, Systems Biology
- Kreyszig, Engineering Mathematics, Wiley

Prerequisites / notice
The course is self-contained. The course assumes no background in biology but a good foundation regarding mathematical and computational techniques.

Mathematical Modelling for Bioengineering and Systems Biology

Abstract
Basic concepts and mathematical tools to explore biochemical reaction kinetics and biological network dynamics.

Objective
The course enables students to formulate, analyse, and simulate mathematical models of biochemical networks. To this end, the course covers basic mathematical concepts and tools to explore biochemical reaction dynamics as well as basic concepts from dynamical systems theory. The exercises serve to deepen the understanding of the presented concepts and the mathematical methods, and to train students to numerically solve and simulate mathematical models.

Content
Biochemical Reaction Modelling
Basic Concepts from Linear Algebra & Differential Equations
Mathematical Methods: Linear Stability Analysis, Phase Plane Analysis, Bifurcation Analysis
Dynamical Systems: Switches, Oscillators, Adaptation Signal Propagation in Signalling Networks
Parameter Estimation

Competencies
Subject-specific Competencies
Concepts and Theories assessed
Techniques and Technologies assessed

Data Science

Advanced Machine Learning

Abstract
Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

Objective
Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real world data.
### Overview

The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:

- **Fundamentals:**
  - What is data?
  - Bayesian Learning
  - Computational learning theory

- **Supervised learning:**
  - Ensembles: Bagging and Boosting
  - Max Margin methods
  - Neural networks

- **Unsupervised learning:**
  - Dimensionality reduction techniques
  - Clustering
  - Mixture Models
  - Non-parametric density estimation
  - Learning Dynamical Systems

Lecture notes

No lecture notes, but slides will be made available on the course webpage.

**Seminar**

The CBB seminar is mandatory.
the MSc CBB programme.

Students of other ETH study programmes interested in this course need to ask the lecturer for permission to enrol in the course.

The Seminar will be offered in autumn semester in Basel (involving professors and lecturers from the University of Basel) and in spring semester in Zurich (involving professors and lecturers from the University of Zurich). Professors and lecturers from ETH Zurich are involved in both semesters.

Uni Basel lecturers: Richard Neher, Attila Becskei, Mihaela Zavolan, Erik van Nimwegen

Abstract
Computational biology and bioinformatics aim at an understanding of living systems through computation. The seminar combines student presentations and current research project presentations to review the rapidly developing field from a computer science perspective.

Areas: DNA sequence analysis, proteomics, optimization and bio-inspired computing, and systems modeling, simulation and analysis.

Objective
Studying and presenting fundamental papers of Computational Biology and Bioinformatics. Learning how to make a scientific presentation and how classical methods are used or further developed in current research.

Content
Computational biology and bioinformatics aim at advancing the understanding of living systems through computation. The complexity of these systems, however, provides challenges for software and algorithms, and often requires entirely novel approaches in computer science. The aim of the seminar is to give an overview of this rapidly developing field from a computer science perspective. In particular, it will focus on the areas of (i) DNA sequence analysis, sequence comparison and reconstruction of phylogenetic trees, (ii) protein identification from experimental data, (iii) optimization and bio-inspired computing, and (iv) systems analysis of complex biological networks.

The seminar combines the discussion of selected research papers with a major impact in their domain by the students with the presentation of current active research projects / open challenges in computational biology and bioinformatics by the lecturers. Each week, the seminar will focus on a different topic related to ongoing research projects at ETHZ, University of Basel and University of Zurich, thus giving the students the opportunity of obtaining knowledge about the basic research approaches and problems as well as of gaining insight into (and getting excited about) the latest developments in the field.

Literature
Original papers to be presented by the students will be provided in the first week of the seminar.

Advanced Courses
A total of 30 ECTS needs to be acquired in the Advanced Courses category. Thereof at least 16 ECTS in the Theory and at least 10 ECTS in the Biology category.

Theory
At least 16 ECTS need to be acquired in this category.

Abstract
The course gives an introduction into fundamental techniques and algorithms of numerical mathematics which play a central role in numerical simulations in science and technology. The course focuses on fundamental ideas and algorithmic aspects of numerical methods. The exercises involve actual implementation of numerical methods in C++.

Objective
* Knowledge of the fundamental algorithms in numerical mathematics
* Knowledge of the essential terms in numerical mathematics and the techniques used for the analysis of numerical algorithms
* Ability to choose the appropriate numerical method for concrete problems
* Ability to interpret numerical results
* Ability to implement numerical algorithms efficiently
Content

First two weeks: A gentle introduction to C++

1. Computing with Matrices and Vectors
   1.1 Fundamentals
   1.2 Software and Libraries
   1.4 Computational Effort
   1.5 Machine Arithmetic and Consequences

2. Direct Methods for (Square) Linear Systems of Equations
   2.1 Introduction: Linear Systems of Equations
   2.3 Gaussian Elimination
   2.6 Exploiting Structure when Solving Linear Systems
   2.7 Sparse Linear Systems

3. Direct Methods for Linear Least Squares Problems
   3.1 Least Squares Solution Concepts
   3.2 Normal Equation Methods
   3.3 Orthogonal Transformation Methods
      3.3.1 Transformation Idea
      3.3.2 Orthogonal/Unitary Matrices
      3.3.3 QR-Decomposition
      3.3.4 QR-Based Solver for Linear Least Squares Problems
   3.4 Singular Value Decomposition

4. Filtering Algorithms
   4.1 Filters and Convolutions
   4.2 Discrete Fourier Transform (DFT)
   4.3 Fast Fourier Transform (FFT)

5. Machine Learning of One-Dimensional Data
   (Data Interpolation and Data Fitting in 1D)
   5.1 Abstract Interpolation (AI)
   5.2 Global Polynomial Interpolation

8. Iterative Methods for Non-Linear Systems of Equations
   8.1 Introduction
   8.2 Iterative Methods
   8.3 Fixed-Point Iterations
   8.4 Finding Zeros of Scalar Functions
   8.5 Newton’s Method in Rn
   8.6 Quasi-Newton Method

Lecture notes

Lecture materials (PDF documents and codes) will be made available to the participants through the course web page and online repositories. Access information will be communicated in the beginning of the course.

Literature

M. Hanke-Bourgeois "Grundlagen der Numerischen Mathematik und des wissenschaftlichen Rechnens", BG Teubner, 2002

P. Deuflhard and A. Hohmann, "Numerische Mathematik I", DeGruyter, 2002

Prerequisites / notice

The course will be accompanied by programming exercises in C++ relying on the template library EIGEN. Familiarity with C++, object oriented and generic programming is an advantage. Participants of the course are expected to learn C++ by themselves, in case they do not know it already.

Competencies

Subject-specific Competencies Concepts and Theories
Techniques and Technologies assessed assessed

Method-specific Competencies Analytical Competencies
Decision-making fostered
Problem-solving assessed
Project Management fostered

263-5210-00L Probabilistic Artificial Intelligence W 8 credits 3V+2U+2A A. Krause

Abstract

This course introduces core modeling techniques and algorithms from machine learning, optimization and control for reasoning and decision making under uncertainty, and study applications in areas such as robotics.

Objective

How can we build systems that perform well in uncertain environments? How can we develop systems that exhibit "intelligent" behavior, without prescribing explicit rules? How can we build systems that learn from experience in order to improve their performance? We will study core modeling techniques and algorithms from statistics, optimization, planning, and control and study applications in areas such as robotics. The course is designed for graduate students.

Content

Topics covered:
- Probability
- Probabilistic inference (variational inference, MCMC)
- Bayesian learning (Gaussian processes, Bayesian deep learning)
- Probabilistic planning (MDPs, POMDPs)
- Multi-armed bandits and Bayesian optimization
- Reinforcement learning

Prerequisites / notice

Solid basic knowledge in statistics, algorithms and programming.

The material covered in the course "Introduction to Machine Learning" is considered as a prerequisite.
Signals arise in most engineering applications. They contain information about the behavior of physical systems. Systems respond to signals and produce other signals. In this course, we explore how signals can be represented and manipulated, and their effects on systems. We further explore how we can discover basic system properties by exciting a system with various types of signals.

- Linear programming (simplex method, duality theory, shadow prices, ...).
- Basic combinatorial optimization problems (spanning trees, shortest paths, network flows, ...).
- Modelling with mathematical optimization: applications of mathematical programming in engineering.

Information about relevant literature will be given in the lecture.

This course is meant for students who did not already attend the course "Mathematical Optimization", which is a more advance lecture covering similar topics. Compared to "Mathematical Optimization", this course has a stronger focus on modeling and applications.

**401-0647-00L Introduction to Mathematical Optimization**

- **W 6 credits**
- **2V+1U**
- **D. Adjiashvili**

**Abstract**
The goal of the course is to obtain a good understanding of some of the most fundamental mathematical optimization techniques used to solve linear programs and basic combinatorial optimization problems. The students will also practice applying the learned models to problems in engineering.

**Objective**
Topics covered in this course include:
- Linear programming (simplex method, duality theory, shadow prices, ...).
- Basic combinatorial optimization problems (spanning trees, shortest paths, network flows, ...).
- Modelling with mathematical optimization: applications of mathematical programming in engineering.

Information about relevant literature will be given in the lecture.

This course is meant for students who did not already attend the course "Mathematical Optimization", which is a more advance lecture covering similar topics. Compared to "Mathematical Optimization", this course has a stronger focus on modeling and applications.

**227-0225-00L Linear System Theory**

- **W 6 credits**
- **5G**
- **J. Lygeros, A. Tsiamis**

**Abstract**
The class is intended to provide a comprehensive overview of the theory of linear dynamical systems, stability analysis, and their use in control and estimation. The focus is on the mathematics behind the physical properties of these systems and on understanding and constructing proofs of properties of linear control systems.

**Objective**
Students should be able to apply the fundamental results in linear system theory to analyze and control linear dynamical systems.

- Proof techniques and practices.
- Linear spaces, normed linear spaces and Hilbert spaces.
- Ordinary differential equations, existence and uniqueness of solutions.
- Continuous and discrete-time, time-varying linear systems. Time domain solutions. Time invariant systems treated as a special case.
- Controllability and observability, duality. Time invariant systems treated as a special case.
- Stability and stabilization, observers, state and output feedback, separation principle.

**Lecture notes**
Available on the course Moodle platform.

**Prerequisites / notice**
Sufficient mathematical maturity, in particular in linear algebra, analysis.

**151-0575-01L Signals and Systems**

- **W 4 credits**
- **2V+2U**
- **A. Carron**

**Abstract**
Signals arise in most engineering applications. They contain information about the behavior of physical systems. Systems respond to signals and produce other signals. In this course, we explore how signals can be represented and manipulated, and their effects on systems. We further explore how we can discover basic system properties by exciting a system with various types of signals.

**Objective**
Master the basics of signals and systems. Apply this knowledge to problems in the homework assignments and programming exercise.

**Content**

**Lecture notes**
Lecture notes available on course website.

**Prerequisites / notice**
Control Systems I is helpful but not required.

**252-0237-00L Concepts of Object-Oriented Programming**

- **W 8 credits**
- **3V+2U+2A**
- **P. Müller**

**Abstract**
Course that focuses on an in-depth understanding of object-oriented programming and compares designs of object-oriented programming languages. Topics include different flavors of type systems, inheritance models, encapsulation in the presence of aliasing, object and class initialization, program correctness, reflection

**Objective**
After this course, students will:
- Have a deep understanding of advanced concepts of object-oriented programming and their support through various language features.
- Be able to understand language concepts on a semantic level and be able to compare and evaluate language designs.
- Be able to learn new languages more rapidly.
- Be aware of many subtle problems of object-oriented programming and know how to avoid them.

**Content**
The main goal of this course is to convey a deep understanding of the key concepts of sequential object-oriented programming and their support in different programming languages. This is achieved by studying how important challenges are addressed through language features and programming idioms. In particular, the course discusses alternative language designs by contrasting solutions in languages such as C++, C#, Eiffel, Java, Python, and Scala. The course also introduces novel ideas from research languages that may influence the design of future mainstream languages.

The topics discussed in the course include among others:
- The pros and cons of different flavors of type systems (for instance, static vs. dynamic typing, nominal vs. structural, syntactic vs. behavioral typing).
- The key problems of single and multiple inheritance and how different languages address them.
- Generic type systems, in particular, Java generics, C# generics, and C++ templates.
- The situations in which object-oriented programming does not provide encapsulation, and how to avoid them.
- The pitfalls of object initialization, exemplified by a research type system that prevents null pointer dereferencing.

How to maintain the consistency of data structures
## Literature

**Prerequisites / notice**

Will be announced in the lecture.

**Prerequisites:**
Mastering at least one object-oriented programming language (this course will NOT provide an introduction to object-oriented programming); programming experience

### 262-6140-00L Random Processes: Theory and Applications from Physics to Finance (University of Basel)

- **Course Type:** W
- **Credits:** 4
- **Grading:** 3G
- **Organisers:** external

**Course Details:**
The course must be registered for directly at Uni Basel.

**Uni Basel course number:** 19300-01

**Mind the enrolment deadlines at Uni Basel:**
https://www.unibas.ch/en/Studies/Mobility/Mobility-Switzerland/Students-
Registering-From-Other-Swiss-Universities.html

**Abstract**
Basics of probability theory; Random processes: General concepts; Markov processes: Master equation, Fokker-Planck equation, stochastic differential equations; Mathematical finance

**Objective**
Basics of the theory of stochastic processes and an overview of selected applications

### 262-6150-00L Programming for Life Sciences (University of Basel)

- **Course Type:** W
- **Credits:** 4
- **Grading:** 2P
- **Organisers:** external

**Course Details:**
The course must be registered for directly at Uni Basel.

**Uni Basel course number:** 43513-01

**Mind the enrolment deadlines at Uni Basel:**
https://www.unibas.ch/en/Studies/Mobility/Mobility-Switzerland/Students-
Registering-From-Other-Swiss-Universities.html

**Abstract**
This course aims to train the students into the proficient use of programming in analyzing data derived from projects in life sciences. The format of the course includes 2 hour lectures, in which notions of software design and engineering will be discussed, and programming projects, done both in groups as well as individually.

**Objective**
By the end of the course, students should be comfortable with accessing and analyzing a wide variety of biological data. Concepts such as reproducibility, modularity, interoperability, and scalability will be emphasised.

### 636-0015-00L An Introduction to Probability Theory and Stochastic Processes with Applications to Biology

- **Course Type:** W
- **Credits:** 4
- **Grading:** 3G

**Does not take place this semester.**

**Abstract**
Biology is becoming increasingly quantitative and mathematical modeling is now an integral part of biological research. In many biological processes, ranging from gene-expression to evolution, randomness plays an important role that can only be understood using stochastic models. This course will provide the students with a theoretical foundation for developing such stochastic models and analyzing phenomena. Throughout the course, several biological applications will be discussed and students will be encouraged to do additional reading based on their research interests.

**Objective**
The aim of this course is to introduce certain topics in Probability Theory and Stochastic Processes that have been specifically selected with an eye on biological applications. This course will teach students the tools and techniques for modeling and analyzing random phenomena. The course will involve a healthy balance between mathematical rigor (theorem proving) and biological applications. Students are expected to have a good grasp of Linear Algebra and Multivariable Calculus. Basic knowledge of set theory will also be needed. Students should be prepared for abstract reasoning.

**Content**
The first half of the course will cover the basics of Probability Theory while the second half will delve into the theory of Stochastic Processes. Below is the list of topics that will be covered in the course.

1. The mathematical representation of random phenomena: The probability space, properties of the probability measure, Independence of events, Conditional probability and Bayes formula, applications to parameter inference.

3. Convergence of Random Variables: Modes of convergence, Laws of large numbers, the central limit theorem, the law of the iterated logarithm, Applications to the analysis of cell population data.

**Literature**
While no specific textbook will be followed, much of the material and homework problems will be taken from the following books:

**Prerequisites / notice**
The course will involve a healthy balance between mathematical rigor (theorem proving) and biological applications. Students are expected to have a good grasp of Linear Algebra and Multivariable Calculus. Basic knowledge of set theory will also be needed. Students should be prepared for abstract reasoning.

### 263-3010-00L Big Data

- **Course Type:** W
- **Credits:** 10
- **Grading:** 3V+2U+4A
- **Organisers:** G. Fourny

**Abstract**
The key challenge of the information society is to turn data into information, information into knowledge, knowledge into value. This has become increasingly complex. Data comes in larger volumes, diverse shapes, from different sources. Data is more heterogeneous and less structured than forty years ago. Nevertheless, it still needs to be processed fast, with support for complex operations.
Objective
Do you want to be able to query your own data productively and efficiently in your future semester projects, master thesis, or PhD thesis? Are you looking for something beyond the Python+Pandas hype? This courses teaches you how to do so as well as the dos and don'ts.

“Big Data” refers to the case when the amount of data is very large (100 GB and more), or when the data is not completely structured (or messy). The Big Data revolution has led to a completely new way to do business, e.g., develop new products and business models, but also to do science -- which is sometimes referred to as data-driven science or the "fourth paradigm". Unfortunately, the quantity of data produced and available -- now in the Zettabyte range (that's 21 zeros) per year -- keeps growing faster than our ability to process it. Hence, new architectures and approaches for processing it are needed. Harnessing them must involve a deep understanding of data not only in the large, but also in the small. The field of databases evolves at a fast pace. In order to be prepared, to the extent possible, to the (i)revolutions that will take place in the next few decades, the emphasis of the lecture will be on the paradigms and core design ideas, while today's technologies will serve as supporting illustrations thereof.

After visiting this lecture, you should have gained an overview and understanding of the Big Data landscape, which is the basis on which one can make informed decisions, i.e., pick and orchestrate the relevant technologies together for addressing each one of your projects efficiently and consistently.

Content
This course gives an overview of database technologies and of the most important database design principles that lay the foundations of the Big Data universe. We take the monolithic, one-machine relational stack from the 1970s, smash it down and rebuild it on top of large clusters: starting with distributed storage, and all the way up to syntax, models, validation, processing, indexing, and querying. A broad range of aspects is covered with a focus on how they fit all together in the big picture of the Big Data ecosystem. No data is harmed during this course, however, please be psychologically prepared that our data may not always be in third normal form.

- physical storage: distributed file systems (HDFS), object storage(S3), key-value stores
- logical storage: document stores (MongoDB), column stores (HBase), graph databases (neo4j), data warehouses (ROLAP)
- data formats and syntaxes (XML, JSON, RDF, Turtle, CSV, XBRL, YAML, protocol buffers, Avro)
- data shapes and models (tables, trees, graphs, cubes)
- type systems and schemas: atomic types, structured types (arrays, maps), set-based type systems (?, *, +)
- an overview of functional, declarative programming languages across data shapes (SQL, XQuery, JSONiq, Cypher, MDX)
- the most important query paradigms (selection, projection, joining, grouping, ordering, windowing)
- paradigms for parallel processing, two-stage (MapReduce) and DAG-based (Spark)
- resource management (YARN)
- what a data center is made of and why it matters (racks, nodes, ...)
- underlying architectures (internal machinery of HDFS, HBase, Spark, neo4j)
- optimization techniques (functional and declarative paradigms, query plans, rewrites, indexing)
- applications.

Literature
Course textbook: https://ghislainfourny.github.io/big-data-textbook/
Papers from scientific conferences and journals. References will be given as part of the course material during the semester.

Prerequisites / notice
The lecture is hybrid, meaning you can attend with us in the lecture hall, or on Zoom, or watch the recordings on YouTube later. Exercise sessions are in presence.

This course, in the autumn semester, is only intended for:
- Computer Science students
- Data Science students
- CBB students with a Computer Science background

Mobility students in CS are also welcome and encouraged to attend. If you experience any issue while registering, please contact the study administration and you will be gladly added.

For students of all other departments interested in this fascinating topic: I would love to have you visit my lectures as well! So there is a series of two courses specially designed for you:
- “Information Systems for Engineers” (SQL, relational databases): this Fall
- “Big Data for Engineers” (similar to Big Data, but adapted for non Computer Scientists): Spring 2023

There is no hard dependency, so you can either them in any order, but it may be more enjoyable to start with Information Systems for Engineers.

Students who successfully completed Big Data for Engineers are not allowed to enrol in the course Big Data.

Competencies
Subject-specific Competencies
Concepts and Theories assessed
Techniques and Technologies assessed
Method-specific Competencies
Analytical Competencies assessed
Decision-making assessed
Media and Digital Technologies fostered
Problem-solving fostered
Social Competencies
Communication fostered
Sensitivity to Diversity fostered
Negotiation fostered
Personal Competencies
Creative Thinking fostered
Critical Thinking assessed
Abstract
Research in Biology and Medicine have been transformed into disciplines of applied data science over the past years. Not only size and inherent complexity of the data but also requirements on data privacy and complexity of search and access pose a wealth of new research questions.

Objective
This interactive course will explore the latest research on algorithms and data structures for population scale genomics applications and give insights into both the technical basis as well as the domain questions motivating it.

Content
Over the duration of the semester, the course will cover three main topics. Each of the topics will consist of 70% lecture content and 30% practical content. Thereby, the practical implementation of the concepts presented in the lecture forms an integral part of the course.

1) Algorithms and data structures for the efficient compression of and search in texts and graphs. Motivated through applications in compressive genomics, the course will cover succinct indexing schemes for strings, trees and general graphs, compression schemes for binary matrices as well as the efficient representation of haplotypes and genomic variants.

2) Stochastic data structures and algorithms for approximate representation of strings and graphs as well as sets in general. This includes winnowing schemes and minimizers, sketching techniques, (minimal perfect) hashing, approximate membership query data structures, and approximate counting.

3) Data structures supporting encryption and data privacy. As an extension to data structures discussed in the earlier topics, this will include secure indexing using homomorphic encryption as well as design for secure storage and distribution of data.

Competencies
Subject-specific Competencies
- Techniques and Technologies assessed

Method-specific Competencies
- Analytical Competencies assessed
- Media and Digital Technologies fostered

Social Competencies
- Cooperation and Teamwork fostered

Personal Competencies
- Critical Thinking fostered
- Integrity and Work Ethics fostered

Abstract
This course provides the basics of relational databases from the perspective of the user. We will discover why tables are so incredibly powerful to express relations, learn the SQL query language, and how to make the most of it. The course also covers support for data cubes (analytics).

Objective
Do you want to be able to query your own data productively and efficiently in your future semester projects, bachelor's thesis, master thesis, or PhD thesis? Are you looking for something beyond the Python+Pandas hype? This courses teaches you how to do so as well as the dos and don'ts.

This lesson is complementary with Big Data for Engineers as they cover different time periods of database history and practices -- you can take them in any order, even though it might be more enjoyable to take this lecture first.

After visiting this course, you will be capable to:

1. Explain, in the big picture, how a relational database works and what it can do in your own words.
2. Explain the relational data model (tables, rows, attributes, primary keys, foreign keys), formally and informally, including the relational algebra operators (select, project, rename, all kinds of joins, division, cartesian product, union, intersection, etc).
3. Perform non-trivial reading SQL queries on existing relational databases, as well as insert new data, update and delete existing data.
4. Design new schemas to store data in accordance to the real world's constraints, such as relationship cardinality
5. Explain what bad design is and why it matters.
6. Adapt and improve an existing schema to make it more robust against anomalies, thanks to a very good theoretical knowledge of what is called "normal forms".
7. Understand how indices work (hash indices, B-trees), how they are implemented, and how to use them to make queries faster.
8. Access an existing relational database from a host language such as Java, using bridges such as JDBC.
9. Explain what data independence is all about and didn't age a bit since the 1970s.
10. Explain, in the big picture, how a relational database is physically implemented.
11. Know and deal with the natural syntax for relational data, CSV.
12. Explain the data cube model including slicing and dicing.
13. Store data cubes in a relational database.
14. Map cube queries to SQL.
15. Slice and dice cubes in a UI.

And of course, you will think that tables are the most wonderful object in the world.
Content

Using a relational database

1. Introduction
2. The relational model
3. Data definition with SQL
4. The relational algebra
5. Queries with SQL

Taking a relational database to the next level

6. Database design theory
7. Databases and host languages
8. Databases and host languages
9. Indices and optimization
10. Database architecture and storage

Analytics on top of a relational database

12. Data cubes

Outlook

13. Outlook

Literature

- Lecture material (slides).
  (It is not required to buy the book, as the library has it)

Prerequisites / notice

The lecture is hybrid, meaning you can attend with us in the lecture hall, or on Zoom, or watch the recordings on YouTube later. Exercise sessions are in presence.

For non-CS/DS students only, BSc and MSc

Elementary knowledge of set theory and logic

Knowledge as well as basic experience with a programming language such as Pascal, C, C++, Java, Haskell, Python

752-5500-00L Applied Bioinformatics: Microbiomes W 5 credits 2V+2U N. Bokulich, A. Lavrinenko, M. Ziemski

Abstract

Learn to apply practical bioinformatics/computational skills for analysis of microbiomes in foods and human health! Students will apply basic programming skills for scientific computing and bioinformatics, and learn and discuss the importance of microbiomes to foods and human health, through recognition and comparison of ecological theory, methodology, and experimental design across systems.

Objective

Learn to apply bioinformatics and computational methods for analysis of microbiome next-generation sequencing data. A secondary goal is to critically examine the relevance of microbiomes to food quality, safety, and human health, through application of theory and appropriate experimental design. Students completing this course will thus be able to both apply appropriate methodology to study microbiomes (or other high-dimensional data) in different systems, as well as evaluate and interpret bioinformatics results.

Content

1. Introduction to microbiomes and microbial bioinformatics toolkit. Python, Pandas, Jupyter, GitHub, visualization libraries for Python.
3. Microbial diversity, function, and ecology. Molecular ecology, diversity metrics, ordination methods.

This course requires extensive engagement in learning outside of the classroom (using online resources and practical exercises), with a focus on active learning in the classroom.

Prerequisites / notice

No specific pre-requisites, but students should have some familiarity with microbiology, molecular biology, programming (Python), bioinformatics, and statistics.

All software used in the course is free and open-source.

636-0554-00L Modelling and Simulation in Drug Development W 2 credits 3V H.-M. Kaltenbach

The course reviews solutions provided by machine learning to the most challenging questions in human genomics. Understanding the pharmacology, pharmacokinetics and pharmacodynamics (PK/PD) of novel drugs is key for a successful drug development process. Modelling and Simulation of these data is at the core to gain this understanding. Focusing on the application using real world examples, this course will introduce the statistical methodologies that have been developed to describe complex biological and pharmacological data with several levels of statistical variability.

The course will cover the basics of drug development and pharmacology with a focus on the principles of drug absorption, distribution, metabolism and excretion (ADME) and drug pharmacokinetics and pharmacodynamics (PK/PD). The different drug formats (small molecules, biologics, cell-based therapies, gene therapies and oligonucleotide formats) and their pharmacological properties will be introduced. The translation from animal to human to inform first-in human dose selections will be discussed.

The methodology part will cover compartmental PK/PD modelling, the practical aspects of numerical solutions of ordinary differential equation (ODEs) and the theory on non-linear mixed effects (NLME) modelling, which has become the de-facto standard methodology in the pharmaceutical industry. Practical problems of Modelling and Simulations will be discussed including parameter identifiability, model development and model evaluation and the application (or not) of the Occam’s Razor.

The course will focus on hands-on exercises using contemporary real-world examples from the pharmaceutical industry and provide necessary theoretical and methodological background in accompanying lectures.

The course is organized jointly by D-BSSE and LYO-X, a Quantitative Systems Pharmacology consulting company situated in Basel.

Prerequisites / notice
Basics of dynamic systems (e.g., BSSE courses by Iber or Kammash, or CSB course by Stelling)

263-5351-00L Machine Learning for Genomics

Objective
The course reviews solutions provided by machine learning to the most challenging questions in human genomics.

Content
Over the last few years, the parallel development of machine learning methods and molecular profiling technologies for human cells, such as sequencing, created an extremely powerful tool to get insights into the cellular mechanisms in healthy and diseased contexts. In this course, we will discuss the state-of-the-art machine learning methodology solving or attempting to solve common problems in human genomics. At the end of the course, you will be familiar with (1) classical and advanced machine learning architectures used in genomics, (2) bioinformatics analysis of human genomic and transcriptomic data, and (3) data types used in this field.

- Short introduction to major concepts of molecular biology: DNA, genes, genome, central dogma, transcription factors, epigenetic code, DNA methylation, signaling pathways
- Prediction of transcription factor binding sites, open chromatin, histone marks, promoters, nucleosome positioning (convolutional neural networks, position weight matrices)
- Prediction of variant effects and gene expression (hidden Markov models, topic models)
- Deconvolution of mixed signal (NMF, ICA)
- DNA, RNA and protein folding (RNN, LSTM, transformers)
- Data imputation for single-cell RNA-seq data, clustering and annotation (diffusion and methods on graphs)
- Batch correction (autoencoders, optimal transport)
- Survival analysis (Cox proportional hazard model, regularization penalties, multi-omics, multi-tasking)

Prerequisites / notice
Introduction to Machine Learning, Statistics/Probability, Programming in Python, Unix Command Line

The deadline for deregistering expires at the end of the second week of the semester. Students who are still registered after that date, but do not attend the seminar, will officially fail the seminar.

Abstract
This seminar course is designed to provide students with an opportunity to review and critically evaluate recent publications in medical field focusing on examples when CS method or bioinformatics/statistical technique has lead to an instrumentation, technique or drug approved for clinical practice use.

Objective
Throughout the course, students will read and analyze recent publications that demonstrate successful applications and sometimes failures in medicine. Promising research applications will also be discussed. The publications will cover a wide range of topics, including drug discovery, image analysis, prognostic models, and learning healthcare.
The course will be structured as half lecture content and half seminar content. Lectures will review state of the medical practice prior to the discovery, obstacles in moving the field forward, and the need for improvement. Lecture will be followed by the seminar part where students will take turns presenting the assigned publications and leading the discussions. Students’ presentations will focus on the main findings, and specific steps taken to translate the finding into clinical practice.

Publications will include examples of:
- specific CS/bioinformatics/statistics applications that has been brought to „bedside” – has been approved by European Medicines Agency / Food and Drug Administration (USA) for clinical use or are widely used in medical research;
- examples of failures of how a discovery did not translate into an endpoint and why;
- current active research areas.

Covered topics will include some of the following:
- Drug discovery: Computer-aided drug discovery has become an integral part of the drug development process, enabling researchers to design and screen large libraries of molecules in silico (i.e., using computer simulations) before synthesizing and testing them in the lab. This has led to the discovery of new drug candidates for a wide range of diseases, including cancer, Alzheimer’s disease, and HIV/AIDS.
- Genomics: Advances in computational genomics have enabled researchers to analyze and interpret large-scale genomic data, including DNA sequencing data, to identify disease-causing mutations, genetic risk factors, and drug targets. Examples of the development of personalized medicine, where treatments are tailored to an individual’s genetic makeup. Examples when drug target identified by genetics has led to approved treatment.
- Imaging: Computer vision and image processing techniques have revolutionized medical imaging, enabling researchers to extract quantitative information from medical images that were previously inaccessible. This has led to the development of new diagnostic and prognostic tools for a wide range of diseases, including cancer, cardiovascular disease, and neurological disorders.
- Real-world data applications: emulation of clinical trials using electronic health records data.
- Large language models: Generating clinical trial protocols using large language models. Natural Language Processing for information extraction and interpretation.
- Learning healthcare systems: Advances in data analytics and information technology have enabled the development of learning healthcare systems, which use real-time data from electronic health records, medical devices, and other sources to improve patient outcomes and reduce healthcare costs. This has the potential to transform the way healthcare is delivered, making it more personalized, efficient, and effective.

In addition to the presentations, students will also be required to write critical reviews of the assigned publications throughout the course. The reviews will be evaluated based on the students’ ability to identify the strengths and weaknesses of the publications and to provide insightful and constructive feedback.

Prerequisites / notice
The course is intended for advanced undergraduate and graduate students with a background in computer science, bioinformatics, or a related field and interest in applying their skills to medical research.

This course assumes a working knowledge of R/Python and intermediate statistical analysis, including linear, logistic, survival regressions or ability and interest to learn them outside of the class.

**Information for UZH students:**
Enrolment to this course unit only possible at ETH. No enrolment to module BIO348 at UZH.

*Please mind the ETH enrolment deadlines for UZH students: https://www.ethz.ch/en/studies/non-degree-courses/special-students/special-students-university-of-zurich.html*

**Abstract**
Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

**Objective**
This course focuses on the concepts of classical and modern genetics and genomics.

**Content**
The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

**Lecture notes**
Scripts and additional material will be provided during the semester.
551-0313-00L  Microbiology (Part I)  W 3 credits  2V  W. D. Hardt, L. Eberl, B. Nguyen, J. Piel, M. Pilhofer, A. Vagstad

Abstract
Advanced lecture class providing a broad overview on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Objective
This concept class will be based on common concepts and introduce to the enormous diversity among bacteria and archaea. It will cover the current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Content
Advanced class covering the state of the research in bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Lecture notes
Updated handouts will be provided during the class.

Literature
Current literature references will be provided during the lectures.

Prerequisites / notice
English
The lecture "Grundlagen der Biologie II: Mikrobiologie" is the basis for this advanced lecture.

551-0317-00L  Immunology I  W 3 credits  2V  M. Kopf, A. Oxenius

Abstract
Introduction into structural and functional aspects of the immune system.

Objective
Introduction into structural and functional aspects of the immune system.

Content
- Introduction and historical background
- Innate and adaptive immunity, Cells and organs of the immune system
- B cells and antibodies
- Generation of diversity
- Antigen presentation and Major Histoincompatibility (MHC) antigens
- Thymus and T cell selection
- Autoimmunity
- Cytotoxic T cells and NK cells
- Th1 and Th2 cells, regulatory T cells
- Allergies
- Hypersensitivities
- Vaccines, immune-therapeutic interventions

Lecture notes
Electronic access to the documentation will be provided. The link can be found at "Lernmaterialien"

Literature
- Kuby, Immunology, 9th edition, Freemen + Co., New York, 2020

Prerequisites / notice
For D-BIOL students Immunology I (WS) and Immunology II (SS) will be examined as one learning entity in a "Sessionsprüfung". All other students write separate exams for Immunology I and Immunology II. All exams (combined exam Immunology I and II, individual exams) are offered in each exam session.

636-0511-00L  Developmental Neuroscience (University of Basel)  W 2 credits  2V  external organisers

Does not take place this semester.
The course must be registered for directly at Uni Basel.
Uni Basel course number: 13186-01

Stem Cells: Biology and Therapeutic Manipulation

Abstract
This lecture will present examples for developmental switches in a variety of systems, including single-cell organisms, plants, nematodes, flies and vertebrates. The lecture will illustrate a way of thinking rather than attempt to cover single details of the issues discussed.

Abstract
This course will introduce the participants to the basic principles, genetic tools and vertebrate model systems used to study developmental processes.

Abstract
This lecture series was redesigned in the scope of the recently established Swiss-wide research network on antibiotics called AntiResist. Internationally renowned scientists from different disciplines present their latest findings and discuss how their work relates to a better understanding of infection processes and antibiotic therapy.

Abstract
This course will describe the structure and function of the eukaryotic nucleus. In this course, all features of the nucleus from regulated import/export through pores, to the compartmentalization of transcription, splicing, replication and repair will be covered. The lectures will give an up-to-date overview of a complex structure-function problem that touches on crucial aspects of cell identity.

Abstract
This course gives an introduction into cellular signalling mechanisms, followed by specific topics covering tyrosine/threonine kinase growth factor receptors, protein/protein and protein/lipid interaction modules, signalling by Ras family G proteins, lipid kinases, phospholipid-coupled transduction systems, protein kinase C, G protein-coupled receptors, and other topics.

Abstract
The lecture will cover the following topics: chemistry and structure of RNA; major classes of cellular RNAs, chemistry and structure of RNA; pre-mRNA processing with emphasis on splicing and polyadenylation; biogenesis of tRNA and rRNA; biochemistry and function of RNA interference (RNAi) and microRNAs; RNA trafficking in the cell, RNA quality control and RNA degradation; and more.
Abstract
Stem cells are central in tissue regeneration and repair, and hold great potential for therapy. We will discuss the role of stem cells in health and disease, and possibilities to manipulate their behavior for therapeutic application. Basic molecular and cell biology, engineering and novel technologies relevant for stem cell research and therapy will be discussed.

Objective
Understanding of current knowledge, and lack thereof, in stem cell biology, regenerative medicine and required technologies. Theoretical preparation for practical laboratory experimentation with stem cells.

Content
We will use different diseases to discuss how to potentially model, diagnose or heal them by stem cell based therapies. This will be used as a guiding framework to discuss relevant concepts and technologies in cell and molecular biology, engineering, imaging, bioinformatics, tissue engineering, that are required to manipulate stem cells for therapeutic application.

Topics will include:
- Embryonic and adult stem cells and their niches
- Induced stem cells by directed reprogramming
- Relevant cell biology and developmental biology
- Relevant molecular biology
- Cell culture systems
- Cell fates and their molecular control by transcription factors and signalling pathways
- Cell reprogramming
- Disease modelling
- Tissue engineering
- Bioimaging, Bioinformatics
- Single cell technologies

Competencies
Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies
- Analytical Competencies
- Media and Digital Technologies

Social Competencies
- Communication
- Cooperation and Teamwork
- Self-presentation and Social Influence

Personal Competencies
- Critical Thinking
- Integrity and Work Ethics

636-0108-00L Biological Engineering and Biotechnology W 4 credits 3V M. Fussenegger
Abstract
Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

Objective
By the end of the course, students will be able to:
- o critically assess the presentation of evolutionary research in the popular media
- o discuss ongoing debates in evolutionary biology
- o approach biological questions from an evolutionary perspective

Content
This course will provide a broad overview of current evolutionary thought, including the mechanisms of evolutionary change, adaptation and the history of life and will involve practical field and lab work as well as lecture material.
Literature Basics:
- Creighton, T.E., Proteins, Freeman, (1993)
- Fersht, A., Enzyme, Structure and Mechanism in Protein Science (1999), Freeman.

Current topics: References will be given during the lectures.

262-6107-00L Applied Mathematics and Informatics in Drug Discovery (University of Basel) W 2 credits 2G external organisers

Mind the enrolment deadlines at Uni Basel:
https://www.unibas.ch/en/Studies/Mobility/Mobility-Switzerland/Students-Registering-From-Other-Swiss-Universities.html

Abstract
This introductory course will offer a practitioner’s review of mathematical concepts, informatics tools, and industrial approaches in relevant fields, especially bioinformatics, molecular modelling, cheminformatics, mathematical modelling, experiment design and statistical inference, and machine learning.

Objective
We explore the drug-discovery process and study applications of mathematics and informatics with case studies. We examine how mathematics concepts and informatics tools are used to model complex systems at multiple levels - molecular level, cellular and omics level, organ- and system-level, and population level - and how the multiscale modelling approach contributes to drug discovery.

529-0733-02L Chemical Biology and Synthetic Biochemistry W 6 credits 3G K. Lang, M. Fottner

Abstract
Overview of modern chemical biology and synthetic biochemistry techniques, focussed on protein modification and labeling and on methods to endow proteins with novel functionalities.

Objective
After taking this course, students should be capable of the following: A) Recall different possibilities for modifying proteins in vitro and in vivo and their applications in a biological context, B) Understand the chemical and biochemical consequences of modifications and assess the different reaction possibilities in the context of in vivo - in vitro, C) Critically analyze and assess current chemical biology articles D) Question the approaches learned and apply them to new biological problems.

Content
- principles of protein labeling and protein modification (fluorescent proteins, enzyme-mediated labeling, bioorthogonal chemistries)
- advanced genetic code expansion methods (amber suppression, orthogonal ribosomes, unnatural base pairs, genome engineering and genome editing)
- directed evolution and protein engineering
- chemical biology of ubiquitin and targeted protein degradation

Lecture notes
A script will not be handed out. Handouts to the lecture will be provided through moodle.

Literature
Citations from the original literature relevant to the individual lectures will be assigned during the lectures.

Prerequisites /
Knowledge provided in the bachelor lectures 'Nucleic Acids and Carbohydrates' and 'Proteins and Lipids' is assumed for this lecture.

Competencies
- Subject-specific Competencies
  - Concepts and Theories assessed
  - Techniques and Technologies assessed
- Method-specific Competencies
  - Analytical Competencies assessed
  - Decision-making fostered
  - Media and Digital Technologies fostered
  - Problem-solving assessed
  - Project Management fostered
- Social Competencies
  - Communication fostered
  - Cooperation and Teamwork fostered
  - Customer Orientation fostered
  - Leadership and Responsibility fostered
  - Self-presentation and Social Influence fostered
  - Sensitivity to Diversity fostered
  - Negotiation fostered
- Personal Competencies
  - Adaptability and Flexibility fostered
  - Creative Thinking assessed
  - Critical Thinking assessed
  - Integrity and Work Ethics fostered
  - Self-awareness and Self-reflection fostered
  - Self-direction and Self-management fostered

Number Title Type ECTS Hours Lecturers
262-0100-00L Lab Rotation Short 1 W 6 credits 13A Lecturers
Abstract Flexible short research project of 4 weeks, completed with a written report.
Objective Students gain an overview of different research areas by applying concepts taught in the core courses and advanced courses.

262-0101-00L Lab Rotation Short 2 W 6 credits 13A Lecturers
Abstract Flexible short research project of 4 weeks, completed with a written report.

Abstract Flexible short research project of 4 weeks, completed with a written report.
Objective Students gain an overview of different research areas by applying concepts taught in the core courses and advanced courses.

Lab Rotations
18 ECTS in total. (MSc CBB students starting after Autumn 2021 must register courses with course number 262-0*3*).
At least one lab rotation in different group/ supervisor than master's thesis.
Further information and options: https://cbb.ethz.ch/studies/lab-rotations-internship.html
Flexible short research project of 6 weeks, completed with a written report. Students gain an overview of different research areas by applying concepts taught in the core courses and advanced courses.

Flexible short research project of 6 weeks, completed with a written report. Students gain an overview of different research areas by applying concepts taught in the core courses and advanced courses.

Industry internship of at least 8 weeks, completed with a written report. Students gain experience in an industrial environment and an overview of different research areas by applying concepts taught in the core courses and advanced courses.

The students look for a placement themselves.

Flexibly short research project of 8 weeks, completed with a written report. Students gain experience in an industrial environment and an overview of different research areas by applying concepts taught in the core courses and advanced courses.

Industry internship of at least 12 weeks, completed with a written report. Students gain experience in an industrial environment and an overview of different research areas by applying concepts taught in the core courses and advanced courses.

The students look for a placement themselves.

Industry internship lasts for 6 weeks, longer duration will delay the completion of studies beyond two years. Recognition of the industry internship requires a meaningful 10-page report.

Industry internship lasts for 12 weeks, longer duration will delay the completion of studies beyond two years. Recognition of the industry internship requires a meaningful 10-page report.

The students look for a placement themselves. Industry internship lasts for 12 weeks, longer duration will delay the completion of studies beyond two years. Recognition of the industry internship requires a meaningful 10-page report.

The Master Thesis is the result of an independent scientific research and/or constructive development project in the chosen area of specialization.

The Master Thesis concludes the Master programme. By writing up the Master thesis, students show their ability to independently produce a coherent and scientific piece of work.

The program concludes with a Master thesis that includes a written report and an oral presentation. The topic of the thesis can be chosen according to the student’s interests in the field of computational biology & bioinformatics.

The students look for a placement themselves. Industry internship lasts for 12 weeks, longer duration will delay the completion of studies beyond two years. Recognition of the industry internship requires a meaningful 10-page report.

The courses below are only available for MSc students with additional requirements.

Enrolment only for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) cannot enrol for this course unit.
Abstract

This course is about fundamental algorithm design paradigms (such as induction, divide-and-conquer, backtracking, dynamic programming), classic algorithmic problems (such as sorting and searching), and data structures (such as lists, hashing, search trees). Moreover, an introduction to parallel programming is provided. The programming model of C++ will be discussed in some depth.

Objective

An understanding of the design and analysis of fundamental algorithms and data structures. Knowledge regarding chances, problems and limits of parallel and concurrent programming. Deeper insight into a modern programming model by means of the programming language C++.

Content

Data structures and algorithms: mathematical tools for the analysis of algorithms (asymptotic function growth, recurrence equations, recurrence trees), informal proofs of algorithm correctness (invariants and code transformation), design paradigms for the development of algorithms (induction, divide-and-conquer, sweep-line method, backtracking and dynamic programming), classical algorithmic problems (searching, selection and sorting), data structures for different purposes (linked lists, hash tables, balanced search trees, quad trees, heaps, union-find), further tools for runtime analysis (e.g. amortized analysis). The relationship and tight coupling between algorithms and data structures is illustrated with geometric problems (convex hull, line intersections, closest point pairs) graph algorithms (traversals, topological sort, transitive closure, shortest paths, minimum spanning trees, max flow).

Programming model of C++: correct and efficient memory handling, generic programming with templates, functional approaches with functors and lambda expressions.

Parallel programming: concepts of parallel programming (Amdahl's and Gustavson's laws, task/data parallelism, scheduling), problems of concurrency (data races, bad interleavings, memory reordering), process synchronisation and communication in a shared memory system (mutual exclusion, semaphores, monitors, condition variables), progress conditions (freedom from deadlock, starvation).

The concepts provided in the course are motivated and illustrated with practically relevant algorithms and applications.

Exercises are carried out in Code-Expert, an online IDE and exercise management system.

Literature

English lecture notes are available for the entire course.

Standard textbooks:

Prerequisites / notice

Lecture Series 252-0835-00L Informatik I or equivalent knowledge in programming with C++.

Please note that this is a self study (virtual) course, which implies that (in the autumn semester) there are no physical lectures or exercise sessions offered. If you want to attend the real course, please go to 252-0002-00L in the spring semester.

Abstract

The course covers the fundamental concepts of computer programming with a focus on systematic algorithmic problem solving. Taught language is C++. No programming experience is required.

Objective

Primary educational objective is to learn programming with C++. After having successfully attended the course, students have a good command of the mechanisms to construct a program. They know the fundamental control and data structures and understand how an algorithmic problem is mapped to a computer program. They have an idea of what happens "behind the scenes" when a program is translated and executed. Secondary goals are an algorithmic computational thinking, understanding the possibilities and limits of programming and to impart the way of thinking like a computer scientist.

Content

The course covers fundamental data types, expressions and statements, (limits of) computer arithmetic, control statements, functions, arrays, structural types and pointers. The part on object orientation deals with classes, inheritance and polymorphism; simple dynamic data types are introduced as examples. In general, the concepts provided in the course are motivated and illustrated with algorithms and applications.

Lecture notes

Lecture slides and all other material will be made available for download on the course web page.

**406-0603-AAL Stochastics (Probability and Statistics)**

*Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.*

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

**Abstract**

Introduction to basic methods and fundamental concepts of statistics and probability theory for non-mathematicians. The concepts are presented on the basis of some descriptive examples. Learning the statistical program R for applying the acquired concepts will be a central theme.

**Objective**

The objective of this course is to build a solid fundament in probability and statistics. The student should understand some fundamental concepts and be able to apply these concepts to applications in the real world. Furthermore, the student should have a basic knowledge of the statistical programming language "R".

**Content**

**262-0945-AAL Cell and Molecular Biology for Engineers I and II**

*Does not take place this semester.*

*Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.*

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

**Abstract**

The course gives an introduction into cellular and molecular biology, specifically for students with a background in engineering. The focus will be on the basic organization of eukaryotic cells, molecular mechanisms and cellular functions. Textbook knowledge will be combined with results from recent research and technological innovations in biology.

**Objective**

After completing this course, engineering students will be able to apply their previous training in the quantitative and physical sciences to modern biology. Students will also learn the principles how biological models are established, and how these models can be tested.

**Content**

Lectures will include the following topics: DNA, chromosomes, RNA, protein, genetics, gene expression, membrane structure and function, vesicular traffic, cellular communication, energy conversion, cytoskeleton, cell cycle, cellular growth, apoptosis, autophagy, cancer, development and stem cells.

Data: 26.07.2024 12:39  Autumn Semester 2024
Abstract
Subject of the class are engineering techniques for developing secure systems. We examine concepts, methods and tools, applied within the different activities of the SW development process to improve security of the system. Topics: security requirements & risk analysis, system modeling & model-based development methods, implementation-level security, and evaluation criteria for secure systems.

Objective
Security engineering is an evolving discipline that unifies two important areas: software engineering and security. Software Engineering addresses the development and application of methods for systematically developing, operating, and maintaining, complex, high-quality software. Security, on the other hand, is concerned with assuring and verifying properties of a system that relate to confidentiality, integrity, and availability of data.

The goal of this class is to survey engineering techniques for developing secure systems. We will examine concepts, methods, and tools that can be applied within the different activities of the software development process, in order to improve the security of the resulting systems.

Topics covered include

* security requirements & risk analysis,
* system modeling and model-based development methods,
* implementation-level security, and
* evaluation criteria for the development of secure systems

Security engineering is an evolving discipline that unifies two important areas: software engineering and security. Software Engineering addresses the development and application of methods for systematically developing, operating, and maintaining, complex, high-quality software.

Security, on the other hand, is concerned with assuring and verifying properties of a system that relate to confidentiality, integrity, and availability of data.

The goal of this class is to survey engineering techniques for developing secure systems. We will examine concepts, methods, and tools that can be applied within the different activities of the software development process, in order to improve the security of the resulting systems.

Topics covered include

- security requirements & risk analysis,
- system modeling and model-based development methods,
- implementation-level security, and
- evaluation criteria for the development of secure systems

Modules taught:

1. Introduction
   - Introduction of Infsec group and speakers
   - Security meets SW engineering: an introduction
   - The activities of SW engineering, and where security fits in
   - Overview of this class
2. Requirements Engineering: Security Requirements and some Analysis
   - Overview: functional and non-functional requirements
   - Use cases, misuse cases, sequence diagrams
   - Safety and security
3. Modeling in the design activities
   - Structure, behavior, and data flow
   - Class diagrams, statecharts
4. Model-driven security for access control (Part I)
   - SecureUML as a language for access control
   - Combining Design Modeling Languages with SecureUML
   - Semantics, i.e., what does it all mean,
   - Generation
   - Examples and experience
5. Model-driven security (Part II)
   - Continuation of above topics
6. Security patterns (design and implementation)
7. Implementation-level security
   - Buffer overflows
   - Input checking
   - Injection attacks
8. Code scanning
   - Static code analysis basics
   - Theoretical and practical challenges
   - Analysis algorithms
   - Common bug pattern search and specification
   - Dataflow analysis
9. Testing
   - Overview and basics
   - Model-based testing
   - Testing security properties
10. Risk analysis and management
    - "Risk": assets, threats, vulnerabilities, risk
    - Risk assessment: quantitative and qualitative
    - Safeguards
    - Generic risk analysis procedure
    - The OCTAVE approach
    - Example of qualitative risk assessment
11. Threat modeling
    - Overview
    - Safety engineering basics: FMEA and FTA
    - Security impact analysis in the design phase
    - Modeling security threats: attack trees
    - Examples and experience
12. Evaluation criteria
    - NIST special papers
    - ISO/IEC 27000
    - Common criteria
    - BSI baseline protection
13. Guest lecture
    - TBA

Literature
- Further relevant books and journal/conference articles will be announced in the lecture.

Prerequisites / notice
Prerequisite: Class on Information Security

252-1414-00L System Security W 7 credits 2V+2U+2A S. Capkun, S. Shinde

Abstract
The first part of the course covers general security concepts and hardware-based support for security.

In the second part, the focus is on system design and methodologies for building secure systems.

Objective
In this lecture, students learn about the security requirements and capabilities that are expected from modern hardware, operating systems, and other software environments. An overview of available technologies, algorithms and standards is given, with which these requirements can be met.
The first part of the lecture covers hardware-based security concepts. Topics include the concept of physical and software-based side channel attacks on hardware resources, architectural support for security (e.g., memory management and permissions, disk encryption), and trusted execution environments (Intel SGX, ARM TrustZone, AMD SEV, and RISC-V Keystone).

In the second part, the focus is on system design and methodologies for building secure systems. Topics include: common software faults (e.g., buffer overflows, etc.), bug-detection, writing secure software (design, architecture, QA, testing), compiler-supported security (e.g., control-flow integrity), and language-supported security (e.g., memory safety).

Along the lectures, model cases will be elaborated and evaluated in the exercises.

| Prerequisites / notice | This course is intended for students with an interest in securing Internet communication services and network devices. Students are assumed to have knowledge in networking as taught in a communication networks lecture like 252-0064-00L or 227-0120-00L. Basic knowledge of information security or applied cryptography as taught in 252-0211-00L or 263-4660-00L is beneficial, but an overview of the most important cryptographic primitives will be provided at the beginning of the course. The course will involve several graded course projects. Students are expected to be familiar with a general-purpose or network programming language such as C/C++, Go, Python, or Rust. |

**Abstract**

This course covers advanced topics and technologies in computer networks, both theoretically and practically. It is offered each Fall. Repetition for credit is possible with the consent of the instructor.

**Objective**

The goals of this course is to provide students with a deeper understanding of the existing and upcoming Internet technologies used in large-scale computer networks such as Internet Service Providers (e.g., Swisscom or Deutsche Telekom), Content Delivery Networks (e.g., Netflix) and Data Centers (e.g., Google). Besides covering the fundamentals, the course will be "hands-on" and will enable students to play with the technologies in realistic network environments.

**Content**

In 2023, the course will cover advanced topics in communication networks such as:

- Advanced Internet routing (convergence, optimality, scalability, flexibility);
- Network programmability (OpenFlow, P4);
- Traffic engineering / Load Balancing;
- Network verification and synthesis;
- Network measurements;
- Network security;
- Upcoming transport protocols and technologies;
- Adaptive video streaming; and
- Network sustainability.

The course will be composed of lectures and practical exercises (some of which including labs).

**Lecture notes**

Lecture notes and material will be made available before each course on the course website.

**Literature**

Relevant references will be made available through the course website.

**Prerequisites / notice**

Prerequisites: Communication Networks (227-0120-00L) or equivalents / programming skills (in any language) are expected (some of the exercises will involve coding).

**Competencies**

- **Subject-specific Competencies**
  - Concepts and Theories
  - Techniques and Technologies
- **Method-specific Competencies**
  - Analytical Competencies
  - Decision-making
  - Problem-solving
  - Project Management
- **Social Competencies**
  - Communication
- **Personal Competencies**
  - Adaptability and Flexibility
  - Creative Thinking
  - Critical Thinking

---

| 227-0579-00L | Hardware Security | W    | 8    | 2V+2U+2A | K. Razavi |

**Abstract**

This course covers the security of commodity computer hardware (e.g., CPU, DRAM, etc.) with a special focus on cutting-edge hands-on research. The aim of the course is familiarizing the students with hardware security and more specifically microarchitectural and circuit-level attacks and defenses through lectures and implementing some of these advanced attacks.

**Objective**

By the end of the course, the students will be familiar with the state of the art in commodity computer hardware attacks and defenses. More specifically, the students will learn about:

- security problems of commodity hardware that we use everyday and how you can defend against them.
- relevant computer architecture and operating system aspects of these issues.
- hands-on techniques for performing hardware attacks.

This is the course where you get credit points by building some of the most advanced exploits on the planet! The luckiest team will collect a Best Demo Award at the end of the course.

**Literature**

Slides, relevant literature and manuals will be made available during the course.

**Prerequisites / notice**

Experience with Linux, low-level systems programming and computer architecture.

**Competencies**

- **Subject-specific Competencies**
  - Concepts and Theories
  - Techniques and Technologies
- **Method-specific Competencies**
  - Analytical Competencies
  - Decision-making
  - Media and Digital Technologies
  - Problem-solving
  - Project Management
- **Social Competencies**
  - Cooperation and Teamwork
- **Personal Competencies**
  - Adaptability and Flexibility
  - Creative Thinking
  - Critical Thinking
  - Integrity and Work Ethics
  - Self-direction and Self-management

---

| 252-0811-00L | Applied Security Laboratory | W    | 8    | 7P     | D. Basin |

**Abstract**

Hands-on course on applied aspects of information security. Applied information security, operating system security, OS hardening, computer forensics, web application security, project work, design, implementation, and configuration of security mechanisms, risk analysis, system review.

**Objective**

The Applied Security Laboratory addresses four major topics: operating system security (hardening, vulnerability scanning, access control, logging), application security with an emphasis on web applications (web server setup, common web exploits, authentication, session handling, code security), computer forensics, and risk analysis and risk management.
Content
This course emphasizes applied aspects of Information Security. The students will study a number of topics in a hands-on fashion and carry out experiments in order to better understand the need for secure implementation and configuration of IT systems and to assess the effectivity and impact of security measures. This part is based on a book and virtual machines that include example applications, questions, and answers.

The students will also complete an independent project: based on a set of functional requirements, they will design and implement a prototypical IT system. In addition, they will conduct a thorough security analysis and devise appropriate security measures for their systems. Finally, they will carry out a technical and conceptual review of another system. All project work will be performed in teams and must be properly documented.

Lecture notes

Literature
Recommended reading includes:
- Various: OWASP Guide to Building Secure Web Applications, available online
- O'Reilly, Loukides: Unix Power Tools, O'Reilly & Associates.
- Frisch: Essential System Administration, O'Reilly & Associates.
- NIST: Risk Management Guide for Information Technology Systems, available online as PDF
- BSI: IT-Grundschutzhandbuch, available online

Prerequisites / notice
- The lab allows flexible working since there are only few mandatory meetings during the semester.
- The lab covers a variety of different techniques. Thus, participating students should have a solid foundation in the following areas: information security, operating system administration (especially Unix/Linux), and networking. Students are also expected to have a basic understanding of HTML, PHP, JavaScript, and MySQL because several examples are implemented in these languages.
- Students must be prepared to spend more than three hours per week to complete the lab assignments and the project. This applies particularly to students who do not meet the recommended requirements given above. Successful participants of the course receive 8 credits as compensation for their effort.
- All participants must sign the lab's charter and usage policy during the introduction lecture.

252-1411-00L Security of Wireless Networks
W 6 credits 2V+1U+2A S. Capkun, K. Kostiainen

Abstract
This course discusses physical layer aspects of wireless communication and a wide range of security-related topics in the domain of wireless technologies. It mainly targets computer science students. Though useful, a background in signal processing or physical layer concepts is not required. A basic understanding of security (e.g., as taught in 252-0211.00L Information Security) is recommended.

Objective
After this course, students should be able to describe and classify security goals of and attacks on various wireless networks and technologies, with an emphasis on physical layer aspects.

Content
- Introduction to wireless communication
- Physical layer security schemes
- Spreading techniques and their application in jamming-resilient communication and Global Navigation Satellite Systems (GNSSs)
- Secure ranging with Ultra-Wide Band (UWB)
- Security aspects of cellular networks, WiFi, and Bluetooth Low Energy (BLE)

Competencies
Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies
Method-specific Competencies
- Analytical Competencies
- Problem-solving
Social Competencies
- Cooperation and Teamwork
Personal Competencies
- Critical Thinking

263-4657-00L Advanced Encryption Schemes
W 5 credits 2V+1U+1A to be announced

Abstract
Public-Key Encryption has had a significant impact by enabling remote parties to communicate securely via an insecure channel. Latest schemes go further by providing a fine-grained access to the encrypted data.

Objective
The student is comfortable with formal security definitions and proof techniques used to analyze the security of the latest encryption schemes with advanced features. This prepares the student to start reading research papers on the field.

Content
We will start by presenting the notion of Public-Key Encryption with its various security guarantees and some constructions. Then we will look into encryption schemes with fine-grained access control to the encrypted data, such as identity-based encryption or attribute-based encryption and present different methodology to prove their security.

Literature
Links to relevant research papers will be given in the course materials.

Prerequisites / notice
It is recommended for students to have prior exposure to cryptography, e.g., the D-INFK course "Digital Signatures" or "Applied Cryptography".

263-4665-00L Zero-Knowledge Proofs
W 5 credits 2V+1U+1A J. Bootle

Abstract
Zero-knowledge proofs are protocols which allow a prover to convince a verifier that a statement is true without leaking any information beyond that fact. This course is a detailed introduction to zero-knowledge proof protocols.

Objective
- To understand what it means for a zero-knowledge proof to be secure
- To construct and analyse various types of zero-knowledge proofs
- To understand some applications of zero-knowledge proofs

Content
The course will discuss interactive zero-knowledge proofs based on various cryptographic assumptions, and their applications in cryptography and the real world. The course may also describe some more advanced constructions of non-interactive proofs.

Lecture notes
The course notes will be written in English

Prerequisites / notice
Students should have taken a first course in Cryptography (as taught in the Information Security course at Bachelor's level), Experience with algebra (groups and finite fields) and probability is highly recommended.

Competencies
Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies
Method-specific Competencies
- Analytical Competencies
- Problem-solving
Personal Competencies
- Creative Thinking
- Critical Thinking

Seminar

Number Title Type ECTS Hours Lecturers

Data: 26.07.2024 12:39 Autumn Semester 2024 Page 614 of 2680
Abstract
The seminar covers various topics in information security: security protocols (models, specification & verification), trust management, access control, non-interference, side-channel attacks, identity-based cryptography, host-based attack detection, anomaly detection in backbone networks, key-management for sensor networks.

Objective
The main goals of the seminar are the independent study of scientific literature and assessment of its contributions as well as learning and practicing presentation techniques.

Content
The seminar covers various topics in information security, including network security, cryptography and security protocols. The participants are expected to read a scientific paper and present it in a 35-40 min talk. At the beginning of the semester a short introduction to presentation techniques will be given.

Selected Topics
- security protocols: models, specification & verification
- trust management, access control and non-interference
- side-channel attacks
- identity-based cryptography
- host-based attack detection
- anomaly detection in backbone networks
- key-management for sensor networks

Literature
The reading list will be published on the course web site.

<tr>
<td>Abstract</td>
<td>The key challenge of the information society is to turn data into information, information into knowledge, knowledge into value. This has become increasingly complex. Data comes in larger volumes, diverse shapes, from different sources. Data is more heterogeneous and less structured than forty years ago. Nevertheless, it still needs to be processed fast, with support for complex operations. Do you want to be able to query your own data productively and efficiently in your future semester projects, master thesis, or PhD thesis? Are you looking for something beyond the Python+Pandas hype? This courses teaches you how to do so as well as the dos and don'ts. &quot;Big Data&quot; refers to the case when the amount of data is very large (100 GB and more), or when the data is not completely structured (or messy). The Big Data revolution has led to a completely new way to do business, e.g., develop new products and business models, but also to do science -- which is sometimes referred to as data-driven science or the &quot;fourth paradigm&quot;. Unfortunately, the quantity of data produced and available -- now in the Zettabyte range (that's 21 zeros) per year -- keeps growing faster than our ability to process it. Hence, new architectures and approaches for processing it are needed. Harnessing them must involve a deep understanding of data not only in the large, but also in the small. The field of databases evolves at a fast pace. In order to be prepared, to the extent possible, to the (r)evolutions that will take place in the next few decades, the emphasis of the lecture will be on the paradigms and core design ideas, while today's technologies will serve as supporting illustrations thereof. After visiting this lecture, you should have gained an overview and understanding of the Big Data landscape, which is the basis on which one can make informed decisions, i.e., pick and orchestrate the relevant technologies together for addressing each one of your projects efficiently and consistently.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
This course gives an overview of database technologies and of the most important database design principles that lay the foundations of the Big Data universe. We take the monolithic, one-machine relational stack from the 1970s, smash it down and rebuild it on top of large clusters: starting with distributed storage, and all the way up to syntax, models, validation, processing, indexing, and querying. A broad range of aspects is covered with a focus on how they fit all together in the big picture of the Big Data ecosystem.

No data is harmed during this course, however, please be psychologically prepared that our data may not always be in third normal form.

- physical storage: distributed file systems (HDFS), object storage, key-value stores
- logical storage: document stores (MongoDB), column stores (HBase), graph databases (neo4j), data warehouses (ROLAP)
- data formats and syntaxes (XML, JSON, RDF, Turtle, CSV, XBRL, YAML, protocol buffers, Avro)
- data shapes and models (tables, trees, graphs, cubes)
- type systems and schemas: atomic types, structured types (arrays, maps), set-based type systems (?, *, +)
- an overview of functional, declarative programming languages across data shapes (SQL, XQuery, JSONiq, Cypher, MDX)
- the most important query paradigms (selection, projection, joining, grouping, ordering, windowing)
- paradigms for parallel processing, two-stage (MapReduce) and DAG-based (Spark)
- resource management (YARN)
- what a data center is made of and why it matters (racks, nodes, …)
- underlying architectures (internal machinery of HDFS, HBase, Spark, neo4j)
- optimization techniques (functional and declarative paradigms, query plans, rewrites, indexing)
- applications.

Large scale analytics and machine learning are outside of the scope of this course.

Course textbook: https://ghislainfourny.github.io/big-data-textbook/

Papers from scientific conferences and journals. References will be given as part of the course material during the semester.

This course, in the autumn semester, is only intended for:
- Computer Science students
- Data Science students
- CBB students with a Computer Science background

Mobility students in CS are also welcome and encouraged to attend. If you experience any issue while registering, please contact the study administration and you will be gladly added.

For students of all other departments interested in this fascinating topic: I would love to have you visit my lectures as well! So there is a series of two courses specially designed for you:
- "Information Systems for Engineers" (SQL, relational databases); this Fall
- "Big Data for Engineers" (similar to Big Data, but adapted for non Computer Scientists): Spring 2023

There is no hard dependency, so you can either them in any order, but it may be more enjoyable to start with Information Systems for Engineers.

Students who successfully completed Big Data for Engineers are not allowed to enrol in the course Big Data.

Data Management Systems

The course will cover the implementation aspects of data management systems using relational database engines as a starting point to cover the basic concepts of efficient data processing and then expanding those concepts to modern implementations in data centers and the cloud.

Objective

The goal of the course is to convey the fundamental aspects of efficient data management from a systems implementation perspective: storage, access, organization, indexing, consistency, concurrency, transactions, distribution, query compilation vs interpretation, data representations, etc. Using conventional relational engines as a starting point, the course will aim at providing an in depth coverage of the latest technologies used in data centers and the cloud to implement large scale data processing in various forms.

Content

The course will first cover fundamental concepts in data management: storage, locality, query optimization, declarative interfaces, concurrency control and recovery, buffer managers, management of the memory hierarchy, presenting them in a system independent manner. The course will place an special emphasis on understanding these basic principles as they are key to understanding what problems existing systems try to address. It will then proceed to explore their implementation in modern relational engines supporting SQL to then expand the range of systems used in the cloud: key value stores, geo-replication, query as a service, serverless, large scale analytics engines, etc.

Literature

The main source of information for the course will be articles and research papers describing the architecture of the systems discussed. The list of papers will be provided at the beginning of the course.
The course requires to have completed the Data Modeling and Data Bases course at the Bachelor level as it assumes knowledge of databases and SQL.

| 252-1414-00L | System Security                          | W    | 7 credits | 2V+2U+2A   | S. Capkun, S. Shinde |
| Abstract     | The first part of the course covers general security concepts and hardware-based support for security. In the second part, the focus is on system design and methodologies for building secure systems. |
| Objective    | In this lecture, students learn about the security requirements and capabilities that are expected from modern hardware, operating systems, and other software environments. An overview of available technologies, algorithms and standards is given, with which these requirements can be met. |
| Content      | The first part of the lecture covers hardware-based security concepts. Topics include the concept of physical and software-based side channel attacks on hardware resources, architectural support for security (e.g., memory management and permissions, disk encryption), and trusted execution environments (Intel SGX, ARM TrustZone, AMD SEV, and RISC-V Keystone). |
| In the second part, the focus is on system design and methodologies for building secure systems. Topics include: common software faults (e.g., buffer overflows, etc.), bug-detection, writing secure software (design, architecture, QA, testing), compiler-supported security (e.g., control-flow integrity), and language-supported security (e.g., memory safety). |
| Along the lectures, model cases will be elaborated and evaluated in the exercises. |
| Competencies | Subject-specific Competencies            | assessed |

| 263-2800-00L | Design of Parallel and High-Performance Computing | W | 9 credits | 2V+2U+4A | T. Hoefler |
| Abstract     | Advanced topics in parallel and high-performance computing. |
Objective
Understand concurrency paradigms and models from a higher perspective and acquire skills for designing, structuring and developing possibly large parallel high-performance software systems. Become able to distinguish parallelism in problem space and in machine space. Become familiar with important technical concepts and with concurrency folklore.

Content
We will cover all aspects of high-performance computing ranging from architecture through programming up to algorithms. We will start with a discussion of caches and cache coherence in practical computer systems. We will dive into parallel programming concepts such as memory models, locks, and lock-free. We will cover performance modeling and parallel design principles as well as basic parallel algorithms.

Prerequisites / notice
This class is intended for the Computer Science Masters curriculum. Students must have basic knowledge in programming in C as well as computer science theory. Students should be familiar with the material covered in the ETH computer science first-year courses "Parallele Programmierung (parallel programming)" and "Algorithmen und Datenstrukturen (algorithm and data structures)" or equivalent courses.

263-3210-00L Deep Learning W 8 credits 3V+2U+2A T. Hofmann

Abstract
Deep learning is an area within machine learning that deals with algorithms and models that automatically induce multi-level data representations.

Objective
In recent years, deep learning and deep networks have significantly improved the state-of-the-art in many application domains such as computer vision, speech recognition, and natural language processing. This class will cover the mathematical foundations of deep learning and provide insights into model design, training, and validation. The main objective is a profound understanding of why these methods work and how. There will also be a rich set of hands-on tasks and practical projects to familiarize students with this emerging technology.

Prerequisites / notice
This is an advanced level course that requires some basic background in machine learning. More importantly, students are expected to have a very solid mathematical foundation, including linear algebra, multivariate calculus, and probability. The course will make heavy use of mathematics and is not (!) meant to be an extended tutorial of how to train deep networks with tools like Torch or Tensorflow, although that may be a side benefit.

The participation in the course is subject to the following condition:
- Students must have taken the exam in Advanced Machine Learning (252-0535-00) or have acquired equivalent knowledge, see exhaustive list below:

Advanced Machine Learning
https://ml2.inf.ethz.ch/courses/aml/

Computational Intelligence Lab
http://da.inf.ethz.ch/teaching/2019/CIL/

Introduction to Machine Learning
https://las.inf.ethz.ch/teaching/introml-S19

Statistical Learning Theory
http://ml2.inf.ethz.ch/courses/slT/

Computational Statistics
https://stat.ethz.ch/lectures/ss19/comp-stats.php

Probabilistic Artificial Intelligence

Abstract
Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

Objective
Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real world data.

Content
The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:

Fundamentals:
What is data?
Bayesian Learning
Computational learning theory

Supervised learning:
Ensembles: Bagging and Boosting
Max Margin methods
Neural networks

Unsupervised learning:
Dimensionality reduction techniques
Clustering
Mixture Models
Non-parametric density estimation
Learning Dynamical Systems

Lecture notes
No lecture notes, but slides will be made available on the course webpage.
Deep Learning

Abstract
Deep learning is an area within machine learning that deals with algorithms and models that automatically induce multi-level data representations.

Objective
In recent years, deep learning and deep networks have significantly improved the state-of-the-art in many application domains such as computer vision, speech recognition, and natural language processing. This class will cover the mathematical foundations of deep learning and provide insights into model design, training, and validation. The main objective is a profound understanding of why these methods work and how. There will also be a rich set of hands-on tasks and practical projects to familiarize students with this emerging technology.

Prerequisites / notice
This course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.

Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

Probabilistic Artificial Intelligence

Abstract
This course introduces core modeling techniques and algorithms from machine learning, optimization and control for reasoning and decision making under uncertainty, and study applications in areas such as robotics.

Objective
How can we build systems that perform well in uncertain environments? How can we develop systems that exhibit “intelligent” behavior, without prescribing explicit rules? How can we build systems that learn from experience in order to improve their performance? We will study core modeling techniques and algorithms from statistics, optimization, planning, and control and study applications in areas such as robotics. The course is designed for graduate students.

Content
Topics covered:
- Probability
- Probabilistic inference (variational inference, MCMC)
- Bayesian learning (Gaussian processes, Bayesian deep learning)
- Probabilistic planning (MDPs, POMDPs)
- Multi-armed bandits and Bayesian optimization
- Reinforcement learning

Prerequisites / notice
Solid basic knowledge in statistics, algorithms and programming.

The material covered in the course “Introduction to Machine Learning” is considered as a prerequisite.
Abstract
This course presents topics in natural language processing with an emphasis on modern techniques, primarily focusing on statistical and deep learning approaches. The course provides an overview of the primary areas of research in language processing as well as a detailed exploration of the models and techniques used both in research and in commercial natural language systems.

Objective
The objective of the course is to learn the basic concepts in the statistical processing of natural languages. The course will be project-oriented so that the students can also gain hands-on experience with state-of-the-art tools and techniques.

Content
This course presents an introduction to general topics and techniques used in natural language processing today, primarily focusing on statistical approaches. The course provides an overview of the primary areas of research in language processing as well as a detailed exploration of the models and techniques used both in research and in commercial natural language systems.

Literature
Lectures will make use of textbooks such as the one by Jurafsky and Martin where appropriate, but will also make use of original research and survey papers.

263-2400-00L Reliable and Trustworthy Artificial Intelligence  W  6 credits  2V+2U+1A  M. Vechev
Abstract
Creating reliable, secure, robust, and fair machine learning models is a core challenge in artificial intelligence and one of fundamental importance. The goal of the course is to teach both the mathematical foundations of this new and emerging area as well as to introduce students to the latest and most exciting research in the space.

Objective
Upon completion of the course, the students should have mastered the underlying methods and be able to apply them to a variety of engineering and research problems. To facilitate deeper understanding, the course includes a group coding project where students will build a system based on the learned material.

Content
The course is split into 4 parts:

Robustness of Machine Learning
- Adversarial attacks and defenses on deep learning models.
- Certified training of deep neural networks (combining symbolic and continuous methods).

Privacy of Machine Learning
- Threat models (e.g., stealing data, poisoning, membership inference, etc.).
- Attacking federated machine learning (across vision, natural language and tabular data).
- Differential privacy for defending machine learning.
- AI Regulations and checking model compliance.

Fairness of Machine Learning
- Introduction to fairness (motivation, definitions).
- Enforcing individual fairness (for both vision and tabular data).
- Enforcing group fairness (e.g., demographic parity, equalized odds).

Robustness, Privacy and Fairness of Foundation Models
- We discuss all previous topics, as well as programmability, in the context of latest foundation models (e.g., LLMs).

Prerequisites / notice
While not a formal requirement, the course assumes familiarity with basics of machine learning (especially linear algebra, gradient descent, and neural networks as well as basic probability theory). These topics are usually covered in “Intro to ML” classes at most institutions (e.g., “Introduction to Machine Learning” at ETH).

The coding project will utilize Python and PyTorch. Thus some programming experience in Python is expected. Students without prior knowledge of PyTorch are expected to acquire it early in the course by solving exercise sheets.

Competencies
Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies
- Analytical Competencies
- Problem-solving

Personal Competencies
- Creative Thinking
- Critical Thinking

263-5005-00L Artificial Intelligence in Education  W  3 credits  1V+0.5U  M. Sachan
Abstract
Artificial Intelligence (AI) methods have shown to have a profound impact in educational technologies, where the great variety of tasks and data types enable us to get benefit of AI techniques in many different ways. We will review relevant methods and applications of AI in various educational technologies, and work on problem sets and projects to solve problems in education with the help of AI.

Objective
The course will be centered around exploring methodological and system-focused perspectives on designing AI systems for education and analyzing educational data using AI methods. Students will be expected to a) engage in presentations and active in-class and asynchronous discussion, and b) work on problem-sets exemplifying the use of educational data mining techniques.

Content
The course will start with an introduction to data mining techniques (e.g., prediction, structured discovery, visualization, and relationship mining) relevant to analyzing educational data. We will then continue with topics on personalization in AI in educational technologies (e.g., learner modeling and knowledge tracing, self-improving AIED systems) while showcasing exemplary applications in areas such as content curation and dialog-based tutoring. Finally, we will cover ethical challenges associated with using AI in student facing settings. Face-to-face meetings will be held every fortnight, although students will be expected to work individually on weekly tasks (e.g., discussing relevant literature, working on problems, preparing seminar presentations).

Lecture notes
Lecture slides will be made available at the course Web site.

Literature
No textbook is required, but there will be regularly assigned readings from research literature, linked to the course website.

Prerequisites / notice
There are no prerequisites for this class. However, it will help if the student has taken an undergraduate or graduate level class in statistics, data science or machine learning. This class is appropriate for advanced undergraduates and master students in Computer Science as well as PhD students in other departments.

263-5056-00L Applications of Deep Learning on Graphs
Does not take place this semester.

Abstract
Graphs are an incredibly versatile abstraction to represent arbitrary structures such as molecules, relational knowledge or social and traffic networks. This course provides a practical overview of deep (representation) learning on graphs and their applications.
Many established deep learning methods require dense input data with a well-defined structure (e.g. an image, a sequence of word embeddings). However, many practical applications deal with sparsely connected and complex data structures, such as molecules, knowledge graphs or social networks. Graph Neural Networks (GNNs) and general representation learning on graphs have recently experienced a surge in popularity because it addresses the challenge to effectively learn representations over said structures. In this course, we aim to understand the fundamental principles of deep (representation) learning on graphs, the similarities and differences to other concepts in deep learning, as well as the unique challenges from a practical point of view. Finally, we provide an overview of recent applications of graph neural networks.

Introduction to GNN concepts: 1) problem-solving on graphs (node-, edge-, graph-level objectives), structural priors (inductive biases) of graph data, applications for graph learning. 2) Graph Neural Networks: convolutional, attentional, message passing; overview on the zoo of published operators. Relations to Transformers and DeepSets. 3) Expressivity of GNNs. 4) Scalability of Graph Neural Networks: Subsampling, Clustering (Pooling). 5) Augmentations and self-supervised learning on Graphs Application: Drug Discovery, Knowledge graphs, Temporal GNNs. Geometric GNNs, Deep Generative Models for Graphs.

Introduction to Machine Learning; Statistics/Probability; Programming in Python; Unix Command Line.

Geometric GNNs, Deep Generative Models for Graphs.
The goal of this course is to provide students with a good understanding of computer vision and image analysis techniques. The main concepts and techniques will be studied in depth and practical algorithms and approaches will be discussed and explored through the exercises.

The objectives of this course are:
1. To introduce the fundamental problems of computer vision.
2. To introduce the main concepts and techniques used to solve those.
3. To enable participants to implement solutions for reasonably complex problems.
4. To enable participants to make sense of the computer vision literature.

Camera models and calibration, invariant features, Multiple-view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition

It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts before taking this course.

- Learning Dynamical Systems

No lecture notes, but slides will be made available on the course webpage.

The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.

Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

Geometry: Combinatorics and Algorithms

Geometric structures are useful in many areas, and there is a need to understand their structural properties, and to work with them algorithmically. The lecture addresses theoretical foundations concerning geometric structures. Central objects of interest are triangulations. We study combinatorial (Does a certain object exist?) and algorithmic questions (Can we find a certain object efficiently?)

The goal is to make students familiar with fundamental concepts, techniques and results in combinatorial and computational geometry, so as to enable them to model, analyze, and solve theoretical and practical problems in the area and in various application domains.

In particular, we want to prepare students for conducting independent research, for instance, within the scope of a thesis project.

Planar and geometric graphs, embeddings and their representation (Whitney's Theorem, canonical orderings, DCEL), polygon triangulations and the art gallery theorem, convexity in R^d, planar convex hull algorithms (Jarvis Wrap, Graham Scan, Chan's Algorithm), point set triangulations, Delaunay triangulations (Lawson flips, lifting map, randomized incremental construction), Voronoi diagrams, the Crossing Lemma and incidence bounds, line arrangements (duality, Zone Theorem, ham-sandwich cuts), 3-SUM hardness, counting planar triangulations.

Literature

Prerequisites / notice

Prerequisites: The course assumes basic knowledge of discrete mathematics and algorithms, as supplied in the first semesters of Bachelor Studies at ETH.
Outlook: In the following spring semester there is a seminar "Geometry: Combinatorics and Algorithms" that builds on this course. There are ample possibilities for Semester-, Bachelor- and Master Thesis projects in the area.

Data: 26.07.2024 12:39
Autumn Semester 2024
### 263-5300-00L

**Guarantees for Machine Learning**

does not take place this semester.

**Abstract**

This course is aimed at advanced master and doctorate students who want to conduct independent research on theory for modern machine learning (ML). It teaches standard methods in statistical learning theory commonly used to prove theoretical guarantees for ML algorithms. The knowledge is then applied in independent project work to understand and follow-up on recent theoretical ML results.

**Objective**

By the end of the semester students should be able to:

- understand a good fraction of theory papers published in the typical ML venues. For this purpose, students will learn common mathematical techniques from statistical learning in the first part of the course and apply this knowledge in the project work
- critically examine recently published work in terms of relevance and find impactful (novel) research problems. This will be an integral part of the project work and involves experimental as well as theoretical questions
- outline a possible approach to prove a conjectured theorem by e.g. reducing to more solvable subproblems. This will be practiced in in-person exercises, homeworks and potentially in the final project
- effectively communicate and present the problem motivation, new insights and results to a technical audience. This will be primarily learned via the final presentation and report as well as during peer-grading of peer talks.

**Content**

This course touches upon foundational methods in statistical learning theory aimed at proving theoretical guarantees for machine learning algorithms. It touches on the following topics:

- concentration bounds
- uniform convergence and empirical process theory
- regularization for non-parametric statistics (e.g. in RKHS, neural networks)
- high-dimensional learning
- computational and statistical learnability (information-theoretic, PAC, SQ)
- overparameterized models, implicit bias and regularization

The project work focuses on current theoretical ML research that aims to understand modern phenomena in machine learning, including but not limited to:

- how overparameterized models generalize (statistically) and converge (computationally)
- complexity measures and approximation theoretic properties of randomly initialized and trained neural networks
- generalization of robust learning (adversarial or distribution-shift robustness)
- private and fair learning

**Prerequisites / notice**

Students should have a very strong mathematical background (real analysis, probability theory, linear algebra) and solid knowledge of core concepts in machine learning taught in courses such as "Introduction to Machine Learning", "Regression", "Statistical Modelling". In addition to these prerequisites, this class requires a high degree of mathematical maturity—including abstract thinking and the ability to understand and write proofs.

**Algebraic Methods in Combinatorics**

does not take place this semester.

**Abstract**

Combinatorics is a fundamental mathematical discipline as well as an essential component of many mathematical areas, and its study has experienced an impressive growth in recent years. This course provides a gentle introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to other areas.

**Objective**

The students will get an overview of various algebraic methods for solving combinatorial problems. We expect them to understand the proof techniques and to use them autonomously on related problems.

**Content**

Combinatorics is a fundamental mathematical discipline as well as an essential component of many mathematical areas, and its study has experienced an impressive growth in recent years. While in the past many of the basic combinatorial results were obtained mainly by ingenuity and detailed reasoning, the modern theory has grown out of this early stage and often relies on deep, well-developed tools.

One of the main general techniques that played a crucial role in the development of Combinatorics was the application of algebraic methods. The most fruitful such tool is the dimension argument. Roughly speaking, the method can be described as follows. In order to bound the cardinality of a discrete structure A one maps its elements to vectors in a linear space, and shows that the set A is mapped to linearly independent vectors. It then follows that the cardinality of A is bounded by the dimension of the corresponding linear space. This simple idea is surprisingly powerful and has many famous applications.

This course provides a gentle introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to other areas. The topics covered in the class will include (but are not limited to):

- Basic dimension arguments. Spaces of polynomials and tensor product methods, Eigenvalues of graphs and their application, the Combinatorial Nullstellensatz and the Chevalley-Warning theorem. Applications such as: Solution of Kakeya problem in finite fields, counterexample to Borsuk's conjecture, chromatic number of the unit distance graph of Euclidean space, explicit constructions of Ramsey graphs and many others.

The course website can be found at [https://moodle-app2.let.ethz.ch/course/view.php?id=15757](https://moodle-app2.let.ethz.ch/course/view.php?id=15757)

**Lecture notes**

Lectures will be on the blackboard only, but there will be a set of typeset lecture notes which follow the class closely.

**Prerequisites / notice**

Students are expected to have a mathematical background and should be able to write rigorous proofs.

Abstract
Mathematical treatment of optimization techniques for linear and combinatorial optimization problems.

Objective
The goal of this course is to get a thorough understanding of various classical mathematical optimization techniques for linear and combinatorial optimization problems, with an emphasis on polyhedral approaches. In particular, we want students to develop a good understanding of some important problem classes in the field, of structural mathematical results linked to these problems, and of solution approaches based on such structural insights.

Content
Key topics include:
- Linear programming and polyhedra;
- Flows and cuts;
- Combinatorial optimization problems and polyhedral techniques;
- Equivalence between optimization and separation.

Literature

Prerequisites / notice
Solid background in linear algebra.

Subject-specific Competencies
Concepts and Theories assessed
Techniques and Technologies fostered

Method-specific Competencies
Analytical Competencies assessed
Decision-making assessed
Media and Digital Technologies fostered
Problem-solving assessed
Project Management fostered

Social Competencies
Communication assessed
Cooperation and Teamwork fostered

Personal Competencies
Adaptability and Flexibility fostered
Creative Thinking assessed
Critical Thinking assessed
Integrity and Work Ethics fostered
Self-awareness and Self-reflection fostered
Self-direction and Self-management fostered

Literature
Quantum Computation and Quantum Information
Michael Nielsen and Isaac Chuang
Cambridge University Press

Prerequisites / notice
A good understanding of finite dimensional linear algebra is recommended.

Abstract
This course covers fundamental and advanced concepts of modern computer graphics. Students will learn the fundamentals of digital scene representations, advanced physically-based light transport algorithms for generating photorealistic images from these scene representations, and inverse rendering methods for recovering digital scene representations from captured images.

Objective
At the end of the course, the students will be able to build a rendering system based on path-tracing algorithms. The students will learn the principles of physically-based rendering and computer graphics. In addition, the course is intended to stimulate the student's curiosity to explore the field of computer graphics in subsequent classes or on their own.
Content
We will begin with an introduction to light emission and radiometric quantities, followed by an exploration of geometry representations and texture mapping. Next, we will mathematically formulate the physics of light transport and appearance modeling. Subsequently, we will introduce relevant concepts from Monte Carlo integration and develop path-tracing algorithms to solve these equations by simulating light transport for direct and global illumination due to hard surfaces and participating media, such as fog, smoke, and translucent objects.
Moreover, we will present techniques for significantly improving path-tracing efficiency, including importance sampling, multiple importance sampling, stratified sampling, denoising, and acceleration data structures. The course lectures will conclude with an overview of image-based capture and rendering methods. Topics covered will include geometry reconstruction, material acquisition, differentiable rendering, and image-based rendering.

Subject-specific Competencies
We will begin with an introduction to light emission and radiometric quantities, followed by an exploration of geometry representations and texture mapping. Next, we will mathematically formulate the physics of light transport and appearance modeling. Subsequently, we will introduce relevant concepts from Monte Carlo integration and develop path-tracing algorithms to solve these equations by simulating light transport for direct and global illumination due to hard surfaces and participating media, such as fog, smoke, and translucent objects.
Moreover, we will present techniques for significantly improving path-tracing efficiency, including importance sampling, multiple importance sampling, stratified sampling, denoising, and acceleration data structures. The course lectures will conclude with an overview of image-based capture and rendering methods. Topics covered will include geometry reconstruction, material acquisition, differentiable rendering, and image-based rendering.

Objective
The objectives of this course are:
1. To introduce the fundamental problems of computer vision.
2. To introduce the main concepts and techniques used to solve those.
3. To enable participants to implement solutions for reasonably complex problems.
4. To enable participants to make sense of the computer vision literature.

Competencies
The content will be presented in the context of autonomous driving. The programming assignments will be in C++. This will not be taught in the class.

Prerequisites
It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts before taking this course.

Abstract
This course introduces the core computer vision techniques and algorithms that autonomous cars use to perceive the semantics and geometry of their driving environment, localize themselves in it, and predict its dynamic evolution. Emphasis is placed on techniques tailored for real-world settings, such as multi-modal fusion, domain-adaptive and outlier-aware architectures, and multi-agent methods.

Objective
Students will learn about the fundamentals of autonomous cars and of the computer vision models and methods these cars use to analyze their environment and navigate themselves in it. Students will be presented with state-of-the-art representations and algorithms for semantic, geometric and temporal visual reasoning in automated driving and will gain hands-on experience in developing computer vision algorithms and architectures for solving such tasks.

After completing this course, students will be able to:
1. understand the operating principles of visual sensors in autonomous cars
2. differentiate between the core architectural paradigms and components of modern visual perception models and describe their logic and the role of their parameters
3. systematically categorize the main visual tasks related to automated driving and understand the primary representations and algorithms which are used for solving them
4. critically analyze and evaluate current research in the area of computer vision for autonomous cars
5. practically reproduce state-of-the-art computer vision methods in automated driving
6. independently develop new models for visual perception
The content of the lectures consists in the following topics:

1. Fundamentals
   (a) Fundamentals of autonomous cars and their visual sensors
   (b) Fundamental computer vision architectures and algorithms for autonomous cars

2. Semantic perception
   (a) Semantic segmentation
   (b) Object detection
   (c) Domain-adaptive and outlier-aware semantic perception

3. Geometric perception and localization
   (a) Depth estimation
   (b) 3D reconstruction
   (c) Visual localization
   (d) Unimodal visual/ lidar 3D object detection

4. Robust perception: multi-modal, multi-domain and multi-agent methods
   (a) Multi-modal 2D and 3D object detection
   (b) Visual grounding and verbo-visual fusion
   (c) Domain-adaptive and outlier-aware semantic perception
   (d) Vehicle-to-vehicle communication for perception

5. Temporal perception
   (a) Multiple object tracking
   (b) Motion prediction

The practical projects involve implementing complex computer vision architectures and algorithms and applying them to real-world, multi-modal driving datasets. In particular, students will develop models and algorithms for:

1. Semantic segmentation and depth estimation
2. Sensor calibration for multi-modal 3D driving datasets
3. 3D object detection using lidars

Lecture notes
Lecture slides are provided in PDF format.

Prerequisites / notice
Students are expected to have a solid basic knowledge of linear algebra, multivariate calculus, and probability theory, and a basic background in computer vision and machine learning. All practical projects will require solid background in programming and will be based on Python and libraries of it such as PyTorch.

252-0546-00L Physically-Based Simulation in Computer Graphics

Abstract
This lecture provides an introduction to physically-based animation in computer graphics and gives an overview of fundamental methods and algorithms. The practical exercises include three assignments which are to be solved in small groups. In an additional course project, topics from the lecture will be implemented into a 3D game or a comparable application.

Objective
This lecture provides an introduction to physically-based animation in computer graphics and gives an overview of fundamental methods and algorithms. The practical exercises include three assignments which are to be solved in small groups. In an additional course project, topics from the lecture will be implemented into a 3D game or a comparable application.

Content
The lecture covers topics in physically-based modeling, such as particle systems, mass-spring models, finite difference and finite element methods. These approaches are used to represent and simulate deformable objects or fluids with applications in animated movies, 3D games and medical systems. Furthermore, the lecture covers topics such as rigid body dynamics, collision detection, and object animation.

Prerequisites / notice
Fundamentals of calculus and physics, basic concepts of algorithms and data structures, basic programming skills in C++. Knowledge on numerical mathematics as well as ordinary and partial differential equations is an asset, but not required.

263-5905-00L Mixed Reality

Abstract
The goal of this course is an introduction and hands-on experience on latest mixed reality technology at the cross-section of 3D computer graphics and vision, human machine interaction, as well as gaming technology.

Objective
After attending this course, students will:
1. Understand the foundations of 3D graphics, Computer Vision, and Human-Machine Interaction
2. Have a clear understanding on how to build mixed reality apps
3. Have a good overview of state-of-the-art Mixed Reality
4. Be able to critically analyze and asses current research in this area.

Content
The course introduces latest mixed reality technology and provides introductory elements for a number of related fields including: Introduction to Mixed Reality / Augmented Reality / Virtual Reality Introduction to 3D Computer Graphics, 3D Computer Vision. This will take place in the form of short lectures, followed by student presentations discussing the current state-of-the-art. The main focus of this course are student projects on mixed reality topics, where small groups of students will work on a particular project with the goal to design, develop and deploy a mixed reality application. The project topics are flexible and can reach from proof-of-concept vision(graphics/HMI research, to apps that support teaching with interactive augmented reality, or game development. The default platform will be Microsoft HoloLens in combination with C# and Unity3D - other platforms are also possible to use, such as tablets and phones.

Prerequisites / notice
- Good programming skills (C# / C++ / Java etc.)
- Computer graphics/vision experience: Students should have taken, at a minimum, Visual Computing. Higher level courses are recommended, such as Introduction to Computer Graphics, 3D Vision, Computer Vision.

Interfocus Courses
Number Title Type ECTS Hours Lecturers
263-0006-00L Algorithms Lab W 8 credits 4P+3A A. Steger
Abstract
Students learn how to solve algorithmic problems given by a textual description (understanding problem setting, finding appropriate modeling, choosing suitable algorithms, and implementing them). Knowledge of basic algorithms and data structures is assumed; more advanced material and usage of standard libraries for combinatorial algorithms are introduced in tutorials.

Objective
The objective of this course is to learn how to solve algorithmic problems given by a textual description. This includes appropriate problem modeling, choice of suitable (combinatorial) algorithms, and implementing them (using C/C++, STL, CGAL, and BGL).

Literature

263-0009-00L Information Security Lab

Abstract
This InterFocus Course will provide a broad, hands-on introduction to Information Security, introducing adversarial thinking and security by design as key approaches to building secure systems.

Objective
This course will introduce key concepts from Information Security, both from attack and defence perspectives. Students will gain an appreciation of the complexity and challenge of building secure systems.

Content
The course is organised in three-week segments. In each segment, a new concept from Information Security will be introduced. The overall scope will be broad, including cryptography, protocol design, system security, and privacy.

Lecture notes
Will be made available during the semester.

Literature
Paul C. van Oorschot, Computer Security and the Internet: Tools and Jewels.
Dan Boneh and Victor Shoup, A Graduate Course in Applied Cryptography.

Prerequisites / notice
Ideally, students will have taken the D-INFK Bachelors course “Information Security” or an equivalent course at Bachelors level.

Competencies
Subject-specific Competencies
Concepts and Theories assessed
Techniques and Technologies assessed
Method-specific Competencies
Analytical Competencies assessed
Problem-solving assessed
Personal Competencies
Adaptability and Flexibility fostered

Free Electives
Students can individually chose from the entire Master course offerings in the area of Computer Science (or a closely related field), from ETH Zurich, EPF Lausanne, the University of Zurich and - but only with the consent of the Director of Studies - from all other Swiss universities.

Master’s Thesis

Number Title Type ECTS Hours Lecturers
260-0800-00L Master’s Thesis O 30 credits 64D Supervisors

Abstract
Only students who fulfill the following criteria are allowed to begin with their master thesis:

a. successful completion of the bachelor programme;
b. fulfilling of any additional requirements necessary to gain admission to the master programme.

Objective
The Master's thesis concludes the study program and demonstrates the students' ability to use the knowledge and skills acquired during Master’s studies to solve a complex cyber security problem.

To work independently and to produce a scientifically structured work.

447-6221-00L Nonparametric Regression [ ]

W 1 credit 1G M. Mächler

Special Students "University of Zurich (UZH)" in the Master Program in Biostatistics at UZH cannot register for this course unit electronically. Forward the lecturer's written permission to attend to the Registrar's Office. Alternatively, the lecturer may also send an email directly to registrar@ethz.ch. The Registrar's Office will then register you for the course.

Abstract
This course focuses on nonparametric estimation of probability densities and regression functions. These recent methods allow modeling without restrictive assumptions such as 'linear function'. These smoothing methods require a weight function and a smoothing parameter. Focus is on one dimension, higher dimensions and samples of curves are treated briefly. Exercises at the computer.

Objective
Knowledge on estimation of probability densities and regression functions via various statistical methods. Understanding of the choice of weight function and of the smoothing parameter, also done automatically. Practical application on data sets at the computer.

447-6233-00L Spatial Statistics [ ]

W 1 credit 1G M. Nussbaum

Special Students "University of Zurich (UZH)" in the Master Program in Biostatistics at UZH cannot register for this course unit electronically. Forward the lecturer's written permission to attend to the Registrar's Office. Alternatively, the lecturer may also send an email directly to registrar@ethz.ch. The Registrar's Office will then register you for the course.

Abstract
In many research fields, spatially referenced data are collected. When analysing such data the focus is either on exploring their structure (dependence on explanatory variables, autocorrelation) and/or on spatial prediction. The course provides an introduction to geostatistical methods that are useful for such purposes.

Objective
The course will provide an overview of the basic concepts and stochastic models that are commonly used to model geostatistical data sets. In addition, the participants will learn a number of geostatistical techniques and acquire some familiarity with software that is useful for analysing spatial data.

Content
After an introductory discussion of the types of problems and the kind of data that arise in environmental research, an introduction into linear geostatistics (models: stationary random processes, modelling large-scale spatial patterns by regression, modelling autocorrelation by variogram; kriging, mean-square prediction of spatial data) will be taught. The lectures will be complemented by data analyses that the participants have to do themselves.

Lecture notes
Slides, descriptions of the problems for the data analyses and worked-out solutions to them will be provided.

447-6255-00L Analysis of High-Dimensional Data [ ]

W 1 credit 1G N. Städler

Special Students "University of Zurich (UZH)" in the Master Program in Biostatistics at UZH cannot register for this course unit electronically. Forward the lecturer's written permission to attend to the Registrar's Office. Alternatively, the lecturer may also send an email directly to registrar@ethz.ch. The Registrar's Office will then register you for the course.

Abstract
Block course on analysis of high-dimensional data with a focus on prediction and feature assessment.
Objective
The goal of this course is to gain a good understanding of the concepts discussed during the lecture and to apply the new methods on real data examples using the software "R". The topics covered in the lecture are:

Part 1: Linear regression in the high-dimensional context; Overfitting, prediction and the bias-variance tradeoff; Model selection; Ridge and Lasso regularization

Part 2: Logistic regression and regularization; Classification based on decision trees, Random Forest and AdaBoost; Multiple testing; P-value adjustment and variance shrinkage

Content
Course on Analysis of High-Dimensional Data with focus on Prediction and Feature Assessment.

Part 1: Linear regression in the high-dimensional context; Overfitting, prediction and the bias-variance tradeoff; Model selection; Ridge and Lasso regularization

Part 2: Logistic regression and regularization; Classification based on decision trees, Random Forest and AdaBoost; Multiple testing; P-value adjustment and variance shrinkage

Lecture notes
The block course is based on lecture notes (https://bookdown.org/staedler_n/highdimstats/).

Literature

Prerequisites / notice
The exercises are done exclusively with the (free, open source) software "R" (http://www.r-project.org). A final exam will also happen at the computers, using R (and your brains!).

447-6273-00L
Applied Bayesian Statistics

Abstract
Introduction to Bayesian statistics: basics of inference, computation with MCMC, linear model, logistic regression, Bayesian hierarchical models. Focus on applications and hands-on programming.

Objective
- understand the basics of Bayesian inference
- fit and understand Bayesian linear models
- introduction to hierarchical Bayesian models

Content
We will learn how to describe business/scientific problems as probabilistic models, apply Bayes rules to draw inference from data, and use the probabilistic programming language STAN to obtain samples from posterior distributions.

There will be examples of applications from various fields: insurance, meteorology, marketing, etc.

Literature
"Bayes Rules! An Introduction to Applied Bayesian Modeling", Alicia A. Johnson, Miles Q. Ott, Mine Dogucu - CRC Press 2022

447-6289-00L
Sampling Surveys

Abstract
Introduction to sampling surveys: basics of sampling designs, computation with R, sample size determination, and randomization tests.

Objective
- understand the basics of sampling designs
- fit and understand Sampling Surveys models
- introduction to hierarchical Bayesian models

Content
We will learn how to describe business/scientific problems as probabilistic models, apply Bayes rules to draw inference from data, and use the probabilistic programming language STAN to obtain samples from posterior distributions.

There will be examples of applications from various fields: insurance, meteorology, marketing, etc.
Abstract
The elements of a sample survey are explained. The most important classical sample designs (simple random sampling and stratified random sampling) with their estimation procedures and the use of auxiliary information including the Horvitz-Thompson estimator are introduced. Data preparation, non-response and its treatment, variance estimation and analysis of survey data is discussed.

Objective
Knowledge of the Elements and the process of a sample survey. Understanding of the paradigm of random samples. Knowledge of simple random sampling and stratified random sampling and capability to apply the corresponding methods. Knowledge of further methods of sampling and estimation as well as data preparation and analysis.

Lecture notes
Introduction to the statistical methods of survey research

447-6191-00L Statistical Analysis of Financial Data  
W 2 credits  1G  M. Dettling, A. F. Ruckstuhl

Abstract

Objective
Getting to know the typical properties of financial data and appropriate statistical models, incl. the corresponding functions in R.

447-6265-00L Deep Learning: A Probabilistic Approach  
W 2 credits  1G

Abstract
This course introduces probabilistic deep learning (DL), DL is used for data with complex features like images. We treat DL as probabilistic models, as a continuation of GLMs (logistic regression, ...). The models are fitted with maximum likelihood or Bayesian learning.

Objective
You will learn about different neural network architectures (e.g. fully connected and convolutional neural networks) and how to choose the appropriate NN architecture for your task at hand.

You will learn to model different outcome distributions such as Gaussians, Poissonians, or Multinomial for the task at hand.

You will get practical experiences in setting up probabilistic DL models, learn how to tune them, and learn how to control the training procedure.

Diploma Thesis

Number  Title  Type  ECTS  Hours  Lecturers
447-1990-00L Diploma Thesis  O  2 credits  4D  Supervisors

Abstract
The diploma thesis typically consists of a data analysis of data from a participant's own field of work. The thesis requires a time expenditure of about one or two weeks. Thesis work should prove the participants' capability to apply useful and modern statistical methods to address appropriate questions properly and effectively.

Objective
Thesis work should prove the participants' capability to apply useful and modern statistical methods to address appropriate questions properly and effectively.

Abstract
Subject of the class are engineering techniques for developing secure systems. We examine concepts, methods and tools, applied within the different activities of the SW development process to improve security of the system. Topics: security requirements & risk analysis, system modeling & model-based development methods, implementation-level security, and evaluation criteria for secure systems.

Objective
Security engineering is an evolving discipline that unifies two important areas: software engineering and security. Software Engineering addresses the development and application of methods for systematically developing, operating, and maintaining, complex, high-quality software. Security, on the other hand, is concerned with assuring and verifying properties of a system that relate to confidentiality, integrity, and availability of data.

The goal of this class is to survey engineering techniques for developing secure systems. We will examine concepts, methods, and tools that can be applied within the different activities of the software development process, in order to improve the security of the resulting systems.

Topics covered include

* security requirements & risk analysis,
* system modeling and model-based development methods,
* implementation-level security, and
* evaluation criteria for the development of secure systems
Security engineering is an evolving discipline that unifies two important areas: software engineering and security. Software Engineering addresses the development and application of methods for systematically developing, operating, and maintaining, complex, high-quality software. Security, on the other hand, is concerned with assuring and verifying properties of a system that relate to confidentiality, integrity, and availability of data.

The goal of this class is to survey engineering techniques for developing secure systems. We will examine concepts, methods, and tools that can be applied within the different activities of the software development process, in order to improve the security of the resulting systems.

Topics covered include

- security requirements & risk analysis,
- system modeling and model-based development methods,
- implementation-level security, and
- evaluation criteria for the development of secure systems

Modules taught:

1. Introduction
   - Introduction of Infsec group and speakers
   - Security meets SW engineering: an introduction
   - The activities of SW engineering, and where security fits in
   - Overview of this class
2. Requirements Engineering: Security Requirements and some Analysis
   - Overview: functional and non-functional requirements
   - Use cases, misuse cases, sequence diagrams
   - Safety and security
3. Modeling in the design activities
   - Structure, behavior, and data flow
   - Class diagrams, statecharts
4. Model-driven security for access control (Part I)
   - SecureUML as a language for access control
   - Combining Design Modeling Languages with SecureUML
   - Semantics, i.e., what does it all mean,
   - Generation
   - Examples and experience
5. Model-driven security (Part II)
   - Continuation of above topics
6. Security patterns (design and implementation)
7. Implementation-level security
   - Buffer overflows
   - Input checking
   - Injection attacks
8. Code scanning
   - Static code analysis basics
   - Theoretical and practical challenges
   - Analysis algorithms
   - Common bug pattern search and specification
   - Dataflow analysis
9. Testing
   - Overview and basics
   - Model-based testing
   - Testing security properties
10. Risk analysis and management
    - "Risk": assets, threats, vulnerabilities, risk
    - Risk assessment: quantitative and qualitative
    - Safeguards
    - Generic risk analysis procedure
    - The OCTAVE approach
    - Example of qualitative risk assessment
11. Threat modeling
    - Overview
    - Safety engineering basics: FMEA and FTA
    - Security impact analysis in the design phase
    - Modeling security threats: attack trees
    - Examples and experience
12. Evaluation criteria
    - NIST special papers
    - ISO/IEC 27000
    - Common criteria
    - BSI baseline protection
13. Guest lecture
    - TBA

Literature
- Further relevant books and journal/conference articles will be announced in the lecture.

Prerequisites / notice
Prerequisite: Class on Information Security

252-1411-00L Security of Wireless Networks

Abstract
This course discusses physical layer aspects of wireless communication and a wide range of security-related topics in the domain of wireless technologies. It mainly targets computer science students. Though useful, a background in signal processing or physical layer concepts is not required. A basic understanding of security (e.g. as taught in 252-0211.00L Information Security) is recommended.

Objective
After this course, students should be able to describe and classify security goals of and attacks on various wireless networks and technologies, with an emphasis on physical layer aspects.
Content
- Introduction to wireless communication
- Physical layer security schemes
- Spreading techniques and their application in jamming-resilient communication and Global Navigation Satellite Systems (GNSSs)
- Secure ranging with Ultra-Wide Band (UWB)
- Security aspects of cellular networks, WiFi, and Bluetooth Low Energy (BLE)

Competencies
Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies
- Analytical Competencies
- Problem-solving

Method-specific Competencies
- Cooperation and Teamwork
- Critical Thinking

Personal Competencies
- Fostered

268-0201-00L
Information Security Seminar and Project
W 2 credits 2S S. Matetic
Abstract
Participants of the seminar are assigned a recent topic in cyber security. They are expected to become acquainted with the assigned issue and to prepare a corresponding presentation in the context of the seminar.

Objective
Participants have understood and presented a publication or report on a present topic in information security. By attending other participants presentations students get further introduced to additional current information security related topics/incidents.

Content
Participants of the seminar are assigned a recent topic in cyber security. They are expected to become acquainted with the assigned issue and to prepare a corresponding presentation in the context of the seminar.

268-0202-00L
Contemporary Topics in Cyber Security
W 3 credits 2G S. Matetic
Abstract
This course is composed of various sub-modules related to Cyber Security taught by experts on the relevant fields.

Objective
Students are expected to see behind the curtain of current research and engineering activities related to Cyber Security. At the same time students are introduced to contemporary challenges in cyber security by renowned experts.

Content
The lectures cover contemporary aspects and challenges in Cyber Security. The goal is to present current fields of research/engineering and the latest results. By way of example, Cyber Security Policy is one of sub-modules presented by researchers of the Center for Security Studies at ETH. Besides faculty members of the computer science department, there will be guest lecturers from industry presenting Cyber Security related challenges in their field of activity.

Literature
Will be announced during the course.

DAS in Data Science

Core Courses

Number | Title                                                  | Type | ECTS | Hours | Lecturers
|-------|--------------------------------------------------------|------|------|-------|-----------
| 227-0105-00L | Introduction to Estimation and Machine Learning | W    | 6 credits | 4G   | H.-A. Loeliger

Abstract
Mathematical basics of estimation and machine learning, with a view towards applications in signal processing.

Objective
Students master the basic mathematical concepts and algorithms of estimation and machine learning.

Content
Review of probability theory; basics of statistical estimation; least squares and linear learning; Hilbert spaces; singular-value decomposition; kernel methods, neural networks, and more

Lecture notes
Lecture notes will be handed out as the course progresses.

Prerequisites / notice
solid basics in linear algebra and probability theory

Capstone Project

Number | Title       | Type | ECTS | Hours | Lecturers
|-------|-------------|------|------|-------|-----------
| 266-0100-00L | Capstone Project | O    | 8 credits | 17A  | Supervisors

Abstract
The capstone project is part of the DAS in Data Science and is an opportunity to apply the knowledge acquired in the program in an independent, real-world project.

Objective
To apply the knowledge acquired in the program in an independent, real-world project.

Content
The capstone project can be done under the supervision of the Swiss Data Science Center, or of any core or adjunct faculty of Data Science. The project has to be finished within 6 months. Deadline for a project the following semester conducted at the SDSC is mid June/mid December.

Specialisation Track

Hardware for Machine Learning

Number | Title                                                  | Type | ECTS | Hours | Lecturers
|-------|--------------------------------------------------------|------|------|-------|-----------
| 227-0155-00L | Machine Learning on Microcontrollers | W    | 6 credits | 4G   | M. Magno

Abstract
Machine Learning (ML) and artificial intelligence are pervading the digital society. Today, even low power embedded systems are incorporating ML, becoming increasingly "smart". This lecture gives an overview of ML methods and algorithms to process and extract useful near-sensor information in end-nodes of the "internet-of-things", using low-power microcontrollers/processors (ARM-Cortex-M; RISC-V)

Objective
Learn how to Process data from sensors and how to extract useful information with low power microprocessors using ML techniques. We will analyze data coming from real low-power sensors (accelerometers, microphones, ExG bio-signals, cameras...). The main objective is to study in details how Machine Learning algorithms can be adapted to the performance constraints and limited resources of low-power microcontrollers.

Content
The final goal of the course is a deep understanding of machine learning and its practical implementation on single- and multi-core microcontrollers, coupled with performance and energy efficiency analysis and optimization. The main topics of the course include:

- Sensors and sensor data acquisition with low power embedded systems
- Machine Learning: Overview of supervised and unsupervised learning and in particular supervised learning (Bayes Decision Theory, Decision Trees, Random Forests, kNN-Methods, Support Vector Machines, Convolutional Networks and Deep Learning)
- Low-power embedded systems and their architecture. Low Power microcontrollers (ARM-Cortex M) and RISC-V-based Parallel Ultra Low Power (PULP) systems-on-chip.
- Low power smart sensor system design: hardware-software tradeoffs, analysis, and optimization. Implementation and performance evaluation of ML in battery-operated embedded systems.

The laboratory exercised will show how to address concrete design problems, like motion, gesture recognition, emotion detection, image and sound classification, using real sensors data and real MCU boards.

Lecture notes
Script and exercise sheets. Books will be suggested during the course.

Prerequisites / notice
Prerequisites: C language programming. Basics of Digital Signal Processing. Basics of processor and computer architecture. Some exposure to machine learning concepts is also desirable

Image Analysis & Computer Vision

Number | Title       | Type | ECTS | Hours | Lecturers
|-------|-------------|------|------|-------|-----------
| 263-5902-00L | Computer Vision | W    | 8 credits | 3V+1U+3A | M. Pollefeys, S. Tang, F. Yu

Abstract
The goal of this course is to provide students with a good understanding of computer vision and image analysis techniques. The main concepts and techniques will be studied in depth and practical algorithms and approaches will be discussed and explored through the exercises.

Objective
The objectives of this course are:
1. To introduce the fundamental problems of computer vision.
2. To introduce the main concepts and techniques used to solve those.
3. To enable participants to implement solutions for reasonably complex problems.
4. To enable participants to make sense of the computer vision literature.
Neural Information Processing

**Number** 227-0421-00L
**Title** Learning in Deep Artificial and Biological Neuronal Networks
**Type** W
**ECTS** 4 credits
**Hours** 3G
**Lecturers** B. Grewe

**Abstract**
Deep-Learning (DL) a brain-inspired weak for of AI allows training of large artificial neuronal networks (ANNs) that, like humans, can learn real-world tasks such as recognizing objects in images. The origins of deep hierarchical learning can be traced back to early neuroscience research by Hubel and Wiesel in the 1960s, who first described the neuronal processing of visual inputs in the mammalian neocortex. Similar to their neocortical counterparts ANNs seem to learn by interpreting and structuring the data provided by the external world.

**Objective**
The main goal of this lecture is to provide a comprehensive overview into the learning principles neuronal networks as well as to introduce a diverse skill set (e.g., simulating spiking neuronal network) that is required to understand learning in large, hierarchical neuronal networks. To achieve this the lectures and exercises will merge ideas, concepts and methods from machine learning and neuroscience. These will include training basic ANNs, simulating spiking neuronal networks as well as being able to read and understand the main ideas presented in today's neuroscience papers.

**Content**
Deep-learning a brain-inspired weak form of AI allows training of large artificial neuronal networks (ANNs) that, like humans, can learn real-world tasks such as recognizing objects in images. The origins of deep hierarchical learning can be traced back to early neuroscience research by Hubel and Wiesel in the 1960s, who first described the neuronal processing of visual inputs in the mammalian neocortex. Similar to their neocortical counterparts ANNs seem to learn by interpreting and structuring the data provided by the external world.

**Prerequisites / notice**
It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts before taking this course.

---

**Neuromorphic Engineering I**

**Number** 227-1033-00L
**Title** Registration in this class requires the permission of the instructors. Class size will be limited to available lab spots. Preference is given to students that require this class as part of their major.
**Type** W
**ECTS** 6 credits
**Hours** 2V+3U
**Lecturers** T. Delbrück, G. Indiveri, S.-C. Liu, M. Payvand

**Abstract**
This course covers analog circuits with emphasis on neuromorphic engineering: MOS transistors in CMOS technology, static circuits, dynamic circuits, systems (silicon neuron, silicon retina, silicon cochlea) with an introduction to multi-chip systems. The lectures are accompanied by weekly laboratory sessions.

**Objective**
Understanding the characteristics of neuromorphic circuit elements.

**Content**
Neuromorphic circuits are inspired by the organizing principles of biological neural circuits. Their computational primitives are based on physics of semiconductor devices. Neuromorphic architectures often rely on collective computation in parallel networks. Adaptation, learning and memory are implemented locally within the individual computational elements. Transistors are often operated in weak inversion (below threshold), where they exhibit exponential I-V characteristics and low currents. These properties lead to the feasibility of high-density, low-power implementations of functions that are computationally intensive in other paradigms. Application domains of neuromorphic circuits include silicon retinas and cochleas for machine vision and auditory real-time simulations of networks of biological neurons, and the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS transistor, phototransducers), static circuits (differential pair, current mirror, transconductance amplifiers, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silicon neuron, silicon retina and cochlea) and an introduction to multi-chip systems that communicate events analogous to spikes. The lectures are accompanied by weekly laboratory sessions on the characterization of neuromorphic circuits, from elementary devices to systems.

**Literature**
S.-C. Liu et al.: Analog VLSI Circuits and Principles; various publications.

**Prerequisites / notice**
Particular: The course is highly recommended for those who intend to take the spring semester course ‘Neuromorphic Engineering II’, that teaches the conception, simulation, and physical layout of such circuits with chip design tools.

Prerequisites: Background in basics of semiconductor physics helpful, but not required.

---

**Statistics**

**Number** 227-1033-00L

**Lecturers** T. Delbrück, G. Indiveri, S.-C. Liu, M. Payvand
**401-0625-01L** Applied Analysis of Variance and Experimental Design  

**Objective**  
Participants will be able to plan and analyze efficient experiments in the fields of natural sciences. They will gain practical experience by using the software R.

**Content**  
Principles of experimental design, one-way analysis of variance, contrasts and multiple comparisons, multi-factor designs and analysis of variance, complete block designs, Latin square designs, random effects and mixed effects models, split-plot designs, incomplete block designs, two-series factorials and fractional designs, power.

**Literature**  

**Prerequisites / notice**  
The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software R, for which an introduction will be held.

**401-0649-00L** Applied Statistical Regression  

**Objective**  
The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.

**Content**  
The course starts with the basics of linear modeling, and then proceeds to parameter estimation, tests, confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, multicollinearity problems and model interpretation, as well as general modeling strategies.

**401-3612-00L** Stochastic Simulation  

**Objective**  
Stochastic simulation (also called Monte Carlo method) is the experimental analysis of a stochastic model by implementing it on a computer. Probabilities and expected values can be approximated by averaging simulated values, and the central limit theorem gives an estimate of the error of this approximation. The course shows examples of the many applications of stochastic simulation and explains different algorithms used for simulation. These algorithms are illustrated with the statistical software R.

**Content**  

**Abstract**  
This course provides an introduction to statistical Monte Carlo methods. This includes applications of simulations in various fields (Bayesian statistics, statistical mechanics, operations research, financial mathematics), algorithms for the generation of random variables (accept-reject, importance sampling), estimating the precision, variance reduction, introduction to Markov chain Monte Carlo.

**Literature**  
Fox (2008): Applied Regression Analysis and GLMs  
Draper & Smith (1998): Applied Regression Analysis  
The main reference for this course is the book "Introduction to Time Series and Forecasting", by P. J. Brockwell and R. A. Davis. This course treats modeling and analysis of time series, that is random variables which change in time. As opposed to the i.i.d. framework, the course considers classical low-dimensional models, with pointers towards today's highly complex models.

**Prerequisites / notice**

Familiarity with basic concepts of probability theory (random variables, joint and conditional distributions, laws of large numbers and central limit theorem) will be assumed.

**Data:** 26.07.2024 12:39
Objective

After this course, you should be able to
- understand the language and concepts of causal inference
- know the assumptions under which one can infer causal relations from observational and/or interventional data
- describe and apply different methods for causal structure learning
- given data and a causal structure, derive causal effects and predictions of interventional experiments

Content

The material covered in this course has a significant overlap with the material that has been covered in 401-3620-22L Student Seminar in Statistics: Causality FS2023.

Literature

Parts of this course will be based on the book “Elements of Causal Inference” (MIT Press, open access). More details will follow.

Data: 26.07.2024 12:39 Autumn Semester 2024 Page 641 of 2680
Abstract
This course presents topics in natural language processing with an emphasis on modern techniques, primarily focusing on statistical and deep learning approaches. The course provides an overview of the primary areas of research in language processing as well as a detailed exploration of the models and techniques used both in research and in commercial natural language systems.

Objective
The objective of the course is to learn the basic concepts in the statistical processing of natural languages. The course will be project-oriented so that the students can also gain hands-on experience with state-of-the-art tools and techniques.

Content
This course presents an introduction to general topics and techniques used in natural language processing today, primarily focusing on statistical approaches. The course provides an overview of the primary areas of research in language processing as well as a detailed exploration of the models and techniques used both in research and in commercial natural language systems.

Literature
Lectures will make use of textbooks such as the one by Jurafsky and Martin where appropriate, but will also make use of original research and survey papers.

263-2400-00L Reliable and Trustworthy Artificial Intelligence W 6 credits 2V+2U+1A M. Vechev
Abstract
Creating reliable, secure, robust, and fair machine learning models is a core challenge in artificial intelligence and one of fundamental importance. The goal of the course is to teach both the mathematical foundations of this new and emerging area as well as to introduce students to the latest and most exciting research in the space.

Objective
Upon completion of the course, the students should have mastered the underlying methods and be able to apply them to a variety of engineering and research problems. To facilitate deeper understanding, the course includes a group coding project where students will build a system based on the learned material.

Content
The course is split into 4 parts:

Robustness of Machine Learning

- Adversarial attacks and defenses on deep learning models.
- Certified training of deep neural networks (combining symbolic and continuous methods).

Privacy of Machine Learning

- Threat models (e.g., stealing data, poisoning, membership inference, etc.).
- Attacking federated machine learning (across vision, natural language and tabular data).
- Differential privacy for defending machine learning.
- AI Regulations and checking model compliance.

Fairness of Machine Learning

- Introduction to fairness (motivation, definitions).
- Enforcing individual fairness (for both vision and tabular data).
- Enforcing group fairness (e.g., demographic parity, equalized odds).

Robustness, Privacy and Fairness of Foundation Models

- We discuss all previous topics, as well as programmability, in the context of latest foundation models (e.g., LLMs).

Prerequisites / notice
While not a formal requirement, the course assumes familiarity with basics of machine learning (especially linear algebra, gradient descent, and neural networks as well as basic probability theory). These topics are usually covered in “Intro to ML” classes at most institutions (e.g., “Introduction to Machine Learning” at ETH).

The coding project will utilize Python and PyTorch. Thus some programming experience in Python is expected. Students without prior knowledge of PyTorch are expected to acquire it early in the course by solving exercise sheets.

Competencies
Subject-specific Competencies
Concepts and Theories assessed
Techniques and Technologies assessed
Method-specific Competencies
Analytical Competencies assessed
Problem-solving assessed
Personal Competencies
Creative Thinking assessed
Critical Thinking assessed

263-3210-00L Deep Learning W 8 credits 3V+2U+2A T. Hofmann
Abstract
Deep learning is an area within machine learning that deals with algorithms and models that automatically induce multi-level data representations.

Objective
In recent years, deep learning and deep networks have significantly improved the state-of-the-art in many application domains such as computer vision, speech recognition, and natural language processing. This class will cover the mathematical foundations of deep learning and provide insights into model design, training, and validation. The main objective is a profound understanding of why these methods work and how. There will also be a rich set of hands-on tasks and practical projects to familiarize students with this emerging technology.
Prerequisites / notice
This is an advanced level course that requires some basic background in machine learning. More importantly, students are expected to have a very solid mathematical foundation, including linear algebra, multivariate calculus, and probability. The course will make heavy use of mathematics and is not (!) meant to be an extended tutorial of how to train deep networks with tools like Torch or Tensorflow, although that may be a side benefit.

The participation in the course is subject to the following condition:
- Students must have taken the exam in Advanced Machine Learning (252-0535-00) or have acquired equivalent knowledge, see exhaustive list below:

Advanced Machine Learning
https://ml2.inf.ethz.ch/courses/aml/

Computational Intelligence Lab
http://da.inf.ethz.ch/teaching/2019/CIL/

Introduction to Machine Learning

Statistical Learning Theory
http://ml2.inf.ethz.ch/courses/slt/

Computational Statistics
https://stat.ethz.ch/lectures/ss19/comp-stats.php

Probabilistic Artificial Intelligence
https://las.inf.ethz.ch/teaching/pai-f18

Abstract
This course introduces core modeling techniques and algorithms from machine learning, optimization and control for reasoning and decision making under uncertainty, and study applications in areas such as robotics.

Objective
How can we build systems that perform well in uncertain environments? How can we develop systems that exhibit "intelligent" behavior, without prescribing explicit rules? How can we build systems that learn from experience in order to improve their performance? We will study core modeling techniques and algorithms from statistics, optimization, planning, and control and study applications in areas such as robotics. The course is designed for graduate students.

Content
Topics covered:
- Probability
- Probabilistic inference (variational inference, MCMC)
- Bayesian learning (Gaussian processes, Bayesian deep learning)
- Probabilistic planning (MDPs, POMDPs)
- Multi-armed bandits and Bayesian optimization
- Reinforcement learning

Prerequisites / notice
Solid basic knowledge in statistics, algorithms and programming.
The material covered in the course "Introduction to Machine Learning" is considered as a prerequisite.

Guarantees for Machine Learning

Does not take place this semester.

Abstract
This course is aimed at advanced master and doctorate students who want to conduct independent research on theory for modern machine learning (ML). It teaches standard methods in statistical learning theory commonly used to prove theoretical guarantees for ML algorithms. The knowledge is then applied in independent project work to understand and follow-up on recent theoretical ML results.

Objective
By the end of the semester students should be able to
- understand a good fraction of theory papers published in the typical ML venues. For this purpose, students will learn common mathematical techniques from statistical learning in the first part of the course and apply this knowledge in the project work
- critically examine recently published work in terms of relevance and find impactful (novel) research problems. This will be an integral part of the project work and involves experimental as well as theoretical questions
- outline a possible approach to prove a conjectured theorem by e.g. reducing to more solvable subproblems. This will be practiced in in-person exercises, homeworks and potentially in the final project
- effectively communicate and present the problem motivation, new insights and results to a technical audience. This will be primarily learned via the final presentation and report as well as during peer-grading of peer talks.
This course touches upon foundational methods in statistical learning theory aimed at proving theoretical guarantees for machine learning algorithms. It touches on the following topics:

- concentration bounds
- uniform convergence and empirical process theory
- regularization for non-parametric statistics (e.g. in RKHS, neural networks)
- high-dimensional learning
- computational and statistical learnability (information-theoretic, PAC, SQ)
- overparameterized models, implicit bias and regularization

The project work focuses on current theoretical ML research that aims to understand modern phenomena in machine learning, including but not limited to:

- how overparameterized models generalize (statistically) and converge (computationally)
- complexity measures and approximation theoretic properties of randomly initialized and trained neural networks
- generalization of robust learning (adversarial or distribution-shift robustness)
- private and fair learning

Prerequisites / notice

Students should have a very strong mathematical background (real analysis, probability theory, linear algebra) and solid knowledge of core concepts in machine learning taught in courses such as "Introduction to Machine Learning", "Regression", "Statistical Modelling". In addition to these prerequisites, this class requires a high degree of mathematical maturity— including abstract thinking and the ability to understand and write proofs.

Abstract

Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

Objective

Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensible to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real-world data.

Content

The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:

- Fundamentals:
- What is data?
- Bayesian Learning
- Computational learning theory

- Supervised learning:
- Ensembles: Bagging and Boosting
- Max Margin methods
- Neural networks

- Unsupervised learning:
- Dimensionality reduction techniques
- Clustering
- Mixture Models
- Non-parametric density estimation
- Learning Dynamical Systems

Prerequisites / notice

The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.

Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

252-0834-00L Information Systems for Engineers W 4 credits 2V+1U G. Fourny

Abstract

This course provides the basics of relational databases from the perspective of the user.

We will discover why tables are so incredibly powerful to express relations, learn the SQL query language, and how to make the most of it. The course also covers support for data cubes (analytics).
Objective

Do you want to be able to query your own data productively and efficiently in your future semester projects, bachelor's thesis, master thesis, or PhD thesis? Are you looking for something beyond the Python+Pandas hype? This courses teaches you how to do so as well as the dos and don'ts.

This lesson is complementary with Big Data for Engineers as they cover different time periods of database history and practices -- you can take them in any order, even though it might be more enjoyable to take this lecture first.

After visiting this course, you will be capable to:

1. Explain, in the big picture, how a relational database works and what it can do in your own words.

2. Explain the relational data model (tables, rows, attributes, primary keys, foreign keys), formally and informally, including the relational algebra operators (select, project, rename, all kinds of joins, division, cartesian product, union, intersection, etc).

3. Perform non-trivial reading SQL queries on existing relational databases, as well as insert new data, update and delete existing data.

4. Design new schemas to store data in accordance to the real world's constraints, such as relationship cardinality

5. Explain what bad design is and why it matters.

6. Adapt and improve an existing schema to make it more robust against anomalies, thanks to a very good theoretical knowledge of what is called "normal forms".

7. Understand how indices work (hash indices, B-trees), how they are implemented, and how to use them to make queries faster.

8. Access an existing relational database from a host language such as Java, using bridges such as JDBC.

9. Explain what data independence is all about and didn't age a bit since the 1970s.

10. Explain, in the big picture, how a relational database is physically implemented.

11. Know and deal with the natural syntax for relational data, CSV.

12. Explain the data cube model including slicing and dicing.

13. Store data cubes in a relational database.

14. Map cube queries to SQL.

15. Slice and dice cubes in a UI.

And of course, you will think that tables are the most wonderful object in the world.

Content

Using a relational database

1. Introduction
2. The relational model
3. Data definition with SQL
4. The relational algebra
5. Queries with SQL

Taking a relational database to the next level

6. Database design theory
7. Databases and host languages
8. Databases and host languages
9. Indices and optimization
10. Database architecture and storage

Analytics on top of a relational database

12. Data cubes

Outlook

13. Outlook

Literature

- Lecture material (slides).
- Book: "Database Systems: The Complete Book", H. Garcia-Molina, J.D. Ullman, J. Widom (It is not required to buy the book, as the library has it)

Prerequisites / notice

For non-CS/DS students only, BSc and MSc
Elementary knowledge of set theory and logics
Knowledge as well as basic experience with a programming language such as Pascal, C, C++, Java, Haskell, Python
We will cover all aspects of high-performance computing ranging from architecture through programming up to algorithms. We will start with an overview of database technologies and of the most important database design principles that lay the foundations of supporting illustrations thereof.

After visiting this lecture, you should have gained an overview and understanding of the Big Data landscape, which is the basis on which one can make informed decisions, i.e., pick and orchestrate the relevant technologies together for addressing each one of your projects efficiently and consistently.

This class is intended for the Computer Science Masters curriculum. Students must have basic knowledge in programming in C as well as computer science theory. Students should be familiar with the material covered in the ETH computer science first-year courses "Parallele Programmierung (parallel programming)" and "Algorithmen und Datenstrukturen (algorithm and data structures)" or equivalent courses.

Abstract
Design of Parallel and High-Performance Computing

Objectives
2V+2U+4A

Content
We will cover all aspects of high-performance computing ranging from architecture through programming up to algorithms. We will start with a discussion of caches and cache coherence in practical computer systems. We will dive into parallel programming concepts such as memory models, locks, and lock-free. We will cover performance modeling and parallel design principles as well as basic parallel algorithms.

Prerequisites / notice
This class is intended for the Computer Science Masters curriculum. Students must have basic knowledge in programming in C as well as computer science theory. Students should be familiar with the material covered in the ETH computer science first-year courses "Parallele Programmierung (parallel programming)" and "Algorithmen und Datenstrukturen (algorithm and data structures)" or equivalent courses.

Literature
Course textbook: https://ghislainfourny.github.io/big-data-textbook/

Papers from scientific conferences and journals. References will be given as part of the course material during the semester.

263-2800-00L Design of Parallel and High-Performance Computing W 9 credits 2V+2U+4A T. Hoefler

Abstract
Advanced topics in parallel and high-performance computing.

Objective
Understand concurrency paradigms and models from a higher perspective and acquire skills for designing, structuring and developing possibly large parallel high-performance software systems. Become able to distinguish parallelism in problem space and in machine space. Become familiar with important technical concepts and with concurrency folklore.

Content
We will cover all aspects of high-performance computing ranging from architecture through programming up to algorithms. We will start with a discussion of caches and cache coherence in practical computer systems. We will dive into parallel programming concepts such as memory models, locks, and lock-free. We will cover performance modeling and parallel design principles as well as basic parallel algorithms.

Prerequisites / notice
This class is intended for the Computer Science Masters curriculum. Students must have basic knowledge in programming in C as well as computer science theory. Students should be familiar with the material covered in the ETH computer science first-year courses "Parallele Programmierung (parallel programming)" and "Algorithmen und Datenstrukturen (algorithm and data structures)" or equivalent courses.

263-3010-00L Big Data W 10 credits 3V+2U+4A G. Fourny

Abstract
The key challenge of the information society is to turn data into information, information into knowledge, knowledge into value. This has become increasingly complex. Data comes in larger volumes, diverse shapes, from different sources. Data is more heterogeneous and less structured than forty years ago. Nevertheless, it still needs to be processed fast, with support for complex operations.

Objective
Do you want to be able to query your own data productively and efficiently in your future semester projects, master thesis, or PhD thesis? Are you looking for something beyond the Python+Pandas hype? This courses teaches you how to do as well as the dos and don'ts.

"Big Data" refers to the case when the amount of data is very large (100 GB and more), or when the data is not completely structured (or messy). The Big Data revolution has led to a completely new way to do business, e.g., develop new products and business models, but also to do science -- which is sometimes referred to as data-driven science or the "fourth paradigm":

Unfortunately, the quantity of data produced and available -- now in the Zettabyte range (that's 21 zeros) per year -- keeps growing faster than our ability to process it. Hence, new architectures and approaches for processing it are needed. Harnessing them must involve a deep understanding of data not only in the large, but also in the small.

The field of databases evolves at a fast pace. In order to be prepared, to the extent possible, to the (r)evolutions that will take place in the next few decades, the emphasis of the lecture will be on the paradigms and core design ideas, while today's technologies will serve as supporting illustrations thereof.

After visiting this lecture, you should have gained an overview and understanding of the Big Data landscape, which is the basis on which one can make informed decisions, i.e., pick and orchestrate the relevant technologies together for addressing each one of your projects efficiently and consistently.

Content
This course gives an overview of database technologies and of the most important database design principles that lay the foundations of the Big Data universe. We take the monolithic, one-machine relational stack from the 1970s, smash it down and rebuild it on top of large clusters: starting with distributed storage, and all the way up to syntax, models, validation, processing, indexing, and querying. A broad range of aspects is covered with a focus on how they fit all together in the big picture of the Big Data ecosystem.

No data is harmed during this course, however, please be psychologically prepared that our data may not always be in third normal form.

- physical storage: distributed file systems (HDFS), object storage(S3), key-value stores
- logical storage: document stores (MongoDB), column stores (HBase), graph databases (neo4j), data warehouses (ROLAP)
- data formats and syntaxes (XML, JSON, RDF, Turtle, CSV, XBRL, YAML, protocol buffers, Avro)
- data shapes and models (tables, trees, graphs, cubes)
- type systems and schemas: atomic types, structured types (arrays, maps), set-based type systems (?, *, +)
- an overview of functional, declarative programming languages across data shapes (SQL, XQuery, JSONiq, Cypher, MDX)
- the most important query paradigms (selection, projection, joining, grouping, ordering, windowing)
- paradigms for parallel processing, two-stage (MapReduce) and DAG-based (Spark)
- resource management (YARN)
- what a data center is made of and why it matters (racks, nodes, ...)
- underlying architectures (internal machinery of HDFS, HBase, Spark, neo4j)
- optimization techniques (functional and declarative paradigms, query plans, rewrites, indexing)
- applications.

Large scale analytics and machine learning are outside of the scope of this course.

**Abstract**
This four-hour course covers the basics of writing and presenting scientific work. The focus lies on the structure and the main elements of a scientific text. Formatting guidelines, citation rules, good practice of scientific writing and hints to convince the audience are part of the course.

**Objective**
- You can write scientific texts using the correct structure
- You can convincingly present scientific work
- You can differentiate the scientific style from novels and news
- You can adhere to citation rules and scientific integrity

**Content**
The block course covers the following topics:
- Structure of Scientific Texts
- Structure of Scientific Presentations
- Formatting of Scientific Elements (figures, equations, tables)
- Citation Rules and Scientific Integrity

The lecture will be given in two parts on two afternoons. Some exercises will be built into the lecture.

**Literature**
Scientific Integrity, see https://ethz.ch/en/research/ethics-and-animal-welfare/research-integrity.html

**Prerequisites / notice**
You should be writing either a bachelor/semester/master thesis or a scientific publication in the immediate future.

**227-3001-00L Diploma Thesis**
Registration for the diploma thesis requires the successful completion of 18 credits ECTS from subjects of specialization.

**Abstract**
The Diploma of Advanced Studies finishes with a 3-months diploma thesis which is directed by a professor of the department ITET. Students prove their ability to conduct independent scientific research on a specific research problem, using skills and knowledge acquired during the program. The thesis includes a written report and an oral presentation.

**Objective**

ECTS European Credit Transfer and Accumulation System

special students and auditors need special permission from the lecturers.
Regenerative Materials can be used to build high-quality envelopes and high-comfort environments. The course presents the basics of hygrothermal building physics and the state of the art in this field. It gives an overview of the type of earth- and bio-based materials that can be used and their hygrothermal properties.

### Objective
- Learn the diversity of regenerative materials used for high-quality envelopes and high-comfort environments
- Learn how to distinguish earth- and bio-based materials based on their hygrothermal properties
- Apply knowledge from previous course on high-quality envelopes built with regenerative materials
- Analyse the transient hygrothermal behaviour of an envelope

### Content
The course presents which Regenerative Materials can be used to build high-quality envelopes and high-comfort environments. It details the basics of hygrothermal building physics: Evolution of standards and models; Strength and weaknesses of Regenerative Materials; State of the art and market evolution. It also gives an overview of the diversity of earth-based materials (plasters, blocks, monolith walls), bio-based materials with fibers (straw bales, wool and rigid panels, bulk fibers) and low-impact composites (light mixes combining mineral binder to bio-sourced materials) from resource to implementation, with a synthesis of their hygrothermal properties and their impact on comfort and energy savings.

### Competencies
- Subject-specific Competencies: Concepts and Theories
- Method-specific Competencies: Analytical Competencies, Decision-making
- Social Competencies: Self-presentation and Social Influence, Sensitivity to Diversity
- Personal Competencies: Adaptability and Flexibility, Creative Thinking

---

### Elective Module Structural Specialisation

#### Objective
- Apply knowledge from previous course on high-quality envelopes built with regenerative materials
- Learn how to distinguish earth- and bio-based materials based on their hygrothermal properties
- Learn how to analyse the transient hygrothermal behaviour of an envelope
- Ensure an efficient and durable impact on participants' professional development

#### Content
Small groups are producing different prototypes during a hands-on workshop. Each group designs and realizes a prototype to explore a specific constructive technique using Regenerative Materials and considering earth- and bio-based materials that can be used and their hygrothermal properties. The prototypes are compared to reference prototypes built with conventional building techniques.

#### Competencies
- Subject-specific Competencies: Concepts and Theories
- Method-specific Competencies: Analytical Competencies, Decision-making
- Social Competencies: Self-presentation and Social Influence, Sensitivity to Diversity
- Personal Competencies: Adaptability and Flexibility, Creative Thinking

---

### Elective Module Hydrothermaal Specialisation

#### Objective
- Learn how to distinguish earth- and bio-based materials based on their hygrothermal properties
- Learn how to analyse the transient hygrothermal behaviour of an envelope
- Ensure an efficient and durable impact on participants' professional development

#### Content
Advanced knowledge on HAM modeling are presented during simulation workshops:
- Transient hygrothermal behaviour:
  - Presentation of relevant software by experts users or developers
  - Presentation of a case study by the HVAC engineers in charge of the calculation
- Digital parametric iteration:
  - Presentation of relevant software by experts users or developers
  - Presentation of a case study by the HVAC engineers in charge of the calculation
  - Calculation exercises based on this case study

#### Competencies
- Method-specific Competencies: Analytical Competencies, Decision-making
- Social Competencies: Self-presentation and Social Influence, Sensitivity to Diversity
- Personal Competencies: Adaptability and Flexibility, Creative Thinking

**136-0250-00L Project Work on Hygrothermal Validation**

*Does not take place this semester.*

- **W** 6 credits
- **3G**
- **G. Habert**

**Abstract**

Based on the content of previous courses, the participant are asked to simulate to analyze the hygrothermal behaviour of a building built with the same constructive technique as their prototype. In addition, they have to reproduce the monitoring conditions of their prototypes and compare measurements to simulation results. The result and discussion is presented in front of a jury.

**Objective**

- Apply knowledge from previous courses on a case study
- Learn how to compare measurements to simulation results
- Enhance communication skills concerning high-quality envelopes built with regenerative materials

**Abstract**
The course gives a description and summary of the field of gene technology and its pharmaceutical applications. The course focuses on important methods and technologies and their application for genomic, transcriptomic and proteomic analyses in human biology.

**Objective**
The course gives an overview of current state-of-the art and advancement in the fields of gene technology. Herein, the course focuses on genomic, transcriptomic and proteomic analysis and their uses in drug discovery and biomedical applications. The course is structured into lectures and practical examples drawn from the research field. Upon completion, the students are familiar and know current state-of-the art of methods and applications, but are also able to classify, contrast and apply different strategies and methods within the field of gene technology. The course is suited for advanced undergraduate and early graduate students in pharmaceutical sciences or related fields.

**Content**

I) Genomics and transcriptomics

Methods and Techniques:
- Recombinant DNA technology
- Next generation sequencing methods, sequencing of genomes
- CRISPR technology

Application to human biology:
- Functional genomics/transcriptomics
- Principles of cancer, genetic diseases
- Therapies: cell-based therapies/gene therapies/DNA and RNA vaccination

II) Proteomics

Methods and Techniques:
- Protein cloning and expression
- The antibody molecule
- Measurement and determination of biomolecular interactions
- Protein characterization and engineering
- Modifications and radioactive labelling

Application to human biology:
- Protein therapeutics
- Proteomic approaches for identification of novel disease-related targets and biomarkers

III) Drug discovery: Protein-based libraries

*Immune repertoire mining*
*Display and selection technologies*
1. antibody phage display
2. other polypeptide display technologies
3. small-molecules display: DNA-encoded chemical libraries

**Lecture notes**
The lecture series follows the above-described content, and the students are provided with the lecture slides and additional notes. The additional notes are needed for the in-depth study of the individual topics, and to set the frame and content of the in-class group work of the chosen examples.

**Competencies**

**Subject-specific Competencies**
- Concepts and Theories assessed

**Abstract**
Principles and technologies for the manufacturing of dosage forms and drug delivery systems. Knowledge of pharm. excipients, materials, containers, liquid and semi-solid dosage forms, their production, function, quality and application. Comprehension of molecular interactions in solution and colloidal systems. Comprehension of interfacial phenomena and stabilization measures in dosage forms.

**Objective**
Knowledge of the most important pharmaceutical excipients, materials, containers, liquid and semi-solid dosage forms, their production, function, quality, stability and application. Comprehension of the molecular interactions in solution and colloidal systems. Comprehension of interfacial phenomena and stabilization measures in disperse dosage forms.

**Content**
Introduction and overview of important fundamentals, principles and technologies for the development and manufacturing of dosage forms and drug delivery systems. Overview of the most important pharmaceutical excipients and polymers, their structure, properties and processing; importance of materials properties for containers. Pharmaceutical solvents, fundamentals of solubility and solubilization of drugs. Water treatment processes, sterilization techniques and quality requirements of pharmaceutical water. Parenteral dosage forms and liquid ophthalmics. Surfactants, micelle formation and colloidal systems. Liquid suspensions and emulsions. Stabilization measures in dosage forms.

#### Abstract
The course places the basic pharmaceutical knowledge acquired to date, particularly in pharmacology, in an applied therapeutic context and encourages interdisciplinary thinking in pharmacy. Weekly practical sessions present and discuss common pharmaceutical case studies that may arise in a pharmacist's daily work.

#### Objective
Students
- are able to independently analyse, present, explain, and discuss simple case studies from pharmacy practice based on their basic knowledge of pharmacy, particularly pharmacology.
- deepen their knowledge of therapeutic classes, drugs, and treatment guidelines.
- are able to analyse the pharmacological profiles of selected drugs in a therapeutic context (e.g., with regard to adverse drug reactions and interactions).
- are able to compare different drugs and derive therapy-relevant characteristics.

#### Content
Pharmaceutical case studies from different therapeutic fields comprehend following subject areas:
- Indication
- Dosage Form
- Adverse Drug Reactions
- Interactions
- Contraindications

#### Lecture notes
Is made available via Moodle.

#### Literature
As stated in the cases.

#### Prerequisites / notice
The lecture Pharmacology and Toxicology I (535-0521-00L) must be attended in parallel to or prior to this course.

The course takes place weekly. For each lesson, group work is prepared and submitted in advance, presented by one group at a time, and discussed in plenary.

#### Abstract
This two-semester lecture course provides a detailed understanding of the fundamentals of drug action and the therapeutic use of important classes of drugs. The lectures are intended for students of pharmaceutical sciences.

#### Objective
The lectures provide a comprehensive survey of pharmacology and toxicology. Special emphasis is placed on the interrelationship between pharmacological, pathophysiological and clinical aspects.

#### Content
Topics include disease-relevant macroscopic, microscopic, pathobiochemical and functional disturbances of specific organs and organ systems. The lectures integrate disease pathology with mechanisms of drug action, usage, metabolism, pharmacokinetics, side effects, toxicity, contraindications and dosage of relevant drugs. Basic principles of clinical pharmacology and pharmacotherapy will be covered.
Lecture notes
A script is provided for each lecture. Scripts define important course contents but do not replace the lectures.

Abstract
This course provides basic clinical and pharmaceutical knowledge and skills for triage, diagnostics and therapy support of the most common diseases.

Objective
- Students
  - know and understand the pathomechanisms and clinical lead and warning symptoms (red flags) of the most common diseases in the fields listed below.
  - can use this knowledge to triage patients: i.e. analyse simple symptoms and diseases, make a tentative diagnosis and recommend suitable medication or further examinations or measures.
  - know the therapeutic guidelines, classes of active ingredients and selected, practice-relevant drugs (including indications and the most frequent and important adverse drug reactions, interactions and contraindications).

Pharmaceutical Immunology II & Therapeutic Proteins

Students know and understand:

Subject-specific Competencies

Communication

In this course, various topics related to the development, GMP production and application of therapeutic proteins will be discussed.

Method-specific Competencies

Analytical Competencies

Decision-making

Problem-solving

Social Competencies

Communication

Customer Orientation

Leadership and Responsibility

Self-presentation and Social Influence

Personal Competencies

Adaptability and Flexibility

Critical Thinking

Self-awareness and Self-reflection

The course advances basic knowledge in pharmacology and toxicology. Special emphasis is placed on the interrelationship between pharmacological, pathophysiological and clinical aspects of drug therapy in the fields of infectious diseases, osteoporosis, autoimmune diseases and cancer. The course also provides an overview of the fields of medical virology, toxicology, and pharmacogenomics with a special focus on the role of genetic polymorphisms in drug response and adverse effects.

Objectives:

The course consists of two parts. The first part focuses on pharmacogenomics of drug metabolism and basic concepts of toxicology.

The second part focuses on topics related to the development and application of therapeutic proteins, such as protein expression, protein engineering, reducing immunogenicity, and GMP production of therapeutic proteins. Furthermore, selected examples of approved therapeutic proteins will be discussed.

The course is divided into three parts. The first part provides an overview of drugs used for the pharmacotherapy of infectious diseases, osteoporosis, autoimmune diseases and cancer. The second part gives an overview of the field of medical virology, and the third part is focused on pharmacogenomics of drug metabolism and basic concepts of toxicology.

The course consists of two parts:

- Basic mechanisms and regulation of the immune response
- The pathogenic mechanisms of the most important immune-mediated disorders
- The concepts of vaccination and cancer immunotherapy
- The most frequently used expression systems for the production of therapeutic proteins
- The use of protein engineering tools for modifying different features of therapeutic proteins
- The mechanism of action of selected therapeutic proteins and their application
- Basic concepts in the GMP production of therapeutic proteins

Abstract:

In this course, various topics related to the development, GMP production and application of therapeutic proteins will be discussed. Furthermore, students will expand their training in pharmaceutical immunology and will be introduced to the basic concepts of pharmaceutical product quality management.

Lecture notes:

Handouts to the lectures will be available for downloading under http://www.pharma.ethz.ch/scripts/index

Prerequisites:

- Either 535-0830-00L Pharmaceutical Immunology I or 551-0317-00L Immunology I must have been taken.

Abstract:

The course is divided into three parts. The first part provides an overview of drugs used for the pharmacotherapy of infectious diseases, osteoporosis, autoimmune diseases and cancer. The second part gives an overview of the field of medical virology, and the third part is focused on pharmacogenomics of drug metabolism and basic concepts of toxicology.

Objective:

The course advances basic knowledge in pharmacology and toxicology. Special emphasis is placed on the interrelationship between pharmacological, pathophysiological and clinical aspects of drug therapy in the fields of infectious diseases, osteoporosis, autoimmune diseases and cancer. The course also provides an overview of the fields of medical virology, toxicology, and pharmacogenomics with a special focus on the role of genetic polymorphisms in drug response and adverse effects.

Content:

Topics include the pharmacology and pharmacotherapy of infectious diseases, osteoporosis, autoimmune diseases and cancer. Medical virology covers important viral infections and their pharmacotherapy with different classes of antiviral drugs. In the field of pharmacogenomics, the course is focused on examples of genetic variability of drug metabolism and drug responses, and the relevance of pharmacogenomics and toxicogenomics for clinical drug development. Finally, basic concepts of toxicology are introduced.

Lecture notes:

A script is provided for each lecture. The scripts define important and exam-relevant contents of the lectures. Scripts do not replace the lectures.

535-0050-00L Pharmacoepidemiology and Drug Safety

Abstract
Introduction to the principles, methods and applications of pharmacoepidemiology and drug safety. Drug safety in the pharmaceutical industry and regulatory authorities, but also for hospital and office pharmacists. Another focus is the evaluation and interpretation of pharmacoepidemiological drug safety studies in the medical literature and the evaluation of benefits vs. risks.

Objective
Objectives:
- To familiarize participants with the principle methods and applications of pharmacoepidemiology and drug safety that is relevant for industry, regulatory affairs, but also for clinical pharmacists in hospitals and office pharmacies.
- Perform independently a causality assessment of suspected adverse drug reactions in patients
- Study designs and biostatistics used for the quantitative evaluation of drug safety
- Setup of programs that can effectively reduce medication errors and improve drug safety in clinical practice, particularly in hospitals

Content
- Historical landmarks of drug safety
- Pharmacovigilance and causality assessment
- Drug safety in premarketing clinical trials
- Descriptive, cohort and case-control drug safety study designs; Data analysis and control of confounding
- Pharmacoepidemiology and regulatory decision making in drug safety; Risk management plans (RMPs)
- Medication errors, clinical pharmacology / clinical pharmacy
- Clinical Decision Support Systems, Interventional Pharmacoepidemiology
- Pharmacoepidemiological databases, ‘Big Data’
- Interactive discussion of many real-life examples for each topic

Lecture notes
This course will be a combination of formal lectures, group discussions and self-directed studies. Course material will be taught through seminars, case studies in small groups.

Literature
Recommended literature
- Rothman: Introduction to Epidemiology
- Strom, Kimmel, Hennessy: Textbook of Pharmacoepidemiology
- Gigerenzer: Risk Savvy - How to Make Good Decisions

535-0137-00L Clinical Chemistry II

Abstract
Detailed knowledge on particular aspects of clinical chemistry and medical laboratory diagnostics concerning quality control, point-of-care analytics, analytics of kidney stones, tumor markers, diagnosis of HIV and hepatitis, pharmacogenetics, thyroid function, bone metabolism and laboratory diagnosis of hypertension.

Objective
Detailed knowledge on the implementation and interpretation of clinical laboratory diagnostic tests. Competence to interpret selected tests.

Content
Internal and external quality control, point-of-care analytics, analytics of kidney stones, use of tumor marker determinations, diagnosis of HIV and hepatitis, pharmacogenetics, thyroid function, bone metabolism and laboratory diagnosis of hypertension.

Lecture notes
Documentation will be available before the lectures electronically.

Literature
- Jürgen Hallbach , Klinische Chemie und Hämatologie für den Einstieg, Thieme Verlag

- Walter Guder, Das Laborbuch für Klinik und Praxis, Elsevier Verlag
- Lothar Thomas , Labor und Diagnose, TH Books
- William Marshall, Clinical Chemistry, Mosby Ltd.
- Alan H.B. Wu, Tietz, Clinical Guide to Laboratory Tests, Saunders

Prerequisites / notice
Requirement: basic knowledge in clinical chemistry and laboratory diagnostics

Second Series of Courses (Group B)
Abstract
This course provides basic clinical and pharmaceutical knowledge and skills for triage, diagnostics and therapy support of the most common diseases.

Objective
Students
- know and understand the pathomechanisms and clinical lead and warning symptoms (red flags) of the most common diseases in the fields listed below.
- can use this knowledge to triage patients: i.e. analyse simple symptoms and diseases, make a tentative diagnosis and recommend suitable medication or further examinations or measures.
- know the therapeutic guidelines, classes of active ingredients and selected, practice-relevant drugs (including indications and the most frequent and important adverse drug reactions, interactions and contraindications).

Content

- Psychiatrie
- Rheumatologie
- Urologie

Lecture notes
Provided via moodle.

Literature
As stated in the lecture notes.

Prerequisites / notice
Please note that the assessment of this course must be passed (not compensable).

The performance assessment of the course takes place in two written on campus online partial examinations. The overall grade results from the average of the grades of both partial examinations. If the overall grade is unsatisfactory, both partial examinations must be repeated.

The courses Pharmacology and Toxicology I and II and Pathobiology provide indispensable basics which students must master at the beginning of the semester in order to successfully complete the course.

Competencies
Subject-specific Competencies
- Concepts and Theories assessed
- Techniques and Technologies assessed

Method-specific Competencies

Clinical Chemistry II
Abstract
Detailed knowledge on particular aspects of clinical chemistry and medical laboratory diagnostics concerning quality control, point-of-care analytics, analytics of kidney stones, tumor markers, diagnosis of HIV and hepatitis, pharmacogenetics, thyroid function, bone metabolism and laboratory diagnosis of hypertension.

Objective
Detailed knowledge on the implementation and interpretation of clinical laboratory diagnostic tests. Competence to interprete selected tests.

Content
Internal and external quality control, point-of-care analytics, analytics of kidney stones, use of tumor marker determinations, diagnosis of HIV and hepatitis, pharmacogenetics, thyroid function, bone metabolism and laboratory diagnosis of hypertension.

Third Series of Courses (Group A and B)
Practical Pharmacy I and Compensatory Courses

Therapeutic Skills I
Abstract
This course provides basic knowledge relevant to pharmacy and its application in nephrology, phytotherapy, complementary medicine, wound care and pharmaceutical care.
Objective

Students know and understand the therapeutic concepts of the mentioned topics and their application in practice.

(for detailed learning objectives see the guidelines)

Content

• complementary medicine
• phytotherapy
• wound care
• pharmaceutical care 2
• nephrology

535-5522-00L Therapeutic Skills II ■ O 3 credits 3G A. Küng Krähenmann, F. Bortoli, E. Trauffer, I. S. Vogel Kahmann

Abstract

This course provides basic clinical and pharmaceutical knowledge and its application for triage, diagnostics and therapy support for the most common diseases in geriatrics, women's health, oncology, paediatrics and neurology (epilepsy). In addition, the role of nutrition in special life situations and in selected health disorders is taught.

Objective

- know and understand the pathomechanisms and the clinical lead and warning symptoms (red flags) of the most common diseases in the fields listed.
- can triage patients by applying this knowledge: i.e. analyse simple symptoms and disease patterns, make a tentative diagnosis and recommend suitable medication or further examinations or measures.
- know the therapeutic guidelines, drug classes and selected, practice-relevant drugs (including indications and the most frequent and important dosages, adverse drug reactions, interactions and contraindications).

(For detailed learning objectives, see the guideline)

535-5524-00L Clinical Trainings ■ O 2 credits 3G A. Gutzeit, D. Stämpfli, P. Wiedemeier

Abstract

Basic training on and around patients with practical confrontation. The path of acute patients from patient presentation, through triage and diagnostics to therapy.

Objective

Students will be able to understand the medical-clinical way of thinking for the diagnosis and treatment of acute patients. They complete the change of perspective from the molecular mechanism of action of drugs to the treatment of patients in all its complexity. Using real patient examples, students acquire exemplary knowledge in diagnostics and triage as well as therapy selection and therapy support. They consolidate their understanding of the importance of pharmaceutical care before and after hospitalization.

Content

535-5502-00L Pharmaceutical Manufacturing in Small Quantities (Compounding) ■ O 3 credits 5G P. G. Tiefenböck, A. Romagna

Autumn Semester 2024
Abstract
Pharmaceutical Manufacturing relevant for the community pharmacy considering the "GMP-Regeln in kleinen Mengen" of the Pharmacopoeia: The preparation of extemporaneous products covering the most common forms under consideration of their Risks and Quality Assurance.

Objective
The students are able to produce pharmaceutical relevant drug Systems without further assistance, lege artis, applying the right techniques and material. The production and packaging has to follow GMP rules and tailored for the patients need. The quality control and correct documentation have to be followed. The students know the most relevant specifications, concentration and dosing ranges of common APIs and excipients. The students are familiar with the relevant literature (Pharmaceutical and legal basis) regarding the Pharmaceutical manufacturing relevant for the community pharmacies

Content
Vermittlung der wichtigsten Kenntnisse, Arbeitsschritte und -techniken im Bereich der Arzneimittelherstellung in kleinen Mengen (Formula) mit Fokus auf der Herstellung, Qualitätssicherung und Risikobeurteilung einschliesslich der patientenspezifischen Abgabepraxis.

In den Praktika: Anhand praxis-relevanter Beispiele wird die Aufgabenplanung, die Fertigung einschliesslich die korrekte Verwendung der Gerätschaften, die Inprozesskontrolle, die Verpackung und die Qualitätssicherung diverser Rezepte und Arzneiformen geübt. Unter Einbezug risikoadaptierter Massnahmen erfolgt die Qualitätssicherung. -kontrolle und Einhaltung von Hygienerichtlinien genümm der geltenden Arzneibüchern. Die Studierenden vertiefen damit ihre GMP-relevanten Kenntnisse und Fertigkeiten

535-5503-00L Institutional Pharmacy ▪ O 2 credits 3G

Abstract
Organisation of institutional environments (emergency hospitals), with special focus on the medication process and institutional pharmaceutical care (continuum of care).

Objective
Students understand the concept of continuum of care and its practical implementation. They know the medication process within an institutional environment. They are able to find the necessary information and deal with problems in connection with pharmaceuticals, to evaluate them and to communicate and documentate their findings adequately. They know how a hospital is organised (procedures, possible problems), responsibilities of the different members of the staff and, most importantly, what the function of a hospital pharmacy is.

Content
Principals of the organisation of institutional environments (emergency hospitals), with special focus on medication processes and institutional pharmaceutical care (circulation of medication, continuum of care). Hygiene regulations, medical products, applications, drug formularies, patient files, SOAP notes, kardex study. Participation at interdisciplinary visits, internal trainings and doctors' reports as well as visitation of the emergency room. Drug interaction, generic substitution, quality management and pharmacovigilance.

535-5526-00L Injection Techniques and Vaccinations ▪ O 2 credits 3G I. S. Vogel Kahmann, C. Hallin Winter

Abstract
Die Studierenden erlernen die praktische Durchführung von subkutanen (s.c.) und intramuskulären (i.m.) Injektionen. Sie wissen, wie in Notfallsituationen vorzugehen ist. Die Besonderheiten von häufig eingesetzten parenteral zu verabreichenden Medikamenten, insbesondere von Impfungen, sind bekannt.

Objective
Die Studierenden erwerben das theoretische Wissen und die praktischen Fähigkeiten, welche für die s.c. und i.m. Verabreichung von Medikamenten erforderlich sind. Sie sind fähig, Risikopatienten zu identifizieren und sind geschult, bei Notfällen (z.B. Anaphylaxie) korrekt zu handeln.

Content
Die Studierenden kennen die in der Schweiz zur Verfügung stehenden Impfungen, den schweizerischen Impfplan und sind vertraut mit der Anwendung von elektronischen Hilfsmitteln bei Feststellung der Impfdauer. Die Studierenden kennen die rechtlichen Grundlagen und regulatorischen Aspekte bezüglich Impfen in der Apotheke und die Beratung mit Fokus auf der Herstellung, Qualitätssicherung und Risikobeurteilung einschliesslich der patientenspezifischen Abgabepraxis.

Literature
Wird im Skript angegeben.

Prerequisites / notice

Lecture notes
Wird auf mystudies veröffentlicht.

**Abstract**

Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

**Objective**

Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real world data.

**Content**

The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:

- **Fundamentals:**
  - What is data?
  - Bayesian Learning
  - Computational learning theory
- **Supervised learning:**
  - Ensembles: Bagging and Boosting
  - Max Margin methods
  - Neural networks
- **Unsupervised learning:**
  - Dimensionality reduction techniques
  - Clustering
  - Mixture Models
  - Non-parametric density estimation
  - Learning Dynamical Systems

**Lecture notes**

No lecture notes, but slides will be made available on the course webpage.

**Literature**

**Prerequisites / notice**

The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments. Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

**Abstract**

This course introduces core modeling techniques and algorithms from machine learning, optimization and control for reasoning and decision making under uncertainty, and study applications in areas such as robotics.

**Objective**

How can we build systems that perform well in uncertain environments? How can we develop systems that exhibit "intelligent" behavior, without prescribing explicit rules? How can we build systems that learn from experience in order to improve their performance? We will study core modeling techniques and algorithms from statistics, optimization, planning, and control and study applications in areas such as robotics. The course is designed for graduate students.

**Content**

Topics covered:

- Probability
- Probabilistic inference (variational inference, MCMC)
- Bayesian learning (Gaussian processes, Bayesian deep learning)
- Probabilistic planning (MDPs, POMDPs)
- Multi-armed bandits and Bayesian optimization
- Reinforcement learning

**Prerequisites / notice**

Solid basic knowledge in statistics, algorithms and programming.

The material covered in the course "Introduction to Machine Learning" is considered as a prerequisite.

Mathematics of Data Science

Abstract
Mostly self-contained, but fast-paced, introductory masters level course on various theoretical aspects of algorithms that aim to extract information from data.

Objective
Introduction to various mathematical aspects of Data Science.

Content
These topics lie in overlaps of Mathematics with: Computer Science, Electrical Engineering, Statistics, and/or Operations Research. Most lectures will feature Mathematical Open Problems. The main mathematical tools used will be Probability and Linear Algebra, and a basic familiarity with these subjects is required. There will also be some (although knowledge of these tools is not assumed) Graph Theory, Representation Theory, Applied Harmonic Analysis, among others. The topics treated will include Dimension reduction, Manifold learning, Sparse recovery, Random Matrices, Approximation Algorithms, Community detection in graphs, and several others.

Lecture notes

Prerequisites / notice
The main mathematical tools used will be Probability, Linear Algebra (and real analysis), and a working knowledge of these subjects is required. In addition, to these prerequisites, this class requires a certain degree of mathematical maturity—including abstract thinking and the ability to understand and write proofs.

We encourage students who are interested in mathematical data science to take both this course and "227-0434-10L Mathematics of Information" taught by Prof. H. Bölcskei. The two courses are designed to be complementary.

Abstract
The key challenge of the information society is to turn data into information, information into knowledge, knowledge into value. This has become increasingly complex. Data comes in larger volumes, diverse shapes, from different sources. Data is more heterogeneous and less structured than forty years ago. Nevertheless, it still needs to be processed fast, with support for complex operations.

Objective
Do you want to be able to query your own data productively and efficiently in your future semester projects, master thesis, or PhD thesis? Are you looking for something beyond the Python+Pandas hype? This courses teaches you how to do so as well as the dos and don'ts.

"Big Data" refers to the case when the amount of data is very large (100 GB and more), or when the data is not completely structured (or messy). The Big Data revolution has led to a completely new way to do business, e.g., develop new products and business models, but also to do science -- which is sometimes referred to as data-driven science or the "fourth paradigm".

Unfortunately, the quantity of data produced and available -- now in the Zettabyte range (that's 21 zeros) per year -- keeps growing faster than our ability to process it. Hence, new architectures and approaches for processing it are needed. Harnessing them must involve a deep understanding of data not only in the large, but also in the small.

The field of databases evolves at a fast pace. In order to be prepared, to the extent possible, to the (r)evolutions that will take place in the next few decades, the emphasis of the lecture will be on the paradigms and core design ideas, while today's technologies will serve as supporting illustrations thereof.

After visiting this lecture, you should have gained an overview and understanding of the Big Data landscape, which is the basis on which one can make informed decisions, i.e., pick and orchestrate the relevant technologies together for addressing each one of your projects efficiently and consistently.
This course gives an overview of database technologies and of the most important database design principles that lay the foundations of the Big Data universe. We take the monolithic, one-machine relational stack from the 1970s, smash it down and rebuild it on top of large clusters: starting with distributed storage, and all the way up to syntax, models, validation, processing, indexing, and querying. A broad range of aspects is covered with a focus on how they fit all together in the big picture of the Big Data ecosystem.

No data is harmed during this course, however, please be psychologically prepared that our data may not always be in third normal form.

- physical storage: distributed file systems (HDFS), object storage (S3), key-value stores
- logical storage: document stores (MongoDB), column stores (HBase), graph databases (neo4j), data warehouses (ROLAP)
- data formats and syntaxes (XML, JSON, RDF, Turtle, CSV, XBRL, YAML, protocol buffers, Avro)
- data shapes and models (tables, trees, graphs, cubes)
- type systems and schemas: atomic types, structured types (arrays, maps), set-based type systems (?, *, +)
- an overview of functional, declarative programming languages across data shapes (SQL, XQuery, JSONiq, Cypher, MDX)
- the most important query paradigms (selection, projection, joining, grouping, ordering, windowing)
- paradigms for parallel processing, two-stage (MapReduce) and DAG-based (Spark)
- resource management (YARN)
- what a data center is made of and why it matters (racks, nodes, …)
- underlying architectures (internal machinery of HDFS, HBase, Spark, neo4j)
- optimization techniques (functional and declarative paradigms, query plans, rewrites, indexing)
- applications.

Large scale analytics and machine learning are outside of the scope of this course.

Course textbook: https://ghislainfourny.github.io/big-data-textbook/

Papers from scientific conferences and journals. References will be given as part of the course material during the semester.

The lecture is hybrid, meaning you can attend with us in the lecture hall, or on Zoom, or watch the recordings on YouTube later. Exercise sessions are in presence.

This course, in the autumn semester, is only intended for:
- Computer Science students
- Data Science students
- CBB students with a Computer Science background

Mobility students in CS are also welcome and encouraged to attend. If you experience any issue while registering, please contact the study administration and you will be gladly added.

For students of all other departments interested in this fascinating topic: I would love to have you visit my lectures as well! So there is a series of two courses specially designed for you:
- "Information Systems for Engineers" (SQL, relational databases): this Fall
- "Big Data for Engineers" (similar to Big Data, but adapted for non Computer Scientists): Spring 2023

There is no hard dependency, so you can either them in any order, but it may be more enjoyable to start with Information Systems for Engineers.

Students who successfully completed Big Data for Engineers are not allowed to enrol in the course Big Data.

263-3845-00L Data Management Systems W 8 credits 3V+1U+3A G. Alonso

Abstract
The course will cover the implementation aspects of data management systems using relational database engines as a starting point to cover the basic concepts of efficient data processing and then expanding those concepts to modern implementations in data centers and the cloud.

Objective
The goal of the course is to convey the fundamental aspects of efficient data management from a systems implementation perspective: storage, access, organization, indexing, consistency, concurrency, transactions, distribution, query compilation vs interpretation, data representations, etc. Using conventional relational engines as a starting point, the course will aim at providing an in-depth coverage of the latest technologies used in data centers and the cloud to implement large scale data processing in various forms.

Content
The course will first cover fundamental concepts in data management: storage, locality, query optimization, declarative interfaces, concurrency control and recovery, buffer managers, management of the memory hierarchy, presenting them in a system independent manner. The course will place an special emphasis on understanding these basic principles as they are key to understanding what problems existing systems try to address. It will then proceed to explore their implementation in modern relational engines supporting SQL to then expand the range of systems used in the cloud: key value stores, geo-replication, query as a service, serverless, large scale analytics engines, etc.

Literature
The main source of information for the course will be articles and research papers describing the architecture of the systems discussed. The list of papers will be provided at the beginning of the course.
The course requires to have completed the Data Modeling and Data Bases course at the Bachelor level as it assumes knowledge of databases and SQL.

### Competencies
- **Subject-specific Competencies**
- **Concepts and Theories**
- **Techniques and Technologies**

#### Prerequisites / notice
- **263-4500-00L Advanced Algorithms**
  - **W 9 credits 3V+2U+3A J. Lengler, B. Häupler, M. Probst**
  - **Abstract**
    - This is a graduate-level course on algorithm design (and analysis). It covers a range of topics and techniques in approximation algorithms, sketching and streaming algorithms, and online algorithms.
  - **Objective**
    - This course familiarizes the students with some of the main tools and techniques in modern subareas of algorithm design.
  - **Content**
    - The lectures will cover modern topics in algorithm design and analysis, including the following: graph sparsifications while preserving cuts or distances, various approximation algorithms techniques and concepts, metric embeddings and probabilistic tree embeddings, online algorithms, multiplicative weight updates, streaming algorithms, sketching algorithms.
  - **Lecture notes**
    - https://people.inf.ethz.ch/~aroeyskoe/AA23

#### Prerequisites / notice
- **This course is designed for masters and doctoral students and it especially targets those interested in theoretical computer science, but it should also be accessible to last-year bachelor students.**

#### Competencies
- **Subject-specific Competencies**
- **Concepts and Theories**
- **Method-specific Competencies**
- **Analytical Competencies**
- **Decision-making**
- **Problem-solving**

</table>
The course is split into 4 parts:

Robustness of Machine Learning
--------------------------------------------
- Adversarial attacks and defenses on deep learning models.
- Certified training of deep neural networks (combining symbolic and continuous methods).

Privacy of Machine Learning
--------------------------------------------
- Threat models (e.g., stealing data, poisoning, membership inference, etc.).
- Attacking federated machine learning (across vision, natural language and tabular data).
- Differential privacy for defending machine learning.
- AI Regulations and checking model compliance.

Fairness of Machine Learning
--------------------------------------------
- Introduction to fairness (motivation, definitions).
- Enforcing individual fairness (for both vision and tabular data).
- Enforcing group fairness (e.g., demographic parity, equalized odds).

Robustness, Privacy and Fairness of Foundation Models
---------------------------------------------------------------------------
- We discuss all previous topics, as well as programmability, in the context of latest foundation models (e.g., LLMs).

Prerequisites / notice
While not a formal requirement, the course assumes familiarity with basics of machine learning (especially linear algebra, gradient descent, and neural networks as well as basic probability theory). These topics are usually covered in "Intro to ML" classes at most institutions (e.g., "Introduction to Machine Learning" at ETH).

The coding project will utilize Python and PyTorch. Thus some programming experience in Python is expected. Students without prior knowledge of PyTorch are expected to acquire it early in the course by solving exercise sheets.

Abstract
Deep learning is an area within machine learning that deals with algorithms and models that automatically induce multi-level data representations.

Objective
In recent years, deep learning and deep networks have significantly improved the state-of-the-art in many application domains such as computer vision, speech recognition, and natural language processing. This class will cover the mathematical foundations of deep learning and provide insights into model design, training, and validation. The main objective is a profound understanding of why these methods work and how. There will also be a rich set of hands-on tasks and practical projects to familiarize students with this emerging technology.

The participation in the course is subject to the following condition:
- Students must have taken the exam in Advanced Machine Learning (252-0535-00) or have acquired equivalent knowledge, see exhaustive list below:

Advanced Machine Learning

Artificial Intelligence in Education
Abstract
Artificial Intelligence (AI) methods have shown to have a profound impact in educational technologies, where the great variety of tasks and data types enable us to get benefit of AI techniques in many different ways. We will review relevant methods and applications of AI in various educational technologies, and work on problem sets and projects to solve problems in education with the help of AI.

The course will be centered around exploring methodological and system-focused perspectives on designing AI systems for education and analyzing educational data using AI methods. Students will be expected to a) engage in presentations and active in-class and asynchronous discussion, and b) work on problem-sets exemplifying the use of educational data mining techniques.

Artificial Intelligence in Education
W 3 credits 1V+0.5U M. Sachan

263-5005-00L
Autumn Semester 2024
Many established deep learning methods require dense input data with a well-defined structure (e.g., an image, a sequence of words). Graph Neural Networks (GNNs) and general representation learning on graphs have recently experienced a surge in popularity because it addresses the challenge to effectively learn representations over said structures. In this course, we aim to understand the fundamental principles of deep (representation) learning on graphs, the similarities and differences to other concepts in deep learning, as well as the unique challenges from a practical point of view. Finally, we provide an overview of recent applications of graph neural networks.

### Content

**Objective**

- Many established deep learning methods require dense input data with a well-defined structure (e.g., an image, a sequence of word embeddings). However, many practical applications deal with sparsely connected and complex data structures, such as molecules, knowledge graphs or social networks. Graph Neural Networks (GNNs) and general representation learning on graphs have recently experienced a surge in popularity because it addresses the challenge to effectively learn representations over said structures.

- It has been shown that GNNs can learn very complex representations of graphs.

- The project work focuses on current theoretical ML research that aims to understand modern phenomena in machine learning, including but not limited to:
  - overparameterized models generalize (statistically) and converge (computationally)
  - complexity measures and approximation theoretic properties of randomly initialized and trained neural networks
  - generalization of robust learning (adversarial or distribution-shift robustness)
  - private and fair learning

- The project work is important for understanding the fundamental principles of deep (representation) learning on graphs, the similarities and differences to other concepts in deep learning, as well as the unique challenges from a practical point of view.

- Finally, we provide an overview of recent applications of graph neural networks.

### Prerequisites

- Students should have a very strong mathematical background (real analysis, probability theory, linear algebra) and solid knowledge of core concepts in machine learning taught in courses such as "Introduction to Machine Learning", "Regression", and "Statistical Modelling". For this purpose, students will learn common mathematical techniques from statistical learning in the first part of the course and apply this knowledge in the project work.

- The knowledge is then applied in independent project work to understand and follow-up on recent theoretical ML results.

### Competencies

- Students have usually taken a subset of Fundamentals of Mathematical Statistics, Probabilistic AI, Neural Network Theory, Optimization for Data Science, Advanced ML, Statistical Learning Theory, Probability Theory (D-MATH).

- Students should be able to:
  - understand a good fraction of theory papers published in the typical ML venues. For this purpose, students will learn common mathematical techniques from statistical learning in the first part of the course and apply this knowledge in the project work.
  - critically examine recently published work in terms of relevance and find impactful (novel) research problems.
  - outline a possible approach to prove a conjectured theorem by e.g., reducing to more solvable subproblems.

- The project work will focus on current theoretical ML research that aims to understand modern phenomena in machine learning, including but not limited to:

- how overparameterized models generalize (statistically) and converge (computationally)

- complexity measures and approximation theoretic properties of randomly initialized and trained neural networks

- generalization of robust learning (adversarial or distribution-shift robustness)

- private and fair learning

- The project work involves experimental as well as theoretical questions.
Objective
Over the last few years, the parallel development of machine learning methods and molecular profiling technologies for human cells, such as
sequencing, created an extremely powerful tool to get insights into the cellular mechanisms in healthy and diseased contexts. In this
course, we will discuss the state-of-the-art machine learning methodology solving or attempting to solve common problems in human
omics. At the end of the course, you will be familiar with (1) classical and advanced machine learning architectures used in genomics,
(2) bioinformatics analysis of human genomic and transcriptomic data, and (3) data types used in this field.

Content
- Short introduction to major concepts of molecular biology: DNA, genes, genome, central dogma, transcription factors, epigenetic code,
- DNA methylation, signaling pathways
- Prediction of transcription factor binding sites, open chromatin, histone marks, promoters, nucleosome positioning (convolutional neural
  networks, position weight matrices)
- Prediction of variant effects and gene expression (hidden Markov models, topic models)
- Deconvolution of mixed signal (NMF, ICA)
- DNA, RNA and protein folding (RNN, LSTM, transformers)
- Data imputation for single-cell RNA-seq data, clustering and annotation (diffusion and methods on graphs)
- Batch correction (autoencoders, optimal transport)
- Survival analysis (Cox proportional hazard model, regularization penalties, multi-omics, multi-tasking)

Prerequisites / notice
Introduction to Machine Learning, Statistics/Probability, Programming in Python, Unix Command Line

Competencies
Subject-specific Competencies
Concepts and Theories fostered
- Techniques and Technologies fostered
- Communication assessed

Social Competencies

6 credits
3V+2P

Script and exercise sheets. Books will be suggested during the course.

227-0155-00L Computer Vision on Microcontrollers

Objective
The goal of this course is to provide students with a good understanding of computer vision and image analysis techniques. The main
concepts and techniques will be studied in depth and practical algorithms and approaches will be discussed and explored through the
exercises.

Abstract
The objectives of this course are:
1. To introduce the fundamental problems of computer vision.
2. To introduce the main concepts and techniques used to solve those.
3. To enable participants to implement solutions for reasonably complex problems.
4. To enable participants to make sense of the computer vision literature.

Content
Camera models and calibration, invariant features, Multiple-view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape
matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition

Prerequisites / notice
It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts
before taking this course.

Lecture notes
Script and exercise sheets.

exposure to machine learning concepts is also desirable

227-0417-00L Information Theory I

Objective
This course covers the basic concepts of information theory and of communication theory. Topics covered include the entropy rate of a
source, mutual information, typical sequences, the asymptotic equi-partition property, Huffman coding, channel capacity, the channel
coding theorem, the source-channel separation theorem, and feedback capacity.

Content
The fundamentals of Information Theory including Shannon's source coding and channel coding theorems

Literature
T.M. Cover and J. Thomas, Elements of Information Theory (second edition)

227-0560-00L Computer Vision and Artificial Intelligence for Autonomous Cars

Objective
This course introduces the core computer vision techniques and algorithms that autonomous cars use to perceive the semantics and
geometry of their driving environment, localize themselves in it, and predict its dynamic evolution. Emphasis is placed on techniques
tailored for real-world settings, such as multi-modal fusion, domain-adaptive and outlier-aware architectures, and multi-agent methods.
Objective
Students will learn about the fundamentals of autonomous cars and of the computer vision models and methods these cars use to analyze their environment and navigate themselves in it. Students will be presented with state-of-the-art representations and algorithms for semantic, geometric and temporal visual reasoning in automated driving and will gain hands-on experience in developing computer vision algorithms and architectures for solving such tasks.

After completing this course, students will be able to:
1. understand the operating principles of visual sensors in autonomous cars
2. differentiate between the core architectural paradigms and components of modern visual perception models and describe their logic and the role of their parameters
3. systematically categorize the main visual tasks related to automated driving and understand the primary representations and algorithms which are used for solving them
4. critically analyze and evaluate current research in the area of computer vision for autonomous cars
5. practically reproduce state-of-the-art computer vision methods in automated driving
6. independently develop new models for visual perception

Content
The content of the lectures consists in the following topics:

1. Fundamentals
   (a) Fundamentals of autonomous cars and their visual sensors
   (b) Fundamental computer vision architectures and algorithms for autonomous cars

2. Semantic perception
   (a) Semantic segmentation
   (b) Instance segmentation and panoptic segmentation

3. Geometric perception and localization
   (a) Depth estimation
   (b) 3D reconstruction
   (c) Visual localization
   (d) Unimodal visual/lidar 3D object detection

4. Robust perception: multi-modal, multi-domain and multi-agent methods
   (a) Multi-modal 2D and 3D object detection
   (b) Visual grounding and verbo-visual fusion
   (c) Domain-adaptive and outlier-aware semantic perception
   (d) Vehicle-to-vehicle communication for perception

5. Temporal perception
   (a) Multiple object tracking
   (b) Motion prediction

The practical projects involve implementing complex computer vision architectures and algorithms and applying them to real-world, multi-modal driving datasets. In particular, students will develop models and algorithms for:
1. Semantic segmentation and depth estimation
2. Sensor calibration for multi-modal 3D driving datasets
3. 3D object detection using lidar

Lecture notes
Lecture slides are provided in PDF format.

Prerequisites / notice
Students are expected to have a solid basic knowledge of linear algebra, multivariate calculus, and probability theory, and a basic background in computer vision and machine learning. All practical projects will require solid background in programming and will be based on Python and libraries of it such as PyTorch.

Competencies
Subject-specific Competencies
Concepts and Theories assessed
Techniques and Technologies assessed

Method-specific Competencies
Analytical Competencies assessed
Media and Digital Technologies fostered

227-0689-00L System Identification W 4 credits 2V+1U R. Smith
Abstract
Theory and techniques for the identification of dynamic models from experimentally obtained system input-output data.
Objective
To provide a series of practical techniques for the development of dynamical models from experimental data, with the emphasis being on the development of models suitable for feedback control design purposes. To provide sufficient theory to enable the practitioner to understand the trade-offs between model accuracy, data quality and data quantity.
Content
Introduction to modeling: Black-box and grey-box models; Parametric and non-parametric models; ARX, ARMAX (etc.) models.
Predictive, open-loop, black-box identification methods. Time and frequency domain methods. Subspace identification methods.
Optimal experimental design, Cramer-Rao bounds, input signal design.
Parametric identification methods. On-line and batch approaches.
Closed-loop identification strategies. Trade-off between controller performance and information available for identification.

Literature
Additional papers will be available via the course Moodle.
Prerequisites / notice
Control systems (227-0216-00L) or equivalent.

401-0625-01L Applied Analysis of Variance and Experimental Design W 5 credits 2V+1U L. Meier
Combinatorics is a fundamental mathematical discipline as well as an essential component of many mathematical areas, and its study has experienced an impressive growth in recent years. While in the past many of the basic combinatorial results were obtained mainly by ingenuity and detailed reasoning, the modern theory has grown out of this early stage and often relies on deep, well-developed tools. One of the main general techniques that played a crucial role in the development of Combinatorics was the application of algebraic methods. The most fruitful such tool is the dimension argument. Roughly speaking, the method can be described as follows. In order to bound the cardinality of a discrete structure A one maps its elements to vectors in a linear space, and shows that the set A is mapped to linearly independent vectors. It then follows that the cardinality of A is bounded by the dimension of the corresponding linear space. This simple idea is surprisingly powerful and has many famous applications.

This course provides a gentle introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to other areas. The topics covered in the class will include (but are not limited to):

- Basic dimension arguments.
- Spaces of polynomials and tensor product methods.
- Eigenvalues of graphs and their application, the Combinatorial Nullstellensatz and the Chevalley-Warning theorem.
- Applications such as: Solution of Kakeya problem in finite fields, counterexample to Borsuk's conjecture, chromatic number of the unit distance graph of Euclidean space, explicit constructions of Ramsey graphs and many others.

The course website can be found at https://moodle-app2.let.ethz.ch/course/view.php?id=15757

Lecture notes
Lectures will be on the blackboard only, but there will be a set of typeset lecture notes which follow the class closely.

Prerequisites / notice
Students are expected to have a mathematical background and should be able to write rigorous proofs.
This course provides an introduction to statistical Monte Carlo methods. This includes applications of simulations in various fields (Bayesian statistics, statistical mechanics, operations research, financial mathematics), algorithms for the generation of random variables (accept-reject, importance sampling), estimating the precision, variance reduction, introduction to Markov chain Monte Carlo.

Stochastic Simulation

401-3612-00L

This course provides an introduction to statistical Monte Carlo methods. This includes applications of simulations in various fields (Bayesian statistics, statistical mechanics, operations research, financial mathematics), algorithms for the generation of random variables (accept-reject, importance sampling), estimating the precision, variance reduction, introduction to Markov chain Monte Carlo.

Statistical Modelling

401-3622-00L

In regression, the dependency of a random response variable on other variables is examined. We consider the theory of linear regression with one or more covariates, high-dimensional linear models, nonlinear models and generalized linear models, robust methods, model choice and nonparametric models. Several numerical examples will illustrate the theory.

Fundamentals of Mathematical Statistics

401-3621-00L

In this course we study the basics of theoretical statistics. The course includes methods for designing estimators, confidence intervals and tests, and various ways to evaluate the accuracy of estimators, confidence intervals and tests. We consider optimality criteria such as admissibility and minimaxity, as well as Bayesian criteria. We will also present the asymptotic point of view.

Time Series Analysis

401-4623-00L

The course offers an introduction into analyzing time series, that is observations which occur in time. The material will cover Stationary Models, ARMA processes, Spectral Analysis, Forecasting, Nonstationary Models, ARIMA Models and an introduction to GARCH models.
This course treats modeling and analysis of time series, that is random variables which change in time. As opposed to the i.i.d. framework, the main feature exhibited by time series is the dependence between successive observations.

The key topics which will be covered as:

Stationarity
Autocorrelation
Trend estimation
Elimination of seasonality
Spectral analysis, spectral densities
Forecasting

Covers the fundamental concepts of Dynamic Programming & Optimal Control.

The main reference for this course is the book "Introduction to Time Series and Forecasting", by P. J. Brockwell and R. A. Davis

<td>Over the duration of the semester, the course will cover three main topics. Each of the topics will consist of 70% lecture content and 30% practical content. Thereby, the practical implementation of the concepts presented in the lecture forms an integral part of the course. 1) Algorithms and data structures for the efficient compression of and search in texts and graphs. Motivated through applications in compressive genomics, the course will cover succinct indexing schemes for strings, trees and general graphs, compression schemes for binary matrices as well as the efficient representation of haplotypes and genomic variants. 2) Stochastic data structures and algorithms for approximate representation of strings and graphs as well as sets in general. This includes winnowing schemes and minimizers, sketching techniques, (minimal perfect) hashing, approximate membership query data structures, and approximate counting. 3) Data structures supporting encryption and data privacy. As an extension to data structures discussed in the earlier topics, this will include secure indexing using homomorphic encryption as well as design for secure storage and distribution of data.</td>

<td>Abstract</td>
<td>The course reviews solutions provided by machine learning to the most challenging questions in human genomics. Over the last few years, the parallel development of machine learning methods and molecular profiling technologies for human cells, such as sequencing, created an extremely powerful tool to get insights into the cellular mechanisms in healthy and diseased contexts. In this course, we will discuss the state-of-the-art machine learning methodology solving or attempting to solve common problems in human genomics. At the end of the course, you will be familiar with (1) classical and advanced machine learning architectures used in genomics, (2) bioinformatics analysis of human genomic and transcriptomic data, and (3) data types used in this field.</td>

Data: 26.07.2024 12:39 Autumn Semester 2024 Page 672 of 2680
This course discusses physical layer aspects of wireless communication and a wide range of security-related topics in the domain of wireless technologies, with an emphasis on physical layer concepts is not required. A basic understanding of security (e.g. as taught in 252-0211.00L Information Security) is recommended.

After this course, students should be able to describe and classify security goals of and attacks on various wireless networks and technologies, with an emphasis on physical layer aspects.

- Introduction to wireless communication
- Physical layer security schemes
- Spreading techniques and their application in jamming-resilient communication and Global Navigation Satellite Systems (GNSSs)
- Secure ranging with Ultra-Wide Band (UWB)
- Security aspects of cellular networks, WiFi, and Bluetooth Low Energy (BLE)

227-0575-00L Advanced Topics in Communication Networks

W 6 credits 2v+2u

L. Vanbeever

Abstract This course covers advanced topics and technologies in computer networks, both theoretically and practically. It is offered each Fall.

Repetition for credit is possible with the consent of the instructor.

Objective The goals of this course is to provide students with a deeper understanding of the existing and upcoming Internet technologies used in large-scale computer networks such as Internet Service Providers (e.g., Swisscom or Deutsche Telekom), Content Delivery Networks (e.g., Netflix) and Data Centers (e.g., Google). Besides covering the fundamentals, the course will be "hands-on" and will enable students to play with the technologies in realistic network environments.
In 2023, the course will cover advanced topics in communication networks such as:

- Advanced Internet routing (convergence, optimality, scalability, flexibility);
- Network programmability (OpenFlow, P4);
- Traffic engineering / Load Balancing;
- Network verification and synthesis;
- Network measurements;
- Network security;
- Upcoming transport protocols and technologies;
- Adaptive video streaming; and
- Network sustainability.

The course will be composed of lectures and practical exercises (some of which including labs).

Network Security W 8 credits 2V+2U+3A P. De Vaere, S. Frei, K. Paterson, A. Perrig

Abstract
Some of today’s most damaging attacks on computer systems involve exploitation of network infrastructure, either as the target of attack or as a vehicle to attack end systems.

Objective
- Students are familiar with fundamental network-security concepts.
- Students can assess current threats that Internet services and networked devices face, and can evaluate appropriate countermeasures.
- Students can identify and assess vulnerabilities in software systems and network protocols.
- Students have an in-depth understanding of a range of important state-of-the-art security technologies.
- Students can implement network-security protocols based on cryptographic libraries.

Content
The course will cover topics spanning four broad themes with a focus on the first two themes:

1. network defense mechanisms such as public-key infrastructures, TLS, VPNs, anonymous-communication systems, secure routing protocols, secure DNS systems, and network intrusion-detection systems;
2. network attacks such as hijacking, spoofing, denial-of-service (DoS), and distributed denial-of-service (DDoS) attacks;
3. analysis and inference topics such as traffic monitoring and network forensics; and
4. new technologies related to next-generation networks.

In addition, several guest lectures will provide in-depth insights into specific current real-world network-security topics.

Prerequisites / notice
This lecture is intended for students with an interest in securing Internet communication services and network devices. Students are assumed to have knowledge in networking as taught in a communication networks lecture like 252-0064-00L or 227-0120-00L. Basic knowledge of information security or applied cryptography as taught in 252-0211-00L or 263-4660-00L is beneficial, but an overview of the most important cryptographic primitives will be provided at the beginning of the course.

The course will involve several graded course projects. Students are expected to be familiar with a general-purpose or network programming language such as C/C++, Go, Python, or Rust.

Mathematical Foundations for Finance W 4 credits 3V+2U D. Possamaï

Abstract
First introduction to main modelling ideas and mathematical tools from mathematical finance

Objective
This course gives a first introduction to the main modelling ideas and mathematical tools from mathematical finance. It mainly aims at non-mathematicians who need an introduction to the main tools from stochastics used in mathematical finance. However, mathematicians who want to learn some basic modelling ideas and concepts for quantitative finance (before continuing with a more advanced course) may also find this of interest. The main emphasis will be on ideas, but important results will be given with (sometimes partial) proofs.
Content
Topics to be covered include
- financial market models in finite discrete time
- absence of arbitrage and martingale measures
- valuation and hedging in complete markets
- basics about Brownian motion
- stochastic integration
- stochastic calculus: Itô's formula, Girsanov transformation, Itô's representation theorem
- Black-Scholes formula

Lecture notes
See information on course homepage

Prerequisites / notice
Prerequisites: Results and facts from probability theory as in the book "Probability Essentials" by J. Jacod and P. Protter will be used freely. Especially participants without a direct mathematics background are strongly advised to familiarise themselves with those tools before (or very quickly during) the course. (A possible alternative to the above English textbook are the (German) lecture notes for the standard course "Wahrscheinlichkeitstheorie".)

For those who are not sure about their background, we suggest to look at the exercises in Chapters 8, 9, 22-25, 28 of the Jacod/Protter book. If these pose problems, you will have a hard time during the course. So be prepared.

Competencies

Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: fostered

Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: fostered
- Problem-solving: assessed

Personal Competencies
- Adaptability and Flexibility: fostered
- Creative Thinking: fostered
- Critical Thinking: fostered
- Integrity and Work Ethics: fostered

Abstract
The classical life insurance model is presented together with the important insurance types (insurance on one and two lives, term and endowment insurance and disability). Besides that the most important terms such as mathematical reserves are introduced and calculated. The profit and loss account and the balance sheet of a life insurance company is explained and illustrated.

Competencies

Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: fostered

Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: fostered
- Problem-solving: assessed

Personal Competencies
- Adaptability and Flexibility: fostered
- Creative Thinking: fostered
- Critical Thinking: fostered
- Integrity and Work Ethics: fostered

Abstract
The lecture aims at providing a basis in non-life insurance mathematics which forms a core subject of actuarial science. It discusses collective risk modeling, individual claim size modeling, approximations for compound distributions, ruin theory, premium calculation principles, tariffication with generalized linear models and neural networks, credibility theory, claims reserving and solvency.

Objective
The student is familiar with the basics in non-life insurance mathematics and statistics. This includes the basic mathematical models for insurance liability modeling, pricing concepts, stochastic claims reserving models and ruin and solvency considerations.

Content
The following topics are treated:
- Collective Risk Modeling
- Claim Counts Models
- Individual Claim Size Modeling
- Censoring and Truncation
- Approximations for Compound Distributions
- Ruin Theory in Discrete Time
- Premium Calculation Principles
- Tariffication
- Generalized Linear Models and Neural Networks
- Bayesian Models and Credibility Theory
- Claims Reserving
- Solvency Considerations

Lecture notes
M.V. Wüthrich, Non-Life Insurance: Mathematics & Statistics
http://ssrn.com/abstract=2319328

Literature
M.V. Wüthrich, M. Merz. Statistical Foundations of Actuarial Learning and its Applications

Prerequisites / notice
The exams ONLY take place during the official ETH examination period (no semester end exams), and only in person exams (i.e. no remote exams).

This course will be held in English and counts towards the diploma of "Aktuar SAV". For the latter, see details under www.actuaries.ch.

Competencies

Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: assessed
- Media and Digital Technologies: fostered
- Problem-solving: assessed
- Project Management: fostered

Abstract
Comprehension and application of advanced portfolio theory

Objective
Comprehension and application of advanced portfolio theory

Data: 26.07.2024 12:39 Autumn Semester 2024 Page 675 of 2680
The theoretical part of the lecture consists of the topics listed below.

- Standard Markowitz Model and Extensions MV Optimization, MV with Liabilities and CAPM.
- The Crux with MV
  Resampling, regression, Black-Litterman, Bayesian, shrinkage, constrained and robust optimization.
- Downside and Coherent Risk Measures
  Definition of risk measures, MV optimization under VaR and ES constraints.
- Risk Budgeting
  Equal risk contribution, most diversified portfolio and other concentration indices
- Regime Switching and Asset Allocation
  An introduction to regime switching models and its intuition.
- Strategic Asset Allocation
  Introducing a continuous-time framework, solving the HJB equation and the classical Merton problem.

401-4889-00L Mathematical Finance

Abstract
Advanced course on mathematical finance:
- semimartingales and general stochastic integration
- absence of arbitrage and martingale measures
- fundamental theorem of asset pricing
- option pricing and hedging
- hedging duality
- optimal investment problems
- additional topics

Objective
Advanced course on mathematical finance, presupposing good knowledge in probability theory and stochastic calculus (for continuous processes).

Content
This is an advanced course on mathematical finance for students with a good background in probability. We want to give an overview of main concepts, questions and approaches, and we do this mostly in continuous-time models.

Topics include
- semimartingales and general stochastic integration
- absence of arbitrage and martingale measures
- fundamental theorem of asset pricing
- option pricing and hedging
- hedging duality
- optimal investment problems
- and probably others

Lecture notes
The course is based on different parts from different books as well as on original research literature.

Literature
While there are many textbooks on mathematical finance, none of them is ideal to cover the contents of this course. References include the following books:

Prerequisites / notice
Prerequisites are the standard courses
- Probability Theory (for which lecture notes are available)
- Brownian Motion and Stochastic Calculus (for which lecture notes are available)
Those students who already attended "Introduction to Mathematical Finance" will have an advantage in terms of ideas and concepts.

This course is the second of a sequence of two courses on mathematical finance. The first course "Introduction to Mathematical Finance" (MF I), 401-3888-00, focuses on models in finite discrete time. It is advisable that the course MF I is taken prior to the present course, MF II.

For an overview of courses offered in the area of mathematical finance, see https://www.math.ethz.ch/imsf/education/education-in-stochastic-finance/overview-of-courses.html.

Competencies

Subject-specific Competencies

103-0227-00L Application Development in Cartography

Abstract
This course introduces concepts and techniques in 3D cartography and web application development. Practical experience will be gained in a map project.

Objective
Students acquire general knowledge about the foundations and best practices in 3D cartography and modern web application development. They learn to plan, design and implement an interactive and animated 3D web map.
Content
- 3D cartography
- Web mapping
- Data processing
- Animations and interactions
- Map and UI design
- Web application development
- Programming (JavaScript).

Lecture notes
Handouts of the lectures and exercise documents are available on Moodle.

Prerequisites / notice
Cartography II or Introduction to Web Cartography Part 1+2 (MOOC) or similar knowledge in mapping with JavaScript.

Competencies
Subject-specific Competencies
Techniques and Technologies assessed

Method-specific Competencies
Analytical Competencies assessed
Media and Digital Technologies assessed
Problem-solving assessed

103-0778-00L GIS and Geoinformatics Lab
W 4 credits 4P P. Kiefer

Abstract
Independent study project with novel geoinformation technologies. Information on past projects: http://gis-lab.ethz.ch/

Objective
This lab focuses on presenting spatial, temporal, and open data in tangible ways. Students will learn how to work with novel geoinformation technologies such as virtual/mixed reality or mobile applications. They will engage in teamwork, application design, programming and presenting their results.

Competencies
Subject-specific Competencies
Techniques and Technologies assessed

851-0760-00L Building a Robot Judge: Data Science for Decision-Making
W 3 credits 2V E. Ash

Does not take place this semester.
This course explores the automation of decisions in the legal system. We delve into the machine learning tools needed to predict judge decision-making and assess whether techniques in model explanation and algorithmic fairness are sufficient to address the potential risks.

Objective

This course introduces students to the data science tools that may provide the first building blocks for a robot judge. While building a working robot judge is beyond us in the future, some of the building blocks are already here, and we will put them to work.

Content

Data science technologies have the potential to improve legal decisions by making them more efficient and consistent. On the other hand, there are serious risks that automated systems could replicate or amplify existing legal biases and rigidities. Given the stakes, these technologies force us to think carefully about notions of fairness and justice and how they should be applied.

The focus is on legal prediction problems. Given the evidence and briefs in this case, how will a judge probably decide? How likely is a criminal defendant to commit another crime? How much additional revenue will this new tax law collect? Students will investigate and implement the relevant machine learning tools for making these types of predictions, including regression, classification, and deep neural networks models.

We then use these predictions to better understand the operation of the legal system. Under what conditions do judges tend to make errors? Against which types of defendants do parole boards exhibit bias? Which jurisdictions have the most tax loopholes? Students will be introduced to emerging applied research in this vein. In a semester paper, students (individually or in groups) will conceive and implement an applied data-science research project.

851-0735-09L Workshop & Lecture Series on the Law & Economics of Innovation W 2 credits 2S S. Bechtold

Abstract

This series is a joint project by ETH Zurich and the Universities of St. Gallen and Zurich. It provides an overview of interdisciplinary research on intellectual property, innovation, antitrust, privacy & technology policy. Scholars from law, economics, management and related fields present their current research. All speakers are internationally well-known experts from Europe, the U.S. & beyond.

Objective

After the workshop and lecture series, participants should be acquainted with interdisciplinary approaches towards intellectual property, innovation, antitrust, privacy and technology policy research. They should also have an overview of current topics of international research in these areas.

Content

The workshop and lecture series will present a mix of speakers who represent the wide range of current social science research methods applied to intellectual property, innovation, antitrust, privacy and technology policy issues. In particular, theoretical models, empirical and experimental research as well as legal research methods will be represented.

Lecture notes

Papers discussed in the workshop and lecture series are posted in advance on the course web page.

227-0421-00L Learning in Deep Artificial and Biological Neuronal Networks W 4 credits 3G B. Grewe

Abstract

Deep-Learning (DL) a brain-inspired weak form of AI allows training of large artificial neuronal networks (ANNs) that, like humans, can learn real-world tasks such as recognizing objects in images. However, DL is far from being understood and investigating learning in biological neuronal networks might serve again as a compelling inspiration to think differently about state-of-the-art ANN training methods.

Objective

The main goal of this lecture is to provide a comprehensive overview into the learning principles neuronal networks as well as to introduce a diverse skill set (e.g. simulating a spiking neuronal network) that is required to understand learning in large, hierarchical neuronal networks. To achieve this the lectures and exercises will merge ideas, concepts and methods from machine learning and neuroscience. These will include training basic ANNs, simulating spiking neuronal networks as well as being able to read and understand the main ideas presented in today's neuroscience papers.

After this course students will be able to:
- read and understand the main ideas and methods that are presented in today's neuroscience papers
- explain the basic ideas and concepts of plasticity in the mammalian brain
- implement alternative ANN learning algorithms to 'error backpropagation' in order to train deep neuronal networks.
- use a diverse set of ANN regularization methods to improve learning
- simulate spiking neuronal networks that learn simple (e.g. digit classification) tasks in a supervised manner.

Content

Deep-learning a brain-inspired weak form of AI allows training of large artificial neuronal networks (ANNs) that, like humans, can learn real-world tasks such as recognizing objects in images. The origins of deep hierarchical learning can be traced back to early neuroscience research by Hubel and Wiesel in the 1960s, who first described the neuronal processing of visual inputs in the mammalian neocortex. Similar to their neocortical counterparts ANNs seem to learn by interpreting and structuring the data provided by the external world. However, while on specific tasks such as playing (video) games deep ANNs outperform humans (Minh et al., 2015, Silver et al., 2018), ANNs are still not performing on par when it comes to recognizing actions in movie data and their ability to act as generalizable problem solvers is still far behind of what the human brain seems to achieve effortlessly. Moreover, biological neuronal networks can learn far more effectively with fewer training examples, they achieve a much higher performance in recognizing complex patterns in time series data (e.g. recognizing actions in movies), they dynamically adapt to new tasks without losing performance and they achieve unmatched performance to detect and integrate out-of-domain data examples (data they have not been trained with). In other words, many of the big challenges and unknowns that have emerged in the field of deep learning over the last years are already mastered exceptionally well by biological neuronal networks in our brain. On the other hand, many facets of typical ANN design and training algorithms seem biologically implausible, such as the non-local weight updates, discrete processing of time, and scalar communication between neurons. Recent evidence suggests that learning in biological systems is the result of the complex interplay of diverse error feedback signaling processes acting at multiple scales, ranging from single synapses to entire networks.

Lecture notes

The lecture slides will be provided as a PDF after each lecture.
Systems Neuroscience (University of Zurich)

No enrollment at this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: INI415

Mind the enrolment deadlines at UZH: https://www.uzh.ch/cmsss/en/studies/application/deadline.html

Abstract
This course focuses on basic aspects of central nervous system physiology, including perception, motor control and cognitive functions.

Objective
To understand the basic concepts underlying perceptual, motor and cognitive functions.

Content
Main emphasis sensory systems, with complements on motor and cognitive functions.

Lecture notes
None

Literature
"Principles of Neural Science", Kandel, Schwartz, and Jessel

Prerequisites / notice
none

Neuromorphic Engineering I

Registration in this class requires the permission of the instructors. Class size will be limited to available lab spots. Preference is given to students that require this class as part of their major.

Information for UZH students:
Enrollment to this course unit only possible at ETH. No enrollment to module INI404 at UZH.
Please mind the ETH enrolment deadlines for UZH students: https://ethz.ch/en/studies/non-degree-courses/special-students/university-of-zurich.html

Abstract
This course covers analog circuits with emphasis on neuromorphic engineering: MOS transistors in CMOS technology, static circuits, dynamic circuits, systems (silicon neuron, silicon retina, silicon cochlea) with an introduction to multi-chip systems. The lectures are accompanied by weekly laboratory sessions.

Objective
Understanding of the characteristics of neuromorphic circuit elements.

Content
Neuromorphic circuits are inspired by the organizing principles of biological neural circuits. Their computational primitives are based on the physics of semiconductor devices. Neuromorphic architectures often rely on collective computation in parallel networks. Adaptation, learning and memory are implemented locally within the individual computational elements. Transistors are often operated in weak inversion (below threshold), where they exhibit exponential I-V characteristics and low currents. These properties lead to the feasibility of high-density, low-power implementations of functions that are computationally intensive in other paradigms. Application domains of neuromorphic circuits include silicon retinas and cochleas for machine vision and audition, real-time emulations of networks of biological neurons, and the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS transistor, phototransducers), static circuits (differential pair, current mirror, transconductance amplifiers, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silicon neuron, silicon retina and cochlea) and an introduction to multi-chip systems that communicate events analogous to spikes. The lectures are accompanied by weekly laboratory sessions on the characterization of neuromorphic circuits, from elementary devices to systems.

Literature
S.-C. Liu et al.: Analog VLSI Circuits and Principles; various publications.

Prerequisites / notice
Particular: The course is highly recommended for those who intend to take the spring semester course ‘Neuromorphic Engineering II’, that teaches the conception, simulation, and physical layout of such circuits with chip design tools.

Prerequisites: Background in basics of semiconductor physics helpful, but not required.
Network Analysis

Particularly suitable for students of D-INFK, D-MATH.

Abstract
Network science is a distinct domain of data science that is characterized by a specific kind of data being studied. While areas of application range from archaeology to zoology, we concern ourselves with social networks for the most part. Emphasis is placed on descriptive and analytic approaches rather than theorizing, modeling, or data collection.

Objective
Students will be able to identify and categorize research problems that call for network approaches while appreciating differences across application domains and contexts. They will master a suite of mathematical and computational tools, and know how to design or adapt suitable methods for analysis. In particular, they will be able to evaluate such methods in terms of appropriateness and efficiency.

Content
The following topics will be covered with an emphasis on structural and computational approaches and frequent reference to their suitability with respect to substantive theory:

* Empirical Research and Network Data
* Macro and Micro Structure
* Centrality
* Roles
* Cohesion
* Influence

Lecture notes
Slides and lecture notes are distributed via the associated course moodle.

Network Modeling

Particularly suitable for students of D-MATH, D-INFK and in the MSc Data Science

Students are required to have basic knowledge in inferential statistics, such as regression models.

Abstract
Social Network Science is a distinct domain of data science that focuses on relational systems. Various models have been proposed to describe structures and dynamics of networks, including statistical and mathematical methods. In this course, the emphasis is placed on the statistical analysis of (social) systems and their connection to social theories and data sources.

Objective
The following topics will be covered:

- Introduction to network models and their applications
- Stylized models:
  * uniform random graph models
  * small world models
  * preferential attachment models
- Models for testing hypotheses while controlling for the network structure:
  * Quadratic assignment procedure regression (QAP regression)
- Models for testing hypotheses on the network structure:
  * Models for one single observation of a network: exponential random graph models (ERGMs)
  * Models for panel network data: stochastic actor-oriented models (SAOMs)

The application of these models is illustrated through examples and practical sessions involving the analysis of network data using the software R.
The following topics will be covered:

- Introduction to network models and their applications

Slides and lecture notes are distributed via the associated course Moodle.

**851-0586-03L Applied Network Science: Sports Networks**

W 3 credits 2S U. Brandes

**Abstract**

We study applications of network science methods, this semester in the domain of sports.

**Objective**

Network science as a paradigm is entering domains from engineering to the humanities but application is tricky. By examples from recent research on sports analytics, students learn to appreciate that, and how, context matters. They will be able to assess the appropriateness of approaches for substantive research problems, and especially when and why quantitative approaches are or are not suitable.

**Competencies**

- Subject-specific Competencies
  - Concepts and Theories
  - Techniques and Technologies
- Method-specific Competencies
  - Analytical Competencies
  - Project Management
- Social Competencies
  - Communication
  - Cooperation and Teamwork
- Personal Competencies
  - Adaptability and Flexibility
  - Creative Thinking
  - Critical Thinking

**Content**

- Knowledge and understanding of statistical methods and algorithms commonly used in transport planning
- Comprehend the reasoning and capabilities of transport models
- Ability to independently develop a transport model able to solve / answer planning problem
- Getting familiar with cost-benefit analysis as a decision-making supporting tool

The application of these models is illustrated through examples and practical sessions involving the analysis of network data using the software R.

### Lecture notes

Moodle platform (enrollment needed)

**810-0417-00L Transport Planning Methods**

W 6 credits 4G E. Heinen

**Abstract**

The course provides the necessary knowledge to develop models supporting and also evaluating the solution of given planning problems. The course is composed of a lecture part, providing the theoretical knowledge, and an applied part in which students develop their own models in order to evaluate a transport project/ policy by means of cost-benefit analysis.

**Objective**

- Knowledge and understanding of statistical methods and algorithms commonly used in transport planning
- Comprehend the reasoning and capabilities of transport models
- Ability to independently develop a transport model able to solve / answer planning problem
- Getting familiar with cost-benefit analysis as a decision-making supporting tool

The course provides the necessary knowledge to develop models supporting the solution of given planning problems and also introduces cost-benefit analysis as a decision-making tool. Examples of such planning problems are the estimation of traffic volumes, prediction of estimated utilization of new public transport lines, and evaluation of effects (e.g. change in emissions of a city) triggered by building new infrastructure and changes to operational regulations.

To cope with that, the problem is divided into sub-problems, which are solved using various statistical models (e.g. regression, discrete choice analysis) and algorithms (e.g. iterative proportional fitting, shortest path algorithms, method of successive averages).

The course is composed of a lecture part, providing the theoretical knowledge, and an applied part in which students develop their own models in order to evaluate a transport project/ policy by means of cost-benefit analysis. Interim lab session take place regularly to guide and support students with the applied part of the course.

**Lecture notes**

Moodle platform (enrollment needed)

**810-0491-00L Agent Based Modeling in Transportation**

W 6 credits 4G M. Balac, G. O. Kagho

**Abstract**

The course is composed of a lecture part, providing the theoretical knowledge, and an applied part in which students develop their own models in order to evaluate a transport project/ policy by means of cost-benefit analysis. Interim lab session take place regularly to guide and support students with the applied part of the course.
This course provides an introduction to agent-based modeling in transportation. The lectures and exercises offer an opportunity to learn about agent-based simulation models’ current methodology, focusing on MATSim, how agent-based models are set up, and perform a practical case study by working in groups.

**Objective**
At the end of the course, the students should:
- have an understanding of agent-based modeling
- have an understanding of MATSim
- have an understanding of the process needed to set up an agent-based study
- have practical experience of using MATSim to perform transportation studies

**Content**
This course provides an introduction to agent-based models for transportation policy analysis. Four essential topics are covered:

1) Introduction of agent-based modeling and its comparison to the traditional state of practice modeling
2) Introduction of MATSim, an open-source agent-based model, developed at ETH Zurich and TU Berlin, and its various parts
3) Setting up an agent-based model simulation, where different statistical methods used in the process will be introduced and explained.
4) Conducting a transport policy study. The case study will be performed in groups and will include a paper-like report.

**Literature**
Agent-based modeling in general

**MATSim**

Additional relevant readings, primarily scientific articles, will be recommended throughout the course.

**Prerequisites / notice**
There are no strict preconditions regarding which lectures the students should have previously attended. However, experience with at least one high-level programming language (Java, R, Python, or other) is recommended.

For those without object-oriented programming experience, a crash course 101-0491-10 Basics of Java and Best Practices for Scientific Computing before the start of HS is recommended.

**Abstract**
Basic principles of the atmosphere, physical structure and chemical composition, trace gases, atmospheric cycles, circulation, stability, radiation, condensation, clouds, oxidation capacity and ozone layer.

**Objective**
- Students are able
  - to explain the physical structure and chemical composition of the atmosphere
  - to quantitatively describe and understand the fundamental physical and chemical process in the atmosphere
  - to explain the interactions and feedbacks between atmosphere - ocean - land surface, troposphere - stratosphere and weather - climate.

In the course “Atmosphere”, the competencies of process understanding, system understanding and data analysis & interpretation are taught, applied and examined.

**Abstract**
Satellite observations; analysis of vertical soundings; geostrophic and thermal wind; cyclones at mid-latitude; global circulation; north-atlantic oscillation; atmospheric blocking situations; Eulerian and Lagrangian perspective; Potential Vorticity; Alpine dynamics (storms, orographic wind); planetary boundary layer; water vapour transport in the atmosphere; water isotopes

**Objective**
The students are able to
- explain basic measurement and analysis techniques that are relevant in atmospheric dynamics
- to discuss the mathematical basics of atmospheric dynamics, based on selected atmospheric flow phenomena
- to explain the basic dynamics of the global circulation and of synoptic- and meso-scale flow features
- to explain how mountains influence the atmospheric flow on different scales
- basic understanding of stable water isotopes as tracers for moist adiabatic processes in weather systems

**Content**

Land-Climate Dynamics

W 3 credits 2G

S. I. Seneviratne, R. Padron Flasher, P. Sieber

Abstract
The purpose of this course is to provide fundamental background on the role of land surface processes (vegetation, soil moisture dynamics, land energy, water and carbon balances) in the climate system. The course consists of 2 contact hours per week, including lectures, group projects and computer exercises.

Objective
The students can understand the role of land processes and associated feedbacks in the climate system.

Prerequisites / notice
Some problem solving experience in Python, Stata, or R is required.

Supervised Research (Law, Economics, and Data Science)

Does not take place this semester.

Supervised Research (Law, Economics, and Data Science)

W 3 credits

E. Ash

Abstract
This is a supervised student project for 3 ECTS, supervised by the professorship of Elliott Ash (DGESS). Students will adapt tools from econometrics and machine learning to questions in law, data science, and social science.

Objective
Students must have some data science and/or statistics experience. Some programming experience in Python, Stata, or R is required. Apply tools from data science and social science to a new project, potentially in a group, to develop a paper or app.

Prerequisites / notice
Some problem solving experience in Python, Stata, or R is required. Some experience with data science or statistics is required.

Machine Learning in Finance and Insurance

Machine Learning in Finance and Insurance

W 5 credits 2V+1U

P. Cheridito

Abstract
This course introduces machine learning methods that can be used in finance and insurance applications.

Objective
The goal is to learn methods from machine learning that can be used in financial and insurance applications.

Content
Linear, polynomial, logistic, ridge and lasso regression, dimension reduction methods, singular value decomposition, kernel methods, support vector machines, classification and regression trees, random forests, XGBoost, neural networks, stochastic gradient descent, autoencoders, graph neural networks, transformers, credit analytics, pricing, hedging, insurance claim prediction.

Course material is available on https://people.math.ethz.ch/~patrickc/mlfi

Literature

Planning and Decision Making for Autonomous Robots

Planning and Decision Making for Autonomous Robots

W 4 credits 2V+1U

E. Frazzoli

Abstract
Planning safe and efficient motions for robots in complex environments, often shared with humans and other robots, is a difficult problem combining discrete and continuous mathematics, as well as probabilistic, game-theoretic, and ethical/regulatory aspects. This course will cover the algorithmic foundations of motion planning, with an eye to real-world implementation issues.

Objective
The students will learn how to design and implement state-of-the-art algorithms for planning robots executing challenging tasks in complex environments.

Content

Lecture notes
Course notes and other education material will be provided for free in an electronic form.

Literature
There is no required textbook, but an excellent reference is Steve Lavalle's book on "Planning Algorithms."

Data: 26.07.2024 12:39  Autumn Semester 2024  Page 683 of 2680
The course consists of three parts: First, we will refresh and deepen the student’s knowledge in kinematics, dynamics, and rotations of multi-body systems. The student receives a solid background in kinematics, dynamics, and rotations of multi-body systems. On the basis of state of the art applications, he/she will learn all necessary tools to work in the field of design or control of robotic systems.

Content: The course consists of three parts: First, we will refresh and deepen the student's knowledge in kinematics, dynamics, and rotations of multi-body systems. In this context, the learning material will build upon the courses for mechanics and dynamics available at ETH, with the particular focus on their application to robotic systems. The goal is to foster the conceptual understanding of similarities and differences among the various types of robots. In the second part, we will apply the learned material to classical robotic arms as well as legged systems and discuss kinematic constraints and interaction forces. In the third part, focus is put on modeling fixed wing aircraft, along with related design and control concepts. In this context, we also touch aerodynamics and flight mechanics to an extent typically required in systems and discuss kinematic constraints and interaction forces. The last part of the course will cover different helicopter types, with a focus on quadrotors and the coaxial configuration which we see today in many UAV applications. Case studies on all main topics provide the link to real applications and to the state of the art in robotics.

Prerequisites / notice: The contents of the following ETH Bachelor lectures or equivalent are assumed to be known: Mechanics and Dynamics, Control, Basics in Control Systems for single input - single output and multivariable systems.

151-0563-01L Dynamic Programming and Optimal Control W 4 credits 2V+1U R. D’Andrea
Abstract: Introduction to Dynamic Programming and Optimal Control.
Objective: Covers the fundamental concepts of Dynamic Programming & Optimal Control.
Content: Dynamic Programming Algorithm; Deterministic Systems and Shortest Path Problems; Infinite Horizon Problems, Bellman Equation; Deterministic Continuous-Time Optimal Control.
Requirements: Knowledge of advanced calculus, introductory probability theory, and matrix-vector algebra.

151-0632-00L Vision Algorithms for Mobile Robotics (University of Zurich) W 6 credits 2V+2U D. Scaramuzza
Abstract: Mind the enrolment deadlines at UZH: https://www.uzh.ch/cmsssl/en/studies/application/deadline.html
Objective: For a robot to be autonomous, it has to perceive and understand the world around it. This course introduces you to the key computer vision algorithms used in mobile robotics, such as feature extraction, structure from motion, dense reconstruction, tracking, image retrieval, event-based vision, and visual-inertial odometry and Simultaneous Localization And Mapping (SLAM) (the algorithms behind Hololens, Facebook-Oculus Quest, and the NASA Mars rovers).
Content: Each lecture will be followed by a lab session where you will learn to implement a building block of a visual odometry algorithm in Matlab. By the end of the course, you will integrate all these building blocks into a working visual odometry algorithm.

Prerequisites / notice: Fundamentals of algebra, geometry, matrix calculus, and Matlab programming.

Note: If you are interested in taking UZH courses, you must register as an incoming mobility student at UZH. For details, see as follows:

UZH course enrollment for ETH student at University of Zurich (UZH) > Mobility within Switzerland – Incoming > Module Mobility: The easiest way to take individual modules/courses to supplement your studies at your home university is with module mobility. This option is not available to students who have dropped out of their home university or have been definitely excluded or banned from the relevant program > Application and Deadlines: Applications are submitted via the UZH application portal (https://www.uzh.ch/cmsssl/en/studies/application/fluxmobilityin.html).
Step-by-step guidelines on how ETH students can register for this course, are given on the official course website: https://rpg.ifi.uzh.ch/teaching.html

ATTENTION: When you book the course at UZH, you are automatically registered for the exam at UZH and you can unregister until the October deadline. After registering for the course, you as an ETH student need to check out your “UZH email account” to receive the related information from the lecturer.

151-0851-00L Robot Dynamics W 4 credits 2V+2U M. Hutter, R. Siegwart
Abstract: We will provide an overview on how to kinematically and dynamically model typical robotic systems such as robot arms, legged robots, rotary wing systems, or fixed wing.
Objective: The primary objective of this course is that the student deepens an applied understanding of how to model the most common robotic systems. The student receives a solid background in kinematics, dynamics, and rotations of multi-body systems. On the basis of state of the art applications, he/she will learn all necessary tools to work in the field of design or control of robotic systems.

227-0103-00L Control Systems W 6 credits 2V+2U F. Dörfler
Abstract: Study of concepts and methods for the mathematical description and analysis of dynamical systems. The concept of feedback. Design of control systems for single input - single output and multivariable systems.
Objective: Study of concepts and methods for the mathematical description and analysis of dynamical systems. The concept of feedback. Design of control systems for single input - single output and multivariable systems.

Abstract

In this class, we bring together data science applications provided by ETH researchers outside computer science and teams of computer science master’s students. Two to three students will form a team working on data science/machine learning-related research topics provided by scientists in a diverse range of domains such as astronomy, biology, social sciences etc.

Objective

The goal of this class if for students to gain experience of dealing with data science and machine learning applications “in the wild”. Students are expected to go through the full process starting from data cleaning, modeling, execution, debugging, error analysis, and quality/performance refinement.

Prerequisites / notice

Prerequisites: At least 8 KP must have been obtained under Data Analysis and at least 8 KP must have been obtained under Data Management and Processing.

Abstract

Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

Objective

Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real world data.

Content

The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:

- Fundamentals:
  - What is data?
  - Bayesian Learning
  - Computational learning theory

- Supervised learning:
  - Ensembles: Bagging and Boosting
  - Max Margin methods
  - Neural networks

- Unsupervised learning:
  - Dimensionality reduction techniques
  - Clustering
  - Mixture Models
  - Non-parametric density estimation
  - Learning Dynamical Systems

Lecture notes

No lecture notes, but slides will be made available on the course webpage.
Literature

Prerequisites / notice

The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.

Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

227-0423-00L Neural Network Theory W 4 credits 2V+1U H. Bölcskei

Abstract The class focuses on fundamental mathematical aspects of neural networks with an emphasis on deep networks: Universal approximation theorems, capacity of separating surfaces, generalization, fundamental limits of deep neural network learning, VC dimension.

Objective After attending this lecture, participating in the exercise sessions, and working on the homework problem sets, students will have acquired a working knowledge of the mathematical foundations of neural networks.

Content
1. Universal approximation with single- and multi-layer networks
2. Introduction to approximation theory: Fundamental limits on compressibility of signal classes, Kolmogorov epsilon-entropy of signal classes, non-linear approximation theory
3. Fundamental limits of deep neural network learning
4. Geometry of decision surfaces
5. Separating capacity of nonlinear decision surfaces
6. Vapnik-Chervonenkis (VC) dimension
7. VC dimension of neural networks
8. Generalization error in neural network learning

Lecture notes Detailed lecture notes are available on the course web page https://www.mins.ee.ethz.ch/teaching/nnt/

Prerequisites / notice This course is aimed at students with a strong mathematical background in general, and in linear algebra, analysis, and probability theory in particular.

Abstract In this course we study the basics of theoretical statistics. The course includes methods for designing estimators, confidence intervals and tests, and various ways to evaluate the accuracy of estimators, confidence intervals and tests. We consider optimality criteria such as admissibility and minimaxity, as well as Bayesian criteria. We will also present the asymptotic point of view.

Objective The aim of this course is to gain insight into the main statistical ideas and concepts, the course considers classical low-dimensional models, with pointers towards today's highly complex models.

Abstract This is a graduate-level course on algorithm design (and analysis). It covers a range of topics and techniques in approximation algorithms, sketching and streaming algorithms, and online algorithms.

Objective This course familiarizes the students with some of the main tools and techniques in modern subareas of algorithm design.

Content The lectures will cover modern topics in algorithm design and analysis, including the following: graph sparsifications while preserving cuts or distances, various approximation algorithms techniques and concepts, metric embeddings and probabilistic tree embeddings, online algorithms, multiplicative weight updates, streaming algorithms, sketching algorithms.

Lecture notes https://people.inf.ethz.ch/~aroeyskoe/AA23

Prerequisites / notice This course is designed for masters and doctoral students and it especially targets those interested in theoretical computer science, but it should also be accessible to last-year bachelor students.

Sufficient comfort with both (A) Algorithm Design & Analysis and (B) Probability & Concentrations. E.g., having passed the course Algorithms, Probability, and Computing (APC) is recommended, though not required formally. If you are not sure whether you're ready for this class or not, please consult the instructor.

</tbody>
</table>
Abstract
The key challenge of the information society is to turn data into information, information into knowledge, knowledge into value. This has become increasingly complex. Data comes in larger volumes, diverse shapes, from different sources. Data is more heterogeneous and less structured than forty years ago. Nevertheless, it still needs to be processed fast, with support for complex operations.

Objective
Do you want to be able to query your own data productively and efficiently in your future semester projects, master thesis, or PhD thesis? Are you looking for something beyond the Python+Pandas hype? This courses teaches you how to do so as well as the dos and don'ts.

"Big Data" refers to the case when the amount of data is very large (100 GB and more), or when the data is not completely structured (or messy). The Big Data revolution has led to a completely new way to do business, e.g., develop new products and business models, but also to do science -- which is sometimes referred to as data-driven science or the "fourth paradigm".

Unfortunately, the quantity of data produced and available -- now in the Zettabyte range (that's 21 zeros) per year -- keeps growing faster than our ability to process it. Hence, new architectures and approaches for processing it are needed. Harnessing them must involve a deep understanding of data not only in the large, but also in the small.

The field of databases evolves at a fast pace. In order to be prepared, to the extent possible, to the (r)evolutions that will take place in the next few decades, the emphasis of the lecture will be on the paradigms and core design ideas, while today's technologies will serve as supporting illustrations thereof.

After visiting this lecture, you should have gained an overview and understanding of the Big Data landscape, which is the basis on which one can make informed decisions, i.e., pick and orchestrate the relevant technologies together for addressing each one of your projects efficiently and consistently.

Content
This course gives an overview of database technologies and of the most important database design principles that lay the foundations of the Big Data universe. We take the monolithic, one-machine relational stack from the 1970s, smash it down and rebuild it on top of large clusters: starting with distributed storage, and all the way up to syntax, models, validation, processing, indexing, and querying. A broad range of aspects is covered with a focus on how they fit all together in the big picture of the Big Data ecosystem.

No data is harmed during this course, however, please be psychologically prepared that our data may not always be in third normal form.

- physical storage: distributed file systems (HDFS), object storage(S3), key-value stores
- logical storage: document stores (MongoDB), column stores (HBase), graph databases (neo4j), data warehouses (ROLAP)
- data formats and syntaxes (XML, JSON, RDF, Turtle, CSV, XBRL, YAML, protocol buffers, Avro)
- data shapes and models (tables, trees, graphs, cubes)
- type systems and schemas: atomic types, structured types (arrays, maps), set-based type systems (?, *, +)
- an overview of functional, declarative programming languages across data shapes (SQL, XQuery, JSONiq, Cypher, MDX)
- the most important query paradigms (selection, projection, joining, grouping, ordering, windowing)
- paradigms for parallel processing, two-stage (MapReduce) and DAG-based (Spark)
- resource management (YARN)
- what a data center is made of and why it matters (racks, nodes, ...)
- underlying architectures (internal machinery of HDFS, HBase, Spark, neo4j)
- optimization techniques (functional and declarative paradigms, query plans, rewrites, indexing)
- applications.

Large scale analytics and machine learning are outside of the scope of this course.

Literature
Course textbook: https://ghislainfourny.github.io/big-data-textbook/
Papers from scientific conferences and journals. References will be given as part of the course material during the semester.

Prerequisites / notice
The lecture is hybrid, meaning you can attend with us in the lecture hall, or on Zoom, or watch the recordings on YouTube later. Exercise sessions are in presence.

This course, in the autumn semester, is only intended for:
- Computer Science students
- Data Science students
- CBB students with a Computer Science background

Mobility students in CS are also welcome and encouraged to attend. If you experience any issue while registering, please contact the study administration and you will be gladly added.

For students of all other departments interested in this fascinating topic: I would love to have you visit my lectures as well! So there is a series of two courses specially designed for you:
- "Information Systems for Engineers" (SQL, relational databases): this Fall
- "Big Data for Engineers" (similar to Big Data, but adapted for non Computer Scientists): Spring 2023

There is no hard dependency, so you can either them in any order, but it may be more enjoyable to start with Information Systems for Engineers.

Students who successfully completed Big Data for Engineers are not allowed to enrol in the course Big Data.
The goal of the course is to convey the fundamental aspects of efficient data management from a systems implementation perspective:

ECTS

Discrete-Time and Statistical Signal Processing
4G
assessed

Analytical Competencies

This course covers the basic concepts of data management systems using relational database engines as a starting point to cover the basic concepts of efficient data processing and then expanding those concepts to modern implementations in data centers and the cloud.

Content

The course will first cover fundamental concepts in data management: storage, locality, query optimization, declarative interfaces, concurrency control and recovery, buffer managers, management of the memory hierarchy, presenting them in a system independent manner. The course will place a special emphasis on understanding these basic principles as they are key to understanding what problems existing systems try to address. It will then proceed to explore their implementation in modern relational engines supporting SQL to then expand the range of systems used in the cloud: key value stores, geo-replication, query as a service, serverless, large scale analytics engines, etc.

Literature

The main source of information for the course will be articles and research papers describing the architecture of the systems discussed. The list of papers will be provided at the beginning of the course.

Prerequisites / notice

The course requires to have completed the Data Modeling and Data Bases course at the Bachelor level as it assumes knowledge of databases and SQL.

Core Electives

Number | Title | Type | ECTS | Hours | Lecturers |
---|---|---|---|---|---|
151-0563-01L | Dynamic Programming and Optimal Control | W | 4 credits | 2V+1U | R. D’Andrea |
227-0101-00L | Discrete-Time and Statistical Signal Processing | W | 6 credits | 4G | H.-A. Loeliger |
227-0417-00L | Information Theory I | W | 6 credits | 3V+2U+3A | G. Alonso |
227-0560-00L | Computer Vision and Artificial Intelligence for Autonomous Cars | W | 6 credits | 3V+2P | C. Sakaridis |
This course introduces the core computer vision techniques and algorithms that autonomous cars use to perceive the semantics and geometry of their driving environment, localize themselves in it, and predict its dynamic evolution. Emphasis is placed on techniques tailored for real-world settings, such as multi-modal fusion, domain-adaptive and outlier-aware architectures, and multi-agent methods.

Students will learn about the fundamentals of autonomous cars and of the computer vision models and methods these cars use to analyze their environment and navigate themselves in it. Students will be presented with state-of-the-art representations and algorithms for semantic, geometric and temporal visual reasoning in automated driving and will gain hands-on experience in developing computer vision algorithms and architectures for solving such tasks.

After completing this course, students will be able to:
1. understand the operating principles of visual sensors in autonomous cars
2. differentiate between the core architectural paradigms and components of modern visual perception models and describe their logic and the role of their parameters
3. systematically categorize the main visual tasks related to automated driving and understand the primary representations and algorithms which are used for solving them
4. critically analyze and evaluate current research in the area of computer vision for autonomous cars
5. practically reproduce state-of-the-art computer vision methods in automated driving
6. independently develop new models for visual perception

The content of the lectures consists in the following topics:

1. Fundamentals
   (a) Fundamentals of autonomous cars and their visual sensors
   (b) Fundamental computer vision architectures and algorithms for autonomous cars

2. Semantic perception
   (a) Semantic segmentation
   (b) Object detection
   (c) Instance segmentation and panoptic segmentation

3. Geometric perception and localization
   (a) Depth estimation
   (b) 3D reconstruction
   (c) Visual localization
   (d) Unimodal visual/lidar 3D object detection

4. Robust perception: multi-modal, multi-domain and multi-agent methods
   (a) Multi-modal 2D and 3D object detection
   (b) Visual grounding and verbo-visual fusion
   (c) Domain-adaptive and outlier-aware semantic perception
   (d) Vehicle-to-vehicle communication for perception

5. Temporal perception
   (a) Multiple object tracking
   (b) Motion prediction

The practical projects involve implementing complex computer vision architectures and algorithms and applying them to real-world, multi-modal driving datasets. In particular, students will develop models and algorithms for:
1. Semantic segmentation and depth estimation
2. Sensor calibration for multi-modal 3D driving datasets
3. 3D object detection using lidars

Lecture notes
Lecture slides are provided in PDF format.

Prerequisites / notice
Students are expected to have a solid basic knowledge of linear algebra, multivariate calculus, and probability theory, and a basic background in computer vision and machine learning. All practical projects will require solid background in programming and will be based on Python and libraries of it such as PyTorch.

227-0689-00L System Identification W 4 credits 2V+1U R. Smith

Abstract
Theory and techniques for the identification of dynamic models from experimentally obtained system input-output data.

Objective
To provide a series of practical techniques for the development of dynamical models from experimental data, with the emphasis being on the development of models suitable for feedback control design purposes. To provide sufficient theory to enable the practitioner to understand the trade-offs between model accuracy, data quality and data quantity.

Content
Introduction to modeling: Black-box and grey-box models; Parametric and non-parametric models; ARX, ARMAX (etc.) models.

Predictive, open-loop, black-box identification methods. Time and frequency domain methods. Subspace identification methods.

Optimal experimental design, Cramer-Rao bounds, input signal design.

Parametric identification methods. On-line and batch approaches.

Closed-loop identification strategies. Trade-off between controller performance and information available for identification.

Literature
Additional papers will be available via the course Moodle.

Prerequisites / notice
Control systems (227-0216-00L) or equivalent.

227-2210-00L Computer Architecture W 8 credits 6G+1A S. Sadrosadati, O. Mutlu

Abstract
Autumn Semester 2024

Prerequisites / notice

Data: 26.07.2024 12:39 Autumn Semester 2024 Page 689 of 2680
Computer architecture is the science & art of designing and optimizing hardware components and the hardware/software interface to create a computer that meets design goals. This course covers basic concepts of a modern computing system (memory, processors, interconnects, accelerators). The course takes a hardware/software cooperative approach to understanding and designing computing systems.

We will learn the fundamental concepts of the different parts of modern computing systems, as well as the latest major research topics in Industry and Academia. We will extensively cover memory systems (including DRAM and new Non-Volatile Memory technologies, memory controllers, flash memory), new paradigms like processing-in-memory, parallel computing systems (including multicore processors, coherence and consistency, GPUs), heterogeneous computing, interconnection networks, specialized systems for major data-intensive workloads (e.g. graph analytics, bioinformatics, machine learning), etc. We will focus on fundamentals as well as cutting-edge research. Significant attention will be given to real-life examples and tradeoffs, as well as critical analysis of modern computing systems.

The principles presented in the lecture are reinforced in the laboratory through 1) the design and implementation of a cycle-accurate assessed simulator, where we will explore different components of a modern computing system (e.g., pipeline, memory hierarchy, branch prediction, prefetching, caches, multithreading), and 2) the extension of state-of-the-art research simulators (e.g., Ramulator) for more in-depth understanding of specific system components (e.g., memory scheduling, prefetching).

See the course website for detailed and complete content of past incarnations of the course: https://safari.ethz.ch/architecture

The video recordings of the lectures are expected to be made available after lectures. See https://safari.ethz.ch/architecture for past examples.

We will provide required and recommended readings in every lecture. They will mainly consist of research papers presented in major Computer Architecture and related conferences and journals. See https://safari.ethz.ch/architecture for past examples.

All the materials (including lecture slides) will be provided on the course website: https://safari.ethz.ch/architecture/

Lectures will make use of textbooks such as the one by Jurafsky and Martin where appropriate, but will also make use of original research.

This course presents an introduction to general topics and techniques used in natural language processing today, primarily focusing on statistical and deep learning approaches. The course provides an overview of the primary areas of research in language processing as well as a detailed exploration of the models and techniques used both in research and in commercial natural language systems.

The first part of the lecture covers hardware-based security concepts. Topics include the concept of physical and software-based side channel attacks on hardware resources, architectural support for security (e.g., memory management and permissions, disk encryption), and trusted execution environments (Intel SGX, ARM TrustZone, AMD SEV, and RISC- V Keystone).

In the second part, the focus is on system design and methodologies for building secure systems. Topics include: common software faults (e.g., buffer overflows, etc.), bug-detection, writing secure software (design, architecture, QA, testing), compiler-supported security (e.g., control-flow integrity), and language-supported security (e.g., memory safety).

Along the lectures, case studies will be elaborated and evaluated in the exercises.

This course presents topics in natural language processing with an emphasis on modern techniques, primarily focusing on statistical and deep learning approaches. The course provides an overview of the primary areas of research in language processing as well as a detailed exploration of the models and techniques used both in research and in commercial natural language systems.

The objective of the course is to learn the basic concepts in the statistical processing of natural languages. The course will be project-oriented so that the students can also gain hands-on experience with state-of-the-art tools and techniques.

This course presents an introduction to general topics and techniques used in natural language processing today, primarily focusing on statistical approaches. The course provides an overview of the primary areas of research in language processing as well as a detailed exploration of the models and techniques used both in research and in commercial natural language systems.

Lectures will make use of textbooks such as the one by Jurafsky and Martin where appropriate, but will also make use of original research and survey papers.

A project description must be submitted at the start of the project to the studies administration.
Abstract
Students learn how to solve algorithmic problems given by a textual description (understanding problem setting, finding appropriate modeling, choosing suitable algorithms, and implementing them). Knowledge of basic algorithms and data structures is assumed; more advanced material and usage of standard libraries for combinatorial algorithms are introduced in tutorials.

Objective
The objective of this course is to learn how to solve algorithmic problems given by a textual description. This includes appropriate problem modeling, choice of suitable (combinatorial) algorithms, and implementing them (using C/C++, STL, OGAL, and BGL).

Literature

Abstract
This InterFocus Course will provide a broad, hands-on introduction to Information Security, introducing adversarial thinking and security by design as key approaches to building secure systems.

Objective
This course will introduce key concepts from Information Security, both from attack and defence perspectives. Students will gain an appreciation of the complexity and challenge of building secure systems.

Content
The course is organised in three-week segments. In each segment, a new concept from Information Security will be introduced. The overall scope will be broad, including cryptography, protocol design, system security, and privacy.

Lecture notes
Will be made available during the semester.

Literature
Paul C. van Oorschot, Computer Security and the Internet: Tools and Jewels.
Dan Boneh and Victor Shoup, A Graduate Course in Applied Cryptography.

Prerequisites / notice
Ideally, students will have taken the D-INFK Bachelors course "Information Security" or an equivalent course at Bachelors level.

Competencies
Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies
- Analytical Competencies
- Problem-solving

Personal Competencies
- Adaptability and Flexibility

Abstract
Creating reliable, secure, robust, and fair machine learning models is a core challenge in artificial intelligence and one of fundamental importance. The goal of the course is to teach both the mathematical foundations of this new and emerging area as well as to introduce students to the latest and most exciting research in the space.

Objective
Upon completion of the course, the students should have mastered the underlying methods and be able to apply them to a variety of engineering and research problems. To facilitate deeper understanding, the course includes a project using state-of-the-art models where students will build a system based on the learned material.

Content
The course is split into 4 parts:

Robustness of Machine Learning

- Adversarial attacks and defenses on deep learning models.
- Certified training of deep neural networks (combining symbolic and continuous methods).

Privacy of Machine Learning

- Threat models (e.g., stealing data, poisoning, membership inference, etc.).
- Attacking federated machine learning (across vision, natural language and tabular data).
- Differential privacy for defending machine learning.
- AI Regulations and checking model compliance.

Fairness of Machine Learning

- Introduction to fairness (motivation, definitions).
- Enforcing individual fairness (for both vision and tabular data).
- Enforcing group fairness (e.g., demographic parity, equalized odds).

Robustness, Privacy and Fairness of Foundation Models

- We discuss all previous topics, as well as programmability, in the context of latest foundation models (e.g., LLMs).

Prerequisites / notice
- While not a formal requirement, the course assumes familiarity with basics of machine learning (especially linear algebra, gradient descent, and neural networks as well as basic probability theory). These topics are usually covered in "Intro to ML" classes at most institutions (e.g., "Introduction to Machine Learning" at ETH).

Competencies
Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies
- Analytical Competencies
- Problem-solving

Personal Competencies
- Critical Thinking
How can we build systems that perform well in uncertain environments? How can we develop systems that exhibit "intelligent" behavior?

We will cover all aspects of high-performance computing ranging from architecture through programming up to algorithms. We will start with a discussion of caches and cache coherence in practical computer systems. We will dive into parallel programming concepts such as memory models, locks, and lock-free. We will cover performance modeling and parallel design principles as well as basic parallel algorithms.

263-3210-00L Deep Learning

**Abstract**

Deep learning is an area within machine learning that deals with algorithms and models that automatically induce multi-level data representations.

**Objective**

In recent years, deep learning and deep networks have significantly improved the state-of-the-art in many application domains such as computer vision, speech recognition, and natural language processing. This class will cover the mathematical foundations of deep learning and provide insights into model design, training, and validation. The main objective is to provide an understanding of why these methods work and how. There will also be a rich set of hands-on tasks and practical projects to familiarize students with this emerging technology.

**Prerequisites / notice**

This is an advanced level course that requires some basic background in AI, as well as programming and probability. The course will make heavy use of mathematics and is not for students interested in computer science theory.

The course will be subject to the following condition:
- Students must have taken the exam in Advanced Machine Learning (252-0535-00) or have acquired equivalent knowledge, see exhaustive list below:

- Advanced Machine Learning https://mi2.inf.ethz.ch/courses/aml/
- Computational Intelligence Lab http://da.inf.ethz.ch/teaching/2019/CIL/

**Literature**

Statistical Learning Theory http://mi2.inform.ethz.ch/courses/sit/
Probabilistic Artificial Intelligence https://las.inf.ethz.ch/teaching/ai-i18

**Course information**

- 8 credits
- W

263-5005-00L Artificial Intelligence in Education

**Abstract**

Artificial Intelligence (AI) methods have shown to have a profound impact in educational technologies, where the great variety of tasks and data types enable us to get benefit of AI techniques in many different ways. We will review relevant methods and applications of AI in various educational technologies, and work on problem sets and projects to solve problems in education with the help of AI.

**Objective**

The course will be centered around exploring methodological and system-focused perspectives on designing AI systems for education and analyzing educational data using AI methods. Students will be expected to a) engage in presentations and active in-class and asynchronous discussion, and b) work on problem-sets exemplifying the use of educational data mining techniques.

**Literature**

- Lecture notes

Lecture slides will be made available at the course Web site.

- No textbook is required, but there will be regularly assigned readings from research literature, linked to the course website.

**Prerequisites / notice**

There are no prerequisites for this class. However, it will help if the student has taken an undergraduate or graduate level class in statistics, data science or machine learning. This class is appropriate for advanced undergraduates and master students in Computer Science as well as PhD students in other departments.

**Course information**

- 3 credits
- W

263-5210-00L Probabilistic Artificial Intelligence

**Abstract**

This course introduces core modeling techniques and algorithms from machine learning, optimization and control for reasoning and decision making under uncertainty, and study applications in areas such as robotics.

**Objective**

How can we build systems that perform well in uncertain environments? How can we develop systems that exhibit "intelligent" behavior, without prescribing explicit rules? How can we build systems that learn from experience in order to improve their performance? We will study core modeling techniques and algorithms from statistics, optimization, planning, and control and study applications in areas such as robotics. The course is designed for graduate students.

**Content**

Topics covered:
- Probability
- Probabilistic inference (variational inference, MCMC)
- Bayesian learning (Gaussian processes, Bayesian deep learning)
- Probabilistic planning (MDPs, POMDPs)
- Multi-armed bandits and Bayesian optimization
- Reinforcement learning

**Prerequisites / notice**

Solid basic knowledge in statistics, algorithms and programming. The material covered in the course "Introduction to Machine Learning" is considered as a prerequisite.
This course is aimed at advanced master and doctorate students who want to conduct independent research on theory for modern camera models and calibration, invariant features, multiple-view geometry, model fitting, stereo matching, segmentation, 2D shape.

**Objective**

By the end of the semester students should be able to:

1. Understand a good fraction of theory papers published in the typical ML venues. For this purpose, students will learn common mathematical techniques from statistical learning in the first part of the course and apply this knowledge in the project work.
2. Critically examine recently published work in terms of relevance and find impactful (novel) research problems. This will be an integral part of the project work and involves experimental as well as theoretical questions.
3. Outline a possible approach to prove a conjectured theorem by e.g. reducing to more solvable subproblems. This will be practiced in individual exercises, homeworks and potentially in the final project.
4. Effectively communicate and present the problem motivation, new insights and results to a technical audience. This will be primarily learned via the final presentation and report as well as during peer-grading of peer talks.

**Prerequisites / notice**

Students should have a very strong mathematical background (real analysis, probability theory, linear algebra) and solid knowledge of core concepts in machine learning taught in courses such as "Introduction to Machine Learning", "Regression"/"Statistical Modelling". In addition to these prerequisites, this class requires a high degree of mathematical maturity— including abstract thinking and the ability to understand and write proofs.

**Competencies**

- Subject-specific Competencies: Concepts and Theories
- Method-specific Competencies: Analytical Competencies, Decision-making, Media and Digital Technologies, Problem-solving, Project Management

**263-5300-00L Guarantees for Machine Learning**

**Abstract**

This course is aimed at advanced master and doctorate students who want to conduct independent research on theory for modern machine learning (ML). It teaches standard methods in statistical learning theory commonly used to prove theoretical guarantees for ML algorithms. The knowledge is then applied in independent project work to understand and follow-up on recent theoretical ML results.

**Objective**

By the end of the semester students should be able to:

1. Understand a good fraction of theory papers published in the typical ML venues. For this purpose, students will learn common mathematical techniques from statistical learning in the first part of the course and apply this knowledge in the project work.
2. Critically examine recently published work in terms of relevance and find impactful (novel) research problems. This will be an integral part of the project work and involves experimental as well as theoretical questions.
3. Outline a possible approach to prove a conjectured theorem by e.g. reducing to more solvable subproblems. This will be practiced in individual exercises, homeworks and potentially in the final project.
4. Effectively communicate and present the problem motivation, new insights and results to a technical audience. This will be primarily learned via the final presentation and report as well as during peer-grading of peer talks.

**Prerequisites / notice**

Students should have a very strong mathematical background (real analysis, probability theory, linear algebra) and solid knowledge of core concepts in machine learning taught in courses such as "Introduction to Machine Learning", "Regression"/"Statistical Modelling". In addition to these prerequisites, this class requires a high degree of mathematical maturity— including abstract thinking and the ability to understand and write proofs.

- Personal Competencies: Critical Thinking

**263-5902-00L Computer Vision**

**Abstract**

The goal of this course is to provide students with a good understanding of computer vision and image analysis techniques. The main concepts and techniques will be studied in depth and practical algorithms and approaches will be discussed and explored through the exercises.

**Objective**

The objectives of this course are:

1. To introduce the fundamental problems of computer vision.
2. To introduce the main concepts and techniques used to solve those.
3. To enable participants to implement solutions for reasonably complex problems.
4. To enable participants to make sense of the computer vision literature.

**Content**

Camera models and calibration, invariant features, multiple-view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition.

**Prerequisites / notice**

It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts before taking this course.

**Competencies**

- Subject-specific Competencies: Concepts and Theories
- Method-specific Competencies: Analytical Competencies
- Social Competencies: Communication
- Personal Competencies: Critical Thinking

**401-0625-01L Applied Analysis of Variance and Experimental Design**

**Abstract**

Principles of experimental design, one-way analysis of variance, contrasts and multiple comparisons, multi-factor designs and analysis of variance, complete block designs, Latin square designs, random effects and mixed effects models, split-plot designs, incomplete block designs, two-series factorial and fractional designs, power.

**Objective**

Participants will be able to plan and analyze efficient experiments in the fields of natural sciences. They will gain practical experience by using the software R.
Content
Principles of experimental design, one-way analysis of variance, contrasts and multiple comparisons, multi-factor designs and analysis of variance, complete block designs, Latin square designs, random effects and mixed effects models, split-plot designs, incomplete block designs, two-series factorial and fractional designs, power.

Literature

Prerequisites / notice
The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software R, for which an introduction will be held.

401-3601-00L

Objective
This course presents the basics of probability theory and the theory of stochastic processes in discrete time. The following topics are planned:
- measure theory formalism and probability theory, Dynkin's lemma and independence, convergence of series of independent random variables, law of large numbers, conditional expectation, martingale convergence theorems, uniform integrability, optional stopping theorem for martingales, the Bienaymé-Galton-Watson process and its R-number, convergence in distribution and the central limit theorem.

Content
This course presents the basics of probability theory and the theory of stochastic processes in discrete time. The following topics are planned:

401-3612-00L

Objective
Stochastic simulation is the experimental analysis of a stochastic model by implementing it on a computer. Probabilities and expected values can be approximated by averaging simulated values, and the central limit theorem gives an estimate of the error of this approximation. The course shows examples of the many applications of stochastic simulation and explains different algorithms used for simulation. These algorithms are illustrated with the statistical software R.

Content
Examples of simulations in different fields (computer science, statistics, statistical mechanics, operations research, financial mathematics).

Lecture notes
A script will be available in English.

Literature

Prerequisites / notice
Familiarity with basic concepts of probability theory (random variables, joint and conditional distributions, laws of large numbers and central limit theorem) will be assumed.

401-3627-00L

Objective
Knowledge of methods and basic theory for high-dimensional statistical inference
### 401-3622-00L Statistical Modelling

**Abstract**
In regression, the dependency of a random response variable on other variables is examined. We consider the theory of linear regression with one or more covariates, high-dimensional linear models, nonlinear models and generalized linear models, robust methods, model choice and nonparametric models. Several numerical examples will illustrate the theory.

**Objective**
Introduction into theory and practice of a broad and popular area of statistics, from a modern viewpoint.

**Content**
- Linear programming and polyhedra; - Flows and cuts; - Combinatorial optimization problems and polyhedral techniques; - Equivalence between optimization and separation.

**Literature**

**Prerequisites**
Solid background in linear algebra.

**Competencies**
- Subject-specific Competencies: Concepts and Theories – Techniques and Technologies – assessed – fostered
- Social Competencies: Communication – Cooperation and Teamwork – Sensitivity to Diversity – assessed – fostered

### 401-3901-00L Linear & Combinatorial Optimization

**Abstract**
The goal of this course is to get a thorough understanding of various classical mathematical optimization techniques for linear and combinatorial optimization problems, with an emphasis on polyhedral approaches. In particular, we want students to develop a good understanding of some important problem classes in the field, of structural mathematical results linked to these problems, and of solution approaches based on such structural insights.

**Objective**
Mathematical treatment of optimization techniques for linear and combinatorial optimization problems.

**Content**
- Linear programming and polyhedra; - Flows and cuts; - Combinatorial optimization problems and polyhedral techniques; - Equivalence between optimization and separation.

**Literature**

**Prerequisites**
Solid background in linear algebra.

**Competencies**
- Subject-specific Competencies: Concepts and Theories – Techniques and Technologies – assessed – fostered
- Social Competencies: Communication – Cooperation and Teamwork – Sensitivity to Diversity – assessed – fostered

### 401-4944-20L Mathematics of Data Science

**Abstract**
Mostly self-contained, but fast-paced, introductory masters level course on various theoretical aspects of algorithms that aim to extract information from data.

**Objective**
Introduction to various mathematical aspects of Data Science.

**Content**
These topics lie in overlaps of Mathematics with: Computer Science, Electrical Engineering, Statistics, and/or Operations Research. Most lectures will feature Mathematical Open Problems. The main mathematical tools used will be Probability and Linear Algebra, and a basic familiarity with these subjects is required. There will also be some (although knowledge of these tools is not assumed) Graph Theory, Representation Theory, Applied Harmonic Analysis, among others. The topics treated will include Dimension reduction, Manifold learning, Sparse recovery, Random Matrices, Approximation Algorithms, Community detection in graphs, and several others.

**Lecture notes**

**Prerequisites**
The main mathematical tools used will be Probability, Linear Algebra (and real analysis), and a working knowledge of these subjects is required. In addition to these prerequisites, this class requires a certain degree of mathematical maturity—including abstract thinking and the ability to understand and write proofs.

We encourage students who are interested in mathematical data science to take both this course and "227-0434-10L Mathematics of Information" taught by Prof. H. Bölcskei. The two courses are designed to be complementary.

A. Bandeira and H. Bölcskei
Causality

The course offers an introduction into analyzing time series, that is observations which occur in time. The material will cover Stationary Models, ARIMA processes, Spectral Analysis, Forecasting, Nonstationary Models, ARIMA Models and an introduction to GARCH models.

The key topics which will be covered as:

- Stationarity
- Autocorrelation
- Trend estimation
- Elimination of seasonality
- Spectral analysis, spectral densities
- Forecasting
- ARIMA, ARIMA Introduction to GARCH models

The main reference for this course is the book “Introduction to Time Series and Forecasting”, by P. J. Brockwell and R. A. Davis

Data: 26.07.2024 12:39 Autumn Semester 2024 Page 696 of 2680
Objective
After this course, you should be able to
- understand the language and concepts of causal inference
- know the assumptions under which one can infer causal relations from observational and/or interventional data
- describe and apply different methods for causal structure learning
- given data and a causal structure, derive causal effects and predictions of interventional experiments

Content
The material covered in this course has a significant overlap with the material that has been covered in 401-3620-22L Student Seminar in Statistics: Causality FS2023.

Literature
Parts of this course will be based on the book “Elements of Causal Inference” (MIT Press, open access). More details will follow.

Prerequisites / notice
Prerequisites: basic knowledge of probability theory and regression

402-0448-01L  Quantum Information Processing I: Concepts
This theory part QIP I together with the experimental part 402-0448-02L QIP II (both offered in the autumn semester) combine to the core course in experimental physics "Quantum Information Processing" (totally 10 ECTS credits). This applies to the Master's degree programme in Physics.

Abstract
The course covers the key concepts and formalism of quantum information processing. Topics include quantum algorithms, quantum error correction, quantum cryptography, and quantum metrology, with an emphasis on the power of quantum information processing beyond that of classical information processing. The formalism of quantum states, measurements, and channels is developed in detail.

Objective
By the end of the course students are able to explain the basic mathematical formalism of quantum mechanics and apply it to quantum information processing problems. They are able to adapt and apply these concepts and methods to analyze and discuss quantum algorithms and other quantum information-processing protocols.

Content
The topics covered in the course will include quantum circuits, gate decomposition and universal sets of gates, efficiency of quantum circuits, quantum algorithms (Shor, Grover, Deutsch-Josza,...), stabilizer-based quantum error correction, fault-tolerant designs, the BB84 quantum key distribution protocol, and simple methods of quantum metrology.

Lecture notes
Will be provided.

Literature

Interdisciplinary Electives

Data Science Lab

Number Title Type ECTS Hours Lecturers
263-3300-00L Data Science Lab Only for Data Science MSc, Programme Regulations 2017. O 14 credits 9P A. Ilie, V. Boeva, R. Cotterell, J. Vogt, F. Yang

Abstract
In this class, we bring together data science applications provided by ETH researchers outside computer science and teams of computer science master's students. Two to three students will form a team working on data science/machine learning-related research topics provided by scientists in a diverse range of domains such as astronomy, biology, social sciences etc.

Objective
The goal of this class if for students to gain experience of dealing with data science and machine learning applications "in the wild". Students are expected to go through the full process starting from data cleaning, modeling, execution, debugging, error analysis, and quality/performance refinement.

Prerequisites / notice
Prerequisites: At least 8 KP must have been obtained under Data Analysis and at least 8 KP must have been obtained under Data Management and Processing.

Seminar

Number Title Type ECTS Hours Lecturers
252-6051-00L Advanced Topics in Machine Learning The deadline for deregistering expires at the end of the second week of the semester. Students who are still registered after that date, but do not attend the seminar, will officially fail the seminar. W 2 credits 2S R. Cotterell, M. El-Assady, N. He, F. Yang

Abstract
In this seminar, recent papers of the pattern recognition and machine learning literature are presented and discussed. Possible topics cover statistical models in computer vision, graphical models and machine learning.
The seminar "Advanced Topics in Machine Learning" familiarizes students with recent developments in pattern recognition and machine learning. Original articles have to be presented and critically reviewed. The students will learn how to structure a scientific presentation in English which covers the key ideas of a scientific paper. An important goal of the seminar presentation is to summarize the essential ideas of the paper in sufficient depth while omitting details which are not essential for the understanding of the work. The presentation style will play an important role and should reach the level of professional scientific presentations. Additionally, students are expected to contribute novel ideas to the areas mentioned above as well as seminal contributions from the past.

The seminar will cover a number of recent papers which have emerged as important contributions to the pattern recognition and machine learning literature. The topics will vary from year to year but they are centered on methodological issues in machine learning like new learning algorithms, ensemble methods or new statistical models for machine learning applications. Frequently, papers are selected from computer vision or bioinformatics - two fields, which relies more and more on machine learning methodology and statistical models.

The seminar will cover topics related to data processing using new hardware in general and hardware accelerators (GPU, FPGA, specialized processors) in particular.

The general application areas are big data and machine learning. The systems covered will include systems from computer architecture, high performance computing, data appliances, and data centers.

Method-specific Competencies

- Communication
- Critical Thinking

Prerequisites / notice

Students taking this seminar should have the necessary background in systems and low level programming.

**Literature**

The seminar "Advanced Topics in Machine Learning" familiarizes students with recent developments in pattern recognition and machine learning. Original articles have to be presented and critically reviewed. The students will learn how to structure a scientific presentation in English which covers the key ideas of a scientific paper. An important goal of the seminar presentation is to summarize the essential ideas of the paper in sufficient depth while omitting details which are not essential for the understanding of the work. The presentation style will play an important role and should reach the level of professional scientific presentations. Additionally, students are expected to contribute novel ideas to the areas mentioned above as well as seminal contributions from the past.

The seminar will cover a number of recent papers which have emerged as important contributions to the pattern recognition and machine learning literature. The topics will vary from year to year but they are centered on methodological issues in machine learning like new learning algorithms, ensemble methods or new statistical models for machine learning applications. Frequently, papers are selected from computer vision or bioinformatics - two fields, which relies more and more on machine learning methodology and statistical models.

The seminar will cover topics related to data processing using new hardware in general and hardware accelerators (GPU, FPGA, specialized processors) in particular.

The general application areas are big data and machine learning. The systems covered will include systems from computer architecture, high performance computing, data appliances, and data centers.

The minimal prerequisites for the Master's thesis registration are:

- Completed Bachelor's program
- All additional requirements completed (additional requirements, if any, are listed in the admission decree)
- Minimum degree requirements fulfilled of the course categories Data Analysis and Data Management and overall 50 credits obtained in the course category Core Courses
- Data Science Lab (14 credits) completed

**Abstract**
The Master's thesis concludes the study program and demonstrates the students' ability to use the knowledge and skills acquired during Master’s studies to solve a complex data science problem.

**Objective**
To work independently and to produce a scientifically structured work.

**Abstract**

This seminar is designed for PhD students and PostDoc researchers involved in inter- or transdisciplinary research. It addresses and discusses challenges of this kind of research using scientific literature presenting case studies, concepts, theories, methods and by testing practical tools. It concludes with a 10-step approach to make participants' research projects more societally relevant.

**Objective**

Participants know specific challenges of inter- and transdisciplinary research and can address them by applying practical tools. They can tackle questions like: how to integrate knowledge from different disciplines, how to engage with societal actors, or how to secure broader impact of research. They learn to critically reflect their own research project in its societal context and on their role as scientists.

**Content**

- Theories and concepts of inter- and transdisciplinary research
- The specific challenges of inter- and transdisciplinary research
- Collaborating between different disciplines
- Engaging with stakeholders
- 10 steps to make participants' research projects more societally relevant

Throughout the whole course, scientific literature will be read and discussed as well as practical tools explored in class to address concrete challenges.

**Literature**

- Literature will be made available to the participants.
- Further, this collection of tools will be used: https://naturalsciences.ch/topics/co-producing_knowledge
- https://www.shapeittoolkit.eu

**Abstract**

This course will present methods of scientific machine and deep learning (ML / DL) for applications in design and construction. After providing proper background on ML and the scientific ML (SciML) track, several applications of SciML together with their computational implementation during the design and construction process of the built environment are examined.

**Objective**

This course aims to provide a graduate-level introduction to machine learning, with a particular focus on scientific machine learning for applications in the design and construction phases of projects from architecture and civil engineering.

Upon completion of the course, the students will be able to:
1. Understand main ML background theory and methods.
2. Assess a problem and apply ML and DL in a computational framework accordingly.
3. Incorporate scientific domain knowledge in the SciML process.
4. Define, plan, conduct and present a SciML project.

**Content**

The course will include theory and algorithms for SciML, programming assignments, as well as a final project assessment.

**Lecture notes**

The course script is composed by lecture slides, which are available online and will be continuously updated throughout the duration of the course.

**Literature**

Suggested Reading:

351-0778-00L Discovering Management

Does not take place this semester.
Entry level course in management for BSc, MSc and PHD students at all levels not belonging to D-MTEC. This course can be complemented with Discovering Management (Exercises) 351-0778-01.

Abstract
Discovering Management offers an introduction to the field of business management and entrepreneurship for engineers and natural scientists. By taking this course, students will enhance their understanding of management principles and the tasks that entrepreneurs and managers deal with. The course consists of theory and practice sessions, presented by a set of area specialists at D-MTEC.

Objective
The general objective of Discovering Management is to introduce students into the field of business management and entrepreneurship.

In particular, the aims of the course are to:
1. broaden understanding of management principles and frameworks
2. advance insights into the sources of corporate and entrepreneurial success
3. develop skills to apply this knowledge to real-life managerial problems

The course will help students to successfully take on managerial and entrepreneurial responsibilities in their careers and / or appreciate the challenges that entrepreneurs and managers deal with.

Content
The course consists of a set of theory and practice sessions, which will be taught on a weekly basis. The course will cover business management knowledge in corporate as well as entrepreneurial contexts.

The course consists of three blocks of theory and practice sessions: Discovering Strategic Management, Discovering Innovation Management, and Discovering HR and Operations Management. Each block consists of two or three theory sessions, followed by one practice session where you will apply the theory to a case.

The theory sessions will follow a “lecture-style” approach and be presented by an area specialist within D-MTEC. Practical examples and case studies will bring the theoretical content to life. The practice sessions will introduce you to some real-life examples of managerial or entrepreneurial challenges. During the practice sessions, we will discuss these challenges in depth and guide your thinking through team coaching.

Through small group work, you will develop analyses of each of the cases. The theory sessions will be assessed via a multiple choice exam.

Lecture notes
All course materials (readings, slides, videos, and worksheets) will be made available to inscribed course participants through Moodle. These course materials will form the point of departure for the lectures, class discussions and team work.

351-0778-01L Discovering Management (Pitch)

Does not take place this semester.
Complementary exercises for the module Discovering Management.

Prerequisite: Participation and successful completion of the module Discovering Management (351-0778-00L) is mandatory.

Abstract
This course is offered complementary to the basis course 351-0778-00L, “Discovering Management”. The course offers an additional exercise.

Objective
The general objective of Discovering Management (Exercises) is to complement the course “Discovering Management” with one larger additional exercise.

Discovering Management (Exercises) thus focuses on developing the skills and competences to apply management theory to a real-life exercise from practice.

Content
The exercise consists of delivering and submitting a “pitch” with a clear recommendation for one of the selected cases amongst those seen in Discovering Management, using your insights from Discovering Management, and an extra session on pitching.

Students have the option to either do this alone or in a group of two students.

Literature
All course materials (readings, slides, videos, and worksheets) will be made available to inscribed course participants through Moodle. Students following this course should also be enrolled for course 351-0778-00L, “Discovering Management”.

<tr>
<td>Abstract</td>
<td>Information technology plays an increasingly important role in research. To meet this challenging development, it is not only important to acquire respective skills, but also to consider and understand information technology in what sets it apart from other gestalts of technics (like mechanics, dynamics, or thermodynamics).</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>The aim of this colloquium is to counter an observable tendency, that proportional to the degree in which students master practical skills in computing, they increasingly submit uncritically, in their understanding and framing of problems, to the dictation of schemata and templates implemented by technical systems.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>The starting point for this colloquium is to comprehend computing not in terms of skills, but as a literacy which we can experience emerging today. Like in the case of writing as well, computing cannot exhaustively be reduced to either logics, grammar, arithmetics, or analytics. Rather, computation, if comprehended as a literacy, relates to any of the established categories of learning and raises questions of an architectonic kind. This colloquium draws from the principal richness of cultural forms of knowing and learning and thematizes approaches to formulate a theoretical stance on information technology for architects which is driven by and resting on the actual reality of computability today. In this, it is complementary to those theory courses on technology offered by the historical disciplines at ETH.</td>
<td></td>
<td></td>

The methodology of humanistic research grows more complex with every academic generation; it presents a thicket of epistemological frameworks rather than a straightforward array of tools. In the omnivorous field of architectural history and theory, the scholar faces yet further possibilities. This course considers the variety of available strategies for the creation of architectural histor(ies) and theor(ies) as an intellectual opportunity distinctive to our discipline. Through close study of a range of historically significant or innovative texts, we will deepen our understanding of how other scholars have structured their work and refine our own research methodologies.

The course, held over two semesters, combines a traditional doctoral theory seminar with a practical writing workshop. We will alternate reading-based discussions with working sessions directed towards the development of the doctoral plan to be submitted at the end of the first year.

The course schedule will be available at the beginning of the semester on the course moodle page.

Please note gta doctoral program courses begin the third week of the semester (the first week of October).

Lecture notes
PDFs of texts for discussion will be provided on the course moodle page (registered students only).

Prerequisites / notice
Required for first-year gta doctoral students; gta MAS and external doctoral students accepted by application, space permitting. Due to the intensive nature of the course, auditors and passive participants are not allowed. Please contact instructor for more information.

- Self-direction and Self-management

Content
The PhD-level course (primarily for A&T PhDs) will introduce computational methods for architecture, engineering, fabrication & construction, incentivising computational literacy. Students learn the theoretical background and basic implementation details of fundamental data structures and algorithms, and to solve realworld problems using the COMPAS framework and other open-source libraries.

Objective
Understand the scope and relevance of computational methods for architecture and engineering research and practice, ii) the theoretical background of fundamental data structures, iii) the basic principles of algorithmic design; iv) implement basic versions of prevalent algorithms related to architectural geometry, structural design, robotic assembly, volumetric modeling & 3D printing, high-performance computation; v) use sophisticated algorithms available through open-source libraries to solve real-world problems; and, vi) use common CAD tools as interfaces to self-implemented solutions.

Content
Course consists of a few lectures, several tutorials and project-based exercises. Topics include:
- intro Python programming
- intro COMPAS open-source framework (https://compas-ev.github.io)
- intro to geometry processing, data structures, topology, numerical computation
- domain-specific case studies (e.g. on architectural geometry, structural design, robotic assembly, volumetric modeling & 3D printing, high-performance computation)

Prerequisites / notice
Priority is given to PhD students.

052-0523-24L 360° - Reality to Virtuality
Enrolment in agreement with the lecturer only
kiryk@arch.ethz.ch

Abstract
"Again, If a thing can be done adequately by means of one, it is superfluous to do it by means of several; for we observe that nature does not employ two instruments where one suffices.”

The methodology of humanistic research grows more complex with every academic generation; it presents a thicket of epistemological frameworks rather than a straightforward array of tools. In the omnivorous field of architectural history and theory, the scholar faces yet further possibilities. This course considers the variety of available strategies for the creation of architectural histor(ies) and theor(ies) as an intellectual opportunity distinctive to our discipline. Through close study of a range of historically significant or innovative texts, we will deepen our understanding of how other scholars have structured their work and refine our own research methodologies.

Priority is given to PhD students.
This course explores the concept of "Hybrid Reality," blending digital and physical spaces using VR technologies. Students will learn to digitize spaces, create immersive environments, and design interactive exhibitions.

The goal is to digitize an existing space and use it in virtual reality as a context for further design. During the course, AI tools will be utilized to enhance the photogrammetry 3D scanning process. In the first part of the course, we learn the tools; then we work on architectural VR projects, either in groups or individually. Throughout the course, we will examine VR workflows to create immersive and interactive architectural spaces. At the end of the course, we will present the works in a VR exhibition. Each student receives an Oculus Quest VR headset to work at home throughout the semester.

Fusions of digital-analog relationships have accompanied us since the very beginning of the digitalization era. The rapidly growing impact of digital technologies on our life necessitates constant adaptation. The course introduces the term "Hybrid Reality," which represents the coexistence of physical and digital spaces. Using state-of-the-art VR technologies, the methodology focuses on immersive, real-time, 1:1 scale space creation, exploring corporeal design, and reinventing conventional methods. Students will learn to digitize physical spaces, create hybrid reality environments, and design interactive exhibitions.

The course "360 – Reality to Virtuality" is interconnected with "3D Scanning and Freeform Modeling". You must register for both courses. "360 – Reality to Virtuality" and "3D-Modeling" (2x 2 ETCS).

Classroom teaching as 4h block + self-teaching and research at home.

Max. number of participants 15 students.

A 200 CHF deposit will be charged for the VR Headset. It will be refunded upon the return of the headset on the last day of the course.

If you already have an Oculus Quest 2, you do not need to pay any deposit and can work on your own device.

Please send a short application email (max 150 words) to Adam Kiryk: kiryk@arch.ethz.ch

If you have questions or need assistance, please contact the seminar coordinator:

101-1400-01L Design++ Seminar Series/Kolloquium (autumn semester)

Abstract
Design++ (Center for Augmented Computational Design in Architecture, Engineering and Construction) is inviting national and international experts from different domains to AI, ML and XR within the AEC (Architecture, Engineering and Construction) domain. The goal of the Seminar Series is to promote the knowledge exchange between academia and industry.

Objective
Insight into current projects and new research results in the fields of AI, ML and XR from the AEC domain

Content
Implementation of AI, ML and XR within current projects from research and practice

064-0017-24L Researching Otherwise: Pluriversal Methodologies for Landscape and Urban Research

Abstract
Researching Otherwise is a call to craft another space for the production of knowledge. It posits that fluid epistemologies that respond to ways of decolonial, pluriversal, and more-than-human knowing can offer tools and ways for reimagining and reconstructing local worlds and transcending developmental paradigms of researching and operating.

Objective
Research in landscape and urban studies just like in other disciplines has been subject to the act of border and boundary-making that mediates, conditions, and limits its horizons while determining its outcomes. Some of these borders and boundaries are more familiar than others. In terms of geographical boundaries, for instance, the global north-south boundary has haunted landscape and urban research shrouded under the narratives of developmentalism. However, there are other borders such as the disciplinary ones, which attempts to separate and isolate a domain from other similarly specialised disciplines. This according to Paul Feyerabend is due to the tendency of modernity whereby ‘scientific education, aims to simplify “science” by simplifying its participants.’ Then there is the methodological boundaries established due to ‘cartesian dualism’, which act in the practice and training of becoming objective, teach researchers to be content with studying the products of imagination rather than working with imaginative processes themselves. Then there is a third, onto-epistemological border which defines that the knowing subject in the disciplines is not transparent and disincorporated or untouched by the geopolitical configuration of the world in which people and regions have and continue to be ranked and configured racially. It argues for moving away from a one world ontology. Decolonial thinkers such as Walter Mignolo and Gloria Anzaldúa have proposed for border thinking as a method for politically and epistemically de-linking from the web of imperial knowledge, which has energised a number of disobedient and anarchic traditions of researching otherwise.

Researching Otherwise is a call ‘to craft another space for the production of knowledge – another way of thinking, un paradigma otro, the very possibility of talking about “worlds and knowledge otherwise.”’. It posits that such ways of decolonial, pluriversal, and more-than-human knowing can offer tools and ways for reimagining and reconstructing local worlds and transcending developmental paradigms of researching and operating. Rather than rigid and closed epistemologies of knowing the landscape and the urban, this seminar promotes fluid epistemologies that respond to the incommensurabilities, radical alterities and other ways of knowing the environment.

The call for researching otherwise is to deploy methodological tools such as drawing, photographing, sounding and listening, filmmaking, walking, and cartography for not only unearthing and unmasking systems of power and domination but also for researching possible other worlds and for countering the disembodiment of research and the researcher.

The seminar will draw upon readings from a forthcoming publication by the same title. In terms of format, it will alternate between inputs by invited guests, reading and discussion sessions, tutorials, and peer-review. A number of input lectures by invited guests will take the participants of the seminar into ways and methods of researching otherwise. These input lectures will be alternated with thematically organised tutorial sessions and peer-review. The seminar participants can choose to present the work developed during the seminar at the LUS Doctoral Cris organised at the end of the semester.

The format will provide an overarching methodological meta-theme, to be defined prior to the event. One external guest critic will be invited. In this case, each presentation will conclude with a discussion round, providing sufficiently detailed feedback for every doctoral candidate.

The seminar will be connected with a forthcoming publication by the same title. In terms of format, it will alternate between inputs by invited guests, reading and discussion sessions, tutorials, and peer-review. A number of input lectures by invited guests will take the participants of the seminar into ways and methods of researching otherwise. These input lectures will be alternated with thematically organised tutorial sessions and peer-review. The seminar participants can choose to present the work developed during the seminar at the LUS Doctoral Cris organised at the end of the semester.

**ECTS**
European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
This course will cover the analysis and design of isolation systems to mitigate earthquakes and other forms of vibrations. The course will cover:

1. Conceptual basis of seismic isolation, seismic isolation types, mechanical characteristics of isolators.
3. Design approaches and code requirements.

After successfully completing this course the students will be able to:

1. Understand the mechanics of and design isolator bearings.
2. Understand the dynamics of and design an isolated structure.

This course will present methods of scientific machine and deep learning (ML / DL) for applications in design and construction. After

1. Understand main ML background theory and methods.
2. Incorporate scientific domain knowledge into ML and DL.

The topics to be covered are:

2. Incorporation of Domain Knowledge into ML and DL.
4. ML training, validation and testing pipelines for academic and research projects.

The course will include theory and algorithms for SciML, programming assignments, as well as a final project assessment.

The electronic copies of the learning material will be uploaded to ILIAS and available through myStudies. The learning material includes:

reading material, and (optional) exercise problems and solutions.

The electronic copies of the learning material will be uploaded to ILIAS and available through myStudies. The learning material includes:

3. Design of seismic isolated structures: from theory to practice, Farzad Naeim and James M. Kelly, John Wiley & Sons, 1999
5. 101-0157-01 Structural Dynamics and Vibration Problems course, or equivalent, or consent of the instructor. Students are expected to know basic modal analysis, elastic spectrum analysis and basic structural mechanics.
6. Mechanism of rubber bearings for seismic and vibration isolation, James M. Kelly and Dimitrios Konstantinidis, John Wiley & Sons, 2011
7. 101-0157-01 Structural Dynamics and Vibration Problems course, or equivalent, or consent of the instructor. Students are expected to know basic modal analysis, elastic spectrum analysis and basic structural mechanics.

Participants are expected to possess elementary skills in statistics, data science and machine learning, including both theory and practical modelling and implementation. The seminar targets students who are actively working on related research projects.

A comprehensive series of computer/lab exercises and in-class demonstrations will take place, providing a "hands-on" feel for the course topics.

The course script is composed by lecture slides, which are available online and will be continuously updated throughout the duration of the course.

The course will include theory and algorithms for SciML, programming assignments, as well as a final project assessment.

701-0015-00L Transdisciplinary Research: Challenges of Interdisciplinarity and Stakeholder Engagement
The lecture takes place if a minimum of 12 students register for it.

Abstract
This seminar is designed for PhD students and PostDoc researchers involved in inter- or transdisciplinary research. It addresses and discusses challenges of this kind of research using scientific literature presenting case studies, concepts, theories, methods and by testing practical tools. It concludes with a 10-step approach to make participants' research projects more societally relevant.

Objective
Participants know specific challenges of inter- and transdisciplinary research and can address them by applying practical tools. They can tackle questions like: how to integrate knowledge from different disciplines, how to engage with societal actors, or how to secure broader impact of research. They learn to critically reflect their own research project in its societal context and on their role as scientists.

Content
The seminar covers the following topics:
(1) Theories and concepts of inter- and transdisciplinary research
(2) The specific challenges of inter- and transdisciplinary research
(3) Collaborating between different disciplines
(4) Engaging with stakeholders
(5) 10 steps to make participants' research projects more societally relevant
Throughout the whole course, scientific literature will be read and discussed as well as practical tools explored in class to address concrete challenges.

Literature
Literature will be made available to the participants.
The following open access article builds a core element of the course:
Further, this collection of tools will be used:
https://naturalsciences.ch/topics/co-producing_knowledge
https://www.shapeitoolkit.eu

Prerequisites / notice
Participation in the course requires participants to be working on their own research project.
Dates (Wednesdays, 8h15-12h00)

701-0523-15L Frontiers in Machine Learning Applied to Civil, Env. and Geospatial Engineering
Does not take place this semester.

Abstract
This doctoral seminar organised by the D-BAUG platform on data science and machine learning aims at discussing recent research papers in the field of machine learning and analyzing the transferability/adaptability of the proposed approaches to applications in the field of civil and environmental engineering (if possible and applicable, also implementing the adapted algorithms).

Objective
Students will
• Critically read scientific papers on the recent developments in machine learning
• Put the research in context
• Present the contributions
• Discuss the validity of the scientific approach
• Evaluate the underlying assumptions
• Evaluate the transferability/adaptability of the proposed approaches to own research
• (Optionally) implement the proposed approaches.
With the increasing amount of data collected in various domains, the importance of data science in many disciplines, such as infrastructure monitoring and management, transportation, spatial planning, structural and environmental engineering, has been increasing. The field is constantly developing further with numerous advances, extensions and modifications.

The course aims at discussing recent research papers in the field of machine learning and analyzing the transferability/adaptability of the proposed approaches to applications in the field of civil and environmental engineering (if possible and applicable, also implementing the adapted algorithms).

Each student will select a paper that is relevant for his/her research and present its content in the seminar, putting it into context, analyzing the assumptions, the transferability and generalizability of the proposed approaches. The students will also link the research content of the selected paper to their own research, evaluating the potential of transferring or adapting it. If possible and applicable, the students will also implement the adapted algorithms. The students will work in groups of three students, where each of the three students will be reading each other's selected papers and providing feedback to each other.

This doctoral seminar is intended for doctoral students affiliated with the Department of Civil, Environmental and Geomatic Engineering. Other students who work on related topics need approval by at least one of the organisers to register for the seminar.

Participants are expected to possess elementary skills in statistics, data science and machine learning, including both theory and practical modelling and implementation. The seminar targets students who are actively working on related research projects.

Autumn Semester 2024
Page 713 of 2680
Only for doctoral students.

Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

Abstract
Active participation in commissions or university bodies, like associations of scientific staff, the university assembly or similar for at least 1 year.

Objective
Active participation in commissions or university bodies, like associations of scientific staff, the university assembly or similar for at least 1 year.

<td>1S</td>
<td>C. Sailer</td>
</tr>
<tr>
<td></td>
<td>Only for doctoral students.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Abstract</td>
<td>This course sensitises doctoral students to ethical issues that may arise during their doctorate. After an introduction to ethics and good scientific practice, students are familiarised with resources that can assist them with ethical decision-making. Students are given the opportunity to apply their knowledge and train their newly acquired skills in an interactive, discipline specific context.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>Doctoral students learn how to identify, analyse and address ethical issues in their own scientific research. Furthermore, they are encouraged to reflect on their professional role as scientific researchers.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>The self-paced e-learning course consists of several modules:</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Module Ethics: Introduction to moral theory (with emphasis on practical guidance regarding decision making)</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Module Ethics in scientific research: Introduction to ethical issues that occur within scientific research (i.e. regarding authorship, cooperation, data use and sharing, and other aspects that are subject to scientific integrity and good scientific practice).</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Module Identification of ethical issues: A variety of tools and resources that help identify ethical issues are presented and explained</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Module Setting up a strategy: Example examination of a case regarding its ethical scope (students develop their own strategy to examine situations for their ethical implications).</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Module Making decisions: Different ways of addressing ethical issues are presented and explained (i.e. how to make hard choices or solve ethical dilemmas).</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>

**Abstract**
The course gives an introduction to human and comparative neuroanatomy, molecular, cellular and systems neuroscience.

**Objective**
The course gives an introduction to the development and anatomical structure of nervous systems. Furthermore, it discusses the basics of cellular neurophysiology and neuropharmacology. Finally, the nervous system is described on a system level.

**Content**
1. Human Neuroanatomy I&II
2. Comparative Neuroanatomy
3. Building a central nervous system I,II
4. Synapses I,II
5. Glia and more
6. Excitability
7. Circuits underlying Emotion
8. Visual System
9. Auditory & Vestibular System
10. Somatosensory and Motor Systems
11. Learning in artificial and biological neural networks

**Prerequisites / notice**
For doctoral students of the Neuroscience Center Zurich (ZNZ).

**Abstract**
The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.

**Objective**
The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.

**Content**
The class covers separation techniques that are central in the purification and downstream processing of chemicals and biopharmaceuticals. Examples from both areas illustrate the utility of the methods: 1) Adsorption and chromatography; 2) Membrane processes; 3) Crystallization and precipitation.

**Prerequisites / notice**
Requirements (recommended, not mandatory): Thermal separation Processes I (151-0926-00) and Modelling and mathematical methods in process and chemical engineering (151-0940-00)

**Abstract**
This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning "good practice" that can be applied in every student's own projects and daily work life. A special focus will be laid in the use of the statistical software package R for regression analysis.

**Objective**
The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.

**Content**
The course starts with the basics of linear modeling, and then proceeds to parameter estimation, tests, confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, multicollinearity problems and model interpretation, as well as general modeling strategies.

The last third of the course is dedicated to an introduction to generalized linear models: this includes the generalized additive model, logistic regression for binary response variables, binomial regression for grouped data and poisson regression for count data.

**Lecture notes**
A script will be available.
Literature

Faraway (2005): Linear Models with R
Faraway (2006): Extending the Linear Model with R
Draper & Smith (1998): Applied Regression Analysis
Fox (2008): Applied Regression Analysis and GLMs
Montgomery et al. (2006): Introduction to Linear Regression Analysis

Prerequisites / notice

The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L "Applied Statistical Regression" and 401-3622-00L "Statistical Modelling" are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

401-5640-00L ZuKoSt: Seminar on Applied Statistics

Abstract
About 3 talks on applied statistics.

Objective
See how statistical methods are applied in practice.

Content
There will be about 3 talks on how statistical methods are applied in practice.

Prerequisites / notice
This is no lecture. There is no exam and no credit points will be awarded. The current program can be found on the web: http://stat.ethz.ch/events/zukost

Course language is English or German and may depend on the speaker.

Competencies

Subject-specific Competencies
- Concepts and Theories: fostered
- Techniques and Technologies: fostered

Method-specific Competencies
- Decision-making: fostered
- Problem-solving: fostered

551-1109-00L Seminars in Microbiology

Abstract
Seminars by invited speakers covering selected microbiology themes.

Objective
Discussion of selected microbiology themes presented by invited speakers.

501-0620-00L Statistical Consulting

Abstract
The Statistical Consulting service is open for all members of ETH, including students, and partly also to other persons.

Objective
Advice for analyzing data by statistical methods.

Content
Students and researchers can get advice for analyzing scientific data, often for a thesis. We highly recommend to contact the consulting service when planning a project, not only towards the end of analyzing the resulting data!

Prerequisites / notice
This is not a course, but a consulting service. There are no exams nor credits.

Contact: beratung@stat.math.ethz.ch . Tel. 044 632 2223. See also http://stat.ethz.ch/consulting

Requirements: Knowledge of the basic concepts of statistics is desirable.

551-0512-00L Current Topics in Molecular and Cellular Neurobiology

Abstract
The course is a literature seminar or "journal club". Each Friday a student, or a member of the Suter Lab in the Institute of Molecular Health Sciences, will present a paper from the recent literature.

Objective
The course introduces you to recent developments in the fields of cellular and molecular neurobiology. It also supports you to develop your skills in critically reading the scientific literature. You should be able to grasp what the authors wanted to learn i.e. their goals, why the authors chose the experimental approach they used, the strengths and weaknesses of the experiments and the data presented, and how the work fits into the wider literature in the field. You will present one paper yourself, which provides you with practice in public speaking.

Data: 26.07.2024 12:39  Autumn Semester 2024  Page 718 of 2680
701-1401-00L  Zürich Ecology and Evolution Interaction Seminar

**Objective**
Students gain competences in presenting their work orally, leading discussions about current topics in ecology and evolution, interacting with colleagues from various subdisciplines, and engaging in critical dialogue about ongoing research projects.

**Content**
Scientific presentations by doctoral students about ongoing research projects: guest presentations by established researchers, interactive discussions about current research in ecology, evolution, and population biology.

551-0509-00L  Current Immunological Research in Zurich

**Abstract**
This monthly meeting is a platform for Zurich-based immunology research groups to present and discuss their ongoing research projects. At each meeting three PhD students or Postdocs from the participating research groups present an ongoing research project in a 30 min seminar followed by a plenary discussion.

**Objective**
The aim of this monthly meeting is to provide further education for master and doctoral students as well as Postdocs in diverse topics of immunology and to give an insight in the related research. Furthermore, this platform fosters the establishment of science- and technology-based interactions between the participating research groups.

**Content**
Presentation and discussion of current research projects carried out by various immunology-oriented research groups in Zurich.

**Lecture notes**
none

551-1615-00L  NMR Methods for Studies of Biological Macromolecules

**Prerequisites:** Basic knowledge in biological NMR spectroscopy.

**Abstract**
In this seminar series, topics relevant to solution state NMR with biological macromolecules are treated. Each semester a different aspect of biomolecular NMR is discussed in depth. The course is tailored to advanced students (PhD students and postdocs) who have experience with applications of NMR spectroscopy. Each participant presents a selected topic in form of a seminar.

**Objective**
The students will actively participate in the course which is held in the form of a seminar. Individual students will prepare particular topics of the course based on literature references and present the material in form of a seminar to their fellow students. In short, the students learn to actively participate in discussions and to prepare a presentation of a scientific topic which was mostly unknown to them before.

551-1409-00L  RNA Biology Lecture Series II: Non-Coding RNAs: Biology and Therapeutics

**Prerequisites / notice**
Does not take place this semester.

**Abstract**
This course covers aspects of RNA biology related to the functions of non-coding RNAs as well as their use as drugs to treat diseases.

**Objective**
The students should get familiar with the wide array of roles, which non-coding RNAs play in cellular functions.

**Content**
Micro RNAs; computational approaches to miRNAs; micro RNA function in metabolism; viruses and viral RNAs; ncRNA-mediated genome regulation; epigenetic programming of genome remodelling in ciliates; telomerase and telomeres; TRNA biology.

**Prerequisites / notice**
Basic knowledge of cell and molecular biology.

551-1407-00L  RNA Biology Lecture Series I: Transcription & Processing & Translation

**Prerequisites / notice**
Does not take place this semester.

**Abstract**
This course covers aspects of RNA biology related to the functions of non-coding RNAs as well as their use as drugs to treat diseases.

**Objective**
The students should get familiar with the wide array of roles, which non-coding RNAs play in cellular functions.

**Content**
Micro RNAs; computational approaches to miRNAs; micro RNA function in metabolism; viruses and viral RNAs; ncRNA-mediated genome regulation; epigenetic programming of genome remodelling in ciliates; telomerase and telomeres; TRNA biology.
Abstract
This course covers aspects of RNA biology related to gene expression at the posttranscriptional level. These include RNA transcription, processing, alternative splicing, editing, export, and translation.

Objective
The students should obtain an understanding of these processes, which are at work during gene expression.

Content
Transcription & 3'end formation; splicing, alternative splicing, RNA editing, polyadenylation, export, RNP biogenesis, nuclear export, miRNA surveillance & miRNA turnover; signal transduction & RNA.

Prerequisites / notice
Basic knowledge of cell and molecular biology.

<td>B. Vienni Baptista, C. E. Pohl, M. Stauffacher</td>
</tr>
</tbody>
</table>

Abstract
This seminar is designed for PhD students and PostDoc researchers involved in inter- or transdisciplinary research. It addresses and discusses challenges of this kind of research using scientific literature presenting case studies, concepts, theories, methods and by testing practical tools. It concludes with a 10-step approach to make participants' research projects more societally relevant.

Objective
Participants know specific challenges of inter- and transdisciplinary research and can address them by applying practical tools. They can tackle questions like: how to integrate knowledge from different disciplines, how to engage with societal actors, or how to secure broader impact of research. They learn to critically reflect their own research project in its societal context and on their role as scientists.

Content
The seminar covers the following topics:
1. Theories and concepts of inter- and transdisciplinary research
2. The specific challenges of inter- and transdisciplinary research
3. Collaborating between different disciplines
4. Engaging with stakeholders
5. 10 steps to make participants’ research projects more societally relevant

Throughout the whole course, scientific literature will be read and discussed as well as practical tools explored in class to address concrete challenges.

Literature
Literature will be made available to the participants.
The following open access article builds a core element of the course:
available at (open access): http://www.ingentaconnect.com/content/oekom/gaia/2017/00000026/00000001/art00011

Further, this collection of tools will be used:
https://naturalsciences.ch/topics/co-producing_knowledge
https://www.shapeitoolkit.eu

Prerequisites / notice
Participation in the course requires participants to be working on their own research project.

Participation in the course requires participants to be working on their own research project.

Dates (Wednesdays, 8h15-12h00)

551-0357-00L Cellular Matters: Properties, Functions and Applications of Biomolecular Condensates

The number of participants is limited to 30 and will only take place with a minimum of 6 participants.

Abstract
This Master level course delves into the emerging field of biomolecular condensates - membrane-less organelles in cells. Using interdisciplinary concepts from biology, chemistry, biophysics, and soft matter, we will explore the biological properties of these condensates, their functions in health and disease, and their potential as new biomimetic materials for various applications.

Objective
In the last decade, a novel type of cell compartments called biomolecular condensates have been discovered. This discovery is radically changing our understanding of the cell, its organization, and dynamics. The emerging picture is that the cytoplasm and nucleoplasm are highly complex fluids that can (meta)stably segregate into membrane-less compartments, similar to emulsions.

This interdisciplinarity course encompasses milestone works and cutting-edge research questions in the young field of biomolecular condensates, including their properties, functions, and applications. The course begins with a lecture series that introduces the topic of condensates to an interdisciplinary audience and provides a theoretical foundation for understanding current research questions in the field. The course will provide a basis for student presentations of recent publications in the field, and for research seminars given by course lecturers, who are all active researchers with diverse expertise. Through this exciting interdisciplinary understanding of biomolecular condensates, bridging biology, chemistry, biophysics, and soft matter.

Students will not only learn how to critically read and evaluate scientific literature but will also gain valuable experience in giving scientific presentations to an interdisciplinary audience. Each presentation will require an introduction, critical analysis of the results, and a discussion of their significance, allowing student to substantiate their statements with a critical mindset that considers the pros and cons of chosen approaches and methods, as well as any limitations or possible follow-up experiments. This process will enable student to ask relevant questions and actively participate in class discussions, further enhancing their scientific skills.

In preparing the presentations, the students will have the unique opportunity to interact closely with each other and with the lecturers, who are all internationally well-established experts, and receive guidance in selecting a topic for the final presentation and supporting literature.
The topic of biomolecular condensates goes beyond the boundaries of traditional disciplines and requires a multi-disciplinary approach that leverages and cross-fertilizes biology, physical chemistry, biophysics, and soft matter. This course will explore the properties, functions and potential applications of biomolecular condensates, including their role in neurodegenerative diseases such as Alzheimer's and Parkinson's, as well as their use as smart biomimetic materials.

This course is divided into two parts. The fist part will introduce the basic concepts essential to the study of biomolecular condensates and phase separation. Topics include: fundamental units and scales in soft matter, phase transitions in biology, biopolymers and molecular self-assembly, introduction to active matter. This will establish a foundation for the second part, which will explore milestone works and current research in the field of biomolecular condensates. Each lecture of this second part will consist of:

1) a short literature seminar, where student groups will present and discuss a milestone paper assigned in advance and
2) a research seminar, where one of the course lecturers will present their own state-of-the-art research in the field, building upon the milestone literature.

At the beginning of the course, student groups will be formed and assigned to the milestone papers. To facilitate this, students must confirm their registration by the beginning of the 3rd week of semester.

**Abstract**

Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

**Objective**

Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

### 900-0112-DRL Participation in Commission I (min 1 year)

**Abstract**

Active participation in commissions or university bodies, like associations of scientific staff, the university assembly or similar for at least 1 year.

**Objective**

Active participation in commissions or university bodies, like associations of scientific staff, the university assembly or similar for at least 1 year.

---

### 900-0113-DRL Participation in Commission II (min 1 year)

**Abstract**

Active participation in commissions or university bodies, like associations of scientific staff, the university assembly or similar for at least 1 year.

**Objective**

Active participation in commissions or university bodies, like associations of scientific staff, the university assembly or similar for at least 1 year.

---

### 900-0114-DRL Member of Executive Board (min 1 year)

**Abstract**

Active participation in the presidium or executive board of a university group for at least 1 year.

**Objective**

Active participation in the presidium or executive board of a university group for at least 1 year.

---

### 701-0703-00L Environmental Ethics (University of Zurich)

**Abstract**

The pressing environmental challenges of today demand a critical reflection. Ethics is an important tool for doing so. This lecture introduces the basics of ethics and provides in-depth knowledge of environmental ethics and its debates. This theoretical background will be applied and critically reflected using examples of current environmental challenges.

**Objective**

On completion of this lecture, you have acquired the ability to identify, analyze, critically reflect and resolve ethical challenges in general and specifically regarding the environment. You know basic concepts, positions and lines of argumentation from the debate in environmental ethics, which you have applied and discussed in smaller exercises.

---

### 851-0745-00L Ethics Workshop: The Impact of Digital Life on Society

**Abstract**

This workshop focuses on understanding and managing the ethical and social issues arising from the integration of new technologies in various aspects of daily life.

**Objective**

- Explain relevant concepts in ethics.
- Evaluate the ethical dimensions of new technology uses.
- Identify impacted stakeholders and who is ethically responsible.
- Engage constructively in the public discourse relating to new technology impacts.
- Review tools and resources currently available that facilitate resolutions and ethical practice.
- Work in a more ethically reflective way.
The workshop offers students an experience that trains their ability for critical analysis and develops awareness of responsibilities as a researcher, consumer and citizen. Learning will occur in the context of three intensive workshop days, which are highly interactive and focus on the development and application of reasoning skills.

The workshop will begin with some fundamentals: the nature of ethics, of consent and big data, of AI ethics, public trust and health ethics. Students will then be introduced to key ethical concepts such as fairness, autonomy, trust, accountability, justice, as well different ways of reasoning about the ethics of digital technologies.

A range of practical problems and issues in the domains of education, media, society, digital health and justice will be then considered. These domains are represented respectively by unique and interesting case studies. Each case study has been selected not only for its timely and engaging nature, but also for its relevance. Through the analysis of these case studies key ethical questions (such as fairness, accountability, explainability, access etc.) will be highlighted and questions of responsibility and tools for ethical practice will be explored. Throughout, the emphasis will be on learning to make sound arguments about the ethical aspects of policy, practice and research.

### Competencies

#### Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

#### Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: assessed
- Media and Digital Technologies: assessed
- Problem-solving: assessed

#### Social Competencies
- Communication: assessed
- Cooperation and Teamwork: fostered
- Self-presentation and Social Influence: fostered
- Negotiation: assessed

#### Personal Competencies
- Creative Thinking: fostered
- Critical Thinking: assessed
- Integrity and Work Ethics: fostered
- Self-awareness and Self-reflection: fostered

### 376-1661-00L Ethics of Life Sciences and Biotechnology

#### Abstract
This semester course enables students to recognize, anticipate and address ethical issues in the domain of health sciences and their technological application. The students will acquire the necessary theoretical and analytic resources to develop critical thinking skills in the field of applied ethics and will practice how to use such resources to address concrete ethical issues in health sciences.

#### Objective
This course is tailored to students who want to become familiar with the analysis of ethical issues in all the different domains of life sciences and biotechnology. The course aims at equipping students with the necessary knowledge and analytic skills to understand, discuss and address the ethical aspects of science and technology in the domain of human health. The specific learning objectives of this course are:

A. Identify ethical issues in in life sciences and biotechnology.
B. Analyze and critically discuss ethical issues in life sciences and biotechnology.
C. Become aware of relevant legal and public policy frameworks.
D. Distinguish different ethical approaches and argumentative strategies in applied ethics.
E. Recognize how ethical issues relate to different accounts of technology and innovation.
F. Develop a personal and critical attitude towards the ethical aspects of life sciences and their technological application.
G. Autonomously anticipate ethical issues.
H. Propose and communicate solutions to ethical challenges and dilemmas.

#### Content
The course starts off with an introductory lecture on ethics as a discipline and an overview of the most relevant approaches in the domain of applied ethics. The students will also be introduced to current theoretical accounts of technology and will start to appreciate the relevance of ethics especially with respect to new and emerging technologies. Usable analytic tools will also be provided, thus enabling the students to engage with the discipline in a practical way from the very onset of the semester.

The course will continue with thematic sessions covering a broad variety of topics all of which are relevant to the different study tracks offered by the department. In particular, the course will cover the following domains: digital health technologies and medical AI; food; nutrition and healthy longevity; biomedical engineering; genetics; neuroscience and Neurotechnologies; medical robotics; disability and rehabilitation; mammalian ethics. The course will also include sessions on cross-cutting ethically relevant aspects of health sciences and technologies, namely: access to innovation, translational research, the relation between science and public policy.

All the topics of the course will be illustrated and interactively discussed through many case studies, offering the students the opportunity to prepare and present them, and to use them in individual as well as group exercises. Throughout the course, the students will have multiple opportunities to experiment with ethical argumentation and to practice their evolving skills.

#### Competencies

#### Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: fostered

#### Method-specific Competencies
- Analytical Competencies: assessed
- Media and Digital Technologies: fostered

#### Social Competencies
- Communication: assessed
- Cooperation and Teamwork: fostered
- Leadership and Responsibility: fostered
- Self-presentation and Social Influence: fostered
- Sensitivity to Diversity: fostered

#### Personal Competencies
- Adaptability and Flexibility: fostered
- Creative Thinking: fostered
- Critical Thinking: assessed
- Integrity and Work Ethics: assessed
- Self-awareness and Self-reflection: assessed

### 851-0178-00L Ethics and Scientific Integrity for Doctoral Students

#### Abstract
This course sensitisises doctoral students to ethical issues that may occur during their doctorate. After an introduction to ethics and good scientific practice, students are familiarised with resources that can assist them with ethical decision-making. Students get the chance to apply and deepen their knowledge in an interactive face-to-face workshop.

#### Objective
Doctoral students learn how to identify, analyse and address ethical issues in their own scientific research. In addition, they will reflect on their professional role as scientific researchers.
Content:

Part I on Moodle
The self-paced e-learning course on Moodle consists of 5 modules:

Module 1: Ethics
- Introduction to moral theory (with emphasis on practical guidance regarding decision making)

Module 2: Ethics in scientific research
- Introduction to ethical issues that occur within scientific research (i.e. regarding authorship, cooperation, data use and sharing, and other aspects that are subject to scientific integrity and good scientific practice).

Module 3: Collecting resources
- A variety of tools and resources that help identify ethical issues are presented and explained

Module 4: Setting up a strategy
- Example examination of a case regarding its ethical scope (students develop their own strategy to examine situations for their ethical implications).

Module 5: Making decisions
- Different ways of addressing ethical issues are presented and explained (i.e. how to make hard choices, or solve ethical dilemmas. But also where to seek advice if needed).

Part II
The second, face-to-face part (group sessions) of this course provides an interactive learning environment (workshop). Students get to apply their knowledge, and they are encouraged to reflect on ethical problems and to critically discuss them with fellow doctoral students.

Prerequisites / notice

For doctoral students only.

Hence, when you choose a group make sure you have enough time to finish the first part on Moodle before the workshop starts (appr. 20 hours).

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>Evolution is the one theory that encompasses all of biology. It provides a single, unifying concept to understand the living systems that we observe today. We will introduce several types of mathematical models of evolution to describe gene frequency changes over time in the context of different biological systems, focusing on asexual populations. Viruses and cancer cells provide the most prominent examples of such systems and they are at the same time of great biomedical interest. The course will cover some classical mathematical population genetics and population dynamics, and also introduce several new approaches. This is reflected in a diverse set of mathematical concepts which make their appearance throughout the course, all of which are introduced from scratch. Topics covered include the quasispecies equation, evolution of HIV, evolutionary game theory, evolutionary stability, evolutionary graph theory, tumor evolution, stochastic tunneling, genetic progression of cancer, diffusion theory, fitness landscapes, branching processes, and evolutionary escape.</td>

</table>
Objective

Students will learn state-of-the-art approaches to modelling spatial effects in dynamical biological systems. The course provides an introduction to dynamical system, and covers the mathematical analysis of pattern formation in growing, developing systems, as well as the description of mechanical effects at the cell and tissue level. The course also provides an introduction to image-based modelling, i.e. the use of microscopy data for model development and testing. The course covers classic as well as current approaches and exposes students to open problems in the field. In this way, the course seeks to prepare students to conduct research in the field. The course prepares students for research in developmental biology, as well as for applications in tissue engineering, and for biomedical research.

Content

1. Introduction to Modelling in Biology
2. Bioimage Analysis
3. Morphogen Gradients
4. Precision & Robustness of Patterning
5. Mathematical Description of Growing Biological Systems
6. Travelling Waves & Wave Pinning
7. Turing Patterns
8. Chemotaxis
9. Epithelial Organisation
10. Tissue Simulation Frameworks
11. Tissue Mechanics & Fluid Dynamics
12. Growth Control
13. Image-Based Modelling
14. Summary

Lecture notes

All lecture material will be made available online via Moodle.

Literature

The lecture course is not based on any textbook. The following textbooks are related to some of its content. The textbooks may be of interest for further reading, but are not necessary to follow the course:

- Murray, Mathematical Biology, Springer
- Forgacs and Newman, Biological Physics of the Developing Embryo, CUP
- Keener and Sneyd, Mathematical Physiology, Springer
- Fall et al., Computational Cell Biology, Springer
- Szallasi et al., System Modeling in Cellular Biology, MIT Press
- Wolkenhauer, Systems Biology
- Keyseziq, Engineering Mathematics, Wiley

Prerequisites / notice

The course is self-contained. The course assumes no background in biology but a good foundation regarding mathematical and computational techniques.

Abstract

Students are introduced to the basics of microtechnology, cleanroom, semiconductor and silicon process technologies. They will get to know the fabrication of mostly silicon-based microdevices and -systems and all related microfabrication processes.

Objective

Students are introduced to the basics of microtechnology, cleanroom, semiconductor and silicon process technologies. They will get to know the different fabrication methods for various microdevices and systems.

Content

Introduction to microtechnology, semiconductors, and micro electro mechanical systems (MEMS)

- Fundamentals of semiconductors and band model
- Fundamentals of devices: transistor and diode.
- Silicon processing and fabrication steps
- Silicon crystal structure and manufacturing
- Thermal oxidation
- Doping via diffusion and ion implantation
- Photolithography
- Thin film deposition: dielectrics and metals
- Wet etching & bulk micromachining
- Dry etching & surface micromachining
- Microelectronic processing and fabrication sequence
- Optional: Packaging

Handouts in English

Prerequisites / notice

Fundamentals in physics and physicochemistry (orbital models etc.) are required, a repetitorium of fundamental physics and quantum theory at the semester beginning can be offered.

The information on the web can be updated until the beginning of the semester.
This course offers an in-depth exploration of the use and engineering of enzymes in biotechnology, spanning fundamental enzymology, enzyme engineering, and applied biocatalysis. Topics will include (1) thermodynamic, kinetic, and mechanistic principles of enzyme catalysis, (2) the generation and engineering of enzymes through technologies such as protein design and directed evolution, (3) industrially applied biocatalysis, and (4) future challenges for biocatalysis.

**Objective**
Students will learn to identify opportunities for utilizing enzymes in biotechnology and develop basic and advanced enzyme engineering skills, informed by the latest research and techniques.

**Content**
This course offers an in-depth exploration of the use and engineering of enzymes in biotechnology, spanning fundamental enzymology, enzyme engineering, and applied biocatalysis. Topics will include (1) thermodynamic, kinetic, and mechanistic principles of enzyme catalysis, (2) the generation and engineering of enzymes through technologies such as protein design and directed evolution, (3) industrially applied biocatalysis, and (4) future challenges for biocatalysis.

**Lecture notes**
Notes will be provided in the form of handouts.

**Literature**
The course will use selected parts of textbooks, original scientific publications, and reviews, which will be shared during the lecture.

**Competencies**
- **Subject-specific Competencies**
  - Concepts and Theories
  - Techniques and Technologies
  - Analytical Competencies
  - Communication
  - Self-direction and Self-management
- **Method-specific Competencies**
  - Critical Thinking

---

**Biotechnology of Enzymes**

**Abstract**
This course covers the role of enzymes in biotechnology, from discovery via engineering to applications in a variety of fields from food to the pharmaceutical industry.

**Objective**
This course offers an in-depth exploration of the use and engineering of enzymes in biotechnology, spanning fundamental enzymology, enzyme engineering, and applied biocatalysis. **Biological Engineering and Biotechnology**

**Abstract**
Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

**Objective**
Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

**Content**

**Lecture notes**
Handout during the course.

**Biomolecular Nanotechnology**

**Abstract**
Biomolecular nanotechnology is a broad field that focuses on the study and science of biological materials including DNA, RNA and proteins at length scales below 10 nm. This is a broad overview of the topic with a focus on current research themes.

**Objective**
The objective is to familiarise the students with a broad range of topics related to biotechnology, nanotechnology, and biophysics with a focus on current research and reading of scientific literature.

**Content**
Introduction to biomacromolecules; Measurement techniques for characterisation of biomacromolecules; Fundamentals of molecular recognition; Recombinant DNA; Protein engineering; Directed evolution; Protein folding; Polymers; Elastin-like polypeptides; Intelligent materials; Spatially localized hydrogels; Mechanical properties of proteins and macromolecules; Single-molecule force spectroscopy

**Literature**
Representative literature:
(1) Alberts, Molecular Biology (Ch.2 Cellular chemistry).
(2) Ratner, Biomaterials Science (Ch. 2.3, 2.4 Polymers & hydrogels).
(3) Walsh, Protein Biochemistry, (Ch. 2. Protein Structure).

**Stem Cells: Biology and Therapeutic Manipulation**

**Abstract**
Stem cells are central in tissue regeneration and repair, and hold great potential for therapy. We will discuss the role of stem cells in health and disease, and possibilities to manipulate their behavior for therapeutic application. Basic molecular and cell biology, engineering and novel technologies relevant for stem cell research and therapy will be discussed.

**Objective**
Understanding of current knowledge, and lack thereof, in stem cell biology, regenerative medicine and required technologies. Theoretical preparation for practical laboratory experimentation with stem cells.
We will use different diseases to discuss how to potentially model, diagnose or heal them by stem cell based therapies. This will be used as a guiding framework to discuss relevant concepts and technologies in cell and molecular biology, engineering, imaging, bioinformatics, tissue engineering, that are required to manipulate stem cells for therapeutic application.

- Embryonic and adult stem cells and their niches
- Induced stem cells by directed reprogramming
- Relevant basic cell biology and developmental biology
- Relevant molecular biology
- Cell culture systems
- Cell fates and their molecular control by transcription factors and signalling pathways
- Cell reprogramming
- Disease modelling
- Tissue engineering
- Bioimaging, Bioinformatics
- Single cell technologies

636-0118-00L Introduction to Dynamical Systems with Applications to Biology

**Objective**
The goal of this course is to introduce the student to dynamical systems and to develop a solid understanding of their fundamental properties. The theory will be developed systematically, focusing on analytical methods for low dimensional systems, geometric intuition, and application examples from biology. Computer simulations using matlab will be used to demonstrate various concepts.

**Contents**
- A dynamical view of the world: the importance of nonlinearity; solutions of differential equations; solving equations on the computer; the phase plane; fixed points and stability; linear stability analysis; classifications of linear systems; Liapunov functions and nonlinear stability; cycles and oscillations; bifurcations and bifurcation diagrams. Many biological examples will be used through the course to demonstrate the concepts

**Lecture notes**
Lecture slides will be available on moodle.

**Literature**

**Prerequisites / notice**
Prerequisites: Calculus; a first course in differential equations; basic linear algebra (eigenvalues and eigenvectors). Matlab programming.

636-0119-00L Introduction to Statistics and R

**Abstract**
This course offers a practical introduction to the fundamentals of data analysis and R

**Objective**
To acquire the statistical understanding to design an appropriate analysis and the practical skills to implement the analysis in R and present the results.

**Contents**
- Data analysis is fundamental for arriving at scientific conclusions and testing different hypotheses. This course offers a hands-on introduction to statistical analyses including: exploratory data analysis, testing differences in populations, p-values, power calculations, multiple testing, confounding, linear regression, maximum likelihood, model selection, and logistic regression; along with the fundamentals of R programming including markdown and data handling with the tidyverse.

**Lecture notes**
Lecture slides will be available with access to Rstudio with some markdown and tidyverse packages installed.

**Prerequisites / notice**
Access to Rstudio with some markdown and tidyverse packages installed.

636-0017-00L Computational Biology

**Abstract**
The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Computational algorithms extracting biological information from genetic sequence data are discussed, and statistical tools to understand this information in detail are introduced.

**Objective**
Attendees will learn which information is contained in genetic sequencing data and how to extract information from this data using computational tools. The main concepts introduced are:
- stochastic models in molecular evolution
- phylogenetic & phylodynamic inference
- maximum likelihood and Bayesian statistics

Attendees will apply these concepts to a number of applications yielding biological insight into:
- epidemiology
- pathogen evolution
- macroevolution of species

**Contents**
The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods for direct alignment analysis using approaches such as BLAST and GWAS. Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. Lastly, we introduce the field of phylogeography, the aim of which is to understand and quantify population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

**Lecture notes**
Lecture slides will be available on moodle.
This course introduces how Modelling and Simulation (=mathematical modelling) is applied today for the development of novel drugs in the pharmaceutical industry. Understanding the pharmacology, pharmacokinetics and pharmacodynamics (PK/PD) of novel drugs is key for a successful drug development process. Modelling and Simulation of these data is at the core to gain biological understanding. The aim of this course is to provide an introductory overview of mathematical and computational methods for the modeling, simulation and analysis of biological networks. We will start with an introduction into the basic units, functions and design principles that are relevant for biology at the level of individual cells. Making extensive use of example systems, the course will then focus on methods that allow for the investigation of biological networks with increasing detail. These include (i) graph theoretical approaches for revealing large-scale network organization, (ii) probabilistic (Bayesian) network representations, (iii) structural network analysis based on reaction stoichiometries, (iv) qualitative methods for dynamic modeling and simulation (Boolean and piece-wise linear approaches), (v) mechanistic modeling using ordinary differential equations (ODEs) and finally (vi) stochastic simulation methods.

The methodology part will cover compartmental PK/PD modelling, the practical aspects of numerical solutions of ordinary differential equations (ODEs) and the then (G)illespie or (non-)linear mixed effects (NLME) modelling, which has become the de-facto standard methodology in the pharmaceutical industry. Practical problems of Modelling and Simulations will be discussed including parameter identifiability, model development and model evaluation and the application (or not) of the Occam’s Razor. The course will focus on hands-on exercises using contemporary real-world examples from the pharmaceutical industry and provide necessary theoretical and methodological background in accompanying lectures. The course is organized jointly by D-BSSE and LYO-X, a Quantitative Systems Pharmacology consulting company situated in Basel. 

The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:

* Yang, Z. 2006. Computational Molecular Evolution.
* Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.

Basic knowledge in linear algebra, analysis, and statistics will be helpful. Programming in R will be required for the project work (compulsory continuous performance assessments). In case you do not have any previous experience with R, we strongly recommend to get familiar with R prior to the semester start. For the D-BSSE students, we highly recommend the voluntary course „Introduction to Programming“, which takes place in Basel before the start of the semester.

The course is organized jointly by D-BSSE and LYO-X, a Quantitative Systems Pharmacology consulting company situated in Basel.
Abstract

Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

Objective

Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real world data.

Content

The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:

- **Fundamentals:**
  - What is data?
  - Bayesian Learning
  - Computational learning theory

- **Supervised learning:**
  - Ensembles: Bagging and Boosting
  - Max Margin methods
  - Neural networks

- **Unsupervised learning:**
  - Dimensionality reduction techniques
  - Clustering
  - Mixture Models
  - Non-parametric density estimation
  - Learning Dynamical Systems

Lecture notes

No lecture notes, but slides will be made available on the course webpage.

Literature

Prerequisites / notice

The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.

Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.
After attending this course, students will be able to:
- Explain the differences between VC and founder thinking
- Evaluate if a start-up is suited for venture capital ("VC readiness")
- Evaluate founder friendliness of term sheets
- Determine funding needs & strategy for a start-up from research to first round
- Write and evaluate an investment memo

The course is practically oriented and features guest speakers from leading venture capital firms and start-ups. The course embraces a unique perspective combining technology and investor thinking. The seminar is structured around five days with the following themes.

The detailed program is listed here: https://bit.ly/techinvesting23

The macro picture. Why does venture capital exist? What are major tech break-through areas and their disruptive potential? We also review the differences in the US and European perspective as well as developments towards more impact and diversity conscious funds.

A peek into the mind of a VC. How to build a successful VC? Learn what key factors & processes required to build a successful venture capital company. This includes strategic decisions for investment thesis, structure of a fund, portfolio economics, valuation & ownership targets, cap table. In addition, we introduce the fundamentals of the investment process (including due diligence, term sheets, and deal memo) as well as portfolio management.

The founder’s perspective. Why should you raise venture capital and how? Learn to evaluate the founder friendliness of terms, company approach, strategic decisions, negotiation and valuation.

Fundraising types. Learn about different types of funding and their implications. This includes an overview of the Swiss ecosystem and a discussion of the different types (grants, equity, loans, SAFE, crowd, …). We also include a practical session on crypto technology for modern fund-raising using launchpads and tokenized shares.

Tying it all together. The last day is focused on simulating an investment committee meeting where the groups present their deal memos and discuss with the audience.

Probabilistic Artificial Intelligence

This course introduces core modeling techniques and algorithms from machine learning, optimization and control for reasoning and decision making under uncertainty, and study applications in areas such as robotics.

How can we build systems that perform well in uncertain environments? How can we develop systems that exhibit "intelligent" behavior, without prescribing explicit rules? How can we build systems that learn from experience in order to improve their performance? We will study core modeling techniques and algorithms from statistics, optimization, planning, and control and study applications in areas such as robotics. The course is designed for graduate students.

Topics covered:
- Probability
- Probabilistic inference (variational inference, MCMC)
- Bayesian learning (Gaussian processes, Bayesian deep learning)
- Probabilistic planning (MDPs, POMDPs)
- Multi-armed bandits and Bayesian optimization
- Reinforcement learning

Prerequisites / notice
The material covered in the course "Introduction to Machine Learning" is considered as a prerequisite.

Advanced Bioengineering

Only for Biotechnologie Master, Programme Regulations 2021 or doctoral students of D-BSEE.

S. Panke, P. S. Dittrich, M. Fussenegger, A. Hierlemann, A. Moor, M. Nash, R. Platt, Autumn Semester 2024
This course provides an overview of modern concepts of bioengineering across different levels of complexity, from single molecules to systems, microscaled reactors to production environments, and across different fields of applications.

**Objective**

Students will be able to recognize major developments in bioengineering across different organisms and levels of complexity and be able to relate it to major technological and conceptual advances in the underlying sciences.

**Content**

Molecular and cellular engineering; Synthetic biology; Engineering strategies in biology; from single molecules to systems; downscaling bioengineering; Bioengineering in chemistry, pharmaceutical sciences, and diagnostics, personalized medicine.

**Lecture notes**

**851-0178-00L**

**Ethics and Scientific Integrity for Doctoral Students**

W 1 credit 2U G. Achermann

*This course is interdisciplinary. If your department offers this course, please register there if possible.*

Abstract
This course sensitises doctoral students to ethical issues that may occur during their doctorate. After an introduction to ethics and good scientific practice, students are familiarised with resources that can assist them with ethical decision-making. Students get the chance to apply and deepen their knowledge in an interactive face-to-face workshop.

Objective
Doctoral students learn how to identify, analyse and address ethical issues in their own scientific research. In addition, they will reflect on their professional role as scientific researchers.

Content

Part I on Moodle

The self-paced e-learning course on Moodle consists of 5 modules:

Module 1: Ethics
- Introduction to moral theory (with emphasis on practical guidance regarding decision making)

Module 2: Ethics in scientific research
- Introduction to ethical issues that occur within scientific research (i.e. regarding authorship, cooperation, data use and sharing, and other aspects that are subject to scientific integrity and good scientific practice).

Module 3: Collecting resources
- A variety of tools and resources that help identify ethical issues are presented and explained

Module 4: Setting up a strategy
- Example examination of a case regarding its ethical scope (students develop their own strategy to examine situations for their ethical implications).

Module 5: Making decisions
- Different ways of addressing ethical issues are presented and explained (i.e. how to make hard choices, or solve ethical dilemmas. But also where to seek advice if needed).

Part II

The second, face-to-face part (group sessions) of this course provides an interactive learning environment (workshop). Students get to apply their knowledge, and they are encouraged to reflect on ethical problems and to critically discuss them with fellow doctoral students.

Competencies

Subject-specific Competencies
- Concepts and Theories assessed

Method-specific Competencies
- Decision-making assessed

Personal Competencies
- Problem-solving assessed
- Critical Thinking assessed
- Integrity and Work Ethics assessed

This Master level course delves into the emerging field of biomolecular condensates - membrane-less organelles in cells. Using interdisciplinary concepts from biology, chemistry, biophysics, and soft matter, we will explore the biological properties of these condensates, their functions in health and disease, and their potential as new biomimetic materials for various applications.

In the last decade, a novel type of cell compartments called biomolecular condensates have been discovered. This discovery is radically changing our understanding of the cell, its organization, and dynamics. The emerging picture is that the cytoplasm and nucleoplasm are highly complex fluids that can (meta)stably segregate into membrane-less compartments, similar to emulsions.

This interdisciplinary course encompasses milestone works and cutting-edge research questions in the young field of biomolecular condensates, including their properties, functions, and applications. The course begins with a lecture series that introduces the topic of condensates to an interdisciplinary audience and provides a theoretical foundation for understanding current research questions in the field. The lectures provide a base for student presentations of recent publications in the field, and for research seminars given by course lecturers, who are all active researchers with diverse expertise. Through this exciting interdisciplinary understanding of biomolecular condensates, bridging biology, chemistry, biophysics, and soft matter.

Students will not only learn how to critically read and evaluate scientific literature but will also gain valuable experience in giving scientific presentations to an interdisciplinary audience. Each presentation will require an introduction, critical analysis of the results, and a discussion of their significance, allowing student to substantiate their statements with a critical mindset that considers the pros and cons of chosen approaches and methods, as well as any limitations or possible follow-up experiments. This process will enable student to ask relevant queries and actively participate in class discussions, further enhancing their scientific skills.

In preparing the presentations, the students will have the unique opportunity to interact closely with each other and with the lecturers, who are all internationally well-established experts, and receive guidance in select a topic for the final presentation and supporting literature.

The topic of biomolecular condensates goes beyond the boundaries of traditional disciplines and requires a multi-disciplinary approach that leverages and cross-fertilizes biology, physical chemistry, biophysics, and soft matter. This course will explore the properties, functions and potential applications of biomolecular condensates, including their role in neurodegenerative diseases such as Alzheimer's and Parkinson's, as well as their use as smart biomimetic materials.

This course is divided into two parts. The fist part will introduce the basic concepts essential to the study of biomolecular condensates and phase separation. Topics include: fundamental units and scales in soft matter, phase transitions in biology, biopolymers and molecular self-assembly, introduction to active matter. This will establish a foundation for the second part, which will explore milestone works and current research in the field of biomolecular condensates. Each lecture of this second part will consist of:

1) a short literature seminar, where student groups will present and discuss a milestone paper assigned in advance and
2) a research seminar, where one of the course lecturers will present their own state-of-the-art research in the field, building upon the milestone literature.

At the beginning of the course, student groups will be formed and assigned to the milestone papers. To facilitate this, students must confirm their registration by the beginning of the 3rd week of semester.

- Lecture slides and some scripts will be provided.
- No compulsory textbooks. Literature will be provided during the course.

The recognition of the concepts that underlie the different approaches devised for the determination of free energies will be announced on http://www.reiher.ethz.ch/courses-and-seminars/theoretical-chemistry.html.

Theoretical Chemistry Seminar
Theoretical analysis as well as issues of practical implementation of state of the art free energy methods.

Doktorats- und Mitarbeiterschulung
Handouts will be provided.

Calculating Free Energy Differences from Molecular Simulation: Theory and Practical Applications
The course teaches advanced topics in molecular spectroscopy: techniques for analysing rotationally and rovibrationally resolved spectra will be discussed, and the sources which may be used in high resolution infrared spectroscopy will be described. The fields in which high resolution infrared/THz spectroscopy is applied will also be reviewed.

Advanced High Resolution Molecular Spectroscopy
The course teaches advanced topics in molecular spectroscopy: techniques for analysing rotationally and rovibrationally resolved spectra will be discussed, and the sources which may be used in high resolution infrared spectroscopy will be described. The fields in which high resolution infrared/THz spectroscopy is applied will also be reviewed.

Handouts will be provided.

Cellular Matters: Properties, Functions and Applications of Biomolecular Condensates
This Master level course delves into the emerging field of biomolecular condensates - membrane-less organelles in cells. Using interdisciplinary concepts from biology, chemistry, biophysics, and soft matter, we will explore the biological properties of these condensates, their functions in health and disease, and their potential as new biomimetic materials for various applications.

ECTS 4

The ICB seminar series covers the umbrella of diverse research activities encompassed within the institute, including catalysis, functional materials, polymer engineering, separations, microfluidics, process design, and systems engineering. This series was founded with the aim of promoting cross-disciplinary scientific discourse and interaction with other distinguished groups working worldwide, and is targeted at materials, polymer engineering, separations, microfluidics, process design, and systems engineering. This series was founded with the aim of promoting cross-disciplinary scientific discourse and interaction with other distinguished groups working worldwide, and is targeted at individuals who have made outstanding contributions within their fields. Each year, around 7 distinguished scientists and technologists will be invited to speak on topics of current interest in Chemical and Biochemical Engineering. PhD students are particularly encouraged to attend in order to broaden their perception and enrich their scientific horizons.

This Master level course delves into the emerging field of biomolecular condensates - membrane-less organelles in cells. Using interdisciplinary concepts from biology, chemistry, biophysics, and soft matter, we will explore the biological properties of these condensates, their functions in health and disease, and their potential as new biomimetic materials for various applications.

**Objective**

In the last decade, a novel type of cell compartments called biomolecular condensates have been discovered. This discovery is radically changing our understanding of the cell, its organization, and dynamics. The emerging picture is that the cytoplasm and nucleoplasm are highly complex fluids that can (meta)stably segregate into membrane-less compartments, similar to emulsions.

This interdisciplinary course encompasses milestone works and cutting-edge research questions in the young field of biomolecular condensates, including their properties, functions, and applications. The course begins with a lecture series that introduces the topic of condensates to an interdisciplinary audience and provides a theoretical foundation for understanding current research questions in the field. The lectures provide a base for student presentations of recent publications in the field, and for research seminars given by course lecturers, who are all active researchers with diverse expertise. Through this exciting interdisciplinary understanding of biomolecular condensates, bridging biology, chemistry, biophysics, and soft matter.

Students will not only learn how to critically read and evaluate scientific literature but will also gain valuable experience in giving scientific presentations to an interdisciplinary audience. Each presentation will require an introduction, critical analysis of the results, and a discussion of their significance, allowing student to substantiate their statements with a critical mindset that considers the pros and cons of chosen approaches and methods, as well as any limitations or possible follow-up experiments. This process will enable student to ask relevant querions and actively participate in class discussions, further enhancing their scientific skills.

In preparing the presentations, the students will have the unique opportunity to interact closely with each other and with the lecturers, who are all internationally well-established experts, and receive guidance in selectin a topic for the final presentation and supporting literature.

**Content**

The topic of biomolecular condensates goes beyond the boundaries of traditional disciplines and requires a multi-disciplinary approach that leverages and cross-fertilizes biology, physical chemistry, biophysics, and soft matter. This course will explore the properties, functions and potential applications of biomolecular condensates, including their role in neurodegenerative diseases such as Alzheimer’s and Parkinson’s, as well as their use as smart biomimetic materials.

This course is divided into two parts. The fist part will introduce the basic concepts essential to the study of biomolecular condensates and phase separation. Topics include: fundamental units and scales in soft matter, phase transitions in biology, biopolymers and molecular self-assembly, introduction to active matter. This will establish a foundation for the second part, which will explore milestone works and current research in the field of biomolecular condensates. Each lecture of this second part will consist of:

1) a short literature seminar, where student groups will present and discuss a milestone paper assigned in advance and
2) a research seminar, where one of the course lecturers will present their own state-of-the-art research in the field, building upon the milestone literature.

At the beginning of the course, student groups will be formed and assigned to the milestone papers. To facilitate this, students must confirm their registration by the beginning of the 3rd week of semester.

**Lecture notes**

Lecture slides and some scripts will be provided.

**Literature**

No compulsory textbooks. Literature will be provided during the course.

**Competencies**

Subject-specific Competencies

- Concepts and Theories: assessed
- Techniques and Technologies: assessed

Method-specific Competencies

- Analytical Competencies: assessed
- Decision-making: fostered
- Media and Digital Technologies: fostered
- Problem-solving: fostered
- Project Management: fostered

Social Competencies

- Communication: assessed
- Cooperation and Teamwork: assessed
- Customer Orientation: fostered
- Leadership and Responsibility: assessed
- Self-presentation and Social Influence: fostered
- Sensitivity to Diversity: assessed
- Negotiation: assessed

Personal Competencies

- Adaptability and Flexibility: fostered
- Creative Thinking: assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: fostered
- Self-awareness and Self-reflection: fostered
- Self-direction and Self-management: fostered

Abstract
The lecture series takes place at the ETH Hönggerberg and covers a variety of major activities involved in drug discovery: selecting drug targets, technologies used in drug discovery, small, medium and large drugs, objectives of the medicinal chemist, assessing drug safety, principles of personalized medicine, designing clinical trials, how intellectual property is protected, as well as others.

Objective
The objective of the course is to gain a global understanding of most of the important phases in the discovery and development of modern synthetic and biological drugs, from the first activities to clinical trials. The lecture is intended for students that have an interest in the area and/or may consider a career working in drug discovery. This lecture course complements knowledge and experience gained in the research project performed by the PhD student.

Content
Thirteen two hour lectures for life-science PhD students and students of the Pharmaceutical Sciences Master, given by experts from the ETH, UZH, USZ and the pharmaceutical industry.

Literature
To be distributed during the lecture

Prerequisites / notice
Formally none, but a basic understanding in biochemistry, physiology and chemistry is highly desirable as it will certainly help to get the most from the lectures.

### Scientific Information Retrieval & Management in Life Sciences and Chemistry

**Abstract**
Students learn how to effectively retrieve, critically judge, analyze, and manage published scientific information – important skill sets in chemistry and life sciences where scientists need to deal with vast amounts of information. The course, using practical examples, also covers scientific writing, visualizations, science communication and state-of-the-art technologies such as text mining.

**Objective**
Students are made aware about the wide variety of information solutions that exist today for all kinds of research processes, get an independent understanding of how they are derived and learn how to critically judge their quality. They learn how scientific communication works today and on which concepts and principles it is based. They develop the ability to select appropriate, subject-specific databases or tools for a given specific scientific question based on a sound understanding on how a tool or database has been developed and maintained, thus building the personal capacity of doing research effectively and efficiently by integrating scientific information into the research process when needed. Students learn how to evaluate information solutions, to build suitable search strategies and to integrate them in their information workflows. Also, they learn how to effectively communicate their own scientific results using various distribution channels and to measure the impact of their outreach activities. Overall, they gain the ability to perform all steps of the research cycle in a time- and cost-efficient manner, from the research strategy up to writing a first paper and their Ph.D. thesis.

**Content**
The course has been primarily designed for Ph.D. students, also for the Life Science Zurich Graduate School, but is also open to Master students. In a series of 12 units, which always include practical examples (for some lectures a notebook is required), the use of scientific information is taught not in a database-centric view but corresponding to the steps through which scientific research is conducted – including the dissemination of scientific results. This is particularly interesting for students who are about to write-up their first paper or thesis.

Students will learn about the different types of information resources and tools, get an insight into the numerous databases and tools that exists and how those are built and maintained, enabling them to critically judge the value and trustworthiness of an information resource. Additionally, they will learn how to communicate their own scientific results properly, using also additional measures that are reflected by alternative metrics.

The following topics are covered in twelve modules:
1. & 2. The world of scientific publishing: basics, publishing models
2. Searching and retrieving scientific information using search engines and literature databases
3. Searching and retrieving scientific information using subject-specific databases in chemistry and materials science
4. Searching and retrieving scientific information using subject-specific databases in life sciences
5. Tools for analyzing scientific information
6. Tools for managing scientific information and sharing knowledge, including pipelining tools
7. Patents
8. Text (literature) mining
9. Visualizing molecules for lab reports, presentations, posters, and publications
10. Scientific writing, good design & good scientific practice
11. Communicating & analyzing the impact of (your) science

**Lecture notes**
The slide deck and supplementary materials will be made available in the teaching document repository (ILIAS) after each lecture.

**Literature**
Additional literature and reference are provided in the course material.

Transferable Skills Course I (1 week, with Poster or Talk)  
Only for doctoral students.

**Abstract**
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

**Objective**
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

Transferable Skills Course II (1 week, with Poster or Talk)  
Only for doctoral students.

**Abstract**
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

**Objective**
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

Transferable Skills Course III (1 week, with Poster or Talk)  
Only for doctoral students.

**Abstract**
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

**Objective**
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

Participation in Commission I (min 1 year)  
Only for doctoral students.

**Abstract**
Active participation in commissions or university bodies, like associations of scientific staff, the university assembly or similar for at least 1 year.

**Objective**
Active participation in commissions or university bodies, like associations of scientific staff, the university assembly or similar for at least 1 year.

Participation in Commission II (min 1 year)  
Only for doctoral students.

**Abstract**
Active participation in commissions or university bodies, like associations of scientific staff, the university assembly or similar for at least 1 year.

**Objective**
Active participation in commissions or university bodies, like associations of scientific staff, the university assembly or similar for at least 1 year.

Member of Executive Board (min 1 year)  
Only for doctoral students.

**Abstract**
Active participation in the presidium or executive board of a university group for at least 1 year.

**Objective**
Active participation in the presidium or executive board of a university group for at least 1 year.

Ethics and Scientific Integrity for Doctoral Students in Chemistry and Related Fields  
C. Copéret, S. J. Sturla

**Abstract**
This course sensitises doctoral students to ethical issues that may occur during their doctorate. After an introduction to ethics and good scientific practice, students are familiarised with resources that can assist them with ethical decision-making. Students get the chance to apply their knowledge in a context specific to research in chemistry.

**Objective**
Doctoral students learn how to identify, analyse and address ethical issues in their own scientific research. In addition, they will reflect on their professional role as scientific researchers.
Part I on Moodle
The self-paced e-learning course on Moodle consists of 5 modules:

Module 1: Ethics
- Introduction to moral theory (with emphasis on practical guidance regarding decision making)
Module 2: Ethics in scientific research
- Introduction to ethical issues that occur within scientific research (i.e. regarding authorship, cooperation, data use and sharing, and other aspects that are subject to scientific integrity and good scientific practice)
Module 3: Collecting resources
- A variety of tools and resources that help identify ethical issues are presented and explained
Module 4: Setting up a Strategy
- Example examination of a case regarding its ethical scope (students develop their own strategy to examine situations for their ethical implications).
Module 5: Making decisions
- Different ways of addressing ethical issues are presented and explained (i.e. how to make hard choices, or solve ethical dilemmas. But also where to seek advice if needed).

Part II
The second, face-to-face part of this course focuses on chemistry-specific aspects. It provides an interactive learning environment. Students get to apply their knowledge, and they are encouraged to reflect on ethical problems and to critically discuss them with fellow doctoral students.

<td>1</td>
<td>1S</td>
<td>O. Bachmann, C. Chelle-Michou, R.-G. Popa</td>
</tr>
<tr>
<td></td>
<td><strong>Abstract</strong></td>
<td></td>
<td></td>
<td></td>
<td>Heat and mass transfers from the mantle to the crust control many aspects of the differentiation of our planet, including (1) primitive melt chemistry, (2) layering of the crust, (3) type of volcanic eruption, (4) formation of mineral deposits. This year, we will focus on processes in crystal mushes (formation, crystallization, remobilization, degassing).</td>
</tr>
<tr>
<td></td>
<td><strong>Objective</strong></td>
<td></td>
<td></td>
<td></td>
<td>This class will allow the students to learn about the modern methods and ideas on heat and mass transfers in magmatology through classic and recently published papers. Communication of scientific results to the scientific community and the public is critical. In the class, the students will read and analyse scientific papers and discuss them orally to the class. The students will also create a Wikipedia page and reformulate scientific results for the public.</td>
</tr>
<tr>
<td></td>
<td><strong>Content</strong></td>
<td></td>
<td></td>
<td></td>
<td>The class will focus mostly on 1) reading literature on topics of interests, 2) oral and written presentations of the papers, 3) exercises illustrating the topic, to allow students to work by themselves on some well-defined problems.</td>

<tr>
<td></td>
<td>Module 2: Ethics in scientific research - Introduction to ethical issues that occur within scientific research (i.e. regarding authorship, cooperation, data use and sharing, and other aspects that are subject to scientific integrity and good scientific practice).</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Module 3: Collecting resources - A variety of tools and resources that help identify ethical issues are presented and explained</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Module 4: Setting up a strategy - Example examination of a case regarding its ethical scope (students develop their own strategy to examine situations for their ethical implications).</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Module 5: Making decisions - Different ways of addressing ethical issues are presented and explained (i.e. how to make hard choices, or solve ethical dilemmas. But also where to seek advice if needed).</td>
<td></td>

Special students and auditors need special permission from the lecturers.
The students shall obtain the following competence:

- **Analytical Competencies**
  - Fostered
  - Assessed
  - A comprehensive script will be made available online on the moodle platform.
  - Distributed electronically.

- **Subject-specific Competencies**
  - Fostered
  - Assessed
  - Papers discussed in the workshop and lecture series are posted in advance on the course web page.

### CIS PhD Colloquium

**Title**: Startups and Law

**Type**: W

**ECTS**: 2 credits

**Hours**: 2K

**Lecturers**: University lecturers

**Abstract**: In this internal colloquium doctoral students present their work after about 12 months of research.

**Objective**: The aim of this colloquium is that the presenters receive feedback on their research at an important stage (a stage at which significant changes of direction, methodology, etc. may still be undertaken) in the PhD process.

**Lecture notes**: Distributed electronically.

**Literature**: Distributed electronically.

**Prerequisites / notice**: Dates: See http://www.cis.ethz.ch/education/index

**Number**: 851-0587-01L

**Subject Specialisation**: Doctorate Humanities, Social and Political Sciences

---

### Workshop & Lecture Series on the Law & Economics of Innovation

**Title**: Workshop & Lecture Series on the Law & Economics of Innovation

**Type**: W

**ECTS**: 2 credits

**Hours**: 2S

**Lecturers**: P. Peyrot, S. Bechtold

**Abstract**: This series is a joint project by ETH Zurich and the Universities of St. Gallen and Zurich. It provides an overview of interdisciplinary research on intellectual property, innovation, antitrust, privacy & technology policy. Scholars from law, economics, management and related fields present their current research. All speakers are internationally well-known experts from Europe, the U.S. & beyond.

**Objective**: After the workshop and lecture series, participants should be acquainted with interdisciplinary approaches towards intellectual property, innovation, antitrust, privacy and technology policy research. They should also have an overview of current topics of international research in these areas.

**Content**: The workshop and lecture series will present a mix of speakers who represent the wide range of current social science research methods applied to intellectual property, innovation, antitrust, privacy and technology policy issues. In particular, theoretical models, empirical and experimental research as well as legal research methods will be represented.

**Lecture notes**: A comprehensive script will be made available online on the moodle platform.

### The Role of Intellectual Property in the Engineering and Technical Sector

**Title**: The Role of Intellectual Property in the Engineering and Technical Sector

**Type**: W

**ECTS**: 2 credits

**Hours**: 2V

**Lecturers**: K. Houshang Pour Islam

**Abstract**: The lecture gives an overview of the fundamental aspects of intellectual property, which plays an important role in the daily routine of engineers and scientists. The lecture aims to make participants aware of the various methods of protection and to put them in a position to use this knowledge in the workplace.

**Number**: 851-0738-01L

---
Objective

In recent years, knowledge about intellectual property has become increasingly important for engineers and scientists. Both in production and distribution and in research and development, they are increasingly being confronted with questions concerning the patenting of technical inventions and the use of patent information.

The lecture will acquaint participants with practical aspects of intellectual property and enable them to use the acquired knowledge in their future professional life.

Topics covered during the lecture will include:
- The importance of innovation in industrialised countries
- An overview of the different forms of intellectual property
- The protection of technical inventions and how to safeguard their commercialisation
- Patents as a source of technical and business information
- Practical aspects of intellectual property in day-to-day research, at the workplace and for the formation of start-ups.

Case studies will illustrate and deepen the topics addressed during the lecture.

The seminar will include practical exercises on how to use and search patent information. Basic knowledge of how to read and evaluate patent documents as well as how to use publicly available patent databases to obtain the required patent information will also be provided.

Prerequisites / notice

The lecture addresses students in the fields of engineering, science and other related technical fields.

851-0252-04L Behavioral Studies Colloquium

Abstract

This colloquium offers an opportunity to discuss recent and ongoing research and scientific ideas in the behavioral sciences, both at the micro- and macro-levels of cognitive, behavioral and social science.

The colloquium features invited presentations from internal and external researchers as well as presentations of doctoral students close to submitting their dissertation research plan.

Objective

Participants are informed about recent and ongoing research and obtain feedback on their dissertation research plan.

Content

This colloquium offers an opportunity to discuss recent and ongoing research and scientific ideas in the behavioral sciences, both at the micro- and macro-levels of cognitive, behavioral and social science. It covers a broad range of areas, including theoretical as well as empirical research in social psychology, research on higher education, sociology, modeling and simulation in sociology, decision theory and behavioral game theory, economics, research on learning and instruction, cognitive psychology and cognitive science.

The colloquium features invited presentations from internal and external researchers as well as presentations of doctoral students close to submitting their dissertation research plan.

Prerequisites / notice

https://sbs.ethz.ch/education.html

851-0252-01L Human-Computer Interaction: Cognition and Usability

Abstract

This seminar will introduce key topics, theories and methodology in human-computer interaction (HCI) and usability, with a focus on applying them to real situations.

Objective

Presentations will cover the basics of human-computer interaction and selected topics:
- History of HCI
- Research ethics
- Literature reviews
- Participant-free methods: cognitive walkthrough and heuristic evaluation
- Card sorting and information architecture
- Usability studies
- Unmoderated research and diary studies
- Surveys
- User Logs and metric frameworks

On a weekly basis, students will conduct authentic research in class covering the topics above. They will submit their in-class research results regularly and also present their findings to the class once per semester.

The final project demonstrates class topic adoption by deeply exploring one HCI problem using the covered methods and tools. Students will choose a research topic and execute their research plan. They will individually write a formal report including problem definition, literature review, methodology, findings and discussion.

851-0252-05L Research Seminar Cognitive Science

Abstract

The colloquium provides a forum for researchers and graduate students in cognitive science to present/discuss their ongoing projects as well as jointly discuss current publications in cognitive science and related fields. A subset of the sessions will include invited external visitors presenting their research. Participants of this colloquium are expected to be involved in active research group.
Objective
Graduate student train and improve their presentation skills based on their own project ideas, all participants stay informed on current trends in the field and have the opportunity for networking with invited scholars.

851-0585-41L Computational Social Science

Abstract
The seminar aims at three-fold integration: (1) bringing modeling and computer simulation of techno-socio-economic processes and phenomena together with related empirical, experimental, and data-driven work, (2) combining perspectives of different scientific disciplines (e.g. sociology, computer science, physics, complexity science, engineering), (3) bridging between fundamental and applied work.

Objective
They should also be able to explain how systemic instabilities can be understood by changing the perspective from a component-oriented to an interaction- and network-oriented view, and what fundamental implications this has for the proper design and management of complex dynamical systems.

Computational Social Science and Global Systems Science serve to better understand the emerging digital society with its close co-evolution of information and communication technology (ICT) and society. They make current theories of crises and disasters applicable to the solution of global-scale problems, taking a data-based approach that builds on a serious collaboration between the natural, engineering, and social sciences, i.e. an interdisciplinary integration of knowledge.

851-0609-06L Governing the Energy Transition

W 2 credits 2V T. Schmidt, L. P. Fesenfeld

Primarily suited for Master and PhD level.

Data: 26.07.2024 12:39 Autumn Semester 2024 Page 759 of 2680
This seminar is designed for PhD students and PostDoc researchers involved in inter- or transdisciplinary research. It addresses and fosters Subject-specific Competencies.

Climate change, access to energy and other societal challenges are directly linked to the way we use and create energy. Both the 2015 United Nations Paris climate change agreement and the UN Sustainable Development Goals make a fast and extensive transition of the energy system necessary. This lecture introduces the social and environmental challenges involved in the energy sector and discusses the implications of these challenges for the rate and direction of technical change in the energy sector. It compares the current situation with historical socio-technical transitions and derives the consequences for policy-making. It introduces theoretical frameworks and concepts for studying innovation and transitions. It then focuses on the role of policy and policy change in governing the energy transition, considering the role of political actors, institutions and policy feedback.

The grade will be determined by a final exam.

Lecture notes: Slides and reading material will be made available via moodle.ethz.ch (only for registered students).

Prerequisites / notice: This course is particularly suited for students of the following programmes: MA Comparative International Studies; MSc Energy Science & Technology; MSc Environmental Sciences; MSc Management, Technology & Economics; MSc Science, Technology & Policy; ETH & UZH PhD programmes.

Abstract

In this seminar, students will study cognitive processes, behaviour and the underlying biological response to financial decisions. Research methods such as asset market experiments, lottery games, risk preference assessment, psychometrics, neuroimaging and psychophysiology of decision processes will be discussed. Financial bubbles and crashes will be the core interest.

Objective

This course has four main goals:
1. To learn about the most important topics within Behavioural Finance
2. To learn to effectively select, review and present information using modern telecommunication tools
3. To practice working on group projects in hybrid working conditions (online + in-person)
4. To solve an applied behavioral finance business case stemming from an industry partner

Content

The course does not contain mandatory reading. Instead, it offers suggested literature that provides guidance to the students who, prepare a presentation on core topics in behavioral finance. The point of this exercise is to critically select the most relevant information on a given topic and present to non-expert educated colleagues. At the same time, the audience learns about the key topics in behavioral finance. Every session involves a discussion moderated and supported by the lecturers.

Throughout the semester, students work on solutions to real business cases stemming from a company partner. They can receive feedback and guidance from project leaders of the industry partner and from the academic supervisors. In the final meeting of the semester, students pitch solutions to their business cases.

The course takes place entirely online. The objective is to prepare the students for the future work in online and hybrid arrangements.

Prerequisites / notice

Students from all domains of ETH and all levels of education are welcome in the course.

Transdisciplinary Research: Challenges of Interdisciplinarity and Stakeholder Engagement

The lecture takes place if a minimum of 12 students register for it.

Abstract

This seminar is designed for PhD students and PostDoc researchers involved in inter- or transdisciplinary research. It addresses and discusses challenges of this kind of research using scientific literature presenting case studies, concepts, theories, methods and by testing practical tools. It concludes with a 10-step approach to make participants' research projects more societally relevant.

Objective

Participants know specific challenges of inter- and transdisciplinary research and can address them by applying practical tools. They can tackle questions like: how to integrate knowledge from different disciplines, how to engage with societal actors, or how to secure broader impact of research. They learn to critically reflect their own research project in its societal context and on their role as scientists.

Content

The seminar covers the following topics:
1. Theories and concepts of inter- and transdisciplinary research
2. The specific challenges of inter- and transdisciplinary research
3. Collaborating between different disciplines
4. Engaging with stakeholders
5. 10 steps to make participants' research projects more societally relevant

Throughout the whole course, scientific literature will be read and discussed as well as practical tools explored in class to address concrete challenges.
Literature will be made available to the participants. The following open access article builds a core element of the course:

available at (open access): http://www.ingentaconnect.com/contentone/oekom/gaia/2017/00000026/00000001/art00011

Further, this collection of tools will be used:

https://naturalsciences.ch/topics/co-producing_knowledge
https://www.shapeidtoolkit.eu

Prerequisites / notice
Participation in the course requires participants to be working on their own research project.

Dates (Wednesdays, 8h15-12h00)

851-0252-13L Network Modeling
Particularly suitable for students of D-MATH, D-INFK and in the MSc Data Science

Students are required to have basic knowledge in inferential statistics, such as regression models.

Abstract

Social Network Science is a distinct domain of data science that focuses on relational systems. Various models have been proposed to describe structures and dynamics of networks, including statistical and mathematical methods. In this course, the emphasis is placed on the statistical analysis of (social) systems and their connection to social theories and data sources.

Objective

The following topics will be covered:

- Introduction to network models and their applications
- Stylized models:
  * uniform random graph models
  * small world models
  * preferential attachment models
- Models for testing hypotheses while controlling for the network structure:
  * Quadratic assignment procedure regression (QAP regression)
- Models for testing hypotheses on the network structure:
  * Models for one single observation of a network: exponential random graph models (ERGMs)
  * Models for panel network data: stochastic actor-oriented models (SAOMs)

The application of these models is illustrated through examples and practical sessions involving the analysis of network data using the software R.

Content

The following topics will be covered:

- Introduction to network models and their applications
- Stylized models:
  * uniform random graph models
  * small world models
  * preferential attachment models
- Models for testing hypotheses while controlling for the network structure:
  * Quadratic assignment procedure regression (QAP regression)
- Models for testing hypotheses on the network structure:
  * Models for one single observation of a network: exponential random graph models (ERGMs)
  * Models for panel network data: stochastic actor-oriented models (SAOMs)
  * Models for relational event data: dynamic network actor models (DyNAMs)

The application of these models is illustrated through examples and practical sessions involving the analysis of network data using the software R.

Lecture notes

Slides and lecture notes are distributed via the associated course moodle.

Literature

Prerequisites / notice

Students are required to have basic knowledge in inferential statistics and should be familiar with linear and logistic regression models.

851-0252-15L Network Analysis
Particularly suitable for students of D-INFK, D-MATH.

Abstract

Network science is a distinct domain of data science that is characterized by a specific kind of data being studied. While areas of application range from archaeology to zoology, we concern ourselves with social networks for the most part. Emphasis is placed on descriptive and analytic approaches rather than theorizing, modeling, or data collection.
Contracts are agreements between parties to engage in transactions. A good contract creates value by giving parties the right incentives to foster specific objectives. In particular, they will be able to evaluate such methods in terms of appropriateness and efficiency.

The following topics will be covered with an emphasis on structural and computational approaches and frequent reference to their suitability with respect to substantive theory:

- Empirical Research and Network Data
- Macro and Micro Structure
- Centrality
- Roles
- Cohesion
- Influence

Slides and lecture notes are distributed via the associated course moodle.

dates: 26.07.2024 12:39

Objective

Students will be able to identify and categorize research problems that call for network approaches while appreciating differences across application domains and contexts. They will master a suite of mathematical and computational tools, and know how to design or adapt suitable methods for analysis.

In particular, they will be able to evaluate such methods in terms of appropriateness and efficiency.

Content

The following topics will be covered with an emphasis on structural and computational approaches and frequent reference to their suitability with respect to substantive theory:

- Empirical Research and Network Data
- Macro and Micro Structure
- Centrality
- Roles
- Cohesion
- Influence

Lecture notes

Slides and lecture notes are distributed via the associated course moodle.

Contract Design I

851-0742-00L

You can find all course materials and the most recent announcements on Moodle. Please log in to Moodle using your ETH or UZH credentials. Then search for “Contract Design I (851-0742-00L; Fall 2023)” and enroll. The password is “ContractDesign01”.

It is NOT a legal drafting class focused on contractual language.

Number of participants limited to 160.
Max 80 ETHZ and 80 UZH Students

Abstract

Contract Design I is taught by Professor Stremitzer and aims to bridge the gap between economic contract theory, contract law, and the writing of real-world contracts. In this course, we take a systematic approach to contract design. This means we first analyze the economic environment in which a transaction takes place and then engineer contracts that achieve the desired outcome.

Objective

Contracts are agreements between parties to engage in transactions. A good contract creates value by giving parties the right incentives to meet their objectives. A good contract designer scrutinizes the economic situation in which parties find themselves and tailors the contract to the challenges at hand. To help you become sophisticated contract designers, we draw from insights for which more than half a dozen Nobel Prizes were awarded in the past two decades and transfer them to the art of writing real-world contracts. In other words, Contract Design will provide you with analytical tools to design contracts that help you be better lawyers, business leaders, and startup founders.

We will cover topics such as moral hazard, adverse selection, elicitation mechanisms, relationship-specific investments, and relational contracting and apply the theoretical insights to real-life case studies ranging from purchases & sales of assets, oil & gas exploration, movie financing, production & distribution, construction & development, M&A deals, venture capital financing, to executive compensation and many other types of transactions.

The course follows a flipped-classroom model: You will watch learning videos specifically produced for this course ahead of class. We will use class time to discuss real-world case studies. The videos will be made available before the lecture each week and need to be watched ahead of coming to class. Computer-graded quizzes at the beginning of each class will test students’ understanding of the concepts introduced in the videos.

As the emphasis of this class is on class discussion, attendance is mandatory. Absent important reasons, you cannot miss class more than twice.

The lectures will be recorded but only made available to those who miss lectures with excused absence.

For ETH students: Your grade will consist of two parts:

1) You will take weekly computer-based quizzes during class time. Thus, it is important that you attend the lectures to be able to finish the quizzes and pass this course.
2) You compose short responses to take-home questions on case studies we assign and upload them ahead of class (Pass/Fail).

Note that UZH and UNISG students enrolling in this course need to earn more ECTS for completing this course than ETH students (due to curricula reasons). This is why UZH and UNISG students must complete a written assignment in addition to the weekly quizzes and take-home questions. UZH students also have to complete an additional group project.

UZH and UNISG students should check out the description of the class at their respective home institutions.

Lecture notes

Handouts, prerecorded videos, slides, case studies, and other materials available on a dedicated webpage: contractdesign.org. Access to this webpage is free of charge for ETH students as ETH purchased a license for ETH students.
The planned course outline is below.

A number of recent regulations will be discussed, including the EU's AI Act, the Digital Services Act (DSA), and the Digital Markets Act (DMA), as well as emerging internet phenomena, like ChatGPT.

In previous years, the course has featured esteemed speakers from various sectors, including industry leaders like Google, NGOs such as Digital Society Switzerland and The European Consumer Organization, regulatory bodies like the Swiss Competition Commission, and noted academics.

The course is open to ETH students through the Science in Perspective program of the Department of Humanities, Social and Political Sciences.

The course introduces students to scientific and technological developments that require regulation or enable legal innovation. We focus particularly on the challenges to current law posed by prominent near-future technologies.

The course is designed for a wide range of ETH students as well as for law students who are keen to deepen their understanding of cutting-edge technology. It offers an overview of key legal areas important for technology regulation, complemented by guest lectures on emerging technological trends.

By the end of the course, the students should be able to better understand the literature on complex social systems, develop their own models for studying specific phenomena and report results according to the standards of the relevant scientific literature by presenting their results both numerically and graphically.

Students are expected to implement themselves models of techno-socio-economic processes and systems, particularly agent-based models, complex networks models, decision making, group dynamics, human crowds, or game-theoretical models. Credit points are finally earned for the implementation of a mathematical or empirical model from the complexity science literature, its presentation, and documentation by a project report.

At the end of the course, the students will deliver a report, computer code and a short oral presentation. To collect credit points, students will have to actively contribute and give a circa 30 minutes presentation in the course on a subject agreed with the lecturers, after which the presentation will be discussed. The presentation will be graded.

If you have any questions regarding the course, please write an email to the teaching assistants, Lucas Gericke (lucas.gericke@gess.ethz.ch) or Serge von Steiger (serge.vonsteiger@gess.ethz.ch).
Prerequisites / notice

The number of participants is limited to the size of the available computer teaching room. The source code related to the seminar thesis should be well enough documented.

Good programming skills and a good understanding of probability & statistics and calculus are expected.

Students need to present a new subject, for which they have not earned any credit points before.

Good scientific practices, in particular citation and quotation rules, must be properly complied with.

Chatham House rules apply to this course. Materials may not be shared without previous written permission.

Evidence-Based Design: Methods and Tools for Evaluating Architectural Design

851-0252-08L

W 3 credits 2S M. Gath Morad, C. Hölscher, L. Narvaez Zertuche, C. Veddeler, to be announced

Abstract

Students are taught a variety of analytic techniques that can be used to evaluate architectural design. The concept of evidence-based design is introduced, and complemented with theoretical background on space syntax and spatial cognition. This is a project-oriented course, students implement a range of methods on a sample project. The course is tailored for architecture design students.

Objective

The course aims to teach students how to evaluate a design project from the perspective of the end user. The concept of evidence-based design is introduced through a series of case studies. Students are given a theoretical background in space syntax and spatial cognition, with a view to applying this knowledge during the design process. The course covers a range of methods including visibility analysis, network analysis, conducting real-world observations, and virtual reality for architectural design. Students apply these methods to a case study of their choice, which can be at building or urban scale. For students taking a B-ARCH or M-ARCH degree, this can be a completed or ongoing design studio project. The course gives students the chance to implement the methods iteratively and explore how best to address the needs of the eventual end-user during the design process.

The course is tailored for students studying for B-ARCH and M-ARCH degrees. As an alternative to obtaining D-GESS credit, architecture students can obtain course credit in "Vertiefungsfach" or "Wahlfach".

Applied Network Science: Sports Networks

851-0586-03L

W 3 credits 2S U. Brandes

Abstract

We study applications of network science methods, this semester in the domain of sports. Topics are selected for diversity in sports, research questions, and techniques with applications such as passing networks, team rankings, or career trajectories. Student teams present results from the recent literature, possibly with replication, in a conference format.

Objective

Network science as a paradigm is entering domains from engineering to the humanities but application is tricky. By examples from recent research on sports analytics, students learn to appreciate that, and how, context matters. They will be able to assess the appropriateness of approaches for substantive research problems, and especially when and why quantitative approaches are or are not suitable.

Doctoral candidates from all ETH departments, whose research is related to global sustainable development issues, and conducting research in low- or middle-income countries are invited to give a presentation about their on-going work and discuss their doctoral project with a diverse group of researchers.

Doctoral students are able to present their doctoral project to an interdisciplinary audience and to respond to questions within a wider global sustainable development context.
The course aims at providing students with practical knowledge and skill of processing, interpreting and analyzing empirical educational data, including different lenses through which to view the nature of inquiry in the field, research design, and an overview of quantitative, qualitative and mixed methods research.

The course will be centered around exploring methodological perspectives by focusing on conceptual aspects of datasets and experiments in the Learning Sciences. Face-to-face meetings will be held every fortnight, although students will be expected to work individually on weekly tasks (e.g., discussing relevant literature, creating and justifying research designs, performing data analysis).

The course has the following components: a) Planning design-based research/research designs, b) Overview of quantitative, qualitative, mixed methods in Learning Sciences, c) Ethics of Learning Sciences research

The course makes students experience an exemplary human-centered design process. They will learn about and practically apply human-centered design and evaluation methods that will allow them to view their solution from the human perspective, e.g., the user, developer or website owner perspective. By taking part in the evaluation of other teams, they will also take the user perspective themselves.

The course provides an overview of major theoretical perspectives that attempt to describe how learning works, and serves as an introduction to interpreting education as a means of designing learning environments. Through assigned readings and discussions, students are expected to become competent in understanding cognitive, embodied, and social perspectives on learning and learning environment design.

The field of learning sciences concerns two interrelated questions: How do people learn? How can we support learning? This course provides an overview of major theoretical perspectives that attempt to describe how learning works, and serves as an introduction to interpreting education as a means of designing learning environments. Through assigned readings and discussions, students are expected to become competent in understanding cognitive, embodied, and social perspectives on learning and learning environment design.

Doctoral students (typically affiliated with the ISTP) present their preliminary research ideas in the first semester. During the second (obligatory) semester, they present their research plan, which is reviewed by three professors affiliated with the ISTP. The research plan should not be longer than 20 pages (references excluded). The second semester will be credited with 1 ECTS. All students are supposed to read and comment on their peers' research ideas and plans throughout both semesters. The results of the review are submitted to the doctoral committee of D-GESS or other ETH departments where ISTP-affiliated doctoral students intend to graduate.
At the beginning of the course, the students will receive an introduction to usable IT security and privacy and relevant concepts. Afterwards, a selection of current research questions from that area will be presented. The students form teams and select one of the proposed research questions. This question will accompany the students throughout the semester. They will design and evaluate a concept for a human-centered solution to that question. To be able to do so, they will receive input on human-centered design and evaluation tools. Their progress and the inclusion of the human perspective will be subject to feedback in milestone presentations. The students' human-centered solution can take the form of a concept (e.g., a concept for a product or app), interface (e.g., a visual or tangible interface), or prototype (e.g., sketches, a click-dummy or a built prototype). The solution will then be subject to evaluations. The solutions will be user-tested by members of other teams that thereby take the perspective of a user themselves. In addition, the solutions will be analyzed from different stakeholders' perspectives, such as developers or website owners. Finally, the students will reflect on potential changes that results from the evaluations and their consequences.

### Literature

**Literature Recommendations:**

### Prerequisites / notice

This course is especially recommended after the related lecture "851-0390-00 G Human-Centered IT Security and Privacy". However, previous participation in the lecture is not a requirement and not necessary for succeeding in the course.

### Competencies

**Subject-specific Competencies**

- Analytical Competencies
  - Decision-making
- Media and Digital Technologies
  - Problem-solving
- Project Management

**Social Competencies**

- Communication
- Cooperation and Teamwork
- Customer Orientation
- Sensitivity to Diversity

**Personal Competencies**

- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

### 851-0251-00L

**Psychedelic Science: Psychology Pharmacology**

**Psychotherapy Philosophy Religion Politics**

W 3 credits 2V K. Stocker

**Abstract**

This lecture series covers psychedelic science mainly psychologically, and additionally pharmacologically, physiologically, psychotherapeutically, philosophically, religiously, and politically. All contributions will also be reflected on from the viewpoint of the humanities and psychology.

**Objective**

To provide students with a multidisciplinary introduction to psychedelic science, and to also comprehensively embed this in a reflection from a humanities/psychology viewpoint.

**Content**

Psychedelic science is a multidisciplinary field of study that involves scholars of the human sciences, the natural sciences, and the humanities. In this course, psychedelic science is presented mainly from the viewpoint of psychology, but will additionally also be considered from the viewpoints of pharmacology, physiology, psychotherapy, philosophy, religion, and politics. All contributions will also be reflected from the viewpoint of the humanities and psychology. The psychedelic studies treated in this course that involve humans focus on controlled and ethically approved studies where these substances are administered to medically screened, prepared, and supported participants. This course is in no way intended to encourage the private/illegal use of psychedelic substances.

A psychedelic experience is occasioned by classic (serotonergic) psychedelics such as lysergic acid diethylamide (LSD), psilocybin, mescaline, and N,N-dimethyltryptamine (DMT). Psychologically, the psychedelic experience can be characterized as a temporary nonordinary state of consciousness (NSC) that basically differs from everyday waking consciousness in terms of all three traditionally identified components of the mind: cognition (perception and thought), affect (emotions and mood), and conation (volition, willpower).

Psychelic nonordinary cognition may for instance involve visions of geometric patterns or the perception of a subject-object transcending oneness; psychedelic nonordinary affect may for instance involve great anxiety, deepest sadness, or highest bliss; and psychedelic nonordinary conation may for instance involve themes such as surrendering to the psychedelic experience or letting go of emotionally difficult aspects of one's life.

Studying the psychedelic experience is a worthwhile endeavor. While psychedelic experiences can also be challenging/confrontational, they are often deeply meaningful to the individual experiencing them. Studies have shown that such experiences are often associated with enduring positive effects on attitudes, mood, and behavior in healthy individuals and—in conjunction with psychotherapy—with sustained symptom reductions in individuals suffering from depression, anxiety, and addiction (also showing some first promise for a number of other mental conditions, such as obsessive-compulsive and eating disorders).

Psychedelic science is overall a large multidisciplinary effort that requires collaboration of scholars of the human sciences, the natural sciences, and the humanities to advance the scientific knowledge of it. In this spirit, this course involves—besides the main lecturer (PD Dr. phil. Kurt Stocker, a psychologist)—also further psychedelic-scientific scholars giving individual lectures in their respective field of expertise: psychology (PD Dr. phil. Katrina Preller, University of Zurich & Yale University), pharmacology (Dr. phil. nat. Dino Luethi, University Hospital Basel; Dr. phil. nat. Deborah Rudin, University Hospital Basel; Prof. Dr. phil. Linda Simmler, University of Basel), physiology (PD Dr. sc. nat. Felix Scholkmann, University of Zurich & University of Bern), psychotherapy (Prof. Dr. med. Gregor Hasler, University of Fribourg; Dr. med. Dr. sc. ETH Milan Scheidegger, University of Zurich), philosophy (Dr. Peter Sjöstedt-Hughes, University of Exeter), religion (TBA), and politics (Dr. phil. Claudia G. Schwarz, Karl Landsteiner University of Health Sciences, Krems). By incorporating all these disciplines, the curricular goal of this ETH course is to cover psychedelic science from the large variety of major academic disciplines that are involved in this field, and to thus introduce psychedelic science to the students as broadly and comprehensively as is possible within a single course.

**Competencies**

- Subject-specific Competencies
  - Concepts and Theories 

- Personal Competencies
  - Critical Thinking
Objective
Ideas and arguments dealing with systematic problems especially in epistemology, ethics, political philosophy, and the philosophy of mind will be scrutinized and elaborated.

Objective
PhD students will have an opportunity to improve their presentation skills and obtain an important chance to receive feedback both from peers and more advanced scholars.

Prerequisites / notice
The venue changes each semester alternately between UZH and ETH.

Objective
This colloquium is devoted to the introduction into the theory and practice of scientific work. The colloquium addresses advanced and graduate students. First, it offers participants the opportunity to present their own research projects (work in progress); and, second, it provides a most fruitful space to discuss methodological, theoretical and systematic complex issues.

Prerequisites / notice
Lectures may be held either in English or German. Students receive 2 credit points for submitting a brief, written commentary on one of the presented topics (approx. 5 pages).

Objective
The students will be able to analyze techno-scientific knowledge and practices from the point of view of various recent philosophical frameworks from the context of feminist and new materialist philosophy.

Competencies
- Subject-specific Competencies: Concepts and Theories assessed
- Techniques and Technologies fostered
- Method-specific Competencies: Analytical Competencies assessed
- Social Competencies: Communication fostered
- Sensitivity to Diversity fostered
- Personal Competencies: Critical Thinking fostered

Objective
The objective is to analyze human-insect interactions by identifying key historical factors (economic, scientific, political). Furthermore, promising new philosophical articles and parts of new philosophical books will be studied.

Prerequisites / notice

Objective
The fortnightly colloquium provides a forum for PhD students and postdoctoral researchers to present and discuss their current work. Half of the slots are reserved for presentations by invited external scholars.

Prerequisites / notice

Abstract
This colloquium is devoted to the introduction into the theory and practice of scientific work. The colloquium addresses advanced and graduate students. First, it offers participants the opportunity to present their own research projects (work in progress); and, second, it provides a most fruitful space to discuss methodological, theoretical and systematic complex issues.

Prerequisites / notice
The venue changes each semester alternately between UZH and ETH.

Abstract
The colloquium addresses advanced and graduate students. First, it offers participants the opportunity to present their own research projects (work in progress); and, second, it provides a most fruitful space to discuss methodological, theoretical and systematic complex issues.

Prerequisites / notice

Objective
The session explores insects as historical actors and their diverse interactions with human societies over time and space. It offers an overview of recent approaches in environmental history and multispecies ethnography while providing an analytical framework to understand global processes of natural resource exploitation, knowledge formation, and imperialism.

Data: 26.07.2024 12:39  Autumn Semester 2024  Page 768 of 2680
Content

This course introduces students to the various forms and functions of knowledge and science in literature, particularly within the realm of science fiction, the genre that most directly epitomises this fundamental connection within literary texts.

In analysing how it shifts our understanding of ourselves and of supposedly inalterable facts about the reality we inhabit, we will examine how science fiction demonstrates that fiction is neither fundamentally in conflict with scientific knowledge, as previously supposed, nor a mere vehicle for its celebration, as still commonly presumed of science fiction. Instead, the genre, with its radical investigations into other forms of being, fearing and hoping, plays a crucial role in the social formation, order and negotiation of knowledge. As such, science fiction also represents a vital thought experiment regarding the “science of fiction”, i.e. the development of a knowledge of literature and the many fascinating ways in which it helps us to know our own world better, in turn.

In this course, we will take a systematic and theory-based approach to a deeper understanding of science fiction, particularly concerning its historical background, unique aesthetic/narrative tools, and relationship with the critical and technocultural contexts that shape it.

Employing contemporary theoretical approaches, we will discuss a variety of themes within primary texts alongside diverse critical sources, all of which ultimately relate to knowledge and knowability. Particular areas of focus may include: other worlds and alien existences; altered temporality and alternate history; utopia and dystopia; climate fiction and the Anthropocene; trans- and posthumanist and cyborg identities; robots and AI; and alternative futurisms. Moreover, the course will thereby also engage with the fundamental (and at times overlooked) role of order and presentation of knowledge, i.e. its aesthetic and narrative forms, within science and literature.

A Sampler of Histories and Philosophies of Science, Trust and Politics

W 3 credits 2V R. Wagner

Mathematics
Particularly suitable for students D-CHAB, D-INFK, D-ITET, D-MATH, D-PHYS

Abstract

This course will review several case studies from the ancient, medieval and modern history of mathematics. The case studies will be analyzed from various philosophical perspectives, while situating them in their historical and cultural contexts.

Objective

The course aims are:

1. To introduce students to the historicity of mathematics
2. To make sense of mathematical practices that appear unreasonable from a contemporary point of view
3. To develop critical reflection concerning the nature of mathematical objects
4. To introduce various theoretical approaches to the philosophy and history of mathematics
5. To open the students' horizons to the plurality of mathematical cultures and practices

Science, Trust and Politics

W 3 credits 2S G. Dorthé

Abstract

The seminar aims to inspire a nuanced understanding of the dynamics of expertise in society. Cross-fertilizing literature from science and technology studies (STS) and from activists’ movements, it focuses on contemporary controversies around emerging technologies and climate policy, where trust in science is said to be undermined (e.g. climate skepticism or anti-vaccine movements).

Objective

1) Introduce to the role and functions of expertise in democratic societies. 2) Familiarize with assumptions about science and society embedded in contemporary controversies. 3) Inspire critical perspectives on (dis)trust in science through activists’ movements on contested environmental and technological issues. 4) Develop a creative position on the relations between science, trust and politics.

Content

Engineers and scientists often pursue their studies and research in the hope that their knowledge can contribute to make a better world, inform democratic deliberation and help public understanding of complex issues. Yet this special status of science and technology is being increasingly contested by marginalized publics, lobbies, exposed populations, and by members of the scientific communities themselves. Climate skepticism or vaccine hesitancy are some of the most vivid examples of this confusing situation. In this seminar, students will learn to reflect on expertise as a form of scientific engagement in the messiness of democratic deliberation and public life, beyond the noble but outdated idea of “speaking truth to power”.

The exercise of expertise is stumbling upon several conundrums. Which knowledge is relevant in which situation? How to make sure that some crucial perspectives are not left in the shadows? How to identify representative experts and make sure that they speak on behalf of a structured community? Whose voices are being silenced? On the other side of the spectrum, the public is often said to lack proper understanding of science and thus in need of being educated or disciplined. Or it is suspected of being manipulated by lobbies or foreign hostile powers, or of being too attached to its own privileges and unwilling to act in favor of the common good. Whose agency is being acknowledged in sociotechnical controversies and whose agency is being denied and why? The seminar will provide a deep understanding of these perspectives, by putting them in a broader historical and epistemological context. Students will thus learn to critically assess their strengths as well as their blind spots.

Whereas opposing technological developments (anti 5G or anti-vaccine activists) or pushing to act accordingly to science (pro-climate movements such as Extinction Rebellion or Scientist Rebellion), activists’ movements make up for a rich field of investigation on the dynamics of expertise and of how various publics can make sense of scientific knowledge. Cross-fertilizing activist’s texts and experiences with literature in science and technology studies and anthropology, this class will be organized as a structured conversation and a collective mapping of actors and key concepts of sociotechnical controversies. Over the course of the semester, students will learn not only to navigate some of the most heated contemporary debates, but also to articulate their own position on an issue of their choice.

Truth and Historical Injustice: The Production of Knowledge about Past Mass Atrocities

W 3 credits 2V S. M. Scheuzger

Abstract

The course deals with the scientific production of knowledge about past mass atrocities. It looks at the interplay of different disciplines, methods and technological means that have been involved in this production over time. Further, it poses the question of what truth can mean in this context.

Objective

The students a) know the main features of the discussion about the truth in the reconstruction of past events; b) have an understanding of the interplay, but also the coexistence of different scientific methods and technological means in the multidisciplinary production of knowledge about past mass crimes; c) have knowledge of important processes of dealing with past mass crimes from the second half of the 20th century onwards.

Data: 26.07.2024 12:39 Autumn Semester 2024 Page 769 of 2680
When discussing the truthfulness of the academic study of the past, politically and ideologically motivated mass crimes are often cited as historical events in order to substantiate the necessity of a claim to truth. In doing so, moral arguments can be made or historical truth can be asserted as a basic prerequisite for living together in a democratic society under constitutional conditions. The production of knowledge about past atrocities has always been an endeavour in which various scientific disciplines have been involved. The multidisciplinary character of the production of knowledge about mass crimes has become even more accentuated since the second half of the 20th century, not least due to the emergence of new technological possibilities. The course offers a brief introduction to the discussion about the meaning of truth about past events. It looks at how different scientific approaches - from the humanities to the natural sciences - have been involved in coming to terms with mass crimes and how they have been related to each other. It deals with the question of what role certain techniques and technologies have played in the production of knowledge about past atrocities and how this has changed over time. These techniques and technologies range from the evaluation of documents and the taking of testimonies to specialised database programs, genetic analysis or imaging techniques, to digital technologies for the procurement of information on social media and the internet or for the modelling of past events.

In addressing these questions, the course looks at processes of dealing with the past from the middle of the 20th century to the 21st century in Europe, Latin America and Africa.
and Current Debates

Does not take place this semester.

Abstract

Technology and society cannot be separated: No society functions without technology. The seminar offers a problem-oriented introduction to basic questions of the history of technology, introduces approaches to the history of technology and discusses selected, ongoing debates.

Objective

The course seeks to provide a critical introduction to the issues, methods, and selected areas of research in the history of technology.

Content

History of technology investigates technological developments that arise in specific historical contexts. These developments are perceived by social groups or entire societies as a means of social change and ultimately find use or are forgotten. The questions that history of technology poses derive from the technological and social change that are a product of contemporary orientation and thinking; current historiographical methods provide the tools for answering these questions.

Understanding in Science and Mathematics: A

Abstract

This is a central goal of science and mathematics, but what exactly is the nature of scientific and mathematical understanding? In this seminar, we will read and discuss a number of key philosophical contributions on understanding in philosophy of science, philosophy of mathematics, and epistemology. You will also practice your skills in giving clear and engaging oral presentations.

Objective

The main objective of this seminar is to gain an in-depth understanding of the recent literature on understanding in the philosophy of science, the philosophy of mathematics, and epistemology. Another practical objective is to increase your skills in giving clear and engaging oral presentations.

Content

Understanding is a central goal of science and mathematics: scientists seek to understand various phenomena in the natural world, while mathematicians aim to increase our understanding of the mathematical world. But what exactly is the nature of understanding in science and mathematics? This issue has been largely neglected in twentieth century philosophy of science, philosophy of mathematics, and epistemology. Yet, in the past twenty years, there has been a regain of philosophical interest into the notion of understanding, leading to a flourishing literature. The aim of this seminar is to gain an in-depth understanding of these recent philosophical developments.

To this end, we will read a number of key philosophical contributions on understanding in philosophy of science, philosophy of mathematics, and epistemology. Along the way, we will address general issues on understanding such as: What is the relation between understanding and knowledge? Does understanding necessarily require explanation? How can understanding be transmitted? What exactly is the value of understanding? We will also look into specific case studies of scientific and mathematical understanding.

Each session will be decomposed into three blocks. In blocks 1 and 2, we will have a short presentation (~15 minutes) of a contribution in the philosophy of understanding followed by a discussion. Block 3 will be methodological and will be concerned with how to give good oral presentations, an essential skill in academia. We will use this block to debrief on the presentations of the day and see how they could be improved. We will also discuss resources on best practices in oral communication.

851-0297-00L

Manipulation in Literature and Cultural History

Abstract

This lecture focuses on the manipulation and control of individuals and the masses. The power of manipulation is based on subtle use of persuasive linguistic elements and knowledge of the desires and fears of the intended audience. In addition to a theoretical overview, the lecture concentrates on the literary and discursive texts that dispute the control of protagonists.

Objective

Students will learn about manipulation as a linguistic and narrative phenomenon steeped in myth and classical rhetoric. Against the backdrop of cultural-historical developments, particularly with regard to major changes in media technology, we will examine how the reach of manipulation was extended from the individual to the masses. Students will be able to refine their critical discourse analysis skills and interdisciplinary abilities by studying texts from literature, politics, sociology, philosophy and psychoanalysis which reflect this shift in emphasis.

Content

Since the dawn of time mankind has tried to exert influence over others through the utilisation of certain techniques: initially for self-preservation – for example the interpretation of Sigmund Freud in Totem und Tabu. Later, desire became the driving force – centre stage: the desire for pleasure, power and control. Manipulation manifests itself in the form of characters and words, it is an authentically linguistic occurrence: classical antiquity, with the rhetoric, develops a system of verbal power of persuasion and, already then, questions were being raised in literary and discursive texts about how people could, or even should, manipulate. The exertion of influence and its impact will be clearly described, propagated, commented upon, criticised and ironised.

In contrast to oppressive overpowering, the power of manipulation (in Latin, manus hand, plere fill) is on the one hand, based on the subtle use of persuasive linguistic elements – it is always a (literary) discourse, too – and on the other, on knowing precisely what the fantasies, desires and fears of the manipulated are. The discourse of manipulation has its beginnings in the age of sophists and their belief in an omnipotence of language and rhetoric. It underwent further transformation under political and psychological signs in the early modern period through Giordano Bruno and Niccolò Machiavelli and culminated in the 20th century in a critique of the deceptive strategies of the “culture industry” (T.W Adorno) and “psychotechnology” (B. Stiegler) in global capitalism. Nowadays social media is the “radicalisation machine” (J. Ebner) that present new challenges for society. Written in the 19th century, the Protocols of the Elders of Zion already gave indications of how present-day conspiracy theorists would manipulate their audience, and its impact can still be felt today. Since manipulation is a linguistic, narrative and also literary phenomenon, the central theme of the lecture is how in literature itself this often politically controversial and manipulative behaviour is picked up and reflected through poetry: such as in Tristan from Gottfried von Strassburg, Goethe’s Wilhelm Meister, Friedrich Schiller’s Die Verschwörung des Fiesco zu Genua or Heinrich von Kleist’s Der zerbrochene Krug, the works of Edgar Allan Poe and Thomas Mann (Mario und der Zauberer) and, most recently in Eckhart Nickel’s novel, Hysteria.

Doctoral Colloquium in History of the Modern World

Abstract

In this colloquium, doctoral students can present their research plan, share a chapter of their thesis, discuss a problem they are facing with their sources, etc. They obtain feedback by postdocs as well by the peer students taking part in the colloquium.

Objective

Obtain feedback on the doctoral research plan as required by ETH Zurich, when applicable, as well as on their research at large.
Doctoral students from the Chair of the History of the Modern World attend this colloquium every semester, during which they present their research according to their PhD stage. All students are supposed to read and comment on their peers’ research ideas and plans throughout both semesters. A one-off 1 ETCS can be credited to registered students. At the end of the second semester, students present their work (the research plan or a 5000-word article) in front of the entire team and two external commentators.

Ethics and Scientific Integrity for Doctoral Students  ■  W  1 credit  2U  G. Achermann

This course is interdisciplinary. If your department offers this course, please register there if possible.

Abstract

This course sensitises doctoral students to ethical issues that may occur during their doctorate. After an introduction to ethics and good scientific practice, students are familiarised with resources that can assist them with ethical decision-making. Students get the chance to apply and deepen their knowledge in an interactive face-to-face workshop.

Objective

Doctoral students learn how to identify, analyse and address ethical issues in their own scientific research. In addition, they will reflect on their professional role as scientific researchers.

Content

Content:

Part I on Moodle

The self-paced e-learning course on Moodle consists of 5 modules:

Module 1: Ethics
- Introduction to moral theory (with emphasis on practical guidance regarding decision making)

Module 2: Ethics in scientific research
- Introduction to ethical issues that occur within scientific research (i.e. regarding authorship, cooperation, data use and sharing, and other aspects that are subject to scientific integrity and good scientific practice).

Module 3: Collecting resources
- A variety of tools and resources that help identify ethical issues are presented and explained

Module 4: Setting up a strategy
- Example examination of a case regarding its ethical scope (students develop their own strategy to examine situations for their ethical implications).

Module 5: Making decisions
- Different ways of addressing ethical issues are presented and explained (i.e. how to make hard choices, or solve ethical dilemmas. But also where to seek advice if needed).

Part II

The second, face-to-face part (group sessions) of this course provides an interactive learning environment (workshop). Students get to apply their knowledge, and they are encouraged to reflect on ethical problems and to critically discuss them with fellow doctoral students.

Prerequisites / notice

For doctoral students only.

Hence, when you choose a group make sure you have enough time to finish the first part on Moodle before the workshop starts (appr. 20 hours).

**Abstract**
The basic course in "Good Clinical Practice" (GCP) contains of two full-time training days (Module 1 and Module 2) and addresses elementary aspects for the appropriate conduct of clinical trials and non-clinical research projects involving human beings. Successful participation will be confirmed by a certificate that is recognized by the Swiss authorities.

**Objective**
Students will get familiar with:
- Key Ethics documents
- (Inter)national Guidelines and Laws (e.g. ICH-GCP, DIN EN ISO 14155, TPA, HRA)
- Sequence of research projects and project-involved parties
- Planning of research projects (statistics, resources, study design, set-up of the study protocol)
- Approval of research projects by Authorities (SwissEthics, Swissmedic, FOPH)
- Roles and responsibilities of project-involved parties

Students will learn how to:
- Classify research projects according the risk-based approach of the HRA
- Write a study protocol
- Inform participating patients/study subjects
- Obtain consent by participating patients/study subjects
- Classify, document and report Adverse Events
- Handle projects with biological material from humans and/or health-related personal data

**Content**
Module 1:
Research and Research Ethics, Guidelines, (inter)national Legislation, Development of therapeutic products, Methodology (Study Design), Study documents (Study protocol, Investigator's Brochure, Patient Information Leaflet, Informed Consent Form)
Module 2:
Roles and Responsibilities, Approval procedures, Notification and Reporting, Study documentation, Research with biological material and health-related data, data protection, data retention

| 376-0303-00L | Colloquium in Translational Science (Autumn Semester) | W    | 1 credit | 1K    | A. Alimonti, V. Falk, J. Goldhahn, K. Maniura, R. M. Rossi, S. Schürle-Finke, G. Shivashankar, E. Vayena, V. Vogel |

**Abstract**
Current topics in translational medicine presented by speakers from academia and industry.

**Objective**
Getting insight into actual areas and problems of translational medicine.

**Content**
Timely and concise presentations of postgraduate students, post-docs, senior scientists, professors, as well as external guests from both academics and industry will present topics of their interest related to translational medicine.

**Prerequisites / notice**
No compulsory prerequisites, but student should have basic knowledge about biomedical research.

| 376-0305-00L | ETHEart Joint Scientific Colloquium (Autumn Semester) | W    | 1 credit | 1K    | V. Falk |

**Abstract**
Lectures, presentations and discussions on chosen topics in biologics, (bio-)materials, devices, sensors, robotics and data science and their relevance for cardiovascular medicine.

**Objective**
Deeper, mutual understanding of current medical challenges and technical solutions in cardiovascular medicine.

**Content**
Timely and didactically structured presentations of postgraduate students, post-docs, senior scientists and professorson topics from Zurich Heart / ETHEart projects, followed by lectures on chosen topics of cardiovascular medicine and research given by leading international clinical scientists in the field.

**Prerequisites / notice**
No compulsory prerequisites, but students should have basic knowledge about cardiovascular system, physiology and biomedical research.

| 376-1176-00L | Wearable and Mobile Technologies of the Future - Focus on Sports and Health | W    | 4 credits | 3G    | C. Menon, C. Ahmadizadeh, C. Oleteanu |

**Abstract**
The course introduces concepts about wearable and unobtrusive technologies for sport and health data collection. Tools for analysing this data and evaluating the performance of these systems are introduced. Topics such as monitoring movement and muscle activation, mental focus, stress, and heart health are covered.

**Objective**
Objective 1:
Acquire knowledge about wearable and unobtrusive technologies and skills to process data acquired using wearable technologies.

Objective 2:
Provide students with hands-on experience using various wearable technologies, including textile-based stretchable sensors, electromyography (EMG), electroencephalogram (EEG) and electrocardiogram (ECG).
Module 0: Fundamentals
This module briefly reviews time-frequency domains, transforms and filtering.

Module 1: Movement.
This module provides the scientific background needed to understand the principles that current technologies investigating movement rely on. It provides an overview of wearable technologies for monitoring overall body movement as well as for tracking motion parameters (e.g. gait, running, posture). Technologies such as inertial measurement units, electromyography, optical motion capture systems, and others are covered. The latest updates on wearable-related (e.g., textile-based) technologies are also introduced. Students are involved in labs/assignments to put into practice the knowledge and skills acquired during this module.

Module 2: Brain.
This module briefly introduces brain functions and provides an overview of related wearable technologies. Topics covered may include electroencephalograms, transcranial magnetic stimulation, and galvanic vestibular stimulation. Data processing techniques such as common spatial patterns, principal component analysis, and linear discriminant analysis are introduced. Students are given a practical assignment to put into practice the knowledge and skills acquired during this module.

Module 3: Cardiac.
This module focuses on wearable technologies for monitoring cardiac health. The module starts by providing information on cardiac physiology and introduces wearable technologies for the heart. Topics such as electrocardiography, photoplethysmography, light sensing, and contactless physiology monitoring are introduced. Data analysis techniques for cardiac data including heart-rate variability, Poincaré plots, and wavelet transforms are discussed. Students will be given an assignment to put into practice the knowledge and skills acquired during this module.

Prerequisites / notice
- Students should be proficient in programming (any language).
- Note: assignments will be in Python. Students are expected to learn Python on their own if not experienced with this programming language.
- Course prerequisites:
  - For Biomedical Engineering Master’s: none
  - For ITET Master’s: none
  - For D-MAVT Master’s: none
  - For D-HEST Master’s and PhD students:
    - If BSc in electrical/mechanical engineering or computer science: none
    - If any other BSc program: 376-0022-00L (Imaging and Computing in Medicine) or 376-1983-00L (Foundations of Data Science)

376-1229-00L Artificial Intelligence in Rehabilitation and Healthcare W 3 credits 3G D. F. Paez Granados

Abstract
Students will delve into AI fundamentals (e.g., regression, classification, and deep neural networks) and their role in patient monitoring & personalized rehab. Collaborative projects offered by MedTech companies provide hands-on experience in developing and evaluating AI-driven solutions. This course will emphasise AI’s explainability and ethical dimensions fostering its critical analysis.

Objective
1. Evaluate the effectiveness of AI tools and algorithms in the context of rehabilitation and healthcare, and suggest modifications or improvements as needed.

2. Understand the ethical and legal considerations surrounding the use of AI in rehabilitation and healthcare and apply this knowledge to ensure patient privacy and data security.

3. Identify potential limitations and risks of using AI in rehabilitation and healthcare and propose strategies to mitigate these challenges.

4. Collaborate effectively with other students on group projects that involve developing and im-plementing AI-based rehabilitation and healthcare solutions.

Content
In the class ‘Artificial Intelligence (AI) in Rehabilitation and Healthcare’, we will explore the integration of advanced technology in the field of rehabilitation. The class consists of both theoretical and practical components. In the theoretical part, students are introduced to the fundamental concepts of artificial intelligence, including regressions and classification in machine learning, deep neural net-works, and large language models. They will explore the applications of AI in rehabilitation and healthcare, including patient monitoring, personalized treatment plans, and predictive analytics.

In the practical component, each student will work with one of the clinics or technology companies to identify real-world problems and gain hands-on experience in developing AI in rehabilitation and healthcare. The practical work will be done in the course room with student assistants and experts from the companies. They will use Python as main language on their own laptops with ready to use Jupiter notebooks that could have access to our lab’s server if needed for computational resources. They will directly start using programming languages and tools to build models, analyze data, and create algorithms that can be used to improve patient outcomes.

Throughout the class, students are encouraged to think critically about the ethical implications of using AI in rehabilitation. They examine the potential benefits and risks of using advanced technology in patient care and explore ways to mitigate potential negative outcomes.

Practical problems partners: Schweizer Paraplegiker-Stiftung, Lake Lucerne Institute, Balgrist Uni-versity Hospital, Ortho-Team Luzern, Akina AG, and Letiwer AG.

Prerequisites / notice
- Required classes:
  - 401-0643-00L Statistik I
  - 401-0643-13L Statistik II
  - 376-1983-00L Foundations of Data Science

Recommended courses:
- 252-0842-00L Programmieren und Problemlösen
Introductory Course in Neuroscience I (University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: SPV0Y005

Mind the enrolment deadlines at UZH:

Abstract
The course gives an introduction to human and comparative neuroanatomy, molecular, cellular and systems neuroscience.

Objective
The course gives an introduction to the development and anatomical structure of nervous systems. Furthermore, it discusses the basics of cellular neurophysiology and neuropharmacology. Finally, the nervous system is described on a system level.

Content
1) Human Neuroanatomy I&II
2) Comparative Neuroanatomy
3) Building a central nervous system I,II
4) Synapses I,II
5) Glia and more
6) Excitability
7) Circuits underlying Emotion
8) Visual System
9) Auditory & Vestibular System
10) Somatosensory and Motor Systems
11) Learning in artificial and biological neural networks

Prerequisites / notice
For doctoral students of the Neuroscience Center Zurich (ZNZ).

Colloquium in Biomechanics

Abstract
Current topics in biomechanics presented by speakers from academia and industry.

Objective
Getting insight into actual areas and problems of biomechanics.

Transdisciplinary Research: Challenges of Interdisciplinarity and Stakeholder Engagement

The lecture takes place if a minimum of 12 students register for it.

Abstract
This seminar is designed for PhD students and PostDoc researchers involved in inter- or transdisciplinary research. It addresses and discusses challenges of this kind of research using scientific literature presenting case studies, concepts, theories, methods and by testing practical tools. It concludes with a 10-step approach to make participants’ research projects more societally relevant.

Objective
Participants know specific challenges of inter- and transdisciplinary research and can address them by applying practical tools. They can tackle questions like: how to integrate knowledge from different disciplines, how to engage with societal actors, or how to secure broader impact of research. They learn to critically reflect their own research project in its societal context and on their role as scientists.

Content
The seminar covers the following topics:
(1) Theories and concepts of inter- and transdisciplinary research
(2) The specific challenges of inter- and transdisciplinary research
(3) Collaborating between different disciplines
(4) Engaging with stakeholders
(5) 10 steps to make participants’ research projects more societally relevant

Throughout the whole course, scientific literature will be read and discussed as well as practical tools explored in class to address concrete challenges.

Literature
Further, this collection of tools will be used:
https://naturalsciences.ch/topics/co-producing_knowledge
https://www.shapeitoolkit.eu

Prerequisites / notice
Participation in the course requires participants to be working on their own research project.

Competencies
Subject-specific Competencies
Concepts and Theories
Method-specific Competencies
Analytical Competencies
Problem-solving
Social Competencies
Communication
Cooperation and Teamwork
Sensitivity to Diversity
Personal Competencies
Critical Thinking
Self-awareness and Self-reflection

Food Science

Colloquium in Food and Nutrition Science

Participation in weekly seminars on a variety of topics including Food Microbiology, Food Toxicology, Food Biochemistry, Food Processing, Consumer Behavior, Food Technology, and Food Materials and Technology, and oral presentation of a selected published study in one of these areas inspired by participation in the seminars.

The objectives are to become familiar with and stimulate interest in leading-edge science related to the research topics of the Institute of Food, Nutrition and Health. Participants attend weekly seminars given by external and internal speakers, and are also required to deliver a presentation on a recent research article inspired by a topic from the semester presentations.

**Abstract**

This course provides a thorough exploration of drug development and involved ethical issues as well as critical analysis of ethical challenges and practical skills to resolve them. It includes elements of drug development processes, alternative regulatory pathways and ethics of drug pricing and develops a solid grasp of ethical complexity as well as practical skills.

**Objective**

This course is tailored to D-HEST students who want to become familiar with pharmaceutical development and its ethical implications. By the end of this course, students will have developed a comprehensive understanding of the ethical complexities and challenges in drug development. They will be equipped with the knowledge and analytical skills to navigate ethical reasoning and contribute to the responsible advancement of pharmaceutical research. The specific learning objectives of the course are:

- Discuss relevant legal and public policy frameworks in drug development, ensuring an understanding of the broader regulatory context within which policy and regulatory decisions are made.
- Recognize and identify ethical dilemmas inherent to drug development, fostering a heightened awareness of ethical considerations across various stages of the process.
- Identify and discuss ethical issues in drug development in light of recent advances in the field of artificial intelligence.
- Critically analyze ethical challenges within drug development, enabling them to discuss complex issues, evaluate competing ethical perspectives, and form reasoned judgments.
- Understand the ethical theories and principles that underpin drug regulation.
- Evaluate the ethical implications of alternative pathways, such as Accelerated Approval and Compassionate Use, equipping students to assess potential benefits, risks, and societal consequences.
- Assess the ethical dimensions of drug pricing decisions and their impact on equity and accessibility, encouraging thoughtful reflection on the broader societal implications of pricing strategies.

**Content**

- Principles of biomedical ethics and how they relate pharmaceutical innovation
- Introduction to drug development, with a focus on the Swiss regulatory ecosystem
- Current trends and impediments to effective drug development, including the use of AI in drug discovery
- Translational medicine and its ethical implications
- Ethical Aspects of pre-clinical research, including animal replacement technologies like organoids and organ chips
- Ethical aspects of clinical research
- Special regulatory pathways: expanded access / compassionate use
- Special regulatory pathways: accelerated approval
- Drug development and public health. emergency use of new drugs
- Drug pricing: introduction to its regulatory and ethical aspects

| 389-7000-00L | Ethics and Scientific Integrity for Doctoral Students in Health Sciences and Technology | W | 1 | E. Vayena, A. Blasimme |

**Abstract**

This course allows D-HEST PhD students to fulfill the requirements of the mandatory training in ethics. The students will acquire the necessary theoretical and analytic resources to develop critical thinking skills in the field of applied ethics and will practice how to use such resources to address concrete ethical issues in health sciences.

**Objective**

The course aims at equipping students with the necessary knowledge and analytic skills to understand, discuss and address the ethical aspects of science and technology in relation to human health. The specific learning objectives of this course are:

- Identify ethical issues in in life sciences and biotechnology.
- Analyze and critically discuss ethical issues in life sciences and biotechnology.
- Become aware of relevant legal and public policy frameworks.
- Distinguish different ethical approaches and argumentative strategies in applied ethics.
- Recognize how ethical issues relate to different accounts of technology and innovation.
- Develop a personal and critical attitude towards the ethical aspects of life sciences and their technological application.
- Autonomously anticipate ethical issues.
- Propose and communicate solutions to ethical challenges and dilemmas.

**Content**

This course allow the students to autonomously decide among a broad list of topics specifically designed to be aligned with the scientific interests of D-HEST doctoral programs.

The course has three components:
1) Students will watch pre-recorded material that will be made available on Moodle.
2) Students will attend an introductory lecture on the ethics of science, technology and innovation.
3) Students will choose two lectures to attend from a list of thematic lectures that will take place throughout the semester.

**Competencies**

| 851-0745-00L | Ethics Workshop: The Impact of Digital Life on Society ■ | W | 2 | 2S |

**Abstract**

This workshop focuses on understanding and managing the ethical and social issues arising from the integration of new technologies in various aspects of daily life.

**Objective**

- Explain relevant concepts in ethics.
- Evaluate the ethical dimensions of new technology uses.
- Identify impacted stakeholders and who is ethically responsible.
- Engage constructively in the public discourse relating to new technology impacts.
- Review tools and resources currently available that facilitate resolutions and ethical practice.
- Work in a more ethically reflective way.
The workshop offers students an experience that trains their ability for critical analysis and develops awareness of responsibilities as a researcher, consumer and citizen. Learning will occur in the context of three intensive workshop days, which are highly interactive and focus on the development and application of reasoning skills.

The workshop will begin with some fundamentals: the nature of ethics, of consent and big data, of AI ethics, public trust and health ethics. Students will then be introduced to key ethical concepts such as fairness, autonomy, trust, accountability, justice, as well different ways of reasoning about the ethics of digital technologies.

A range of practical problems and issues in the domains of education, media, society, digital health and justice will be then considered. These domains are represented respectively by unique and interesting case studies. Each case study has been selected not only for its timely and engaging nature, but also for its relevance. Through the analysis of these case studies key ethical questions (such as fairness, accountability, explainability, access etc.) will be highlighted and questions of responsibility and tools for ethical practice will be explored.

Throughout, the emphasis will be on learning to make sound arguments about the ethical aspects of policy, practice and research.

851-0178-00L Ethics and Scientific Integrity for Doctoral Students ■ W 1 credit 2U G. Achermann
This course is interdisciplinary. If your department offers this course, please register there if possible.

Abstract
This course sensitises doctoral students to ethical issues that may occur during their doctorate. After an introduction to ethics and good scientific practice, students are familiarised with resources that can assist them with ethical decision-making. Students get the chance to apply and deepen their knowledge in an interactive face-to-face workshop.

Objective
Doctoral students learn how to identify, analyse and address ethical issues in their own scientific research. In addition, they will reflect on their professional role as scientific researchers.

Content
Content:
Part I on Moodle
The self-paced e-learning course on Moodle consists of 5 modules:
Module 1: Ethics
- Introduction to moral theory (with emphasis on practical guidance regarding decision making)
Module 2: Ethics in scientific research
- Introduction to ethical issues that occur within scientific research (i.e. regarding authorship, cooperation, data use and sharing, and other aspects that are subject to scientific integrity and good scientific practice).
Module 3: Collecting resources
- A variety of tools and resources that help identify ethical issues are presented and explained
Module 4: Setting up a strategy
- Example examination of a case regarding its ethical scope (students develop their own strategy to examine situations for their ethical implications).
Module 5: Making decisions
- Different ways of addressing ethical issues are presented and explained (i.e. how to make hard choices, or solve ethical dilemmas. But also where to seek advice if needed).

Part II
The second, face-to-face part (group sessions) of this course provides an interactive learning environment (workshop). Students get to apply their knowledge, and they are encouraged to reflect on ethical problems and to critically discuss them with fellow doctoral students.

Prerequisites / notice
For doctoral students only.

The first part on Moodle (part I) must be successfully completed before the face-to-face workshop (part II).

Hence, when you choose a group make sure you have enough time to finish the first part on Moodle before the workshop starts (appr. 20 hours).

**Data:** 26.07.2024 12:39  **Autumn Semester 2024**  **Page 782 of 2680**
Objective
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week.

900-0109-DRL Transferable Skills Course I (1 week, with Poster or Talk)  
Only for doctoral students.

Abstract
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

Objective
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

900-0110-DRL Transferable Skills Course II (1 week, with Poster or Talk)  
Only for doctoral students.

Abstract
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

Objective
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

900-0111-DRL Transferable Skills Course III (1 week, with Poster or Talk)  
Only for doctoral students.

Abstract
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

Objective
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

900-0112-DRL Participation in Commission I (min 1 year)  
Only for doctoral students.

Abstract
Active participation in commissions or university bodies, like associations of scientific staff, the university assembly or similar for at least 1 year.

Objective
Active participation in commissions or university bodies, like associations of scientific staff, the university assembly or similar for at least 1 year.

900-0113-DRL Participation in Commission II (min 1 year)  
Only for doctoral students.

Abstract
Active participation in commissions or university bodies, like associations of scientific staff, the university assembly or similar for at least 1 year.

Objective
Active participation in commissions or university bodies, like associations of scientific staff, the university assembly or similar for at least 1 year.

900-0114-DRL Member of Executive Board (min 1 year)  
Only for doctoral students.

Abstract
Active participation in the presidium or executive board of a university group for at least 1 year.

Objective
Active participation in the presidium or executive board of a university group for at least 1 year.

**Abstract**
This seminar aims to understand better what creativity and creative thinking is by looking at the history of the creativity dispositives we are embedded in. We will look, learn and apply creative artistic practices to find innovative solutions. And we will also look beyond the artistic practices, into the creative potential of today’s technologies, especially Generative AI.

**Objective**
The students will gain insights into the concept and mechanics of Creative Thinking. They will trace the historical roots of creativity and its contemporary significance, explore how Creative Thinking intersects with modern innovations and technologies. The students will develop a comprehensive understanding of Creative Thinking and its practical application, start to cultivate the ability to generate innovative solutions through creative practices and will analyze the broader implications of creativity in various contexts.

**Content**
In the business world Creative Thinking is considered to be one of the “top ten skills” or “most In-Demand skill” in 2024. With Creative Thinking innovative solutions to problems are developed and not only a large number of ideas but also a variety and range of them are brainstormed. It seems that in today’s dynamic world, creativity isn’t just an asset – but actually necessity. But what exactly is Creative Thinking? In the above mentioned business context it is assumed everybody knows. And what is creativity? And how can we use it. Or not. Originally, connected to artistic practice, creativity is nowadays a skill and practice that can be found in all work areas, especially in innovative and maybe even in technological applications themselves. Today, not only because of creative economy, creative cities or innovation, but also because of generative AI creativity has gained new and broad attention. In the seminar we go back in history to the invention of the genius and look at different social subsystems like art, psychology, economy as well as field as fashion, advertisement and arts and crafts, how our understanding of creativity has emerged till today.

**Abstract**
Presentation of recent publications in theoretical computer science, including results by diploma, masters and doctoral candidates.

**Objective**
The goal is to introduce students to current research, and to enable them to read, understand, and present scientific papers.

**Prerequisites / notice**
This seminar takes place as part of the joint research seminar of several theory groups. Intended participation is for students with excellent performance only. Formal restriction is: prior successful participation in a master level seminar in theoretical computer science.

**Abstract**
The key challenge of the information society is to turn data into information, information into knowledge, knowledge into value. This has become increasingly complex. Data comes in larger volumes, diverse shapes, from different sources. Data is more heterogeneous and less structured than forty years ago. Nevertheless, it still needs to be processed fast, with support for complex operations.

**Objective**
Do you want to be able to query your own data productively and efficiently in your future semester projects, master thesis, or PhD thesis? Are you looking for something beyond the Python+Pandas hype? This courses teaches you how to do so as well as the dos and don't's.

"Big Data" refers to the case when the amount of data is very large (100 GB and more), or when the data is not completely structured (or messy). The Big Data revolution has led to a completely new way to do business, e.g., develop new products and business models, but also to do science -- which is sometimes referred to as data-driven science or the "fourth paradigm".

Unfortunately, the quantity of data produced and available -- now in the Zettabyte range (that's 21 zeros) per year -- keeps growing faster than our ability to process it. Hence, new architectures and approaches for processing it are needed. Harnessing them must involve a deep understanding of data not only in the large, but also in the small. The field of databases evolves at a fast pace. In order to be prepared, to the extent possible, to the (r)evolutions that will take place in the next few decades, the emphasis of the lecture will be on the paradigms and core design ideas, while today’s technologies will serve as supporting illustrations thereof.

After visiting this lecture, you should have gained an overview and understanding of the Big Data landscape, which is the basis on which one can make informed decisions, i.e., pick and orchestrate the relevant technologies together for addressing each one of your projects efficiently and consistently.
This course gives an overview of database technologies and of the most important database design principles that lay the foundations of the Big Data universe. We take the monolithic, one-machine relational stack from the 1970s, smash it down and rebuild it on top of large clusters: starting with distributed storage, and all the way up to syntax, models, validation, processing, indexing, and querying. A broad range of aspects is covered with a focus on how they fit all together in the big picture of the Big Data ecosystem.

No data is harmed during this course, however, please be psychologically prepared that our data may not always be in third normal form.

- physical storage: distributed file systems (HDFS), object storage (S3), key-value stores
- logical storage: document stores (MongoDB), column stores (HBase), graph databases (neo4j), data warehouses (ROLAP)
- data formats and syntaxes (XML, JSON, RDF, Turtle, CSV, XBRL, YAML, protocol buffers, Avro)
- data shapes and models (tables, trees, graphs, cubes)
- type systems and schemas: atomic types, structured types (arrays, maps), set-based type systems (? , *, +)
- an overview of functional, declarative programming languages across data shapes (SQL, XQuery, JSONiq, Cypher, MDX)
- the most important query paradigms (selection, projection, joining, grouping, ordering, windowing)
- paradigms for parallel processing, two-stage (MapReduce) and DAG-based (Spark)
- resource management (YARN)
- what a data center is made of and why it matters (racks, nodes, …)
- underlying architectures (internal machinery of HDFS, HBase, Spark, neo4j)
- optimization techniques (functional and declarative paradigms, query plans, rewrites, indexing)
- applications.

Large scale analytics and machine learning are outside of the scope of this course.

Course textbook: https://ghislainfourny.github.io/big-data-textbook/

Papers from scientific conferences and journals. References will be given as part of the course material during the semester.

The lecture is hybrid, meaning you can attend with us in the lecture hall, or on Zoom, or watch the recordings on YouTube later. Exercise sessions are in presence.

This course, in the autumn semester, is only intended for:
- Computer Science students
- Data Science students
- CBB students with a Computer Science background

Mobility students in CS are also welcome and encouraged to attend. If you experience any issue while registering, please contact the study administration and you will be gladly added.

For students of all other departments interested in this fascinating topic: I would love to have you visit my lectures as well! So there is a series of two courses specially designed for you:
- "Information Systems for Engineers" (SQL, relational databases): this Fall
- "Big Data for Engineers" (similar to Big Data, but adapted for non Computer Scientists): Spring 2023

There is no hard dependency, so you can either them in any order, but it may be more enjoyable to start with Information Systems for Engineers.

Students who successfully completed Big Data for Engineers are not allowed to enrol in the course Big Data.

Abstract

Venture Capital is important to fund big transformational ideas and is often misunderstood by tech or research entrepreneurs. This lecture immerses participants in the role of a Venture Capitalist (VC) to learn from experienced entrepreneurs and investors. In small teams, you work on a case of a real start-up and defend the case in a simulated investment committee consisting of experienced VCs.

After attending this course, students will be able to:
- Explain the differences between VC and founder thinking
- Evaluate if a start-up is suited for venture capital ("VC readiness")
- Evaluate founder friendliness of term sheets
- Determine funding needs & strategy for a start-up from research to first round
- Write and evaluate an investment memo

Competencies

Subject-specific Competencies
- Concepts and Theories assessed
- Techniques and Technologies assessed

Method-specific Competencies
- Analytical Competencies assessed
- Decision-making assessed
- Media and Digital Technologies fostered
- Problem-solving fostered

Social Competencies
- Communication fostered
- Sensitivity to Diversity fostered
- Negotiation fostered

Personal Competencies
- Creative Thinking fostered
- Critical Thinking assessed

263-5053-00L Technology Investing W 2 credits 3S A. Ilic, C. Jurytko

Objective

Venture Capital is important to fund big transformational ideas and is often misunderstood by tech or research entrepreneurs. This lecture immerses participants in the role of a Venture Capitalist (VC) to learn from experienced entrepreneurs and investors. In small teams, you work on a case of a real start-up and defend the case in a simulated investment committee consisting of experienced VCs.

After attending this course, students will be able to:
- Explain the differences between VC and founder thinking
- Evaluate if a start-up is suited for venture capital ("VC readiness")
- Evaluate founder friendliness of term sheets
- Determine funding needs & strategy for a start-up from research to first round
- Write and evaluate an investment memo
After attending this course, students will be able to:

- Assess and foster innovative ideas and technologies.
- Understand the legal implications of AI and software patents.
- Develop effective communication and teamwork skills.
- Improve analytical and problem-solving abilities.
- Cultivate adaptability and flexibility in a rapidly changing field.
- Enhance their personal and professional competencies.

In this seminar dedicated to digital innovations, we will bust the most stubborn myths around AI software patents such as “Software/AI isn’t patentable”, “AI patents are useless because you can’t figure out if they are infringed”, and many others. We will look at how AI and software start-ups can use patents to create a strong IP position in a scalable way.

**263-5054-00L  Patenting Digital Innovations**  
**W 1 credit  2S  A. Ilie, B. Best**

**Abstract**

In this seminar dedicated to digital innovations, we will bust the most stubborn myths around AI software patents such as “Software/AI isn’t patentable”, “AI patents are useless because you can’t figure out if they are infringed”, and many others. We will look at how AI and software start-ups can use patents to create a strong IP position in a scalable way.

**Objective**

- Understand the basics of patenting in the digital space relevant for a global market.
- Evaluate patenting opportunities with a more differentiated view on the topic.
- Effectively use patents as a cost-effective part of a technology startup’s business plan.
- Conduct patent searches, freedom-to-operate analysis and infringement analyses.
- Write their first software/AI-related invention disclosure suitable for patenting.

**Content**

The course is focused on patenting digital innovations. It is designed for students with entrepreneurial interests that like to get a hands-on perspective on the topic of intellectual property strategies and patents.

The seminar includes presentations and practical group exercises to apply the acquired knowledge in practice. Entrepreneurs and leading IP experts are joining the seminar as guest speakers for discussion of real-life examples.

Topics that will be covered include:
- Best practices that any AI/software startups should know about IP and patents.
- How to efficiently monitor competitor patent activity and obtain “FTO”.
- How to create an effective patent filing strategy that grows with the business.
- How to develop a PPA for the business.
- How to create AI patents while not getting distracted from the founder’s core business.

The course also contains a group work of a “FTO battle” where two teams compete in a freedom-to-operate analysis and individual work to write their first invention disclosure related to an AI or software topic.

**263-5057-00L  From Publication to the Doctor's Office**  
**W 3 credits  2S+1A  O. Demler**

**Abstract**

This seminar course is designed to provide students with an opportunity to review and critically evaluate recent publications in medical field focusing on examples when CS method or bioinformatics/statistical technique has lead to an instrumentation, technique or drug approved for clinical practice use.

**Objective**

Throughout the course, students will read and analyze recent publications that demonstrate successful applications and sometimes failures in medicine. Promising research applications will also be discussed. The publications will cover a wide range of topics, including drug discovery, image analysis, prognostic models, and learning healthcare.
The course will be structured as half lecture content and half seminar content. Lectures will review state of the medical practice prior to the discovery, obstacles in moving the field forward, and the need for improvement. Lecture will be followed by the seminar part where students will take turns presenting the assigned publications and leading the discussions. Students’ presentations will focus on the main findings, and specific steps taken to translate the finding into clinical practice.

Publications will include examples of:
- specific CS/bioinformatics/statistics applications that has been brought to “bedside” – has been approved by European Medicines Agency / Food and Drug Administration (USA) for clinical use or are widely used in medical research;
- examples of failures of how a discovery did not translate into an endproduct and why;
- current active research areas.

Covered topics will include some of the following:
- Drug discovery: Computer-aided drug discovery has become an integral part of the drug development process, enabling researchers to design and screen large libraries of molecules in silico (i.e., using computer simulations) before synthesizing and testing them in the lab. This has led to the discovery of new drug candidates for a wide range of diseases, including cancer, Alzheimer’s disease, and HIV/AIDS.
- Genomics: Advances in computational genomics have enabled researchers to analyze and interpret large-scale genomic data, including DNA sequencing data, to identify disease-causing mutations, genetic risk factors, and drug targets. Examples of the development of personalized medicine, where treatments are tailored to an individual’s genetic makeup. Examples when drug target identified by genetics has led to approved treatment.
- Imaging: Computer vision and image processing techniques have revolutionized medical imaging, enabling researchers to extract quantitative information from medical images that were previously inaccessable. This has led to the development of new diagnostic and prognostic tools for a wide range of diseases, including cancer, cardiovascular disease, and neurological disorders.
- Real-world data applications: emulation of clinical trials using electronic health records data.
- Large language models: Generating clinical trial protocols using large language models. Natural Language Processing for information extraction and interpretation.
- Learning healthcare systems: Advances in data analytics and information technology have enabled the development of learning healthcare systems, which use real-time data from electronic health records, medical devices, and other sources to improve patient outcomes and reduce healthcare costs. This has the potential to transform the way healthcare is delivered, making it more personalized, efficient, and effective.

In addition to the presentations, students will also be required to write critical reviews of the assigned publications throughout the course. The reviews will be evaluated based on the students’ ability to identify the strengths and weaknesses of the publications and to provide insightful and constructive feedback.

Prerequisites / notice

The course is intended for advanced undergraduate and graduate students with a background in computer science, bioinformatics, or a related field and interest in applying their skills to medical research.

This course assumes a working knowledge of R/Python and intermediate statistical analysis, including linear, logistic, survival regressions or ability and interest to learn them outside of the class.

Competencies

Subject-specific Competencies

- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies

- Analytical Competencies
- Communication

Social Competencies

- Cooperation and Teamwork
- Leadership and Responsibility

Personal Competencies

- Critical Thinking
- Integrity and Work Ethics

263-5058-00L Technology and Entrepreneurship W 3 credits 6S A. Ilic

Abstract

This course provides theoretical and practical insights into technology entrepreneurship. It focusses on the process of building new ventures from the idea to successfully scaling its business operations.

Objective

Students will develop internationally scalable and technology-based ventures using the Startup Navigator and ScaleUp Navigator Framework. They will learn how to structure and communicate these ideas to business angel and venture capital investors.

Content

This course provides theoretical and practical insights into technology entrepreneurship. It focusses on the process of building new ventures from the idea to successfully scaling its business operations. All tasks will lead students to give a complete pitch presentation in front of business experts and investors at the end of the seminar. The course structure will broadly follow the four dimensions of the St.Galler Startup NavigatorTM.

- Profiling (Problem-Solution-Fit): Here, students will learn to answer questions such as (1) what is your motivation to start a business? (2) What is the real customer problem? (2) What solution can be identified? (3) Who are the customers? (4) What is the job they need done? etc.
- Prototyping (Product-Market-Fit): After this section, students will be able to answer questions such as (1) What is the product or service that solves a customer need? (2) What is the value proposition? (3) What is the unique selling proposition? (4) What is the go-to market strategy? (5) Who are the competitors? etc.
- Sourcing (Execution-Fit): Here, students will learn to address questions such as (1) What are important team roles? (2) How to leverage network and partners? (3) What are the requirements to execute the business? (4) Are there any IP-related challenges? (5) How may we co-create with others? etc.
- Scaling (Performance-Fit): In this section, students will reflect their concept in terms of scalability. They will learn to answer questions such as (1) How do we create purpose-driven culture for growth? (2) How do we scale-up revenues? (3) How do we optimize our startup’s valuation in Series-X funding? (4) What kind of exit options are there?

As a result, students develop internationally scalable and technology-driven businesses in teams. The special focus lies on the ability to successfully pitch these ventures to business angels or venture capital investors.

Literature

- Course slides and case-based literature provided by the instructor.
- Additional material pointed out by the instructor prior to and during the course.
In this doctoral seminar, current research at the Institute for Visual Computing will be presented and discussed. The goal is to learn about current research projects at our institute, to strengthen our expertise in the field, to provide a platform where research challenges can be discussed, and to practice scientific presentations.

Participants will be expected to produce several short texts as homework assignments, so ideally they will already be working on writing about their research in English when they take the course. Assignment submissions can include sections of the Doctoral Plan as well as sections of research articles and conference papers. Participants will receive individual feedback on these texts during the course, both from the instructor and from their peers.

Part 1: Part 1 will provide an introduction to the course, and will then focus on using model texts, improving vocabulary and phrasing, and constructing reader-friendly sentences.

Part 2: We will discuss structural decisions about research articles in different journals, review the basics of paragraph structure and organization, and examine how to create better flow in a text.

Part 3: We will work on creating successful introductions, integrating the literature, and writing abstracts.

Part 4: Part 4 will address the main content and grammar concerns of writing about methods and results, and review key grammar concepts for writing complex sentences.

Part 5: We will look at how to construct discussion and conclusion sections and how to strike the right tone of caution/confidence. We will then discuss the editing process, preparing articles for submission, and responding to reviewers' comments.

All sessions will involve group work and peer review of participants' writing.

---

**Abstract**

This short course (5 x 4-lesson workshops) is designed to help doctoral students develop the skills needed to write their first research articles, conference submissions and proposals. The course will help participants to:

- understand the needs of different target readerships,
- manage the writing process efficiently,
- structure texts effectively,
- produce logical flow in sentences and paragraphs,
- edit texts before submission, and
- revise texts in response to colleagues' feedback and reviewers' comments.

**Objective**

This course is designed to help junior researchers in Computer Science develop the skills needed to write their first research articles and/or their Doctoral Plan.

**Content**

Participants will be expected to produce several short texts as homework assignments, so ideally they will already be working on writing about their research in English when they take the course. Assignment submissions can include sections of the Doctoral Plan as well as sections of research articles and conference papers. All sessions will involve group work and peer review of participants' writing.
Assuming some basic knowledge of elementary differential geometry of curves and surfaces in 3-dimensional Euclidean space, we will discuss concepts of classical constructive differential geometry and their discrete versions, with a focus on quadrilateral nets. Topics to be addressed include mappings between surfaces, conjugate parameterizations, principal parameterizations, developable surfaces and their applications in architectural structures, design of mechanical metamaterials and fabrication processes based on bending of material. Another focus is on geometric optimization problems, discussing mainly geometric ideas on initialization, regularization and the formulation of frequently appearing objective functions. A further topic is given by transformations which preserve important structures. This reaches into the sphere geometries of Möbius and Laguerre and transformations of nets. Finally, we present the basics of kinematical geometry, such as velocity fields and their use in registration algorithms, infinitesimal flexibility and the closely related static equilibrium of shells.

</tbody>
</table>

**Abstract**
This course sensitises doctoral students to ethical issues that may occur during their doctorate. After an introduction to ethics and good scientific practice, students are familiarised with resources that can assist them with ethical decision-making. Students get the chance to apply and deepen their knowledge in an interactive face-to-face workshop.

**Objective**
Doctoral students learn how to identify, analyse and address ethical issues in their own scientific research. In addition, they will reflect on their professional role as scientific researchers.

**Content**

Part I on Moodle
The self-paced e-learning course on Moodle consists of 5 modules:

- Module 1: Ethics
  - Introduction to moral theory (with emphasis on practical guidance regarding decision making)

- Module 2: Ethics in scientific research
  - Introduction to ethical issues that occur within scientific research (i.e. regarding authorship, cooperation, data use and sharing, and other aspects that are subject to scientific integrity and good scientific practice).

- Module 3: Collecting resources
  - A variety of tools and resources that help identify ethical issues are presented and explained.

- Module 4: Setting up a strategy
  - Example examination of a case regarding its ethical scope (students develop their own strategy to examine situations for their ethical implications).

- Module 5: Making decisions
  - Different ways of addressing ethical issues are presented and explained (i.e. how to make hard choices, or solve ethical dilemmas. But also where to seek advice if needed).

**Prerequisites / notice**
For doctoral students only.

The first part on Moodle (part I) must be successfully completed before the face-to-face workshop (part II).

Hence, when you choose a group make sure you have enough time to finish the first part on Moodle before the workshop starts (appr. 20 hours).

**851-0373-00L Learning to Teach ■**

This programme is designed for ETH Doctoral Teaching Assistants with current teaching responsibilities.

**Abstract**
This course imparts a variety of teaching skills which will help Doctoral Teaching Assistants with their teaching tasks.

**Objective**
In this course Doctoral Teaching Assistants will:

- discuss learning science and teaching techniques with peers.
- design the introduction of their course/lecture/exercise class.
- develop learning activities according to learning objectives.
- practice classroom assessment techniques in order to measure student learning.
- engage in peer feedback in order to improve own teaching.

**Content**
We will meet for the mandatory kick-off meeting online in October. You will get detailed information together with the invitation email in the first week of the semester. The online phase, where you work through 6 modules in the Moodle course page will end in November. We will meet also face-to-face for the Consolidation workshop. You will find more information on the course page in Moodle.

**Prerequisites / notice**
This programme is designed for ETH Doctoral Teaching Assistants with current teaching responsibilities (exercises, excursions, supervision of practicals, lectures, etc.) or those who will assume teaching tasks in the semester following the programme. No previous teacher training is required.

The consolidation workshop will take place in November. Dates will be announced at the beginning of the semester.
Ethics Workshop: The Impact of Digital Life on Society

Open to all Master level / PhD students.

**Abstract**

This workshop focuses on understanding and managing the ethical and social issues arising from the integration of new technologies in various aspects of daily life.

**Objective**

- Explain relevant concepts in ethics.
- Evaluate the ethical dimensions of new technology uses.
- Identify impacted stakeholders and who is ethically responsible.
- Engage constructively in the public discourse relating to new technology impacts.
- Work in a more ethically reflective way.

**Content**

The workshop offers students an experience that trains their ability for critical analysis and develops awareness of responsibilities as a researcher, consumer and citizen. Learning will occur in the context of three intensive workshop days, which are highly interactive and focus on the development and application of reasoning skills.

The workshop will begin with some fundamentals: the nature of ethics, of consent and big data, of AI ethics, public trust and health ethics.

Students will then be introduced to key ethical concepts such as fairness, autonomy, trust, accountability, justice, as well different ways of reasoning about the ethics of digital technologies.

A range of practical problems and issues in the domains of education, media, society, digital health and justice will be then considered. These domains are represented respectively by unique and interesting case studies. Each case study has been selected not only for its timely and engaging nature, but also for its relevance. Through the analysis of these case studies key ethical questions (such as fairness, accountability, explainability, access etc.) will be highlighted and questions of responsibility and tools for ethical practice will be explored.

Throughout, the emphasis will be on learning to make sound arguments about the ethical aspects of policy, practice and research.

**Competencies**

**Subject-specific Competencies**

- Concepts and Theories: assessed
- Media and Digital Technologies: fostered

**Method-specific Competencies**

- Media and Digital Technologies: fostered
- Teamwork: assessed

**Social Competencies**

- Communication: assessed
- Critical Thinking: assessed
- Self-awareness and Self-reflection: assessed
- Self-direction and Self-management: fostered

**Personal Competencies**

- Creative Thinking: fostered
- Critical Thinking: assessed
- Self-awareness and Self-reflection: assessed
- Negotiation: assessed

Transferable Skills Course I (1-3 days)

Only for doctoral students.

**Abstract**

Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days.

**Objective**

Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days.

Transferable Skills Course II (1-3 days)

Only for doctoral students.

**Abstract**

Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days.

**Objective**

Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days.

Transferable Skills Course III (1-3 days)

Only for doctoral students.

**Abstract**

Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days.

Only for doctoral students.

Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

Abstract
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

Objective
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

900-0111-DRL Transferable Skills Course III (1 week, with Poster or Talk)

Only for doctoral students.

Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

Abstract
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

Objective
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

900-0112-DRL Participation in Commission I (min 1 year)

Only for doctoral students.

Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

Abstract
Active participation in commissions or university bodies, like associations of scientific staff, the university assembly or similar for at least 1 year.

Objective
Active participation in commissions or university bodies, like associations of scientific staff, the university assembly or similar for at least 1 year.

900-0113-DRL Participation in Commission II (min 1 year)

Only for doctoral students.

Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

Abstract
Active participation in commissions or university bodies, like associations of scientific staff, the university assembly or similar for at least 1 year.

Objective
Active participation in commissions or university bodies, like associations of scientific staff, the university assembly or similar for at least 1 year.

900-0114-DRL Member of Executive Board (min 1 year)

Only for doctoral students.

Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

Abstract
Active participation in the presidium or executive board of a university group for at least 1 year.

Objective
Active participation in the presidium or executive board of a university group for at least 1 year.

227-0105-00L Introduction to Estimation and Machine Learning | W | 6 credits | 4G | H.-A. Loeliger |
Abstract         | Mathematical basics of estimation and machine learning, with a view towards applications in signal processing. |
Objective        | Students master the basic mathematical concepts and algorithms of estimation and machine learning. |
Content          | Review of probability theory; basics of statistical estimation; least squares and linear learning; Hilbert spaces; singular-value decomposition; kernel methods, neural networks, and more |
Lecture notes    | Lecture notes will be handed out as the course progresses. |
Prerequisites / notice | More Information at https://ee.ethz.ch/doctoral-studies.html |

227-0146-00L Data Conversion System Design | W | 6 credits | 2V+2U | T. Burger, G. Cervelli, R. Reutemann |
Abstract         | This course provides a thorough treatment of integrated data conversion systems from system level specifications and trade-offs, over architecture choice down to circuit implementation. Data conversion systems are substantial sub-parts of many electronic systems, e.g. the audio conversion system of a home-cinema systems or the base-band front-end of a wireless modem. Data conversion systems usually determine the performance of the overall system in terms of dynamic range and linearity. Students will learn the underlying principles of data conversion and be introduced to the different methods and circuit architectures to implement such a conversion. The conversion methods such as successive approximation or algorithmic conversion are explained based on their operation principle accompanied with the appropriate mathematical calculations, including effects of non-idealties in some cases. After successful completion of the course students should understand the concept of an ideal ADC, know all major converter architectures, their principle of operation and what governs their performance. |
Objective        | Students master the basic mathematical concepts and algorithms of estimation and machine learning. |
Content          | - Introduction: examples of data conversion architectures; information representation; abstraction, categorization and symbolic representation; basic conversion algorithms; data converter application; tradeoffs among key parameters; ADC taxonomy. - Dual-slope & successive approximation register (SAR) converters: dual slope principle & converter; SAR ADC operating principle; SAR implementation with a capacitive array; range extension with segmented array. - Algorithmic & pipelined A/D converters: algorithmic conversion principle; sample & hold stage; pipeline converter; multiplying DAC; flash sub-ADC and n-bit MDAC; redundancy for correction of non-idealities, error correction. - Performance metrics and non-linearity: ideal ADC; offset, gain error, differential and integral non-linearities; capacitor mismatch; impact of capacitor mismatch on SAR ADC's performance. - Flash, folding an interpolating analog-to-digital converters: flash ADC principle, thermometer to binary coding, sparkle conversion; limitations of flash converters; the folding principle, residue extraction; folding amplifiers; cascaded folding; interpolation for folding converters; cascaded folding and interpolation. - Noise in analog-to-digital converters: types of noise; noise calculation in electronic circuit, kT/C-noise, sampled noise; noise analysis in switched-capacitor circuits; aperture time uncertainty and sampling jitter. - Delta-sigma A/D-converters: linearity and resolution; from delta-modulation to delta-sigma modulation; first-order delta-sigma modulation, clock jitter & SNR in delta-sigma modulators; second-order delta-sigma modulation, higher-order modulation, design procedure for a single-loop modulator. - Digital-to-analog converters: introduction; current scaling D/A converter, current steering DAC, calibration for improved performance, delta-sigma D/A-converters. |
Lecture notes    | Slides are available online under https://lis-students.ee.ethz.ch/lectures/analog-to-digital-converters/ |
Prerequisites / notice | It is highly recommended to attend the course "Analog Integrated Circuits" of Prof. T. Jang as a preparation for this course. |

Lecture notes    | |
Prerequisites / notice | |

Data: 26.07.2024 12:39  Autumn Semester 2024  Page 797 of 2680
Abstract
The class is intended to provide a comprehensive overview of the theory of linear dynamical systems, stability analysis, and their use in control and estimation. The focus is on the mathematics behind the physical properties of these systems and on understanding and constructing proofs of properties of linear control systems.

Objective
Students should be able to apply the fundamental results in linear system theory to analyze and control linear dynamical systems.

Content
- Proof techniques and practices.
- Linear spaces, normed linear spaces and Hilbert spaces.
- Ordinary differential equations, existence and uniqueness of solutions.
- Continuous and discrete-time, time-varying linear systems. Time domain solutions. Time invariant systems treated as a special case.
- Controllability and observability, duality. Time invariant systems treated as a special case.
- Stability and stabilization, observers, state and output feedback, separation principle.

Lecture notes
Available on the course Moodle platform.

Prerequisites / notice
Sufficient mathematical maturity, in particular in linear algebra, analysis.

227-0377-10L Physics of Failure and Reliability of Electronic Devices and Systems

W 3 credits 2V I. Shorubalo, M. Held

Abstract
Understanding the physics of failures and failure mechanisms enables reliability analysis and serves as a practical guide for electronic devices design, integration, systems development and manufacturing. The field gains additional importance in the context of managing safety, sustainability and environmental impact for continuously increasing complexity and scaling-down trends in electronics.

Objective
Provide an understanding of the physics of failure and reliability. Introduce the degradation and failure mechanisms, basics of failure analysis, methods and tools of reliability testing.

Content
Summary of reliability and failure analysis terminology: physics of failure: materials properties, physical processes and failure mechanisms; failure analysis: basics and properties of instruments; quality assurance of technical systems (introduction); introduction to stochastic processes; reliability analysis; component selection and qualification; maintainability analysis (introduction); design rules for reliability, maintainability, reliability tests (introduction).

Literature

227-0417-00L Information Theory I

W 6 credits 4G A. Lapidoth

Abstract
This course covers the basic concepts of information theory and of communication theory. Topics covered include the entropy rate of a source, mutual information, typical sequences, the asymptotic equi-partition property, Huffman coding, channel capacity, the channel coding theorem, the source-channel separation theorem, and feedback capacity.

Objective
The fundamentals of Information Theory including Shannon's source coding and channel coding theorems

Content
The entropy rate of a source, Typical sequences, the asymptotic equi-partition property, the source coding theorem, Huffman coding, Arithmetic coding, channel capacity, the channel coding theorem, the source-channel separation theorem, feedback capacity

Literature
- T.M. Cover and J. Thomas, Elements of Information Theory (second edition)

227-0579-00L Hardware Security

W 8 credits 2V+2U+2A K. Razavi

Abstract
This course covers the security of commodity computer hardware (e.g., CPU, DRAM, etc.) with a special focus on cutting-edge hands-on research. The aim of the course is familiarizing the students with hardware security and more specifically microarchitectural and circuit-level attacks and defenses through lectures and implementing some of these advanced attacks.

Objective
By the end of the course, the students will be familiar with the state of the art in commodity computer hardware attacks and defenses. More specifically, the students will learn about:

- Security problems of commodity hardware that we use everyday and how you can defend against them.
- Relevant computer architecture and operating system aspects of these issues.
- Hands-on techniques for performing hardware attacks.

This is the course where you get credit points by building some of the most advanced exploits on the planet! The luckiest team will collect a Best Demo Award at the end of the course.

Literature
- Slides, relevant literature and manuals will be made available during the course.

Prerequisites / notice
- Experience with Linux, low-level systems programming and computer architecture.

227-0654-00L Carbon-based Nanoelectronics

W 6 credits 2V+1U+1A M. Perrin, G. Borin Barin

Abstract
This course explores the exciting realm of carbon-based nanoelectronics, where the remarkable quantum properties of materials like graphene, carbon nanotubes, graphene nanoribbons, and single molecules are used for building electronic devices.
The objective of this course is to understand how the electronic properties of carbon-based materials can be exploited for fabricating quantum devices. We will delve into both the theoretical and experimental aspects, discussing how these materials’ unique properties can be translated into device functionality.

On the theoretical side, we will cover how the chemical structure of the material and its dimensionality, ranging from 0D to 2D, affects the electronic properties. We will also discuss how charge carriers flow through the devices and what charge transport mechanisms are at play.

On the experimental side, we will cover how such devices are fabricated, including how the materials are synthesized. We will also discuss how to characterize the devices and assess their performance.

The course will cover the following carbon-based materials:
- Single-molecule
- Graphene (single layer, bilayer, twisted bilayer)
- Graphene nanoribbons
- Carbon nanotubes

For each material, we will discuss:
- Electronic structure and charge transport properties
- Material synthesis and characterization
- Device integration and characterization

The course also includes a presentation by each student in which a related scientific publication is discussed. This presentation is compulsory and accounts for 30% of the grade.

Lecture slides are distributed every week. In addition, relevant scientific articles and book chapters will be provided for self-study.

A basic knowledge of solid-state physics and quantum mechanics is required. The course is taught in English.

**Abstract**

Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

**Objective**

Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real world data.

**Content**

The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:

- **Fundamentals:**
  - What is data?
  - Bayesian Learning
  - Computational learning theory

- **Supervised learning:**
  - Ensembles: Bagging and Boosting
  - Max Margin methods
  - Neural networks

- **Unsupervised learning:**
  - Dimensionality reduction techniques
  - Clustering
  - Mixture Models
  - Non-parametric density estimation
  - Learning Dynamical Systems

**Lecture notes**

No lecture notes, but slides will be made available on the course webpage.

**Literature**

**Prerequisites / notice**

The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.

Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

---

### 327-2210-00L Thin Films Technology - From Fundamentals to Oxide Electronics

<table>
<thead>
<tr>
<th>W</th>
<th>5 credits</th>
<th>4G</th>
<th>M. Trassin, C. Schneider</th>
</tr>
</thead>
</table>

**Abstract**

Oxide films with a thickness of just a few atoms can now be grown with a precision matching that of semiconductors. This opens up a whole world of functional device concepts and fascinating phenomena that would not occur in the expanded bulk crystal.

We will give an introduction to thin films deposition techniques and applications with a focus on the growth of multifunctional oxide thin films.

**Objective**

In this course students will obtain an overarching view on thin film deposition techniques with a focus on epitaxial deposition processes. The main learning objectives are:

- Identification of most relevant deposition technique for a given application.
- Understanding of growth mechanism and growth modes.
- Understanding strategies for engineering the functionalities of the films using the deposition process.
- Selection of the most appropriate characterization technique.
- Understanding device concepts and fundamental limits in the technology relevant ultra-thin limit.
- Assessing the relevance of scientific literature dealing with complex oxide thin films.

Data: 26.07.2024 12:39   Autumn Semester 2024   Page 800 of 2680
Combinatorics is a fundamental mathematical discipline as well as an essential component of many mathematical areas, and its study has fostered the development of a variety of applications and devices. This course provides an introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to other areas.

One of the main general techniques that played a crucial role in the development of Combinatorics was the application of algebraic methods. The most fruitful such tool is the dimension argument. Roughly speaking, the method can be described as follows. In order to bound the cardinality of a discrete structure $A$ one maps its elements to vectors in a linear space, and shows that the set $A$ is mapped to linearly independent vectors. It then follows that the cardinality of $A$ is bounded by the dimension of the corresponding linear space. This simple idea is surprisingly powerful and has many famous applications.

This course provides a gentle introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to other areas. The topics covered in the class will include (but are not limited to):

- Basic dimension arguments, Spaces of polynomials and tensor product methods, Eigenvalues of graphs and their application, the Combinatorial Nullstellensatz and the Chevalley-Warning theorem. Applications such as: Solution of Kakeya problem in finite fields, counterexample to Borsuk’s conjecture, chromatic number of the unit distance graph of Euclidean space, explicit constructions of Ramsey graphs and many others.
- The course website can be found at https://moodle-app2.let.ethz.ch/course/view.php?id=15757
- Lectures will be on the blackboard only, but there will be a set of typeset lecture notes which follow the class closely.
- Students are expected to have a mathematical background and should be able to write rigorous proofs.

### 401-3055-64L Algebraic Methods in Combinatorics

**W** 5 credits  **2V+1U** not available

**Does not take place this semester.**

**Abstract**

Combinatorics is a fundamental mathematical discipline as well as an essential component of many mathematical areas, and its study has experienced an impressive growth in recent years. This course provides a gentle introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to other areas.

**Objective**

The students will get an overview of various algebraic methods for solving combinatorial problems. We expect them to understand the proof techniques and to use them autonomously on related problems.

**Content**

Combinatorics is a fundamental mathematical discipline as well as an essential component of many mathematical areas, and its study has experienced an impressive growth in recent years. While in the past many of the basic combinatorial results were obtained mainly by ingenuity and detailed reasoning, the modern theory has grown out of this early stage and often relies on deep, well-developed tools.

One of the main general techniques that played a crucial role in the development of Combinatorics was the application of algebraic methods. The most fruitful such tool is the dimension argument. Roughly speaking, the method can be described as follows. In order to bound the cardinality of a discrete structure $A$ one maps its elements to vectors in a linear space, and shows that the set $A$ is mapped to linearly independent vectors. It then follows that the cardinality of $A$ is bounded by the dimension of the corresponding linear space. This simple idea is surprisingly powerful and has many famous applications.

This course provides a gentle introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to other areas. The topics covered in the class will include (but are not limited to):

- Basic dimension arguments, Spaces of polynomials and tensor product methods, Eigenvalues of graphs and their application, the Combinatorial Nullstellensatz and the Chevalley-Warning theorem. Applications such as: Solution of Kakeya problem in finite fields, counterexample to Borsuk’s conjecture, chromatic number of the unit distance graph of Euclidean space, explicit constructions of Ramsey graphs and many others.
- The course website can be found at https://moodle-app2.let.ethz.ch/course/view.php?id=15757

- Students are expected to have a mathematical background and should be able to write rigorous proofs.
Should we use this technology or not? What are the ethical opportunities and risks of this technological application? Should we always foster technology?

Ethics in Technology

In times of fast technological progress and rapid technology-based innovation, being able to distinguish on ethical grounds what is technically feasible from all that is technically possible proves to be essential for a humane and sustainable future for humanity and for the planet. The aim of this introductory course is to introduce the ethics of technology by discovering different ethical theories and models while applying them to concrete technological innovations.

Number Title Type ECTS Hours Lecturers
227-0809-00L Ethics in Technology W 2 credits 2V P. G. Kirchschläger

Abstract
Should we use this technology or not? What are the ethical opportunities and risks of this technological application? Should we always pursue all that is technically possible? What is ethics? How do ethics and technologies relate to each other? Does ethics hinder technological progress? How can ethics foster innovation? Which ethical theory should we apply in a global research-context? The course assesses in times of fast technological progress and rapid technology-based innovation, being able to distinguish on ethical grounds what is technically feasible from all that is technically possible proves to be essential for a humane and sustainable future for humanity and for the planet. This introductory course is to introduce the ethics of technology by discovering different ethical theories and models while applying them to concrete technological innovations.

Objective
In times of fast technological progress and rapid technology-based innovation, being able to distinguish on ethical grounds what is technically feasible from all that is technically possible proves to be essential for a humane and sustainable future for humanity and for the planet. The aim of this introductory course is to introduce the ethics of technology by discovering different ethical theories and models while applying them to concrete technological innovations.

Content
This course considers the correlation between ethics and technologies. The relationship of ethics and technologies will be explored as reciprocal, with each contributing to the other. Applications of groundbreaking technologies often reshape the ethical environment by creating new solutions to societal challenges and new value. At the same time, scientists and technologists all perform their work within an ethically informed context. Meanwhile, ethics contributes to technology by stimulating technological innovation, by recognizing technological inventions, and by providing ethical guidance.

Ethics bears on technology even by setting the parameters in which research, discussions, and studies can be conducted. No one should delude themselves that freedom of research cannot be infringed. New ideas and discoveries have always faced suppression on ethical grounds, because they represent challenges to putative “absolute truths” or undermine the enforcement of economic or political power structures. Even in today’s world, the danger of members of the technology community not being able to conduct their research freely and independently still exists.

At the same time, ethics can limit technology as well. For example, health and safety guidelines, patents, intellectual property rights, competition policy, consumer protection, and ethical codes of conduct belong to this category. This impact of ethics can be perceived as blocking and hindering technological innovation. In reality, ethics is only informing the innovation process that not everything that is doable is ethically good and should be done. At this point, different ethical theories and models need to be considered in order to gain ethical guidance.

Literature

851-0178-00L Ethics and Scientific Integrity for Doctoral Students W 1 credit 2U G. Achermann

This course is interdisciplinary. If your department offers this course, please register there if possible.

Abstract
This course sensitises doctoral students to ethical issues that may occur during their doctorate. After an introduction to ethics and good scientific practice, students are familiarised with resources that can assist them with ethical decision-making. Students get the chance to apply and deepen their knowledge in an interactive face-to-face workshop.

Objective
Doctoral students learn how to identify, analyse and address ethical issues in their own scientific research. In addition, they will reflect on their professional role as scientific researchers.

Data: 26.07.2024 12:39 Autumn Semester 2024 Page 802 of 2680
The students will gain insights into the concept and mechanics of Creative Thinking. They will trace the historical roots of creativity and its evolution, and how advances in technology have transformed the way we think and create. This seminar aims to understand better what creativity and creative thinking is by looking at the history of the creativity dispositive we are embedding in. We will look, learn and apply creative artistic practices to find innovative solutions. And we will also look beyond the artistic practices, into the creative potential of today’s technologies, especially Generative AI.

In the business world, Creative Thinking is considered to be one of the “top ten skills” or “most in-demand skills” in 2024. With Creative Thinking innovative solutions to problems are developed and not only a large number of ideas but also a variety and range of them are generated through creative practices and will analyze the broader implications of creativity in various contexts.

Originally, connected to artistic practice, creativity is nowadays a skill and practice that can be found in all work areas, especially in innovation and maybe even in technological applications themselves. Today, not only because of creative economy, creative cities or arts and crafts, how our understanding of creativity has emerged till today.

And how can we use it. Or not.

But what exactly is Creative Thinking? In the above mentioned business context it is assumed everybody knows. And what is creativity?

Brainstormed. It seems that in today’s dynamic world, creativity isn't just an asset – but actually a necessity. The second, face-to-face part (group sessions) of this course provides an interactive learning environment (workshop). Students get to apply their knowledge, and they are encouraged to reflect on ethical problems and to critically discuss them with fellow doctoral students. Hence, when you choose a group make sure you have enough time to finish the first part on Moodle before the workshop starts (appr. 20 hours).

The seminar aims to understand better what creativity and creative thinking is by looking at the history of the creativity dispositive we are embedding in. We will look, learn and apply creative artistic practices to find innovative solutions. And we will also look beyond the artistic practices, into the creative potential of today’s technologies, especially Generative AI.

In the business world, Creative Thinking is considered to be one of the “top ten skills” or “most in-demand skills” in 2024. ECTS European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
Adaptability and Flexibility

ECTS

The vast majority of data has been created within the last decade. As a result, more and more fields of research start to consider and foster the development of technologies and methods to process and analyse this data. This course will introduce some of the major theoretical threads and controversies in the broad field of innovation studies. During the first part of the course, the emphasis will be on the evolution of innovation studies. The final part of the course will focus on one of the directions in which those studies have evolved: the field of managerial cognition.

Objective

Students will learn about various perspectives, examine different methodologies, explore some original empirical research, make connections between theory and empirical research, and practice reviewing and identifying insights in research. Students will be able to:
1) Be able to display some knowledge on a few major theoretical streams in the area.
2) Be familiar with the methods, issues and current gaps in the area.
3) Have practiced skills in finding insight and reviewing the literature.
4) Have practiced skills in defining research problems and proposing empirical research in this area.

Hacking for Sciences - An Applied Guide to Programming with Data

Basic experience with either R or Python, e.g., a stats course that was taught using R.

Abstract

The vast majority of data has been created within the last decade. As a result, more and more fields of research start to consider and embrace programming to process and analyse data. This course teaches applied programming and data science skills and aims to leverage the open source tech stack to deal with this new wealth and complexity of data.

Objective

The idea behind Hacking for Science is to build a solid understanding of core technologies and concepts to help researchers develop a data science tech stack for their research project. The course approach is to single out those concepts stemming from software development that are easy to adopt and useful to non-computer scientists. The course has three major learning objectives:

- Understand the role of focal components in a data science tech toolbox.
- Learn how technologies like R, Python, Git Version Control, docker or Cloud Computing could play together in your research project.
- Learn how to manage and version control source code.
- Learn how to communicate with SQL databases. Learn how to consume data from different sources using machine to machine communication interfaces (APIs) such as the OpenStreetMap geocoding API / Routing Engine or the KOF data API for macroeconomic time series.

Non-Goals:

Hacking for Science is not a Statistics, Econometrics or Machine Learning course. Though experience in these fields will help inasmuch that students will have an easier time to motivate investing in programming and to come up with their own application examples, profound methodological knowledge is not a prerequisite.

Content

Hacking for Science is a guide to programming with data. It is tailored to the needs of a field in which scholars’ typical curricula do not contain a strong programming component. Yet this course argues that what the open source community calls a ‘software carpentry’ level is totally within reach for a quantitative social scientist and well worth the investment: being able to code leverages field specific expertise and fosters interdisciplinary collaboration, as source code continues to become an important communication channel.

The course contains three blocks that are mostly based on the three learning objectives presented above. Hacking for Social Sciences explicitly plans to spread its three blocks over 1-2 months to give students the ability to work on applied examples in between sessions in order to get most out of the subsequent sessions.

The first block demonstrates the components of a modern data science tech stack, classifies technologies and gives a big picture overview: from languages such as R and Python to container technology such as docker. The second block focuses on git version control, the de facto industry standard to manage source code. Version control is not only crucial to knowledge management and reproducible research, but it is also the backbone of collaboration in distributed teams. The third and final block focuses on data analysis and teaches how to obtain data through machine to machine communication. Furthermore, the third block discusses data management in a research project.

Lecture notes

A free and open online book (made with quarto) is available from https://rse-book.github.io/. The book/script will be continuously updated during the course to account for questions and participants’ questions.

All course materials including, slides, resources and source code will be made available through the course Website: https://rseed.ch/h4sci.html
Prerequisites / notice

Basic experience with either R or Python, e.g., a stats course that was taught using R.

Abstract

The purpose of this course is to review and discuss issues in current theory and research relevant to innovation in the digital space.

Objective

Through in-depth analysis of published work, doctoral candidates will identify and appraise theoretical and empirical studies, formulate research questions, and improve the positioning of their own research within the academic debate.

Content

The Internet has a twofold impact on the way individuals and firms innovate. First, firms increasingly draw on digital technology to access and capture innovation-relevant knowledge in their environment. Second, individuals, firms, and other organizations extensively utilize the Internet to create, diffuse, and commercialize new digital products and services. During the past decade, theory and research on innovation in the digital space has flourished and generated extensive insights of relevance to both academia and management practice. This has brought us better understanding of working models, and some fundamental reasons for innovation success or failure. A host of new models and research designs have been created to explore the innovation in the digital space, but these have also brought out many open research questions. We will review some of the existing streams of work, and in the process explore a new research agenda.

Format:

The course is organized in one block of 2 days. The course is a combination of pre-readings, presentations by faculty and students, and discussions. The students prepare presentations of papers in order to facilitate analysis and discussion.
The purpose of the course is to confront students with current theoretical thinking in marketing, and currently used theories for

F. von Wangenheim

Marketing Theory

The course is taught Florian Wangenheim (ETHZ)

It focuses on the theoretical foundations of marketing and marketing research.

The purpose of the course is to confront students with current theoretical thinking in marketing, and currently used theories for understanding and explaining buyer and customer behavior in response to marketing action.

In the first class, current understanding of the marketing literature and marketing thought is discussed.

In the following classes, various theories are discussed, particularly in light of their importance for marketing. Economic, psychological and sociological theory will be related to current marketing thought.

Organizational Behavior

Does not take place this semester.

Organizational behavior concerns the study of individual and group-level processes in organizations like creativity, motivation, and leadership. In this PhD course, an overview of major concepts and research insights in organizational behavior is provided. The participants are encouraged to discuss their own work situation as PhD students in relation to the OB insights covered in the course.

The objectives of the course are:

• to provide an overview of OB research
• to discuss major research streams in OB
• to enable students to reflect their own work situation based on concepts used in OB.

Methods in Management Research: Methodological Fit

This course covers available methodologies and research design in management research, measurement and validity issues, and a broad overview of the main quantitative and qualitative methods. Students will reflect on the fit between research question and research design in their own research field.
The course aims to support students in:

- knowing basic quantitative and qualitative research methods
- understanding what data each method needs and what outcomes it can provide, as well as its advantages and disadvantages
- understanding how to link a research question to an appropriate research design and method
- acquiring a basic understanding of how each method works (e.g., which software to use)
- having an idea of how to apply these methods to one’s own research
- having a group of peers to share ideas and feedback with

Content

This course covers basic methodological topics relevant to research in the management field, including available methodologies (inductive, deductive) and research design (e.g., interviews, field survey, lab experiment, secondary data), the definition and measurement of constructs, validity, the choice of data collection and data analysis methods. A broad overview of the main quantitative (ANOVA, regression, path analysis, SEM, multilevel models, growth models) and qualitative methods (thematic analysis, grounded theory) currently used in management research will also be provided, together with a brief analysis of the advantages and disadvantages of each method.

Topics related to research design, including pre-registration, power analysis, and data management, as well as level of analysis and temporal issues (in particular related to data collection) can also be discussed, depending on the interest of the class. Finally, the course will cover fit between research question, research design, and methods of data analysis.

Literature

(Refer to Syllabus and Moodle)

Prerequisites / notice

Students should: (1) Be able to read and understand academic papers, including both empirical papers and method papers, to facilitate and actively participate to the class discussions; (2) Download SPSS and R + R Studio before the course to be able to conduct hands-on exercises in class; (3) complete a short survey that the instructor will share before the course, with he goal of optimising course organisation.

Competencies

- Self-direction and Self-management

364-1154-00L Technological Innovations and Sustainability Transitions

Objective

The course provides a better understanding of innovation, transition and sustainability challenges. After completing this course, students will:

- understand the particularities and complexities of selected empirical examples of sustainability transitions,
- be familiar with key concepts and frameworks of research in sustainability transitions and innovation studies,
- know the relevant literature on transition studies and adjacent fields (corporate sustainability, policy analysis) and how to apply the new knowledge, e.g. to design a research project in the field.

Content

Societies are confronted with major sustainability challenges such as climate change, resource depletion, water pollution, or loss of biodiversity. To address these challenges, we need fundamental changes in how we produce and consume things. We need to transform business models, industries, technologies, policies, lifestyles and habits. Sustainability transitions is a new and rapidly growing field of research addressing major socio-technical changes, typically at the sectoral level. Sustainability transitions research seeks to analyze and understand the multi-dimensional nature of innovation and decline, and to provide tools for researchers and decision makers to navigate transitions. Widely known cases include the ongoing energy transition (with renewables replacing fossil and nuclear fuels) or the transition toward electric mobility. Also in other sectors, more sustainable niches are emerging (non-meat alternatives, bioplastic, responsible finance etc.)

In the course, we will familiarize ourselves with key concepts and topics including ‘classic’ innovation theory, innovation systems, incumbent organizations vs newcomers, the multi-level perspective, politics of transitions and sustainability transition policies. We will read, present and discuss peer-reviewed literature and we will develop and discuss ideas for potential research projects.

Format:
The course will consist of 3*45min sessions on Monday afternoons. There is a combination of preparatory reading, presentations by faculty and students, short papers, and discussions. Attendance is required in all sessions.

Pls reserve Mondays, 2:15-4:45pm (3x45min, 15min break). Some Mondays will be free, some meetings will be shorter.

Make sure you don’t miss the first session on Sept 16 (2:15-3:45).

This is when we will discuss and allocate student assignments.

Competencies

- Self-awareness and Self-reflection
- Self-direction and Self-management

Data: 26.07.2024 12:39  Autumn Semester 2024  Page 809 of 2680
The following topics will be addressed:
2) Collective models. Cooperative and non cooperative models of household behavior.
3) Choice under uncertainty. The foundations of expected utility theory. Some insights on other approaches to choice under uncertainty.

The course will be based on some chapters of the books "Advanced Microeconomic Theory" by Jehle and Reny (2011) and "Microeconomic Theory", by Mas-Colell, Whinston and Green (1995), as well as research articles for the most advanced parts.

**364-1179-00L** Calibration in Macroeconomics

**Abstract**
Macroeconomic models allow us to perform policy counterfactuals related to inequality, monetary policy, and trade. But to believe our predictions, the models' parameters must be reasonable. Calibration is the process of choosing parameters (usually related to technology and preferences). This course explores common approaches with applications to inequality, trade, finance, and monetary policy.

**Objective**
Using examples from both classic and frontier papers in quantitative macroeconomics, this course teaches students popular approaches to calibrating models and evaluating model fit. While the emphasis is on calibration methodology, students will also learn about a variety of model solution algorithms, key datasets, standard parameter values, and the contributions/takeaways of the various papers. After taking this course, students will be able to:
- understand and implement the main approaches to calibration
- assess the plausibility and fit of calibrations in new papers or their own research
- integrate standard functional forms and parameter values into their research
- gather and analyse key datasets used in calibration
- understand the basics of a variety of solution algorithms for equilibrium models

Additionally, this course gives students a sense of the frontier of research in some of the fields covered.

**Content**
The course is designed for PhD students in economics, finance, and related fields, especially those who wish to use quantitative macroeconomic models for research or policy. Enrolling students should have experience with graduate-level economic theory and be able to code in one of the programming languages commonly used in macroeconomics (e.g., Matlab, Python, Julia, Fortran, etc.).

The purpose of the course is to show students how calibration is and has been used in quantitative macroeconomics. The predictions and implications of macroeconomic models — the costs of trade barriers, the causes of changes in inequality, the effects of fiscal and monetary policy shocks, and the consequences of sovereign default for example — depend on the underlying parameters. Typical parameters include consumer risk aversion and patience, firm and consumer elasticities of substitution, firm and consumer persistence of shocks to firms and consumers, and credit constraints. To believe the welfare implications, counterfactuals, or forecasts of our models, the parameters must be set to "reasonable" values. Calibration is the process of choosing reasonable parameters using, for example, previous research, estimates from microeconomic data, or the comparison of model moments with empirical counterparts.

Calibration is an essential tool in macroeconomics. It is employed in a large fraction of the academic literature as well as in many influential policy analyses. The course is directed towards researchers interested in the frontier of macroeconomic theory, but it is also relevant for anyone working on policy-related theoretical models in public finance, trade, and international finance.

The instructor will prepare and present lecture slides, but class discussion is strongly encouraged. Students are expected to read the papers assigned for each week. Assessment is based on a final project: each student must replicate the main result of a paper from the class or another paper approved by the instructor.

**Literature**
The course is framed around papers that discuss or employ calibration, likely including:

**Prerequisites / notice**
Knowledge of graduate-level economic theory.

**Competencies**
- Concepts and Theories: assessed
- Techniques and Technologies: assessed
- Analytical Competencies: fostered
- Decision-making: fostered

Dynamic Macroeconomics, Innovation and Growth
363-1136-00L

Abstract
Introducing dynamic models and workhorses in macroeconomics, understanding the role of innovation and institutions for economic development and discussing policies to foster innovation and economic growth.

Objective
After the course, students will be familiar with dynamic general equilibrium theory and the basic workhorse models in macroeconomics. Participants will be able to apply the frameworks to interesting issues, such as innovation and growth. Moreover, students will understand how the world has developed over the last centuries and the proximate and fundamental causes of innovation and economic growth. Students will understand and apply the basic models of economic growth and will be able to identify policies to foster innovation and growth and to reduce the large wealth differences in the world. Finally, they will get an idea how digitization and artificial intelligence might drive economic growth.

Content
1. Introduction

2. The Solow Model

3. The Neoclassical Growth Model (with Mathematical Background)

4. Technological Progress and how the World has developed

5. Innovations and Growth (New Growth Theory)

6. Growth Policies and Fundamental Causes for Growth

7. Digitization and Artificial Intelligence

Literature
14. Current Literature on Digitization and Artificial Intelligence

Prerequisites / notice
Students who have successfully completed the course “Dynamic Macroeconomics” (364-0559-00L) or “Economics of Innovation and Growth” (363-0562-01L) can not register for this course.

Economics of Inequality
364-1168-00L

Abstract
We discuss research on inequality in different areas of economics. Possible topics include distributional national accounts, heterogeneous returns, inheritances, intergenerational mobility, gender inequality in the labor market (topics will also be decided upon depending on the students' interests). Students will present a paper and critically comment on it (as if they would referee the paper).

Objective
After the course, participants will have a solid understanding of the current state of research on inequality in different fields in economics and, starting from there, will be able to develop their own research ideas. They will further learn how to critically assess and referee a paper, as it is common practice during the referee process, and they will practice their presentation skills and give feedback to each other. The students will therefore also acquire competences for conferences and participation in the scientific discourse.
Content

The target group of this course are PhD students who are interested in writing a paper related to economic inequality. Advanced Master students who are interested in taking the course, especially those who plan to pursue a PhD in Economics, are welcome, too. The topic is intentionally kept broad to leave room for individual research interests and cover different areas. This will allow students to get to know the current state of research in different but related areas, and help them develop their own research question.

By critically examining the literature, students will also learn what makes a well-written paper. By presenting papers, students will further train their presentation skills, and we will take time to give feedback in class on the presentations, too. Oral and written presentation of research are both integral parts of a successful academic career. In the written assignment, finally, students will write a referee report or a research proposal, starting from a paper we discussed in the course.

The course will start with an introduction into the topic and an overview of inequality research in economics. Inequality has become a buzzword in many paper titles and abstracts, but different areas of economics have sometimes very different approaches to this popular topic. The main part of the course will consist of reading and presenting papers that belong to different areas of economics, including Macroeconomics, Public Economics, and Microeconomics / Labour Economics.

Below you find the “suggestive” syllabus for this course. I will provide a list of papers in each of the six blocks at the beginning of the semester, and students will choose a paper to present during the semester (suggestions to present a paper that is not on the list are welcome). Students are required to read all papers discussed in the course and active participation is expected. At the end of the semester, they will write a referee report with possible suggestions for future research or develop a research proposal. The written assignment is due by January 24, 2024.

Topics (suggestive)
- Aggregate trends in income and wealth inequality
- Top income and wealth shares
- Distributional national accounts DINA
- Wealth income ratios

Measurement of top wealth and its difficulties
- Capitalization and heterogeneous returns
- Tax data and tax evasion
- Alternative data and its limitations

Inheritances
- Their role for wealth inequality
- Optimal taxation of inheritances

Intergenerational mobility
- Measurement
- Exogenous variation and causal identification

Gender Inequality in the labour market
- Gender wage gap
- Child penalties

Pandemics and their effects on inequalities
- Covid-19
- 1918 Influenza Pandemic (“Spanish Flu”)
- The plague

Competencies

Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies

- Self-awareness and Self-reflection
- Self-direction and Self-management

363-1036-00L Empirical Innovation Economics

Does not take place this semester.

W 3 credits 1G M. Wörter

Abstract

The course focuses on important factors that drive the innovation performance of firms, like innovation capabilities, the use of digital technologies, environmental and innovation policy and it shows how innovation activities relate to firm performance and to the technological dynamics of industries. We also discuss the implications of the findings for effective economic policy-making.

Objective

The course provides students with the basic skills to understand and assess empirically the technological activities of firms and the technological dynamics of industries. In addition, the aim is to promote the understanding of the essential criteria for innovation policy-making.

Personal and social skills are also addressed during the course. In particular, there is the possibility to improve communication and presentation skills, the ability to develop arguments for the positions of political representatives, policy-makers, pressure groups, or NGOs in connection with innovation policy-making.

Content

The course consists of two parts. Part I provides an introduction into important topics in the field of the economics of innovation. Part II consists of empirical exercises based on various firm-level data sets, e.g., the KOF Innovation data, data about the digitization of firms, data about environmentally friendly innovations, or patent data. In part II, we will learn about ...a) market conditions that encourage firms to invest in R&D (Research and Development) and develop new products and processes. ...b) the role of competition and market structure for the R&D activities of companies. ...c) how digital and environmentally friendly technologies diffuse among firms. ...d) how the R&D activities of firms are affected by economic crises and how firms finance their R&D activities. ...e) how we can measure the returns to R&D activities. ...f) how environmental policies and innovation policies affect the technological activities of a firm. In part II we will use the KOF Innovation Survey data, patent data, data on digitization of firms, or other longitudinal data sources, to investigate empirically the technological activities of firms in relation to the topics introduced in part I.

Lecture notes

Will be provided in the course and in the e-learning environment: https://moodle-app2.let.ethz.ch/course/view.php?id=15120

Literature

Will be presented in the course. For an introduction into the economics of innovation see G.M. Peter Swann, The Economics of Innovation - an Introduction, Edward Elgar, 2009.

Prerequisites / notice
Course is directed to advanced Master-Students and PhD Students with an interest in empirical studies.

364-1015-00L KOF-ETH-UZH International Economic Policy Seminar
(University of Zurich)
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.
UZH Module Code: 03SMD0EC1051

Abstract
In this seminar series, which is held jointly with Prof. Dr. Woitek and Prof. Dr. Hoffman from the University of Zurich, distinguished international researchers present their current research related to international economic policy. The participating doctoral students are expected to attend the presentations (bi-weekly). Moreover, a critical review has to be prepared for 1 of the papers presented.

Objective
On the one hand, participating students are exposed to research at the frontier of international economic policy research. On the other hand, skills such as critical thinking and preparing reviews are learned.

364-0581-00L Microeconomics Seminar (ETH/UZH)

364-0585-01L PhD Course: Applied Econometrics
W 2 credits 2V P. Egger

Abstract
In this course, we will address three blocs of selected problems: (i) estimation of fixed and random effects panel data models for single equations and systems of equations; (ii) estimation of models with endogenous treatment effects or sample selection; (iii) estimation of models with interdependent data (so-called spatial models).

Objective
The main agenda of this course is to familiarize students with the estimation of econometric problems with three alternative types of problems: (i) estimation of fixed and random effects panel data models for single equations and systems of equations; (ii) estimation of models with endogenous treatment effects or sample selection; (iii) estimation of models with interdependent data (so-called spatial models). Students will be able to program estimation routines for such problems in STATA and apply them to data-sets. They will be given a data-set and will have to work out empirical problems in the context of a term paper.

Lecture notes
For panel data analysis, I will rely on the book:

For sample selection and endogenous treatment effect analysis, I will rely on the book:

For spatial econometrics:
I will mostly use papers.
I will prepare a script (based on slides), covering all topics.

This course is a mixture between a seminar primarily for PhD and postdoc students and a colloquium involving invited speakers. It consists of presentations and subsequent discussions in the area of modeling complex socio-economic systems and crises. Students and other guests are welcome.

**Objective**

Participants should learn to get an overview of the state of the art in the field, to present it in a well understandable way to an interdisciplinary scientific audience, to develop novel mathematical models for open problems, to analyze them with computers, and to defend their results in response to critical questions. In essence, participants should improve their scientific skills and learn to work scientifically on an internationally competitive level.

**Content**

This course is a mixture between a seminar primarily for PhD and postdoc students and a colloquium involving invited speakers. It consists of presentations and subsequent discussions in the area of modeling complex socio-economic systems and crises. For details of the program see the webpage of the colloquium. Students and other guests are welcome.

**Prerequisites / notice**

Participants should have relatively good mathematical skills and some experience of how scientific work is performed.

</tbody>
</table>

**Abstract**

This course is geared towards first and second-year doctoral candidates of MTEC. It is held as in a workshop style. Students attending this seminar will benefit from interdisciplinary discussions and insights into current and future work in business and economics research.

**Objective**

- introduce doctoral candidates to the world of economics, management and systems research at MTEC
- make doctoral candidates aware of silo-thinking in the specific sub-disciplines and encourage them to go beyond those silos
- discuss current issues with regard to substantive, methodological and theoretical domains of research in the respective fields
- sensitize doctoral candidates to ethical issues that may occur during their doctorate
- familiarise doctoral candidates with resources that can assist them with ethical decision-making

**Content**

This course is geared towards first and second-year doctoral candidates of MTEC. It is held as in a workshop style. Doctoral candidates attending this seminar will benefit from interdisciplinary discussions and insights into current and future work in business and economics research. The Doctoral Retreat is new connected with a course on “Ethics and Scientific Integrity”. The first part is an online self-paced e-learning Moodle course which consists of 5 modules and should be completed before the retreat starts. The second, face-to-face part of the Ethic course focuses on discipline-specific aspects and takes place on the 2nd day of the retreat. It provides an interactive learning environment. Doctoral candidates get to apply their knowledge, and they are encouraged to reflect on ethical problems and to critically discuss them with fellow doctoral colleagues.

### 900-0102-DRL Transferable Skills Course III (1-3 days)

- **W 1 credit**
- **2S Lecturers**

**Abstract**
Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

**Objective**
Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days.

### 900-0103-DRL Transferable Skills Course I (1-3 days, with Poster or Talk)

- **W 2 credits**
- **4S Lecturers**

**Abstract**
Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

**Objective**
Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days. Participants need to present either a poster or a talk at this occasion.

### 900-0104-DRL Transferable Skills Course II (1-3 days, with Poster or Talk)

- **W 2 credits**
- **4S Lecturers**

**Abstract**
Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

**Objective**
Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days. Participants need to present either a poster or a talk at this occasion.

### 900-0105-DRL Transferable Skills Course III (1-3 days, with Poster or Talk)

- **W 2 credits**
- **4S Lecturers**

**Abstract**
Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

**Objective**
Acquisition of transferable skills and cross-disciplinary competences in the range of short courses or workshops with a maximum duration of 3 days. Participants need to present either a poster or a talk at this occasion.

### 900-0106-DRL Transferable Skills Course I (1 week)

- **W 2 credits**
- **4S Lecturers**

**Abstract**
Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

**Objective**
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week.

### 900-0107-DRL Transferable Skills Course II (1 week)

- **W 2 credits**
- **4S Lecturers**

**Abstract**
Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

**Objective**
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week.

### 900-0108-DRL Transferable Skills Course III (1 week)

- **W 2 credits**
- **4S Lecturers**

**Abstract**
Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

**Objective**
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week.

### 900-0109-DRL Transferable Skills Course I (1 week, with Poster or Talk)

- **W 3 credits**
- **6S Lecturers**

**Abstract**
Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

**Objective**
Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week.
Only for doctoral students.

Please select your doctoral thesis supervisor as a lecturer and prove your participation with the appropriate certificate.

Abstract

Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

Objective

Acquisition of transferable skills and cross-disciplinary competences in the range of courses or workshops with a minimum duration of 1 week. Participants need to present either a poster or a talk at this occasion.

**Abstract**
The course presents an overview of measurement tasks in engineering environments. Different concepts for the acquisition and processing of typical measurement quantities are introduced. Following an initial in-class introduction, laboratory exercises from different application areas (especially in thermofluidics, energy, and process engineering) are attended by students in small groups.

**Objective**
Introduction to various aspects of measurement techniques, with particular emphasis on thermo-fluidic, energy, and process-engineering applications.

- Understanding of various sensing technologies and analysis procedures.
- Exposure to typical experiments, diagnostics hardware, data acquisition, and processing.

**Content**
In-class introduction to representative measurement techniques in the research areas of the participating institutes (fluid dynamics, energy technology, and process engineering).

- Student participation in ~6 laboratory experiments (study groups of ~3 students, dependent on the number of course participants and available experiments).

**Lecture notes**
Lab reports for all attended experiments have to be submitted by the study groups.

**Literature**

**Prerequisites / notice**
Basic understanding in the following areas:
- fluid mechanics, thermodynamics, heat and mass transfer
- electrical engineering / electronics
- numerical data analysis and processing (e.g. using MATLAB)

**Competencies**

- Subject-specific Competencies
  - Concepts and Theories: assessed
  - Techniques and Technologies: assessed

- Method-specific Competencies
  - Analytical Competencies: fostered
  - Decision-making: fostered
  - Media and Digital Technologies: fostered
  - Problem-solving: fostered
  - Project Management: fostered

- Social Competencies
  - Communication: fostered
  - Cooperation and Teamwork: assessed
  - Leadership and Responsibility: fostered

- Personal Competencies
  - Critical Thinking: fostered

**Abstract**
The determination of structure–property relationships in functional materials relies critically on structural characterization methods. This course introduces the basics of X-ray powder diffraction, pair distribution function (PDF) of X-ray total scattering and X-ray absorption spectroscopy analyses to determine the structure of inorganic functional materials.

**Objective**
Introduction basics of the structural characterization of materials using X-rays: covering the local and average structures. Specifically: X-ray powder diffraction, -total scattering and -absorption spectroscopy.

**Content**
The course outlines experimental techniques based on X-rays to investigate the atomic structure of materials covering the local- mid- and long-range order. It covers:
2. - Overview of the different characterization methods to investigate the structure of functional materials, spanning the local to long-range order structure.
3. - X-ray powder diffraction.
4. - X-ray total scattering and pair distribution function analysis.
5. - X-ray absorption spectroscopy.
6. - Practical sessions on X-ray powder diffraction and PDF experiments.

**Literature**
Literature will be given during the course.

151-9901-00L Scientific Writing for Publication in Engineering ■ W 2 credits 1G P. Maher

For the participation in the course, payment of a course fee is required. To register for the course, you need to obtain from your supervisor the confirmation that s/he is willing to pay for your course fee.

Abstract
Scientific Writing for Publication in Engineering is a short course (7 half-day workshops) designed to help junior researchers develop the skills needed to write their research articles in English.

Objective
The course deals with topics such as
• Fitting texts to target readerships and journals
• Managing the writing process efficiently
• Structuring each section of the text effectively
• Producing fluent and reader-focused sentences and paragraphs
• Editing the text before submission
• Revising in response to reviewers' comments.

Content
Participants produce a number of short texts as homework assignments and receive detailed individual feedback as well as peer feedback on these during the course. The course takes place at times and locations chosen to suit MAVT doctoral researchers. Content and materials deal specifically with the demands of writing in engineering research fields. Wherever feasible, elements of participants' future research articles are developed as assignments within the course, so it is particularly useful for those who have their data and are about to begin the writing process.

151-9905-00L Applied Category Theory for Engineering I W 4 credits 3G A. Censi, J. Lorand

Note: The previous course title until HS22 "Applied Compositional Thinking for Engineers II"

Abstract
Applied Category Theory is an exciting multidisciplinary field of research which harnesses the mathematical language of category theory for applications across a broad range of disciplines. This course is a gentle introduction to the theory, emphasizing applications in engineering and the "compositional approach" to systems analysis, co-design, and computation.

Objective
1) Learn basic concepts from algebra and category theory, together with ways to make use of these concepts for engineering applications.

2) Become familiar with case studies of applied category theory, for instance involving dynamical systems, databases, and complex system co-design (e.g. in the context of autonomous vehicles).

3) Be able to recognize compositional structures in concrete scenarios at different levels of abstraction.

4) Understand the “compositional way of thinking” as an approach to systems analysis, co-design, and computation.
The general objective of Discovering Management is to introduce students into the field of business management and entrepreneurship. The course consists of a set of theory and practice sessions, which will be taught on a weekly basis. The course will cover business economic behavior of firms and consumers in the context of markets. Market demand and supply are derived from the individual decision-making of people. The course targets students with no prior knowledge in Economics and Management.

The course consists of three blocks of theory and practice sessions: Discovering Strategic Management, Discovering Innovation Management, and Discovering HR and Operations Management. Each block consists of two or three theory sessions, followed by one practice session where you will apply the theory to a case.

The theory sessions will follow a "lecture-style" approach and be presented by an area specialist within D-MTEC. Practical examples and case studies will bring the theoretical content to life. The practice sessions will introduce you to some real-life examples of managerial or entrepreneurial challenges. During the practice sessions, we will discuss these challenges in depth and guide your thinking through team coaching.

Through small group work, you will develop analyses of each of the cases. The theory sessions will be assessed via a multiple choice exam.

This introductory course aims at providing essential knowledge from the fields of Economics and Management relevant for economic decision-making in the context of both the private and public sector.

For many further resources, see also https://applied-compositional-thinking.engineering/
The course targets both Bachelor and Master students. No prior knowledge in the areas of Economics and Management is required.

**363-0389-00L Technology and Innovation Management**

**Abstract**
This course focuses on the sources of innovation (with a specific focus on digital technologies), the tools and techniques that organizations deploy to innovate routinely, and the strategic implications of technical change at different levels of analysis: individuals, firms and whole ecosystems.

**Objective**
This course intends to enable all students to:
- Acquire and understand the basic jargon, concepts and methods necessary to discuss, in a precise and concise manner, innovation processes and their outcomes at different levels of analysis
- Analyze the differences between individual and organizational decision processes and their innovative outcomes
- Evaluate critically the potential of different (digital) technologies to impact business organizations.

**Content**
Organizations and people are faced with a fundamental decision: they have to allocate resources between well-known tasks that reliably generate positive results; or explore new ways of doing things, new technologies, products and services. The latter is a high risk choice. Its rewards can be high, but the chances of success are small. How do firms organize to take these decisions? What kind of management skills are necessary to take them? What kind of tools and methods are deployed to sustain managerial decision-making in highly volatile environments? These are the central questions on which this course focuses, relying on a combination of lectures, case-based discussion, and guest speakers.

**Lecture notes**
Slides will be available on the Moodle page.

**Literature**
Readings will be available on the Moodle page.

**Prerequisites / notice**
The course content and methods are designed for students with some background in management and/or economics.

**363-0403-00L Introduction to Marketing**

**Abstract**
This course provides an overview on essential perspectives of marketing and how marketing adds value to a business. It will teach concepts, frameworks and methods for marketing decision making. The course will also look at issues related to marketing implementation. Thereby, a particular focus will be on how data and data analytics can help to support marketers in their decision making.

**Objective**
After taking the class, students will be able to
1) Understand how marketing adds value to a business,
2) Provide an overview of key concepts in marketing that are applicable to any business
3) Understand how consumers behave and how this impacts marketing
4) Learn how analytics and quantitative methods can help to improve decision making in marketing
5) Get to know the elements that shape a firm’s marketing strategy (segmentation, targeting, positioning) and marketing tactics (product, price, promotion, place)

**Content**
The class will center on the importance of marketing as an activity that creates long-term value for the benefit of organizations and their customers. It will teach concepts, frameworks and methods for marketing decision making. Specifically, the course is aimed to provide students with a) an overview on the role of marketing within a business, b) details on strategic marketing management decisions and tools, c) a profound knowledge on the individual elements of the marketing mix (product, price, promotion, place), d) an awareness of specific contexts of marketing, and e) first-hand experience on data-driven techniques to support marketers’ decision making.

Thus, this course will introduce key analytical tools to help solving respective managerial tasks. This is a lecture with integrated exercises. Access to a laptop is required for the exercises. The class might be thought in an in-person, remote or in a hybrid format. Students might also be taught via pre-recorded videos and assigned material for self-study.

**Literature**

The course might comprise mandatory and supplemental reading material. Other literature may be assigned in class.
The set-up of the course will closely follow the book of H. Chen, Analytical Competencies.

This lecture will introduce the fundamentals of macroeconomic theory and explain their relevance to everyday economic problems.

The course Accounting for Managers offers an introduction to financial and managerial accounting, especially for students who aspire for a career in business, and need the skills and knowledge to understand, analyze, and interpret accounting information to make informed decisions. The course is divided into two parts. In the first part, we focus on financial reporting and start with the basic accounting concepts and the accounting cycle, to learn how the financial system is set up in a company and how financial statements are prepared. We then delve deeper into each major account, and discuss how revenues and expenses are recognized, and how assets, liabilities, and equities are reported. In the second part, we focus on managerial accounting for internal managerial/operational decisions including fundamental topics such as cost behavior, cost estimation, CVP analyses, and relevant costing. We then cover budgeting and standard costing, which are important parts of accounting system in companies.

Besides this textbook, the slides, lecture notes and problem sets will cover the content of the lecture and the exam questions.

This course examines the behaviour of macroeconomic variables, such as gross domestic product, unemployment and inflation rates. It tries to answer questions like: How can we explain fluctuations of national economic activity? What can economic policy do against unemployment and inflation?

This course helps you understand the world in which you live. There are many questions about the macroeconomy that might spark your curiosity. Why are living standards so meagre in many African countries? Why do some countries have high rates of inflation while others have stable prices? Why have some European countries adopted a common currency? These are just a few of the questions that this course will help you answer. Furthermore, this course will give you a better understanding of the potential and limits of economic policy. As a voter, you help choose the policies that guide the allocation of society's resources. When deciding which policies to support, you may find yourself asking various questions about economics. What are the burdens associated with alternative forms of taxation? What are the effects of free trade with other countries? How does the government budget deficit affect the economy? These and similar questions are always on the minds of policy makers.

This course examines the behaviour of macroeconomic variables, such as gross domestic product, unemployment and inflation rates. It tries to answer questions like: How can we explain fluctuations of national economic activity? What can economic policy do against unemployment and inflation?

Besides this textbook, the slides, lecture notes and problem sets will cover the content of the lecture and the exam questions.
This course provides theory-grounded knowledge and practice-driven skills for founding, financing, and growing new technology ventures. Communication

Applied Analysis of Variance and Experimental Design

Participants will be able to plan and analyze efficient experiments in the fields of natural sciences. They will gain practical experience by using the software R.

Typical lecture format (2h):
15': Introduction
60': Guest testimonial
15': Discussion related to topic (in groups)
10': Plenary discussion
20': Q&A with (guest) lecturer

The course Moodle page contains announcements, course information and lecture slides.

Weekly sessions - recorded.

The course will be based on chapters of:

Technology Entrepreneurship
F. Hacklin
Communication
L. Meier

Subject-specific Competencies
Concepts and Theories
Techniques and Technologies

Social Competencies
Communication
Cooperation and Teamwork
Sensitivity to Diversity

Part I
The self-paced e-learning course consists of 5 modules:
(1) Ethics: Introduction to moral theory (with emphasis on practical guidance regarding decision making)
(2) Ethics in Scientific Research: Introduction to ethical issues that occur within scientific research (i.e. regarding authorship, cooperation, data usage and sharing, and other aspects that are subject to scientific integrity and good scientific practice).
(3) Collecting Resources: A variety of tools and resources that help identify ethical issues are presented and explained
(4) Setting up a Strategy: Example examination of a case regarding its ethical scope (students develop their own strategy to examine situations for their ethical implications).
(5) Making Decisions: Different ways of addressing ethical issues are presented and explained (i.e. how to make hard choices, or solve ethical dilemmas. But also where to seek advice if needed).

Part II
The second, face-to-face part of this course focuses on discipline-specific aspects of Materials, Processes and Manufacturing Technologies. It provides an interactive learning environment. Participants get to apply their knowledge, and they are encouraged to reflect on ethical problems and critically discuss them with fellow doctoral students.

Prerequisites / notice
For doctoral students only

### Microscopy Training SEM I - Introduction to SEM

<table>
<thead>
<tr>
<th>Number</th>
<th>Title</th>
<th>Type</th>
<th>ECTS</th>
<th>Hours</th>
<th>Lecturers</th>
</tr>
</thead>
</table>

For PhD students, postdocs and others, a fee will be charged (https://scopem.ethz.ch/education/MTP.html).

All applicants must additionally register on this form:
During the course, students learn through lectures, demonstrations, and hands-on sessions how to setup and operate SEM instruments.

This introductory course on Scanning Electron Microscopy (SEM) emphasizes hands-on learning. Using ScopeM SEMs, students have the opportunity to study their own samples (or samples provided) and solve practical problems by applying knowledge acquired during the lectures. At the end of the course, students will be able to apply SEM for their (future) research projects.

Content

During the course, students learn through lectures, demonstrations, and hands-on sessions how to setup and operate SEM instruments, including low-vacuum and low-voltage applications.

This course gives basic skills for students new to SEM. At the end of the course, students are able to align an SEM, to obtain secondary electron (SE) and backscatter electron (BSE) images and to perform energy dispersive X-ray spectroscopy (EDX) semi-quantitative analysis. Emphasis is put on procedures to optimize SEM parameters in order to best solve practical problems and deal with a wide range of materials.

Lectures:
- Introduction on Electron Microscopy and instrumentation
- electron sources, electron lenses and probe formation
- beam/specimen interaction, image formation, image contrast and imaging modes.
- sample preparation techniques for EM
- X-ray micro-analysis (theory and detection), qualitative and semi-quantitative EDX and point analysis, linescan and spectral mapping

Practicals:
- Brief description and demonstration of the SEM microscope
- Practice on image formation, image contrast (and image processing)
- Student participation on sample preparation techniques
- Scanning Electron Microscopy lab exercises: setup and operate the instrument under various imaging modalities
- Practice on real-world samples and report results

Literature

Prerequisites / notice

No mandatory prerequisites.
Introduction to Computational Research in Architecture, Engineering, Fabrication and Construction

The PhD-level course (primarily for A&T PhDs) will introduce computational methods for architecture, engineering, fabrication & construction, incentivising computational literacy. Students learn the theoretical background and basic implementation details of fundamental data structures and algorithms, and to solve realworld problems using the COMPAS framework and other open-source libraries.
Objective
Understand the scope and relevance of computational methods for architecture and engineering research and practice, ii) the theoretical background of fundamental data structures, iii) the basic principles of algorithmic design; iv) implement basic versions of prevalent algorithms related to architectural geometry, structural design, robotic assembly, volumetric modeling & 3D printing, high-performance computation; v) use sophisticated algorithms available through open-source libraries to solve real-world problems; and, vi) use common CAD tools as interfaces to self-implemented solutions.

Content
Course consists of a few lectures, several tutorials and project-based exercises. Topics include:
- intro Python programming
- intro COMPAS open-source framework (https://compas-ev.github.io)
- intro to geometry processing, data structures, topology, numerical computation
- domain-specific case studies (e.g. on architectural geometry, structural design, robotic assembly, volumetric modeling & 3D printing, high-performance computation)

Prerequisites / notice
Priority is given to PhD students.

101-0139-00L Scientific Machine and Deep Learning for Design and Construction

Abstract
This course will present methods of scientific machine and deep learning (ML / DL) for applications in design and construction. After providing proper background on ML and the scientific ML (SciML) track, several applications of SciML together with their computational implementation during the design and construction process of the built environment are examined.

Objective
This course aims to provide a graduate-level introduction to machine learning, with a particular focus on scientific machine learning for applications in the design and construction phases of projects from architecture and civil engineering.

Upon completion of the course, the students will be able to:
1. Understand main ML background theory and methods.
2. Assess a problem and apply ML and DL in a computational framework accordingly.
3. Incorporate scientific domain knowledge in the SciML process.
4. Define, plan, conduct and present a SciML project.

Content
The course will include theory and algorithms for SciML, programming assignments, as well as a final project assessment.

The topics to be covered are:
2. Incorporation of Domain Knowledge into ML and DL.
4. ML training, validation and testing pipelines for academic and research projects.

A comprehensive series of computer/lab exercises and in-class demonstrations will take place, providing a “hands-on” feel for the course topics.

Lecture notes
The course script is composed by lecture slides, which are available online and will be continuously updated throughout the duration of the course.

Literature
Suggested Reading:
- Marc Peter Deisenroth, A Aldo Faisal, and Cheng Soon Ong Mathematics for Machine Learning
- S. Guido, A. Müller: Introduction to machine learning with python. O'Reilly Media, 2016

Prerequisites / notice
Familiarity with Python is advised.

101-0167-01L Fibre Composite Materials in Structural Engineering

Abstract
1) Lamina and Laminate Theory
2) FRP Manufacturing and Testing Methods
3) Design and Application of Externally Bonded Reinforcement to Concrete, Timber, and metallic Structures
4) FRP Reinforced Concrete, All FRP Structures
5) Measurement Techniques and Structural Health Monitoring

Objective
At the end of the course, you shall be able to:
1) Design advanced FRP composites for your structures,
2) To consult owners and clients with necessary testing and SHM techniques for FRP structures,
3) Continue your education as a PhD student in this field.

Content
Fibre Reinforced Polymer (FRP) composites are increasingly being used in civil infrastructure applications, such as reinforcing rods, tendons and FRP profiles as well as wraps for seismic upgrading of columns and repair of deteriorated structures. The objective of this course is on one hand to provide new generation of engineering students with an overall awareness of the application and design of FRP reinforcing materials for internal and external strengthening (repair) of reinforced concrete structures. The FRP strengthening of other structures such as metallic and timber will also be shortly discussed. On the other hand the course will provide guidance to students seeking additional information on the topic. Many practical cases will be presented analysed and discussed. An ongoing structural health monitoring of these new materials is necessary to ensure that the structures are performing as planned, and that the safety and integrity of structures is not compromised. The course outlines some of the primary considerations to keep in mind when designing and utilizing structural health monitoring technologies. During the course, students will have the opportunity to design FRP strengthened concrete beams and columns, apply the FRP by themselves, and finally test their samples up to failure.

Lecture notes
Power Point Presentations available online at www.empa.ch/abt303
Waste Recycling Technologies

This course will provide an introduction to the fundamentals and the applications of combustion in energy conversion and nanoparticles.

Introduction

The handout is available in German and English.

Waste Recycling Technology (WRT) is a sub-discipline of Mechanical Process Engineering. WRT is employed in production plants processing contaminated soil, construction wastes, scrap metal, recovered paper and the like. While WRT is well established in Central Europe, it is only just now catching on in emerging markets as well.

Content

Introduction

Waste Recycling; Scope and objectives

Waste recycling technologies in Switzerland

Fundamentals

Properties of particles: Liberation conditions, Particle size and shape, Porosity of bulk materials

Fluid dynamics of particles: Stationary particle beds, Fluidized beds, Free settling particles

Flow sheet basics: Balancing mass flows

Standard processes: batch vs. continuous

Assessment of separation success: Separation function; grade vs. recovery

Separation Processes

Separation according to size and shape (Classification): Screening, Flow separation

Separation according to material properties (Concentration): Manual Sorting, Gravity concentration; Magnetic separation, Eddy current separation, Electrostatic separation, Sensor technology, Froth separation

The script consists of the slides shown during the lectures. Background material will be provided on the script-server.

A list of recommended books will be provided.

The topic will be discussed not from the perspective of theory, but rather in the context of practical application. However, solid fundamentals in physics (in particular in mechanics) are strongly recommended.

Literature

Fundamentals and Applications of Combustion

Note: The previous course title until HS23 "Combustion and Reactive Processes in Energy and Materials Technology"

Abstract

This course will provide an introduction to the fundamentals and the applications of combustion in energy conversion and nanoparticles. The content is highly relevant for technologies which cannot be electrified such as long distance aviation and shipping, and which will more and more rely on carbon-neutral synthetic fuels.

Objective

The main learning objectives of this course are:

1. Understand the thermodynamic, fluid-dynamic and chemical kinetics fundamentals of combustion processes.
2. Predict relevant parameters for combustion systems, such as laminar and turbulent flame speeds, adiabatic flame temperature or quenching distance.
3. Understand the causal relations of relevant combustion parameters such as the pressure influence on the laminar flame speed.
4. Analyze the challenges of developing sustainable combustion technologies based on carbon-neutral synthetic fuels.

Content

Reaction kinetics, fuel oxidation mechanisms, premixed and diffusion laminar flames, two-phase-flows, turbulence and turbulent combustion, pollutant formation, development of sustainable combustion technologies for power generation, shipping and aviation.

Lecture notes

No script available. Instead, material will be provided in lecture slides and the following text book (which can be downloaded for free) will be followed:

Teaching language, assignments and lecture slides in English

Visualization, Simulation and Interaction - Virtual Reality II

Abstract

This lecture provides deeper knowledge on the possible applications of virtual reality, its basic technology, and future research fields. The goal is to provide a strong knowledge on Virtual Reality for a possible future use in business processes.

Objective

Virtual Reality can not only be used for the visualization of 3D objects, but also offers a wide application field for small and medium enterprises (SME). This could be for instance an enabling technology for net-based collaboration, the transmission of images and other data, the interaction of the human user with the digital environment, or the use of augmented reality systems.

The goal of the lecture is to provide a deeper knowledge of today's VR environments that are used in business processes. The technical background, the algorithms, and the applied methods are explained more in detail. Finally, future tasks of VR will be discussed and an outlook on ongoing international research is given.

Content

Introduction into Virtual Reality; basics of augmented reality; interaction with digital data, tangible user interfaces (TUI); basics of simulation; compression procedures of image-, audio-, and video signals; new materials for force feedback devices; introduction into data security; cryptography; definition of free-form surfaces; digital factory; new research fields of virtual reality

Lecture notes

The handout is available in German and English.

Prerequisites / notice

"Visualization, Simulation and Interaction - Virtual Reality II" is recommended, but not mandatory.

Didactical concept:

The course consists of lectures and exercises.

Literature

3) fib bulletin 19, Externally applied FRP reinforcement for concrete structures, technical report, 2019

Prerequisites / notice

4) SIA166 (2004) Klebebewehrungen (Externally bonded reinforcement), Schweizerischer Ingenieur- und Architekturverein SIA.

1) Laboratory Tours and Demonstrations: Emory Structural Engineering Laboratory including FRP Composites, Shape Memory Alloys, Timber Elements, Large Scale Testing of Structural Components

2) Working with Composite Materials in the Laboratory (application, testing, etc)
### 151-0353-00L Mechanics of Composite Materials

**Abstract**
The courses treats aspects related to elastic behavior of unidirectional and multidirectional laminates, micromechanics, failure and damage analysis, analysis and design of composite structures. The focus is on laminated fiber-reinforced polymer composites.

**Objective**
The objective is to introduce the basic concept of composite materials and provide a thorough understanding of the mechanical response of such materials and structures particularly made from fiber reinforced polymer composites, including elastic behavior, failure, fracture and damage analysis as well as structural design aspects. The ultimate goal is to provide the necessary skills to address the design and analysis of modern lightweight composite structures.

**Content**
The course is addressing following topics:
- Introduction
- Elastic anisotropy
- Micromechanics & Homogenization
- Classical Laminate Theory (CLT)
- Strength, failure and damage analysis
- Thin ply composite shells & effects of material non-linearity
- Analysis and design of composite structures

**Lecture notes**
Script, handouts, exercises and additional material are available in PDF-format on the moodle page of the lecture.

**Literature**
The lecture material is covered by a script/lecture notes compiled by CMASLab and further literature is referenced therein.

### 151-0524-00L Continuum Mechanics I

**Abstract**
The lecture deals with constitutive models that are relevant for the design and analysis of components and structures. These include anisotropic linear elasticity, linear viscoelasticity, plasticity and viscoplasticity. The basic concepts of homogenization and laminate theory are introduced. Theoretical models are complemented by examples of engineering applications and experiments.

**Objective**
After successful completion of the course students are able to
- explain basic theories for solving continuum mechanics problems
- proficiently apply these theories by solving application-related academic examples
- relate the theories and examples to real engineering applications and challenges
- distinguish between different mechanical behaviors of materials
- systematically select appropriate constitutive theories suitable to analyze and model these materials

**Content**

### 151-0544-00L Metal Additive Manufacturing - Mechanical Integrity and Process Simulation

**Abstract**
An introduction to Metal Additive Manufacturing (MAM) (e.g. different techniques, the metallurgy of common alloy-systems, existing challenges) will be given. The focus of the lecture will be on the employment of different simulation approaches to address MAM challenges and to enable exploiting the full advantage of MAM for the manufacture of structures with desired property and functionality.
The main objectives of this lecture are:
- Acknowledging the possibilities and challenges for MAM (with a particular focus on mechanical integrity aspects),
- Understanding the importance of material science and metallurgical considerations in MAM,
- Appreciating the importance of thermal, fluid, mechanical and microstructural simulations for efficient use of MAM technology,
- Using commercial analysis tools (e.g. ABAQUUS) for simulation of the MAM process.

Handouts of the presented slides.

- Introduction to MAM (concept, application examples, pros & cons),
- Powder-bed and powder-blown metal additive manufacturing,
- Thermo-fluid analysis of additive manufacturing,
- Continuum-based thermal modelling and experimental validation techniques,
- Residual stress and distortion simulation and verification methods,
- Microstructural simulation (basics, analytical, kinetic Monte Carlo, cellular automata, phase-field),
- Mechanical property prediction for MAM,
- Microstructure and mechanical response of MAM material (stainless steel, Ti6Al4V, Inconel 718),
- Design for additive manufacturing,
- Artificial intelligence for AM

Exercise sessions use ABAQUUS for analysis of MAM process. Detailed video instructions will be provided to enable students to set up their own simulations. Students can install the packages on their own systems.

No textbook is available for the course (unfortunately), since it is a dynamic and relatively new topic. In addition to the material presented in the course slides, suggestions/recommendations for additional literature/publications will be given (for each individual topic).

A basic knowledge of mechanical analysis, metallurgy, thermodynamics is recommended.

This course consists of a series of seven lectures given by researchers who have distinguished themselves in the area of Robotics, Systems, and Controls.

No textbook is available for the course (unfortunately), since it is a dynamic and relatively new topic. In addition to the material presented in the course slides, suggestions/recommendations for additional literature/publications will be given (for each individual topic). Students are required to attend all seven lectures to obtain credit. If a student must miss a lecture then attendance at a related special seminar related to the field and submit a one page description of the seminar topic. Please see http://www.msrl.ethz.ch/education/distinguished-seminar-in-robotics--systems---controls--151-0623-0.html for a list of upcoming lectures.

Students should make their first experiences in the use of computer-based simulation.

Further, the lecture gives insights into the methods-time measurement (MTM) for evaluating human workplaces as basis for the simulation and learn how this is performed using virtual reality.

The knowledge is enhanced by practice-oriented exercises and an excursion. A guest speaker will present a practical example.

A bibliography will be handed out during the lectures.

Recommended for all Bachelor-Students in the 5th semester and Master-Students in the 7th semester (MAVT, MTEC, PhD students in material sciences) and for all with interest in production (e.g., MTEC, HEST, etc.)

### 151-0727-00L Colloquium on Manufacturing Technology

**W 4 credits 2.5K A. Kunz**

**Abstract**
Future training on selected current topics of the manufacturing technology. Per afternoon a selected topic is presented in several lectures, by the majority by experts from the industry. The students prepare a summary of the lectures given and prepare themselves on the basis of these lectures and own information search.

**Objective**
Contious further training to current topics of the manufacturing technique. Exchange of experience and knowledge with the industry and other universities.

**Content**
Selected actual topics on manufacturing methods and tools, machine tools, NC-control and drives, components and measuring methods and devices. Topics are changing every year.

**Lecture notes / notice**
- Students must have participated and passed the courses Manufacturing, Production Machines I and Forming Technology III - Forming Processes.
- Further training with specialized lectures and large participation from the industry.

**Language:** Help for English speaking students on request.

### 151-0833-00L Applied Finite Element Analysis

**W 4 credits 2V+2U B. Berisha, D. Mohr**

**Abstract**
Most problems in engineering are of nonlinear nature. The nonlinearities are caused basically due to the nonlinear material behavior, contact conditions and instability of structures. The principles of the nonlinear Finite-Element-Method (FEM) will be introduced for treating such problems. The finite element program ABAQUS is introduced to investigate real engineering problems.

**Objective**
The goal of the lecture is to provide the students with the fundamentals of the non linear Finite Element Method (FEM). The lecture focuses on the principles of the nonlinear Finite-Element-Method based on explicit and implicit formulations. Typical applications of the nonlinear Finite-Element-Methods are simulations of:

- Crash
- Collapse of structures
- Material behavior (metals and rubber)
- General forming processes

Special attention will be paid to the modeling of the nonlinear material behavior, thermo-mechanical processes and processes with large plastic deformations. The ability to independently create a virtual model which describes the complex non-linear systems will be acquired through accompanying exercises. These will include the Matlab programming of important model components such as constitutive equations. The FEM Program ABAQUS will be introduced to investigate real engineering problems.

**Content**
- Introduction into FEM
- Fundamentals of continuum mechanics to characterize large plastic deformations
- Elasto-plastic material models
- Lagrange and Euler approaches
- FEM implementation of constitutive equations
- Element formulations
- Implicit and explicit FEM methods
- FEM formulations of coupled thermo-mechanical problems
- Modelling of tool contact and the influence of friction
- Solvers and convergence
- Instability problems

**Lecture notes**
Lecture slides

### 151-3209-00L Engineering Design Optimization

**W 4 credits 4G K. Shea, T. Stankovic**

**Abstract**
The course covers fundamentals of computational optimization methods in the context of engineering design. It develops skills to formally state and model engineering design tasks as optimization problems and select appropriate methods to solve them.

**Objective**
The lecture and exercises teach the fundamentals of optimization methods in the context of engineering design. After taking the course students will be able to express engineering design problems as formal optimization problems. Students will also be able to select and apply a suitable optimization method given the nature of the optimization model. They will understand the links between optimization and engineering design in order to design more efficient and performance optimized technical products. The exercises are MATLAB based.

**Content**

**Lecture notes**

### 151-3215-00L Design for Additive Manufacturing

**W 4 credits 2G M. Meboldt, J. Ferchow**

**Abstract**
Please write a short motivation letter to apply for the course. The motivation letter should state why you wish to attend the course. Please also mention any experience you have with relevant topics such as CAD, project work, additive manufacturing (AM), simulation or experimental design. Please also mention in the letter if you already have a proposal for an AM component to be designed as part of the project, or if you have a real-world challenge that you could address using AM. Please send your letter

**Prerequisites / notice**
- Further training with specialized lectures and large participation from the industry.

**Language:** Help for English speaking students on request.

Data: 26.07.2024 12:39  Autumn Semester 2024  Page 838 of 2680
Abstract
This course focuses on the design, manufacture and testing of components produced using additive manufacturing (AM) technologies. The course includes a project based on a real-world challenges where students design, fabricate and iteratively optimize functional AM parts using an appropriate AM technology.

Objective
This course provides a basic knowledge of design for additive manufacturing (AM). The course will prepare students to
- Apply basic AM processes (metal and plastic)
- Apply AM design guidelines
- Adopt AM in an industrial environment
- Apply design tools and methods in AM
- Create value from AM
- Work in a project based product development team

Content
In parallel to the lectures, the students design, manufacture and test prototypes in a project at different stages of product development. The course covers the following topics:
- State-of-the-art AM processes for metals and plastics: PBF (also known as SLM, SLS), BJT, MJF, MEX (FDM)
- Design guidelines in AM
- Industrial adoption of AM
- Value creation and business models for AM
- Design tools and methodologies for AM
- Quality management in AM
- Industrial cases of AM applications
- Problem solving and creativity
- Agile development

Lecture notes
Script and handouts are available in PDF-format.

Ian Gibson; David Rosen; Brent Stucker: Additive manufacturing technologies - 3D printing, rapid prototyping, and direct digital manufacturing
Springer, New York
ISBN: 978-1-4939-2112-6

Prerequisites / notice
This course is for master's students.
The course covers the most fundamental strategic and tactical concepts in production and operations management (POM).

Production and Operations Management (POM) is at the heart of any business. It is concerned with the business processes that transform input into output and deliver products and services to customers. Factory management is an important part of POM, but it is much more than what takes place inside the production facilities of companies like ABB, Boeing, BMW, LEGO, Nestlé, Roche, TESLA, and Toyota. Did you know that the largest portion of assets and employees in most organizations are engaged in the operations function? Although this course focuses on manufacturing, all types of organizations depend on their operational capabilities. With the ongoing globalization and digitalization of manufacturing, POM has won a deserved status for providing a competitive advantage.

This course covers the following topics: Introduction to POM, Manufacturing strategy, Forecasting and capacity, Process design, Layout, Industry 4.0, Information flow, Material flow, Logistics/SCM Performance management, Performance improvement, Quality management, and Maintenance.

This course is administered via Moodle. The course is designed around five elements:
2. Video lectures. Short video lectures presenting basic POM concepts.
3. Class lectures. Deep-dives with case examples on select topics.
4. FactoryVR group assignment. FactoryVR allows students to visit factories virtually.
5. Quizzes. A few quizzes during the semester help students check their progress and prepare for the written exam.

Literature
Suggested literature is provided in the syllabus.

529-0455-00L Laser for Micro- and Nanostructuring

Abstract
Introduction to the fundamentals of lasers and their applications with an emphasis on micro- and nano-structuring. Several applications which are still in the research state, will be discussed together with industrial applications, such as micro lithography and laser welding. Other aspects are the materials that are applied in these applications, e.g. photoresists, and their functioning.

Objective
Introduction to the fundamentals of lasers and their applications with an emphasis on micro- and nano structuring. Several applications which are still in the research state, e.g. non-optical lithographies, will be discussed together with industrial applications, such as micro lithography and laser welding. Other aspects are the materials that are applied in these applications, e.g. photoresists, and their functioning.

Content
Introduction to lasers, Overview of micro- and nanotechnology, micro lithography, photoresists: classical types and new developments, laser cutting and welding, laser cleaning, laser ablation, polymer ablation: designed polymers, lasers and surfaces, laser spectroscopy, laser chemical vapor deposition, pulsed laser deposition (PLD), special materials by PLD, alternative structuring methods.

Lecture notes
The script (a copy of the slides) will be handed out during the first lecture.

Literature
FSRM, CD-ROM: An Introduction to the World of Microsystems, Neuchatel.
This class introduces both theoretical and practical aspects related to the modeling and simulation of multiphysics systems. Students will be assessed on their ability to foster the development of robust case models to evaluate their technical and financial constraints. How can parameters of a running process in one industry be scaled into another industry? Can dimensionless engineering numbers be applied beyond traditional chemical processes? Do different modeling techniques fit into some industries and not in others? How does a given compound in a specific setting provide a service? We then learn how to translate new, often ill-defined wishes or needs into quantifiable specifications.

### Content

Part A: The 'Chemical Product Design' course starts with discussing questions along, 'What is a chemical product, and why do people pay for it? How does a given compound in a specific setting provide a service?' We then learn how to translate new, often ill-defined wishes or needs into quantifiable specifications.

Part B: Thermodynamic and kinetic data allow sharp selection criteria for successful products. We learn how to deal with insufficient data and development of robust case models to evaluate their technical and financial constraints. How can parameters of a running process in one industry be scaled into another industry? Can dimensionless engineering numbers be applied beyond traditional chemical processes?

Part C: Manufacturing of commodity products, devices and molecular products: Chemical reactors, separation and detection or isolation units as part of a toolbox. Planning of manufacturing and decisions based on hard data. Providing quantitative answers on potential value generated.

Students are expected to actively develop chemical products along the course during the exercise sessions. Contributions will be made in small groups, where a larger topic is studied. The progress of each group will be followed by reports and short presentations during the semester, and one final pitching presentation at the end of the semester. Active participation in the group projects is mandatory for the admission to the oral exam.

### Literature

### Prerequisites

Basic chemistry and chemical engineering knowledge (Diffusion, Thermodynamics, Kinetics,...).

### Types and Technologies

- **Chemical Product Design**
  - **Prerequisites:** Basic chemistry and chemical engineering knowledge (Diffusion, Thermodynamics, Kinetics,...).
  - **Abstract:** The 'Chemical Product Design' course teaches students quantitative concepts to analyze, select and transform theoretical concepts from chemistry and engineering into valuable real-world products. Basic chemistry and chemical engineering knowledge is required (Diffusion, Thermodynamics, Kinetics, ...).
  - **Objective:** This course starts with analyzing existing chemical needs and unmet technical challenges. We then develop the skills to critically analyze a specific chemical idea for a product, to rapidly test feasibility or chance for success and to eventually realize its manufacturing. The course teaches the interface between laboratory and market with a specific focus on evaluating the chemical value of a given process or compound, and the necessary steps to pursue the resulting project within an entrepreneurial environment. We therefore extend the questions of process design (how do we make something?) to the question of what should we make?
  - **Content:**

### Data

Data: 26.07.2024 12:39 Autumn Semester 2024 Page 841 of 2680
Content
- Recap of ordinary and partial differential equations
- The Finite Element Method (and the Method of Lines)
- Numerical solvers
- Geometry simplification and discretization
- Continuous and discrete symmetries
- Approximate and simplified formulations; domains of applicability
- Boundary conditions and constraints
- Solution-appropriate discretization; hp-refinement, local/global adaptive meshing
- Ramping of nonlinearities and couplings
- Coupling and segregation of multiphysics

Lecture notes
Lecture handouts will be posted online.

Competencies

151-0509-00L Acoustics in Fluid Media: From Robotics to Additive Manufacturing
W 4 credits 3G D. Ahmed

Abstract
The course will provide you with the fundamentals of the new and exciting field of ultrasound-based microrobots to treat various diseases. Furthermore, we will explore how ultrasound can be used in additive manufacturing for tissue constructs and robotics.

Objective
The course is designed to equip students with skills in the design and development of ultrasound-based manipulation devices and microrobots for applications in medicine and additive manufacturing.

Content
Linear and nonlinear acoustics, foundations of fluid and solid mechanics and piezoelectricity, Gorkov potential, numerical modelling, acoustic streaming, applications from ultrasonic microrobotics to surface acoustic wave devices

Lecture notes

Literature

Prerequisites / notice
Solid and fluid continuum mechanics. Notice: The exercise part is a mixture of presentation, lab sessions (both compulsory) and hand in homework.

Competencies

151-0604-00L Microrobotics
W 4 credits 3G B. Nelson

Abstract
Microrobotics is an interdisciplinary field that combines aspects of robotics, micro and nanotechnology, biomedical engineering, and materials science. The aim of this course is to expose students to the fundamentals of this emerging field. Throughout the course, the students apply these concepts in assignments. The course concludes with an end-of-semester examination.

Objective
The objective of this course is to expose students to the fundamental aspects of the emerging field of microrobotics. This includes a focus on physical laws that predominate at the microscale, technologies for fabricating small devices, bio-inspired design, and applications of the field.

Content
Main topics of the course include:
- Scaling laws at micro/nano scales
- Electrostatics
- Electromagnetism
- Low Reynolds number flows
- Observation tools
- Materials and fabrication methods
- Applications of biomedical microrobots
Students are introduced to the fundamentals of semiconductors, the basics of micromachining and silicon process technology and will understand the fabrication of microsystems.

**Objective**

- Students learn the individual process steps that are required to make a MEMS (Micro Electro Mechanical System). Students carry out the process steps themselves in laboratories and clean rooms. Furthermore, participants become familiar with the special requirements (cleanliness, safety, operation of equipment and handling hazardous chemicals) of working in the clean rooms and laboratories. The entire production, processing, and characterization of the MEMS is documented and evaluated in a final report.

- With guidance from a tutor, the individual silicon microsystem process steps that are required for the fabrication of an accelerometer are carried out:
  - Photolithography, dry etching, wet etching, sacrificial layer etching, various cleaning procedures
  - Packaging and electrical connection of a MEMS device
  - Testing and characterization of the MEMS device
  - Written documentation and evaluation of the entire production, processing and characterization

**Content**

A document containing theory, background and practical course content is distributed at the Introductory lecture day of the course.

The document provides sufficient information for the participants to successfully participate in the course.

The powerpoint slides presented in the lectures will be made available as pdf files. Several readings will also be made available electronically.

**Literature**

- Introduction to Photonics
- S.M. Sze: Semiconductor Devices, Physics and Technology
- C. Hierold, A. Güntner, M. Haluska

**Prerequisites / notice**

Participating students are required to attend all scheduled lectures and meetings of the course.

For safety and efficiency reasons the number of participating students is limited. We regret to restrict access to this course by the following rules:

1. Priority 1: master students of the master's program in "Micro and Nanosystems"
2. Priority 2: master students of the master's program in "Mechanical Engineering" with a specialization in Microsystems and Nanoscale Engineering.
3. Priority 3: master students, who attended the bachelor course *151-0621-00L Microsystems Technology* successfully.
4. Priority 4: all other students (PhD, bachelor, master) with a background in silicon or microsystems process technology.

If there are more students in one of these priority groups than places available, we will decide by (in following order) best achieved grade from 151-0621-00L Microsystems Technology, registration to this practicum at previous semester, and by drawing lots.

**Prerequisites**

- Physics I and II
- Specific microsystems technologies: Bulk and surface micromachining, dry and wet etching, isotropic and anisotropic etching, beam and membrane formation, wafer bonding, thin film mechanical properties.
- Application of selected technologies will be demonstrated on case studies.

**Content**

- Introduction to microsystems technology (MST) and micro electro mechanical systems (MEMS)
- Basic silicon technologies: Thermal oxidation, photolithography and etching, diffusion and ion implantation, thin film deposition.
- Specific microsystems technologies: Bulk and surface micromachining, dry and wet etching, isotropic and anisotropic etching, beam and membrane formation, wafer bonding, thin film mechanical properties.

**Literature**

- Hong Xiao: Introduction to Semiconductor Manufacturing Technology
- T. M. Adams, R. A. Layton: Introductory MEMS, Fabrication and Applications
- T. M. Adams, R. A. Layton: Microelectromechanical Systems and Applications
- M. Haluska

**Prerequisites / notice**

- Handouts (available online)
- M. Haluska, C. Hierold

**Abstract**

This course introduces students to the main concepts of optics and photonics. Specifically, we will describe the laws obeyed by optical waves and discuss how to use them to manipulate light.

**Objective**

Photons, the science of light, has become ubiquitous in our lives. Control and manipulation of light is what enables us to interact with the screen of our smart devices and exchange large amounts of complex information. Photonics has also taken a preponderant role in cutting-edge science, allowing for instance to image nano specimens, detect diseases or sense very tiny forces. The purpose of this course is three-fold: (i) We first aim to provide the fundamentals of photonics, establishing a solid basis for more specialised courses. (ii) Beyond theoretical concepts, our intention is to have students develop an intuition on how to manipulate light in practise. (iii) Finally, the course highlights how the taught concepts apply to modern research as well as to everyday life technologies (LCD screens, polarisation sun glasses, anti-reflection coating etc...). Content, including videos of laboratory experiments, has been designed to be approachable by students from a diverse set of science and engineering backgrounds.
I- BASICS OF WAVE THEORY
1) General concepts
2) Differential wave equation
3) Wavefront
4) Plane waves and Fourier decomposition of optical fields
5) Spherical waves and Huygens-Fresnel principle

II- ELECTROMAGNETIC WAVES
1) Maxwell equations
2) Wave equation for EM waves
3) Dielectric permittivity
4) Refractive index
5) Nonlinear optics
6) Polarisation and polarisation control

III- PROPAGATION OF LIGHT
1) Waves at an interface
2) The Fresnel coefficients
3) Total internal reflection
4) Evanescent waves
5) Dispersion diagram

IV- INTERFERENCES
1) General considerations
2) Temporal and spatial coherence
3) The Young double slit experiment
4) Diffraction gratings
5) The Michelson interferometer
6) Multi-wave interference
7) Antireflecting coating and interference filters
8) Optical holography

V- LIGHT MANIPULATION
1) Optical waveguides
2) Photonic crystals
3) Metamaterials and metasurfaces
4) Optical cavities

VI- OPTICAL FORCES AND OPTICAL TWEEZERS
1) History of optical forces
2) Theory of optical trapping
3) Atom cooling
4) Optomechanics
5) Applications of optical tweezers

VII- INTRODUCTION TO OPTICAL MICROSCOPY
1) Basic concepts
2) Direct and Fourier imaging
3) Image formation
4) Fluorescence microscopy
5) Scattering-based microscopy
6) Digital holography
7) Computational imaging

Abstract
Introduction to the basics of high-frequency circuit design techniques used in the realization of high-bandwidth communication systems and devices. Modern society depends on increasingly large data masses that need to be transmitted/processed as rapidly as possible: higher carrier frequencies allow wider bandwidth channels which enable higher data transmission rates.

Objective
Familiarize students with the essential tools and principles exploited in the high-frequency design. Introduction to circuit simulation. Introduction to amplifier design.

Content
Introduction to wireless, radio spectrum. Review of vectors and complex numbers, AC circuit analysis, matching networks, distributed circuit design, transmission lines and transmission line equations, reflection coefficients, the Smith Chart and its software, voltage standing wave ratio (VSWR), skin effect, matrix analysis, scattering parameters, electromagnetic fields and waves, amplifier design. Hands-on experience with measurement equipment.

Literature
The script (in book style) is sufficient. Further reading will be recommended in the lecture.

The course addresses the physical principles of modern semiconductor devices and the foundations of their modeling and numerical simulation. Necessary basic knowledge on quantum-mechanics, semiconductor physics and device physics is provided. Computer simulations of the most important devices and of interesting physical effects supplement the lectures.

The exercises are focussed on the theory and the basic understanding of the operation of special devices, as single-electron transistor, resonant tunneling diode, pn-diode, bipolar transistor, MOSFET, and laser. Numerical simulations of such devices are performed with an advanced simulation package (Sentaurus-Synopsys). This enables to understand the physical effects by means of computer experiments.

Lecture notes: Lecture notes and slides will be handed out during the lectures.

**227-0110-00L Electromagnetic Waves: Materials, Effects, and Antennas**

**Abstract**

Does not take place this semester.

**Objective**

You can describe wave propagation in classical and nonclassical materials and know the fundamental solutions. You know how waves interact with matter and about nonlinear, scattering and resonant effects. You can apply the acquired knowledge in scattering, waveguiding, radiation, and antenna problems.

**Content**

- General time-harmonic electromagnetic fields
- Fundamental solutions of the wave equation
- Wave propagation in various types of materials
- Interaction of waves with matter
- Nonlinear effects
- Resonant effects
- Applications like scattering, waveguiding, radiation
- Radio frequency and optical antennas

**Lecture notes**

Lecture notes and slides will be handed out during the lectures.

**Prerequisites**

**227-0157-00L Semiconductor Devices: Physical Bases and Simulation**

**Abstract**

The course addresses the physical principles of modern semiconductor devices and the foundations of their modeling and numerical simulation. Necessary basic knowledge on quantum-mechanics, semiconductor physics and device physics is provided. Computer simulations of the most important devices and of interesting physical effects supplement the lectures.

**Objective**

The course aims at the understanding of the principle physics of modern semiconductor devices, of the foundations in the physical modeling of transport and its numerical simulation. During the course also basic knowledge on quantum-mechanics, semiconductor physics and device physics is provided.

**Content**

- Transport models for semiconductor devices (quantum transport, Boltzmann equation, drift-diffusion model, hydrodynamic model), physical characterization of silicon (intrinsinc properties, scattering processes), mobility of cold and hot carriers, recombination (Shockley-Read-Hall statistics, Auger recombination), impact ionization, metal-semiconductor contact, metal-insulator-semiconductor structure, and heterojunctions.

**Lecture notes**

The script (in book style) can be downloaded from: https://iis-students.ee.ethz.ch/lectures/

**Prerequisites / notice**

The script (in book style) is sufficient. Further reading will be recommended in the lecture.

**227-0311-00L Qubits, Electrons, Photons**

**Abstract**

In-depth analysis of the quantum mechanics origin of nuclear magnetic resonance (qubits, two-level systems), of LASER (quantization of the electromagnetic field, photons), and of electron transfer (from electrochemistry to photosynthesis).

**Objective**

Beside electronics nanodevices, D-ITET is pushing its research in the fields of NMR (MRI), electrochemistry, bioelectronics, nano-optics, and quantum information, which are all rationalized in terms of quantum mechanics.

Starting from the axioms of quantum mechanics, we will derive the fascinating theory describing spin and qubits, electron transitions and transfer, photons and LASER: quantum mechanics is different because it mocks our daily Euclidean intuition!

In this way, students will work out a robust quantum mechanics (theoretical!!) basis which will help them in their advanced studies of the following masters: EEIT (batteries), Biomedical Engineering (NMR, bioelectronics), Quantum Engineering, Micro- and Nanosystems.

IMPORTANT: “qubits” from the point of view of NMR (and NOT from that of quantum computing!).

**Content**

- Lagrangian and Hamiltonian: Symmetries and Poisson Brackets
- Postulates of QM: Hilbert Spaces and Operators
- Heisenberg’s Matrix Mechanics: Hamiltonian and Time Evolution Operator
- Density Operator
- Spin: Qubits, Bloch Equations, and NMR
- Entanglement
- Symmetries and Corresponding Operators
- Schrödinger's Wave Mechanics: Electrons in a Periodic Potential and Energy Bands
- Harmonic Oscillator: Creation and Annihilation Operators
- Identical Particles: Bosons and Fermions
- Quantization of the Electromagnetic Field: Photons, Absorption and Emission, LASER
- Electron Transfer: Marcus Theory via Born-Oppenheimer, Franck-Condon, Landau-Zener
No lecture notes because the proposed textbooks together with the provided supplementary material are more than exhaustive!

!!! I am using OneNote. All lectures and exercises will be broadcast via ZOOM, while corresponding videos of the previous years are available in Moodle !!!

Literature

Supplementary material will be uploaded in Moodle.

+ (as rigorous and profound presentation of the mathematical framework) G. Dell'Antonio, "Lectures on the Mathematics of Quantum Mechanics I", 2015, Springer

+ (as account of those formidable years) G. Gamow, "Thirty Years that Shook Physics", 1985, Dover Publications Inc.

Prerequisites / notice

The course has been intentionally conceived to be self-consistent with respect to QM for those master students not having encountered it in their track yet. Therefore, a presumably large overlapping has to be expected with a (welcome!) QM introduction course like the D-ITET "Physics II".

A solid base of Analysis I & II as well as of Linear Algebra is really helpful.

227-0615-00L Simulation of Photovoltaic Devices - From Materials to Modules

Abstract

The lecture provides an introduction to the theoretical foundations and numerical approaches for the simulation of photovoltaic power conversion, from the microscopic description of component materials to macroscopic continuum modelling of solar cells and network simulation or effective models for performance prediction of entire solar modules.

Objective

Get an overview of the current status of photovoltaic technology. Understand the physics of photovoltaic energy conversion and solar cell device operation. Know how to obtain and assess by simulation the key material properties and device parameters. Be able to use standard device simulation tools to analyze, optimize, and predict the performance of solar cells and modules.

Content

Photovoltaic technology: history and overview; The solar spectrum; Thermodynamics of solar energy conversion; Detailed balance models and efficiency limit; Microscopic rates of charge carrier generation and recombination; Optical simulation of solar cells; Models for charge transport in semiconductor devices; High-efficiency wafer-based (silicon) photovoltaics; Thin film photovoltaics based on disordered materials (amorphous silicon, organic PV); High-efficiency thin film photovoltaics (CIGS, CdTe, metal-halide perovskites); PV beyond the single junction detailed balance (Shockley-Queisser) limit; Simulation of photovoltaic modules; Energy yield and performance modelling for PV systems; Quantum simulation of nanostructure-based solar cell devices (bonus lecture)

Literature

- M. A. Green, „Solar cells: operating principles, technology, and system applications”, Prentice Hall, 1982.

Prerequisites / notice

Undergraduate physics (including basic quantum mechanics), mathematics, semiconductor devices, optics. Knowledge of some scripting language (e.g. python) is of advantage.

### 227-0654-00L Carbon-based Nanoelectronics

**W 6 credits 2V+1U+1A**

M. Perrin, G. Borin Barin

#### Abstract
This course explores the exciting realm of carbon-based nanoelectronics, where the remarkable quantum properties of materials like graphene, carbon nanotubes, graphene nanoribbons, and single molecules are used for building electronic devices.

#### Objective
The objective of this course is to understand how the electronic properties of carbon-based materials can be exploited for fabricating quantum devices. We will delve into both the theoretical and experimental aspects, discussing how these materials' unique properties can be translated into device functionality.

#### Content
- Single-molecule
- Graphene (single layer, bilayer, twisted bilayer)
- Graphene nanoribbons
- Carbon nanotubes

For each material, we will discuss:
- Electronic structure and charge transport properties
- Material synthesis and characterization
- Device integration and characterization

The course also includes a presentation by each student in which a related scientific publication is discussed. This presentation is compulsory and accounts for 30% of the grade.

#### Lecture notes
Lecture slides are distributed every week. In addition, relevant scientific articles and book chapters will be provided for self-study.

#### Prerequisites / notice
A basic knowledge of solid-state physics and quantum mechanics is required. The course is taught in English.
Lecture and exercises slides will be distributed after each lecture via Moodle platform; additional materials to be accessed online.

327-0505-00L Surfaces and Interfaces I: Fundamentals, Analytics and Applications W 6 credits 3G L. Isa, M. P. Heuberger

Extended course starting HS23. Old title: Surfaces, Interfaces and their Applications I. Students who obtained credit points for the old course cannot retake it.

Abstract

This course teaches the basics of surface and interface science and technology, including surface modifications and forces. It covers various analytical techniques to study surface and interface properties, and explores phenomena of applied relevance like friction, lubrication, phoresis, and wetting where surfaces play a crucial role.

Objective

Students are able to
- describe the physical and chemical properties of surfaces and interfaces.
- analyze and compare analytical tools for surfaces.
- choose and combine appropriate surface-analytical approaches for solving problems connected to applications.
- understand and explain the importance of surfaces and interfaces in a broad range of phenomena and applications.

Content

- Introduction to surfaces and interfaces
- Structure of surfaces over different length scales: from macroscopic roughness to atomic structure
- Surface modifications
- Adsorption and adsorption models
- Surface forces
- Basic physical concepts
- Thermodynamics of surfaces and interfaces
- Measurement of intermolecular and surface forces
- Dynamics and history effects
- Surface analytics: X-ray Photocorrelation Spectroscopy (XPS) – principles and modern developments
- Surface analytics: Secondary Ion Mass Spectroscopy (SIMS) and IR Spectroscopy – Principles and examples
- Atomic Force Microscopy (AFM): Principles and modes of operation
- Tribology: Adhesion, Friction and Lubrication
- Contact mechanics
- Micro and macroscale friction
- Boundary lubrication
- Wetting
- Contact angles
- Phoretic phenomena
- Electric double layer and electrophoresis
- Electro-osmosis
- Other types of phoresis
- Case studies

### 327-0703-00L Electron and Ion Microscopy in Material Science

**Abstract**
A comprehensive understanding of the interaction of electrons and ions with condensed matter and details on the instrumentation and methods designed to use these probes in the structural and chemical analysis of various materials.

**Objective**
A comprehensive understanding of the interaction of electrons and ions with condensed matter and details on the instrumentation and methods designed to use these probes in the structural and chemical analysis of various materials.

**Content**
This course provides a general introduction into electron- and ion-microscopy of organic and inorganic materials. In the first part, the basics of transmission- and scanning electron microscopy are presented. The second part includes the most important aspects of specimen preparation, imaging and image processing. In the third part, focused ion-beam and atom probe microscopes are presented. Throughout the semester, various applications in materials science, solid state physics, structural biology, structural geology, and structural chemistry will be reported.

**Lecture notes**
will be distributed in English

**Literature**

### 327-2137-00L Scattering Techniques for Material Characterization

**Abstract**
The lecture presents the currently most efficient experimental techniques for microstructure material characterization: X-ray diffraction (XRD) and transmission electron microscopy (TEM). The theoretical basics, instrumentation, complementarity and exclusivity of both techniques will be taught. The course includes practical elements and examples of current research projects at D-MATL.

**Objective**
Students are able to do:
- systematically characterise the microstructure and phases of a given material with X-rays and electrons
- select the right tool (source, instrument, measurement strategy) and design a workflow for solving a microstructure or phase analysis problem
- describe possibilities and limitations of a given characterisation method
- comprehensively store experimentally collected data in a repository following modern data management rules such that data can be evaluated by students not involved in the experiment
- qualitatively and quantitatively evaluate and present experimental data and results collected by others

**Content**
The main objective of this hands-on practical course is to give students a comprehensive insight into the most important aspects of microstructure characterization using electron and X-ray scattering. The focus is on the complementarity and exclusivity of the two techniques. We will introduce the most important material characterization tasks, present the relevant physical and crystallographic fundamentals, and discuss how the tasks can be solved with electron and X-ray scattering. We will discuss intrinsic and extrinsic advantages and limitations of the methods and explain essential instrumentation requirements specific to each setup. Another essential facet of the course is the link to everyday D-MATL project problems presented by the lecturers or researchers from D-MATL. The lecture is accompanied by hands-on experiments on samples of D-MATL projects using state-of-the-art instruments.

**Literature**
- Crystallography, X-ray diffraction and electron microscopy on the BSc level. All enrolled students are initially placed on the “waiting list” until the registration deadline. In the case of more than 12 applicants, the students will be selected by the lecturers before the start of the lecture according to the priority criteria: master students before doctoral students, Material Science students before students of other departments.

**Prerequisites / notice**
- Former title: Electron Microscopy in Material Science

Abstract
The aim is an overview of the different ordering phenomena that occur in materials: magnetic, electrical, mechanical, structural. Special emphasis is placed on a comprehensive definition of the term "ferroic". Novel forms of order, such as multiferroicity, are of particular interest. Their exploration and the material functionalities derived from these are a central theme in our Department.

Objective
Ferromagnetism is known to humankind for 2500 years, but there are many other forms of spontaneously ordered states in nature that wait to be explored. One of these is ferroelectricity, the spontaneous electric order of a material, which rapidly gains importance in science and technology. It is the aim of this course to learn what actually defines a state as ferroic, what forms of ordering are known or newly proposed, and what kind of materials and functionalities are related to ferroic materials. We also explore the transition from order to disorder, which is fluent and offers materials properties that are not found in the fully ordered or disordered state.

It is an equally important goal that attendees learn to work critically and creatively with the "unfinished knowledge" of a "hot" research field that is in continuous and rapid development. Realizing that scientific results are not eternally true, but need to be constantly challenged and revised if necessary is very important in becoming a researcher working at the forefront of science.

Content
The power of symmetry analysis, aspects of crystallography and group theory, definition and concept of ferroic order, Forms of ferroic order in nature, domains and domain walls, multiferroics and magnetoelectric correlations, dynamical processes and functionalities in ferroic materials, the transition from order to disorder, thermodynamics of such transitions and associated material properties, tour through the Laboratory for Multifunctional Ferroic Materials.

Lecture notes
There is no actual script because one of the main goals of this lecture is to work critically and creatively with the "unfinished knowledge" of a "hot" research field that is in continuous and rapid development. It is important that attendees of the lecture form their own view of this field rather than following the filtered and biased view presented in a script.

Literature
V. K. Wadhawan, Introduction to Ferroic Materials, (Gordon and Breach 2000)
M. Fiebig, Nonlinear Optics on Ferroic Materials, (Wiley 2023)

M. Fiebig, Nonlinear Optics on Ferroic Materials, (Wiley 2023)
R. R. Birss, Symmetry and Magnetism, (North Holland 1966)

Prerequisites / notice
Knowledge of the physics of materials, as provided by the ETH Zurich B.S. curriculum in Materials Science. Interdisciplinary or Physics students are also welcome. This lecture is on a "hot" research field that is in continuous and rapid development, so students are encouraged to provide continuous feedback so that the topics covered by the lecture can be constantly adopted. The lecture can only be as good as the constructive/critical feedback that is received.

327-2210-00L Thin Films Technology - From Fundamentals to Oxide Electronics
Students who already took "327-2104-00L Inorganic Thin Films: Processing, Properties and Applications" AND "327-2132-00 Multifunctional Ferroic Materials: Growth and Characterisation" are not allowed to attend this course.

Abstract
Oxide films with a thickness of just a few atoms can now be grown with a precision matching that of semiconductors. This opens up a whole world of functional device concepts and fascinating phenomena that would not occur in the expanded bulk crystal.

We will give an introduction to thin films deposition techniques and applications with a focus on the growth of multifunctional oxide thin films.

Objective
In this course students will obtain an overarching view on thin film deposition techniques with a focus on epitaxial deposition processes. The main learning objectives are:
- Identification of most relevant deposition technique for a given application.
- Understanding of growth mechanism and growth modes.
- Understanding strategies for engineering the functionalities of the films using the deposition process.
- Selection of the most appropriate characterization technique.
- Understanding device concepts and fundamental limits in the technology relevant ultra-thin limit.
- Assessing the relevance of scientific literature dealing with complex oxide thin films.

Content
A lab visit will be organized and students will participate to the design of thin films with atomic precision.

General description of the leading deposition routes including physical and chemical vapor deposition techniques (PVD and CVD) as well as so called "wet techniques" (e.g. spin coating and spray pyrolysis).

Growth modes and processes.

Part of the course discusses vacuum technologies.

Fundamental characterization techniques for application-relevant thin films as well as state of the art approaches for in situ and ex-situ determination of the structural, chemical and ferroic (ferromagnetic and ferroelectric) properties of films: (XRD for thin films, RHEED, EDX, scanning probe microscopy techniques, laser-optical characterization and many more)

Epitaxy for the advanced design and characterization of high quality thin films for energy efficient oxide electronics.

Types of ferroic order, multiferroics, multifunctional oxide materials, epitaxial strain related effects, oxide thin film based devices and examples.

Regular discussions on preselected scientific literature and mini-seminars will be organized.
### 376-1351-00L Micro/Nanotechnology and Microfluidics for Biomedical Applications

**W** 2 credits **2V** E. Delamarcke

**Abstract**
This course is an introduction to techniques in micro/nanotechnology and to microfluidics. It reviews how many familiar devices are built and can be used for research and biomedical applications. Transistors for DNA sequencing, beamers for patterning proteins, hard-disk technology for biosensing and microfluidics for point-of-care diagnostics are just a few examples of the covered topics.

**Objective**
The main objective of the course is to introduce micro/nanotechnology and microfluidics to students having any technical background. The course is multi-disciplinary and covers a broad range of techniques. For each lecture, a brief historical perspective is given to illustrate by whom and how the techniques were invented.

The course should familiarize the students with the techniques used in micro/nanotechnology, cleanroom microfabrication, and show them how micro/nanotechnology pervades throughout life sciences. Microfluidics will be emphasized due to their increasing importance in research and for medical applications.

The second objective is to have life sciences students less intimidated by micro/nanotechnology and make them able to link instruments and techniques to specific problems that they might have in their projects/studies. This will also help students getting access to the ETHZ/IBM Nanotech Center infrastructure if needed.

**Content**
Mostly formal lectures (2 × 45 min), with few specific guest lectures on topics of particular relevance. For example, an introduction to cleanroom and micro/nanotechnology concepts and microfluidics, examples of DNA microarrays - the principles of microfluidics, microfluidic functions and fabrication, from microfluidics for research to point-of-care diagnostics, and the (infamous) history of Theranos, as well as some discussions on diagnostics for COVID, R0, and (im)precision of diagnostic devices and why it matters - 2 × 45 min will be covered by Yuksel Temiz, a master of Arduino programming and do-it-yourself electronics, who will present how to make 20$ electronic components that are synergistic to microfluidic devices and that can be controlled using a smartphone

### 376-1353-00L Nanostructured Materials Safety

**W** 2 credits **1V** P. Wick, T. Bürki-Thurnherr

**Abstract**
Fundamentals in nanostructured material - living system interactions focusing on the main exposure routes, lung, gastrointestinal tract, skin and intravenous injection

**Objective**
Understanding the potential side effects of nanomaterials in a context-specific way, enabling to evaluate nanomaterial safety and provide knowledge to design safer materials

**Content**
Building upon new technologies to engineer and functionalize well-defined nanostructured materials, a plethora of exciting discoveries were made and found their way in our daily live. These customized nanomaterials provides extraordinary properties and make them attractive for many innovative applications. Exactly these new properties may have the potential to be responsible for unforeseen side effects, which hamper a straightforward translation into new products. Therefore, the safety research provide the evidence for a responsible and sustainable use of nanomaterials.

The lecture will focus on basic principles of nanotoxicology, provide the understanding of the potential side effects of nanomaterial in a context-specific way addressing the main exposure routes such as inhalation, ingestion, topical applications and intravenous injections as well as it will provide impulses for safer material designs.

Structure of the planned lecture (2 × 45 min)
1. Introduction: the principles of nanotoxicology
2. Lung - particles interactions: two disease scenarios and their molecular mechanism
3. GI - particles interactions: intendent and unintendent particle exposure via food
4. Skin - particles interactions: body care products and their influence on skin physiology
5. Intravenous injections: protein corona and cellular effects
6. Micro- / Nanoplastics and development of a safety research plan
7. End of semester exam
Lecture notes: Handouts provided during the classes and references therein as well as primary literature as case studies will be posted to the course website.

Prerequisites / notice: course “Introduction to Toxicology”

Competencies:

**Subject-specific Competencies**
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

**Method-specific Competencies**
- Analytical Competencies: fostered
- Decision-making: fostered
- Problem-solving: fostered
- Project Management: fostered

**Social Competencies**
- Communication: fostered
- Cooperation and Teamwork: fostered

### 402-0317-00L Semiconductor Materials: Fundamentals and Fabrication

**W 6 credits 2V+1U S. Schön, W. Wegscheider**

**Abstract**
This course gives an introduction into the fundamentals of semiconductor materials. The main focus is on state-of-the-art fabrication and characterization methods. The course will be continued in the spring term with a focus on applications.

**Objective**
Basic knowledge of semiconductor physics and technology. Application of this knowledge for state-of-the-art semiconductor device processing.

**Content**
1. Fundamentals of Solid State Physics
   1.1 Semiconductor materials
   1.2 Band structures
   1.3 Conduction and valence bands in intrinsic and doped semiconductors
   1.4 p-n junctions
   1.5 Low-dimensional structures
2. Bulk Material growth of Semiconductors
   2.1 Czochalski method
   2.2 Floating zone method
   2.3 High pressure synthesis
3. Semiconductor Epitaxy
   3.1 Fundamentals of Epitaxy
   3.2 Molecular Beam Epitaxy (MBE)
   3.3 Metal-Organic Chemical Vapor Deposition (MOCVD)
   3.4 Liquid Phase Epitaxy (LPE)
4. In situ characterization
   4.1 Pressure and temperature
   4.2 Reflectometry
   4.3 Ellipsometry and RAS
   4.4 LEED, AES, XPS
   4.5 STM, AFM
5. The invention of the transistor - Christmas lecture

**Lecture notes**
https://moodle-app2.let.ethz.ch/course/view.php?id=23113

**Prerequisites / notice**
The "compulsory performance element" of this lecture is a short presentation of a research paper complementing the lecture topics. Several topics and corresponding papers will be offered on the moodle page of this lecture.

### 402-0402-00L Ultrafast Laser Physics

**W 10 credits 3V+2U L. P. Gallmann**

**Abstract**
Introduction to ultrafast laser physics with an outlook into cutting edge research topics such as attosecond science and coherent ultrafast sources from THz to X-rays.

**Objective**
Understanding of basic physics and technology for pursuing research in ultrafast laser science. How are ultrashort laser pulses generated, how do they interact with matter, how can we measure these shortest man-made events and how can we use them to time-resolve ultrafast processes in nature? Fundamental concepts and techniques will be linked to a selection of hot topics in current research and applications.
The lecture covers the following topics:

a) Linear pulse propagation: mathematical description of pulses and their propagation in linear optical systems, effect of dispersion on ultrashort pulses, concepts of pulse carrier and envelope, time-bandwidth product

b) Dispersion compensation: technologies for controlling dispersion, pulse shaping, measurement of dispersion

c) Nonlinear pulse propagation: intensity-dependent refractive index (Kerr effect), self-phase modulation, nonlinear pulse compression, self-focusing, filamentation, nonlinear Schrödinger equation, solitons, non-instantaneous nonlinear effects (Raman/Brillouin), self-steepening, saturable gain and absorption

d) Second-order nonlinearities with ultrashort pulses: phase-matching with short pulses and real beams, quasi-phase matching, second-harmonic and sum-frequency generation, parametric amplification and generation

e) Relaxation oscillations: dynamical behavior of rate equations after perturbation

f) Q-switching: active Q-switching and its theory based on rate equations, active Q-switching technologies, passive Q-switching and theory

g) Active modelocking: introduction to modelocking, frequency comb versus axial modes, theory for various regimes of laser operation, Haus master equation formalism

h) Passive modelocking: slow, fast and ideally fast saturable absorbers, semiconductor saturable absorber mirror (SESAM), designs of and materials for SESAMs, modellocking with slow absorber and dynamic gain saturation, modellocking with ideally fast saturable absorber, Kerr-lens modelocking, soliton modellocking, Q-switching instabilities in modelocked lasers, inverse saturable absorption

i) Pulse duration measurements: rf cables and electronics, fast photodiodes, linear system theory for microwave test systems, intensity and interferometric autocorrelations and their limitations, frequency-resolved optical gating, spectral phase interferometry for direct electric-field reconstruction and more

j) Noise: microwave spectrum analyzer as laser diagnostics, amplitude noise and timing jitter of ultrafast lasers, lock-in detection

k) Ultrafast measurements: pump-probe scheme, transient absorption/differential transmission spectroscopy, four-wave mixing, optical gating and more

l) Frequency combs and carrier-envelope offset phase: measurement and stabilization of carrier-envelope offset phase (CEP), time and frequency domain applications of CEP-stabilized sources

m) High-harmonic generation and attosecond science: non-perturbative nonlinear optics / strong-field phenomena, high-harmonic generation (HHG), phase-matching in HHG, attosecond pulse generation, attosecond technology: detectors and diagnostics, attosecond metrology (streaking, RABBITT, transient absorption, attoclock), example experiments

n) Ultrafast THz science: generation and detection, physics in THz domain, weak-field and strong-field applications

### Abstract

This course gives an introduction to the fundamental concepts of Quantum Optics and will highlight state-of-the-art developments in this rapidly evolving discipline. The topics covered include the quantum nature of light, semi-classical and quantum mechanical description of light-matter interaction, laser manipulation of atoms and ions, optomechanics and quantum computation.

### Objective

The course aims to provide the knowledge necessary for pursuing research in the field of Quantum Optics. Fundamental concepts and techniques of Quantum Optics will be linked to modern experimental research. During the course the students should acquire the capability to understand currently published research in the field.

### Content

This course gives an introduction to the fundamental concepts of Quantum Optics and will highlight state-of-the-art developments in this rapidly evolving discipline. The topics that are covered include:

- coherence properties of light
- quantum nature of light: statistics and non-classical states of light
- light matter interaction: density matrix formalism and Bloch equations
- quantum description of light matter interaction: the Jaynes-Cummings model, photon blockade
- laser manipulation of atoms and ions: laser cooling and trapping, atom interferometry,
- further topics: Rydberg atoms, optomechanics, quantum computing, complex quantum systems.

### Lecture notes

Selected book chapters will be distributed.

### Text-books:

- G. Gryenberg, A. Aspect and C. Fabre, Introduction to Quantum Optics
- R. Loudon, The Quantum Theory of Light
- Atomic Physics, Christopher J. Foot
- Advances in Atomic Physics, Claude Cohen-Tannoudji and David Guéry-Odelin
- C. Cohen-Tannoudji et al., Atom-Photon-Interactions
- M. Scully and M.S. Zubairy, Quantum Optics
- Y. Yamamoto and A. Imamoglu, Mesoscopic Quantum Optics
The course covers the key concepts and formalism of quantum information processing. Topics include quantum algorithms, quantum error correction, quantum cryptography, and quantum metrology, with an emphasis on the power of quantum information processing beyond that of classical information processing. The formalism of quantum states, measurements, and channels is developed in detail.

Abstract

The topics covered in the course will include quantum circuits, gate decomposition and universal sets of gates, efficiency of quantum information processing problems. They are able to adapt and apply these concepts and methods to analyze and discuss quantum algorithms and other information-processing protocols.

Objective

By the end of the course students are able to explain the basic mathematical formalism of quantum mechanics and apply it to quantum information processing problems. They are able to adapt and apply these concepts and methods to analyze and discuss quantum algorithms and other information-processing protocols.

Content

The class will be taught in English language.

Lecture notes

Will be provided.

Literature

402-0448-01L Quantum Information Processing I: Concepts

This theory part QIP I together with the experimental part 402-0448-02L QIP II (both offered in the autumn semester) combine to the core course in experimental physics "Quantum Information Processing" (totally 10 ECTS credits). This applies to the Master's degree programme in Physics.

Abstract

The course covers the key concepts and formalism of quantum information processing. Topics include quantum algorithms, quantum error correction, quantum cryptography, and quantum metrology, with an emphasis on the power of quantum information processing beyond that of classical information processing. The formalism of quantum states, measurements, and channels is developed in detail.

Objective

By the end of the course students are able to explain the basic mathematical formalism of quantum mechanics and apply it to quantum information processing problems. They are able to adapt and apply these concepts and methods to analyze and discuss quantum algorithms and other information-processing protocols.

Content

The topics covered in the course will include quantum circuits, gate decomposition and universal sets of gates, efficiency of quantum circuits, quantum algorithms (Shor, Grover, Deutsch-Josza,...), stabilizer-based quantum error correction, fault-tolerant designs, the BB84 quantum key distribution protocol, and simple methods of quantum metrology.

Lecture notes

Will be provided.

402-0448-02L Quantum Information Processing II: Implementations

This experimental part QIP II together with the theoretical part 402-0448-01L QIP I (both offered in the autumn semester) combine to the core course in experimental physics "Quantum Information Processing" (totally 10 ECTS credits). This applies to the Master's degree programme in Physics.

Abstract

Objective

Throughout the past 20 years the realm of quantum physics has entered the domain of information technology in more and more prominent ways. Enormous progress in the physical sciences and in engineering and technology has allowed us to build novel types of information processors based on the concepts of quantum physics. In these processors information is stored in the quantum state of physical systems forming quantum bits (qubits). The interaction between qubits is controlled and the resulting states are read out on the level of single quanta in order to process information. Realizing such challenging tasks is believed to allow constructing an information processor much more powerful than a classical computer. This task is taken on by academic labs, startups and major industry. The aim of this class is to give a thorough introduction to physical implementations pursued in current research for realizing quantum information processors. The field of quantum information science is one of the fastest growing and most active domains of research in modern physics.

Content

Introduction to experimental systems for quantum information processing (QIP).
- Quantum bits
- Coherent Control
- Measurement
- Decoherence

QIP with
- Ions
- Superconducting Circuits
- Photons
- NMR
- Rydberg atoms
- NV-centers
- Quantum dots

Lecture notes

Course material be made available at www.qudev.ethz.ch and on the Moodle platform for the course. More details to follow.

Literature

Quantum Computation and Quantum Information
Michael Nielsen and Isaac Chuang
Cambridge University Press

Prerequisites / notice

Basic knowledge of concepts of quantum physics and quantum systems, e.g. from courses such as Physics III, Quantum Mechanics I and II or courses on topics such as atomic physics, solid state physics, quantum electronics are considered helpful.

More information on this class can be found on the web site www.qudev.ethz.ch
402-0464-00L  Light-Matter Interaction in Semiconductors: Physics and Applications

Abstract
The course presents fundamental aspects of light-matter interaction in semiconductor materials, from basic research topics to opto-electronic devices.

Objective
The rich physics of the optical properties of semiconductors, as well as the advanced processing available on these materials, enabled numerous applications as well as the realization of new physical concepts. In this course, we will learn the principles of light-matter interaction in semiconductors for single and multiple particle excitations, and cover opto-electronic applications based on these principles. We will study systems that include quantum dots, exciton-polaritons, quantum Hall fluids and graphene-like materials.

Content
Electronic states in III-V materials and quantum structures, optical transitions, excitons and polaritons, novel two dimensional semiconductors, spin-orbit interaction, magneto-optics and opto-electronic devices.

Prerequisites / notice
Prerequisites: Quantum Mechanics II, Introduction to Solid State Physics, Quantum Electronics

402-0465-58L  Intersubband Optoelectronics

Abstract
Intersubband transitions in quantum wells are transitions between states created by quantum confinement in ultra-thin layers of semiconductors. Because of its inherent taylorability, this system can be seen as the "ultimate quantum designer's material".

Objective
The goal of this lecture is to explore both the rich physics as well as the application of these system for sources and detectors. In fact, devices based on intersubband transitions are now unlocking large area of the electromagnetic spectrum.

Content
The lecture will treat the following chapters:
- Introduction: intersubband optoelectronics as an example of quantum engineering
- Technological aspects
- Electronic states in semiconductor quantum wells
- Intersubband absorption and scattering processes
- Mid-IR and THz ISB Detectors
- Mid-infrared and THz photonics: waveguides, resonators, metamaterials
- Quantum Cascade lasers:
  - Mid-IR QCLs
  - THZ QCLs (direct and non-linear generation)
- Further electronic confinement: interlevel Qdot transitions and magnetic field effects
- Strong light-matter coupling in Mid-IR and THz range

Lecture notes
The reference book for the lecture is "Quantum Cascade Lasers" by Jerome Faist, published by Oxford University Press.

Literature
Mostly the original articles, other useful reading can be found in:
- E. Rosencher and B. Vinter, Optoelectronics, Cambridge Univ. Press
- G. Bastard, Wave mechanics applied to semiconductor heterostructures, Halsted press

Prerequisites / notice
Requirements: A basic knowledge of solid-state physics and of quantum electronics.

402-0526-00L  Ultrafast Processes in Solids

Abstract
Ultrafast processes in solids are of fundamental interest as well as relevant for modern technological applications. The dynamics of the lattice, the electron gas as well as the spin system of a solid are discussed. The focus is on time resolved experiments which provide insight into pico- and femtosecond dynamics.

Objective
After attending this course you understand the dynamics of essential excitation processes which occur in solids and you have an overview over state of the art experimental techniques used to study fast processes.

Content
1. Experimental techniques, an overview
   2. Dynamics of the electron gas
      2.1 First experiments on electron dynamics and lattice heating
      2.2 The finite lifetime of excited states
      2.3 Detection of lifetime effects
      2.4 Dynamical properties of reactions and adsorbents
   3. Dynamics of the lattice
      3.1 Phonons
      3.2 Non-thermal melting
   4. Dynamics of the spin system
      4.1 Laser induced ultrafast demagnetization
      4.2 Ultrafast spin currents generated by lasers
      4.3 Landau-Lifschitz-Dynamics
      4.4 Laser induced switching
   5. Correlated materials

Lecture notes
will be distributed

Literature
relevant publications will be cited

Prerequisites / notice
The lecture can also be followed by interested non-physics students as basic concepts will be introduced.

1. Introduction and overview

Wassesserd Subject-specific Competencies

Concepts and Theories

Objective

By the end of this course, students will develop the ability to utilize quantum mechanics concepts to estimate the strength of atomic magnetic moments and understand their reciprocal interactions. They will gain proficiency in interpreting experimental measurements on model systems in terms of material composition and an appropriate, phenomenological spin Hamiltonian. For instance, students will be able to recognize whether the magnetic hysteresis observed in some samples arises from slow dynamics or from a phase transition. Lastly, they will be capable of interpreting the occurrence of abrupt transitions or the emergence of characteristic length scales as resulting from the interplay between competing interactions. Altogether, students will acquire the basic knowledge needed to develop a research project in the field of magnetism or to attend effectively more advanced courses on this topic.

Content

The lecture “Introduction to Magnetism” aims at letting students familiarize themselves with the basic principles of quantum and statistical physics that determine the behavior of real magnets. Understanding why only a few materials are magnetic at finite temperature will be the leitmotiv of the course. We will see that defining in a formal way what “being magnetic” means is essential to address this question properly. Theoretical concepts will be applied to a few selected nano-sized magnets, which will serve as clear reference systems.

Topics:
- Magnetism in atoms (quantum-mechanical origin of atomic magnetic moments, intra-atomic exchange interaction)
- Magnetism in solids (mechanisms producing inter-atomic exchange interaction in solids, crystal field)
- Magnetic order at finite temperatures (Ising, XY, and Heisenberg models, low-dimensional magnetism)
- Spin precession and relaxation (Larmor precession, resonance phenomena, quantum tunneling, Bloch equation, superparamagnetism)

2. Semiconductor Nanostructures

Semiconductor Nanostructures

W 6 credits 2V+1U T. M. Ihn

Abstract

The course covers the foundations of semiconductor nanostructures, e.g., materials, band structures, bandgap engineering and doping, field-effect transistors. The physics of the quantum Hall effect and of common nanostructures based on two-dimensional electron gases will be discussed, i.e., quantum point contacts, Aharonov-Bohm rings and quantum dots.

Objective

At the end of the course students will develop the ability to utilize quantum mechanics concepts to estimate the strength of atomic magnetic moments and understand their reciprocal interactions. They will gain proficiency in interpreting experimental measurements on model systems in terms of material composition and an appropriate, phenomenological spin Hamiltonian. For instance, students will be able to recognize whether the magnetic hysteresis observed in some samples arises from slow dynamics or from a phase transition. Lastly, they will be capable of interpreting the occurrence of abrupt transitions or the emergence of characteristic length scales as resulting from the interplay between competing interactions. Altogether, students will acquire the basic knowledge needed to develop a research project in the field of magnetism or to attend effectively more advanced courses on this topic.

We will see that defining in a formal way what “being magnetic” means is essential to address this question properly. Theoretical concepts will be applied to a few selected nano-sized magnets, which will serve as clear reference systems.

Topics:
- Semiconductor crystals: Fabrication and molecular beam epitaxy
- Band structures of semiconductors
- Surfaces and metal-semiconductor contacts, fabrication of semiconductor nanostructures
- Heterostructures and two-dimensional electron gases
- Drude Transport and scattering mechanisms
- Single- and bilayer graphene
- Electrons in a magnetic field, Shubnikov-de HAAS effect
- Integer quantum Hall effect
- Conductance quantization in quantum point contacts
- Aharonov-Bohm effect
- Coulomb blockade in quantum dots
- Coulomb blockade and quantum dots

Lecture notes

Learning material will be made available through Moodle and through the ETH JupyterHub.

Prerequisites

Students are assumed to possess a basic background knowledge in quantum mechanics, solid-state and statistical physics as well as classical electromagnetism.

Students will have the opportunity to self-assess their understanding through quizzes and interactive tutorials, mostly inspired by topics of current research in nanoscale magnetism.

Personal Competencies

Creative Thinking

Problem-solving

Self-direction and Self-management
The course is for advanced students and covers selected topics from magnetic resonance spectroscopy. The following topics will be covered:

- DNP theory & instrumentation
- Microwave theory & technology
- Biological applications of solid-state DNP

The second part of the course is dedicated to the microwave theory and technology. This part starts with an introduction of the two different types of microwave sources, such as the solid-state devices and vacuum tubes, which are extensively used in DNP and EPR spectroscopy. A special focus will be given to the vacuum tube’s theory and technology. In this context, the Maxwell equations and the propagation of the transverse electric and transverse magnetic modes in circular waveguides will be taught. This material will be the basis for understanding the resonance theory and the fundamentals of the microwave’s generation in vacuum tubes. Based on the theoretical background gained in the previous lectures it will be possible to understand the operation principle of the slow wave devices, such as Klystron, Traveling Wave Tube (TWT), Backward Wave Oscillator (BWO) and Surface Wave Structure (SWS), as well as, the fast wave devices, such as gyro-devices, Free Electron Laser, etc. Finally, some details on the structure of a real DNP gyrottron will be presented.

The third part of the course will cover CPMAS and homonuclear and heteronuclear recoupling schemes and their use in correlation spectroscopy for structure and molecular interaction determination. Sample preparation with particular emphasis of glassing agents and their relationship to DNP enhancements will be discussed. Resolution under DNP including a discussion about inhomogeneous and homogeneous broadening at cryogenic temperatures. Methods for circumventing low resolution at cryogenic temperatures will be discussed including site specific isotope labeling, bio-orthogonal labeling and site specific radical labeling/targeting. Concepts around the role of spin diffusion in DNP, direct and indirect DNP, paramagnetic broadening, longitudinal T1 and methyl quenching in biological NMR will also be discussed. These concepts will then be tied together through discussions of biomolecular applications of solid-state DNP including membrane proteins, in-cell DNP and viruses.

Lecture notes
A script which covers the topics will be accessible through the course Moodle

Prerequisites
A script which covers the topics will be accessible through the course Moodle

Lecture notes
The script (a copy of the slides) will be handed out during the first lecture.
