**Abstract**

This course provides an introduction to engineering design. Through hands-on, practice-oriented exercises, students learn about and experience the fundamentals of engineering design, including concept design, technical drawing, CAD, material selection, manufacturing process selection and sustainability. Three case studies in healthcare, mobility and sustainable materials are explored.

**Objective**

The lecture and exercises teach the fundamentals of engineering design, technical drawing and CAD as well as material selection. After taking the course, students will be able to tackle simple design tasks, generate and evaluate concepts, accurately create technical drawings of parts and assemblies as well as read them. Students will also be able to create models of parts and assemblies in a 3D, feature-based CAD system. They will understand the links between engineering design, sustainability, material selection and manufacturing process selection.

**Content**

- Introduction to Engineering Design
  - design requirements
  - concept generation and selection
  - prototyping

- Design Representations
  - Sketching in Engineering Design
  - Technical Drawing:
    - projections, views and cuts
    - dimensioning
    - assemblies
  - CAD:
    - CAD modeling operations
    - parametric design and feature-based modeling
    - assemblies
    - creating 2D drawings from 3D part models

- Fabrication and Additive manufacturing

- Design for the Environment

- Material and Manufacturing Process Selection
  - materials and their properties, with emphasis on sustainable materials
  - basic mechanics
  - material selection processes
  - manufacturing process selection

Three case studies in healthcare, mobility and sustainable materials

**Lecture notes**

Lecture slides and exercise handouts are available on the course Moodle website: https://moodle-app2.let.ethz.ch/course/view.php?id=17403

**Literature**

All literature will be given on the Moodle website: https://moodle-app2.let.ethz.ch/course/view.php?id=17403

**Prerequisites / notice**

This course is given as a lecture (1h/week) and an exercise (3h/week). Students are split into working groups for the exercises with a maximum of 20 students per group.

Semester Fee: A fee is charged for printed copies of the course handouts and 3D printing (the 3D-Car project). The fee is 14.– CHF per student.

Competencies

- Subject-specific Competencies
  - Concepts and Theories
  - Techniques and Technologies

- Method-specific Competencies
  - Analytical Competencies
  - Decision-making
  - Media and Digital Technologies
  - Problem-solving

- Social Competencies
  - Communication
  - Cooperation and Teamwork
  - Leadership and Responsibility
  - Self-presentation and Social Influence

- Personal Competencies
  - Adaptability and Flexibility
  - Creative Thinking
  - Critical Thinking
  - Integrity and Work Ethics
  - Self-awareness and Self-reflection
  - Self-direction and Self-management
Additional Project

ONLY for Mechanical Engineering BSc, Programme Regulations 2022.

Enrollment only in consultation with the D-MAVT student administration.

Abstract
Additional Project

Objective
Compensation of missing credit points due to transition between regulations.

Abstract
Dynamics of particles, rigid bodies, and deformable bodies: Motion of a single particle, motion of systems of particles, 2D and 3D motion of rigid bodies, vibrations, waves.

Objective
This course enables students to apply the concepts and laws governing the kinematics and kinetics of particles, rigid bodies, and elastic bodies in order to identify, formulate, and solve dynamical engineering problems. Specifically, students will be able to describe, analyze, and predict the motion of particles and bodies in space over time and to relate their motion to the applied forces for applications in (not only) mechanical and civil engineering.

Content
Students of mechanical and civil engineering learn the fundamental concepts of the dynamics of mechanical systems. By studying the motion of a single particle, systems of particles, of rigid bodies, and of deformable bodies, we introduce essential concepts such as kinematics, kinetics, work and energy, equations of motion, and forces and torques. Further topics include the stability of equilibria and vibrations as well as an introduction to the dynamics of deformable bodies and waves in elastic rods. Throughout the course, application-oriented examples help students acquire a proficient background in engineering dynamics, further to learn and embrace problem-solving techniques for dynamical engineering problems, gain cross-disciplinary expertise (by linking concepts from, among others, mechanics, mathematics, and physics), and prepare students for advanced courses and work on engineering applications. The detailed syllabus includes:

1. Motion of a single particle: kinematics (trajectory, velocity, acceleration), forces and torques, constraints, active and reaction forces, balance of linear and angular momentum, work-energy balance, conservative systems, equations of motion.
2. Motion of systems of particles: internal and external forces, balance of linear and angular momentum, work-energy balance, rigid systems of particles, particle collisions, mass accretion/loss.
3. Motion of rigid bodies in 2D and 3D: kinematics (angular velocity, velocity and acceleration transfer, instantaneous center and axis of rotation), balance of linear and angular momentum, work-energy balance, angular momentum transport, inertial vs. moving reference frames, apparent forces, Euler equations.
5. Introduction to waves and vibrations of elastic bodies: local form of linear momentum balance, waves in slender elastic rods.

Lecture notes
Lecture notes (a complete scriptum) is available on Moodle. Students are encouraged to take their own notes during class.

Literature
Lecture notes (a complete scriptum) is available on Moodle. Further reading materials are suggested but not required for this class.

Prerequisites / notice
For students in the bachelor's degree programme in mechanical engineering:
Precondition for this course unit are passed first year examination blocks A and B.

Competencies
All course materials (including lecture notes, exercise problems, etc.) are available on Moodle.

Control Systems I

Abstract
Objective

The course addresses dynamic control systems, i.e., systems that (i) evolve over time, and (ii) have control inputs and measured outputs. The main objective is to learn how to design the control inputs in such a way that the measured outputs have some desirable properties. For example, for an advanced driver assistance system, how to control acceleration so that the speed remains constant, and how to control the steering angle so that the car remains in the center of the lane.

In order to pursue this objective, the course is organized into three main parts:

1) Modeling: learn how to represent a dynamic control system in such a way that it can be treated effectively using computational and mathematical tools. This will include learning how to use computer tools like Matlab to simulate dynamic control systems.

2) Analysis: understand the basic characteristics of a system, such as its (internal and external) stability, performance, and robustness, and how the input affects the output. We will also learn to analyze systems obtained as interconnections (e.g., feedback) of two or more other systems. In particular, we will focus on tools that allow to understand how a system will behave under feedback control (i.e., closed-loop behavior), based only on its open-loop behavior.

3) Synthesis: the last part of the course will concentrate on how to design feedback control laws, in order to change the behavior of the system in a desirable way.

In this course, we will concentrate on systems that can be modeled by Ordinary Differential Equations (ODEs), and that satisfy certain other technical conditions, such as linearity and time-invariance. In addition, we will focus on systems with a Single Input and a Single Output (SISO).

This will allow us to use "classical control" tools that are very powerful and easy to use (i.e., mostly graphical), and which are really laying the foundation of any follow-up work on more challenging control problems.

In addition to paper-and-pencil techniques, we will leverage modern computational tools for control design, such as Matlab.

Lecture notes

Lecture slides and additional material will be posted online.

Literature

There is no required textbook.

A nice introductory book on feedback control, available online for free, is:

Feedback Systems: An Introduction for Scientists and Engineers
Karl J. Astrom and Richard M. Murray

http://www.cds.caltech.edu/~murray/amwiki/index.php/First_Edition

Prerequisites / notice

Basic knowledge of (complex) analysis and linear algebra.
Familiarity with Matlab is recommended.

For students in the bachelor's degree programme in mechanical engineering:
Precondition for this course unit are passed first year examination blocks A and B.

151-0051-00L Thermodynamics I 4 credits 2V+2U A. Bardow, C. Müller

Abstract

Introduction to the fundamentals of technical thermodynamics.

1. Konzepte und Definitionen
2. Der erste Hauptsatz, der Begriff der Energie und Anwendungen für geschlossene Systeme
3. Eigenschaften reiner kompressibler Substanzen, quasistatische Zustandsänderungen
4. Elemente der kinetischen Gastheorie
5. Der erste Hauptsatz in offenen Systemen - Energieanalyse in einem Kontrollvolumen
6. Der zweite Hauptsatz - Der Begriff der Entropie
7. Nutzbarkeit der Energie - Exergie
8. Thermodynamische Beziehungen für einfache, kompressible Substanzen.

Lecture notes available

Literature

227-0075-00L Electrical Engineering I 4 credits 2V+2U J. Leuthold

Abstract

Basic course in electrical engineering with the following topics: Concepts of voltage and currents; Analyses of dc and ac networks; Series and parallel resistive circuits, circuits including capacitors and inductors; Kirchhoff’s laws and other network theorems; Transient responses; Basics of electrical and magnetic fields;

Objective

Understanding of the basic concepts in electrical engineering with focus on network theory. The successful student knows the basic components of electrical circuits and the network theorems after attending the course.
Diese Vorlesung vermittelt Grundlagenkenntnisse im Fachgebiet Elektrotechnik. Ausgehend von den grundlegenden Konzepten der Spannung und des Stroms wird die Analyse von Netzwerken bei Gleich- und Wechselstrom behandelt. Dabei werden folgende Themen behandelt:

Kapitel 1 Das elektrostatische Feld
Kapitel 2 Das stationäre elektrische Strömungsfeld
Kapitel 3 Einfache elektrische Netzwerke
Kapitel 4 Halbleiterbauelemente (Dioden, der Transistor)
Kapitel 5 Das stationäre Magnetfeld
Kapitel 6 Das zeitlich veränderliche elektromagnetische Feld
Kapitel 7 Der Übergang zu den zeitabhängigen Strom- und Spannungsformen
Kapitel 8 Wechselspannung und Wechselstrom

Die Vorlesungsfolien werden auf Moodle bereitgestellt.

Als ausführliches Skript wird das Buch "Manfred Albach. Elektrotechnik, Person Verlag, Ausgabe vom 1.8.2011" empfohlen.

Für das weitergehende Studium werden in der Vorlesung verschiedene Bücher vorgestellt.

Precondition for this course unit are passed first year examination blocks A and B.

401-0363-10L Analysis III

Abstract

Introduction to partial differential equations. Differential equations which are important in applications are classified and solved. Elliptic, parabolic and hyperbolic differential equations are treated. The following mathematical tools are introduced: Laplace transforms, Fourier series, separation of variables, methods of characteristics.

Objective

Mathematical treatment of problems in science and engineering. To understand the properties of the different types of partial differential equations.

Content

Laplace Transforms:
- Laplace Transform, Inverse Laplace Transform, Linearity, s-Shifting
- Transforms of Derivatives and Integrals, ODEs
- Unit Step Function, t-Shifting
- Short Impulses, Dirac's Delta Function, Partial Fractions
- Convolution, Integral Equations
- Differentiation and Integration of Transforms

Fourier Series, Integrals and Transforms:
- Fourier Series
- Functions of Any Period p=2L
- Even and Odd Functions, Half-Range Expansions
- Forced Oscillations
- Approximation by Trigonometric Polynomials
- Fourier Integral
- Fourier Cosine and Sine Transform

Partial Differential Equations:
- Basic Concepts
- Modeling: Vibrating String, Wave Equation
- Solution by separation of variables; use of Fourier series
- D'Alembert Solution of Wave Equation, Characteristics
- Heat Equation: Solution by Fourier Series
- Heat Equation: Solutions by Fourier Integrals and Transforms
- Modeling Membrane: Two Dimensional Wave Equation
- Laplacian in Polar Coordinates: Circular Membrane, Fourier-Bessel Series
- Solution of PDEs by Laplace Transform

Lecture notes

Literature

For reference/complement of the Analysis I/II courses:

Christian Blatter: Ingenieur-Analysis
https://people.math.ethz.ch/~blatter/dlp.html

For students in the bachelor's degree programme in mechanical engineering:
Precondition for this course unit are passed first year examination blocks A and B.

Examination Block 2
Offered in the spring semester only

Project

Number 151-0300-10L

Title Innovation Project

Abstract The students are going through a product development process starting with the first idea to the functional product. The participants will learn to work on a complex development task in a team (5 pers.), to structure a given problem, to generate and evaluate ideas as well as the design and realization of the product with subsequent verification.

Objective The students learn and experience the principles of product development. In addition to acquiring development methodical responsibilities, the main focus is on working together as a team. The participants are taught how to structure a complex development objective and how to achieve this objective in team work. In the end, the students will master the basics of development processes and development methodical tools.
Prerequisites / notice
Successfull completion of the project is mandatory for course attestation.

For students in the bachelor's degree programme in mechanical engineering:
Precondition for this course unit are passed first year examination blocks A and B.

**Objective**

Photonics, the science of light, has become ubiquitous in our lives. Control and manipulation of light is what enables us to interact with the screen of our smart devices and exchange large amounts of complex information. Photonics has also taken a preponderant role in cutting-edge science, allowing for instance to image nanospecimens, detect diseases or sense very tiny forces. The purpose of this course is three-fold: (i) We first aim to provide the fundamentals of photonics, establishing a solid basis for more specialised courses. (ii) Beyond theoretical concepts, our intention is to have students develop an intuition on how to manipulate light in practice. (iii) Finally, the course highlights how the taught concepts apply to modern research as well as to everyday life technologies (LCD screens, polarisation sun glasses, anti-reflection coating etc...). Content, including videos of laboratory experiments, has been designed to be approachable by students from a diverse set of science and engineering backgrounds.

**Content**

I- **BASICS OF WAVE THEORY**
1) General concepts
2) Differential wave equation
3) Wavefront
4) Plane waves and Fourier decomposition of optical fields
5) Spherical waves and Huygens-Fresnel principle

II- **ELECTROMAGNETIC WAVES**
1) Maxwell equations
2) Wave equation for EM waves
3) Dielectric permittivity
4) Refractive index
5) Nonlinear optics
6) Polarisation and polarisation control

III- **PROPAGATION OF LIGHT**
1) Waves at an interface
2) The Fresnel coefficients
3) Total internal reflection
4) Evanescent waves
5) Dispersion diagram

IV- **INTERFERENCES**
1) General considerations
2) Temporal and spatial coherence
3) The Young double slit experiment
4) Diffraction gratings
5) The Michelson interferometer
6) Multi-wave interference
7) Antireflecting coating and interference filters
8) Optical holography

V- **LIGHT MANIPULATION**
1) Optical waveguides
2) Photonic crystals
3) Metamaterials and metasurfaces
4) Optical cavities

VI- **OPTICAL FORCES AND OPTICAL TWEEZERS**
1) History of optical forces
2) Theory of optical trapping
3) Atom cooling
4) Optomechanics
5) Applications of optical tweezers

VII- **INTRODUCTION TO OPTICAL MICROSCOPY**
1) Basic concepts
2) Direct and Fourier imaging
3) Image formation
4) Fluorescence microscopy
5) Scattering-based microscopy
6) Digital holography
7) Computational imaging

**151-0917-00L** **Mass Transfer**

W 4 credits 2V+2U M. Tibbitt, V. Mavrantzas, C.-J. Shih

**Abstract**

This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore, the application of these principles to important engineering problems is demonstrated.

**Objective**

This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore, the application of these principles to important engineering problems is demonstrated.

**Content**

Fick's laws; application and significance of mass transfer; comparison of Fick's laws with Newton's and Fourier's laws; derivation of Fick's 2nd law; diffusion in dilute and concentrated solutions; rotating disk; dispersion; diffusion coefficients, viscosity and heat conduction (Pr and Sc numbers); Brownian motion; Stokes-Einstein equation; mass transfer coefficients (Nu and Sh numbers); mass transfer across interfaces; Analogies for mass-, heat-, and momentum transfer in turbulent flows; film-, penetration-, and surface renewal theories; simultaneous mass, heat and momentum transfer (boundary layers); homogeneous and heterogeneous reversible and irreversible reactions; diffusion-controlled reactions; mass transfer and first order heterogeneous reaction. Applications.

**Literature**

Prerequisites / notice
Students attending this highly-demanding course are expected to allocate sufficient time within their weekly schedule to successfully conduct the exercises.

Competencies

Subject-specific Competencies
- Concepts and Theories: assessed

- Self-direction and Self-management: fostered

151-0973-00L Introduction to Process Engineering

Abstract
Overview of process engineering; fundamentals of process engineering; processes and balances; overview of thermal separation processes and multiphase systems; overview of mechanical separation processes and granular systems; introduction into reaction engineering, reactors and residence times.

Objective
We teach the fundamentals of process engineering using practical examples as well as concrete process engineering problems in the areas of process control and balancing, thermal separation processes, mechanical separation processes and reaction engineering.

Content
Overview of process engineering; fundamentals of process engineering; processes and balances; overview of thermal separation processes and multiphase systems; overview of mechanical separation processes and granular systems; introduction into reaction engineering, reactors and residence times.

In addition to teaching basic theoretical knowledge, the focus is on solving typical problems in various subdisciplines of process engineering.

Lecture notes
A script is provided (German language).

Literature
Further literature will be announced during the course. For the successful completion of the course, the lecture notes, the slides of the lecture and the exercise materials are sufficient.

151-3207-00L Lightweight Structures

Abstract
The elective course Lightweight includes numerical methods for the analysis of the load carrying and failure behavior of lightweight structures, as well as construction methods and design principles for lightweight design.

Objective
The goal of this course is to convey substantiated background for the understanding and the design and sizing of modern lightweight structures in mechanical engineering, vehicle and airplane design.

Content
Lightweight design
- Thin-walled beams and structures
- Instability behavior of thin walled structures
- Reinforced shell structures
- Load introduction in lightweight structures
- Joining technology
- Sandwich design

Lecture notes
Handouts, Exercises

Competencies

Subject-specific Competencies

351-0511-00L Managerial Economics

Abstract
"Managerial Economics" provides an introduction to the theories and methods from Economics and Management Science to analyze economic decision-making in the context of markets. The course targets students with no prior knowledge in Economics and Management.

Objective
The objective of this course is to provide an introduction to microeconomic thinking. Based on the fundamental principles of economic analysis (optimization and equilibrium), the focus lies on understanding key economic concepts relevant for understanding and analyzing economic behavior of firms and consumers in the context of markets. Market demand and supply are derived from the individual decision-making of economic agents and market outcomes under different assumptions about the market structure and market power (perfect competition, monopoly, oligopoly, game theory) are studied. This introductory course aims at providing essential knowledge from the fields of Economics and Management relevant for economic decision-making in the context of both the private and public sector.

Literature

Prerequisites / notice
The course targets both Bachelor and Master students. No prior knowledge in the areas of Economics and Management is required.

Competencies

Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

Method-specific Competencies
- Analytical Competencies: assessed

Focus Project
In addition to the focus project, 8 ECTS must be acquired as focus courses. Choose these subjects in consultation with the professor responsible for your focus project from the categories of "Electives" and "Focus Specialization".

Number Title Type ECTS Hours Lecturers
151-0073-10L MONKEE n
This course is part of a one-year course. The 20 credit points will be issued at the end of FS2025 with new enrolling for the same Focus Project in FS2025.
Abstract
Students develop and build a product from A-Z! They work in teams and independently, learn to structure problems, to identify solutions, system analysis and simulations, as well as presentation and documentation techniques. They build the product with access to a machine shop and state of the art engineering tools (Matlab, Simulink, etc).

Objective
The various objectives of the Focus Project are:
- Synthesizing and deepening the theoretical knowledge from the basic courses of the 1. - 4. semester
- Team organization, work in teams, increase of interpersonal skills
- Independence, initiative, independent learning of new topic contents
- Problem structuring, solution identification in indistinct problem definitions, searches of information
- System description and simulation
- Presentation methods, writing of a document
- Ability to make decisions, implementation skills
- Workshop and industrial contacts
- Learning and recess of special knowledge
- Control of most modern engineering tools (Matlab, Simulink, CAD, CAE, PDM)

Prerequisites / notice
Participation in the Focus Rollout is part of the Focus Project.

The various objectives of the Focus Project are:
- Synthesizing and deepening the theoretical knowledge from the basic courses of the 1. - 4. semester
- Team organization, work in teams, increase of interpersonal skills
- Independence, initiative, independent learning of new topic contents
- Problem structuring, solution identification in indistinct problem definitions, searches of information
- System description and simulation
- Presentation methods, writing of a document
- Ability to make decisions, implementation skills
- Workshop and industrial contacts
- Learning and recess of special knowledge
- Control of most modern engineering tools (Matlab, Simulink, CAD, CAE, PDM)

Prerequisites / notice
Participation in the Focus Rollout is part of the Focus Project.

Abstract

Students develop and build a product from A-Z! They work in teams and independently, learn to structure problems, to identify solutions, system analysis and simulations, as well as presentation and documentation techniques. They build the product with access to a machine shop and state of the art engineering tools (Matlab, Simulink, etc).

Objective

The various objectives of the Focus Project are:
- Synthesizing and deepening the theoretical knowledge from the basic courses of the 1. - 4. semester
- Team organization, work in teams, increase of interpersonal skills
- Independence, initiative, independent learning of new topic contents
- Problem structuring, solution identification in indistinct problem definitions, searches of information
- System description and simulation
- Presentation methods, writing of a document
- Ability to make decisions, implementation skills
- Workshop and industrial contacts
- Learning and recess of special knowledge
- Control of most modern engineering tools (Matlab, Simulink, CAD, CAE, PDM)

Prerequisites / notice

Participation in the Focus Rollout is part of the Focus Project.
Prerequisites for the focus projects:
a. First year examinations successfully passed.
b. Block 1 and 2 successfully passed.

Abstract
Students develop and build a product from A-Z! 151-0917-00L Mass Transfer

Abstract
This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore, the application of these principles to important engineering problems is demonstrated.

Objective
This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore, the application of these principles to important engineering problems is demonstrated.

Content
Fick's laws; application and significance of mass transfer; comparison of Fick's laws with Newton's and Fourier's laws; derivation of Fick's 2nd law; diffusion in dilute and concentrated solutions; rotating disk; dispersion; diffusion coefficients, viscosity and heat conduction (Pr and Sc numbers); Brownian motion; Stokes-Einstein equation; mass transfer coefficients (Nu and Sh numbers); mass transfer across interfaces; Analogies for mass-, heat-, and momentum transfer in turbulent flows; film-, penetration-, and surface renewal theories; simultaneous mass, heat and momentum transfer (boundary layers); homogeneous and heterogeneous reversible and irreversible reactions; diffusion-controlled reactions; mass transfer and first order heterogeneous reaction. Applications.

Self-awareness and Self-reflection fostered
Self-direction and Self-management fostered

151-0973-00L Introduction to Process Engineering

Abstract
Overview of process engineering; fundamentals of process engineering; processes and balances; overview of thermal separation processes and multiphase systems; overview of mechanical separation processes and granular systems; introduction into reaction engineering, reactors and residence times.

Objective
We teach the fundamentals of process engineering using practical examples as well as concrete process engineering problems in the areas of process control and balancing, thermal separation processes, mechanical separation processes and reaction engineering.

Content
Overview of process engineering; fundamentals of process engineering; processes and balances; overview of thermal separation processes and multiphase systems; overview of mechanical separation processes and granular systems; introduction into reaction engineering, reactors and residence times.
In addition to teaching basic theoretical knowledge, the focus is on solving typical problems in various subdisciplines of process engineering.

Lecture notes
A script is provided (German language).

Literature
Further literature will be announced during the course. For the successful completion of the course, the lecture notes, the slides of the lecture and the exercise materials are sufficient.

151-0123-00L Experimental Methods for Engineers

Abstract
The course presents an overview of measurement tasks in engineering environments. Different concepts for the acquisition and processing of typical measurement quantities are introduced. Following an initial in-class introduction, laboratory exercises from different application areas (especially in thermofluidics, energy, and process engineering) are attended by students in small groups.
Objective

Introduction to various aspects of measurement techniques, with particular emphasis on thermo-fluidic, energy, and process-engineering applications.

Understanding of various sensing technologies and analysis procedures.

Exposure to typical experiments, diagnostics hardware, data acquisition, and processing.

Study of applications in the laboratory. Fundamentals of scientific documentation and reporting.

Content

In-class introduction to representative measurement techniques in the research areas of the participating institutes (fluid dynamics, energy technology, and process engineering).

Student participation in ~6 laboratory experiments (study groups of ~3 students, dependent on the number of course participants and available experiments).

Lecture notes

Lab reports for all attended experiments have to be submitted by the study groups.

Literature

Presentations, handouts, and instructions are provided for each experiment.

Prerequisites / notice

Basic understanding in the following areas:
- fluid mechanics, thermodynamics, heat and mass transfer
- electrical engineering / electronics
- numerical data analysis and processing (e.g. using MATLAB)

Competencies

Subject-specific Competencies

Concepts and Theories assessed
Techniques and Technologies assessed

Method-specific Competencies

Analytical Competencies fostered
Decision-making fostered
Media and Digital Technologies fostered
Problem-solving fostered
Project Management fostered

Self-direction and Self-management fostered

151-0109-00L Turbulent Flows W 4 credits 2V+1U P. Jenny

Abstract

Laminar and turbulent flows, instability and origin of turbulence - Statistical description: averaging, turbulent energy, dissipation, closure problem - Scalars: Homogeneous isotropic turbulence, correlations, Fourier representation, energy spectrum - Free turbulence: wake, jet, mixing layer - Wall turbulence: Channel and boundary layer - Computation and modelling of turbulent flows

Objective

Basic physical phenomena of turbulent flows, quantitative and statistical description, basic and averaged equations, principles of turbulent flow computation and elements of turbulence modelling

Content

- Properties of laminar, transitional and turbulent flows.
- Origin and control of turbulence. Instability and transition.
- Statistical description, averaging, equations for mean and fluctuating quantities, closure problem.
- Scalars, homogeneous isotropic turbulence, energy spectrum.
- Turbulent free shear flows. Jet, wake, mixing layer,
- Wall-bounded turbulent flows.
- Turbulent flow computation and modeling.

Lecture notes

Lecture notes are available

Literature

151-0125-00L Hydrodynamics and Cavitation W 4 credits 3G O. Supponen

Abstract

This course builds on the foundations of fluid dynamics to describe hydrodynamic flows and provides an introduction to cavitation.

Objective

The main learning objectives of this course are:
1. Identify and describe dominant effects in liquid fluid flows through physical modelling.
2. Identify and predict the onset of hydrodynamic instabilities.
3. Describe acoustic wave behaviour in liquids.
4. Explain tension, nucleation and phase-change in liquids.
5. Predict the behaviour of a gas bubble subject to changes in surrounding liquid pressure.
6. Describe hydrodynamic cavitation and its consequences in physical terms.
7. Recognise experimental techniques and industrial and medical applications for cavitation.
8. Read and evaluate research papers on recent research on cavitation and bubble dynamics and communicate the content orally to a multidisciplinary audience.

Content

The course gives an overview on the following topics: basics of hydrodynamics, capillarity, hydrodynamic instabilities, liquid fragmentation. Acoustics in liquids, tension in liquids, phase change. Cavitation and bubble dynamics: single bubbles (nucleation, dynamics, collapse), bubble clouds and cavitating flows. Industrial applications and measurement techniques.

Lecture notes

Class notes and handouts

151-0163-00L Nuclear Energy Conversion W 4 credits 2V+1U A. Manera
Abstract
Physical fundamentals of the fission reaction and the sustainable chain reaction, thermal design, construction, function and operation of nuclear reactors and power plants, light water reactors and other reactor types, conversion and breeding

Objective
Students get an overview on energy conversion in nuclear power plants, on construction and function of the most important types of nuclear reactors with special emphasis to light water reactors. They obtain the mathematical/physical basis for quantitative assessments concerning most relevant aspects of design, dynamic behaviour as well as material and energy flows.

Content
Nuclear physics of fission and chain reaction. Thermodynamics of nuclear reactors. Design of the reactor core. Introduction into the dynamic behaviour of nuclear reactors. Overview on types of nuclear reactors, difference between thermal reactors and fast breeders. Construction and operation of nuclear power plants with pressurized and boiling water reactors, role and function of the most important safety systems, special features of the energy conversion. Development tendencies of reactor technology.

Lecture notes
Hand-outs will be distributed. Additional literature and information on the website of the lab: https://www.ethz.ch/content/specialinterest/matv/energy-technology/lab-of-nuclear-energy-systems/en/studium/teaching-materials/151-0163-00l-nuclear-energy-conversion.html

Literature

R. L. Murray: Nuclear Energy (Sixth Edition), An Introduction to the Concepts, Systems, and Applications of Nuclear Processes, Elsevier

151-0215-00L Fundamentals of Acoustics W 4 credits 3G N. Noiray, B. Van Damme
Abstract
This course provides an introduction to acoustics. It focusses on fundamental phenomena of airborne and structure-borne sound waves. The lecture combines theoretical principles with practical insights and interpretations.

Objective
This course is proposed for Master and PhD students interested in getting knowledge in acoustics. Students will be able to understand, describe analytically and interpret sound generation, absorption and propagation.

Content
First, magnitudes characterizing sound propagation are reviewed and the constitutive equations for acoustics are derived. Then the different types of sources (monopole/dipole/quadrupole, punctual, non-compact) are introduced and linked to the noise generated by turbulent flows, coherent vortexal structures or fluctuating heat release. The scattering of sound by rigid bodies is given in basic configurations. Analytical, experimental and numerical methods used to analyze sound in ducts and rooms are presented (Green functions, Galerkin expansions, Helmholz solvers).

Lecture notes
Handouts will be distributed during the class

Literature
Books will be recommended for each chapter

151-0221-00L Introduction to Modeling and Optimization of Sustainable Energy Systems W+ 4 credits 4G G. Sansavini, A. Bardow, S. Moret
Abstract
This course introduces the fundamentals of energy system modeling for the analysis and the optimization of the energy system design and operations.

Objective
At the end of this course, students will be able to:
- define and quantify the key performance indicators of sustainable energy systems;
- select and apply appropriate models for conversion, storage and transport of energy;
- develop mathematical models for the analysis, design and operations of multi-energy systems and solve them with appropriate mathematical tools;
- select and apply methodologies for the uncertainty analysis on energy systems models;
- apply the acquired knowledge to tackle the challenges of the energy transition.

Content
In the course "Introduction to Modeling and Optimization of Sustainable Energy Systems", the competencies of process understanding, system understanding, modeling, concept development, data analysis & interpretation and measurement methods are taught, applied and examined. Programming is applied.

Lecture notes
Lecture slides and supplementary documentation will be available online. Reference to appropriate book chapters and scientific papers will be provided.

151-0293-00L Fundamentals and Applications of Combustion W 4 credits 2V+1U+2A N. Noiray, F. Ernst, C. E. Frouzakis
Abstract
Note: The previous course title until HSS6 "Combustion and Reactive Processes in Energy and Materials Technology"

This course will provide an introduction to the fundamentals and the applications of combustion in energy conversion and nanoparticles synthesis. The content is highly relevant for technologies which cannot be electrified such as long distance aviation and shipping, and which will more and more rely on carbon-neutral synthetic fuels.

Objective
The main learning objectives of this course are: 1. Understand the thermodynamic, fluid-dynamic and chemical kinetics fundamentals of combustion processes. 2. Predict relevant parameters for combustion systems, such as laminar and turbulent flame speeds, adiabatic flame temperature or quenching distance. 3. Understand the causal relations of relevant combustion parameters such as the pressure influence on the laminar flame speed. 4. Analyze the challenges of developing sustainable combustion technologies based on carbon-neutral synthetic fuels.

Content

Lecture notes
No script available. Instead, material will be provided in lecture slides and the following text book (which can be downloaded for free) will be followed:

Teaching language, assignments and lecture slides in English

Literature

151-0913-00L Introduction to Photonics W 4 credits 2V+2U R. Guident, J. Ortega Arroyo
Abstract
This course introduces students to the main concepts of optics and photonics. Specifically, we will describe the laws obeyed by optical waves and discuss how to use them to manipulate light.
Objective

Photonics, the science of light, has become ubiquitous in our lives. Control and manipulation of light is what enables us to interact with the screen of our smart devices and exchange large amounts of complex information. Photonics has also taken a preponderant role in cutting-edge science, allowing for instance to image nanospecimens, detect diseases or sense very tiny forces. The purpose of this course is three-fold: (i) We first aim to provide the fundamentals of photonics, establishing a solid basis for more specialised courses. (ii) Beyond theoretical concepts, our intention is to have students develop an intuition on how to manipulate light in practise. (iii) Finally, the course highlights how the taught concepts apply to modern research as well as to everyday life technologies (LCD screens, polarisation sun glasses, anti-reflection coating etc...). Content, including videos of laboratory experiments, has been designed to be approachable by students from a diverse set of science and engineering backgrounds.

Content

I- BASICS OF WAVE THEORY
1) General concepts
2) Differential wave equation
3) Wavefront
4) Plane waves and Fourier decomposition of optical fields
5) Spherical waves and Huygens-Fresnel principle

II- ELECTROMAGNETIC WAVES
1) Maxwell equations
2) Wave equation for EM waves
3) Dielectric permittivity
4) Refractive index
5) Nonlinear optics
6) Polarisation and polarisation control

III- PROPAGATION OF LIGHT
1) Waves at an interface
2) The Fresnel coefficients
3) Total internal reflection
4) Evanscement waves
5) Dispersion diagram

IV- INTERFERENCES
1) General considerations
2) Temporal and spatial coherence
3) The Young double slit experiment
4) Diffraction gratings
5) The Michelson interferometer
6) Multi-wave interference
7) Antireflecting coating and interference filters
8) Optical holography

V- LIGHT MANIPULATION
1) Optical waveguides
2) Photonic crystals
3) Metamaterials and metasurfaces
4) Optical cavities

VI- OPTICAL FORCES AND OPTICAL TWEEZERS
1) History of optical forces
2) Theory of optical trapping
3) Atom cooling
4) Optomechanics
5) Applications of optical tweezers

VII- INTRODUCTION TO OPTICAL MICROSCOPY
1) Basic concepts
2) Direct and Fourier imaging
3) Image formation
4) Fluorescence microscopy
5) Scattering-based microscopy
6) Digital holography
7) Computational imaging

151-0941-00L Molecular Sensors: From Fundamentals to Health and Environmental Applications
W 4 credits 2V+2U A. Güntner, P. Gerber

Abstract
Molecular sensors are used in everyday life in health care, environmental monitoring, food safety, space and other fields. Sources of molecular information, its transport and fundamental concepts of molecular sensing will be discussed. In the scope of group projects, the acquired knowledge will be applied and deepened in case studies.
After the course, the students will:

- know the requirements and merits of molecular sensors for health, environmental and other emerging applications (e.g. space)
- understand transport phenomena of molecular information & surface interactions and know how to quantitatively describe these
- understand fundamental sensing concepts for the detection and quantification of molecular analytes
- know concepts of signal processing
- be capable to apply the learnt knowledge to conceive and engineer sensor concepts and systems
- know how to investigate sensor-related literature and present scientific data

This course consists of a theoretical and a project-based learning block. In the first 10 semester weeks, theoretical knowledge will be provided through lectures and deepened in corresponding exercises. In the last 4 weeks, the students will apply the learned concepts through group projects to investigate case studies. The outcome will be present.

**Content**
Transport of Molecular Information; Surface Interactions; Sensor Fundamentals; Chemoresistive Sensing; Electrochemical Sensing; Mass-sensitive; Capacitive Sensing; Signal Processing; Medical Requirements for Molecular Sensing

**Lecture notes**
Hand-outs will be provided to each lecture including the exercises and their solutions.

**Abstract**
The course will provide you with the fundamentals of the new and exciting field of ultrasound-based microrobots to treat various diseases. Furthermore, we will explore how ultrasound can be used in additive manufacturing for tissue constructs and robotics.

**Objective**
The course is designed to equip students with skills in the design and development of ultrasound-based manipulation devices and microrobots for applications in medicine and additive manufacturing.

**Content**
Linear and nonlinear acoustics, foundations of fluid and solid mechanics and piezoelectricity, Gorkov potential, numerical modelling, acoustic streaming, applications from ultrasonic microrobotics to surface acoustic wave devices

**Lecture notes**

**Literature**

**Prerequisites / notice**
Solid and fluid continuum mechanics. Notice: The exercise part is a mixture of presentation, lab sessions (both compulsory) and hand in homework.

**Abstract**
Signals arise in most engineering applications. They contain information about the behavior of physical systems. Systems respond to signals and produce other signals. In this course, we explore how signals can be represented and manipulated, and their effects on systems. We further explore how we can discover basic system properties by exciting a system with various types of signals.

**Objective**
Master the basics of signals and systems. Apply this knowledge to problems in the homework assignments and programming exercise.

**Content**

**Lecture notes**
Lecture notes available on course website.

**Prerequisites / notice**
Control Systems I is helpful but not required.
151-0604-00L  
**Microsystems I: Process Technology and Integration**  
W 4 credits 3G  

**B. Nelson**

**Abstract**  
Microsystems is an interdisciplinary field that combines aspects of robotics, micro and nanotechnology, biomedical engineering, and materials science. The aim of this course is to expose students to the fundamentals of this emerging field. Throughout the course, the students apply these concepts in assignments. The course concludes with an end-of-semester examination.

**Objective**  
The objective of this course is to expose students to the fundamental aspects of the emerging field of Microsystems. This includes a focus on physical laws that predominate at the micrometer scale, technologies for fabricating small devices, bio-inspired design, and applications of the field.

**Content**  
Main topics of the course include:
- Scaling laws at micro/nano scales  
- Electrostatics  
- Electromagnetism  
- Low Reynolds number flows  
- Observation tools  
- Materials and fabrication methods  
- Applications of biomedical microrobots

**Lecture notes**  
The powerpoint slides presented in the lectures will be made available as pdf files. Several readings will also be made available electronically.

**Prerequisites / notice**  
The lecture will be taught in English.

151-0621-00L  
**Microsystems I: Process Technology and Integration**  
W 6 credits 3V+2U  

**M. Haluska**, **C. Hierold**

**Abstract**  
Students are introduced to the fundamentals of semiconductors, the basics of micromachining and silicon process technology and will learn about the fabrication of microsystems and devices by a sequence of defined processing steps (process flow).

**Objective**  
Students are introduced to the basics of micromachining and silicon process technology and will understand the fabrication of microsystems devices by the combination of unit process steps (= process flow).

**Content**  
- Introduction to Microsystems technology (MST) and micro electro mechanical systems (MEMS)  
- Basic silicon technologies: Thermal oxidation, photolithography and etching, diffusion and ion implantation, thin film deposition.  
- Specific Microsystems technologies: Bulk and surface micromachining, dry and wet etching, isotropic and anisotropic etching, beam and membrane formation, wafer bonding, thin film mechanical properties.

**Lecture notes**  
Handouts (available online)

**Literature**  
- S.M. Sze: Semiconductor Devices, Physics and Technology

Prerequisites: Physics I and II

151-0640-00L  
**Studies on Mechatronics**  
W 5 credits 11A  

**Supervisors**

**Abstract**  
Overview of Mechatronics topics and study subjects. Identification of minimum 10 pertinent refereed articles or works in the literature in consultation with supervisor or instructor. After 4 weeks, submission of a 2-page proposal outlining the title, state-of-the-art and study plan based on these articles. After feedback on the substance and technical writing by the instructor, project commences.

**Objective**  
The students are familiar with the challenges of the fascinating and interdisciplinary field of Mechatronics and Microsystems. They are introduced in the basics of independent non-experimental scientific research and are able to summarize and present their results efficiently.

**Content**  
The students work independently on a study of selected topics in the field of Mechatronics or Microsystems. They start with a selection of scientific papers to continue literature research. The results (e.g. state-of-the-art, methods) are evaluated with respect to predefined criteria. Then the results are presented in an oral presentation and summarized in a report, which takes the discussion of the presentation into account.

**Literature**  
will be available

151-0703-00L  
**Operational Simulation of Production Lines**  
W 4 credits 2V+1U  

**P. Acél**, **A. Kunz**

**Abstract**  
The students learn the application of the event-driven and computer-based simulation for layout and improvement of production facilities by means of practical examples and by using the so-called «Digital Twin» within the context of «Industry 4.0». They learn how virtual and mixed reality tools can be used together with the Digital Twin to plan and support the operation of a production line.

**Objective**  
The students learn the correct use of (Who? When? How?) of the event-driven and computer-based simulation in the illustration of the operating procedures and the production facilities. The simulation is an important basis for creating a digital twin in the context of Industry 4.0.

Operating simulation in the productions, logistic and scheduling will be shown by means of practical examples. The students should make their first experiences in the use of computer-based simulation. Further, the lecture gives insights into the methods-time measurement (MTM) for evaluating human work places as basis for the simulation and learn how this is performed using virtual reality.

**Content**  
- Application and application areas of the event-driven simulation  
- Simulation in the context of Industry 4.0 (digital twin)  
- Exemplary application of a software tool (Technomatrix-Simulation-Software)  
- Internal organization and functionality of simulation tools  
- Procedure for application: optimizing, experimental design planning, analysis, data preparation  
- Controlling philosophies, emergency concepts, production in sequence, line production, rescheduling  
- Application on the facilities projecting  
- Applications of Virtual and Mixed Reality

**Lecture notes**  
The knowledge is enhanced by practice-oriented exercises and an excursion. A guest speaker will present a practical example.

**Literature**  
Will be sent by email before the lecture (pdf).

A bibliography will be handed out during the lectures.

**Prerequisites / notice**  
Recommended for all Bachelor-Students in the 5th semester and Master-Students in the 7th semester (MAVT, MTEC, PhD students in materials science) and for all with interest in production (e.g., MTEC, HEST, etc.)
We will provide an overview on how to kinematically and dynamically model typical robotic systems such as robot arms, legged robots, and rotary wing systems, or fixed wing. The student receives a solid background in kinematics, dynamics, and rotations of multi-body systems. On the basis of state of the art applications, he/she will learn all necessary tools to work in the field of design or control of robotic systems.

The course consists of three parts: First, we will refresh and deepen the student’s knowledge in kinematics, dynamics, and rotations of multi-body systems. In this context, the learning material will build upon the courses for mechanics and dynamics available at ETH, with the particular focus on their application to robotic systems. The goal is to foster the conceptual understanding of similarities and differences among the various types of robots. In the second part, we will apply the learned material to classical robotic arms as well as legged systems and discuss kinematic constraints and interaction forces. In the third part, focus is put on modeling fixed wing aircraft, along with rotary wing systems, or fixed wing.
I- BASICS OF WAVE THEORY
1) General concepts
2) Differential wave equation
3) Wavefront
4) Plane waves and Fourier decomposition of optical fields
5) Spherical waves and Huygens-Fresnel principle

II- ELECTROMAGNETIC WAVES
1) Maxwell equations
2) Wave equation for EM waves
3) Dielectric permittivity
4) Refractive index
5) Nonlinear optics
6) Polarisation and polarisation control

III- PROPAGATION OF LIGHT
1) Waves at an interface
2) The Fresnel coefficients
3) Total internal reflection
4) Evanescent waves
5) Dispersion diagram

IV- INTERFERENCES
1) General considerations
2) Temporal and spatial coherence
3) The Young double slit experiment
4) Diffraction gratings
5) The Michelson interferometer
6) Multi-wave interference
7) Antireflecting coating and interference filters
8) Optical holography

V- LIGHT MANIPULATION
1) Optical waveguides
2) Photonic crystals
3) Metamaterials and metasurfaces
4) Optical cavities

VI- OPTICAL FORCES AND OPTICAL TWEEZERS
1) History of optical forces
2) Theory of optical trapping
3) Atom cooling
4) Optomechanics
5) Applications of optical tweezers

VII- INTRODUCTION TO OPTICAL MICROSCOPY
1) Basic concepts
2) Direct and Fourier imaging
3) Image formation
4) Fluorescence microscopy
5) Scattering-based microscopy
6) Digital holography
7) Computational imaging

151-0941-00L Molecular Sensors: From Fundamentals to Health and Environmental Applications
W 4 credits 2V+2U A. Güntner, P. Gerber

Abstract
Molecular sensors are used in everyday life in health care, environmental monitoring, food safety, space and other fields. Sources of molecular information, its transport and fundamental concepts of molecular sensing will be discussed. In the scope of group projects, the acquired knowledge will be applied and deepened in case studies.

Objective
After the course, the students will:
• know the requirements and merits of molecular sensors for health, environmental and other emerging applications (e.g. space)
• understand transport phenomena of molecular information & surface interactions and know how to quantitatively describe these
• understand fundamental sensing concepts for the detection and quantification of molecular analytes
• know concepts of signal processing
• be capable to apply the learnt knowledge to conceive and engineer sensor concepts and systems
• know how to investigate sensor-related literature and present scientific data

This course consists of a theoretical and a project-based learning block. In the first 10 semester weeks, theoretical knowledge will be provided through lectures and deepened in corresponding exercises. In the last 4 weeks, the students will apply the learned concepts through group projects to investigate case studies. The outcome will be present.

Content
Transport of Molecular Information; Surface Interactions; Sensor Fundamentals; Chemoresistive Sensing; Electrochemical Sensing; Mass-sensitive; Capacitive Sensing; Signal Processing; Medical Requirements for Molecular Sensing

Lecture notes
Hand-outs will be provided to each lecture including the exercises and their solutions.
Power Electronics

Abstract
Fields of application of power electronic converters; basic concept of switch-mode voltage and current conversion; derivation of circuit structures of non-isolated and isolated DC/DC converters, AC/DC- and DC/AC converter structures; analysis procedure and analysis of the operating behaviour and operating range; design criteria and design of main power components.

Objective
Fields of application of power electronic converters; basic concept of switch-mode voltage and current conversion; derivation of circuit structures of non-isolated and isolated DC/DC converters, AC/DC- and DC/AC converter structures; analysis procedure and analysis of the operating behaviour and operating range; design criteria and design of main power components.

Content
Fields of application and application examples of power electronic converters, basic concept of switch-mode voltage and current conversion, pulse-width modulation (PWM); derivation and operating modes (continuous and discontinuous current mode) of DC/DC converter topologies, buck / boost / buck-boost converter; extension to DC/AC conversion using differences of unipolar output voltages varying over time; single-phase diode rectifier; boost-type PWM rectifier featuring sinusoidal input current; tolerance band AC current control and cascaded output voltage control with inner constant switching current control; local and global averaging of switching frequency discontinuous quantities for calculation of component stresses; three-phase AC/DC conversion, center-tap rectifier with impressed output current, thyristor function, thyristor center-tap and full-bridge converter, rectifier and inverter operation, control angle and recovery time, inverter operation limit; fundamentals of AC-side operating behaviour; three-phase DC/AC converter with star-connected three-phase load, zero sequence (common-mode) and current forming differential-mode output voltage components, fundamental frequency modulation and PWM with single triangular carrier and individual carrier signals of the phases.

Lecture notes
Lecture notes and associated exercises including correct answers, simulation program for interactive self-learning including visualization/animation features.

Prerequisites / notice
Prerequisites: Basic knowledge of electrical engineering / electric circuit analysis and signal theory.

Competencies

227-0124-00L	Embedded Systems	W	6 credits	4G	M. Magno

Abstract
An embedded system is a combination of hardware and software, either fixed in function or programmable, that is designed for a specific application scenario or for a specific task within a larger system. They are part of industrial machines such as agricultural and manufacturing equipment, automotive systems, medical equipment, household appliances, sensor networks, and the Internet of Things.
This lecture focuses on the design of embedded systems using formal models and methods.

Besides the theoretical lecture, the course contains laboratory sessions where students transfer the learned theoretical aspects into praxis by programming a microcontroller and interfacing it with sensors and actuators. Students will be exposed to a commercial microcontroller, and the development board extend with a custom-designed embedded systems educational platform.

Specifically, the following topics will be covered in the course: hardware and software structures of embedded systems, low-level instruction set, memory architecture and memory map, peripherals, hardware-software interfaces, communication between components, firmware design methodologies, firmware design using the C programming language, embedded real-time operating systems, real-time scheduling, shared resources, low-power, and low-energy designs as well as computational accelerators.

The objective of this course is to convey knowledge on the operating principles of different types of electric machines. Further objectives are to evaluate machine types for given specifications and to acquire the ability to perform a rough design of an electrical machine while considering the versatile aspects with respect to magnetic, electrical, mechanical and thermal limitations. Exercises are used to consolidate the presented theoretical concepts.

- Fundamentals in magnetic circuits and electromechanical energy conversion.
- Force and torque calculation.
- Operating principles, magnetic and electric modelling and design of different electric machine concepts: DC machine, AC machines (permanent magnet synchronous machine, reluctance machine and induction machine).
- Complex space vector notation, rotating coordinate system (dq-transformation).
- Loss components in electric machines, scaling laws of electromechanical actuators.
- Mechanical and thermal modelling.

This course introduces to different electric machine concepts and provides a deeper understanding of their detailed operating principles. Different aspects arising in the design of electric machines, like dimensioning of magnetic and electric circuits as well as consideration of mechanical and thermal constraints, are investigated. The exercises are used to consolidate the concepts discussed.

The objective of this course is to convey knowledge on the operating principles of different types of electric machines. Further objectives are to evaluate machine types for given specifications and to acquire the ability to perform a rough design of an electrical machine while considering the versatile aspects with respect to magnetic, electrical, mechanical and thermal limitations. Exercises are used to consolidate the presented theoretical concepts.

This course focuses on the emerging, interdisciplinary field of physical human-robot interaction, bringing together themes from robotics, real-time control, human factors, haptics, virtual environments, interaction design and other fields to enable the development of human-oriented robotic systems.
Objective

The objective of this course is to give an introduction to the fundamentals of physical human robot interaction, through lectures on the underlying theoretical/mechatronics aspects and application fields, in combination with a hands-on lab tutorial. The course will guide students through the design and evaluation process of such systems.

By the end of this course, you should understand the critical elements in human-robot interactions - both in terms of engineering and human factors - and use these to evaluate and design safe and efficient assistive and rehabilitative robotic systems. Specifically, you should be able to:

1) identify critical human factors in physical human-robot interaction and use these to derive design requirements;
2) compare and select mechatronic components that optimally fulfill the defined design requirements;
3) derive a model of the device dynamics to guide and optimize the selection and integration of selected components into a functional system;
4) design control hardware and software and implement and test human-interactive control strategies on the physical setup;
5) characterize and optimize such systems using both engineering and psychophysical evaluation metrics;
6) investigate and optimize one aspect of the physical setup and convey and defend the gained insights in a technical presentation.

Content

This course provides an introduction to fundamental aspects of physical human-robot interaction. After an overview of human haptic, visual and auditory sensing, neurophysiology and psychophysics, principles of human-robot interaction systems (kinematics, mechanical transmissions, robot sensors and actuators used in these systems) will be introduced. Throughout the course, students will gain knowledge of interaction control strategies including impedance/admittance and force control, haptic rendering basics and issues in device design for humans such as transparency and stability analysis, safety hardware and procedures. The course is organized into lectures that aim to bring students up to speed with the basics of these systems, readings on classical and current topics in physical-human-robot interaction, laboratory sessions and lab visits.

Students will attend periodic laboratory sessions where they will implement the theoretical aspects learned during the lectures. Here the salient features of haptic device design will be identified and theoretical aspects will be implemented in a haptic system based on the haptic paddle (https://relab.ethz.ch/downloads/open-hardware/haptic-paddle.html), by creating simple dynamic haptic virtual environments and understanding the performance limitations and causes of instabilities (direct/virtual coupling, friction, damping, time delays, sampling rate, sensor quantization, etc.) during rendering of different mechanical properties.

Lecture notes

Will be distributed on Moodle before the lectures.

Literature

Prerequisites

Notice:

The registration is limited to 26 students

There are 4 credit points for this lecture.

The lecture will be held in English.

The students are expected to have basic control knowledge from previous classes.

| Abstract | Microrobotics is an interdisciplinary field that combines aspects of robotics, micro and nanotechnology, biomedical engineering, and materials science. The aim of this course is to expose students to the fundamentals of this emerging field. Throughout the course, the students apply these concepts in assignments. The course concludes with an end-of-semester examination. |
| Objective | The objective of this course is to expose students to the fundamental aspects of the emerging field of microrobotics. This includes a focus on physical laws that predominate at the microscale, technologies for fabricating small devices, bio-inspired design, and applications of the field. |
Content: Main topics of the course include:
- Scaling laws at micro/nano scales
- Electrostatics
- Electromagnetism
- Low Reynolds number flows
- Observation tools
- Materials and fabrication methods
- Applications of biomedical microrobots

Lecture notes: The powerpoint slides presented in the lectures will be made available as pdf files. Several readings will also be made available electronically.

Prerequisites / notice: The lecture will be taught in English.

151-0913-00L  | Introduction to Photonics            | W    | 4 credits | 2V+2U | R. Quidant, J. Ortega Arroyo |
| Abstract      | This course introduces students to the main concepts of optics and photonics. Specifically, we will describe the laws obeyed by optical waves and discuss how to use them to manipulate light. |
| Objective     | Photonics, the science of light, has become ubiquitous in our lives. Control and manipulation of light is what enables us to interact with the screen of our smart devices and exchange large amounts of complex information. Photonics has also taken a preponderant role in cutting-edge science, allowing for instance to image nanospecimens, detect diseases or sense very tiny forces. The purpose of this course is three-fold: (i) We first aim to provide the fundamentals of photonics, establishing a solid basis for more specialised courses. (ii) Beyond theoretical concepts, our intention is to have students develop an intuition on how to manipulate light in practice. (iii) Finally, the course highlights how the taught concepts apply to modern research as well as to everyday life technologies (LCD screens, polarisation sun glasses, anti-reflection coating etc...). Content, including videos of laboratory experiments, has been designed to be approachable by students from a diverse set of science and engineering backgrounds. |

151-0941-00L Molecular Sensors: From Fundamentals to Health and Environmental Applications

Note: previous course title until HS23 "Molecular Health Sensors and Devices"

Abstract
Molecular sensors are used in everyday life in health care, environmental monitoring, food safety, space and other fields. Sources of molecular information, its transport and fundamental concepts of molecular sensing will be discussed. In the scope of group projects, the acquired knowledge will be applied and deepened in case studies.

Objective
After the course, the students will:

• know the requirements and merits of molecular sensors for health, environmental and other emerging applications (e.g. space)
• understand transport phenomena of molecular information & surface interactions and know how to quantitatively describe these
• understand fundamental sensing concepts for the detection and quantification of molecular analytes
• know concepts of signal processing
• be capable to apply the learnt knowledge to conceive and engineer sensor concepts and systems
• know how to investigate sensor-related literature and present scientific data

This course consists of a theoretical and a project-based learning block. In the first 10 semester weeks, theoretical knowledge will be provided through lectures and deepened in corresponding exercises. In the last 4 weeks, the students will apply the learned concepts through group projects to investigate case studies. The outcome will be present.

Content
Transport of Molecular Information; Surface Interactions; Sensor Fundamentals; Chemoresistive Sensing; Electrochemical Sensing; Mass-sensitive; Capacitive Sensing; Signal Processing; Medical Requirements for Molecular Sensing

Lecture notes
Hand-outs will be provided to each lecture including the exercises and their solutions.

151-0135-00L Additional Case for the Focus Specialization
Exclusive for D-MAVT Bachelor's students in Focus Specialization.
For enrollment, please contact the D-MAVT Student Administration.

Abstract
Independent studies on a defined field within the selected Focus Specialization.

Objective
Independent studies on a defined field within the selected Focus Specialization.

227-0145-00L Solid State Electronics and Optics
W 6 credits 4G N. Yazdani, V. Wood

Abstract
"Solid State Electronics" is an introductory condensed matter physics course covering crystal structure, electron models, classification of metals, semiconductors, and insulators, band structure engineering, thermal and electronic transport in solids, magnetoresponse, and optical properties of solids.

Objective
Understand the fundamental physics behind the mechanical, thermal, electric, magnetic, and optical properties of materials.

Prerequisites / notice
Recommended background: Undergraduate physics, mathematics, semiconductor devices

Studies on Engineering for Health

The student is responsible to find a project offered and supervised by ETH Professor in the area of Engineering.
for Health. Once received the approval of the ETH professor the student should forward the approval and the content of the project to the Student Administration info@mavt.ethz.ch for the enrolment.

This course is not available to incoming exchange students.

Abstract
Overview of Engineering for Health topics. Identification of minimum 10 pertinent refereed articles or works in the literature in consultation with supervisor or instructor. After 4 weeks, submission of a 2-page proposal outlining the value, state-of-the art and study plan based on these articles. After feedback on the substance and technical writing by the instructor, project commences.

Objective
The students are familiar with the challenges of the fascinating and interdisciplinary field of Engineering for Health. They are introduced in the basics of independent non-experimental scientific research and are able to summarize and to present the results efficiently. The students work independently on a study of selected topics in the field of Studies on Engineering for Health. They start with a selection of scientific papers to continue literature research. The results (e.g. state-of-the-art, methods) are evaluated with respect to predefined criteria. Then the results are presented in an oral presentation and summarized in a report, which takes the discussion of the presentation into account.

151-8101-00L International Engineering: from Hubris to Hope
W 4 credits 3G E. Tilley

Abstract
Since Europe surrendered their colonial assets, engineers from rich countries have returned to the African continent to address the real and perceived ills that they felt technology could solve. And yet, 70 years on, the promise of technology has largely failed to deliver widespread, substantive improvements in the quality of life. Why?

Objective
This course is meant for engineers who are interested in pursuing an ethical and relevant career internationally, and who are willing to examine the complex role that well-meaning foreigners have played and continue to play in the disappointing health outcomes that characterize much of the African continent.

After completing the course, participants will be able to

- critique the jargon and terms used by the international community, i.e. “development”, “aid”, “cooperation”, “assistance” “third world”
- developing “global south” “low and middle-income” and justify their own chosen terminology
- recognize the role of racism and white-supremacy in the development of the Aid industry
- understand the political, financial, and cultural reasons why technology and infrastructure have historically failed
- Debate the merits of international engineering in popular culture and media
- Propose improved SDG indicators that address current shortcomings
- Compare the engineering curricula of different countries to identify relative strengths and shortcomings
- Explain the inherent biases of academic publishing and its impact on engineering failure
- Analyse linkages between the rise of philanthropy and strategic priority areas
- Recommend equitable, just funding models to achieve more sustainable outcomes
- Formulate a vision for the international engineer of the future
Subject-specific Competencies

- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies

- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving

Social Competencies

- Communication
- Cooperation and Teamwork
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation

Personal Competencies

- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

- learn about the remaining challenges in this field
- be able to solve typical problems in bioelectronics
- learn the basic concepts in bioelectronics including the sources of bioelectronic signals and the methods to measure them
- understand the fundamental concepts and challenges of measuring bioelectronic signals and the basic concepts to record optogenetically modified organisms are introduced.

Biomedical Imaging

- X-rays (production, tissue interaction, contrast, modular transfer function)
- Magnetic Resonance (magnetic moment, spin transitions, excitation, relaxation, detection)
- Magnetic Resonance (plane wave encoding, Fourier reconstruction, pulse sequences)
- Magnetic Resonance (contrast mechanisms, gradient- and spin-echo, applications)
- Ultrasound (mechanical wave generation, propagation in tissue, reflection, transmission)
- Ultrasound (spatial and temporal resolution, phased arrays)
- Ultrasound (Doppler shift, implementations, applications)

- Identify advantages and limitations of different imaging methods in relation to medical diagnostic applications
- Explain the physical and mathematical foundations of diagnostic medical imaging systems
- Characterize system performance based on signal-to-noise ratio and transfer function
- Design a basic diagnostic imaging system chain including data acquisition and data reconstruction
- Design a basic diagnostic imaging system chain including data acquisition and data reconstruction
- Design a basic diagnostic imaging system chain including data acquisition and data reconstruction

Bioelectronics and Biosensors

- learn the basic concepts in bioelectronics including the sources of bioelectronic signals and the methods to measure them
- learn about the remaining challenges in this field
- The course introduces bioelectricity and the sensing concepts that enable obtaining information about neurons and their networks. The sources of electrical fields and currents in the context of biological systems are discussed. The fundamental concepts and challenges of measuring bioelectronic signals and the basic concepts to record optogenetically modified organisms are introduced.

Subject-specific Competencies

- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies

- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving

Social Competencies

- Communication
- Cooperation and Teamwork
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation

Personal Competencies

- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

- learn about the remaining challenges in this field
- be able to solve typical problems in bioelectronics
- learn the basic concepts in bioelectronics including the sources of bioelectronic signals and the methods to measure them

Biomedical Imaging

- X-rays (filtered back-projection, spiral computed tomography, image quality, dose)
- Nuclear imaging (radioactive tracer, collimation, point spread function, SPECT/PET)
- Magnetic Resonance (magnetic moment, spin transitions, excitation, relaxation, detection)
- Magnetic Resonance (plane wave encoding, Fourier reconstruction, pulse sequences)
- Magnetic Resonance (contrast mechanisms, gradient- and spin-echo, applications)
- Ultrasound (mechanical wave generation, propagation in tissue, reflection, transmission)
- Ultrasound (spatial and temporal resolution, phased arrays)
- Ultrasound (Doppler shift, implementations, applications)

- Identify advantages and limitations of different imaging methods in relation to medical diagnostic applications
- Explain the physical and mathematical foundations of diagnostic medical imaging systems
- Characterize system performance based on signal-to-noise ratio and transfer function
- Design a basic diagnostic imaging system chain including data acquisition and data reconstruction
- Design a basic diagnostic imaging system chain including data acquisition and data reconstruction
- Design a basic diagnostic imaging system chain including data acquisition and data reconstruction

Bioelectronics and Biosensors

- learn the basic concepts in bioelectronics including the sources of bioelectronic signals and the methods to measure them
- learn about the remaining challenges in this field
- The course introduces bioelectricity and the sensing concepts that enable obtaining information about neurons and their networks. The sources of electrical fields and currents in the context of biological systems are discussed. The fundamental concepts and challenges of measuring bioelectronic signals and the basic concepts to record optogenetically modified organisms are introduced.

- The course introduces bioelectricity and the sensing concepts that enable obtaining information about neurons and their networks. The sources of electrical fields and currents in the context of biological systems are discussed. The fundamental concepts and challenges of measuring bioelectronic signals and the basic concepts to record optogenetically modified organisms are introduced.
Content

Lecture topics:

1. Introduction
2. Membrane and Transport
3-4. Action potential and Hodgkin-Huxley
5. Measuring bioelectronic signals
6. Measuring currents in solutions, nanopore sensing and patch clamp pipettes
7. Measuring potentials in solution and core conductance model
8. Measuring electronic signals with wearable electronics, ECG, EEG
9. Measuring mechanical signals with bioelectronics
10. Measuring biochemical signals
11. Optical recording and control of neurons (optogenetics)
12. Functional electric stimulation
13. In vivo electrophysiology
14. In vivo stimulation and recording
15. Measuring neurons optically, fundamentals of optical microscopy
16. Fluorescent probes and scanning microscopy, optogenetics, in vivo microscopy

Materials and Mechanics in Medicine

W 4 credits 3G M. Zenobi-Wong, J. G. Snedeker

Abstract
Understanding of physical and technical principles in biomechanics, biomaterials, and tissue engineering as well as a historical perspective.

Objective
Mathematical description and problem solving. Knowledge of biomedical engineering applications in research and clinical practice.

Content
Biomaterials, Tissue Engineering, Tissue Biomechanics, Implants.

Lecture notes
Course website on Moodle

Academic Press

Movement and Sport Biomechanics

W 4 credits 3G W. R. Taylor, R. List

Abstract
Learning to view the human body as a (bio-)mechanical system. Making the connections between everyday movements and sports activity with injury, discomfort, prevention and rehabilitation.

Objective
Students are able to describe the human body as a mechanical system.

They analyse and describe human movement according to the laws of mechanics.

Content
Movement- and sports biomechanics deals with the attributes of the human body and their link to mechanics. The course includes topics such as functional anatomy, biomechanics of daily activities (gait, running, etc.) and looks at movement in sport from a mechanical point of view. Furthermore, simple reflections on the loading analysis of joints in various situations are discussed. Additionally, questions covering the statics and dynamics of rigid bodies, and inverse dynamics, relevant to biomechanics are investigated.

Lecture notes

Physical Human Robot Interaction (pHRI)

W 4 credits 2V+2U O. Lambercy, P. Wolf
This course focuses on the emerging, interdisciplinary field of physical human-robot interaction, bringing together themes from robotics, real-time control, human factors, haptics, virtual environments, interaction design and other fields to enable the development of human-oriented robotic systems.

By the end of this course, you should understand the critical elements in human-robot interactions - both in terms of engineering and human factors - and use these to evaluate and design safe and efficient assistive and rehabilitative robotic systems. Specifically, you should be able to:

1) Identify critical human factors in physical human-robot interaction and use these to derive design requirements;
2) Compare and select mechatronic components that optimally fulfill the defined design requirements;
3) Derive a model of the device dynamics to guide and optimize the selection and integration of selected components into a functional system;
4) Design control hardware and software and implement and test human-interactive control strategies on the physical setup;
5) Characterize and optimize such systems using both engineering and psychophysical evaluation metrics;
6) Investigate and optimize one aspect of the physical setup and convey and defend the gained insights in a technical presentation.

This course provides an introduction to fundamental aspects of physical human-robot interaction. After an overview of human haptic, visual and auditory sensing, neurophysiology and psychophysics, principles of human-robot interaction systems (kinematics, mechanical transmissions, robot sensors and actuators used in these systems) will be introduced. Throughout the course, students will gain knowledge of interaction control strategies including impedance/admittance and force control, haptic rendering basics and issues in device design for humans such as transparency and stability analysis, safety hardware and procedures. The course is organized into lectures that aim to bring students up to speed with the basics of these systems, readings on classical and current topics in physical human-robot interaction, laboratory sessions and lab visits.

Students will attend periodic laboratory sessions where they will implement the theoretical aspects learned during the lectures. Here the salient features of haptic device design will be identified and theoretical aspects will be implemented in a haptic system based on the haptic paddle (https://relab.ethz.ch/downloads/open-hardware/haptic-paddle.html), by creating simple dynamic haptic virtual environments and understanding the performance limitations and causes of instabilities (direct/virtual coupling, friction, damping, time delays, sampling rate, sensor quantization, etc.) during rendering of different mechanical properties.

The lecture will be held in English.

The registration is limited to 26 students.

Notice:

Prerequisites / notice

The registration is limited to 26 students.
There are 4 credit points for this lecture.
The lecture will be held in English.

The students are expected to have basic control knowledge from previous classes.

**376-1714-00L Biocompatible Materials**

**Abstract**
Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.

**Objective**
The course covers the following topics:
1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
2. The concept of biocompatibility.
3. Introduction into methodology used in biomaterials research and application.
4. Introduction to different material classes in use for medical applications.

**Content**
Introduction into natural and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering, drug delivery and for medical devices are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated. Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed.

A link between academic research and industrial entrepreneurship is demonstrated by external guest speakers, who present their current research topics.

**Lecture notes**
Handouts are deposited online (moodle).

**Literature**

(available online via ETH library)

Handouts and references therein.

**Design, Mechanics and Manufacturing**

Focus Coordinator: Prof. Dennis Kochmann
To achieve the required 20 credit points for the Focus Specialization Design, Mechanics and Manufacturing, all of the courses listed can be selected. If you wish to take a Master level course, you must obtain the consent of the responsible lecturer. After approval by the focus coordinator, an additional course to the listed courses can be requested. There are recommended lectures for the “Design” track, the “Mechanics” track and the “Manufacturing” track. For recommended courses and further information, please visit the MAVT website for Focus Specialization (https://mavt.ethz.ch/studies/bachelor/ focus/ focus-specialization.html).

</table>

**Abstract**
Teams of 2 to 3 students have to design, size, and manufacture a lightweight structure complying with given specifications. An aircraft wing spar prototype as well as later a second improved spar will be tested and assessed regarding to design and to structural mechanical criteria.

**Objective**
To develop the skills to identify and solve typical problems of the structure mechanics on a real application. Other important aspects are to foster team work and team spirit, to link theoretical knowledge and practice, to gather practical experiences in various fields related to lightweight structures such as design, different CAE-methods and structural testing.

**Content**
The task of each team (typically 2-3 students) is the realization of a reduced-scale aircraft wing spar, a typical load-carrying structure, with selected materials. The teams are free to develop and implement their own ideas. In this context, specified requirements include information about loads, interface to the surrounding structures.

The project is structured as described below:
- Concept development
- design of the component including FEM simulation and stability checks
- manufacturing and structural testing of a prototype in the lab
- manufacturing and structural testing of an improved component in the lab
- cost assessment
- Report

The practical project work is supported by selected teaching units.

**Lecture notes**
Handouts for selected topics are available.

151-0509-00L Acoustics in Fluid Media: From Robotics to Additive Manufacturing

**W** 4 credits  **3G** D. Ahmed

**Abstract**
The course will provide you with the fundamentals of the new and exciting field of ultrasound-based microrobots to treat various diseases. Furthermore, we will explore how ultrasound can be used in additive manufacturing for tissue constructs and robotics.

**Objective**
The course is designed to equip students with skills in the design and development of ultrasound-based manipulation devices and microrobots for applications in medicine and additive manufacturing. Furthermore, we will explore how ultrasound can be used in additive manufacturing for tissue constructs and robotics.

**Content**
Linear and nonlinear acoustics, foundations of fluid and solid mechanics and piezoelectricity, Gorkov potential, numerical modelling, acoustic streaming, applications from ultrasonic microrobots to surface acoustic wave devices

**Lecture notes**

**Literature**

**Prerequisites / notice**
Solid and fluid continuum mechanics. Notice: The exercise part is a mixture of presentation, lab sessions (both compulsory) and homework.

151-0524-00L Continuum Mechanics I

**W** 4 credits  **2V+1U** A. E. Ehret

**Abstract**
The lecture deals with constitutive models that are relevant for the design and analysis of components and structures. These include anisotropic linear elasticity, linear viscoelasticity, plasticity and viscoplasticity. The basic concepts of homogenization and laminate theory are introduced. Theoretical models are complemented by examples of engineering applications and experiments.

**Objective**
After successful completion of the course students are able to
- explain basic theories for solving continuum mechanics problems
- proficiently apply these theories by solving application-related academic examples
- relate the theories and examples to real engineering applications and challenges
- distinguish between different mechanical behaviors of materials
- systematically select appropriate constitutive theories suitable to analyze and model these materials

**Content**
Anisotropic Elasticity, Linear Elastic and Linear Viscoelastic Material Behavior, Viscoelasticity, Micro-Macro Modelling, Laminate Theory, Plasticity, Viscoplasticity, Examples of Engineering Applications, Comparison with Experiments

**Lecture notes**
Yes

151-0532-00L Nonlinear Dynamics and Chaos I

**W** 4 credits  **4G** G. Haller

**Abstract**
Basic facts about nonlinear systems; stability and near-equilibrium dynamics; bifurcations; dynamical systems on the plane; non-autonomous dynamical systems; chaotic dynamics.

**Objective**
This course is intended for Masters and Ph.D. students in engineering sciences, physics and applied mathematics who are interested in the behavior of nonlinear dynamical systems. It offers an introduction to the qualitative study of nonlinear physical phenomena modeled by differential equations or discrete maps. We discuss applications in classical mechanics, electrical engineering, fluid mechanics, and biology. A more advanced Part II of this class is offered every other year.

Data: 26.07.2024 12:39	Autumn Semester 2024	Page 1772 of 2680
The class lecture notes will be posted electronically after each lecture. Students should not rely on these but prepare their own notes during the lecture.

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Content
- Introduction: what is sustainability, which industrial sectors are responsible for the most CO2 (and other) emissions
- The “real” numbers: where to find reliable data and how one can play with the figures
- Basics of life cycle analysis
- CO2 and other emissions
- The most used materials
  - The 5 most used materials today, their key properties and what they are used for
  - Evolution of production, consumption and resources
- Production, recyclability and new processing routes for Al and steel
- Use less material by design
- Re-use of materials & prolonging products life
- Production of cement, new developments & alternatives
- Presentation of students’ projects

151-0763-00L  Practical Course of CAD and CAE Application in Projects
W  4 credits  3G  M. Schütz, J.-L. Emery

Abstract
This course provides in-depth knowledge of CAD and serves as an introduction to FEM simulation with Siemens NX, with the aim of using CAD and CAE effectively in projects.

Objective
- Insight and application of advanced CAD modeling
- Introduction to CAE simulation
- Effective use of CAD and CAE tools in projects
- Teaching methodical aspects
- Application of the tools in a project (own projects, focus projects)

Content
CAD with Siemens NX (semester week 2, 3, 4):
- Advanced CAD Modeling - parametric Modelling
- Freeform Modeling
- CAD modeling methodology - top-down modeling (WAVE, interpart expressions, etc.).

CAE with Siemens NX (semester week 5, 6, 7):
- Linear structural analysis (individual parts)
- Non-linear structural analysis (contacts, assemblies)
- Motion Simulation
- Thermal Simulation, CFD

Further tools and functions (from semester week 8):
- Application of further CAD tools: Sheet Metal, Synchronous, etc.
- Insight into other CAE tools, e.g. Ansys Discovery Live
- methodical aspects in the field of CAD and CAE

Competencies
Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving

151-0833-00L  Applied Finite Element Analysis
W  4 credits  2V+2U  B. Berisha, D. Mohr

Abstract
Most problems in engineering are of nonlinear nature. The nonlinearities are caused basically due to the nonlinear material behavior, contact conditions and instability of structures. The principles of the nonlinear Finite-Element-Method (FEM) will be introduced for treating such problems. The finite element program ABAQUS is introduced to investigate real engineering problems.

Objective
The goal of the lecture is to provide the students with the fundamentals of the non linear Finite Element Method (FEM). The lecture focuses on the principles of the nonlinear Finite-Element-Method based on explicit and implicit formulations. Typical applications of the nonlinear Finite-Element-Methods are simulations of:
- Crash
- Collapse of structures
- Material behavior (metals and rubber)
- General forming processes

Special attention will be paid to the modeling of the nonlinear material behavior, thermo-mechanical processes and processes with large plastic deformations. The ability to independently create a virtual model which describes the complex non linear systems will be acquired through accompanying exercises. These will include the Matlab programming of important model components such as constitutive equations. The FEM Program ABAQUS will be introduced to investigate real engineering problems.
Content  
- introduction into FEM  
- Fundamentals of continuum mechanics to characterize large plastic deformations  
- Elasto-plastic material models  
- Lagrange and Euler approaches  
- FEM implementation of constitutive equations  
- Element formulations  
- Implicit and explicit FEM methods  
- FEM formulations of coupled thermo-mechanical problems  
- Modeling of tool contact and the influence of friction  
- Solvers and convergence  
- Instability problems

Abstract  
The course is building up skills and experience in coaching engineering teams. To gain experience and to reflect real coaching situations, the participants of the course have the role of teaching assistance of the innovation project (151-0300-00L). In this framework the participants coach teams and professionalize the knowledge in the area product development methods.

Objective  
- Critical thinking and reasoned judgements  
- Basic knowledge about role and mindset of a coach  
- Understanding the challenges of engineering projects and design teams  
- Development of personal skills to apply and train product development methods  
- Knowledge and know-how about applying methods  
- Reflection and exchange of experiences about personal coaching situations  
- Inspiration and learning from good cases regarding organizational and team management aspects  
- Decision-making under uncertainty

Content  
The following topics will be covered in the lecture:  
- Kick-off & Experience Exchange  
- Coaching Role  
- Active Listening  
- Giving and Receiving Feedback  
- Team Building & Psychological Safety  
- Building Hypotheses in the coaching process  
- conflict resolution and motivation

In addition to the content topics, one-on-one coaching will be provided and classes will reflect on current, practical issues derived from coaching of the innovation teams.

Prerequisites / notice  
Only for participants (Bachelor Students, Master Students) who are teaching assistants in the innovation project.

Competencies  
Subject-specific Competencies: Concepts and Theories  
Analytical Competencies: Problem-solving

Method-specific Competencies  
Cooperation and Teamwork: assessed  
Leadership and Responsibility: assessed  
Self-presentation and Social Influence: assessed

Social Competencies  
Adaptability and Flexibility: assessed  
Critical Thinking: assessed  
Self-awareness and Self-reflection: assessed  
Self-direction and Self-management: assessed

Note: the previous course title until HS23 “Leichtbau” in German.

Abstract  
The elective course Lightweight includes numerical methods for the analysis of the load carrying and failure behavior of lightweight structures, as well as construction methods and design principles for lightweight design.

Objective  
The goal of this course is to convey substantiated background for the understanding and the design and sizing of modern lightweight structures in mechanical engineering, vehicle and airplane design.

Content  
Lightweight design  
Thin-walled beams and structures  
Instability behavior of thin walled structures  
Reinforced shell structures  
Load introduction in lightweight structures  
Joining technology  
Sandwich design

Abstract  
The course covers fundamentals of computational optimization methods in the context of engineering design. It develops skills to formally state and model engineering design tasks as optimization problems and select appropriate methods to solve them.

Objective  
The lecture and exercises teach the fundamentals of optimization methods in the context of engineering design. After taking the course students will be able to express engineering design problems as formal optimization problems. Students will also be able to select and apply a suitable optimization method given the nature of the optimization model. They will understand the links between optimization and engineering design in order to design more efficient and performance optimized technical products. The exercises are MATLAB based.

Content  
1. Optimization modeling and theory  
2. Unconstrained optimization methods  
3. Constrained optimization methods - linear and non-linear  
4. Direct search methods  
5. Stochastic and evolutionary search methods  
6. Multi-objective optimization

Number of participants limited to 12.
The participants learn about the procedures and tools that are necessary to develop technical products. The focus is on computer-based tools.

**Bachelor's Thesis with Focus Project**

The Bachelor's Thesis is the culmination of the program. The thesis corresponds to a workload of 480 hours and can be done in part- or full-time. The Bachelor's Thesis: All D-MAVT professors.

**Objective**

The objectives of the course are to use the practical ski/board design and building exercise to gain hands-on experience in design, mechanics and materials. A selection of sustainable materials are also used to introduce students to sustainable design. The built ski/board will be mechanically tested in the lab as well as together out in the field on a ski day and evaluated from various perspectives. Students can keep their personal built skis/boards after the course.

**Content**

This practical ski/board design and building workshop consists of planning, designing, engineering and building your own alpine ski or snowboard. Students learn and execute all the needed steps in the process, such as engineering design, CAD, material selection, analysis of the mechanical properties of a composite layup, fabrication, routing wood cores, 3D printing of plastic protectors, milling side walls from wood or ABS plastic, laying up the fibers from carbon, glass, basalt or flax, laminating with resins, sanding and finishing, as well as laser engraving and veneer wood inlays.

**Prerequisites / notice**

Willingness to engage in the practical building of your ski/board also beyond the course hours in the evening.

**Bachelor's Thesis**

Abstract

The Bachelor's Thesis is the culmination of the program. The thesis corresponds to a work load of 480 hours and can be done in part- or full-time.

Objective

The students develop, enhance and demonstrate their methodological abilities to independently tackle and solve a given research problem.

Content

The topics for the Bachelor's Thesis are published by the professorship or they can be set in consultation between the professors and the students. Thesis projects in cooperation with the industry are also possible.

Prerequisites / notice

The Bachelor's Thesis can be only started when the First Year Examinations, the Additional First Year Courses, the Examination Block 1 and 2 are passed. It is insistently recommended for students to only begin the Bachelor's Thesis if 150 credit points have been achieved. The declaration of originality is an integral part of the Bachelor's Thesis. This course must be chosen by students which have selected a focus specialization in their third year.

<td>M. Schütz</td>
</tr>
</tbody>
</table>

Abstract

The participants learn about the procedures and tools that are necessary to develop technical products. The focus is on computer-based design and development and the management in an integrated software environment.
The participants will deepen their existing CAD knowledge and learn new PDM knowledge, so that these may be directly applied and used in the focus project.

- CAD refresh (Modelling, Assembling, Drafting, etc.) and CAD methodology for construction (Top-Down modelling)
- Introduction to the Team Center (Siemens PDM System)
- TeamCenter data flow, in particular the process of creating and managing new Items and Parts, the approval procedure and creating different versions of Parts

The participants will learn and experiment with procedures by working on concrete examples so that they will subsequently be able to begin with independent product construction.

The following topics will be dealt with in depth in the lectures supporting the focus project (Praxiskurs): CAD-Methodology, FE calculations, motion simulation and construction methodology.

Content
1. Afternoon: CAD refresher and top down modelling
   - To refresh already existing knowledge of CAD functionality.
     i. Sketch and features as well as manipulation and optimizing models.
     ii. Assembling
     iii. Drafting
     iv. Organisation, working methods, conventions.
   - Top down modelling CAD
     i. Introduction to top down modelling and concept modelling
     ii. Case study of top down modelling

2. Afternoon: Introduction to TC (Team Center)
   - Introduction: Short introduction to PLM (What is the idea of PLM? PLM is more than the pure management of drawings!).
   - Lesson 1 - Team Center Rich Client Interface
   - Lesson 2 - TC data types
   - Lesson 3 - Construction from data in TC
   - Lesson 4 - Searching for and examining data.

3. Afternoon: TC application
   - Lesson 5 - Unit lists (PSE)
   - Lesson 6 - Cross-referencing
   - Lesson 7 - Data release
   - Lesson 8 - Product data examination

Prerequisites / notice
- at least two students of a Focus-Team should sign in for this course, if the use of Siemens Teamcenter PLM is given for the Team.
- only for students participating in a Focus course in the same semester

151-0061-10L Engineering Tool: Scientific Writing with LaTeX and Vector Graphics
W 0.4 credits 1K O. Lambery

Abstract
This course provides insights into the structure and compilation of scientific papers and publications using LaTeX as well as open source software for image editing and the creation of vector graphics. LaTeX is a typesetting tool that separates text format and layout. It is widely used for reports and publications in the scientific domain.

Objective
By looking at specific examples during class you will obtain an overview on composing scientific papers (e.g. bachelor theses, semester theses, master theses) using LaTeX and acquire the most important commands to typeset complex formulas, tables and graphics.

Content
- layout of scientific reports
- writing with LaTex (structure, formatting, formulas, tables, graphics, references, table of contents, hyperlinks, packages) based on a template for bachelor/semester/master theses.
- graphic design and illustration using open source software and Matlab
- including PDF files in the report (project description, data sheets)
- managing bibliography databases

Literature
http://www.relab.ethz.ch/education/courses/engineering-tools-latex.html

Prerequisites / notice
- Particularly:
The exercises will be done on your personal laptop (at least one laptop per two students). The complete (full) LaTeX package, Inkscape and Gimp should be installed in advance.

151-0062-10L Engineering Tool: Computer-Aided Design Methods
W 0.4 credits 1K T. Stankovic, K. Shea

Abstract
Participants will learn about the Computer-Aided Design fundamentals and methods that are necessary to model complex technical products. The focus will be placed on feature-based and parametric modelling that is common to all modern CAD tools used in mechanical engineering design.

Objective
CAD knowledge and skills will be further developed to enable students to recognize both the advantages and limitations of current Computer-Aided Design tools. Examples of how to build feature-based and parametric models including design automation will be given along with common pitfalls. After taking the course students should be able to independently create effective feature-based and parametric models of mechanical parts.

Content
1. CAD Methods and Feature-Based Design (2 afternoons):
   - CAD in the context of the design process
   - Feature types and their relation to mechanical design
   - Strategies for building feature-based assemblies
   - Integration of digital part libraries
   - Common issues and difficulties with feature interaction

2. CAD and Parametric Modeling (1 afternoon):
   - Designing and building parametric models
   - Design automation to create design variants
   - Common issues and difficulties with parametric modelling

Lecture notes
available on Moodle

151-0069-10L Engineering Tool: Design Optimization and CAD
W 0.4 credits 1K T. Stankovic

Abstract
Participants will learn about the Computer-Aided Engineering fundamentals and methods that are necessary for successful design of modern technical products. The focus will be placed on the simulation-driven design in the context of product development process as well as on the fundamentals of the design optimization.
Objective
Basic Computer-Aided Engineering (CAE) knowledge and skills will be acquired to enable students to recognize both the advantages and the limitations of current CAE tools. Examples of how to build feature-based and parametric models for simulation-driven design automation will be given along with common pitfalls. The CAE environment will be the Siemens NX 8.5 which couples the simulation modeling (e.g. structural, thermal, flow, motion, and multiphysics) with design optimization and Feature-Based Design (FBD). After taking the course students should be able to independently create effective feature-based and parametric models to suit the requirements of simulation-driven design.

Content
1. Computer-Aided Engineering (CAE) methods and tools in context of design process (2 afternoons):
   * CAE in the context of the design process
   * Simulation-driven design
   * Introduction to design optimization
   * Features, parameterization and synchronous modeling technology
   * Basic design optimization examples
   * Introduction to Finite-Element Method (FEM) with basic examples

2. Simulation-Driven Design with application to structural design (1 afternoon):
   * Coupling simulation with structural design optimization and feature-based-design
   * Simulation driven design examples (single parts and assemblies)

Abstract
Selected laboratory experiments in physics, mechanical and process engineering. With the Laboratory Training held during the fourth and fifth semester, the students learn how to handle and apply measurement methods and devices. Students are offered a diversified choice of laboratory experiments at least ten of which must be completed. Four of the chosen experiments must be in physics.

Objective
With the Laboratory Training held during the fourth and fifth semester, the students learn how to handle and apply measurement methods and devices.

<p>| 151-0125-00L | Hydrodynamics and Cavitation        | W    | 4    | 3G    | O. Suppenen |
| Abstract     | This course builds on the foundations of fluid dynamics to describe hydrodynamic flows and provides an introduction to cavitation. The main learning objectives of this course are: 1. Identify and describe dominant effects in liquid fluid flows through physical modelling. 2. Identify and predict the onset of hydrodynamic instabilities. 3. Describe acoustic wave behaviour in liquids. 4. Explain tension, nucleation and phase-change in liquids. 5. Predict the behaviour of a gas bubble subject to changes in surrounding liquid pressure. 6. Describe hydrodynamic cavitation and its consequences in physical terms. 7. Recognise experimental techniques and industrial and medical applications for cavitation. 8. Read and evaluate research papers on recent research on cavitation and bubble dynamics and communicate the content orally to a multidisciplinary audience. |
| Objective    | The course gives an overview on the following topics: basics of hydrodynamics, capillarity, hydrodynamic instabilities, liquid fragmentation. Acoustics in liquids, tension in liquids, phase change. Cavitation and bubble dynamics: single bubbles (nucleation, dynamics, collapse), bubble clouds and cavitation flows. Industrial applications and measurement techniques. |
| Content      | Class notes and handouts |
| Lecture notes| Literature will be provided in the course material. |

**151-0163-00L Nuclear Energy Conversion**

- **Abstract**: Physical fundamentals of the fission reaction and the sustainable chain reaction, thermal design, construction, function and operation of nuclear reactors and power plants, light water reactors and other reactor types, conversion and breeding.
- **Objective**: Students get an overview on energy conversion in nuclear power plants, on construction and function of the most important types of nuclear reactors with special emphasis to light water reactors. They obtain the mathematical/physical basis for quantitative assessments concerning most relevant aspects of design, dynamic behaviour as well as material and energy flows.
- **Content**: Nuclear physics of fission and chain reaction. Thermodynamics of nuclear reactors. Design of the reactor core. Introduction into the dynamic behaviour of nuclear reactors. Overview on types of nuclear reactors, difference between thermal reactors and fast breeders. Construction and operation of nuclear power plants with pressurized and boiling water reactors, role and function of the most important safety systems, special features of the energy conversion. Development tendencies of reactor technology.
- **Lecture notes**: Hand-outs will be distributed. Additional literature and information on the website of the lab: https://www.ethz.ch/content/specialinterest/mavt/energy-technology/lab-of-nuclear-energy-systems/en/studium/teaching-materials/151-0163-00l-nuclear-energy-conversion.html

R. L. Murray: Nuclear Energy (Sixth Edition), An Introduction to the Concepts, Systems, and Applications of Nuclear Processes, Elsevier

**151-0204-00L Aerospace Propulsion**

- **Abstract**: An introduction of working principals and design of airbreathing engines as well as rocket propulsion are presented. Key elements of the propulsion system as well as the design choices for the engineering of various components are examined.
- **Objective**: Introduction of working principals and design of aircraft engines and the related background in aero- and thermodynamics. Engineering aspects of the component designs are examined.
- **Content**: This course focuses on the fundamental concepts as well as the applied technologies for aerospace application, with a primary focus related to aviation. The systematic evolution of the aircraft propulsion engines, from turbojet to the modern high bypass ratio turbofan, including the operational limitations, are examined. Following the system analysis, the aero/thermo design of each component, including the inlet, fan, compressor, combustors, turbines and exhaust nozzles are presented. The mechanical and material limitations, as well as design choices related to manufacturing and operability of engines are also presented. The environmental aspects of propulsion (noise and emissions) are also presented. In the last part of the course, a basic introduction to the fundamentals of space propulsion is also presented.
- **Lecture notes**: Lecture notes will be distributed. There will be NO recording of the lectures, nor the exercise sessions. Physical attendance in this course is advised.
- **Literature**: Aircraft Engines and Gas Turbines, second edition By Jack L. Kerrebrock

**Prerequisites / notice**: This course requires prior background in mechanical or aerospace engineering. Students must have already completed courses in basics of Thermodynamics (including cycles) as well as compressible Fluid Dynamics.

**151-0209-00L Renewable Energy Technologies**

- **Abstract**: The first part of the course covers the engineering aspects of the prominent renewable energy technologies: solar (PV and thermal), wind, hydro, geothermal and bioenergy. We further discuss energy storage, renewable transport and renewable heating & cooling. Finally, we introduce the key concepts of the economics of renewable energy and its integration in the energy system.
- **Objective**: Students learn the potential and limitations of renewable energy technologies and their contribution towards sustainable energy utilization.
- **Lecture notes**: Lecture Notes containing copies of the presented slides.
- **Prerequisites / notice**: Prerequisite: strong background on the fundamentals of engineering thermodynamics, equivalent to the material taught in the courses Thermodynamics I, II, and III of D-MAVT.

Data: 26.07.2024 12:39  Autumn Semester 2024  Page 1781 of 2680
### Objective
Methods like molecular dynamics, DSMC, lattice Boltzmann etc are being increasingly used by engineers all over and these methods require knowledge of kinetic theory and statistical mechanics which are traditionally not taught at engineering departments. The goal of this course is to give an introduction to ideas of kinetic theory and non-equilibrium thermodynamics with a focus on developing simulation algorithms and their realizations.

During the course, students will be able to develop a lattice Boltzmann code on their own. Practical issues about implementation and performance on parallel machines will be demonstrated hands on.

Central element of the course is the completion of a lattice Boltzmann code (using the framework specifically designed for this course).

The course will also include a review of topics of current interest in various fields of fluid dynamics, such as multiphase flows, reactive flows, microflows among others.

Optionally, we offer an opportunity to complete a project of student's choice as an alternative to the oral exam. Samples of projects completed by previous students will be made available.

### Content
The course builds upon three parts:

1. **Theoretical basis of statistical mechanics and kinetic equations.**
2. **Lattice Boltzmann method for real-world applications.**
3. **Elementary kinetic theory and lattice Boltzmann simulations introduced on simple examples.**

The content of the course includes:

1. **Background:** Elements of statistical mechanics and kinetic theory:
   - Particle's distribution function, Liouville equation, entropy, ensembles; Kinetic theory: Boltzmann equation for rarefied gas, H-theorem, hydrodynamic limit and derivation of Navier-Stokes equations, Chapman-Enskog method, Grad method, boundary conditions; mean-field interactions, Vlasov equation; Kinetic models: BGK model, generalized BGK model for mixtures, chemical reactions and other fluids.

2. **Basics of the Lattice Boltzmann Method and Simulations:**
   - Minimal kinetic models: lattice Boltzmann method for single-component fluid, discretization of velocity space, time-space discretization, boundary conditions, forcing, thermal models, mixtures.

3. **Hands on:**
   - Development of the basic lattice Boltzmann code and its validation on standard benchmarks (Taylor-Green vortex, lid-driven cavity flow etc).

4. **Practical issues of LBM for fluid dynamics simulations:**
   - Lattice Boltzmann simulations of turbulent flows; numerical stability and accuracy.

5. **Microflow:**
   - Rarefaction effects in moderately dilute gases; Boundary conditions, exact solutions to Couette and Poiseuille flows; micro-channel simulations.

6. **Advanced lattice Boltzmann methods:**
   - Entropic lattice Boltzmann scheme, subgrid simulations at high Reynolds numbers; Boundary conditions for complex geometries.

7. **Introduction to LB models beyond hydrodynamics:**
   - Relativistic fluid dynamics; flows with phase transitions.

### Literature
Handouts and basic code framework for implementation of the lattice Boltzmann models will be provided.

- **Fundamentals of Acoustics**
  - 
  - **Wind Energy**
  - 
  - **Introduction to Modeling and Optimization of Sustainable Energy Systems**

### Prerequisites / notice
The course addresses mainly graduate students (MSc/Ph D) but BSc students can also attend.

### 151-0215-00L Fundamentals of Acoustics
- **Objective**
  - This course provides an introduction to acoustics. It focuses on fundamental phenomena of airborne and structure-borne sound waves.
  - The lecture combines theoretical principles with practical insights and interpretations.

- **Content**
  - First, magnitudes characterizing sound propagation are reviewed and the constitutive equations for acoustics are derived. Then the different types of sources (monopole/dipole/quadrupole, punctual, non-compact) are introduced and linked to the noise generated by turbulent flows, coherent vortical structures or fluctuating heat release. The scattering of sound by rigid bodies is given in basic configurations. Analytical, experimental and numerical methods used to analyze sound in ducts and rooms are presented (Green functions, Galerkin expansions, Helmholtz solvers).
  - The second part covers elastic wave phenomena, such as dispersion and vibration modes, in infinite and finite structures.

- **Lecture notes**
  - Handouts will be distributed during the class

### 151-0216-00L Wind Energy
- **Objective**
  - The objective of this course is to introduce the students to the fundamentals, technologies, modern day application, and economics of wind energy.

- **Content**
  - This mechanical engineering course focuses on the technical aspects of wind turbines; non-technical issues are not within the scope of this technically oriented course. On completion of this course, the student shall be able to conduct the preliminary aerodynamic and structural design of the wind turbine blades. The student shall also be more aware of the broad context of drivetrains, dynamics and control, electrical systems, and meteorology, relevant to all types of wind turbines.

### 151-0221-00L Introduction to Modeling and Optimization of Sustainable Energy Systems
- **Objective**
  - This course introduces the fundamentals of energy system modeling for the analysis and the optimization of the energy system design and operations.
At the end of this course, students will be able to:
- define and quantify the key performance indicators of sustainable energy systems;
- select and apply appropriate models for conversion, storage and transport of energy;
- develop mathematical models for the analysis, design and operations of multi-energy systems and solve them with appropriate mathematical tools;
- select and apply methodologies for the uncertainty analysis on energy systems models;
- apply the acquired knowledge to tackle the challenges of the energy transition.

In the course "Introduction to Modeling and Optimization of Sustainable Energy Systems", the competencies of process understanding, system understanding, modeling, concept development, data analysis & interpretation and measurement methods are taught, applied and examined. Programming is applied.

The global energy transition; Key performance indicators of sustainable energy systems; Optimization models; Heat integration and heat exchanger networks; Life-cycle assessment; Models for conversion, storage and transport technologies; Multi-energy systems; Design, operations and analysis of energy systems; Uncertainties in energy system modeling.

Lectures and supplementary documentation will be available online. Reference to appropriate book chapters and scientific papers will be provided.

### Literature

- Literature will be given during the course.

### 151-0225-00L

**Material Characterization by X-ray Techniques: Diffraction, Absorption, Total Scattering**

**Objective**

- Introduce the basics of structural characterization methods.
- X-ray powder diffraction, pair distribution function (PDF) of X-ray total scattering, and X-ray absorption spectroscopy analyses to determine the structure of inorganic functional materials.

**Content**

The course outlines experimental techniques based on X-rays to investigate the atomic structure of materials covering the local- mid- and long-range order. It covers:
- Overview of fundamentals of materials science and the structure of solids.
- Overview of the different characterization methods to investigate the structure of functional materials, spanning the local to long-range order structure.
- X-ray powder diffraction.
- X-ray total scattering and pair distribution function analysis.
- X-ray absorption spectroscopy.
- Practical sessions on X-ray powder diffraction and PDF experiments.

**Literature**

- Literature will be given during the course.

### 151-0227-00L

**Basics of Air Transport (Aviation I)**

**Abstract**

In general the course explains the main principles of air transport and elaborates on simple interdisciplinary topics. Working on broad 14 different topics like aerodynamics, manufacturers, airport operations, business aviation, business models etc. the students get a good overview in air transportation.

The program is taught in English and we provide 11 different experts/lecturers.

**Objective**

- The goal is to understand and explain basics, principles and contexts of the broader air transport industry.
- Further, we provide the tools for starting a career in the air transport industry. The knowledge may also be used for other modes of transport.
- Ideal foundation for Aviation II - Management of Air Transport.

**Content**

- Weekly: 1h independent preparation; 2h lectures and 1 h training with an expert in the respective field.
- Concept: This course will be taught as Aviation I. A subsequent course - Aviation II - covers the "Management of Air Transport".

**Literature**

- Literature will be provided by the lecturers, respectively there will be additional Information upon registration (normally available in Moodle).

### Prerequisites / notice

- The lecture is planned as class teaching.

### Competencies

**Subject-specific Competencies**

- Concepts and Theories
- Techniques and Technologies

**Method-specific Competencies**

- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management

**Social Competencies**

- Communication
- Cooperation and Teamwork
- Customer Orientation
- Leadership and Responsibility
- Sensitivity to Diversity

**Personal Competencies**

- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking

**151-0245-00L**

**Energy Systems Analysis: an Introduction and Overview with Applications**

**Abstract**

Introductory (advanced Bachelor or beginner Master level) course on Energy Systems Analysis, providing an overview of the field and methods. After an introduction to systems thinking and characterisation of technologies, three main blocks cover with Lifecycle Assessment (LCA, 3 units), bottom-up linear optimisation models (5 units) and Multi-Criteria Decision Analysis (MCDCA, 3 units).

**Objective**

- Analyse energy technologies with respect to different criteria/characteristics.
- Discuss and debate the pros and cons of different ESA models/approaches (for specific applications).
- Explain the system-level interdependencies/interconnections within the energy system.
- Evaluate the effect of uncertainties and "the human dimension" on ESA and scenarios.
The course provides an introduction and overview to the most well-established models and methods of energy systems analysis, in each case introducing students to the theory and assumptions of the method, strengths and weaknesses of the specific approach, and case studies for exemplary energy technologies and systems. The students are taught to understand and will be able to apply the basic principles of these methods in the context of targeted assignments relating to real-world energy systems.

Lecture notes
No but slides are provided before the lectures and videos recorded.

Literature
Will be provided during the course.

Prerequisites
No specific prerequisites, some background in energy-related topics in the Bachelor would be beneficial.

**151-0251-00L**  
**Principles, Efficiency Optimization and Future Applications of IC Engines**  

**Objective**  
The students get familiar with operating characteristics and efficiency maximization methods of IC engines for propulsion and decentralized power/heat cogeneration and use of renewable/e-fuels.

**Content**  
The students are introduced to the working principles and efficiency optimization methods for Internal Combustion (IC) engines which are expected to continue to play a very important role in transportation (long-haul heavy duty, marine) and decentralized combined heat and power generation. Following an overview of different applications and powertrains, the course will focus on the following topics: First, a generic overview of the history of IC-Engines is given, and the basic dimensions and specific engine-relevant terminology are introduced. Next, operating maps for different duty cycles are discussed, highlighting the benefits of individual powertrain configurations for different usage scenarios. The high-pressure thermodynamic process and combustion-induced heat release are analyzed in detail and the design of the combustion processes is discussed in view of further optimization of the energy conversion efficiency. The concept of boosting, its challenges and potential are also presented. In addition, flow field characteristics, convective and radiative heat transfer and combustion modes, boosting and simulation methods. Hybrid powertrains, decentralized power/heat cogeneration and use of renewable/e-fuels.

**Literature**  

**Prerequisites**  
No specific prerequisites, some background in energy-related topics in the Bachelor would be beneficial.

**151-0317-00L**  
**Visualization, Simulation and Interaction - Virtual Reality II**  

**Abstract**  
This lecture provides deeper knowledge on the possible applications of virtual reality, its basic technology, and future research fields. The goal is to provide a strong knowledge on Virtual Reality for a possible future use in business processes.

**Objective**  
Virtual Reality can not only be used for the visualization of 3D objects, but also offers a wide application field for small and medium enterprises (SME). This could be for instance an enabling technology for net-based collaboration, the transmission of images and other data, the interaction of the human user with the digital environment, or the use of augmented reality systems.

**Content**  
The goal of the lecture is to provide a deeper knowledge of today’s VR environments that are used in business processes. The technical background, the algorithms, and the applied methods are explained more in detail. Finally, future tasks of VR will be discussed and an outlook on ongoing international research is given.

**Lecture notes**  
The handout is available in German and English.

**Didactical concept**  
The course consists of lectures and exercises.

**Competencies**  
The course consists of lectures and exercises.

The objective of the course is to introduce the basic concept of composite materials and provide a thorough understanding of the mechanical response of such materials and structures particularly made from fiber reinforced polymer composites, including elastic behavior, failure, fracture and damage analysis, as well as structural design aspects. The ultimate goal is to provide the necessary skills to address the design and analysis of modern lightweight composite structures.

Content
The course content includes:
- Introduction
- Elastic anisotropy
- Micromechanics & Homogenization
- Classical Laminate Theory (CLT)
- Strength, failure and damage analysis
- Thin ply composite shells & effects of material non-linearity
- Analysis and design of composite structures

Literature
The lecture material is covered by a script/lecture notes compiled by CMASLab and further literature is referenced therein.

### 151-0368-00L Aeroelasticity

**W 4 credits 2V+1U**

**M. Righi**

**Abstract**

Introduction to the basics and into the methods of Aeroelasticity. An overview of the main static and dynamic phenomena arising from the interaction between structural and aerodynamic loads.

**Objective**

The course will provide a basic physical understanding of flow-structure interaction focused on lifting bodies such as wings. You will get to know the most important phenomena in the static and dynamic aeroelasticity, as well as a presentation of the most relevant analytical and numerical prediction methods.

**Content**

- Introduction to steady and unsteady thin airfoil theory, extension to three dimension wing aerodynamics, strip theory, overview of numerical methods available (panel methods, CFD).
- Introduction to unsteady aerodynamics (theory): Theodorsen and Wagner functions. Unsteady aerodynamics observed from numerical experiments (CFD).
- Presentation of steady aeroelasticity: equations of equilibrium for the typical section, aeroelastic deformation, effectiveness of the aeroelastic system, stability (definition), divergence condition, role played by a control surface, control effectiveness, sweep angle, aeroelastic tailoring of bending-torsion coupling. Ritz model to model beams, use of FEM, modal condensation, choice of generalized coordinates.
- Numerical aeroelasticity (Test Cases extracted from the latest AIAA Aeroelastic Prediction Workshops). Generation of Reduced Order Models from CFD data (in some cases though Machine Learning).
- Aeroelasticity of modern aircraft: assessment of the effects induced by the control surfaces and control systems (Aeroservoelasticity), active controlled aircraft, flutter-suppression systems, certification (EASA, FAA).
- Planning and execution of Wind Tunnel experiments with aeroelastic models. Live-execution of an experiment in the WT of the ETH.
- Brief presentation of phenomena like Limit-Cycle Oscillations (LCO) and panel flutter.

**Lecture notes**

A script in English language is available.

**Literature**

- Bispilnghoff Ashley, Aeroelasticity
- Abbott, Theory of Wing sections,

### 151-0371-00L Advanced Model Predictive Control

**W 4 credits 2V+1U**

**M. Zeilinger, A. Carron, L. Hewing, J. Köhler**

**Abstract**

Model predictive control (MPC) has established itself as a powerful control technique for complex systems under state and input constraints. This course discusses the theory and application of recent advanced MPC concepts, focusing on system uncertainties and safety, as well as data-driven formulations and learning-based control.

**Objective**

Design, implement and analyze advanced MPC formulations for robust and stochastic uncertainty descriptions, in particular with data-driven formulations.

**Content**

- Topics include:
  - Nominal MPC for uncertain systems (nominal robustness)
  - Robust MPC
  - Stochastic MPC
  - Review of regression methods
  - Set-membership Identification and robust data-driven MPC
  - Bayesian regression and stochastic data-driven MPC
  - MPC as safety filter for reinforcement learning

**Lecture notes**

Lecture notes will be provided.
Prerequisites / notice
Basic courses in control, advanced course in optimal control, basic MPC course (e.g. 151-0660-00L Model Predictive Control in Spring Semester) strongly recommended. Background in linear algebra and stochastic systems recommended.

151-0409-00L Multiphysics Modeling and Simulation
W  4 credits  2V+2U  C. I. Roman

Abstract
This class introduces both theoretical and practical aspects related to the modeling and simulation of multiphysics systems. Students will learn how to set up multiphysics models systematically, and therefore reduce time-consuming trial-and-error. Comsol Multiphysics will be utilized to apply the concepts learned during the lectures to solve exercises.

Objective
As information technology continues its fast-paced evolution, solid-state devices and systems increase in complexity. Engineers and scientists are thus increasingly facing the need to model and simulate their problems numerically where analytic textbook solution cease to exist. Moreover, boundaries between traditional disciplines are harder to maintain, as a proper description of the system might involve phenomena from several domains. Examples include—but not limited to—mechatronics which relies on mechanical, electrical and electronic engineering, and transducers (sensors and actuators) which are by definition devices that convert signals from one physical domain to another. Simulation platforms such as Comsol Multiphysics have truly opened the way to easy multi-domain numerical simulation, offering tools that cover all operations from geometry definition, to meshing, to physics and boundary conditions setting to simulation and result post-processing and analysis in a unified, domain-independent fashion. However, this high degree of freedom has it price, as inexperienced users may face cryptic error messages, incomprehensible or even incorrect results. It is the mission of this course to show how to properly set up a problem by exposing some of the most common misconceptions and pitfalls in multiphysics modeling. Good practices will be taught that should simplify the modeling process and increase the likelihood of correct results. Examples will mainly come from the fields of mechanics (continuum solid mechanics), electromagnetism (electrostatics and conductive media), heat transfer (conductive not convective) and combinations of these domains.

Content
- Recap of ordinary and partial differential equations
- The Finite Element Method (and the Method of Lines)
- Numerical solvers
- Geometry simplification and discretization
- Continuous and discrete symmetries
- Approximate and simplified formulations; domains of applicability
- Boundary conditions and constraints
- Solution-appropriate discretization; hp-refinement, local/global adaptive meshing
- Ramping of nonlinearities and couplings
- Coupling and segregation of multiphysics

Lecture notes
Lecture handouts will be posted online.

151-0509-00L Acoustics in Fluid Media: From Robotics to Additive Manufacturing
W  4 credits  3G  D. Ahmed

Abstract
The course will provide you with the fundamentals of the new and exciting field of ultrasound-based microrobots to treat various diseases. Furthermore, we will explore how ultrasound can be used in additive manufacturing for tissue constructs and robotics.

Objective
The course is designed to equip students with skills in the design and development of ultrasound-based manipulation devices and microrobots for applications in medicine and additive manufacturing.

Content
Linear and nonlinear acoustics, foundations of fluid and solid mechanics and piezoelectricity. Gorkov potential, numerical modelling, acoustic streaming, applications from ultrasonic microrobotic to surface acoustic wave devices

Lecture notes

Literature

Prerequisites / notice
Solid and fluid continuum mechanics. Notice: The exercise part is a mixture of presentation, lab sessions ( both compulsory) and hand in homework.
Lecture notes will be provided. However, students are encouraged to take their own notes.

2V+2U

Nonlinear FEA

Subject-specific Competencies

To be able to address all major sources of non-linearity in theory and numerics, and to apply this knowledge to the solution of relevant problems in solid mechanics.

Does not take place this semester.

Note: The previous course title until HS23 “Computational Mechanics II: Nonlinear FEA”

Abstract

The course provides an introduction to non-linear finite element analysis. The treated sources of non-linearity are related to material properties (hyperelasticity, plasticity), kinematics (large deformations, instability problems) and boundary conditions (contact).

Objective

To be able to address all major sources of non-linearity in theory and numerics, and to apply this knowledge to the solution of relevant problems in solid mechanics.

Content

1. Introduction: various sources of nonlinearities and implications for FEA.

Lecture notes

Lecture notes will be provided. However, students are encouraged to take their own notes.
The class lecture notes will be posted electronically after each lecture. Students should not rely on these but prepare their own notes.

After introducing optics and image acquisition, the lecture explains how to transform mechanical quantities such as shape, deformation, strain, or stress into image content. We show how the methods can be applied to microsystems and large engineering structures. In addition, we explore time-resolved measurement tasks.

The lecture will take place two afternoons at Empa, where the students will gain first-hand experience with several optical methods in the laboratory. They will also experience the fabrication of thin films and 3D printing. Depending on the availability of the equipment and the student's interests, these hands-on classes may include, e.g., Digital Image Correlation, THz holography, Time-domain spectroscopy, Thermal Stress Analysis, ellipsometry, and fringe projection.

Imaging techniques rely on area detectors, most notably CCD cameras, infrared sensors, and micro-bolometers. Natural white light, halogen lamps, and coherent light sources such as lasers will be used and demonstrated. The topics of the lecture include:

- **Optics and imaging**
- **Digital Image Correlation (DIC) in 2D and 3D**
- **Diffraction and holography**
- **Terahertz (THz) techniques**
- **Simulations**
- **Device fabrication and 3D printing**
- **Photoelasticity and ellipsometry**
- **Thermoelastic Stress Analysis**
- **Validation of numerical models**

We show how the methods can be applied to microsystems and large engineering structures. In addition, we explore time-resolved measurements in the context of modal analysis and dynamic events.

The lecture notes will be posted electronically after each lecture. Students should not rely on these but prepare their own notes during the lecture.

Prerequisites / notice

- Prerequisites: Analysis, linear algebra and a basic course in differential equations.

Literature

A good overview on common optical methods is presented in the following text books:

  ISBN 978-1-4665-7359-8

  ISBN 978-3-527-41111-3

  ISBN 978-3-642-29565-2

- Erik Bründemann, Heinz-Wilhelm Hübers, Murice FitzGerald Kimmitt. Terahertz techniques Springer Series in Optical Science 151
  ISBN 978-3-642-02593-8

Textbooks for specific methods will be introduced in the respective lesson.
Prerequisites / notice
Basic knowledge of optics and interferometry, as taught in introductory physics courses, is advantageous. We encourage the audience to share their specific questions.

151-0544-00L Metal Additive Manufacturing - Mechanical Integrity and Process Simulation
W 4 credits 3G E. Hosseini
Note: The previous course title until HS22 "Metal Additive Manufacturing - Mechanical Integrity and Numerical Analysis"

Abstract
An introduction to Metal Additive Manufacturing (MAM) (e.g. different techniques, the metallurgy of common alloy-systems, existing challenges) will be given. The focus of the lecture will be on the employment of different simulation approaches to address MAM challenges and to enable exploiting the full advantage of MAM for the manufacture of structures with desired property and functionality.

Objective
The main objectives of this lecture are:
- Acknowledging the possibilities and challenges for MAM (with a particular focus on mechanical integrity aspects),
- Understanding the importance of material science and metallurgical considerations in MAM,
- Appreciating the importance of thermal, fluid, mechanical and microstructural simulations for efficient use of MAM technology,
- Using commercial analysis tools (e.g. ABAQUS) for simulation of the MAM process.

Content
- Introduction to MAM (concept, application examples, pros & cons),
- Powder-bed and powder-blown metal additive manufacturing,
- Thermo-fluid analysis of additive manufacturing,
- Continuum-based thermal modelling and experimental validation techniques,
- Residual stress and distortion simulation and verification methods,
- Microstructural simulation (basics, analytical, kinetic Monte Carlo, cellular automata, phase-field),
- Mechanical property prediction for MAM,
- Microstructure and mechanical response of MAM material (stainless steel, Ti6Al4V, Inconel 718),
- Design for additive manufacturing
- Artificial intelligence for AM

Exercise sessions use ABAQUS for analysis of MAM process. Detailed video instructions will be provided to enable students to set up their own simulations. Students can install the packages on their own systems.

Lecture notes
Handouts of the presented slides.

Literature
No textbook is available for the course (unfortunately), since it is a dynamic and relatively new topic. In addition to the material presented in the course slides, suggestions/recommendations for additional literature/publications will be given (for each individual topic).

151-0550-00L Adaptive Materials for Structural Applications W 4 credits 3G A. Bergamini

Abstract
Adaptive materials offer appealing ways to extend the design space of structures by introducing time-variable properties into them. In this course, the physical working principles of selected adaptive materials are analyzed and simple models for describing their behavior are presented. Some applications are illustrated, also with laboratory experiments where possible.

Objective
The study of adaptive materials covers topics that range from chemistry to theoretical mechanics.

The aim of this course is to convey knowledge about adaptive materials, their properties and the physical mechanisms that govern their function, so as to develop the skills to deal with this interdisciplinary subject.
This course will provide the students with an insight into the properties and physical phenomena which lead to the features of adaptive materials. Starting from chemo-mechanical (skeletal muscles), the physical behavior of a wide range of adaptive materials, thermo- and photo-mechanical, electro-mechanical, magneto-mechanical and meta-materials will be thoroughly discussed and analyzed. Up-to-date results on their performance and their implementation in mechanical structures will be detailed and studied in laboratory sessions. Analytical tools and energy based considerations will provide the students with effective instruments for understanding adaptive materials and assess their performance when integrated in structures or when arranged in particular fashions.

Basic concepts: Power conjugated variables, dissipative effects, geometry- and materials-based energy conversion

Thermo-mechanical coupling: Shape memory alloys / polymers

Electromechanical coupling(1): DEA, EBL, electrorheological fluids

Shape control / morphing: Use, requirements, challenges

Morphing applications of variable stiffness structures: Lab work

Electromechanical coupling (2): Piezoelectric, electroactive effect

Vibration Reduction: Measurement, passive, semi-active (active) damping methods

Vibration reduction applications of piezoelectric materials: Lab work

Metamaterials: Definition of metamaterials - electromagnetic, acoustical and other metamaterials

Energy harvesting and sensing: Energy harvesting with EAP and piezoelectric materials, transducers as sensors: Piezo, resistive,...

Abstract

Introduction to Dynamic Programming and Optimal Control.

Objective

Covers the fundamental concepts of Dynamic Programming & Optimal Control.

Content

Dynamic Programming Algorithm; Deterministic Systems and Shortest Path Problems; Infinite Horizon Problems, Bellman Equation; Deterministic Continuous-Time Optimal Control.

Literature

Prerequisites / notice

Requirements: Knowledge of advanced calculus, introductory probability theory, and matrix-vector algebra.

151-0563-01L Dynamic Programming and Optimal Control W 4 credits 2V+1U R. D’Andrea

Objective

Introduction to Dynamic Programming and Optimal Control.

Content

Dynamic Programming Algorithm; Deterministic Systems and Shortest Path Problems; Infinite Horizon Problems, Bellman Equation; Deterministic Continuous-Time Optimal Control.

Lecture notes

Lecture notes (manuscript and handouts) will be provided

Prerequisites / notice

Introduction to current and future engine systems and their control systems

151-0567-00L Engine Systems W 4 credits 3G C. Onder

Objective

Introduction to current and future engine systems and their control systems

Content

Physical description and mathematical models of components and subsystems (mixture formation, load control, supercharging, emissions, drive train components, etc.).

Case studies of model-based optimal design and control of engine systems with the goal of minimizing fuel consumption and emissions.

Lecture notes

Introduction to Modeling and Control of Internal Combustion Engine Systems

Prerequisites / notice

Combined homework and testbench exercise (air-to-fuel-ratio control or idle-speed control) in groups

151-0569-00L Vehicle Propulsion Systems W 4 credits 3G C. Onder, P. Elbert

Objective

Introduction to current and future propulsion systems and the electronic control of their longitudinal behavior

Content

Understanding of physical phenomena and mathematical models of components and subsystems (manual, automatic and continuously variable transmissions, energy storage systems, electric drive trains, batteries, hybrid systems, fuel cells, road/wheel interaction, automatic braking systems, etc.).

Presentation of mathematical methods, CAE tools and case studies for the model-based design and control of propulsion systems with the goal of minimizing fuel consumption and emissions.

Lecture notes

Vehicle Propulsion Systems -- Introduction to Modeling and Optimization

Prerequisites / notice

Lectures of Prof. Dr. Ch. Onder and Dr. Ph. Elbert are also possible to be held in German.

151-0593-00L Embedded Control Systems W 4 credits 6G C. Onder, M. Schmid Daners

Objective

Familiarize students with main architectural principles and concepts of embedded control systems.
With guidance from a tutor, the individual silicon microsystem process steps that are required for the fabrication of an accelerometer are

Microsystems I: Process Technology and Integration

W

Students are introduced to the fundamentals of semiconductors, the basics of micromachining and silicon process technology and will learn

Main topics of the course include:
- Scaling laws at micro/nano scales
- Electrostatics
- Electromagnetism
- Low Reynolds number flows
- Observation tools
- Materials and fabrication methods
- Applications of biomedical microrobots

Lecture notes

Prerequisite courses are Control Systems I and Informatics I.

This course is restricted to 33 students due to limited lab infrastructure. Interested students please contact Marianne Schmid Daners (E-Mail: marischtch@ethzn.ch)

After your reservation has been confirmed please register online at www.mystudien.ethzn.ch.

Detailed information can be found on the course website http://www.idsc.ethzn.ch/education/lectures/embedded-control-systems.html

151-0604-00L MicroRobotics

Abstract
MicroRobotics is an interdisciplinary field that combines aspects of robotics, micro and nanotechnology, biomedical engineering, and materials science. The aim of this course is to expose students to the fundamentals of this emerging field. Throughout the course, the students apply these concepts in assignments. The course concludes with an end-of-semester examination.

Objective
The objective of this course is to expose students to the fundamental aspects of the emerging field of microRobotics. This includes a focus on physical laws that predominate at the microscale, technologies for fabricating small devices, bio-inspired design, and applications of the field.

Content
Main topics of the course include:
- Scalings laws at micro/nano scales
- Electrostatics
- Electromagnetism
- Low Reynolds number flows
- Observation tools
- Materials and fabrication methods
- Applications of biomedical microRobotics

Lecture notes
The powerpoint slides presented in the lectures will be made available as pdf files. Several readings will also be made available electronically.

Prerequisites / notice
The lecture will be taught in English.

151-0620-00L Embedded MEMS Lab

Abstract
Practical course: Students are introduced to the process steps required for the fabrication of MEMS (Micro Electro Mechanical System) and carry out the fabrication and testing steps in the clean rooms by themselves. Additionally, they learn the requirements for working in clean rooms. Processing and characterization will be documented and analyzed in a final report.

Objective
Students learn the individual process steps that are required to make a MEMS (Micro Electro Mechanical System). Students carry out the process steps themselves in laboratories and clean rooms. Furthermore, participants become familiar with the special requirements (cleanliness, safety, operation of equipment and handling hazardous chemicals) of working in the clean rooms and laboratories. The entire production, processing, and characterization of the MEMS is documented and evaluated in a final report.

Content
With guidance from a tutor, the individual silicon microsystem process steps that are required for the fabrication of an accelerometer are carried out:
- Photolithography, dry etching, wet etching, sacrificial layer etching, various cleaning procedures
- Packaging and electrical connection of a MEMS device
- Testing and characterization of the MEMS device
- Written documentation and evaluation of the entire production, processing and characterization

Lecture notes
A document containing theory, background and practical course content is distributed at the Introductory lecture day of the course.

Literature
The document provides sufficient information for the participants to successfully participate in the course.

Prerequisites / notice
Participating students are required to attend all scheduled lectures and meetings of the course.

Participating students are required to provide proof that they have personal accident insurance prior to the start of the laboratory portion of the course.

For safety and efficiency reasons the number of participating students is limited. We regret to restrict access to this course by the following rules:

Priority 1: master students of the master's program in "Micro and Nanosystems"
Priority 2: master students of the master's program in "Mechanical Engineering" with a specialization in Microsystems and Nanoscale Engineering (MAYT-tutors Profs Darais, Dual, Hierold, Koumoutsakos, Nelson, Norris, Poulikakos, Pratsinis, Stemmer), who attended the bachelor course "151-0621-00L Microsystems Technology" successfully.

Priority 3: master students, who attended the bachelor course "151-0621-00L Microsystems Technology" successfully.

Priority 4: all other students (PhD, bachelor, master) with a background in silicon or microsystems process technology.

If there are more students in one of these priority groups than places available, we will decide by (in following order) best achieved grade from 151-0621-00L Microsystems Technology, registration to this practicum at previous semester, and by drawing lots.

Students will be notified at the first lecture of the course (introductory lecture) as to whether they are able to participate.

The course is offered in autumn and spring semester.

151-0621-00L Microsystems I: Process Technology and Integration

Abstract
Students are introduced to the fundamentals of semiconductors, the basics of micromachining and silicon process technology and will learn about the fabrication of microsystems and -devices by a sequence of defined processing steps (process flow).
Students are introduced to the basics of micromachining and silicon process technology and will understand the fabrication of microsystem devices by the combination of unit process steps (also process flow).

- Introduction to microsystems technology (MST) and micro electro mechanical systems (MEMS)
- Basic silicon technologies: Thermal oxidation, photolithography and etching, diffusion and ion implantation, thin film deposition.
- Specific microsystems technologies: Bulk and surface micromachining, dry and wet etching, isotropic and anisotropic etching, beam and membrane formation, wafer bonding, thin film mechanical properties.

Application of selected technologies will be demonstrated on case studies.

Abstract
For a robot to be autonomous, it has to perceive and understand the world around it. This course introduces you to the key computer vision algorithms used in mobile robotics, such as feature extraction, structure from motion, dense reconstruction, tracking, image retrieval, event-based vision, and visual-inertial odometry (the algorithms behind Hololens, Oculus Quest, and the NASA Mars rovers).

Objective
Learn the fundamental computer vision algorithms used in mobile robotics, in particular: filtering, feature extraction, structure from motion, multiple view geometry, dense reconstruction, tracking, image retrieval, event-based vision, and visual-inertial odometry and Simultaneous Localization And Mapping (SLAM) (the algorithms behind Hololens, Facebook-Oculus Quest, and the NASA Mars rovers).

Content
Each lecture will be followed by a lab session where you will learn to implement a building block of a visual odometry algorithm in Matlab.

By the end of the course, you will integrate all these building blocks into a working visual odometry algorithm.

Lecture notes
Lecture slides will be made available on the course official website: http://rpg.ifi.uzh.ch/teaching.html

Literature

Abstract
- Observing and developing cooperation and communication in innovation teams
- Facilitating idea generation and development in teams
- Evaluating and developing individual skills for creativity

Prerequisites / notice
- Fundamentals of algebra, geometry, matrix calculus, and Matlab programming.

Note: If you are interested in taking UZH courses, you must register as an incoming mobility student at UZH. For details, see as follows:

UZH course enrollment for ETH student at University of Zurich (UZH) > Mobility within Switzerland – Incoming > Module Mobility: The easiest way to take individual modules/courses to supplement your studies at your home university is with module mobility. This option is not available to students who have dropped out of their home university or have been definitely excluded or banned from the relevant program. A program > Application and Deadlines: Applications are submitted via the UZH application portal (https://www.uzh.ch/cmsssl/en/studies/application/chmobilityin.html)

Step-by-step guidelines on how ETH students can register for this course, are given on the official course website: https://rpg.ifi.uzh.ch/teaching.html

ATTENTION: When you book the course at UZH, you are automatically registered for the exam at UZH and you can unregister until the October deadline. After registering for the course, you as an ETH student need to check out your "UZH email account" to receive the related information from the lecturer.

Abstract
In particular, the seminar addresses students, who are interested in scientific work in the field of Micro- and Nanosystem technologies, or who have started already with it. Respectively, current examples in the research will be discussed.

Content
Current themes in the field of Micro- and Nanosystem technologies using the examples of intern and extern research groups, as well as ongoing themes of study-, diplom- and doctoral thesis will be introduced and discussed. The scope of the seminar is broadened by occasional guest speakers.

Abstract
- Reading and applying research papers on individual and team creativity
- Evaluating and developing individual skills for creativity
- Facilitating idea generation and development in teams
- Observing and developing cooperation and communication in innovation teams

Prerequisites / notice
- -
Content

Knowledge about prerequisites of creativity - theoretical models and empirical results:
- Motivation
- Domain knowledge
- Thinking processes

Development of individual skills for creativity:
- Focus on creativity as problem analysis & solving
- Individual skill exercises and reflection

Knowledge about teams - theoretical models and empirical results:
- Team climate, Psychological Safety
- Team development
- Creative problem solving in teams

Facilitating creative team processes:
- The role of the team facilitator
- Cooperation and communication in innovation teams

Development of team-oriented skills for creativity:
- Idea generation and development in teams
- Cooperation and communication in innovation teams

151-0703-00L Operational Simulation of Production Lines

Abstract

The students learn the application of the event-based and computer-based simulation for layout and improvement of production facilities by means of practical examples and by using the so-called «Digital Twin» within the context of «Industry 4.0». They learn how virtual and mixed reality tools can be used together with the Digital Twin to plan and support the operation of a production line.

Objective

The students learn the correct use of (Who? When? How?) of the event-driven and computer-based simulation in the illustration of the operating procedures and the production facilities. The simulation is an important basis for creating a digital twin in the context of Industry 4.0.

Operating simulation in the productions, logistic and scheduling will be shown by means of practical examples. The students should make their first experiences in the use of computer-based simulation. Further, the lecture gives insights into the methods-time measurement (MTM) for evaluating human work places as basis for the simulation and learn how this is performed using virtual reality.

Content

- Application and application areas of the event-driven simulation
- Simulation in the context of Industry 4.0 (digital twin)
- EXEMPLARY application of a software tool (Technomatix-Simulation-Software)
- Internal organization and functionality of simulation tools
- Procedure for application: optimizing, experimental design planning, analysis, data preparation
- Controlling philosophies, emergency concepts, production in sequence, line production, rescheduling
- Application on the facilities projecting
- Applications of Virtual and Mixed Reality

The knowledge is enhanced by practice-oriented exercises and an excursion. A guest speaker will present a practical example.

Lecture notes

Will be sent by email before the lecture (pdf).

Literature

A bibliography will be handed out during the lectures.

Prerequisites / notice

Recommended for all Bachelor-Students in the 5th semester and Master-Students in the 7th semester (MAVT, MTEC, PhD students in material sciences) and for all with interest in production (e.g., MTEC, HEST, etc.)

Autumn Semester 2024
By the end of the course you will be familiar with a range of mathematical/statistical tools that enable a quantitative treatment of problems that are subject to uncertainties or that respond to parameter changes in a chaotic manner. Corresponding systems may arise in fluid dynamics, structural mechanics, biology, electrical engineering as well as other areas.

The lecture follows the value added process sequence of electric and electronic components. It contains: Development of electric and electronic circuits, design of electronic circuits on printed circuit boards as well as in hybrid technology, integrated test technology, planning of production lines, value added process sequence for photovoltaics.

The lecture concludes with an excursion to a large manufacturing company. Here, students can see the application and realization of the manufacturing of electric and electronic devices.

Lecture notes are handed out during the individual lessons.

Some textbooks related to the material covered in the course:
- Statistical tests for means and goodness-of-fit
- Kalman filters (classical and ensemble-based)
- Statistical tests for means and goodness-of-fit
- Linear and nonlinear estimation problems
- Spectral methods for uncertainty quantification
- Monte Carlo integration with importance and stratified sampling
- Stochastic differential equations, Ito calculus, PDF evolution equations
- Estimation of statistical moments and probability densities based on data
- Stochastic differential equations, Ito calculus, PDF evolution equations
- Monte Carlo integration with importance and stratified sampling
- Markov-chain Monte Carlo sampling
- Control-variate and multi-level Monte Carlo estimation
- Kalman filters (classical and ensemble-based)
- Statistical tests for means and goodness-of-fit

The lecture follows the value added process sequence for electric and electronic components.
The lecture is partly given by experts from industry. It is supplemented by an excursion to one of the industry partners.

Exciting Leadership in a Thrilling Real Business World

Abstract
What is leadership in a real world? What are the preconditions of personal leadership? What is the differences between Leadership and Management? What is the price to be payed to be a Leader? What are the core competences of a Leader? How to become an inspiring Leader? How to experience exciting leadership in a thrilled real business world.

Objective
The objective of this course is to understand the impact of Leadership and to learn based on longterm international leadership experiences very practicable competences and skills needed to be a leader.

Content
Definitions and methods what leadership is about based on real industrial examples. Levels of Leadership. Conflicts, challenges and risks of Leaders. Competences of a leader such as: decision making processes, communication, emotional intelligence, change processes and understanding of people behaviours.

Lecture notes
Yes, always after lecture via mail.

Literature
Not mandatory, but to be recommended: "The Effective Executive" from Peter Drucker, Verlag Vahlen; ISBN 978 3 8006 46715 from 2014.
We will provide an overview on how to kinematically and dynamically model typical robotic systems such as robot arms, legged robots, and rotary wing systems, or fixed wing.

The course consists of three parts: First, we will refresh and deepen the student’s knowledge in kinematics, dynamics, and rotations of multibody systems. The ability to independently create a virtual mechanical complex non-linear systems will be acquired through accompanying exercises. These will include the Matlab programming of important model components such as constitutive equations. The finite element program ABAQUUS will be introduced to investigate real engineering problems.

The primary objective of this course is that the student deepens an applied understanding of how to model the most common robotic systems. The student receives a solid background in kinematics, dynamics, and rotations of multi-body systems. On the basis of state of the art applications, he/she will learn all necessary tools to work in the field of design or control of robotic systems.

The course consists of three parts: First, we will refresh and deepen the student’s knowledge in kinematics, dynamics, and rotations of multi-body systems. In this context, the learning material will build upon the courses for mechanics and dynamics available at ETH, with the particular focus on their application to robotic systems. The goal is to foster the conceptual understanding of similarities and differences among the various types of robots. In the second part, we will apply the learned material to classical robotic arms as well as legged systems and discuss kinematic constraints and interaction forces. In the third part, focus is put on modeling fixed wing aircraft, along with related design and control concepts. In this context, we also touch aerodynamics and flight mechanics to an extent typically required in rotary wing systems, or fixed wing.

Most problems in engineering are of nonlinear nature. The nonlinearities are caused basically due to the nonlinear material behavior, contact conditions and instability of structures. The principles of the nonlinear Finite-Element-Method (FEM) will be introduced for treating such problems. The finite element program ABAQUUS is introduced to investigate real engineering problems.

The contents of the following ETH Bachelor lectures or equivalent are assumed to be known: Mechanics and Dynamics, Control, Basics in Fluid Dynamics, Robot Dynamics, Medical Technology Innovation - From Concept to Clinics, and 3G.

- Crash
- Collapse of structures
- Material behavior (metals and rubber)
- General forming processes

Special attention will be paid to the modeling of the nonlinear material behavior, thermo-mechanical processes and processes with large plastic deformations. The ability to independently create a virtual mechanical complex non-linear systems will be acquired through accompanying exercises. These will include the Matlab programming of important model components such as constitutive equations. The FEM Program ABAQUUS will be introduced to investigate real engineering problems.

The goal of the lecture is to provide the students with the fundamentals of the non-linear Finite Element Method (FEM). The lecture focuses on the principles of the nonlinear Finite-Element-Method based on explicit and implicit formulations. Typical applications of the nonlinear Finite-Element-Methods are simulations of:

- Instability problems
- Modeling of tool contact and the influence of friction
- Solvers and convergence
- General forming processes

The most used materials

CO2 and other emissions
Basics of life cycle analysis
The real numbers: where to find reliable data and how one can play with the figures
Evolution of production, consumption and resources

The 5 most used materials today, their key properties and what they are used for

- Production, recyclability and new processing routes for Al and steel

The course will be available on the moodle.

The goal of the lecture is to provide the students with the fundamentals of the non-linear Finite Element Method (FEM). The lecture focuses on the principles of the nonlinear Finite-Element-Method based on explicit and implicit formulations. Typical applications of the nonlinear Finite-Element-Methods are simulations of:

- Instability problems
- Modeling of tool contact and the influence of friction
- Solvers and convergence
- General forming processes

Special attention will be paid to the modeling of the nonlinear material behavior, thermo-mechanical processes and processes with large plastic deformations. The ability to independently create a virtual mechanical complex non-linear systems will be acquired through accompanying exercises. These will include the Matlab programming of important model components such as constitutive equations. The FEM Program ABAQUUS will be introduced to investigate real engineering problems.

The primary objective of this course is that the student deepens an applied understanding of how to model the most common robotic systems. The student receives a solid background in kinematics, dynamics, and rotations of multi-body systems. On the basis of state of the art applications, he/she will learn all necessary tools to work in the field of design or control of robotic systems.

The course consists of three parts: First, we will refresh and deepen the student’s knowledge in kinematics, dynamics, and rotations of multi-body systems. In this context, the learning material will build upon the courses for mechanics and dynamics available at ETH, with the particular focus on their application to robotic systems. The goal is to foster the conceptual understanding of similarities and differences among the various types of robots. In the second part, we will apply the learned material to classical robotic arms as well as legged systems and discuss kinematic constraints and interaction forces. In the third part, focus is put on modeling fixed wing aircraft, along with related design and control concepts. In this context, we also touch aerodynamics and flight mechanics to an extent typically required in robotics. The last part finally covers different helicopter types, with a focus on quadrotors and the coaxial configuration which we see today in many UAV applications. Case studies on all main topics provide the link to real applications and to the state of the art in robotics.

The contents of the following ETH Bachelor lectures or equivalent are assumed to be known: Mechanics and Dynamics, Control, Basics in Fluid Dynamics.
Introduction to Photonics

151-0913-00L

W 4 credits 2V+2U R. Quidant, J. Ortega Arroyo

Abstract
This course introduces students to the main concepts of optics and photonics. Specifically, we will describe the laws obeyed by optical waves and discuss how to use them to manipulate light.

Objective
Photonics, the science of light, has become ubiquitous in our lives. Control and manipulation of light is what enables us to interact with the screen of our smart devices and exchange large amounts of complex information. Photonics has also taken a preponderant role in cutting-edge science, allowing for instance to image nanospecimens, detect diseases or sense very tiny forces. The purpose of this course is three-fold: (i) We first aim to provide the fundamentals of photonics, establishing a solid basis for more specialised courses. (ii) Beyond theoretical concepts, our intention is to have students develop an intuition on how to manipulate light in practice. (iii) Finally, the course highlights how the taught concepts apply to modern research as well as to everyday life technologies (LCD screens, polarisation sun glasses, anti-reflection coating etc...). Content, including videos of laboratory experiments, has been designed to be approachable by students from a diverse set of science and engineering backgrounds.

Content

I- BASICS OF WAVE THEORY
1) General concepts
2) Differential wave equation
3) Wavefront
4) Plane waves and Fourier decomposition of optical fields
5) Spherical waves and Huygens-Fresnel principle

II- ELECTROMAGNETIC WAVES
1) Maxwell equations
2) Wave equation for EM waves
3) Dielectric permittivity
4) Refractive index
5) Nonlinear optics
6) Polarisation and polarisation control

III- PROPAGATION OF LIGHT
1) Waves at an interface
2) The Fresnel coefficients
3) Total internal reflection
4) Evanescent waves
5) Dispersion diagram

IV- INTERFERENCES
1) General considerations
2) Temporal and spatial coherence
3) The Young double slit experiment
4) Diffraction gratings
5) The Michelson interferometer
6) Multi-wave interference
7) Antireflecting coating and interference filters
8) Optical holography

V- LIGHT MANIPULATION
1) Optical waveguides
2) Photonic crystals
3) Metamaterials and metasurfaces
4) Optical cavities

VI- OPTICAL FORCES AND OPTICAL TWEEZERS
1) History of optical forces
2) Theory of optical trapping
3) Atom cooling
4) Optomechanics
5) Applications of optical tweezers

VII- INTRODUCTION TO OPTICAL MICROSCOPY
1) Basic concepts
2) Direct and Fourier imaging
3) Image formation
4) Fluorescence microscopy
5) Scattering-based microscopy
6) Digital holography
7) Computational imaging
Abstract
This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore, the application of these principles to important engineering problems is demonstrated.

Objective
This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore, the application of these principles to important engineering problems is demonstrated.

Content
Fick's laws; application and significance of mass transfer; comparison of Fick's laws with Newton's and Fourier's laws; derivation of Fick's 2nd law; diffusion in dilute and concentrated solutions; rotating disk; dispersion; diffusion coefficients, viscosity and heat conduction (Pr and Sc numbers); Brownian motion; Stokes-Einstein equation; mass transfer coefficients (Nu and Sh numbers); mass transfer across interfaces; Analogies for mass-, heat-, and momentum transfer in turbulent flows; film-, penetration-, and surface renewal theories; simultaneous mass, heat and momentum transfer (boundary layers); homogeneous and heterogeneous reversible and irreversible reactions; diffusion-controlled reactions; mass transfer and first order heterogeneous reaction. Applications.

Literature

Prerequisites / notice
Students attending this highly-demanding course are expected to allocate sufficient time within their weekly schedule to successfully conduct the exercises.

Competencies
Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

Method-specific Competencies
- Analytical Competencies: assessed
- Problem-solving: assessed

Personal Competencies
- Creative Thinking: assessed
- Critical Thinking: assessed

151-0927-00L Rate-Controlled Separations in Fine Chemistry

Abstract
The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.

Objective
The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.

Content
The class covers separation techniques that are central in the purification and downstream processing of chemicals and bio-pharmaceuticals. Examples from both areas illustrate the utility of the methods: 1) Adsorption and chromatography; 2) Membrane processes; 3) Crystallization and precipitation.

Literature
Recommendations for text books will be covered in the class

Prerequisites / notice
Requirements (recommended, not mandatory): Thermal separation Processes I (151-0926-00) and Modelling and mathematical methods in process and chemical engineering (151-0940-00)

Competencies
Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: fostered
- Media and Digital Technologies: fostered
- Problem-solving: assessed

Social Competencies
- Communication: assessed
- Cooperation and Teamwork: fostered

Personal Competencies
- Adaptability and Flexibility: fostered
- Creative Thinking: assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: fostered
- Self-awareness and Self-reflection: fostered
- Self-direction and Self-management: fostered
Molecular Sensors: From Fundamentals to Health and Environmental Applications

Note: previous course title until HS23 "Molecular Health Sensors and Devices"

Abstract
Molecular sensors are used in everyday life in health care, environmental monitoring, food safety, space and other fields. Sources of molecular information, its transport and fundamental concepts of molecular sensing will be discussed. In the scope of group projects, the acquired knowledge will be applied and deepened in case studies.

Objective
After the course, the students will:

• know the requirements and merits of molecular sensors for health, environmental and other emerging applications (e.g. space)
• understand transport phenomena of molecular information & surface interactions and know how to quantitatively describe these
• understand fundamental sensing concepts for the detection and quantification of molecular analytes
• know concepts of signal processing
• be capable to apply the learnt knowledge to conceive and engineer sensor concepts and systems
• know how to investigate sensor-related literature and present scientific data

This course consists of a theoretical and a project-based learning block. In the first 10 semester weeks, theoretical knowledge will be provided through lectures and deepened in corresponding exercises. In the last 4 weeks, the students will apply the learned concepts through group projects to investigate case studies. The outcome will be present.

Content
Transport of Molecular Information; Surface Interactions; Sensor Fundamentals; Chemoresistive Sensing; Electrochemical Sensing; Mass-sensitive; Capacitive Sensing; Signal Processing; Medical Requirements for Molecular Sensing

Process Design and Safety

Abstract
The lecture Process Design and Safety deals with the fundamentals of project management, scale-up, dimensioning and safety of chemical process equipment and plants.

Objective
The objective of the lecture is to expound the engineering design approach of important elements in chemical plant design.

Content
Fundamentals in Chemical engineering Design;
Project Management,
Cost estimate,
Materials and Corrosion,
Piping and Armatures,
Pumps,
Reactors and Scale-up,
Safety of chemical processes,
Patents

Introduction to Aircraft and Car Aerodynamics

Abstract
An introduction to the basic principles and interrelationships of aircraft and automotive aerodynamics.

Objective
To understand the basic relations of the origin of aerodynamic forces (ie lift, drag). To quantify the aerodynamic forces for basic configurations of aircraft and car components.

Content
Airframe aerodynamics: Atmosphere; aerodynamic forces (lift, drag); thrust.

Lecture notes
Preparation materials & slides are provided prior to each class.
Optimization modeling and theory

1. Unconstrained optimization methods
   - Direct search methods
   - Stochastic and evolutionary search methods
   - Multi-objective optimization

2. Constrained optimization methods
   - Linear and non-linear

The lecture and exercises teach the fundamentals of optimization methods in the context of engineering design. After taking the course, students will be able to express engineering design tasks as formal optimization problems. Students will also be able to select and apply a suitable optimization method given the nature of the optimization problem. They will understand the links between optimization and engineering design in order to design more efficient and performance-optimized technical products. The exercises are MATLAB based.

Aircraft Aerodynamics:
- Schlichting,H. und Truckenbrodt, E: Aerodynamik des Flugzeuges (Band I und II), Springer Verlag, 1960

Vehicle Aerodynamics:

151-3204-00L Coaching Innovation Projects

Objective
- Critical thinking and reasoned judgements
- Basic knowledge about role and mindset of a coach
- Understanding the challenges of engineering projects and design teams
- Development of personal skills to apply and train product development methods
- Knowledge and know-how about applying methods
- Reflection and exchange of experiences about personal coaching situations
- Inspiration and learning from good cases regarding organizational and team management aspects
- Decision-making under uncertainty

Content
- Kick-off & Experience Exchange
- Coaching Role
- Active Listening
- Giving and Receiving Feedback
- Team Building & Psychological Safety
- Building Hypotheses in the coaching process
- conflict resolution and motivation

In addition to the content topics, one-on-one coaching will be provided and classes will reflect on current, practical issues derived from coaching the innovation teams.

Prerequisites / notice
Only for participants (Bachelor Students, Master Students) who are teaching assistants in the innovation project.

Competencies

Self-direction and Self-management

151-3209-00L Engineering Design Optimization

Objective
- The lecture and exercises teach the fundamentals of optimization methods in the context of engineering design. After taking the course students will be able to express engineering design problems as formal optimization problems. Students will also be able to select and apply a suitable optimization method given the nature of the optimization model. They will understand the links between optimization and engineering design in order to design more efficient and performance-optimized technical products. The exercises are MATLAB based.

Content
- 1. Optimization modeling and theory
- 2. Unconstrained optimization methods
- 3. Stochastic and evolutionary search methods
- 4. Multi-objective optimization
- 5. Direct search methods
- 6. Constrained optimization methods

Lecture notes
available on Moodle

151-3215-00L Design for Additive Manufacturing

Objective
- This course focuses on the design, manufacture and testing of components produced using additive manufacturing (AM) technologies.
- The course includes a project based on a real-world challenges where students design, fabricate and iteratively optimize functional AM parts using an appropriate AM technology.

This course provides a basic knowledge of design for additive manufacturing (AM). The course will prepare students to

- Apply basic AM processes (metal and plastic)
- Apply AM design guidelines
- Adopt AM in an industrial environment
- Apply design tools and methods in AM
- Create value from AM
- Work in a project based product development team

Literature

- Schlichting,H. und Truckenbrodt, E: Aerodynamik des Flugzeuges (Band I und II), Springer Verlag, 1960

151-3215-00L Design for Additive Manufacturing

W 4 credits

2G M. Meboldt, J. Ferchow
Content
In parallel to the lectures, the students design, manufacture and test prototypes in a project at different stages of product development. The course covers the following topics:
- State-of-the-art AM processes for metals and plastics: PBF (also known as SLM, SLS), BJT, MJF, MEX (FDM)
- Design guidelines in AM
- Industrial adoption of AM
- Value creation and business models for AM
- Design tools and methodologies for AM
- Quality management in AM
- Industrial cases of AM applications
- Problem solving and creativity
- Agile development

Lecture notes
Script and handouts are available in PDF-format.

151-8101-00L International Engineering: from Hubris to Hope
W 4 credits 3G E. Tilley

Abstract
Since Europe surrendered their colonial assets, engineers from rich countries have returned to the African continent to address the real and perceived ills that they felt technology could solve. And yet, 70 years on, the promise of technology has largely failed to deliver widespread, substantive improvements in the quality of life. Why?

Objective
This course is meant for engineers who are interested in pursuing an ethical and relevant career internationally, and who are willing to examine the complex role that well-meaning foreigners have played and continue to play in the disappointing health outcomes that characterize much of the African continent.

After completing the course, participants will be able to
- critique the jargon and terms used by the international community, i.e. “development”, “aid”, “cooperation”, “assistance” “third world” “developing” “global south” “low and middle-income” and justify their own chosen terminology
- recognize the role of racism and white-supremacy in the development of the Aid industry
- understand the political, financial, and cultural reasons why technology and infrastructure have historically failed
- Debate the merits of international engineering in popular culture and media
- Propose improved SDG indicators that address current shortcomings
- Compare the engineering curricula of different countries to identify relative strengths and shortcomings
- Explain the inherent biases of academic publishing and its impact on engineering failure
- Analyse linkages between the rise of philanthropy and strategic priority areas
- Recommend equitable, just funding models to achieve more sustainable outcomes
- Formulate a vision for the international engineer of the future

Content
Role of international engineering during colonialism
Transition of international engineering following colonialism
White saviourism and racism in international engineering
International engineering in popular culture
The missing role of Engineering Education
Biases in academic publishing
The emerging role in Global Philanthropy
The paradox of International funding

Literature
Abstract

Applied Category Theory is an exciting multidisciplinary field of research which harnesses the mathematical language of category theory for applications across a broad range of disciplines. This course is a gentle introduction to the theory, emphasizing applications in engineering and the "compositional approach" to systems analysis, co-design, and computation.

Objective

1) Learn basic concepts from algebra and category theory, together with ways to make use of these concepts for engineering applications.

2) Become familiar with case studies of applied category theory, for instance involving dynamical systems, databases, and complex system co-design (e.g. in the context of autonomous vehicles).

3) Be able to recognize compositional structures in concrete scenarios at different levels of abstraction.

4) Understand the "compositional way of thinking" as an approach to systems analysis, co-design, and computation.

Content

Review of basic algebraic structures [sets, relations, (semi)groups, monoids, actions, order theory]

Gentle introduction to category theory [series and parallel composition, feedback, actions, functors, universal properties]

Many simple applied examples illustrating concepts along the way. Extended examples from dynamical systems, databases, and systems co-design in engineering.

Homework will consist of 1) basic exercises to check one's understanding of core concepts, and 2) a choice between either A) coding exercises (in python) to learn how to implement concepts in software or B) further theory exercises to deepen mathematical understanding.

Homework will be graded on a schedule that allows some flexibility, and it will constitute 100% of the grade (no exam).

Lecture notes

Slides and a (work-in-progress) textbook for the course will be provided (A. Censi, J. Lorand, G. Zardini, "Applied Compositional Thinking for Engineers").

For many further resources, see also https://applied-compositional-thinking.engineering/

Prerequisites / notice

A knowledge of algebra at the level of a bachelor’s degree in engineering/computer science.
Content

Engineers are confronted every day to decision making under limited amount of information and uncertain conditions. When designing new structures and systems, the design codes such as SIA or Euro-codes usually provide a framework that guarantees safety and reliability. However, the level of safety is not quantified explicitly, which does not allow the analyst to properly choose between design variants and evaluate a total cost in case of failure. In contrast, the framework of risk analysis allows one to incorporate the uncertainty in decision making.

The first part of the course is a reminder on probability theory that is used as a main tool for reliability and risk analysis. Classical concepts such as random variables and vectors, dependence and correlation are recalled. Basic statistical inference methods used for building a probabilistic model from the available data, e.g. the maximum likelihood method, are presented.

The second part is related to structural reliability analysis, i.e. methods that allow one to compute probabilities of failure of a given system with respect to prescribed criteria. The framework of reliability analysis is first set up. Reliability indices are introduced together with the first order-second moment method (FORM) and the first order reliability method (FORM). Methods based on Monte Carlo simulation are then reviewed and illustrated through various examples. By-products of reliability analysis such as sensitivity measures and partial safety coefficients are derived and their links to structural design codes is shown. The reliability of structural systems is also introduced as well as the methods used to reassess existing structures based on new information.

The third part of the course addresses risk assessment methods. Techniques for the identification of hazard scenarios and their representation by fault trees and event trees are described. Risk is defined with respect to the concept of expected utility in the framework of decision making. Elements of Bayesian decision making, i.e. pre-, post and pre-post risk assessment methods are presented.

The course also includes a tutorial using the UQLab software dedicated to real world structural reliability analysis.

Lecture notes

Slides of the lectures are available online every week. A printed version of the full set of slides is proposed to the students at the beginning of the semester.

Literature

Prerequisites / notice

Basic course on probability theory and statistics

227-0124-00L Embedded Systems W 6 credits 4G M. Magno

Abstract

An embedded system is a combination of hardware and software, either fixed in function or programmable, that is designed for a specific application scenario or for a specific task within a larger system. They are part of industrial machines such as agricultural and manufacturing equipment, automotive systems, medical equipment, household appliances, sensor networks, and the Internet of Things.

Objective

Understanding the specific requirements and problems that arise in embedded system applications.

Understanding the hardware structure of a microcontroller and an embedded system; memory architecture and memory map, internal and external peripherals, low-power and low-energy design as well as instruction sets and computational accelerators.

Understanding the firmware structure of a microcontroller and an embedded system; low-level instruction set, hardware/software interfaces, communication between components, embedded real-time operating systems, real-time scheduling, shared resources, low-power and low-energy programming as well as computational accelerators.

Using formal models and methods for designing and optimizing embedded systems.

Gaining experience with practical applications of the C programming language, embedded real-time operating systems, and debug functionalities of the associated design environment to design, implement, and verify embedded firmware.

Through project-based activities, students will gain substantial experience in applying the C programming language in the context of embedded systems. Projects will involve developing and implementing firmware, utilizing embedded real-time operating systems, and exploring the debugging functionalities within design environments. This hands-on approach aims to bridge the gap between theoretical knowledge and practical application, allowing students to experience the full lifecycle of embedded system development from design to implementation and verification.

Content

This lecture focuses on the design of embedded systems using formal models and methods.

Besides the theoretical lecture, the course contains laboratory sessions where students transfer the learned theoretical aspects into praxis by programming a microcontroller and interfacing it with sensors and actuators. Students will be exposed to a commercial microcontroller, and the development board extend with a custom-designed embedded systems educational platform.

Specifically, the following topics will be covered in the course: hardware and software structures of embedded systems, low-level instruction set, memory architecture and memory map, peripherals, hardware/software interfaces, communication between components, firmware design methodologies, firmware design using the C programming language, embedded real-time operating systems, real-time scheduling, shared resources, low-power, and low-energy designs well as computational accelerators.

Lecture notes

Lecture material, publications, exercise sheets, and laboratory documentation will be available on the course's Moodle page.

Literature

Prerequisites / notice

Prerequisites: C programming, circuit theory, digital logic, binary number representations.

Competencies

Recommended: basic knowledge of assembly programming and computer architecture.

Subject-specific Competencies

Concepts and Theories assessed

Techniques and Technologies assessed

227-0225-00L Linear System Theory W 6 credits 5G J. Lygeros, A. Tsiamis

Abstract

The class is intended to provide a comprehensive overview of the theory of linear dynamical systems, stability analysis, and their use in control and estimation. The focus is on the mathematics behind the physical properties of these systems and on understanding and constructing proofs of properties of linear control systems.

Objective

Students should be able to apply the fundamental results in linear system theory to analyze and control linear dynamical systems.
Content
- Proof techniques and practices.
- Linear spaces, normed linear spaces and Hilbert spaces.
- Ordinary differential equations, existence and uniqueness of solutions.
- Continuous and discrete-time, time-varying linear systems. Time domain solutions. Time invariant systems treated as a special case.
- Stability and stabilization, observers, state and output feedback, separation principle.

Lecture notes
Available on the course Moodle platform.

Prerequisites / notice
Sufficient mathematical maturity, in particular in linear algebra, analysis.

Competencies
Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies
- Analytical Competencies
- Problem-solving

Personal Competencies
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics

227-0385-10L Biomedical Imaging

Abstract
Introduction to diagnostic medical imaging based on electromagnetic and acoustic fields including X-ray planar and tomographic imaging, radio-tracer based nuclear imaging techniques, magnetic resonance imaging and ultrasound-based procedures.

Objective
Upon completion of the course students are able to:
- Explain the physical and mathematical foundations of diagnostic medical imaging systems
- Characterize system performance based on signal-to-noise ratio, contrast-to-noise ratio and transfer function
- Design a basic diagnostic imaging system chain including data acquisition and data reconstruction
- Identify advantages and limitations of different imaging methods in relation to medical diagnostic applications

Content
- Introduction (intro, overview, history)
- Signal theory and processing (foundations, transforms, filtering, signal-to-noise ratio)
- X-rays (production, tissue interaction, contrast, modular transfer function)
- X-rays (resolution, detection, digital subtraction angiography, Radon transform)
- X-rays (filtered back-projection, spiral computed tomography, image quality, dose)
- Nuclear imaging (radioactive tracer, collimation, point spread function, SPECT/PET)
- Nuclear imaging (detection principles, image reconstruction, kinetic modelling)
- Magnetic Resonance (magnetic moment, spin transitions, excitation, relaxation, detection)
- Magnetic Resonance (plane wave encoding, Fourier reconstruction, pulse sequences)
- Magnetic Resonance (contrast mechanisms, gradient- and spin-echo, applications)
- Ultrasound (mechanical wave generation, propagation in tissue, reflection, transmission)
- Ultrasound (spatial and temporal resolution, phased arrays)
- Ultrasound (Doppler shift, implementations, applications)
- Summary, example exam questions

227-0386-00L Biomedical Engineering

Abstract
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The focus is on learning the basic vocabulary of biomedical engineering and getting familiar with concepts that govern common medical instruments and the most important organs from an engineering point of view.

Objective
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The course provides an overview of the various topics of the different tracks of the biomedical engineering master course and helps orienting the students in selecting their specialized classes and project locations. It also serves as an introduction to the field for students of the ITET, MAVT, HEST and other bachelor programs.

In addition, the most recent achievements and trends of the field of biomedical engineering are also outlined.
Content

History of BME and the role of biomedical engineers. Ethical issues related to BME.
Biomedical sensors both wearable and also biochemical sensors.
Bioelectronics: Nernst equation, Donnan equilibrium, equivalent circuits of biological membranes and bioelectronic devices.
Bioinformatics: genomic and proteomic tools, databases and basic calculations.
Equations describing basic reactions and enzyme kinetics.
Medical optics: Optical components and systems used in hospitals.
Basic concepts of tissue engineering and organ printing.
Biomaterials and their medical applications.
Function of the heart and the circulatory system.
Transport and exchange of substances in the human body, compartment modeling.
The respiratory system.
Bioimaging.
Orthopedic biomechanics.
Lectures (2h), discussion of practical exercises (1h) and homework exercises.

Lecture notes

Introduction to Biomedical Engineering
by Enderle, Banchard, and Bronzino

AND

moodle page of the course

Prerequisites / notice

No specific requirements, BUT
ITE, MAVT, PHYS students will have to learn a lot of new words related to biochemistry, biology and medicine, while
HEST and BIOL students will have to grasp basic engineering concepts (circuits, equations, etc.).

Abstract

The course introduces bioelectricity and the sensing concepts that enable obtaining information about neurons and their networks. The sources of electrical fields and currents in the context of biological systems are discussed. The fundamental concepts and challenges of measuring bioelectronic signals and the basic concepts to record optogenetically modified organisms are introduced.

Objective

During this course the students will:
- learn the basic concepts in bioelectronics including the sources of bioelectronic signals and the methods to measure them
- be able to solve typical problems in bioelectronics
- learn about the remaining challenges in this field

Content

Lecture topics:

1. Introduction
2. Sources of bioelectronic signals
3. Membrane and Transport
4. Action potential and Hodgkin-Huxley
5. Measuring bioelectronic signals
6. Detection and Noise
7. Measuring currents in solutions, nanopore sensing and patch clamp pipettes
8. Measuring potentials in solution and core conductance model
9. Measuring electronic signals with wearable electronics, ECG, EEG
10. Measuring mechanical signals with bioelectronics
11. In vivo stimulation and recording
12. Functional electric stimulation
13. In vivo electrophysiology
14. Optical recording and control of neurons (optogenetics)
15. Measuring neurons optically, fundamentals of optical microscopy
16. Fluorescent probes and scanning microscopy, optogenetics, in vivo microscopy
17. Measuring biochemical signals

Lecture notes

A detailed script is provided to each lecture including the exercises and their solutions.

Literature

Plonsey and Barr, Bioelectricity: A Quantitative Approach (Third edition)

Prerequisites / notice

The course requires an open attitude to the interdisciplinary approach of bioelectronics.
In addition, it requires undergraduate entry-level familiarity with electric & magnetic fields/forces, resistors, capacitors, electric circuits, differential equations, calculus, probability calculus, Fourier transformation & frequency domain, lenses / light propagation / refractive index, pressure, diffusion AND basic knowledge of biology and chemistry (e.g. understanding the concepts of concentration, valence, reactants-products, etc.).
Assessed Concepts and Theories
Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

Fostered Fundamentals of Electric Machines
This course introduces to different electric machine concepts and provides a deeper understanding of their detailed operating principles.

Fostered Analytical Competencies
Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies
Method-specific Competencies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management
Social Competencies
- Communication
- Cooperation and Teamwork
- Customer Orientation
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation
Personal Competencies
- Adaptability and Flexibility
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

Assessed Fundamentals of Electric Machines
This course introduces to different electric machine concepts and provides a deeper understanding of their detailed operating principles.

Fostered Analystic Competencies
M. Meyer
This course is to convey knowledge on the operating principles of different types of electric machines. Further objectives are to evaluate machine types for given specifications and to acquire the ability to perform a rough design of an electrical machine while considering the versatile aspects with respect to magnetic, electrical, mechanical and thermal limitations. Exercises are used to consolidate the presented theoretical concepts.

Image Analysis and Computer Vision
- The next part describes necessary pre-processing steps, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and 3D shape as two important examples. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed. A major part at the end is devoted to deep learning and AI-based approaches to image analysis. Its main focus is on object recognition, but also other examples of image processing using deep neural nets are given.

Fundamentals of Electric Machines
- The objective of this course is to convey knowledge on the operating principles of different types of electric machines. Further objectives are to evaluate machine types for given specifications and to acquire the ability to perform a rough design of an electrical machine while considering the versatile aspects with respect to magnetic, electrical, mechanical and thermal limitations. Exercises are used to consolidate the presented theoretical concepts.

Fundamentals of Electric Machines
- Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Python and Linux. The course language is English.

Fundamentals of Electric Machines
- Subject-specific Competencies
- Method-specific Competencies
- Social Competencies
- Personal Competencies

Objective
- Overview of the technical characteristics of railway systems
- Know-how about the design and construction principles of rail vehicles
- Interrelationship between different fields of engineering sciences (mechanics, electro and information technology, transport systems)
- Understanding tasks and opportunities of engineers working in an environment which has strong economical and political boundaries
- Insight into the activities of the railway vehicle industry and railway operators in Switzerland
- Motivation of young engineers to start a career in the railway industry or with railway operators

Content
EST I (Herbstsemester) - Begriffen, Grundlagen, Merkmale

1 Einführung:
1.1 Geschichte und Struktur des Bahnsystems
1.2 Fahrdynamik

2 Vollbahnfahrzeuge:
2.3 Mechanik: Kasten, Drehgestelle, Lauftechnik, Adhäsion
2.2 Bremsen
2.3 Traktionsantriebssysteme
2.4 Hilfsbetriebe und Komfortanlagen
2.5 Steuerung und Regelung

3 Infrastruktur:
3.1 Fahrweg
3.2 Bahnstromversorgung
3.3 Sicherungsanlagen

4 Betrieb:
4.1 Interoperabilität, Normen und Zulassung
4.2 RAMS, LCC
4.3 Anwendungsbeispiele

Voraussichtlich ein oder zwei Gastvorträge

Lecture notes
Abgabe der Unterlagen (gegen eine Schutzgebühr) zu Beginn des Semesters. Rechtzeitig eingeschriebene Teilnehmer können die Unterlagen auf Wunsch und gegen eine Zusatzgebühr auch in Farbe beziehen.

Prerequisites / notice
Dozent: Dr. Markus Meyer, Emkamatik GmbH

Voraussichtlich ein oder zwei Gastvorträge von anderen Referenten.

EST I (Herbstsemester) kann als in sich geschlossene einsemestrige Vorlesung besucht werden. EST II (Frühjahrssemester) dient der weiteren Vertiefung der Fahrzeugtechnik und der Integration in die Bahninfrastruktur.

252-0535-00L Advanced Machine Learning

W 10 credits 3V+2U+4A C. Cotrini Jimenez

Abstract
Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

Objective
Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real world data.

Content
The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:
- Fundamentals:
  - What is data?
  - Bayesian Learning
  - Computational learning theory
- Supervised learning:
  - Ensembles: Bagging and Boosting
  - Max Margin methods
  - Neural networks
- Unsupervised learning:
  - Dimensionality reduction techniques
  - Clustering
  - Mixture Models
  - Non-parametric density estimation
  - Learning Dynamical Systems

Lecture notes
No lecture notes, but slides will be made available on the course webpage.
This course covers fundamental and advanced concepts of modern computer graphics. Students will learn the fundamentals of digital scene representations, advanced physically-based light transport algorithms for generating photorealistic images from these scene representations, and inverse rendering methods for recovering digital scene representations from captured images.

At the end of the course, the students will be able to build a rendering system based on path-tracing algorithms. The students will learn the principles of physically-based rendering and computer graphics. In addition, the course is intended to stimulate the student's curiosity to explore the field of computer graphics in subsequent classes or on their own.

We will begin with an introduction to light emission and radiometric quantities, followed by an exploration of geometry representations and texture mapping.

Next, we will mathematically formulate the physics of light transport and appearance modeling. Subsequently, we will introduce relevant concepts from Monte Carlo integration and develop path-tracing algorithms to solve these equations by simulating light transport for direct and global illumination due to hard surfaces and participating media, such as fog, smoke, and translucent objects.

Moreover, we will present techniques for significantly improving path-tracing efficiency, including importance sampling, multiple importance sampling, stratified sampling, denoising, and acceleration data structures.

The course lectures will conclude with an overview of image-based capture and rendering methods. Topics covered will include geometry reconstruction, material acquisition, differentiable rendering, and image-based rendering.

The programming assignments will be in C++. This will not be taught in the class.

The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.

Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.
Objective

Engineering uses the laws of physics to predict the behavior of a system. Biological systems are so diverse and complex prompting the question whether we can apply unifying concepts of theoretical physics coping with the multiplicity of life's mechanisms.

Objective of this course is to show that biological phenomena despite their variety can be analytically described using only two principles from statistical mechanics: maximization of the entropy and minimization of the Gibbs free energy.

Starting point of the course is the probability theory, which enables to derive step-by-step the two pillars of thermodynamics from the perspective of statistical mechanics: the maximization of entropy according to the Boltzmann's law as well as the minimization of the Gibbs free energy. Then, an assortment of biological phenomena at the molecular and cellular level (e.g. cytoskeletal polymerization, action potential, photosynthesis, gene regulation, morphogen patterning) will be examined at the light of these two principles with the aim to derive a quantitative expression describing their behavior. Each analytical model is finally validated by comparing it with the corresponding experimental results from the literature.

By the end of the course, students will also learn to critically evaluate the concepts of making an assumption and making an approximation.

Content

- Basics of theory of probability
- Boltzmann's law
- Entropy maximization and Gibbs free energy minimization
- Ligand-receptor: two-state systems and the MWC model
- Random walks, diffusion, crowding
- Electrostatics for salty solutions
- Elasticity: fibers and membranes
- Molecular motors
- Action potential: Hodgkin-Huxley model
- Photosynthesis and vision
- Gene regulation
- Development: Turing patterns

Theory and corresponding exercises are merged together during the classes.

Lecture notes

No lecture notes because the two proposed textbooks are more than exhaustive!

I am willingly available Mondays 17.00 o'clock - 18.00 in my office GLC F12.2 for whatever discussion about the lessons and the exercises.

!!! I am using OneNote. All lectures will be broadcast via ZOOM, while corresponding videos of the previous years (lectures and exercises) are available in Moodle !!!

Literature

As further deepening:

Prerequisites / notice

Participants need a good command of:
- differentiation and integration of a function with one or more variables (basics of Analysis),
- Newton's and Coulomb's laws (basics of Mechanics and Electrostatics).

Notions of vectors in 2D and 3D are beneficial.

Competencies

Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management

Social Competencies
- Communication
- Cooperation and Teamwork
- Customer Orientation
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation

Personal Competencies
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

Prerequisites / notice

A maximum of 12 medical degree students and 12 (biomedical) engineering degree students can be admitted, their number should be equal.

IMPORTANT: Note that a special permission from the lecturers is required to register for this course. Contact the head lecturer to that end.
Abstract
Cross-disciplinary collaboration between engineers and medical doctors is indispensable for innovation in health care. This course brings together engineering students from ETH Zurich and medical students from the University of Zurich to experience the rewards and challenges of such interdisciplinary work in a project based learning environment.

Objective
The main goal of this course is to demonstrate the differences in communication between the fields of medicine and engineering. Since such differences become most evident during actual collaborative work, the course is based on a project in physiology, medical or clinical research that combines medicine and engineering.

For the engineering students, the specific aims of the course are to:
- Identify and precisely define a clinical need;
- Acquire a working understanding of the investigated system;
- Identify the engineering challenges in the project and communicate them to the medical students;
- Develop and implement, together with the medical students, solution strategies for the identified challenges;
- Present the solution concept to a cross-disciplinary audience; Preliminary need and solution validation;

Content
After a general introduction to interdisciplinary communication, need identification and product development, the engineering students will team up with medical students to 1) identify a clinically relevant need, 2) develop early-stage solution concepts to it. In the process, they will be supervised both by lecturers from ETH Zurich and the University of Zurich, receiving coaching customized to the project. The project is usually defined by the team itself, but can also be guided by the lecturers. The course will end with each team presenting identified need and solution concept to a cross-disciplinary audience.

Lecture notes
Lecture handouts and relevant material will be provided.

Prerequisites
IMPORTANT: Note that a special permission from the lecturers is required to register for this course. Contact the head lecturer to that end.

227-0965-00L Micro and Nano-Tomography of Biological Tissues

Abstract
The lecture introduces the physical and technical know-how of X-ray tomographic microscopy. Several X-ray imaging techniques (absorption-, phase- and darkfield contrast) will be discussed and their use in daily research, in particular biology, is presented. The course discusses the aspects of quantitative evaluation of tomographic data sets like segmentation, morphometry and statistics.

Objective
Introduction to the basic concepts of X-ray tomographic imaging, image analysis and data quantification at the micro and nano scale with particular emphasis on biological applications.

Content
Synchrotron-based X-ray micro- and nano-tomography is today a powerful technique for non-destructive, high-resolution investigations of a broad range of materials. The high-brilliance and high-coherence of third generation synchrotron radiation facilities allow quantitative, three-dimensional imaging at the micro and nanometer scale and extend the traditional absorption imaging technique to edge-enhanced and phase-sensitive measurements, which are particularly suited for investigating biological samples.

The lecture includes a general introduction to the principles of tomographic imaging from image formation to image reconstruction. It provides the physical and engineering basics to understand how imaging beamlines at synchrotron facilities work, looks into the recently developed phase contrast methods, and explores the first applications of X-ray nano-tomographic experiments.

The course finally provides the necessary background to understand the quantitative evaluation of tomographic data, from basic image analysis to complex morphometrical computations and 3D visualization, keeping the focus on biomedical applications.

Lecture notes
Available online

Literature
Will be indicated during the lecture.

252-0834-00L Information Systems for Engineers

Abstract
This course provides the basics of relational databases from the perspective of the user.

We will discover why tables are so incredibly powerful to express relations, learn the SQL query language, and how to make the most of it. The course also covers support for data cubes (analytics).
Objective

Do you want to be able to query your own data productively and efficiently in your future semester projects, bachelor's thesis, master thesis, or PhD thesis? Are you looking for something beyond the Python+Pandas hype? This course teaches you how to do so as well as the dos and don'ts.

This lesson is complementary with Big Data for Engineers as they cover different time periods of database history and practices -- you can take them in any order, even though it might be more enjoyable to take this lecture first.

After visiting this course, you will be capable to:

1. Explain, in the big picture, how a relational database works and what it can do in your own words.
2. Explain the relational data model (tables, rows, attributes, primary keys, foreign keys), formally and informally, including the relational algebra operators (select, project, rename, all kinds of joins, division, cartesian product, union, intersection, etc).
3. Perform non-trivial reading SQL queries on existing relational databases, as well as insert new data, update and delete existing data.
4. Design new schemas to store data in accordance to the real world's constraints, such as relationship cardinality
5. Explain what bad design is and why it matters.
6. Adapt and improve an existing schema to make it more robust against anomalies, thanks to a very good theoretical knowledge of what is called "normal forms".
7. Understand how indices work (hash indices, B-trees), how they are implemented, and how to use them to make queries faster.
8. Access an existing relational database from a host language such as Java, using bridges such as JDBC.
9. Explain what data independence is all about and didn't age a bit since the 1970s.
10. Explain, in the big picture, how a relational database is physically implemented.
11. Know and deal with the natural syntax for relational data, CSV.
12. Explain the data cube model including slicing and dicing.
13. Store data cubes in a relational database.
14. Map cube queries to SQL.
15. Slice and dice cubes in a UI.

And of course, you will think that tables are the most wonderful object in the world.

Content

Using a relational database

1. Introduction
2. The relational model
3. Data definition with SQL
4. The relational algebra
5. Queries with SQL

Taking a relational database to the next level

6. Database design theory
7. Databases and host languages
8. Databases and host languages
9. Indices and optimization
10. Database architecture and storage

Analytics on top of a relational database

12. Data cubes

Outlook

13. Outlook

Literature

- Lecture material (slides).
- Book: "Database Systems: The Complete Book", H. Garcia-Molina, J.D. Ullman, J. Widom (it is not required to buy the book, as the library has it)

Prerequisites / notice

For non-CS/DS students only, BSc and MSc
Elementary knowledge of set theory and logic
Knowledge as well as basic experience with a programming language such as Pascal, C, C++, Java, Haskell, Python
**Competencies**

**Subject-specific Competencies**

- Concepts and Theories: assessed
- Techniques and Technologies: assessed

**Method-specific Competencies**

- Analytical Competencies: assessed
- Decision-making: assessed
- Media and Digital Technologies: fostered
- Problem-solving: fostered

**Social Competencies**

- Communication: fostered
- Sensitivity to Diversity: fostered

---

**252-3110-00L Human Computer Interaction**

**Objective**

The goal of the course is that students should understand the principles of user-centred design and be able to apply these in practice. As well as understand the basic notions of Computational Design in a HCI context.

**Content**

The course will introduce students to several methods of analysing the user experience, showing how these can be used at different stages of system development from requirements analysis through to usability testing.

Students will get experience of designing and carrying out user studies as well as analysing results. The course will also cover the basic principles of interaction design. Practical exercises related to touch and gesture-based interaction will be used to reinforce the concepts introduced in the lecture. To get students to further think beyond traditional system design, we will discuss issues related to ambient information and awareness.

---

**263-5200-00L Probabilistic Artificial Intelligence**

**Abstract**

This course introduces core modeling techniques and algorithms from machine learning, optimization and control for reasoning and decision making under uncertainty, and study applications in areas such as robotics.

**Objective**

How can we build systems that perform well in uncertain environments? How can we develop systems that exhibit “intelligent” behavior, without prescribing explicit rules? How can we build systems that learn from experience in order to improve their performance? We will study core modeling techniques and algorithms from statistics, optimization, planning, and control and study applications in areas such as robotics. The course is designed for graduate students.

**Content**

Topics covered:
- Probability
- Probabilistic inference (variational inference, MCMC)
- Bayesian learning (Gaussian processes, Bayesian deep learning)
- Probabilistic planning (MDPs, POMDPs)
- Multi-armed bandits and Bayesian optimization
- Reinforcement learning

**Prerequisites / notice**

Solid basic knowledge in statistics, algorithms and programming.

The material covered in the course “Introduction to Machine Learning” is considered as a prerequisite.

---

**263-5902-00L Computer Vision**

**Abstract**

The goal of this course is to provide students with a good understanding of computer vision and image analysis techniques. The main concepts and techniques will be studied in depth and practical algorithms and approaches will be discussed and explored through the exercises.

**Objective**

The objectives of this course are:
1. To introduce the fundamental problems of computer vision.
2. To introduce the main concepts and techniques used to solve those.
3. To enable participants to implement solutions for reasonably complex problems.
4. To enable participants to make sense of the computer vision literature.

**Content**

Camera models and calibration, invariant features, Multiple-view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition

It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts before taking this course.

---

**351-0555-00L Open- and User Innovation**

**Abstract**

The course introduces the students to the long-standing tradition of actively involving users of technology and other knowledge-intensive products in the development and production process, and through own cases they develop an entrepreneurial understanding of product development under distributed, user-centered, or open innovation strategies.

---

**Prerequisites / notice**

Not for students belonging to D-MTEC!
Objective

The course includes both lectures and exercises alternately. The goal is to understand the opportunity of user innovation for management and develop strategies to harness the value of user-developed ideas and contributions for firms and other organizations.

The students actively participate in discussions during the lectures and contribute presentations of case studies during the exercises. The combination should allow to compare theory with practical cases from various industries.

The course presents and builds upon recent research and challenges the students to devise innovation strategies that take into account the availability of user expertise, free and public knowledge, and the interaction with communities that span beyond one organization.

Performance assessment will be: a written group essay based on the open/user innovation case that participants will research and present during the block seminar (including the slides). Each group will have to hand in a 15-20 page essay, details on the required format and the content will be distributed during the course. Active lass participation is required.

Content

This course on user innovation extends courses on knowledge management and innovation as well as marketing. The students are introduced to the long-standing tradition of actively involving users of technology and other knowledge-intensive products in the development and production process, and through own cases they develop an entrepreneurial understanding of product development under distributed, user-centered, or open innovation strategies. Theoretical underpinnings taught in the course include models of innovation, the structuration of technology, and an introduction to entrepreneurship.

Lecture notes

The slides of the lectures are made available and updated continuously through Moodle.

Literature

Relevant literature for the course includes slides and reading assignments. Papers will be made available through a corresponding Moodle group.

Abstract

This core course provides insights into the basic theories, principles, concepts, and techniques used to design, analyze, and improve the operational capabilities of an organization.

Objective

This course provides students with a broad theoretical basis for understanding, designing, analyzing, and improving manufacturing operations. After completing this course:

1. Students can apply key concepts of POM to detail an operations strategy.
2. Students can do simple forecasting of demand and plan the needed capacity to meet it.
3. Students can conduct process mapping analysis, use it to design and improve processes and layouts, and elaborate on the limitations of the chosen method.
4. Students can choose IT, OT, and automation technology for manufacturing applications.
5. Students can design information flows, manage master data, and use it to plan and control a factory.
6. Students can design material flows in and beyond factories.
7. Students can design performance management systems.
8. Students can select and use problem-solving tools to improve quality and productivity.
9. Additional skills: Students acquire experience in teamwork.

Content

Production and Operations Management (POM) is at the heart of any business. It is concerned with the business processes that transform input into output and deliver products and services to customers. Factory management is an important part of POM, but it is much more than what takes place inside the production facilities of companies like ABB, Boeing, BMW, LEGO, Nestlé, Roche, TESLA, and Toyota. Did you know that the largest portion of assets and employees in most organizations are engaged in the operations function? Although this course focuses on manufacturing, all types of organizations depend on their operational capabilities. With the ongoing globalization and digitization of manufacturing, POM has won a deserved status for providing a competitive advantage.

This course covers the following topics: Introduction to POM, Manufacturing strategy, Forecasting and capacity, Process design, Layout, Industry 4.0, Information flow, Material flow, Logistics/SCM

Performance management, Performance improvement, Quality management, and Maintenance.

This course is administered via Moodle. The course is designed around five elements:
2. Video lectures. Short video lectures presenting basic POM concepts.
3. Class lectures. Deep-dives with case examples on select topics.
4. FactoryVR group assignment. FactoryVR allows students to visit factories virtually.
5. Quizzes. A few quizzes during the semester help students check their progress and prepare for the written exam.

Literature

Suggested literature is provided in the syllabus.
What causes economic business cycles? How are limited resources, competition, and cooperation reflected in growth dynamics? To answer such questions, we combine macroeconomic models and methods of nonlinear dynamics. We study the role of bifurcations and control parameters for dynamic stability. Feedback cycles and coupled dynamics are reasons for limited predictability, instability and chaos.

Our approach to economic dynamics combines insights from different disciplines: macroeconomics studying business cycles and growth, system dynamics rooted general system theory and cybernetics, and nonlinear dynamics using applied mathematics.

We start with a comparison of different modeling approaches, to highlight the problems and challenges of system modeling. The subsequent lectures then introduce different one- and two-dimensional nonlinear models with applications in economics, such as models of supply and demand, business cycles, growth and competition.

Emphasis is on the formal analysis of these models using methods from applied mathematics and tools for solving coupled differential equations.

Weekly self-study tasks are used to apply the concepts introduced in the lectures. We practice how to solve nonlinear models formally and numerically and how to interpret the results.

Lecture notes
The lecture slides are provided as handouts - including notes and literature sources - to registered students only. All material is to be found on the Moodle platform. More details during the first lecture.

Prerequisites / notice
Students should be familiar with nonlinear differential equations and should have basic programming skills. All necessary details to solve nonlinear models will be provided in the course. The course will not build on mathematical proofs, optimization, statistics, efficient numerical computation and other specialized skills.

376-0121-00L Multiscale Bone Biomechanics W 6 credits 3S R. Müller, X.-H. Qin
The seminar provides state-of-the-art insight to the biomechanical function of bone from molecules, to cells, tissue and up to the organ. Multiscale imaging and simulation allows linking different levels of hierarchy, where systems biology helps understanding the mechanobiological response of bone to loading and injury in scenarios relevant for personalized health and translational medicine.

Objective
The learning objectives include
1. advanced knowledge of the state-of-the-art in multiscale bone biomechanics;
2. basic understanding of the biological principles governing bone in health, disease and treatment from molecules, to cells, tissue and up to the organ;
3. good understanding of the prevalent biomechanical testing and imaging techniques on the various levels of bone hierarchy;
4. practical implementation of state-of-the-art multiscale simulation techniques;
5. improved programing skills through the use of python;
6. hands on experience in designing solutions for clinical and industrial problems;
7. encouragement of critical thinking and creating an environment for independent and self-directed studying.
Bone is one of the most investigated biological materials due to its primary function of providing skeletal stability. Bone is susceptible to different local stimuli including mechanical forces and has great capabilities in adapting its mechanical properties to the changes in its environment. Nevertheless, aging or hormonal changes can make bone lose its ability to remodel appropriately, with loss of strength and increased fracture risk as a result, leading to devastating diseases such as osteoporosis.

To better understand the biomechanical function of bone, one has to understand the hierarchical organization of this fascinating material down from the molecules, to the cells, tissue and up to the organ. Multiscale imaging and simulation allow to link these different levels of hierarchy. Incorporating systems biology approaches, not only biomechanical strength of the material can be assessed but also the mechanobiological response of the bone triggered by loading and injury in scenarios relevant for personalized health. Watching cells working together to build and repair bone in a coordinated fashion is a spectacle, which will need dynamic image content and deep discussions in the lecture room to probe the imagination of the individual student interested in the topic. Lastly, state-of-the-art developments in tissue engineering and regeneration, 3D bioprinting and bio-manufacturing and organoid technology will be highlighted towards personalized health.

For the seminar, concepts of video lectures will be used in a flipped classroom setup, where students can study the basic biology, engineering, and mathematical concepts in video tutorials online (TORQUES). All videos and animations will be incorporated in Moodle and PolyBook allowing studying and interactive course participation online. It is anticipated that the students need to prepare 2x45 minutes for the study of the actual lecture material. The course is structured as a seminar in three parts of 45 minutes with video lectures and a flipped classroom setup. In the first part (TORQUES: Tiny, Open-with-Restrictions courses focused on QUAlity and Effectiveness), students study the basic concepts in short, interactive video lectures on the online learning platform Moodle. Students are able to post questions at the end of each video lecture or the Moodle forum that will be addressed in the second part of the lectures using a flipped classroom concept. For the flipped classroom, the lecturers may prepare additional teaching material to answer the posted questions (Q&A).

Following the Q&A, the students will have to form small groups to try to solve such problems and to present their solutions for advanced multiscale investigation of bone ranging from basic science to clinical application. Towards the end of the semester, students will have to present self-selected publications associated with the different topics of the lecture identified through PubMed or the Web of Science.

For the flipped classroom, the lecturers may prepare additional teaching material to answer the posted questions (Q&A).

Following the Q&A, the students will have to form small groups to try to solve such problems and to present their solutions for advanced multiscale investigation of bone ranging from basic science to clinical application. Towards the end of the semester, students will have to present self-selected publications associated with the different topics of the lecture identified through PubMed or the Web of Science.

For the seminar, concepts of video lectures will be used in a flipped classroom setup, where students can study the basic biology, engineering, and mathematical concepts in video tutorials online (TORQUES). All videos and animations will be incorporated in Moodle and PolyBook allowing studying and interactive course participation online. It is anticipated that the students need to prepare 2x45 minutes for the study of the actual lecture material. The course is structured as a seminar in three parts of 45 minutes with video lectures and a flipped classroom setup. In the first part (TORQUES: Tiny, Open-with-Restrictions courses focused on QUAlity and Effectiveness), students study the basic concepts in short, interactive video lectures on the online learning platform Moodle. Students are able to post questions at the end of each video lecture or the Moodle forum that will be addressed in the second part of the lectures using a flipped classroom concept. For the flipped classroom, the lecturers may prepare additional teaching material to answer the posted questions (Q&A).

Prerequisites / notice
- Students should be proficient in programming (any language).
- Note: assignments will be in Python. Students are expected to learn Python on their own if not experienced with this programming language.
- Course prerequisites:
  - For Biomedical Engineering Master's: none
  - For ITET Master's: none
  - For D-MAVT Master's: none
  - For D-HEST Master's and PhD students:
    - If BSc in electrical/mechanical engineering or computer science: none
    - If any other BSc program: 376-0022-00L (Imaging and Computing in Medicine) or 376-1983-00L (Foundations of Data Science)

Competencies

Subject-specific Competencies
- Concepts and Theories assessed
- Techniques and Technologies assessed

Method-specific Competencies
- Analytical Competencies assessed
- Decision-making fostered
- Media and Digital Technologies fostered
- Problem-solving assessed

Social Competencies
- Communication fostered
- Cooperation and Teamwork fostered

Personal Competencies
- Adaptability and Flexibility fostered
- Creative Thinking assessed
- Critical Thinking assessed
- Integrity and Work Ethics fostered
- Self-direction and Self-management fostered

376-1177-00L Human Factors I

Abstract
Strategies of human-system-interaction, individual needs, physical & mental abilities, and system properties are key factors affecting the quality and performance in interaction processes. In the lecture, factors are investigated by basic scientific approaches. Discussed topics are important for optimizing people's health, well-being, and satisfaction as well as the overall system performance.

Objective
The goal of the lecture is to empower students in better understanding the applied theories, principles, and methods in various applications. Students are expected to learn about how to enable an efficient and qualitatively high standing interaction between human and the environment, considering costs, benefits, health, and safety as well. Thus, an ergonomic design and evaluation process of products, tasks, and environments may be promoted in different disciplines. The goal is achieved in addressing a broad variety of topics and embedding the discussion in macroscopic factors such as the behavior of consumers and objectives of economy.

Content
- Physiological, physical, and cognitive factors in sensation, perception, and action
- Body spaces and functional anthropometry, Digital Human Models
- Experimental techniques in assessing human performance, well-being, and comfort
- Usability engineering in system designs, product development, and innovation
- Human information processing and biological cybernetics
- Interaction among consumers, environments, behavior, and tasks

Literature
- Gavriel Salvendy, Handbook of Human Factors and Ergonomics, 4th edition (2012), is available on NEBIS as electronic version and for free to ETH students
- Further textbooks are introduced in the lecture
- Brouchures, checklists, key articles etc. are uploaded in ILIAS

376-1219-00L Rehabilitation Engineering II: Rehabilitation of Sensory and Vegetative Functions

Abstract
Rehabilitation Engng is the application of science and technology to ameliorate the handicaps of individuals with disabilities to reintegrate them into society. The goal is to present classical and new rehabilitation engineering principles applied to compensate or enhance motor, sensory, and cognitive deficits. Focus is on the restoration and treatment of the human sensory and vegetative system.

Objective
Provide knowledge on the anatomy and physiology of the human sensory system, related dysfunctions and pathologies, and how rehabilitation engineering can provide sensory restoration and substitution.

Content
Introduction, problem definition, overview
Rehabilitation of visual function
- Anatomy and physiology of the visual sense
- Technical aids (glasses, sensor substitution)
- Retina and cortex implants
Rehabilitation of hearing function
- Anatomy and physiology of the auditory sense
- Hearing aids
- Cochlea Implants
Rehabilitation and use of kinesthetic and tactile function
- Anatomy and physiology of the kinesthetic and tactile sense
- Tactile/haptic displays for motion therapy (incl. electrical stimulation)
- Role of displays in motor learning
Rehabilitation of vestibular function
- Anatomy and physiology of the vestibular sense
- Rehabilitation strategies and devices (e.g. BrainPort)
Rehabilitation of vegetative Functions
- Cardiac Pacemaker
- Phrenic stimulation, artificial breathing aids
- Bladder stimulation, artificial sphincter
Brain stimulation and recording
- Deep brain stimulation for patients with Parkinson, epilepsy, depression
- Brain-Computer Interfaces
Literature

Selected Journal Articles and Web Links:

Abstract

This course focuses on the emerging, interdisciplinary field of physical human-robot interaction, bringing together themes from robotics, real-time control, human factors, haptics, virtual environments, interaction design and other fields to enable the development of human-oriented robotic systems.
Objective

The objective of this course is to give an introduction to the fundamentals of physical human robot interaction, through lectures on the underlying theoretical/mechatronics aspects and application fields, in combination with a hands-on lab tutorial. The course will guide students through the design and evaluation process of such systems.

By the end of this course, you should understand the critical elements in human-robot interactions - both in terms of engineering and human factors - and use these to evaluate and design safe and efficient assistive and rehabilitative robotic systems. Specifically, you should be able to:

1) identify critical human factors in physical human-robot interaction and use these to derive design requirements;
2) compare and select mechatronic components that optimally fulfill the defined design requirements;
3) derive a model of the device dynamics to guide and optimize the selection and integration of selected components into a functional system;
4) design control hardware and software and implement and test human-interactive control strategies on the physical setup;
5) characterize and optimize such systems using both engineering and psychophysical evaluation metrics;
6) investigate and optimize one aspect of the physical setup and convey and defend the gained insights in a technical presentation.

Content

This course provides an introduction to fundamental aspects of physical human-robot interaction. After an overview of human haptic, visual and auditory sensing, neurophysiology and psychophysics, principles of human-robot interaction systems (kinematics, mechanical transmissions, robot sensors and actuators used in these systems) will be introduced. Throughout the course, students will gain knowledge of interaction control strategies including impedance/admittance and force control, haptic rendering basics and issues in device design for humans such as transparency and stability analysis, safety hardware and procedures. The course is organized into lectures that aim to bring students up to speed with the basics of these systems, readings on classical and current topics in physical human-robot interaction, laboratory sessions and lab visits.

Students will attend periodic laboratory sessions where they will implement the theoretical aspects learned during the lectures. Here the salient features of haptic device design will be identified and theoretical aspects will be implemented in a haptic system based on the haptic platform (https://roborix.ethz.ch/teleop-software/haptic-platform.html), by creating simple dynamic haptic virtual environments and understanding the performance limitations and causes of instabilities (direct/virtual coupling, friction, damping, time delays, sampling rate, sensor quantization, etc.) during rendering of different mechanical properties.

Lecture notes

Will be distributed on Moodle before the lectures.

Literature

Prerequisites / notice

The registration is limited to 26 students
There are 4 credit points for this lecture.
The lecture will be held in English.
The students are expected to have basic control knowledge from previous classes.

### Abstract

This course includes an introduction to study design, measurement techniques, signal processing, as well as musculoskeletal modeling with regards to human movement and its clinical applications.

### Objective

The students are able to analyse the human movement from a technical point of view, to process the data and perform modeling with a focus towards clinical application.

### Clinical and Movement Biomechanics

**W 4 credits**  
**D. K. Ravi, S. H. Hosseini Nasab, R. List, further lecturers**

### Course Details

**Content**

Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.

**Objective**

The course covers the following topics:

1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
2. The concept of biocompatibility.
3. Introduction into methodology used in biomaterials research and application.
4. Introduction to different material classes in use for medical applications.

**Abstract**

Introduction into natural and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering, drug delivery and for medical devices are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated.

A link between academic research and industrial entrepreneurship is demonstrated by external guest speakers, who present their current research topics.

**Literature**

(available online via ETH library)

Handouts and references in handouts and references therin.

### Bone Biology: Basics, Research and Clinics

**W 2 credits**  
**E. Wehrle, G. A. Kuhn, to be announced**

### Course Details

**Abstract**

The course gives an introduction into bone biology and provides an overview on current research methods and clinical approaches. Emphasis is put on skeletal development and metabolism, osteoporosis as well as fracture healing. Each topic is structured into three parts: basics, research and clinics.

**Objective**

After completing the Bone Biology course, students will be able to:

1. Remember and apply basics in bone biology and disease
2. Remember clinical features and surgical approaches
3. Select adequate research methods and approaches
4. Evaluate publications on topics presented in the lecture

Abstract

Trauma biomechanics in an interdisciplinary research field investigating the biomechanics of injuries and related subjects such as prevention. The lecture provides an introduction to the basic principles of trauma biomechanics.

Objective

Introduction to the basic principles of trauma biomechanics.

Content

This lecture serves as an introduction to the field of trauma biomechanics. Emphasis is placed on the interdisciplinary nature of impact biomechanics, which uses the combination of fundamental engineering principles and advanced medical technologies to develop injury prevention measures. Topics include: accident statistics and accident reconstruction, biomechanical response of the human to impact loading, injury mechanisms and injury criteria, test methods (including crash tests), computer simulations, aspects of vehicle safety. Real world examples mainly from automobile safety are used to augment lecture material.

Lecture notes

Handouts will be made available.

401-0547-00L  Introduction to Mathematical Optimization

Objective

The goal of the course is to obtain a good understanding of some of the most fundamental mathematical optimization techniques used to solve linear programs and basic combinatorial optimization problems. The students will also practice applying the learned models to problems in engineering.

Content

Topics covered in this course include:
- Linear programming (simplex method, duality theory, shadow prices, ...).
- Basic combinatorial optimization problems (spanning trees, shortest paths, network flows, ...).
- Modelling with mathematical optimization: applications of mathematical programming in engineering.

Literature

Information about relevant literature will be given in the lecture.

Prerequisites / notice

This course is meant for students who did not already attend the course "Mathematical Optimization", which is a more advance lecture covering similar topics. Compared to "Mathematical Optimization", this course has a stronger focus on modeling and applications.

402-0341-00L  Medical Physics I

Objective

Introduction to the fundamentals of medical radiation physics. Functional chain due to radiation exposure from the primary physical effect to the radiobiological and medically manifest secondary effects. Dosimetric concepts of radiation protection in medicine. Mode of action of radiation sources used in medicine and its illustration by means of Monte Carlo simulations.

Content

The lecture is covering the basic principles of ionizing radiation and its physical and biological effects. The physical interactions of photons as well as charged particles will be reviewed and their consequences for medical applications will be discussed. The concept of Monte Carlo simulation will be introduced in the exercises and will help the student to understand the characteristics of ionizing radiation in simple and complex situations. Fundamentals in dosimetry will be provided in order to understand the physical and biological effects of ionizing radiation. Deterministic as well as stochastic effects will be discussed and fundamental knowledge about radiation protection will be provided. In the second part of the lecture series, we will cover the generation of ionizing radiation. By this means, the x-ray tube, the clinical linear accelerator, and different radioactive sources in radiology, radiotherapy and nuclear medicine will be addressed. Applications in radiology, nuclear medicine and radiotherapy will be described with a special focus on the physics underlying these applications.

Lecture notes

A script will be provided.

Prerequisites / notice

For students of the MAS in Medical Physics (Specialization A) the performance assessment is offered at the earliest in the second year of the studies.

Competencies

Subject-specific Competencies

Concepts and Theories assessed
Techniques and Technologies assessed

Cellular Biochemistry (Part I)

Objective

Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

Abstract

The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Personal Competencies

Adaptability and Flexibility fostered
Creative Thinking assessed
Critical Thinking assessed
Integrity and Work Ethics fostered
Self-awareness and Self-reflection fostered
Self-direction and Self-management fostered

401-0547-00L  Introduction to Mathematical Optimization

W 5 credits 2V+1U  D. Adjahashvili

402-0341-00L  Medical Physics I

W 6 credits 2V+1U  P. Manser

551-0319-00L  Cellular Biochemistry (Part I)

W 3 credits 2V  U. Kutay, F. Allain, T. Kleele, I. Zemp
Content
Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes. Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

Lecture notes
Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

Literature
Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

Prerequisites / notice
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

Competencies

Concepts and Theories assessed
Techniques and Technologies assessed

► Multidisciplinary Courses
The students are free to choose individually Master's courses from the Course Catalogue of ETH Zurich, ETH Lausanne and the Universities of Zurich (https://www.uzh.ch/cmsssl/en/studies/application/chmobilityin.html) and St. Gallen.

Course Catalogue of ETH Zurich

► Semester Project
Number Type ECTS Hours Lecturers
151-1002-00L Semester Project Mechanical Engineering O 8 credits 17A Supervisors

Abstract
The semester project is designed to train the students in the solution of specific engineering problems. This makes use of the technical and social skills acquired during the master's program. Tutors propose the subject of the project, elaborate the project plan, and define the roadmap together with their students, as well as monitor the overall execution.

Objective
The semester project is designed to train the students in the solution of specific engineering problems. This makes use of the technical and social skills acquired during the master's program.

► Industrial Internship
Number Type ECTS Hours Lecturers
151-1090-00L Industrial Internship O 8 credits external organisers

Abstract
Access to the company list and request for recognition under www.mavt.ethz.ch/praxis.
No registration required via myStudies.

Objective
The main objective of the minimum twelve-week internship is to expose Master's students to the industrial work environment. The aim of the Industrial Internship is to apply engineering knowledge to practical situations.

► Science in Perspective
see Science in Perspective: Language Courses ETH/UZH
see Science in Perspective: Type A: Enhancement of Reflection Capability

Recommended Science in Perspective (Type B) for D-MAVT

► Master's Thesis
Number Type ECTS Hours Lecturers
151-1001-00L Master's Thesis Mechanical Engineering O 30 credits 64D Supervisors

Abstract
Students who fulfill the following criteria are allowed to begin with their Master's Thesis: a. successful completion of the bachelor program; b. fulfilling of any additional requirements necessary to gain admission to the master programme; c. successful completion of the semester project and industrial internship; d. achievement of 28 ECTS in the category "Core Courses".

The Master's Thesis must be approved in advance by the tutor and is supervised by a professor of ETH Zurich.

Objective
The Master's programs are concluded by the master's thesis. The thesis is aimed at enhancing the student's capability to work independently toward the solution of a theoretical or applied problem. The subject of the master's thesis, as well as the project plan and roadmap, are proposed by the tutor and further elaborated with the student.

The thesis is aimed at enhancing the student's capability to work independently toward the solution of a theoretical or applied problem.

► Course Units for Additional Admission Requirements
The courses below are only available for MSc students with additional admission requirements.

Number Type ECTS Hours Lecturers
406-0173-AAL Linear Algebra I and II E- 6 credits 13R N. Hungerbühler

Abstract
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.
Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.
Linear algebra is an indispensable tool of engineering mathematics. The course is an introduction to basic methods and fundamental concepts of linear algebra and its applications to engineering sciences.
Objective

After completion of this course, students are able to recognize linear structures and to apply adequate tools from linear algebra in order to solve corresponding problems from theory and applications. In addition, students have a basic knowledge of the software package Matlab.

**Abstract**: This course focuses on teaching units in chemistry, physics and mathematics that have been developed at the MINT Learning Center of the ETH Zurich. In the first meeting, the mission of the MINT Learning Center will be communicated. Furthermore, in groups of two, the students will intensively work on, refine and optimize a teaching unit following a goal set in advance.

**Objective**: Students possess theoretical knowledge and practical competences to be able to cope with the psychosocial demands of teaching.

1. They know relevant rules of conversation and conflict management and are able to apply them in an appropriate way in the school context (e.g. in parental talks).
2. They know core aspects of classroom management and know how to apply it concretely (e.g. promoting a positive learning atmosphere, avoiding disciplinary difficulties) and they are aware of possible contacts (e.g. illegal or psychological services).

**Prerequisites / notice**: This course is only apt for students who intend to enrol in the programs "Lehrdiplom" or "Didaktisches Zertifikat". It is about learning in childhood and adolescence.

**Content**: 
- Understanding findings relevant for education
- Getting to know intelligence tests
- Understanding findings relevant for education

**Literature**:

**Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).**

Learning (EW 1)*.

### Abstract
Course promotes exchange between student teachers and elementary school teachers in STEM teaching with 3 parts: 1) block seminar (ca. 16 h), 2) collaboration with elementary school teacher in a class (ca. 34 h, with approx. 50% spent in the elementary or middle school class and ca. 50% for preparation), and 3) final report (ca. 10 h). Registration implies participation in all 3 parts.

### Objective
Deepening the understanding of knowledge formation and learning processes of primary and secondary students from a cognitive and developmental psychology perspective for students. The assistant ship provides didactic experience and exposure to a different school level (more heterogenous groups such as for example low-performing to very high-performing Children, language problems etc.).

### Content
Students learn more about the potential and challenges of pupils. They get to know the early stages of knowledge as well as the development of pre-concepts of students in their subject area. The seminar with a phase of cooperation consists of three phases: In the block seminar, pre-concepts are discussed in their own subject as well as theoretical inputs from developmental and cognitive psychology. During the cooperation phase, a teaching task defined by the primary and secondary school teachers is actively undertaken in a class. Finally, a final report is written, which contains a description of the students' level of knowledge. This seminar is only suitable for students who can adapt flexibly to the needs of pupils from lower class levels.

### Prerequisites / notice

</tbody>
</table>

- **Abstract**
  - Students apply the insights, abilities and skills they have acquired within the context of an educational institution. They observe 10 lessons and teach 20 lessons independently. Two of them are as assessed as Examination Lessons.

- **Objective**
  - Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
  - They are able to assess the significance of tuition topics for their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
  - They learn the skills of the teaching trade.
  - They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
  - They learn to assess pupils’ work.
  - Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

- **Content**
  - Anlässlich der Hospitationen erläutert die Praktikumslehrperson ihre fachlichen, fachdidaktischen und pädagogischen Überlegungen, auf deren Basis sie den Unterricht geplant hat und tauscht sich mit dem/der Studierenden aus. Die von dem/der Studierenden gehaltenen Lektionen werden vor- und nachbesprochen.

- **Lecture notes**
  - Wird von der Praktikumslehrperson bestimmt.

- **Abstract**
  - The purpose of the mentored thesis is to bring together the findings from didactics and to expand them by incorporating specific teaching techniques and teaching methods. The thesis can be thematically aligned with the subsequent teaching internship.

- **Objective**
  - The students learn to link theoretical topics from the didactic education with practice-relevant aspects and to articulate the result in written form by means of a suitable task.

- **Content**
  - The choice of the topic and the definition of the contents takes place in agreement between the students and the mentor. The topic must be chosen in such a way that the learning objective described above can be achieved.

- **Literature**
  - A short guideline is available.

- **Abstract**
  - Didactics I focuses on teaching techniques as building blocks of typical lessons. This is done on the basis of the findings of teaching and learning research and their implementation in practice. The aim is the planning and implementation of effective teaching sequences as well as their evaluation and reflection.
Objective
- The students can plan, conduct and critically reflect single lessons.
- They orient themselves towards the academic goals and take into account existing knowledge, the professional environment and the ambitions of the students.
- They can apply the basic teaching principles meaningfully in their subject and suitably structure the learning phases.
- They can reduce and present complex technical content such that it is in a form suitable for the students to learn.
- They have considered examples of the common conceptual errors encountered by students

Content
- Planning a teaching unit
- Opening a lecture
- Direct Instruction
- Embedded exercises
- Learning objectives
- Practicing teaching
- Excursion Fachhochschule

Lecture notes
Lecture materials are provided via Moodle.

**Abstract**

- **Analysis I**
  - Functions: Differential and integral calculus for functions of one variable; power series. The mathematical methods are applied in a large number of examples from mechanics, physics and other areas which are basic to engineering.

- **Linear Algebra I**
  - Linear algebra is an indispensable tool of engineering mathematics. The course offers an introduction into the theory with many applications. The new notions are practised in the accompanying exercise classes. The course will be continued as Linear algebra II.

- **Chemistry I**
  - Introduction to the basics, terms and concepts of general chemistry, their application to questions in material science and their connection to laboratory experiments and projects.

- **Physics I**
  - The lecture covers the basics of classical mechanics.

**Objective**

- **Analysis I**
  - Introduction to the mathematical foundations of engineering sciences, as far as concerning differential and integral calculus in one variable.

- **Linear Algebra I**
  - Upon completion of this course, students will be able to recognize linear structures, and to solve corresponding problems in theory and in practice.

- **Chemistry I**
  - We start the lecture with the question what chemistry has to do with material science. After that, we devote ourselves to the classification and separation of substances. In the next chapter we discuss the atomic structure and the periodic table. After the introduction to stoichiometry, the field of chemistry that deals with the amounts of substances added and formed in chemical reactions, we will cover the meaning of acids and bases using material science examples.

- **Physics I**
  - The aim of this lecture is to become familiar with the central concepts of classical mechanics, to test and consolidate basic concepts and physical intuition, and to be able to describe and solve problems with applications from everyday life and technology with the tools learned.

**Lecture notes / notice**

- **Analysis I**
  - Exercises and online quizzes are an important aspect of this course. Attempts at solving these problems will be honored with a bonus on the final grade. See "Performance assessment" for more information.

- **Linear Algebra I**
  - Active participation in the exercises is part of this course. It is expected, that students submit 3/4 of all exercises for control.

- **Chemistry I**
  - Personal Competencies
    - Active participation in the exercises will be part of this course. It is expected, that students submit 3/4 of all exercises for control.

- **Physics I**
  - A skript to the lecture is provided online.

Abstract
The basic physical concepts for the description of materials are taught, partly in self-study, and applied in exercises. Basic atomistic and macroscopic concepts (e.g. phase diagrams, phase transformations, response functions) are introduced through examples. Selected topics are deepened in classroom lectures.

Objective
Students are able to
- name the basic concepts of materials science. (remember, 1)
- describe simple relations between atomic structure and macroscopic properties. (understand, 2)
- calculate basic material-specific quantities. (apply, 3)
- read and interpret phase diagrams, material characteristic (e.g. stress-strain) diagrams and Ashby plots (analyse, 4)

Content
Atomic structure
Crystalline structure and defects
Thermodynamics, phase diagrams and phase transformations
Diffusion
Mechanical and thermal properties of materials

Literature
Main textbook:
William D. Callister, Jr., David G. Rethwisch

Abstract
Practical introduction to the basics of the scientific method, materials science, physics and chemistry in the form of laboratory experiments and projects, some of which are closely related to the lectures in the first year. Important chemical and physical methods are tested, project work is practiced and the basics of working safely in the laboratory are learned.

Objective
The students
- keep a laboratory journal independently, completely and appropriately.
- can evaluate and display measurement data in a targeted manner.
- are able to write laboratory reports appropriately.
- know the communicative and rhetorical factors that are decisive for the success of an oral presentation.
- create effective presentation documents.
- know the general safety rules and disposal concepts for working in laboratories and apply them practically.
- proceed correctly in case of accidents and evacuations.
- learn practically how to fight a fire (fire protection course of the ETH).
- apply the basic knowledge in analytics, chemistry, physics and materials science acquired in the base year in a practical way.
- practice carrying out small experiments or small projects independently under supervision.

Content
In the area of scientific work: Keeping lab journals, data analysis, writing reports, presentation techniques, Test preparation and introduction to safe working and behaviour in the lab.
Lab experiments: Experiments from the fields of synthetic and analytical chemistry and experiments from the fields of physics and materials science, e.g.: Mechanical/thermal properties (e.g. modulus of elasticity, fracture mechanics), thermodynamics, colloid chemistry, "particle tracking" with DLS and microscopy, surface technology, "wood, stone and metal" processing, and electrochemistry. Some practical experiments are organized as short projects (two afternoons), e.g. "Building a microscope from a webcam", etc.
In the projects: Two "reverse engineering" projects with everyday objects: Analysis of construction and materials, functioning in the overall context, life cycle of materials, alternative materials, etc.

Lecture notes
Instructions and further information on the individual experiments and projects (objectives, theory, experimental procedure, notes on evaluation) are available on the following website (= Moodle dieser Veranstaltung).

Prerequisites / notice
Special students and auditors need a special permission from the lecturers
## Programming I

**O 2 credits 2G**

L. De Pietro

### Abstract
This course provides an introduction to the general computer and programming concepts, which are necessary to perform numerical calculations, representations and simulations in materials science.

### Objective
- Students independently develop programs to accomplish numerical calculations, representations and simulations.
- They analyse and understand the functionality of existing programs and can supplement or adapt them according to their requirements.
- They recognize basic computer science concepts and apply algorithmic thinking, i.e. they have the ability to solve problems systematically using developed algorithms.

### Content
The course contains a first introduction to Python and Matlab. It contains:

- Basic programming concepts of structural programming like
  - Variables
  - Lists
  - Loops
  - Branches
  - Control structures
- Input and output
- Modular structure of programs with functions
- Flowcharts
- Numerical accuracy
- Data evaluation and presentation
  - Regression
  - Interpolation
  - Curves fit
- Complexity Theory
- Sorting and searching
- Dynamic programming
- Recursion
- Graph Algorithms

#### Literature

---

## Examination Block 1

### Analysis III

**401-0363-10L**

**O 4 credits 2V+2U**

A. Iozzi

### Abstract
Introduction to partial differential equations. Differential equations which are important in applications are classified and solved. Elliptic, parabolic and hyperbolic differential equations are treated. The following mathematical tools are introduced: Laplace transforms, Fourier series, separation of variables, methods of characteristics.

### Objective
Mathematical treatment of problems in science and engineering. To understand the properties of the different types of partial differential equations.

### Content
Laplace Transforms:
- Laplace Transform, Inverse Laplace Transform, Linearity, s-Shifting
- Transforms of Derivatives and Integrals, ODEs
- Unit Step Function, t-Shifting
- Short Impulses, Dirac's Delta Function, Partial Fractions
- Convolution, Integral Equations
- Differentiation and Integration of Transforms

Fourier Series, Integrals and Transforms:
- Fourier Series
- Functions of Any Period p=2L
- Even and Odd Functions, Half-Range Expansions
- Forced Oscillations
- Approximation by Trigonometric Polynomials
- Fourier Integral
- Fourier Cosine and Sine Transform

Partial Differential Equations:
- Basic Concepts
- Modeling: Vibrating String, Wave Equation
- Solution by separation of variables; use of Fourier series
- D’Alembert Solution of Wave Equation, Characteristics
- Heat Equation: Solution by Fourier Series
- Heat Equation: Solutions by Fourier Integrals and Transforms
- Modeling Membrane: Two Dimensional Wave Equation
- Laplacian in Polar Coordinates: Circular Membrane, Fourier-Bessel Series
- Solution of PDEs by Laplace Transform
**Abstract**

Analysis and motivation for the necessity of a theory beyond classical mechanics to describe materials properties. The principles, terminology and concepts of quantum mechanics will be introduced and mathematically represented on the basis of simple problems.

**Objective**

- Give reasons for the necessity of quantum mechanical description of matter and explain experimental observations leading to this description.
- Clarification of the term quantum object.
- Formulate and solve the Schrödinger equation for simple problems.
- Application of the operator formalism for the calculation of observables and the interpretation of physical processes. Interpretation of the wavefunction.
- Explain the solution of the hydrogen atom. Derivation of the approach to the solution in the application of symmetries and angular momentum operators.
- Give reasons for the electron spin and calculate magnetic moments.

**Content**

- Crisis of classical physics
  - Planck's law of radiation (cavity radiation), photoelectric effect (Einstein's light quantum hypothesis), Bohr quantisation of the atom, De Broglie hypothesis
  - Wave-particle dualism - wave mechanics, matter waves, double-slit experiment, comparison of classical mechanics and quantum mechanics
- Introduction of the wave function, de-Broglie relation, probability
- Postulates of quantum mechanics
  - Introduction of the Schrödinger equation, normalisation of the wave function, stationary Schrödinger equation, location and momentum space, location representation of the momentum operator
- Wave packets (Gaussian bell curve), decay of wave packets, indeterminacy principle
- Wave mechanics with forces
  - Piecewise constant potentials, particles in the potential well, potential step, probability current density, potential wall, tunnel effect, potential well
- Formalism of quantum mechanics
  - Hilbert space, scalar product, vectors (basis), states, normalizability, completeness, eigenfunctions, notations, operators - general definitions and properties,
  - Expectation values, spectrum (discrete, continuous), matrix representation, measurement process and collapse of the wave function
- Central potential
  - Eigenvalue problem in spherical coordinates, limiting cases, particles in a 3D pot, symmetries, rotation and angular momentum, angular momentum operator and spherical surface functions
- Hydrogen atom
  - Coulomb potential, radial wave function, orbitals, atomic structure

**Lecture notes**

- Quantum Mechanics and Solid State Physics I

**Literature**

**Prerequisites**

- Physics I and II.
- Analysis I and II.
- Linear Algebra I and II.
- Fourier-Transformation from Analysis III is used, but is not a basic requirement.
Materials Characterization I

Objective
The aim of the course is to enable the students to select and apply the optimal analytical/spectroscopic methods for the identification of organic, inorganic and polymeric materials.

Content
Particular emphasis is given to qualitative and quantitative analysis of material composition at the atomic/molecular level by mass spectrometry, atomic absorption, vibrational and UV-vis spectroscopy, thermal analysis, nuclear magnetic resonance. The course will include lectures as well as hands-on practical sessions.

Abstract
The course teaches the basics and terminology of polymer synthesis. To synthesize various polymeric materials, different polymerization techniques are required. This course will introduce representative polymerization methodologies and will discuss how they operate in order to yield materials with enhanced polymeric characteristics.

Objective
1) The students will be able to recognize different polymer types and associate them with their chemical structure and properties (i.e. rubber elasticity, glass transition temperature, etc.)
2) The students will become familiar with various synthetic methods to produce polymers of different architectures and topologies
3) The students will be exposed to different characterization methods (e.g. size exclusion chromatography, mass-spectrometry, nuclear magnetic resonance) that are necessary to confirm the successful synthesis and structure of a polymer
4) The students will understand the mechanism of selected polymerization methodologies
5) The students will be introduced to state-of-the-art polymer synthesis and recent literature examples will be critically discussed

Content
Conventional chain growth polymerization, living chain growth polymerization, step growth polymerization, polymeric architectures, molecular weight determination methods, polymer properties, polymerization mechanisms, polymer characterization methods

Lecture notes
Lecture slides with references to further literature will be available on Moodle

Literature
L. Mandelkern "An Introduction to Macromolecules"
J. M. G. Cowie "Polymers: Chemistry and Physics of Modern Materials"
publications mentioned on the slides

Statistical Thermodynamics

Abstract
Foundations and applications of equilibrium thermodynamics and statistical mechanics, supplemented by an elementary theory of transport phenomena.

Objective
The course provides a solid working knowledge in thermodynamics (as the appropriate language for treating a variety of problems in materials science) and in statistical mechanics (as a systematic tool to find thermodynamic potentials for specific problems)

Lecture notes
A guideline and a summary will be provided on the course website

Literature
R. Piazza, Statistical Physics, Springer International Publishing Switzerland 2017

Crystallography - Introduction to lattices and symmetries

Abstract
The properties of crystals, which make up a large part of solid materials, are closely related to the symmetry of their internal structure. The objective of the crystallography lecture is to provide concepts and mathematical fundamentals of symmetry theory, structure-property relationships, and the basic principles of structure determination. Simple crystal structures will be discussed.

Objective
Students are able to:
- mathematically represent the geometry of a crystal lattice and derive and understand its symmetry.
- apply concepts of group theory to classify crystal lattices based on their symmetry.
- analyse simple crystal structures in terms of their symmetry.
- develop a basic understanding of the relationships between crystal structure, symmetry and physical properties of solids.
- understand the concept of X-ray diffraction as an elementary experimental technique for determining crystal structures.
- apply the methods and concepts presented in the lecture and communicate the results in written and oral form.

Content
Symmetry and crystal lattices: symmetry operations and lattices in two and three dimensions, point groups, space groups.

Crystal structures: symmetry and typical simple crystal structures.

Structural/property relationships: Neumann's principle; examples: piezoelectricity, ferroelectricity.

Lecture notes
Materials characterization: diffraction techniques.

Literature

Computational Thinking Lab I - A. Shiflet, G.W. Shiflet, Introduction to Computational Science: Modeling and Simulation for the Sciences, Princeton University Press; 2nd

Projects and Lab Courses III assessed

ECTS assessed

Semester-long project, project assignment is determined at the beginning of each semester.

Subject-specific Competencies assessed

You are going to address, in groups, problems that are arising or may arise in the context of remaining courses of your studies, that cannot be solved analytically or manually within reasonable amounts of time, but solved computationally with the help of a programming language and computers. Knowledge of a computing language is required.

Objective assessed

Getting used to the idea that solving problems using a programming language is a dynamic process, where one can learn from errors assessed

- Thinking in modules that perform a task and can be tested separately. Modules are then combined to interact lateron. fostered

- Organizing the distribution of work across a small group of students and ask questions, as soon as they arise. fostered

- Using existing resources if helpful to implement your ideas fostered

Content assessed

Develop ideas to solve well-defined problems using computational methods fostered

- Make use of collaborative tools (vscode, github) to edit, store and execute python code in groups fostered

- Create accompanying descriptions and resulting graphs (at github, using mark-down language) fostered

- Make use of internet resources or vscode to find answers to questions that arise (python command and their syntax, existing libraries, if helpful) fostered

- Short oral presentation of algorithms, results, possible improvements at the end of the semester fostered

Lecture notes assessed

There is no script for this course. Each project has its own project description at github. Information available at https://polyphys.mat.ethz.ch/education/courses/CTL-I.html and alternatively, at https://ctl.polyphys.mat.ethz.ch/

Literature assessed

Prerequisites / notice assessed

- Basic knowledge of a programming language, ideally python fostered

- github account fostered

- Local installation of python and Visual Studio code (vscode) until the 2nd week of the semester. Detailed information available at https://ctl.polyphys.mat.ethz.ch/

Competencies fostered

Subject-specific Competencies fostered

- Concepts and Theories fostered

Techniques and Technologies assessed

Method-specific Competencies assessed

Analytical Competencies assessed

Decision-making fostered

Media and Digital Technologies assessed

Problem-solving fostered

Project Management assessed

Social Competencies assessed

Communication assessed

Cooperation and Teamwork assessed

Leadership and Responsibility fostered

Negotiation fostered

Personal Competencies fostered

Adaptability and Flexibility fostered

Creative Thinking fostered

Critical Thinking fostered

Integrity and Work Ethics fostered

Projects and Lab Courses III

Number 327-0311-00L

Title A project lasting one semester, with special requirements regarding choice of materials, properties, etc., concluding project presentation event.

Type O

ECTS 8 credits

Hours 8P

Lecturers M. B. Willeke, L. De Pietro, T.-B. Schweizer

Abstract

A project lasting one semester, with special requirements regarding choice of materials, properties, etc., concluding project presentation event.

Experiments to teach experimental competence using selected examples from polymer chemistry, analytics and physics (e.g. for the storage or conversion of energy), partly closely based on courses.

Objective

Learn how to organize, manage, and execute a semester-long project.

To impart basic knowledge and experimental competence using selected examples from chemistry and physics.

Content

Semester-long project, project assignment is determined at the beginning of each semester.

Chemistry III: Synthesis of PMMA via Transesterification; PET recycling or manufacture of poly(methylmethacrylat) via radical polymerization of methylmethacrylat; 3D-printing.

Physics I, five experiments out of: reflection spectroscopy, experiments on the field of polymers, e.g. viscoelastivity of the polymer melt (or an equivalent exp.), 2 physics experiments (out of 4) at the EMPA: e.g. X-ray florescence analysis, impedance measurements of batteries, “power to gas” or texture measurement, building a Lithium ionic battery; and further physic experiments.

Lecture notes

Notes with information for each experiment (aim of the experiment, theory, experimental procedure, data analysis) will be made available via moodle (link in mystudies).

Abstract
This course provides physical foundations to understand the response of different classes of materials to electromagnetic fields, focusing on their electrical, optical, and magnetic properties, and on the basic functioning of devices that exploit such properties. The lectures build on classical and quantum mechanical concepts to provide microscopic understanding and modelling.

Objective
Student should be able to:
- Apply fundamental concepts in solid state physics to describe and explain the behavior of different types of materials, including the ability to make semi-quantitative assertions about relevant physical quantities.
- Analyze and evaluate different models and approaches to describe specific material properties, and appreciate the pertinence of these models to real-world applications, including the ability to make numerical estimates of the relevant parameters.
- Explain the working principles of a range of devices that take advantage of the physical properties of materials, including electronic, photonic, and magnetic devices.
- Develop an appreciation for the role of solid state physics in modern society and technology, and understand the importance of continued research and development in this field for future technological advancements.

Content
Understanding the electronic properties of solids is at the heart of modern society and technology. The aim of this course is to provide fundamental physical concepts that allow one to relate the electronic structure of different types of materials to their electrical, optical, and magnetic behavior as well as the functioning of basic electronic, photonic, and magnetic devices. Beyond fundamental curiosity, such level of understanding is required in order to develop and appropriately describe new classes of materials for future technology applications. The course is divided in six parts.

PART I: The electronic structure of metals, semiconductors, and insulators
Revision of classical concepts: electric fields and currents, Ohm’s and Drude’s model of electrical conductivity, Hall effect, thermoelectric effects.
Revision of quantum mechanical concepts: Electron bands, Fermi statistics, Fermi energy and Fermi surface, density of states in k-space and as a function of energy.

PART II: Semiconductors: concepts and devices

PART III: Dielectric properties of insulators

PART IV: Interaction of electromagnetic waves with matter
The electromagnetic (EM) spectrum. Electromagnetic waves in vacuum; Energy, momentum, and angular momentum of EM waves; Sources of EM radiation; EM waves in matter. The refractive index. Transmission, Reflection, and Refraction from a microscopic point of view. Optical anisotropy, Optical activity, Dichroism. Optical properties of crystalline insulators and semiconductors, glasses, and metals.

PART V: Photonic devices
Photodiodes, photovoltaic cells, light emitting devices (LEDs), Laser diodes, displays, optical fibers.

PART VI: Magnetism

Lecture notes in English, available for download at http://www.intermag.mat.ethz.ch/education.html
This lecture has the irreversible mechanical deformation of materials as its core topic. Independent of the material classes, the following phenomena are explained in detail and rigorously derived: Crystal plasticity at low temperatures (dislocation theory, hardening mechanisms, twinning, brittle-ductile transitions), plasticity in disordered structures (shear bands and strain localisation), Fracture mechanics (Griffith criterion, Weibull statistics, crack tip plasticity, J-integral, R-curve), fatigue (Wöhler curves and Paris law), environmental influences, high temperature plasticity (creep and deformation mechanism diagrams). All phenomena are illustrated by actual case studies using concrete materials and material systems. These include aluminium alloys, steels, high temperature alloys, advanced ceramics, structural polymers and composites. The lecture is supported by exercises and practical experiments and uses material databases.

Methods can be used to determine material-specific mechanical parameters are examined. The nano- and microstructure of the materials, how the mechanical properties are influenced by the composition or processing, as well as which methods can be used to determine material-specific mechanical parameters are examined. The nano- and microstructure of the materials, how the mechanical properties are influenced by the composition or processing, as well as which methods can be used to determine material-specific mechanical parameters are examined.

Abstract
Independent scientific project in a D-MATL research group. A written report will be prepared on the scientific studies carried out, as well as on the evaluation and discussion of the results.
Objective
To develop the capability of independently analyzing and addressing scientific problems.
Content
Independent work on a scientific research project. The project will be carried out either for two days per week during the 6th semester or in a block within the first 6 weeks after the 6th semester.
Prerequisites / notice
The entire project, including preparation of the report, needs to take place within the allotted time.

327-0505-00L  Surfaces and Interfaces I: Fundamentals, Analytics and Applications  
*Extended course starting HS23. Old title: Surfaces, Interfaces and Their Applications I. Students who obtained credit points for the old course cannot retake it.*

**Abstract**  
This course teaches the basics of surface and interface science and technology, including surface modifications and forces. It covers various analytical techniques to study surface and interface properties, and explores phenomena of applied relevance like friction, lubrication, phoresis, and wetting where surfaces play a crucial role.

**Objective**  
Students are able to:
- describe the physical and chemical properties of surfaces and interfaces.
- analyze and compare analytical tools for surfaces.
- choose and combine appropriate surface-analytical approaches for solving problems connected to applications.
- understand and explain the importance of surfaces and interfaces in a broad range of phenomena and applications.

**Content**  
- Introduction to surfaces and interfaces
- Structure of surfaces over different length scales: from macroscopic roughness to atomic structure
- Surface modifications
- Adsorption and adsorption models
- Surface forces
- Basic physical concepts
- Thermodynamics of surfaces and interfaces
- Measurement of intermolecular and surface forces
- Dynamics and history effects
- Surface analytics: X-ray Photocorrelation Spectroscopy (XPS) – principles and modern developments
- Surface analytics: Secondary Ion Mass Spectroscopy (SIMS) and IR Spectroscopy – Principles and examples
- Atomic Force Microscopy (AFM): Principles and modes of operation
- Tribology: Adhesion, Friction and Lubrication
- Contact mechanics
- Micro and macroscale friction
- Boundary lubrication
- Wetting
- Contact angles
- Phoretic phenomena
- Electric double layer and electrophoresis
- Electro-osmosis
- Other types of phoresis
- Case studies

327-0703-00L  Electron and Ion Microscopy in Material Science  
*Former title: Electron Microscopy in Material Science*

**Abstract**  
A comprehensive understanding of the interaction of electrons and ions with condensed matter and details on the instrumentation and methods designed to use these probes in the structural and chemical analysis of various materials.

**Objective**  
A comprehensive understanding of the interaction of electrons and ions with condensed matter and details on the instrumentation and methods designed to use these probes in the structural and chemical analysis of various materials.

**Content**  
This course provides a general introduction into electron- and ion-microscopy of organic and inorganic materials. In the first part, the basics of transmission- and scanning electron microscopy are presented. The second part includes the most important aspects of specimen preparation, imaging and image processing. In the third part, focused ion beam and atom probe microscopes are presented. Throughout the semester, various applications in materials science, solid state physics, structural biology, structural geology, and structural chemistry will be reported.

**Lecture notes**  
will be distributed in English

**Literature**  

Enri: Aberration-corrected imaging in transmission electron microscopy, Imperial College Press (2010, and 2nd ed. 2015)

The course is divided into two main blocks. The first block focuses on the primary molecular adaptations of living organisms, while the second block covers the fundamental microstructural design principles present in biological materials. Throughout the course, we will also explore the correlation between function, microstructure, and performance of biological and bio-inspired materials. Through engaging activities, students will gain the ability to analyze and integrate bio-inspired adaptive functions into synthetic material systems, as well as interpret the design principles and processing steps.

### Content

This course is divided into two main blocks. The first block focuses on the primary molecular adaptations of living organisms, while the second block covers the fundamental microstructural design principles present in biological materials.

**Block I: Molecular Adaptations of Living Organisms and Creation of Adaptive Bio-inspired Materials**

- Temporal regulation in biological and bio-inspired molecular systems;
- Autonomic molecular structures and out-of-equilibrium systems;
- Molecular motion and work generation mechanisms in biological and bio-inspired systems;
- Sensing, adaptation, and communication in biological and bio-inspired material systems;

**Block II: Principles of Microstructural Design in Biological Materials and Their Synthetically Engineered Counterparts**

- Fundamentals of engineering in biological and bio-inspired materials;
- Replicating biological design principles in synthetic materials (structural, optical, surface properties, etc.);
- Bio-inspired design and systems (mechanical actuation and bio-inspiration in the built environment).

### Literature

Communication fostered

Ferromagnetism is known to humankind for 2500 years, but there are many other forms of spontaneously ordered states in nature that wait to be explored. One of these is ferroelectricity, the spontaneous electric order of a material, which rapidly gains importance in science and technology. It is the aim of this course to learn what actually defines a state as ferroic, what forms of ordering are known or newly proposed, and what kind of materials and functionalities are related to ferroic materials. We also explore the transition from order to disorder, which is fluent and offers materials properties that are not found in the fully ordered or disordered state.

It is an equally important goal that attendees learn to work critically and creatively with the "unfinished knowledge" of a "hot" research field that is in continuous and rapid development. Realizing that scientific results are not eternally true, but need to be constantly challenged and revised if necessary is very important in becoming a researcher working at the forefront of science.

An important trait of researchers is to question the given, proposed, and what kind of materials and functionalities are related to ferroic materials. We also explore the transition from order to disorder, which is fluent and offers materials properties that are not found in the fully ordered or disordered state.

Prerequisites / notice
Knowledge in the physics of materials, as provided by the ETH Zurich B.S. curriculum in Materials Science. Interdisciplinary or Physics students are also welcome. This lecture is on a "hot" research field that is in continuous and rapid development, so students are encouraged to provide continuous feedback so that the topics covered by the lecture can be constantly adopted. The lecture can only be as good as the constructive/critical feedback that is received.

327-221000L Thin Films Technology - From Fundamentals to Oxide Electronics

Students who already took "327-2104-00L Inorganic Thin Films: Processing, Properties and Applications" AND "327-2132-00 Multifunctional Ferroic Materials: Growth and Characterisation" are not allowed to attend this course.

Abstract
Oxide films with a thickness of just a few atoms can now be grown with a precision matching that of semiconductors. This opens up a whole world of functional device concepts and fascinating phenomena that would not occur in the expanded bulk crystal.

We will give an introduction to thin films deposition techniques and applications with a focus on the growth of multifunctional oxide thin films.
In this course students will obtain an overarching view on thin film deposition techniques with a focus on epitaxial deposition processes. The main learning objectives are:

- Identification of most relevant deposition technique for a given application.
- Understanding of growth mechanism and growth modes.
- Understanding strategies for engineering the functionalities of the films using the deposition process.
- Selection of the most appropriate characterization technique.
- Understanding device concepts and fundamental limits in the technology relevant ultra-thin limit.
- Assessing the relevance of scientific literature dealing with complex oxide thin films.

A lab visit will be organized and students will participate to the design of thin films with atomic precision.

General description of the leading deposition routes including physical and chemical vapor deposition techniques (PVD and CVD) as well as so-called "wet techniques" (e.g. spin coating and spray pyrolysis).

Growth modes and processes.

Part of the course discusses vacuum technologies.

Fundamental characterization techniques for application-relevant thin films as well as state of the art approaches for in situ and ex-situ determination of the structural, chemical and ferroic (ferromagnetic and ferroelectric) properties of films: (XRD for thin films, RHEED, EDX, scanning probe microscopy techniques, laser-optical characterization and many more)

Epitaxy for the advanced design and characterization of high quality thin films for energy efficient oxide electronics.

Types of ferroic order, multiferroics, multifunctional oxide materials, epitaxial strain related effects, oxide thin film based devices and examples.

Regular discussions on preselected scientific literature and mini-seminars will be organized.

402-0535-00L Introduction to Magnetism

This course tackles the fundamental question of why only a few materials exhibit magnetism in Nature. The origin of atomic magnetic moments and the key mechanisms that govern their interactions are justified starting from fundamental principles. In addition, the influence of thermal fluctuations on magnetic ordering is discussed as well as the formalism to describe magnetic resonance phenomena.

By the end of this course, students will develop the ability to utilize quantum mechanics concepts to estimate the strength of atomic magnetic moments and understand their reciprocal interactions. They will gain proficiency in interpreting experimental measurements on model systems in terms of material composition and an appropriate, phenomenological spin Hamiltonian. For instance, students will be able to recognize whether the magnetic hysteresis observed in some samples arises from slow dynamics or from a phase transition. Lastly, they will be capable of interpreting the occurrence of abrupt transitions or the emergence of characteristic length scales as resulting from the interplay between competing interactions. Altogether, students will acquire the basic knowledge needed to develop a research project in the field of magnetism or to attend effectively more advanced courses on this topic.

The lecture “Introduction to Magnetism” aims at letting students familiarize themselves with the basic principles of quantum and statistical physics that determine the behavior of real magnets. Understanding why only a few materials are magnetic at finite temperature will be the leitmotiv of the course. We will see that defining in a formal way what “being magnetic” means is essential to address this question properly. Theoretical concepts will be applied to a few selected nano-sized magnets, which will serve as clean reference systems.

Topics:
- Magnetism in atoms (quantum-mechanical origin of atomic magnetic moments, intra-atomic exchange interaction)
- Magnetism in solids (mechanisms producing inter-atomic exchange interaction in solids, crystal field)
- Magnetic order at finite temperatures (Ising, XY, and Heisenberg models, low-dimensional magnetism)
- Spin precession and relaxation (Larmor precession, resonance phenomena, quantum tunneling, Bloch equation, superparamagnetism)

Learning material will be made available through Moodle and through the ETH JupyterHub.

Students are assumed to possess a basic background knowledge in quantum mechanics, solid-state and statistical physics as well as classical electromagnetism.

Students will have the opportunity to self-assess their understanding through quizzes and interactive tutorials, mostly inspired by topics of current research in nanoscale magnetism.
**Elective Courses**

The students are free to choose individually from the entire course offer of ETH Zürich on the Master level. Please consult the study administration in case of questions.

| 327-1101-00L | Biomineralization                      | W    | 2 credits | 2V | K.-H. Ernst               |
| Abstract     | The course addresses undergraduate and graduate students interested in getting introduced into the basic concepts of biomineralization. |
| Objective    | The course aims to introduce the basic concepts of biomineralization and the underlying principles, such as supersaturation, nucleation and growth of minerals, the interaction of biomolecules with mineral surfaces, and cell biology of inorganic materials creation. An important part of this class is the independent study and the presentation of original literature from the field. |
| Content      | Biomineralization is a multidisciplinary field. Topics dealing with biology, molecular and cell biology, solid state physics, mineralogy, crystallography, organic and physical chemistry, biochemistry, dentistry, oceanography, geology, etc. are addressed. The course covers definition and general concepts of biomineralization (BM), types of biominerals and their function, crystal nucleation and growth, biological induction of BM, control of crystal morphology, habit, shape and orientation by organisms, strategies of compartmentalization, the interface between biomolecules (peptides, polysaccharides) and the mineral phase, modern experimental methods for studying BM phenomena, inter-, intra-, extra- and epicellular BM, organic templates and matrices for BM, structure of bone, teeth (vertebrates and invertebrates) and mollusk shells, calcification, silification in diatoms, radiolarians and plants, calcium and iron storage, impact of BM on lithosphere and atmosphere, evolution, taxonomy of organisms. |
| Lecture notes | Script with more than 600 pages with many illustrations will be distributed free of charge. |
|               | 3) P. M. Dove, J. J. DeYoreo, S. Weiner (Eds.) Biomineralization, Reviews in Mineralogy & Geochemistry Vol. 54, 2003 |
| Prerequisites / notice | No special requirements are needed for attending. Basic knowledge in chemistry and cell biology is expected. |

| 327-2103-00L | Composites and Hybrids: From Design to Application | W    | 5 credits | 3V+1U | F. J. Clemens, B. Weisse, A. Winstößer |
| Abstract     | Composites/hybrids are heterogeneous materials consisting of two or more bonded components, and it is possible to tailor material properties for certain applications. Typically, the components retain their structure and properties, but the properties of the composite are a combination of the properties of its components. |
| Objective    | In this course you will get an inside to lightweight material with high strength, materials that are resistant against abrasion, ceramics with damage tolerance behavior, composites with bioactive, bioreabsorbable, piezoresistive and -electric properties. Enables materials scientists to design composite/hybrid materials for different applications. The course will comprise a balance of lectures, exercises and laboratory classes. |
Content

Introduction and basic concepts on biomedical composites and smart composites/hybrids with sensing and actuation properties; production and properties of composites reinforced with particles, whiskers, short or long fibers; selection criteria, case studies and applications, future perspectives.

1. Structural composites (polymer-, metal- and ceramic matrix composites)
   1.1. Introduction and historical background
   1.2. Components: Matrix and reinforcement materials
   1.3. Types of composites and mechanisms of reinforcement
   1.4. Production processes
   1.5. Physical and chemical properties
   1.6. Applications

2. Biomedical Composites
   2.1. Introduction and historical background
   2.2. Components: Metals&alloys, natural/synthetic polymers, bioceramics
   2.3. Types of biocomposites
   2.4. Production processes
   2.5. Properties
   2.6. Applications

3. Functional Composites (Sensors and Actuators)
   3.1. Introduction and historical background
   3.2. Components: Matrix and functional filler material
   3.3. Types of composites
   3.4. Production processes
   3.5. Properties
   3.6. Applications

Abstract
This introductory course on Scanning Electron Microscopy (SEM) emphasizes hands-on learning. Using ScopeM SEMs, students have the opportunity to study their own samples (or samples provided) and solve practical problems by applying knowledge acquired during the lectures. At the end of the course, students will be able to apply SEM for their (future) research projects.

Objective
- Set-up, align and operate a SEM successfully and safely.
- Understand important operational parameters of SEM and optimize microscope performance.
- Explain different signals in SEM and obtain secondary electron (SE) and backscatter electron (BSE) images.
- Operate the SEM in low-vacuum mode.
- Make use of EDX for semi-quantitative elemental analysis.
- Prepare samples with different techniques and equipment for imaging and analysis by SEM.
During the course, students learn through lectures, demonstrations, and hands-on sessions how to setup and operate SEM instruments, including low-vacuum and low-voltage applications.

This course gives basic skills for students new to SEM. At the end of the course, students are able to align an SEM, to obtain secondary electron (SE) and backscatter electron (BSE) images and to perform energy dispersive X-ray spectroscopy (EDX) semi-quantitative analysis. Emphasis is put on procedures to optimize SEM parameters in order to best solve practical problems and deal with a wide range of materials.

Lectures:
- Introduction on Electron Microscopy and instrumentation
- electron sources, electron lenses and probe formation
- beam/specimen interaction, image formation, image contrast and imaging modes.
- sample preparation techniques for EM
- X-ray micro-analysis (theory and detection), qualitative and semi-quantitative EDX and point analysis, linescan and spectral mapping

Practicals:
- Brief description and demonstration of the SEM microscope
- Practice on image formation, image contrast (and image processing)
- Student participation on sample preparation techniques
- Scanning Electron Microscopy lab exercises: setup and operate the instrument under various imaging modalities
- Practice on real-world samples and report results

Lecture notes will be distributed.

Literature

Prerequisites / notice
No mandatory prerequisites.

327-2126-00L Microscopy Training TEM I - Introduction to TEM
W 2 credits 3P P. Zeng, E. J. Barthaay Meier, A. G. Bittermann, F. Gramm, A. Sologubenko

Objective
Understanding of
1. the set-up and individual components of a TEM
2. the basics of electron optics and image formation
3. the basics of electron beam – sample interactions
4. the contrast mechanism
5. various sample preparation techniques

Learning how to
1. align and operate a TEM
2. acquire data using different operation modes of a TEM instrument, i.e. Bright-field and Dark-field imaging
3. record electron diffraction patterns and index diffraction patterns
4. interpret TEM data

Abstract
The introductory course on Transmission Electron Microscopy (TEM) provides theoretical and hands-on learning for beginners who are interested in using TEM for their Master or PhD thesis. TEM sample pretreatment techniques are also discussed. During hands-on sessions at different TEM instruments, students will have the opportunity to examine their own samples if time allows.

Content
Lectures:
- basics of electron optics and the TEM instrument set-up
- TEM imaging modes and image contrast
- STEM operation mode
- Sample preparation techniques for hard and soft materials

Practicals:
- Demo, practical demonstration of a TEM: instrument components, alignment, etc.
- Hands-on training for students: sample loading, instrument alignment and data acquisition.
- Sample preparation for different types of materials
- Practical work with TEMs
- Demonstration of advanced Transmission Electron Microscopy techniques

Lecture notes will be distributed.

Literature

Prerequisites / notice
No mandatory prerequisites. Please consider the prior attendance to EM Basic lectures (551-1618-00V; 227-0390-00L; 327-0703-00L) as suggested prerequisite.

327-2127-00L Sustainable Materials Management: Concepts, Methods and Principles
W 2 credits 1V+1U P. Wäger

Abstract
The aim of this course is to introduce important concepts, methods and principles for sustainable materials management and to critically reflect their possibilities and limitations. A particular focus will be laid on recycling issues.

Objective
Students develop a basic understanding of important concepts, methods and principles for sustainable materials management and become acquainted with their possibilities and limitations.

Content
The course consists of six lectures introducing concepts, methods and principles for a sustainable materials management (including, amongst others, material flow analysis, life cycle assessment, raw materials criticality evaluation), with a particular focus on recycling issues and exemplifications for materials relevant for Information and Communication Technologies (ICT) and emerging energy technologies.

327-2128-00L High Resolution Transmission Electron Microscopy
Limited number of participants.
W 2 credits 3G A. Sologubenko, R. Erni, A. Sologubenko, R. Emi, R. Schäublin, P. Zeng

More information here:
This advanced course on High Resolution Transmission Electron Microscopy (HRTEM) provides lectures focused on HRTEM and HRSTEM imaging principles, related data analysis and simulation and phase restoration methods.

Topics:
1. Introduction to HRTEM and HRSTEM
2. Considerations on (S)TEM instrumentation for high resolution imaging
3. Lectures on aberrations, aberration correction and aberration corrected images
4. HRTEM and HRSTEM simulation
5. Data analysis, phase restoration and lattice-strain analysis

Literature
- Detailed course manual

Prerequisites / notice
- The students should fulfill one or more of these prerequisites:
  - Prior attendance to the ScopEM TEM basic course
  - Prior attendance to ETH EM lectures (327-0703-00L Electron Microscopy in Material Science)
  - Prior TEM experience

Abstract
The main goal of this hands-on course is to provide students with previous TEM experience. At the end of the course, students will know how to obtain HR(S)TEM images, how to analyse, process and simulate them.

Objective
- Learning how HRTEM and HRSTEM images are obtained.
- Learning about the aberrations affecting the resolution in TEM and STEM and the different methods to correct them.
- Learning about TEM and STEM images simulation software.
- Performing TEM and STEM image analysis (processing of TEM images and phase restoration after focal series acquisitions).

Content
This course provides new skills to students with previous TEM experience. At the end of the course, students will know how to obtain HR(S)TEM images, how to analyse, process and simulate them.

Objectives are the general physical concepts of physical and chemical analysis and their application on the most important questions in energy applications. Questions tackled include:
- What is determines selectivity / sensitivity of a technique?
- What is its spatial/temporal resolution?
- How to probe chemical reactions in action?
Future as well as existing energy supply relies on the precise determination of the amount of the energy carrier either produced or spent. The devices used for this purpose range from simple amperemeter and its scientific pendant impedance spectrometer for electricity, and the chemical analysis of fuels and their combustion products. With the advent of renewable energy and its chemical or electro-chemical storage, there is increasing demand for advanced analysis tools as well as operando spectroscopy. The objective of the course is to introduce the physical basis of most commonly used methods, i.e., separation techniques (GC, MS), spectroscopic methods (impedance spectroscopy, UV-Vis-, IR-, Raman- spectroscopy), and scattering techniques (X-ray/photoelectron spectroscopy, neutron scattering) with focus on operando techniques. The methods are discussed within the framework of current scientific questions in renewable energy research such as the analysis of reaction mechanisms in thermo- and electro-catalysis and the in-situ characterization of new energy materials with particular focus on surface phenomena and gas-solid interactions.

The course will build on the Bachelor’s degree courses Analytical Chemistry and Materials Characterization Methods.

### Scattering Techniques for Material Characterization

#### Objective

Students are able to do:
- systematically characterise the microstructure and phases of a given material with X-rays and electrons
- select the right tool (source, instrument, measurement strategy) and design a workflow for solving a microstructure or phase analysis problem
- describe possibilities and limitations of a given characterisation method
- comprehensively store experimentally collected data in a repository following modern data management rules such that data can be evaluated by students not involved in the experiment
- qualitatively and quantitatively evaluate and present experimental data and results collected by others

#### Content

The main objective of this hands-on practical course is to give students a comprehensive insight into the most important aspects of microstructure characterization using electron and X-ray scattering. The focus is on the complementarity and exclusivity of the two techniques. We will introduce the most important characterisation tasks, present the relevant physical and crystallographic fundamentals, and discuss how the tasks can be solved with electron and X-ray scattering. We will discuss intrinsic and extrinsic advantages and limitations of the methods and explain essential instrumentation requirements specific to each setup. Another essential facet of the course is the link to everyday D-MATL project problems presented by the lecturers or researchers from D-MATL. The lecture is accompanied by hands-on experiments on samples of D-MATL projects using state-of-the-art instruments. The lecture is intended to help the students to understand the chemical analysis of fuels and their combustion products. With the advent of renewable energy and its chemical or electro-chemical storage, there is increasing demand for advanced analysis tools as well as operando spectroscopy. The objective of the course is to introduce the physical basis of most commonly used methods, i.e., separation techniques (GC, MS), spectroscopic methods (impedance spectroscopy, UV-Vis-, IR-, Raman- spectroscopy), and scattering techniques (X-ray/photoelectron spectroscopy, neutron scattering) with focus on operando techniques. The methods are discussed within the framework of current scientific questions in renewable energy research such as the analysis of reaction mechanisms in thermo- and electro-catalysis and the in-situ characterization of new energy materials with particular focus on surface phenomena and gas-solid interactions.

The course will build on the Bachelor’s degree courses Analytical Chemistry and Materials Characterization Methods.

### Focused Ion Beam and Applications

#### Objective

Overview of FIB theory, instrumentation. FIB hardware operation and applications. Set-up, align and operate a FIB-SEM successfully and safely. Accomplish operational tasks (milling and deposition) and optimize microscope parameters. Perform cross-sections: preparation and analysis Understanding of workflow for sample preparation (TEM lamella, APT needles, XCT pillars...) using FIB-SEM. Applying FIB-SEM for materials characterization.

#### Abstract

The course on Focused Ion Beam (FIB) provides theoretical and hands-on learning, applying what is learned in lectures to hands-on sessions.

#### Prerequisites / notice

Lecture according to the priority criteria: master students before doctoral students, Material Science students before students of other departments.

#### Literature

- Crystallography, X-ray diffraction and electron microscopy on the BSc level. All enrolled students are initially placed on the “waiting list” until the registration deadline. In the case of more than 12 applicants, the students will be selected by the lecturers before the start of the lecture according to the priority criteria: master students before doctoral students, Material Science students before students of other departments.

Polymerization is a series of continuous organic transformations and connects small molecules. The course will give an overview of polymerization principles and strategies.

Lecture notes will be distributed.

**Literature**

**Prerequisites / notice**
- Prior attendance to the ScopeM Microscopy Training SEM I: Introduction to SEM (327-2125-00L)
- Prior SEM experience.

**327-2144-00L**

**Microscopy Training Cryogenic Electron Microscopy**

**Objective**
- Overview of cryoEM theory, instrumentation, and operations.
- Prepare cryoEM sample (vitrification using Vitrobot).
- Set-up, align and operate a cryoTEM successfully and safely.
- Set-up automated data collection.
- Basic processing steps to analyze/interpret the data e.g., reconstruction 3D volumes.

**Content**
- Introduction and discussion on cryoEM and instrumentation.
- Lectures on cryoEM theory.
- Lectures on cryoEM applications.
- Practical demonstrations on vitrification, grid preparation.
- Practical demonstrations on data collection.
- Lecture and practicals/demonstrations on reconstruction of 3D volumes from 2D cryoEM projections/images.

**Prerequisites / notice**
- The students should fulfill one or more of these prerequisites:
  - Prior attendance to the ScopeM Microscopy Training SEM I.
  - Prior TEM experience.

**327-2145-00L**

**Advanced Polymer Synthesis**

**Objective**
- Students should be able to: Identify important polymerization procedures and types of polymerization. Predict activities of monomers based on the chemical structures. Devise synthetic pathways to produce a given polymer structure. Evaluate properties of macromolecules based on structure and synthesis method. Develop synthesis schemes for target structures and discuss potential applications of polymers.

**Content**
- Polymerization is a series of continuous organic transformation and connects small molecules. The course will give an overview of the following important polymerization procedures:
  - Modern step-growth polymerization.
  - Living Anionic polymerization.
  - Group transfer polymerization (GTP).
  - Controlled cationic polymerization.
  - Controlled radical polymerization.
  - Coordination polymerization: Ziegler-Natta and Metallocene catalysts.
  - Olefin metathesis polymerization: ROMP, ADMET and cyclopolymerization.
  - Synthesis of conjugated polymers based on transition metal catalysis.
  - Complex macromolecules including brush and dendronized polymers.

**Prerequisites / notice**
- Strong basic knowledge of Organic Chemistry. Any course on Introductory Polymer Chemistry such as "Advanced Building Blocks for Soft Materials" or "Introduction to Macromolecular Chemistry" or equivalent (bachelor level is also sufficient). Please discuss with the lecturer if one is not certain about the prerequisites.

**Registration form:**
https://docs.google.com/forms/d/1VednFjQ4nc0gB5erOr-o-mjeJD7F5Dmbrw70F407rSfA/edit

**Lecture notes**
- They will be uploaded on Moodle.

**Literature**
- EM-University: (https://em-learning.com/)
- Lectures on cryoEM applications.
- Lectures on cryoEM theory.
- Lectures on cryoEM applications.
- Practical demonstrations on vitrification, grid preparation.
- Practical demonstrations on data collection.
- Lecture and practicals/demonstrations on reconstruction of 3D volumes from 2D cryoEM projections/images.

### Analytical Competencies
Each year, we extract and process a staggering amount of resources from the Earth and biosphere to cover our needs and appetite for housing, energy, transport, nutrition, technology and consumer goods. In this course, we investigate the material cycles primarily from a technical and scientific perspective (geoscience & biosphere, process engineering, material science).

### Social Competencies
- Communication
- Customer Orientation

### Personal Competencies
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics

### Lecture notes & presentations will be provided in electronic format.

#### 327-2146-00L
**Raw Materials: From Earth to Consumer (and back)**  
**W. J. Malfait**

**Objective**
At the end of the course, the students should have a qualitative and quantitative understanding of where most of the materials around them come from, how they were processed, how they got to where they are used, and what happens to them after use. The students should be able to:
- Answer the question where the world's raw materials come from within the earth and biosphere.
- For the most important elements, describe where the major deposits are located and in which geological setting.
- Explain how these resources are mined and how the commodities are extracted from the ore.
- Estimate how much material we consume globally in terms of volume and value.
- Analyse whether there are alternatives to digging things up from the ground and plan (or decide) with recycling and sustainability in mind.
- Independently research a specific raw material and compile a summary of its cycle and value chain.

#### Content
- The earth from a materials’ perspective
- Coal, oil and gas – not just energy, but a materials resource
- Phosphor and nitrogen – how we feed 8 billion people
- Biological resources
- Sand, gravel and limestone – how we build infrastructure
- Copper keeps the light on
- Iron versus Aluminum
- Noble metals – small volume, big business
- Rare earth elements – when demand and supply do not match
- Lithium gold rush
- Radioactivity
- Student presentations on selected topics
- Raw materials – how geopolitics, industry, and activists shape policy
- Gemstones & curiosities

#### Lecture notes
Lecture notes & presentations will be provided in electronic format.

#### Prerequisites / notice
- Students signing up should have a strong interest in both the natural and man-made world around them.

#### 327-2148-00L
**Fabrication and Characterisation of Magnetic Films**  
**W. J. Malfait**

**Objective**
The goal of this course is to provide the participants with a full overview of the fabrication and characterization of thin magnetic films, which will be followed by hands-on sessions.

#### Content
- This block course takes place at the campus of the Paul Scherrer Institute on the premises of Laboratory for Mesoscopic Systems. The program consists of brief introductory lectures to the fabrication and characterization of thin magnetic films, which will be followed by hands-on sessions.
- The course takes place at the campus of the Paul Scherrer Institute in the Laboratory for Mesoscopic Systems. The morning consists of introductory lectures on the use of specific fabrication and characterisation techniques, which are listed below. In the afternoon, the participants will carry out hands-on experiments, where they will have a chance to step through the multifaceted chain of magnetic film development. At the end of the week, the students will be required to give a presentation about the fabrication techniques presented in the course and of the results they obtained with their experiments in relation to future applications.
- The course takes place at the campus of the Paul Scherrer Institute on the premises of Laboratory for Mesoscopic Systems. The morning consists of brief introductory lectures to the fabrication and characterization of thin magnetic films, which will be followed by hands-on sessions.

This course for civil engineers lays the grounds in the specialization Materials and Mechanics and complements the second introductory course on Advances in Building Materials provides an introductive overview of the needs and future of materials science in the building sector. Focus topics concern sustainability, durability, thermal insulation, coatings, sealants, adhesives, flame retardancy and the future perspective and developments of concrete and wood with regard to smart material development and ecological concerns.

By the end of the course, students will be able to learn the soft material library and collection of mechanisms to build soft functional devices, ranging from actuators, sensors, to integrated systems. Students will develop an understanding of material selection and development, as well as be able to evaluate the pros and cons of various mechanisms for different robotic and biomedical applications. Through the project-based lab sessions in parallel to the lectures, students will acquire the ability to design, fabricate, characterize, and integrate various soft functional devices (e.g., wearable sensors, grippers, mobile robots, etc.). A final soft robotic challenge (group project) will test the performance of the integrated system for a medical application.

Soft material library for functional devices
- intrinsically soft materials
- hybrid materials approach with extrinsically soft structures

Actuating mechanisms with soft materials
- Lecture: fluidic elastomer actuator, electroactive polymer actuator, stimuli-responsive actuator
- Lab: design, fabrication, and characterization of soft actuators for steering, gripping and locomotion

Sensing mechanisms with soft materials
- Lecture: resistive, capacitive, and optoelectronic soft sensors
- Lab: design, fabrication, and characterization of soft sensors as wearable devices

Sustainable soft devices and robots
- Lecture: natural and synthetic soft materials, devices, and robots that can self-heal, biodegrade, and recycle

Medical soft robotics
- Lecture: overview of soft bioelectronic devices, review of current soft robotic technologies in medical applications
- Lab: final project on design, fabrication, and testing of a soft robotic instrument for a medical application.

### Literature
Stretchable Bioelectronics for Medical Devices and Systems, John A. Rogers, Rozbeh Ghaffari, Dae-Hyeong Kim ISBN: 978-3-319-28694-5

### Prerequisites / notice
Basic knowledge in material properties, circuits, and polymers covered at the bachelor level required. (courses: Physics 2, Mechanics, Material Synthesis)

# 101-0617-01L Advances in Building Materials

| Objective | The course on Advances in Building Materials provides an introductive overview of the needs and future of materials science in the building sector. Bioelectronics for Medical Devices and Systems, John A. Rogers, Rozbeh Ghaffari, Dae-Hyeong Kim ISBN: 978-3-319-28694-5
Based on the lecture 'Werkstoffe' students receive deep concrete technology training. Comprehensive knowledge of the most important properties of conventional concrete and the current areas of research in concrete technology will be presented. The course covers various topics, including:

- concrete components
- concrete properties
- concrete mix design
- production, transport, casting
- demoulding, curing and additional protective measures
- durability
- standards
- chemical admixtures
- alternative binders
- specialty concretes such as: self compacting concrete, fiber reinforced concrete, fast setting concrete
- the role of sustainability in concrete technology
- new research in digital fabrication with concrete

Mechanics of Composite Materials
W 4 credits 2V+1U G. Pappas

Abstract
The course treats aspects related to elastic behavior of unidirectional and multidirectional laminates, micromechanics, failure and damage analysis, analysis and design of composite structures. The focus is on laminated fiber-reinforced polymer composites.

Objective
The objective is to introduce the basic concept of composite materials and provide a thorough understanding of the mechanical response of such materials and structures particularly made from fiber reinforced polymer composites, including elastic behavior, failure, fracture and damage analysis as well as structural design aspects. The ultimate goal is to provide the necessary skills to address the design and analysis of modern lightweight composite structures.

Content
The course is addressing following topics:
- Introduction
- Elastic anisotropy
- Micromechanics & Homogenization
- Classical Lamine Theory (CLT)
- Strength, failure and damage analysis
- Thin ply composite shells & effects of material non-linearity
- Analysis and design of composite structures

Lecture notes
Script, handouts, exercises and additional material are available in PDF-format on the moodle page of the lecture.

Literature
The lecture material is covered by a script/lecture notes compiled by CMASLab and further literature is referenced therein.

Metal Additive Manufacturing - Mechanical Integrity and Process Simulation
W 4 credits 3G E. Hosseini

Note: The previous course title until HS22 "Metal Additive Manufacturing - Mechanical Integrity and Numerical Analysis"

Abstract
An introduction to Metal Additive Manufacturing (MAM) (e.g. different techniques, the metallurgy of common alloy-systems, existing challenges) will be given. The focus of the lecture will be on the employment of different simulation approaches to address MAM challenges and to enable exploiting the full advantage of MAM for the manufacture of structures with desired property and functionality.

Objective
The main objectives of this lecture are:
- Acknowledging the possibilities and challenges for MAM (with a particular focus on mechanical integrity aspects),
- Understanding the importance of material science and metallurgical considerations in MAM,
- Appreciating the importance of thermal, fluid, mechanical and microstructural simulations for efficient use of MAM technology,
- Using commercial analysis tools (e.g. ABAQUS) for simulation of the MAM process.
Content
- Introduction to MAM (concept, application examples, pros & cons),
- Powder-bed and powder-blown metal additive manufacturing,
- Thermo-fluid analysis of additive manufacturing,
- Continuum-based thermal modelling and experimental validation techniques,
- Residual stress and distortion simulation and verification methods,
- Microstructural simulation (basics, analytical, kinetic Monte Carlo, cellular automata, phase-field),
- Mechanical property prediction for MAM,
- Microstructure and mechanical response of MAM material (stainless steel, Ti6Al4V, Inconel 718),
- Design for additive manufacturing
- Artificial intelligence for AM

Exercise sessions use ABAQUS for analysis of MAM process. Detailed video instructions will be provided to enable students to set up their own simulations. Students can install the packages on their own systems.

Lecture notes
Handouts of the presented slides.

Literature
No textbook is available for the course (unfortunately), since it is a dynamic and relatively new topic. In addition to the material presented in the course slides, suggestions/recommendations for additional literature/publications will be given (for each individual topic).

Prerequisites / notice
A basic knowledge of mechanical analysis, metallurgy, thermodynamics is recommended.

Lecture notes (manuscript and handouts) will be provided.

Literature
Handouts of the presented slides.

Abstract
Adaptive materials offer appealing ways to extend the design space of structures by introducing time-variable properties into them. In this course, the physical working principles of selected adaptive materials are analyzed and simple models for describing their behavior are presented. Some applications are illustrated, also with laboratory experiments where possible.

Objective
The study of adaptive materials covers topics that range from chemistry to theoretical mechanics.

Content
This course will provide the students with an insight into the properties and physical phenomena which lead to the features of adaptive materials. Starting from chemomechanical (skeletal muscles), the physical behavior of a wide range of adaptive materials, thermo- and photo-mechanical, electro-mechanical, magneto-mechanical and meta-materials will be thoroughly discussed and analyzed. Up-to-date results on their performance and their implementation in mechanical structures will be detailed and studied in laboratory sessions.

Basic concepts: Power conjugated variables, dissipative effects, geometry- and materials-based energy conversion

Thermo-mechanical coupling: Shape memory alloys / polymers

Electromechanical coupling(1): DEA, EBL, electromechanical fluids

Shape control / morphing: Use, requirements, challenges

Morphing applications of variable stiffness structures: Lab work

Electromechanical coupling (2): Piezoelectric, electrostrictive effect

Vibration Reduction: Measurement, passive, semi-active (active) damping methods

Vibration reduction applications of piezoelectric materials: Lab work

Metamaterials: Definition of metamaterials - electromagnetic, acoustical and other metamaterials

Energy harvesting and sensing: Energy harvesting with EAP and piezoelectric materials, transducers as sensors: Piezo, resistive,....

Practice sessions
Exercise sessions use ABAQUS for analysis of MAM process. Detailed video instructions will be provided to enable students to set up their own simulations. Students can install the packages on their own systems.

Abstract
Physics, technology, characteristics and applications of photovoltaic solar cells and systems.

Objective
The students will appreciate the potential of solar radiation and photovoltaics, will learn the physics and technology of various solar cells, and will get to know the design basics of PV modules and systems for different applications.

Content
Introduction to photovoltaics and economic aspects, solar radiation, semiconductor physics and operation of solar cells, technology of wafer-based (Si, GaAs, multi-junction) and thin-film (CIGS, CdTe, perovskite) solar cells, emerging technologies, design of PV modules, systems and plants including system components such as inverters and controllers, engineering procedures with software demonstration, integration in buildings and other specific examples such concentrated photovoltaics and power generation for space applications.

Data: 26.07.2024 12:39 Autumn Semester 2024 Page 1852 of 2680
## Objective

By the end of this course, the students will (1) understand the fundamentals of electronic and ionic charge transport, (2) understand analogies between semiconductor physics and electrochemistry, and (3) understand fundamental limits for each device type. In addition, the students will learn how to simulate these devices during guided exercise sessions and develop an intuitive understanding on how to interpret the most important device characteristics.

## Literature

- R. Huggins, Advanced Batteries, DOI:10.1007/9780387764245

## Prerequisites

- Basic knowledge of semiconductors.

## Competencies

### Subject-specific Competencies
- Charge Transport in Energy Conversion and Storage Devices
- Emerging Memory Technologies
- Frontiers in Nanotechnology

### Analytical Competencies
- Be motivated to change the world to renewable energies!
- Students are required to bring a windows-compatible computer with a common data analysis software to the exercises. Apps for simulating devices under different operating conditions will be made available to the students.

### Conceptual Competencies
- Students will have the opportunity to compare emerging memory technologies with state-of-the-art SSD Flash, DRAM, and SRAM, as well as evaluate their potential. Through critical thinking discussions, students will acquire important skills for assessing the strengths and limitations of these emerging technologies.

### Social Competencies
- Students will have the opportunity to compare emerging memory technologies with state-of-the-art SSD Flash, DRAM, and SRAM, as well as evaluate their potential. Through critical thinking discussions, students will acquire important skills for assessing the strengths and limitations of these emerging technologies.

### Personal Competencies
- Creative Thinking
- Critical Thinking

## Course Information

- **227-0619-00L**: Charge Transport in Energy Conversion and Storage Devices
- **227-0621-00L**: Emerging Memory Technologies
- **376-1103-00L**: Frontiers in Nanotechnology

### Prerequisites

- Basic knowledge of semiconductors.

### Literature

- M. Yarema, C. Battaglia, 1V+1U, Starting with the fabrication and analysis of nanoparticles and nanostructured materials that enable a variety of scientific and technical applications, we will transition to discussing biological nanosystems, how they work and what bioinspired engineering principles can be derived, to finally discussing biomedical applications and potential health risk issues. Scientific aspects as well as the many of the emerging technologies will be covered that start impacting so many aspects of our lives. This includes new phenomena in physics, advanced materials, novel technologies and new methods to address major medical challenges.
The enrolled students will get access to a password protected website where they can find pdf files of the lecture notes, and typically 1-2 journal articles per lecture that cover selected topics.

**Abstract**

Introduction to molecules for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.

**Objective**

The course covers the following topics:
1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
2. The concept of biocompatibility.
3. Introduction into methodology used in biomaterials research and application.
4. Introduction to different materials classes in use for medical applications.

**Content**

Introduction into natural and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering, drug delivery and for medical devices are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated.

Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed.

A link between academic research and industrial entrepreneurship is demonstrated by external guest speakers, who present their current research topics.

Semiconductor Materials: Fundamentals and Fabrication

**Abstract**

This course gives an introduction into the fundamentals of semiconductor materials. The main focus is on state-of-the-art fabrication and characterization methods. The course will be continued in the spring term with a focus on applications.

**Objective**

Basic knowledge of semiconductor physics and technology. Application of this knowledge for state-of-the-art semiconductor device processing.

**Content**

1. Fundamentals of Solid State Physics
2. Semiconductor materials
3. Band structures
4. Carrier statistics in intrinsic and doped semiconductors
5. Low-dimensional structures
6. Bulk Material growth of Semiconductors
7. Czochalski method
8. Floating zone method
9. High pressure synthesis
10. Semiconductor Epitaxy
11. Fundamentals of Epitaxy
12. Molecular Beam Epitaxy (MBE)
13. Metal-Organic Chemical Vapor Deposition (MOCVD)
14. Liquid Phase Epitaxy (LPE)
15. In situ characterization
16. Pressure and temperature
17. Reflectometry
18. Ellipsometry and RAS
19. LEED, AES, XPS
20. STM, AFM

5. The invention of the transistor - Christmas lecture

**Prerequisites / notice**

The "compulsory performance element" of this lecture is a short presentation of a research paper complementing the lecture topics. Several topics and corresponding papers will be offered on the moodle page of this lecture.

Nanomaterials for Photonic Devices

**Abstract**

The lecture describes various nanomaterials (semiconductor, metal, dielectric, carbon-based...) for photonic applications (optoelectronics, plasmonics, photonic integrated circuits, ordered and disordered structures...). It starts with concepts of light-matter interactions, fabrication and characterization, the description of the properties and the state-of-the-art applications and devices.

The students will acquire theoretical and experimental knowledge about the different types of nanomaterials (semiconductors, metals, dielectric, carbon-based, ...) and their uses as building blocks for advanced applications in photonics (optoelectronics, plasmonics, photonic crystal, ...). Together with the exercises, the students will learn (1) to read, summarize and discuss scientific articles related to the lecture, (2) to estimate order of magnitudes with calculations using the theory seen during the lecture, (3) to prepare a short oral presentation and report about one topic related to the lecture, and (4) to imagine an original photonic device.
# 402-0475-00L Terahertz Science and Applications

**Abstract**

The Terahertz (THz) range (0.1 – 10 THz), lies between the infrared and microwave spectral regions and has become accessible in the past few years. This new capability has had great impact in scientific research, and has led to technological advances and to the development of a variety of applications and devices. This course provides an introduction to THz science, technology and applications.

**Objective**

The goal of this course is to enable students to determine whether a THz solution can be applied to a particular scientific or technological problem. Armed with the fundamentals of THz science and of current THz technologies, covered in this introductory course, students will be able to weigh the capabilities, advantages and limitations of THz tools to address topics ranging from phonons in solid state systems and molecular vibrations in solutions to medical imaging and wireless communications.

**Lecture notes**

Will be distributed via moodle.

**Literature**

Yun-Shik Lee, Principles of Terahertz Science and Technology, Springer 2009

Additional references distributed via moodle.

**Prerequisites / notice**

Basic knowledge in physics, especially in electromagnetism, is required. No formal prerequisites.

# 402-0595-00L Semiconductor Nanostructures

**Abstract**

The course covers the foundations of semiconductor nanostructures, e.g., materials, band structures, bandgap engineering and doping, field-effect transistors. The physics of the quantum Hall effect and of common nanostructures based on two-dimensional electron gases will be discussed, i.e., quantum point contacts, Aharonov-Bohm rings and quantum dots.

**Objective**

At the end of the lecture the student should understand four key phenomena of electron transport in semiconductor nanostructures:

1. The integer quantum Hall effect
2. Conductance quantization in quantum point contacts
3. the Aharonov-Bohm effect
4. Coulomb blockade in quantum dots
Communication

Introduction to computer simulation methods for physics problems. Models from classical mechanics, electrodynamics and statistical mechanics as well as some interdisciplinary applications are used to introduce modern programming methods for numerical simulations using Julia. Furthermore, an overview of existing software libraries for numerical simulations is presented.

Techniques and Technologies

402-0809-00L Introduction to Computational Physics

W 8 credits 2V+2U A. Adelmann

Abstract

This course offers an introduction to computer simulation methods for physics problems and their implementation on PCs and supercomputers. The covered topics include classical equations of motion, partial differential equations (wave equation, diffusion equation, Maxwell's equations), Monte Carlo simulations, percolation, phase transitions, and N-Body problems.

Objective

Students learn to apply the following methods: Random number generators, Determination of percolation critical exponents, numerical solution of problems from classical mechanics and electrodynamics, canonical Monte-Carlo simulations to numerically analyze magnetic systems. Students also learn how to implement their own numerical frameworks in Julia and how to use existing libraries to solve physical problems. In addition, students learn to distinguish between different numerical methods to apply them to solve a given physical problem.

Content

Introduction to computer simulation methods for physics problems. Models from classical mechanics, electrodynamics and statistical mechanics as well as some interdisciplinary applications are used to introduce modern programming methods for numerical simulations using Julia. Furthermore, an overview of existing software libraries for numerical simulations is presented.

Lecture notes

Lecture notes and slides are available online and will be distributed if desired.

Literature

Lecture notes and slides are available online and will be distributed if desired.

Prerequisites / notice

The lecture is suitable for all physics students, students of Quantum Engineering, and students of Micro- and Nanosystems beyond the bachelor of science degree. Basic knowledge of solid state physics is a prerequisite. Very ambitioned students in the third year of Physics may be able to follow. The lecture can be chosen as part of the PhD-program. The course is taught in English.

Competencies

529-0615-00L Biochemical and Polymer Reaction Engineering

W 6 credits 3G P. Arosio, P. Fleckenstein

Abstract

Objective

The aim of the course is to learn how to design polymerization reactors and bioreactors to produce polymers and proteins with the specific product qualities that are required by different applications in chemical, pharmaceutical and food industry. This activity includes the post-treatment of polymer latexes, the downstream processing of proteins and the analysis of their colloidal behavior.

Content

We will cover the fundamental processes and the operation units involved in the production of polymeric materials and proteins. In particular, the following topics are discussed: Overview on the different polymerization processes, Kinetics of free-radical polymerization and use of population balance models. Production of polymers with controlled characteristics in terms of molecular weight distribution. Kinetics and control of emulsion polymerization. Surfactants and colloidal stability. Aggregation kinetics and aggregate structure in conditions of diffusion and reaction limited aggregation. Modeling and design of colloid aggregation processes. Physico-chemical characterization of proteins and description of enzymatic reactions. Operation units in bioprocessing: upstream, reactor design and downstream. Industrial production of therapeutic proteins. Characterization and engineering of protein aggregation. Protein aggregation in biology and in biotechnology as functional materials.

Lecture notes

Scripts are available on the web page of the Arosio-group: http://www.arosioroup.ethz.ch/education.html Additional handout of slides will be provided during the lectures.

Literature

H.W. Blanch, D. S. Clark, Biochemical Engineering, CRC Press, 1995

529-0659-00L Electrochemistry

W 6 credits 3G L. Gubler

Abstract

Introduction to electrochemistry from a physical chemistry point of view, focusing on thermodynamics & kinetics of electrochemical reactions, and engineering aspects of electrochemical cells. The topics are of generic nature yet also discussed in the context of specific applications in industrial electrochemistry, energy storage and conversion, electroanalytical techniques, sensors and corrosion.
Objective

The course establishes the fundamentals to understand and describe electrochemical reactions and phenomena related to these. The students are familiarized with key concepts and approaches in electrochemistry and selected aspects of materials science and engineering and how they are put to use in selected applications.

Content

- Introduction: important quantities & units, terminology;
- Chapter I - Redox reactions, Faraday’s laws;
- Chapter II - Equilibrium electrochemistry: cells, galvanic and electrolytic cells, thermodynamic state functions, theoretical cell voltage, half-cell / electrode potential, hydrogen electrode, the electrochemical series, Nernst equation;
- Chapter III - Electrodes & interfaces: electrochemical potential, phase potentials, work function, Fermi level, the electrified interface, the electrochemical double layer, reference electrodes and laboratory cells;
- Chapter IV - Electrolytes: conductivity, aqueous electrolytes, transference effects, liquid junctions, polymer electrolytes, ion-exchange membranes, Donnan exclusion, solid state ion conductors;
- Chapter V - Dynamic electrochemistry: overpotentials, description of charge-transfer reaction, Butler-Volmer and Tafel equation, exchange current density, mass transport limitations;
- Chapter VI - Industrial electrochemistry: electrochemical engineering, process and reactor types, current density distribution, porous electrodes, chlor-alkali and HCl electrolysis, oxygen depolarized cathode;
- Chapter VII - Energy storage & conversion: important primary and secondary battery chemistries, fuel cells, polymer electrolyte fuel cells, low temperature H2 and O2 electrochemistry, electrocatalysis, triple-phase boundary, solid oxide fuel cell, conversion efficiency;
- Chapter VIII - Electroanalytical methods & sensors: potentiometry, amperometry, cyclic and stripping voltammetry, rotating disc electrode studies, electrochemical sensors;
- Chapter IX - Corrosion: corrosion reactions,Pourbaix diagram, corrosion potential, passivation, corrosion protection

Cellular Matters: Properties, Functions and Applications of Biomolecular Condensates

551-0357-00L

W 4 credits 2S

The number of participants is limited to 30 and will only take place with a minimum of 6 participants.

At the beginning of the course, student groups will be formed and assigned to the milestone papers. To facilitate this, students must confirm their registration by the beginning of the 3rd week of semester.

Abstract

This Master level course delves into the emerging field of biomolecular condensates - membrane-less organelles in cells. Using interdisciplinary concepts from biology, chemistry, biophysics, and soft matter, we will explore the biological properties of these condensates, their functions in health and disease, and their potential as new biomimetic materials for various applications.
In the last decade, a novel type of cell compartments called biomolecular condensates have been discovered. This discovery is radically changing our understanding of the cell, its organization, and dynamics. The emerging picture is that the cytoplasm and nucleoplasm are highly complex fluids that can (meta)stably segregate into membrane-less compartments, similar to emulsions.

This interdisciplinary course encompasses milestone works and cutting-edge research questions in the young field of biomolecular condensates, including their properties, functions, and applications. The course begins with a lecture series that introduces the topic of condensates to an interdisciplinary audience and provides a theoretical foundation for understanding current research questions in the field. The lectures provide a base for student presentations of recent publications in the field, and for research seminars given by course lecturers, who are all active researchers with diverse expertise. Through this exciting interdisciplinary understanding of biomolecular condensates, bridging biology, chemistry, biophysics, and soft matter.

Students will not only learn how to critically read and evaluate scientific literature but will also gain valuable experience in giving scientific presentations to an interdisciplinary audience. Each presentation will require an introduction, critical analysis of the results, and a discussion of their significance, allowing student to substantiate their statements with a critical mindset that considers the pros and cons of chosen approaches and methods, as well as any limitations or possible follow-up experiments. This process will enable student to ask relevant questions and actively participate in class discussions, further enhancing their scientific skills.

In preparing the presentations, the students will have the unique opportunity to interact closely with each other and with the lecturers, who are all internationally well-established experts, and receive guidance in select a topic for the final presentation and supporting literature. The topic of biomolecular condensates goes beyond the boundaries of traditional disciplines and requires a multi-disciplinary approach that leverages and cross-fertilizes biology, physical chemistry, biophysics, and soft matter. This course will explore the properties, functions and potential applications of biomolecular condensates, including their role in neurodegenerative diseases such as Alzheimer's and Parkinson's, as well as their use as smart biomimetic materials.

This course is divided into two parts. The first part will introduce the basic concepts essential to the study of biomolecular condensates and phase separation. Topics include: fundamental units and scales in soft matter, phase transitions in biology, biopolymers and molecular self-assembly, introduction to active matter. This will establish a foundation for the second part, which will explore milestone works and current research in the field of biomolecular condensates. Each lecture of this second part will consist of:

1) a short literature seminar, where student groups will present and discuss a milestone paper assigned in advance and
2) a research seminar, where one of the course lecturers will present their own state-of-the-art research in the field, building upon the milestone literature.

At the beginning of the course, student groups will be formed and assigned to the milestone papers. To facilitate this, students must confirm their registration by the beginning of the 3rd week of semester.

Lecturers, who are all active researchers with diverse expertise. Through this exciting interdisciplinary understanding of biomolecular condensates, bridging biology, chemistry, biophysics, and soft matter.

Abstract

The lecture aims at providing a basis in non-life insurance mathematics which forms a core subject of actuarial science. It discusses collective risk modeling, individual claim size modeling, approximations for compound distributions, ruin theory, premium calculation principles, tariffication with generalized linear models and neural networks, credibility theory, claims reserving and solvency.

Objective

The student is familiar with the basics in non-life insurance mathematics and statistics. This includes the basic mathematical models for insurance liability modeling, pricing concepts, stochastic claims reserving models and ruin and solvency considerations.

Content

The following topics are treated:

- Collective Risk Modeling
- Claim Counts Models
- Individual Claim Size Modeling
- Censoring and Truncation
- Approximations for Compound Distributions
- Ruin Theory in Discrete Time
- Premium Calculation Principles
- Tarification
- Generalized Linear Models and Neural Networks
- Bayesian Models and Credibility Theory
- Claims Reserving
- Solvency Considerations

401-3922-00L Life Insurance Mathematics W 4 credits 2V M. Koller

Abstract

The classical life insurance model is presented together with the important insurance types (insurance on one and two lives, term and endowment insurance and disability). Besides that the most important terms such as mathematical reserves are introduced and calculated. The profit and loss account and the balance sheet of a life insurance company is explained and illustrated.

401-3929-00L Financial Risk Management in Social and Pension Insurance W 4 credits 2V P. Blum

Abstract

Investment returns are an important source of funding for social and pension insurance, and financial risk is an important threat to stability. We study short-term and long-term financial risk and its interplay with other risk factors, and we develop methods for the measurement and management of financial risk and return in an asset/liability context with the goal of assuring sustainable funding.
Objective

Understand the basic asset-liability framework: essential principles and properties of social and pension insurance; cash flow matching, duration matching, valuation portfolio and loose coupling; the notion of financial risk; long-term vs. short-term risk; coherent measures of risk.

Understand the conditions for sustainable funding: derivation of required returns; interplay between return levels, contribution levels and other parameters; influence of guaranteed benefits.

Understand the notion of risk-taking capability: capital process as a random walk; measures of long-term risk and relation to capital; short-term solvency vs. long-term stability; effect of embedded options and guarantees; interplay between required return and risk-taking capability.

Be able to study empirical properties of financial assets: the Normal hypothesis and the deviations from it; statistical tools for investigating relevant risk and return properties of financial assets; time aggregation properties; be able to conduct analysis of real data for the most important asset classes.

Understand and be able to carry out portfolio construction: the concept of diversification; limitations to diversification; correlation breakdown; incorporation of constraints; sensitivities and shortcomings of optimized portfolios.

Understand and interpret the asset-liability interplay: the optimized portfolio in the asset-liability framework; short-term risk vs. long-term risk; the influence of constraints; feasible and non-feasible solutions; practical considerations.

Understand and be able to address essential problems in asset/liability management, e.g. optimal risk/return positioning, optimal discount rate, target value for funding ratio or turnaround issues.

Have an overall view: see the big picture of what asset returns can and cannot contribute to social security; be aware of the most relevant outcomes; know the role of the actuary in the financial risk management process.

For pension insurance and other forms of social insurance, investment returns are an important source of funding. In order to earn these returns, substantial financial risks must be taken, and these risks represent an important threat to financial stability, in the long term and in the short term.

Risk and return of financial assets cannot be separated from one another and, hence, asset management and risk management cannot be separated either. Managing financial risk in social and pension insurance is, therefore, the task of reconciling the contradictory dimensions of

1. Required return for a sustainable funding of the institution,
2. Risk-taking capability of the institution,
3. Returns available from financial assets in the market,
4. Risks incurred by investing in these assets.

This task must be accomplished under a number of constraints. Financial risk management in social insurance also means reconciling the long time horizon of the promised insurance benefits with the short time horizon of financial markets and financial risk.

It is not the goal of this lecture to provide the students with any cookbook recipes that can readily be applied without further reflection. The goal is rather to enable the students to develop their own understanding of the problems and possible solutions associated with the management of financial risks in social and pension insurance.

To this end, a rigorous intellectual framework will be developed and a powerful set of mathematical tools from the fields of actuarial mathematics and quantitative risk management will be applied. When analyzing the properties of financial assets, an empirical viewpoint will be taken using statistical tools and considering real-world data.

Solid base knowledge of probability and statistics is indispensable. Specialized concepts from financial and insurance mathematics as well as quantitative risk management will be introduced in the lecture as needed, but some prior knowledge in some of these areas would be an advantage.

This course counts towards the diploma of "Aktuar SAV".

The exams ONLY take place during the official ETH examination period.

Mathematical Modelling in Life Insurance

401-3927-00L

**Objective**

The course's objective is to provide the students with the understanding and the tools to create mortality tables on their own. Additionally, students should learn the basics of survival analysis.

Abstract

In life insurance, it is essential to have adequate mortality rates, be it for reserving or pricing purposes. The course provides the classical tools necessary to create mortality tables from scratch as well as modern machine learning approaches to forecast mortality rates. It also covers the basics of survival analysis.
Following main topics are covered:

- Determining raw mortality rates
- Smoothing techniques
- Trends in mortality rates
- Integration of safety margins
- Stochastic mortality model due to Lee and Carter
- Neural network extension of the Lee-Carter model
- Machine learning for mortality forecasts
- Survival analysis

The course counts towards the diploma of "Aktuar SAV".

Basic knowledge in probability theory is assumed. Some knowledge in financial mathematics is useful.

Prerequisites:

Results and facts from probability theory as in the book "Probability Essentials" by J. Jacod and P. Protter will be used freely. Especially participants without a direct mathematics background are strongly advised to familiarise themselves with those tools before (or very quickly during) the course. (A possible alternative to the above English textbook are the (German) lecture notes for the standard course "Wahrscheinlichkeitstheorie").

For those who are not sure about their background, we suggest to look at the exercises in Chapters 8, 9, 22-25, 28 of the Jacod/Protter book. If these pose problems, you will have a hard time during the course. So be prepared.

Personal Competencies

Adaptability and Flexibility fostered
Creative Thinking fostered
Critical Thinking fostered
Integrity and Work Ethics fostered

Abstract

First introduction to main modelling ideas and mathematical tools from mathematical finance.

Objective

This course gives a first introduction to the main modelling ideas and mathematical tools from mathematical finance. It mainly aims at non-mathematicians who need an introduction to the main tools from stochastics used in mathematical finance. However, mathematicians who want to learn some basic modelling ideas and concepts for quantitative finance (before continuing with a more advanced course) may also find this of interest. The main emphasis will be on ideas, but important results will be given with (sometimes partial) proofs.

Content

Topics to be covered include:

- financial market models in finite discrete time
- absence of arbitrage and martingale measures
- valuation and hedging in complete markets
- basics about Brownian motion
- stochastic integration
- stochastic calculus: Itô's formula, Girsanov transformation, Itô's representation theorem
- Black-Scholes formula
### Responsible Machine Learning with Insurance Applications

**W 4 credits 2G M. Mayer, C. Lorentzen-Geiser**

**Abstract**
This lecture covers important aspects of applying supervised machine learning models in a responsible way, based on sound statistical theory. The focus is on model interpretability, calibration (bias) assessment, and proper model comparison. The methods are illustrated with actuarial datasets.

**Objective**
The student is familiar with the main tools of model interpretability, calibration assessment, and model comparison and knows how to apply supervised machine learning in a responsible way.

**Content**
- Overview of supervised machine learning (statistical learning theory, GLMs, tree based methods, and neural nets; cross-validation)
- Model interpretability methods (partial dependence plots, measures of variable importance, and SHAP)
- Bias/calibration assessment with identification functions
- Model comparison with consistent scoring functions
- Working with dependent observations and further topics

**Prerequisites / notice**
This course will be held in English and counts towards the diploma of "Aktuar SAV". For the latter, see details under www.actuaries.ch.

### Risk and Insurance Economics

**W 3 credits 2G H. Schernberg**

**Abstract**
The course covers the economics of risk and insurance, in particular the following topics will be discussed:
1) The economics of risk
2) Individual decision making under risk
3) Models of insurance demand, risk sharing, insurance supply
4) Information issues in insurance markets
5) Advanced topics in microeconomics and behavioral economics
6) The macroeconomic role of insurers and insurance regulation

**Objective**
The course introduces students to basic microeconomic models of risk attitudes and highlight the role insurance can – or cannot – play for individuals facing risks.

**Content**
In the first part of this lecture, we discuss a normative decision concept, Expected Utility theory, and compare it with empirically observed behaviour.

Students then learn about the rationale for individuals to purchase insurance, and for companies to offer it. We derive the optimal level of insurance demand and discuss how it depends on our model's underlying assumptions.

We then discuss the consequences of information asymmetries in insurance markets and the consequences for insurance supply.

Finally, we discuss refinements in decision theory that help account for observed behaviours that don't fit with the basic models of microeconomic theory. For example, we'll explore how behavioural economics can be leveraged by the insurance industry.

Abstract
This course gives a first introduction to Physics with an emphasis on classical mechanics.

Objective
Acquire knowledge of the basic principles regarding the physics of classical mechanics. Skills in solving physics problems.

252-0847-00L Computer Science O 5 credits 2V+2U M. Fischer, F. Friedrich Wicker

Abstract
The course covers the fundamental concepts of computer programming with a focus on systematic algorithmic problem solving. Taught language is C++. No programming experience is required.

Objective
Primary educational objective is to learn programming with C++. After having successfully attended the course, students have a good command of the mechanisms to construct a program. They know the fundamental control and data structures and understand how an algorithmic problem is mapped to a computer program. They have an idea of what happens "behind the scenes" when a program is translated and executed. Secondary goals are an algorithmic computational thinking, understanding the possibilities and limits of programming and to impart the way of thinking like a computer scientist.

Content
The course covers fundamental data types, expressions and statements, (limits of) computer arithmetic, control statements, functions, arrays, structural types and pointers. The part on object orientation deals with classes, inheritance and polymorphism; simple dynamic data types are introduced as examples. In general, the concepts provided in the course are motivated and illustrated with algorithms and applications.

Lecture notes
Lecture slides and all other material will be made available for download on the course web page.

Abstract: Introductory course on quantum and atomic physics including optics and statistical physics.

Objective: A basic introduction to quantum and atomic physics, including basics of optics and equilibrium statistical physics. The course will focus on the relation of these topics to experimental methods and observations.

Content:
- Einführung in die Quantenphysik: Planck'sche Strahlung (Wärmestrahlung), Photonen, Photoelektrischer Effekt, Thomson und Rutherford Streuung, Compton Streuung, Bohrsche Atombau, de-Broglie Materiewellen.
- Optik-Wellenoptik: Linsen, Abbildungssysteme, Brechung und Fermatsches Prinzip, Beugung, Interferenz, Fabry-Perot, Interferometer, Spektrometer.
- Quantenmechanik: Dualismus Teilchen-Welle, Wellenfunktionen, Operatoren, Schrödinger-Gleichung, Potentialstufe und Potentialkasten, harmonischer Oszillator
Lecture notes
Im Rahmen der Veranstaltung werden die Folien in elektronischer Form zur Verfügung gestellt. Ergänzendes Buch wird als Pflichtlektüre empfohlen. Es wird kein Skript in der Vorlesung verteilt.
Wir werden die Quantenmechanik anhand der Schrödinger-Gleichung mit den klassischen elektro-magnetischen Wellen vergleichen. Zu den klassischen Wellen werden Ergänzungsunterlagen verteilt.

Theoretical Computer Science

Abstract
Concepts to cope with: a) what can be accomplished in a fully automated fashion (algorithmically solvable) b) How to measure the inherent difficulty of tasks (problems) c) What is randomness and how can it be useful? d) What is nondeterminism and what role does it play in CS? e) How to represent infinite objects by finite automata and grammars?

Objective
Learning the basic concepts of computer science along their historical development

Content
This lecture gives an introduction to theoretical computer science, presenting the basic concepts and methods of computer science in its historical context. We present computer science as an interdisciplinary science which, on the one hand, investigates the border between the possible and the impossible and the quantitative laws of information processing, and, on the other hand, designs, analyzes, verifies, and implements computer systems.

The main topics of the lecture are:
- alphabets, words, languages, measuring the information content of words, representation of algorithmic tasks
- finite automata, regular and context-free grammars
- Turing machines and computability
- complexity theory and NP-completeness
- design of algorithms for hard problems

Lecture notes
The lecture is covered in detail by the textbook "Theoretical Computer Science".

Abstract
Introduction to differential manifolds and differential geometry.

Introduce the language, tools, and basic results of differentiable manifolds, tensors, Riemannian geometry, and related geometric structures. Relate geometric intuition to formulas involving curvature, derivatives and tensors.

Objective
Learn to compute, describe, prove, and solve problems in the language of differential geometry.

Content
Submanifolds of R^n, immersions, submersions, and embeddings. Sard's Theorem, abstract differentiable manifolds, charts, vector fields and flows, vector bundles, tensor fields, covariant derivatives, parallel transport, Riemannian metrics, geodesics, Riemann curvature tensor. Complete manifolds, Hopf-Rinow theorem. Many examples including curves, surfaces, hyperbolic space, S^3, the unit quaternions, the Gauss-Bonnet theorem, etc.

Core Courses: Pure Mathematics (Mathematics Master)

401-3461-00L Functional Analysis I

At most one of the three course units (Bachelor Core Courses)
401-3461-00L Functional Analysis I
401-3531-00L Differential Geometry I
401-3601-00L Probability Theory can be recognised for the Master's degree in Mathematics or Applied Mathematics. In this case, you cannot change the category assignment by yourself in myStudies but must take contact with the Study Administration Office (www.math.ethz.ch/studiensekretariat) after having received the credits.

Abstract
Baire category; Banach and Hilbert spaces, bounded linear operators; basic principles: Uniform boundedness, open mapping/closed graph theorem, Hahn-Banach; convexity; dual spaces; weak and weak* topologies; Banach-Alaoglu; reflexive spaces; compact operators and Fredholm theory; closed graph theorem; spectral theory of self-adjoint operators in Hilbert spaces. Basics of Sobolev spaces.

Objective
Acquire a good degree of fluency with the fundamental concepts and tools belonging to the realm of linear Functional Analysis, with special emphasis on the geometric structure of Banach and Hilbert spaces, and on the basic properties of linear maps.

Literature
Recommended references include the following:

Prerequisites / notice
Solid background on the content of all Mathematics courses of the first two years of the undergraduate curriculum at ETH. Most importantly: fluency with point set topology and measure theory, in part. Lebesgue integration and L^p spaces.

401-3001-61L Algebraic Topology I

Abstract
This is an introductory course in algebraic topology, which is the study of algebraic invariants of topological spaces. Topics covered include:
singular homology, cell complexes and cellular homology, the Eilenberg-Steenrod axioms.

Book can be downloaded for free at:
http://www.math.cornell.edu/~hatcher/AT/ATpage.html

See also:
http://www.math.cornell.edu/~hatcher/#anchor1772800

3) E. Spanier, "Algebraic topology", Springer-Verlag
You should know the basics of point-set topology.

Useful to have (though not absolutely necessary) basic knowledge of the fundamental group and covering spaces (at the level covered in the course "topology").

Some knowledge of differential geometry and differential topology is useful but not strictly necessary.

Some (elementary) group theory and algebra will also be needed.

401-3132-00L Commutative Algebra

Abstract
This course provides an introduction to commutative algebra. It serves in particular as a foundation for modern algebraic geometry.
Objective

The topics presented in the course will include:

* Basics facts about rings, ideals, and modules
* Constructions of rings: quotients, polynomial rings, localization
* The prime spectrum of a ring
* Chain conditions, Noetherian/Artinian rings and modules
* The tensor product of modules over commutative rings
* Some homological algebra
* Integral extensions, going up, going down
* Finitely generated algebras over fields, including the Noether Normalization Theorem and the Nullstellensatz
* Discrete valuation rings and some applications
* Dimension theory

Techniques and Technologies assessed

401-3111-72L Number Theory I W 7 credits 4G E. Kowalski

Abstract

This course will give an introduction to various aspects of number theory, both algebraic and analytic.

Objective

The course will present some representative results in important directions of number theory. Students who attend the lecture will acquire a solid background in all aspects of modern number theory, both towards algebraic and analytic directions. They will also learn how to use software such as Pari/GP for experiments in number theory.

Content

The course will present some representative results in the following directions, each of which belongs to an important area of number theory:

(1) congruences, including the law of Quadratic Reciprocity
(2) diophantine approximation (Dirichlet's Theorem, continued fractions)
(3) sums of two and four squares
(4) elementary algebraic number theory
(5) examples of Diophantine equations
(6) the Prime Number Theorem
(7) Dirichlet characters and primes in arithmetic progressions
(8) Arithmetic functions and their statistical properties

The lecture will emphasize the connections between the topics and their links to current research. Moreover, computer experiments using Pari/GP and other software will be part of the lecture.

Number Title Type ECTS Hours Lecturers

401-3651-00L Numerical Methods for Elliptic and Parabolic Partial Differential Equations W 9 credits 4V+1U J. Nick

Abstract

This course gives a comprehensive introduction into the numerical treatment of linear and nonlinear elliptic boundary value problems, related eigenvalue problems and linear, parabolic evolution problems. Emphasis is on theory and the foundations of numerical methods. Practical exercises include MATLAB implementations of finite element methods.

Objective

Participants of the course should become familiar with

* concepts underlying the discretization of elliptic and parabolic boundary value problems
* analytical techniques for investigating the convergence of numerical methods for the approximate solution of boundary value problems
* methods for the efficient solution of discrete boundary value problems
* implementational aspects of the finite element method
The course will address the mathematical analysis of numerical solution methods for linear and nonlinear elliptic and parabolic partial differential equations. Functional analytic and algebraic (De Rham complex) tools will be provided. Particular attention will be placed on developing mathematical foundations (Regularity, Approximation theory) for a-priori convergence rate analysis. A-posteriori error analysis and mathematical proofs of adaptivity and optimality will be covered. Implementations for model problems in MATLAB and python will illustrate the theory.

A selection of the following topics will be covered:

- Elliptic boundary value problems
- Galerkin discretization of linear variational problems
- The primal finite element method
- Mixed finite element methods
- Discontinuous Galerkin Methods
- Boundary element methods
- Spectral methods
- Adaptive finite element schemes
- Singularly perturbed problems
- Sparse grids
- Galerkin discretization of elliptic eigenproblems
- Non-linear elliptic boundary value problems
- Discretization of parabolic initial boundary value problems

Additional Literature:

  (Also available in German.)
Introduction into theory and practice of a broad and popular area of statistics, from a modern viewpoint.

B. Gärtner

Algorithms, Probability, and Computing

In regression, the dependency of a random response variable on other variables is examined. We consider the theory of linear regression.

J. Ziegel

Fundamentals of Mathematical Statistics

In this course we study the basics of theoretical statistics. The course includes methods for designing estimators, confidence intervals and tests, and various ways to evaluate the accuracy of estimators, confidence intervals and tests. We consider optimality criteria such as admissibility and minimaxity, as well as Bayesian criteria. We will also present the asymptotic point of view.

R. Zenklusen

Linear & Combinatorial Optimization

The goal of this course is to gain insight into the main statistical ideas and concepts. The course considers classical low-dimensional models, with pointers towards today's highly complex models.

J. Kalisch

Statistical Modelling

In regression, the dependency of a random response variable on other variables is examined. We consider the theory of linear regression with one or more covariates, high-dimensional linear models, nonlinear models and generalized linear models, robust methods, model choice and nonparametric models. Several numerical examples will illustrate the theory.

M. Kalisch

Quantum Mechanics I

Physics BSc students with programme regulations 2016 need to register for "402-0205-10L Quantenmechanik I"
Abstract

Objective
Introduction to single-particle quantum mechanics. Familiarity with basic ideas and concepts (quantisation, operator formalism, symmetries, angular momentum, perturbation theory) and generic examples and applications (bound states, tunneling, hydrogen atom, harmonic oscillator). Ability to solve simple problems.

Content
The beginnings of quantum theory with Planck, Einstein and Bohr; Wave mechanics; Simple examples; The formalism of quantum mechanics (states and observables, Hilbert spaces and operators, the measurement process); Heisenberg uncertainty relation; Harmonic oscillator; Symmetries (in particular rotations); Hydrogen atom; Angular momentum addition; Quantum mechanics and classical physics (EPR paradox and Bell's inequality); Perturbation theory.

Abstract
The course Combinatorics I and II is an introduction into the field of enumerative combinatorics.

Objective
Upon completion of the course, students are able to classify combinatorial problems and to apply adequate techniques to solve them.

Content
Contents of the lectures Combinatorics I and II: congruence transformation of the plane, symmetry groups of geometric figures, Euler's function, Cayley graphs, formal power series, permutation groups, cycles, Bunsdie's lemma, cycle index, Polya's theorems, applications to graph theory and isomers.

Abstract
Finite geometries I, II: Finite geometries combine aspects of geometry, discrete mathematics and the algebra of finite fields. In particular, we will construct models of axioms of incidence and investigate closing theorems. Applications include test design in statistics, block design, and the construction of orthogonal Latin squares.

Objective
Finite geometries I, II: Students will be able to construct and analyse models of finite geometries. They are familiar with closing theorems of the axioms of incidence and are able to design statistical tests by using the theory of finite geometries. They are able to construct orthogonal Latin squares and know the basic elements of the theory of block design.

Content
Finite geometries I, II: finite fields, rings of polynomials, finite affine planes, axioms of incidence, Euler's thirty-six officers problem, design of statistical tests, orthogonal Latin squares, transformation of finite planes, closing theorems of Desargues and Pappus-Pascal, hierarchy of closing theorems, finite coordinate planes, division rings, finite projective planes, duality principle, finite Moebius planes, error correcting codes, block design

Selection: Numerical Analysis

Selection: Probability Theory, Statistics
Abstract
This course is meant to serve as an introduction to the theory of Markov processes on finite or countable state spaces. We will discuss what a Markov process is along with associated concepts such as transition probabilities, recurrence, transience, ergodicity, reversibility etc. We will motivate various abstract notions introduced with concrete examples from physics and statistics.

Objective
I. Discrete-time Markov processes, i.e. Markov chains, e.g. the random walk on the integers
II. Transition probabilities and Doeblin’s theorem
III. Stationary probabilities and ergodic properties
IV. Continuous-time Markov processes. e.g. the Poisson process
V. Reversibility

401-0627-00L Applied Statistical Regression

Data: 26.07.2024 12:39 Autumn Semester 2024 Page 1875 of 2680
The course starts with the basics of linear modeling, and then proceeds to parameter estimation, tests, confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, multicollinearity problems and model interpretation, as well as general modeling strategies.

The last third of the course is dedicated to an introduction to generalized linear models: this includes the generalized additive model, logistic regression for binary response variables, binomial regression for grouped data and poisson regression for count data.

401-3622-14L Bayesian Statistics

Abstract
Introduction to the Bayesian approach to statistics: decision theory, prior distributions, hierarchical Bayes models, empirical Bayes, Bayesian tests and model selection, empirical Bayes, Laplace approximation, Monte Carlo and Markov chain Monte Carlo methods.

Objective
Students understand the conceptual ideas behind Bayesian statistics and are familiar with common techniques used in Bayesian data analysis.

Content
Topics that we will discuss are:

- Difference between the frequentist and Bayesian approach (decision theory, principles), priors (conjugate priors, noninformative priors, Jeffreys prior), tests and model selection (Bayes factors, hyper-g priors for regression), hierarchical models and empirical Bayes methods, computational methods (Laplace approximation, Monte Carlo and Markov chain Monte Carlo methods).

Lecture notes
A script will be available in English.

Literature

Prerequisites / notice
Familiarity with basic concepts of frequentist statistics and with basic concepts of probability theory (random variables, joint and conditional distributions, laws of large numbers and central limit theorem) will be assumed.

401-3925-00L Non-Life Insurance: Mathematics and Statistics

Abstract
The lecture aims at providing a basis in non-life insurance mathematics which forms a core subject of actuarial science. It discusses collective risk modeling, individual claim size modeling, approximations for compound distributions, ruin theory, premium calculation principles, tariffication with generalized linear models and neural networks, credibility theory, claims reserving and solvency.

Objective
The student is familiar with the basics in non-life insurance mathematics and statistics. This includes the basic mathematical models for insurance liability modeling, pricing concepts, stochastic claims reserving models and ruin and solvency considerations.
The following topics are treated:
- Collective Risk Modeling
- Claim Counts Models
- Individual Claim Size Modeling
- Censoring and Truncation
- Approximations for Compound Distributions
- Ruin Theory in Discrete Time
- Premium Calculation Principles
- Tarification
- Generalized Linear Models and Neural Networks
- Bayesian Models and Credibility Theory
- Claims Reserving
- Solvency Considerations

Prerequisites / notice
The exams ONLY take place during the official ETH examination period (no semester end exams), and only in person exams (i.e. no remote exams).

This course will be held in English and counts towards the diploma of “Aktuar SAV”. For the latter, see details under www.actuaries.ch.

Competencies

Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management

Methods:
- Determining raw mortality rates
- Smoothing techniques
- Trends in mortality rates
- Integration of safety margins
- Stochastic mortality model due to Lee and Carter
- Neural network extension of the Lee-Carter model
- Machine learning for mortality forecasts
- Survival analysis

Lecture notes
Lectures notes and slides will be provided

Prerequisites / notice
The exams ONLY take place during the official ETH examination period.

The course counts towards the diploma of “Aktuar SAV”.

Basic knowledge in probability theory is assumed. Some knowledge in financial mathematics is useful.

Competencies

Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management

Methods:
- Overview of supervised machine learning (statistical learning theory, GLMs, tree based methods, and neural nets; cross-validation)
- Model interpretability methods (partial dependence plots, measures of variable importance, and SHAP)
- Bias/calibration assessment with identification functions
- Model comparison with consistent scoring functions
- Working with dependent observations and further topics

Prequisites:
Good knowledge in statistics/probability theory, statistical modelling and Python (or R) programming are assumed.

Methods:
- Selection: Mathematical Physics, Theoretical Physics

402-0830-00L | General Relativity | W | 10 | 4V+2U | R. Renner

Abstract
Introduction to the theory of general relativity. The course puts a strong focus on the mathematical foundations of the theory as well as the underlying physical principles and concepts. It covers selected applications, such as the Schwarzschild solution and gravitational waves.
Combinatorics is a fundamental mathematical discipline as well as an essential component of many mathematical areas, and its study has experienced an impressive growth in recent years. While in the past many of the basic combinatorial results were obtained mainly by ingenuity and detailed reasoning, the modern theory has grown out of this early stage and often relies on deep, well-developed tools.

One of the main general techniques that played a crucial role in the development of Combinatorics was the application of algebraic methods. The most fruitful such tool is the dimension argument. Roughly speaking, the method can be described as follows. In order to bound the cardinality of a discrete structure A one maps its elements to vectors in a linear space, and shows that the set A is mapped to linearly independent vectors. It then follows that the cardinality of A is bounded by the dimension of the corresponding linear space. This simple idea is surprisingly powerful and has many famous applications.

This course provides a gentle introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to other areas. The topics covered in the class will include (but are not limited to):

- Basic dimension arguments, Spaces of polynomials and tensor product methods, Eigenvectors of graphs and their application, the Combinatorial Nullstellensatz and the Chevalley-Warning theorem. Applications such as: Solution of Kakeya problem in finite fields, counterexample to Borsuk’s conjecture, chromatic number of the unit distance graph of Euclidean space, explicit constructions of Ramsey graphs and many others.
- Linear Algebra: The students will get an overview of various algebraic methods for solving combinatorial problems. We expect them to understand the abstract techniques and to use them autonomously on related problems.

The course provides an introduction to the theory of integrable systems, related symmetry algebras and efficient calculational methods. Examples of integrable models appear in many different areas of physics including classical mechanics, condensed matter, 2D quantum field theories and lately in string- and gauge theories. They offer a unique opportunity to gain a deeper understanding of generic phenomena in a simplified, exactly solvable setting. In this course we introduce the notion and formulation of integrability in classical and quantum mechanics. We discuss various efficient methods for constructing solutions and eigenstates in these models. Finally, we elaborate on the enhanced symmetries that underly integrable models.

The course can be found at https://moodle-app2.let.ethz.ch/course/view.php?id=15757

The course website can be found at https://moodle-app2.let.ethz.ch/course/view.php?id=15757

Lectures will be on the blackboard only, but there will be a set of typeset lecture notes which follow the class closely.

Students are expected to have a mathematical background and should be able to write rigorous proofs.
The lectures will cover modern topics in algorithm design and analysis, including the following: graph sparsifications while preserving cuts and planar and geometric graphs, embeddings and their representation (Whitney’s Theorem, canonical orderings, DCEL), polygon triangulations and the art gallery theorem, convexity in $\mathbb{R}^d$, planar convex hull algorithms (Jarvis Wrap, Graham Scan, Chan’s Algorithm), point set triangulations, Delaunay triangulations (Lawson flips, lifting map, randomized incremental construction), Voronoi diagrams, the Crossing Lemma and incidence bounds, line arrangements (duality, Zone Theorem, ham-sandwich cuts), 3-SUM hardness, counting planar triangulations.

Prerequisites / notice
Prerequisites: The course assumes basic knowledge of discrete mathematics and algorithms, as supplied in the first semesters of Bachelor Studies at ETH.

Outlook: In the following spring semester there is a seminar "Geometry: Combinatorics and Algorithms" that builds on this course. There are ample possibilities for Semester-, Bachelor- and Master Thesis projects in the area.

Prerequisites:
Sufficient comfort with both (A) Algorithm Design & Analysis and (B) Probability & Concentrations. E.g., having passed the course Algorithms, Probability, and Computing (APC) is recommended, though not required formally. If you are not sure whether you’re ready for this class or not, please consult the instructor.

Abstract
This seminar complements the course „Introduction to Topological Data Analysis“. Students of the seminar will collaborate with students from international universities on concrete projects in topological data analysis, both theoretical and applied.

Objective
Each student is expected to collaborate in an international working group with students from the partner universities. Each group works on one of the projects suggested by the lecturers, and is assigned a mentor. At the end of the semester, each working group presents their findings in a written report and an oral presentation.

Content
This seminar complements the course Introduction to Topological Data Analysis. Students get to apply what they learned in the introductory course to concrete projects in the area of topical data analysis. These projects can be of theoretical nature, e.g., the design and analysis of a new algorithm, or applied, such as using methods from topological data analysis on concrete data sets.

Prerequisites / notice
Successful participation in the course “Introduction to Topological Data Analysis” or equivalent background in topological data analysis is required.

263-5300-00L Guarantees for Machine Learning

Does not take place this semester.

Abstract
This course is aimed at advanced master and doctorate students who want to conduct independent research on theory for modern machine learning (ML). It teaches standard methods in statistical learning theory commonly used to prove theoretical guarantees for ML algorithms. The knowledge is then applied in independent project work to understand and follow-up on recent theoretical ML results.

Objective
By the end of the semester students should be able to
- understand a good fraction of theory papers published in the typical ML venues. For this purpose, students will learn common mathematical techniques from statistical learning in the first part of the course and apply this knowledge in the project work
- critically examine recently published work in terms of relevance and find impactful (novel) research problems. This will be an integral part of the project work and involves experimental as well as theoretical questions
- outline a possible approach to prove a conjectured theorem by e.g. reducing to more solvable subproblems. This will be practiced in in-person exercises, homeworks and potentially in the final project
- effectively communicate and present the problem motivation, new insights and results to a technical audience. This will be primarily learned via the final presentation and report as well as during peer-grading of peer talks.

Content
This course touches upon foundational methods in statistical learning theory aimed at proving theoretical guarantees for machine learning algorithms. It touches on the following topics
- concentration bounds
- uniform convergence and empirical process theory
- regularization for non-parametric statistics (e.g. in RKHS, neural networks)
- high-dimensional learning
- computational and statistical learnability (information-theoretic, PAC, SQ)
- overparameterized models, implicit bias and regularization

The project work focuses on current theoretical ML research that aims to understand modern phenomena in machine learning, including but not limited to
- how overparameterized models generalize (statistically) and converge (computationally)
- complexity measures and approximation theoretic properties of randomly initialized and trained neural networks
- generalization of robust learning (adversarial or distribution-shift robustness)
- private and fair learning

Prerequisites / notice
Students should have a very strong mathematical background (real analysis, probability theory, linear algebra) and solid knowledge of core concepts in machine learning taught in courses such as “Introduction to Machine Learning”, “Regression” / “Statistical Modelling”. In addition to these prerequisites, this class requires a high degree of mathematical maturity—including abstract thinking and the ability to understand and write proofs.

Students have usually taken a subset of Fundamentals of Mathematical Statistics, Probabilistic AI, Neural Network Theory, Optimization for Data Science, Advanced ML, Statistical Learning Theory, Probability Theory (D-MATH)

Core Courses (Mathematics Master)

Electives (Mathematics Master)

Electives (only conditionally recognised)

In the Bachelor's programme in Mathematics 401-3913-01L Mathematical Foundations for Finance is eligible as an elective course, but only if 401-3888-00L Introduction to Mathematical Finance isn't recognised for credits (neither in the Bachelor's nor in the Master's programme). For the category assignment take contact with the Study Administration Office (www.math.ethz.ch/studiensekretariat) after having received the credits.
Mathematical Foundations for Finance

**Abstract**
First introduction to main modelling ideas and mathematical tools from mathematical finance

**Objective**
This course gives a first introduction to the main modelling ideas and mathematical tools from mathematical finance. It mainly aims at non-mathematicians who need an introduction to the main tools from stochastics used in mathematical finance. However, mathematicians who want to learn some basic modelling ideas and concepts for quantitative finance (before continuing with a more advanced course) may also find this of interest. The main emphasis will be on ideas, but important results will be given with (sometimes partial) proofs.

**Content**
Topics to be covered include
- financial market models in finite discrete time
- absence of arbitrage and martingale measures
- valuation and hedging in complete markets
- basics about Brownian motion
- stochastic integration
- stochastic calculus: Itô's formula, Girsanov transformation, Itô's representation theorem
- Black-Scholes formula

**Lecture notes**
See information on course homepage

**Prerequisites / notice**
Prerequisites: Results and facts from probability theory as in the book "Probability Essentials" by J. Jacod and P. Protter will be used freely. Especially participants without a direct mathematics background are strongly advised to familiarize themselves with those tools before (or very quickly during) the course. (A possible alternative to the above English textbook are the (German) lecture notes for the standard course "Wahrscheinlichkeitstheorie").

For those who are not sure about their background, we suggest to look at the exercises in Chapters 8, 9, 22-25, 28 of the Jacod/Protter book. If these pose problems, you will have a hard time during the course. So be prepared.

**Competencies**
Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies
- Analytical Competencies
- Decision-making
- Problem-solving

Personal Competencies
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics

**Mathematical Writing**

**Abstract**
The content includes (tentative):
- General guidelines for writing math papers, structure, format etc.
- Mathematical Language
- Ethics
- Good and bad examples
- Technical aspects (LaTeX, how to look up and format citations etc.)
- Possibly a component contributed by the ETH language center on language and presentation skills.
- Exercises or small practical assignments

**Seminars**

NOTICE: The number of seminar places is limited, and the special selection procedure should help to allocate the places not primarily according to the registration time. Everybody is waitlisted first when he/she tries to register for such a seminar in myStudies. Moreover: Only one mathematics seminar can be chosen per semester. Notice also the course unit 401-0002-99L Generic Seminar - Second Priority / Third Priority.

**Student Seminar in Combinatorics**

**Abstract**
The seminar will consist of student presentations and will cover a variety of topics in modern-day combinatorics. The seminar is aimed at third year bachelor students or master students with a background in combinatorics (e.g. the Graph Theory course).

**Objective**
The seminar’s aim is to acquaint students with interesting results, proofs and techniques in combinatorics and graph theory, and to give them the opportunity to work with advanced research papers and practice their presentation skills.

**Introduction to Morse Theory**

**Abstract**
The seminar will mainly follow Milnor's book "Introduction to Morse Theory" though we might make some excursions into some other references such as Audin & Damian's book "Morse Theory and Floer homology".

**Prerequisites / notice**
Prerequisites include basic familiarity with differentiable manifolds.

**Student Seminar on Harmonic Analysis**

**Abstract**
In this course, we will explore the most fundamental and classical topics in Harmonic Analysis, including maximal functions, Marcinkiewicz interpolation, singular integrals, Calderón-Zygmund theory, and Littlewood-Paley theory.

**Prerequisites / notice**
Prerequisite: Analysis IV (Fourier Theory) or an equivalent course

### Abstract

**Student Seminar in Numerical Algebraic Geometry**

*Number of participants limited to 12.*

**Abstract**

Numerical algebraic geometry is a research area that aims to use numerical methods to solve systems of polynomial equations. Sometimes, these numerical algorithms can be turned into theoretical, exact proofs, as we will see. The lectures will cover two major research directions in numerical algebraic geometry: the theory of normal forms and homotopy continuation methods.

**Content**

- Critical Thinking fostered

### Abstract

**Student Seminar in Statistics: MCMC Sampling Algorithms in Bayesian Computation**

*Number of participants limited to 24.*

**Mainly for students from the Mathematics Bachelor and Master Programmes who, in addition to the introductory course unit 401-2604-00L Probability and Statistics, have heard at least one core or elective course in statistics. Also offered in the Master Programmes Statistics resp. Data Science.*

**Abstract**

Algorithms in Bayesian Computation

**Objective**

Mainly for students from the Mathematics Bachelor and Master Programmes who, in addition to the introductory course unit 401-2604-00L Probability and Statistics, have heard at least one core or elective course in statistics. Also offered in the Master Programmes Statistics resp. Data Science.

**Content**

Mainly for students from the Mathematics Bachelor and Master Programmes who, in addition to the introductory course unit 401-2604-00L Probability and Statistics, have heard at least one core or elective course in statistics. Also offered in the Master Programmes Statistics resp. Data Science.

**Number of participants limited to 24.**

**Mainly for students from the Mathematics Bachelor and Master Programmes who, in addition to the introductory course unit 401-2604-00L Probability and Statistics, have heard at least one core or elective course in statistics. Also offered in the Master Programmes Statistics resp. Data Science.**

### Objective

Participants of the seminar should acquire familiarity with the concept of port-Hamiltonian systems and the relevant mathematical theory for their analysis. They should be enabled to devise and understand port-Hamiltonian models of physical systems.

### Content

- Port-Hamiltonian provide a mathematical framework for the modeling of complex (multi-physics) systems, of their dynamical behavior, for understanding their stability and effective control. They are based on geometric structure and represent a generalization of Hamiltonian systems towards open systems. The building blocks of port-Hamiltonian systems are thought to interact by exchanging energy. So the main focus of port-Hamiltonian modeling is on accurately representing the flow, storage, and dissipation of energy.

- Port-Hamiltonian models are ubiquitous nowadays, used in areas like mechanics, fluid dynamics, thermodynamics, and (electric) circuits. They play a big role in modern control theory and are a highly active field of theoretical and applied research.

This seminar will study a number of monograph chapters and research papers dealing with both theoretical and application aspects of post-Hamiltonian system models.

### Topics

Student groups will be decided and topics will be assigned during the preparatory meeting.

### Literature

- Good skills in linear algebra and ordinary differential equations are required

### Preparatory meeting

Every presentation has to be done jointly by a group of 2-3 students with presenters selected at random. Every participant will have to present on 2-3 occasions.

401-5990-00L Zurich Graduate Colloquium E- 0 credits 0.5K University lecturers, further speakers

Abstract

The Graduate Colloquium is an informal seminar aimed at graduate students and postdocs whose purpose is to provide a forum for communicating one's interests and thoughts in mathematics.

401-5960-00L Colloquium on Mathematics, Computer Science, and Education E- 0 credits Didactics colloquium

Subject didactics for mathematics and computer science teachers.

402-0101-00L The Zurich Physics Colloquium E- 0 credits 1K S. Huber, A. Refregier, University lecturers

Abstract

The goal of this event is to bring you closer to current day research in all fields of physics. In each semester we have a set of distinguished speakers covering the full range of topics in physics. As a participating student should learn how to follow a research talk. In particular, you should be able to extract key points from a colloquium where you don’t necessarily understand every detail that is presented.

402-0800-00L The Zurich Theoretical Physics Colloquium E- 0 credits 1K J. Renes, University lecturers
Abstract
Research colloquium

Objective
The Zurich Theoretical Physics Colloquium is jointly organized by the University of Zurich and ETH Zurich. Its mission is to bring both students and faculty with diverse interests in theoretical physics together. Leading experts explain the basic questions in their field of research and communicate the fascination for their work.

251-0100-00L Computer Science Colloquium E- 0 credits 2K Lecturers

Abstract
Invited talks, covering the entire scope of computer science. External Listeners are welcome at no charge. A detailed schedule is published at the beginning of each semester.

Objective
Top international computer scientists take the floor at the distinguished computer science colloquium. Our guest speakers present impacting topics across various areas of the discipline. The colloquium series is held every semester and also includes inaugural and farewell lectures of the department's professors. The colloquium is a noteworthy event for all graduate students. Outside attendance is equally welcome.

Content
Renowned international computer scientists take the floor at our distinguished colloquium series, to present topics across all areas of computer science.

Lectures notes

401-9983-00L Mentored Work Subject Didactics Mathematics A ■ O 2 credits 4A Supervisors

Abstract

In their mentored work on subject didactics, students put into practice the contents of the subject-didactics lectures and go into these in greater depth. Under supervision, they compile tuition materials that are conducive to learning and/or analyse and reflect on certain topics from a subject-based and pedagogical angle.

Objective

The objective is for the students:

- to be able to familiarise themselves with a tuition topic by consulting different sources, acquiring materials and reflecting on the relevance of the topic and the access they have selected to this topic from a specialist, subject-didactics and pedagogical angle and potentially from a social angle too.
- to show that they can independently compile a tuition sequence that is conducive to learning and develop this to the point where it is ready for use.

401-3059-00L Combinatorics II  W 4 credits 2G N. Hungerbühler

Abstract

The course Combinatorics I and II is an introduction into the field of enumerative combinatorics.

Objective

Upon completion of the course, students are able to classify combinatorial problems and to apply adequate techniques to solve them.

Content

Contents of the lectures Combinatorics I and II: congruence transformation of the plane, symmetry groups of geometric figures, Euler's function, Cayley graphs, formal power series, permutation groups, cycles, Bunsides's lemma, cycle index, Polya's theorems, applications to graph theory and isomers.

401-0293-00L Mathematics III  W 5 credits 3V+2U A. Caspar, N. Hungerbühler

Abstract

Vertiefung der mehrdimensionalen Analysis mit Schwerpunkt in der Anwendung der partiellen Differentialgleichungen, Vertiefung der Linearen Algebra und Einführung in die Systemanalyse und Modellbildung.

Objective

Die Studierenden

- verstehen Mathematik als Sprache zur Modellbildung und als Werkzeug zur Lösung angewandter Probleme in den Naturwissenschaften.
- können anspruchsvolle Modelle analysieren, Lösungen qualitativ beschreiben oder allenfalls explizit berechnen: diskret/ kontinuierlich in Zeit, Ebene und Raum.
- können Beispiele und konkrete arithmetische und geometrische Situationen aus Anwendungen mit Methoden der höheren Mathematik interpretieren und bearbeiten.
Einführung Modellbildung

- SIR-Modelle: Ausbreitung von Krankheiten bei Epidemien
- Pocken-Modell: Was ist der Effekt von Impfungen?

Lineare Modelle

- Vektorräume
- Lösungsraum eines Linearen DGL-Systems
- Diagonalisierbarkeit und Normalformen
- Exponential einer Matrix

Fourier-Reihen

- Euklidische Vektorräume
- Orthogonale Projektion
- Anwendungen

Nichtlineare Modelle

- Stationäre Lösungen, Qualitative Aussagen
- Mehrdimensionale Modelle: Räuber-Beute, Lotka-Volterra

Partielle Differentialgleichungen: Vorgänge, die von Raum und Zeit abhängen

- Einführung, Repetition, Beispiele
- Fourier-Methoden: Wärmeleitung, Laplace, Wellengleichung, Filter, Computertomographie

401-9985-00L Mentored Work Specialised Courses in the Respective Subject with an Educational Focus Mathematics A

Subject didactics for mathematics and computer science teachers.

ECTS: 2

4A Supervisors

Abstract

In the mentored work on their subject specialisation, students link high-school and university aspects of the subject, thus strengthening their teaching competence with regard to curriculum decisions and the future development of the tuition. They compile texts under supervision that are directly comprehensible to the targeted readers - generally specialist-subject teachers at high-school level.

Objective

- to familiarise themselves with a new topic by obtaining material and studying the sources, so that they can selectively extend their specialist competence in this way.
- to independently develop a text on the topic, with special focus on its mathematical comprehensibility in respect of the level of knowledge of the targeted readership.
- To try out different options for specialist further training in their profession.

Abstract

- Students learn about and learn to use findings from empirical research into mathematical didactics and best practice, as well as theoretical approaches to teaching various topics in mathematics. Methodological suggestions are compared and draft tuition concepts discussed.
- In their mentored work on subject didactics, students put into practice the contents of the subject-didactics lectures and go into these in greater depth. Under supervision, they compile tuition materials that are conducive to learning and/or analyse and reflect on certain topics from a subject-based and pedagogical angle.
- The objective is for the students:
  - to be able to familiarise themselves with a tuition topic by consulting different sources, acquiring materials and reflecting on the relevance of the topic and the access they have selected to this topic from a specialist, subject-didactics and pedagogical angle and potentially from a social angle too.
  - to show that they can independently compile a tuition sequence that is conducive to learning and develop this to the point where it is ready for use.
- The objective is for the students:
  - to be able to familiarise themselves with a tuition topic by consulting different sources, acquiring materials and reflecting on the relevance of the topic and the access they have selected to this topic from a specialist, subject-didactics and pedagogical angle and potentially from a social angle too.
  - to show that they can independently compile a tuition sequence that is conducive to learning and develop this to the point where it is ready for use.

Objective

- On the basis of their understanding of mathematics, of the knowledge acquired from research into teaching/learning and subject teaching, and also of best practice, students who have completed this course will be in a position to draft motivating learning arrangements, with cognitive appeal, which trigger and maintain learning processes. The aim here is to implement a corresponding teaching plan, so that the mathematics tuition that is given has a general-education value, on the one hand, and ensures that pupils acquire the fundamental knowledge necessary for studying at university, on the other hand.

Content

- Thematische Schwerpunkte
  - Die Gegenstände der mentorierten Arbeit in Fachdidaktik stammen in der Regel aus dem gymnasialen Unterricht.

Lecture notes

- Eine kurze Anleitung zur mentorierten Arbeit in Fachdidaktik wird zur Verfügung gestellt.

Literature

- Die Literatur ist themenspezifisch. Die Studierenden beschaffen sie sich in der Regel selber (siehe Lernziele). In besonderen Fällen wird sie vom Betreuer zur Verfügung gestellt.

Prerequisites / notice

- Die Arbeit sollte vor Beginn des Praktikums abgeschlossen werden.
- Die Arbeit sollte vor Beginn des Praktikums abgeschlossen werden.
During the introductory teaching practice, the students sit in on five lessons given by the teacher responsible for their teaching practice, and teach five lessons themselves. The students are given observation and reflection assignments by the teacher responsible for their teaching practice.

Right at the start of their training, students acquire initial experience with the observation of teaching, the establishment of concepts for teaching and the implementation of teaching. This early confrontation with the complexity of everything that teaching involves helps students decide whether they wish to and, indeed, ought to, continue with the training. It forms a basis for the subsequent pedagogical and subject-didactics training.

Den Studierenden bietet das Einführungspraktikum einen Einblick in den Berufsalltag einer Lehrperson.

This course is to be chosen jointly with 401-3972-00L.

This is a supplement to the Teaching Internship required to obtain a Master of Advanced Studies in Secondary and Higher Education in the corresponding subject. It is aimed at enlarging the already acquired teaching experience. Students observe 10 lessons and teach 15 lessons independently.

The teaching practice takes in 50 lessons: 30 are taught by the students, and the students sit in on 20 lessons. The teaching practice lasts 4-6 weeks. It gives students the opportunity to implement the contents of their specialist-subject, educational science and subject-didactics training in the classroom. Students also conduct work assignments in parallel to their teaching practice.

- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics in their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They acquire the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils’ work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

Examination Lesson II Mathematics

Simultaneous enrolment in "Examination Lesson I Mathematics" (401-9991-01L) is compulsory.

Abstract
In the context of an examination lesson conducted and graded at a high school, the candidates provide evidence of the subject-matter-based and didactic skills they have acquired in the course of their training.

Objective
- to develop and conduct teaching that is conducive to learning at high school level, substantiating it in terms of the subject-matter and from the didactic angle
- to analyze the tuition they have given with regard to its strengths and weaknesses, and outline improvements.

Content
Die Studierenden erfahren das Lektionsthema in der Regel 10 Tage vor dem Prüfungstermin. Von der zuständigen Lehrperson erhalten sie Informationen über den Wissensstand der zu unterrichtenden Klasse und können sie vor dem Prüfungstermin besuchen.

Die gehaltene Lektion wird kriteriumsbasiert beurteilt. Die Beurteilung umfasst auch die schriftliche Vorbereitung und eine mündliche Reflexion des Kandidaten/ der Kandidatin über die gehaltene Lektion im Rahmen eines kurzen Kolloquiums.

Lecture notes
Dokument: Schriftliche Vorbereitung für Prüfungslektionen.

Prerequisites / notice
Nach Abschluss der übrigen Ausbildung.

Content

Einführung Modellbildung

- SIR-Modelle: Ausbreitung von Krankheiten bei Epidemien
- Pocken-Modell: Was ist der Effekt von Impfungen?

Lineare Modelle

- Vektorräume
- Lösungsraum eines Linearen DGL-Systems
- Diagonalisierbarkeit und Normalformen
- Exponential einer Matrix

Fourier-Reihen

- Euklidische Vektorräume
- Orthogonale Projektion
- Anwendungen

Nichtlineare Modelle

- Stationäre Lösungen, Qualitative Aussagen
- Mehrdimensionale Modelle: Räuber-Beute, Lotka-Volterra

Partielle Differentialgleichungen: Vorgänge, die von Raum und Zeit abhängen

- Einführung, Repetition, Beispiele
- Fourier-Methoden: Wärmeleitung, Laplace, Wellengleichung, Filter, Computertomographie

Laplace-Transformation

- Definition und Notation
- Rechenregeln
- Anwendungsbeispiele

Abstract

In the mentored work on their subject specialisation, students link high-school and university aspects of the subject, thus strengthening their teaching competence with regard to curriculum decisions and the future development of the tuition. They compile texts under supervision that are directly comprehensible to the targeted readers - generally specialist-subject teachers at high-school level.

Objective

The aim is for the students
- to familiarise themselves with a new topic by obtaining material and studying the sources, so that they can selectively extend their specialist competence in this way.
- to independently develop a text on the topic, with special focus on its mathematical comprehensibility in respect of the level of knowledge of the targeted readership.
- To try out different options for specialist further training in their profession.

### Core Courses: Pure Mathematics

#### 401-3001-61L Algebraic Topology I

**Abstract**
This is an introductory course in algebraic topology, which is the study of algebraic invariants of topological spaces. Topics covered include:
- singular homology, cell complexes and cellular homology, the Eilenberg-Steenrod axioms.

**Literature**

**Prerequisites / notice**
- You should know the basics of point-set topology.
- Useful to have (though not absolutely necessary) basic knowledge of the fundamental group and covering spaces (at the level covered in the course "topology").
- Some knowledge of differential geometry and differential topology is useful but not strictly necessary.

#### 401-3132-00L Commutative Algebra

**Abstract**
This course provides an introduction to commutative algebra. It serves in particular as a foundation for modern algebraic geometry.

**Objective**
The topics presented in the course will include:
- Basics facts about rings, ideals, and modules
- Constructions of rings: quotients, polynomial rings, localization
- The prime spectrum of a ring
- Chain conditions, Noetherian/Artinian rings and modules
- The tensor product of modules over commutative rings
- Some homological algebra
- Integral extensions, going up, going down
- Finitely generated algebras over fields, including the Noether Normalization Theorem and the Nullstellensatz
- Discrete valuation rings and some applications
- Dimension theory

**Literature**
- Primary Reference: "Introduction to Commutative Algebra" by M. F. Atiyah and I. G. Macdonald (Addison-Wesley Publ., 1969)
- Secondary References:

**Prerequisites / notice**
- Prerequisites: Algebra I/II (or a similar introduction to the basic concepts of ring theory, including field theory).

#### 401-3111-72L Number Theory I

**Abstract**
This course will give an introduction to various aspects of number theory, both algebraic and analytic.

**Objective**
The course will present some representative results in important directions of number theory. Students who attend the lecture will acquire a solid background in all aspects of modern number theory, both towards algebraic and analytic directions. They will also learn how to use software such as Pari/GP for experiments in number theory.

**Content**
The course will present some representative results in the following directions, each of which belongs to an important area of number theory:

1. congruences, including the law of Quadratic Reciprocity
2. diophantine approximation (Dirichlet’s Theorem, continued fractions)
3. sums of two and four squares
4. elementary algebraic number theory
5. examples of Diophantine equations
6. the Prime Number Theorem
7. Dirichlet characters and primes in arithmetic progressions
8. Arithmetic functions and their statistical properties

The lecture will emphasize the connections between the topics and their links to current research. Moreover, computer experiments using Pari/GP and other software will be part of the lecture.

**Lecture notes**
The lecturer's notes will be scanned and available.

**Literature**
- J-P. Serre, "A course in arithmetic"
- Ireland and Rosen, "A classical introduction to modern number theory"
- Hardy and Wright, "An introduction to the theory of numbers"

Core Courses: Applied Mathematics and Further Appl.-Oriented Fields

Number Title Type ECTS Hours Lecturers
401-3226-00L Symmetric Spaces W 7 credits 4G A. Iozzi
Abstract
* Generalities on symmetric spaces: locally and globally symmetric spaces, groups of isometries, examples
* Symmetric spaces of non-compact type: flats and rank, roots and root spaces
* Iwasawa decomposition, Weyl group, Cartan decomposition
* Geometry at infinity

Objective
Learn the basics of symmetric spaces

401-3651-00L Numerical Methods for Elliptic and Parabolic Partial Differential Equations W 9 credits 4V+1U J. Nick
Abstract
This course gives a comprehensive introduction into the numerical treatment of linear and nonlinear elliptic boundary value problems, related eigenvalue problems and linear, parabolic evolution problems. Emphasis is on theory and the foundations of numerical methods. Practical exercises include MATLAB implementations of finite element methods.

Objective
Participants of the course should become familiar with
* concepts underlying the discretization of elliptic and parabolic boundary value problems
* analytical techniques for investigating the convergence of numerical methods for the approximate solution of boundary value problems
* methods for the efficient solution of discrete boundary value problems
* implementational aspects of the finite element method

Content
The course will address the mathematical analysis of numerical solution methods for linear and nonlinear elliptic and parabolic partial differential equations. Functional analytic and algebraic (De Rham complex) tools will be provided.
Practical exercises include MATLAB implementations of finite element methods.

A selection of the following topics will be covered:
* Elliptic boundary value problems
* Galerkin discretization of linear variational problems
* The primal finite element method
* Mixed finite element methods
* Discontinuous Galerkin Methods
* Boundary element methods
* Spectral methods
* Adaptive finite element schemes
* Singularly perturbed problems
* Sparse grids
* Galerkin discretization of elliptic eigenproblems
* Non-linear elliptic boundary value problems
* Discretization of parabolic initial boundary value problems

Literature

Additional Literature:
D. Braess: Finite Elements, THIRD Ed., Cambridge Univ. Press, (2007). (Also available in German.)

401-3621-00L Fundamentals of Mathematical Statistics W 9 credits 4V+1U J. Ziegel
Abstract
In this course we study the basics of theoretical statistics. The course includes methods for designing estimators, confidence intervals and tests, and various ways to evaluate the accuracy of estimators, confidence intervals and tests. We consider optimality criteria such as admissibility and minimaxity, as well as Bayesian criteria. We will also present the asymptotic point of view.

Literature

Additional Literature:
D. Braess: Finite Elements, THIRD Ed., Cambridge Univ. Press, (2007). (Also available in German.)

The aim of this course is to gain insight into the main statistical ideas and concepts. The course considers classical low-dimensional models, with pointers towards today’s highly complex models.

**401-3622-00L Statistical Modelling**

**W** 7 credits 4G M. Kalisch

**Abstract**

In regression, the dependency of a random response variable on other variables is examined. We consider the theory of linear regression with one or more covariates, high-dimensional linear models, nonlinear models and generalized linear models, robust methods, model choice and nonparametric models. Several numerical examples will illustrate the theory.

**Objective**

Introduction into theory and practice of a broad and popular area of statistics, from a modern viewpoint.

**Content**

In der Regression wird die Abhängigkeit einer beobachteten quantitativen Größe von einer oder mehreren anderen (unter Berücksichtigung zufälliger Fehler) untersucht. Themen der Vorlesung sind: Einfache und multiple Regression, Theorie allgemeiner linearer Modelle, Hoch-dimensional Modelle, Ausblick auf nichtlineare Modelle, Querverbindungen zur Varianzanalyse, Modelsuche, Residuenanalyse; Einblicke in Robuste Regression, Durchrechnung und Diskussion von Anwendungsbeispielen.

**Prerequisites / notice**

This is the course unit with former course title "Regression".

Credits cannot be recognised for both courses 401-3622-00L Statistical Modelling and 401-0649-00L Applied Statistical Regression in the Mathematics Bachelor and Master programmes (to be precise: one course in the Bachelor and the other course in the Master is also forbidden).

**401-4889-00L Mathematical Finance**

**W** 10 credits 4V+2U B. Acciaio

**Abstract**

Advanced course on mathematical finance:
- semimartingales and general stochastic integration
- absence of arbitrage and martingale measures
- fundamental theorem of asset pricing
- option pricing and hedging
- hedging duality
- optimal investment problems
- additional topics

**Objective**

Advanced course on mathematical finance, presupposing good knowledge in probability theory and stochastic calculus (for continuous processes).

**Content**

This is an advanced course on mathematical finance for students with a good background in probability. We want to give an overview of main concepts, questions and approaches, and we do this mostly in continuous-time models.

Topics include
- semimartingales and general stochastic integration
- absence of arbitrage and martingale measures
- fundamental theorem of asset pricing
- option pricing and hedging
- hedging duality
- optimal investment problems
- and probably others

**Lecture notes**

The course is based on different parts from different books as well as on original research literature.

**Literature**

While there are many textbooks on mathematical finance, none of them is ideal to cover the contents of this course. References include the following books:

**Prerequisites / notice**

Prerequisites are the standard courses
- Probability Theory (for which lecture notes are available)
- Brownian Motion and Stochastic Calculus (for which lecture notes are available)

Those students who already attended "Introduction to Mathematical Finance" will have an advantage in terms of ideas and concepts.

This course is the second of a sequence of two courses on mathematical finance. The first course "Introduction to Mathematical Finance" (MF I), 401-3888-00, focuses on models in finite discrete time. It is advisable that the course MF I is taken prior to the present course, MF II.

For an overview of courses offered in the area of mathematical finance, see https://www.math.ethz.ch/imsf/education/education-in-stochastic-finance/overview-of-courses.html.
Abstract
Mathematical treatment of optimization techniques for linear and combinatorial optimization problems.

Objective
The goal of this course is to get a thorough understanding of various classical mathematical optimization techniques for linear and combinatorial optimization problems, with an emphasis on polyhedral approaches. In particular, we want students to develop a good understanding of some important problem classes in the field, of structural mathematical results linked to these problems, and of solution approaches based on such structural insights.

Content
Key topics include:
- Linear programming and polyhedra;
- Flows and cuts;
- Combinatorial optimization problems and polyhedral techniques;
- Equivalence between optimization and separation.

Literature

Prerequisites / notice
Solid background in linear algebra.

401-4944-20L  Mathematics of Data Science  W  8 credits  3V+2U  A. Bandeira

Abstract
Mostly self-contained, but fast-paced, introductory masters level course on various theoretical aspects of algorithms that aim to extract information from data.

Objective
Introduction to various mathematical aspects of Data Science.

Content
These topics lie in overlaps of Mathematics with: Computer Science, Electrical Engineering, Statistics, and/or Operations Research. Most lectures will feature Mathematical Open Problems. The main mathematical tools used will be Probability and Linear Algebra, and a basic familiarity with these subjects is required. There will also be some (although knowledge of these tools is not assumed) Graph Theory, Representation Theory, Applied Harmonic Analysis, among others. The topics treated will include Dimension reduction, Manifold learning, Sparse recovery, Random Matrices, Approximation Algorithms, Community detection in graphs, and several others.

Lecture notes

Prerequisites / notice
The main mathematical tools used will be Probability, Linear Algebra (and real analysis), and a working knowledge of these subjects is required. In addition to these prerequisites, this class requires a certain degree of mathematical maturity--including abstract thinking and the ability to understand and write proofs.

We encourage students who are interested in mathematical data science to take both this course and "227-0434-10L Mathematics of Information" taught by Prof. H. Bölcskei. The two courses are designed to be complementary.

A. Bandeira and H. Bölcskei

At most one of the three course units (Bachelor Core Courses)
401-3461-00L Functional Analysis I
401-3531-00L Differential Geometry I
401-3601-00L Probability Theory

can be recognised for the Master's degree in Mathematics or Applied Mathematics. In this case, you cannot change the category assignment by yourself in myStudies but must take contact with the Study Administration Office (www.math.ethz.ch/studiensekretariat) after having received the credits.

Abstract
Baire category; Banach and Hilbert spaces, bounded linear operators; basic principles: Uniform boundedness, open mapping/closed graph theorem, Hahn-Banach; convexity; dual spaces; weak and weak* topologies; Banach-Alaoglu; reflexive spaces; compact operators and Fredholm theory; closed graph theorem; spectral theory of self-adjoint operators in Hilbert spaces. Basics of Sobolev spaces.

Objective
Acquire a good degree of fluency with the fundamental concepts and tools belonging to the realm of linear Functional Analysis, with special emphasis on the geometric structure of Banach and Hilbert spaces, and on the basic properties of linear maps.

Literature
Recommended references include the following:

Prerequisites / notice
Solid background on the content of all Mathematics courses of the first two years of the undergraduate curriculum at ETH. Most importantly: fluency with point set topology and measure theory, in part. Lebesgue integration and $L^p$ spaces.

Abstract
Introduction to differential manifolds and differential geometry.

Objective
Learn to compute, describe, prove, and solve problems in the language of differential geometry.

Content
Submanifolds of $\mathbb{R}^n$, immersions, submersions, and embeddings. Sard's Theorem, abstract differentiable manifolds, charts, vector fields and flows, vector bundles, tensor fields, covariant derivatives, parallel transport, Riemannian metrics, geodesics, Riemann curvature tensor. Complete manifolds, Hopf-Rinow theorem. Many examples including curves, surfaces, hyperbolic space, $S^3$, the unit quaternions, the Gauss-Bonnet theorem, etc.

Literature
John M. Lee: Introduction to Smooth Manifolds
John M. Lee: Introduction to Riemannian Manifolds

This following books were inherited from before. The only one I know is DoCarmo.

Quantum Mechanics I

This course presents the basics of probability theory and the theory of stochastic processes in discrete time. The following topics are planned:
- measure theory formalism and probability theory, Dynkin's lemma and independence, convergence of series of independent random variables, law of large numbers, conditional expectation, martingale convergence theorems, uniform integrability, optional stopping theorem for martingales, the Bienaymé-Galton-Watson process and its R-number, convergence in distribution and the central limit theorem.

Moreover, 401-3601-00L Probability Theory can only be recognised for the Master Programme if neither 401-3642-00L Brownian Motion and Stochastic Calculus nor 401-3602-00L Applied Stochastic Processes has been recognised for the Bachelor Programme.

Quantum Mechanics I

Abstract

Objective
Introduction to single-particle quantum mechanics. Familiarity with basic ideas and concepts (quantisation, operator formalism, symmetries, angular momentum, perturbation theory) and generic examples and applications (bound states, tunneling, hydrogen atom, harmonic oscillator). Ability to solve simple problems.

Content
The beginnings of quantum theory with Planck, Einstein and Bohr; Wave mechanics; Simple examples; The formalism of quantum mechanics (states and observables, Hilbert spaces and operators, the measurement process); Heisenberg uncertainty relation; Harmonic oscillator; Symmetries (in particular rotations); Hydrogen atom; Angular momentum addition; Quantum mechanics and classical physics (EPR paradox and Bell's inequality); Perturbation theory.

Electives: Applied Mathematics and Further Application-Oriented Fields

Selection: Numerical Analysis
401-4657-00L  Numerical Solution of Stochastic Ordinary Differential Equations  W  6 credits  3V+1U  C. Schwab

Abstract
This course is on the numerical approximations of stochastic ordinary differential equations (SDEs) driven by Brownian motions and Lévy processes. SDEs have several applications, for example in financial engineering. The contents cover stochastic processes, stochastic calculus, well-posedness results for SDEs, strong and weak approximations of SDEs, and simulation via Monte Carlo methods.

Objective
The aim of this course is to enable the students to carry out simulations and their mathematical convergence analysis for stochastic models originating from applications such as mathematical finance. For this the course teaches a decent knowledge of the different numerical methods, their underlying ideas, convergence properties and implementation issues.

Content
Brownian motion and Lévy processes
Stochastic integration and stochastic calculus
Stochastic ordinary differential equations (SDEs)
Numerical approximations of SDEs
Stochastic simulation and Monte Carlo methods
Applications to computational finance: Option valuation

Lecture notes
There will be English, typed lecture notes for registered participants in the course.

401-4785-00L  Mathematical and Computational Methods in Photonics  W  7 credits  4G  H. Ammari

Abstract
The aim of this course is to review new and fundamental mathematical tools, computational approaches, and inversion and optimal design methods used to address challenging problems in nanophotonics. The emphasis will be on analyzing plasmon resonant nanoparticles, super-focusing & super-resolution of electromagnetic waves, photonic crystals, electromagnetic cloaking, metamaterials, and metasurfaces.
The field of photonics encompasses the fundamental science of light propagation and interactions in complex structures, and its technological applications.

The recent advances in nanoscience present great challenges for the applied and computational mathematics community. In nanophotonics, the aim is to control, manipulate, reshape, guide, and focus electromagnetic waves at nanometer length scales, beyond the resolution limit. In particular, one wants to break the resolution limit by reducing the focal spot and confine light to length scales that are significantly smaller than half the wavelength.

Interactions between the field of photonics and mathematics has led to the emergence of a multitude of new and unique solutions in which today's conventional technologies are approaching their limits in terms of speed, capacity and accuracy. Light can be used for detection and measurement in a fast, sensitive and accurate manner, and thus photonics possesses a unique potential to revolutionize healthcare.

Light-based technologies can be used effectively for the very early detection of diseases, with non-invasive imaging techniques or point-of-care applications. They are also instrumental in the analysis of processes at the molecular level, giving a greater understanding of the origin of diseases, and hence allowing prevention along with new treatments. Photonic technologies also play a major role in addressing the needs of our ageing society: from pacemakers to synthetic bones, and from endoscopes to the micro-cameras used in in-vivo processes. Furthermore, photonics are also used in advanced lighting technology, and in improving energy efficiency and quality. By using photonic media to control waves across a wide band of wavelengths, we have an unprecedented ability to fabricate new materials with specific microstructures.

The main objective in this course is to report on the use of sophisticated mathematics in diffractive optics, plasmonics, super-resolution, photonic crystals, and metamaterials for electromagnetic invisibility and cloaking. The book merges highly nontrivial multi-technologies in order to make a breakthrough in the field of mathematical modelling, imaging, and optimal design of optical nanodevices and nanostructures capable of light enhancement, and of the focusing and guiding of light at a subwavelength scale. We demonstrate the power of layer potential techniques in solving challenging problems in photonics, when they are combined with asymptotic analysis and the elegant theory of Gohberg and Sigal on meromorphic operator-valued functions.

In this course we shall consider both analytical and computational matters in photonics. The issues we consider lead to the investigation of fundamental problems in various branches of mathematics. These include asymptotic analysis, spectral analysis, mathematical imaging, optimal design, stochastic modelling, and analysis of wave propagation phenomena. On the other hand, deriving mathematical foundations, and new and efficient computational frameworks and tools in photonics, requires a deep understanding of the different scales in the wave propagation problem, an accurate mathematical modelling of the nanodevices, and fine analysis of complex wave propagation phenomena. An emphasis is put on mathematically analyzing plasmon resonant nanoparticles, diffractive optics, photonic crystals, super-resolution, and metamaterials.

401-4656-21L AI in the Sciences and Engineering W 6 credits 2V+2U S. Mishra

Abstract

AI is having a profound impact on science by accelerating discoveries across physics, chemistry, biology, and engineering. This course aims to present a highly topical selection of AI applications across these fields. Emphasis will be placed on using AI, particularly deep learning, to understand systems modelled by PDEs, and key scientific machine learning concepts and themes will be discussed.

Objective

Learning objectives:
- Aware of advanced applications of AI in the sciences and engineering
- Familiar with the design, implementation, and theory of these algorithms
- Understand the pros/cons of using AI and deep learning for science
- Understand key scientific machine learning concepts and themes

Content

A selection of the following topics will be presented in the lectures:
1. Key scientific tasks common to many scientific domains, such as simulation, inverse problems, equation discovery, design, and control problems, and issues with traditional methods for solving them
2. Physics-informed neural networks for solving forward, inverse and equation discovery problems related to PDEs
3. Neural operators, including Fourier neural operators and DeepONets, for learning efficient surrogate models, and their theoretical foundations
4. Differentiable scientific algorithms, neural differential equations, and the benefits of hybrid workflows
5. AI for symbolic regression and equation discovery
6. Applications of graph neural networks in science
7. Guest lectures on AI for chemistry and biology
8. Large language models and other Foundation models for scientific discovery

Applications using these techniques will be illustrated across fluid dynamics, wave physics, medical physics, molecular design, and computational biology. Several examples where AI algorithms outperform traditional scientific workflows will be shown.

Lecture notes

Lecture slides, recordings, and tutorials will be available on Moodle.

Literature

All the material in the course is based on research articles written in last 1-3 years. The relevant references will be provided.

Prerequisites / notice

- An understanding of basic ML concepts including supervised learning, overfitting/underfitting, optimisation, and neural networks is required; you should understand the main concepts in the ETH 252-0220-00L Introduction to Machine Learning course (but note, completing this course is not a formal requirement)
- Familiar with PDEs and numerical methods for solving them
- Basic competence in Python and some practical familiarity with deep learning frameworks (e.g. PyTorch, TensorFlow, or Keras)

Competencies

Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies
- Analytical Competencies
- Problem-solving
- Project Management

Social Competencies
- Communication
- Cooperation and Teamwork

Personal Competencies
- Adaptability and Flexibility

Inversion and Inverse Problems
- Critical Thinking
- Integrity and Work Ethics

401-4652-23L Inverse Problems W 4 credits 2G R. Alalfari

Abstract

Inverse problems arise in many applications in science & engineering. Typically, a physical model describes a forward problem and the task is to reconstruct from measurements, i.e. to perform inversion. In ill-posed problems, these inversions are troublesome as the inverse lacks e.g. stability. Regularization theory studies the controlled extraction of information from such systems.
Objective
The goal of this course is to give an understanding of ill-posedness and how it arises and to introduce the theory of regularization, which gives a mathematical framework to handle these delicate systems.

Content
Linear inverse problems, compact operators and singular value decompositions, regularization of linear inverse problems, regularization penalties, regularization parameters and parameter choice rules, iterative regularization schemes and stopping criteria, non-linear inverse problems.

Lecture notes
The lecture notes will be made available during the semester.

Literature

Prerequisites / notice
Analysis, linear algebra, numerical analysis, ideal but not necessary: functional analysis

Competencies
Subject-specific Competencies
Concepts and Theories assessed
Techniques and Technologies assessed

Method-specific Competencies
Analytical Competencies assessed
Problem-solving assessed

Personal Competencies
Creative Thinking fostered
Critical Thinking assessed

Objective
This course is meant to serve as an introduction to the theory of Markov processes on finite or countable state spaces. We will discuss what a Markov process is along with associated concepts such as transition probabilities, recurrence, transience, ergodicity, reversibility etc. We will motivate various abstract notions introduced with concrete examples from physics and statistics.

Instructor
R. S. Gvalani

Prerequisites / notice
Recommended: Analysis III (measure theory)

Competencies
Subject-specific Competencies
Concepts and Theories assessed
Techniques and Technologies assessed

Method-specific Competencies
Analytical Competencies assessed
Problem-solving assessed

Social Competencies
Self-presentation and Social Influence assessed

Personal Competencies
Creative Thinking assessed

Literature

**Abstract**

This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning "good practice" that can be applied in every student's own projects and daily work life. A special focus will be laid in the use of the statistical software package R for regression analysis.

**Objective**

The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.

**Content**

The course starts with the basics of linear modeling, and then proceeds to parameter estimation, tests, confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, multicollinearity problems and model interpretation, as well as general modeling strategies.

The last third of the course is dedicated to an introduction to generalized linear models: this includes the generalized additive model, logistic regression for binary response variables, binomial regression for grouped data and poisson regression for count data.

**Lecture notes**

A script will be available.

**Literature**

Faraway (2005): Linear Models with R
Faraway (2006): Extending the Linear Model with R
Draper & Smith (1998): Applied Regression Analysis
Fox (2008): Applied Regression Analysis and GLMs
Montgomery et al. (2006): Introduction to Linear Regression Analysis

**Prerequisites / notice**

The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L "Applied Statistical Regression" and 401-3622-00L “Statistical Modelling” are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

**Competencies**

Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management

Social Competencies
- Communication
- Cooperation and Teamwork
- Customer Orientation
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity

Personal Competencies
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

**401-3627-00L High-Dimensional Statistics**

4 credits

**Abstract**

“High-Dimensional Statistics” deals with modern methods and theory for statistical inference when the number of unknown parameters is of much larger order than sample size. Statistical estimation and algorithms for complex models and aspects of multiple testing will be discussed.

**Objective**

Knowledge of methods and basic theory for high-dimensional statistical inference

**Content**

Lasso and Group Lasso for high-dimensional linear and generalized linear models; Additive models and many smooth univariate functions; Non-convex loss functions and l1-regularization; Stability selection, multiple testing and construction of p-values; Undirected graphical modeling

**Literature**

**Prerequisites / notice**

Knowledge of basic concepts in probability theory, and intermediate knowledge of statistics (e.g. a course in linear models or computational statistics).

**401-4632-15L Causality**

5 credits

**Abstract**

In statistics, we are used to search for the best predictors of some random variable. In many situations, however, we are interested in predicting a system's behavior under manipulations. For such an analysis, we require knowledge about the underlying causal structure of the system. In this course, we study concepts and theory behind causal inference.

**Objective**

After this course, you should be able to
- understand the language and concepts of causal inference
- know the assumptions under which one can infer causal relations from observational and/or interventional data
- describe and apply different methods for causal structure learning
- given data and a causal structure, derive causal effects and predictions of interventional experiments

**Content**

The material covered in this course has a significant overlap with the material that has been covered in 401-3620-22L Student Seminar in Statistics: Causality FS2023.

**Literature**

Parts of this course will be based on the book "Elements of Causal Inference" (MIT Press, open access). More details will follow.

**Prerequisites / notice**

Prerequisites: basic knowledge of probability theory and regression

**Competencies**

Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

**401-4623-00L Time Series Analysis**

4 credits

**Abstract**

The course offers an introduction into analyzing times series, that is observations which occur in time. The material will cover Stationary Models, ARMA processes, Spectral Analysis, Forecasting, Nonstationary Models, ARIMA Models and an introduction to GARCH models.

**Objective**

The goal of the course is to have a good overview of the different types of time series and the approaches used in their statistical analysis.
This course treats modeling and analysis of time series, that is random variables which change in time. As opposed to the i.i.d. framework, the main feature exhibited by time series is the dependence between successive observations.

The key topics which will be covered as:

- Stationarity
- Autocorrelation
- Trend estimation
- Elimination of seasonality
- Spectral analysis, spectral densities
- Forecasting

The main reference for this course is the book "Introduction to Time Series and Forecasting", by P. J. Brockwell and R. A. Davis.

---

**Subject-specific Competencies**

- Basic knowledge in probability and statistics

**Prerequisites / notice**

Familiarity with basic concepts of probability theory (random variables, joint and conditional distributions, laws of large numbers and central limit theorem) will be assumed.

---

**Selection: Financial and Insurance Mathematics**

In the Master's programme in Mathematics (direction Mathematics resp. Applied Mathematics 401-3013-01L Mathematical Foundations for Finance is eligible as an elective course resp. applied elective course, but only if 401-3888-00L Introduction to Mathematical Finance isn't recognised for credits (neither in the Bachelor's nor in the Master's programme). For the category assignment take contact with the Study Administration Office (www.math.ethz.ch/studiensekretariat) after having received the credits.

---

**Prerequisites: knowledge of probability theory, statistics and applied stochastic processes.**

---

**Number** 401-3925-00L

**Title** Non-Life Insurance: Mathematics and Statistics

**Abstract**

Does not take place this semester.

**Objective**

The lecture aims at providing a basis in non-life insurance mathematics which forms a core subject of actuarial science. It discusses collective risk modeling, individual claim size modeling, approximations for compound distributions, ruin theory, premium calculation principles, tariffication with generalized linear models and neural networks, credibility theory, claims reserving and solvency.

**Content**

The following topics are treated:

- Collective Risk Modeling
- Claim Counts Models
- Individual Claim Size Modeling
- Censoring and Truncation
- Approximations for Compound Distributions
- Ruin Theory in Discrete Time
- Premium Calculation Principles
- Tariffication
- Generalized Linear Models and Neural Networks
- Bayesian Models and Credibility Theory
- Claims Reserving
- Solvency Considerations

**Lecture notes**

http://ssrn.com/abstract=2319328

**Literature**

M. V. Wüthrich, M. Merz. Statistical Foundations of Actuarial Learning and its Applications

**Prerequisites / notice**

The exams ONLY take place during the official ETH examination period (no semester end exams), and only in person exams (i.e. no remote exams).

This course will be held in English and counts towards the diploma of "Aktuar SAV". For the latter, see details under www.actuaries.ch.

---

**Number** 401-3612-00L

**Title** Stochastic Simulation

**Abstract**

This course provides an introduction to statistical Monte Carlo methods. This includes applications of simulations in various fields (Bayesian statistics, statistical mechanics, operations research, financial mathematics), algorithms for the generation of random variables (accept-reject, importance sampling), estimating the precision, variance reduction, introduction to Markov chain Monte Carlo.

**Objective**

Stochastic simulation (also called Monte Carlo method) is the experimental analysis of a stochastic model by implementing it on a computer. Probabilities and expected values can be approximated by averaging simulated values, and the central limit theorem gives an estimate of the error of this approximation. The course shows examples of the many applications of stochastic simulation and explains different algorithms used for simulation. These algorithms are illustrated with the statistical software R.

**Content**

Examples of simulations in different fields (computer science, statistics, statistical mechanics, operations research, financial mathematics).

**Lecture notes**

A script will be available in English.

**Literature**

P. Glasserman, Monte Carlo Methods in Financial Engineering.

**Competencies**

- Subject-specific Competencies: Concepts and Theories, Techniques and Technologies, Analytical Competencies, Decision-making, Media and Digital Technologies, Problem-solving, Project Management
- Method-specific Competencies: assessed, assessed, assessed, fostered, fostered
### Life Insurance Mathematics

**Abstract**
The classical life insurance model is presented together with the important insurance types (insurance on one and two lives, term and endowment insurance and disability). Besides that the most important terms such as mathematical reserves are introduced and calculated. The profit and loss account and the balance sheet of a life insurance company is explained and illustrated.

**Objective**

**Content**
- Determining raw mortality rates
- Smoothing techniques
- Trends in mortality rates
- Integration of safety margins
- Stochastic mortality model due to Lee and Carter
- Neural network extension of the Lee-Carter model
- Machine learning for mortality forecasts
- Survival analysis

**Lecture notes**
Lectures notes and slides will be provided

**Prerequisites / notice**
The exams ONLY take place during the official ETH examination period.

**Competencies**
- Basic knowledge in probability theory is assumed. Some knowledge in financial mathematics is useful.

---

### Mathematical Modelling in Life Insurance

**Abstract**
In life insurance, it is essential to have adequate mortality rates, be it for reserving or pricing purposes. The course provides the classical tools necessary to create mortality tables from scratch as well as modern machine learning approaches to forecast mortality rates. It also covers the basics of survival analysis.

**Objective**
The course's objective is to provide the students with the understanding and the tools to create mortality tables on their own.

**Content**
- Overview of supervised machine learning (statistical learning theory, GLMs, tree based methods, and neural nets; cross-validation)
- Linear, polynomial, logistic, ridge and lasso regression, dimension reduction methods, singular value decomposition, kernel methods, support vector machines, classification and regression trees, random forests, XGBoost, neural networks, stochastic gradient descent, autoencoders, graph neural networks, transformers, credit analytics, pricing, hedging, insurance claim prediction.

**Lecture notes**
Course material is available on https://people.math.ethz.ch/~patrickc/mlfi

**Literature**

---

### Machine Learning in Finance and Insurance

**Abstract**
This course introduces machine learning methods that can be used in finance and insurance applications.

**Objective**
The goal is to learn methods from machine learning that can be used in financial and insurance applications.

**Content**
- Linear, polynomial, logistic, ridge and lasso regression, dimension reduction methods, singular value decomposition, kernel methods, support vector machines, classification and regression trees, random forests, XGBoost, neural networks, stochastic gradient descent, autoencoders, graph neural networks, transformers, credit analytics, pricing, hedging, insurance claim prediction.

**Lecture notes**
Course material is available on https://people.math.ethz.ch/~patrickc/mlfi

**Literature**

---

### Responsible Machine Learning with Insurance Applications

**Abstract**
This lecture covers important aspects of applying supervised machine learning models in a responsible way, based on sound statistical theory. The focus is on model interpretability, calibration (bias) assessment, and proper model comparison. The methods are illustrated with actuarial datasets.

**Objective**
The student is familiar with the main tools of model interpretability, calibration assessment, and model comparison and knows how to apply supervised machine learning in a responsible way.

**Content**
- Overview of supervised machine learning (statistical learning theory, GLMs, tree based methods, and neural nets; cross-validation)
- Model interpretability methods (partial dependence plots, measures of variable importance, and SHAP)
- Bias/calibration assessment with identification functions
- Model comparison with consistent scoring functions
- Working with dependent observations and further topics

**Prerequisites / notice**
This course will be held in English and counts towards the diploma of “Aktuar SAV”. For the latter, see details under www.actuaries.ch.

Prerequisites: Good knowledge in statistics/probability theory, statistical modelling and Python (or R) programming are assumed.
Selection: Mathematical Physics, Theoretical Physics

Abstract: This course discusses the quantisation of fields in order to introduce a coherent formalism for the combination of quantum mechanics and special relativity. Topics include:
- Relativistic quantum mechanics
- Quantisation of bosonic and fermionic fields
- Interactions in perturbation theory
- Scattering processes and decays
- Elementary processes in QED
- Radiative corrections

Objective: The goal of this course is to provide a solid introduction to the formalism, the techniques, and important physical applications of quantum field theory. Furthermore, it prepares students for the advanced course in quantum field theory (Quantum Field Theory II), and for work on research projects in theoretical physics, particle physics, and condensed-matter physics.

Lecture notes: Will be provided as the course progresses.

402-0861-00L | Statistical Physics         | W    | 10   | 4V+2U  | M. Sigrist      |

Abstract: This lecture covers the concepts of classical and quantum statistical physics. Several techniques such as second quantization formalism for fermions, bosons, photons, and phonons as well as mean field theory and self-consistent field approximation. These are used to discuss phase transitions, critical phenomena, and superfluidity.

Objective: This lecture gives an introduction in the basic concepts and applications of statistical physics for the general use in physics and, in particular, as a preparation for the theoretical solid state physics.

Content: Kinetic approach to statistical physics: H-theorem, detailed balance and equilibrium conditions.
- Classical statistical physics: microcanonical ensembles, canonical ensembles, and grandcanonical ensembles, applications to simple systems.
- Quantum statistical physics: density matrix, ensembles, Fermi gas, Bose gas (Bose-Einstein condensation), photons and phonons.
- Identical quantum particles: many body wave functions, second quantization formalism, equation of motion, correlation functions, selected applications, e.g., Bose-Einstein condensate and coherent state, phonons in elastic media and melting.
- One-dimensional interacting systems.
- Phase transitions: mean field approach to Ising model, Gaussian transformation, Ginzburg-Landau theory (Ginzburg criterion), self-consistent field approach, critical phenomena, Peierls' arguments on long-range order.

Lecture notes: Lecture notes available in English.

Literature: No specific book is used for the course. Relevant literature will be given in the course.

Prerequisites / notice: Knowledge in basic thermodynamics and quantum mechanics.

402-0830-00L | General Relativity          | W    | 10   | 4V+2U  | R. Renner       |

Abstract: Introduction to the theory of general relativity. The course puts a strong focus on the mathematical foundations of the theory as well as the underlying physical principles and concepts. It covers selected applications, such as the Schwarzschild solution and gravitational waves.

Objective: Basic understanding of general relativity, its mathematical foundations (in particular the relevant aspects of differential geometry), and some of the phenomena it predicts (with a focus on black holes).
Introduction to the theory of general relativity. The course puts a strong focus on the mathematical foundations, such as differentiable manifolds, the Riemannian and Lorentzian metric, connections, and curvature. It discusses the underlying physical principles, e.g., the equivalence principle, and concepts, such as curved spacetime and the energy-momentum tensor. The course covers some basic applications and special cases, including the Newtonian limit, post-Newtonian expansions, the Schwarzschild solution, light deflection, and gravitational waves.

Parts of the lecture are based on the book "General Relativity" by R. Wald.

Other suggested textbooks:

"Gravitation" by C. Misner, K. Thorne and J. Wheeler
"Spacetime and Geometry: An Introduction to General Relativity" by S. Carroll
"Gravitation and Cosmology" by S. Weinberg

402-0822-13L Introduction to Integrability W 6 credits 2V+1U N. Beisert

Abstract

This course gives an introduction to the theory of integrable systems, related symmetry algebras and efficient calculational methods.

Objective

Integrable systems are a special class of physical models that can be solved exactly due to an exceptionally large number of symmetries. Examples of integrable models appear in many different areas of physics including classical mechanics, condensed matter, 2d quantum field theories and lately in string- and gauge theories. They offer a unique opportunity to gain a deeper understanding of generic phenomena in a simplified, exactly solvable setting. In this course we introduce the notion and formulation of integrability in classical and quantum mechanics. We discuss various efficient methods for constructing solutions and eigenstates in these models. Finally, we elaborate on the enhanced symmetries that underly integrable models.

Content

- Classical Integrability
- Algebraic Methods for Integrability
- Classical Spin Chains
- Spectral Curves and Inverse Scattering
- Quantum Spin Chains
- Bethe Ansatz
- Classical and Quantum Algebra

Literature

402-0897-00L Introduction to String Theory W 6 credits 2V+1U J. Brödel

Abstract

String theory is an attempt to quantise gravity and unite it with the other fundamental forces of nature. It is related to numerous interesting topics and questions in quantum field theory. In this course, an introduction to the basics of string theory is provided.

Objective

Within this course, a basic understanding and overview of the concepts and notions employed in string theory shall be given. More advanced topics will be touched upon towards the end of the course briefly in order to foster further research.

Content

- mechanics of point particles and extended objects
- string modes and their quantisation; higher dimensions, supersymmetry
- critical dimension and no-ghost theorem
- D-branes, T-duality
- two-dimensional conformal field theories

Literature

M.B. Green, J.H. Schwarz, E. Witten, Superstring Theory I, CUP (1987).

Prerequisites / notice

Recommended: Quantum Field Theory I (in parallel)

Competencies / notice

401-3055-64L Algebraic Methods in Combinatorics W 5 credits 2V+1U

Abstract

Does not take place this semester.

The students will get an overview of various algebraic methods for solving combinatorial problems. We expect them to understand the proof techniques and to use them autonomously on related problems.
Analytical Competencies

A. Lapidoth

One of the main general techniques that played a crucial role in the development of Combinatorics was the application of algebraic methods. The most fruitful such tool is the dimension argument. Roughly speaking, the method can be described as follows: In order to bound the cardinality of a discrete structure A one maps its elements to vectors in a linear space, and shows that the set A is mapped to linearly independent vectors. It then follows that the cardinality of A is bounded by the dimension of the corresponding linear space. This simple idea is surprisingly powerful and has many famous applications.

This course provides a gentle introduction to Algebraic methods, illustrated by examples and focusing on basic ideas and connections to other areas. The topics covered in the class will include (but are not limited to):

- Basic dimension arguments, Spaces of polynomials and tensor product methods, Eigenvalues of graphs and their application, the Combinatorial Nullstellensatz and the Chevalley-Warning theorem. Applications such as: Solution of Kakeya problem in finite fields, counterexample to Borsuk’s conjecture, chromatic number of the unit distance graph of Euclidean space, explicit constructions of Ramsey graphs and many others.

The course website can be found at https://people.inf.ethz.ch/~aroeyskoe/AA23

This course will cover modern topics in algorithm design and analysis, including the following:

- Graph sparsifications while preserving cuts
- Or distances, various approximation algorithms techniques and concepts, metric embeddings and probabilistic tree embeddings, online algorithms, sketching and streaming algorithms, and online algorithms.

Outlook: In the following spring semester there is a seminar "Geometry: Combinatorics and Algorithms" that builds on this course. There are ample possibilities for Semester-, Bachelor- and Master Thesis projects in the area.

- Analytical Competencies: fostered
- Concepts and Theories: fostered

Prerequisites / notice

- Students are expected to have a mathematical background and should be able to write rigorous proofs.
- Lectures will be on the blackboard only, but there will be a set of typeset lecture notes which follow the class closely.
- Lectures will be on the blackboard only, but there will be a set of typeset lecture notes which follow the class closely.
- Sufficient comfort with both (A) Algorithm Design & Analysis and (B) Probability & Concentrations. E.g., having passed the course Algorithms, Probability, and Computing (APC) is recommended, though not required formally. If you are not sure whether you're ready for this class or not, please consult the instructor.

Literature

Objective
The fundamentals of Information Theory including Shannon's source coding and channel coding theorems

Content
The entropy rate of a source, Typical sequences, the asymptotic equi-partition property, the source coding theorem, Huffman coding, Arithmetic coding, channel capacity, the channel coding theorem, the source-channel separation theorem, feedback capacity

Literature
T.M. Cover and J. Thomas, Elements of Information Theory (second edition)

Summary:

Objective: The fundamentals of Information Theory including Shannon's source coding and channel coding theorems.

Content:
The entropy rate of a source, Typical sequences, the asymptotic equi-partition property, the source coding theorem, Huffman coding, Arithmetic coding, channel capacity, the channel coding theorem, the source-channel separation theorem, feedback capacity.

Literature:
T.M. Cover and J. Thomas, Elements of Information Theory (second edition)

Abstract:

For this Reading Course proactive students make an individual agreement with a lecturer to acquire knowledge through independent literature study.

252-0535-00L Advanced Machine Learning

Objective:
Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real world data.

Content:
The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:
- Fundamentals:
  - What is data?
  - Bayesian Learning
  - Computational learning theory
- Supervised learning:
  - Ensembles: Bagging and Boosting
  - Max Margin methods
  - Neural networks
- Unsupervised learning:
  - Dimensionality reduction techniques
  - Clustering
  - Mixture Models
  - Non-parametric density estimation
  - Learning Dynamical Systems

Lecture notes:
No lecture notes, but slides will be made available on the course webpage.

Autumn Semester 2024
How can we build systems that perform well in uncertain environments? How can we develop systems that exhibit “intelligent” behavior?

Guarantees for Machine Learning

This course introduces foundational methods in statistical learning theory aimed at proving theoretical guarantees for machine learning algorithms. The knowledge is then applied in independent project work to understand and follow-up on recent theoretical ML results.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

263-5300-00L Guarantees for Machine Learning W 7 credits 3V+1U+2A F. Yang

Abstract

This course is aimed at advanced master and doctorate students who want to conduct independent research on theory for modern machine learning (ML). It teaches standard methods in statistical learning theory commonly used to prove theoretical guarantees for ML algorithms. The knowledge is then applied in independent project work to understand and follow-up on recent theoretical ML results.

Objective

By the end of the semester students should be able to

- understand a good fraction of theory papers published in the typical ML venues. For this purpose, students will learn common mathematical techniques from statistical learning in the first part of the course and apply this knowledge in the project work
- critically examine recently published work in terms of relevance and find impactful (novel) research problems. This will be an integral part of the project work and involves experimental as well as theoretical questions
- outline a possible approach to prove a conjectured theorem by e.g. reducing to more solvable subproblems. This will be practiced in individual exercises, homeworks and potentially in the final project
- effectively communicate and present the problem motivation, new insights and results to a technical audience. This will be primarily learned via the final presentation and report as well as during peer-grading of peer talks

Content

This course touches upon foundational methods in statistical learning theory aimed at proving theoretical guarantees for machine learning algorithms. It touches on the following topics

- concentration bounds
- uniform convergence and empirical process theory
- regularization for non-parametric statistics (e.g. in RKHS, neural networks)
- high-dimensional learning
- computational and statistical learnability (information-theoretic, PAC, SQ)
- overparameterized models, implicit bias and regularization

The project work focuses on current theoretical ML research that aims to understand modern phenomena in machine learning, including but not limited to

- overparameterized models generalize (statistically) and converge (computationally)
- complexity measures and approximation theoretic properties of randomly initialized and trained neural networks
- generalization of robust learning (adversarial or distribution-shift robustness)
- private and fair learning

Prerequisites / notice

Students should have a very strong mathematical background (real analysis, probability theory, linear algebra) and solid knowledge of core concepts in machine learning taught in courses such as "Introduction to Machine Learning", "Regression", "Statistical Modelling". In addition to these prerequisites, this class requires a high degree of mathematical maturity—including abstract thinking and the ability to understand and write proofs.

Students have usually taken a subset of Fundamentals of Mathematical Statistics, Probabilistic AI, Neural Network Theory, Optimization for Data Science, Advanced ML, Statistical Learning Theory, Probability Theory (D-MATH)

Competencies

Subject-specific Competencies Concepts and Theories assessed
Method-specific Competencies Analytical Competencies assessed

Social Competencies Communication assessed

Personal Competencies Creative Thinking assessed

Critical Thinking assessed

8 credits

263-5210-00L Probabilistic Artificial Intelligence W 8 credits 3V+2U+2A A. Krause

Abstract

This course introduces core modeling techniques and algorithms from machine learning, optimization and control for reasoning and decision making under uncertainty, and study applications in areas such as robotics. The course is designed for graduate students.

Objective

How can we build systems that perform well in uncertain environments? How can we develop systems that exhibit "intelligent" behavior, without prescribing explicit rules? How can we build systems that learn from experience in order to improve their performance? We will study core modeling techniques and algorithms from statistics, optimization, planning, and control and study applications in areas such as robotics. The course is designed for graduate students.

Content

Topics covered:

- Probability
- Probabilistic inference (variational inference, MCMC)
- Bayesian learning (Gaussian processes, Bayesian deep learning)
- Probabilistic planning (MDPs, POMDPs)
- Multi-armed bandits and Bayesian optimization
- Reinforcement learning

Prerequisites / notice

Solid basic knowledge in statistics, algorithms and programming.

The material covered in the course "Introduction to Machine Learning" is considered as a prerequisite.
Neural Network Theory

**W 4 credits 2V+1U**

H. Bölcskei

### Abstract

The class focuses on fundamental mathematical aspects of neural networks with an emphasis on deep networks: Universal approximation theorems, capacity of separating surfaces, generalization, fundamental limits of deep neural network learning, VC dimension.

### Objective

After attending this lecture, participating in the exercise sessions, and working on the homework problem sets, students will have acquired a working knowledge of the mathematical foundations of neural networks.

### Content

1. Universal approximation with single- and multi-layer networks
2. Introduction to approximation theory: Fundamental limits on compressibility of signal classes, Kolmogorov epsilon-entropy of signal classes, non-linear approximation theory
3. Fundamental limits of deep neural network learning
4. Geometry of decision surfaces
5. Separating capacity of nonlinear decision surfaces
6. Vapnik-Chervonenkis (VC) dimension
7. VC dimension of neural networks
8. Generalization error in neural network learning

### Lecture notes

Detailed lecture notes are available on the course web page [https://www.mins.ee.ethz.ch/teaching/int/](https://www.mins.ee.ethz.ch/teaching/int/)

### Prerequisites / notice

This course is aimed at students with a strong mathematical background in general, and in linear algebra, analysis, and probability theory in particular.

---

Projects in Topological Data Analysis

**W 4 credits 3G**

P. Schnider

### Abstract

This seminar complements the course "Introduction to Topological Data Analysis". Students of the seminar will collaborate with students from international universities on concrete projects in topological data analysis, both theoretical and applied.

### Objective

Each student is expected to collaborate in an international working group with students from the partner universities. Each group works on one of the projects suggested by the lecturers, and is assigned a mentor. At the end of the semester, each working group presents their findings in a written report and an oral presentation.

### Content

This seminar complements the course Introduction to Topological Data Analysis. Students get to apply what they learned in the introductory course to concrete projects in the area of topological data analysis. These projects can be of theoretical nature, e.g., the design and analysis of a new algorithm, or applied, such as using methods from topological data analysis on concrete data sets.

### Prerequisites / notice

Successful participation in the course "Introduction to Topological Data Analysis" or equivalent background in topological data analysis is required.

---

### Electives (Direction Applied Mathematics MSc Only)

Electives from applied mathematics and further application-oriented fields that are only eligible for credits for the Master's degree in Applied Mathematics.

### Abstract

Basic facts about nonlinear systems; stability and near-equilibrium dynamics; bifurcations; dynamical systems on the plane; non-autonomous dynamical systems; chaotic dynamics.

### Objective

This course is intended for Masters and Ph.D. students in engineering sciences, physics and applied mathematics who are interested in the behavior of nonlinear dynamical systems. It offers an introduction to the qualitative study of nonlinear physical phenomena modeled by differential equations or discrete maps. We discuss applications in classical mechanics, electrical engineering, fluid mechanics, and biology. A more advanced Part II of this class is offered every other year.

### Content

1. Basic facts about nonlinear systems: Existence, uniqueness, and dependence on initial data.
2. Near equilibrium dynamics: Linear and Lyapunov stability
3. Bifurcations of equilibria: Center manifolds, normal forms, and elementary bifurcations
4. Nonlinear dynamical systems on the plane: Phase plane techniques, limit sets, and limit cycles.
5. Time-dependent dynamical systems: Floquet theory, Poincare maps, averaging methods, resonance
Mathematical Foundations for Finance

**Number** 401-3913-01L

**Title** Mathematical Foundations for Finance

**Type** W

**ECTS** 4 credits

**Hours** 3V+2U

**Lecturers** D. Possamaï

**Abstract** First introduction to main modelling ideas and mathematical tools from mathematical finance.

**Objective**

This course gives a first introduction to the main modelling ideas and mathematical tools from mathematical finance. It mainly aims at non-mathematicians who need an introduction to the main tools from stochastics used in mathematical finance. However, mathematicians who want to learn some basic modelling ideas and concepts for quantitative finance (before continuing with a more advanced course) may also find this of interest. The main emphasis will be on ideas, but important results will be given with (sometimes partial) proofs.

**Content**

Topics to be covered include:

- financial market models in finite discrete time
- absence of arbitrage and martingale measures
- valuation and hedging in complete markets
- basics about Brownian motion
- stochastic integration
- stochastic calculus: Itô's formula, Girsanov transformation, Itô's representation theorem
- Black-Scholes formula

**Prerequisites / notice**

The class lecture notes will be posted electronically after each lecture. Students should not rely on these but prepare their own notes during the lecture.

- Prerequisites: Analysis, linear algebra and a basic course in differential equations.

**ECTS**

- 6 credits

**Lecturers** T. Vaughan, C. Magnus, T. Stadler

---

**Application Area**

Only necessary and eligible for the Master degree in Applied Mathematics.

One of the application areas specified must be selected for the category Application Area for the Master degree in Applied Mathematics. At least 8 credits are required in the chosen application area. Credits from other application areas cannot be recognised for further application areas.

---

**Atmospherical Physics**

**Number** 701-1221-00L

**Title** Dynamics of Large-Scale Atmospheric Flow

**Type** W

**ECTS** 4 credits

**Hours** 2V+1U

**Lecturers** H. Wernli, J. Riboldi

**Abstract**

This lecture course is about the fundamental aspects of the dynamics of extratropical weather systems (quasi-geostrophic dynamics, potential vorticity, Rossby waves, baroclinic instability). The fundamental concepts are formally introduced, quantitatively applied and illustrated with examples from the real atmosphere. Exercises (quantitative and qualitative) form an essential part of the course.

**Objective**

Understanding of dynamic processes of large-scale atmospheric flow and their mathematical-physical formulation.

**Content**

Dynamical Meteorology is concerned with the dynamical processes of the earth's atmosphere. The fundamental equations of motion in the atmosphere will be discussed along with the dynamics and interactions of synoptic system - i.e. the low and high pressure systems that determine our weather. The motion of such systems can be understood in terms of quasi-geostrophic theory. The lecture course provides a derivation of the mathematical basis along with some interpretations and applications of the concept.

**Lecture notes**

Dynamics of large-scale atmospheric flow

**Literature**

- Pichler H., Dynamik der Atmosphäre, Bibliographisches Institut, 456 pp. 1997

**Prerequisites / notice**

Physics I, II, Environmental Fluid Dynamics

**Lecturers** T. Vaughan, C. Magnus, T. Stadler

---
Abstract

The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Computational algorithms extracting biological information from genetic sequence data are discussed, and statistical tools to understand this information in detail are introduced.

Objective

Attendees will learn which information is contained in genetic sequencing data and how to extract information from this data using computational tools. The main concepts introduced are:

- stochastic models in molecular evolution
- phylogenetic & phylodynamic inference
- maximum likelihood and Bayesian statistics

Attendees will apply these concepts to a number of applications yielding biological insight into:

- epidemiology
- pathogen evolution
- macroevolution of species

Content

The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods for direct alignment analysis using approaches such as BLAST and GAWAS. Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. Lastly, we introduce the field of phylodynamics, the aim of which is to understand and quantify population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

Lecture notes

Lecture slides will be available on moodle.

Literature

The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:

- Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.

Prerequisites / notice

Basic knowledge in linear algebra, analysis, and statistics will be helpful. Programming in R will be required for the project work (compulsory continuous performance assessments). In case you do not have any previous experience with R, we strongly recommend to get familiar with R prior to the semester start. For the D-BSSE students, we highly recommend the voluntary course „Introduction to Programming“, which takes place in Basel before the start of the semester.

Evolutionary Dynamics

W  6 credits 2V+1U+2A  N. Beerenwinkel

Abstract

Evolutionary dynamics is concerned with the mathematical principles according to which life has evolved. This course offers an introduction to mathematical modeling of evolution, including deterministic and stochastic models, with an emphasis on tumor evolution.

Objective

The goal of this course is to understand and to appreciate mathematical models and computational methods that provide insight into the evolutionary process in general and tumor evolution in particular. Students should analyze and evaluate models and their application critically and be able to design new models.

Content

Evolution is the one theory that encompasses all of biology. It provides a single, unifying concept to understand the living systems that we observe today. We will introduce several types of mathematical models of evolution to describe gene frequency changes over time in the context of different biological systems, focusing on asexual populations. Viruses and cancer cells provide the most prominent examples of such systems and they are at the same time of great biomedical interest. The course will cover some classical mathematical population genetics and population dynamics, and also introduce several new approaches. This is reflected in a diverse set of mathematical concepts which make their appearance throughout the course, all of which are introduced from scratch. Topics covered include the quasispecies equation, evolution of HIV, evolutionary game theory, evolutionary stability, evolutionary graph theory, tumor evolution, stochastic tunneling, genetic progression of cancer, diffusion theory, fitness landscapes, branching processes, and evolutionary escape.

**Abstract**

Introduces and develops the fundamental concepts and solution methods of Dynamic Programming.

**Objective**

Understands the basic asset-liability framework: essential principles and properties of social and pension insurance; cash flow matching.

**Content**

Understands the conditions for sustainable funding: derivation of required returns; interplay between return levels, contribution levels and other parameters; influence of guaranteed benefits.

**Lecture notes**

Extensive handouts will be provided. Moreover, practical examples and data sets in Excel will be made available.

**Prerequisites / notice**

Solid base knowledge of probability and statistics is indispensable. Specialized concepts from financial and insurance mathematics as well as quantitative risk management will be introduced in the lecture as needed, but some prior knowledge in some of these areas would be an advantage.

This course counts towards the diploma of "Aktuar SAV".

The exams ONLY take place during the official ETH examination period.

</thead>
</table>

#### Abstract

A successful completion of the course will enable a thorough understanding of the basic questions and methods of resource and environmental economics and the ability to solve typical problems using appropriate tools consisting of concise verbal explanations, diagrams or mathematical expressions. Concrete goals are first of all the acquisition of knowledge about the main questions of resource and environmental economics and about the foundation of the theory with different normative concepts in terms of efficiency and fairness. Secondly, students should be able to deal with environmental externalities and internalisation through appropriate policies or private negotiations, including knowledge of the available policy instruments and their relative strengths and weaknesses. Thirdly, the course will allow for in-depth economic analysis of renewable and non-renewable resources, including the role of stock constraints, regeneration functions, market power, property rights and the impact of technology. A fourth objective is to successfully use the well-known tool of cost-benefit analysis for environmental policy problems, which requires knowledge of the benefits of an improved natural environment. The last two objectives of the course are the acquisition of sufficient knowledge about the economics of sustainability and the application of environmental economic theory and policy at international level, e.g. to the problem of climate change.

#### Objective

The course covers all the interactions between the economy and the natural environment. It introduces and explains basic welfare concepts and market failure; external effects, public goods, and environmental policy; the measurement of externalities and contingent valuation; the economics of non-renewable resources, renewable resources, cost-benefit-analysis, sustainability concepts; international aspects of resource and environmental problems; selected examples and case studies. After a general introduction to resource and environmental economics, highlighting its importance and the main issues, the course explains the normative basis, utilitarianism, and fairness according to different principles. Pollution externalities are a deep core topic of the lecture. We explain the governmental internalisation of externalities as well as the private internalisation of externalities (Coase theorem). Furthermore, the issues of free rider problems and public goods, efficient levels of pollution, tax vs. permits, and command and control instruments add to a thorough analysis of environmental policy. Turning to resource supply, the lecture first looks at empirical data on non-renewable natural resources and then develops the optimal price development (Hotelling-rule). It deals with the effects of explorations, new technologies, and market power. When treating the renewable resources, we look at biological growth functions, optimal harvesting of renewable resources, and the overuse of open-access resources. A next topic is cost-benefit analysis with the environment, requiring measuring environmental benefits and measuring costs. In the chapter on sustainability, the course covers concepts of sustainability, conflicts with optimality, and indicators of sustainability. In a final chapter, we consider international environmental problems and in particular climate change and climate policy.

#### Content

The resources on our planet are finite. The discipline of microeconomics therefore deals with the question of how society can use scarce resources to produce goods and services and ensure a (fair) distribution. The learning objectives of the course are:

1. Students must be able to discuss basic principles, problems and approaches in microeconomics. (2) Students can analyse and explain simple economic principles in a market using supply and demand graphs. (3) Students can contrast different market structures and describe firm and consumer behaviour. (4) Students can identify market failures such as externalities related to market activities and illustrate how these affect the economy as a whole. (5) Students can also recognize behavioural failures within a market and discuss basic concepts related to behavioural economics. (6) Students can apply simple mathematical concepts on economic problems.

#### Abstract

The course introduces basic principles, problems and approaches of microeconomics. This provides the students with reflective and contextual knowledge on how societies use scarce resources to produce goods and services and ensure a (fair) distribution.

#### Objective

The learning objectives of the course are:

1. Students must be able to discuss basic principles, problems and approaches in microeconomics. (2) Students can analyse and explain simple economic principles in a market using supply and demand graphs. (3) Students can contrast different market structures and describe firm and consumer behaviour. (4) Students can identify market failures such as externalities related to market activities and illustrate how these affect the economy as a whole. (5) Students can also recognize behavioural failures within a market and discuss basic concepts related to behavioural economics. (6) Students can apply simple mathematical concepts on economic problems.

#### Content

The resources on our planet are finite. The discipline of microeconomics therefore deals with the question of how society can use scarce resources to produce goods and services and ensure a (fair) distribution. In particular, microeconomics deals with the behaviour of consumers and firms in different market forms. Economic considerations and discussions are not part of classical engineering and science study programme. Thus, the goal of the lecture "Principles of Microeconomics" is to teach students how economic thinking and argumentation works. The course should help the students to look at the contents of their own studies from a different perspective and to be able to critically reflect on economic problems discussed in the society.

#### Topics covered by the course are:

- Supply and demand
- Consumer demand: neoclassical and behavioural perspective
- Cost of production: neoclassical and behavioural perspective
- Welfare economics, deadweight losses
- Governmental policies
- Market failures, common resources and public goods
- Public sector, tax system
- Market forms (competitive, monopolistic, monopolistic competitive, oligopolistic)
- International trade

#### Lecture notes

Lecture notes, exercises and reference material can be downloaded from Moodle.

363-0565-00L Principles of Macroeconomics

W 3 credits 2V J.-E. Sturm

Abstract
This course examines the behaviour of macroeconomic variables, such as gross domestic product, unemployment and inflation rates. It tries to answer questions like: How can we explain fluctuations of national economic activity? What can economic policy do against unemployment and inflation?

Objective
This lecture will introduce the fundamentals of macroeconomic theory and explain their relevance to everyday economic problems.

Content
This course helps you understand the world in which you live. There are many questions about the macroeconomy that might spark your curiosity. Why are living standards so meagre in many African countries? Why do some countries have high rates of inflation while others have stable prices? Why have some European countries adopted a common currency? These are just a few of the questions that this course will help you answer.

Furthermore, this course will give you a better understanding of the potential and limits of economic policy. As a voter, you help choose the policies that guide the allocation of society's resources. When deciding which policies to support, you may find yourself asking various questions about economics. What are the burdens associated with alternative forms of taxation? What are the effects of free trade with other countries? How does the government budget deficit affect the economy? These and similar questions are always on the minds of policy makers.

Lecture notes
The course Moodle page contains announcements, course information and lecture slides.

Literature

This book can also be used for the course ‘363-0503-00L Principles of Microeconomics’ (Filippini).

Besides this textbook, the slides, lecture notes and problem sets will cover the content of the lecture and the exam questions.

363-1021-00L Monetary Policy

W 3 credits 2V J.-E. Sturm, A. Rathke

Abstract
The main aim of this course is to analyze the goals of monetary policy and to review the instruments available to central banks in order to pursue these goals. It will focus on the transmission mechanisms of monetary policy and the differences between monetary policy rules and discretionary policy. It will also make connections between theoretical economic concepts and current real world issues.
Objective
This lecture will introduce the fundamentals of monetary economics and explain the working and impact of monetary policy. The main aim of this course is to describe and analyze the goals of monetary policy and to review the instruments available to central banks in order to pursue these goals. It will focus on the transmission mechanisms of monetary policy, the effectiveness of monetary policy actions, the differences between monetary policy rules and discretionary policy, as well as in institutional issues concerning central banks, transparency of monetary authorities and monetary policy in a monetary union framework. Moreover, we discuss the implementation of monetary policy in practice and the design of optimal policy.

Content
For the functioning of today's economy, central banks and their policies play an important role. Monetary policy is the policy adopted by the monetary authority of a country, the central bank. The central bank controls either the interest rate payable on very short-term borrowing or the money supply, often targeting inflation or the interest rate to ensure price stability and general trust in the currency. This monetary policy course looks into today's major questions related to policies of central banks. It provides insights into the monetary policy process using core economic principles and real-world examples.

Lecture notes
The course Moodle page contains announcements, course information and lecture slides.

Literature
The course will be based on chapters of:

Prerequisites / notice
Basic knowledge in international economics and a good background in macroeconomics.

<tbody>
<tr>
<td>Everyday, we take decisions involving risks. These decisions are driven by our perception of and our appetite for risk. Insurance plays a significant role in people's risk-management strategies.</td>
</tr>
</tbody>
</table>

In the first part of this lecture, we discuss a normative decision concept, Expected Utility theory, and compare it with empirically observed behaviour.

Students then learn about the rationale for individuals to purchase insurance, and for companies to offer it. We derive the optimal level of insurance demand and discuss how it depends on our model's underlying assumptions.

We then discuss the consequences of information asymmetries in insurance markets and the consequences for insurance supply.

Finally, we discuss refinements in decision theory that help account for observed behaviours that don't fit with the basic models of microeconomic theory. For example, we'll explore how behavioural economics can be leveraged by the insurance industry.

Abstract

This course develops and refines tools for evaluating investments (capital budgeting), capital structure, and corporate securities. The course seeks to deepen students' understanding of the link between corporate finance theory and practice.

Objective

This course develops and refines tools for evaluating investments (capital budgeting), capital structure, and corporate securities. With respect to capital structure, we start with the famous Miller and Modigliani irrelevance proposition and then move on to study the effects of taxes, bankruptcy costs, information asymmetries between firms and the capital markets, and agency costs. In this context, we will also study how leverage affects some central financial ratios that are often used in practice to assess firms and their stock. Other topics include corporate cash holdings, the use and pricing of convertible bonds, and risk management. The latter two topics involve option pricing. With respect to capital budgeting, the course pays special attention to tax effects in valuation, including in the estimation of the cost of capital. We will also study payout policy (dividends and share repurchases). The course seeks to deepen students' understanding of the link between corporate finance theory and practice. Various cases will be assigned to help reach this objective.

Content

Topics covered:
1. Capital structure: Perfect markets and irrelevance
2. Risk, leverage, taxes, and the cost of capital
3. Leverage and financial ratios
4. Payout policy: Dividends and share repurchases
5. Capital structure: Taxes and bankruptcy costs
6. Capital structure: Information asymmetries, agency costs, cash holdings
7. Valuation: DCF, adjusted present value and WACC
8. Valuation using options
9. The use and pricing of convertible bonds
10. Corporate risk management

261-5111-00L Asset Management: Advanced Investments (University of Zurich)

Abstract

Comprehension and application of advanced portfolio theory

Objective

Comprehension and application of advanced portfolio theory

Content

The theoretical part of the lecture consists of the topics listed below.

- Standard Markowitz Model and Extensions
- MV Optimization, MV with Liabilities and CAPM.
- The Crux with MV
- Resampling, regression, Black-Litterman, Bayesian, shrinkage, constrained and robust optimization.
- Downside and Coherent Risk Measures
- Definition of risk measures, MV optimization under VaR and ES constraints.
- Risk Budgeting
- Equal risk contribution, most diversified portfolio and other concentration indices
- Regime Switching and Asset Allocation
- An introduction to regime switching models and its intuition.
- Strategic Asset Allocation
- Introducing a continuous-time framework, solving the HJB equation and the classical Merton problem.

363-1017-00L Risk and Insurance Economics

Abstract

The course covers the economics of risk and insurance, in particular the following topics will be discussed:

2) individual decision making under risk
3) models of insurance demand, risk sharing, insurance supply
4) information issues in insurance markets
5) advanced topics in microeconomics and behavioral economics
6) the macroeconomic role of insurers and insurance regulation

Objective

The course introduces students to basic microeconomic models of risk attitudes and highlight the role insurance can – or cannot – play for individuals facing risks.

Content

Everyday, we take decisions involving risks. These decisions are driven by our perception of and our appetite for risk. Insurance plays a significant role in people's risk-management strategies.

In the first part of this lecture, we discuss a normative decision concept, Expected Utility theory, and compare it with empirically observed behaviour.

Students then learn about the rationale for individuals to purchase insurance, and for companies to offer it. We derive the optimal level of insurance demand and discuss how it depends on our model's underlying assumptions.

We then discuss the consequences of information asymmetries in insurance markets and the consequences for insurance supply.

Finally, we discuss refinements in decision theory that help account for observed behaviours that don't fit with the basic models of microeconomic theory. For example, we'll explore how behavioural economics can be leveraged by the insurance industry.
The course is about some fundamental topics of digital signal processing with a bias towards applications in communications. The two main themes are linearity and probability. In the first part of the course, we deepen our understanding of discrete-time linear filters. In the second part of the course, we review the basics of probability theory and discrete-time stochastic processes. We then discuss some basic concepts of detection theory and estimation theory, as well as some practical methods including LMMSE estimation and LMMSE filtering, the LMS algorithm, and the Viterbi algorithm. A recurrent theme throughout the course is the stable and robust "inversion" of a linear filter.

Content
- Image segmentation. Motion extraction and tracking. 3D data extraction. Invariant features. Specific object recognition and object class recognition. Deep learning and Convolutional Neural Networks.
- Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

Objective
- This course aims at offering a self-contained account of computer vision and its underlying concepts, including the recent use of deep learning.

Prerequisites / notice
- Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Python and Linux.

Lecture notes
- Course material, Script, computer demonstrations, exercises and problem solutions

Literature
Objective
The fundamentals of Information Theory including Shannon's source coding and channel coding theorems

Content
The entropy rate of a source, Typical sequences, the asymptotic equi-partition property, the source coding theorem, Huffman coding, Arithmetic coding, channel capacity, the channel coding theorem, the source-channel separation theorem, feedback capacity

Literature
T.M. Cover and J. Thomas, Elements of Information Theory (second edition)

A set of detailed lecture notes will be provided, which will cover the whole course. A selection of the following topics will be presented in the lectures:

1. Key scientific tasks common to many scientific domains, such as simulation, inverse problems, equation discovery, design, and control problems, and issues with traditional methods for solving them
2. Physics-informed neural networks for solving forward, inverse and equation discovery problems related to PDEs
3. Neural operators, including Fourier neural operators and DeepONets, for learning efficient surrogate models, and their theoretical foundations
4. Differentiable scientific algorithms, neural differential equations, and the benefits of hybrid workflows
5. AI for symbolic regression and equation discovery
6. Applications of graph neural networks in science
7. Guest lectures on AI for chemistry and biology
8. Large language models and other Foundation models for scientific discovery

Applications using these techniques will be illustrated across fluid dynamics, wave physics, medical physics, molecular design, and computational biology. Several examples where AI algorithms outperform traditional scientific workflows will be shown.

Aimed at students in a Master's Programme in Mathematics, Engineering and Physics.

### Abstract

AI is having a profound impact on science by accelerating discoveries across physics, chemistry, biology, and engineering. This course aims to present a highly topical selection of AI applications across these fields. Emphasis will be placed on using AI, particularly deep learning, to understand systems modelled by PDEs, and key scientific machine learning concepts and themes will be discussed.

### Objective

- Aware of advanced applications of AI in the sciences and engineering
- Familiar with the design, implementation, and theory of these algorithms
- Understand the pros/cons of using AI and deep learning for science
- Understand key scientific machine learning concepts and themes

### Content

#### Lecture notes
Lecture slides, recordings, and tutorials will be available on Moodle.

#### Literature
- All the material in the course is based on research articles written in last 1-3 years. The relevant references will be provided.

#### Prerequisites / notice
- An understanding of basic ML concepts including supervised learning, overfitting/underfitting, optimisation, and neural networks is required; you should understand the main concepts in the ETH 252-0220-00L Introduction to Machine Learning course (but note, completing this course is not a formal requirement)
- Familiar with PDEs and numerical methods for solving them
- Basic competence in Python and some practical familiarity with deep learning frameworks (e.g. PyTorch, TensorFlow, or Keras)

### Competencies

#### Subject-specific Competencies
- Concepts and Theories assessed
- Techniques and Technologies assessed

#### Method-specific Competencies
- Analytical Competencies assessed
- Problem-solving assessed
- Project Management fostered

#### Social Competencies
- Communication fostered
- Cooperation and Teamwork fostered

#### Personal Competencies
- Adaptability and Flexibility fostered
- Critical Thinking assessed
- Integrity and Work Ethics fostered

#### Methods

- Basic competence in Python and some practical familiarity with deep learning frameworks (e.g. PyTorch, TensorFlow, or Keras)

#### ECTS
6 credits

#### Hours
3G

#### Lecturers
M. Reiher, T. Weymuth

### Number

- Advanced, but fundamental topics central to the understanding of theory in chemistry and for solving actual chemical problems with a computer.
- Examples are:
  - Operators derived from principles of relativistic quantum mechanics
  - Relativistic effects + methods of relativistic quantum chemistry
  - Open-shell molecules + spin-density functional theory
  - New electron-correlation theories

### Objective

The aim of the course is to provide an in-depth knowledge of theory and method development in theoretical chemistry. It will be shown that this is necessary in order to be able to solve actual chemical problems on a computer with quantum chemical methods.

The relativistic re-derivation of all concepts known from (nonrelativistic) quantum mechanics and quantum-chemistry lectures will finally explain the form of all operators in the molecular Hamiltonian - usually postulated rather than deduced. From this, we derive operators needed for molecular spectroscopy (like those required by magnetic resonance spectroscopy). Implications of other assumptions in standard non-relativistic quantum chemistry shall be analyzed and understood, too. Examples are the Born-Oppenheimer approximation and the expansion of the electronic wave function in a set of pre-defined many-electron basis functions (Slater determinants). Overcoming these concepts, which are so natural to the theory of chemistry, will provide deeper insights into many-particle quantum mechanics. Also revisiting the workhorse of quantum chemistry, namely density functional theory, with an emphasis on open-shell electronic structures (radicals, transition-metal complexes) will contribute to this endeavor. It will be shown how these insights allow us to make more accurate predictions in chemistry in practice - at the frontier of research in theoretical chemistry.

### Content

1) Introductory lecture: basics of quantum mechanics and quantum chemistry
2) Einstein's special theory of relativity and the (classical) electromagnetic interaction of two charged particles
3) Klein-Gordon and Dirac equation: the Dirac hydrogen atom
4) Numerical methods based on the Dirac-Fock-Coulomb Hamiltonian, two-component and scalar relativistic Hamiltonians
5) Response theory and molecular properties, derivation of property operators, Breit-Pauli-Hamiltonian
6) Relativistic effects in chemistry and the emergence of spin
7) Spin in density functional theory
8) New electron-correlation theories: Tensor network and matrix product states, the density matrix renormalization group

### Lecture notes
A set of detailed lecture notes will be provided, which will cover the whole course.
Introduction to Computational Physics

The lecture slides are provided as handouts - including notes and literature sources - to registered students only. All material is to be found on the Moodle platform. More details during the first lecture.

Weekly self-study tasks are used to apply the concepts introduced in the lectures. We practice how to solve nonlinear models formally and numerically and how to interpret the results.

Lecture notes

The lecture slides are provided as handouts - including notes and literature sources - to registered students only. All material is to be found on the Moodle platform. More details during the first lecture.

Prerequisites / notice

Students should be familiar with nonlinear differential equations and should have basic programming skills. All necessary details to solve nonlinear models will be provided in the course. The course will not build on mathematical proofs, optimization, statistics, efficient numerical computation and other specialized skills.

Abstract

What causes economic business cycles? How are limited resources, competition, and cooperation reflected in growth dynamics? To answer such questions, we combine macroeconomic models and methods of nonlinear dynamics. We study the role of bifurcations and control parameters for dynamic stability. Feedback cycles and coupled dynamics are reasons for limited predictability, instability and chaos.

Objective

successful participant of the course is able to:
- understand the importance of different modeling approaches
- formalize and solve one- and two-dimensional nonlinear models
- identify critical conditions for stability and dynamic transitions
- analyze macroeconomic models of business cycles, supply and demand
- apply formal concepts to model economic growth and competition

Content

System theory sees the economy as a complex adaptive system. What does this mean for economic modeling?

We focus on two sources of complexity: (a) nonlinear dynamics, which is captured in this course, “Economic Dynamics and Complexity” and (b) collective interactions, which is captured in the course “Agent-Based Modeling of Economic Systems” (in Spring).

Our approach to economic dynamics combines insights from different disciplines: macroeconomics studying business cycles and growth, system dynamics rooted general system theory and cybernetics, and nonlinear dynamics using applied mathematics.

We start with a comparison of different modeling approaches, to highlight the problems and challenges of system modeling. The subsequent lectures then introduce different one- and two-dimensional nonlinear models with applications in economics, such as models of supply and demand, business cycles, growth and competition. Emphasis is on the formal analysis of these models using methods from applied mathematics and tools for solving coupled differential equations.

Weekly self-study tasks are used to apply the concepts introduced in the lectures. We practice how to solve nonlinear models formally and numerically and how to interpret the results.

Theoretical Physics

In the Master's programme in Applied Mathematics 402-0205-00L Quantum Mechanics I is eligible as a course unit in the application area Theoretical Physics, but only if 402-0224-00L Theoretical Physics wasn't or isn't recognised for credits (neither in the Bachelor's nor in the Master's programme). For the category assignment take contact with the Study Administration Office (www.math.ethz.ch/studiensekretariat) after having received the credits.

### Objective
Students learn to apply the following methods: Random number generators, Determination of percolation critical exponents, numerical solution of problems from classical mechanics and electrodynamics, canonical Monte-Carlo simulations to numerically analyze magnetic systems. Students also learn how to implement their own numerical frameworks in Julia and how to use existing libraries to solve physical problems. In addition, students learn to distinguish between different numerical methods to apply them to solve a given physical problem.

### Content
Introduction to computer simulation methods for physics problems. Models from classical mechanics, electrodynamics and statistical mechanics as well as some interdisciplinary applications are used to introduce modern programming methods for numerical simulations using Julia. Furthermore, an overview of existing software libraries for numerical simulations is presented.

### Literature
Lecture notes and slides are available online and will be distributed if desired.

**Abstract**

Introduction to the theory of general relativity. The course puts a strong focus on the mathematical foundations of the theory as well as the underlying physical principles and concepts. It covers selected applications, such as the Schwarzschild solution and gravitational waves.

**Objective**

Basic understanding of general relativity, its mathematical foundations (in particular the relevant aspects of differential geometry), and some of the phenomena it predicts (with a focus on black holes).

**Content**

Basic understanding of general relativity, its mathematical foundations, such as differentiable manifolds, the Riemannian and Lorentzian metric, connections, and curvature. It discusses the underlying physical principles, e.g., the equivalence principle, and concepts, such as curved spacetime and the energy-momentum tensor. The course covers some basic applications and special cases, including the Newtonian limit, post-Newtonian expansions, the Schwarzschild solution, light deflection, and gravitational waves.

**Literature**

Parts of the lecture are based on the book "General Relativity" by R. Wald.

Other suggested textbooks:

- "Gravitation" by C. Misner, K. Thorne and J. Wheeler
- "Spacetime and Geometry: An Introduction to General Relativity" by S. Carroll
- "Gravitation and Cosmology" by S. Weinberg

**Competencies**

**Subject-specific Competencies**

**Abstract**

The course provides the necessary knowledge to develop models supporting and also evaluating the solution of given planning problems. The course is composed of a lecture part, providing the theoretical knowledge, and an applied part in which students develop their own models in order to evaluate a transport project/policy by means of cost-benefit analysis. The course provides the necessary knowledge to develop models supporting and also evaluating the solution of given planning problems. Examples of such planning problems are the estimation of traffic volumes, prediction of estimated utilization of new public transport lines, and evaluation of effects (e.g., change in emissions of a city) triggered by building new infrastructure and changes to operational regulations.

**Objective**

- Knowledge and understanding of statistical methods and algorithms commonly used in transport planning
- Comprehend the reasoning and capabilities of transport models
- Ability to independently develop a transport model able to solve/answer planning problems
- Get familiar with cost-benefit analysis as a decision-making tool

**Content**

The course provides the necessary knowledge to develop models supporting and also introduces cost-benefit analysis as a decision-making tool. Examples of such planning problems are the estimation of traffic volumes, prediction of estimated utilization of new public transport lines, and evaluation of effects (e.g., change in emissions of a city) triggered by building new infrastructure and changes to operational regulations.

To cope with that, the problem is divided into sub-problems, which are solved using various statistical models (e.g. regression, discrete choice analysis) and algorithms (e.g. iterative proportional fitting, shortest path algorithms, method of successive averages).

The course is composed of a lecture part, providing the theoretical knowledge, and an applied part in which students develop their own models in order to evaluate a transport project/policy by means of cost-benefit analysis. Interim lab session take place regularly to guide and support students with the applied part of the course.

<td>Abstract</td>
<td>The seminar covers theory and applications of port-Hamiltonian system models based on current literature. The various topics have to be presented by groups of students.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Objective
Participants of the seminar should acquire familiarity with the concept of port-Hamiltonian systems and the relevant mathematical theory for their analysis. They should be enabled to devise and understand port-Hamiltonian models of physical systems.

Content
Port-Hamiltonian provide a mathematical framework for the modeling of complex (multi-physics) systems, of their dynamical behavior, for understanding their stability and effective control. They are based on geometric structure and represent a generalization of Hamiltonian systems towards open systems. The building blocks of port-Hamiltonian systems are thought to interact by exchanging energy. So the main focus of port-Hamiltonian modeling is on accurately representing the flow, storage, and dissipation of energy. Port-Hamiltonian models are ubiquitous nowadays, used in areas like mechanics, fluid dynamics, thermodynamics, and (electric) circuits. They play a big role in modern control theory and are a highly active field of theoretical and applied research.

This seminar will study a number of monograph chapters and research papers dealing with both theoretical and application aspects of post-Hamiltonian system models.

Topics:

Student groups will be decided and topics will be assigned during the preparatory meeting.

Prerequisites / notice

Good skills in linear algebra and ordinary differential equations are required

Preparatory meeting on

Every presentation has to be done jointly by a group of 2-3 students with presenters selected at random. Every participant will have to present on 2-3 occasions.

Competencies
Subject-specific Competencies
- Concepts and Theories assessed
- Analytical Competencies assessed
- Media and Digital Technologies assessed

Method-specific Competencies
- Problem-solving fostered

Social Competencies
- Communication assessed
- Cooperation and Teamwork assessed
- Customer Orientation fostered

Personal Competencies
- Critical Thinking assessed
- Self-awareness and Self-reflection assessed

401-3760-74L Stability of Phase Retrieval Problems W 4 credits 2S M. Taylor
Prerequisites / notice

The background would be a general course in functional analysis, covering Banach and Hilbert spaces.

401-3650-73L Numerical Analysis Seminar Does not take place this semester.
Prerequisites / notice

There are several course units "Semester Paper" that are all equivalent. If, during your studies, you write several semester papers, choose among the different numbers in order to be able to obtain credits again.

Semester Papers

There are several course units "Semester Paper" that are all equivalent. If, during your studies, you write several semester papers, choose among the different numbers in order to be able to obtain credits again.

Science in Perspective

Two credits are needed from the "Science in Perspective" programme with language courses excluded if three credits from language courses have
already been recognised for the Bachelor's degree.
see https://ethz.ch/content/dam/ethz/common/docs/weisungssammlung/files-en/science-in-perspective.pdf (Eight credits must be acquired in this category: normally six during the Bachelor's degree programme, and two during the Master's degree programme. A maximum of three credits from language courses from the range of the Language Center of the University of Zurich and ETH Zurich may be recognised. In addition, only advanced courses (level B2 upwards) in the European languages English, French, Italian and Spanish are recognised. German language courses are recognised from level C2 upwards.)

Abstract Invited talks, covering the entire scope of computer science. External Listeners are welcome at no charge. A detailed schedule is published at the beginning of each semester.

Objective Top international computer scientists take the floor at the distinguished computer science colloquium. Our guest speakers present impacting topics across various areas of the discipline. The colloquium series is held every semester and also includes inaugural and farewell lectures of the department's professors. The colloquium is a noteworthy event for all graduate students. Outside attendance is equally welcome.

Content Renowned international computer scientists take the floor at our distinguished colloquium series, to present topics across all areas of computer science.

Galois theory and related topics.

The precise content changes with the examiner. Candidates must therefore contact the examiner in person before studying the material.

The main topic is Galois Theory. Starting point is the problem of solvability of algebraic equations by radicals. Galois theory solves this problem by making a connection between field extensions and group theory. Galois theory will enable us to prove the theorem of Abel-Ruffini, that there are polynomials of degree 5 that are not solvable by radicals, as well as Galois' theorem characterizing those polynomials which are solvable by radicals.

Galois Theory is the topic treated in Chapter A5.

Or: Chapters I to III, that is, Sections 1-16 of the book
Patrick Morandi: Field and Galois Theory, Springer 1996

Algebra I, in Rotman's book this corresponds to the topics treated in the Chapters A3 and A4.

406-2005-AAL Algebra I and II
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Introduction and development of some basic algebraic structures - groups, rings, fields including Galois theory, representations of finite groups, algebras.

Content
Basic notions and examples of groups;
Subgroups, Quotient groups and Homomorphisms,
Group actions and applications

Basic notions and examples of rings;
Ring Homomorphisms, ideals, and quotient rings, rings of fractions
Euclidean domains, Principal ideal domains, Unique factorization domains

Basic notions and examples of fields;
Field extensions, Algebraic extensions, Classical straight edge and compass constructions

Fundamentals of Galois theory
Representation theory of finite groups and algebras

Literature

406-2303-AAL Complex Analysis
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Complex functions of one variable, Cauchy-Riemann equations, Cauchy theorem and integral formula, singularities, residue theorem, index of closed curves, analytic continuation, conformal mappings, Riemann mapping theorem.

Literature

R.Remmert: Theory of Complex Functions.. Springer Verlag

E.Hille: Analytic Function Theory. AMS Chelsea Publication

406-2554-AAL Topology
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Abstract
- Probability spaces
- Discrete models, Random walk
- Conditional probabilities, independence
- Continuous models
- Limit theorems
- Methods of moments
- Maximum likelihood estimation
- Hypothesis testing
- Confidence intervals
- Introductory Bayesian statistics
- Linear regression model

Objective
The first part of the course gives an overview of the main concepts needed to understand probability theory (sample spaces, discrete models, random walk, continous models and limit theorems such as the Laws of Large Numbers and the Central limit theorem). It will be based on the German script "Wahrscheinlichkeitsrechnung und Statistik".

The second part covers some fundamental results of mathematical statistics including estimation methods, hypothesis testing as well as the linear regression model. For this part, we will use the script "Statistics for Mathematics". Both scripts are available at

https://www.stat.math.ethz.ch/~fadouab/

Content
Probability:
Chapters 1-5 (Probabilities and events, Discrete and continuous random variables, Generating functions) and Sections 7.1-7.5 (Convergence of random variables) from the book "Probability and Random Processes". Most of this material is also covered in Chap. 1-5 of "Mathematical Statistics and Data Analysis", on a slightly easier level.

Statistics:
Sections 8.1 - 8.5 (Estimation of parameters), 9.1 - 9.4 (Testing Hypotheses), 11.1 - 11.3 (Comparing two samples) from "Mathematical Statistics and Data Analysis".

Abstract
This course provides a foundation in analog integrated circuit design based on bipolar and CMOS technologies.

Objective
Integrated circuits are responsible for much of the progress in electronics in the last 50 years, particularly the revolutions in the Information and Communications Technologies we witnessed in recent years. Analog integrated circuits play a crucial part in the highly integrated systems that power the popular electronic devices we use daily. Understanding their design is beneficial to both future designers and users of such systems.

Content
The basic elements, design issues and techniques for analog integrated circuits will be taught in this course.

Abstract
This course introduces students to the main concepts of optics and photonics. Specifically, we will describe the laws obeyed by optical waves and discuss how to use them to manipulate light.

Objective
Photonics, the science of light, has become ubiquitous in our lives. Control and manipulation of light is what enables us to interact with the screen of our smart devices and exchange large amounts of complex information. Photonics has also taken a preponderant role in cutting-edge science, allowing for instance to image nanospecimens, detect diseases or sense very tiny forces. The purpose of this course is three-fold: (i) We first aim to provide the fundamentals of photonics, establishing a solid basis for more specialised courses. (ii) Beyond theoretical concepts, our intention is to have students develop an intuition on how to manipulate light in practise. (iii) Finally, the course highlights how the taught concepts apply to modern research as well as to everyday life technologies (LCD screens, polarisation sun glasses, anti-reflection coating etc...). Content, including videos of laboratory experiments, has been designed to be approachable by students from a diverse set of science and engineering backgrounds.
I- BASICS OF WAVE THEORY
1) General concepts
2) Differential wave equation
3) Wavefront
4) Plane waves and Fourier decomposition of optical fields
5) Spherical waves and Huygens-Fresnel principle

II- ELECTROMAGNETIC WAVES
1) Maxwell equations
2) Wave equation for EM waves
3) Dielectric permittivity
4) Refractive index
5) Nonlinear optics
6) Polarisation and polarisation control

III- PROPAGATION OF LIGHT
1) Waves at an interface
2) The Fresnel coefficients
3) Total internal reflection
4) Evanescent waves
5) Dispersion diagram

IV- INTERFERENCES
1) General considerations
2) Temporal and spatial coherence
3) The Young double slit experiment
4) Diffraction gratings
5) The Michelson interferometer
6) Multi-wave interference
7) Antireflecting coating and interference filters
8) Optical holography

V- LIGHT MANIPULATION
1) Optical waveguides
2) Photonic crystals
3) Metamaterials and metasurfaces
4) Optical cavities

VI- OPTICAL FORCES AND OPTICAL TWEETERS
1) History of optical forces
2) Theory of optical trapping
3) Atom cooling
4) Optomechanics
5) Applications of optical tweezers

VII- INTRODUCTION TO OPTICAL MICROSCOPY
1) Basic concepts
2) Direct and Fourier imaging
3) Image formation
4) Fluorescence microscopy
5) Scattering-based microscopy
6) Digital holography
7) Computational imaging

402-0468-15L Nanomaterials for Photonic Devices W 6 credits 2V+1U R. Grange, E. Bailly, R. Chapman, V. Falcone, A. Morandi

Abstract
The lecture describes various nanomaterials (semiconductor, metal, dielectric, carbon-based...) for photonic applications (optoelectronics, plasmonics, photonic integrated circuits, ordered and disordered structures...). It starts with concepts of light-matter interactions, fabrication and characterization, the description of the properties and the state-of-the-art applications and devices.

Objective
The students will acquire theoretical and experimental knowledge about the different types of nanomaterials (semiconductors, metals, dielectric, carbon-based,...) and their uses as building blocks for advanced applications in photonics (optoelectronics, plasmonics, photonic crystal, ...). Together with the exercises, the students will learn (1) to read, summarize and discuss scientific articles related to the lecture, (2) to estimate order of magnitudes with calculations using the theory seen during the lecture, (3) to prepare a short oral presentation and report about one topic related to the lecture, and (4) to imagine an original photonic device.
1. Introduction to nanophotonics
2. Wave physics for nanophotonics
3. Characterization of nanomaterials
4. Semiconductors
5. Nonlinear crystals
6. Photonic integrated circuits
7. Optical quantum devices
8. Plasmonics
9. Metasurfaces
10. Graphene & 2D Materials

Semiconductor Nanostructures

W+ 6 credits 2V+1U T. M. Ihn

Abstract
The course covers the foundations of semiconductor nanostructures, e.g., materials, band structures, bandgap engineering and doping, field-effect transistors. The physics of the quantum Hall effect and of common nanostructures based on two-dimensional electron gases will be discussed, i.e., quantum point contacts, Aharonov-Bohm rings and quantum dots.

Objective
At the end of the lecture the student should understand four key phenomena of electron transport in semiconductor nanostructures:
1. The integer quantum Hall effect
2. Conductance quantization in quantum point contacts
3. the Aharonov-Bohm effect
4. Coulomb blockade in quantum dots

Content
1. Introduction and overview
2. Semiconductor crystals: Fabrication and molecular beam epitaxy
3. Band structures of semiconductors
4. k.p-theory, effective mass, envelope functions
5. Heterostructures and band engineering, doping
6. Surfaces and metal-semiconductor contacts, fabrication of semiconductor nanostructures
7. Heterostructures and two-dimensional electron gases
8. Drude Transport and scattering mechanisms
9. Single- and bilayer graphene
10. Electron transport in quantum point contacts; Landauer-Büttiker description, ballistic transport experiments
11. Interference effects in Aharonov-Bohm rings
12. Electron in a magnetic field, Shubnikov-de Haas effect
13. Integer quantum Hall effect
14. Coulomb blockade and quantum dots

Lecture notes

Literature
In addition to the lecture notes, the following supplementary books can be recommended:

Prerequisites / notice
The lecture is suitable for all physics students, students of Quantum Engineering, and students of Micro- and Nanosystems beyond the bachelor of science degree. Basic knowledge of solid state physics is a prerequisite. Very ambitioned students in the third year of Physics may be able to follow. The lecture can be chosen as part of the PhD-program. The course is taught in English.
Material, Surfaces and Properties

### Number 151-0509-00L
#### Title: Acoustics in Fluid Media: From Robotics to Additive Manufacturing

**Type**: W  
**ECTS**: 4 credits  
**Hours**: 3G  
**Lecturers**: D. Ahmed

**Abstract**
The course will provide you with the fundamentals of the new and exciting field of ultrasound-based microrobots to treat various diseases. Furthermore, we will explore how ultrasound can be used in additive manufacturing for tissue constructs and robotics.

**Objective**
The course is designed to equip students with skills in the design and development of ultrasound-based manipulation devices and microrobots for applications in medicine and additive manufacturing.

**Content**
Linear and nonlinear acoustics, foundations of fluid and solid mechanics and piezoelectricity, Gorkov potential, numerical modelling, acoustic streaming, applications from ultrasonic microrobots to surface acoustic wave devices

**Lecture notes**

**Literature**

**Prerequisites / notice**
Solid and fluid continuum mechanics. Notice: The exercise part is a mixture of presentation, lab sessions (both compulsory) and hand in homework.

- Self-direction and Self-management  

### Number 151-0524-00L
#### Title: Continuum Mechanics I

**Type**: W  
**ECTS**: 4 credits  
**Hours**: 2V+1U  
**Lecturers**: A. E. Ehret

**Abstract**
The lecture deals with constitutive models that are relevant for the design and analysis of components and structures. These include anisotropic linear elasticity, linear viscoelasticity, plasticity and viscoplasticity. The basic concepts of homogenization and laminate theory are introduced. Theoretical models are complemented by examples of engineering applications and experiments.

**Objective**
After successful completion of the course students are able to
- explain basic theories for solving continuum mechanics problems
- proficiently apply these theories by solving application-related academic examples
- relate the theories and examples to real engineering applications and challenges
- distinguish between different mechanical behaviors of materials
- systematically select appropriate constitutive theories suitable to analyze and model these materials

**Content**
Anisotropic Elasticity, Linear Elastic and Linear Viscous Material Behavior, Viscoelasticity, Micro-Macro Modelling, Laminate Theory, Plasticity, Viscoplasticity, Examples of Engineering Applications, Comparison with Experiments

**Lecture notes**
Yes

### Competencies

### Number 327-0505-00L
#### Title: Surfaces and Interfaces I: Fundamentals, Analytics and Applications

**Type**: W  
**ECTS**: 6 credits  
**Hours**: 3G  
**Lecturers**: L. Isa, M. P. Heuberger

**Abstract**
This course teaches the basics of surface and interface science and technology, including surface modifications and forces. It covers various analytical techniques to study surface and interface properties, and explores phenomena of applied relevance like friction, lubrication, phoresis, and wetting where surfaces play a crucial role.

**Extended course starting HS23. Old title: Surfaces, Interfaces and their Applications I. Students who obtained credit points for the old course cannot retake it.**

Data: 26.07.2024 12:39  
Autumn Semester 2024  
Page 1938 of 2680
Objective
Students are able to
- describe the physical and chemical properties of surfaces and interfaces.
- analyze and compare analytical tools for surfaces.
- choose and combine appropriate surface-analytical approaches for solving problems connected to applications.
- understand and explain the importance of surfaces and interfaces in a broad range of phenomena and applications.

Content
- Introduction to surfaces and interfaces
- Structure of surfaces over different length scales: from macroscopic roughness to atomic structure
- Surface modifications
- Adsorption and adsorption models
- Surface forces
- Basic physical concepts
- Thermodynamics of surfaces and interfaces
- Measurement of intermolecular and surface forces
- Dynamics and history effects
- Surface analytics: X-ray Photoelectron Spectroscopy (XPS) – principles and modern developments
- Surface analytics: Secondary Ion Mass Spectroscopy (SIMS) and IR Spectroscopy – Principles and examples
- Atomic Force Microscopy (AFM): Principles and modes of operation
- Tribology: Adhesion, Friction and Lubrication
- Contact mechanics
- Micro and macroscale friction
- Boundary lubrication
- Wetting
- Contact angles
- Phoretic phenomena
- Electric double layer and electrophoresis
- Electro-osmosis
- Other types of phoresis
- Case studies

Abstract
This module consists of (a) an introduction to fundamental equations of electromagnetics, mechanics and heat transfer, (b) a detailed overview of numerical methods for field simulations, and (c) practical examples solved in form of small projects.

Objective
Basic knowledge of the fundamental equations and effects of electromagnetics, mechanics, and heat transfer. Knowledge of the main concepts of numerical methods for physical modelling and simulation. Ability (a) to develop own simple field simulation programs, (b) to select an appropriate field solver for a given problem, (c) to perform field simulations, (d) to evaluate the obtained results, and (e) to interactively improve the models until sufficiently accurate results are obtained.

Content
The module begins with an introduction to the fundamental equations and effects of electromagnetics, mechanics, and heat transfer. After the introduction follows a detailed overview of the available numerical methods for solving electromagnetic, thermal and mechanical boundary value problems. This part of the course contains a general introduction into numerical methods, differential and integral forms, linear equation systems, Finite Difference Method (FDM), Boundary Element Method (BEM), Moment of Forces (MoM), Multiple Multiple Program (MMP) and Finite Element Method (FEM). The theoretical part of the course finishes with a presentation of multiphysics simulations through several practical examples of HF-engineering such as coupled electromagnetic-mechanical and electromagnetic-thermal analysis of MEMS.

In the second part of the course the students will work in small groups on practical simulation problems. For solving practical problems the students can develop and use own simulation programs or chose an appropriate commercial field solver for their specific problem. This practical simulation work of the students is supervised by the lecturers.

Abstract
Practical course: Students are introduced to the process steps required for the fabrication of MEMS (Micro Electro Mechanical System) and carry out the fabrication and testing steps in the clean rooms by themselves. Additionally, they learn the requirements for working in clean rooms. Processing and characterization will be documented and analyzed in a final report.

Objective
Students learn the individual process steps that are required to make a MEMS (Micro Electro Mechanical System). Students carry out the process steps themselves in laboratories and clean rooms. Furthermore, participants become familiar with the special requirements (cleanliness, safety, operation of equipment and handling hazardous chemicals) of working in the clean rooms and laboratories. The entire production, processing, and characterization of the MEMS is documented and evaluated in a final report.
With guidance from a tutor, the individual silicon microsystem process steps that are required for the fabrication of an accelerometer are carried out:
- Photolithography, dry etching, wet etching, sacrificial layer etching, various cleaning procedures
- Packaging and electrical connection of a MEMS device
- Testing and characterization of the MEMS device
- Written documentation and evaluation of the entire production, processing and characterization

A document containing theory, background and practical course content is distributed at the Introductory lecture day of the course. The document provides sufficient information for the participants to successfully participate in the course.

Participating students are required to attend all scheduled lectures and meetings of the course.

For safety and efficiency reasons the number of participating students is limited. We regret to restrict access to this course by the following rules:

Priority 1: master students of the master's program in "Micro and Nanosystems"

Priority 2: master students of the master's program in "Mechanical Engineering" with a specialization in Microsystems and Nanoscale Engineering (MAVT-tutors Profs Darait, Dual, Hierold, Koumoutsakos, Nelson, Norris, Poulikakos, Pratsinis, Stemmer), who attended the bachelor course "151-0621-00L Microsystems Technology" successfully.

Priority 3: master students, who attended the bachelor course "151-0621-00L Microsystems Technology" successfully.

Priority 4: all other students (PhD, bachelor, master) with a background in silicon or microsystems process technology.

If there are more students in one of these priority groups than places available, we will decide by (in following order) best achieved grade from 151-0621-00L Microsystems Technology, registration to this practicum at previous semester, and by drawing lots.

Students will be notified at the first lecture of the course (introductory lecture) as to whether they are able to participate.

The course is offered in autumn and spring semester.

This class introduces both theoretical and practical aspects related to the modeling and simulation of multiphysics systems. Students will learn how to set up multiphysics models systematically, and therefore reduce time-consuming trial-and-error. Comsol Multiphysics will be utilized to apply the concepts learned during the lectures to solve exercises.

As information technology continues its fast-paced evolution, solid-state devices and systems increase in complexity. Engineers and scientists are thus increasingly facing the need to model and simulate their problems numerically where analytic textbook solution cease to exist. Moreover, boundaries between traditional disciplines are harder to maintain, as a proper description of the system might involve phenomena from several domains. Examples include—but not limited to—mechatronics which relies on mechanical, electrical and electronic engineering, and transducers (sensors and actuators) which are by definition devices that convert signals from one physical domain to another. Simulation platforms such as Comsol Multiphysics have truly opened the way to easy multi-domain numerical simulation, offering tools that cover all operations from geometry definition, to meshing, to physics and boundary conditions setting to simulation and result post-processing and analysis in a unified, domain-independent fashion. However, this high degree of freedom has its price, as inexperienced users may face cryptic error messages, incomprehensible or even incorrect results. It is the mission of this course to show how to properly set up a problem by exposing some of the most common misconceptions and pitfalls in multiphysics modeling. Good practices will be taught that should simplify the modeling process and increase the likelihood of correct results. Examples will mainly come from the fields of mechanics (continuum solid mechanics), electromagnetism (electrostatics and conductive media), heat transfer (conductive not convective) and combinations of these domains.

  - Self-direction and Self-management: assessed

**Objective**
- Students will learn to apply, understand and develop computational models of a large spectrum of engineering materials to predict their dynamic deformation response and failure in finite element simulations. Students will become familiar with important dynamic testing techniques to identify material model parameters from experiments. The ultimate goal is to provide the students with the knowledge and skills required to engineer modern multi-material solutions for high performance structures in automotive, aerospace and naval engineering.

**Content**
- Topics include temperature and strain rate dependent elasto-plasticity, dynamic brittle and ductile fracture; impulse transfer, impact and wave propagation in solids; computational aspects of material model implementation; simulation of dynamic failure of structures;

**Prerequisites / notice**
- Course in continuum mechanics (mandatory), finite element method (recommended)
### Content
An embedded system is a microprocessor used as a component in another piece of technology, such as cell phones or automobiles. In this intensive two-week block course the students are presented the principles of embedded digital control systems using a haptic device as an example for a mechatronic system. A haptic interface allows for a human to interact with a computer through the sense of touch.

Subjects covered in lectures and practical lab exercises include:
- The application of C-programming on a microprocessor
- Digital I/O and serial communication
- Quadrature decoding for wheel position sensing
- Queued analog-to-digital conversion to interface with the analog world
- Pulse width modulation
- Timer interrupts to create sampling time intervals
- System dynamics and virtual worlds with haptic feedback
- Introduction to rapid prototyping

### Lecture notes
Lecture notes, lab instructions, supplemental material

### Prerequisites / notice
Prerequisite courses are Control Systems I and Informatics I.

This course is restricted to 33 students due to limited lab infrastructure. Interested students please contact Marianne Schmid Daners (E-Mail: marischm@ethz.ch)

After your reservation has been confirmed please register online at www.mystudies.ethz.ch.

Detailed information can be found on the course website
http://www.idsc.ethz.ch/education/lectures/embedded-control-systems.html

### 227-0145-00L Solid State Electronics and Optics

**Abstract**

"Solid State Electronics" is an introductory condensed matter physics course covering crystal structure, electron models, classification of metals, semiconductors, and insulators, band structure engineering, thermal and electronic transport in solids, magnetoresistance, and optical properties of solids.

**Objective**

Understand the fundamental physics behind the mechanical, thermal, electric, magnetic, and optical properties of materials.

**Content**

The main topics are: transport models for semiconductor devices (quantum transport, Boltzmann equation, drift-diffusion model, hydrodynamic model), physical characterization of silicon (intrinsic properties, scattering processes), mobility of cold and hot carriers, recombination (Shockley-Read-Hall statistics, Auger recombination), impact ionization, metal-semiconductor contact, metal-insulator-semiconductor structure, and heterojunctions.

The exercises are focussed on the theory and the basic understanding of the operation of special devices, as single-electron transistor, resonant tunneling diode, pn-diode, bipolar transistor, MOSFET, and laser. Numerical simulations of such devices are performed with an advanced simulation package (Sentaurus-Synopsys). This enables to understand the physical effects by means of computer experiments.

**Literature**

The script (in book style) can be downloaded from: https://iis-students.ee.ethz.ch/lectures/

**Prerequisites / notice**

---

### 227-0157-00L Semiconductor Devices: Physical Bases and Simulation

**Abstract**

The course addresses the physical principles of modern semiconductor devices and the foundations of their modeling and numerical simulation. Necessary basic knowledge on quantum-mechanics, semiconductor physics and device physics is provided. Computer simulations of the most important devices and of interesting physical effects supplement the lectures.

**Objective**

The course aims at the understanding of the principle physics of modern semiconductor devices, of the foundations in the physical modeling of transport and its numerical simulation. During the course also basic knowledge on quantum-mechanics, semiconductor physics and device physics is provided.

**Content**

The main topics are: transport models for semiconductor devices (quantum transport, Boltzmann equation, drift-diffusion model, hydrodynamic model), physical characterization of silicon (intrinsic properties, scattering processes), mobility of cold and hot carriers, recombination (Shockley-Read-Hall statistics, Auger recombination), impact ionization, metal-semiconductor contact, metal-insulator-semiconductor structure, and heterojunctions.

The exercises are focussed on the theory and the basic understanding of the operation of special devices, as single-electron transistor, resonant tunneling diode, pn-diode, bipolar transistor, MOSFET, and laser. Numerical simulations of such devices are performed with an advanced simulation package (Sentaurus-Synopsys). This enables to understand the physical effects by means of computer experiments.

**Literature**

The script (in book style) is sufficient. Further reading will be recommended in the lecture.

**Prerequisites / notice**

---

### 227-0225-00L Linear System Theory

**Abstract**

The class is intended to provide a comprehensive overview of the theory of linear dynamical systems, stability analysis, and their use in control and estimation. The focus is on the mathematics behind the physical properties of these systems and on understanding and constructing proofs of properties of linear control systems.

**Objective**

Students should be able to apply the fundamental results in linear system theory to analyze and control linear dynamical systems.

**Content**

- Proof techniques and practices.
- Linear spaces, normed linear spaces and Hilbert spaces.
- Ordinary differential equations, existence and uniqueness of solutions.
- Continuous and discrete-time, time-varying linear systems. Time domain solutions. Time invariant systems treated as a special case.
- Controllability and observability, duality. Time invariant systems treated as a special case.
- Stability and stabilization, observers, state and output feedback, separation principle.

**Lecture notes**

Available on the course Moodle platform.

**Prerequisites / notice**

Sufficient mathematical maturity, in particular in linear algebra, analysis.

---

### 227-0311-00L Qubits, Electrons, Photons

**Abstract**

In-depth analysis of the quantum mechanics origin of nuclear magnetic resonance (qubits, two-level systems), of LASER (quantization of the electromagnetic field, photons), and of electron transfer (from electrochemistry to photosynthesis).

**Objective**

Beside electronics nanodevices, D-ITET is pushing its research in the fields of NMR (MRI), electrochemistry, bioelectronics, nano-optics, and quantum information, which are all rationalized in terms of quantum mechanics.

Starting from the axioms of quantum mechanics, we will derive the fascinating theory describing spin and qubits, electron transitions and transfer, photons and LASER: quantum mechanics is different because it mocks our daily Euclidean intuition!

In this way, students will work out a robust quantum mechanics (theoretical!!!) basis which will help them in their advanced studies of the following masters: EEIT (batteries), Biomedical Engineering (NMR, bioelectronics), Quantum Engineering, Micro- and Nanosystems.

**Literature**

The script (in book style) is sufficient. Further reading will be recommended in the lecture.

**Prerequisites / notice**

---

**IMPORTANT:** "qubits" from the point of view of NMR (and NOT from that of quantum computing!).
Content

- Lagrangian and Hamiltonian: Symmetries and Poisson Brackets
- Postulates of QM: Hilbert Spaces and Operators
- Heisenberg’s Matrix Mechanics: Hamiltonian and Time Evolution Operator
- Density Operator
- Spin: Qubits, Bloch Equations, and NMR
- Entanglement
- Symmetries and Corresponding Operators
- Schrödinger’s Wave Mechanics: Electrons in a Periodic Potential and Energy Bands
- Harmonic Oscillator: Creation and Annihilation Operators
- Identical Particles: Bosons and Fermions
- Quantization of the Electromagnetic Field: Photons, Absorption and Emission, LASER
- Electron Transfer: Marcus Theory via Born-Oppenheimer, Franck-Condon, Landsau-Zener

Lecture notes

No lecture notes because the proposed textbooks together with the provided supplementary material are more than exhaustive!

!!! I am using OneNote. All lectures and exercises will be broadcast via ZOOM, while corresponding videos of the previous years are available in Moodle !!!

Literature

Supplementary material will be uploaded in Moodle.

Comprehensiveness

227-0468-00L Analog Signal Processing and Filtering

W 6 credits 2V+2U H. Schmid

Abstract

This lecture provides a wide overview over analog filters (continuous-time and discrete-time), signal-processing systems, and sigma-delta conversion, and gives examples with sensor interfaces and class-D audio drivers. All systems and circuits are treated using a signal-flow view. The lecture is suitable for both analog and digital designers.

Objective

This lecture provides a wide overview over analog filters (continuous-time and discrete-time), signal-processing systems, and sigma-delta conversion, and gives examples with sensor interfaces and class-D audio drivers. All systems and circuits are treated using a signal-flow view. The lecture is suitable for both analog and digital designers. The way the exam is done allows for the different interests of the two groups.

The learning goal is that the students can apply signal-flow graphs and can understand the signal flow in such circuits and systems (including non-ideal effects) well enough to gain an understanding of further circuits and systems by themselves.

Content

At the beginning, signal-flow graphs in general and driving-point signal-flow graphs in particular are introduced. We will use them during the whole term to analyze circuits on a system level (analog continuous-time, analog discrete-time, mixed-signal and digital) and understand how signals propagate through them. The theory and CMOS implementation of active Filters is then discussed in detail using the example of Gm-C filters and active-RC filters. The ideal and nonideal behaviour of opamps, current conveyors, and inductor simulators follows. The link to the practical design of circuits and systems is done with an overview over different quality measures and figures of merit used in scientific literature and datasheets. Finally, an introduction to discrete-time and mixed-domain filters and circuits is given, including sensor read-out amplifiers, correlated double sampling, and chopping, and an introduction to sigma-delta A/D and D/A conversion on a system level.

This lecture does not go down to the details of transistor implementations. The lecture "227-0166-00L Analog Integrated Circuits" complements this lecture very well in that respect.
Quantum Measurements and Optomechanics

Prerequisites

1. Electrodynamics
2. Physics 1-2
3. Introduction to quantum mechanics

Notes

The lecture notes will be made available on the website.

Lecture notes

The base for these lectures are lecture notes and two or three published scientific papers. From these papers we will together develop the technical content.

Details: https://people.ee.ethz.ch/~haschmid/asfwiki/

The graph methods are also supported with teaching videos: https://tube.switch.ch/channels/d20e6c96c?order=episodes, and a Python-based open-source tool to manipulate graphs is available on https://github.com/hanspi42/signalflowgrapher

Some material is protected by password; students from ETHZ who are interested can write to haschmid@ethz.ch to ask for the password even if they do not attend the lecture.

Prerequisites / Notice

Prerequisites: Recommended (but not required): Stochastic models and signal processing, Communication Electronics, Analog Integrated Circuits, Transmission Lines and Filters.

Knowledge of the Laplace transform and z transform and their interpretation (transfer functions, poles and zeros, bode diagrams, stability criteria ...) and of the main properties of linear systems is necessary.

Self-direction and Self-management fostered

Course content

Quantum Measurements and Optomechanics

Abstract

The lecture starts with summarizing the relevant fundamentals of the treatment of noisy signals. We familiarize ourselves with the concept of measurement imprecision in light-based measurement systems. To this end, we consider the process of photodetection and discuss the statistical fluctuations arising from the quantization of the electromagnetic field into photons. We exemplify our insights at hand of concrete examples, such as homodyne and heterodyne photodetection. Furthermore, we focus on the process of measurement backaction, the inevitable result of the interaction of the probe with the system under investigation. We discuss the "standard quantum limit" as it arises from the balance of measurement imprecision and backaction, before turning to approaches to overcome it and reach the fundamental "Heisenberg limit". The course emphasizes the connection between the taught concepts and current state-of-the-art research carried out in the field of optomechanics. Exercises serve to consolidate our understanding and insight.

Objective

In this course, students will learn about the leading contenders for post-silicon storage-class and main memory technologies. Decades of research have yielded several efficient memory device working principles, including phase-change (PC), materials conversion (OxRAM), ion diffusion (CBRAM), magnetic properties (STT-MRAM, MTJ), and ferroelectricity (FRAM, FeFET). Currently, these memory technologies are transitioning from research to industry, and are predicted to have at least niche applications in the ever-growing hardware market. Some technologies, such as PCM, may even eventually surpass silicon-based flash memory, providing better performance and unique features.

Students will have the opportunity to compare emerging memory technologies with state-of-the-art SSD Flash, DRAM, and SRAM, as well as evaluate their potential. Through critical thinking discussions, students will acquire important skills for assessing the strengths and limitations of these emerging technologies.

Content

The course is organized as a series of lectures, focusing on selected memory technologies. This class also includes practical laboratory sessions for the PCM research topics. Students will spend 2 hours per week in the class or laboratory and additional 2-3 hours per week to prepare for the exam.

Literature

Lecture notes will be made available on the website.

Course content

Emerging Memory Technologies

Abstract

This course focuses on the current state and prospects of memory technologies, emerging beyond the silicon transistor era. We explore resistive PCM and RRAM, magnetic MRAM and ferroelectric FRAM memories, covering physics, device aspects and the latest research in the field. Through interactive lectures and laboratory sessions, students gain up-to-date knowledge and compare emerging memory techs.

Objective

In this course, students will learn about the leading contenders for post-silicon storage-class and main memory technologies. Decades of research have yielded several efficient memory device working principles, including phase-change of the structure (PCM), materials conversion (OxRAM), ion diffusion (CBRAM), magnetic properties (STT-MRAM, MTJ), and ferroelectricity (FRAM, FeFET). Currently, these memory technologies are transitioning from research to industry, and are predicted to have at least niche applications in the ever-growing hardware market. Some technologies, such as PCM, may even eventually surpass silicon-based flash memory, providing better performance and unique features.

Students will have the opportunity to compare emerging memory technologies with state-of-the-art SSD Flash, DRAM, and SRAM, as well as evaluate their potential. Through critical thinking discussions, students will acquire important skills for assessing the strengths and limitations of these emerging technologies.

Content

The course is organized as a series of lectures, focusing on selected memory technologies. This class also includes practical laboratory sessions for the PCM research topics. Students will spend 2 hours per week in the class or laboratory and additional 2-3 hours per week to prepare for the exam.

This course explores the exciting realm of carbon-based nanoelectronics, where the remarkable quantum properties of materials like graphene, carbon nanotubes, graphene nanoribbons, and single molecules are used for building electronic devices.

**Objective**

The objective of this course is to understand how the electronic properties of carbon-based materials can be exploited for fabricating quantum devices. We will delve into both the theoretical and experimental aspects, discussing how these materials’ unique properties can be translated into device functionality.

On the theoretical side, we’ll cover how the chemical structure of the material and its dimensionality, ranging from 0D to 2D, affects the electronic properties. We’ll also discuss how charge carriers flow through the devices and what charge transport mechanisms are at play.

On the experimental side, we’ll cover how such devices are fabricated, including how the materials are synthesized. We’ll also discuss how to characterize the devices and assess their performance.

**Content**

The course will cover the following carbon-based materials:
- Single-molecule
- Graphene (single layer, bilayer, twisted bilayer)
- Graphene nanoribbons
- Carbon nanotubes

For each material, we will discuss:
- Electronic structure and charge transport properties
- Material synthesis and characterization
- Device integration and characterization

The course also includes a presentation by each student in which a related scientific publication is discussed. This presentation is compulsory and accounts for 30% of the grade.

**Prerequisites / notice**

A basic knowledge of solid-state physics and quantum mechanics is required. The course is taught in English.

**Lecture slides**

Lecture slides are distributed every week. In addition, relevant scientific articles and book chapters will be provided for self-study.

**Literature**

In addition to the slides, the following supplementary books can be recommended:

**227-0663-00L Nano-Optics**

| W 6 credits | 2V+2U M. Frimmer |

**Abstract**

Nano-Optics is the study of light-matter interaction at the sub-wavelength scale. It is an flourishing field of fundamental and applied research enabled by the rapid advance of nanotechnology. Nano-optics embraces topics such as plasmonics, optical antennas, optical trapping and manipulation, and high/super-resolution imaging and spectroscopy.

**Objective**

Understanding concepts of light localization and light-matter interactions on the sub-wavelength scale.

**Content**

We start with the angular spectrum representation of fields to understand the classical resolution limit. We continue with the theory of strongly focused light, the point spread function, and resolution criteria of conventional microscopy, before turning to super-resolution techniques, based on near- and far-fields. We introduce the local density of states and approaches to control spontaneous emission rates in inhomogeneous environments, including optical antennas. Finally, we touch upon optical forces and their applications in optical tweezers.

**Prerequisites / notice**

- Electromagnetic fields and waves (or equivalent)
- Physics I+II

Neuromorphic circuits are inspired by the organizing principles of biological neural circuits. Their computational primitives are based on physics of semiconductor devices. Neuromorphic architectures often rely on collective computation in parallel networks. Adaptation, learning and memory are implemented locally within the individual computational elements. Transistors are often operated in weak inversion (below threshold), where they exhibit exponential I-V characteristics and low currents. These properties lead to the feasibility of high-density, low-power implementations of functions that are computationally intensive in other paradigms. Application domains of neuromorphic circuits include silicon retinas and cochleas for machine vision and audition, real-time emulations of networks of biological neurons, and the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS transistor, phototransducers), static circuits (differential pair, current mirror, transconductance amplifiers, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silicon neuron, silicon retina and cochlea) and an introduction to multi-chip systems that communicate events analogous to spikes. The lectures are accompanied by weekly laboratory sessions on the characterization of neuromorphic circuits, from elementary devices to systems.

**Objective**
Understanding the characteristics of neuromorphic circuit elements.

**Content**

**Literature**
S.-C. Liu et al.: Analog VLSI Circuits and Principles; various publications.

**Prerequisites / notice**
Particular: The course is highly recommended for those who intend to take the spring semester course ‘Neuromorphic Engineering II’, that teaches the conception, simulation, and physical layout of such circuits with chip design tools.

**Prerequisites:** Background in basics of semiconductor physics helpful, but not required.

**376-1176-00L Wearable and Mobile Technologies of the Future - Focus on Sports and Health**

| Objective 1: | Acquire knowledge about wearable and unobtrusive technologies and skills to process data acquired using wearable technologies. |
| Module 0: Fundamentals | This module briefly reviews time-frequency domains, transforms and filtering. |
| Module 1: Movement | This module provides the scientific background needed to understand the principles that current technologies investigating movement rely on. It provides an overview of wearable technologies for monitoring overall body movement as well as for tracking motion parameters (e.g. gait, running, posture). Technologies such as inertial measurement units, electromyography, optical motion capture systems, and others are covered. The latest updates on wearable-related (e.g., textile-based) technologies are also introduced. Students are involved in labs/assignments to put into practice the knowledge and skills acquired during this module. |
| Module 2: Brain | This module briefly introduces brain functions and provides an overview of related wearable technologies. Topics covered may include electroencephalograms, transcranial magnetic stimulation, and galvanic vestibular stimulation. Data processing techniques such as common spatial patterns, principal component analysis, and linear discriminant analysis are introduced. Students are given a practical assignment to put into practice the knowledge and skills acquired during this module. |
| Module 3: Cardiac | This module focuses on wearable technologies for monitoring cardiac health. The module starts by providing information on cardiac physiology and introduces wearable technologies for the heart. Topics such as electrocardiography, photoplethysmography, light sensing, and contactless physiology monitoring are introduced. Data analysis techniques for cardiac data including heart-rate variability, Poincare plots, and wavelet transforms are discussed. Students will be given an assignment to put into practice the knowledge and skills acquired during this module. |

**Prerequisites / notice**
- Students should be proficient in programming (any language).
- Note: assignments will be in Python. Students are expected to learn Python on their own if not experienced with this programming language.
- Course prerequisites:
  - For Biomedical Engineering Master’s: none
  - For ITET Master’s: none
  - For D-MAVT Master’s: none
  - For D-HEST Master’s and PhD students:
    - If BSc in electrical/mechanical engineering or computer science: none
    - If any other BSc program: 376-0022-00L (Imaging and Computing in Medicine) or 376-1983-00L (Foundations of Data Science)

Introduction to experimental systems for quantum information processing (QIP). By the end of the course students are able to explain the basic mathematical formalism of quantum mechanics and apply it to quantum information processing problems. They are able to adapt and apply these concepts and methods to analyze and discuss quantum algorithms and other quantum information-processing protocols.

The topics covered in the course include quantum circuits, gate decomposition and universal sets of gates, efficiency of quantum algorithms, quantum error correction, quantum cryptography, and quantum metrology, with an emphasis on the power of quantum information processing beyond that of classical information processing. The formalism of quantum states, measurements, and channels is developed in detail.

The course covers the key concepts and formalism of quantum information processing. Topics include quantum algorithms, quantum error correction, quantum cryptography, and quantum metrology, with an emphasis on the power of quantum information processing beyond that of classical information processing. The formalism of quantum states, measurements, and channels is developed in detail.

Throughout the past 20 years the realm of quantum physics has entered the domain of information technology in more and more prominent ways. Enormous progress in the physical sciences and in engineering technology has allowed us to build novel types of information processors based on the concepts of quantum physics. In these processors information is stored in the quantum state of physical systems. In these processors information is stored in the quantum state of physical systems forming quantum bits (qubits). The interaction between qubits is controlled and the resulting states are read out on the level of single quanta in order to process information. Realizing such challenging tasks is believed to allow constructing an information processor much more powerful than a classical computer. This task is taken on by academic labs, startups and major industry. The aim of this class is to give a thorough introduction to physical implementations pursued in current research for realizing quantum information processors. The field of quantum information science is one of the fastest growing and most active domains of research in modern physics. QIP gives rise to a new quantum computer, quantum algorithms, quantum error correction, quantum cryptography, quantum metrology, quantum simulation, quantum computing, quantum communication, and quantum cryptography.

The course will be taught in English language.

### Competencies
- Subject-specific Competencies: Concepts and Theories
- Method-specific Competencies: Analytical Competencies, Decision-making, Problem-solving
- Personal Competencies: Adaptability and Flexibility, Creative Thinking, Critical Thinking

### Prerequisites / notice
A good understanding of finite dimensional linear algebra is recommended.

### Literature
- Quantum Computation and Quantum Information
- Michael Nielsen and Isaac Chuang
- Cambridge University Press

### Course Material
- Lecture notes: Will be provided.
- Literature: Quantum Computation and Quantum Information
- Michael Nielsen and Isaac Chuang
- Cambridge University Press

### Prerequisites / notice
More information on this class can be found on the web site www.qudev.ethz.ch
Abstract
Basic elements of surface science important for materials and catalysis research. Physical and chemical methods important for research in surface science, material science and catalysis are considered and their application is demonstrated on practical examples.

Objective
Basic aspects of surface science. Understanding of principles of most important experimental methods used in research concerned with surface science, material science and catalysis.

Content
Methods which are covered embrace: Gas adsorption and surface area analysis, IR-Spectroscopy, X-ray diffraction, X-ray photoelectron spectroscopy, X-ray absorption, solid state NMR, Electron Microscopy and others.

---

**529-0643-01L**
Process Design and Development

**Abstract**
The course is focused on the design of Chemical Processes, with emphasis on the preliminary stages of the design approach, where process creation and quick selection among many alternatives are important. The main concepts behind more detailed process design and process simulation are also examined.

**701-1239-00L**
Aerosols I: Physical and Chemical Principles

**Abstract**
Aerosols I deals with basic physical and chemical properties of aerosol particles. The importance of aerosols in the atmosphere and in other fields is discussed.

**Objective**
Physical and chemical principles:
- The students...
- know the processes and physical laws of aerosol dynamics.
- understand the thermodynamics of phase equilibria and chemical equilibria.
- know the photo-chemical formation of particulate matter from inorganic and organic precursor gases.

Experimental methods:
The students...
- know the most important chemical and physical measurement instruments.
- understand the underlying chemistry and physics.

Environmental impacts:
The students...
- know the major sources of atmospheric aerosols, their chemical composition and key physical properties.
- know the most important climate impacts of atmospheric aerosols.
- are aware of the health impacts of atmospheric aerosols.

**Lecture notes**
materiel is distributed during the lecture

**Literature**
### Multidisciplinary Courses

The students are free to choose individually Master's courses from the Course Catalogue of ETH Zurich, ETH Lausanne and the Universities of Zurich (https://www.uzh.ch/cmsssl/en/studies/application/chmobilityin.html) and St. Gallen.

### Science in Perspective

- see Science in Perspective: Language Courses ETH/UZH
- see Science in Perspective: Type A: Enhancement of Reflection Capability

**Recommended Science in Perspective (Type B) for D-MAVT**

### Semester Project

</tbody>
</table>

**Abstract**

The semester project is designed to train the students in the solution of specific engineering problems. This makes use of the technical and social skills acquired during the master's program. Tutors propose the subject of the project, elaborate the project plan, and define the roadmap together with their students, as well as monitor the overall execution.

**Objective**

The semester project is designed to train the students in the solution of specific engineering problems. This makes use of the technical and social skills acquired during the master's programme.

### Industrial Internship

</tbody>
</table>

**Abstract**

No registration required via myStudies.

**Objective**

The main objective of the minimum twelve-week internship is to expose Master's students to the industrial work environment. The aim of the Industrial Internship is to apply engineering knowledge to practical situations.
Students who fulfill the following criteria are allowed to begin with their Master's Thesis:
a. successful completion of the bachelor program;
b. fulfilling of any additional requirements necessary to gain admission to the master programme;
c. successful completion of the semester project;
d. achievement of 32 ECTS in the category "Core Courses".

The Master's Thesis must be approved in advance by the tutor and is supervised by a professor of ETH Zurich.

Master's programs are concluded by the master's thesis. The thesis is aimed at enhancing the student's capability to work independently toward the solution of a theoretical or applied problem. The subject of the master's thesis, as well as the project plan and roadmap, are proposed by the tutor and further elaborated with the student.

ECTS European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
Exchange Students

Courses for Exchange Students

Prepare a study plan

In case the course catalogue of the upcoming semester is not available yet, please expect it to be like the year before.
You can study at ETH Zurich as an exchange student for 1 or 2 semesters, starting in the autumn or in the spring semester.

Exchange students may choose courses from different curricula and years, provided that at least two thirds of all courses are taken in the ETH Zurich department they are registered in. Please be sure to coordinate your schedule with your home university.

Exam sessions and End-of-semester examinations

Like all ETH Zurich students, exchange students are obliged to sit their exams during the official examination periods. Students are requested to be present at ETH Zurich during these periods. You are therefore expected to plan your studies, internships, jobs, and financial means accordingly.

Research Project

The courses below are only available for exchange students.

Abstract

Mind the enrolment deadlines at UZH: https://www.uzh.ch/cmsssl/en/studies/application/deadlines.html

Registration in this class requires the permission of the instructors. Class size will be limited to available lab spots. Preference is given to students that require this class as part of their major.

Objective

The goal of these talks is to provide insight into recent research results. The talks are not meant for the general public, but really aimed at assessed Subject-specific Competencies

- Concepts and Theories
- Techniques and Technologies
- Analytical Competencies
- Decision-making
- Communication
- Cooperation and Teamwork
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

Reports must contain detailed descriptions of the measurement goal, the measurement procedure, and the measurement outcome. Either confidence or significance of measurements must be provided. Acquisition and analysis software must be documented.

Abstract

The Neuroinformatics Journal club is a weekly meeting during which students present current research papers. The presentation is followed by a general discussion.

Objective

The Neuroinformatics Journal club aims to train students to present cutting-edge research clearly and efficiently. It leads students to learn about current topics in neurosciences and neuroinformatics, to search the relevant literature and to critically and scholarly appraise published papers. The students learn to present complex concepts and answer critical questions.

Content

Relevant current papers in neurosciences and neuroinformatics are covered.

Competencies

- Subject-specific Competencies
- Method-specific Competencies
- Social Competencies
- Personal Competencies

227-1043-00L | Neuroinformatics - Colloquia (University of Zurich)                     | Z    | 0    | 1K    | S.-C. Liu, R. Hahnloser, V. Mante                   |

Abstract

The colloquium in Neuroinformatics is a series of lectures given by invited experts. The lecture topics reflect the current themes in neurobiology and neuromorphic engineering that are relevant for our Institute.

Objective

The goal of these talks is to provide insight into recent research results. The talks are not meant for the general public, but really aimed at specialists in the field.

Content

The topics depend heavily on the invited speakers, and thus change from week to week. All topics concern neural computation and their implementation in biological or artificial systems.

227-1045-00L | Readings in Neuroinformatics (University of Zurich)                     | O    | 3    | 1S    | W. von der Behrens, R. Hahnloser, V. Mante, M. Payvand |

### Data: 26.07.2024 12:39  Autumn Semester 2024  Page 1953 of 2680
Abstract
Thirteen major areas of research have been selected. They cover the key concepts that have led to our current ideas of how the nervous system is built and functions. Unusually, we will explore these areas of research by reading the original publications, instead of reading a digested summary from a textbook or review. By doing this, we will learn how the discoveries were made, what instrumentation was used, how the scientists interpreted their own findings, and how their work, often over many decades and linked together with related findings from many different scientists, generate the current views of mechanism and structure of the nervous system. We will read different original papers and explore the conceptual links between them and discuss the 'sociology' of science. We will also explore the personalities of the scientists and the context in which they made their seminal discoveries. Each week, course members will be given original papers to read for homework and they will write a short abstract for each paper. We will then meet weekly with the course leader and an assistant for an hour-or-so long interactive seminar. An intimate knowledge of the papers will be assumed so that the discussion does not center simply on an explication of the contents of the papers. Assessment will be in the form of assignments throughout the semester.

Content
It is commonplace that scientists rarely cite literature that is older than 10 years and when they do, they usually cite one paper that serves as the representative for a larger body of work that has long since been incorporated anonymously in textbooks. Even worse, many authors have not even read the papers they cite in their own publications. This course, ‘Foundations of Neuroscience’ is one antidote. Thirteen major areas of research have been selected. They cover the key concepts that have led to our current ideas of how the nervous system is built and functions. Unusually, we will explore these areas of research by reading the original publications, instead of reading a digested summary from a textbook or review. By doing this, we will learn how the discoveries were made, what instrumentation was used, how the scientists interpreted their own findings, and how their work, often over many decades and linked together with related findings from many different scientists, generate the current views of mechanism and structure of the nervous system. We will read different original papers and explore the conceptual links between them and discuss the 'sociology' of science. We will also explore the personalities of the scientists and the context in which they made their seminal discoveries. Each week, course members will be given original papers to read for homework and they will write a short abstract for each paper. We will then meet weekly with the course leader and an assistant for an hour-or-so long interactive seminar. An intimate knowledge of the papers will be assumed so that the discussion does not center simply on an explication of the contents of the papers. Assessment will be in the form of assignments throughout the semester.

Prerequisites / notice
Restricted admission. Only open for students of the MSc program 'Neural Systems and Computation'.

Abstract
Deep-Learning (DL) a brain-inspired weak form of AI allows training of large artificial neuronal networks (ANNs) that, like humans, can learn real-world tasks such as recognizing objects in images. However, DL is far from being understood and investigating learning in biological networks might serve again as a compelling inspiration to think differently about state-of-the-art ANN training methods.

Objective
The main goal of this lecture is to provide a comprehensive overview into the learning principles neuronal networks as well as to introduce a diverse skill set (e.g. simulating a spiking neuronal network) that is required to understand learning in large, hierarchical neuronal networks. To achieve this the lectures and exercises will merge ideas, concepts and methods from machine learning and neuroscience. These will include training basic ANNs, simulating spiking neuronal networks as well as being able to read and understand the main ideas presented in today's neuroscience papers.

After this course students will be able to:
- read and understand the main ideas and methods that are presented in today's neuroscience papers
- explain the basic ideas and concepts of plasticity in the mammalian brain
- implement alternative ANN learning algorithms to 'error backpropagation' in order to train neuronal networks.
- use a diverse set of ANN regularization methods to improve learning
- simulate spiking neuronal networks that learn simple (e.g. digit classification) tasks in a supervised manner.

Content
Deep-learning a brain-inspired weak form of AI allows training of large artificial neuronal networks (ANNs) that, like humans, can learn real-world tasks such as recognizing objects in images. The origins of deep hierarchical learning can be traced back to early neuroscience research by Hubel and Wiesel in the 1960s, who first described the neuronal processing of visual inputs in the mammalian neocortex.

Similar to their neocortical counterparts ANNs seem to learn by interpreting and structuring the data provided by the external world. However, while on specific tasks such as playing (video) games deep ANNs outperform humans (Mnih et al, 2015, Silver et al., 2018). ANNs are still far behind of what the human brain seems to achieve effortlessly. Moreover, biological neuronal networks can learn far more effectively with fewer training examples, they achieve a much higher performance in recognizing complex patterns in time series data (e.g. recognizing actions in movies), they dynamically adapt to new tasks without losing performance and they achieve unmatched performance to detect and integrate out-of-domain data samples (data they have not been trained on). In other words, many of the big challenges and unknowns that have emerged in the field of deep learning over the last years are already mastered exceptionally well by biological neuronal networks in our brain. On the other hand, many facets of typical ANN design and training algorithms seem biologically implausible, such as the non-local weight updates, discrete processing of time, and scalar communication between neurons. Recent evidence suggests that learning in biological systems is the result of the complex interplay of diverse error feedback signaling processes acting at multiple scales, ranging from single synapses to entire networks.

Lecture notes
The lecture slides will be provided as a PDF after each lecture.
This advanced level lecture requires some basic background in machine/deep learning. Thus, students are expected to have a basic mathematical foundation, including linear algebra, multivariate calculus, and probability. The course is not to be meant as an extended tutorial of how to train deep networks in PyTorch or Tensorflow, although these tools used. The participation in the course is subject to the following conditions:

1) The number of participants is limited to 120 students (MSc and PhDs).

2) Students must have taken the exam in Deep Learning (263-3210-00L) or have acquired equivalent knowledge.

Abstract
The course provides an introduction to the functional properties of neurons. Particularly the description of membrane electrical properties (action potentials, channels), neuronal anatomy, synaptic structures, and neuronal networks. Simple models of computation, learning, and behavior will be explained. Some artificial systems (robot, chip) are presented.

Objective
Understanding computation by neurons and neuronal circuits is one of the great challenges of science. Many different disciplines can contribute their tools and concepts to solving mysteries of neural computation. The goal of this introductory course is to introduce the monocolours of physics, maths, computer science, engineering, biology, psychology, and even philosophy and history, to discover the enchantments and challenges that we all face in taking on this major 21st century problem and how each discipline can contribute to discovering solutions.

Content
This course considers the structure and function of biological neural networks at different levels. The function of neural networks lies fundamentally in their wiring and in the electro-chemical properties of nerve cell membranes. Thus, the biological structure of the nerve cell needs to be understood if biologically-realistic models are to be constructed. These simpler models are used to estimate the electrical current flow through dendritic cables and explore how a more complex geometry of neurons influences this current flow. The active properties of nerves are studied to understand both sensory transduction and the generation and transmission of nerve impulses along axons. The concept of local neuronal circuits arises in the context of the rules governing the formation of nerve connections and topographic projections within the nervous system. Communication between neurons in the network can be thought of as information flow across synapses, which can be modified by experience. We need an understanding of the action of inhibitory and excitory neurotransmitters and neuromodulators, so that the dynamics and logic of synapses can be interpreted. Finally, simple neural architectures of feedforward and recurrent networks are discussed in the context of co-ordination, control, and integration of sensory and motor information.

Connections to computer science and artificial intelligence are discussed, but the main focus of the course is on establishing the biological basis of computations in neurons.

Abstract
This course focuses on basic aspects of central nervous system physiology, including perception, motor control and cognitive functions.

Objective
To understand the basic concepts underlying perceptual, motor and cognitive functions.

Content
Main emphasis sensory systems, with complements on motor and cognitive functions.

Abstract
The course provides an introduction to the functional properties of neurons. Particularly the description of membrane electrical properties (action potentials, channels), neuronal anatomy, synaptic structures, and neuronal networks. Simple models of computation, learning, and behavior will be explained. Some artificial systems (robot, chip) are presented.

Objective
Understanding computation by neurons and neuronal circuits is one of the great challenges of science. Many different disciplines can contribute their tools and concepts to solving mysteries of neural computation. The goal of this introductory course is to introduce the monocultures of physics, maths, computer science, engineering, biology, psychology, and even philosophy and history, to discover the engravings and challenges that we all face in taking on this major 21st century problem and how each discipline can contribute to discovering solutions.

Content
This course considers the structure and function of biological neural networks at different levels. The function of neural networks lies fundamentally in their wiring and in the electro-chemical properties of nerve cell membranes. Thus, the biological structure of the nerve cell needs to be understood if biologically-realistic models are to be constructed. These simpler models are used to estimate the electrical current flow through dendritic cables and explore how a more complex geometry of neurons influences this current flow. The active properties of nerves are studied to understand both sensory transduction and the generation and transmission of nerve impulses along axons. The concept of local neuronal circuits arises in the context of the rules governing the formation of nerve connections and topographic projections within the nervous system. Communication between neurons in the network can be thought of as information flow across synapses, which can be modified by experience. We need an understanding of the action of inhibitory and excitatory neurotransmitters and neuromodulators, so that the dynamics and logic of synapses can be interpreted. Finally, simple neural architectures of feedforward and recurrent networks are discussed in the context of co-ordination, control, and integration of sensory and motor information.

Connections to computer science and artificial intelligence are discussed, but the main focus of the course is on establishing the biological basis of computations in neurons.
Neuromorphic circuits are inspired by the organizing principles of biological neural circuits. Their computational primitives are based on physics of semiconductor devices. Neuromorphic architectures often rely on collective computation in parallel networks. Adaptation, learning and memory are implemented locally within the individual computational elements. Transistors are often operated in weak inversion (below threshold), where they exhibit exponential I-V characteristics and low currents. These properties lead to the feasibility of high-density, low-power implementations of functions that are computationally intensive in other paradigms. Application domains of neuromorphic circuits include silicon retinas and cochleas for machine vision and audition, real-time emulations of networks of biological neurons, and the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS transistor, phototransducers), static circuits (differential pair, current mirror, transconductance amplifiers, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silicon neuron, silicon retina and cochlea) and an introduction to multi-chip systems that communicate events analogous to spikes. The lectures are accompanied by weekly laboratory sessions on the characterization of neuromorphic circuits, from elementary devices to systems.

Prerequisites: Background in basics of semiconductor physics helpful, but not required.

Abstract

Contents: Linear systems - the Gaussian algorithm, matrices - LU decomposition, determinants, vector spaces, least squares - QR decomposition, linear maps, eigenvalue problem, normal forms - singular value decomposition; numerical aspects.

Objective

You can:
+ solve linear systems of equations with the Gauss elimination;
+ interpret and appropriately use the standard operations with vectors and matrices;
+ compute and properly apply various matrix decompositions;
+ compute eigenvalues, eigenvectors and the determinant of a matrix;
+ use the properties of vector spaces and linear operators;
+ formulate and solve linear least squares problems with the appropriate methods;
+ understand and apply the singular value decomposition.

Content

+ linear systems of equations, matrices, Gauss-Elimination, LU and QR decomposition
+ linear spaces, first part of the fundamental theorem of linear algebra, choice of basis and change of coordinates
+ linear operators and change of variables
+ norm and scalar product in a linear space, Gram-Schmidt orthogonalisation, projectors
+ linear least squares problems
+ determinants
+ eigenvalues, eigenvectors, symmetric matrices
+ singular value decomposition, second part of the fundamental theorem of linear algebra, applications

401-2813-00L Programming Techniques for Scientific Simulations I

W 5 credits
4G
R. Käppeli

Abstract

Students in the Master's Degree Programme in Computational Science and Engineering must enrol only if this course unit is an additional requirement.

Objective

The goal of the course is that students learn basic and advanced programming techniques and scientific software libraries as used and applied for scientific simulations.

Content

A comprehensive understanding of the interaction of electrons and ions with condensed matter and details on the instrumentation and methods designed to use these probes in the structural and chemical analysis of various materials.

Lecture notes

Lecture notes and slides are available online and will be distributed if desired.

Literature

Erni: Aberration-corrected imaging in transmission electron microscopy, Imperial College Press (2010, and 2nd ed. 2015)

### Competencies

**Subject-specific Competencies**
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

**Method-specific Competencies**
- Analytical Competencies: assessed
- Decision-making: fostered
- Problem-solving: assessed

### Medical Physics I

**W 6 credits 2V+1U**  
P. Manser

**Abstract**
Introduction to the fundamentals of medical radiation physics. Functional chain due to radiation exposure from the primary physical effect to the radiobiological and medically manifest secondary effects. Dosimetric concepts of radiation protection in medicine. Mode of action of radiation sources used in medicine and its illustration by means of Monte Carlo simulations.

**Objective**
Understanding the functional chain from primary physical effects of ionizing radiation to clinical radiation effects. Dealing with dose as a quantitative measure of medical exposure. Getting familiar with methods to generate ionizing radiation in medicine and learn how they are applied for medical purposes. Eventually, the lecture aims to show the students that medical physics is a fascinating and evolving discipline where physics can directly be used for the benefits of patients and the society.

**Content**
The lecture is covering the basic principles of ionizing radiation and its physical and biological effects. The physical interactions of photons as well as of charged particles will be reviewed and their consequences for medical applications will be discussed. The concept of Monte Carlo simulation will be introduced in the exercises and will help the student to understand the characteristics of ionizing radiation in simple and complex situations. Fundamentals in dosimetry will be provided in order to understand the physical and biological effects of ionizing radiation. Deterministic as well as stochastic effects will be discussed and fundamental knowledge about radiation protection will be provided. In the second part of the lecture series, we will cover the generation of ionizing radiation. By this means, the x-ray tube, the clinical linear accelerator, and different radioactive sources in radiology, radiotherapy and nuclear medicine will be addressed. Applications in radiology, nuclear medicine and radiotherapy will be described with a special focus on the physics underlying these applications.

**Lecture notes**
A script will be provided.

**Prerequisites / notice**
For students of the MAS in Medical Physics (Specialization A) the performance assessment is offered at the earliest in the second year of the studies.

**Competencies**
- Subject-specific Competencies: Concepts and Theories assessed
- Techniques and Technologies assessed

### Consciousness: From Philosophy to Neuroscience

**W 3 credits 2V**  
D. Kiper

**Abstract**
This seminar reviews the philosophical and phenomenological as well as the neurobiological aspects of consciousness. The subjective features of consciousness are explored, and modern research into its neural substrate, particularly in the visual domain, is explained. Emphasis is placed on students developing their own thinking through a discussion-centered course structure.

**Objective**
The course's goal is to give an overview of the contemporary state of consciousness research, with emphasis on the contributions brought by modern cognitive neuroscience. We aim to clarify concepts, explain their philosophical and scientific backgrounds, and to present experimental protocols that shed light on a variety of consciousness related issues.

**Content**
The course includes discussions of scientific as well as philosophical articles. We review current schools of thought, models of consciousness, and proposals for the neural correlate of consciousness (NCC).

**Lecture notes**
None

**Literature**
We display articles pertaining to the issues we cover in the class on the course's webpage.

**Prerequisites / notice**
Since we are all experts on consciousness, we expect active participation and discussions!

---

### Physics in Medical Research: From Atoms to Cells

**W 6 credits 2V+1U**  
B. K. R. Müller

**Abstract**
Scanning probe and diffraction techniques allow studying activated atomic processes during early stages of epitaxial growth. For quantitative description, rate equation analysis, mean-field nucleation and scaling theories are applied on systems ranging from simple metallic to complex organic materials. The knowledge is expanded to optical and electronic properties as well as to proteins and cells.
Objective

The lecture series is motivated by an overview covering the skin of the crystals, roughness analysis, contact angle measurements, protein absorption/activity and monocyte behaviour.

As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducing, oxide and organic surfaces are introduced.

The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure's shapes, which are based on the strain relieving mechanisms and kinetic growth processes.

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. Recently, ellipsometry has been introduced to on-line monitor film thickness, and roughness with sub-nanometer precision. These characterisation techniques are vital for optimising the preparation of medical implants.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.

X rays are more and more often used to characterise the human tissues down to the nanometer level. The combination of highly intense beams only some micrometers in diameter with scanning enables spatially resolved measurements and the determination of tissue's anisotropies of biopsies.

252-0535-00L Advanced Machine Learning

W 10 credits 3V+2U+4A C. Cotrini Jimenez

Abstract

Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

Objective

Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real world data.

Content

Topics covered in the lecture include:

Fundamentals:
- What is data?
- Bayesian Learning
- Computational learning theory

Supervised learning:
- Ensembles; Bagging and Boosting
- Max Margin methods
- Neural networks

Unsupervised learning:
- Dimensionality reduction techniques
- Clustering
- Mixture Models
- Non-parametric density estimation
- Learning Dynamical Systems

Lecture notes

No lecture notes, but slides will be made available on the course webpage.

Prerequisites / notice

The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving machine learning problems. Students should have followed at least "Introduction to Machine Learning" or an equivalent course offered by another institution.

PhD students are required to obtain a passing grade in the course (4.0 or higher based on project and exam) to gain credit points.

**Abstract**

In this course, one acquires an understanding of the basic neutronics interactions occurring in a nuclear fission reactor and, as such, the conditions for establishing and controlling a nuclear chain reaction.

**Objective**

By the end of the course, the student must be able to:

- Elaborate on neutron diffusion equation
- Systematize nuclear reaction cross sections
- Formulate approximations to solving the diffusion equation for simple systems

**Content**

- Brief review of nuclear physics
- Historical: Constitution of the nucleus and discovery of the neutron
  - Nuclear reactions and radioactivity
  - Cross sections
  - Differences between fusion and fission
- Nuclear fission
- Characteristics - Nuclear fuel - Introductory elements of neutronics
- Fissile and fertile materials - Breeding
- Neutron diffusion and slowing down
- Monoenergetic neutrons - Angular and scalar flux
- Diffusion theory as simplified case of transport theory
- Neutron slowing down through elastic scattering
- Multiplying media (reactors)
- Multiplication factors - Criticality condition in simple cases
- Thermal reactors - Neutron spectra - Multizone reactors - Multigroup theory and general criticality condition - Heterogeneous reactors
- Reactor kinetics
- Point reactor model: prompt and delayed transients - Practical applications
- Reactivity variations and control
- Short, medium and long term reactivity changes? Different means of control

**Literature**

Distributed documents, recommended book chapters

**Prerequisites / notice**

Prerequisite for: Reactor Experiments

**Abstract**

An introductory course in the basic concepts of radiation detection and interactions and energy deposition by ionizing radiation in matter, radioisotope production and its applications in medicine, industry and research. The course includes presentations, lecture notes, problem sets and seminars.
By the end of the course, the student must be able to:

- Explain the basic physics principles that underpin radiotherapy, e.g. types of radiation, atomic structure, etc.
- Explain the interaction mechanisms of ionizing radiation at keV and MeV energies with matter.
- Explain the principles of radiation dosimetry.
- Explain the principles of therapeutic radiation physics including X-rays, electron beam physics, radioactive sources, use of unsealed sources and Brachytherapy.
- Describe how to use radiotherapy equipment both for tumour localisation, planning and treatment.
- Define quality assurance and quality control, in the context of radiotherapy and the legal requirements.
- Explain the principles and practice of radiation protection, dose limits, screening and protection mechanisms.

**Content**

- Basics: radiation sources and interaction with matter, radioisotope production using reactors and accelerators, radiation protection and shielding.
- Medical applications: diagnostic tools, radiopharmaceuticals, cancer treatment methodologies such as brachytherapy, neutron capture therapy and proton therapy.
- Industrial applications: radiation gauges, radiochemistry, tracer techniques, radioisotope batteries, sterilization, etc.

Applications in research: dating by nuclear methods, applications in environmental and life sciences, etc.

**151-2021-00L Hydraulic Turbomachines (EPFL)**

**Objective**

By the end of the course, the student must be able to:

- Formulate the operating point of a hydraulic turbomachine
- Specify a type of hydraulic turbine
- Sketch the layout of a hydraulic turbomachine
- Select appropriately the dimensions of a hydraulic turbomachine

**Content**

- Turbomachine equations, mechanical power balance in a hydraulic machines, moment of momentum balance applied to the runner/impeller, generalized Euler equation.
- Hydraulic characteristic of a reaction turbine, a Pelton turbine and a pump, losses and efficiencies of a turbomachine, real hydraulic characteristics.
- Similarity laws, non dimensional coefficients, reduced scale model testing, scale effects.
- Cavitation, hydraulic machine setting, operating range, adaptation to the piping system, operating stability, start stop transient operation, runaway.
- Reaction turbine design: general procedure, general project layout, design of a Francis runner, design of the spiral casing and the distributor, draft tube role, CFD validation of the design, design fix, reduced scale model experimental validation.
- Pelton turbine design: general procedure, project layout, injector design, bucket design, mechanical problems.
- Centrifugal pump design: general architecture, energetic loss model in the diffuser and/or the volute, volute design, operating stability.

Franc, Avellan et al., Cavitation, EDP Grenoble, 1994

Handout and Scientific Litterature from LMH, Industry, International Association

**151-2023-00L Nuclear Fusion and Plasma Physics (EPFL)**

**Objective**

By the end of the course, the student must be able to:

1) Basics of thermonuclear fusion
2) The plasma state and its collective effects
3) Charged particle motion and collisional effects
4) Fluid description of a plasma
5) Plasma equilibrium and stability
6) Magnetic confinement: Tokamak and Stellarator
7) Waves in plasma
8) Wave-particle interactions
9) Heating and non inductive current drive by radio frequency waves
10) Heating and non inductive current drive by neutral particle beams
11) Material science and technology: Low and high Temperature superconductor - Properties of material under irradiation
12) Some nuclear aspects of a fusion reactor: Tritium production
13) Licensing a fusion reactor: safety, nuclear waste
14) Inertial confinement

**Content**

**Prerequisites / notice**

Required prior knowledge:
Basic knowledge of electricity and magnetism, and of simple concepts of fluids

**151-2025-00L Introduction to Particle Accelerators (EPFL)**

**Objective**

By the end of the course, the student must be able to:

- Identify the main technological challenges of fusion
- Identify the main physics challenges on the way to fusion
- Design the main elements of a fusion reactor
- Identify the main technological challenges of fusion

**Content**

- Formulate the operating point of a hydraulic turbomachine
- Sketch the layout of a hydraulic turbomachine
- Select appropriately the dimensions of a hydraulic turbomachine

**Literature**

**Prerequisites / notice**

Required prior knowledge:
Basic knowledge of electricity and magnetism, and of simple concepts of fluids
### Abstract
The course presents basic physics ideas underlying the workings of modern accelerators. We will examine key features and limitations of these machines as used in accelerator driven sciences like high energy physics, materials and life sciences.

### Objective
By the end of the course, the student must be able to:
- Design basic linear and non-linear charged particles optics
- Elaborate basic ideas of physics of accelerators
- Use a computer code for optics design
- Optimize accelerator design for a given application
- Estimate main beam parameters of a given accelerator

### Content
Overview, history and fundamentals
- Transverse particle dynamics (linear and nonlinear)
- Longitudinal particle dynamics
- Linear accelerators
- Circular accelerators
- Acceleration and RF-technology
- Beam diagnostics
- Accelerator magnets
- Injection and extraction systems
- Synchrotron radiation

### Literature
Recommended during the course
Prérequis: Notion de relativité restreinte et d'électrodynamique

### Prerequisites / notice
Prerequisite: Notion of General Relativity and Electrodynamics

### 151-2041-00L Introduction to Medical Radiation Physics (EPFL)
No enrolment to this course at ETH Zurich. Book the corresponding module directly at EPFL.

Abstract

By the end of the course, the student must be able to:
- Explain interaction processes of ionising radiation and matter
- Describe the production of a detection signal and its processing
- Explain the operation of all types of commonly used detectors
- Assess / Evaluate the detection system and method required for a specific measurement

Content

- Interaction of radiation with matter at low energies: X-rays/gammas, charged particles and neutrons up to MeV range, ionisation, nuclear cross sections
- Characteristics and types of detectors: gas detectors, semiconductor detectors, scintillators and optical fibers, fission chambers, meshed and pixel detectors
- Signal processing and analysis: types of electronics, signal collection and amplification, particle discrimination, spatial and time resolution
- Nuclear instrumentation and measurements: principle of measurements, spectrometry, common detection instrumentations, applications in nuclear engineering and R&D.

Literature

Radiation detection and measurement, Glenn F. Knoll. Wiley 2010

151-2053-00L Experimental Methods in Physics (EPFL) W 3 credits 3G external organisers

No enrolment to this course at ETH Zurich. Book the corresponding module directly at EPFL.

Objective

By the end of the course, the student must be able to:
- Integrate the notions of critical reading of articles
- Assess / Evaluate scientific articles, their quality and defaults
- Interpret knowledge of several specific experimental methods

Content

- Noise and interference: Their origins, their influence on experimental results, methods for noise and interference reduction
- Scanning probe microscopy (SPM): Principles of operation of the scanning tunneling microscope and atomic force microscope, Advanced scanning microscopy techniques, applications
- Electron microscopy: Transmission and scanning microscopes, their principles of operation, observation techniques, uses ...
- Structural characterization: RX, electron diffraction, ...

151-2055-00L Image Processing I (EPFL) W 3 credits 3G external organisers

No enrolment to this course at ETH Zurich. Book the corresponding module directly at EPFL.

Objective

Introduction to the basic techniques of image processing. Introduction to the development of image-processing software and to prototyping in JAVA. Application to real-world examples in industrial vision and biomedical imaging.

By the end of the course, the student must be able to:
- Exploit the multidimensional Fourier transform
- Select appropriately Hilbert spaces and inner-products
- Optimize 2-D sampling to avoid aliasing
- Formalize convolution and optical systems
- Design digital filters in 2-D
- Analyze multidimensional linear shift-invariant systems
- Apply image-analysis techniques
- Construct image-processing software
- Elaborate morphological filters

Content

No enrolment to this course at ETH Zurich. Book the corresponding module directly at EPFL.

Objective

The goal of the lecture is to present and apply techniques for the modelling and the thermo-economic optimisation of industrial process and energy systems. The lecture covers the problem statement, the solving methods for the simulation and the single and multi-objective optimisation problems.

By the end of the course, the student must be able to:
- Master the concepts of thermodynamic efficiency, E6
- Establish the flow diagram of an industrial process and calculate the corresponding energy and mass balance, E22
- Analyse the energy and exergy efficiency of industrial energy systems, E23
- Model, design and optimize energy conversion systems and industrial processes, E24
- Establish the flow diagram of an industrial process and calculate the corresponding energy and mass balance, E20
- Explain and apply the concepts of thermodynamic efficiency, E6
- Analyse the energy and exergy efficiency of industrial energy systems, E21
- Model, design and optimize energy conversion systems and industrial processes, E22
By the end of the course, the student must be able to:
- Use applications codes.
- External organisers

Neutron and X-ray Scattering of Quantum Materials
Plasma I (EPFL)

Neutron and X-ray scattering are some of the most powerful and versatile experimental methods to study the structure and dynamics of quantum solids, from simple metals and superconductors to complex quantum materials. These methods allow for the determination of the electron density, the intrinsically quantum mechanical electron configuration, and the nuclear charge density.

Objective
By the end of the course, the student must be able to:
- Review the fundamental concepts of nuclear interaction with neutrons.
- Understand the importance of nuclear data in various applications.
- Be familiar with the data evaluation and processing.
- Propose feedback to influence new measurements, or new calculations.

Content
- Theoretical background: Many of the needs are covered by experimental knowledge, but not all. Some reactions cannot be easily measured, or are simply out of range with current technologies (for instance for with short-lived isotopes). What can we do in this case?
- Measurement facilities: The current knowledge of nuclear interactions, cross sections and uncertainties is based on measurements. In many instances, measurements are necessary due to the lack of prediction power for models. We will see the existing facilities, their advantages and drawback. We will also visit the installation worldwide, with a view on the future needs.
- Evaluation: Once quantities have been measured or calculated, they need to be presented to potential users. This step is called "evaluation". The outcome of the process is "what the users will see". It covers compiling measurements, combining them with theoretical predictions, formatting, and processing in forms that users need. We will go through these steps, and you will globally understand the importance of these steps.
- Applications: finally, we will see how these nuclear data are used. What are the applications, what are the needs, and how users can propose feedback to influence new measurements, or new calculations.

Nuclear Interaction : from Reactors to Stars (EPFL)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at EPFL.

Numerics for Fluids, Structures and Electromagnetics

Objective
By the end of the course, the student must be able to:
- Identify features of a PDE relevant for the selection and performance of a numerical algorithm.
- Assess / Evaluate numerical methods in light of the theoretical results.
- Implement numerical methods for saddle point problems
- Choose an appropriate method to solve a given differential problem.
- Prove convergence of a discretisation scheme

Content
- Manipulate the fundamental elements of the plasma fluid and kinetic theory
- Collisional and relaxation phenomena
- Inelastic collisions: ionization and recombination, degree of ionization
- Elastic collisions: Coulomb collisions
- Ionisation and thermalisation
- Plasma resistivity and the runaway regime
- Transport in plasmas
- Random walk and diffusion
- Ambipolar and cross-field diffusion
- Energy and particle confinement
- Waves in cold magnetized plasma
- Dielectric tensor
- Resonances and cut-offs
- Parallel and perpendicular propagation
- Wave-particle interaction and kinetic description of waves in hot un-magnetized plasmas
- The Vlasov-Maxwell model
- Resonant wave-particle interaction and Landau damping
- Stability criteria and streaming instabilities
- Langmuir and ion-acoustic waves and instabilities
- Waves in hot magnetized plasmas
- Examples of nonlinear effects

Objective By the end of the course, the student must be able to:
- Plan, predict and interpret neutron scattering experiments
- Read and evaluate articles containing neutron scattering results

Content Neutron scattering is one of the most powerful and versatile experimental methods to study the structure and dynamics of materials on the nanometer scale. Its application spans from crystalline matter to bio-materials and engineering, including fields like magnetism and superconductivity. Similar to the vast possibilities with X-rays at synchrotron facilities, neutron scattering is a so-called large scale facility technique with neutron facilities among other at PSI in Switzerland, ILL in Grenoble and a new joint European Spallation Source under construction in Sweden.

The course provides an introduction to the versatile experimental techniques of neutron scattering and covers the following aspects:

1. Theory of the neutron scattering cross section
2. Neutron sources and neutron instrumentation
3. Neutron imaging, neutron reflectivity and neutron small angle scattering
4. Neutron diffraction, crystal structures
5. Inelastic neutron scattering, phonons
6. Magnetic neutron scattering, magnetic structures
7. Inelastic magnetic neutron scattering, magnetic dynamics
8. Resonant Inelastic X-ray Scattering (RIXS) a complementary technique

The course contain lectures and exercise sessions. Exercise sessions will contain deriving relevant formulas, monte-carlo simulation of neutron scattering experiments, and discussion of representative scientific articles using neutron scattering. We use partially flip-class room format for interactive learning.

Lecture notes Lecture notes, example articles.
Prerequisites / notice Required courses: Solid State Physics 1 and 2; Basic quantum mechanics

151-2005-00L Elective Project Nuclear Engineering

The subject of the Elective Project and the choice of the supervisor (ETH or EPFL professor) are to be approved in advance by the tutor.

Abstract The elective project has the purpose to train the students in the solution of specific engineering problems related to nuclear technology. This makes use of the technical and social skills acquired during the master's program. Tutors propose the subject of the project, and define the roadmap together with their students, as well as monitor the overall execution.

Objective The elective project is designed to train the students in the solution of specific engineering problems. This makes use of the technical and social skills acquired during the master's programme.

Number Title Type ECTS Hours Lecturers
151-0150-00L Advanced Topics in Nuclear Reactor Materials O 4 credits 3G M. A. Pouchon, P. J.-P. Spätig, M. Streit
151-2037-00L Nuclear Computations Lab O 4 credits 3G A. Pautz, H. Ferroukhi, further lecturers
151-2039-00L Beyond-Design-Basis Safety O 4 credits 3G A. Manera, T. Lind, D. Paladin
Hand-outs will be distributed upon completion of the course. Students are able to:

**Professors:**

- Legal framework, project management and operations methods and tools, cost estimation approaches and methods, nuclear calculations (F. Leibundgut)
- The elective project is designed to train the students in the solution of specific engineering problems. This uses technical and S. Kozerke

**Lecture notes and handouts**

- Introduction to diagnostic medical imaging based on electromagnetic and acoustic fields including X-ray planar and tomographic imaging, Ultrasound (Doppler shift, implementations, applications)
- Biomedical Imaging
  - Ultrasound (spatial and temporal resolution, phased arrays)
  - Magnetic Resonance (plane wave encoding, Fourier reconstruction, pulse sequences)
  - Magnetic Resonance (contrast mechanisms, gradient- and spin-echo, applications)
  - Ultrasound (mechanical wave generation, propagation in tissue, reflection, transmission)
  - Magnetic Resonance (magnetic moment, spin transitions, excitation, relaxation, detection)
  - Nuclear imaging (radioactive tracer, collimation, point spread function, SPECT/PET)
  - Nuclear imaging (detection principles, image reconstruction, kinetic modelling)
  - Magnetic Resonance (magnetic moment, spin transitions, excitation, relaxation, detection)
  - Nuclear imaging (radioactive tracer, collimation, point spread function, SPECT/PET)
  - Nuclear imaging (detection principles, image reconstruction, kinetic modelling)
  - Magnetic Resonance (plane wave encoding, Fourier reconstruction, pulse sequences)
  - Magnetic Resonance (contrast mechanisms, gradient- and spin-echo, applications)
  - Ultrasound (mechanical wave generation, propagation in tissue, reflection, transmission)
  - Ultrasound (spatial and temporal resolution, phased arrays)
  - Ultrasound (Doppler shift, implementations, applications)
  - Summary, example exam questions

**Prerequisites / notice**

- Decommission: Recommended courses: 151-0156-00L Safety of Nuclear Power Plants plus either 151-0163-00L Nuclear Energy Conversion or 151-2015-00L Reactor Technology

**151-2045-00L**

- **Decommissioning of Nuclear Power Plants**
  - Students registered at ETH Zurich have to enroll to this course at ETH. EPFL students can enroll to this course directly at EPFL.
  - **Abstract**
    - Introduction to aspects of Nuclear Power Plant decommissioning including project planning and management, costs and financing, radiological characterization, dismantling/decontamination technologies, safety aspects and radioactive waste management considerations.
  - **Objective**
    - Aim of this course is to provide the students with an overview of the multidisciplinary issues that have to be addressed for the successful decommissioning of NPPs. Students will get exposed to principles of project management, operations management, cost estimations, radiological characterization, technologies relevant to the safe dismantling of NPPs and best-practice in the context of radioactive waste management.
  - **Content**
    - Legal framework, project management and operations methods and tools, cost estimation approaches and methods, nuclear calculations and on-site radiological characterization and inventorying, state-of-the-art technologies for decontamination and dismantling, safety considerations, state-of-the-art practice for radioactive waste treatment, packaging and transport, interface with radioactive waste management and disposal. The course will additionally include student visits to relevant nuclear sites in Switzerland and Germany.
  - **Lecture notes**
    - Slides will be handed out.
  - **Literature**

**151-2005-00L**

- **Elective Project Nuclear Engineering**
  - The subject of the Elective Project and the choice of the supervisor (ETH or EPFL professor) are to be approved in advance by the tutor.
  - **Abstract**
    - The elective project has the purpose to train the students in the solution of specific engineering problems related to nuclear technology. This makes use of the technical and social skills acquired during the master's program. Tutors propose the subject of the project, elaborate the project plan, and define the roadmap together with their students, as well as monitor the overall execution.
  - **Objective**
    - The elective project is designed to train the students in the solution of specific engineering problems. This makes use of the technical and social skills acquired during the master's programme.

**227-0385-10L**

- **Biomedical Imaging**
  - Introduction to diagnostic medical imaging based on electromagnetic and acoustic fields including X-ray planar and tomographic imaging, radio-tracer based nuclear imaging techniques, magnetic resonance imaging and ultrasound-based procedures.
  - **Objective**
    - Upon completion of the course students are able to:
      - Explain the physical and mathematical foundations of diagnostic medical imaging systems
      - Characterize system performance based on signal-to-noise ratio, contrast-to-noise ratio and transfer function
      - Design a basic diagnostic imaging system chain including data acquisition and data reconstruction
      - Identify advantages and limitations of different imaging methods in relation to medical diagnostic applications
  - **Content**
    - Introduction (intro, overview, history)
    - Signal theory and processing (foundations, transforms, filtering, signal-to-noise ratio)
    - X-rays (production, tissue interaction, contrast, modal transfer function)
    - X-rays (resolution, detection, digital subtraction angiography, Radon transform)
    - X-rays (filtered back-projection, spiral computed tomography, image quality, dose)
    - Nuclear imaging (radioactive tracer, collimation, point spread function, SPECT/PET)
    - Nuclear imaging (detection principles, image reconstruction, kinetic modelling)
    - Magnetic Resonance (magnetic moment, spin transitions, excitation, relaxation, detection)
    - Magnetic Resonance (plane wave encoding, Fourier reconstruction, pulse sequences)
    - Magnetic Resonance (contrast mechanisms, gradient- and spin-echo, applications)
    - Ultrasound (mechanical wave generation, propagation in tissue, reflection, transmission)
    - Ultrasound (spatial and temporal resolution, phased arrays)
    - Ultrasound (Doppler shift, implementations, applications)
    - Summary, example exam questions

Students who fulfill the following criteria are allowed to begin with their Master's Thesis:

a. successful completion of the bachelor programme;
b. fulfilling of any additional requirements necessary to gain admission to the master programme.
c. successful completion of the semester project.d. completion of minimum 72 ECTS in the categories “Core Courses” and “Electives” in the master studies and completion of 8 ECTS in the “Semester Project”

Master's programs are concluded by the master's thesis. The thesis is aimed at enhancing the student's capability to work independently toward the solution of a theoretical or applied problem. The subject of the master's thesis, as well as the project plan and roadmap, are proposed by the tutor and further elaborated with the student.

The thesis is aimed at enhancing the student's capability to work independently toward the solution of a theoretical or applied problem.

**Abstract**

In this course, various topics related to the development, GMP production and application of therapeutic proteins will be discussed. Furthermore, students will expand their training in pharmaceutical immunology and will be introduced to the basic concepts of pharmaceutical product quality management.

**Objective**

Students know and understand:

- basic mechanisms and regulation of the immune response
- the pathogenic mechanisms of the most important immune-mediated disorders
- the concepts of vaccination and cancer immunotherapy
- the most frequently used expression systems for the production of therapeutic proteins
- the use of protein engineering tools for modifying different features of therapeutic proteins
- the mechanism of action of selected therapeutic proteins and their application
- basic concepts in the GMP production of therapeutic proteins

**Content**

The course consists of two parts:

In the first part, students will complete their training in Pharmaceutical Immunology. This part particularly focuses on the pathogenic mechanisms of immune-mediated diseases, vaccination and cancer immunotherapy. Deepened knowledge of immunology will be relevant for understanding the mechanism of action of many therapeutic proteins, as well as for understanding one major concern related to the use of protein-based drugs, namely, immunogenicity.

The second part focuses on topics related to the development and application of therapeutic proteins, such as protein expression, protein engineering, reducing immunogenicity, and GMP production of therapeutic proteins. Furthermore, selected examples of approved therapeutic proteins will be discussed.

**Lecture notes**

Handouts to the lectures will be available for downloading under http://www.pharma.ethz.ch/scripts/index

**Literature**

- Janeway’s Immunobiology, by Kenneth Murphy (9th or 10th Edition)
- Lecture Handouts
- Paper References provided in the Scripts
- EMEA Dossier for Humira

**Abstract**

The course is divided into three parts. The first part provides an overview of drugs used for the pharmacotherapy of infectious diseases, osteoporosis, autoimmune diseases and cancer. The second part gives an overview of the field of medical virology, and the third part is focused on pharmacogenomics of drug metabolism and basic concepts of toxicology.

**Objective**

The course advances basic knowledge in pharmacology and toxicology. Special emphasis is placed on the interrelationship between pharmacological, pathophysiological and clinical aspects of drug therapy in the fields of infectious diseases, osteoporosis, autoimmune diseases and cancer. The course also provides an overview of the fields of medical virology, toxicology, and pharmacogenomics with a special focus on the role of genetic polymorphisms in drug response and adverse effects.

**Content**

Topics include the pharmacology and pharmacotherapy of infectious diseases, osteoporosis, autoimmune diseases and cancer. Medical virology covers important viral infections and their pharmacotherapy with different classes of antiviral drugs. In the field of pharmacogenomics, the course is focused on examples of genetic variability of drug metabolism and drug responses, and the relevance of pharmacogenomics and toxicogenomics for clinical drug development. Finally, basic concepts of toxicology are introduced.

**Lecture notes**

A script is provided for each lecture. The scripts define important and exam-relevant contents of the lectures. Scripts do not replace the lectures.

**Literature**

Recommended reading:
The classic textbook in Pharmacology:
Goodman and Gilman’s The Pharmacological Basis of Therapeutics
Laurence Brunton, Bjorn C. Knollman.
14th edition (2022)
ISBN-10: 1264258070

or

13th edition (2022)
Urban & Fischer (Elsevier)
Introduction to the principles, methods and applications of pharmacoepidemiology and drug safety. Drug safety in the pharmaceutical industry and regulatory authorities, but also for hospital and office pharmacists. Another focus is the evaluation and interpretation of pharmacoepidemiological drug safety studies in the medical literature and the evaluation of benefits vs. risks.

Objectives:
- To familiarize participants with the principle methods and applications of pharmacoepidemiology and drug safety that is relevant for industry, regulatory affairs, but also for clinical pharmacists in hospitals and office pharmacies.
- Perform independently a causality assessment of suspected adverse drug reactions in patients.
- Setup of programs that can effectively reduce medication errors and improve drug safety in clinical practice, particularly in hospitals.

Content:
- Historical landmarks of drug safety
- Pharmacovigilance and causality assessment
- Drug safety in premarketing clinical trials
- Descriptive, cohort and case-control drug safety study designs; Data analysis and control of confounding
- Pharmacoepidemiology and regulatory decision making in drug safety; Risk management plans (RMPs)
- Medication errors, clinical pharmacology / clinical pharmacy
- Clinical Decision Support Systems, Interventional Pharmacoepidemiology
- Pharmacoepidemiological databases, 'Big Data'
- Interactive discussion of many real-life examples for each topic

Lecture notes:
This course will be a combination of formal lectures, group discussions and self-directed studies. Course material will be taught through seminars, case studies in small groups. Reading material and scripts will be provided for each week.

Literature:
- Rothman: Introduction to Epidemiology
- Strom, Kimmel, Hennessy: Textbook of Pharmacoepidemiology
- Gigerenzer: Risk Savvy - How to Make Good Decisions
Drug Discovery and Development

This course provides an overview over the concepts and processes employed in today’s drug discovery and development. It has an introductory character but will also provide more detailed insights employing real life examples. The course combines lectures and interactive elements with active participation of the students.

Objective

Students
- Understand the drug discovery process and can explain major approaches and relevant technical terms (for details see lecture notes).
- Understand and appreciate the content and timing of drug development process steps, development phases and decision criteria.
- Understand the concepts underlying drug product development through all the phases from preclinical and clinical development to regulatory submission, approval and market launch.
- Can differentiate between small molecule drug development and biological drug development.
- Understand the most important differences for drug development and approval between the EU and USA pharma markets with regard to legal and regulatory requirements.

Content

Course unit comprises weekly lectures covering the early phases of target and drug discovery (535-0901-01 S “From A to Z in Drug Discovery and Development I”) with group work in the area of Drug Development (511-0000-00 G). The latter course lasts 2 full days (Days 1 and 2) and comprises both lectures and group work: inter alia an introduction to the entire suite of drug product development processes in the pharmaceutical industry, covering preclinical research and development, clinical development, regulatory processes and market launch.

R&D support processes such as project management, quality management, pharmacovigilance and pharmaco economics will be covered as well as organizational and governance aspects of the pharmaceutical industry. In addition, important success factors for a later career in the pharmaceutical industry will be briefly discussed at the end of day 2 of the course.

Lecture notes

Will be published on “mystudies”

Literature

Further readings will be listed in the lecture notes.

Prerequisites / notice

This course provides the essential basic knowledge required for the industry-specific modules of the spring semester.

Scientific Writing and Presenting

This introductory class provides an overview of the basic scientific writing techniques and a guideline to presenting scientific data, together with guided exercises and hands-on training. It is devised to accompany the research projects within the curriculum of the MSc in Pharmaceutical Sciences.

Abstract

This introductory class provides an overview of the basic scientific writing techniques and a guideline to presenting scientific data, together with guided exercises and hands-on training. It is devised to accompany the research projects within the curriculum of the MSc in Pharmaceutical Sciences.

Objective

The class enables the participants to prepare their own scientific texts and oral presentations, and critically assess the quality of the presentations of scientific data.

Content

Topical seminars alternate with practical task for the participants, which will be evaluated in a peer-to-peer setting. Performance feedback is provided by both the teachers and the peers.

Abstract

The course provides a platform for the investigation, presentation and discussion of a topic with relevance to the field of pharmaceutical sciences. Students work in small groups on a chosen topic and present their work on a one day symposium.
Subject-specific Competencies

The main objectives of this course are:

- students develop their scientific reflection (Critical Thinking) and working skills by working independently on a relevant pharmaceutical topic.
- students gain in-depth knowledge of the topic investigated
- students train their scientific writing and presentation skills
- students train their ability to plan a project and work in a team

Content

The Course Drug Seminar takes place during the first 7 weeks of the 1. Master semester. It is a compulsory course of the MSc Pharmacy curriculum and an elective course in the MSc PharmSciences.

The course provides a platform for the investigation, presentation and discussion of a topic with relevance to the field of pharmaceutical sciences.

During the course, students work in small teams on a topic of their choice and elaborate an oral presentation. Each team is tutored by a lecturer of the Institute of Pharmaceutical Sciences. The work is mainly based on literature search/review, but may also involve conducting interviews or site visits, if appropriate. The final presentations of all groups will take place in the framework of a dedicated Symposium held in the middle of the semester.

Prerequisites / notice

Only for students of MSc Pharmacy and MSc Pharmaceutical Sciences.

| Objective                             | - students develop their scientific reflection (Critical Thinking) and working skills by working independently on a relevant pharmaceutical topic.
| - students gain in-depth knowledge of the topic investigated
| - students train their scientific writing and presentation skills
| - students train their ability to plan a project and work in a team
| Content                               | - Knowledge of the ADMET processes and the respective pharmacokinetic parameters.
| - Interpretation of pharmacokinetic parameters.
| - Analysis of drug plasma concentration-time curves.
| - Prediction of pharmacokinetic parameters based on in vitro assays and physicochemical drug properties.
| - Knowledge of the effects of physiological factors on the pharmacokinetic parameters and on drug plasma and tissue concentrations.
| - Design of dosage regimens, based on pharmacokinetic parameters.
| - Prediction of drug-drug interaction potentials based on in vitro assays and pharmacokinetic parameters.
| - Introduction to biopharmacy (ADMET) and pharmacokinetics.
| - Definition of the most important pharmacokinetic parameters and their calculation from plasma concentration-time curves.
| - Introduction to compartment models, statistical models, physiological models.
| - Pharmacokinetic profiling of drugs for therapy optimization and for the analysis of the interaction potential.
| - Design of dosage regimens. In vitro assays to predict pharmacokinetic parameters.
| Lecture notes                        | Slides, see documents repository.

Abstract
Knowledge of the major reactions of biotransformation in drug therapy, prediction of possible metabolites of drugs and xenobiotics, recognition of structure elements and reactions which can lead to toxic metabolites. Knowledge of inter- and intraindividual factors influencing metabolism.

Objective
Goals: knowledge of the major reactions of biotransformation in drug therapy, prediction of possible metabolites of drugs and xenobiotics, recognition of structure elements and reactions which can lead to toxic metabolites. Knowledge of inter- and intraindividual factors influencing metabolism.

Content
Major reactions of biotransformation. Major enzymes and reaction partners involved in the biotransformation of drugs and xenobiotics. Toxic reactions of metabolites. Factors which affect the biotransformation.

Lecture notes
Biotransformation of drugs and xenobiotics

Abstract
In the lecture, basic knowledge of the history of pharmacy is imparted, taking into account the various historical epochs.

Objective
After attending the lecture, the students are able to name significant events in the development of the pharmacy profession, pharmacy and medicines and to place them in a temporal context. They can list sources for working on questions from the history of pharmacy and evaluate their advantages and disadvantages. This enables them to confidently describe the importance of pharmacy as an independent, supporting pillar of the health system, the history of which has many interfaces with medicine, science, social and cultural history.

Content
The lecture conveys knowledge about the development of the pharmacist profession from ancient times to the present. Some pharmacists who made significant contributions to pharmacy are presented in more detail and their significance for today's pharmacy is discussed. The social position of pharmacists in society and the legal conditions in different epochs are also discussed. It explains what influence the pharmacists had on the development of the pharmaceuticals, but again the pharmaceuticals on the development of the pharmacists. For this purpose, it is shown how much the meaning, the nature, the type and the composition of pharmaceuticals and the knowledge about them changed over time.

Prerequisites / notice
An interest in the history of pharmacy, the pharmacy profession, and medicines is an asset.

Abstract
Basic understanding and awareness of ethnopharmaceutical and ethnopharmacological issues and research. Knowledge of methods used in drug discovery from natural sources. Discussion of the issues around law and international treaties. Importance of ethnopharmaceutical knowledge for world health.

Objective
Basic understanding and awareness of ethnopharmaceutical and ethnopharmacological issues and research. Knowledge of methods used in drug discovery from natural sources. Discussion of the issues around law and international treaties. Importance of ethnopharmaceutical knowledge for world health.

Content

Prerequisites / notice
Prerequisites: Basic lectures in biology or biochemistry and pharmaceutical biology have been attended; not suitable for first semester students.
Concepts and Theories

To develop a critical understanding of the relevance and limitations of the current approaches to explaining and anticipating drug effects.

Communication

Subject-specific Competencies

To foster the development of specific subject-related skills and knowledge.

J. Scheuermann

Analytical Competencies

1V

Molecular Mechanisms of Drug Actions and Targets

535-0310-00L

Protein-based drugs constitute around 25% of new approvals and most of them are glycoproteins. Using selected examples of prominent glycoprotein drugs, the course aims at providing insight into glycosylation-activity relationships and into biotechnological production and analytics.

Students gain basic knowledge in "pharmaceutical glycobiology". This implies knowing and understanding:
- major mechanisms underlying the roles of glycosylation for the biological/therapeutic actions of glycoproteins (glycosylation-function relationships) using prominent examples of glycoprotein drugs.
- the major types of protein-linked glycans and the biosynthetic pathways for their formation
- how glycoprotein drugs are produced (including the most important expression systems used), glycoengineered and analysed (quality control).

Students are able to apply this knowledge in solving simple problems in glycoprotein drug development (on paper). Students gain the ability to reflect on roles of glycosylation in various biological contexts.

Glycobiology in Drug Development

Students are able to apply this knowledge in solving simple problems in glycoprotein drug development (on paper). Students gain the ability to reflect on roles of glycosylation in various biological contexts.
Deficiencies of particular vitamins result in specific diseases such as for example scurvy (vitamin C deficiency). Such disease patterns are usually easily recognized and fail to be treated. The clinical utility of supplementation concerns people with severe deficiencies and a risk of complications. Latent vitamin deficiencies might result in variable disorders and risks. As an example neurological disorders in elderly as a consequence of chronic lack of vitamin B12 should be mentioned. Subclinical deficiencies are often difficult to assess. However, these are exactly the cases where advice of a pharmacist is requested. 

A large intake of vitamins by over-supplementation or food fortification might be dangerous (hypervitaminosis). This is in particular the case for fat-soluble vitamins or in the case of constant intake of high amounts of water-soluble vitamins over a long time period. The lecture 'Vitamins in Heath and Disease' will give an overview over the history and applications of vitamins and their functions to preserve good health. The utility of vitamin supplementation during conditions of deficiencies, potential consequences of a latent deficiency as well as risks of over-supplementation will be discussed.

The topics are explained and critically discussed using various phytopharmaceuticals as examples (see programme below).

Based on epidemiology, economic importance and evidence-based medicine, basic principles of rational phytotherapy will be discussed: 

a) Identification of drug candidates, b) registration requirements, c) criteria to assess efficacy, d) biomarkers and pharmacokinetics, e) safety and f) principles of extract generation. Important prototypes will be discussed.

The topics include molecular representations and similarity, ligand-based virtual screening (similarity search, QSAR, etc.) and structure-based virtual screening. All theoretical concepts and algorithms presented are illustrated by practical applications and case studies. The students will learn how molecules can be represented in computers and how molecular similarity is calculated. They will learn the basics of computer-assisted drug design studies in medicinal chemistry projects. The concepts of ligand-based and structure-based virtual screening to identify potential drug candidates, and understand possibilities and limitations of computer-assisted drug design in pharmaceutical chemistry. As a result, they are prepared for professional assessment of computer-assisted drug design studies in medicinal chemistry projects.

The lecture series provides an introduction to computer applications in medicinal chemistry. The topics cover molecular representations and similarity, ligand-based virtual screening, and structure-based virtual screening. All theoretical concepts and algorithms presented are illustrated by practical applications and case studies.

The topics include molecular representations and similarity, ligand-based virtual screening (similarity search, QSAR, etc.) and structure-based virtual screening (Docking, physics-based models).

The lecture 'Vitamins in Heath and Disease' will give an overview over the history and applications of vitamins and their functions to preserve good health. The utility of vitamin supplementation during conditions of deficiencies, potential consequences of a latent deficiency as well as risks of over-supplementation will be discussed.

Students should learn about the importance of rational (= evidence-based) pharmacotherapy with herbal extracts and know which factors influence the quality of such medicinal products.

How are interesting development candidates identified. What are the strategies? What are the regulatory requirements (traditional use, well-established use, new herbal entities)? Determination of efficacy from (animal/human studies, biomarkers)

Student will learn how molecules can be represented in computers and how molecular similarity is calculated. They will learn the basics of computer-assisted drug design studies in medicinal chemistry projects. The concepts of ligand-based and structure-based virtual screening to identify potential drug candidates, and understand possibilities and limitations of computer-assisted drug design in pharmaceutical chemistry. As a result, they are prepared for professional assessment of computer-assisted drug design studies in medicinal chemistry projects.

The topics include molecular representations and similarity, ligand-based virtual screening (similarity search, QSAR, etc.) and structure-based virtual screening (Docking, physics-based models).

The lecture series provides an introduction to computer applications in medicinal chemistry. The topics cover molecular representations and similarity, ligand-based virtual screening, and structure-based virtual screening. All theoretical concepts and algorithms presented are illustrated by practical applications and case studies.
Students get acquainted with scientific working methods and deepen their knowledge in a particular research area.

Participants become familiar with state-of-the-art methodologies in a real-life computer-aided medicinal chemistry project. Participants work as small teams, perform literature research and discuss recent research findings. A seminar talk is to be given presenting the molecular design strategy chosen and the results obtained during the course.

The course offers the possibility for people with and without computational and or laboratory background to get an introduction into computer-assisted drug design, as well as practical training in a modern chemical laboratory. Using various software suites, the participants will computationally create and screen a virtual compound library for potential active small molecules. The process will involve an introduction to screening a virtual compound library, synthesizing candidate ligands, and biophysical testing against a pharmacologically important drug target.

The course is mandatory for all participants of the course "Computer-Assisted Drug Design" (535-0023-00 P).

The lecture is organized as a two-week block during the practical course "Computer-Assisted Drug Design" (535-0023-00 P), totalling 10 two-hour lectures. It provides an introduction to advanced drug design techniques and approaches emphasizing computer-assisted molecular design.

Participants learn about computational algorithms and advanced experimental approaches to drug discovery and design, including selected actual topics and practical applications. The contents of the lecture will allow for a deeper understanding of modern computer-assisted drug design methods and how they are linked to experimental applications. The main focus is on computational medicinal chemistry, so that participants will be able to use relevant computer-based methods in own research projects.

The number of participants is limited.

Kick-off meeting and confirmation of registration (Vorbesprechung und Platzvergabe): During the last lecture of the class "Computer-Assisted Drug Design" (535-0022-00).

Ideally, students interested in the course participated and successfully passed the lecture "Computer-Assisted Drug Design" (535-0022-00).

Research project familiarises students with scientific procedures and operational methodologies through supervised participation in current research work. The research group is chosen by the student.

Objective
Students get acquainted with scientific working methods and deepen their knowledge in a particular research area.

Prerequisites / notice
Prerequisite: Practical Methods in Pharmaceutical Sciences passed

Abstract
The internship takes place outside universities, the main locations being: pharmaceutical industry, consultancy, health and regulatory authorities and hospitals. Students experience the professional handling of questions in the field of pharmaceutical sciences through their own practical activities.

Objective
In an internship the students experience the professional handling of questions in the field of pharmaceutical sciences through their own practical activities and be able to implement the knowledge gained, by
• analysing problems in their complexity and developing solutions in a conceptual way,
• experiencing the aspects of an everyday working environment,
• acquiring key skills,
• establishing contacts for prospective careers.

Content
Work experience outside of university, duration of at least 12 weeks.

An internship agreement is set up between the student, the company and a member of the teaching staff of the Institute of Pharmaceutical Sciences.

At the end of the internship, the student draws up a formal report.

Abstract
The Consolidation Work consists of a literature work and provides an opportunity for the students to deeply investigate and consolidate their knowledge in a scientific or technical field of relevance to pharmaceutical sciences / the pharmaceutical industry.

Objective
• students develop their scientific reflection ("Critical Thinking") and independent working skills on a topic relevant to pharmaceutical sciences / the pharmaceutical industry
• students gain in-depth knowledge of the topic investigated
• students train their scientific writing skills

Content
The Consolidation Work consists of a literature work and provides an opportunity for the students to deeply investigate and consolidate their knowledge in a scientific or technical field of relevance to pharmaceutical sciences / the pharmaceutical industry. Students work alone on a topic of their choice over a time period of maximally 12 weeks and elaborate a written review article. Over this time, the student is loosely supervised by a lecturer of the Master Study Program.

Master's Thesis
Only students who fulfill the following criteria are allowed to begin with their master thesis:
- a. successful completion of the bachelor programme;
- b. fulfilling of any additional requirements necessary to gain admission to the master programme.

Abstract
In the Master thesis students prove their ability to independent, structured and scientific working. The Master thesis is usually carried out in a subject area of Pharmaceutical Sciences as chosen by the student.

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Introduction into the histology and anatomy of the human body, including the musculoskeletal, cardio-respiratory, digestive, endocrine, urinary, reproductive systems, as well as the nervous system and sensory organs.

Objective
Students acquire basic knowledge of the micro- and macro structure of the organ systems in the human body. They understand basic concepts of the relationship between structure and function, and - based on examples - of the relationship between structural changes and disease.

376-0173-AAL  Physiology I+II  E-  5 credits  11R  C. Spengler
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Principles of human physiology and clinical pathophysiology.

Objective
Understand the basic principles of human physiology and mechanisms of related clinical pathophysiology.

406-0603-AAL  Stochastics (Probability and Statistics)  E-  4 credits  9R  M. Kalisch
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Introduction to basic methods and fundamental concepts of statistics and probability theory for non-mathematicians. The concepts are presented on the basis of some descriptive examples. Learning the statistical program R for applying the acquired concepts will be a central theme.

Objective
The objective of this course is to build a solid fundament in probability and statistics. The student should understand some fundamental concepts and be able to apply these concepts to applications in the real world. Furthermore, the student should have a basic knowledge of the statistical programming language "R".

Content

**Abstract**

The lecture deals with a number of basic chemistry concepts. These include (amongst others) chemical reactions, energy transfer during chemical reactions, properties of ionic and covalent bonds, Lewis structures, properties of solutions, kinetics, thermodynamics, acid-base equilibria, electrochemistry, and properties of metal complexes.

**Objective**

The course is designed to provide an understanding of the basic principles and concepts of general and inorganic chemistry.

**Abstract**

The lecture provides an introduction to the basics of biochemistry and molecular biology as well as evolutionary principles. The focus is on bacteria and archaea under consideration of universal concepts.

**Objective**

Introduction to biochemistry, molecular biology and evolutionary principles.
The lecture introduces biology as an interdisciplinary science. Links to physics and chemistry will manifest as biological processes that operate within the laws of thermodynamics and are rooted in elements, molecules and chemical reactions. The transition from geochemistry to biochemistry is discussed and considered in relation to the origin of life. Evolutionary principles are introduced and resulting processes are used as a guiding principle. Unifying concepts in biology are presented, including the structure and function of cellular macromolecules and the ways in which hereditary information is encoded, decoded and replicated. Central principles of universal energy conversion are looked at, starting from redox processes and focusing on bacteria and archaea. Finally, biological processes are put into an ecosystems perspective.

The lecture is divided into different sections:
1. Geochemical perspectives on Earth and introduction to evolution
2. Building blocks of life
3. Macromolecules: Proteins
4. Membranes and transport across the plasma membrane
5. Universal mechanisms of inheritance, transcription and translation
6. Reaction Kinetics, binding equilibria and enzymatic catalysis
7. Essentials of Catabolism
8. Essentials of Anabolism
9. Metabolism and biogeochemical cycling of elements

The newly conceived lecture is supported by scripts.

Abstract
First identification with Pharmaceutical Sciences; motivation for profiling in the Natural Sciences, which are focused on within the first two years as a preparation for the specialized studies; sensitization for the duties and the responsibilities of a person with a federal diploma in Pharmacy; information about job opportunities.

Objective
First identification with Pharmaceutical Sciences; motivation for profiling in the Natural Sciences as a preparation for the specialized studies; sensitization for the duties and the responsibilities of a person with a federal diploma in Pharmacy; information about job opportunities.

Content
Introduction to Pharmaceutical Sciences by selected milestones of research and development. Overview on research activities at the Institute of Pharmaceutical Sciences that is focussed on drug delivery and development (from concepts to prototypes). Sensitization for communication skills and information management. Demonstration of job opportunities in community pharmacies, in the hospital, in industry, and in the public sector by experts in the different fields.

Lecture notes
Handouts for individual lectures.

Prerequisites / notice
Interactive teaching

401-0291-00L Mathematics I

Abstract
Mathematics I/II is an introduction to one- and multidimensional calculus and linear algebra emphasizing on applications.

Objective
Students understand mathematics as a language for modeling and as a tool for solving practical problems in natural sciences. Students can analyze models, describe solutions qualitatively or calculate them explicitly if need be. They can solve examples as well as their practical applications manually and using computer algebra systems.
## Eindimensionale diskrete Entwicklungen ##
- linear, exponentiell, begrenzt, logistisch
- Fixpunkte, diskrete Veränderungsrate
- Folgen und Grenzwerte

## Funktionen in einer Variablen ##
- Reproduktion, Fixpunkte
- Periodizität
- Stetigkeit

## Differentialrechnung (I) ##
- Veränderungsrate/-geschwindigkeit
- Differentialquotient und Ableitungsfunktion
- Anwendungen der Ableitungsfunktion

## Integralechnik (I) ##
- Stammfunktionen
- Integrationstechniken

## Gewöhnliche Differentialgleichungen (I) ##
- Qualitative Beschreibung an Beispielen:
  - Beschränkt, Logistisch, Gompertz
  - Stationäre Lösungen
  - Lineare DGL 1. Ordnung
  - Trennung der Variablen

## Lineare Algebra ##
- Erste Arithmetische Aspekte
- Matrizenrechnung
- Eigenwerte / -vektoren
- Quadratische LGS und Determinante

Lecture notes
In Ergänzung zu den Vorlesungskapiteln der Lehrveranstaltungen fassen wir wichtige Sachverhalte, Formeln und weitere Ausführungen jeweils in einem Vademecum zusammen.

Dabei gilt:
- Die Skripte ersetzen nicht die Vorlesung und/oder die Übungen!
- Ohne den Besuch der Lehrveranstaltungen verlieren die Ausführungen ihren Mehrwert.
- Details entwickeln wir in den Vorlesungen und den Übungen, um die hier bestehenden Lücken zu schliessen.
- Prüfungsrelevant ist, was wir in der Vorlesung und in den Übungen behandeln.

Abstract
Introduction to the concepts and tools in physics with the help of demonstration experiments: mechanics and elements of quantum mechanics

402-0073-00L Physics I O 3 credits 2V+2U T. M. Ihn

Objective
Students know and understand the basic ideas of the scientific description of nature. They understand the fundamental concepts and laws of mechanics and they are able to apply them in practical problems. They know the concepts of quantization and quantum numbers.

Content
1. Description of Motion
2. The laws of Newton
3. Work and energy
4. Collission problems
5. Wave properties of particles
6. The atomic structure of matter

Lecture notes
T. Ihn: Physics for Students in Biology and Pharmazeutical Sciences (unpublished lecture notes)

Literature
The lecture contains elements of:

Additional First Year Courses

Number | Title | Type | ECTS | Hours | Lecturers
--- | --- | --- | --- | --- | ---
535-1001-00L | Laboratory Course General Chemistry (for Biology and Pharmacy) | O | 6 credits | 8P | S. Gruber, J. Hall

Register in myStudies as early as possible, because the fire protection courses take place separately before the internship starts.

Abstract
Introduction to the practical work in a chemistry laboratory. The most important manipulations and techniques are treated, as well as the most fundamental chemical reaction types.

Objective
- Knowledge of the basic chemical laboratory methods
- Basic knowledge of the scientific approach in experimenting
- Observation and interpretation of chemical processes
- Keeping of a reliable laboratory journal

Content
- Simple chemical working techniques/methods
- Separation techniques
- Physical measurements: mass, volume, pH
- Ionic solids (salts)
- Acid/base chemistry, buffers
- Redox reactions
- Metal complexes
- Titration methods and quantitative spectrometry
- Introduction to qualitative analysis

Lecture notes
Course manual in German (is handed out to the students at the begin of the lessons)

Language: German. English upon request

Literature

Wiley

is a suitable textbook.

Prerequisites / notice
This practical course causes costs for materials and chemicals. The costs are charged to the students at the end of semester.

By enrolling in this lab course, students confirm that they will thoroughly study and follow all safety information and instructions and that they have an accident insurance valid for Switzerland for the entire duration of the semester.

Second Year Courses

Core Courses

Number | Title | Type | ECTS | Hours | Lecturers
--- | --- | --- | --- | --- | ---
252-0852-00L | Foundations of Computer Science | O | 4 credits | 2V+2U | M. Dahinden, L. E. Fässler

This course provides selected computer science concepts for interdisciplinary projects.

The following topics are covered: introduction to programming, sequence analysis, modeling and simulations, introduction matrices, managing data with with relational databases.
Objective

Students learn to...
- encode a problem into a program, test the program, and correct errors.
- understand and improve existing code.
- deal with the complexity of real data.
- store data in a suitable data structure.
- query databases and understand and evaluate the corresponding database model.
- implement models from the natural sciences as a simulation.
- run random experiments and interpret the results.
- explain and apply standard algorithms and evaluate their efficiency.

Content

1. Variables, data types
2. Control structures, logic
3. Sequential data types, search- and sort algorithms, sequence analysis
4. Functions, modules , simulation and animation
5. Manage data with a relational database
6. Matrices, random experiments, cellular automata

Statistics II

401-0643-13L

Abstract
Vertiefung von Statistikmethoden. Nach dem detaillierten Fundament aus Statistik I liegt nun der Fokus auf konzeptuellere Breite und

Objective
Nach diesem Kurs können Sie mit der Statistiksoftware R Daten einlesen, auf vielfältige Art verarbeiten und Grafiken für Berichte oder
Vorhänge exportieren. Sie verstehen die Konzepte von Methoden wie Linerare Regression (mit Faktoren, Interaktion, Modellwahl), ANOVA
(1-weg, 2-weg), Chi-Quadrat-Test, Fisher-Test, GLMs, Mixed Models, Clustering, PCA und können diese mit der Statistiksoftware R in der
Praxis umsetzen. Zudem kennen Sie die Grundprinzipien von gutem experimentellem Design und können bestehende Studien kritisch
hinterfragen.

Fundamentals of Biology III: Multicellularity

551-0127-00L

Abstract
The lecture conveys the fundamental concepts underlying multicellularity with an emphasis on the molecular basis of multicellular biological systems and their functional integration into coherent wholes. The structural and functional specialization in multicellular organisms will be discussed by highlighting common and specific functions in fungi, plants, and animals (including humans).

Objective
1. Students can describe advantages and challenges associated with being multicellular and outline independent solutions that organisms have developed to cope with the challenges of complex multicellularity.
2. Students can explain how the internal and external structures of fungi, plants and animals function to support survival, growth, behavior, and reproduction.
3. Students can explain the basic pathways and mechanisms of cellular communication regulating cellular behavior (cell adhesion, metabolism, proliferation, reproduction, development).
4. Students can describe how a single cell develops from one cell into many, each with different specialized functions.

Content
The lecture introduces the structural and functional specialization in fungi, plants and animals, including humans. After providing an overview on the diversity of eukaryotic organisms, the lecture will discuss how fungi, plants, animals and humans have evolved structures and strategies to cope with the challenges of multicellularity. The molecular basis underlying communication, coordination and differentiation will be conveyed and complemented by key aspects of reproduction, metabolism development, and regeneration. Topics include form and function of fungi and plants, human anatomy and physiology, metabolism, cell signaling, adhesion, stem cells, regeneration, reproduction, and development.

Literature
Campbell "Biology", 11th Edition

Prerequisites / notice
This course is based on application-oriented learning. The students spend most of their time working through projects with data from natural science and discussing their results with teaching assistants. To learn the computer science basics there are electronic tutorials available.

### Pharmaceutical Analytics I

**Abstract**

This course provides the basic concepts of pharmaceutical analytics in the context of pharmacopeial regulation by Ph. Eur and Ph. Helv.

**Objective**

- Summarize the structure of the Ph. Eur.
- Summarize the most important pharmacopeias and their commonalities and differences (USP, JP, Ph.Eur., Ph. Helv.)
- Discuss the structure of a monograph
- Explain qualification of instruments and validation of methods
- Explain and compare most important analytical techniques for pharmacies and pharmaceutical industry
- Knowledge in pharmaceutical analytics to fulfill regulatory requirements in pharmaceutical industry based on the pharmacopeia in force.
- Focus is set on method validation, equipment qualification, identification of functional groups and content determination of active pharmaceutical ingredients and excipients.

**Prerequisites / notice**

- SR 2013: 3 credits Analytical Chemistry or 3 credits of compulsory lectures 2nd year
- SR 2020: 3 credits Pharmazeutische Analytik I und II or 3 credits of compulsory lectures 2nd year

**Literature**

- Instrumentelle Analytik; G. Rücker, M. Neugebauer, G.G. Willems; Deutscher Apotheker Verlag, Stuttgart
- Arzneistoffanalyse; H. J. Roth, K. Eger, R. Troschütz; Deutscher Apotheker Verlag, Stuttgart
- Introduction to Pharmaceutical Chemical Analysis; S.H. Hansen, S. Pedersen-Bjergaard, K. Rasmussen; Wiley & Sons

**Abstract**

- Latest online enrolment is 10 days before the beginning of the semester.
- Students who did not pass the first-year examinations need the lecturers’ written permission to take this course.

**Objective**

- Learn the basic techniques for the preparation and purification of organic compounds.
- Learn to take accurate notes of the experiments and to write reports.
- Deepen the understanding of reaction mechanisms.
Content

Analytical part: basic operations for the separation of mixtures of organic compounds (recrystallization, distillation, extraction, chromatography).

Synthetic part (main part): at least 8 synthesis steps (one- to two-step preparations) from the following classes of reactions: 1. nucleophilic substitution at C(sp3), 2. elimination or electrophilic addition to a C=C bond, 3. electrophilic aromatic substitution, 4. reduction of an aldehyde/ketone, 5. Grignard reaction, 6. heterocyclization with imine/enamine formation, 7. synthesis of a carboxylic acid derivative by acyl group transfer, 8. aldol, Claisen, Mannich, Michael reaction or Robinson anellation.

Introduction to database searches (Reaxys, SciFinder).

Lecture notes

Written documents are distributed via Moodle course.

Literature

1) P. Wörfel, M. Bitzer, U. Claus, H. Felber, M. Hübel, B. Vollenweider, Laborpraxis (Bd. 1: Einführung, allgemeine Methoden; Bd. 2: Messmethoden; Bd. 3: Trennungsmethoden; Bd. 4: Analytische Methoden); Birkhäuser Verlag; Basel; 1990.

Prerequisites / notice

The basic reactions of Organic Chemistry and their mechanisms should be known and the corresponding exam have been passed (cf. course 529-1012-00L Organic Chemistry II for Students of Biology, Pharmaceutical Sciences, and Health Sci. and Tech.).

The prerequisite for participation is passing the ETH security exam.

By enrolling in this lab course, students confirm that they have thoroughly studied all safety information and will follow all instructions.

**535-0333-00L Pharmaceutical Biology**

**Abstract**
The structure and biosynthesis of plant constituents and the pharmacological effects and therapeutic applications of biogenic drugs of plant origin (extract-based herbal medicines; isolated natural products) are discussed. Areas of focus are (a) major biosynthetic pathways for plant-derived natural products, (b) pharmacological effects of herbal extracts, and (c) molecular mechanisms of action.

**Objective**
The understanding of the biosynthesis of plant-derived natural products. Acquisition of fundamental knowledge on the medical applications of important herbal medicines and of isolated natural products (general disease areas, molecular constituents of medicinal plants and herbal medicines in general, molecular constituents responsible for pharmacological activity, possible mechanisms of action, available clinical data to support medical use).

**Content**
The lecture is centered around the discussion of medicinal plants and herbal medicines and their common medical applications. The main areas addressed in the lecture are (a) the structure and biosynthesis of plant constituents (i.e. plant-derived natural products) and (b) the pharmacological effects and therapeutic applications of biogenic drugs of plant origin (herbal medicines based on plant extracts as well as isolated natural products). The basic pathways for the biosynthesis of the most important classes of plant-derived natural products are discussed in detail. Likewise, the molecular basis of the pharmacological effects of medicinal plant extracts (and derived herbal medicines) and their individual constituent components (isolated natural products) is broadly addressed. As part of this discussion the availability of clinical data (or lack thereof) to support specific clinical applications of herbal medicines will be repeatedly highlighted. Potential risks associated with the use of herbal medicines are discussed for selected cases.

The lecture is structured according to the major classes of natural products prevalent in medicinal plants and herbal medicines: Carbohydrates, lipids, terpenes, phenolic compounds, alkaloids, essential oils.

**Lecture notes**
Is provided in parts before each lecture (electronically as pdf) and also available on the Ilias platform via My Studies.

**Literature**
- There is no English translation of the above textbook (or any reasonably equivalent text). Students intending to take the exam for the course and are not sufficiently proficient in German should contact the lecturer before the start of the course.

**Prerequisites / notice**
Requirements: Lecture courses in basic organic chemistry, biochemistry, and biology

---

**535-0525-00L Pharmaceutical Cases**

**Abstract**
The course places the basic pharmaceutical knowledge acquired to date, particularly in pharmacology, in an applied therapeutic context and encourages interdisciplinary thinking in pharmacy. Weekly practical sessions present and discuss common pharmaceutical case studies that may arise in a pharmacist's daily work.

**Objective**
Students
- are able to independently analyse, present, explain, and discuss simple case studies from pharmacy practice based on their basic knowledge of pharmacy, particularly pharmacology.
- deepen their knowledge of therapeutic classes, drugs, and treatment guidelines.
- are able to analyse the pharmacological profiles of selected drugs in a therapeutic context (e.g., with regard to adverse drug reactions and interactions).
- are able to compare different drugs and derive therapy-relevant characteristics.

**Content**
Pharmaceutical case studies from different therapeutic fields comprehend following subject areas:
- Indication
- Dosage Form
- Adverse Drug Reactions
- Interactions
- Contraindications

**Lecture notes**
Is made available via Moodle.

**Prerequisites / notice**
The lecture Pharmacology and Toxicology I (535-0521-00L) must be attended in parallel to or prior to this course.

The course takes place weekly. For each lesson, group work is prepared and submitted in advance, presented by one group at a time, and discussed in plenary.
Gene Technology

**Abstract**
The course gives a description and summary of the field of gene technology and its pharmaceutical applications. The course focuses on important methods and technologies and their application for genomic, transcriptomic and proteomic analyses in human biology. The course gives an overview of current state-of-the-art and advancement in the fields of gene technology. Herein, the course focuses on genomic, transcriptomic and proteomic analysis and their uses in drug discovery and biomedical applications. The course is structured into lectures and practical examples drawn from the research field. Upon completion, the students are familiar and know current state-of-the-art of methods and applications, but are also able to classify, contrast and apply different strategies and methods within the field of gene technology. The course is suited for advanced undergraduate and early graduate students in pharmaceutical sciences or related fields.

**Content**

I) Genomics and transcriptomics

**Methods and Techniques:**
- Recombinant DNA technology
- Next generation sequencing methods, sequencing of genomes
- CRISPR technology
- Functional genomics/transcriptomics
- Principles of cancer, genetic diseases
- Therapies: cell-based therapies/gene therapies/DNA and RNA vaccination

**Application to human biology:**
- Functional genomics/transcriptomics

II) Proteomics

**Methods and Techniques:**
- Protein cloning and expression
- The antibody molecule
- Measurement and determination of biomolecular interactions
- Protein characterization and engineering
- Modifications and radioactive labelling
- Protein therapeutics
- Proteomic approaches for identification of novel disease-related targets and biomarkers

**Application to human biology:**
- Protein therapeutics
- Proteomic approaches for identification of novel disease-related targets and biomarkers

III) Drug discovery: Protein-based libraries

- Immune repertoire mining
- Display and selection technologies
  1. antibody phage display
  2. other polypeptide display technologies
  3. small-molecules display: DNA-encoded chemical libraries

**Lecture notes**
The lecture series follows the above-described content, and the students are provided with the lecture slides and additional notes. The additional notes are needed for the in-depth study of the individual topics, and to set the frame and content of the in-class group work of the chosen examples.

**Competencies**

- Subject-specific Competencies
  - Concepts and Theories
  - Techniques and Technologies
- Method-specific Competencies

**Clinical Microbiology**

**Abstract**
Thorough knowledge of major pathogens involved in infectious diseases; principles of laboratory diagnosis of pathogenic bacteria and fungi.

**Objective**
Thorough knowledge of all major pathogens involved in infectious diseases; principles of laboratory diagnosis of pathogenic bacteria and fungi.
Content
Basics and principles of clinical microbiology:
- host-pathogen interaction
- symptoms and diagnosis of major bacterial pathogens
- therapeutic regimens commonly used against bacterial disease
- major aspects of medical mycology, virology and parasitology
- epidemiology

Literature

Abstract
- Molecular imaging in drug development
- Radiopharmaceutical syntheses
- Knowledge of the physical principles of radioactivity
- Structure and function of radiopharmaceuticals
- Examples of application in diagnosis and therapy in humans

Objective
- The students know and are able to describe the different imaging procedures in medicine, especially PET and SPET.
- At the end of the lecture, the students are able to explain and describe the physical basics in connection with radioactivity and the different types of radioactive radiation that are relevant in radiopharmacy and nuclear medicine.
- The students know how radionuclides can be produced and extracted.
- The students can describe the structure and function of radiopharmaceuticals and are able to develop strategies for the design of new radiopharmaceuticals.
- The students know selected examples of clinically relevant radiopharmaceuticals and can explain the structure and mechanism of action.
- The students can discuss and apply the principles of internal dosimetry of systemically applied radiopharmaceuticals using selected examples.

Content
Introduction to molecular imaging, radioactive decay, radiation and radionuclides relevant in nuclear medicine.
Radionuclide generators
Radiopharmaceutical synthesis strategies
Heart, brain and tumour diagnostics with radiopharmaceuticals
Kinetic modelling with radiopharmaceuticals
Tumour therapy with radiopharmaceuticals
Dosimetry of radiopharmaceuticals
Practical aspect of nuclear medicine and radiopharmacy

Abstract
This two-semester lecture course provides a detailed understanding of the fundamentals of drug action and the therapeutic use of important classes of drugs. The lectures are intended for students of pharmaceutical sciences.

Objective
The lectures provide a comprehensive survey of pharmacology and toxicology. Special emphasis is placed on the interrelationship between pharmacological, pathophysiological and clinical aspects.

Content
Topics include disease-relevant macroscopic, microscopic, pathobiochemical and functional disturbances of specific organs and organ systems. The lectures integrate disease pathology with mechanisms of drug action, usage, metabolism, pharmacokinetics, side effects, toxicity, contraindications and dosage of relevant drugs. Basic principles of clinical pharmacology and pharmacotherapy will be covered.
A script is provided for each lecture. Scripts define important course contents but do not replace the lectures.

<td>Supplement to the parallel lecture in Medical Microbiology. Analysis of simulated clinical specimens using classical methods of Medical Microbiology (microscopy, culture etc.). Main aims are the detection and identification of bacterial, mycobacterial and mycolological pathogens as well as microbial susceptibility testing. Safe lab-technical handling is imperative, because pathogens of risk groups 1 and 2 are cultured. Therefore aseptic techniques need to be learned together with the basics in sterilization, disinfection and preservation. Basics of Bio-Safety. Simulated patient specimens representing ca. 50 realistically constructed cases are analysed. The students work in groups and gain insight into the procedures in a routine clinical microbiological laboratory. Using a scriptum, they learn how to identify pathogens and test them for antimicrobial susceptibility. As single groups can work only on a fraction of the cases, results and observations are shared by short presentations through all groups.</td>

Basic understanding and awareness of ethnopharmaceutical and ethnopharmacological issues and research. Knowledge of methods used in drug discovery from natural sources. Discussion of the issues around law and international treaties. Importance of ethnopharmaceutical knowledge for world health.

Content

Lecture notes
Handouts will be provided.

Literature

Prerequisites / notice
Prerequisites: Basic lectures in biology or biochemistry and pharmaceutical biology have been attended; not suitable for first semester students.
Vitamins are essential organic compounds that cannot be synthesized by an organism and hence, they have to be acquired from the diet.

The aim of this lecture is a critical examination of the students with the topic of "Vitamins in Health and Disease". The students will get an overview of vitamins, of their medical applications and the role of the pharmacist with "over-the-counter" products.
Deficiencies of particular vitamins result in specific diseases such as for example scurvy (vitamin C deficiency). Such disease patterns are usually easily recognized and facile to be treated. The clinical utility of supplementation concerns people with severe deficiencies and a risk of complications. Latent vitamin deficiencies might result in variable disorders and risks. As an example neurological disorders in elderly as a consequence of chronic lack of vitamin B12 should be mentioned. Subclinical deficiencies are often difficult to assess. However, these are exactly the cases where advice of a pharmacist is requested.

A large intake of vitamins by over-supplementation or food fortification might be dangerous (hypervitaminosis). This is in particular the case for fat-soluble vitamins or in the case of constant intake of high amounts of water-soluble vitamins over a long time period.

The lecture ‘Vitamins in Health and Disease’ will give an overview over the history and applications of vitamins and their functions to preserve good health. The utility of vitamin supplementation during conditions of deficiencies, potential consequences of a latent deficiency as well as risks of over-supplementation will be discussed.

Hand-outs will be distributed during the lecture (partly in English, partly in German).

The slides used for the lectures will be provided online.

Requirements: Basic knowledge in biochemistry and pharmacology. Ability to read and understand scientific publications in English.

Objective

Students gain basic knowledge in "pharmaceutical glycobiology". This implies knowing and understanding:
- major mechanisms underlying the roles of glycosylation for the biological/therapeutic actions of glycoproteins (glycosylation-function relationships) using prominent examples of glycoprotein drugs.
- the major types of protein-linked glycans and the biosynthetic pathways for their formation
- how glycoproteins are produced (including the most important expression systems used), glycoengineered and analysed (quality control).

Students are able to apply this knowledge in solving simple problems in glycoprotein drug development (on paper).

Students gain the ability to reflect on roles of glycosylation in various biological contexts.

Content

lecture plan:
1. Glycans - information carriers in biology and pharmacotherapy
2. Glucocerebrosidase and the biosynthesis of N-glycans
3. Improving the therapeutic profile of monoclonal antibodies by glycoengineering
4. Mucin-type O-glycans and sialylation as gCQA of glycoprotein hormone drugs
5. gCQA analysis of glycoprotein hormone drugs (sialylated glycoproteins)
6. EPO "the same but different"

Literature

- recent publications as cited/proposed on the lecture slides

Prerequisites / notice

Requirements: Basic knowledge in immunology, molecular biology, protein and carbohydrate chemistry, analytical techniques. Basic knowledge in pharmacology.

Competencies

535-0022-00L Computer-Assisted Drug Design

The lecture series provides an introduction to computer applications in medicinal chemistry. The topics cover molecular representations and similarity, ligand-based virtual screening, and structure-based virtual screening. All theoretical concepts and algorithms presented are illustrated by practical applications and case studies

The students will learn how molecules can be represented in computers and how molecular similarity is calculated. They will learn the concepts of ligand-based and structure-based virtual screening to identify potential drug candidates, and understand possibilities and limitations of computer-assisted drug design in pharmaceutical chemistry. As a result, they are prepared for professional assessment of computer-assisted drug design studies in medicinal chemistry projects.

The topics include molecular representations and similarity, ligand-based virtual screening (similarity search, QSAR, etc.) and structure-based virtual screening (docking, physics-based models).

535-0423-00L Drug Delivery and Drug Targeting

Abstract
The students gain an overview on current principles, methodologies and systems for controlled delivery and targeting of drugs. This enables the students to understand and evaluate the field in terms of scientific criteria.

Objective
The students dispose of an overview on current principles and systems for the controlled delivery and targeting of drugs. The focus of the course lies on developing a capacity to understand the involved technologies and methods, as well as an appreciation of the chances and constraints of their therapeutic usage, with prime attention on anticancer drugs, therapeutic peptides, proteins, nucleic acids and vaccines.

Content
The course covers the following topics: drug targeting and delivery principles, macromolecular drug carriers, liposomes, micelles, micro/nanoparticles, gels and implants, administration of vaccines, targeting at the gastrointestinal level, synthetic carriers for nucleic acid drugs, ophthalmic devices, novel trends in transdermal and nasal drug delivery and 3D printing of drug delivery systems.

Lecture notes
Selected lecture notes, documents and supporting material will be directly provided or may be downloaded from the course website.

376-0021-00L Materials and Mechanics in Medicine

Abstract
Understanding of physical and technical principles in biomechanics, biomaterials, tissue engineering as well as a historical perspective. Mathematical description and problem solving. Knowledge of biomedical engineering applications in research and clinical practice.

Objective
Understanding of physical and technical principles in biomechanics, biomaterials, tissue engineering, Mathematical description and problem solving. Knowledge of biomedical engineering applications in research and clinical practice.

Content
Biomaterials, Tissue Engineering, Tissue Biomechanics, Implants.

Lecture notes
course website on Moodle

Literature

376-1305-00L Development of the Nervous System (University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: BIO344

Mind the enrolment deadlines at UZH: https://www.uzh.ch/cmsssl/en/studies/application/deadlines.html

Abstract
The lecture will cover molecular and cellular processes underlying the development of the nervous system (neurogenesis, cell death, cell migration and differentiation, axon guidance and synapse formation). The importance of these processes in the context of developmental diseases is discussed.
Objective

On successful completion of the module the student should be able to
- relate structure and function of the nervous system to its development
- apply principles of molecular, cellular, and developmental biology to the development of the nervous system
- identify key steps in development underlying neurological syndromes and diseases

Key skills
On successful completion of the module the student should be able to
- interpret and critically evaluate original research reports
- apply knowledge and relate experimental approaches from molecular, cellular and developmental biology to the developing nervous system.

Content

The lecture will cover molecular and cellular processes underlying the development of the nervous system. After an introduction to structure and function of the nervous system, we will discuss neurogenesis, cell death, cell migration and differentiation, axon guidance and synapse formation. The importance of these processes in the context of developmental diseases will be discussed.

Lecture notes

Must be downloaded from OLAT: https://www.olat.uzh.ch/olat/dmz/assBC0344

Literature

The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on OLAT.

Prerequisites

BIO142 Developmental Biology, BIO143 Neurobiology

---

**376-1305-01L Molecular Neurophysiology: From Molecules to Systems**

*Information for UZH students: Enrolment to this course unit only possible at ETH. Please mind the ETH enrolment deadlines for UZH students: https://ethz.ch/en/studies/non-degree-courses/special-students-special-students-university-of-zurich.html*

**Abstract**
The course covers the physiology of nerve cells, from the single cell through the neuronal network to the systemic level. The focus is on molecular and cellular mechanisms – synaptic transmission, signal transduction, gene expression, synaptic plasticity. Afterwards, their significance for selected neurophysiological processes (learning/memory, sleep, sensory) will be illuminated.

**Objective**
Based on an understanding of molecular and cellular mechanisms, the aim is to provide a deepened insight into neurophysiological processes underlying complex brain functions – learning/memory, sleep, sensory.

**Competencies**

Subject-specific Competencies: Concepts and Theories

- Analytical Competencies: assessed

**Literature**
The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on Moodle.

**376-1714-00L Biocompatible Materials**

*W 4 credits 3V K. Manirua, M. Rottmar, M. Zenobi-Wong*

**Abstract**
Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.

**Objective**
The course covers the following topics:
1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
2. The concept of biocompatibility.
3. Introduction into methodology used in biomaterials research and application.
4. Introduction to different material classes in use for medical applications.

**Content**
Introduction into natural and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering, drug delivery and for medical devices are introduced.

Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated.

Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed.

A link between academic research and industrial entrepreneurship is demonstrated by external guest speakers, who present their current research topics.

**Lecture notes/Literature**
Handouts are deposited online (moodle).

(available online via ETH library)

**551-0313-00L Microbiology (Part I)**

*W 3 credits 2V W.-D. Hardt, L. Eberl, B. Nguyen, J. Piel, M. Pilhofer, A. Vagstad*

**Abstract**
Advanced lecture class providing a broad overview on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

**Objective**
This concept class will be based on common concepts and introduce to the enormous diversity among bacteria and archaea. It will cover the current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

**Content**
Advanced class covering the state of the research in bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

**Lecture notes/Literature**
Updated handouts will be provided during the class.

**Prerequisites / notice**
English

The lecture "Grundlagen der Biologie II: Mikrobiologie" is the basis for this advanced lecture.

**551-0319-00L Cellular Biochemistry (Part I)**

*W 3 credits 2V U. Kutay, F. Allain, T. Kleele, I. Zemp*

**Abstract**
Advanced lecture class providing a broad overview on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

**Objective**
This concept class will be based on common concepts and introduce to the enormous diversity among bacteria and archaea. It will cover the current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

**Content**
Advanced class covering the state of the research in bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

**Lecture notes/Literature**
Updated handouts will be provided during the class.

**Prerequisites / notice**
English

The lecture "Grundlagen der Biologie II: Mikrobiologie" is the basis for this advanced lecture.
Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

The lecture offers insights into the fundamentals and applications of Food Microbiology. Contents include basic microbiology of the different bacteria, yeasts and molds present in foods, as well as the occurrence and control of foodborne pathogens and spoilage organisms.

The focus of this first part of the two part lecture (Food Micro II is offered in the FS) will be on the organisms, but also on the factors which determine spoilage and foodborne disease.

The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

Food Microbiology I

This lecture is the first part of a one-year course. It offers insights into the fundamentals and applications of Food Microbiology. Contents include basic microbiology of the different bacteria, yeasts and molds present in foods, as well as the occurrence and control of foodborne pathogens and spoilage organisms.

The lectures Food Chemistry I and Food Chemistry II constitute a unit.

The lectures Food Chemistry I and Food Chemistry II constitute a unit.
Communication assessed

Molecular biology of infectious foodborne pathogens (Listeria, E. coli, Campylobacter, Salmonella, etc) and toxin-producing organisms assessed

Detailed and current status of research and insights into the molecular basis of foodborne diseases, with focus on interactions of the

Handouts will be made available.

This lecture deals with the basic principles of injury mechanics and rehabilitation. Mechanisms that can possibly result in injury. Investigating the background and cause of injury should allow you to assess the injury risk for sports activities. Furthermore you should be able to develop measures to prevent such injury.

Furthermore possibilities to prevent injuries are discussed. Thereby the lecture focuses on sports injuries.

Within the scope of this lecture you will learn the basic principles of trauma biomechanics. Based on examples from sports, you will get to know different mechanisms that can possibly result in injury. Investigating the background and cause of injury should allow you to assess the injury risk for sports activities. Furthermore you should be able to develop measures to prevent such injury.

Furthermore you should be able to develop measures to prevent such injury. Last, but not least, the role of

Work? How is the interaction between the human host and the microbial pathogen? What are the roles of food and the environment? What can be done to interfere with the potential risks? Which methods are best suited for what approach? Last, but not least, the role of bacteriophages in microbial pathogenicity will be highlighted, in addition to various applications of bacteriophage for both diagnostics and antimicrobial intervention.

Recommendations will be given in the first lecture.

Recommendations will be given in the first lecture.

376-2017-00L Biomechanics of Sports Injuries and Rehabilitation W 3 credits 2V K.-U. Schmitt, J. Goldhahn

Abstract

This lectures introduces the basic principles of injury mechanics and rehabilitation focussing on sports injuries.

Objective

Within the scope of this lecture you will learn the basic principles of trauma biomechanics. Based on examples from sports, you will get to know different mechanisms that can possibly result in injury. Investigating the background and cause of injury should allow you to assess the injury risk for sports activities. Furthermore you should be able to develop measures to prevent such injury.

Content

This lecture deals with the basic principles of injury mechanics and rehabilitation. Mechanisms that can result in injury are presented. Furthermore possibilities to prevent injuries are discussed. Thereby the lecture focuses on sports injuries.

Lecture notes

Handouts will be made available.

Prerequisites / notice

A course work is required. The mark of this course work contributes to the final credits for this lecture. Details will be given during the first lecture.

752-4009-00L Molecular Biology of Foodborne Pathogens W 3 credits 2V M. Loessner, A. Harms, M. Schmelcher, M. Schuppler, E. Slack

Abstract

The course offers detailed information on selected foodborne pathogens and toxin producing organisms; the focus lies on relevant molecular biological aspects of pathogenicity and virulence, as well as on the occurrence and survival of these organisms in foods.

Objective

Detailed and current status of research and insights into the molecular basis of foodborne diseases, with focus on interactions of the microorganism or the toxins they produce with the human system. Understanding the relationship between specific types of food and the associated pathogens and microbial risks. Another focus lies on the currently available methods and techniques useful for the various purposes, i.e., detection, differentiation (typing), and antimicrobial agents.

Content

Molecular biology of infectious foodborne pathogens (Listeria, E. coli, Campylobacter, Salmonella, etc) and toxin-producing organisms (Bacillus, Clostridium, Staphylococcus). How and under which conditions will toxins and virulence factors be produced, and how do they work? How is the interaction between the human host and the microbial pathogen? What are the roles of food and the environment? What can be done to interfere with the potential risks? Which methods are best suited for what approach? Last, but not least, the role of bacteriophages in microbial pathogenicity will be highlighted, in addition to various applications of bacteriophage for both diagnostics and antimicrobial intervention.

Lecture notes

Electronic copies of the presentation slides (PDF) and additional material will be made available for download to registered students.

Literature

Recommendations will be given in the first lecture.
### Prerequisites / notice

Lectures (2 hours) will be held as a single session of approximately 60+ minutes (10:15 until approx. 11:15 h), without a break!

### Competencies

**Subject-specific Competencies**
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

**Method-specific Competencies**
- Analytical Competencies: assessed
- Decision-making: fostered
- Problem-solving: assessed

- Creative Thinking: fostered
- Critical Thinking: fostered

### 752-6101-00L Nutrition and Chronic Disease

**ECTS**: 3 credits  
**Lecturers**: F. von Meyenn, M. Andersson

**Abstract**
To have the student gain understanding of the links between the diet and the etiology and progression of chronic diseases, including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

**Objective**
To examine and understand the protective effect of foods and food ingredients in the maintenance of health and the prevention of chronic disease, as well as the progression of complications of the chronic diseases.

**Content**
The course evaluates food and food ingredients in relation to primary and secondary prevention of chronic diseases including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

**Lecture notes**
There is no script. Powerpoint presentations will be made available on-line to students.

**Literature**
To be provided by the individual lecturers, at their discretion.

**Prerequisites / notice**
No compulsory prerequisites, but prior completion of the courses "Introduction to Nutritional Science" and "Advanced Topics in Nutritional Science" is strongly advised.

---

### 752-6105-00L Epidemiology and Prevention

**ECTS**: 3 credits  
**Lecturers**: M. Puhan, R. Heusser

**Abstract**
The module Epidemiology and prevention describes the process of scientific discovery from the detection of a disease and its causes, to the development and evaluation of preventive and treatment interventions and to improved population health.

**Objective**
The overall goal of the course is to introduce students to epidemiological thinking and methods, which are critical pillars for medical and public health research. Students will also become aware on how epidemiological facts are used in prevention, practice and politics.

**Content**
The module Epidemiology and prevention follows an overall framework that describes the course of scientific discovery from the detection of a disease to the development of prevention and treatment interventions and their evaluation in clinical trials and real world settings. We will discuss study designs in the context of existing knowledge and the type of evidence needed to advance knowledge. Examples from nutrition, chronic and infectious diseases will be used in order to show the underlying concepts and methods.

### 752-5001-00L Food Biotechnology

**ECTS**: 3 credits  
**Lecturers**: N. Bokulich, A. Greppi, B. Pugin

**Abstract**
Biotechnology is the use of living organisms (or their products) to produce valuable substances or to perform specific services. In this course, you will learn about diverse applications of biotechnology in food and ingredient production, with a focus on microbial biotechnologies.

**Objective**
In this course you will explore the roles and potential of biotechnology in food production past, present, and future, with a focus on microbial biotechnologies. At the end of this course, you will be able to identify the microorganisms and biotechnologies currently implemented in food and food ingredient production and independently evaluate the potential of biotechnological solutions to current and future food challenges.

**Content**
The course will cover diverse topics in modern food biotechnology, including:
- food fermentation (arguably the world's oldest biotechnology)  
- the taxonomy and metabolism of microorganisms used in food production  
- microbial and fermentation kinetics  
- bioreactors for food and ingredient production  
- biopreservation  
- molecular diagnostics  
- safety and regulation of biotechnological ingredients in food production.
At the end of this course, you will be able to identify beneficial/detrimental bacteria associated with food products, execute basic bioinformatic analysis (DNA-based) to identify them, explain the main production (upstream) and purification (downstream) processes of food-relevant microorganisms and ingredients, calculate microbial kinetic parameters, connect key metabolic features with specific application in the food industry (e.g. biopreservation), and understand the general legislation (EU/CH) regarding the use of microorganisms in food.

Data: 26.07.2024 12:39  
Autumn Semester 2024  
Page 2002 of 2680
Content
Introduction into ethnopharmacy and related disciplines; definitions of terms, working methods, research projects, bioprospecting. Traditional medicinal plants of different cultures and their role in modern Western medicine (rational application of traditional uses). Historical data as sources for drug research. Today's "fashion plants." Empirical, traditional knowledge versus Evidence Based Medicine. The role of biodiversity (CBD, Rio 1992; Nagoya, 2010) and problems associated with drug discovery from natural products. Screening strategies for drug discovery (random screening versus screening based on cultural, ecological, ethnopharmacological, chemotaxonomic criteria). Traditional knowledge in relation to the fight against malaria and its implementation in research, product development and development cooperation. Introduction to and selected examples of herbal drugs and poisons, mode of action, and their ethnopharmacological importance. Critical analysis of bioprospecting as a drug discovery strategy.

**535-0015-00L History of Pharmacy**

**W 1 credit 1V**

**S. Ruppen**

**Abstract**
In the lecture, basic knowledge of the history of pharmacy is imparted, taking into account the various historical epochs.

**Objective**
After attending the lecture, the students are able to name significant events in the development of the pharmacy profession, pharmacy and medicines and to place them in a temporal context. They can list sources for working on questions from the history of pharmacy and evaluate their advantages and disadvantages. This enables them to confidently describe the importance of pharmacy as an independent, supporting pillar of the health system, the history of which has many interfaces with medicine, science, social and cultural history.

**Content**
The lecture conveys knowledge about the development of the pharmacist profession from ancient times to the present. Some pharmacists who made significant contributions to pharmacy are presented in more detail and their significance for today's pharmacy is discussed. The social position of pharmacists in society and the legal conditions in different epochs are also discussed. It explains what influence the pharmacists had on the development of the pharmaceuticals, but again the pharmaceuticals on the development of the pharmacists. For this purpose, it is shown how much the meaning, the nature, the type and the composition of pharmaceuticals and the knowledge about them changed over time.

**Literature**
Wird in der ersten Veranstaltung mitgeteilt.

**Prerequisites / notice**
An interest in the history of pharmacy, the pharmacy profession, and medicines is an asset.

**535-0360-00L Evidence Based Phytotherapy**

**W 1 credit 1V**

**K. Berger Büter; S. Nicolussi**

**Abstract**
Based on epidemiology, economic importance and evidence-based medicine, basic principles of rational phytotherapy will be discussed: a) Identification of drug candidates, b) registration requirements, c) criteria to assess efficacy, d) biomarkers and pharmacokinetics, e) safety and f) principles of extract generation. Important prototypes will be discussed.

**Objective**
Content and aim of the lecture:
Students should learn about the importance of rational (= evidence-based) pharmacotherapy with herbal extracts and know which factors influence the quality of such medicinal products.

The following topics are covered:

- How are interesting development candidates identified. What are the strategies?
- What are the regulatory requirements (traditional use, well-established use, new herbal entities)?
- Determination of efficacy from (animal/human studies, biomarkers)
- Quality of clinical studies
- Pharmacokinetics of phytopharmaceuticals
- Safety (toxicity, adverse effects, interactions)
- Pharmaceutical quality
- Varietal purity (wild collections, cultivation)
- Influence of genetic variability on extract quality
- Ensuring consistent quality
- Which extraction methods?

The topics are explained and critically discussed using various phytopharmaceuticals as examples (see programme below).

**535-0021-00L Vitamins in Health and Disease**

**W** 1 credit 1V C. Müller

**Abstract**

Vitamins are essential organic compounds that cannot be synthesized by an organism and hence, they have to be acquired from the diet. This lecture will give an overview about the application of vitamins in health and disease.

**Objective**

The aim of this lecture is a critical examination of the students with the topic of "Vitamins in Health and Disease". The students will get an overview of vitamins, of their medical applications and the role of the pharmacist with "over-the-counter" products.

**Content**

Deficiencies of particular vitamins result in specific diseases such as for example scurvy (vitamin C deficiency). Such disease patterns are usually easily recognized and facile to be treated. The clinical utility of supplementation concerns people with severe deficiencies and a risk of complications. Latent vitamin deficiencies might result in variable disorders and risks. As an example neurological disorders in elderly as a consequence of chronic lack of vitamin B12 should be mentioned. Subclinical deficiencies are often difficult to assess. However, these are exactly the cases where advice of a pharmacist is requested.

A large intake of vitamins by over-supplementation or food fortification might be dangerous (hypervitaminosis). This is in particular the case for fat-soluble vitamins or in the case of constant intake of high amounts of water-soluble vitamins over a long time period.

The lecture 'Vitamins in Health and Disease' will give an overview over the history and applications of vitamins and their functions to preserve good health. The utility of vitamin supplementation during conditions of deficiencies, potential consequences of a latent deficiency as well as risks of over-supplementation will be discussed.

**Lecture notes**

Hand-outs will be distributed during the lecture (partly in English, partly in German).

**Literature**

Book recommendation: reference books:
- Handbuch Nährstoffe, Burgerstein, Trias Verlag ISBN 978-3-8304-6071-8

Prerequisites / notice

Requirements: Basic knowledge in biochemistry and pharmacology. Ability to read and understand scientific publications in English.

**535-0250-00L Biotransformation of Drugs and Xenobiotics**

**W** 1 credit 1V S.-D. Krämer

**Abstract**

Knowledge of the major reactions of biotransformation in drug therapy, prediction of possible metabolites of drugs and xenobiotics, recognition of structure elements and reactions which can lead to toxic metabolites. Knowledge of inter- and intraindividual factors influencing metabolism.

**Objective**

Goals: knowledge of the major reactions of biotransformation in drug therapy, prediction of possible metabolites of drugs and xenobiotics, recognition of structure elements and reactions which can lead to toxic metabolites. Knowledge of inter- and intraindividual factors influencing metabolism.

**Content**

Major reactions of biotransformation. Major enzymes and reaction partners involved in the biotransformation of drugs and xenobiotics. Toxic reactions of metabolites. Factors which affect the biotransformation.

**Lecture notes**

Biotransformation of drugs and xenobiotics

**Literature**

**535-0310-00L Glycobiology in Drug Development**

**W** 1 credit 1V V. I. Otto

**Abstract**

Protein-based drugs constitute around 25% of new approvals and most of them are glycoproteins. Using selected examples of prominent glycoprotein drugs, the course aims at providing insight into glycosylation-activity relationships and into biotechnological production and analytics.

**Objective**

Students gain basic knowledge in "pharmaceutical glycobiology". This implies knowing and understanding:
- major mechanisms underlying the roles of glycosylation for the biological/therapeutic actions of glycoproteins (glycosylation-function relationships) using prominent examples of glycoprotein drugs.
- the major types of protein-linked glycans and the biosynthetic pathways for their formation
- how glycoprotein drugs are produced (including the most important expression systems used), glycoengineered and analysed (quality control).

Students are able to apply this knowledge in solving simple problems in glycoprotein drug development (on paper).

Students gain the ability to reflect on roles of glycosylation in various biological contexts.

**Content**

- lecture plan:
  1. Glycans - information carriers in biology and pharmacotherapy
  2. Glucocerebrosidase and the biosynthesis of N-glycans
  3. Improving the therapeutic profile of monoclonal antibodies by glycoengineering
  4. Mucin-type O-glycans and sialylation as gCQA of glycoprotein hormone drugs
  5. gCQA analysis of glycoprotein hormone drugs (sialylated glycoproteins)
  6. EPO "the same but different"

**Lecture notes**

The slides used for the lectures will be provided online

**Literature**

- recent publications as cited/proposed on the lecture slides

**Prerequisites / notice**

Requirements: Basic knowledge in immunology, molecular biology, protein and carbohydrate chemistry, analytical techniques. Basic knowledge in pharmacology.
The topics include molecular representations and similarity, ligand-based virtual screening (similarity search, QSAR, etc.) and structure-based virtual screening. All theoretical concepts and algorithms presented are illustrated by practical applications and case studies.

Lecture notes
Selected lecture notes, documents and supporting material will be directly provided or may be downloaded from the course website.

Literature

Further references will be provided in the course.

535-0423-00L Drug Delivery and Drug Targeting

Abstract
The students gain an overview on current principles, methodologies and systems for controlled delivery and targeting of drugs. This enables the students to understand and evaluate the field in terms of scientific criteria.

Objective
The students develop an overview of current principles and systems for the controlled delivery and targeting of drugs. The focus of the course lies on developing a capacity to understand the involved technologies and methods, as well as an appreciation of the chances and constraints of their therapeutic usage, with prime attention on anticancer drugs, therapeutic peptides, proteins, nucleic acids and vaccines.

Content
The course covers the following topics: drug targeting and delivery principles, macromolecular drug carriers, liposomes, micelles, micro/nanoparticles, gels and implants, administration of vaccines, targeting at the gastrointestinal level, synthetic carriers for nucleic acid drugs, ophthalmic devices, novel trends in transdermal and nasal drug delivery and 3D printing of drug delivery systems.

Requirements: basic knowledge in Medicinal Chemistry and Pharmacology. Ability to read and understand scientific publications written in English.

Lecture notes
Lecture slides and literature for reading and discussions will be available online.

### Materials and Mechanics in Medicine

- **W**
- **3G**
- **M. Zenobi-Wong, J. G. Snedeker**

### Objective

Understanding of physical and technical principles in biomechanics, biomaterials, and tissue engineering as well as a historical perspective. Mathematical description and problem solving. Knowledge of biomedical engineering applications in research and clinical practice.

### Content

Biomaterials, Tissue Engineering, Tissue Biomechanics, Implants.

### Lecture notes

- course website on Moodle

### Literature

- Academic Press

### Development of the Nervous System (University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

**UZH Module Code: BIO344**

Mind the enrolment deadlines at UZH:

https://www.uzh.ch/cmsssl/en/studies/application/deadline.s.html

### Abstract

The lecture will cover molecular and cellular processes underlying the development of the nervous system (neurogenesis, cell death, cell migration and differentiation, axon guidance and synapse formation). The importance of these processes in the context of developmental diseases is discussed.

### Objective

On successful completion of the module the student should be able to:

- relate structure and function of the nervous system to its development - apply principles of molecular, cellular, and developmental biology to the development of the nervous system - identify key steps in development underlying neurological syndromes and diseases

### Key skills

On successful completion of the module the student should be able to:

- interpret and critically evaluate original research reports - apply knowledge and relate experimental approaches from molecular, cellular and developmental biology to the developing nervous system.

### Content

The lecture will cover molecular and cellular processes underlying the development of the nervous system. After an introduction to structure and function of the nervous system, we will discuss neurogenesis, cell death, cell migration and differentiation, axon guidance and synapse formation. The importance of these processes in the context of developmental diseases will be discussed.

### Lecture notes

Must be downloaded from OLAT: https://www.olat.uzh.ch/olat/dmz/as BIO344

### Literature

The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on OLAT.

### Prerequisites / notice

BIO142 Developmental Biology, BIO143 Neurobiology

### Molecular Neurophysiology: From Molecules to Systems

**W**

**3 credits**

**2V**

University lecturers

### Objective

On successful completion of the module the student should be able to:

- apply knowledge and relate experimental approaches from molecular, cellular and developmental biology to the developing nervous system.

### Content

The lecture will cover molecular and cellular processes underlying the development of the nervous system. After an introduction to structure and function of the nervous system, we will discuss neurogenesis, cell death, cell migration and differentiation, axon guidance and synapse formation. The importance of these processes in the context of developmental diseases is discussed.

### Literature

- Mind the enrolment deadlines at UZH:

### Notice

- The course covers the physiology of nerve cells, from the single cell through the neuronal network to the systemic level. The focus is on molecular and cellular mechanisms – synaptic transmission, signal transduction, gene expression, synaptic plasticity.

### Objective

Based on an understanding of molecular and cellular mechanisms, the aim is to provide a deepened insight into neurophysiological processes underlying complex brain functions – learning/memory, sleep, sensory.

### Content

First, basic molecular and cellular mechanisms in nerve cells (excitability, neurotransmission, signal transduction, gene expression, synaptic plasticity) are introduced. Afterwards, their significance for selected neurophysiological processes (learning/memory, sleep, sensory) will be illuminated.

### Literature

The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on Moodle.

**Abstract**

Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.

**Objective**

The course covers the following topics:

1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
2. The concept of biocompatibility.
3. Introduction into methodology used in biomaterials research and application.
4. Introduction to different material classes in use for medical applications.

**Content**

Introduction into natural and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering, drug delivery and for medical devices are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated.

Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed.

A link between academic research and industrial entrepreneurship is demonstrated by external guest speakers, who present their current research topics.

**Lecture notes**

Handouts are deposited online (moodle).

**Abstract**

Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

**Objective**

The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

**Content**

Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

**Lecture notes**

Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

**Literature**

Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

**Abstract**

Descriptive chemistry of food constituents (focus on structure-function relationships).

Reactions which affect the colour, flavour, texture, and the nutritional value of food raw materials and food products during processing, storage and preparation in a positive or in a negative way (lipid oxidation, Maillard reaction, enzymatic browning).

**Objective**

Be able to draw chemical structures of the main ingredients, recognize functional groups in the structures and explain their properties.

Understand foods as complex systems and be able to make connections between chemical structures, chemical reactions and their influence on quality.

Recognize chemical reactions of lipid oxidation, Maillard reaction and enzymatic reactions and be able to formulate them themselves.

**Content**

Descriptive chemistry of food constituents (focus on structure-function relationships).

Reactions which affect the colour, flavour, texture, and the nutritional value of food raw materials and food products during processing, storage and preparation in a positive or in a negative way (lipid oxidation, Maillard reaction, enzymatic browning).

Links to food analysis, food processing, and nutrition.

**Topics:**

- Lipid oxidation, Maillard reaction, structural proteins/enzymes
- Food as complex systems
- Chemical reactions and reaction mechanisms
- Selected (possibly changing) food chemistry topics (e.g. sweeteners, polysaccharides, from olive to margarine, etc.)

**Lecture notes**

The lectures Food Chemistry I and Food Chemistry II constitute a unit.

The lectures are supplemented with handouts.
Abstract
This lecture introduces the basic principles of injury mechanics and rehabilitation focussing on sports injuries.

Objective
Within the scope of this lecture you will learn the basic principles of trauma biomechanics. Based on examples from sports, you will get to know different mechanisms that can possibly result in injury. Investigating the background and cause of injury should allow you to assess the injury risk for sports activities. Furthermore you should be able to develop measures to prevent such injury.

Content
This lecture deals with the basic principles of injury mechanics and rehabilitation. Mechanisms that can result in injury are presented. Furthermore possibilities to prevent injuries are discussed. Thereby the lecture focuses on sports injuries.

Lecture notes
Handouts will be made available.

Literature

Prerequisites / notice
A course work is required. The mark of this course work contributes to the final credits for this lecture. Details will be given during the first lecture.

752-4005-00L Food Microbiology I W 3 credits 2V M. Loessner, A. Harms

Abstract
The lecture offers insights into the fundamentals and applications of Food Microbiology. Contents include basic microbiology of the different bacteria, yeasts, and molds present in foods, as well as the occurrence and control of foodborne pathogens and spoilage organisms. The focus of this first part of the two part lecture (Food Micro II is offered in the FS) will be on the organisms, but also on the factors which determine spoilage and foodborne disease.

Content
1. History of Food Microbiology
   1.1. Short synopsis of foodborne microorganisms
   1.2. Spoilage of Foods
   1.3. Foodborne Disease
   1.4. Food Preservation
   1.5. VIP's of Food Microbiology
2. Overview of Microorganisms in Foods
   2.1. Origin of foodborne Microorganisms
   2.2. Bacteria
   2.3. Yeasts
   2.4. Molds
3. Microbial Spoilage of Foods
   3.1. Intrinsic and Extrinsic Parameters
   3.2. Meats, Seafoods, Eggs
   3.3. Milk and Milk Products
   3.4. Vegetable and Fruit Products
   3.5. Miscellaneous (baked goods, nuts, spices, ready-to-eat products)
   3.6. Drinks and Canned Foods
4. Foodborne Disease
   4.1. Significance and Transmission of Foodborne pathogens
   4.2. Staphylococcus aureus
   4.3. Gram-positive Sporeformers (Bacillus & Clostridium)
   4.4. Listeria monocytogenes
   4.5. Salmonella, Shigella, Escherichia coli
   4.6. Vibrio, Yersinia, Campylobacter
   4.7. Brucella, Mycobacterium
   4.8. Parasites
   4.9. Viruses and Bacteriophages
   4.10. Mycotoxins
   4.11. Bioactive Amines
   4.12. Miscellaneous (Antibiotic-resistant Bacteria, Biofilms)

Lecture notes
Electronic copies of the presentation slides (PDF) and additional material will be made available for download.

Literature
Recommendations will be given in the first lecture.

752-4009-00L Molecular Biology of Foodborne Pathogens W 3 credits 2V M. Loessner, A. Harms
Abstract
The course offers detailed information on selected foodborne pathogens and toxin producing organisms; the focus lies on relevant molecular biological aspects of pathogenicity and virulence, as well as on the occurrence and survival of these organisms in foods.

Objective
Detailed and current status of research and insights into the molecular basis of foodborne diseases, with focus on interactions of the microorganism or the toxins they produce with the human system. Understanding the relationship between specific types of food and the associated pathogens and microbial risks. Another focus lies on the currently available methods and techniques useful for the various purposes, i.e., detection, differentiation (typing), and antimicrobial agents.

Content
Molecular biology of infectious foodborne pathogens (Listeria, E. coli, Campylobacter, Salmonella, etc) and toxin-producing organisms (Bacillus, Clostridium, Staphylococcus). How and under which conditions will toxins and virulence factors be produced, and how do they work? How is the interaction between the human host and the microbial pathogen? What are the roles of food and the environment? What can be done to interfere with the potential risks? Which methods are best suited for what approach? Last, but not least, the role of bacteriophages in microbial pathogenicity will be highlighted, in addition to various applications of bacteriophage for both diagnostics and antimicrobial intervention.

Lecture notes
Electronic copies of the presentation slides (PDF) and additional material will be made available for download to registered students.

Prerequisites / notice
Lectures (2 hours) will be held as a single session of approximately 60+ minutes (10:15 until approx. 11:15 h), without a break!

752-6101-00L Nutrition and Chronic Disease

Abstract
To have the student gain understanding of the links between the diet and the etiology and progression of chronic diseases, including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

Objective
To examine and understand the protective effect of foods and food ingredients in the maintenance of health and the prevention of chronic disease, as well as the progression of complications of the chronic diseases.

Content
The course evaluates food and food ingredients in relation to primary and secondary prevention of chronic diseases including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

Lecture notes
There is no script. Powerpoint presentations will be made available on-line to students.

Literature
To be provided by the individual lecturers, at their discretion.

Prerequisites / notice
No compulsory prerequisites, but prior completion of the courses "Introduction to Nutritional Science" and "Advanced Topics in Nutritional Science" is strongly advised.

752-6105-00L Epidemiology and Prevention

Abstract
The module Epidemiology and prevention describes the process of scientific discovery from the detection of a disease and its causes, to the development and evaluation of preventive and treatment interventions and to improved population health.

Objective
The overall goal of the course is to introduce students to epidemiological thinking and methods, which are critical pillars for medical and public health research. Students will also become aware on how epidemiological facts are used in prevention, practice and politics.

Content
The module Epidemiology and prevention follows an overall framework that describes the course of scientific discovery from the detection of a disease to the development of prevention and treatment interventions and their evaluation in clinical trials and real world settings. We will discuss study designs in the context of existing knowledge and the type of evidence needed to advance knowledge. Examples from nutrition, chronic and infectious diseases will be used in order to show the underlying concepts and methods.

752-5001-00L Food Biotechnology

Abstract
Biotechnology is the use of living organisms (or their products) to produce valuable substances or to perform specific services. In this course, you will learn about diverse applications of biotechnology in food and ingredient production, with a focus on microbial biotechnologies.

Objective
In this course you will explore the roles and potential of biotechnology in food production past, present, and future, with a focus on microbial biotechnologies. At the end of this course, you will be able to identify the microorganisms and biotechnologies currently implemented in food and food ingredient production and independently evaluate the potential of biotechnological solutions to current and future food challenges.

Content
The course will cover diverse topics in modern food biotechnology, including:
* food fermentation (arguably the world's oldest biotechnology)
* the taxonomy and metabolism of microorganisms used in food production
* microbial and fermentation kinetics
* bioreactors for food and ingredient production
* biopreservation
* molecular diagnostics
* safety and regulation of biotechnological ingredients in food production.

At the end of this course, you will be able to identify beneficial/detrimental bacteria associated with food products, execute basic bioinformatic analysis (DNA-based) to identify them, explain the main production (upstream) and purification (downstream) processes of food-relevant microorganisms and ingredients, calculate microbial kinetic parameters, connect key metabolic features with specific application in the food industry (e.g. biopreservation), and understand the general legislation (EU/CH) regarding the use of microorganisms in food.

Literature
A list of references will be given at the beginning of the course for the different topics presented during the course.

<th>Lecturers</th>
</tr>
</thead>
</table>

Abstract
The course provides a platform for the investigation, presentation and discussion of a topic with relevance to the field of pharmaceutical sciences. Students work in small groups on a chosen topic and present their work on a one day symposium.

Objective
The main objectives of this course are:
- students develop their scientific reflection (Critical Thinking) and working skills by working independently on a relevant pharmaceutical topic
- students gain in-depth knowledge of the topic investigated
- students train their scientific writing and presentation skills
- students train their ability to plan a project and work in a team

Content
The Course Drug Seminar takes place during the first 7 weeks of the 1. Master semester. It is a compulsory course of the MSc Pharmacy curriculum and an elective course in the MSc PharmSciences.

During the course, students work in small teams on a topic of their choice and elaborate an oral presentation. Each team is tutored by a lecturer of the Institute of Pharmaceutical Sciences. The work is mainly based on literature search/review, but may also involve conducting interviews or site visits, if appropriate. The final presentations of all groups will take place in the framework of a dedicated Symposium held in the middle of the semester.

Prerequisites / notice
Only for students of MSc Pharmacy and MSc Pharmaceutical Sciences.

535-0041-00L Pharmacology and Toxicology III O 2 credits 2G U. Quitterer, M. Arand, Y. Yamauchi

Abstract
The course is divided into three parts. The first part provides an overview of drugs used for the pharmacotherapy of infectious diseases, osteoporosis, autoimmune diseases and cancer. The second part gives an overview of the field of medical virology, and the third part is focused on pharmacogenomics of drug metabolism and basic concepts of toxicology.

Objective
The course advances basic knowledge in pharmacology and toxicology. Special emphasis is placed on the interrelationship between pharmacological, pathophysiological and clinical aspects of drug therapy in the fields of infectious diseases, osteoporosis, autoimmune diseases and cancer. The course also provides an overview of the fields of medical virology, toxicology, and pharmacogenomics with a special focus on the role of genetic polymorphisms in drug response and adverse effects.

Content
Topics include the pharmacology and pharmacotherapy of infectious diseases, osteoporosis, autoimmune diseases and cancer. Medical virology covers important viral infections and their pharmacotherapy with different classes of antiviral drugs. In the field of pharmacogenomics, the course is focused on examples of genetic variability of drug metabolism and drug responses, and the relevance of pharmacogenomics and toxicogenomics for clinical drug development. Finally, basic concepts of toxicology are introduced.

Lecture notes
A script is provided for each lecture. The scripts define important and exam-relevant contents of the lectures. Scripts do not replace the lectures.

### Lecture notes

This course will be a combination of formal lectures, group discussions and self-directed studies. Course material will be taught through seminars, case studies in small groups. Reading material and scripts will be provided for each week.

### Literature

- Rothman: Introduction to Epidemiology
- Strom, Kimmel, Hennessy: Textbook of Pharmacoepidemiology
- Gigerenzer: Risk Savvy - How to Make Good Decisions

### 535-0050-00L Pharmacoepidemiology and Drug Safety

**Abstract**

Introduction to the principles, methods and applications of pharmacoepidemiology and drug safety. Drug safety in the pharmaceutical industry and regulatory authorities, but also for hospital and office pharmacists. Another focus is the evaluation and interpretation of pharmacoepidemiological drug safety studies in the medical literature and the evaluation of benefits vs. risks.

**Objective**

**Objectives:**
- To familiarize participants with the principle methods and applications of pharmacoepidemiology and drug safety that is relevant for industry, regulatory affairs, but also for clinical pharmacists in hospitals and office pharmacies.
- Perform independently a causality assessment of suspected adverse drug reactions in patients
- Study designs and biostatistics used for the quantitative evaluation of drug safety
- Setup of programs that can effectively reduce medication errors and improve drug safety in clinical practice, particularly in hospitals

**Content**

- Historical landmarks of drug safety
- Pharmacovigilance and causality assessment
- Drug safety in premarketing clinical trials
- Descriptive, cohort and case-control drug safety study designs; Data analysis and control of confounding
- Pharmacoepidemiology and regulatory decision making in drug safety; Risk management plans (RMPes)
- Medication errors, clinical pharmacology / clinical pharmacy
- Clinical Decision Support Systems, Interventional Pharmacoepidemiology
- Pharmacoepidemiological databases, 'Big Data'
- Interactive discussion of many real-life examples for each topic

### 535-0003-00L Pharmaceutical Immunology II & Therapeutic Proteins

**Abstract**

In this course, various topics related to the development, GMP production and application of therapeutic proteins will be discussed. Furthermore, students will expand their training in pharmaceutical immunology and will be introduced to the basic concepts of pharmaceutical product quality management.

**Objective**

**Objectives:**
- Students know and understand:
  - basic mechanisms and regulation of the immune response
  - the pathogenic mechanisms of the most important immune-mediated disorders
  - the concepts of vaccination and cancer immunotherapy
  - the most frequently used expression systems for the production of therapeutic proteins
  - the use of protein engineering tools for modifying different features of therapeutic proteins
  - the mechanism of action of selected therapeutic proteins and their application
  - basic concepts in the GMP production of therapeutic proteins

**Content**

The course consists of two parts:
In the first part, students will complete their training in Pharmaceutical Immunology. This part particularly focuses on the pathogenic mechanisms of immune-mediated diseases, vaccination and cancer immunotherapy. Deepened knowledge of immunology will be relevant for understanding the mechanism of action of many therapeutic proteins, as well as for understanding one major concern related to the use of protein-based drugs, namely, immunogenicity.

The second part focuses on topics related to the development and application of therapeutic proteins, such as protein expression, protein engineering, reducing immunogenicity, and GMP production of therapeutic proteins. Furthermore, selected examples of approved therapeutic proteins will be discussed.

**Lecture notes**

Handouts to the lectures will be available for downloading under http://www.pharma.ethz.ch/scripts/index

**Literature**

- Janeway's Immunobiology, by Kenneth Murphy (9th or 10th Edition)
- Lecture Handouts
- Paper References provided in the Scripts
- EMEA Dossier for Humira

### Prerequisites / notice

Prerequisites: Either 535-0830-00L Pharmaceutical Immunology I or 551-0317-00L Immunology I
Clinical Chemistry II

Abstract
Detailed knowledge on particular aspects of clinical chemistry and medical laboratory diagnostics concerning quality control, point-of-care analytics, analytics of kidney stones, tumor markers, diagnosis of HIV and hepatitis, pharmacogenetics, thyroid function, bone metabolism and laboratory diagnosis of hypertension.

Objective
Detailed knowledge on the implementation and interpretation of clinical laboratory diagnostic tests. Competence to interpret selected tests.

Content
Internal and external quality control, point-of-care analytics, analytics of kidney stones, use of tumor marker determinations, diagnosis of HIV and hepatitis, pharmacogenetics, thyroid function, bone metabolism and laboratory diagnosis of hypertension.

Lecture notes
Documentation will be available before the lectures electronically.

Literature
- Jürgen Hallbach, Klinische Chemie und Hämatologie für den Einstieg, Thieme Verlag
- Harald Renz, Praktische Labordiagnostik, de Gruyter Verlag
- Walter Guder, Das Laborbuch für Klinik und Praxis, Elsevier Verlag
- Lothar Thomas, Labor und Diagnose, TH Books
- William Marshall, Clinical Chemistry, Mosby Ltd.
- Alan H.B. Wu, Tietz, Clinical Guide to Laboratory Tests, Saunders

Prerequisites / notice
Requirement: basic knowledge in clinical chemistry and laboratory diagnostics
Concepts and Theories

The students gain an overview on current principles, methodologies and systems for controlled delivery and targeting of drugs. This enables the students to understand and evaluate the field in terms of scientific criteria.

Biotransformation of Drugs and Xenobiotics

Knowledge of the major reactions of biotransformation in drug therapy, prediction of possible metabolites of drugs and xenobiotics, recognition of structure elements and reactions which can lead to toxic metabolites. Knowledge of inter- and intraindividual factors influencing metabolism.

Methods-specific Competencies

Analytical Competencies: assessed
Decision-making: assessed
Media and Digital Technologies: fostered
Problem-solving: assessed
Project Management: fostered

Communication: assessed
Cooperation and Teamwork: assessed
Customer Orientation: fostered
Leadership and Responsibility: fostered
Self-presentation and Social Influence: fostered
Sensitivity to Diversity: fostered
Negotiation: fostered

Adaptability and Flexibility: assessed
Creative Thinking: fostered
Critical Thinking: assessed
Integrity and Work Ethics: fostered
Self-awareness and Self-reflection: fostered
Self-direction and Self-management: fostered

Further references will be provided in the course.

535-0423-00L Drug Delivery and Drug Targeting

The students gain an overview on current principles, methodologies and systems for controlled delivery and targeting of drugs. This enables the students to understand and evaluate the field in terms of scientific criteria.

Objective: The focus of the course lies on developing a capacity to understand the involved technologies and methods, as well as an appreciation of the chances and constraints of their therapeutic usage, with prime attention on anticancer drugs, therapeutic peptides, proteins, nucleic acids and vaccines.

Content: The course covers the following topics: drug targeting and delivery principles, macromolecular drug carriers, liposomes, micelles, micro/nanoparticles, gels and implants, administration of vaccines, targeting at the gastrointestinal level, synthetic carriers for nucleic acid drugs, ophthalmic devices, novel trends in transdermal and nasal drug delivery and 3D printing of drug delivery systems.

Lecture notes: Selected lecture notes, documents and supporting material will be directly provided or may be downloaded from the course website.

Further references will be provided in the course.

535-0250-00L Biotransformation of Drugs and Xenobiotics

Knowledge of the major reactions of biotransformation in drug therapy, prediction of possible metabolites of drugs and xenobiotics, recognition of structure elements and reactions which can lead to toxic metabolites. Knowledge of inter- and intraindividual factors influencing metabolism.

Objective: Goals: knowledge of the major reactions of biotransformation in drug therapy, prediction of possible metabolites of drugs and xenobiotics, recognition of structure elements and reactions which can lead to toxic metabolites. Knowledge of inter- and intraindividual factors influencing metabolism.

Content: Major reactions of biotransformation. Major enzymes and reaction partners involved in the biotransformation of drugs and xenobiotics. Toxic reactions of metabolites. Factors which affect the biotransformation.

Lecture notes: Biotransformation of drugs and xenobiotics

535-0423-00L Patents

Knowledge in the field of industrial property, especially of patents and trademarks, with particular emphasis on pharmaceuticals and biotech field.

Objective: Basic knowledge in the field of industrial property, especially of patents and trademarks, with particular emphasis on pharmaceuticals and biotech field.

Content: 1. Introduction into industrial property (patents, trademarks, industrial designs); 2. Prosecution of patent applications (patentability); 3. Patent information (patent publications, databases, searches); 4. Exploitation and enforcement of patents (possibilities of exploitation, licenses, parallel imports, scope of protection, patent infringement); 5. Peculiarities in pharmaceutics and medicine (supplementary protection certificates, experimental use exemption, therapy and diagnosis, medical indication); 6. Social, political and ethical aspects (patents and prices for medicinal products, traditional knowledge and ethnomedicine, bioprospecting and biopiracy, human DNA inventions); 7. Trademarks, types of trademarks, grounds for refusal, peculiarities of pharma-trademarks.

Lecture notes: A script is provided in electronic form during the lecture.

Objective

In the lecture, basic knowledge of the history of pharmacy is imparted, taking into account the various historical epochs.

Content

After attending the lecture, the students are able to name significant events in the development of the pharmacy profession, pharmacy and medicines and to place them in a temporal context. They can list sources for working on questions from the history of pharmacy and evaluate their advantages and disadvantages. This enables them to confidently describe the importance of pharmacy as an independent, supporting pillar of the health system, the history of which has many interfaces with medicine, science, social and cultural history.

Literature
An interest in the history of pharmacy, the pharmacy profession, and medicines is an asset.

Prerequisites / notice

Wird in der ersten Veranstaltung mitgeteilt.

Abstract

The lecture conveys knowledge about the development of the pharmacist profession from ancient times to the present. Some pharmacists who made significant contributions to pharmacy are presented in more detail and their significance for today's pharmacy is discussed. The social position of pharmacists in society and the legal conditions in different epochs are also discussed. It explains what influence the pharmacists had on the development of the pharmaceuticals, but again the pharmaceuticals on the development of the pharmacists.

Notes

None

Handouts will be provided.

Prerequisites: Basic lectures in biology or biochemistry and pharmaceutical biology have been attended; not suitable for first semester students.

**Abstract**

On average one drug per year is withdrawn from the market. Using selected examples of such drug failures, the course aims at analyzing and discussing the present explanations of drug actions as well as the design and predictive power of animal models and clinical trials. In addition, the ethical, societal, and economical expectations in new drugs shall be reflected and discussed.

**Objective**

To critically appraise the ethical, societal, economical and political expectations in the development of new drugs.

**Content**

In December 2006, Pfizer stopped a large phase III study on the use of Torcetrapib for the prevention of atherosclerosis and cardiovascular disease. 800 million $ in development costs and 21 billion $ in stocks were annihilated overnight. The failure of Torcetrapib has pinpointed the limitations of an extremely reductionist view of atherosclerosis and it’s prevention by drug therapy. It has also highlighted what high expectations we have in a safe and wide applicability of drugs and of their economical success. Torcetrapib is not a single case. In the last 10 years, on average one drug per year was withdrawn from the market due to lack of efficacy, unexpected side effects or toxicity. This clearly shows that the common investigations and the modern understanding of drug actions are often not sufficient to predict the effects a drug will have in large patient populations.

These are the topics of the present course. Using three particularly informative examples of drug failures, the problems encountered and the concepts and informative value of preclinical and clinical studies will be analyzed and discussed. Furthermore, the ethical, societal, economical and political expectations in new drugs shall be reflected.

**Lecture notes**

Lecture slides and literature for reading and discussions will be available online.

**Prerequisites / notice**

Requirements: basic knowledge in Medicinal Chemistry and Pharmacology. Ability to read and understand scientific publications written in English.

**Abstract**

Protein-based drugs constitute around 25% of new approvals and most of them are glycoproteins. Using selected examples of prominent glycoprotein drugs, the course aims at providing insight into glycosylation-activity relationships and into biotechnological production and analytics.

**Objective**

Students gain basic knowledge in "pharmaceutical glycobiology". This implies knowing and understanding:

- major mechanisms underlying the roles of glycosylation for the biological/therapeutic actions of glycoproteins (glycosylation-function relationships) using prominent examples of glycoprotein drugs,
- the major types of protein-linked glycans and the biosynthetic pathways for their formation,
- how glycoprotein drugs are produced (including the most important expression systems used), glycoengineered and analysed (quality control), Students are able to apply this knowledge in solving simple problems in glycoprotein drug development (on paper),
- Students gain the ability to reflect on roles of glycosylation in various biological contexts.

**Content**

lecture plan:

1. Glycans - information carriers in biology and pharmacotherapy
2. Glucocerebrosidase and the biosynthesis of N-glycans
3. Improving the therapeutic profile of monoclonal antibodies by glycoengineering
4. Mucin-type O-glycans and sialylation as gCQA of glycoprotein hormone drugs
5. gCQA analysis of glycoprotein hormone drugs (sialylated glycoproteins)
6. EPO "the same but different"

**Lecture notes**

The slides used for the lectures will be provided online

**Literature**

- recent publications as cited/proposed on the lecture slides

**Prerequisites / notice**

Requirements: Basic knowledge in immunology, molecular biology, protein and carbohydrate chemistry, analytical techniques. Basic knowledge in pharmacology.

**Abstract**

Vitamins are essential organic compounds that cannot be synthesized by an organism and hence, thy have to be acquired from the diet. This lecture will give an overview about the application of vitamins in health and disease.

**Objective**

The aim of this lecture is a critical examination of the students with the topic of "Vitamins in Health and Disease". The students will get an overview of vitamins, of their medical applications and the role of the pharmacist with "over-the-counter" products.
Deficiencies of particular vitamins result in specific diseases such as for example scurvy (vitamin C deficiency). Such disease patterns are usually easily recognized and facile to be treated. The clinical utility of supplementation concerns people with severe deficiencies and a risk of complications. Latent vitamin deficiencies might result in variable disorders and risks. As an example neurological disorders in elderly as a consequence of chronic lack of vitamin B12 should be mentioned. Subclinical deficiencies are often difficult to assess. However, these are exactly the cases where advice of a pharmacist is requested. A large intake of vitamins by over-supplementation or food fortification might be dangerous (hypervitaminosis). This is in particular the case for fat-soluble vitamins or in the case of constant intake of high amounts of water-soluble vitamins over a long time period.

The lecture 'Vitamins in Health and Disease' will give an overview over the history and applications of vitamins and their functions to preserve good health. The utility of vitamin supplementation during conditions of deficiencies, potential consequences of a latent deficiency as well as risks of over-supplementation will be discussed.

The following topics are covered:

- How are interesting development candidates identified. What are the strategies?
- What are the regulatory requirements (traditional use, well-established use, new herbal entities)?
- Determination of efficacy from (animal/human studies, biomarkers)
- Quality of clinical studies
- Pharmacokinetics of phytopharmaceuticals
- Safety (toxicity, adverse effects, interactions)
- Pharmaceutical quality
- Varietal purity (wild collections, cultivation)
- Influence of genetic variability on extract quality
- Ensuring consistent quality
- Which extraction methods?

The topics are explained and critically discussed using various phytopharmaceuticals as examples (see programme below).

The lecture series provides an introduction to advanced drug design techniques and approaches emphasizing computer-assisted drug design studies in medicinal chemistry. As a result, they are prepared for professional assessment of computer-assisted drug design studies in medicinal chemistry projects.

The lecture series provides an introduction to advanced drug design techniques and approaches emphasizing computer-assisted drug design studies in medicinal chemistry. The topics cover molecular representations and similarity, ligand-based virtual screening, and structure-based virtual screening. All theoretical concepts and algorithms presented are illustrated by practical applications and case studies.

The topics cover molecular representations and similarity, ligand-based virtual screening, and structure-based virtual screening. All theoretical concepts and algorithms presented are illustrated by practical applications and case studies.
Objective
Participants will learn about computational algorithms and advanced experimental approaches to drug discovery and design, including selected actual topics and practical applications. The contents of the lecture will allow for a deeper understanding of modern computer-assisted drug design methods and how they are linked to experimental applications. The main focus is on computational medicinal chemistry, so that participants will be able to use relevant computer-based methods in their own research projects.

Literature
Additional selected literature will be provided during the lecture.

Prerequisites / notice
The lecture is mandatory for all participants of the course "Computer-Assisted Drug Design" (535-0023-00 P).

535-0023-00L Computer-Assisted Drug Design (Practical Course)  W  4 credits  6P  G. Schneider
Does not take place this semester.

Abstract
The practical course is open for master and graduate students to get an introduction into hands-on computer-assisted drug design. The class includes an introduction to computer-based screening of a virtual compound library, subsequent synthesis of candidate ligands, and biochemically testing for activity on pharmacologically important drug targets.

Objective
Participants become familiar with state-of-the-art methodologies in a real-life computer-aided medicinal chemistry project. Participants work as small teams, perform literature research and discuss recent research findings. A seminar talk is to be given presenting the molecular design strategy chosen and the results obtained during the course.

Content
The course offers the possibility for people with and without computational and or laboratory background to get an introduction into computer-assisted drug design, as well as practical training in a modern chemical laboratory. Using various software suites, the participants will computationally create and screen a virtual compound library for potential active small molecules. The process will involve an introduction to screening a virtual compound library, synthesizing candidate inhibitors, and biophysical testing against a pharmacologically important drug target.

Lecture notes
Detailed information will be handed out during the course.

Literature
Textbook:

Prerequisites / notice
The class is organized as a two-week block course.
The number of participants is limited.
Kick-off meeting and confirmation of registration (Vorbesprechung und Platzvergabe): During the last lecture of the class "Computer-Assisted Drug Design" (535-0022-00)
Ideally, students interested in the course participated and successfully passed the lecture "Computer-Assisted Drug Design" (535-0022-00).

Practical Pharmacy I

Abstract
This course provides basic knowledge relevant to pharmacy and its application in nephrology, phytotherapy, complementary medicine, wound care and pharmaceutical care.

Objective
Students know and understand the therapeutic concepts of the mentioned topics and their application in practice.

(for detailed learning objectives see the guidelines)

Content
- complementary medicine
- phytotherapy
- wound care
- pharmaceutical care 2
- nephrology

Lecture notes
Provided via myStudies.

Literature
As specified in the lecture notes

Competencies
- **Subject-specific Competencies**
  - Concepts and Theories
  - Techniques and Technologies
  - Analytical Competencies
  - Decision-making
  - Problem-solving

- **Method-specific Competencies**
  - Communication
  - Cooperation and Teamwork
  - Customer Orientation
  - Leadership and Responsibility
  - Sensitivity to Diversity

- **Social Competencies**
  - Critical Thinking
  - Self-awareness and Self-reflection

- **Personal Competencies**

Abstract
This course provides basic clinical and pharmaceutical knowledge and its application for triage, diagnostics and therapy support for the most common diseases in geriatrics, women's health, oncology, paediatrics and neurology (epilepsy). In addition, the role of nutrition in special life situations and in selected health disorders is taught.
Objective

- know and understand the pathomechanisms and the clinical lead and warning symptoms (red flags) of the most common diseases in the fields listed.
- can triage patients by applying this knowledge: i.e. analyse simple symptoms and disease patterns, make a tentative diagnosis and recommend suitable medication or further examinations or measures.
- know the therapeutic guidelines, drug classes and selected, practice-relevant drugs (including indications and the most frequent and important dosages, adverse drug reactions, interactions and contraindications).

(for detailed learning objectives, see the guideline)

Abstract

Pharmaceutical Manufacturing relevant for the community pharmacy considering the “GMP-Regeln in kleinen Mengen” of the Pharmacopoeia: The preparation of extemporaneous products covering the most common forms under consideration of their Risks and Quality Assurance.

Objective

The students are able to produce pharmaceutical relevant drug Systems without further assistance, lege artis, applying the right techniques and material. The production and packaging has to follow GMP rules and tailored for the patients need. The quality control and correct documentation have to be followed. The students know the most relevant specifications, concentration and dosing ranges of common APIs and excipients. The students are familiar with the relevant literature (Pharmaceutical and legal basis) regarding the Pharmaceutical manufacturing relevant for the community pharmacies.

Content

Vermittlung der wichtigsten Kenntnisse, Arbeitsschritte und -techniken im Bereich der Arzneimittelherstellung in kleinen Mengen (Formula) mit Fokus auf die Herstellung, Qualitätssicherung und Risikobeurteilung einschliesslich der patientenspezifischen Abgabepraxis.

In den Praktika: Anhand praxis-relevanter Beispiele wird die Aufgabenplanung, die Fertigung einschliesslich die korrekte Verwendung der Gerätschaften, die Inprozesskontrolle, die Verpackung und die Qualitätssicherung diverser Rezepte und Arzneiformen geübt. Unter Einbezug risikoadaptierter Massnahmen erfolgt die Qualitätssicherung, -kontrolle und Einhaltung von Hygienierichtlinien gemäss den geltenden Arzneibüchern. Die Studierenden vertiefen damit ihre GMP-relevanten Kenntnisse und Fertigkeiten.

535-5503-00L | Institutional Pharmacy | O    | 2    | 3G    |

Abstract

Organisation of institutional environments (emergency hospitals), with special focus on the medication process and institutional pharmaceutical care (continuum of care).

Objective

Students understand the concept of continuum of care and its practical implementation. They know the medication process within an institutional environment. They are able to find the necessary information and deal with problems in connection with pharmaceuticals, to evaluate them and to communicate and documentate their findings adequately. They know how a hospital is organised (procedures, possible problems), responsibilities of the different members of the staff and, most importantly, what the function of a hospital pharmacy is.
Fostered concepts and theories.

Abstract

Basic training on and around patients with practical confrontation. The path of acute patients from patient presentation, through triage and diagnostics to therapy.

Objective

Students will be able to understand the medical-clinical way of thinking for the diagnosis and treatment of acute patients. They complete the change of perspective from the molecular mechanism of action of drugs to the treatment of patients in all its complexity. Using real patient examples, students acquire exemplary knowledge in diagnostics and triage as well as therapy selection and therapy support. They consolidate their understanding of the importance of pharmaceutical care before and after hospitalization.

Content

---

Injection Techniques and Vaccinations

Abstract

Die Studierenden erlernen die praktische Durchführung von subkutanen (s.c.) und intramuskulären (i.m.) Injektionen. Sie wissen, wie in Notfallsituationen vorzugehen ist.

Objective

Die Studierenden erwerben das theoretische Wissen und die praktischen Fähigkeiten, welche für die s.c. und i.m. Verabreichung von Medikamenten erforderlich sind. Sie sind fähig, Risikopatienten zu identifizieren und sind geschult, bei Notfällen (z.B. Anaphylaxie) korrekt zu handeln.

Content

Die Lernziele und Inhalte entsprechen dem Fähigkeitsprogramm FPH Impfen und Blutentnahme von PharmaSuisse (ausser venöse Blutentnahmen)

- Impfungübungen (z.B. Lesen von Impfausweisen, Erstellen eines individuellen Impfschemas, Impfdebatte)
- Theorie und praktische Aspekte bei der Durchführung von subkutanen Blutentnahmen
- Impflagen (z.B. Lesen von Impfausweisen, Erstellen eines individuellen Impfschemas, Impfdebatte)

Only students who fulfill the following criteria are allowed

---

Prerequisites / notice

Schutzkonzept: https://chab.ethz.ch/studium/bachelor1.html
to begin with their master thesis:
a. successful completion of the bachelor programme;
b. fulfilling of any additional requirements necessary to
gain admission to the master programme.

Abstract
During the Master’s thesis students prove their ability to independent, structured scientific work. The Master’s thesis is usually carried out in
a subject area of Pharmaceutical Sciences as chosen by the student.

Objective
In the Master Thesis students prove their ability to independent, structured and scientific working.

**Abstract**
The goal of this event is to bring you closer to current day research in all fields of physics. In each semester we have a set of distinguished speakers covering the full range of topics in physics. As a participating student should learn how to follow a research talk. In particular, you should be able to extract key points from a colloquium where you don't necessarily understand every detail that is presented.

Concepts and Theories
S. Johnson
We will provide German lecture notes and an English translation at latest at the start of the semester.

Ö. Imamoglu
4V+2U
Working knowledge of functions of one complex variables; in particular applications of the residue theorem.

Lecturers

Assessed

Assessed

Title

Physics III

Fundamental understanding of the description of Mechanics in the Lagrangian and Hamiltonian formulation. Detailed understanding of important applications, in particular, the Kepler problem, the physics of rigid bodies (spinning top) and of oscillatory systems.

Objectives

- Mastering basic concepts of Linear Algebra
- Introduction to mathematical methods
- Basics
- Vector spaces and linear maps
- Systems of linear equations and matrices
- Determinants
- Endomorphisms and eigenvalues

Lecture notes

We will provide German lecture notes and an English translation at latest at the start of the semester.

Lecture notes in German and an English translation will be published on the website of the course, at latest at the start of the semester.

In addition we recommend this general introduction into studying mathematics:

402-2203-01L Classical Mechanics

Abstract
A conceptual introduction to theoretical physics: Newtonian mechanics, central force problem, oscillations, Lagrangian mechanics, symmetries and conservation laws, Hamiltonian mechanics, canonical transformations, Hamilton-Jacobi equation, spinning top, relativistic space-time structure.

Objective
Fundamental understanding of the description of Mechanics in the Lagrangian and Hamiltonian formulation. Detailed understanding of important applications, in particular, the Kepler problem, the physics of rigid bodies (spinning top) and of oscillatory systems.

Competencies
Subject-specific Competencies
- Concepts and Theories: assessed

Method-specific Competencies
- Analytical Competencies: assessed

402-2883-00L Physics III

Abstract
Introductory course on quantum and atomic physics including optics and statistical physics.

Objective
A basic introduction to quantum and atomic physics, including basics of optics and equilibrium statistical physics. The course will focus on the relation of these topics to experimental methods and observations.

Content
Einführung in die Quantenphysik: Planck'sche Strahlung (Wärmestrahlung), Photonen, Photoelektrischer Effekt, Thomson und Rutherford Streuung, Compton Streuung, Bohrsche Atommodell, de-Broglies Materiewellen.

Optik-Wellenoptik: Linsen, Abbildungssysteme, Brechung und Fermatsches Prinzip, Beugung, Interferenz, Fabry-Perot, Interferometer, Spektrometer.

Quantenmechanik: Dualismus Teilchen-Welle, Wellenfunktionen, Operatoren, Schrödinger-Gleichung, Potentialstufe und Potentialkasten, harmonischer Oscillator

Lecture notes
Im Rahmen der Veranstaltung werden die Folien in elektronischer Form zur Verfügung gestellt. Ergänzendes Buch wird als Pflichtlektüre empfohlen. Es wird kein Skript in der Vorlesung verteilt.

Wir werden die Quantenmechanik anhand der Schrödinger-Gleichung mit den klassischen elektro-magnetischen Wellen vergleichen. Zu den klassischen Wellen werden Ergänzungsunterlagen verteilt.

--- | --- | --- | --- | --- | ---
402-0205-00L | Quantum Mechanics I | O | 8 credits | 3V+2U | M. Krstic Marinkovic

Abstract
Applications: simple potentials in wave mechanics, scattering and resonance, harmonic oscillator, hydrogen atom, and perturbation theory.

Objective
Introduction to single-particle quantum mechanics. Familiarity with basic ideas and concepts (quantisation, operator formalism, symmetries, angular momentum, perturbation theory) and generic examples and applications (bound states, tunneling, hydrogen atom, harmonic oscillator). Ability to solve simple problems.

Content
The beginnings of quantum theory with Planck, Einstein and Bohr; Wave mechanics; Simple examples; The formalism of quantum mechanics (states and observables, Hilbert spaces and operators, the measurement process); Heisenberg uncertainty relation; Harmonic oscillator; Symmetries (in particular rotations); Hydrogen atom; Angular momentum addition; Quantum mechanics and classical physics (EPR paradoxon and Bell's inequality); Perturbation theory.

Abstract
This introductory course will develop basic concepts in astrophysics as applied to the understanding of the physics of planets, stars, galaxies, and the Universe.

Objective
The course provides an overview of fundamental concepts and physical processes in astrophysics with the dual goals of: i) illustrating physical principles through a variety of astrophysical applications; and ii) providing an overview of research topics in astrophysics.

Abstract
The course provides an introduction to solid state physics, covering several topics that are later discussed in more detail in other more specialized lectures. The central topics are: solids and their lattice structures; interatomic bindings; lattice dynamics, electronic properties of insulators, metals, semiconductors, transport properties, and magnetism.

Objective
Introduction to Solid State Physics.

Content
The course provides an introduction to solid state physics, covering several topics that are later discussed in more detail in other more specialized lectures. The central topics are: solids and their lattice structures; interatomic bindings; lattice dynamics, thermal properties of insulators, metals (classical and quantum mechanical description of electronic states, thermal and transport properties of metals); semiconductors (bandstructure and n/p-type doping); magnetism.

Lecture notes
The script will be available on moodle.

Only for Physics BSc, Programme Regulations 2016.
This introductory course will develop basic concepts in astrophysics as applied to the understanding of the physics of planets, stars, galaxies, and the Universe.

The course provides an overview of fundamental concepts and physical processes in astrophysics with the dual goals of: i) illustrating physical principles through a variety of astrophysical applications; and ii) providing an overview of research topics in astrophysics.

Exercise: Only for bachelor physics students in their last year of studies. Topics covered are...
Attending students will fostered

1. Introduction to Energy – what is it all about

Part I of this course covers the energy-related topics in this two-semester course. The importance of energy to life and our modern culture fostered

Energy and Sustainability in the 21st Century (Part I)

Lecture Series: Space Research and Exploration

Creative Thinking

Social Competencies

Communication

Personal Competencies

Critical Thinking

Concepts and Theories

Techniques and Technologies

Problem-solving

Cooperation and Teamwork

Creative Thinking

Self-awareness and Self-reflection

Self-direction and Self-management

402-0368-07L Lecture Series: Space Research and Exploration W 2V+1U 1 credit S. P. Quanz

Abstract

Lecture Series about selected topics of space research and exploration consisting of individual talks given by different leading experts from academia and industry.

Objective

Attending students will fostered

- experience the interdisciplinarity of space research and exploration spanning physics, engineering, geosciences, biology and more
- get familiar with the Swiss space research and industry landscape
- enhance their communication skills by broadening their research horizon
- have the opportunity for direct learning by posing questions to experts

Content

The field of space research and exploration is intrinsically interdisciplinary. Cutting edge space activities are dominated by an interplay between the scientifically desirable and the technologically possible. The 'Lecture Series: Space Research and Exploration' aims to shed light on key questions engaged by leading scientists and engineers today. It consists of weekly lectures, given by different speakers with vast experience in their respective field (e.g., Human Spaceflight, System Engineering of Spacecraft, Space Life Sciences, Space-based astrophysics). Subsequent to the talk, the student will have the opportunity to deepen their understanding by asking questions to the presenter in a moderated Q&A.

Confirmed speakers will be announced by the start of the semester (see lecture from last year for previous speakers).

Competencies

Subject-specific Competencies

Concepts and Theories fostered

Techniques and Technologies fostered

Problem-solving fostered

Cooperation and Teamwork fostered

Critical Thinking fostered

402-0737-00L Energy and Sustainability in the 21st Century (Part I) W 6 credits 2V+1U P. Morf

Abstract

Part I of this course covers the energy-related topics in this two-semester course. The importance of energy to life and our modern culture is explored and placed in the perspective of the ongoing energy transition in the context of necessary and urgent decarbonization efforts. How much energy do we need and how can it be provided in a way that enables a sustainable existence?

Objective

Why is energy important for life, economy and our society?

How did energy use change over time? Which effects did these changes have on the environment?

What are the physical basics of energy technologies?

When, why and how did technology and science of energy come together?

What are the limits and benefits of all the various energy technologies?

How can different energy technologies be compared?

Can we understand the changes in the current energy systems?

How will the energy systems of the future look like?

How fast can we and should we enforce the current energy transition?

Which could be the overall guide lines for a working and sustainable energy system of the future?

Content

1. Introduction to Energy – what is it all about

2. Energy and making use of it – a short history of energy use and an overview on energy technologies

3. Coal, oil and natural gas – fossil fuels

4. Renewables I: Biomass, Hydropower, and Wind Energy – from traditional use to the modern concepts

5. Renewables II: Geothermal, Tidal power and Solar Technologies – new renewables to lead the change

6. Nuclear power, radioactivity and ultimate storage – the quest for a safe technology

7. Breeding and Nuclear Fusion – can it work at all?

8. Energy Storage – the need to increase capacity and for new technologies

9. Climate Change and Decarbonisation of the Energy Mix – how much time do we have?

11. Energy Systems – how everything can play together

12. Life Cycle Assessment of Energy Technologies – problems and possibilities

14. The Actual Energy Transition and Decarbonisation – How is your 2040, 2050?

Prerequisites / notice

Basic foundation in Physics and Energy Technology is required.

Literature

The Physics of Energy, R.L. Jaffe, W. Taylor, 2018

Clean Disruption of Energy and Transportation, T. Seba 2014

Energy and Civilization: A History, V. Smil, 2018

### 402-0809-00L Introduction to Computational Physics

#### Objective

Students learn to apply the following methods: Random number generators, Determination of percolation critical exponents, numerical solution of problems from classical mechanics and electrodynamics, canonical Monte-Carlo simulations to numerically analyze magnetic systems. Students also learn how to implement their own numerical frameworks in Julia and how to use existing libraries to solve physical problems. In addition, students learn to distinguish between different numerical methods to apply them to solve a given physical problem.

#### Content

- Turbulent flow computation and modeling of turbulent flows
- Basic physical phenomena of turbulent flows, statistical description, basic and averaged equations, principles of turbulent flow computation and elements of turbulence modelling
- Laminar and turbulent flows, instability and origin of turbulence
- Statistical description: averaging, turbulent energy, dissipation, closure problem
- Scalings, homogeneous isotropic turbulence, correlations, Fourier representation, energy spectrum
- Free turbulence: wake, jet, mixing layer
- Wall turbulence: Channel and boundary layer
- Computation and modelling of turbulent flows

#### Literature

### 151-0109-00L Turbulent Flows

#### Objective

- Properties of laminar, transitional and turbulent flows
- Origin and control of turbulence, Instability and transition
- Statistical description, averaging, equations for mean and fluctuating quantities, closure problem
- Scalings, homogeneous isotropic turbulence, energy spectrum
- Turbulent free shear flows, Jet, wake, mixing layer
- Wall-bounded turbulent flows
- Turbulent flow computation and modeling

#### Literature

Lecture notes are available

### 151-0221-00L Introduction to Modeling and Optimization of Sustainable Energy Systems

#### Objective

At the end of this course, students will be able to:
- Define and quantify the key performance indicators of sustainable energy systems;
- Select and apply appropriate models for conversion, storage and transport of energy;
- Develop mathematical models for the analysis, design and operations of multi-energy systems and solve them with appropriate mathematical tools;
- Select and apply methodologies for the uncertainty analysis on energy systems models;
- Apply the acquired knowledge to tackle the challenges of the energy transition.

#### Content

The global energy transition: Key performance indicators of sustainable energy systems; Optimization models; Heat integration and heat exchanger networks; Life-cycle assessment; Models for conversion, storage and transport technologies; Multi-energy systems; Design, operations and analysis of energy systems; Uncertainties in energy system modeling.

#### Literature

Lecture slides and supplementary documentation will be available online. Reference to appropriate book chapters and scientific papers will be provided.
Content
The course will develop along the following outline:
- How glaciology became a scientific discipline
- Glaciology and hydropower
- Glacier mechanics and ice flow
- Gravitational glacier instabilities
- Glacier hydrology and glacier lake outbursts
- Lake ice and ice bearing capacity
- Field excursion to Jungfraujoch
- Discussion of the exercises performed during the semester

Lecture notes
Digital lecture handouts will be distributed prior to each class.

Literature
Links to relevant literature will be provided during the classes.

Prerequisites / notice
Completed BSc studies. Basic knowledge in computer scripting in any language (e.g. Python, R, Julia, Matlab, IDL, ...) will be advantageous for solving the exercises. The exercises will be performed in groups. A minimal level of fitness is required for the field excursion.

151-0575-01L Signals and Systems

Abstract
Signals arise in most engineering applications. They contain information about the behavior of physical systems. Systems respond to signals and produce other signals. In this course, we explore how signals can be represented and manipulated, and their effects on systems. We further explore how we can discover basic system properties by exciting a system with various types of signals.

Objective
Master the basics of signals and systems. Apply this knowledge to problems in the homework assignments and programming exercise.

Content

Lecture notes
Lecture notes available on course website.

Prerequisites / notice
Control Systems I is helpful but not required.

151-0621-00L Microsystems I: Process Technology and Integration

Abstract
Students are introduced to the fundamentals of semiconductors, the basics of micromachining and silicon process technology and will learn about the fabrication of microsystems and -devices by a sequence of defined processing steps (process flow).

Objective
Students are introduced to the basics of micromachining and silicon process technology and will understand the fabrication of microsystem devices by the combination of unit process steps (= process flow).

Content
- Introduction to microsystems technology (MST) and micro electro mechanical systems (MEMS)
- Basic silicon technologies: Thermal oxidation, photolithography and etching, diffusion and ion implantation, thin film deposition.
- Specific microsystems technologies: Bulk and surface micromachining, dry and wet etching, isotropic and anisotropic etching, beam and membrane formation, wafer bonding, thin film mechanical properties.
- Application of selected technologies will be demonstrated on case studies.

Lecture notes
Handouts (available online)

151-0913-00L Introduction to Photonics

Abstract
This course introduces students to the main concepts of optics and photonics. Specifically, we will describe the laws obeyed by optical waves and discuss how to use them to manipulate light.

Objective
Photonics, the science of light, has become ubiquitous in our lives. Control and manipulation of light is what enables us to interact with the screen of our smart devices and exchange large amounts of complex information. Photonics has also taken a preponderant role in cutting-edge science, allowing for instance to image nanospecimens, detect diseases or sense very tiny forces. The purpose of this course is three-fold: (i) We first aim to provide the fundamentals of photonics, establishing a solid basis for more specialised courses. (ii) Beyond theoretical concepts, our intention is to have students develop an intuition on how to manipulate light in practise. (iii) Finally, the course highlights how the taught concepts apply to modern research as well as to everyday life technologies (LCD screens, polarisation sun glasses, anti-reflection coating etc...). Content, including videos of laboratory experiments, has been designed to be approachable by students from a diverse set of science and engineering backgrounds.
Content

I- BASICS OF WAVE THEORY
1) General concepts
2) Differential wave equation
3) Wavefront
4) Plane waves and Fourier decomposition of optical fields
5) Spherical waves and Huygens-Fresnel principle

II- ELECTROMAGNETIC WAVES
1) Maxwell equations
2) Wave equation for EM waves
3) Dielectric permittivity
4) Refractive index
5) Nonlinear optics
6) Polarisation and polarisation control

III- PROPAGATION OF LIGHT
1) Waves at an interface
2) The Fresnel coefficients
3) Total internal reflection
4) Evanescent waves
5) Dispersion diagram

IV- INTERFERENCES
1) General considerations
2) Temporal and spatial coherence
3) The Young double slit experiment
4) Diffraction gratings
5) The Michelson interferometer
6) Multi-wave interference
7) Antireflecting coating and interference filters
8) Optical holography

V- LIGHT MANIPULATION
1) Optical waveguides
2) Photonic crystals
3) Metamaterials and metasurfaces
4) Optical cavities

VI- OPTICAL FORCES AND OPTICAL TWEEzers
1) History of optical forces
2) Theory of optical trapping
3) Atom cooling
4) Optomechanics
5) Applications of optical tweezers

VII- INTRODUCTION TO OPTICAL MICROSCOPY
1) Basic concepts
2) Direct and Fourier imaging
3) Image formation
4) Fluorescence microscopy
5) Scattering-based microscopy
6) Digital holography
7) Computational imaging

252-0061-00L Systems Programming and Computer Architecture W 7 credits 4V+2U A. Klimovic, T. Roscoe

Abstract
Introduction to systems programming. C and assembly language, floating point arithmetic, basic translation of C into assembler, compiler optimizations, manual optimizations. How hardware features like superscalar architecture, exceptions and interrupts, caches, virtual memory, multicore processors, devices, and memory systems function and affect correctness, performance, and optimization.

Objective
The course objectives are for students to:

1. Develop a deep understanding of, and intuition about, the execution of all the layers (compiler, runtime, OS, etc.) between programs in high-level languages and the underlying hardware: the impact of compiler decisions, the role of the operating system, the effects of hardware on code performance and scalability, etc.

2. Be able to write correct, efficient programs on modern hardware, not only in C but high-level languages as well.

3. Understand Systems Programming as a complement to other disciplines within Computer Science and other forms of software development.

This course does not cover how to design or build a processor or computer.
Content
This course provides an overview of “computers” as a platform for the execution of (compiled) computer programs. This course provides a programmer’s view of how computer systems execute programs, store information, and communicate. The course introduces the major computer architecture structures that have direct influence on the execution of programs (processors with registers, caches, other levels of the memory hierarchy, supervisor/kernel mode, and I/O structures) and covers implementation and representation issues only to the extend that they are necessary to understand the structure and operation of a computer system.

The course attempts to expose students to the practical issues that affect performance, portability, security, robustness, and extensibility. This course provides a foundation for subsequent courses on operating systems, networks, compilers and many other courses that require an understanding of the system-level issues. Topics covered include: machine-level code and its generation by optimizing compilers, address translation, input and output, trap/event handlers, performance evaluation and optimization (with a focus on the practical aspects of data collection and analysis).

Lecture notes
- C programming
- Integers
- Pointers and dynamic memory allocation
- Basic computer architecture
- Compiling C control flow and data structures
- Code vulnerabilities
- Implementing memory allocation
- Linking
- Floating point
- Optimizing compilers
- Architecture and optimization
- Caches
- Exceptions
- Virtual memory
- Multicore
- Devices

Literature
The course is based in part on “Computer Systems: A Programmer's Perspective” (3rd Edition) by R. Bryant and D. O'Hallaron, with additional material.

Prerequisites / notice
252-0029-00L Parallel Programming

252-0028-00L Design of Digital Circuits

Abstract
This course acquaints students with core knowledge in computer graphics, image processing, multimedia and computer vision. Topics include: Graphics pipeline, perception and camera models, transformation, shading, global illumination, texturing, sampling, filtering, image representations, image and video compression, edge detection and optical flow.

Objective
This course provides an in-depth introduction to the core concepts of computer graphics, image processing, multimedia and computer vision. The course forms a basis for the specialization track Visual Computing of the CS master program at ETH.

Content
Course topics will include: Graphics pipeline, perception and color models, camera models, transformations and projection, projections, lighting, shading, global illumination, texturing, sampling theorem, Fourier transforms, image representations, convolution, linear filtering, diffusion, nonlinear filtering, edge detection, optical flow, image and video compression.

In theoretical and practical homework assignments students will learn to apply and implement the presented concepts and algorithms.

Lecture notes
A scriptum will be handed out for a part of the course. Copies of the slides will be available for download. We will also provide a detailed list of references and textbooks.

Literature

252-0834-00L Information Systems for Engineers

W 4 credits 2V+1U G. Fourny

Abstract
This course provides the basics of relational databases from the perspective of the user.

We will discover why tables are so incredibly powerful to express relations, learn the SQL query language, and how to make the most of it. The course also covers support for data cubes (analytics).
Objective

Do you want to be able to query your own data productively and efficiently in your future semester projects, bachelor's thesis, master thesis, or PhD thesis? Are you looking for something beyond the Python+Pandas hype? This course teaches you how to do so as well as the dos and don'ts.

This lesson is complementary with Big Data for Engineers as they cover different time periods of database history and practices -- you can take them in any order, even though it might be more enjoyable to take this lecture first.

After visiting this course, you will be capable to:

1. Explain, in the big picture, how a relational database works and what it can do in your own words.
2. Explain the relational data model (tables, rows, attributes, primary keys, foreign keys), formally and informally, including the relational algebra operators (select, project, rename, all kinds of joins, division, cartesian product, union, intersection, etc).
3. Perform non-trivial reading SQL queries on existing relational databases, as well as insert new data, update and delete existing data.
4. Design new schemas to store data in accordance to the real world's constraints, such as relationship cardinality
5. Explain what bad design is and why it matters.
6. Adapt and improve an existing schema to make it more robust against anomalies, thanks to a very good theoretical knowledge of what is called "normal forms".
7. Understand how indices work (hash indices, B-trees), how they are implemented, and how to use them to make queries faster.
8. Access an existing relational database from a host language such as Java, using bridges such as JDBC.
9. Explain what data independence is all about and didn't age a bit since the 1970s.
10. Explain, in the big picture, how a relational database is physically implemented.
11. Know and deal with the natural syntax for relational data, CSV.
12. Explain the data cube model including slicing and dicing.
13. Store data cubes in a relational database.
14. Map cube queries to SQL.
15. Slice and dice cubes in a UI.

And of course, you will think that tables are the most wonderful object in the world.

Content

Using a relational database

1. Introduction
2. The relational model
3. Data definition with SQL
4. The relational algebra
5. Queries with SQL

Taking a relational database to the next level

6. Database design theory
7. Databases and host languages
8. Databases and host languages
9. Indices and optimization
10. Database architecture and storage

Analytics on top of a relational database

12. Data cubes

Outlook

13. Outlook

Literature

- Lecture material (slides).
- Book: "Database Systems: The Complete Book", H. Garcia-Molina, J.D. Ullman, J. Widom (It is not required to buy the book, as the library has it)

Prerequisites / notice

For non-CS/DS students only, BSc and MSc
Elementary knowledge of set theory and logic
Knowledge as well as basic experience with a programming language such as Pascal, C, C++, Java, Haskell, Python

Autumn Semester 2024
### Computer Science II

**W 4 credits 2V+2U**  
R. Sasse, F. Friedrich Wicker

#### Abstract

The course covers the foundations of design and analysis of algorithms and data structures, including graph theory and graph problems. It also introduces generic and parallel programming.

#### Objective

- Understanding design, analysis and implementation of fundamental algorithms and data structures. Overview of the concepts of generic and parallel programming. Hands-on experience with implementing the aforementioned in C++.

#### Content

- Asymptotic runtime (algorithmic complexity)
- Fundamental algorithmic problems, e.g. searching, sorting, shortest paths, spanning trees
- Classical data structures, e.g. search trees, balanced trees, heaps, hash tables
- Graph theory and graph problems
- Problem solving strategies as design patterns for algorithms, e.g. induction, divide and conquer, backtracking, dynamic programming
- Generic programming: C++ templates higher-order functions, lambdas, closures
- Parallel programming: (in)dependence of computations, parallelism and concurrency, shared memory, races, mutual exclusion, communication and synchronisation

Knowledge obtained in the lecture is deepened through practical and/or programming exercises (C++, Code Expert).

#### Lecture notes

All material (slides, lecture recordings, examples, exercises, etc.) will be published on the course website.

#### Literature

- B. Stroustrup, A Tour of C++, 3rd Edition, Addison-Wesley, 2022

#### Prerequisites / notice

Prerequisite: Computer Science I

### Electronic, Optical and Magnetic Properties of Materials

**W 7 credits 5V+2U**  
P. Gambardella

#### Abstract

This course provides physical foundations to understand the response of different classes of materials to electromagnetic fields, focusing on their electrical, optical, and magnetic properties, and on the basic functioning of devices that exploit such properties. The lectures build on classical and quantum mechanical concepts to provide microscopic understanding and modelling.

#### Objective

Student should be able to:

- Apply fundamental concepts in solid state physics to describe and explain the behavior of different types of materials, including the ability to make semi-quantitative assertions about relevant physical quantities.
- Analyze and evaluate different models and approaches to describe specific material properties, and appreciate the pertinence of these models to real-world applications, including the ability to make numerical estimates of the relevant parameters.
- Explain the working principles of a range of devices that take advantage of the physical properties of materials, including electronic, photonic, and magnetic devices.
- Develop an appreciation for the role of solid state physics in modern society and technology, and understand the importance of continued research and development in this field for future technological advancements.
Understanding the electronic properties of solids is at the heart of modern society and technology. The aim of this course is to provide fundamental physical concepts that allow one to relate the electronic structure of different types of materials to their electrical, optical, and magnetic behavior as well as the functioning of basic electronic, photonic, and magnetic devices. Beyond fundamental curiosity, such level of understanding is required in order to develop and appropriately describe new classes of materials for future technology applications. The course is divided in six parts.

PART I: The electronic structure of metals, semiconductors, and insulators
Revision of classical concepts: electric fields and currents, Ohm’s and Drude’s model of electrical conductivity, Hall effect, thermoelectric effects.
Revision of quantum mechanical concepts: Electron bands, Fermi statistics, Fermi energy and Fermi surface, density of states in k-space and as a function of energy.

PART II: Semiconductors: concepts and devices

PART III: Dielectric properties of insulators

PART IV: Interaction of electromagnetic waves with matter
The electromagnetic (EM) spectrum. Electromagnetic waves in vacuum; Energy, momentum, and angular momentum of EM waves; Sources of EM radiation; EM waves in matter. The refractive index. Transmission, Reflection, and Refraction from a microscopic point of view. Optical anisotropy, Optical activity, Dichroism. Optical properties of crystalline insulators and semiconductors, glasses, and metals.

PART V: Photonic devices
Photodiodes, photovoltaic cells, light emitting devices (LEDs), Laser diodes, displays, optical fibers.

PART VI: Magnetism

### Literature

C. Kittel, Introduction to Solid State Physics (Wiley, 2005), also printed in German. General text that covers many arguments from the point of view of condensed matter physics.

D. A. Neamen, Semiconductor Physics and Devices (McGraw-Hill, 2012). General treatment of semiconductor physics and devices, including both basic and more advanced topics.

Introduction to optics and light waves: E. Hecht, Optics (Lehmanns); Optical properties of materials: M. Fox, Optical Properties of Solids (Oxford U. Press)

Optoelectronic devices: D. A. Neamen (see above); Simon Sze, Physics of Semiconductor Devices (Wiley)

Physik I and II, Materialphysik I and II. The lecture will be given in English. The script will be available in English.

**401-2813-00L Programming Techniques for Scientific Simulations I**

*Students in the Master's Degree Programme in Computational Science and Engineering must enrol only if this course unit is an additional requirement.*

**Abstract**
This lecture provides an overview of programming techniques for scientific simulations. The focus is on basic and advanced C++ programming techniques and scientific software libraries. Based on an overview over the hardware components of PCs and supercomputer, optimization methods for scientific simulation codes are explained.

**Objective**
The goal of the course is that students learn basic and advanced programming techniques and scientific software libraries as used and applied for scientific simulations.

**401-2283-00L Analysis III (Measure Theory)**

**Abstract**
Measure and integration theory, including: Caratheodory's theorem, Lebesgue measure, Radon measure, Hausdorff measure, convergence theorems, L^p spaces, Radon-Nikodym theorem, product measure and Fubini's theorem

**Objective**
Basics of abstract measure and integration theory

**Content**
Measure Spaces (Lebesgue Measure, Hausdorff Measure, Radon Measure)
- Measurable Functions: definition and properties
- Integration: definition, properties, theorems of convergence, Lebesgue L^p spaces
- Product Measures and Multiple Integrals. Fubini and Tonelli Theorems, Convolutions
- Differentiation of measures (if time permits)

**Lecture notes**

**Literature**
1. Lecture notes by Professor Michael Struwe (http://www.math.ethz.ch/~struwe/Skripten/AnalysisIII-SS2007-18-4-08.pdf)
2. L. Evans and R.F. Gariepy "Measure theory and fine properties of functions"
3. Walter Rudin "Real and complex analysis"
4. R. Bartle The elements of Integration and Lebesgue Measure

**401-3461-00L Functional Analysis I**

**Abstract**
Baire category; Banach and Hilbert spaces, bounded linear operators; basic principles: Uniform boundedness, open mapping/closed graph theorem, Hahn-Banach; convexity; dual spaces; weak and weak* topologies; Banach-Alaoglu; reflexive spaces; compact operators and Fredholm theory; closed graph theorem; spectral theory of self-adjoint operators in Hilbert spaces. Basics of Sobolev spaces.

**Objective**
Acquire a good degree of fluency with the fundamental concepts and tools belonging to the realm of linear Functional Analysis, with special emphasis on the geometric structure of Banach and Hilbert spaces, and on the basic properties of linear maps.
Recommended references include the following:

Prerequisites / notice

Solid background on the content of all Mathematics courses of the first two years of the undergraduate curriculum at ETH. Most importantly: fluency with point set topology and measure theory, in part. Lebesgue integration and $L^p$ spaces.

401-3531-00L Differential Geometry I

401-3601-00L Probability Theory

can be recognised for the Master's degree in Mathematics or Applied Mathematics. In this case, you cannot change the category assignment by yourself in myStudies but must take contact with the Study Administration Office (www.math.ethz.ch/studiensekretariat) after having received the credits.

Abstract

Introduction to differential manifolds and differential geometry.

Objective

Learn to compute, describe, prove, and solve problems in the language of differential geometry.

Content

Submanifolds of $\mathbb{R}^n$, immersions, submersions, and embeddings, Sard's Theorem, abstract differentiable manifolds, charts, vector fields and flows, vector bundles, tensor fields, covariant derivatives, parallel transport, Riemannian metrics, geodesics, Riemann curvature tensor. Complete manifolds, Hopf-Rinow theorem. Many examples including curves, surfaces, hyperbolic space, $S^3$, the unit quaternions, the Gauss-Bonnet theorem, etc.

Literature

401-3601-00L Probability Theory

can be recognised for the Master's degree in Mathematics or Applied Mathematics. In this case, you cannot change the category assignment by yourself in myStudies but must take contact with the Study Administration Office (www.math.ethz.ch/studiensekretariat) after having received the credits.

Moreover, 401-3601-00L Probability Theory can only be recognised for the Master Programme in Mathematics if neither 401-3642-00L Brownian Motion and Stochastic Calculus nor 401-3602-00L Applied Stochastic Processes has been recognised for the Bachelor Programme.

Abstract

Basics of probability theory and the theory of stochastic processes in discrete time
This course presents the basics of probability theory and the theory of stochastic processes in discrete time. The following topics are planned:

- Measure theory formalism and probability theory, Dynkin's lemma and independence, convergence of series of independent random variables, law of large numbers, conditional expectation, martingale convergence theorems, uniform integrability, optional stopping theorem for martingales, the Bienaymé-Galton-Watson process and its R-number, convergence in distribution and the central limit theorem.

This course presents the basics of probability theory and the theory of stochastic processes in discrete time. The following topics are planned:

- Measure theory formalism and probability theory, Dynkin's lemma and independence, convergence of series of independent random variables, law of large numbers, conditional expectation, martingale convergence theorems, uniform integrability, optional stopping theorem for martingales, the Bienaymé-Galton-Watson process and its R-number, convergence in distribution and the central limit theorem.

Lecture notes will be available in electronic form.

Lecture notes See information on course homepage

Prerequisites: Results and facts from probability theory as in the book "Probability Essentials" by J. Jacod and P. Protter will be used freely. Especially participants without a direct mathematics background are strongly advised to familiarise themselves with those tools before (or very quickly during) the course. A possible alternative to the above English textbook are the (German) lecture notes for the standard course "Wahrscheinlichkeitstheorie."

For those who are not sure about their background, we suggest to look at the exercises in Chapters 8, 9, 22-25, 28 of the Jacod/Protter book. If these pose problems, you will have a hard time during the course. So be prepared.
A. Hauser

Creative Thinking
Cooperation and Teamwork

The dynamics of glaciers and polar ice sheets is the key requisite to understand their history and their future evolution. We will take a closer look at ice deformation, basal motion, heat flow and glacier hydraulics. The specific dynamics of tide water and calving glaciers is investigated, as is the reaction of glaciers to changes in mass balance (and therefore climate).

Lecture notes
Will be provided on Moodle

Literature
A list of relevant literature is available on Moodle

Prerequisites / notice
High-school mathematics and physics knowledge required.

651-4101-00L Physics of Glaciers W 3 credits 3G M. Lüthi, F. T. Walter, M. Werder

Abstract
Understanding glaciers and ice sheets with simple physical concepts. Topics include the reaction of glaciers to the climate, flow of glacier ice, temperature in glaciers and ice sheets, glacier hydrology, glacier seismology, basal motion and calving glaciers. A special focus is the current development of the ice sheets of Greenland and Antarctica.

Objective
After the course the students are able understand and interpret measurements of ice flow, subglacial water pressure and ice temperature. They will have an understanding of glaciology-related physical concepts sufficient to understand most of the contemporary literature on the topic. The students will be well equipped to work on glacier-related problems by numerical modeling, remote sensing, and field work.

Content
The dynamics of glaciers and polar ice sheets is the key requisite to understand their history and their future evolution. We will take a closer look at ice deformation, basal motion, heat flow and glacier hydraulics. The specific dynamics of tide water and calving glaciers is investigated, as is the reaction of glaciers to changes in mass balance (and therefore climate).

401-6215-00L Using R for Data Analysis and Graphics (Part I) W 1.5 credits 1G A. Hauser

Abstract
The course provides the first part an introduction to the statistical/graphical/data science software R (https://www.r-project.org/) for scientists. Topics covered are data generation and selection, graphical and basic statistical functions, creating simple functions, basic types of objects.

Objective
The students will be able to use the software R for simple data analysis and graphics.

Content
The course provides the first part of an introduction to the statistical software R for scientists. R is free software that contains a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

Part I of the course covers the following topics:
- What is R?
- R Basics: reading and writing data from/to files, creating vectors & matrices, selecting elements of dataframes, vectors and matrices, arithmetics;
- Types of data: numeric, character, logical and categorical data, missing values;
- Simple (statistical) functions: summary, mean, var, etc., simple statistical tests;
- Writing simple functions;
- Introduction to graphics: scatter-, boxplots and other high-level plotting functions, embellishing plots by title, axis labels, etc., adding elements (lines, points) to existing plots.

The course focuses on practical work at the computer with R. We will make use of the graphical user interface RStudio: https://www.rstudio.org

Note: Part I of UsingR is complemented and extended by Part II, which is offered during the second part of the semester and which can be taken independently from Part I.

Lecture notes
An Introduction to R. http://stat.ethz.ch/R CRAN/doc/contrib/Lam-IntroductionToR_LHL.pdf

Prerequisites / notice
The course will be provided via the Moodle web learning platform.

Competencies
| Subject-specific Competencies | Concepts and Theories | assessed

401-6217-00L Using R for Data Analysis and Graphics (Part II) W 1.5 credits 1G M. Mächler

Abstract
The course provides the second part an introduction to the statistical software R for scientists. Topics are data generation and selection, graphical functions, important statistical functions, types of objects, models, programming and writing functions.

Objective
The students will be able to use the software R efficiently for data analysis, graphics and simple programming.
The course provides the second part of an introduction to the statistical software R (https://www.r-project.org/) for scientists. R is free software that contains a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

Part II of the course builds on part I and covers the following additional topics:
- Elements of the R language: control structures (if, else, loops), lists, overview of R objects, attributes of R objects;
- More on R functions;
- Applying functions to elements of vectors, matrices and lists;
- Object oriented programming with R: classes and methods;
- Tayloring R: options;
- Extending basic R: packages

Lecture notes
The course focuses on practical work at the computer. We will make use of the graphical user interface RStudio: www.rstudio.org

Prerequisites / notice
Basic knowledge of R equivalent to "Using R .. (part 1)" (~ 401-6215-00L) is a prerequisite for this course.

The course resources will be provided via the Moodle web learning platform. As from FS 2019, subscribing via Mystudies should *automatically* make you a student participant of the Moodle course of this lecture, which is at

https://moodle-app2.let.ethz.ch/course/view.php?id=20848

**401-4623-00L Time Series Analysis**

**Objective**
The goal of the course is to have a good overview of the different types of time series and the approaches used in their statistical analysis.

**Content**
This course treats modeling and analysis of time series, that is random variables which change in time. As opposed to the i.i.d. framework, the main feature exhibited by time series is the dependence between successive observations.

The key topics which will be covered as:

- Stationarity
- Autocorrelation
- Trend estimation
- Elimination of seasonality
- Spectral analysis, spectral densities
- ARMA, ARIMA, Introduction into GARCH models

**Literature**
The main reference for this course is the book "Introduction to Time Series and Forecasting", by P. J. Brockwell and R. A. Davis

**401-0625-01L Applied Analysis of Variance and Experimental Design**

**Objective**
Participants will be able to plan and analyze efficient experiments in the fields of natural sciences. They will gain practical experience by using the software R.

**Content**
Principles of experimental design, one-way analysis of variance, contrasts and multiple comparisons, multi-factor designs and analysis of variance, complete block designs, Latin square designs, random effects and mixed effects models, split-plot designs, incomplete block designs, two-series factorials and fractional designs, power.

**Literature**

**401-0647-00L Introduction to Mathematical Optimization**

**Objective**
The goal of the course is to obtain a good understanding of some of the most fundamental mathematical optimization techniques used to solve linear programs and basic combinatorial optimization problems. The students will also practice applying the learned models to problems in engineering.
The course starts with introducing selected concepts of thermodynamics for atmospheric processes: The students learn the concept of the thermodynamic equilibrium and derive the Clausius-Clayperon equation from the first law of thermodynamics. This equation is central for the phase transitions in clouds.

Students also learn to use thermodynamic charts (tephigrams) and to identify cloud base, cloud top, available convective energy in radiosonde ascents. Atmospheric mixing processes are introduced as a basis for fog formation. The concept of an air parcel is used to understand convection.

Aerosol particles are introduced in terms of their physical properties and their role in cloud formation based on Köhler theory. Thereafter cloud microphysical processes including ice nucleation are discussed.

With these basics, the different forms of precipitation (convective vs. stratiform) are discussed and how they can be identified in radar images. Students will also learn under which conditions severe convective storms (especially supercells with tornados) can form.

The concepts are applied to understand and judge the validity of different proposed artificial weather modification ideas.
We offer experiments covering the following topics:

- Experiments with examples from mechanics, optics, thermodynamics, electronics, electricity and nuclear physics.
- Basic topics from mechanics, optics, thermodynamics, electromagnetism and electronics; as well as central topics from nuclear and particle physics, quantum electronics, quantum mechanics, solid state physics and astrophysics.

The overarching topic of the student lab is an understanding of the fundamental challenges in experimental physics. The following aspects are particularly important:

- Why does one conduct experiments, and how should an experiment be planned?
- How does one set up an experiment? What are the important characteristics of measurement instruments and methods?
- Introduction to basic statistical data analysis
- Critical interpretation of measurement results
- Scientific communication, reporting, graphic representation of results
- Ethical aspects of experimental research and reporting

In the first week, only an introductory event is taking place in the lecture hall. This event provides relevant information regarding safety and organisational matters (e.g. testat conditions).

Students must pass an online safety test to be allowed to conduct experiments in the lab. It is recommended that every student acquires an individually adjusted safety goggle.

The following aspects are emphasized:

- understanding complicated physical phenomena
- structured approach to experiments with complex instruments
- various practical aspects of experimenting and determining uncertainties
- learning the relevant statistical methods for data analysis
- interpretation of measurements and uncertainties
- describing the experiments and the results in a scientifically proper manner, in direct analogy to publishing
- ethical aspects of experimental research and scientific communication

The following topics are covered:

- Ethical aspects of experimental research and reporting
- Scientific communication, reporting, graphic representation of results
- Critical interpretation of measurement results
- Introduction to basic statistical data analysis
- How does one set up an experiment? What are the important characteristics of measurement instruments and methods?
- Why does one conduct experiments, and how should an experiment be planned?

Students are required to attend a safety lecture on the first day of the course and pass the corresponding online moodle-test before being allowed to access the laboratory rooms and perform the experiments.

Instructions for experiments are available in English.

Manuals for the individual experiments are available in English.

For further information visit: https://ap.phys.ethz.ch

Please make an enrolment in mystudies.

Only students from 3rd Semester BSc Physics and IN are admitted to Physics Lab 2.

6 Experiments have to be conducted (typically in teams of 2).

From the Microscale to Climate, Cambridge Univ. Press, 391 pp., 2016.

An electronic version of this book can be obtained via the ETH library.

pdf-files of the revised book will be provided on moodle on a chapter-by-chapter basis.

There is a additional tutorial right after each lecture to give you the chance to ask further questions and discuss the exercises. The participation is recommended but voluntary.

Enrol at most once in the course of the Bachelor programme!

Abstract
This laboratory course provides basic training of experimental skills. These are experimental design, implementation, measurement, data analysis and interpretation, as well as error analysis. The experimental work has to be complemented by a concise written report, which trains the scientific writing skills.

Manuals for the individual experiments are available in English.

Objective
Students learn to independently perform advanced experiments and document them scientifically correct.

Students are required to attend a safety lecture on the first day of the course and pass the corresponding online moodle-test before being allowed to access the laboratory rooms and perform the experiments.

The following aspects are emphasized:
- understanding complicated physical phenomena
- structured approach to experiments with complex instruments
- various practical aspects of experimenting and determining uncertainties
- learning the relevant statistical methods for data analysis
- interpretation of measurements and uncertainties
- describing the experiments and the results in a scientifically proper manner, in direct analogy to publishing
- ethical aspects of experimental research and scientific communication

Content
We offer experiments covering the following topics:
Basic topics from mechanics, optics, thermodynamics, electromagnetism and electronics; as well as central topics from nuclear and particle physics, quantum electronics, quantum mechanics, solid state physics and astrophysics.

Lecture notes
Instructions for experiments are available in English.

Prerequisites / notice
From a variety of over 50 experiments, students have to perform 4 experiments covering different topics. The experimental work is complemented by writing a scientific report.

402-0218-BSL Research Project ■ W 8 credits 15A Supervisors

Abstract
Students conduct a small research project within a research group or carry out a guided self-study of original papers on a given theoretical topic. The results are submitted in a written report and an oral presentation.

Objective
Students are enabled to:
- expand their knowledge in a specific area of physics,
- conduct a project (a) in a research laboratory or (b) on a specific topic of theoretical physics,
- discuss their project results and conclusions in a team,
- present their findings in written and oral form.

Objective
Introduction to basic notions and results of group, ring and field theory.

Content
Group Theory: basic notions and examples of groups, subgroups, factor groups, homomorphisms, group actions, Sylow theorems, applications

Ring Theory: basic notions and examples of rings, ring homomorphisms, ideals

Field Theory: basic notions and examples of fields and field extensions, applications

Literature
J.F. Humphreys: A Course in Group Theory (Oxford University Press)
G. Smith and O. Tabachnikova: Topics in Group Theory (Springer-Verlag)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: INI701

Mind the enrolment deadlines at UZH:
https://www.uzh.ch/cmsssl/en/studies/application/deadline
The colloquium in Neuroinformatics is a series of lectures given by invited experts. The lecture topics reflect the current themes in neurobiology and neuromorphic engineering that are relevant for our Institute.

The goal of these talks is to provide insight into recent research results. The talks are not meant for the general public, but really aimed at specialists in the field.

The topics depend heavily on the invited speakers, and thus change from week to week.

Recent Research Highlights in Astrophysics

Part I of this course covers the energy-related topics in this two-semester course. The importance of energy to life and our modern culture is explored and placed in the perspective of the ongoing energy transition in the context of necessary and urgent decarbonization efforts. How much energy do we need and how can it be provided in a way that enables a sustainable existence?

Why is energy important for life, economy and our society?
How did energy use change over time? Which effects did these changes have on the environment?
What are the physical basics of energy technologies?
When, why and how did technology and science of energy come together?
What are the limits and benefits of all the various energy technologies?
How can different energy technologies be compared?
Can we understand the changes in the current energy systems?
How will the energy systems of the future look like?
How fast can we and should we enforce the current energy transition?
Which could be the overall guide lines for a working and sustainable energy system of the future?
1. Introduction to Energy – what is it all about
2. Energy and making use of it – a short history of energy use and an overview on energy technologies
3. Coal, oil and natural gas – fossil fuels
4. Renewables I: Biomass, Hydropower, and Wind Energy – from traditional use to the modern concepts
5. Renewables II: Geothermal, Tidal power and Solar Technologies – new renewables to lead the change
6. Nuclear power, radioactivity and ultimate storage – the quest for a safe technology
7. Breeding and Nuclear Fusion – can it work at all?
8. Energy Storage – the need to increase capacity and for new technologies
9. Climate Change and Decarbonisation of the Energy Mix – how much time do we have?
11. Energy Systems – how everything can play together
12. Life Cycle Assessment of Energy Technologies – problems and possibilities
13. Economics of Energy, Learning Curves, Technology Assessments and Innovation
14. The Actual Energy Transition and Decarbonisation – How is your 2040, 2050?

Literature

- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management

Social Competencies
- Communication
- Cooperation and Teamwork
- Sensitivity to Diversity
- Negotiation

Personal Competencies
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection

Abstract

Objective

Introduction to the most important concepts of superconductivity both on phenomenological and microscopic level, including experimental and theoretical aspects.

Content

This lecture course provides an introduction to superconductivity, covering both experimental as well as theoretical aspects. The following topics are covered:
- Basic phenomena of superconductivity: thermodynamics, electrodynamics, London and Pippard theory; Ginzburg-Landau theory; spontaneous symmetry breaking, flux quantization, properties of type I and II superconductors; mixed phase; microscopic BCS theory; electron-phonon mechanism, Cooper pairing, coherent state, quasiparticle spectrum, thermodynamics and response to magnetic fields; Josephson effect, superconducting quantum interference devices (SQUID) and other applications.

Lecture notes

Lecture notes and additional materials are available.

Literature
- M. Tinkham "Introduction to Superconductivity"
- P. G. de Gennes “Superconductivity Of Metals And Alloys”
- A. A. Abrikosov “Fundamentals of the Theory of Metals”
- J.B. Ketterson & S.N. Song "Superconductivity"
- H. Stolz “ Supraleitung” (German)
- K. Fossheim & A. Sudbo “Superconductivity: Physics and Applications”

Prerequisites / notice

The preceding attendance of the scheduled lecture courses "Introduction to Solid State Physics" and "Quantum Mechanics I" are mandatory. The lectures "Quantum Mechanics II" and "Solid State Theory" provide the most optimal conditions to follow this course.

Electives (Physics Master)
The lecture series is motivated by an overview covering the skin of the crystals, roughness analysis, contact angle measurements, protein absorption/activity and monocyte behaviour.

As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting, oxidic and organic surfaces are introduced.

The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure's shapes, which are based on the strain relieving mechanisms and kinetic growth processes.

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. Recently, ellipsometry has been introduced to on-line monitor film thickness, and roughness with sub-nanometer precision. These characterisation techniques are vital for optimising the preparation of medical implants.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.

X rays are more and more often used to characterise the human tissues down to the nanometer level. The combination of highly intense beams only some micrometers in diameter with scanning enables spatially resolved measurements and the determination of tissue's anisotropies of biopsies.

<td>Abstract</td>
<td>The course provides an introduction to the functional properties of neurons. Particularly the description of membrane electrical properties (action potentials, channels), neuronal anatomy, synaptic structures, and neuronal networks. Simple models of computation, learning, and behavior will be explained. Some artificial systems (robot, chip) are presented.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>Understanding computation by neurons and neuronal circuits is one of the great challenges of science. Many different disciplines can contribute their tools and concepts to solving mysteries of neural computation. The goal of this introductory course is to introduce the monocultures of physics, maths, computer science, engineering, biology, psychology, and even philosophy and history, to discover the enchantments and challenges that we all face in taking on this major 21st century problem and how each discipline can contribute to discovering solutions.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>This course considers the structure and function of biological neural networks at different levels. The function of neural networks lies fundamentally in their wiring and in the electro-chemical properties of nerve cell membranes. Thus, the biological structure of the nerve cell needs to be understood if biologically-realistic models are to be constructed. These simpler models are used to estimate the electrical current flow through dendritic cables and explore how a more complex geometry of neurons influences this current flow. The active properties of nerves are studied to understand both sensory transduction and the generation and transmission of nerve impulses along axons. The concept of local neuronal circuits arises in the context of the rules governing the formation of nerve connections and topographic projections within the nervous system. Communication between neurons in the network can be thought of as information flow across synapses, which can be modified by experience. We need an understanding of the action of inhibitory and excitatory neurotransmitters and neuromodulators, so that the dynamics and logic of synapses can be interpreted. Finally, simple neural architectures of feedforward and recurrent networks are discussed in the context of co-ordination, control, and integration of sensory and motor information.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Literature</td>
<td>Connections to computer science and artificial intelligence are discussed, but the main focus of the course is on establishing the biological basis of computations in neurons.</td>

### 401-3621-00L

**Fundamentals of Mathematical Statistics**

- **Objective**: The course provides the basic knowledge necessary to understand, design and simulate analog electronic circuits. In the exercises, the concepts can be experienced in a hands-on manner. Every student has the opportunity to go through all steps of an electronic design cycle. Those include designing schematics, generating a printed circuit board layout, and the realization of a soldered prototype.

- **Competencies**
  - Subject-specific Competencies: Concepts and Theories, assessed
  - Method-specific Competencies: Analytical Competencies, assessed
  - Personal Competencies: Creative Thinking, assessed

### 402-0247-00L

**Electronics for Physicists I (Analogue)**

- **Objective**: In this course we study the basics of theoretical statistics. The course includes methods for designing estimators, confidence intervals and tests, and various ways to evaluate the accuracy of estimators, confidence intervals and tests. We consider optimality criteria such as admissibility and minimaxity, as well as Bayesian criteria. We will also present the asymptotic point of view.

- **Competencies**
  - Subject-specific Competencies: Concepts and Theories, assessed
  - Method-specific Competencies: Problem-solving, assessed
  - Personal Competencies: Creative Thinking, assessed

### 402-0010-00L

**Basics of Computing Environments for Scientists**

- **Abstract**: Introduce IT services at D-PHYS and offer modules covering IT-related topics for scientists.

- **Objective**: The "IT at D-PHYS" introduction provides a good understanding of how IT works at D-PHYS and presents an overview of the IT services and their providers. It is recommended for everyone joining the department.

- **Competencies**
  - Subject-specific Competencies: Concepts and Theories, fostered
  - Method-specific Competencies: Problem-solving, fostered
  - Social Competencies: Cooperation and Teamwork, fostered
  - Personal Competencies: Critical Thinking, fostered

---

**Data: 26.07.2024 12:39**  **Autumn Semester 2024**  **Page 2051 of 2680**
Introduction:

IT at D-PHYS (IT service providers and IT services at D-PHYS)
IT and Information Security

Modules:

- Linux Basics I (system components, basic shell usage)
- Linux Basics II (advanced tools, scripting)
- Python Ecosystem I (interpreters, packages, virtual environments)
- Python Ecosystem II (development environments, formatter and linter, string formatting, regexp)
- Python Ecosystem III (external data files, config parameters and automation)
- System Aspects (how the hardware affects your scientific code and vice versa)

**Abstract**
Anyone wishing to be a successful teacher must first of all understand the learning process. Against this background, theories and findings on the way humans process information and on human behaviour are prepared in such a manner that they can be used for planning and conducting lessons. Students additionally gain an understanding of what is going on in learning and behavioural research so that teachers are put in a position where they can further educate themselves in the field of research into teaching and learning.

**Objective**
This is class, students will learn concepts and skills for coping with psychosocial demands of teaching.

**Prerequisites / notice**
This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW1)".

</table>

**Abstract**
In this class, students will learn concepts and skills for coping with psychosocial demands of teaching.

**Objective**
Students possess theoretical knowledge and practical competences to be able to cope with the psychosocial demands of teaching.

1. They know relevant rules of conversation and conflict management and are able to apply them in an appropriate way in the school context (e.g. in parental talks).
2. They know core aspects of classroom management and know how to apply it concretely (e.g. promoting a positive learning atmosphere, avoiding disciplinary difficulties) and they are aware of possible contacts (e.g. illegal or psychological services).

**Abstract**
The focus will be on the book "Intelligenz: Grosse Unterschiede und ihre Folgen" by Stern and Neubauer. Participation at the first meeting is obligatory. It is required that all participants read the complete book. Furthermore, in two meetings of 90 minutes, concept papers developed in small groups (5 - 10 students) will be discussed.

**Objective**
- Getting to know intelligence tests
- Understanding findings relevant for education

---

**Physics TC**

Detailed information on the programme at: [www.didaktischeausbildung.ethz.ch](http://www.didaktischeausbildung.ethz.ch)

Please note that the course number will change from HS24 onwards. This change will have no effect on the courses and performances already completed and will be recognised for the respective degree.
**Deepening the understanding of knowledge formation and learning processes of primary and secondary students from a cognitive and developmental psychology perspective for students. The assistant ship provides didactic experience and exposure to a different school level (more heterogeneous groups such as for example low-performing Children, language problems etc.).**

**Students learn more about the potential and challenges of pupils, They get to know the early stages of knowledge as well as the development of pre-concepts of students in their subject area. The seminar with a phase of cooperation consists of three phases: In the block seminar, pre-concepts are discussed in their own subject as well as theoretical inputs from developmental and cognitive psychology. During the cooperation phase, a teaching task defined by the primary and secondary school teachers is actively undertaken in a class.**

**Finally, a final report is written, which contains a description of the students' level of knowledge. This seminar is only suitable for students who can adapt flexibly to the needs of pupils from lower class levels.**

---

**Course promotes exchange between student teachers and elementary school teachers in STEM teaching with 3 parts: 1) block seminar (ca. 16 h), 2) collaboration with elementary school teacher in a class (ca. 34 h, with approx. 50% spent in the elementary or middle school class and ca. 50% for preparation), and 3) final report (ca. 10 h). Registration implies participation in all 3 parts.**

**Objective**

**Content**

- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching. Analytical Competencies

**Teaching Internship Including Examination Lessons**

- **Physics Didactics I: Special Didactics of Physics**
  - **Course 402-0910-00L - is compulsory for Teaching Diploma Physic**
  - Limited number of participants.
  - Further information is available from the lecturer via email: mamohr@ethz.ch
  - Simultaneous enrolment in Introductory Internship Physics - course 402-0920-00L - is compulsory for Teaching Diploma Physic

**Objective**

**Content**

- The Studierenden verfügen über fachdidaktisches Grundwissen für den Physikunterricht an einer Mittelschule. Sie können eigene Lektionen unter Berücksichtigung der vielfältigen Rahmenbedingungen planen, durchführen und evaluieren. Sie reflektieren ihren Unterricht und sind bestrebt, ihn didaktisch und pädagogisch weiter zu entwickeln.
- Die Studierenden kennen die Einsatzmöglichkeiten, Chancen und Schwierigkeiten verschiedener Unterrichtsmethoden und Hilfsmittel. Sie können die Eignung von Unterrichtsformen im Hinblick auf eine Lernsituation beurteilen. Sie bemühen sich in ihrem Unterricht, geeignete Methoden und Medien angepasst an die Klasse und das Thema einzusetzen.

**Teaching Internship Physics for TC**

- **Teaching Internship Physics**
  - **Course 402-0915-00L - is compulsory for Teaching Diploma Physic**
  - Repetition of the Teaching Internship is excluded even if Examination Lessons are to be repeated.

**Abstract**

**Objective**

- Students apply the insights, abilities and skills they have acquired within the context of an educational institution. They observe 10 lessons and teach 20 lessons independently. Two of them are as assessed as Examination Lessons.
- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics for their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They learn the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils' work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

Die Themen für die beiden Prüfungslektionen am Schluss des Praktikums erfahren die Studierenden in der Regel eine Woche vor dem Prüfungstermin. Sie erstellen eine Vorbereitung gemäß Anleitung und reichen sie bis am Vortrag um 12 Uhr den beiden Prüfungsexperten (Fachdidaktiker/-in, Departementsvertreter/-in) ein. Die gehaltenen Lektionen werden kriteriumsbasiert beurteilt. Die Beurteilung umfasst auch die schriftliche Vorbereitung und eine mündliche Reflexion des Kandidaten/der Kandidatin über die gehaltenen Lektionen im Rahmen eines kurzen Kolloquiums.

**Lecture notes:**
Dokument: schriftliche Vorbereitung für Prüfungslektionen.

**Literature:**
Wird von der Praktikumslehrperson bestimmt.

<td>P. Morf</td>
</tr>
</tbody>
</table>

**Abstract**
Part I of this course covers the energy-related topics in this two-semester course. The importance of energy to life and our modern culture is explored and placed in the perspective of the ongoing energy transition in the context of necessary and urgent decarbonization efforts. How much energy do we need and how can it be provided in a way that enables a sustainable existence?

**Objective**
- Why is energy important for life, economy and our society?
- How did energy use change over time? Which effects did these changes have on the environment?
- What are the physical basics of energy technologies?
- What, when and how did technology and science of energy come together?
- What are the limits and benefits of all the various energy technologies?
- How can different energy technologies be compared?
- Can we understand the changes in the current energy systems?
- How will the energy systems of the future look like?
- How fast can we and should we enforce the current energy transition?
- Which could be the overall guide lines for a working and sustainable energy system of the future?
Content
1. Introduction to Energy – what is it all about
2. Energy and making use of it – a short history of energy use and an overview on energy technologies
3. Coal, oil and natural gas – fossil fuels
4. Renewables I: Biomass, Hydropower, and Wind Energy – from traditional use to the modern concepts
5. Renewables II: Geothermal, Tidal power and Solar Technologies – new renewables to lead the change
6. Nuclear power, radioactivity and ultimate storage – the quest for a safe technology
7. Breeding and Nuclear Fusion – can it work at all?
8. Energy Storage – the need to increase capacity and for new technologies
9. Climate Change and Decarbonisation of the Energy Mix – how much time do we have?
11. Life Cycle Assessment of Energy Technologies – problems and possibilities
13. The Actual Energy Transition and Decarbonisation – How is your 2040, 2050?

Literature
- The Physics of Energy, R.L. Jaffe, W. Taylor, 2018
- Clean Disruption of Energy and Transportation, T. Seba 2014

Prerequisites / notice
Basics of Physics applied to Energy and Energy Technology.
Investigation on current problems (and possible solutions) related to the energy system and the environmental interactions.

</table>

Abstract
In the mentored work on their subject specialisation, students link high-school and university aspects of the subject, thus strengthening their teaching competence with regard to curriculum decisions and the future development of the tuition. They compile texts under supervision that are directly comprehensible to the targeted readers - generally specialist-subject teachers at high-school level.

Objective
Practice in the explanation of complex topics in physics as the core competence of the teaching profession

Improvement of the physics education by providing attractive recent topics with regard to future curricular decisions and the public view of physics

Abstract
Passive components, linear networks, transmission lines, simulation of analog circuits, semiconductor components: diodes, bipolar and field-effect transistors, basic amplifier circuits, small signal analysis, differential amplifiers, noise, operational amplifiers, feedback and stability, oscillators, ADCs and DACs, introduction to CMOS technology

Objective
The lecture provides the basic knowledge necessary to understand, design and simulate analog electronic circuits. In the exercises, the concepts can be experienced in a hands-on manner. Every student has the opportunity to go through all steps of an electronic design cycle. Those include designing schematics, generating a printed circuit board layout, and the realization of a soldered prototype.
Content
Passive elements, linear complex networks, transmission lines, simulation of analog circuits (SPICE), semiconductor elements: diodes, bipolar and fieldeffect transistors, basic amplifier circuits, small signal analysis, differential amplifiers, noise in analog circuits, operational amplifiers, feedback and stability in amplifiers, oscillators, ADC's and DAC's, introduction in CMOS technology.

Practical exercises in small groups to the above themes complement the lectures.

Prerequisites / notice
no prior knowledge in electronics is required

Mentored Work Subject Didactics Physics A

Mentored Work Subject Didactics in Physics for TC and Teaching Diploma.

Abstract

In their mentored work on subject didactics, students put into practice the contents of the subject didactics lectures and go into these in greater depth. Under supervision, they compile tuition materials that are conducive to learning and/or analyse and reflect on certain topics from a subject-based and pedagogical angle.
Objective

The objective is for the students:
- to be able to familiarise themselves with a tuition topic by consulting different sources, acquiring materials and reflecting on the relevance of the topic and the access they have selected to this topic from a specialist, subject-didactics and pedagogical angle and potentially from a social angle too.
- to show that they can independently compile a tuition sequence that is conducive to learning and develop this to the point where it is ready for use.

Content

Thematic Focus
The topics of the mentored work are mostly chosen from the high school curriculum.

Methods

With the help of the mentor the students individually work on a topic and write a thesis about it.

Lecture notes

http://www.fachdidaktik.physik.ethz.ch/unterlagen.html

Prerequisites / notice

The mentored work should usually be finished before the teaching internship. FD2 (402-0909-00L) is required or should be achieved in the same semester.

Competencies

Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Data: 26.07.2024 12:39  Autumn Semester 2024  Page 2059 of 2680
During the introductory teaching practice, the students sit in on five lessons given by the teacher responsible for their teaching practice, and teach five lessons themselves. The students are given observation and reflection assignments by the teacher responsible for their teaching practice.

Right at the start of their training, students acquire initial experience with the observation of teaching, the establishment of concepts for teaching and the implementation of teaching. This early confrontation with the complexity of everything that teaching involves helps students decide whether they wish to and, indeed, ought to, continue with the training. It forms a basis for the subsequent pedagogical and subject-didactics training.

The candidates provide evidence of the subject-matter and didactic skills they have acquired in the course of their training.

In the context of an examination lesson conducted and graded at a high school, the candidates provide evidence of the subject-matter-based and didactic skills they have acquired in the course of their training.

Simultaneous enrolment in Physics Didactics: Special Didactics of Physics Teaching - course 402-0910-00L - is compulsory.

Abstract
During the introductory teaching practice, the students sit in on five lessons given by the teacher responsible for their teaching practice, and teach five lessons themselves. The students are given observation and reflection assignments by the teacher responsible for their teaching practice.

Objective
Right at the start of their training, students acquire initial experience with the observation of teaching, the establishment of concepts for teaching and the implementation of teaching. This early confrontation with the complexity of everything that teaching involves helps students decide whether they wish to and, indeed, ought to, continue with the training. It forms a basis for the subsequent pedagogical and subject-didactics training.

Content

402-0911-00L
Teaching Internship Physics ■ O 8 credits 17P M. Mohr

Abstract
The teaching practice takes place in 50 lessons: 30 are taught by the students, and the students sit in on 20 lessons. The teaching practice lasts 4-6 weeks. It gives students the opportunity to implement the contents of their specialist-subject, educational science and subject-didactics training in the classroom. Students also conduct work assignments in parallel to their teaching practice.

Objective
- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics in their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They acquire the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils’ work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

402-0913-00L
Teaching Internship Physics II ■ W 4 credits 9P M. Mohr

Abstract
This is a supplement to the Teaching Internship required to obtain a Master of Advanced Studies in Secondary and Higher Education in the corresponding subject. It is aimed at enlarging the already acquired teaching experience. Students observe 10 lessons and teach 15 lessons independently.

Objective
Die Studierenden können die Bedeutung von Unterrichtsthemen in ihrem Fach unter verschiedenen Blickwinkeln einschätzen. Sie kennen und beherrschen das unterrichtliche Handwerk. Sie können ein gegebenes Unterrichtsthema für eine Gruppe von Lernenden fachlich und didaktisch korrekt strukturieren und in eine adäquate Lernumgebung umsetzen. Es gelingt ihnen, die Balance zwischen Anleitung und Offenheit zu finden, sodass die Lernenden sowohl über den nötigen Freiraum wie über ausreichend Orientierung verfügen, um aktiv und effektiv flexibel nutzbares (Fach-)Wissen zu erwerben.

Content
Die Studierenden können die Bedeutung von Unterrichtsthemen in ihrem Fach unter verschiedenen Blickwinkeln einschätzen. Sie kennen und beherrschen das unterrichtliche Handwerk. Sie können ein gegebenes Unterrichtsthema für eine Gruppe von Lernenden fachlich und didaktisch korrekt strukturieren und in eine adäquate Lernumgebung umsetzen. Es gelingt ihnen, die Balance zwischen Anleitung und Offenheit zu finden, sodass die Lernenden sowohl über den nötigen Freiraum wie über ausreichend Orientierung verfügen, um aktiv und effektiv flexibel nutzbares (Fach-)Wissen zu erwerben.

Prerequisites / notice
Findet in der Regel am Schluss der Ausbildung, vor Ablegung der Prüfungslektionen statt.

402-0921-01L
Examination Lesson I Physics ■ O 1 credit 2P M. Mohr

Abstract
In the context of an examination lesson conducted and graded at a high school, the candidates provide evidence of the subject-matter-based and didactic skills they have acquired in the course of their training.

Objective
- to analyze the tuition they have given with regard to its strengths and weaknesses, and outline improvements.
- They learn to assess pupils’ work.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They are able to assess the significance of tuition topics in their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They acquire the skills of the teaching trade.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

Content
In the context of an examination lesson conducted and graded at a high school, the candidates provide evidence of the subject-matter-based and didactic skills they have acquired in the course of their training.

Prerequisites / notice
Nach Abschluss der Übrigen Ausbildung.

402-0921-02L
Examination Lesson II Physics ■ O 1 credit 2P M. Mohr

Abstract
In the context of an examination lesson conducted and graded at a high school, the candidates provide evidence of the subject-matter-based and didactic skills they have acquired in the course of their training.
This lecture gives a general introduction to main topics in modern astronomy. The lecture provides a basis for the more advanced lectures in astrophysics.

On the basis of a specified topic, the candidate shows that they are in a position to analyze the tuition they have given with regard to its strengths and weaknesses, and outline improvements.

Dokument: Schriftliche Vorbereitung für Prüfungslektionen.

Kopien der Präsentationen werden zur Verfügung gestellt.

Prerequisites / notice
- Nach Abschluss der übrigen Ausbildung.

Core courses that counted towards the Bachelor or Master programme in physics or comprised additional admission requirements in subject didactics are not eligible for the teaching diploma.

Mentored Work Specialised Courses in Physics with an Educational Focus B
Mentored Work Specialised Courses in the Respective Subject with an Educational Focus in Physics for Teaching Diploma and for students upgrading TC to Teaching Diploma.

Abstract
In the mentored work on their subject specialisation, students link high-school and university aspects of the subject, thus strengthening their teaching competence with regard to curriculum decisions and the future development of the tuition. They compile texts under supervision that are directly comprehensible to the targeted readers - generally specialist-subject teachers at high-school level.

Objective
Practice in the explanation of complex topics in physics as the core competence of the teaching profession

Content
Choice of topic by individual arrangement

Competencies
Subject-specific Competencies

402-0924-00L Internship Physics Didactics
W 4 credits 9P M. Mohr, A. Vaterlaus

Abstract
During the Internship Physics Didactics students teach 8 lessons in the classes of an internship teaching person. Students develop, test and analyze teaching arrangement under the guidance of a mentor (one of the lecturers).

Objective
Basic knowledge for the design of teaching arrangements is the topic of the Physics Didactics I and II courses. In the subsequent Internship Physics Didactics students combine the theoretical knowledge acquired in the didactics courses with practical aspects of teaching. During the internship students learn to transform their teaching goals into a real live classroom setting considering subject specific, didactical and pedagogical aspects.

Content

Lecture notes
Wird vom Mentor bestimmt.
Das Fachdidaktikpraktikum kann erst nach dem Besuch der FD1 und frühestens mit der FD2 durchgeführt werden (eine gleichzeitige Belegung von Fachdidaktik 2 und Fachdidaktikpraktikum ist möglich).

**402-0263-00L Astrophysics I**

**Physics BSc students with programme regulations 2016 need to register for "402-0263-10L Astrophysics".**

**Abstract**

This introductory course will develop basic concepts in astrophysics as applied to the understanding of the physics of planets, stars, galaxies, and the Universe.

**Objective**

The course provides an overview of fundamental concepts and physical processes in astrophysics with the dual goals of: i) illustrating physical principles through a variety of astrophysical applications; and ii) providing an overview of research topics in astrophysics.

**Literature**

Astrophysics for physicist, Arnab Ray Choudhuri

**Competencies**

**402-0255-00L Introduction to Solid State Physics**

**Physics BSc students with programme regulations 2016 need to register for "402-0255-10L Einführung in die Festkörperphysik".**

**Abstract**

The course provides an introduction to solid state physics, covering several topics that are later discussed in more detail in other more specialized lectures. The central topics are: solids and their lattice structures; interatomic bindings; lattice dynamics, electronic properties of insulators, metals, semiconductors, transport properties, and magnetism.

**Objective**

Introduction to Solid State Physics.

**Content**

The course provides an introduction to solid state physics, covering several topics that are later discussed in more detail in other more specialized lectures. The central topics are: solids and their lattice structures; interatomic bindings; lattice dynamics, thermal properties of insulators; metals (classical and quantum mechanical description of electronic states, thermal and transport properties of metals); semiconductors (bandstructure and n/p-type doping); magnetism.

**Lecture notes**

The script will be available on moodle.

**Literature**

C. Kittel, Festkörperphysik

Ashcroft & Mermin, Festkörperphysik

**Prerequisites / notice**

**402-0247-00L Electronics for Physicists I (Analogue)**

**W 4 credits 2V+2P**

G. Bison, W. Erdmann

**Abstract**

Passive components, linear networks, transmission lines, simulation of analog circuits, semiconductor components: diodes, bipolar and field-effect transistors, basic amplifier circuits, small signal analysis, differential amplifiers, noise, operational amplifiers, feedback and stability, oscillators, ADCs and DACs, introduction to CMOS technology

**Objective**

The lecture provides the basic knowledge necessary to understand, design and simulate analog electronic circuits. In the exercises, the concepts can be experienced in a hands-on manner. Every student has the opportunity to go through all steps of an electronic design cycle. Those include designing schematics, generating a printed circuit board layout, and the realization of a soldered prototype.

**Content**

Passive elements, linear complex networks, transmission lines, simulation of analog circuits (SPICE), semiconductor elements: diodes, bipolar and fieldeffect transistors, basic amplifier circuits, small signal analysis, differential amplifiers, noise in analog circuits, operational amplifiers, feedback and stability in amplifiers, oscillators, ADCs and DACs, introduction in CMOS technology. Practical excercises in small groups to the above themes complement the lectures.

**Prerequisites / notice**

no prior knowledge in electronics is required
Compulsory Elective Courses

Further course offerings from the category Educational Science are listed under "Programme: Educational Science for Teaching Diploma and TC".

252-0855-00L | Computer Science in Secondary School Mathematics W 4 credits 3G | D. Komm, J. Hromkovic, G. Serafini |
| Abstract   | The unit "Computer Science in Secondary School Mathematics" addresses key contributions of computer science to general education, the tight relations between the algorithmic and the mathematical way of thinking, and the thoughtful choice of computer science topics for high school mathematics classes. |
Objective

The general goal of the course consists in presenting ways to teach fundamentals of computer science, which are closely related to contents and methods of mathematics. After attending the course unit, a mathematics teacher is able to teach selected fundamentals of computer science in mathematics classes.

The students understand the fundamental concepts of computer science in the context of a broad and deep knowledge. Through this understanding, they manage to prepare teaching materials for a successful knowledge transfer and to pass their passion for the subject on to their pupils.

The students know various teaching methods as well as their advantages and disadvantages. They can handle inhomogeneous prior knowledge of the learners inside a class. Besides holding classes, the students do care about the individual pupil support.

They encourage the autonomy of the learners, manage to work with diverse target groups and to establish a positive learning environment.

The students are able to express themselves using a comprehensible and refined professional language, both in a spoken and a written way, and they master the basic terminology of computer science. Besides the English terms, they are familiar with the corresponding German expressions. The students are able to produce detailed, matured, linguistically correct and design-wise appealing teaching materials.

Content

The main topics of the course unit "Computer Science in Secondary School Mathematics" represent a scientific and didactic added value for mathematics classes.

The course covers the didactics of logic, of cryptography, of finite state automata, of computability and of the introduction to programming.

The students develop the understanding of fundamental scientific concepts such as algorithm, program, complexity, determinism, computation, automata, verification, testing, security of a cryptosystem and secure communication. They reflect on ways to embed them into a scientifically sound and didactically sustainable mathematics course.

In a semester exercise, the students develop and document an adaptive teaching unit for computer science. They learn to employ the didactics methods and techniques that are introduced at the beginning of the semester.

Prerequisites / notice

no prior knowledge in electronics is required

Comprehending the basic concepts can be experienced in a hands-on manner. Every student has the opportunity to go through all steps of an electronic design cycle. Those include designing schematics, generating a printed circuit board layout, and the realization of a soldered prototype.

Practical exercises in small groups to the above themes complement the lectures.

**Lecturers**

W. Wegscheider

The purpose of this course is to learn to navigate the complex collective quantum phases, excitations and phase transitions that are the dominant theme in modern solid state physics. The emphasis is on the main concepts and on specific experimental examples, both classic ones and those from recent research.

**Objective**

The goal is to study how novel phenomena emerge in the solid state.

**Content**

Today's challenges and opportunities in Solid State Physics:

Phase transitions and critical phenomena, Fermi surface instabilities, Superconductors, Magnetism of insulators, Semiconductors

**Lecture notes**

The printed material for this course involves: (1) a self-contained script, distributed electronically at semester start. (2) experimental examples (Power Point slide-style) selected from original publications, distributed at the start of every lecture.

**Literature**

A list of books will be distributed. Numerous references to useful published scientific papers will be provided.

This course is for students who like to be engaged in active learning. The "exercise classes" are organized in a non-traditional way: following the idea of "less is more", we will work on only about half a dozen topics, and this gives students a chance to take a look at original literature (provided), and to get the grasp of a topic from a broader perspective.

The "compulsory performance element" of this lecture is a presentation of a paper complementing the lecture topics. Several topics and corresponding papers will be offered on the moodle page of this lecture.

A. Imamoglu

This course gives an introduction to the fundamental concepts of Quantum Optics and will highlight state-of-the-art developments in this rapidly evolving discipline. The topics covered include the quantum nature of light, semi-classical and quantum mechanical description of light-matter interaction, laser manipulation of atoms and ions, optomechanics and quantum computation.

**Abstract**

This course gives an introduction to the fundamental concepts of Quantum Optics and will highlight state-of-the-art developments in this rapidly evolving discipline. The topics covered include:

- coherence properties of light
- quantum nature of light: statistics and non-classical states of light
- light matter interaction: density matrix formalism and Bloch equations
- quantum description of light matter interaction: the Jaynes-Cummings model, photon blockade
- further topics: Rydberg atoms, optomechanics, quantum computing, complex quantum systems.

**Objective**

The course aims to provide the knowledge necessary for pursuing research in the field of Quantum Optics. Fundamental concepts and techniques of Quantum Optics will be linked to modern experimental research. During the course the students should acquire the capability to understand currently published research in the field.

**Content**

This course gives an introduction to the fundamental concepts of Quantum Optics and will highlight state-of-the-art developments in this rapidly evolving discipline. The topics that are covered include:

- coherence properties of light
- quantum nature of light: statistics and non-classical states of light
- light matter interaction: density matrix formalism and Bloch equations
- quantum description of light matter interaction: the Jaynes-Cummings model, photon blockade
- further topics: Rydberg atoms, optomechanics, quantum computing, complex quantum systems.

**Lecture notes**

Selected book chapters will be distributed.

Autumn Semester 2024

Page 2068 of 2680
### 402-0402-00L Ultrafast Laser Physics

**Abstract**
Introduction to ultrafast laser physics with an outlook into cutting edge research topics such as attosecond science and coherent ultrafast sources from THz to X-rays.

**Objective**
Understanding of basic physics and technology for pursuing research in ultrafast laser science. How are ultrashort laser pulses generated, how do they interact with matter, how can we measure these shortest man-made events and how can we use them to time-resolve ultrafast processes in nature? Fundamental concepts and techniques will be linked to a selection of hot topics in current research and applications.

**Content**
The lecture covers the following topics:

- Linear pulse propagation: mathematical description of pulses and their propagation in linear optical systems, effect of dispersion on ultrashort pulses, concepts of pulse carrier and envelope, time-bandwidth product
- Dispersion compensation: technologies for controlling dispersion, pulse shaping, measurement of dispersion
- Nonlinear pulse propagation: intensity-dependent refractive index (Kerr effect), self-phase modulation, nonlinear pulse compression, self-focusing, filamentation, nonlinear Schrödinger equation, solitons, non-instantaneous nonlinear effects (Raman/Brillouin), self-steepening, saturable gain and absorption
- Second-order nonlinearities with ultrashort pulses: phase-matching with short pulses and real beams, quasi-phase matching, second-harmonic and sum-frequency generation, parametric amplification and generation
- Relaxation oscillations: dynamical behavior of rate equations after perturbation
- Q-switching: active Q-switching and its theory based on rate equations, active Q-switching technologies, passive Q-switching and theory
- Active modelocking: introduction to modelocking, frequency comb versus axial modes, theory for various regimes of laser operation, Haus master equation formalism
- Passive modelocking: slow, fast and ideally fast saturable absorbers, semiconductor saturable absorber mirror (SESAM), designs of and materials for SESAMs, modelocking with slow absorber and dynamic gain saturation, modelocking with ideally fast saturable absorber, Kerr-lens modelocking, soliton modelocking, Q-switching instabilities in modelocked lasers, inverse saturable absorption
- Pulse duration measurements: rf cables and electronics, fast photodiodes, linear system theory for microwave test systems, intensity and interferometric autocorrelations and their limitations, frequency-resolved optical gating, spectral phase interferometry for direct electric-field reconstruction and more
- Noise: microwave spectrum analyzer as laser diagnostics, amplitude noise and timing jitter of ultrafast lasers, lock-in detection
- Ultrafast measurements: pump-probe scheme, transient absorption/differential transmission spectroscopy, four-wave mixing, optical gating and more
- Frequency combs and carrier-envelope offset phase: measurement and stabilization of carrier-envelope offset phase (CEP), time and frequency domain applications of CEP-stabilized sources
- High-harmonic generation and attosecond science: non-perturbative nonlinear optics / strong-field phenomena, high-harmonic generation (HHG), phase-matching in HHG, attosecond pulse generation, attosecond technology: detectors and diagnostics, attosecond metrology (streaking, RABBITT, transient absorption, attoclock), example experiments
- Ultrafast THz science: generation and detection, physics in THz domain, weak-field and strong-field applications

**Literature**
- https://doi.org/10.1007/978-3-030-82532-4

**Prerequisites**
- Prerequisites: Basic knowledge of quantum electronics (e.g., 402-0275-00L Quantenelektronik).

### 402-0891-00L Phenomenology of Particle Physics I

**Abstract**
The course focuses on the connection between particle physics theory and experimental results to provide a comprehensive modern view of the Standard Model. The covered topics are quantum electrodynamics (QED) and quantum chromodynamics (QCD).

**Objective**
The students will deepen the knowledge on particle physics acquired during their bachelor studies. They will be able to apply the basics of relativistic quantum field theory (QFT) to derive the Feynman rules and to apply those to compute QED and QCD processes. They will be able to explain and discuss the connection between theory and experiments.

**Content**
- Relativistic kinematics
- Decay rates and cross sections
- Quantisation of Klein-Gordon (boson) and Dirac (fermion)'s fields
- From the S-matrix to the Feynman rules of QED
- Scattering processes in QED/QCD and running of alpha and alpha_s
- Experimental tests of QED and QCD

**Literature**
As described in the entity: Lernmaterialien
The course covers the key concepts and formalism of quantum information processing. Topics include quantum algorithms, quantum error correction, quantum cryptography, and quantum metrology, with an emphasis on the power of quantum information processing beyond that of classical information processing. The formalism of quantum states, measurements, and channels is developed in detail.

By the end of the course students are able to explain the basic mathematical formalism of quantum mechanics and apply it to quantum circuits, quantum algorithms (Shor, Grover, Deutsch-Josza,..), stabilizer-based quantum error correction, fault-tolerant designs, the BB84 quantum key distribution protocol, and simple methods of quantum metrology.

Please note:

A good understanding of finite dimensional linear algebra is recommended.

Prerequisites / Literature

Quantum Computation and Quantum Information
Michael Nielsen and Isaac Chuang
Cambridge University Press

The class will be taught in English language.

Cambridge University Press

- Quantum dots
- NV-centers
- Rydberg atoms
- NMR
- Photons
- Superconducting Circuits
- Ions
- Charge and flux quanta in superconducting circuits.

Novel hybrid systems.

Throughout the past 20 years the realm of quantum physics has entered the domain of information technology in more and more prominent ways. Enormous progress in the physical sciences and in engineering and technology has allowed us to build novel types of information processors based on the concepts of quantum physics. In these processors information is stored in the quantum state of physical systems forming quantum bits (qubits). The interaction between qubits is controlled and the resulting states are read out on the level of single quanta in order to process information. Realizing such challenging tasks is believed to allow constructing an information processor much more powerful than a classical computer. This task is taken on by academic labs, startups and major industry. The aim of this class is to give a thorough introduction to physical implementations pursued in current research for realizing quantum information processors. The field of quantum information science is one of the fastest growing and most active domains of research in modern physics.

Introduction to experimental systems for quantum information processing (QIP). - Quantum bits - Coherent Control - Measurement - Decoherence QIP with - Ions - Superconducting Circuits - Photons - NMR - Rydberg atoms - NV-centers - Quantum dots

More information on this class can be found on the web site www.qudev.ethz.ch
Classical and Quantum Parametric Phenomena

**Abstract**
There are numerous physical phenomena that rely on time-dependent Hamiltonians (or parametric driving) to amplify, cool, squeeze or couple resonating systems. In this course, we will introduce parametric phenomena in different fields of physics, ranging from classical engineering ideas to devices proposed for quantum computing.

**Objective**
This course is intended for:
- Experimentalists who desire to gain a solid theoretical understanding of nonlinear driven-dissipative systems,
- Theorists looking to enter a topical new field,
- Any scientist interested to learn what lies beyond the harmonic resonator.

In the course, the students will grasp the ubiquitous nature of parametric phenomena and apply it to both classical and quantum systems. The students will understand both the theoretical foundations leading to the parametric drive as well as the experimental aspect related to the realizations of the effect. Each student will analyze an independent system using the tools acquired in the course and will present his/her insights to the class.

**Content**
This course will provide a general framework for understanding and linking various phenomena, ranging from the child-on-a-swing problem to quantum-limited amplifiers, to optical frequency combs, and to optomechanical sensors used in the LIGO experiment. The course will combine theoretical lectures and the study of important experiments through literature.

The students will receive an extended lecture summary as well as numerous Python scripts, including some that are base on the QuTiP library. These tools will enable them to apply analytical and numerical methods to a wide range of systems beyond the duration of the course.

**Lecture notes**
A full script will be available in the form of chapters from a dedicated book ("Classical and Quantum Parametric Phenomena").

**Prerequisites / notice**
The students should be familiar with wave mechanics as well as second quantization. Following the course requires a laptop with Python installed to run Jupyter notebooks, including the QuTiP library.

---

Ultrafast Processes in Solids

**Abstract**
Ultrafast processes in solids are of fundamental interest as well as relevant for modern technological applications. The dynamics of the lattice, the electron gas as well as the spin system of a solid are discussed. The focus is on time resolved experiments which provide insight into pico- and femtosecond dynamics.

**Objective**
After attending this course you understand the dynamics of essential excitation processes which occur in solids and you have an overview over state of the art experimental techniques used to study fast processes.

**Content**
1. Experimental techniques, an overview
2. Dynamics of the electron gas
   2.1 First experiments on electron dynamics and lattice heating
   2.2 The finite lifetime of excited states
   2.3 Detection of lifetime effects
   2.4 Dynamical properties of reactions and adsorbents
3. Dynamics of the lattice
   3.1 Phonons
   3.2 Non-thermal melting
4. Dynamics of the spin system
   4.1 Laser induced ultrafast demagnetization
   4.2 Ultrafast spin currents generated by lasers
   4.3 Landau-Lifschitz-Dynamics
   4.4 Laser induced switching
5. Correlated materials

**Lecture notes**
will be distributed

**Literature**
relevant publications will be cited

**Prerequisites / notice**
The lecture can also be followed by interested non-physics students as basic concepts will be introduced.
Introduction to Magnetism

Abstract
This course tackles the fundamental question of why only a few materials exhibit magnetism in Nature. The origin of atomic magnetic moments and the key mechanisms that govern their interactions are justified starting from fundamental principles. In addition, the influence of thermal fluctuations on magnetic ordering is discussed as well as the formalism to describe magnetic resonance phenomena.

Objective
By the end of this course, students will develop the ability to utilize quantum mechanics concepts to estimate the strength of atomic magnetic moments and understand their reciprocal interactions. They will gain proficiency in interpreting experimental measurements on model systems in terms of material composition and an appropriate, phenomenological spin Hamiltonian. For instance, students will be able to recognize whether the magnetic hysteresis observed in some samples arises from slow dynamics or from a phase transition. Lastly, they will be capable of interpreting the occurrence of abrupt transitions or the emergence of characteristic length scales as resulting from the interplay between competing interactions. Altogether, students will acquire the basic knowledge needed to develop a research project in the field of magnetism or to attend effectively more advanced courses on this topic.

Content
The lecture “Introduction to Magnetism” aims at letting students familiarize themselves with the basic principles of quantum and statistical physics that determine the behavior of real magnets. Understanding why only a few materials are magnetic at finite temperature will be the leitmotiv of the course. We will see that defining in a formal way what “being magnetic” means is essential to address this question properly. Theoretical concepts will be applied to a few selected nano-sized magnets, which will serve as clean reference systems.

Topics:
- Magnetism in atoms (quantum-mechanical origin of atomic magnetic moments, intra-atomic exchange interaction)
- Magnetic order at finite temperatures (Ising, XY, and Heisenberg models, low-dimensional magnetism)
- Spin precession and relaxation (Larmor precession, resonance phenomena, quantum tunneling, Bloch equation, superparamagnetism)

Lecture notes / notice
Learning material will be made available through Moodle and through the ETH JupyterHub.

Literature
- Spin precession and relaxation (Larmor precession, resonance phenomena, quantum tunneling, Bloch equation, superparamagnetism)

Competencies
Subject-specific Competencies
Concepts and Theories
Techniques and Technologies

Method-specific Competencies
Analytical Competencies
Decision-making
Problem-solving
Project Management

Social Competencies
Communication
Self-presentation and Social Influence

Personal Competencies
Creative Thinking
Critical Thinking

Prerequisites / notice
Students will have the opportunity to self-assess their understanding through quizzes and interactive tutorials, mostly inspired by topics of current research in nanoscale magnetism.
Semiconductor Materials: Fundamentals and Fabrication

Abstract
This course gives an introduction into the fundamentals of semiconductor materials. The main focus is on state-of-the-art fabrication and characterization methods. The course will be continued in the spring term with a focus on applications.

Objective
Basic knowledge of semiconductor physics and technology. Application of this knowledge for state-of-the-art semiconductor device processing

Content
1. Fundamentals of Solid State Physics
   1.1 Semiconductor materials
   1.2 Band structures
   1.3 Carrier statistics in intrinsic and doped semiconductors
   1.4 p-n junctions
   1.5 Low-dimensional structures
2. Bulk Material growth of Semiconductors
   2.1 Czochalski method
   2.2 Floating zone method
   2.3 High pressure synthesis
3. Semiconductor Epitaxy
   3.1 Fundamentals of Epitaxy
   3.2 Molecular Beam Epitaxy (MBE)
   3.3 Metal-Organic Chemical Vapor Deposition (MOCVD)
   3.4 Liquid Phase Epitaxy (LPE)
   4. In situ characterization
   4.1 Pressure and temperature
   4.2 Reflectometry
   4.3 Ellipsometry and RAS
   4.4 LEED, AES, XPS
   4.5 STM, AFM
   5. The invention of the transistor - Christmas lecture

Lecture notes
https://moodle-app2.let.ethz.ch/course/view.php?id=23113

Prerequisites / notice
The "compulsory performance element" of this lecture is a short presentation of a research paper complementing the lecture topics. Several topics and corresponding papers will be offered on the moodle page of this lecture.

Competencies
Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies
Method-specific Competencies
- Analytical Competencies
- Media and Digital Technologies
- Problem-solving
Social Competencies
- Communication
- Self-presentation and Social Influence
- Sensitivity to Diversity
Personal Competencies
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-direction and Self-management

Seminar: Quantum Electronics

Advanced Topics in Quantum Optics

Abstract
The lecture will cover current topics and papers in the wider field of quantum optics in an interactive format. Several papers will be presented by the students in the style of a journal club. Selected papers will be contrasted and their strengths and weaknesses discussed by the students in panel discussions. Recent papers on arXiv.org will be discussed and referee reports referee reports.

Objective
The aim of the lecture is to deepen and broaden the knowledge about current research in the field of quantum optics. In addition, it will also be discussed and critically examined how research results are communicated via publications and lectures and which techniques are used in the process.

Content
We will select topical fields in quantum optics and quantum science and discuss recently published work.

Topics:
- Atoms or ions-based quantum computing
- Quantum simulation
- Opto-mechanics
- Driven and dissipative quantum systems
- Cavity based atom-light interaction
- Topological photonics

The interactive part of the lecture will include presentations of recent papers, panel discussions of recent papers and the writing of a critical assessment of an arXiv paper in the style of a referee report.

Competencies
Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies
Method-specific Competencies
- Analytical Competencies
Social Competencies
- Communication
Personal Competencies
- Creative Thinking
- Critical Thinking

Dissipative Quantum Systems

Abstract
This course builds up on the material covered in the Quantum Optics course. The emphasis will be on quantum optics in condensed-matter systems.

Competencies
Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies
Method-specific Competencies
- Analytical Competencies
- Media and Digital Technologies
- Problem-solving
Social Competencies
- Communication
- Self-presentation and Social Influence
- Sensitivity to Diversity
Personal Competencies
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-direction and Self-management

Selection: Quantum Electronics

Number | Title | Type | ECTS | Hours | Lecturers

402-0442-05L | Advanced Topics in Quantum Optics | W | 4 credits | 2G | T. Esslinger
402-0444-00L | Dissipative Quantum Systems | W | 6 credits | 2V+1U | A. Imamoglu

Does not take place this semester.
The course aims to provide the knowledge necessary for pursuing advanced research in the field of Quantum Optics in condensed matter systems. Fundamental concepts and techniques of Quantum Optics will be linked to experimental research in systems such as quantum dots, exciton-polaritons, quantum Hall fluids and graphene-like materials.

The first lectures will be dedicated to review the open questions of the Standard Model and the different Beyond Standard Model extensions which can be probed with quantum technologies. This will include searches for dark sector, dark matter, axion and axion-like particles, new gauge bosons (e.g. Dark photons) and extra short-range forces.

The main part of the course will introduce the following (quantum) technologies and systems, and how they can be used for probing New Physics.

- Cold atoms
- Trapped ions
- Atoms interferometry
- Atomic clocks
- Cold molecules and molecular clocks
- Exotic Atoms
- Anti-matter
- Quantum Sensors

The course presents fundamental aspects of light-matter interaction in semiconductor materials, from basic research topics to opto-electronic devices.

The rich physics of the optical properties of semiconductors, as well as the advanced processing available on these materials, enabled numerous applications as well as the realization of new physical concepts. In this course, we will learn the principles of light-matter interaction in semiconductors for single and multiple particle excitations, and cover opto-electronic applications based on these principles. We will study systems that include quantum dots, exciton-polaritons, quantum Hall fluids and graphene-like materials.

Prerequisites / notice

Requirements: A basic knowledge of solid-state physics and of quantum electronics.

402-0468-15L Nanomaterials for Photonic Devices W 6 credits 2V+1U R. Grange, E. Bailly, R. Chapman, V. Falcone, A. Morandi

Abstract
The lecture describes various nanomaterials (semiconductor, metal, dielectric, carbon-based...) for photonic applications (optoelectronics, plasmonics, photonic integrated circuits, ordered and disordered structures,...). It starts with concepts of light-matter interactions, fabrication and characterization, the description of the properties and the state-of-the-art applications and devices.

Objective
The students will acquire theoretical and experimental knowledge of the different types of nanomaterials (semiconductors, metals, dielectric, carbon-based, ...) and their uses as building blocks for advanced applications in photonics (optoelectronics, plasmonics, photonic crystal, ...). Together with the exercises, the students will learn (1) to read, summarize and discuss scientific articles related to the lecture, (2) to estimate order of magnitudes with calculations using the theory seen during the lecture, (3) to prepare a short oral presentation and report about one topic related to the lecture, and (4) to imagine an original photonic device.

Content
1. Introduction to nanophotonics
2. Wave physics for nanophotonics
3. Characterization of nanomaterials
4. Semiconductors
5. Nonlinear crystals
6. Photonic integrated circuits
7. Optical quantum devices
8. Plasmonics
9. Metasurfaces
10. Graphene & 2D Materials
11. Nanocomposites

Lecture notes
Slides and book chapter will be available for downloading

Literature
References will be given during the lecture

Prerequisites / notice
Basics of solid-state physics (i.e. energy bands) can help

Competencies
Subject-specific Competencies
- Concepts and Theories assessed
- Techniques and Technologies assessed

Method-specific Competencies

402-0475-00L Terahertz Science and Applications W 6 credits 2V+1U E. Abreu

Abstract
The Terahertz (THz) range (0.1 – 10 THz), lies between the infrared and microwave spectral regions and has become accessible in the past few years. This new capability has had great impact in scientific research, and has led to technological advances and the development of a variety of applications and devices. This course provides an introduction to THz science, technology and applications.

Objective
The goal of this course is to enable students to determine whether a THz solution can be applied to a particular scientific or technological problem. Armed with the fundamentals of THz science and of current THz technologies, covered in this introductory course, students will be able to weigh the capabilities, advantages and limitations of THz tools to address topics ranging from phonons in solid state systems and molecular vibrations in solutions to medical imaging and wireless communications.

Lecture notes
Will be distributed via moodle.

Literature
Yun-Shik Lee, Principles of Terahertz Science and Technology, Springer 2009

Additional references distributed via moodle.

Prerequisites / notice
Basic knowledge in physics, especially in electromagnetism, is required. No formal prerequisites.

402-0492-00L Experimental Techniques in Quantum and Electro-Optics W 6 credits 2V+1U D. Kienzler, D. Prado, Aude Craik

Autumn Semester 2024
Abstract
We will cover experimental issues in making measurements in modern physics experiments. The primary challenge in any measurement is achieving good signal to noise. We will cover areas such as optical propagation, electronics, noise limits and feedback control. Methods for stabilizing frequencies and intensities of laser systems will also be described.

Objective
I aim to give an in-depth understanding of experimental issues for students wishing to work on experimental science. The methods covered are widely applicable in modern physics, since light and electronics are the primary methods by which measurements are made across the field.

Content
The course will cover a number of different areas of experimental physics, including

- Optical elements and propagation
- Electronics and Electronic Noise
- Optical Detection
- Control Theory

Examples from a modern quantum information laboratory will be discussed and illustrated through active devices in the lecture.

Abstract
Recent years have witnessed incredible progress in the development of new quantum technologies driven by their application in quantum information, metrology, high precision spectroscopy and quantum sensing. This course will present how these emerging technologies are powerful tools to address open questions of the Standard Model in a complementary way to what is done at the high energy frontier.

Objective
The aim of this course is to equip students of different backgrounds with a solid base to follow this rapidly developing and exciting multi-disciplinary field.

Content
- Cold atoms
- Trapped ions
- Atoms interferometry
- Atomic clocks
- Cold molecules and molecular clocks
- Exotic Atoms
- Anti-matter
- Quantum Sensors

The main part of the course will introduce the following (quantum) technologies and systems, and how they can be used for probing New Physics:

- Cold atoms
- Trapped ions
- Atoms interferometry
- Atomic clocks
- Cold molecules and molecular clocks
- Exotic Atoms
- Anti-matter
- Quantum Sensors

Prerequisites / notice
The preceding attendance of introductory particle physics, quantum mechanics and quantum electronics courses at the bachelor level is recommended.

Abstract
This course gives an introduction into Accelerator Mass Spectrometry (AMS), the most sensitive method for measuring long-lived radionuclides in natural samples.

Objective
Students learn the basic concepts of Accelerator Mass Spectrometry. Based on the underlying physics of ion matter interaction they learn the measurement methods and interpretation of the results for most of the important AMS radionuclides, e.g. radiocarbon (14C), the cosmogenic radionuclides 10Be, 26Al, 36Cl, and anthropogenic nuclides 129I, 236U and other actinides.

Content
- Ion optics and ion acceleration.
- Mass separation, molecular destruction and isobar separation.
- Ion detection and identification.

The measurement methods for all the important radionuclides and the interpretation of their results are discussed on a few examples from the application:

- 14C – radiocarbon dating and environmental studies
- 10Be, 26Al, 36Cl – cosmogenic dating and ice core research
- 129I, 236U, actinides – anthropogenic tracers in the environment
- 41Ca – biomedical studies
- 60Fe, 244Pu – astrophysics

Alternative methods: ICP-MS, RIMS, ATTA

A visit to the Tandem accelerator and AMS facilities at ETH Hönggerberg is organized as part of lectures and exercises.

Abstract
Low energy particle physics provides complementary information to high energy physics with colliders. In this lecture, we will concentrate on flagship experiments which have significantly improved our understanding of particle physics today, concentrating mainly on precision experiments with neutrons, muons and exotic atoms.

Objective
You will be able to present and discuss:

- the principle of the experiments
- the underlying technique and methods
- the context and the impact of these experiments on particle physics
Low energy particle physics provides complementary information to high energy physics with colliders. At the Large Hadron Collider one directly searches for new particles at energies up to the TeV range. In a complementary way, low energy particle physics indirectly probes the existence of such particles and provides constraints for "new physics", making use of high precision and high intensities.

Besides the sensitivity to effects related with new physics (e.g. lepton flavor violation, symmetry violations, CPT tests, searches for electric dipole moments, new low mass exchange bosons etc.), low energy physics provides the best test of QED (electron g-2), the best tests of bound-state QED (atomic physics and exotic atoms), precise determinations of fundamental constants, information about the CKM matrix, precise information on the weak and strong force even in the non-perturbative regime etc.

Starting from a general introduction on high intensity/high precision particle physics and the main characteristics of muons and neutrons and their production, we will then focus on the discussion of fundamental problems and ground-breaking experiments:

- search for rare decays and charged lepton flavor violation
- electric dipole moments and CP violation
- spectroscopy of exotic atoms and symmetries of the standard model
- what atomic physics can do for particle physics and vice versa
- neutron decay and primordial nucleosynthesis
- atomic clock
- Penning traps
- Ramsey spectroscopy
- Spin manipulation
- neutron-matter interaction
- ultra-cold neutron production
- various techniques: detectors, cryogenics, particle beams, laser cooling....

Einführung in die Kern- und Teilchenphysik / Introduction to Nuclear- and Particle-Physics

---

**402-0767-00L**  
Neutrino Physics  

**W  6 credits  2V+1U**  
A. Rubbia, D. Sgalaberna

**Abstract**  
Theoretical basis and selected experiments to determine the properties of neutrinos and their interactions (mass, spin, helicity, chirality, oscillations, charge-parity violation, interactions with leptons and quarks) and implications on physics beyond the Standard Model of elementary particles as well as on Cosmology.

**Objective**  
Critically analyze and elaborate the neutrino production and detection techniques. Derive the theory of neutrino scattering and analyze its implications in neutrino experiments. Analyze the phenomenology of neutrino oscillations and its implication on the physics Beyond the Standard Model of particles. Derive the main concepts of the theory of neutrino masses within and beyond the Standard Model of particles and analyze the experimental techniques related to the measurement of the neutrino masses. Describe the role of neutrinos in Cosmology and make connections with current and future neutrino experiments. Review the experimental configurations and analyze the challenges in searches for leptonic Charge-Parity symmetry violation and the measurement of the neutrino mass hierarchy.

**Content**

1. Introduction to Neutrinos and Neutrino Sources;  
2. Neutrino Detectors  
3. Neutrino Interactions  
4. Neutrino Oscillations  
5. Nature of Neutrino masses  
6. Neutrinos in Cosmology  
7. Search for leptonic Charge Parity violation and precision measurement of the neutrino oscillation probability

M. Backhaus, D. Sgalaberna

**Abstract**  

**Objective**  
Acquire an in-depth understanding and overview of the essential elements of experimental methods in particle and astroparticle physics.

**Content**

1. Examples of modern experiments  
2. Introduction to particle sources and accelerators  
4. Detailed analysis of non-electronic, noble element, solid state, scintillator-based and Cherenkov particle detectors  
5. Experimental techniques for particle tracking, calorimetry and identification  
6. Monte Carlo simulations, trigger and data acquisition system readout

### Abstract
This is the first of two courses, introducing particle accelerators from a theoretical point of view and covers state-of-the-art modelling techniques.

### Objective
You obtain a theoretical understanding of the building blocks of particle accelerators. Modern numerical analysis tools allows you to model state-of-the-art particle accelerators. We will develop a Julia simulation tool (JuliaAccel.jl) that reflects the theory from the lecture.

### Content
Here is the rough plan of the topics, however the actual pace may vary relative to this plan.

- Recap of Relativistic Classical Mechanics and Electrodynamics
- Building Blocks of Particle Accelerators
- Lie Algebraic Structure of Classical Mechanics and Application to Particle Accelerators
- Symplectic Maps & Analysis of Maps
- Symplectic Particle Tracking
- Collective Effects
- Linear & Circular Accelerators

### Abstract
This lecture provides an overview of programming techniques for scientific simulations. The focus is on basic and advanced C++ programming techniques and scientific software libraries. Based on an overview over the hardware components of PCs and supercomputer, optimization methods for scientific simulation codes are explained.

### Objective
The goal of the course is that students learn basic and advanced programming techniques and scientific software libraries as used and applied for scientific simulations.

### Literature

### Abstract

### Objective
Introduction to the most important concepts of superconductivity both on phenomenological and microscopic level, including experimental and theoretical aspects.

### Content
This lecture course provides an introduction to superconductivity, covering both experimental as well as theoretical aspects. The following topics are covered:
- Basic phenomena of superconductivity: thermodynamics, electrodynamics, London and Pippard theory; Ginzburg-Landau theory: spontaneous symmetry breaking, flux quantization, properties of type I and II superconductors; mixed phase; microscopic BCS theory: electron-phonon mechanism, Cooper pairing, coherent state, quasiparticle spectrum, thermodynamics and response to magnetic fields; Josephson effect, superconducting quantum interference devices (SQUID) and other applications.

### Lecture notes
Lecture notes and additional materials are available.

### Literature
- M. Tinkham "Introduction to Superconductivity"
- P. G. de Gennes "Superconductivity Of Metals And Alloys"
- A. A. Abrikosov "Fundamentals of the Theory of Metals"
- J.B. Ketterson & S.N. Song "Superconductivity"
- H. Stolz "Supraleitung" (German)
- K. Fossheim & A. Sudbo "Superconductivity: Physics and Applications"
This course offers an introduction to computer simulation methods for physics problems and their implementation on PCs and supercomputers. The covered topics include classical equations of motion, partial differential equations (wave equation, diffusion equation, Maxwell's equations), Monte Carlo simulations, percolation, phase transitions, and N-Body problems.

Students learn to apply the following methods: Random number generators, Determination of percolation critical exponents, numerical solution of problems from classical mechanics and electrodynamics, canonical Monte-Carlo simulations to numerically analyze magnetic systems. Students also learn how to implement their own numerical frameworks in Julia and how to use existing libraries to solve physical problems. In addition, students learn to distinguish between different numerical methods to apply them to solve a given physical problem.

Introduction to computer simulation methods for physics problems. Models from classical mechanics, electrodynamic and statistical mechanics as well as some interdisciplinary applications are used to introduce modern programming methods for numerical simulations using Julia. Furthermore, an overview of existing software libraries for numerical simulations is presented.

Lecture notes and slides are available online and will be distributed if desired.

Abstract

This course gives an introduction to the theory of integrable systems, related symmetry algebras and efficient calculation methods.

Objective

Integrable systems are a special class of physical models that can be solved exactly due to an exceptionally large number of symmetries. Examples of integrable models appear in many different areas of physics including classical mechanics, condensed matter, 2D quantum field theories and lately in string- and gauge theories. They offer a unique opportunity to gain a deeper understanding of generic phenomena in a simplified, exactly solvable setting. In this course we introduce the notion and formulation of integrability in classical and quantum mechanics. We discuss various efficient methods for constructing solutions and eigenstates in these models. Finally, we elaborate on the enhanced symmetries that underly integrable models.

Content

• Classical Integrability
• Algebraic Methods for Integrability
• Classical Spin Chains
• Spectral Curves and Inverse Scattering
• Quantum Spin Chains
• Bethe Ansatz
• Classical and Quantum Algebra

402-0836-16L Quantum Simulations of Gauge Theories

W 6 credits

2V+1U

M. Krstic Marinkovic

Abstract

Does not take place this semester.

Divided into three parts, the course introduces various aspects of lattice quantum field theory (QFT), gauge symmetries, quantum simulators, and implementation schemes. Other than highlighting the strengths and weaknesses of the lattice formulation of QFTs suitable for Monte Carlo simulations, the course discusses practical realization of quantum simulators for gauge theories.

Objective

After acquiring the foundations on lattice formulation of gauge theories, and challenges of conventional Monte Carlo simulation approaches, the students will learn about different strategies for quantum simulation of gauge theories and their implementation on digital and analog quantum devices.

Content

1. Background and Motivation
   1.1 From Quantum Field Theories to Lattice field theories;
   1.2 Lattice Gauge Theories - Lagrangian formulation, gauge symmetries, observables;
   1.3 Monte Carlo simulations, sign problems, and complex actions.
2. Road-map for Quantum Simulation of Gauge Theories
   2.1 Hamiltonian formulation, Wilson's formulation, and the infinite Hilbert spaces;
   2.2 Finite Hilbert spaces: Z(N) gauge theories. Dualizing the ising model and relation with the toric code;
   2.3 Finite Hilbert spaces: Quantum link models for Abelian gauge theories;
   2.4 Finite Hilbert spaces: Quantum link models for non-Abelian gauge theories;
   2.5 Exploring the physics of gauge theories - phases, dynamics, and thermalization;
   2.6 Exploring methods for gauge theories - exact diagonalization, tensor networks, Monte Carlo.
3. Quantum Simulation Approaches and Platforms
   3.1 Digital vs. analog quantum simulations;
   3.2 Proposals for simulations of gauge theories, realization, and perspectives.

### 402-0845-61L Effective Field Theories for Particle Physics

**W 6 credits 2V+1U**

*Prerequisites / notice* QFT-I (mandatory) and QFT-II (highly recommended)

#### Objective
This course will cover the basic concepts of effective field theories (EFTs) and dispersion theory. We will start by introducing the core concept of constructing EFTs and apply them to the low-energy description of the weak interaction and the effective description of heavy physics beyond the Standard Model.

#### Content
- Introduction to Effective Field Theories
- Decoupling and matching
- Renormalization group resummation
- The Model Effective Field Theory (SMEFT)
- Chiral Lagrangians
- Unitarity of the S-matrix
- Analyticity and dispersion relations

*Prerequisites /

### 402-0865-70L Strongly Correlated Systems in Atomic and Condensed Matter Physics

**W 8 credits 3V+1U**

*Prerequisites / notice* Lecture notes will be handed out (in English).

#### Objective
This course will review recent progress in realizing strongly correlated many-body systems with ultracold atoms. Both theory and experiments will be discussed with an emphasis on the connection between the physics of ultracold atoms and correlated electron systems. The course will explore unique features of ultracold atoms such as dynamical control of Hamiltonians and single atom resolution.

#### Content
Subjects covered in this class include: Bose-Einstein condensation of weakly interacting atomic gases; analogue gravity with BEC; spinor condensates; noninteracting atoms in optical lattices and probes of band structure; state dependent lattices and synthetic gauge fields; Bose Hubbard model; quantum magnetism with ultracold atoms in optical lattices; quantum noise measurements as a probe of many-body states; Feshbach resonance; fermion pairing close to Feshbach resonance; the BCS-BEC crossover; polarons in systems of bosonic and fermionic ultracold atoms; fermionic Hubbard model; realizing and probing topological states with ultracold atoms; one dimensional systems; SU(N) magnetism and Kondo physics with alkaline-earth atoms; systems with long range interactions; many body localization; superradiance and Dicke quantum phase transitions in optical cavities for bosonic and fermionic atoms.

*Prerequisites / notice* Lecture notes will be handed out (in English).

### 402-0870-00L Introduction to Quantum Electrodynamics

**W 6 credits 2V+1U**

*Prerequisites / notice* Will be provided at the Moodle site for the course.

#### Objective
This course provides a pedagogical introduction to Quantum Electrodynamics.

#### Content
The course will cover:
- an introduction to QED as the quantum theory of interactions of light and matter.
- Feynman rules for QED
- Amplitudes and cross sections for simple processes in QED
- Gauge invariance and the Ward identity
- Ultraviolet singularities and Renormalization
- Infrared singularities and their cancelation
- The Ueling potential and the Lamb shift
- Anomalous magnetic moments

*Prerequisites / notice* Will be provided at the Moodle site for the course.
Content
Finite group theory, including representation theory and character methods; applications to crystallography and solid state physics. The symmetric group and the structure of its representations; applications to identical particles. Clifford algebras; application to relativistic wave equations equations. Simple Lie algebras and their finite-dimensional representations. Description of representations of SU(n) in terms of Young diagrams; applications in particle physics.

402-0886-00L QCD and Scattering Amplitudes
W 6 credits 2V+1U
A. Gehrmann-De Ridder

Abstract
The course presents the quantum field theory of the strong interaction (quantum chromodynamics, QCD) and discusses its applications to particle physics observables.

Objective
The course aims to familiarize the students with the concepts and applications of QCD and to introduce them to modern techniques for computations in QCD.

Content
- Review of non-Abelian gauge theories
- Renormalization of QCD and running coupling constant
- Jet observables in e+e- annihilation
- QCD at lepton-proton colliders
- Multiparticle production
- Spino-helicity formalism
- Perturbation theory techniques: loops and phase space

Prerequisites / notice
The course assumes prior knowledge of the content of the quantum field theory 1+2 lectures.

Competencies

Subject-specific Competencies

402-0897-00L Introduction to String Theory
W 6 credits 2V+1U
J. Brödel

Abstract
String theory is an attempt to quantise gravity and unite it with the other fundamental forces of nature. It is related to numerous interesting topics and questions in quantum field theory. In this course, an introduction to the basics of string theory is provided.

Objective
Within this course, a basic understanding and overview of the concepts and notions employed in string theory shall be given. More advanced topics will be touched upon towards the end of the course briefly in order to foster further research.

Content
- mechanics of point particles and extended objects
- string modes and their quantisation; higher dimensions, supersymmetry
- critical dimension and no-ghost theorem
- D-branes, T-duality
- two-dimensional conformal field theories

Literature
M.B. Green, J.H. Schwarz, E. Witten, Superstring Theory I, CUP (1987).

Prerequisites / notice
Recommended: Quantum Field Theory I (in parallel)

Abstract
Astronomical techniques and observing strategies are presented with a particular emphasis on currently available professional telescopes of the European Southern Observatory.

Objective
The course shall provide a basic understanding of the potential and limitation of different types of modern astronomical observations for early career researchers. The course will present technical aspects which are important to prepare, to carry out and to calibrate different types of astronomical measurements: photometry, spectroscopy, astrometry, polarimetry and others. Many practical examples will be discussed including methods for the detection of physical samples of cosmic dust. Also scientific aspects of instrumental projects and observational programs are addressed. An opportunity to contribute to solar spacecraft operations will be available during the course.

Content
1. Introduction: research projects in astronomical observations
2. Observables: electromagnetic radiation, particles
3. Optical telescopes: Optics, types, mechanical concepts, examples
4. Detectors: CCDs, IR detectors, basic data reduction steps
5. Photometry: signal extraction, calibration, faint sources, etc.
6. Spectroscopy: spectrographs, calibration, spectral features
7. Introduction to solar space instrumentation
8. Space observations of cosmic dust: introduction, remote sensing, in situ instruments, sample return, calibration, data analysis and practical examples
9. Speckles and adaptive optics: atmosphere, AO-systems
10. Polarimetry: measuring principles
11. Interferometry

Lecture notes
Notes will be distributed.

402-0355-00L Planet Formation
W 4 credits 2V
J. Szulagyi
This course reviews the formation processes of terrestrial- and gaseous planets, and their moons. It provides a basic understanding on how our Solar System came to be, and how other planetary systems form, as well as how/when planets & moons can be habitable places for life.

Objective
Overview the state of the art planet- and moon formation models and identify open questions in the field. Understanding the formation process of planetary systems, and the formation of habitable worlds.

Content
1) Planet types
2) The Solar System planets
3) Extrasolar Planets
4) The protoplanetary disk where planets are forming. The initial conditions for planet formation.
5) The formation of the building blocks of planets (so-called "planetesimals")
6) Terrestrial Planet formation
7) Formation models of giant planets
8) Formation of moons
9) Evolution of planetary systems, orbital evolution of planets, resonances, planet-disk interactions
10) Origin of life, habitability, astrobiology

402-0368-07L Lecture Series: Space Research and Exploration W 1 credit 2V S. P. Quanz
Abstract
Lecture Series about selected topics of space research and exploration consisting of individual talks given by different leading experts from academia and industry.

Objective
Attending students will
- experience the interdisciplinary nature of space research and exploration spanning physics, engineering, geosciences, biology and more
- get familiar with the Swiss space research and industry landscape
- enhance their communication skills by broadening their research horizon
- have the opportunity for direct learning by posing questions to experts

Content
The field of space research and exploration is intrinsically interdisciplinary. Cutting edge space activities are dominated by an interplay between the scientifically desirable and the technologically possible. The 'Lecture Series: Space Research and Exploration' aims to shed light on key questions engaged by leading scientists and engineers today. It consists of weekly lectures, given by different speakers with vast experience in their respective field (e.g., Human Spaceflight, System Engineering of Spacecraft, Space Life Sciences, Space-based astrophysics). Subsequent to the talk, the student will have the opportunity to deepen their understanding by asking questions to the presenter in a moderated Q&A.

402-0368-11L Earth - A (Unique?) Habitable Planet W 6 credits 2V+1U S. P. Quanz

Abstract
While thousands of extrasolar planets are known to orbit stars other than the Sun, Earth is - until now - the only planet known to be habitable. This lecture takes an interdisciplinary view on Earth as a habitable planet, how it formed, evolved, allowed life to flourish, and how its future might look like. Would we be able to identify another Earth-like planet amongst the population of exoplanets?

Objective
Attending students will
- understand Earth place in the cosmos
- learn tools to discern the history of Earth and other planets
- explore the origin and co-evolution of Earth and life
- put Earth in context with extrasolar planets

Content
This lecture focuses on our home planet - Earth - from an interdisciplinary perspective. As the search for habitable - and potentially even inhabited - extrasolar planets is one of the most dynamic research fields in modern astrophysics, understanding what makes a planet habitable is a topic of increasing importance; and a highly interdisciplinary topic. In broad brushes, this lecture will discuss the building blocks of planetary systems and their formation, how we can learn about the history of Earth and other planets, what major epochs we can identify over the course of Earth’s 4.5 billion year history, when life arose on Earth and what impact it had on Earth’s evolution, how the future Earth might look like, and - last but certainly not least - how we can search for an Earth-like planet in our cosmic neighbourhood and what our chances are to be successful.
### Abstract

Our understanding of the universe has made great progress recently thanks to the combination of several cosmological probes such as the cosmic microwave background, galaxy clustering, gravitational lensing, and supernovae. After a review of cosmology, this course will cover the physics of these different probes along with their application, combination and use to measure cosmological parameters.

### Objective

The goal of this course is to provide an understanding of the physics, application and combination of cosmological probes, and highlight current research topics.

### Prerequisites / notice

Credits or current enrollment in Astrophysics I and II is recommended but not required.

---

### 402-0398-00L Cosmic Dust in the Solar System: From Science Case to Mission Design

**W 3 credits 1V+1U V. J. Sterken**

**Abstract**

This course provides students with a basic understanding of the science of cosmic dust in the solar system and how to measure it with space-based satellites and instrumentation. The lectures include the physical processes of both interplanetary and interstellar dust, trajectory simulations (i.e. orbital dynamics), in situ measurement techniques, and mission design aspects.

**Objective**

Cosmic dust is an important building block for planets and towards life. This course provides students with a basic understanding of the science of cosmic dust in the solar system, and how to measure it with space-based satellites and instrumentation. The lectures include the physical processes of both interplanetary and interstellar dust, trajectory simulations (i.e. orbital dynamics), in situ measurement techniques, and mission design aspects. At the end of the course, students are able to classify the different types of dust in the solar system, and to relate them to their sources, sinks, their importance for planetary science and astronomy, physical processes, and appropriate measurement techniques. They will be able to simulate dust trajectories and use them to gain insight into how orbital dynamics and the space environment shape them. Students can design a basic concept of a space mission for dust measurements. The skills taught in this course will be useful to students in a broader way for planetary sciences.

**Content**

1. Introduction, course outline, historical notes, interstellar and interplanetary dust, dust in the solar system, sources, sinks, importance for science
2. Dust instrumentation and observables: ground-based, space-based and sample return techniques, calibration of dust instruments in the lab
3. Dust dynamics: recap basic aspects of orbital dynamics, the SPICE toolkit, types of orbits
4. Dust dynamics: space environment, dust processes and implications (e.g. in the early solar system), dust charging, consequences for dynamics, comparison with spacecraft dynamics
5. Dust models and dust data analysis: types of models and their limitations, data analysis
6. Mission design aspects: orbits, mission design limitations, advantages, disadvantages, instrument accommodation, example missions

**Lecture notes**

Slides will be provided before each lecture.

**Literature**

Interplanetary dust (freely available online)

### 402-0713-00L Astro-Particle Physics I

**W 6 credits 2V+1U A. Biland**

**Abstract**

This lecture gives an overview of the present research in the field of Astro-Particle Physics, including the different experimental techniques. In the first semester, main topics are the charged cosmic rays including the antimatter problem. The second semester focuses on the neutral components of the cosmic rays as well as on some aspects of Dark Matter.

**Objective**

Successful students know:
- experimental methods to measure cosmic ray particles over full energy range
- current knowledge about the composition of cosmic ray
- possible cosmic acceleration mechanisms
- correlation between astronomical object classes and cosmic accelerators
- information about our galaxy and cosmology gained from observations of cosmic rays

**Content**

First semester (Astro-Particle Physics I):
- definition of ‘Astro-Particle Physics’
- important historical experiments
- chemical composition of the cosmic rays
- direct observations of cosmic rays
- indirect observations of cosmic rays
- ‘extended air showers’ and ‘cosmic muons’
- ‘knee’ and ‘ankle’ in the energy spectrum
- the ‘anti-matter problem’ and the Big Bang
- ‘cosmic accelerators’

**Lecture notes**

See lecture home page: http://ihp-lx2.ethz.ch/AstroTeilchen/

**Literature**

See lecture home page: http://ihp-lx2.ethz.ch/AstroTeilchen/
Bayesian Statistical Methods and Data Analysis

**W 6 credits  3G  T. Tröster**

**Abstract**
The course covers various data analysis methods using Bayesian statistics, with a focus on practical problem solving. We will go over a brief introduction to probability theory, Bayesian reasoning, and how to build a statistical model and compare it to data. The course builds towards analysing data from real astrophysical problems, using both classical statistical methods and machine learning.

**Objective**
The goal of this course is to introduce students to Bayesian statistics and prepare them to solve statistical inference problems in contemporary (astrophysics) research. After introducing Bayesian statistics and general methodology, the course focuses on building up a structured approach to analyse increasingly complex data and models. The methods are general and applicable beyond (astro)physics, however.

**Content**
Topics covered include:
- Review of probability theory:
  - Independence, joint and conditional probabilities
  - Univariate and multivariate probability distributions
  - Change of variables
- Bayesian statistics:
  - Bayes' theorem
  - Priors
  - Bayesian reasoning
  - Posterior distributions, model checking, and model comparison Tools for statistical inference:
  - Various sampling methods, such as Markov chain Monte Carlo (Metropolis Hastings, slice sampling, Hamiltonian Monte Carlo) and nested sampling
  - Simulation-based inference
  - PCA, bootstrap
  - Gaussian processes and Gaussian random fields
  - Machine learning and probabilistic programming

The lectures are accompanied with code examples, both to illustrate the covered topics and to demonstrate how the theoretical concepts can be implemented in practical computational inference problems. The students complete a project on a statistical analysis, using the tools covered in the course.

*This course unit can only be booked together with a research project (402-0218-MS). This extension is not available for the options Proseminars, Particle Physics at PSI, Medical Physics and Experimental Foundations of Particle Physics. The extension is only possible with the agreement of the supervising professor. The extension must be booked at the same time as the research project.*

**Abstract**
Extension of the Research Project

**Objective**
Students are enabled to:
- expand their knowledge in a specific area of physics,
- conduct a project (a) in a research laboratory or (b) on a specific topic of theoretical physics,
- discuss their project results and conclusions in a team,
- present their findings in written and oral form.

The extension allows for a more in-depth research experience.
Why is energy important for life, economy and our society?

1. Introduction to Energy – what is it all about
   Passive components, linear networks, transmission lines, simulation of analog circuits, semiconductor components: diodes, bipolar and field-effect transistors, basic amplifier circuits, small signal analysis, differential amplifiers, noise, operational amplifiers, feedback and stability, oscillators, ADCs and DACs, introduction to CMOS technology

2. Energy and making use of it – a short history of energy use and an overview on energy technologies
   Concepts and Theories fostered
   Techniques and Technologies fostered
   Problem-solving fostered
   Project Management fostered
   Communication fostered
   Cooperation and Teamwork fostered
   Sensitivity to Diversity fostered
   Negotiation fostered
   Adaptability and Flexibility fostered
   Creative Thinking fostered
   Critical Thinking fostered
   Integrity and Work Ethics fostered
   Self-awareness and Self-reflection fostered
   Self-direction and Self-management fostered

3. Coal, oil and natural gas – fossil fuels
4. Renewables I: Biomass, Hydropower, and Wind Energy – from traditional use to the modern concepts
5. Renewables II: Geothermal, Tidal power and Solar Technologies – new renewables to lead the change
6. Nuclear power, radioactivity and ultimate storage – the quest for a safe technology
7. Breeding and Nuclear Fusion – can it work at all?
8. Energy Storage – the need to increase capacity and for new technologies
10. Energy Systems – how everything can play together
11. Energy Systems – how much energy do we need and how can it be provided in a way that enables a sustainable existence?
12. Life Cycle Assessment of Energy Technologies – problems and possibilities
14. The Actual Energy Transition and Decarbonisation – How is your 2040, 2050?

Which could be the overall guidelines for a working and sustainable energy system of the future?

How much energy do we need and how can it be provided in a way that enables a sustainable existence?

How will the energy systems of the future look like?

How can different energy technologies be compared?

Can we understand the changes in the current energy systems?

How fast can we and should we enforce the current energy transition?

Which could be the overall guidelines for a working and sustainable energy system of the future?

1. Introduction to Energy – what is it all about

Abstract
This class introduces both theoretical and practical aspects related to the modeling and simulation of multiphysics systems. Students will learn how to set up multiphysics models systematically, and therefore reduce time-consuming trial-and-error. Comsol Multiphysics will be utilized to apply the concepts learned during the lectures to solve exercises.

Objective
As information technology continues its fast-paced evolution, solid-state devices and systems increase in complexity. Engineers and scientists are thus increasingly facing the need to model and simulate their problems numerically where analytic textbook solution cease to exist. Moreover, boundaries between traditional disciplines are harder to maintain, as a proper description of the system might involve phenomena from several domains. Examples include—but not limited to—mechatronics which relies on mechanical, electrical and electronic engineering, and transducers (sensors and actuators) which are by definition devices that convert signals from one physical domain to another. Simulation platforms such as Comsol Multiphysics have truly opened the way to easy multi-domain numerical simulation, offering tools that cover all operations from geometry definition, to meshing, to physics and boundary conditions setting to simulation and result post-processing and analysis in a unified, domain-independent fashion. However, this high degree of freedom has its price, as inexperienced users may face cryptic error messages, incomprehensible or even incorrect results. It is the mission of this course to show how to properly set up a problem by exposing some of the most common misconceptions and pitfalls in multiphysics modeling. Good practices will be taught that should simplify the modeling process and increase the likelihood of correct results. Examples will mainly come from the fields of mechanics (continuum solid mechanics), electromagnetism (electrostatics and conductive media), heat transfer (conductive not convective) and combinations of these domains.

Content
- Recap of ordinary and partial differential equations
- The Finite Element Method (and the Method of Lines)
- Numerical solvers
- Geometry simplification and discretization
- Continuous and discrete symmetries
- Approximate and simplified formulations; domains of applicability
- Boundary conditions and constraints
- Solution-appropriate discretization; hp-refinement, local/global adaptive meshing
- Ramping of nonlinearities and couplings
- Coupling and segregation of multiphysics

Lecture notes
Lecture handouts will be posted online.

Information for UZH students:
Enrollment to this course unit only possible at ETH. No enrolment to module IN404 at UZH.
Please mind the ETH enrollment deadlines for UZH students: https://ethz.ch/en/studies/non-
The course provides an introduction to the functional properties of neurons. Particularly the description of membrane electrical properties

Neuromorphic circuits are inspired by the organizing principles of biological neural circuits. Their computational primitives are based on

Neuromorphic architectures often rely on collective computation in parallel networks. Adaptation, learning and memory are implemented locally within the individual computational elements. Transistors are often operated in weak inversion (below threshold), where they exhibit exponential I-V characteristics and low currents. These properties lead to the feasibility of high-density, low-power implementations of functions that are computationally intensive in other paradigms. Application domains of neuromorphic circuits include silicon retinas and cochleas for machine vision and audition, real-time emulations of networks of biological neurons, and the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS transistor, phototransducers), static circuits (differential pair, current mirror, conductance amplifiers, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silicon neuron, silicon retina and cochlea) and an introduction to multi-chip systems that communicate events analogous to spikes. The lectures are accompanied by weekly laboratory sessions.

Neuromorphic circuits include silicon retinas and cochleas for machine vision and audition, real-time emulations of networks of biological neurons, and the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS transistor, phototransducers), static circuits (differential pair, current mirror, conductance amplifiers, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silicon neuron, silicon retina and cochlea) and an introduction to multi-chip systems that communicate events analogous to spikes. The lectures are accompanied by weekly laboratory sessions.

The course covers analog circuits with emphasis on neuromorphic engineering: MOS transistors in CMOS technology, static circuits, dynamic circuits, systems (silicon neuron, silicon retina, silicon cochlea) with an introduction to multi-chip systems. The lectures are accompanied by weekly laboratory sessions.

The course considers the structure and function of biological neural networks at different levels. The function of neural networks lies fundamentally in their wiring and in the electro-chemical properties of nerve cell membranes. Thus, the biological structure of the nerve cell needs to be understood if biologically-realistic models are to be constructed. These simpler models are used to estimate the electrical current flow through dendritic cables and explore how a more complex geometry of neurons influences this current flow. The active properties of nerves are studied to understand both sensory transduction and the generation and transmission of nerve impulses along axons. The concept of local neuronal circuits arises in the context of the rules governing the formation of nerve connections and topographic projections within the nervous system. Communication between neurons in the network can be thought of as information flow across synapses, which can be modified by experience. We need an understanding of the action of inhibitory and excitatory neurotransmitters and neuromodulators, so that the dynamics and logic of synapses can be interpreted. Finally, simple neural architectures of feedforward and recurrent networks are discussed in the context of co-ordination, control, and integration of sensory and motor information.

Connections to computer science and artificial intelligence are discussed, but the main focus of the course is on establishing the biological basis of computations in neurons.

</tr>
</tbody>
</table>

Data: 26.07.2024 12:39  Autumn Semester 2024  Page 2087 of 2680
The lecture series is motivated by an overview covering the skin of the crystals, roughness analysis, contact angle measurements, protein
absorption/activity and monocyte behaviour.

As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are
presented, before the preparation of clean metallic, semiconducting, oxido and organic surfaces are introduced.

The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning
tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining
the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is
characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the
mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure's
shapes, which are based on the strain relieving mechanisms and kinetic growth processes.

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena
are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need
to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic
excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy
electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from
ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism
and second harmonic generation measurements. Recently, ellipsometry has been introduced to on-line monitor film thickness, and
roughness with sub-nanometer precision. These characterisation techniques are vital for optimising the preparation of medical implants.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to
quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell
proliferation and metabolism and to determine the relation between cell morphology and function.

X rays are more and more often used to characterise the human tissues down to the nanometer level. The combination of highly intense
beams only some micrometers in diameter with scanning enables spatially resolved measurements and the determination of tissue’s
anisotropies of biopsies.

465-0970-00L  Image Guided Medical Interventions  W  6 credits  2V+1U  G. Fattori

Abstract

Computer assistance and robotics have entered many fields of interventional medicine, shaping the way high-precision procedures are
performed today. In this lecture series, we will present the methods and technologies used in image-guided radiotherapy, from the use of
medical images to model the patient's anatomy to intraoperative navigation and registration.

Upon completion of the course, students are able to explain the methods and technologies for image guidance and stereotactic
radiotherapy. In particular, they are able to design the calibration of in-room imaging solutions and other navigation systems to verify and
correct patient position in high-precision radiotherapy. In addition, they are familiar with common tools used in medical image processing
research.

Content

Basics of imaging and image processing for IGRT:
* 3D/4D imaging.
* Segmentation (thresholding, region growing and similar).
* Filtering (morphological filters and similar fundamentals).
* Modelling and rendering of volumes and surfaces.
* Image registration.
* Conventions for position and orientation representation.

Technologies and methods for localisation and navigation:
* Reference systems mapping.
* Kinematic of a robotic treatment couch.
* Optical tracking systems, calibration and use.
* Registration of points and surfaces.
* In-room imaging and geometry calibration of X-ray systems.
* 2D/3D and 3D/3D registration.
* Organ motion.

Technologies and methods for on-line treatment verification
* In-room imaging for verification of proton therapy treatment.

If you like playing with medical imaging and computer vision tools, you could be interested in this course.

Abstract

Physical and chemical principles:
The students...
- know the processes and physical laws of aerosol dynamics.
- understand the thermodynamics of phase equilibria and chemical equilibria.
- know the photo-chemical formation of particulate matter from inorganic and organic precursor gases.

Experimental methods:
The students...
- know the most important chemical and physical measurement instruments.
- understand the underlying chemistry and physics.

Environmental impacts:
The students...
- know the major sources of atmospheric aerosols, their chemical composition and key physical properties.
- know the most important climate impacts of atmospheric aerosols.
- are aware of the health impacts of atmospheric aerosols.

Lecture notes
materiel is distributed during the lecture.

701-0475-00L Atmospheric Physics

Abstract
This course covers the basics of atmospheric physics, which consist of: cloud and precipitation formation, especially prediction of showers and severe convective storms, and optical phenomena.

Objective
Students are able to explain the mechanisms of convective storm formation using knowledge of thermodynamics and cloud microphysics.

Content
Students will also learn under which conditions severe convective storms (especially supercells with tornados) can form. With these basics, the different forms of precipitation (convective vs. stratiform) are discussed and how they can be identified in radar images. Students will also learn under which conditions severe convective storms (especially supercells with tornados) can form.

Lecture notes
Powerpoint slides and chapters from the textbook will be made available on moodle: https://moodle-app2.let.ethz.ch/course/view.php?id=22731

Literature

An electronic version of this book can be obtained via the ETH library.

701-1221-00L Dynamics of Large-Scale Atmospheric Flow

Abstract
This lecture course is about the fundamental aspects of the dynamics of extratropical weather systems (quasi-geostropic dynamics, potential vorticity, Rossby waves, baroclinic instability). The fundamental concepts are formally introduced, quantitatively applied and illustrated with examples from the real atmosphere. Exercises (quantitative and qualitative) form an essential part of the course.

Objective
Understanding of dynamic processes of large-scale atmospheric flow and their mathematical-physical formulation.
Dynamical Meteorology is concerned with the dynamical processes of the earth's atmosphere. The fundamental equations of motion in the atmosphere will be discussed along with the dynamics and interactions of synoptic system - i.e. the low and high pressure systems that determine our weather. The motion of such systems can be understood in terms of quasi-geostrophic theory. The lecture course provides a derivation of the mathematical basis along with some interpretations and applications of the concept.

651-4053-05L Boundary Layer Meteorology W 4 credits 3G M. Rotach, P. Calanca

Abstract
The Planetary Boundary Layer (PBL) constitutes the lower part of the atmosphere, is characterized by turbulent mixing and ensures the exchange of energy, mass and momentum between the Earth’s surface and the atmosphere. The course provides the theoretical background for understanding the structure and dynamics of the PBL. Idealized concepts are reviewed and contrasted to real world applications.

Objective
Students are able to:
- Name the basic approaches needed to describe planetary boundary layer flows and associated turbulent exchange processes.
- Apply these concepts to answer comprehension questions and solve simple problems related to the structure and dynamics of the PBL.
- Independently judge the applicability of learned concepts and tools to real-world situations.

Content
- Introduction
- PBL structure and stability
- Turbulence and turbulent transport
- Scaling and similarity theory
- Spectral characteristics
- Conservation equations in a turbulent flow
- Closure problem and closure assumptions
- Rough surfaces and the roughness sublayer
- Complex terrain

Abstract
Introduction to differential manifolds and differential geometry.

Objective
Learn to compute, describe, prove, and solve problems in the language of differential geometry.

Content
Submanifolds of R^n, immersions, submersions, and embeddings, Sard's Theorem, abstract differential manifolds, charts, vector fields and flows, vector bundles, tensor fields, covariant derivatives, parallel transport, Riemannian metrics, geodesics, Riemann curvature tensor. Complete manifolds, Hopf-Rinow theorem. Many examples including curves, surfaces, hyperbolic space, S^3, the unit quaternions, the Gauss-Bonnet theorem, etc.
This following books were inherited from before. The only one I know is DoCarmo.

401-3461-00L Functional Analysis I

Abstract
Baire category; Banach and Hilbert spaces, bounded linear operators; basic principles: Uniform boundedness, open mapping/closed graph theorem, Hahn-Banach; convexity; dual spaces; weak and weak* topologies; Banach-Alaoglu; reflexive spaces; compact operators and Fredholm theory; closed graph theorem; spectral theory of self-adjoint operators in Hilbert spaces. Basics of Sobolev spaces.

Objective
Acquire a good degree of fluency with the fundamental concepts and tools belonging to the realm of linear Functional Analysis, with special emphasis on the geometric structure of Banach and Hilbert spaces, and on the basic properties of linear maps.

Literature
Recommended references include the following:

Prerequisites / notice
Solid background on the content of all Mathematics courses of the first two years of the undergraduate curriculum at ETH. Most importantly: fluency with point set topology and measure theory, in part. Lebesgue integration and L^p spaces.

401-3601-00L Probability Theory

Abstract
Basics of probability theory and the theory of stochastic processes in discrete time

Objective
This course presents the basics of probability theory and the theory of stochastic processes in discrete time. The following topics are planned:
- measure theory formalism and probability theory, Dynkin's lemma and independence, convergence of series of independent random variables, law of large numbers, conditional expectation, martingale convergence theorems, uniform integrability, optional stopping theorem for martingales, the Bienaymé-Galton-Watson process and its R-number, convergence in distribution and the central limit theorem.
Content
This course presents the basics of probability theory and the theory of stochastic processes in discrete time. The following topics are planned:
- Measure theory formalism and probability theory, Dynkin's lemma and independence, convergence of series of independent random variables, law of large numbers, conditional expectation, martingale convergence theorems, uniform integrability, optional stopping theorem for martingales, the Bienaymé-Galton-Watson process and its R-number, convergence in distribution and the central limit theorem.

401-3621-00L Fundamentals of Mathematical Statistics

Abstract
In this course we study the basics of theoretical statistics. The course includes methods for designing estimators, confidence intervals and tests, and various ways to evaluate the accuracy of estimators, confidence intervals and tests. We consider optimality criteria such as admissibility and minimaxity, as well as Bayesian criteria. We will also present the asymptotic point of view.

Objective
The aim of this course is to gain insight into the main statistical ideas and concepts. The course considers classical low-dimensional models, with pointers towards today's highly complex models.

401-7851-00L Theoretical Astrophysics (University of Zurich)

Number
401-7851-00L

Title
Theoretical Astrophysics (University of Zurich)

Type
W

ECTS
9 credits

Hours
4V+1U

L. Ziegel

Objective
Acquire knowledge of main methodologies for computer-based models of astrophysical systems, the physical equations behind them, and train such knowledge with simple examples of computer programmes

Content
This course covers the foundations of astrophysical fluid dynamics, the Boltzmann equation, equilibrium systems and their stability, the structure of stars, astrophysical turbulence, accretion disks and their stability, the foundations of radiation transfer, collisionless systems, the structure and stability of dark matter halos and stellar galactic disks.

Literature
Course Materials:
1- The Physics of Astrophysics, Volume 1: Radiation by Frank H. Shu
2- The Physics of Astrophysics, Volume 2: Gas Dynamics by Frank H. Shu
3- Foundations of radiation hydrodynamics, Dimitri Mihalas and Barbara Weibel-Mihalas
4- Radiative Processes in Astrophysics, George B. Rybicki and Alan P. Lightman
5- Galactic Dynamics, James Binney and Scott Tremaine

Prerequisites / notice
This is a full black board ad chalk experience for students with a strong background in mathematics and physics.

Prerequisites:
- Introduction to Astrophysics
- Mathematical Methods for the Physicist
- Quantum Mechanics
  (All preferred but not obligatory)

Prior Knowledge:
- Mechanics
- Quantum Mechanics and atomic physics
- Thermodynamics
- Fluid Dynamics
- Electrodynamics

Objective
Acquire knowledge of main methodologies for computer-based models of astrophysical systems, the physical equations behind them, and train such knowledge with simple examples of computer programmes

Content
This course covers the foundations of astrophysical fluid dynamics, the theory of collisions and the Boltzmann equation, the notion of equilibrium systems and their stability, the structure of stars, the theory of astrophysical turbulence, the theory of accretion disks and their stability, the foundations of astrophysical radiative transfer, the theory of collisionless systems, the structure and stability of dark matter halos and stellar galactic disks.

Literature
Course Materials:
1- The Physics of Astrophysics, Volume 1: Radiation by Frank H. Shu
2- The Physics of Astrophysics, Volume 2: Gas Dynamics by Frank H. Shu
3- Foundations of radiation hydrodynamics, Dimitri Mihalas and Barbara Weibel-Mihalas
4- Radiative Processes in Astrophysics, George B. Rybicki and Alan P. Lightman
5- Galactic Dynamics, James Binney and Scott Tremaine

Prerequisites / notice
This is a full black board ad chalk experience for students with a strong background in mathematics and physics.

Prerequisites:
- Introduction to Astrophysics
- Mathematical Methods for the Physicist
- Quantum Mechanics
  (All preferred but not obligatory)

Prior Knowledge:
- Mechanics
- Quantum Mechanics and atomic physics
- Thermodynamics
- Fluid Dynamics
- Electrodynamics
Content

1. Integration of ODE, Hamiltonians and Symplectic integration techniques, time adaptivity, time reversibility
2. Large-N gravity calculation, collisionless N-body systems and their simulation
3. Fast Fourier Transform and spectral methods in general
4. Eulerian Hydrodynamics: Upwinding, Riemann solvers, Limiters
5. Lagrangian Hydrodynamics: The SPH method
6. Resolution and instabilities in Hydrodynamics
7. Initial Conditions: Cosmological Simulations and Astrophysical Disks
8. Physical Approximations and Methods for Radiative Transfer in Astrophysics

Literature

Galactic Dynamics (Binney & Tremaine, Princeton University Press),
Computer Simulation using Particles (Hockney & Eastwood CRC press),
Targeted journal reviews on computational methods for astrophysical fluids (SPH, AMR, moving mesh)

Prerequisites / notice

Some knowledge of UNIX, scripting languages (see www.physik.uzh.ch/lectures/informatik/python/ as an example), some prior experience programming, knowledge of C, C++ beneficial

402-6394-00L Advanced Topics of Theoretical Cosmology (University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: AST802

Abstract

The course will cover a selection of advanced topics:
- Hamiltonian formulation of general relativity
- Quantum cosmology
- Cosmic Microwave Background
- Dark Matter and Dark Energy
- Nonlinear structure formation
- Galaxy clustering and large-scale structure
- Model selection and Bayesian inference in cosmology

Content

The topics in the course are as follows:
- spherical collapse model, Press-Schechter formalism, applications
- Standard Newtonian and Lagrangian Perturbation Theory
- galaxy bias
- nonlinear relativistic dynamics: ADM formalism
- inflationary models, effective field theory
- modification of gravity
- weak gravitational lensing, CMB anisotropies

Prerequisites / notice

Prerequisite: 402-0394-00L Theoretical Astrophysics and Cosmology

402-0831-67L Advanced Topics in General Relativity and Gravitational Waves (University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.

UZH Module Code: PHY529

Abstract

The aim of this lecture is to discuss some advanced topics in general relativity, which are useful to understand the present research activities in the field. A list of possible topics is given below. A basic knowledge of general relativity is required (ideally having followed the lecture on General Relativity). The course is particularly suited for master and PhD students.

Objective

Is to be able to read and understand the original literature and the presently published papers in the field of the discussed advanced topics.
This might be also useful in view of doing afterwards a master thesis in the field of general relativity.

Content

Possible content:
- General relativistic stellar structure equations (Neutron stars)
- Tetrad formalism
- Spinors in GR
- Klein-Gordon & Dirac eqs. in GR
- Thermodynamics of black holes and Hawking radiation
- Topics in gravitational waves: GW generation by PN sources, GW from elliptic, hyperbolic binaries
- Tests of the equivalence principle

Prerequisites / notice

Prerequisite: 402-0394-00L Theoretical Astrophysics and Cosmology

402-0810-70L Advanced Quantum Algorithms (University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: PHY582

Abstract

The course treats selected families of quantum algorithms, currently the best candidates to achieve a practical quantum advantage over classical computation in physics, chemistry, optimization, sampling and machine learning.
Starting from the basics, quantum algorithms are introduced and their feasibility to solve real-world problems in science and industry is critically discussed.

Objective

The course aims to provide a balanced outlook of this transformative technology, discussing strengths and possible limitations of all discussed algorithms, especially in the context of concrete today and future hardware implementation.
After the course, students will have a clear understanding of the state-of-the-art of this field (i.e., the applications and algorithms amenable to quantum speedup, types of hardware, and quantum software).

The course content is devised to provide first-hand experience with quantum algorithms and stimulate critical thinking. The course will be instrumental for the student's career development in quantum technology and computational science, in academia or industry.
Content
Course content:
- Quantum gates and circuits basics
- Quantum annealing
- Hamiltonian simulations (Trotter, LCU, circuit decompositions)
- Mapping fermionic, bosonic operators to qubits
- Quantum phase estimation and applications
- Variational quantum algorithms (VQE, QAOA)
- Algorithms for sampling and search (Amplitude amplification, estimation, quantum walks, quantum enhanced Markov chains)
- Selected Quantum Machine learning algorithms
- Prospects for quantum advantage

Lecture notes
Lecture notes covering in detail all the course content will be provided.

Literature
My lecture notes and references therein which are open-access will be more than enough to follow.

Prerequisites / notice
For an introduction to quantum computing and information it could be useful to read specific chapters of Nielsen and Chuang book.

Competencies
Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies
- Analytical Competencies

- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics

402-0889-90L Geometry and Topology in Condensed Matter Physics (University of Zurich)
W 6 credits 2V+2U T. Bzdusek

Abstract
This course equips the student with an adequate understanding of geometric and topological methods employed in theoretical characterization of classical and quantum matter. Diverse mathematical techniques will be systematically introduced in a semi-formal approach, and the significance of each presented tool will be illustrated through applications to diverse condensed matter systems.

Objective
The objective of the course is to familiarize the student with selected techniques from differential geometry and algebraic topology, and with their applications in the field of condensed matter physics. The course is aimed at the graduate level and requires a basic knowledge of quantum mechanics, solid state physics, and elementary group theory. By the end of this course, the students will understand the relevance of these advanced mathematical tools to diverse physics problems, and they will become familiar with selected topics from recent research of classical and quantum topological matter.

Content
The covered mathematical topics include: homotopy groups, singular homology, Morse theory, Riemannian geometry, vector bundles, parallel transport, characteristic classes, cohomology theory, and Clifford algebras.

The applications to condensed matter physics include: defects of order parameters, Van Hove singularities, flat energy bands, topological band theory, gauge fields, tenfold way classification, and topologically ordered phases.

Lecture notes
Lecture notes will be provided at the beginning of the semester.

Literature
Suggested complementary literature will be provided in the class.

General Electives

Students may choose General Electives from the entire course programme of ETH Zurich - with the following restrictions: courses that belong to the first or second year of a Bachelor curriculum at ETH Zurich as well as courses from OESS "Science in Perspective" are not eligible here. The following courses are explicitly recommended to physics students by their lecturers. (Courses in this list may be assigned to the category "General Electives" directly in myStudies. For the category assignment of other eligible courses keep the choice "no category" and take contact with the Study Administration (www.phys.ethz.ch/studies/application/deadline.html) after having received the credits.)

Number Title Type ECTS Hours Lecturers
052-0579-24L Understanding Light W 2 credits 2S R. Barba, P. Anantha Murthy

Abstract
The seminar explores light from the perspectives of Physics and Art, opening up new dimensions for collaboration across disciplines by tackling questions such as: What is the origin and nature of light? How does it travel through space and time? How can it be made productive in an artistic sense and what, in turn, can artistic methodologies contribute to experimenting and thinking about light?

Objective
- Learn about the properties of light: intensities, phases, colors, and interactions with matter
- Exploring optical effects: reflection, refraction, dispersion
- Learn to plan and carry out an art project based on research inputs from other sciences
- Enhancing conceptual and interdisciplinary thinking in unusual set-ups
- Learn how to cope with unforeseen results and make random events productive for the successful implementation of a project
- Fostering communication and presentation skills

Content
In this course, we will set a performative frame for experimentation and exploration.

Coupled with experiments in the Dep. of Physics, students will be introduced to concepts such as the origin of light and color, and the interpretation of the optical world that surrounds us to understand what actually gives rise to the effects we see everyday—from butterfly wings and autumn colors to the appearance of buildings and cities. In addition, we will perform practical experiments with basic optical components like lenses, mirrors, and prisms, in order to understand how they can be used to capture images. Inputs by guest lecturers (e.g. on light in photography, anthropology or urban landscapes) are planned. Students will be asked to present related topics.

At the end of the semester, the artistic experiments will be presented.

Prerequisites / notice
Max. number of participants: 15
Please send a short motivation letter (max. 300 words) to artinspaceandtime@arch.ethz.ch by 05 September 2024.

Data: 26.07.2024 Autumn Semester 2024 Page 2095 of 2680
A document containing theory, background and practical course content is distributed at the Introductory lecture day of the course. The document provides sufficient information for the participants to successfully participate in the course. Participating students are required to attend all scheduled lectures and meetings of the course. Participating students are required to provide proof that they have personal accident insurance prior to the start of the laboratory portion of the course. For safety and efficiency reasons the number of participating students is limited. We regret to restrict access to this course by the following rules:

Priority 1: master students of the master's program in "Micro and Nanosystems"

Priority 2: master students of the master's program in "Mechanical Engineering" with a specialization in Microsystems and Nanoscale Engineering (MAMT-posts Prons Daraio, Dual, Hierold, Koumoutsakos, Nelson, Nüssl, Pohlakos, Pratsinis, Stemmer), who attended the bachelor course "151-0621-00L Microsystems Technology" successfully.

Priority 3: master students, who attended the bachelor course "151-0621-00L Microsystems Technology" successfully.

Priority 4: all other students (PhD, bachelor, master) with a background in silicon or Microsystems process technology.

If there are more students in one of these priority groups than places available, we will decide by (in following order) best achieved grade from 151-0621-00L Microsystems Technology, registration to this practicum at previous semester, and by drawing lots. Students will be notified at the first lecture of the course (introductory lecture) as to whether they are able to participate.

The course is offered in autumn and spring semester.

Abstract

The course provides an introduction to theoretical foundations and practical usage of the Lattice Boltzmann Method for fluid dynamics simulations.

Objective

Methods like molecular dynamics, DSMC, lattice Boltzmann etc are being increasingly used by engineers all over and these methods require knowledge of kinetic theory and statistical mechanics which are traditionally not taught at engineering departments. The goal of this course is to give an introduction to ideas of kinetic theory and non-equilibrium thermodynamics with a focus on developing simulation algorithms and their realizations.

During the course, students will be able to develop a lattice Boltzmann code on their own. Practical issues about implementation and performance on parallel machines will be demonstrated hands on.

Central element of the course is the completion of a lattice Boltzmann code (using the framework specifically designed for this course).

The course will also include a review of topics of current interest in various fields of fluid dynamics, such as multiphase flows, reactive flows, micromodels among others.

Optionally, we offer an opportunity to complete a project of student's choice as an alternative to the oral exam. Samples of projects completed by previous students will be made available.

The course builds upon three parts:

I. Elementary kinetic theory and lattice Boltzmann simulations introduced on simple examples.

II. Theoretical basis of statistical mechanics and kinetic equations.

III. Lattice Boltzmann method for real-world applications.

The content of the course includes:

1. Background: Elements of statistical mechanics and kinetic theory:
   - Particle's distribution function, Liouville equation, entropy, ensembles; Kinetic theory: Boltzmann equation for rarefied gas, H-theorem, hydrodynamic limit and derivation of Navier-Stokes equations, Chapman-Enskog method, Grad method, boundary conditions; mean-field interactions, Vlasov equation; Kinetic models: BGK model, generalized BGK model for mixtures, chemical reactions and other fluids.

2. Basics of the Lattice Boltzmann Method and Simulations:
   - Minimal kinetic models: lattice Boltzmann method for single-component fluid, discretization of velocity space, time-space discretization, boundary conditions, forcing, thermal models, mixtures.

3. Hands on:
   - Development of the basic lattice Boltzmann code and its validation on standard benchmarks (Taylor-Green vortex, lid-driven cavity flow etc).

4. Practical issues of LBM for fluid dynamics simulations:
   - Lattice Boltzmann simulations of turbulent flows; numerical stability and accuracy.

5. Microflows:
   - Rarefaction effects in moderately dilute gases; Boundary conditions, exact solutions to Couette and Poiseuille flows; micro-channel simulations.

6. Advanced lattice Boltzmann methods:
   - Entropic lattice Boltzmann scheme, subgrid simulations at high Reynolds numbers; Boundary conditions for complex geometries.

7. Introduction to LB models beyond hydrodynamics:
   - Relativistic fluid dynamics; flows with phase transitions.
   - Lecture notes on the theoretical parts of the course will be made available. Selected original and review papers are provided for some of the lectures on advanced topics.
   - Handouts and basic code framework for implementation of the lattice Boltzmann models will be provided.
   - The course addresses mainly graduate students (MSc/PhD) but BSc students can also attend.

Abstract

Students are introduced to the fundamentals of semiconductors, the basics of micromachining and silicon process technology and will learn about the fabrication of Microsystems and -devices by a sequence of defined processing steps (process flow).
Students are introduced to the basics of micromachining and silicon process technology and will understand the fabrication of microsystem devices by the combination of unit process steps ( = process flow).

Introduction to microsystems technology (MST) and micro electro mechanical systems (MEMS)

Basic silicon technologies: Thermal oxidation, photolithography and etching, diffusion and ion implantation, thin film deposition.

Specific microsystems technologies: Bulk and surface micromachining, dry and wet etching, isotropic and anisotropic etching, beam and membrane formation, wafer bonding, thin film mechanical properties.

Application of selected technologies will be demonstrated on case studies.

Handouts (available online)

- T. M. Adams, R. A. Layton: Introductory MEMS, Fabrication and Applications
- J. Vörös: Biomedical Imaging
- W. Menz, J. Mohr, O. Paul: Microsystems Technology

Introduction to diagnostic medical imaging based on electromagnetic and acoustic fields including X-ray planar and tomographic imaging, radio-tracer based nuclear imaging techniques, magnetic resonance imaging and ultrasound-based procedures.

Upon completion of the course students are able to:

- Explain the physical and mathematical foundations of diagnostic medical imaging systems
- Characterize system performance based on signal-to-noise ratio, contrast-to-noise ratio and transfer function
- Design a basic diagnostic imaging system chain including data acquisition and data reconstruction
- Identify advantages and limitations of different imaging methods in relation to medical diagnostic applications

Introduction (intro, overview, history)

- Signal theory and processing (foundations, transforms, filtering, signal-to-noise ratio)
- X-rays (production, tissue interaction, contrast, modular transfer function)
- X-rays (resolution, detection, digital subtraction angiography, Radon transform)
- X-rays (filtered back-projection, spiral computed tomography, image quality, dose)
- Nuclear imaging (radioactive tracer, collimation, point spread function, SPECT/PET)
- Nuclear imaging (detection principles, image reconstruction, kinetic modelling)
- Magnetic Resonance (magnetic moment, spin transitions, excitation, relaxation, detection)
- Magnetic Resonance (plane wave encoding, Fourier reconstruction, pulse sequences)
- Magnetic Resonance (contrast mechanisms, gradient- and spin-echo, applications)
- Ultrasound (mechanical wave generation, propagation in tissue, reflection, transmission)
- Ultrasound (spatial and temporal resolution, phased arrays)
- Ultrasound (Doppler shift, implementations, applications)
- Summary, example exam questions

Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The focus is on learning the basic vocabulary of biomedical engineering and getting familiar with concepts that govern common medical instruments and the most important organs from an engineering point of view.

In addition, the most recent achievements and trends of the field of biomedical engineering are also outlined.

Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The course provides an overview of the various topics of the different tracks of the biomedical engineering master course and helps orienting the students in selecting their specialized classes and project locations. It also serves as an introduction to the field for students of the ITET, MAVT, HEST and other bachelor programs.

History of BME and the role of biomedical engineers. Ethical issues related to BME. Biomedical sensors both wearable and also biochemical sensors.

Biomedical Imaging: Nernst equation, Donnan equilibrium, equivalent circuits of biological membranes and bioelectronic devices.

Bioinformatics: genomic and proteomic tools, databases and basic calculations.

Equations describing basic reactions and enzyme kinetics.

Medical optics: Optical components and systems used in hospitals.

Basic concepts of tissue engineering and organ printing.

Biomaterials and their medical applications.

Function of the heart and the circulatory system.

Transport and exchange of substances in the human body, compartment modeling.

The respiratory system.

Bone imaging.

Orthopedic biomechanics.

Lectures (2h), discussion of practical exercises (1h) and homework exercises.
Introduction to Biomedical Engineering
by Enderle, Banchard, and Bronzino

AND

moodle page of the course

Prerequisites / notice
No specific requirements, BUT ITET, MAVT, PHYS students will have to learn a lot of new words related to biochemistry, biology and medicine, while HEST and BIOL students will have to grasp basic engineering concepts (circuits, equations, etc.).

Competencies

227-1047-00L Consciousness: From Philosophy to Neuroscience (University of Zurich)
W 3 credits 2V D. Kiper

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: INI410

Mind the enrolment deadlines at UZH: https://www.uzh.ch/cmsssl/en/studies/application/deadlines.html

Abstract
This seminar reviews the philosophical and phenomenological as well as the neurobiological aspects of consciousness. The subjective features of consciousness are explored, and modern research into its neural substrate, particularly in the visual domain, is explained.

Objective
The course's goal is to give an overview of the contemporary state of consciousness research, with emphasis on the contributions brought by modern cognitive neuroscience. We aim to clarify concepts, explain their philosophical and scientific backgrounds, and to present experimental protocols that shed light on a variety of consciousness related issues.

Content
The course includes discussions of scientific as well as philosophical articles. We review current schools of thought, models of consciousness, and proposals for the neural correlate of consciousness (NCC).

Lecture notes
None

Literature
We display articles pertaining to the issues we cover in the class on the course's webpage.

Prerequisites / notice
Since we are all experts on consciousness, we expect active participation and discussions!

227-0939-00L Cell Biophysics W 6 credits 4G T. Zambelli

Abstract
Applying two fundamental principles of thermodynamics (entropy maximization and Gibbs energy minimization), an analytical model is derived for a variety of biological phenomena at the molecular as well as cellular level, and critically compared with the corresponding experimental data in the literature.

Objective
Engineering uses the laws of physics to predict the behavior of a system. Biological systems are so diverse and complex prompting the question whether we can apply unifying concepts of theoretical physics coping with the multiplicity of life’s mechanisms.

Objective of this course is to show that biological phenomena despite their variety can be analytically described using only two principles from statistical mechanics: maximization of the entropy and minimization of the Gibbs free energy.

Starting point of the course is the probability theory, which enables to derive step-by-step the two pillars of thermodynamics from the perspective of statistical mechanics: the maximization of entropy according to the Boltzmann’s law as well as the minimization of the Gibbs free energy. Then, an assortment of biological phenomena at the molecular and cellular level (e.g. cytoskeletal polymerization, action potential, photosynthesis, gene regulation, morphogen patterning) will be examined at the light of these two principles with the aim to derive a quantitative expression describing their behavior. Each analytical model is finally validated by comparing it with the corresponding experimental results from the literature.

By the end of the course, students will also learn to critically evaluate the concepts of making an assumption and making an approximation.
Content

- Basics of theory of probability
- Boltzmann's law
- Entropy maximization and Gibbs free energy minimization
- Ligand-receptor: two-state systems and the MWC model
- Random walks, diffusion, crowding
- Electrostatics for salty solutions
- Elasticity: fibers and membranes
- Molecular motors
- Action potential: Hodgkin-Huxley model
- Photosynthesis and vision
- Gene regulation
- Development: Turing patterns

Lecture notes

Theory and corresponding exercises are merged together during the classes.

No lecture notes because the two proposed textbooks are more than exhaustive!

I am willingly available Mondays 17.00 o'clock - 18.00 in my office GLC F12.2 for whatever discussion about the lessons and the exercises.

!!! I am using OneNote. All lectures will be broadcast via ZOOM, while corresponding videos of the previous years (lectures and exercises) are available in Moodle !!!

Literature

As further deepening:

Prerequisites / notice

Participants need a good command of
- differentiation and integration of a function with one or more variables (basics of Analysis),
- Newton's and Coulomb's laws (basics of Mechanics and Electrostatics).

Notions of vectors in 2D and 3D are beneficial.

Neural Network Theory

W 4 credits 2V+1U H. Bölcskei

Does not take place this semester.

Abstract

The class focuses on fundamental mathematical aspects of neural networks with an emphasis on deep networks: Universal approximation theorems, capacity of separating surfaces, generalization, fundamental limits of deep neural network learning, VC dimension.

Objective

After attending this lecture, participating in the exercise sessions, and working on the homework problem sets, students will have acquired a working knowledge of the mathematical foundations of neural networks.

Content

1. Universal approximation with single- and multi-layer networks
2. Introduction to approximation theory: Fundamental limits on compressibility of signal classes, Kolmogorov epsilon-entropy of signal classes, non-linear approximation theory
3. Fundamental limits of deep neural network learning
4. Geometry of decision surfaces
5. Separating capacity of nonlinear decision surfaces
6. Vapnik-Chervonenkis (VC) dimension
7. VC dimension of neural networks
8. Generalization error in neural network learning

Lecture notes

Detailed lecture notes are available on the course web page https://www.mins.ee.ethz.ch/teaching/nnt/
Prerequisites / notice
This course is aimed at students with a strong mathematical background in general, and in linear algebra, analysis, and probability theory in particular.

227-0563-00L Quantum Measurements and Optomechanics
Quantum Measurements and Optomechanics

Abstract
The measurement process is at the heart of both science and engineering. Measurement precision is ultimately limited by the laws of quantum mechanics. This course provides the knowledge necessary to understand current state-of-the-art quantum measurement systems operating at their fundamental limits with a particular focus on optomechanical implementations.

Objective
The goal of this course is to understand the quantum limits of measurement precision together with a formal description of the measurement process in the framework of quantum mechanics.

Content
The lecture starts with summarizing the relevant fundamentals of the treatment of noisy signals. We familiarize ourselves with the concept of measurement imprecision in light-based measurement systems. To this end, we consider the process of photodetection and discuss the statistical fluctuations arising from the quantization of the electromagnetic field into photons. We exemplify our insights at hand of concrete examples, such as homodyne and heterodyne photodetection. Furthermore, we focus on the process of measurement backaction, the inevitable result of the interaction of the probe with the system under investigation. We discuss the “standard quantum limit” as it arises from the balance of measurement imprecision and backaction, before turning to approaches to overcome it and reach the fundamental “Heisenberg limit”. The course emphasizes the connection between the taught concepts and current state-of-the-art research carried out in the field of optomechanics. Exercises serve to consolidate our understanding and insight.

Prerequisites / notice
1. Electrodynamics
2. Physics 1,2
3. Introduction to quantum mechanics

227-0965-00L Micro and Nano-Tomography of Biological Tissues
Micro and Nano-Tomography of Biological Tissues

Abstract
The lecture introduces the physical and technical know-how of X-ray tomographic microscopy. Several X-ray imaging techniques (absorption-, phase- and darkfield contrast) will be discussed and their use in daily research, in particular biology, is presented. The course discusses the aspects of quantitative evaluation of tomographic data sets like segmentation, morphometry and statistics.

Objective
Introduction to the basic concepts of X-ray tomographic imaging, image analysis and data quantification at the micro and nano scale with particular emphasis on biological applications.

Content
Synchrotron-based X-ray micro- and nano-tomography is today a powerful technique for non-destructive, high-resolution investigations of a broad range of materials. The high-brilliance and high-coherence of third generation synchrotron radiation facilities allow quantiative, three-dimensional imaging at the micro and nanometer scale and extend the traditional absorption imaging technique to edge-enhanced and phase-sensitive measurements, which are particularly suited for investigating biological samples.

The lecture includes a general introduction to the principles of tomographic imaging from image formation to image reconstruction. It provides the physical and engineering basics to understand how imaging beamlines at synchrotron facilities work, looks into the recently developed phase contrast methods, and explores the first applications of X-ray nano-tomographic experiments.

The course finally provides the necessary background to understand the quantitative evaluation of tomographic data, from basic image analysis to complex morphometrical computations and 3D visualization, keeping the focus on biomedical applications.

Lecture notes
Available online

Literature
Will be indicated during the lecture.

227-0157-00L Semiconductor Devices: Physical Bases and Simulation
Semiconductor Devices: Physical Bases and Simulation

Abstract
The course addresses the physical principles of modern semiconductor devices and the foundations of their modeling and numerical simulation. Necessary basic knowledge on quantum-mechanics, semiconductor physics and device physics is provided. Computer simulations of the most important devices and of interesting physical effects supplement the lectures.

Objective
The course aims at the understanding of the physical principles of modern semiconductor devices, of the foundations in the physical modeling of transport and its numerical simulation. During the course also basic knowledge on quantum-mechanics, semiconductor physics and device physics is provided.

Content
The main topics are: transport models for semiconductor devices (quantum transport, Boltzmann equation, drift-diffusion model, hydrodynamic model), physical characterization of silicon (intrinsic properties, scattering processes), mobility of cold and hot carriers, recombination (Shockley-Read-Hall statistics, Auger recombination), impact ionization, metal-semiconductor contact, metal-insulator-semiconductor structure, and heterojunctions. The exercises are focussed on the theory and the basic understanding of the operation of special devices, as single-electron transistor, resonant tunneling diode, pn diode, bipolar transistor, MOSFET, and laser. Numerical simulations of such devices are performed with an advanced simulation package (Sentaurus-Synopsys). This enables to understand the physical effects by means of computer experiments.

Lecture notes
The script (in book style) can be downloaded from: https://iis-students.ee.ethz.ch/lectures/

Literature
The script (in book style) is sufficient. Further reading will be recommended in the lecture.

Prerequisites / notice

227-0147-10L VLSI 3: Full-Custom Digital Circuit Design
VLSI 3: Full-Custom Digital Circuit Design

Abstract
This third course in our VLSI series is concerned with full-custom digital integrated circuits. The goals include learning the design of digital circuits on the schematic, layout, gate, and register-transfer levels. The use of state-of-the-art CAD software (Cadence Virtuoso) in order to simulate, optimize, and characterize digital circuits is another important topic of this course.

26.07.2024 12:39 Autumn Semester 2024 Page 2100 of 2680
Objective
At the end of this course, you will
- understand the design of the main building blocks of state-of-the-art digital integrated circuits
- be able to design and optimize digital integrated circuits on the schematic, layout, and gate levels
- be able to use standard industry software (Cadence Virtuoso) for drawing, simulating, and characterizing digital circuits
- understand the performance trade-offs between delay, area, and power consumption

Content
The third VLSI course begins with the basics of metal-oxide-semiconductor (MOS) field-effect transistors (FETs) and moves up the stack towards logic gates and increasingly complex digital circuit structures. The topics of this course include:
- Nanometer MOSFETs
- Static and dynamic behavior of complementary MOS (CMOS) inverters
- CMOS gate design, sizing, and timing
- Full-custom standard-cell design
- Wire models and parasitics
- Latch and flip-flop circuits
- Gate-level timing analysis and optimization
- Static and dynamic power consumption; low-power techniques
- Alternative logic styles (dynamic logic, pass-transistor logic, etc.)
- Arithmetic and logic circuits
- Fixed-point and floating-point arithmetic
- Synchronous and asynchronous design principles
- Memory circuits (ROM, SRAM, and DRAM)
- In- and near-memory processing architectures
- Full-custom accelerator circuits for machine learning

The exercises are concerned with schematic entry, layout, and simulation of digital integrated circuits using a disciplined standard-cell-based approach with Cadence Virtuoso.

Literature

227-0116-00L
VLSI 1: HDL Based Design for FPGAs

Abstract
This first course in a series that extends over three consecutive terms is concerned with tailoring algorithms and with devising high performance hardware architectures for their implementation as ASIC or with FPGAs. The focus is on front end design using HDLs and automatic synthesis for producing industrial-quality circuits.

Objective
Understand Very-Large-Scale Integrated Circuits (VLSI) chips, Application-Specific Integrated Circuits (ASIC), and Field-Programmable Gate-Arrays (FPGA). Know their organization and be able to identify suitable application areas. Become fluent in front-end design from architectural conception to gate-level netlists. How to model digital circuits with SystemVerilog. How to ensure they behave as expected with the aid of simulation, testbenches, and assertions. How to take advantage of automatic synthesis tools to produce industrial-quality VLSI and FPGA circuits. Gain practical experience with the hardware description language SystemVerilog and with industrial Electronic Design Automation (EDA) tools.

Content
This course is concerned with system-level issues of VLSI design and FPGA implementations. Topics include:
- Overview on design methodologies and fabrication depths.
- Levels of abstraction for circuit modeling.
- Organization and configuration of commercial field-programmable components.
- FPGA design flows.
- Dedicated and general purpose architectures compared.
- How to obtain an architecture for a given processing algorithm.
- Meeting throughput, area, and power goals by way of architectural transformations.
- Hardware Description Languages (HDL) and the underlying concepts.
- SystemVerilog
- Register Transfer Level (RTL) synthesis and its limitations.
- Building blocks of digital VLSI circuits.
- Functional verification techniques and their limitations.
- Modular and largely reusable testbenches.
- Assertion-based verification.
- Synchronous versus asynchronous circuits.
- The case for synchronous circuits.
- Periodic events and the Anceau diagram.
- Case studies, ASICs compared to microprocessors, DSPs, and FPGAs.

During the exercises, students learn how to model FPGAs with SystemVerilog. They write testbenches for simulation purposes and synthesize gate-level netlists for FPGAs. Commercial EDA software by leading vendors is being used throughout.

Lecture notes
Textbook and all further documents in English.

Literature

Prerequisites
- Basics of digital circuits.
- Understanding Very-Large Scale Integrated Circuits (VLSI) design.

Examination:
In written form following the course semester (spring term). Problems are given in English, answers will be accepted in either English oder German.

Further details:
https://iis-students.ee.ethz.ch/lectures/vlsi-i/

227-0301-00L
Optical Communication Fundamentals

Abstract
The path of an analog signal in the transmitter to the digital world in a communication link and back to the analog world at the receiver is discussed. The lecture covers the fundamentals of all important optical and photonic components in a fiber communication system. This includes the transmitter, the fiber channel and the receiver with the electronic digital signal processing elements.

Objective
An in-depth understanding of how information is transmitted from source to destination. Also the mathematical framework to describe the important elements will be passed on. Students attending the lecture will further get engaged in critical discussion on societal, economical and environmental aspects related to the on-going exponential growth in the field of communications.
The objective of this course is to understand how the electronic properties of carbon-based materials can be exploited for fabricating electronic devices. We explore resistive PCM and RRAM, magnetic MRAM and ferroelectric FRAM memories, covering physics, device aspects and the latest research in the field. Through interactive lectures and laboratory sessions, students gain up-to-date knowledge and compare emerging memory techs.

In this course, students will learn about the leading contenders for post-silicon storage-class and main memory technologies. Decades of research have yielded several efficient memory device working principles, including phase-change of the structure (PCM), materials conversion (OxRAM), ion diffusion (CBRAM), magnetic properties (STT-MRAM, MTJ), and ferroelectricity (FRAM, FeFET). Currently, these memory technologies are transitioning from research to industry, and are predicted to have at least niche applications in the ever-growing hardware market. Some technologies, such as PCM, may even eventually surpass silicon-based flash memory, providing better performance and unique features.

Students will have the opportunity to compare emerging memory technologies with state-of-the-art SSD Flash, DRAM, and SRAM, as well as evaluate their potential. Through critical thinking discussions, students will acquire important skills for assessing the strengths and limitations of these emerging technologies.

The course is organized as a series of lectures, focusing on selected memory technologies. This class also includes practical laboratory sessions for the PCM research topics. Students will spend 2 hours per week in the class or laboratory and additional 2-3 hours per week to prepare for the exam.

The course will cover the following carbon-based materials:
- Single-molecule
- Graphene (single layer, bilayer, twisted bilayer)
- Graphene nanoribbons
- Carbon nanotubes

For each material, we will discuss:
- Electronic structure and charge transport properties
- Material synthesis and characterization
- Device integration and characterization

The course also includes a presentation by each student in which a related scientific publication is discussed. This presentation is compulsory and accounts for 30% of the grade.

Lecture notes and Literature
Lecture notes are handed out. Lecture slides are distributed every week. In addition, relevant scientific articles and book chapters will be provided for self-study.

In addition to the slides, the following supplementary books can be recommended:

Prerequisites / notice
A basic knowledge of solid-state physics and quantum mechanics is required. The course is taught in English.
227-0663-00L  Nano-Optics  W  6 credits  2V+2U  M. Frimmer

Abstract
Nano-Optics is the study of light-matter interaction at the sub-wavelength scale. It is an flourishing field of fundamental and applied research enabled by the rapid advance of nanotechnology. Nano-optics embraces topics such as plasmonics, optical antennas, optical trapping and manipulation, and high/super-resolution imaging and spectroscopy.

Objective
Understanding concepts of light localization and light-matter interactions on the sub-wavelength scale.

Content
We start with the angular spectrum representation of fields to understand the classical resolution limit. We continue with the theory of strongly focused light, the point spread function, and resolution criteria of conventional microscopy, before turning to super-resolution techniques, based on near- and far-fields. We introduce the local density of states and approaches to control spontaneous emission rates in inhomogeneous environments, including optical antennas. Finally, we touch upon optical forces and their applications in optical tweezers.

Prerequisites / notice
- Electromagnetic fields and waves (or equivalent)
- Physics I+II

227-0671-00L  Nanodevices and Circuits for the Beyond-Moore Era  W  3 credits  2V  M. Csontos, I. Shorubalko

Abstract
Big Data, AI and the Internet of Things demand new hardware which overcomes the limitations of von Neumann architectures. The lecture gives an insight how the fundamental physics and the resulting complex functionalities of nanodevices and circuits offer viable alternatives. Their increased computational power and energy efficiency are demonstrated through neuromorphic computing applications.

Objective
The students will gain a firm understanding in the theory and pioneering experiments of electronic and heat transport at atomic- to nanometer length-scales. Advanced device functionalities enabled by recently discovered material systems will be covered. The students will learn how to exploit such phenomena for designing nanodevices and circuits to energy-efficiently implement neuromorphic algorithms for a sustainable future of information technologies.

Lecture notes
The presentation slides and further material will be provided every week.

Prerequisites / notice
Basic knowledge of solid state physics and semiconductors.

252-0834-00L  Information Systems for Engineers  W  4 credits  2V+1U  G. Fourny

Abstract
This course provides the basics of relational databases from the perspective of the user.

We will discover why tables are so incredibly powerful to express relations, learn the SQL query language, and how to make the most of it. The course also covers support for data cubes (analytics).
Objective

Do you want to be able to query your own data productively and efficiently in your future semester projects, bachelor's thesis, master thesis, or PhD thesis? Are you looking for something beyond the Python+Pandas hype? This courses teaches you how to do so as well as the dos and don'ts.

This lesson is complementary with Big Data for Engineers as they cover different time periods of database history and practices -- you can take them in any order, even though it might be more enjoyable to take this lecture first.

After visiting this course, you will be capable to:

1. Explain, in the big picture, how a relational database works and what it can do in your own words.
2. Explain the relational data model (tables, rows, attributes, primary keys, foreign keys), formally and informally, including the relational algebra operators (select, project, rename, all kinds of joins, division, cartesian product, union, intersection, etc).
3. Perform non-trivial reading SQL queries on existing relational databases, as well as insert new data, update and delete existing data.
4. Design new schemas to store data in accordance to the real world's constraints, such as relationship cardinality
5. Explain what bad design is and why it matters.
6. Adapt and improve an existing schema to make it more robust against anomalies, thanks to a very good theoretical knowledge of what is called "normal forms".
7. Understand how indices work (hash indices, B-trees), how they are implemented, and how to use them to make queries faster.
8. Access an existing relational database from a host language such as Java, using bridges such as JDBC.
9. Explain what data independence is all about and didn't age a bit since the 1970s.
10. Explain, in the big picture, how a relational database is physically implemented.
11. Know and deal with the natural syntax for relational data, CSV.
12. Explain the data cube model including slicing and dicing.
13. Store data cubes in a relational database.
14. Map cube queries to SQL.
15. Slice and dice cubes in a UI.

And of course, you will think that tables are the most wonderful object in the world.

Content

Using a relational database

=*=*=*=*=*=*=*=*=*=*=*=*=*
1. Introduction
2. The relational model
3. Data definition with SQL
4. The relational algebra

Literature

- Lecture material (slides).
  (it is not required to buy the book, as the library has it)

Prerequisites / notice

For non-CS/DS students only, BSc and MSc
Elementary knowledge of set theory and logic
Knowledge as well as basic experience with a programming language such as Pascal, C, C++, Java, Haskell, Python
Microscopy Training SEM I - Introduction to SEM

**Objective**
A comprehensive understanding of the interaction of electrons and ions with condensed matter and details on the instrumentation and methods designed to use these probes in the structural and chemical analysis of various materials.

**Content**
This course provides a general introduction into electron- and ion-microscopy of organic and inorganic materials. In the first part, the basics of transmission- and scanning electron microscopy are presented. The second part includes the most important aspects of specimen preparation, imaging and image processing. In the third part, focused ion-beam and atom probe microscopes are presented. Throughout the semester, various applications in materials science, solid state physics, structural biology, structural geology, and structural chemistry will be reported.

**Prerequisites / Literature**
For PhD students, postdocs and others, a fee will be charged (https://scopem.ethz.ch/education/MTP.html).

**Lecture notes**
will be distributed in English

**Literature**
Erni: Aberration-corrected imaging in transmission electron microscopy, Imperial College Press (2010, and 2nd ed. 2015)

**Content**
The number of participants is limited. In case of overbooking, the course will be repeated once. All registrations will be recorded on the waiting list.

For PhD students, postdocs and others, a fee will be charged (https://scopem.ethz.ch/education/MTP.html).

All applicants must additionally register on this form:
https://docs.google.com/forms/d/1Xw8L_2yXE9qXxW9C/c6mjKMVqdVkxSJEa--9CwDXkd0/edit

The selected applicants will be contacted and asked for confirmation a few weeks before the course date.

**Abstract**
This introductory course on Scanning Electron Microscopy (SEM) emphasizes hands-on learning. Using Scopem SEMs, students have the opportunity to study their own samples (or samples provided) and solve practical problems by applying knowledge acquired during the lectures. At the end of the course, students will be able to apply SEM for their (future) research projects.

**Objective**
- Set-up, align and operate a SEM successfully and safely.
- Understand important operational parameters of SEM and optimize microscope performance.
- Explain different signals in SEM and obtain secondary electron (SE) and backscatter electron (BSE) images.
- Operate the SEM in low-vacuum mode.
- Make use of EDX for semi-quantitative elemental analysis.
- Prepare samples with different techniques and equipment for imaging and analysis by SEM.
During the course, students learn through lectures, demonstrations, and hands-on sessions how to setup and operate SEM instruments, including low-vacuum and low-voltage applications. This course gives basic skills for students new to SEM. At the end of the course, students are able to align an SEM, to obtain secondary electron (SE) and backscatter electron (BSE) images and to perform energy dispersive X-ray spectroscopy (EDX) semi-quantitative analysis. Emphasis is put on procedures to optimize SEM parameters in order to best solve practical problems and deal with a wide range of materials.

Lectures:
- basics of electron optics and the TEM instrument set-up
- TEM imaging modes and image contrast
- STEM operation mode
- Sample preparation techniques for hard and soft materials

Practicals:
- X-ray micro-analysis (theory and detection), qualitative and semi-quantitative EDX and point analysis, linescan and spectral mapping
- Tilt experiments
- Bright-field and Dark-field imaging
- STEM operation mode
- Sample preparation techniques for hard and soft materials
- Practical work with TEMs
- Practice on real-world samples and report results

Lecture notes will be distributed.

Literature

No mandatory prerequisites.

Data: 26.07.2024 12:39  Autumn Semester 2024  Page 2106 of 2680
In this course students will obtain an overarching view on thin film deposition techniques with a focus on epitaxial deposition processes. The main learning objectives are:

- Identification of most relevant deposition technique for a given application.
- Understanding of growth mechanism and growth modes.
- Understanding strategies for engineering the functionalities of the films using the deposition process.
- Selection of the most appropriate characterization technique.
- Understanding device concepts and fundamental limits in the technology relevant ultra-thin limit.
- Assessing the relevance of scientific literature dealing with complex oxide thin films.

Content

A lab visit visit will be organized and students will participate to the design of thin films with atomic precision.

General description of the leading deposition routes including physical and chemical vapor deposition techniques (PVD and CVD) as well as so called "wet techniques" (e.g. spin coating and spray pyrolysis).

Growth modes and processes.

Part of the course discusses vacuum technologies.

Fundamental characterization techniques for application-relevant thin films as well as state of the art approaches for in situ and ex-situ determination of the structural, chemical and ferroic (ferromagnetic and ferroelectric) properties of films: (XRD for thin films, RHEED, EDX, scanning probe microscopy techniques, laser-optical characterization and many more)

Epitaxy for the advanced design and characterization of high quality thin films for energy efficient oxide electronics.

Types of ferroic order, multiferroics, multifunctional oxide materials, epitaxial strain related effects, oxide thin film based devices and examples.

Regular discussions on preselected scientific literature and mini-seminars will be organized.

363-0537-00L Resource and Environmental Economics W 3 credits 2G A. Miftakhova, A. Minabutdinov

Abstract

Relationship between economy and environment, market failures, external effects and public goods, contingent valuation, internalisation of externalities, economics of non-renewable resources, economics of renewable resources, environmental cost-benefit analysis, sustainability economics, and international resource and environmental problems.

Objective

A successful completion of the course will enable a thorough understanding of the basic questions and methods of resource and environmental economics and the ability to solve typical problems using appropriate tools consisting of concise verbal explanations, diagrams or mathematical expressions. Concrete goals are first of all the acquisition of knowledge about the main questions of resource and environmental economics and about the foundation of the theory with different normative concepts in terms of efficiency and fairness. Secondly, students should be able to deal with environmental externalities and internalisation through appropriate policies or private negotiations, including knowledge of the available policy instruments and their relative strengths and weaknesses. Thirdly, the course will allow for in-depth economic analysis of renewable and non-renewable resources, including the role of stock constraints, regeneration functions, market power, property rights and the impact of technology. A fourth objective is to successfully use the well-known tool of cost-benefit analysis for environmental policy problems, which requires knowledge of the benefits of an improved natural environment. The last two objectives of the course are the acquisition of sufficient knowledge about the economics of sustainability and the application of environmental economic theory and policy at international level, e.g. to the problem of climate change.

Content

The course covers all the interactions between the economy and the natural environment. It introduces and explains basic welfare concepts and market failure; external effects, public goods, and environmental policy; the measurement of externalities and contingent valuation; the economics of non-renewable resources, renewable resources, cost-benefit-analysis, sustainability concepts; international aspects of resource and environmental problems; selected examples and case studies. After a general introduction to resource and environmental economics, highlighting its importance and the main issues, the course explains the normative basis, utilitarianism, and fairness according to different principles. Pollution externalities are a deep core topic of the lecture. We explain the governmental internalisation of externalities as well as the private internalisation of externalities (Coase theorem). Furthermore, the issues of free rider problems and public goods, efficient levels of pollution, tax vs. permits, and command and control instruments add to a thorough analysis of environmental policy. Turning to resource supply, the lecture first looks at empirical data on non-renewable natural resources and then develops the optimal price development (Hotelling-rule). It deals with the effects of explorations, new technologies, and market power. When treating the renewable resources, we look at biological growth functions, optimal harvesting of renewable resources, and the overuse of open-access resources. A next topic is cost-benefit analysis with the environment, requiring measuring environmental benefits and measuring costs. In the chapter on sustainability, the course covers concepts of sustainability, conflicts with optimality, and indicators of sustainability. In a final chapter, we consider international environmental problems and in particular climate change and climate policy.

Data: 26.07.2024 12:39 Autumn Semester 2024 Page 2107 of 2680
What causes economic business cycles? How are limited resources, competition, and cooperation reflected in growth dynamics? To answer such questions, we combine macroeconomic models and methods of nonlinear dynamics. We study the role of bifurcations and control parameters for dynamic stability. Feedback cycles and coupled dynamics are reasons for limited predictability, instability and chaos.

Our approach to economic dynamics combines insights from different disciplines: macroeconomics studying business cycles and growth, system dynamics rooted general system theory and cybernetics, and nonlinear dynamics using applied mathematics.

We start with a comparison of different modeling approaches, to highlight the problems and challenges of system modeling. The subsequent lectures then introduce different one- and two-dimensional nonlinear models with applications in economics, such as models of supply and demand, business cycles, growth and competition. Emphasis is on the formal analysis of these models using methods from applied mathematics and tools for solving coupled differential equations.

Weekly self-study tasks are used to apply the concepts introduced in the lectures. We practice how to solve nonlinear models formally and numerically and how to interpret the results.

The course is for advanced students and covers selected topics from magnetic resonance spectroscopy. The following topics will be covered:

- DNP theory & instrumentation
- Biological applications of solid-state DNP

The course is separated in three well separated parts.

The first part will cover DNP concept and mechanisms, while a special focus will be given in DNP instrumentation, such as MAS spectroscopy. A special focus will be given to the vacuum tube’s theory and technology. In this context, the Maxwell equations and the propagation of the transverse electric and transverse magnetic modes in circular waveguides will be taught. This material will be the basis for understanding the resonance theory and the fundamentals of the microwave’s generation in vacuum tubes. Based on the theoretical background gained in the previous lectures it will be possible to understand the operation principle of the slow wave devices, such as Klystron, Traveling Wave Tube (TWT), Backward Wave Oscillator (BWO) and Surface Wave Structure (SWS), as well as, the fast wave devices, such as gyro-devices, Free Electron Laser, etc. Finally, some details on the structure of a real DNP gyrotron will be presented.

The second part of the course is dedicated to the microwave theory and technology. This part starts with an introduction of the two different types of microwave sources, such as the solid-state devices and vacuum tubes, which are extensively used in DNP and EPR spectroscopy. A special focus will be given to the vacuum tube’s theory and technology. In this context, the Maxwell equations and the propagation of the transverse electric and transverse magnetic modes in circular waveguides will be taught. This material will be the basis for understanding the resonance theory and the fundamentals of the microwave’s generation in vacuum tubes. Based on the theoretical background gained in the previous lectures it will be possible to understand the operation principle of the slow wave devices, such as Klystron, Traveling Wave Tube (TWT), Backward Wave Oscillator (BWO) and Surface Wave Structure (SWS), as well as, the fast wave devices, such as gyro-devices, Free Electron Laser, etc. Finally, some details on the structure of a real DNP gyrotron will be presented.

The third part of the course will cover CPMAS and homonuclear and heteronuclear recoupling schemes and their use in correlation spectroscopy for structure and molecular interaction determination. Sample preparation with particular emphasis of glassing agents and their relationship to DNP enhancements will be discussed. Resolution under DNP including a discussion about inhomogeneous and homogeneous broadening at cryogenic temperatures. Methods for circumventing low resolution at cryogenic temperatures will be discussed including site specific isotope labeling, bio-orthogonal labeling and site specific radical labeling/targeting. Concepts around the role of spin diffusion in DNP, direct and indirect DNP, paramagnetic broadening, longitudinal T1 and methyl quenching in biological NMR will also be discussed. These concepts will then be tied together through discussions of biomolecular applications of solid-state DNP, including membrane proteins, in-cell DNP and viruses.
529-0026-00L Advanced Magnetic Resonance - Biological Magnetic Resonance

Abstract
The course is for advanced students and covers selected topics from magnetic resonance spectroscopy. It is concerned with inference of structure and dynamics of proteins and their complexes from data obtained by EPR and liquid-state NMR experiments. The special focus is on multi-state and ensemble modelling.

Objective
This course enables students to design experimental strategies for characterization of structure and dynamics of proteins whose flexibility is relevant for their function. Students understand the spin dynamics that encodes sidechain and backbone motion as well as distance information into signals measured by magnetic resonance experiments. They learn to solve the inverse problem of inferring dynamics parameters and distances from the experimental results. They acquire skills in modelling protein ensemble structure from constraints derived by analyzing magnetic resonance data. Students are aware of the complications introduced by the use of spin labels in such experiments and learn how to include such labels in modelling.

Content
- Nitroxide spin labels, their interaction with the environment, and influence of their dynamics on EPR line shapes
- Contributions to electron spin decoherence and ways to improve resolution in pulsed EPR
- Measurement of electron-electron dipole-dipole interaction and conversion of the primary data to distance distributions
- Modelling of spin labels by rotamer libraries
- Ensemble modelling with distance distributions
- Liquid-state NMR experiments for assessing protein structure and dynamics
- Assignment of NMR signals for proteins
- Theory of the nuclear Overhauser effect (NOE)
- Ensemble modelling with exact NOE constraints
- Multistate structure calculation and analysis
- Further constraints on protein structure and dynamics from NMR experiments

Lecture notes
A script, which covers the topics, will be accessible through the course Moodle

Prerequisites / notice
A basic knowledge of magnetic resonance, e.g. as covered in the lecture course Physical Chemistry IV or in the book "Spin Dynamics" by Malcolm Levitt

Competencies

Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies
- Analytical Competencies
- Decision-making
- Problem-solving

Social Competencies
- Communication
- Cooperation and Teamwork

Personal Competencies
- Adaptability and Flexibility
- Critical Thinking
- Integrity and Work Ethics

Self-direction and Self-management

529-0027-00L Advanced Magnetic Resonance - Solid State NMR

Does not take place this semester.

Abstract
The course is for advanced students and introduces and discusses the theoretical foundations of solid-state nuclear magnetic resonance (NMR).

Objective
The aim of the course is to familiarize the students with the basic concepts of modern high-resolution solid-state NMR. Starting from the mathematical description of spin dynamics, important building blocks for multi-dimensional experiments are discussed to allow students a better understanding of modern solid-state NMR experiments. Particular emphasis is given to achieving high spectral resolution.

Content
The basic principles of NMR in solids will be introduced. After the discussion of basic tools to describe NMR experiments, basic methods and experiments will be discussed, e.g., magic-angle spinning, cross polarization, decoupling, and recoupling experiments. Such basic building blocks allow a tailoring of the effective Hamiltonian to the needs of the experiment. These basic building blocks can then be combined in different ways to obtain spectra that contain the desired information.

Lecture notes
A script which covers the topics will be distributed in the lecture and will be accessible through the web page http://www.ssnmr.ethz.ch/education/

Prerequisites / notice
Prerequisite: A basic knowledge of NMR, e.g. as covered in the Lecture Physical Chemistry IV, or the book by Malcolm Levitt.

529-0433-01L Advanced Physical Chemistry: Statistical Thermodynamics

Abstract
Introduction to statistical mechanics and thermodynamics. Prediction of thermodynamic and kinetic properties from molecular data.

Objective
Introduction to statistical mechanics and thermodynamics. Prediction of thermodynamic and kinetic properties from molecular data.

Content

Lecture notes
See homepage of the lecture.

Literature
See homepage of the lecture.

Prerequisites / notice
Chemical Thermodynamics, Reaction Kinetics, Molecular Quantum Mechanics and Spectroscopy; Mathematical Foundations (Analysis, Combinatorial Relations, Integral and Differential Calculus)

651-3440-02L Geophysics III

Abstract
This course builds on Geophysik I and Geophysik II, broadening the students' education in seismology, geodynamics and geodynamics theory, by considering various specific topics of particular interest.

Objective
To teach students the basics of observational seismology, earthquake source seismology, seismotectonics and the principle of seismic tomography, mantle convection over Earth history, structure of the oceanic and continental lithosphere, plate tectonics, hotspots, global heat flux, dynamo operation and magnetic field generation in Earth, planets, the Sun and stars and electromagnetism to probe the mantle.
Content
Observational seismology, earthquake source seismology, seismotectonics and the principle of seismic tomography. Mantle convection over Earth history, structure of the oceanic and continental lithosphere, plate tectonics, hotspots, global heat flux. Dynamo operation and magnetic field generation in Earth, planets, the Sun and stars; electromagnetism to probe the mantle.

651-4010-00L Planetary Sciences: a Physical Perspective W 3 credits 2G C. Gillmann

Abstract
This course aims to give a physical understanding of the formation, structure, dynamics and evolution of planetary bodies in our solar system and also apply it to ongoing discoveries regarding planets around other stars.

Objective
The goal of this course is to enable students to understand current knowledge and uncertainties regarding the formation, structure, dynamics and evolution of planets and moons in our solar system, as well as ongoing discoveries regarding planets around other stars. Students will practice making quantitative calculations relevant to various aspects of these topics through weekly homeworks.

The main topics covered are: Orbital dynamics and Tides, Solar heating and Energy transport, Planetary atmospheres, Planetary surfaces, Planetary interiors, Asteroids and Meteorites, Comets, Planetary rings, Magnetic fields and Magnetospheres, The Sun and Stars, Planetary formation, Exoplanets and Exobiology

Lecture notes
Slides and scripts will be posted on Moodle.

701-1257-00L European Climate Change W 3 credits 2G E. Fischer, J. Rajczak, S. C. Scherrer

Abstract
The lecture provides an overview of climate change in Europe, from a physical and atmospheric science perspective. It covers the following topics:

• observational datasets, observation and detection of climate change;
• underlying physical processes and feedbacks;
• numerical and statistical approaches;
• currently available projections.

Objective
At the end of this course, participants should:

• understand the key physical processes shaping climate change in Europe;
• know about the methodologies used in climate change studies, encompassing observational, numerical, as well as statistical approaches;
• be familiar with relevant observational and modeling data sets;
• be able to tackle simple climate change questions using available data sets.

Content
Contents:
• global context
• observational data sets, analysis of climate trends and climate variability in Europe
• global and regional climate modeling
• statistical downscaling
• key aspects of European climate change: intensification of the water cycle, Polar and Mediterranean amplification, changes in extreme events, changes in hydrology and snow cover, topographic effects
• projections of European and Alpine climate change

Lecture notes
Slides and lecture notes will be made available at http://www.iac.ethz.ch/edu/courses/master/electives/european-climate-change.html

Prerequisites / notice
Participants should have a background in natural sciences, and have attended introductory lectures in atmospheric sciences or meteorology.

Proseminars and Semester Papers
Detailed information at:
https://www.phys.ethz.ch/studies/master/semester-projects.html

Bachelor students in Physics who wish to register for a MSc Semester Project or Proseminar need to contact the study administration (studiensekretariat@phys.ethz.ch).

Number Title Type ECTS Hours Lecturers
402-0218-MSL Research Project W 8 credits 15A Supervisors

Abstract
Students conduct a small research project within a research group or carry out a guided self-study of original papers on a given theoretical topic. The results are submitted in a written report and an oral presentation.

Objective
Students are enabled to:
• expand their knowledge in a specific area of physics,
• conduct a project (a) in a research laboratory or (b) on a specific topic of theoretical physics,
• discuss their project results and conclusions in a team,
• present their findings in written and oral form.

Abstract
Master students who cannot document to have received an adequate training in working scientifically.

Directive

Objective
Basic standards for scientific works in physics: How to write a Master Thesis. What to know about research integrity.

402-0900-30L  Master’s Thesis  O  30 credits  57D

Only students who fulfil the following criteria are allowed to begin with their master's programme:
- a. successful completion of the bachelor programme;
- b. fulfilling of any additional requirements necessary to gain admission to the master programme;
- c. have acquired at least 8 credits in the category Proseminars and Semester Papers.

Further information:
Abstract
The Master's thesis concludes the Master's programme and constitutes a full-time project of six-month duration aimed at advancing the skills and capabilities of students to work independently and creatively towards the solution of an individual research problem which has been agreed upon in advance.

Objective
Students are enabled to:
- solve a complex problem by applying theoretical and experimental methods and skills,
- articulate their beliefs and thoughts on a scientific subject, appreciate the positions of others and revisit their own positions based on new insights,
- contribute constructively to the projects of a diverse research team,
- actively participate in a scientific discourse on a specific area of physics and present positions based on scientific arguments.

<td>Introduce IT services at D-PHYS and offer modules covering IT-related topics for scientists.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
**Objective**

The "IT at D-PHYS" introduction provides a good understanding of how IT works at D-PHYS and presents an overview of the IT services and their providers. It is recommended for everyone joining the department.

The "IT and Information Security" crash course will address the most common threats you'll encounter when using the internet and teach you how to fend them off.

The remainder is structured into individual modules which can be attended separately. They give practical insights into everyday research-related IT challenges.

The "Linux Basics" modules offer an introduction to the Linux landscape and show how to work on the shell by using command line tools. The first part provides a basic understanding of Linux systems and their components. It introduces commands essential to working with local and remote machines. The second part focuses on more advanced tools and workflows and provides guidelines to scripting, automation, and customization.

The "Python Ecosystem" modules present various aspects of the environment around Python. Without teaching the Python programming language itself, it aims at providing understanding of various concepts surrounding it. The first part focuses on getting ready to run code. It discusses the management of Python interpreters, packages, and virtual environments. The second part presents tools for writing Python code and interacting with strings. From development environments (IDE, Jupyter), code formatters and linters, to string formatting and parsing with regular expressions. The third part sits at the interface between Python code and external data files. We explain how to read or write files, discuss data types and file formats. We show how to handle configuration parameters and mention tools to automate the data analysis.

The "System Aspects" module deals with the hardware-related side of scientific computing. To get the best performance out of your scientific code, you have to be aware of the underlying hardware and adapt to it.

Use the dedicated web page https://www.lehrbetrieb.ethz.ch/laborpraktika to register. Enrolled students are eligible for an attestation of attendance after visiting at least 3 out of the 5 modules. Refer to https://compenv.phys.ethz.ch for the detailed contents.

**Content**

**Introduction:**

- IT at D-PHYS (IT service providers and IT services at D-PHYS)
- IT and Information Security

**Modules:**

- Linux Basics I (system components, basic shell usage)
- Linux Basics II (advanced tools, scripting)
- Python Ecosystem I (interpreters, packages, virtual environments)
- Python Ecosystem II (development environments, formatter and linter, string formatting, regexp)
- Python Ecosystem III (external data files, config parameters and automation)
- System Aspects (how the hardware affects your scientific code and vice versa)

</table>

**Abstract**

- Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.
- Develop a physical understanding for static and dynamic phenomena related to (moving) charged objects and understand the structure of the classical field theory of electrodynamics (transverse versus longitudinal physics, invariances (Lorentz-, gauge-)). Appreciate the interrelation between electric, magnetic, and optical phenomena and the influence of media. Understand a set of classic electrodynamical phenomena and develop the ability to solve simple problems independently. Apply previously learned mathematical concepts (vector analysis, complete systems of functions, Green's functions, co- and contravariant coordinates, etc.). Prepare for quantum mechanics (eigenvalue problems, wave guides and cavities).
- Classical field theory of electrodynamics: Derivation and discussion of Maxwell equations, starting from the static limit (electrostatics, magnetostatics, boundary value problems) in the vacuum and in media and subsequent generalization to the full dynamical case (Faraday's law, Ampere/Maxwell law; potentials and gauge invariance). Wave equation and solutions in full space, half-space (Snell's law), waveguides, cavities, generation of electromagnetic radiation, scattering and diffraction of light (optics). Application to various specific examples. Discussion of the structure of Maxwell's equations, Lorentz invariance, relativity theory and covariance, Lagrangian formulation. Dynamics of relativistic particles in the presence of fields and their radiation properties (synchrotron).
- J.D. Jackson, Classical Electrodynamics
- W.K.H Panovsky and M. Phillips, Classical electricity and magnetism
- A. Sommerfeld, Elektrodynamik, Optik (Vorlesungen über theoretische Physik)
- M. Born and E. Wolf, Principles of optics
- R. Feynman, R. Leighton, and M. Sands, The Feynman Lectures of Physics, Vol II

**Literature**

- A. Sommerfeld, Elektrodynamik, Optik (Vorlesungen über theoretische Physik)
- M. Born and E. Wolf, Principles of optics
- R. Feynman, R. Leighton, and M. Sands, The Feynman Lectures of Physics, Vol II

**Problem-solving**

- Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.
- he course gives an introduction to fundamental techniques and algorithms of numerical mathematics which play a central role in numerical simulations in science and technology. The course focuses on fundamental ideas and algorithmic aspects of numerical methods. The exercises involve actual implementation of numerical methods in C++.
Objective

* Knowledge of the fundamental algorithms in numerical mathematics
* Knowledge of the essential terms in numerical mathematics and the techniques used for the analysis of numerical algorithms
* Ability to choose the appropriate numerical method for concrete problems
* Ability to interpret numerical results
* Ability to implement numerical algorithms efficiently

Content

* Direct Methods for linear systems of equations
* Least Squares Techniques
* Data Interpolation and Fitting
* Filtering Algorithms
* Approximation of Functions
* Numerical Quadrature
* Iterative Methods for non-linear systems of equations

Lecture notes

Lecture materials (PDF documents and codes) will be made available to participants.

Literature

M. Hanke-Bourgeois "Grundlagen der Numerischen Mathematik und des wissenschaftlichen Rechnens", BG Teubner, 2002

P. Deuflhard and A. Hohmann, "Numerische Mathematik I", DeGruyter, 2002

Prerequisites / notice

Solid knowledge about fundamental concepts and techniques from linear algebra & calculus as taught in the first year of science and engineering curricula.

The course will be accompanied by programming exercises in C++ relying on the template library EIGEN. Familiarity with C++, object oriented and generic programming is an advantage. Participants of the course are expected to learn C++ by themselves.

Abstract
First introduction to main modelling ideas and mathematical tools from mathematical finance.

Objective
This course gives a first introduction to the main modelling ideas and mathematical tools from mathematical finance. It mainly aims at non-mathematicians who need an introduction to the main tools from stochastics used in mathematical finance. However, mathematicians who want to learn some basic modelling ideas and concepts for quantitative finance (before continuing with a more advanced course) may also find this of interest. The main emphasis will be on ideas, but important results will be given with (sometimes partial) proofs.

Content
Topics to be covered include:
- financial market models in finite discrete time
- absence of arbitrage and martingale measures
- valuation and hedging in complete markets
- basics about Brownian motion
- stochastic integration
- stochastic calculus: Itô’s formula, Girsanov transformation, Itô’s representation theorem
- Black-Scholes formula

Lecture notes
See information on course homepage

Prerequisites / notice
Prerequisites: Results and facts from probability theory as in the book "Probability Essentials" by J. Jacod and P. Protter will be used freely. Especially participants without a direct mathematics background are strongly advised to familiarise themselves with those tools before (or very quickly during) the course. (A possible alternative to the above English textbook are the (German) lecture notes for the standard course "Wahrscheinlichkeitstheorie".)

For those who are not sure about their background, we suggest to look at the exercises in Chapters 8, 9, 22-25, 28 of the Jacod/Protter book. If these pose problems, you will have a hard time during the course. So be prepared.

Abstract
This lecture covers organizations and businesses’ end-to-end data analytics process and deepens each process stage. It shows why a stage is needed and what actions are taken in each stage. It gives steps successfully applied in practice and loopholes when issues arise. Case studies from various industries will be presented for each stage.

Objective
This course aims to give the students an understanding of the whole data analytics life cycle in the business world. It shows the expectations of companies and how it is measured. It enables the student to manage successfully all the non-methodological aspects of a data analytics project which are the primary source of failure in end-to-end executions. The student will become familiar with the business language, and cultural aspects of organizations. It also gives an overview of the data analytics tool, platform, and methods ecosystem for successfully technical data analyses.

Content
1) Introduction
2) Framing the business problem
3) Framing the analytics problem
4) Data
5) Identification of problem-solving approaches and appropriate tools
6) How to set up and validate models
7) The deployment of a model
8) Model lifecycle
9) Operating models and roles
10) Some words about soft skills needed by statistical and mathematical professionals

Lecture notes
The lecture's presentation slides will be provided.

<td>363-0711-00L</td>
<td>Accounting for Managers</td>
<td>W</td>
<td>3</td>
<td>2V</td>
<td>H. Chen, E. Petrov</td>
</tr>
</tbody>
</table>

Abstract
The course Accounting for Managers offers an introduction to financial and managerial accounting, especially for students who aspire for a career in business and management with a science or engineering background.
Objective
After attending the class, you should be able to:
- understand the accounting system, the reporting process, and be able to prepare financial statements
- feel comfortable reading and using the information presented in companies’ annual reports
- understand cost concepts and conduct cost analyses
- become familiar with several classic decisions using managerial accounting information
- comment on the current events related to these topics

Content
Accounting plays a critical role in the effective functioning of the financial market as well as the long-term success of a company. This course intends to provide an introduction to accounting for those who wish to pursue a career in business, and need the skills and knowledge to understand, analyze, and interpret accounting information to make informed decisions. The course is divided into two parts. In the first part, we focus on financial reporting and start with the basic accounting concepts and the accounting cycle, to learn how the financial system is set up in a company and how financial statements are prepared. We then delve deeper into each major account, and discuss how revenues and expenses are recognized, and how assets, liabilities, and equities are reported. In the second part, we focus on managerial accounting for internal managerial/operational decisions including fundamental topics such as cost behavior, cost estimation, CVP analyses, and relevant costing. We then cover budgeting and standard costing, which are important parts of accounting system in companies.

Prerequisites / notice
This course is a prerequisite for the course Financial Management.

363-1081-00L Asset Liability Management and Treasury Risks
W 3 credits 2V P. Mangold, M. Eichhorn

Abstract
Asset Liability Management (ALM) is key to the financial success of any corporation. The goal is to develop a comprehensive understanding of the nature of corporate balance sheet and off-balance sheet positions and related profits and losses, including identification and mitigation of undue risks taken. This course is geared towards preparing students to apply these concepts in practical settings.

Objective
The main learning objectives of this course are:
- develop a comprehensive understanding of the nature of corporate balance sheet and off-balance sheet positions and their respective contribution to profits and losses
- measure and assess exposures to risk factors such as interest and FX rates, equity and commodity prices, as well as liquidity events
- trading and hedging to mitigate undue risks incurred

Content
The course is organized around a series of case studies. We will first discuss and develop an understanding of the fundamentals on different aspects of the management and risk management of the balance sheet. Using real life case studies each concept will then be directly applied and tested. In-class discussions, presentations and one written assignment are used to facilitate active and interactive learning in a stimulating environment. During the case studies students will frequently work in small groups. Therefore, the number of participants is limited to 40.

The course focuses on the application of finance concepts to the financial management of corporations and is geared towards preparing students to apply these concepts in practical settings. Executives of all sectors are expected to have a sound understanding of the content covered. As such, the course is not exclusively targeted at students who are considering a career in the financial services sector. It also recommended for students who want to work in the finance, treasury or risk area of corporates. It is also suitable for students who want to work for a consultancy firm.

Literature
No single textbook covers the course, below we list some useful references. Further materials will be made available to students prior to the lectures

Prerequisites / notice
Participants should have a basic understanding of financial management, gained, for example, from prior undergraduate economics, business, or accounting studies.

Number  Title  Type  ECTS  Hours  Lecturers
401-3925-00L Non-Life Insurance: Mathematics and Statistics Does not take place this semester.
W 8 credits 4V+1U M. V. Wüthrich

Abstract
The lecture aims at providing a basis in non-life insurance mathematics which forms a core subject of actuarial science. It discusses collective risk modeling, individual claim size modeling, approximations for compound distributions, ruin theory, premium calculation principles, tariffication with generalized linear models and neural networks, credibility theory, claims reserving and solvency.

Objective
The student is familiar with the basics in non-life insurance mathematics and statistics. This includes the basic mathematical models for insurance liability modeling, pricing concepts, stochastic claims reserving models and ruin and solvency considerations.

Data: 26.07.2024 12:39 Autumn Semester 2024 Page 2117 of 2680
The following topics are treated:
- Collective Risk Modeling
- Claim Counts Models
- Individual Claim Size Modeling
- Censoring and Truncation
- Approximations for Compound Distributions
- Ruin Theory in Discrete Time
- Premium Calculation Principles
- Tarification
- Generalized Linear Models and Neural Networks
- Bayesian Models and Credibility Theory
- Claims Reserving
- Solvency Considerations

M.V. Wüthrich, Non-Life Insurance: Mathematics & Statistics
http://ssrn.com/abstract=2319328

Literature
M.V. Wüthrich, M. Merz. Statistical Foundations of Actuarial Learning and its Applications

Prerequisites / notice
The exams ONLY take place during the official ETH examination period (no semester end exams), and only in person exams (i.e. no remote exams).

This course will be held in English and counts towards the diploma of “Aktuar SAV”. For the latter, see details under www.actuaries.ch.

Prerequisites: knowledge of probability theory, statistics and applied stochastic processes.

Competencies
Subject-specific Competencies
- Concepts and Theories

Method-specific Competencies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management

401-4889-00L Mathematical Finance W 10 credits 4V+2U B. Acciaio

Abstract
Advanced course on mathematical finance:
- semimartingales and general stochastic integration
- absence of arbitrage and martingale measures
- fundamental theorem of asset pricing
- option pricing and hedging
- hedging duality
- optimal investment problems
- additional topics

Objective
Advanced course on mathematical finance, presupposing good knowledge in probability theory and stochastic calculus (for continuous processes)

Content
This is an advanced course on mathematical finance for students with a good background in probability. We want to give an overview of main concepts, questions and approaches, and we do this mostly in continuous-time models.

Topics include
- semimartingales and general stochastic integration
- absence of arbitrage and martingale measures
- fundamental theorem of asset pricing
- option pricing and hedging
- hedging duality
- optimal investment problems
- and probably others

Literature
While there are many textbooks on mathematical finance, none of them is ideal to cover the contents of this course. References include the following books:

Prerequisites / notice
Prerequisites are the standard courses
- Probability Theory (for which lecture notes are available)
- Brownian Motion and Stochastic Calculus (for which lecture notes are available)

Those students who already attended "Introduction to Mathematical Finance" will have an advantage in terms of ideas and concepts.

This course is the second of a sequence of two courses on mathematical finance. The first course "Introduction to Mathematical Finance" (MF I), 401-3888-00, focuses on models in finite discrete time. It is advisable that the course MF I is taken prior to the present course, MF II.

For an overview of courses offered in the area of mathematical finance, see https://www.math.ethz.ch/imsl/education/education-in-stochastic-finance/overview-of-courses.html.
### Numerical Solution of Stochastic Ordinary Differential Equations

**W 6 credits 3V+1U C. Schwab**

**Abstract**
This course is on the numerical approximations of stochastic ordinary differential equations (SDEs) driven by Brownian motions and Lévy processes. SDEs have several applications, for example in financial engineering. The contents cover stochastic processes, stochastic calculus, well-posedness results for SDEs, strong and weak approximations of SDEs, and simulation via Monte Carlo methods.

**Objective**
The aim of this course is to enable the students to carry out simulations and their mathematical convergence analysis for stochastic models originating from applications such as mathematical finance. For this the course teaches a decent knowledge of the different numerical methods, their underlying ideas, convergence properties and implementation issues.

**Content**
- Brownian motion and Lévy processes
- Stochastic integration and stochastic calculus
- Stochastic ordinary differential equations (SDEs)
- Numerical approximations of SDEs
- Stochastic simulation and Monte Carlo methods
- Applications to computational finance: Option valuation

**Lecture notes**
There will be English, typed lecture notes for registered participants in the course.

**Literature**

**Prerequisites / notice**
Mandatory:
- Probability and measure theory, basic numerical analysis and basics of MATLAB/Python programming.

a) mandatory courses:
- Measure - and Probability Theory I as covered in courses: ETH 401-2283-00L Analysis III (Measure Theory) UZH Kursmodul 10496 Hauptvorlesung: Mass- und Integrationstheorie

b) recommended courses:
- Stochastic Processes I

### Abstract
Investment returns are an important source of funding for social and pension insurance, and financial risk is an important threat to stability. We study short-term and long-term financial risk and its interplay with other risk factors, and we develop methods for the measurement and management of financial risk and return in an asset/liability context with the goal of ensuring sustainable funding. Understand the basic asset-liability framework: essential principles and properties of social and pension insurance; cash flow matching, duration matching, valuation portfolio and loose coupling; the notion of financial risk; long-term vs. short-term risk; coherent measures of risk.

Understand the conditions for sustainable funding: derivation of required returns; interplay between return levels, contribution levels and other parameters; influence of guaranteed benefits.

Understand the notion of risk-taking capability: capital process as a random walk; measures of long-term risk and relation to capital; short-term solvency vs. long-term stability; effect of embedded options and guarantees; interplay between required return and risk-taking capability.

Be able to study empirical properties of financial assets: the Normal hypothesis and the deviations from it; statistical tools for investigating relevant risk and return properties of financial assets; time aggregation properties; be able to conduct analysis of real data for the most important asset classes.

Understand and be able to carry out portfolio construction: the concept of diversification; limitations to diversification; correlation breakdown; incorporation of constraints; sensitivities and shortcomings of optimized portfolios.

Understand and interpret the asset-liability interplay: the optimized portfolio in the asset-liability framework; short-term risk vs. long-term risk; the influence of constraints; feasible and non-feasible solutions; practical considerations.

Have an overall view: see the big picture of what asset returns can and cannot contribute to social security; be aware of the most relevant outcomes; know the role of the actuary in the financial risk management process.

For pension insurance and other forms of social insurance, investment returns are an important source of funding. In order to earn these returns, substantial financial risks must be taken, and these risks represent an important threat to financial stability, in the long term and in the short term.

Risk and return of financial assets cannot be separated from one another and, hence, asset management and risk management cannot be separated either. Managing financial risk in social and pension insurance is, therefore, the task of reconciling the contradictory dimensions of

1. Required return for a sustainable funding of the institution,
2. Risk-taking capability of the institution,
3. Returns available from financial assets in the market,
4. Risks incurred by investing in these assets.

This task must be accomplished under a number of constraints. Financial risk management in social insurance also means reconciling the long time horizon of the promised insurance benefits with the short time horizon of financial markets and financial risk.

It is not the goal of this lecture to provide the students with any cookbook recipes that can readily be applied without further reflection. The goal is rather to enable the students to develop their own understanding of the problems and possible solutions associated with the management of financial risks in social and pension insurance.

To this end, a rigorous intellectual framework will be developed and a powerful set of mathematical tools from the fields of actuarial mathematics and quantitative risk management will be applied. When analyzing the properties of financial assets, an empirical viewpoint will be taken using statistical tools and considering real-world data.

Extensive handouts will be provided. Moreover, practical examples and data sets in Excel will be made available.

Solid base knowledge of probability and statistics is indispensable. Specialized concepts from financial and insurance mathematics as well as quantitative risk management will be introduced in the lecture as needed, but some prior knowledge in some of these areas would be an advantage.

This course counts towards the diploma of "Aktuar SAV".

### Content
- For pension insurance and other forms of social insurance, investment returns are an important source of funding. In order to earn these returns, substantial financial risks must be taken, and these risks represent an important threat to financial stability, in the long term and in the short term.
- Risk and return of financial assets cannot be separated from one another and, hence, asset management and risk management cannot be separated either. Managing financial risk in social and pension insurance is, therefore, the task of reconciling the contradictory dimensions of

1. Required return for a sustainable funding of the institution,
2. Risk-taking capability of the institution,
3. Returns available from financial assets in the market,
4. Risks incurred by investing in these assets.

This task must be accomplished under a number of constraints. Financial risk management in social insurance also means reconciling the long time horizon of the promised insurance benefits with the short time horizon of financial markets and financial risk.

It is not the goal of this lecture to provide the students with any cookbook recipes that can readily be applied without further reflection. The goal is rather to enable the students to develop their own understanding of the problems and possible solutions associated with the management of financial risks in social and pension insurance.

To this end, a rigorous intellectual framework will be developed and a powerful set of mathematical tools from the fields of actuarial mathematics and quantitative risk management will be applied. When analyzing the properties of financial assets, an empirical viewpoint will be taken using statistical tools and considering real-world data.

Extensive handouts will be provided. Moreover, practical examples and data sets in Excel will be made available.

Solid base knowledge of probability and statistics is indispensable. Specialized concepts from financial and insurance mathematics as well as quantitative risk management will be introduced in the lecture as needed, but some prior knowledge in some of these areas would be an advantage.

This course counts towards the diploma of "Aktuar SAV".
Abstract
This course introduces machine learning methods that can be used in finance and insurance applications.

Objective
The goal is to learn methods from machine learning that can be used in financial and insurance applications.

Content
Linear, polynomial, logistic, ridge and lasso regression, dimension reduction methods, singular value decomposition, kernel methods, support vector machines, classification and regression trees, random forests, XGBoost, neural networks, stochastic gradient descent, autoencoders, graph neural networks, transformers, credit analytics, pricing, hedging, insurance claim prediction.

Lecture notes
Course material is available on https://people.math.ethz.ch/~patrickc/mlfi

Literature

Prerequisites / notice
The course requires basic knowledge in analysis, linear algebra, probability theory and statistics.

Competencies
Subject-specific Competencies
Concepts and Theories assessed
Techniques and Technologies assessed
Analytical Competencies assessed
Problem-solving assessed
Project Management assessed

Method-specific Competencies
Communication assessed

401-3931-00L Responsible Machine Learning with Insurance Applications

Abstract
This lecture covers important aspects of applying supervised machine learning models in a responsible way, based on sound statistical theory. The focus is on model interpretability, calibration (bias) assessment, and proper model comparison. The methods are illustrated with actuarial datasets.

Objective
The student is familiar with the main tools of model interpretability, calibration assessment, and model comparison and knows how to apply supervised machine learning in a responsible way.

Content
• Overview of supervised machine learning (statistical learning theory, GLMs, tree based methods, and neural nets; cross-validation)
• Model interpretability methods (partial dependence plots, measures of variable importance, and SHAP)
• Bias/calibration assessment with identification functions
• Model comparison with consistent scoring functions
• Working with dependent observations and further topics

Prerequisites / notice
This course will be held in English and counts towards the diploma of "Aktuar SAV". For the latter, see details under www.actuaries.ch.

Quantum Engineering Master

► Core Courses

A minimum of 24 credits must be obtained from core courses during the MSc QE; course selection is subject to the tutor’s agreement.

★★ Quantum Technology Lab

This core course is a prerequisite for participation in the QuanTech Labs of the second and third semester.

<table>
<thead>

Abstract
In this course students will be exposed to different topics of quantum engineering and develop ideas for possible projects. Based on presentations by ETH labs participating in the MSc QE program and with the assistance of a mentor students will work in groups to develop concrete plans for a quantum experiment.

Objective
Acquire a broad overview of quantum engineering activities at ETH and develop own ideas about future quantum engineering projects.

★★ Engineering Core Courses

These core courses target students with a physics background and all those who need additional engineering foundations.

Prerequisites
Prerequisites: Signals and Systems Theory I, II.

MATLAB is used for system analysis and simulation.

227-0116-00L | VLSI 1: HDL Based Design for FPGAs | W | 6 credits | 5G | F. K. Gürkaynak |

Abstract
This first course in a series that extends over three consecutive terms is concerned with tailoring algorithms and with devising high performance hardware architectures for their implementation as ASIC or with FPGAs. The focus is on front end design using HDLs and automatic synthesis for producing industrial-quality circuits.

Objective
Understand Very-Large-Scale Integrated Circuits (VLSI chips), Application-Specific Integrated Circuits (ASIC), and Field-Programmable Gate-Arrays (FPGA). Know their organization and be able to identify suitable application areas. Become fluent in front-end design from architectural conception to gate-level netlists. How to model digital circuits with SystemVerilog. How to ensure they behave as expected with the aid of simulation, testbenches, and assertions. How to take advantage of automatic synthesis tools to produce industrial-quality VLSI and FPGA circuits. Gain practical experience with the hardware description language SystemVerilog and with industrial Electronic Design Automation (EDA) tools.

Content
This course is concerned with system-level issues of VLSI design and FPGA implementations. Topics include:
- Overview on design methodologies and fabrication depths.
- Levels of abstraction for circuit modelling.
- Organization and configuration of commercial field-programmable components.
- FPGA design flows.
- Dedicated and general purpose architectures compared.
- How to obtain an architecture for a given processing algorithm.
- Meeting throughput, area, and power goals by way of architectural transformations.
- Hardware Description Languages (HDL) and the underlying concepts.
- SystemVerilog
- Register Transfer Level (RTL) synthesis and its limitations.
- Building blocks of digital VLSI circuits.
- Functional verification techniques and their limitations.
- Modular and largely reusable testbenches.
- Assertion-based verification.
- Synchronous versus asynchronous circuits.
- The case for synchronous circuits.
- Periodic events and the Anceau diagram.
- Case studies, ASICs compared to microprocessors, DSPs, and FPGAs.

During the exercises, students learn how to model FPGAs with SystemVerilog. They write testbenches for simulation purposes and synthesize gate-level netlists for FPGAs. Commercial EDA software by leading vendors is being used throughout.

Lecture notes
Textbook and all further documents in English.

Literature

Prerequisites
Prerequisites: Basics of digital circuits.

Examination
In written form following the course semester (spring term). Problems are given in English, answers will be accepted in either English oder German.

Further details:
https://iis-students.ee.ethz.ch/lectures/vlsi-i/

Data: 26.07.2024 12:39  Autumn Semester 2024  Page 2123 of 2680
Integrated circuits are responsible for much of the progress in electronics in the last 50 years, particularly the revolutions in the Information and Communications Technologies we witnessed in recent years. Analog integrated circuits play a crucial part in the highly integrated systems that power the popular electronic devices we use daily. Understanding their design is beneficial to both future designers and users of such systems. The basic elements, design issues and techniques for analog integrated circuits will be taught in this course.

The exercise sessions aim to reinforce the lecture material by well guided step-by-step design tasks. The circuit simulator SPECTRE is used to facilitate the tasks. There is also an experimental session on op-amp measurements.

Lecture notes
Handouts of presented slides. No script but an accompanying textbook is recommended.

Literature

The path of an analog signal in the transmitter to the digital world in a communication link and back to the analog world at the receiver is discussed. The lecture covers the fundamentals of all important optical and optoelectronic components in a fiber communication system. This includes the transmitter, the fiber channel and the receiver with the electronic digital signal processing elements.

An in-depth understanding on how information is transmitted from source to destination. Also the mathematical framework to describe the important elements will be passed on. Students attending the lecture will further get engaged in critical discussion on societal, economical and environmental aspects related to the on-going exponential growth in the field of communications.

Lecture notes

402-0209-00L Quantum Physics for Non-Physicists

Abstract
This is an introduction to the physics of quantum mechanics following an information-theoretical approach. We start from the basic postulates, study the behaviour of quantum systems from a single spin to entangled particles in space, and connect the learnings to groundbreaking experiments from the past and the present. This course is well-suited for students with little background in physics.

Objective
This course teaches the basics of quantum physics, and complements courses in quantum computation and information theory. Students are equipped with tools to tackle complex quantum mechanical problems and foundational questions. The course covers approximately the same content as QM1, but from an information-driven perspective.

Content
Quantum formalism, from qubits to particles in space; Time and dynamics for quantum systems; Problems in 1D; Uncertainty and open systems; Spin; Problems in 3D; Non-locality and foundational aspects of quantum theory

Lecture notes
Lecture notes will be provided.

Literature
Quantum Processes Systems, and Information, by Benjamin Schumacher and Michael Westmoreland, available at https://www.cambridge.org/core/books/quantum-processes-systems-and-information/4E459E64E1EE7121CA2321435FAECC8A

Prerequisites / notice
This course is aimed at non-physicists, and in particular at students with a background in computer science, mathematics or engineering. Basic linear algebra and calculus knowledge is required (equivalent to first-year courses). Physics knowledge is not required. Physicists and students from a different background than outlined above are welcome at their own risk.

Note that while we follow an information-theoretical approach, this is not a course on quantum information theory or quantum computing. It therefore complements those courses offered at ETH Zurich.

This course can be taken in parallel to Quantum Information Processing I & II.

402-0255-00L Introduction to Solid State Physics

Abstract
The course provides an introduction to solid state physics, covering several topics that are later discussed in more detail in other more specialized lectures. The central topics are: solids and their lattice structures; interatomic bindings; lattice dynamics, electronic properties of insulators, metals, semiconductors, transport properties, and magnetism.

Objective
Introduction to Solid State Physics.

Content
The course provides an introduction to solid state physics, covering several topics that are later discussed in more detail in other more specialized lectures. The central topics are: solids and their lattice structures; interatomic bindings; lattice dynamics, thermal properties of insulators; metals (classical and quantum mechanical description of electronic states, thermal and transport properties of metals); semiconductors (bandstructure and n/p-type doping); magnetism.

Lecture notes
The script will be available on moodle.

402-0255-10L Einführung in die Festkörperphysik

Physics BSc students with programme regulations 2016 need to register for "402-0255-10L Einführung in die Festkörperphysik".

Abstract
The course provides an introduction to solid state physics, covering several topics that are later discussed in more detail in other more specialized lectures. The central topics are: solids and their lattice structures; interatomic bindings; lattice dynamics, electronic properties of insulators, metals, semiconductors, transport properties, and magnetism.

Quantum Information Processing II: Implementations

W 5 credits 2V+1U  A. Wallraff, J.-C. Bessède

This experimental part QIP II together with the theory part 402-0448-01L Quantum Information Processing I: Concepts

This theory part QIP I together with the experimental part 402-0448-02L QIP II (both offered in the autumn semester) combine to the core course in experimental physics "Quantum Information Processing" (totally 10 ECTS credits). This applies to the Master's degree programme in Physics.

By the end of the course students are able to explain the basic mathematical formalism of quantum mechanics and apply it to quantum information processing problems. They are able to adapt and apply these concepts and methods to analyze and discuss quantum algorithms and other quantum information-processing protocols.

A good understanding of finite dimensional linear algebra is recommended.

402-0442-00L Quantum Optics W 10 credits 3V+2U A. Imamoglu

This course gives an introduction to the fundamental concepts of Quantum Optics and will highlight state-of-the-art developments in this rapidly evolving discipline. The topics covered include the quantum nature of light, semi-classical and quantum mechanical description of light-matter interaction, laser manipulation of atoms and ions, optomechanics and quantum computation.

The course aims to provide the knowledge necessary for pursuing research in the field of Quantum Optics. Fundamental concepts and techniques of Quantum Optics will be linked to modern experimental research. During the course the students should acquire the capability to understand currently published research in the field.

This course gives an introduction to the fundamental concepts of Quantum Optics and will highlight state-of-the-art developments in this rapidly evolving discipline. The topics that are covered include:

- coherence properties of light
- quantum nature of light: statistics and non-classical states of light
- light matter interaction: density matrix formalism and Bloch equations
- quantum description of light matter interaction: the Jaynes-Cummings model, photon blockade
- laser manipulation of atoms and ions: laser cooling and trapping, atom interferometry,
- further topics: Rydberg atoms, optomechanics, quantum computing, complex quantum systems.

Selected book chapters will be distributed.

Text-books:

402-0448-01L Quantum Information Processing I: Concepts W 5 credits 2V+1U J. Renes

This course gives an introduction to the fundamental concepts of Quantum Optics and will highlight state-of-the-art developments in this rapidly evolving discipline. The topics covered include the quantum nature of light, semi-classical and quantum mechanical description of light-matter interaction, laser manipulation of atoms and ions, optomechanics and quantum computation.

The course aims to provide the knowledge necessary for pursuing research in the field of Quantum Optics. Fundamental concepts and techniques of Quantum Optics will be linked to modern experimental research. During the course the students should acquire the capability to understand currently published research in the field.

The topics covered in the course will include quantum circuits, gate decomposition and universal sets of gates, efficiency of quantum circuits, quantum algorithms (Shor, Grover, Deutsch-Josza,...), stabilizer-based quantum error correction, fault-tolerant designs, the BB84 quantum key distribution protocol, and simple methods of quantum metrology.

The end of the course students are able to explain the basic mathematical formalism of quantum mechanics and apply it to quantum information processing problems. They are able to adapt and apply these concepts and methods to analyze and discuss quantum algorithms and other quantum information-processing protocols.

A good understanding of finite dimensional linear algebra is recommended.

Literature

C. Besse, Quantum Computation and Quantum Information

Michael Nielsen and Isaac Chuang

Cambridge University Press

Prerequisites / notice

A good understanding of finite dimensional linear algebra is recommended.
Introduction to experimental systems for quantum information processing (QIP). This lecture gives an introduction in the basic concepts and applications of statistical physics for the general use in physics and, in particular, as a preparation for the theoretical solid state physics.

Abstract

Objective
Throughout the past 20 years the realm of quantum physics has entered the domain of information technology in more and more prominent ways. Enormous progress in the physical sciences and in engineering and technology has allowed us to build novel types of information processors based on the concepts of quantum physics. In these processors information is stored in the quantum state of physical systems forming quantum bits (qubits). The interaction between qubits is controlled and the resulting states are read out on the level of single quanta in order to process information. Realizing such challenging tasks is believed to allow constructing an information processor much more powerful than a classical computer. This task is taken on by academic labs, startups and major industry. The aim of this class is to give a thorough introduction to physical implementations pursued in current research for realizing quantum information processors. The field of quantum information science is one of the fastest growing and most active domains of research in modern physics.

Content
- Quantum bits
  - Coherent Control
  - Measurement
  - Decoherence
- QIP with
  - Ions
  - Superconducting Circuits
  - Photons
  - NMR
  - Rydberg atoms
  - NV-centers
  - Quantum dots

Lecture notes
Course material be made available at www.qudev.ethz.ch and on the Moodle platform for the course. More details to follow.

Literature
Quantum Computation and Quantum Information
Michael Nielsen and Isaac Chuang
Cambridge University Press

Prerequisites / notice
Basic knowledge of concepts of quantum physics and quantum systems, e.g from courses such as Physiscs III, Quantum Mechanics I and II or courses on topics such as atomic physics, solid state physics, quantum electronics are considered helpful.

More information on this class can be found on the web site www.qudev.ethz.ch
Communication

Analytical Competencies

1. Discrete-time linear systems and filters:

Introduction: examples of data conversion architectures; information representation; abstraction, categorization and symbolic concepts and theories.

Data Conversion System Design

fostered

Concepts and Theories

The course is about some fundamental topics of digital signal processing with a bias towards applications in communications. The two main themes are linearity and probability. In the first part of the course, we deepen our understanding of discrete-time linear filters. In the second part of the course, we review the basics of probability theory and discrete-time stochastic processes. We then discuss some basic concepts of detection theory and estimation theory, as well as some practical methods including LMMSE estimation and LMMSE filtering, the LMS algorithm, and the Viterbi algorithm. A recurrent theme throughout the course is the stable and robust 'inversion' of a linear filter.

Content

1. Discrete-time linear systems and filters:

- state-space realizations, z-transform and spectrum, decimation and interpolation, digital filter design, stable realizations and robust inversion.

2. The discrete Fourier transform and its use for digital filtering.

3. The statistical perspective:

- probability, random variables, discrete-time stochastic processes; detection and estimation: MAP, ML, Bayesian MMSE, LMMSE;
- Wiener filter, LMS adaptive filter, Viterbi algorithm.

Literature

- M. Gustavsson et. al., CMOS Data Converters for Communications, Springer, 2010

Prerequisites / notice

Recommended background:

- undergraduate physics, mathematics, semiconductor devices

Lecture notes

- Lecture Notes
- Slides are available online under https://lis-students.ee.ethz.ch/lectures/analog-to-digital-converters/
- A detailed script is provided for each lecture, including the exercises and their solutions.
- A recurrent theme throughout the course is the stable and robust 'inversion' of a linear filter.
- It is highly recommended to attend the course "Analog Integrated Circuits" of Prof. T. Jang as a preparation for this course.

227-0154-00L

Solid State Electronics and Optics

W 6 credits 4G 4 credits N. Yazdani, V. Wood

Solid State Electronics is an introductory condensed matter physics course covering crystal structure, electron models, classification of metals, semiconductors, and insulators, band structure engineering, thermal and electronic transport in solids, magnetoresistance, and optical properties of solids.

Objective

Understand the fundamental physics behind the mechanical, thermal, electric, magnetic, and optical properties of materials.

Lecture notes

- Lecture Notes
- Slides are available online under https://lis-students.ee.ethz.ch/lectures/analog-to-digital-converters/
- A detailed script is provided for each lecture, including the exercises and their solutions.
- A recurrent theme throughout the course is the stable and robust 'inversion' of a linear filter.

227-0157-00L

Semiconductor Devices: Physical Bases and Simulation

W 4 credits 3G 4 credits A. Schenk, C. I. Roman

It is highly recommended to attend the course "Analog Integrated Circuits" of Prof. T. Jang as a preparation for this course.
The course addresses the physical principles of modern semiconductor devices and the foundations of their modeling and numerical simulation. Necessary basic knowledge on quantum-mechanics, semiconductor physics and device physics is provided. Computer simulations of the most important devices and of interesting physical effects supplement the lectures.

Objective

The course aims at the understanding of the principle physics of modern semiconductor devices, of the foundations in the physical modeling of transport and its numerical simulation. During the course also basic knowledge on quantum-mechanics, semiconductor physics and device physics is provided.

Content

The main topics are: transport models for semiconductor devices (quantum transport, Boltzmann equation, drift-diffusion model, hydrodynamic model), physical characterization of silicon (intrinsinc properties, scattering processes), mobility of cold and hot carriers, recombination (Shockley-Read-Hall statistics, Auger recombination), impact ionization, metal-semiconductor contact, metal-insulator-semiconductor structure, and heterojunctions.

The exercises are focussed on the theory and the basic understanding of the operation of special devices, as single-electron transistor, resonant tunneling diode, pn-diode, bipolar transistor, MOSFET, and laser. Numerical simulations of such devices are performed with an advanced simulation package (Sentaurus-Synopsys). This enables to understand the physical effects by means of computer experiments.

Lecture notes

The script (in book style) can be downloaded from: https://iis-students.ee.ethz.ch/lectures/

Literature

The script (in book style) is sufficient. Further reading will be recommended in the lecture.

Prerequisites

227-0166-00L Analog Integrated Circuits W 6 credits 4G T. Jang

Abstract

This course provides a foundation in analog integrated circuit design based on bipolar and CMOS technologies.

Objective

Integrated circuits are responsible for much of the progress in electronics in the last 50 years, particularly the revolutions in the Information and Communications Technologies we witnessed in recent years. Analog integrated circuits play a crucial part in the highly integrated systems that power the popular electronic devices we use daily. Understanding their design is beneficial to both future designers and users of such circuits.

Content

The basic elements, design issues and techniques for analog integrated circuits will be taught in this course.

Lecture notes

Handouts of presented slides. No script but an accompanying textbook is recommended.

Literature

227-0225-00L Linear System Theory W 6 credits 5G J. Lygeros, A. Tsiamis

Abstract

The class is intended to provide a comprehensive overview of the theory of linear dynamical systems, stability analysis, and their use in control and estimation. The focus is on the mathematics behind the physical properties of these systems and on understanding and constructing proofs of properties of linear control systems.

Objective

Students should be able to follow the fundamental results in linear system theory to analyze and control linear dynamical systems.

Content

- Proof techniques and practices.
- Linear spaces, normed linear spaces and Hilbert spaces.
- Ordinary differential equations, existence and uniqueness of solutions.
- Continuous and discrete-time, time-varying linear systems. Time domain solutions. Time invariant systems treated as a special case.
- Controllability and observability, duality. Time invariant systems treated as a special case.
- Stability and stabilization, observers, state and output feedback, separation principle.

Lecture notes

Available on the course Moodle platform.

Prerequisites

Sufficient mathematical maturity, in particular in linear algebra, analysis.

227-0311-00L Qubits, Electrons, Photons W 6 credits 3V+2U T. Zambelli

Abstract

In-depth analysis of the quantum mechanics origin of nuclear magnetic resonance (qubits, two-level systems), of LASER (quantization of the electromagnetic field, photons), and of electron transfer (from electrochemistry to photosynthesis).

Objective

Beside electronics nanodevices, D-ITET is pushing its research in the fields of NMR (and NOT from that of quantum computing!).

Starting from the axioms of quantum mechanics, we will derive the fascinating theory describing spin and qubits, electron transitions and transfer, photons and LASER: quantum mechanics is different because it mocks our daily Euclidean intuition!

In this way, students will work out a robust quantum mechanics (theoretical!) basis which will help them in their advanced studies of the following masters: EIT (batteries), Biomedical Engineering (NMR, bioelectronics), Quantum Engineering, Micro- and Nanosystems.

IMPORTANT: “qubits” from the point of view of NMR (and NOT from that of quantum computing!).

Content

• Lagrangian and Hamiltonian: Symmetries and Poisson Brackets
• Postulates of QM: Hilbert Spaces and Operators
• Heisenberg’s Matrix Mechanics: Hamiltonian and Time Evolution Operator
• Density Operator
• Spin: Qubits, Bloch Equations, and NMR
• Entanglement
• Symmetries and Corresponding Operators
• Schrödinger’s Wave Mechanics: Electrons in a Periodic Potential and Energy Bands
• Harmonic Oscillator: Creation and Annihilation Operators
• Identical Particles: Bosons and Fermions
• Quantization of the Electromagnetic Field: Photons, Absorption and Emission, LASER
• Electron Transfer: Marcus Theory via Born-Oppenheimer, Franck-Condon, Landau-Zener
At the beginning, signal-flow graphs in general and driving-point signal-flow graphs in particular are introduced. We will use them during this lecture provides a wide overview over analog filters (continuous-time and discrete-time), signal-processing systems, and sigma-delta conversion, and gives examples with sensor interfaces and class-D audio drivers. All systems and circuits are treated using a signal-flow view. The lecture is suitable for both analog and digital designers.

The learning goal is that the students can apply signal-flow graphs and can understand the signal flow in such circuits and systems (including non-ideal effects) well enough to gain an understanding of further circuits and systems by themselves.

At the beginning, signal-flow graphs in general and driving-point signal-flow graphs in particular are introduced. We will use them during the whole term to analyze circuits on a system level (analog continuous-time, analog discrete-time, mixed-signal and digital) and understand how signals propagate through them. The theory and CMOS implementation of active Filters is then discussed in detail using the example of Gm-C filters and active-RC filters. The ideal and nonideal behaviour of opamps, current conveyors, and inductor simulators follows. The link to the practical design of circuits and systems is done with an overview over different quality measures and figures of merit used in scientific literature and datasheets. Finally, an introduction to discrete-time and mixed-domain filters and circuits is given, including sensor read-out amplifiers, correlated double sampling, and chopping, and an introduction to sigma-delta A/D and D/A conversion on a system level.

The learning goal is that the students can apply signal-flow graphs and can understand the signal flow in such circuits and systems (including non-ideal effects) well enough to gain an understanding of further circuits and systems by themselves.

This lecture does not go down to the details of transistor implementations. The lecture “227-0166-00L Analog Integrated Circuits” complements this lecture very well in that respect.

The base for these lectures are lecture notes and two or three published scientific papers. From these papers we will together develop the technical content.

The graph methods are also supported with teaching videos: https://tube.switch.ch/channels/d206c96c?order=episodes , and a Python-based open-source tool to manipulate graphs is available on https://github.com/hanspi42/signalflowgrapher

Supplementary material will be uploaded in Moodle.

Prerequisites / notice
The course has been intentionally conceived to be self-consistent with respect to QM for those master students not having encountered it in their track yet. Therefore, a presumably large overlapping has to be expected with a (welcome!!) QM introduction course like the D-ITET "Physics II".

A solid base of Analysis I & II as well as of Linear Algebra is really helpful.
The goal of this lecture is to explore both the rich physics as well as the application of these systems for sources and detectors. In fact, Intersubband Optoelectronics

Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: fostered
- Media and Digital Technologies: fostered
- Problem-solving: assessed

Social Competencies
- Communication: fostered
- Cooperation and Teamwork: fostered
- Customer Orientation: fostered
- Leadership and Responsibility: fostered
- Self-presentation and Social Influence: fostered
- Sensitivity to Diversity: fostered
- Negotiation: fostered

Personal Competencies
- Adaptability and Flexibility: fostered
- Creative Thinking: fostered
- Critical Thinking: assessed
- Integrity and Work Ethics: fostered
- Self-awareness and Self-reflection: fostered
- Self-direction and Self-management: fostered

Quantum Measurements and Optomechanics

Quantum Measurements and Optomechanics

Abstract
The measurement process is at the heart of both science and engineering. Measurement precision is ultimately limited by the laws of quantum mechanics. This course provides the knowledge necessary to understand current state-of-the-art quantum measurement systems operating at their fundamental limits with a particular focus on optomechanical implementations.

Objective
The goal of this course is to understand the quantum limits of measurement precision together with a formal description of the measurement process in the framework of quantum mechanics.

Content
The lecture starts with summarizing the relevant fundamentals of the treatment of noisy signals. We familiarize ourselves with the concept of measurement imprecision in light-based measurement systems. To this end, we consider the process of photodetection and discuss the statistical fluctuations arising from the quantization of the electromagnetic field into photons. We exemplify our insights at hand of concrete examples, such as homodyne and heterodyne photodetection. Furthermore, we focus on the process of measurement backaction, the inevitable result of the interaction of the probe with the system under investigation. We discuss the "standard quantum limit" as it arises from the balance of measurement imprecision and backaction, before turning to approaches to overcome it and reach the fundamental "Heisenberg limit". The course emphasizes the connection between the taught concepts and current state-of-the-art research carried out in the field of optomechanics. Exercises serve to consolidate our understanding and insight.

Prerequisites / notice
1. Electrodynamics
2. Physics 1,2
3. Introduction to quantum mechanics

Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed
- Analytical Competencies: assessed
- Decision-making: fostered
- Media and Digital Technologies: fostered
- Problem-solving: assessed
- Communication: assessed
- Cooperation and Teamwork: fostered

Intersubband Optoelectronics

Intersubband Optoelectronics

Abstract
Intersubband transitions in quantum wells are transitions between states created by quantum confinement in ultra-thin layers of semiconductors. Because of its inherent tailorable nature, this system can be seen as the "ultimate quantum designer's material".

Objective
The goal of this lecture is to explore both the rich physics as well as the application of these systems for sources and detectors. In fact, devices based on intersubband transitions are now unlocking large areas of the electromagnetic spectrum.

Content
The lecture will treat the following chapters:
- Introduction: intersubband optoelectronics as an example of quantum engineering
- Technological aspects
- Electronic states in semiconductor quantum wells
- Intersubband absorption and scattering processes
- Mid-IR and THz ISB Detectors
- Mid-infrared and THz photonics: waveguides, resonators, metamaterials
- Quantum Cascade lasers:
  - Mid-IR QCLs
  - THz QCLs (direct and non-linear generation)
- Further electronic confinement: interlevel Qdot transitions and magnetic field effects
- Strong light-matter coupling in Mid-IR and THz range

Lecture notes
The reference book for the lecture is "Quantum Cascade Lasers" by Jerome Faist, published by Oxford University Press.

Literature
Mostly the original articles, other useful reading can be found in:
- E. Rosencher and B. Vinter, Optoelectronics, Cambridge Univ. Press
- G. Bastard, Wave mechanics applied to semiconductor heterostructures, Halsted press

Prerequisites / notice
Requirements: A basic knowledge of solid-state physics and of quantum electronics.
Nano-Optics

Nano-Optics is the study of light-matter interaction at the sub-wavelength scale. It is an flourishing field of fundamental and applied research enabled by the rapid advance of nanotechnology. Nano-optics embraces topics such as plasmonics, optical antennas, optical trapping and manipulation, and high/super-resolution imaging and spectroscopy.

Objective

Understanding concepts of light localization and light-matter interactions on the sub-wavelength scale.

Content

We start with the angular spectrum representation of fields to understand the classical resolution limit. We continue with the theory of strongly focused light, the point spread function, and resolution conventions of conventional microscopy, before turning to super-resolution techniques, based on near- and far-fields. We introduce the local density of states and approaches to control spontaneous emission rates in inhomogeneous environments, including optical antennas. Finally, we touch upon optical forces and their applications in optical tweezers.

Prerequisites / notice

- Electromagnetic fields and waves (or equivalent)
- Physics I+II

Dynamic Programming and Optimal Control

Introduction to Dynamic Programming and Optimal Control.

Objective

Covers the fundamental concepts of Dynamic Programming & Optimal Control.

Content

Dynamic Programming Algorithm; Deterministic Systems and Shortest Path Problems; Infinite Horizon Problems, Bellman Equation; Deterministic Continuous-Time Optimal Control.

Prerequisites / notice

Requirements: Knowledge of advanced calculus, introductory probability theory, and matrix-vector algebra.

Advanced Machine Learning

Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

Objective

Students will be familiarized with advanced concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. Machine learning projects will provide an opportunity to test the machine learning algorithms on real-world data.

Content

The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:

Fundamentals:
- What is data?
- Bayesian Learning
- Computational learning theory

Supervised learning:
- Ensembles: Bagging and Boosting
- Max Margin methods
- Neural networks

Unsupervised learning:
- Dimensionality reduction techniques
- Clustering
- Mixture Models
- Non-parametric density estimation
- Learning Dynamical Systems

Lecture notes

No lecture notes, but slides will be made available on the course webpage.

Computer Science II

The courses covers the foundations of design and analysis of algorithms and data structures, including graph theory and graph problems. It also introduces generic and parallel programming.

Objective

Understanding design, analysis and implementation of fundamental algorithms and data structures. Overview of the concepts of generic and parallel programming. Hands-on experience with implementing the aforementioned in C++.

Content

- Asymptotic runtime (algorithmic complexity)
- Fundamental algorithmic problems, e.g. searching, sorting, shortest paths, spanning trees
- Classical data structures, e.g. search trees, balanced trees, heaps, hash tables
- Graph theory and graph problems
- Problem solving strategies as design patterns for algorithms, e.g. induction, divide and conquer, backtracking, dynamic programming
- Generic programming: C++ templates higher-order functions, lambda closure
- Parallel programming: (in)dependence of computations, parallelism and concurrency, shared memory, races, mutual exclusion, communication and synchronisation

Knowledge obtained in the lecture is deepened through practical and/or programming exercises (C++, Code Expert).
Lecture notes
All material (slides, lecture recordings, examples, exercises, etc.) will be published on the course website.

402-0257-00L Advanced Solid State Physics  W  10 credits  3V+2U  W. Wegscheider

Abstract
This course is an extension of the introductory course on solid state physics.

Objective
The purpose of this course is to learn to navigate the complex collective quantum phases, excitations and phase transitions that are the dominant theme in modern solid state physics. The emphasis is on the main concepts and on specific experimental examples, both classic ones and those from recent research.

Content
Written contribution: (1) a self-contained script, distributed electronically at semester start. (2) Experimental examples (Power Point slide-style) selected from original publications, distributed at the start of every lecture.

Literature
A list of books will be distributed. Numerous references to useful published scientific papers will be provided.

Prerequisites / notice
This course is for students who like to be engaged in active learning. The "exercise classes" are organized in a non-traditional way: following the idea of "less is more", we will work on only about half a dozen topics, and this gives students a chance to take a look at original literature (provided), and to get the grasp of a topic from a broader perspective.

The "compulsory performance element" of this lecture is a presentation of a paper complementing the lecture topics. Several topics and corresponding papers will be offered on the moodle page of this lecture.

402-0317-00L Semiconductor Materials: Fundamentals and Fabrication  W  6 credits  2V+1U  S. Schön, W. Wegscheider

Abstract
This course gives an introduction into the fundamentals of semiconductor materials. The main focus is on state-of-the-art fabrication and characterization methods. The course will be continued in the spring term with a focus on applications.

Objective
Basic knowledge of semiconductor physics and technology. Application of this knowledge for state-of-the-art semiconductor device processing.

Content
1. Fundamentals of Solid State Physics
   1.1 Semiconductor materials
   1.2 Band structures
   1.3 Carrier statistics in intrinsic and doped semiconductors
   1.4 p-n junctions
   1.5 Low-dimensional structures
2. Bulk Material Growth of Semiconductors
   2.1 Czochalski method
   2.2 Floating zone method
   2.3 High pressure synthesis
3. Semiconductor Epitaxy
   3.1 Fundamentals of Epitaxy
   3.2 Molecular Beam Epitaxy (MBE)
   3.3 Metal-Organic Chemical Vapor Deposition (MOCVD)
   3.4 Liquid Phase Epitaxy (LPE)
4. In situ characterization
   4.1 Pressure and temperature
   4.2 Reflectometry
   4.3 Ellipsometry and RAS
   4.4 LEED, AES, XPS
5. The invention of the transistor - Christmas lecture

Lecture notes
https://moodle-app2.let.ethz.ch/course/view.php?id=23113

Prerequisites / notice
The "compulsory performance element" of this lecture is a short presentation of a research paper complementing the lecture topics. Several topics and corresponding papers will be offered on the moodle page of this lecture.
Introduction to ultrafast laser physics with an outlook into cutting edge research topics such as attosecond science and coherent ultrafast 

The aim of the lecture is to deepen and broaden the knowledge about current research in the field of quantum optics. In addition, it will also 

Concepts and Theories
Techniques and Technologies
Analytical Competencies
Communication
Self-presentation and Social Influence

The lecture covers the following topics:

a) Linear pulse propagation: mathematical description of pulses and their propagation in linear optical systems, effect of dispersion on ultrashort pulses, concepts of pulse carrier and envelope, time-bandwidth product

b) Dispersion compensation: technologies for controlling dispersion, pulse shaping, measurement of dispersion

c) Nonlinear pulse propagation: intensity-dependent refractive index (Kerr effect), self-phase modulation, nonlinear pulse compression, self-focusing, filamentation, nonlinear Schrödinger equation, solitons, non-instantaneous nonlinear effects (Raman/Brillouin), self-steepening, saturable gain and absorption

d) Second-order nonlinearities with ultrashort pulses: phase-matching with short pulses and real beams, quasi-phase matching, second-harmonic and sum-frequency generation, parametric amplification and generation

e) Relaxation oscillations: dynamical behavior of rate equations after perturbation

f) Q-switching: active Q-switching and its theory based on rate equations, active Q-switching technologies, passive Q-switching and theory

g) Active modelocking: introduction to modelocking, frequency comb versus axial modes, theory for various regimes of laser operation, Haus master equation formalism

h) Passive modelocking: slow, fast and ideally fast saturable absorbers, semiconductor saturable absorber mirror (SESAM), designs of and materials for SESAMs, modelocking with slow absorber and dynamic gain saturation, modelocking with ideally fast saturable absorber, Kerr-lens modelocking, soliton modelocking, Q-switching instabilities in modelocked lasers, inverse saturable absorption

i) Pulse duration measurements: rf cables and electronics, fast photodiodes, linear system theory for microwave test systems, intensity and interferometric autocorrelations and their limitations, frequency-resolved optical gating, spectral phase interferometry for direct electric-field reconstruction and more

j) Noise: microwave spectrum analyzer as laser diagnostics, amplitude noise and timing jitter of ultrafast lasers, lock-in detection

k) Ultrafast measurements: pump-probe scheme, transient absorption/differential transmission spectroscopy, four-wave mixing, optical gating and more

l) Frequency combs and carrier-envelope offset phase: measurement and stabilization of carrier-envelope offset phase (CEP), time and frequency domain applications of CEP-stabilized sources

m) High-harmonic generation and attosecond science: non-perturbative nonlinear optics / strong-field phenomena, high-harmonic generation (HHG), phase-matching in HHG, attosecond pulse generation, attosecond technology: detectors and diagnostics, attosecond metrology (streaking, RABBITT, transient absorption, attoclock), example experiments

n) Ultrafast THz science: generation and detection, physics in THz domain, weak-field and strong-field applications

The lecture will cover current topics and papers in the wider field of quantum optics in an interactive format. Several papers will be presented by the students in the style of a journal club. Selected papers will be contrasted and their strengths and weaknesses discussed by the students in panel discussions. Recent papers on arXiv.org will be discussed and referee reports referee reports.

The aim of the lecture is to deepen and broaden the knowledge about current research in the field of quantum optics. In addition, it will also be discussed and critically examined how research results are communicated via publications and lectures and which techniques are used in the process.

We will select topical fields in quantum optics and quantum science and discuss recently published work.

Topics:
- Atoms or ions-based quantum computing
- Quantum simulation
- Opto-mechanics
- Driven and dissipative quantum systems
- Cavity based atom-light interaction
- Topological photonics

The interactive part of the lecture will include presentations of recent papers, panel discussions of recent papers and the writing of a critical assessment of an arXiv paper in the style of a referee report.
The course presents fundamental aspects of light-matter interaction in semiconductor materials, from basic research topics to opto-electronic devices. This course builds up on the material covered in the Quantum Optics course. The emphasis will be on quantum optics in condensed-matter systems. Fundamental concepts and techniques of Quantum Optics will be linked to experimental research in systems such as quantum dots, exciton-polaritons, quantum Hall fluids and graphene-like materials.

Content

Lecture notes
Lecture notes will be provided

Complete the following exercises during the lecture:
1. A collection of review articles (will be pointed out during the lecture)

Prerequisites / notice
Masters level quantum optics knowledge

Competencies
Subject-specific Competencies
- Concepts and Theories
- Analytical Competencies
- Problem-solving
- Cooperation and Teamwork
- Creative Thinking
- Critical Thinking

Literature
- C. Cohen-Tannoudji et al., Atom-Photon-Interactions (recommended)
- Y. Yamamoto and A. Imamoglu, Mesoscopic Quantum Optics (recommended)

The course aims to provide the knowledge necessary for pursuing advanced research in the field of Quantum Optics in condensed matter systems. The students will acquire theoretical and experimental knowledge about the different types of nanomaterials (semiconductors, metals, dielectric, carbon-based, ...) and their uses as building blocks for advanced applications in photonics (optoelectronics, plasmonics, photonic crystal, ...). Together with the exercises, the students will learn (1) to read, summarize and discuss scientific articles related to the lecture, (2) to estimate order of magnitudes with calculations using the theory seen during the lecture, (3) to prepare a short oral presentation and report about one topic related to the lecture, and (4) to imagine an original photonic device.
1. Introduction to nanophotonics
2. Wave physics for nanophotonics
3. Characterization of nanomaterials
4. Semiconductors
5. Nonlinear crystals
6. Photonic integrated circuits
7. Optical quantum devices
8. Plasmonics
9. Metasurfaces
10. Graphene & 2D Materials
11. Nanocomposites

Lecture notes
Slides and book chapter will be available for downloading

Literature
References will be given during the lecture

Prerequisites / notice
Basics of solid-state physics (i.e. energy bands) can help

Competencies

402-0469-67L
Classical and Quantum Parametric Phenomena
W 6 credits 3G A. Eichler, A. Grimm

Abstract
There are numerous physical phenomena that rely on time-dependent Hamiltonians (or parametric driving) to amplify, cool, squeeze or couple resonating systems. In this course, we will introduce parametric phenomena in different fields of physics, ranging from classical engineering ideas to devices proposed for quantum computing.

Objective
This course is intended for
- Experimentalists who desire to gain a solid theoretical understanding of nonlinear driven-dissipative systems,
- Theorists looking to enter a topical new field,
- Any scientist interested to learn what lies beyond the harmonic resonator.

In the course, the students will grasp the ubiquitous nature of parametric phenomena and apply it to both classical and quantum systems. The students will understand both the theoretical foundations leading to the parametric drive as well as the experimental aspect related to the realizations of the effect. Each student will analyze an independent system using the tools acquired in the course and will present his/her insights to the class.

Content
This course will provide a general framework for understanding and linking various phenomena, ranging from the child-on-a-swing problem to quantum-limited amplifiers, to optical frequency combs, and to optomechanical sensors used in the LIGO experiment. The course will combine theoretical lectures and the study of important experiments through literature.

The students will receive an extended lecture summary as well as numerous Python scripts, including some that are base on the QuTiP library. These tools will enable them to apply analytical and numerical methods to a wide range of systems beyond the duration of the course.

Lecture notes
A full script will be available in the form of chapters from a dedicated book ("Classical and Quantum Parametric Phenomena").

Prerequisites / notice
The students should be familiar with wave mechanics as well as second quantization. Following the course requires a laptop with Python installed to run Jupyter notebooks, including the QuTiP library.

Competencies

402-0492-00L
Experimental Techniques in Quantum and Electro-Optics
W 6 credits 2V+1U D. Kienzler, D. Prado Lopes Aude Craik

Abstract
We will cover experimental issues in making measurements in modern physics experiments. The primary challenge in any measurement is achieving good signal to noise. We will cover areas such as optical propagation, electronics, noise limits and feedback control. Methods for stabilizing frequencies and intensities of laser systems will also be described.
I aim to give an in depth understanding of experimental issues for students wishing to work on experimental science. The methods covered are widely applicable in modern physics, since light and electronics are the primary methods by which measurements are made across the field.

The course will cover a number of different areas of experimental physics, including
- Optical elements and propagation
- Electronics and Electronic Noise
- Optical Detection
- Control Theory

Examples from a modern quantum information laboratory will be discussed and illustrated through active devices in the lecture.

402-0535-00L Introduction to Magnetism

**Objective**
This course tackles the fundamental question of why only a few materials exhibit magnetism in Nature. The origin of atomic magnetic moments and the key mechanisms that govern their interactions are justified starting from fundamental principles. In addition, the influence of thermal fluctuations on magnetic ordering is discussed as well as the formalism to describe magnetic resonance phenomena.

**Content**
By the end of this course, students will develop the ability to utilize quantum mechanics concepts to estimate the strength of atomic magnetic moments and understand their reciprocal interactions. They will gain proficiency in interpreting experimental measurements on model systems in terms of material composition and an appropriate, phenomenological spin Hamiltonian. For instance, students will be able to recognize whether the magnetic hysteresis observed in some samples arises from slow dynamics or from a phase transition. Lastly, they will be capable of interpreting the occurrence of abrupt transitions or the emergence of characteristic length scales as resulting from the interplay between competing interactions. Altogether, students will acquire the basic knowledge needed to develop a research project in the field of magnetism or to attend effectively more advanced courses on this topic.

**Competencies**
- Subject-specific Competencies
  - Concepts and Theories: assessed
  - Techniques and Technologies: fostered
- Method-specific Competencies
  - Analytical Competencies: assessed
  - Media and Digital Technologies: fostered
  - Problem-solving: fostered
- Personal Competencies
  - Creative Thinking: fostered
  - Critical Thinking: assessed
  - Self-direction and Self-management: fostered

402-0595-00L Semiconductor Nanostructures

**Abstract**
The course covers the foundations of semiconductor nanostructures, e.g., materials, band structures, bandgap engineering and doping, field-effect transistors. The physics of the quantum Hall effect and of common nanostructures based on two-dimensional electron gases will be discussed, i.e., quantum point contacts, Aharonov-Bohm rings and quantum dots.

**Objective**
At the end of the lecture the student should understand four key phenomena of electron transport in semiconductor nanostructures:
1. The integer quantum Hall effect
2. Conductance quantization in quantum point contacts
3. the Aharonov-Bohm effect
4. Coulomb blockade in quantum dots

**Content**
1. Introduction and overview
2. Semiconductor crystals: Fabrication and molecular beam epitaxy
3. Band structures of semiconductors
4. k.p-theory, effective mass, envelope functions
5. Heterostructures and band engineering, doping
6. Surfaces and metal-semiconductor contacts, fabrication of semiconductor nanostructures
7. Heterostructures and two-dimensional electron gases
8. Drude Transport and scattering mechanisms
9. Single- and bilayer graphene
10. Electron transport in quantum point contacts; Landauer-Büttiker description, ballistic transport experiments
11. Interference effects in Aharonov-Bohm rings
12. Electron in a magnetic field, Shubnikov-de Haas effect
13. Integer quantum Hall effect
14. Coulomb blockade and quantum dots

**Literature**
- In addition to the lecture notes, the following supplementary books can be recommended:

**Prerequisites / notice**
The lecture is suitable for all physics students, students of Quantum Engineering, and students of Micro- and Nanosystems beyond the bachelor of science degree. Basic knowledge of solid state physics is a prerequisite. Very ambitious students in the third year of Physics may be able to follow. The lecture can be chosen as part of the PhD-program. The course is taught in English.
402-0810-70L Advanced Quantum Algorithms (University of Zurich) W 6 credits 2V+1U G. Mazzola

Abstract
The course treats selected families of quantum algorithms, currently the best candidates to achieve a practical quantum advantage over classical computation in physics, chemistry, optimization, sampling and machine learning.

Objective
The course aims to provide a balanced outlook of this transformative technology, discussing strengths and possible limitations of all discussed algorithms, especially in the context of concrete today and future hardware implementation. After the course, students will have a clear understanding of the state-of-the-art of this field (i.e., the applications and algorithms amenable to quantum speedup, types of hardware, and quantum software). The course content is devised to provide first-hand experience with quantum algorithms and stimulate critical thinking. The course will be instrumental for the student's career development in quantum technology and computational science, in academia or industry.

Content
Course content:
- Quantum gates and circuits basics
- Quantum annealing
- Hamiltonian simulations (Trotter, LCU, circuit decompositions)
- Mapping fermionic, bosonic operators to qubits
- Quantum phase estimation and applications
- Variational quantum algorithms (VQE, QAOA)
- Algorithms for sampling and search (Amplitude amplification, estimation, quantum walks, quantum enhanced Markov chains)
- Selected Quantum Machine learning algorithms
- Prospects for quantum advantage

Lecture notes
Lecture notes covering in detail all the course content will be provided.

Literature
- My lecture notes and references therein which are open-access will be more than enough to follow.
- For an introduction to quantum computing and information it could be useful to read specific chapters of Nielsen and Chuang book.

Prerequisites
- Prior knowledge in quantum information science is beneficial but not required.
- Knowledge of basic statistical mechanics and quantum mechanics is required, specifically: linear algebra, spin operators, many-body wavefunctions, Hamiltonians in second quantisation formalism.

Semester Project

Number Title Type ECTS Hours Lecturers
227-1871-00L Semester Project O 12 credits 20A Supervisors

Abstract
Semester projects are designed to train the students for independent scientific work. A project uses the student's technical and social skills acquired during the master's program. The semester project comprises 280 hours of work and is supervised by a professor.

Objective
see above

Prerequisites
Supervisor must be a professor at D-ITET or associated, see https://www.ee.ethz.ch/studies/main-master/projects-and-master-thesis.html

Internship

Number Title Type ECTS Hours Lecturers
227-1873-00L Internship in Industry W 12 credits external organisers

Abstract
The main objective of the (minimum) 12-week (full-time) internship in industry is to expose master's students to the industrial work environment. During this period, students can be involved in on-going projects at the company. Projects in academic institutions are subject to agreement of the programme direction.

Objective
see above

227-1873-10L QuanTech Workshops W 12 credits 2P G. Raino, M. Frimmer

Data: 26.07.2024 12:39  Autumn Semester 2024  Page 2138 of 2680
Abstract
The QuanTech Workshops are a project-oriented learning environment in the context of quantum technology. Students work in teams, consisting of engineers and physicists, and jointly tackle a quantum engineering project. During the preceding course "Case Studies: Application of Quantum Technologies", students develop project proposals. Successful proposals will be realized in a QuanTech Workshop.

Objective
Students practice development, planning, and execution of a project in the quantum engineering domain. By working in close collaboration with senior scientists and professors from the two departments D-ITET and D-PHYS, the goal is to provide solutions for pressing challenges in in the field of quantum technologies.

Prerequisites / notice
Attendance of "227-1831-10L Case Studies: Applications of Quantum Technology" and successful "QuanTech Workshop" proposal.

Admission only if ALL of the following apply:
- a) bachelor program successfully completed;
- b) acquired (if applicable) all credits from additional requirements for admission to master program;
- c) successfully completed the semester project.

Note: the conditions above are not applicable to incoming exchange students.

Registration in mystudies required!
Supervisor must be a professor at D-ITET or D-PHYS, see http://master-ge.ethz.ch/education/master-project.html.

Abstract
The Master Program finishes with a 6-months Master Thesis which is directed by a Professor of the Department or a Professor of another Department who is associated with the D-ITET. Students gain the ability to conduct independent scientific research on a specific research problem.

Objective
see above

Prerequisites / notice
Supervisor must be a professor at D-ITET or associated, see https://www.ee.ethz.ch/studies/main-master/projects-and-master-thesis.html

► Science in Perspective

Only courses offered under "GESS Science in Perspective" count in this category. See "Offered in" tab in course view. For more information, please refer to https://gess.ethz.ch/en/studies/science-in-perspective/SiP-FAQs.html

Data: 26.07.2024 12:39  Autumn Semester 2024  Page 2140 of 2680
Die Vorlesung deckt die Grundlagen der (Schweizerischen) Raumplanung und Landschaftsentwicklung ab:

- Was ist Raumplanung (Definitionen und Begriffe)
- Aktuelle Herausforderungen, Entwicklungen und Tendenzen der Raumplanung
- Grundprinzipien historische Entwicklung und Gesetzgebungen der Schweizer Raumplanung
- Die Raumplanung als staatliche Aufgabe – Raumordnungspolitik auf Bundesebene
- Instrumente der Raumplanung auf nationaler, kantonaler, regionaler und kommunaler Ebene (u.a. Sachpläne und Konzepte, Richtplanung, Nutzungsplanung, Sondernutzungsplanung, Mehrwertausgleich)
- Problemlösungsverfahren in der Raumplanung – systemtechnisches Vorgehen
- Thematische Vertiefungen: Siedlungsentwicklung nach innen; Klimaangepasste Raumplanung; Grundeigentum und kooperative Planung; Raumbeobachtung

Lecture notes
Skript und einzelne Dokumente werden ausgegeben. Unterlagen zur Vorlesung werden auf der SPUR-Kursseite und/oder auf Moodle direkt zur Verfügung gestellt.

Abstract
The lecture deals with ecological and pedological basics, especially from an engineering and spatial planning perspective. Students learn about soil properties, genesis, ecosystem functions and cycles. Soil changes due to natural and human intervention, the resulting soil degradation and functional restrictions as well as soil protection and management are taught.

Objective
- Students know the basic concepts of soil science and ecology.
- Students can explain soil properties, soil ecosystems and material cycles.
- Students can understand, calculate, analyze and assess the effects of human activities on soils and their functions.
- Students can understand and apply engineering and spatial planning approaches to soil protection and management.

Content
Basics of soil science & ecology: Basic terms, definition of soil, soil functions, soil formation, soil composition, soil types and key parameters, connection between soil and ecology,
Soil use & hazards: Soil compaction, erosion, material pollution of the soil, water balance changes & disturbances
Soil protection & management: soil recultivation and soil monitoring, soil in the city, soil and spatial planning, soil monitoring and the role of the federal government

Lecture notes
Lecture notes and slides (in German) can be found on the Moodle page of the course.

Abstract
We will model and solve scientific problems with partial differential equations. Differential equations which are important in applications will be classified and solved. Elliptic, parabolic and hyperbolic differential equations will be treated. The following mathematical tools will be introduced: Laplace and Fourier transforms, Fourier series, separation of variables, methods of characteristics.

Objective
Learning to model scientific problems using partial differential equations and developing a good command of the mathematical methods that can be applied to them. Knowing the formulation of important problems in science and engineering with a view toward civil engineering (when possible). Understanding the properties of the different types of partial differential equations arising in science and in engineering.

Content
Study of the Heat equation general diffusion/parabolic problems using the following tools through Separation of variables as an introduction to Fourier Series.
Systematic treatment of the complex and real Fourier Series
Study of the wave equation and general hyperbolic problems using Fourier Series, D'Alembert solution and the method of characteristics.
Laplace transform and it's uses to differential equations
Study of the Laplace equation and general elliptic problems using similar tools and generalizations of Fourier series.
Application of Laplace transform for beam theory will be discussed.
Time permitting, we will introduce the Fourier transform.

Lecture notes
Lecture notes will be provided
large part of the material follow certain chapters of the following first two books quite closely.

The course material is taken from the following sources:

Stanley J. Farlow - Partial Differential Equations for Scientists and Engineers

Prerequisites / notice

Analysis I and II, insbesondere, gewöhnliche Differentialgleichungen.

103-0233-10L Fundamentals of GIS O 6 credits 5G M. Raubal

Abstract Fundamentals of geographic information systems: spatial data modeling; metrics & topology; vector, raster and network data; thematic data; spatial statistics; system architectures; data quality; spatial queries and analysis; geovisualisation; spatial databases; labs with GIS software

Objective Knowing theoretical aspects of geographic information regarding data acquisition, representation, analysis and visualisation. Knowing the fundamentals of geoinformation technologies for the realization, application and operation of geographic information systems in engineering projects.

Content
- Einführung GIS & GIScience
- Konzeptionelles Modell & Datenschema
- Vektorgeometrie & Topologie
- Rastergeometrie und -algebra
- Netzwerke
- Thematische Daten
- Räumliche Statistik
- Systemarchitekturen & Interoperabilität
- Datenqualität, Unsicherheiten & Metadaten
- Räumliche Abfragen und Analysen
- Präsentation raumbezogener Daten
- Geodatenbanken

Lecture notes Vorlesungspräsentationen werden digital zur Verfügung gestellt.

Competencies

Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving

Social Competencies
- Self-presentation and Social Influence

Personal Competencies
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

103-0187-02L Satellite Geodesy O 4 credits 3G M. Aichinger-Rosenberger

Objective
- Sicherheit im Umgang mit Koordinaten-, Referenz- und Zeitsystemen
- Grundlegendes Verständnis der Berechnung von Satellitenbahnen
- Grundlegendes Verständnis der geodätischen Weltraumverfahren und deren Stärken und Schwächen
- Kenntnis der wichtigsten Prozesse, die für Änderungen in der Geometrie, der Rotation und dem Schwerefeld der Erde verantwortlich sind.
- Erkennen der Anwendungsmöglichkeiten der Satellitengeodäsie für interdisziplinäre Aufgaben (System Erde).

Content
- Koordinatensysteme, Transformationen
- Referenz- und Zeitsysteme
- Grundlagen Satellitenbahnen
- Weltraumverfahren: VLBI, SLR, DORIS, Altimetrie
- Schwerefeldmissionen
- Kombination der Weltraumverfahren zur Bestimmung der Geometrie, Orientierung sowie des Schwerefeldes der Erde
- Interdisziplinäre Anwendungen (Meteorologie, Klimatologie, Hydrologie, etc.)

Students are able to identify basic structures of the legal system. They understand selected topics of public and private law. They are able to fostered

This class introduces students into basic features of the legal system. Fundamental issues of constitutional law, administrative law, private law and the law of the EU are covered. The focus is on legal problems related to space. Active participation is expected in short interactive sequences.

Objective

Students are able to identify basic structures of the legal system. They understand selected topics of public and private law. They are able to apply the fundamentals in more advanced law classes and to recognize the relevance of law in their own field.
The concepts and tools in physics, as well as the methods of an experimental science are taught. The student should learn to identify, assess, and foster the fundamental principles of physics through practical demonstration experiments. Mechanics of point-like and rigid bodies, periodic motion and waves, along with concepts and theories of parameters estimation and data processing, are covered. Further, the course aims to foster problem-solving skills and introduce students to the use of specialized project management software.

<td><strong>Content</strong></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>The economic environment of today's companies is characterized by high cost pressure, declining margins, intensified international competition, rising customer requirements and increasingly strict regulations. Strategic and operational decisions at all management levels are becoming more and more complex due to the increasing amount of data, interrelationships, conditions and target criteria to be considered. Often it is no longer possible to solve operational tasks with experience and common sense alone and to adequately estimate the consequences of decisions without software support.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Quantitative models and methods of operations research and operations management offer decision support for complex problems. Mathematical optimization models are used to precisely formulate operational decision problems so that they can subsequently be analysed and optimized using suitable solution methods. A large number of quantitative real-world problems can be formulated and solved in this general framework. Applications of operations research comprise, for instance, decision problems in production planning, supply chain management, transportation networks, machine and workforce scheduling, blending of components, telecommunication network design, airline fleet assignment and revenue management.</td>

Projects are not only the base of work in modern enterprises, but also the primary type of cooperation with customers. Students of ETH will often work in or manage projects in the course of their career. Good project management knowledge is not only a guarantee for individual, but also for company-wide success.

The goal of this course is to give a detailed introduction into project management. The students should learn to plan and execute a project.

Project planning (aims, appointments, capacities, efforts and costs), project organization, scheduling and risk analysis, project execution, supervision and control, project evaluation, termination and documentation, conflict management, multinational project management, IT support as well as agile project management methods such as SCRUM.

The lecture slides and other additional material will be available for download from Moodle a week before each class.

- **Subject-specific Competencies**
  - Concepts and Theories: assessed
  - Media and Digital Technologies: fostered
  - Problem-solving: fostered
  - Project Management: assessed

- **Method-specific Competencies**
  - Analytical Competencies: assessed
  - Decision-making: assessed
  - Media and Digital Technologies: fostered
  - Problem-solving: fostered

- **Social Competencies**
  - Communication: assessed
  - Cooperation and Teamwork: fostered
  - Customer Orientation: fostered
  - Leadership and Responsibility: assessed
  - Self-presentation and Social Influence: fostered
  - Sensitivity to Diversity: fostered
  - Negotiation: assessed

- **Personal Competencies**
  - Adaptability and Flexibility: fostered
  - Critical Thinking: assessed
  - Integrity and Work Ethics: fostered
  - Self-awareness and Self-reflection: fostered
  - Self-direction and Self-management: assessed

---

**Systems Engineering**

- **Objective**
  - Systems Engineering is a way of thinking that helps engineer sustainable systems, i.e., ones that meet the needs of stakeholders in the short, medium and long term.
  - This course provides an overview of the main principles of Systems Engineering, and includes an introduction to the use of operations research methods in the determination of optimal systems.

- **Content**
  - The world’s growing population, changing demographics, and changing climate pose formidable challenges to humanity’s ability to live sustainably. Ensuring that humanity can live sustainably requires accommodating Earth’s growing and changing population through the provision and operation of a sustainable and resilient built environment. This requires ensuring excellent decision-making as to how the built environment is constructed and modified.

  The objective of this course is to ensure the best possible decision making when engineering sustainable systems, i.e., ones that meet the needs of stakeholders in the short, medium and long term. In this course, you will learn the main principles of Systems Engineering that help you from the first idea that a system may not meet expectations, to the quantitative and qualitative evaluation of possible system modifications. Additionally, the course includes an introduction to the use of operations research methods in the determination of optimal solutions in complex systems.

- **Abstract**
  - Systems Engineering is a way of thinking that helps engineer sustainable systems, i.e., ones that meet the needs of stakeholders in the short, medium and long term. A high-level overview of the main principles of System Engineering. The expectations of your efforts throughout the semester.
  - Situation analysis – How to structure the large amount of information that is often associated with attempting to modify complex systems. Additionally, the course includes an introduction to the use of operations research methods in the determination of optimal solutions in complex systems.

- **Lecture notes**
  - The lectures are structured as follows:
    1. Introduction – An introduction to System Engineering, a way of thinking that helps to engineer sustainable systems, i.e., ones that meet the needs of stakeholders in the short, medium and long term. A high-level overview of the main principles of System Engineering. The expectations of your efforts throughout the semester.
    2. Situation analysis – How to structure the large amount of information that is often associated with attempting to modify complex systems.
    3. Goals and constraints – How to set goals and constraints to identify the best solutions as clearly as possible.
    4. Generation of possible solutions – How to generate possible solutions to problems, considering multiple stakeholders.
    5. The principles of net-benefit maximization and a series of methods that range from qualitative and approximate to quantitative and exact, including pairwise comparison, elimination, weighting, and expected value.
    6. The idea behind the supply and demand curves and revealed preference methods.
    7. The concept of equivalence, including the time value of money, interest, life times and terminal values.
    8. The relationship between net-benefit and the benefit-cost ratio. How incremental cost benefit analysis can be used to determine the maximum net benefit. Internal rates of return.
    9. How to consider multiple possible futures and use simple rules to help pick optimal solutions and to determine the value of more information.
    10. Once quantitative analysis is used it becomes possible to use operations research methods to analyse large numbers of possible solutions. Linear programming and the simplex method.
    11. How sensitivity analysis is conducted using linear programming.
    12. How to use operations research to solve problems that consist of discrete values, as well as how to exploit the structure of networks to find optimal solutions to network problems.
    13. How to set up and solve problems when there are multiple objectives.

- **Lecture notes**
  - The lecture materials consist of a script, the slides, example calculations in Excel, Moodle quizzes, and exercises.
  - The lecture materials will be distributed via Moodle before each lecture.
Appropriate literature in addition to the lecture materials will be handed out when required via Moodle.

### Competencies

#### Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

#### Method-specific Competencies
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management

#### Social Competencies
- Communication
- Cooperation and Teamwork
- Customer Orientation
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation

#### Personal Competencies
- Adaptable and Flexible
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Leadership and Responsibility
- Self-awareness and Self-reflection
- Self-direction and Self-management

</thead>
</table>

**Abstract**
Advanced topics in geodetic metrology with focus on approaches to 3d modelling of local real world environments with higher accuracy.

**Objective**
By the end of this course, the students are able to create digital 3d models of the real world covering areas with an extension up to several 100 m with accuracies in the mm- to cm-level range. They can select the appropriate geodetic instruments or terrestrial laser scanners, plan and carry out the required working steps, test the equipment before use, and describe the quality of the results. They know a broad spectrum of visualization options and can assess their respective suitability for various application cases.

**Content**
- Overview: 3D Modelling from planning of data acquisition to visualization of the results
- Modern geodetic instruments
- Atmospheric effects
- Measurement techniques for high accuracy
- Introduction to terrestrial laser scanning
- Test and calibration of measurement instruments
- Point cloud processing: preprocessing, registration & georeferencing
- 3d modelling and visualization of objects, VR/AR/MR

**Literature**

**Prerequisites / notice**
The course is carried out in German. Basic knowledge of geodetic metrology is required as a prerequisite, corresponding to the learning objectives and content of the course Geodätische Messtechnik GZ. Besides lectures and data processing, the course also comprises extensive practical exercises in the field.

Spatial and Environmental Planning

Number Title Type ECTS Hours Lecturers
103-0325-02L Integrated Spatial Planning in Cities and Districts W 6 credits 4G G. Di Carlo Alvarez, F. Günther, R. Streit

Abstract
Methodische und instrumentelle Grundlagen der Raumentwicklung werden aus integrierter Sicht (Städtebau, Freiraum, Verkehr) vermittelt und von den Studierenden konkret in einem Zürcher Stadtquartier als Semesterübung angewendet.

Objective
- Ein Repertoire an hilfreichen Werkzeugen sowie Denkmuster aus der Raumplanung kennen
- Quartiere eigenständig zu erkunden, Potentiale sowie Risiken der Raumentwicklung zu erkennen und zu dokumentieren
- Eigene Räumliche Entwicklungskonzepte zu entwerfen und zu präsentieren
- Massnahmen für Schlüsselgebiete zu konkreter gestalten, u.a. hinsichtlich Zeitplanung, Organisation und Kosten

Content
Die Vorlesung vermittelt methodische und instrumentelle Grundlagen zu planerischen Denkmustern und Repertoire sowie Hilfestellungen für Entwerfen, Argumentieren und Entscheiden.

Lecture notes
Vorlesungsskript und Unterlagen werden auf Moodle hochgeladen.

Traffic Systems

Number Title Type ECTS Hours Lecturers
101-0415-01L Public Transport and Railways W 3 credits 2G F. Corman

Abstract
Fundamentals of public and collective transport, in its different forms. Categorization of performance dimensions of public transport systems, and their implications to their design and operations.

Objective
Teaches the basic principles of public transport network and topology design, to understand the main characteristics and differences of public transport networks, based on buses, railways, or other technologies. Teach students to recognize the interactions between the infrastructure design and the production processes, and various performance criteria based on various perspectives and stakeholders.
At the end of this course, students can critically analyze existing networks of public transport, their design and use; consider and substantiate different choices of technologies to suitable cases; optimize the use of resources in public transport.
**Content**

Fundamentals: Infrastructures and vehicle technologies of public transport systems; interaction between track and vehicles; passengers and goods as infrastructure users; management and financing of networks.

Infrastructure: Planning processes and decision levels in network development and infrastructure planning, planning of topologies; tracks and roadways, station infrastructures; Fundamentals of the infrastructure design for lines; track geometries; switches and crossings

Vehicles: Classification, design and suitability for different goals

Network design: design dilemmas, conceptual models for passenger transport on long distance, urban regional transport.

Operations: Passenger/Supply requirements for line operations; timetabling, measures of realized operations, capacity

**Lecture notes**

Slides, in English, are made available some days before each lecture.

**Literature**

Reference material books are provided in German and English (list disseminated at lecture), plus Skript Bahninfrastruktur; System- und Netzplanung

</tbody>
</table>

**Abstract**

In this lecture, the basics for the construction and operation of power grids are explained. The focus is on the components of the grid, from generation to transport and consumption.

**Objective**

- an overview of how the power grid is constructed and which components it requires.
- an understanding of the advantages and disadvantages of the different technologies and systems (e.g. cable and overhead lines or AC and DC voltage).
- an overview of the challenges and opportunities presented by external influences and new technologies.

**Content**

Electricity is one of the most important forms of energy used by modern society. The availability of electricity has an immense impact on our daily lives and is an essential prerequisite for economic and social development. Electricity is used in almost all aspects of daily life due to its high flexibility of use. From lighting and cooling homes and offices, to running factories and machinery, and powering electric vehicles, electricity is a major driver of modern society.

The goal of this course is to provide an understanding of electricity as a form of energy, its generation, transmission and use. To this end, the necessary systems and components as well as their interaction in one of the largest technical systems in the world, the interconnected power grid, will be presented.

This includes in particular:
- Electricity as a form of energy
- Electricity generation and storage
- Loads
- Transmission components (overhead lines, cables, substations)
- Protection technology
- Grid operation
- HVDC and power electronics for the power grids of the future
- Energy transition and current challenges

**Prerequisites / notice**

Enrolment only for students in Geospatial Engineering.

**Abstract**
The Bachelor Programme concludes with the Bachelor Thesis. This project is supervised by a professor. Writing up the Bachelor Thesis encourages students to show independence and to produce structured work.

**Objective**
Encourages students to show independence, to produce scientifically structured work and to apply engineering working methods.

**Content**
The contents base upon the fundamentals of the Bachelor Programme. Students can choose from different subjects and tasks. The thesis consists of both a written report and an oral presentation.

Abstract
History, impact and principles of the design and operation of transport systems. Only for master students, otherwise a special permission by the lecturers is required.

Objective
Introduction of the basic principles of the design and operation of transport systems (road, rail, air) and of the essential pathways of their impacts (investment, generalised costs, accessibilities, external effects), referring to relatively constant, and factors with substantial future uncertainty, in the past and expected evolution of transport systems.

Content
Network layout and its impact on road traffic. Traffic control systems for urban and inter-urban areas. Fundamentals of road safety and infrastructure maintenance.

Lecture notes
Lecturer notes and slides as well as hints to further literature will be given during the course.

Prerequisites / notice
Obligatory lecture for students of the first semester of MSc Spatial development and Infrastructure Systems.

Competencies

Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies
- Analytical Competencies
- Decision-making
- Problem-solving

Social Competencies
- Communication
- Cooperation and Teamwork

Content
Classification of public transport systems; Characteristics of rail systems, bus systems, cable cars and funiculars, unconventional systems; introduction to logistics; fundamentals of rail freight transports; freight transport systems; intermodal transportation

Lecture notes
Lecturer notes and slides as well as hints to further literature will be given during the course.

Prerequisites / notice
Obligatory lecture for students of the first semester of MSc Spatial development and Infrastructure Systems.

- Cooperation and Teamwork

Content
Spatial development as a discipline deals with the development, (trans)formation, and arrangement of our urban environment. Classification of public transport systems; Characteristics of rail systems, bus systems, cable cars and funiculars, unconventional systems; introduction to logistics; fundamentals of rail freight transports; freight transport systems; intermodal transportation

Lecture notes
Lecturer notes and slides as well as hints to further literature will be given during the course.

Prerequisites / notice
Obligatory lecture for students of the first semester of MSc Spatial development and Infrastructure Systems.

Competencies

Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies
- Analytical Competencies
- Decision-making
- Problem-solving

Social Competencies
- Communication
- Cooperation and Teamwork

Content
Transport systems and land use; network design; fundamental model of mobility behaviour; costs and benefits of mobility; transport history

Lecture notes
Lecturer notes and slides as well as hints to further literature will be given during the course.

Prerequisites / notice
Obligatory lecture for students of the first semester of MSc Spatial development and Infrastructure Systems.

Competencies

Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies
- Analytical Competencies
- Decision-making
- Problem-solving

Social Competencies
- Communication
- Cooperation and Teamwork

Content
The overall aim of the course is to raise students’ awareness and curiosity about the aspects that guide and shape our environment. You as students will:

- identify and apply spatially relevant principles and systems for action-oriented planning and decision-making.
- acquire theoretical, methodological, practical know-how to examine, clarify, and solve tasks on spatial development

You as students will:

- discuss the role of spatial planning and development in shaping our living environment.
- differentiate the levels, scales and tasks of spatial planning instruments and processes.
- reflect on theoretical concepts and practical examples of decision-making of spatial tasks.
- identify and apply spatially relevant principles and systems for action-oriented planning and decision-making.
- acquire theoretical, methodological, practical know-how to examine, clarify, and solve tasks on spatial development

The course focuses on both theoretical concepts and practice-oriented approaches to gain knowledge and be equipped to address current issues in spatial planning and development. This is mirrored in the course’s structure made of both of lectures and exercises.

The course deals with theoretical, methodological and practical foundations around the understanding and production of urban space. It discusses theoretical planning frameworks, and tasks of spatial planning at various scales, addresses current and future challenges of spatial development and reviews approaches for a sustainable development in Switzerland and beyond.

Through lectures, readings, discussions, and exercises, the course seeks to achieve this goal by accumulating crucial notions from both theoretical and practice-based examples, and applying such knowledge into tasks of spatial planning.

At the end of this course, students should feel empowered to critically engage with the teaching topic from a variety of approaches. By taking up the lecture, the students should be able to to analyse, interpret and reflect complex cross-scale tasks of spatial development and transformation, and to use their theoretical, methodical and professional knowledge to tackle them.

The course focuses on both theoretical concepts and practice-oriented approaches to gain knowledge and be equipped to address current issues in spatial planning and development. This is mirrored in the course’s structure made of both of lectures and exercises.

The lecture series introduces necessary key concepts and covers the following main topics:
- Drivers of spatial development, inward development, core tasks and current challenges for (spatial) planners.
- Interplay of formal and informal planning instruments across scales and actors.
- Differentiation urban typologies, their characteristics and challenges
- Types of spatial analysis and key figures
- Planning approaches and the (political) steering of spatial development.
- Types of processes and participation in spatial development.
- Approaches for planning complex urban situations
- Concepts for sustainable development

The exercises provide a framework for practical application of the learned theoretical concepts of spatial planning to real-life situations.

A course will be set up on Moodle for the provision of lectures and documents, to upload group deliverables and to ask questions in a discussion Forum. All documents provided are exclusively available for use within this course.
### Landscape Planning and Environmental Systems

#### Objective
The overall objective is to equip students with the necessary skills and knowledge to effectively conduct academic writing, specifically fostered in this course. Students will learn how to search for scientific literature, create graphs, and give a presentation while writing a literature review. By the end of the course, students should be able to:

- search for and evaluate high-quality sources on their chosen topic and use citation management software.
- organize their writing and construct a scientific text, paragraph, and sentence structure using coherent and complete arguments and clear, concise, and specific language.
- understand citation styles and subject conventions, apply references to the chosen reference system, and properly cite all types of sources.
- determine appropriate types of graphs to represent data and create and evaluate effective graphical representations of data.
- present results systematically and persuasively using a consistent, informative slide deck with engaging and accurate visualizations; speak clearly and confidently using effective words, voice, and body language; know how to practice and deliver the presentation.
- review and provide appropriate feedback on peer work, use AI tools to assist in various stages of the writing process, and critically reflect on originality declarations, plagiarism, etc.

#### Content
In this course, the following topics are discussed:

- Definition of the concept of landscape
- Relevance of landscape planning
- Landscape metrics
- Landscape change
- Methods, instruments and aims of landscape planning (policy)
- Socio-political questions of the future
- Environmental systems, ecological connectivity
- Ecosystem services
- Urban landscape services
- Practice of landscape planning
- Use of GIS in landscape planning

#### Lecture notes
No script. The documentation, consisting of presentation slides are partly handed out and are provided for download on Moodle.

#### Prerequisites / notice
The contents of the course will be illustrated in the associated course 103-0347-01 U (Landscape Planning and Environmental Systems (GIS Exercises)) or in Project LAND within the Experimental and Computer Lab (for Environmental Engineers). A combination of courses is recommended.

### Basics of RE&IS

#### Abstract
The course Basics of RE&IS provides essential skills and knowledge for the Master's degree program in Spatial Development & Infrastructure Systems. Students will know the basics of scientific writing with complementary use of human and artificial intelligence. Students will learn how to search for scientific literature, create graphs, and give a presentation while writing a literature review.

#### Objective
The overall objective is to equip students with the necessary skills and knowledge to effectively conduct academic writing, specifically focused on writing a review article, and to introduce them to the use of Generative AI in enhancing their research and writing process. By the end of the course, students should be able to:

- search for and evaluate high-quality sources on their chosen topic and use citation management software.
- organize their writing and construct a scientific text, paragraph, and sentence structure using coherent and complete arguments and clear, concise, and specific language.
- understand citation styles and subject conventions, apply references to the chosen reference system, and properly cite all types of sources.
- determine appropriate types of graphs to represent data and create and evaluate effective graphical representations of data.
- present results systematically and persuasively using a consistent, informative slide deck with engaging and accurate visualizations; speak clearly and confidently using effective words, voice, and body language; know how to practice and deliver the presentation.
- review and provide appropriate feedback on peer work, use AI tools to assist in various stages of the writing process, and critically reflect on originality declarations, plagiarism, etc.

Data: 26.07.2024 12:39  Autumn Semester 2024  Page 2153 of 2680
This course explains how ideas for infrastructure emerge from strategic planning (macro scale), are taken up in the planning of systems (meso scale) and progress to project evaluation (micro scale). It also provides infrastructure planners with principles for the appraisal of possible projects with and without the explicit valuation of costs and benefits.

More specifically, upon completion of the course students will understand:
- how ideas for infrastructure are generated at a strategic level, are interpreted in the development of system plans and reach concrete project proposals
- how project ideas emerge from system plans and are iteratively developed and appraised until approval
- the principles of system modelling and system modelling over time in appraising and defending infrastructure proposals
- the advantages and disadvantages of explicitly evaluating the costs and benefits in the appraisal of infrastructure proposals and the advantages and disadvantages of not evaluating the costs and benefits in the appraisal of infrastructure proposals.

This course provide infrastructure planners with an understanding of how ideas for infrastructure emerge from strategic planning (macro scale), are taken up in the planning of systems (meso scale) and progress to approval through project evaluation (micro scale). It also provides infrastructure planners with principles for the appraisal of possible projects with and without the explicit valuation of costs and benefits.

The course consists of 5 lectures, 4 help sessions and 4 presentation/evaluation sessions. The two hour weekly lecture period is used as follows:

1-Introduction: Strategic planning to project appraisals – This lecture provides an introduction to the course and an explanation of how the impetus for infrastructure modifications emerge from strategic planning and evolve to the appraisal and approval of specific infrastructure projects. The requirements for successful completion of the course are discussed.
2-Project appraisals: Case for change to approval – This lecture explains how project ideas are generated from system plans and iteratively evolve to become an appraised project.
3-Modelling how a system works and doesn’t work - This lecture explain the principles of how to model a system to facilitate the appraisal of the project.
4-Modelling how systems evolve over time - This lecture explains how to model how systems evolve over time using Monte Carlo simulations and both system changes and planner decisions triggered by system changes.
5-Appraising potential projects with/without cost benefit analysis - This lecture explains two way of appraising projects. The first can be used when it is possible to explicitly estimate the costs and benefits of the proposed modifications. The second can be used when it is not possible to explicitly estimate costs and benefits of the proposed modifications.
6-10-Help sessions – We use the lecture periods to answer any questions you might have on your project. Your project is due on Friday of week 9.
11-14-Project presentations – In these lecture periods each group will be asked to present their project and be asked to field questions from the lecturers and fellow students. The presentations will be graded by the lecturers. Fellow students will give their impressions of the presentations and ability of the group to answer the questions.

Christian Sailer, education developer at the D-BAUG, has a special focus on interdisciplinary competencies in teaching at the D-BAUG. He provides infrastructure planners with principles for the appraisal of possible projects with and without the explicit valuation of costs and benefits.
### Introduction to the Programming Language R

**O 3 credits 2G M. J. Van Strien, A. Grêt-Regamey**

**Abstract**
R is one of the most popular programming language in science and practice for data analysis, modelling and visualisation. In this course, you will learn the basics of R and some common applications of R, such as making plots, regression analysis and working with spatial data. The weekly computer labs start with a short lecture followed by exercises that have to be handed in to pass the course.

**Objective**
The overall objective of this course is to provide an introduction to the programming language R and to build confidence to apply R in other courses. More specifically, the objectives are:
- Understand how to import and export data, and how to work with the most important types of R-objects (e.g. vectors, data frames, matrices and lists).
- Learn how to create meaningful and visually attractive graphics and apply this knowledge to several datasets.
- Learn how to apply several types of important functions (e.g. for- and while-loops, if-else statements, data manipulation).
- Understand descriptive statistics and regression analysis and apply this knowledge to analyse several datasets.
- Understand the possibilities of analysing and plotting spatial data.
- Learn how to write own functions.

**Content**
The course has a strong focus on “learning by doing”. During the weekly computer lab sessions, students will be given an introduction to the programming language R. Each lab session will start with a short introductory lecture, after which students work through the script and complete the exercises. During the lab sessions, the lecturers will be available to answer individual questions. The main topics that will be covered in the lab sessions are:
- importing and exporting data
- types of R-objects
- data scraping
- plotting data
- descriptive statistics
- data manipulation
- conditionals and loops
- regression analysis
- plotting and analysing spatial data
- writing own functions

In the 7th and 14th week of the course, students have the time to finish the exercises that should be handed in at the end of those weeks.

**Lecture notes**
A script with theory, examples and exercises will be handed out at the beginning of the course. Data for the exercises will be made available via Moodle.

**Literature**

**Prerequisites / notice**
No prior knowledge of R or any other programming language is required for this course.

### 103-0327-00L History of Spatial Planning

**Abstract**

The course examines the patterns of cleavage, conflict, convergence of interest, and consensus that have influenced spatial planning.

**Objective**

This course aims to provide students with knowledge of the historical background to understand the current spatial structure and to face the current challenges in spatial planning. Social, cultural, and economic forces will be analyzed for the roles they have played in shaping the landscapes and cityscapes and the answers spatial planning had to spatial development. The course focuses on the history of planning ideas, paradigms and approaches. A link is made to current challenges in spatial planning. Students will critically discuss the challenges spatial planning is facing today.

**Lecture notes**

Handouts will be available.

**Literature**

- Daniel Kurz: Die Disziplinierung der Stadt - Moderner Städtebau in Zürich 1900 bis 1940. gta Verlag 2008

### 103-0569-00L European Aspects of Spatial Development

**Abstract**

Following the insight into historical perspective and contemporary models of governance and planning, the course focuses on the international dimension of spatial planning in Europe. This includes a discussion of how European spatial policy is made and by whom, how planners can participate in such process and how they can address transnational challenges of spatial development cooperatively.

**Objective**

Keeping the general aim of exploring the European dimension of spatial planning in mind, the specific course learning objectives are as follows:
- to interpret the history of spatial planning at the transnational scale
- to understand and explain the content of the European spatial policy agenda
- to describe and analyse the role of territorial cooperation in making European spatial development patterns and planning procedures
- to discuss the changing role of planners and evaluate the ways of their engagement in European spatial policy-making

**Content**

- European spatial policy agenda: introduction and basic directives
- governance models
- planning models; collaborative planning model (main concepts & critics)
- post-positivist approach to spatial planning
- transnational spatial planning in Europe; questioning the European spatial planning; spatial development trends in Europe
- EU as a political system: EU institutions & non-EU actors
- planning families in Europe; the European spatial planning agenda
- spatial planning strategies and programmes on territorial cooperation
- the notion of planning culture and planning system; planning cultures in Europe
- basic characteristics of planning systems in Europe
- the relevance of European transnational cooperation for spatial planning
- European transnational initiatives

**Lecture notes**

The documents for the lecture will be provided at the moodle.
Literature

Obligatory literature:

Recommended literature:

Goverance models:

Planning models:

EU as a political context:

Territorial cooperation in Europe:

Planning systems in Europe:

Planning families and cultures:

Planning systems in Europe:

Prerequisites / notice

Only for master students, otherwise a special permission by the lecturer is required.

Competencies

Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies
- Analytical Competencies
- Decision-making

Social Competencies
- Communication
- Cooperation and Teamwork
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation

Personal Competencies
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

Lectures

The course content of the lecture Landscape Planning and Environmental Systems (103-0347-00 V) will be illustrated in practical GIS exercises (e.g. habitat modelling, land use change, ecosystem services, connectivity).

Exercises

The course content of the lecture Landscape Planning and Environmental Systems (103-0347-00 V) will be illustrated in practical GIS exercises (e.g. habitat modelling, land use change, ecosystem services, connectivity).

Abstract

The course content of the lecture Landscape Planning and Environmental Systems (103-0347-00 V) will be illustrated in practical GIS exercises (e.g. habitat modelling, land use change, ecosystem services, connectivity).

Objective

- Practical application of theory from the lectures
- Quantitative assessment and evaluation of landscape characteristics
- Learning useful applications of GIS for landscape planning
- Developing landscape planning measures for practical case studies

Content

- Applications of GIS in landscape planning
- Landscape analysis
- Landscape structural metrics
- Modelling habitats and land use change
- Calculating urban ecosystem services
- Ecological connectivity

Lecture notes

A script and presentation slides for each exercise will be provided on Moodle.

Literature

Will be named in the lecture.

Prerequisites / notice

Basic GIS skills are strongly recommended.

#### 701-1631-00L Foundations of Ecosystem Management

**Abstract**

This course introduces the broad variety of conflicts that arise in projects focusing on sustainable management of natural resources. It explores case studies of ecosystem management approaches and considers their practicability, their achievements and possible barriers to their uptake.

**Objective**

Students should be able to

a) propose appropriate and realistic solutions to ecosystem management problems that integrate ecological, economic and social dimensions across relevant temporal and spatial scales;

b) identify important stakeholders, their needs and interests, and the main conflicts that exist among them in the context of land and resource management.

**Content**

Traditional management systems focus on extraction of natural resources, and their manipulation and governance. However, traditional management has frequently resulted in catastrophic failures such as, for example, the collapse of fish stocks and biodiversity loss. These failures have stimulated the development of alternative ecosystem management approaches that emphasise the functionality of human-dominated systems. Inherent to such approaches are world-wide perspectives and a focus on ecological processes and services, multiple spatial and temporal scales, as well as the need to incorporate diverse stakeholder interests in decision making. Thus, ecosystem management is the science and practice of managing natural resources, biodiversity and ecological processes, to meet multiple demands of society. It can be local, regional or global in scope, and addresses critical issues in developed and developing countries relating to economic and environmental security and sustainability.

This course provides an introduction to ecosystem management, and in particular the importance of integrating ecology into management systems to meet multiple societal demands. The course explores the extent to which human-managed terrestrial systems depend on underlying ecological processes, and the consequences of degradation of these processes for human welfare and environmental well-being. Building upon a theoretical foundation, the course will tackle issues in resource ecology and management, notably forests, agriculture and wild resources within the broader context of sustainability, biodiversity conservation and poverty alleviation or economic development. Case studies from tropical and temperate regions will be used to explore these issues. Dealing with ecological and economic uncertainty, and how this affects decision making, will be discussed. Strategies for conservation and management of terrestrial ecosystems will give consideration to landscape ecology, protected area systems, and community management, paying particular attention to alternative livelihood options and marketing strategies of common pool resources.

**Lecture notes**

**Literature**

#### 701-1453-00L Ecological Assessment and Evaluation

**Abstract**

The course provides methods and tools for ecological evaluations dealing with nature conservation or landscape planning. It covers census methods, ecological criteria, indicators, indices and critically appraises objectivity and accuracy of the available methods, tools and procedures. Birds and plants are used as main example guiding through different case studies.

The course provides the basics and tools for an in-depth understanding of the discipline of landscape architecture and its far-reaching effects. The lectures in the fall semester course “History and Theory of Gardens and Landscape Architecture” provide an overview of the cultural history of nature, the landscape and the garden from its origins to the present day. An in-depth understanding of change as well as the design strategies and characteristics of the most important epochs and their current relevance will be discussed.

Students learn about historical developments and their topicality and learn “from history”. Design contexts are presented on the basis of examples. Students develop a basis for ways of thinking and action for current landscape architectural challenges.

The lectures series looks at the design of nature from the first cultural landscapes to today’s complex cultural landscape formations. The lecture series not only analyzes the results of anthropogenic nature design, but also discusses its various causes, contexts and consequences.

The course provides the basics and tools for an in-depth understanding of the discipline of landscape architecture and its far-reaching interconnections with architecture, urban planning, ecology and other spatial and nature-related sciences. The aim is to adopt landscape perspectives in planning and design processes and to critically reflect on one's own projects within a specific context.

The lectures are designed as an annual program. As the written session exam tests knowledge from both the Landscape Architecture I and II lecture series, it is strongly recommended that you attend the course over two semesters.

Students registered for the exam will receive further information on the exam procedure by email shortly before the end of the semester. The lecturer will provide texts on the examination topics as pdf files for download. These serve to deepen understanding of the lecture.

Mobility students or students from other departments: Students who only attend the lecture for one semester complete the lecture with an end-of-semester oral examination. Here too, the lecturer provides literature relevant to the examination as a download.

Prerequisites / notice

Suggested prerequisites for attending this course are skills and knowledge equivalent to those taught in the following ETH courses:

- Pflanzen- und Vegetationsökologie
- Systematische Botanik
- Raum- und Regionalentwicklung
- Naturschutz und Naturschutzbiole

Lecture notes

Basic literature and references are listed on the webpage.

Powerpoint slides are available on the moodle page. Additional documents are handed out as copies.

Handouts and a bibliography will be provided.

Mobility students or students from other departments: Students who only attend the lecture for one semester complete the lecture with an end-of-semester oral examination. Here too, the lecturer provides literature relevant to the examination as a download.

General information on the examination:

Bachelor students: The knowledge taught in the lecture and the exam-relevant literature provided by the lecturer serve as the basis for exam preparation. The course is designed as an annual program. As the written session exam tests knowledge from both the Landscape Architecture I and II lecture series, it is strongly recommended that you attend the course over two semesters.

The examination topics will be announced shortly before the end of the semester. The lecturer will provide texts on the examination topics as pdf files for download. These serve to deepen understanding of the lecture.

Students who only attend the lecture for one semester complete the lecture with an end-of-semester oral examination. Here too, the lecturer provides literature relevant to the examination as a download.

Students registered for the exam will receive further information on the exam procedure by email shortly before the end of the semester.

This course has the aim of deepening students' knowledge of the environmental assessment methodologies and their various applications. In particular, students completing the course should have the - Ability to judge the scientific quality and reliability of environmental assessment studies, the appropriateness of inventory data and modelling, and the adequacy of life cycle impact assessment models and factors - Knowledge about the current state of the scientific discussion and new research developments - Ability to properly plan, conduct and interpret environmental assessment studies - Knowledge of how to use LCA as a decision support tool for companies, public authorities, and consumers

- Inventory developments, transparency, data quality, data completeness, and data exchange formats
- Allocation (multiprocesses and recycling)
- Hybrid LCA methods.
- Consequential and marginal analysis
- Recent development in impact assessment
- Spatial differentiation in Life Cycle Assessment
- Workplace and indoor exposure in Risk and Life Cycle Assessment
- Uncertainty analysis
- Subjectivity in environmental assessments
- Multicriteria analysis
- Case Studies

No script. Lecture slides and literature will be made available on Moodle.

Basic knowledge of environmental assessment tools is a prerequisite for this class. Students that have not done classwork in this topic before are required to read an appropriate textbook before or at the beginning of this course (e.g. Jolliet, O et al. 2016: Environmental Life Cycle Assessment. CRC Press, Boca Raton - London - New York. ISBN 978-1-4398-6766-0 (Chapters 2-5-2)).

Introduction to mathematical and statistical tools for geospatial data analysis. The goal is to familiarise students with the principles and tools of geospatial data analysis, and to enable them to apply those tools to practical tasks.

The course introduces basic methods of geostatistics and geospatial data analysis. Topics include spatial correlation, auto-correlation and the variogram; surface interpolation (kernel-based, kriging, parametric surface models); spatially adaptive filtering (bilinear, guided filter); spatial stochastic processes and random fields; time series models and spatio-temporal analysis.

Bachelor level mathematics: analysis, linear algebra, statistics and probability theory, parameter estimation. Basic knowledge of multivariate statistics and machine learning is recommended.

The course explores research designs and methods as tools in urban planning and urban studies. Students will actively engage with literature will be made available on Moodle.

No script. Lecture slides and literature will be made available on Moodle.

Overarching learning objective: To create coherent research designs by formulating relevant research questions and assessing and discussing suitable methods.

Specific objectives:
- Know and critically assess urban research methods
- Select, investigate, and learn to apply urban research methods
- Interpret and discuss urban research projects by evaluating the applied research methods
- Create coherent research designs

- Concepts and Theories
- Techniques and Technologies
- Analytical Competencies
- Media and Digital Technologies
- Problem-solving
- Critical Thinking

Creative Thinking

While architects, planners, and urban designers have engaged with the city, the analysis of urbanising territories 'beyond the city' have been assessed. This elective course gives architecture students the opportunity to further develop their perception of space through a site-specific analysis of urbanising territories. Students will document and analyze a case-study site to reveal its topological potentials and sensory qualities. This understanding will be gained through point cloud modeling and audiovisual composition. In particular, we will develop a new, comprehensive sectional model of a topologically interesting site situation.

Students will become acquainted to working with point cloud models produced with laser-scanning. Through a series of steps, they will learn how a laser-scanning survey is conducted, how the raw data is processed, how point cloud models are assembled, what qualities these models can provide to analyze, explore and represent space as an audiovisual experience.

Collected samples from the field will be assembled and built into an interactive application in the «Landscape Visualization and Modelling Lab». All software required is open source and can also be installed on private laptops, facilitating work from home if necessary.

Objective

This course aims at analyzing, designing, improving public transport systems, as part of the overall transport system. The enrolment will be prioritized by the time of inscription and balanced between departments. Literature will be provided during the course.

Prerequisites / notice

- The course is limited to 20 students (based on available computer stations)
- Students will work in groups of 2
- The lectures will be held in English, assistance in English and German
- The enrolment will be prioritized by the time of inscription and balanced between departments

ECTS: 6 credits

Methods of Urban Research: Extended Urbanisation

W 2 credits 2G C. Schmid

Abstract

While architects, planners, and urban designers have engaged with the city, the analysis of urbanising territories 'beyond the city' have been a blind spot. This lecture series attempts to close this gap by discussing with researchers who will present methods, experiences and findings from a great variety of territories of extended urbanisation.

The lecture series “Methods of Urban Research: Extended Urbanisation” presents the methodology of sociological analysis of territories of extended urbanisation. These territories, which have traditionally been beyond the sensorium of architecture and urban design professions provide important terrains for urban practice. The lecture series will bring together researchers that have been part of a long-standing research project on territories of extended urbanisation. They will present a kaleidoscopic overview of the diverse methods and insights into international research on urbanisation processes in large metropolises and in territories characterized by extended urbanisation. Most of the presented case studies are published in the brand new book “Extended Urbanisation: Tracing Planetary Struggles”. Semester performance will be assessed on a case by case basis.

Objective

The lecture series “Methods of Urban Research: Extended Urbanisation” presents the methodology of sociological analysis of territories of extended urbanisation. This territory, which has traditionally been beyond the sensorium of architecture and urban design professions provide important terrains for urban practice. The lecture series will bring together researchers that have been part of a long-standing research project on territories of extended urbanisation. They will present a kaleidoscopic overview of the diverse methods and insights into international research on urbanisation processes in large metropolises and in territories characterized by extended urbanisation. Most of the presented case studies are published in the brand new book “Extended Urbanisation: Tracing Planetary Struggles”. Semester performance will be assessed on the basis of a written group assignment on extended urbanization (approximately 10 pages, in groups of four). For the assignment - describe and analyse an example of extended urbanization in a geography of your choice. The example may be from Switzerland or from any other region of the planet. Based on scientific literature and other data, conduct a critical analysis of the chosen case study, and discuss the consequences of urbanization of this area for its people and the environment. Develop a possible urban strategy for alternative inclusive development. Summarize your findings through a A3-sized poster.

Public Transport Design and Operations

W 6 credits 4G F. Corman

Abstract

This course aims at analyzing, designing, improving public transport systems, as part of the overall transport system.
Objective
Public transport is a key driver for making our cities more livable, clean and accessible, providing safe, and sustainable travel options for millions of people around the globe. Proper planning of public transport system also ensures that the system is competitive in terms of speed and cost. Public transport is a crucial asset, whose social, economic and environmental benefits extend beyond those who use it regularly; it reduces the amount of cars and road infrastructure in cities; reduces injuries and fatalities associated to car accidents, and gives transport accessibility to very large demographic groups.

Goal of the class is to understand the main characteristics and differences of public transport networks. Their various performance criteria based on various perspective and stakeholders. The most relevant decision making problems in a planning tactical and operational point of view At the end of this course, students can critically analyze existing networks of public transport, their design and use; consider and substantiate possible improvements to existing networks of public transport and the management of those networks; optimize the use of resources in public transport.

General structure:
- general introduction of transport, modes, technologies,
- system design and line planning for different situations,
- timetabling and tactical planning, and related mathematical approaches
- operations, and quantitative support to operational problems,
- evaluation of public transport systems.

Content
- Basics for line transport systems and networks
- Passenger/Supply requirements for line operations
- Objectives of system and network planning, from different perspectives and users, design dilemmas
- Conceptual concepts for passenger transport: long-distance, urban transport, regional, local transport

Planning process, from demand evaluation to line planning to timetables to operations
- Matching demand and modes
- Line planning techniques
- Timetabling principles
- Allocation of resources
- Management of operations
- Measures of realized operations
- Improvements of existing services

Lecture notes
Lecture slides are provided.

  - Self-awareness and Self-reflection
  - Self-direction and Self-management

151-0227-00L Basics of Air Transport (Aviation I) W 4 credits 3G P. Wild

Abstract
In general the course explains the main principles of air transport and elaborates on simple interdisciplinary topics. Working on broad 14 different topics like aerodynamics, manufacturers, airport operations, business aviation, business models etc. the students get a good overview in air transportation. The program is taught in English and we provide 11 different experts/lecturers.

Objective
The goal is to understand and explain basics, principles and contexts of the broader air transport industry. Further, we provide the tools for starting a career in the air transport industry. The knowledge may also be used for other modes of transport. Ideal foundation for Aviation II - Management of Air Transport.
Concept: This course will be taught as Aviation I. A subsequent course - Aviation II - covers the "Management of Air Transport".

Content: Transport as part of the overall transportation scheme; Aerodynamics; Aircraft (A/C) Designs & Structures; A/C Operations; Aviation Law; Maintenance & Manufacturers; Airport Operations & Planning; Aviation Security; ATC & Airspace; Air Freight; General Aviation; Business Jet Operations; Business models within Airline Industry; Military Aviation.

Technical visit: This course includes a guided tour at Zurich Airport and Dubendorf Airfield (baggage sorting system, apron, Tower & Radar Simulator at Skyguide Dubendorf).

Lecture notes Preparation materials & slides are provided prior to each class

Literature Literature will be provided by the lecturers, respectively there will be additional Information upon registration (normally available in Moodle)

The lecture is planned as class teaching.

101-0417-00L Transport Planning Methods W 6 credits 4G E. Heinen

Abstract

The course provides the necessary knowledge to develop models supporting and also evaluating the solution of given planning problems. The course is composed of a lecture part, providing the theoretical knowledge, and an applied part in which students develop their own models in order to evaluate a transport project/ policy by means of cost-benefit analysis.

Objective

- Knowledge and understanding of statistical methods and algorithms commonly used in transport planning
- Comprehend the reasoning and capabilities of transport models
- Ability to independently develop a transport model able to solve / answer planning problem
- Getting familiar with cost-benefit analysis as a decision-making supporting tool

Content

The course provides the necessary knowledge to develop models supporting the solution of given planning problems and also introduces cost-benefit analysis as a decision-making tool. Examples of such planning problems are the estimation of traffic volumes, prediction of estimated utilization of new public transport lines, and evaluation of effects (e.g. change in emissions of a city) triggered by building new infrastructure and changes to operational regulations.

To cope with that, the problem is divided into sub-problems, which are solved using various statistical models (e.g. regression, discrete choice analysis) and algorithms (e.g. iterative proportional fitting, shortest path algorithms, method of successive averages).

The course is composed of a lecture part, providing the theoretical knowledge, and an applied part in which students develop their own models in order to evaluate a transport project/ policy by means of cost-benefit analysis. Interim lab session take place regularly to guide and support students with the applied part of the course.

Lecture notes Moodle platform (enrollment needed)

Literature

Abstract
Basic characteristics of railway vehicles and their interfaces with the railway infrastructure:
- Transportation tasks and vehicle types
- Running dynamics
- Mechanical part of rail vehicles
- Brakes
- Traction chain and auxiliary supply
- Railway power supply
- Signaling systems
- Standards
- Availability and safety
- Traffic control and maintenance

Objective
- Overview of the technical characteristics of railway systems
- Know-how about the design and construction principles of rail vehicles
- Interrelationship between different fields of engineering sciences (mechanics, electro and information technology, transport systems)
- Understanding tasks and opportunities of engineers working in an environment which has strong economical and political boundaries
- Insight into the activities of the railway vehicle industry and railway operators in Switzerland
- Motivation of young engineers to start a career in the railway industry or with railway operators

Urban Systems and Transportation
This course is an introduction to urban and regional economics. It focuses on the formation and development of urban systems, and highlight how transport infrastructure investments can affect the location, size and composition of such systems.

Objective
The main objective of this course is to provide students with some basic tools to analyze the fundamental economic forces at play in urban systems (i.e., agglomeration and congestion forces), and the role of transport networks in shaping the structure of these systems. Why do urban areas grow or decline? How do transport networks affect the location of individuals and firms? Does the location of a firm determine its productivity? Can transport infrastructure investments reduce economic disparities? These are some of the questions that students should be able to answer after having completed the course.
The course is organized in four parts. I start with the key observation that economic activity (both in terms of population density and productivity) is unevenly distributed in space. For instance, the share of the population living in urban centers is increasing globally, from 16% in 1900 and 50% in 2000 to about 68% by the year 2050 (UN, World Economic Prospects, 2014). The goal of the first part is then to understand the economic forces at play behind these trends, looking at the effects within and across urban areas. I will also discuss how natural or man-made geographical characteristics (e.g., rivers, mountains, borders, etc.) affect the development of such urban systems.

In the second part, I discuss the planning and pricing of transport networks, moving from simple local models to more complex transport models at a global scale. The key aspects include: the first and second best road pricing, the public provision of transport networks and the demographic effects of transport networks.

In the third part, I combine the previous two parts and analyze the interaction between urban systems and transportation. Thereby, the main focus is to understand the economic mechanisms that can lead to a general equilibrium of all actors involved. However, as the study of the historical development of urban systems and transport networks provides interesting insights, I will discuss how their interaction in the past shapes today’s economic geography.

Finally, I broaden the scope of the course and explore related topics. There will be a particular emphasis on the relation between urban systems and fiscal federalism as well as environmental policies. Both aspects are important determinants of the contemporary developments of urban systems, and as such deserve our attention.

In general, this class focuses on the latest research developments in urban and regional economics, though it does not require prior knowledge in this field. It pays particular attention to economic approaches, which are based on theoretical frameworks with strong microfoundations and allow for precise policy recommendations.

In this course, the students will first learn some microscopic modelling and simulation concepts, and then complete a traffic-engineering project. The objective of this course is to conduct a realistic traffic engineering project from beginning to end. The students will first familiarize themselves with microscopic traffic models. Students will work in groups on a project that includes a base scenario on a real traffic network. Throughout the semester, along with theoretical concepts, the students will build the base scenario (design, calibration and validation) and will develop alternative scenarios regarding modification on the infrastructure, simulation of in-vehicle technologies and vehicle-to-everything (V2X) communication. Simulations will be implemented in Aimsun software. The students will be asked to understand, analyze, interpret and present traffic properties. Evaluation of alternative scenarios over the same network will be performed. Finally, students will be asked to design, implement, analyze and present a novel proposal, which will be compared with the base scenario.

Upon completion of the course, the students will:
- Understand the basic models used in microsimulation software (car-following, lane changing, gap acceptance, give ways, on/off-ramps, etc.).
- Design a road transport network inside the simulation software.
- Understand the basics behind modeling traffic demand and supply, vehicle dynamics, performance indicators for evaluation and network design for a realistic road transport network.
- Understand how to design a complete study, implement and validate it for planning purposes, e.g. creating a new road infrastructure.
- Make valid and concrete engineering proposals based on the simulation model and alternative scenarios.

In this course, the students will first learn some microscopic modelling and simulation concepts, and then complete a traffic-engineering project with microscopic traffic simulator Aimsun.

Microscopic modelling and simulation concepts will include:
1) Car following models
2) Lane change models
3) Calibration and validation methodology

Specific tasks for the project will include:
1) Building a model with the simulator Aimsun in order to replicate and analyze the traffic conditions measured/observed.
2) Calibrating and validating the simulation model.
3) Redesigning/extending the model to improve the traffic performance through Aimsun and with/without programming in Python or C++.

The course will be based on a project that each group of students will build (design, calibrate, analyze and presentation) across the semester. A mid-term and final presentation of the work will be asked from each group of students.

It consists of weekly 2-hour lectures. The students work in pairs on a group project that completes in the end of the semester. The modelling software used is Aimsun and lectures (theory and hands on experience) are taking place in a computer room. The course Road Transport Systems (Verkehr III), or simultaneously taking the course Traffic Engineering is encouraged. Previous experience with Aimsun/Python/C++ is helpful but not mandatory.

The lecture notes and additional handouts will be provided before the lectures. Additional literature recommendations will be provided at the lectures.

Students need to know some basic road transport concepts. The course Road Transport Systems (Verkehr III), or simultaneously taking the course Traffic Engineering is encouraged. Previous experience with Aimsun is helpful but not mandatory.

101-0492-00L Microscopic Modelling and Simulation of Traffic Operations

W 3 credits 2G M. Makridis

Abstract

The course introduces basics of microscopic modelling and simulation of traffic operations, including model design and development, calibration, validation, data analysis, identification of strategies for improving traffic flow performance, and evaluation of such strategies. The aim is to provide the fundamentals for building a realistic traffic-engineering project from beginning to end.

Objective

The objective of this course is to conduct a realistic traffic engineering project from beginning to end. The students will first familiarize themselves with microscopic traffic models. Students will work in groups on a project that includes a base scenario on a real traffic network. Throughout the semester, along with theoretical concepts, the students will build the base scenario (design, calibration and validation) and will develop alternative scenarios regarding modification on the infrastructure, simulation of in-vehicle technologies and vehicle-to-everything (V2X) communication. Simulations will be implemented in Aimsun software. The students will be asked to understand, analyze, interpret and present traffic properties. Evaluation of alternative scenarios over the same network will be performed. Finally, students will be asked to design, implement, analyze and present a novel proposal, which will be compared with the base scenario.

Upon completion of the course, the students will:
- Understand the basic models used in microsimulation software (car-following, lane changing, gap acceptance, give ways, on/off-ramps, etc.).
- Design a road transport network inside the simulation software.
- Understand the basics behind modeling traffic demand and supply, vehicle dynamics, performance indicators for evaluation and network design for a realistic road transport network.
- Understand how to design a complete study, implement and validate it for planning purposes, e.g. creating a new road infrastructure.
- Make valid and concrete engineering proposals based on the simulation model and alternative scenarios.

In this course, the students will first learn some microscopic modelling and simulation concepts, and then complete a traffic-engineering project with microscopic traffic simulator Aimsun.

Microscopic modelling and simulation concepts will include:
1) Car following models
2) Lane change models
3) Calibration and validation methodology

Specific tasks for the project will include:
1) Building a model with the simulator Aimsun in order to replicate and analyze the traffic conditions measured/observed.
2) Calibrating and validating the simulation model.
3) Redesigning/extending the model to improve the traffic performance through Aimsun and with/without programming in Python or C++.

The course will be based on a project that each group of students will build (design, calibrate, analyze and presentation) across the semester. A mid-term and final presentation of the work will be asked from each group of students.

It consists of weekly 2-hour lectures. The students work in pairs on a group project that completes in the end of the semester. 101-0491-00L Agent Based Modeling in Transportation

W 6 credits 4G M. Balac, G. O. Kagho

Abstract

This course provides an introduction to agent-based modeling in transportation. The lectures and exercises offer an opportunity to learn about agent-based simulation models' current methodology, focusing on MATSim, how agent-based models are set up, and perform a practical case study by working in groups.
This course provides an introduction to agent-based models for transportation policy analysis. Four essential topics are covered:

1) Introduction of agent-based modeling and its comparison to the traditional state of practice modeling
2) Introduction of MATSim, an open-source agent-based model, developed at ETH Zurich and TU Berlin, and its various parts
3) Setting up an agent-based model simulation, where different statistical methods used in the process will be introduced and explained. Here the open-source eqasim framework used at ETH Zurich to set up agent-based models will be introduced
4) Conducting a transport policy study. The case study will be performed in groups and will include a paper-like report.

During the course, outside lecturers will give several lectures on using MATSim in practice (i.e., SBB).

101-0469-00L Road Safety W 6 credits 4G M. Deublein, P. Eberling

Abstract

The collection and the methods of statistical and geographical analysis of road accidents are important fundamentals of this course. Safety Awareness, calibration and validation are discussed and measures for improving the safety situation are presented. Procedures of infrastructure safety management for administrations and police are another topic.

Objective

Imparting knowledge base about road safety and the event of accident, presenting possibilities to increase road safety

Content

Accident origin, collection of road accidents, statistical (descriptive and multivariate, accident prediction models) and geographical analysis of road accidents, risk analysis and rehabilitation measures, road safety instruments for infrastructure with focus on road safety audit, Swiss and international transport policy

Literature

Further literature: will be presented during the course

101-0419-02L Railway Infrastructures 2 W 2 credits 2G U. A. Weidmann, M. Kohler, M. J. Manhart

Abstract

Railway technology; interaction between track and vehicles; stress; track construction including features of railway bridges and tunnels; starting up; track diagnostics and forecast; track maintenance and related methods

Objective

The lecture gives a deeper insight into railway technology, the interaction between track and vehicles as well as in construction and dimensioning of the track. Methods for starting up and the diagnosis of the state of the track and its forecast are shown. State-of-the-art maintenance strategies and technologies are presented.

Content

1 - Railway technology
Track, power supply / catenaries, information technology, safety / interlockings / dispatching

2 - Interaction
Interaction between track and vehicles, vehicle dynamics

3 - Railway Track
Stress; track construction including special features of railway bridges and tunnels

4 - Starting up
Goals, methods, procedures

5 - Diagnostics, maintenance strategies
Track diagnostics and forecast

6 - Track maintenance
Maintenance strategies, fundamentals of track maintenance and related methods

Lecture notes

The slides will be made available.

Literature

A list with related technical literature will be handed out.
Prerequisite: 101-0419-01 Railway Infrastructures 1 (FS)

Abstract
What causes economic business cycles? How are limited resources, competition, and cooperation reflected in growth dynamics? To answer such questions, we combine macroeconomic models and methods of nonlinear dynamics. We study the role of bifurcations and control parameters for dynamic stability. Feedback cycles and coupled dynamics are reasons for limited predictability, instability and chaos.

Objective
The successful participant of the course is able to:
- understand the importance of different modeling approaches
- formalize and solve one- and two-dimensional nonlinear models
- identify critical conditions for stability and dynamic transitions
- analyze macroeconomic models of business cycles, supply and demand
- apply formal concepts to model economic growth and competition

Content
System theory sees the economy as a complex adaptive system.
What does this mean for economic modeling?
We focus on two sources of complexity: (a) nonlinear dynamics, which is captured in this course, “Economic Dynamics and Complexity” and (b) collective interactions, which is captured in the course “Agent-Based Modeling of Economic Systems” (in Spring).

Our approach to economic dynamics combines insights from different disciplines: macroeconomics studying business cycles and growth, system dynamics rooted general system theory and cybernetics, and nonlinear dynamics using applied mathematics.

We start with a comparison of different modeling approaches, to highlight the problems and challenges of system modeling.
The subsequent lectures then introduce different one- and two-dimensional nonlinear models with applications in economics, such as models of supply and demand, business cycles, growth and competition.
Emphasis is on the formal analysis of these models using methods from applied mathematics and tools for solving coupled differential equations.

Weekly self-study tasks are used to apply the concepts introduced in the lectures.
We practice how to solve nonlinear models formally and numerically and how to interpret the results.

Lecture notes
The lecture slides are provided as handouts - including notes and literature sources - to registered students only. All material is to be found on the Moodle platform. More details during the first lecture.

Prerequisites / notice
Students should be familiar with nonlinear differential equations and should have basic programming skills. All necessary details to solve nonlinear models will be provided in the course. The course will not build on mathematical proofs, optimization, statistics, efficient numerical computation and other specialized skills.

Abstract
The Interdisciplinary Project Activity (IPA) forms the key feature of the MSc RE&IS. Students work on an interdisciplinary task from the field of spatial development and infrastructure systems in a real-life application. The interdisciplinary cooperation and strong communication skills are crucial skills required in practice to communicate with and between relevant actors and other stakeholders.
Upon completion of the Interdisciplinary Project Activity, students will have gained experience in:

1) Investigating and understanding the project area as well as identifying, evaluating and formulating the current challenges and relevant topics within that area.

2) Creating, designing, developing and evaluating an overall integrated strategy for an urban area with relevant interventions as well as an in-depth study of either a focus area or focus topic within the given urban area.

3) Organising, structuring and fostering teamwork within an interdisciplinary group of 4-5 students in self-responsibility.

4) Applying previously learnt interdisciplinary methodological and theoretical skills from different fields to create solutions to real-world challenges as well as arguing for the solutions’ suitability.

5) Evaluating and choosing effective ways of presenting and communicating information (e.g., text, statistics, images, etc.), ideas, and recommendations throughout the whole semester.

6) Understanding, developing, strengthening, and critically self-evaluating their disciplinary position and role in planning urban development.

Students apply the full range of their previously learned theoretical and methodological skills to solve the task together in their project team. Working closely with representatives of the case study area (e.g., officials, the wider public, different experts and decision-makers), as well as other experts, through site visits, and through individual mentoring by the six RE&IS chairs, students work in a stimulating and motivating environment to solve real-world spatial challenges. The case study area changes every year.

- The semester is structured through an intermediate and final presentation, bilateral discussions with the chairs involved as well as individual group mentoring. During these meetings, the work status has to be communicated and presented with appropriate means. The status of the work is discussed with the professors, assistants and possibly external experts.

- The project begins with a site visit of the project area at the beginning of the semester and the identification as well as precise formulation of the challenges and opportunities observed within the project area.

- The students work on a complex, rather rough task and define their exact objective independently on the basis of the as-is analysis. In the overall strategy, the future development direction for the project area is then determined and interventions are formulated to steer the development in this direction. Within a focus area or focus topic, students further develop their project and deepen their overall strategy. The students test and evaluate the impact of selected interventions and finally reflect on their project, summarize the most important findings and make a recommendation formulated to decision-makers.

- The project gets developed in an interdisciplinary group of students. The internal structuring of the group and distribution of work is to be organised by the students themselves.

- The choice of software for the project development is up to the students. The software used could be applicable to data analysis, information processing, image production and word processing, e.g., the Adobe programs such as InDesign, Illustrator or Photoshop, GIS software, the Microsoft programs such as Word, PowerPoint or Excel as well as CAD, R, Python etc.

#### Master's Thesis

<table>
<thead>
<tr>
<th>Number</th>
<th>Title</th>
</tr>
</thead>
</table>

Before starting the Master's thesis, students must have

a. obtained the Bachelor's degree;

b. fulfilled all specified admission conditions, if any;

c. acquired at least 90 credits in the Master's programme, including the required credits for compulsory courses and for interdisciplinary project work.

The Master Programme concludes with the Master Thesis, which has to be done in one of the chosen Majors and has to be completed within 16 weeks. The Master Thesis is supervised by a professor and shall attest the students ability to work independently and to produce scientifically structured work.

The topics of the Master Thesis are published by the professors. The Topic can be set also in consultation between the student and the professor.

**Abstract**
This course focuses on the history of the design of cities, as well as on the ideas, processes and actors that engender and lead their development and transformation. The history of urban design will be approached as a cross-cultural field of knowledge that integrates scientific, economic and technical innovation as well as social and cultural advances.

**Objective**
The lectures deal mainly with the definition of urban design as an independent discipline, which maintains connections with other disciplines (politics, sociology, geography) that are concerned with the transformation of the city. The aim is to make students conversant with the multiple theories, concepts and approaches of urban design as they were articulated throughout time in a variety of cultural contexts, thus offering a theoretical framework for students’ future design work.

**Content**
In the first semester the genesis of the objects of study, the city, urban culture and urban design, are introduced and situated within their intellectual, cultural and political contexts:

01. The History and Theory of the City as Project
02. Of Rituals, Water and Mud: The Urban Revolution in Mesopotamia and the Indus
03. The Idea of the Polis: Rome, Greece and Beyond
04. The Long Middle Ages and their Counterparts: From the Towns of Tuscany to Delhi
05: Between Ideal and Laboratory: Of Middle Eastern Grids and European Renaissance Principles
06: Of Absolutism and Enlightenment: Baroque, Defense and Colonization
07: The City of Labor; Company Towns as Cross-Cultural Phenomenon
08: Garden Cities of Tomorrow: From the Global North to the Global South and Back Again
09: Civilized Wilderness and City Beautiful: The Park Movement of Olmsted and The Urban Plans of Burnham
10: The Extension of the European City: From the Viennese Ringstrasse to Amsterdam Zuid

**Lecture notes**
Prior to each lecture a chapter of the reader (Skript) will be made available through the webpage of the Chair. These chapters will provide an introduction to the lecture, the basic visual references of each lecture, key dates and events, as well as references to the compulsory and additional reading.

**Literature**
There are three books that will function as main reference literature throughout the course:

These books will be reserved for consultation in the ETH Baubibliothek, and will not be available for individual loans.

A list of further recommended literature will be found within each chapter of the reader (Skript).

**Prerequisites / notice**
Students are required to familiarize themselves with the conventions of architectural drawing (reading and analyzing plans at various scales).

**Competencies**

</table>

**Additional skills**

- Students can select and use problem-solving tools to improve quality and productivity.
- Students can design performance management systems.
- Students can design information flows, manage master data, and use it to plan and control a factory.
- Students can choose IT, OT, and automation technology for manufacturing applications.
- Students can conduct process mapping analysis, use it to design and improve processes and layouts, and elaborate on the limitations of the chosen method.
- Students can do simple forecasting of demand and plan the needed capacity to meet it.
- Students can apply key concepts of POM to detail an operations strategy.
- Students can design material flows in and beyond factories.

**Additional skills**

- Students can select and use problem-solving tools to improve quality and productivity.
- Students can design performance management systems.
- Students can design information flows, manage master data, and use it to plan and control a factory.
- Students can choose IT, OT, and automation technology for manufacturing applications.
- Students can conduct process mapping analysis, use it to design and improve processes and layouts, and elaborate on the limitations of the chosen method.
- Students can do simple forecasting of demand and plan the needed capacity to meet it.
- Students can apply key concepts of POM to detail an operations strategy.
- Students can design material flows in and beyond factories.
- Students can design performance management systems.
- Students can select and use problem-solving tools to improve quality and productivity.
- Additional skills: Students acquire experience in teamwork.
The course covers the most fundamental strategic and tactical concepts in production and operations management (POM).

Production and Operations Management (POM) is at the heart of any business. It is concerned with the business processes that transform input into output and deliver products and services to customers. Factory management is an important part of POM, but it is much more than what takes place inside the production facilities of companies like ABB, Boeing, BMW, LEGO, Nestlé, Roche, TESLA, and Toyota. Did you know that the largest portion of assets and employees in most organizations are engaged in the operations function? Although this course focuses on manufacturing, all types of organizations depend on their operational capabilities. With the ongoing globalization and digitization of manufacturing, POM has won a deserved status for providing a competitive advantage.

This course covers the following topics: Introduction to POM, Manufacturing strategy, Forecasting and capacity, Process design, Layout, Industry 4.0, Information flow, Material flow, Logistics/SCM

Performance management, Performance improvement, Quality management, and Maintenance.

This course is administrated via Moodle. The course is designed around five elements:
2. Video lectures. Short video lectures presenting basic POM concepts.
3. Class lectures. Deep-dives with case examples on select topics.
4. FactoryVR group assignment. FactoryVR allows students to visit factories virtually.
5. Quizzes. A few quizzes during the semester help students check their progress and prepare for the written exam.

Suggested literature is provided in the syllabus.

The course covers the most fundamental strategic and tactical concepts in production and operations management (POM).
Road Safety

Road Safety

W  6 credits  4G  M. Deubel, P. Eberling

Abstract

The collection and the methods of statistical and geographical analysis of road accidents are important fundamentals of this course. Safety

aspects in design of urban roads are discussed and measures for improving the safety situation are presented. Procedures of

infrastructure safety management for administrations and police are another topic.

Objective

Imparting knowledge base about road safety and the event of accident, presenting possibilities to increase road safety

Content

Accident origin, collection of road accidents, statistical (descriptive and multivariate, accident prediction models) and geographical analysis

of road accidents, risk analysis and rehabilitation measures, road safety instruments for infrastructure with focus on road safety audit, Swiss

and international transport policy

Literature

Handbook of Road Safety Measures. Oxford: ELSEVIER Ltd.; EU-Projekti RIPCORD-iSEREST (http://ripcord.bast.de/)

Further literature: will be presented during the course

Microscopic Modelling and Simulation of Traffic Operations

W  3 credits  2G  M. Makridis

Abstract

The course introduces basics of microscopic modelling and simulation of traffic operations, including model design and development, calibration, validation, data analysis, identification of strategies for improving traffic flow performance, and evaluation of such strategies. The aim is to provide the fundamentals for building a realistic traffic-engineering project from beginning to end.

Objective

The objective of this course is to conduct a realistic traffic engineering project from beginning to end. The students will first familiarize themselves with microscopic traffic models. Students will work in groups on a project that includes a base scenario on a real traffic network. Throughout the semester, along with theoretical concepts, the students will build the base scenario (design, calibration and validation) and will develop alternative scenarios regarding modification on the infrastructure, simulation of in-vehicle technologies and vehicle-to-everything (V2X) communication.

Simulations will be implemented in Aimsun software. The students will be asked to understand, analyze, interpret and present traffic properties. Evaluation of alternative scenarios over the same network will be performed. Finally, students will be asked to design, implement, analyze and present a novel proposal, which will be compared with the base scenario.

Upon completion of the course, the students will:

- Understand the basic models used in microsimulation software (car-following, lane changing, gap acceptance, give ways, on/off-ramps, etc.).
- Design a road transport network inside the simulation software.
- Understand the basics behind modeling traffic demand and supply, vehicle dynamics, performance indicators for evaluation and network design for a realistic road transport network.
- Understand how to design a complete study, implement and validate it for planning purposes, e.g. creating a new road infrastructure.
- Make valid and concrete engineering proposals based on the simulation model and alternative scenarios.

Content

In this course, the students will first learn some microscopic modelling and simulation concepts, and then complete a traffic-engineering project with microscopic traffic simulator Aimsun.

Microscopic modelling and simulation concepts will include:

1) Car following models
2) Lane change models
3) Calibration and validation methodology

Specific tasks for the project will include:

1) Building a model with the simulator Aimsun in order to replicate and analyze the traffic conditions measured/observed.
2) Calibrating and validating the simulation model.
3) Redesigning/ extending the model to improve the traffic performance through Aimsun and within programming in Python or C++.

The course will be based on project that each group of students will build (design, calibrate, analyze and present) across the semester. A mid-term and final presentation of the work will be asked from each group of students. It consists of weekly 2-hour lectures. The students work in pairs on a group project that completes in the end of the semester. The modelling software used is Aimsun and lectures (theory and hands on experience) are taking place in a computer room.

The course Road Transport Systems (Verkehr III), or simultaneously taking the course Traffic Engineering is encouraged. Previous experience with Aimsun/Python/C++ is helpful but not mandatory.

Lecture notes

The lecture notes and additional handouts will be provided before the lectures.

Literature

Additional literature recommendations will be provided at the lectures.

Prerequisites / notice

Students need to know some basic road transport concepts. The course Road Transport Systems (Verkehr III), or simultaneously taking the course Traffic Engineering is encouraged. Previous experience with Aimsun is helpful but not mandatory.

Introduction to Mathematical Optimization

W  5 credits  2V+1U  D. Adjiaashvili

Abstract

Introduction to basic techniques and problems in mathematical optimization, and their applications to a variety of problems in engineering.

Objective

The goal of the course is to obtain a good understanding of some of the most fundamental mathematical optimization techniques used to solve linear programs and basic combinatorial optimization problems. The students will also practice applying the learned models to problems in engineering.

Content

Topics covered in this course include:

- Linear programming (simplex method, duality theory, shadow prices, ...).
- Basic combinatorial optimization problems (spanning trees, shortest paths, network flows, ...).
- Modelling with mathematical optimization: applications of mathematical programming in engineering.

Literature

Information about relevant literature will be given in the lecture.

Prerequisites / notice

This course is meant for students who did not already attend the course "Mathematical Optimization", which is a more advance lecture covering similar topics. Compared to "Mathematical Optimization", this course has a stronger focus on modeling and applications.

101-0491-10L

Basics of Java and Best Practices for Scientific Computing

W  1 credit  1G  M. Balac

Abstract

The objective of this course is to conduct a realistic traffic engineering project from beginning to end. The students will first familiarize themselves with microscopic traffic models. Students will work in groups on a project that includes a base scenario on a real traffic network. Throughout the semester, along with theoretical concepts, the students will build the base scenario (design, calibration and validation) and will develop alternative scenarios regarding modification on the infrastructure, simulation of in-vehicle technologies and vehicle-to-everything (V2X) communication.

Abstract
This course provides an introduction to programming in Java, version control, and cloud computing.

Objective
At the end of the course, the students should
1. Have acquired object-oriented programming skills with a focus on Java.
2. Have an understanding of version control using git
3. Have learned to deploy java applications on servers

Content
This course provides an introduction to object-oriented programming with Java. Four topics are covered:
1. Basics of Java (objects, classes, interfaces, abstract classes, static classes, static methods,...)
2. Injection (traditional vs. Guice)
3. Code versioning
4. Java application deployment on servers

Literature
Intro to Java Programming, Comprehensive Version (10th Edition) by Y. Daniel Liang

Abstract
The lecture addresses the fundamentals of river engineering to quantitatively describe the flow of water, transport of sediment and wood, and morphological changes such as erosion and deposition processes associated with river structures. In addition, design guidelines for river engineering structures are introduced.

Objective
At the end of the course, the students will be able to:
1. recall and describe the fundamentals of transport processes in rivers,
2. apply different calculation approaches and methods to tackle river engineering problems and tasks such as the discharge capacity of a river, scour estimation, or sediment budget of a river,
3. design and dimension river engineering works needed to influence the processes in watercourses, and
4. determine the interaction between flow (discharge), sediment transport, wood transport and the resulting channel evolution.

Content
The first part of the lecture introduces the fundamentals of river engineering, such as methods to determine and calculate the river discharge, or sampling methods to characterize the bed material. In addition, the transport processes of sediment (bedload and suspended load) and wood in rivers will be examined, including the principles of incipient motion, and initiation of erosion or deposition processes.

In the second part of the lecture, the methods will be explained to quantify the bed load budget and the morphological changes (erosion, deposition) in river systems. Specifically, natural channel formation processes, different bed forms and plan forms of rivers (straight, meandering, braided) are examined.

The last part of the lecture focuses on the design of river engineering structures, including examples from an ongoing flood and river rehabilitation project at the Alpine Rhine in Austria and Switzerland.

Lecture notes
Lecture slides can be downloaded via Moodle.

1) Building a model with the simulator Aimsun in order to replicate and analyze the traffic conditions measured/observed.
2) Calibrating and validating the simulation model.
3) Redesigning/extending the model to improve the traffic performance through Aimsun and with/without programming in Python or C++.

The course will be based on a project that each group of students will build (design, calibrate, analyze and presentation) across the semester. A mid-term and final presentation of the work will be asked from each group of students. It consists of weekly 2-hour lectures. The students work in pairs on a group project that completes in the end of the semester. The modelling software used is Aimsun and lectures (theory and hands on experience) are taking place in a computer room.

The course Road Transport Systems (Verkehr III), or simultaneously taking the course Traffic Engineering is encouraged. Previous experience with Aimsun/Python/C++ is helpful but not mandatory.

The course gives a deeper insight into railway technology, the interaction between track and vehicles as well as in construction and dimensioning of the track. Methods for starting up and the diagnosis of the state of the track and its forecast are shown. State-of-the-art maintenance strategies and technologies are presented.

3) Redesigning/extending the model to improve the traffic performance through Aimsun and with/without programming in Python or C++.

Specific tasks for the project will include:

1) Building a model with the simulator Aimsun in order to replicate and analyze the traffic conditions measured/observed.
2) Calibrating and validating the simulation model.
3) Redesigning/extending the model to improve the traffic performance through Aimsun and with/without programming in Python or C++.

The course will be based on a project that each group of students will build (design, calibrate, analyze and presentation) across the semester. A mid-term and final presentation of the work will be asked from each group of students. It consists of weekly 2-hour lectures. The students work in pairs on a group project that completes in the end of the semester. The modelling software used is Aimsun and lectures (theory and hands on experience) are taking place in a computer room.

The course Road Transport Systems (Verkehr III), or simultaneously taking the course Traffic Engineering is encouraged. Previous experience with Aimsun/Python/C++ is helpful but not mandatory.

The lecture notes and additional handouts will be provided before the lectures.

Additional literature recommendations will be provided at the lectures.

Students need to know some basic road transport concepts. The course Road Transport Systems (Verkehr III), or simultaneously taking the course Traffic Engineering is encouraged. Previous experience with Aimsun is helpful but not mandatory.

Critical Thinking assessed

### Content

1. Railway technology
   - Interaction between track and vehicles; stress; track construction including features of railway bridges and tunnels; starting up; track diagnostics and forecast; track maintenance and related methods
   - Track, power supply / catenaries, information technology, safety / interlockings / dispatching
   - Stress; track construction including special features of railway bridges and tunnels

2. Starting up
   - Goals, methods, procedures

3. Diagnostics, maintenance strategies
   - Track diagnostics and forecast

4. Maintenance strategies, fundamentals of track maintenance and related methods

The slides will be made available. A list with related technical literature will be handed out.

Prerequisite: 101-0419-01 Railway Infrastructures 1 (FS)

Abstract
Structural reliability aims at quantifying the probability of failure of systems due to uncertainties in their design, manufacturing and environmental conditions. Risk analysis combines this information with the consequences of failure for the purpose of optimal decision making. The course presents the underlying probabilistic modelling and computational methods for reliability and risk assessment.

Objective
The goal of this course is to provide the students with a thorough understanding of the key concepts behind structural reliability and risk analysis. After this course the students will have refreshed their knowledge of probability theory and statistics to model uncertainties in view of engineering applications. They will be able to analyze the reliability of a structure and to use risk assessment methods for decision making under uncertain conditions. They will be aware of the state-of-the-art computational methods and software in this field.

Content
Engineers are confronted every day to decision making under limited amount of information and uncertain conditions. When designing new structures and systems, the design codes such as SIA or Euro-codes usually provide a framework that guarantees safety and reliability. However the level of safety is not quantified explicitly, which does not allow the analyst to properly choose between design variants and evaluate a total cost in case of failure. In contrast, the framework of risk analysis allows one to incorporate the uncertainty in decision making.

The first part of the course is a reminder on probability theory that is used as a main tool for reliability and risk analysis. Classical concepts such as random variables and vectors, dependence and correlation are recalled. Basic statistical inference methods used for building a probabilistic model from the available data, e.g. the maximum likelihood method, are presented.

The second part is related to structural reliability analysis, i.e. methods that allow one to compute probabilities of failure of a given system with respect to prescribed criteria. The framework of reliability analysis is first set up. Reliability indices are introduced together with the first order-second moment method (FORM) and the first order reliability method (FORM). Methods based on Monte Carlo simulation are then reviewed and illustrated through various examples. By-products of reliability analysis such as sensitivity measures and partial safety coefficients are derived and their links to structural design codes is shown. The reliability of structural systems is also introduced as well as the methods used to reassess existing structures based on new information.

The third part of the course addresses risk assessment methods. Techniques for the identification of hazard scenarios and their representation by fault trees and event trees are described. Risk is defined with respect to the concept of expected utility in the framework of decision making. Elements of Bayesian decision making, i.e. pre-, post and pre-post risk assessment methods are presented.

The course also includes a tutorial using the UQLab software dedicated to real world structural reliability analysis.

<tr>
<th>Objective</th>
<th>Content</th>
<th>Literature</th>
</tr>
</thead>
</table>
| The goal of the course is to obtain a good understanding of some of the most fundamental mathematical optimization techniques used to solve linear programs and basic combinatorial optimization problems. The students will also practice applying the learned models to problems in engineering. | Topics covered in this course include:  
- Linear programming (simplex method, duality theory, shadow prices, ...).  
- Basic combinatorial optimization problems (spanning trees, shortest paths, network flows, ...).  
- Modelling with mathematical optimization: applications of mathematical programming in engineering. | Information about relevant literature will be given in the lecture. |

### 363-0445-00L Production and Operations Management

<table>
<thead>
<tr>
<th>Objective</th>
<th>Content</th>
<th>Literature</th>

</thead>
</table>
| This course provides students with a broad theoretical basis for understanding, designing, analyzing, and improving manufacturing operations. After completing this course:  
1. Students can apply key concepts of POM to detail an operations strategy.  
2. Students can do simple forecasting of demand and plan the needed capacity to meet it.  
3. Students can conduct process mapping analysis, use it to design and improve processes and layouts, and elaborate on the limitations of the chosen method.  
4. Students can choose IT, OT, and automation technology for manufacturing applications.  
5. Students can design information flows, manage master data, and use it to plan and control a factory.  
6. Students can design material flows in and beyond factories.  
7. Students can design performance management systems.  
8. Students can select and use problem-solving tools to improve quality and productivity.  
9. Additional skills: Students acquire experience in teamwork. | Production and Operations Management (POM) is at the heart of any business. It is concerned with the business processes that transform input into output and deliver products and services to customers. Factory management is an important part of POM, but it is much more than what takes place inside the production facilities of companies like ABB, Boeing, BMW, LEGO, Nestlé, Roche, TESLA, and Toyota. Did you know that the largest portion of assets and employees in most organizations are engaged in the operations function? Although this course focuses on manufacturing, all types of organizations depend on their operational capabilities. With the ongoing globalization and digitization of manufacturing, POM has won a deserved status for providing a competitive advantage. |

This course covers the following topics: Introduction to POM, Manufacturing strategy, Forecasting and capacity, Process design, Layout, Industry 4.0, Information flow, Material flow, Logistics/SCM  
Performance management, Performance improvement, Quality management, and Maintenance.  
This course is administered via Moodle. The course is designed around five elements:  
2. Video lectures. Short video lectures presenting basic POM concepts.  
3. Class lectures. Deep-dives with case examples on select topics.  
4. FactoryVR group assignment. FactoryVR allows students to visit factories virtually.  
5. Quizzes. A few quizzes during the semester help students check their progress and prepare for the written exam. | Suggested literature is provided in the syllabus. |

### Analytical Competencies

This course provides an overview of the main natural hazards and their importance in a national and international context. The probability, risk and implications of various natural hazards will be discussed, along with potential management options. The course consists of introductory lectures and exercises, seminars with guest lectures by experts and a field trip.

### Objective

By the end of the course, students will be able to:

- explain the main natural hazards, their processes and their importance in different contexts.
- describe the likelihood, risk, and consequences of natural hazards and their management options.
- identify and discuss the development of natural hazards in the context of climate change.

### Literature

will be distributed and available on Moodle.

This lecture will introduce the fundamentals of macroeconomic theory and explain their relevance to everyday economic problems. This course examines the behavior of macroeconomic variables, such as gross domestic product, unemployment and inflation rates. Mathematical treatment of optimization techniques for linear and combinatorial optimization problems.

This course helps you understand the world in which you live. There are many questions about the macroeconomy that might spark your curiosity. Why are living standards so meager in many African countries? Why do some countries have high rates of inflation while others have stable prices? Why have some European countries adopted a common currency? These are just a few of the questions that this course will help you answer. Furthermore, this course will give you a better understanding of the potential and limits of economic policy. As a voter, you help choose the policies that guide the allocation of society's resources. When deciding which policies to support, you may find yourself asking various questions about economics. What are the burdens associated with alternative forms of taxation? What are the effects of free trade with other countries? How does the government budget deficit affect the economy? These and similar questions are always on the minds of policy makers.

Besides this textbook, the slides, lecture notes and problem sets will cover the content of the lecture and the exam questions. The course Moodle page contains announcements, course information and lecture slides. The set-up of the course will closely follow the book of N. Gregory Mankiw and Mark P. Taylor (2023), Economics, Cengage Learning, 6th Edition. This book can also be used for the course ‘363-0503-00L Principles of Microeconomics’ (Filippini).

Prerequisites

- Basic course on probability theory and statistics

Lecture notes

- Slides of the lectures are available online each week. A printed version of the full set of slides is proposed to the students at the beginning of the semester.
- The course also includes a tutorial using the UQLab software dedicated to real-world structural reliability analysis.

Literature

- S. Marelli, R. Schöbi, B. Sudret, UQLab user manual - Structural reliability (rare events estimation), Report UQLab-v0.92-107.
Content
Key topics include:
- Linear programming and polyhedra;
- Flows and cuts;
- Combinatorial optimization problems and polyhedral techniques;
- Equivalence between optimization and separation.

Literature

Prerequisites / notice
Solid background in linear algebra.

Recommended lectures:
Hydrology (102-0293-AAL), Hydraulics I (101-0203-01L), and Hydraulic Engineering (101-0206-00L).

Short practical exercises (voluntary) will be offered throughout the semester to improve the application of the learned subjects.

Abstract
Students are introduced to a narrative of ‘Urban Stories’ through a series of three tools driven by social, governance, and environmental transformations in today’s urbanization processes. Each lecture explores one city’s spatial and organizational ingenuity born out of a particular place’s realities, allowing students to transfer these inventions into a catalog of conceptual tools.
Objective
How can students of architecture become active agents of change? What does it take to go beyond a building's scale, making design-relevant decisions for the city rather than a single client? How can we design in cities with a lack of land, tax base, risk, and resilience, understanding that Zurich is the exception and these other cities are the rule? How can we discover, set rather than follow trends and understand existing urban phenomena activating them in a design process? The lecture series produces a growing catalog of operational urban tools across the globe, considering Governance, Social, and Environmental realities. Instead of limited binary comparing of cities, we are building a catalog of change, analyzing what design solutions cities have been developing informally incrementally over time, why, and how. We look at the people, institutions, culture behind the design and make concepts behind these tools visible. Students get first-hand information from cities where the chair as a Team has researched, worked, or constructed projects over the last year, allowing competent, practical insight about the people and topics that make these places unique. Students will be able to use and expand an alternative repertoire of experiences and evidence-based design tools, go to the conceptual core of them, and understand how and to what extent they can be relevant in other places. Urban Stories is the basic practice of architecture and urban design. It introduces a repertoire of urban design instruments to the students to use, test, and start their designs.

Content
Urban form cannot be reduced to physical space. Cities result from social construction, under the influence of technologies, ecology, culture, the impact of experts, and accidents. Urban un-concluded processes respond to political interests, economic pressure, cultural inclinations, along with the imagination of architects and urbanists and the informal powers at work in complex adaptive systems. Current urban phenomena are the result of urban evolution. The facts stored in urban environments include contributions from its entire lifecycle, visible in the physical environment, and non-physical aspects. This imaginary city exists along with its potentials and problems and with the conflicts that have evolved. Knowledge and understanding, along with a critical observation of the actions and policies, are necessary to understand the diversity and instability present in the contemporary city and understand how urban form evolved to its current state.

How did cities develop into the cities we live in now? Urban plans, instruments, visions, political decisions, economic reasonings, cultural inputs, and social organization have been used to operate in urban Settlements in specific moments of change. We have chosen cities that exemplify how these instruments have been implemented and how they have shaped urban environments. We transcribe these instruments into urban operational tools that we have recognized and collected within existing tested cases in contemporary cities across the globe.

This lecture series will introduce urban knowledge and the way it has introduced urban models and operational modes within different concrete realities, therefore shaping cities. The lecture series translates urban knowledge into operational tools, extracted from cities where they have been tested and become exemplary samples, most relevant for understanding how the urban landscape has taken shape. The tools are clustered in twelve thematic clusters and three tool scales for better comparability and cross-reflection.

The Tool case studies are compiled into a global urbanization toolbox, which we use as typological models to read the city and critically reflect upon it. The presented contents are meant to serve as inspiration for positioning in future professional life and provide instruments for future design decisions.

In an interview with a local designer, we measure our insights against the most pressing design topics in cities today, including inclusion, affordable housing, provision of public spaces, and infrastructure for all.

Lecture notes
The learning material, available via https://moodle-app2.let.ethz.ch/ is comprised of:
- Toolbox 'Reader' with an introduction to the lecture course and tool summaries
- Weekly exercise tasks
- Infographics with basic information of each city
- Quiz question for each tool
- Additional reading material
- Interviews with experts
- Archive of lecture recordings

Literature
- Reading material will be provided throughout the semester.

Abstract
Conception, structure and impact of cadastral systems such as property cadastre, PLR-cadastre, digital twin and related spatial data infrastructures (SDI) as well as their importance for civil society.

Objective
Students will get an understanding of the conception, structure and impact of cadastral systems and related concepts such as land administration, land registry, PLR-cadastre, spatial data infrastructures and Digital Twins. The link between cadastral systems, gender equality, economic prosperity and the contribution of property cadastre to achieving the United Nation Sustainable Development Goals (UN SDG) is discussed.

The Swiss cadastral system ("Amtliche Vermessung") as well as a number of international systems in developed as well as developing countries are discussed. The importance of the data from the property cadastre for the National Spatial Data Infrastructure (NSDI) and digital transformation will be investigated using various examples.

Content
- Origin and purpose of cadastral systems
- Importance of documentation of property information as a basis for economic development
- Basic concepts of cadastral systems (legal basis, conceptual principles, types of property, real estate types)
- Importance of cadastral systems for societal prosperity due to the impact on the economy, society and the environment.
- Contribution of the cadastre to the achievement of the UN SDGs on gender equality, poverty and food security.

Swiss cadastral system
- legal basis
- organisation
- technical implementation
- quality and integrity assurance
- profession
- embedding cadastral data in the national spatial data infrastructure

Contribution of cadastral systems as spatial reference data to the digital transformation of the society.

International trends, developments and initiatives to strengthen property rights, 3D cadastral system (above and below ground)

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

**Abstract**

- Systems Engineering is a way of thinking that helps engineer sustainable systems, i.e. ones that meet the needs of stakeholders in the short, medium and long terms.
- This course provides an overview of the main principles of Systems Engineering, and includes an introduction to the use of operations research methods in the determination of optimal solutions in complex systems.

**Objective**

The world’s growing population, changing demographics, and changing climate pose formidable challenges to humanity’s ability to live sustainably. Ensuring that humanity can live sustainably requires accommodating Earth’s growing and changing population through the provision and operation of a sustainable and resilient built environment. This requires ensuring excellent decision-making as to how the built environment is constructed and modified.

The objective of this course is to ensure the best possible decision making when engineering sustainable systems, i.e. ones that meet the needs of stakeholders in the short, medium and long term. In this course, you will learn the main principles of Systems Engineering that can help you from the first idea that a system may not meet expectations, to the quantitative and qualitative evaluation of possible system modifications. Additionally, the course includes an introduction to the use of operations research methods in the determination of optimal solutions in complex systems.

More specifically upon completion of the course, you will have gained insight into:

- how to structure the large amount of information that is often associated with attempting to modify complex systems
- how to set goals and define constraints in the engineering of complex systems
- how to generate possible solutions to complex problems in ways that limit exceedingly narrow thinking
- how to compare multiple possible solutions over time with differences in the temporal distribution of costs and benefits and uncertainty as to what might happen in the future
- how to assess values of benefits to stakeholders that are not in monetary units
- how to assess whether it is worth obtaining more information in determining optimal solution
- how to take a step back from the numbers and qualitatively evaluate the possible solutions in light of the bigger picture
- the basics of operations research and how it can be used to determine optimal solutions to complex problems, including linear, integer and network programming, dealing with multiple objectives and conducting sensitivity analyses.

**Content**

This is a self-study course, there are no lectures or help sessions. A Moodle page with the relevant literature, study materials, and course information is provided. For questions regarding course content or administration, students may approach the lecturers/teaching assistants.

**Lecture notes**

The script for the original course is in German. The English material that can be used for the self-study course is:

- 2 Books (provided as PDFs):

- 2 exams from previous semesters (2017 and 2021) for practice, with solutions provided.

### Project Management

**Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement. Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.**

**Abstract**

General introduction to the development, the life cycle and the characteristics of projects. Introduction to, and experience with, the methods and tools to help with the preparation, evaluation, organisation, planning, controlling and completion of projects.

**Objective**

To introduce the methods and tools of project management. To impart knowledge in the areas of project organisation and structure, project planning, resource management, project controlling and on team leadership and team work.

**Content**

- From strategic planning to implementation (Project phases, goals, constraints, and feasibility)
- Project leadership (Leadership, Teams)
- Project organization (Structure)
- Project planning (Schedule, cost and resource planning)
- Project controlling
- Risk and Quality Management
- Project completion

**Lecture notes**

This is a self-study course, there are no lectures or help sessions. A Moodle page with the relevant literature, study materials, and course information is provided. For questions regarding course content or administration, students may approach the lecturers/teaching assistants.

**Literature**

Material that can be used for the self-study course is:

- 2 Books:
  - Shub, Bard and Globerson, 2nd ed. Chapters 1, 6-11 (provided as PDFs)
  - Nicholas and Steyn, 4th ed., Chapters 1, 5-15 (Available online)

- 2 exams from previous semesters (2012 fall and spring) for practice, with solutions provided.

### Spatial Planning and Landscape Development

**Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.**

**Abstract**

The lecture introduces into the main-features of spatial planning. Attended will be the subjects of planning as a national responsibility, instruments of spatial planning, techniques for problem solving in spatial planning and the Swiss concept for regional planning.

**Objective**

- To get to know the interaction between the community and our living space and their resulting conflicts.
- Link theory and practice in spatial planning.
- To get to know instruments and facilities to process problems in spatial planning.

### Transport Basics

**Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.**

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

**Abstract**

- Introduction to the fundamentals of transportation
- Developing an understanding of the interactions between land use and transportation
- Introduction to the dynamics of transport systems: daily patterns and historical developments

**Objective**

Introduction to the fundamentals of transportation.
### Content
- Accessibility
- Equilibrium in transport networks
- Fundamental transport models
- Traffic flow and control
- Vehicle dynamics on rail and road
- Transport modes and supply patterns
- Time tables

### ECTS
- European Credit Transfer and Accumulation System
- Special students and auditors need special permission from the lecturers.
### Computer Science

**Primary educational objective is to learn programming with C++.**

After having successfully attended the course, students have a good understanding of the C++ programming language and are able to write effective and efficient programs. They are also able to use standard libraries and tools.

#### Contents:
- Fundamental data types, expressions and statements
- (Limits of) computer arithmetic
- Control statements
- Functions

#### Lecture notes
- Course web page
- Lecture notes available for download

#### Literature
- Bjarne Stroustrup: *Einführung in die Programmierung mit C++*, Pearson Studium, 2010
- Andrew Koenig and Barbara E. Moo: *Accelerated C++*, Addison-Wesley, 2000

---

### Discrete Mathematics

**Objective**

The primary goals of this course are (1) to introduce the most important concepts of discrete mathematics, (2) to understand and appreciate the role of abstraction and mathematical proofs, and (3) to discuss a number of applications, e.g. in cryptography, coding theory, and algorithm theory.

**Content**

- You can:
  - solve linear systems of equations with the Gauss elimination;
  - interpret and appropriately use the standard operations with vectors and matrices;
  - compute and properly apply various matrix decompositions;
  - compute eigenvalues, eigenvectors and the determinant of a matrix;
  - use the properties of vector spaces and linear operators;
  - formulate and solve linear least squares problems with the appropriate methods;
  - understand and apply the singular value decomposition.

**Competencies**

- Concepts and Theories
- Techniques and Technologies
- Analytical Competencies
- Decision-making
- Problem-solving
- Communication
- Cooperation and Teamwork
- Creative Thinking
- Critical Thinking

**Lecture notes**

- Available in English

---

### Computer Science

**Objective**

Primary educational objective is to learn programming with C++. After having successfully attended the course, students have a good command of the mechanisms to construct a program. They know the fundamental control and data structures and understand how an algorithmic problem is mapped to a computer program. They have an idea of what happens behind the scenes when a program is translated and executed. Secondary goals are an algorithmic computational thinking, understanding the possibilities and limits of programming and to impart the way of thinking like a computer scientist.

**Content**

The course covers fundamental concepts of computer programming with a focus on systematic algorithmic problem solving. Taught language is C++. No programming experience is required.

**Competencies**

- Concepts and Theories
- Techniques and Technologies
- Analytical Competencies
- Decision-making
- Problem-solving
- Communication
- Cooperation and Teamwork
- Creative Thinking
- Critical Thinking
- Self-awareness and Self-reflection
- Self-direction and Self-management

---

### Linear Algebra

**Objective**

You can:

- solve linear systems of equations with the Gauss elimination;
- interpret and appropriately use the standard operations with vectors and matrices;
- compute and properly apply various matrix decompositions;
- compute eigenvalues, eigenvectors and the determinant of a matrix;
- use the properties of vector spaces and linear operators;
- formulate and solve linear least squares problems with the appropriate methods;
- understand and apply the singular value decomposition.

**Competencies**

- Concepts and Theories
- Techniques and Technologies
- Analytical Competencies
- Decision-making
- Problem-solving
- Communication
- Cooperation and Teamwork
- Creative Thinking
- Critical Thinking
- Self-awareness and Self-reflection
- Self-direction and Self-management

---

Content

1.) General introduction to PDEs and their classification (linear, quasilinear, semilinear, nonlinear / elliptic, parabolic, hyperbolic)

2.) Quasilinear first order PDEs
   - Solution with the method of characteristics
   - Conservation laws

3.) Hyperbolic PDEs
   - wave equation
   - d'Alembert formula in (1+1)-dimensions
   - method of separation of variables

4.) Parabolic PDEs
   - heat equation
   - maximum principle
   - method of separation of variables

5.) Elliptic PDEs
   - Laplace equation
   - maximum principle
   - method of separation of variables
   - variational method

Literature

Prerequisites / notice

401-0647-00L Introduction to Mathematical Optimization  O  5 credits  2V+1U  D. Adjiaishvili

Abstract

Introduction to basic techniques and problems in mathematical optimization, and their applications to a variety of problems in engineering.

Objective

The goal of the course is to obtain a good understanding of some of the most fundamental mathematical optimization techniques used to solve linear programs and basic combinatorial optimization problems. The students will also practice applying the learned models to problems in engineering.

Content

Topics covered in this course include:
- Linear programming (simplex method, duality theory, shadow prices, ...).
- Basic combinatorial optimization problems (spanning trees, shortest paths, network flows, ...).
- Modelling with mathematical optimization: applications of mathematical programming in engineering.

401-2673-00L Numerical Methods for CSE  O  9 credits  2V+2U+4R  R. Hiptmair

Abstract

The course gives an introduction into fundamental techniques and algorithms of numerical mathematics which play a central role in numerical simulations in science and technology. The course focuses on fundamental ideas and algorithmic aspects of numerical methods. The exercises involve actual implementation of numerical methods in C++.

Objective

* Knowledge of the fundamental algorithms in numerical mathematics
* Knowledge of the essential terms in numerical mathematics and the techniques used for the analysis of numerical algorithms
* Ability to choose the appropriate numerical method for concrete problems
* Ability to interpret numerical results
* Ability to implement numerical algorithms efficiently

Content

* Computing with Matrices and Vectors
* Direct Methods for linear systems of equations
* Least Squares Techniques
* Data Interpolation and Fitting
* Iterative Methods for non-linear systems of equations
* Filtering Algorithms
* Approximation of Functions
* Numerical Quadrature

Lecture notes

Lecture materials (PDF documents and codes) will be made available to the participants through the course web page, whose address will be announced in the beginning of the course.

Literature

M. Hanke-Bourgeois "Grundlagen der Numerischen Mathematik und des wissenschaftlichen Rechnens", BG Teubner, 2002

P. Deuflhard and A. Hohmann, "Numerische Mathematik I", DeGruyter, 2002
The course will be accompanied by programming exercises in C++ relying on the template library EIGEN. Knowledge of C++ is taken for granted.

**Competencies**

**Subject-specific Competencies**
- Concepts and Theories assessed
- Techniques and Technologies assessed

**Method-specific Competencies**
- Analytical Competencies assessed
- Media and Digital Technologies fostered
- Problem-solving assessed

**Prerequisites / notice**
- 252-0029-00L  Parallel Programming
- 252-0028-00L  Design of Digital Circuits

**Abstract**
Students in the Master's Degree Programme in Computational Science and Engineering must enrol only if this course unit is an additional requirement.

**Objective**

The goal of the course is that students learn basic and advanced programming techniques and scientific software libraries as used and applied for scientific simulations.

**252-0061-00L Systems Programming and Computer Architecture**

<table>
<thead>
<tr>

<th>Lecturers</th>
</tr>
</thead>
<tbody>
<tr>
<td>O</td>
<td>7 credits</td>
<td>4V+2U</td>
<td>A. Klimovic, T. Roscoe</td>
</tr>
</tbody>
</table>

**Abstract**
Introduction to systems programming. C and assembly language, floating point arithmetic, basic translation of C into assembler, compiler optimizations, manual optimizations. How hardware features like superscalar architecture, exceptions and interrupts, caches, virtual memory, multicore processors, devices, and memory systems function and affect correctness, performance, and optimization.

**Objective**

The course objectives are for students to:

1. Develop a deep understanding of, and intuition about, the execution of all the layers (compiler, runtime, OS, etc.) between programs in high-level languages and the underlying hardware: the impact of compiler decisions, the role of the operating system, the effects of hardware on code performance and scalability, etc.

2. Be able to write correct, efficient programs on modern hardware, not only in C but high-level languages as well.

3. Understand Systems Programming as a complement to other disciplines within Computer Science and other forms of software development.

This course does not cover how to design or build a processor or computer.

**Content**
This course provides an overview of “computers” as a platform for the execution of (compiled) computer programs. This course provides a programmer’s view of how computer systems execute programs, store information, and communicate. The course introduces the major computer architecture structures that have direct influence on the execution of programs (processors with registers, caches, other levels of the memory hierarchy, supervisor/kernel mode, and I/O structures) and covers implementation and representation issues only to the extent that they are necessary to understand the structure and operation of a computer system.

The course attempts to expose students to the practical issues that affect performance, portability, security, robustness, and extensibility. This course provides a foundation for subsequent courses on operating systems, networks, compilers and many other courses that require an understanding of the system-level issues. Topics covered include: machine-level code and its generation by optimizing compilers, address translation, input and output, trap/event handlers, performance evaluation and optimization (with a focus on the practical aspects of data collection and analysis).

**Lecture notes**
- C programming
- Integers
- Pointers and dynamic memory allocation
- Basic computer architecture
- Compiling C control flow and data structures
- Code vulnerabilities
- Implementing memory allocation
- Linking
- Floating point
- Optimizing compilers
- Architecture and optimization
- Caches
- Exceptions
- Virtual memory
- Multicore
- Devices

**Literature**
The course is based in part on "Computer Systems: A Programmer's Perspective" (3rd Edition) by R. Bryant and D. O'Hallaron, with additional material.
All course units within Block G3 are offered in the spring semester.

All course units within Block G4 are offered in the spring semester.

This is a full black board ad chalk experience for students with a strong background in mathematics and physics.

Prerequisites:
Introduction to Astrophysics
Mathematical Methods for the Physicist
Quantum Mechanics
(All preferred but not obligatory)

Prior Knowledge:
Mechanics
Quantum Mechanics and atomic physics
Thermodynamics
Fluid Dynamics
Electrodynamics

401-7855-00L Computational Astrophysics (University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: AST245

Objective
Acquire knowledge of main methodologies for computer-based models of astrophysical systems, the physical equations behind them, and train such knowledge with simple examples of computer programmes

Content
1. Integration of ODE, Hamiltonians and Symplectic integration techniques, time adaptivity, time reversibility
2. Large-N gravity calculation, collisionless N-body systems and their simulation
3. Fast Fourier Transform and spectral methods in general
4. Eulerian Hydrodynamics: Upwinding, Riemann solvers, Limiters
5. Lagrangian Hydrodynamics: The SPH method
6. Resolution and instabilities in Hydrodynamics
7. Initial Conditions: Cosmological Simulations and Astrophysical Disks
8. Physical Approximations and Methods for Radiative Transfer in Astrophysics

Literature
Galactic Dynamics (Binney & Tremaine, Princeton University Press),
Computer Simulation using Particles (Hockney & Eastwood CRC press),
Targeted journal reviews on computational methods for astrophysical fluids (SPH, AMR, moving mesh)

Prerequisites / notice
Some knowledge of UNIX, scripting languages (see www.physik.uzh.ch/lectures/informatik/python/ as an example), some prior experience programming, knowledge of C, C++ beneficial

Physics of the Atmosphere

Number Title Type ECTS Hours Lecturers
701-0023-00L Atmosphere W 3 credits 2V E. Fischer, U. Lohmann

Abstract
Basic principles of the atmosphere, physical structure and chemical composition, trace gases, atmospheric cycles, circulation, stability, radiation, condensation, clouds, oxidation capacity and ozone layer.

Objective
Students are able
- to explain the physical structure and chemical composition of the atmosphere
- to quantitatively describe and understand the fundamental physical and chemical process in the atmosphere
- to explain the interactions and feedbacks between atmosphere - ocean - land surface, troposphere - stratosphere and weather - climate.

In the course "Atmosphere", the competencies of process understanding, system understanding and data analysis & interpretation are taught, applied and examined.

Content
Basic principles of the atmosphere, physical structure and chemical composition, trace gases, atmospheric cycles, circulation, stability, radiation, condensation, clouds.

Lecture notes
Written information will be supplied.

Chemistry

Number Title Type ECTS Hours Lecturers
529-0004-01L Classical Simulation of (Bio)Molecular Systems W 6 credits 4G P. H. Hünenberger, J. Dolenc, S. Riniker

Abstract
Molecular models, classical force fields, configuration sampling, molecular dynamics simulation, boundary conditions, electrostatic interactions, analysis of trajectories, free-energy calculations, structure refinement, applications in chemistry and biology. Exercises: hands-on computer exercises for learning progressively how to perform an analyze classical simulations (using the package GROMOS).

Objective
Introduction to classical (atomicistic) computer simulation of (bio)molecular systems, development of skills to carry out and interpret these simulations.

Content
Molecular models, classical force fields, configuration sampling, molecular dynamics simulation, boundary conditions, electrostatic interactions, analysis of trajectories, free-energy calculations, structure refinement, applications in chemistry and biology. Exercises: hands-on computer exercises for learning progressively how to perform an analyze classical simulations (using the package GROMOS).
Lecture notes
The powerpoint slides of the lectures will be made available weekly on the website in pdf format (on the day preceding each lecture).

Literature
See: www.csms.ethz.ch/education/CSBMS

Prerequisites / notice
Since the exercises on the computer do convey and test essentially different skills than those being conveyed during the lectures and tested at the oral exam, the results of the exercises are taken into account when evaluating the results of the exam (learning component, possible bonus of up to 0.25 points on the exam mark).

For more information about the lecture: www.csms.ethz.ch/education/CSBMS

Competencies

Subject-specific Competencies
- Concepts and Theories

Method-specific Competencies
- Analytical Competencies
- Media and Digital Technologies
- Problem-solving

Personal Competencies
- Adaptability and Flexibility
- Creative Thinking

Quantum Mechanics I

Physics BSc students with programme regulations 2016 need to register for "402-0205-10L Quantenmechanik I"

Abstract

Applications: simple potentials in wave mechanics, scattering and resonance, harmonic oscillator, hydrogen atom, and perturbation theory.

Objective
Introduction to single-particle quantum mechanics. Familiarity with basic ideas and concepts (quantisation, operator formalism, symmetries, angular momentum, perturbation theory) and generic examples and applications (bound states, tunneling, hydrogen atom, harmonic oscillator). Ability to solve simple problems.

Content
The beginnings of quantum theory with Planck, Einstein and Bohr; Wave mechanics; Simple examples; The formalism of quantum mechanics (states and observables, Hilbert spaces and operators, the measurement process); Heisenberg uncertainty relation; Harmonic oscillator; Symmetries (in particular rotations); Hydrogen atom; Angular momentum addition; Quantum mechanics and classical physics (EPR paradoxon and Bell's inequality); Perturbation theory.

Fluid Dynamics

Number Title Type ECTS Hours Lecturers
151-0709-00L Stochastic Methods for Engineers and Natural Scientists W 4 credits 4G D. W. Meyer-Massetti

Abstract
The course provides an introduction into stochastic methods that are applicable for the description, treatment, and modeling of systems that are subject to uncertainties or that respond to parameter changes in a chaotic manner. Corresponding systems may arise in fluid dynamics, structural mechanics, biology, electrical engineering as well as other areas.

Objective
By the end of the course you will be familiar with a range of mathematical/statistical tools that enable a quantitative treatment of problems that involve uncertainties.

Content
- Probability theory, single and multiple random variables, mappings of random variables
- Estimation of statistical moments and probability densities based on data
- Stochastic differential equations, Ito calculus, PDF evolution equations
- Monte Carlo integration with importance and stratified sampling
- Markov-chain Monte Carlo sampling
- Control-variate and multi-level Monte Carlo estimation
- Kalman filters (classical and ensemble-based)
- Statistical tests for means and goodness-of-fit

Lecture notes
Detailed lecture notes will be provided.

EEE 227-0103-00L

Hydrodynamics and Cavitation

W 4 credits 3G 0. Supponen

Abstract
This course builds on the foundations of fluid dynamics to describe hydrodynamic flows and provides an introduction to cavitation.

Objective
- The main learning objectives of this course are:
  1. Identify and describe dominant effects in liquid fluid flows through physical modelling.
  2. Identify and predict the onset of hydrodynamic instabilities.
  3. Describe acoustic wave behaviour in liquids.
  4. Explain tension, nucleation and phase-change in liquids.
  5. Predict the behaviour of a gas bubble subject to changes in surrounding liquid pressure.
  6. Describe hydrodynamic cavitation and its consequences in physical terms.
  7. Recognise experimental techniques and industrial and medical applications for cavitation.
  8. Read and evaluate research papers on recent research on cavitation and bubble dynamics and communicate the content orally to a multidisciplinary audience.

Content
- The course gives an overview on the following topics: basics of hydrodynamics, capillarity, hydrodynamic instabilities, liquid fragmentation.
- Acoustics in liquids, tension in liquids, phase change. Cavitation and bubble dynamics: single bubbles (nucleation, dynamics, collapse), bubble clouds and cavitating flows. Industrial applications and measurement techniques.
- Literature will be provided in the course material.
- Prerequisites / notice
  - Fluid dynamics I & II or equivalent

<tr>
<td>Content</td>
<td>This course aims at offering a self-contained account of computer vision and its underlying concepts, including the recent use of deep learning. The first part starts with an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First the interaction of light with matter is considered. The most important hardware components such as cameras and illumination sources are also discussed. The course then turns to image discretization, necessary to process images by computer. The next part describes necessary pre-processing steps, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and 3D shape as two important examples. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed. A major part at the end is devoted to deep learning and AI-based approaches to image analysis. Its main focus is on object recognition, but also other examples of image processing using deep neural nets are given.</td>

</table>
Objective
In recent years, deep learning and deep networks have significantly improved the state-of-the-art in many application domains such as computer vision, speech recognition, and natural language processing. This class will cover the mathematical foundations of deep learning and provide insights into model design, training, and validation. The main objective is to provide a good understanding of the basic methods and concepts used in modern deep learning applications. The course will also introduce basic neural networks and learning algorithms.

Prerequisites / notice
This course requires some basic background in machine learning. It is recommended that students have taken a course on machine learning or have acquired equivalent knowledge, see the full list below:

151-0563-01L Dynamic Programming and Optimal Control W 4 credits 2V+1U R. D’Andrea
Objective
Introduction to Dynamic Programming and Optimal Control.
Content
Covers the fundamental concepts of Dynamic Programming & Optimal Control.
Prerequisites / notice
Requirements: Knowledge of dynamic programming, computational linear algebra, and matrix-vector algebra.

151-0851-00L Robot Dynamics ■ W 4 credits 2V+2U M. Hutter, R. Siegwart
Objective
We will provide an overview on how to kinematically and dynamically model typical robotic systems such as robot arms, legs, and fixed wing aircraft systems.
Content
The primary objective of this course is the student to become knowledge of how to model and control the common robotic systems. The student receives knowledge about the dynamics of multi-body systems. The systems are based on the principles of state of the art applications, he/she will learn new techniques to work with in the field of design or control of robotic systems.
Prerequisites / notice
The contents of the following ETH Bachelor lectures or equivalent are assumed to be known: Mechanics and Dynamics, Control, Basics in Fluid Dynamics.

For the category assignment take contact with the Study Administration (www.math.ethz.ch/studiensekretariat).

Number Title Type ECTS Hours Lecturers
263-5902-00L Computer Vision W 8 credits 3V+1U+3A M. Pollefeys, S. Tang, F. Yu

Abstract
The goal of this course is to provide students with a good understanding of computer vision and image analysis techniques. The main concepts and techniques will be studied in depth and practical algorithms and approaches will be discussed and explored through the exercises.

Objective
The objectives of this course are:
1. To introduce the fundamental problems of computer vision.
2. To introduce the main concepts and techniques used to solve these.
3. To enable participants to implement solutions for reasonably complex problems.
4. To enable participants to make sense of the computer vision literature.

Content
Camera models and calibration, invariant features, Multiple-view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition.

Prerequisites / notice
It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts before taking this course.

Data: 26.07.2024 12:39  Autumn Semester 2024  Page 2193 of 2680
How can we build systems that perform well in uncertain environments? How can we develop systems that exhibit "intelligent" behavior, without prescribing explicit rules? How can we build systems that learn from experience in order to improve their performance? We will study core modeling techniques and algorithms from statistics, optimization, planning, and control and study applications in areas such as robotics. The course is designed for graduate students.

### Subject-specific Competencies

Students learn to:

- Apply the following methods: Random number generators, Determination of percolation critical exponents, numerical solution of problems from classical mechanics and electrodynamics, canonical Monte-Carlo simulations to numerically analyze magnetic systems. Students also learn how to implement their own numerical frameworks in Julia and how to use existing libraries to solve physical problems. In addition, students learn to distinguish between different numerical methods to apply them to solve a given physical problem.

- Implement their own numerical frameworks in Julia and how to use existing libraries to solve physical problems. Students also learn how to implement their own numerical frameworks in Julia and how to use existing libraries to solve physical problems. In addition, students learn to distinguish between different numerical methods to apply them to solve a given physical problem.

- Use existing libraries to solve physical problems. The covered topics include classical equations of motion, partial differential equations (wave equation, diffusion equation, Maxwell's equations), Monte Carlo simulations, percolation, phase transitions, and N-Body problems.

Abstract
This module consists of (a) an introduction to fundamental equations of electromagnetics, mechanics and heat transfer, (b) a detailed overview of numerical methods for field simulations, and (c) practical examples solved in form of small projects.

Objective
Basic knowledge of the fundamental equations and effects of electromagnetics, mechanics, and heat transfer. Knowledge of the main concepts of numerical methods for physical modelling and simulation. Ability (a) to develop own simple field simulation programs, (b) to select an appropriate field solver for a given problem, (c) to perform field simulations, (d) to evaluate the obtained results, and (e) to interactively improve the models until sufficiently accurate results are obtained.

Content
The module begins with an introduction to the fundamental equations and effects of electromagnetics, mechanics, and heat transfer. After the introduction follows a detailed overview of the available numerical methods for solving electromagnetic, thermal and mechanical boundary value problems. This part of the course contains a general introduction into numerical methods, differential and integral forms, linear equation systems, Finite Difference Method (FDM), Boundary Element Method (BEM), Method of Moments (MoM), Multiple Multipole Program (MMP) and Finite Element Method (FEM). The theoretical part of the course finishes with a presentation of multiphysics simulations through several practical examples of HF-engineering such as coupled electromagnetic-mechanical and electromagnetic-thermal analysis of MEMS.

In the second part of the course the students will work in small groups on practical simulation problems. For solving practical problems the students can develop and use own simulation programs or chose an appropriate commercial field solver for their specific problem. This practical simulation work of the students is supervised by the lecturers.

Geophysics

Recommended combinations:
Subject 1 + Subject 2
Subject 1 + Subject 3
Subject 2 + Subject 3
Subject 3 + Subject 4
Subject 5 + Subject 6 + Subject 8
Subject 4 + Subject 5
Subject 7 + Subject 8

Geophysics: Subject 1
In this course, students learn crucial partial differential equations (conservation laws) that are applicable to any continuum including the Earth's mantle, core, atmosphere and ocean. The course will provide step-by-step introduction into the mathematical structure, physical meaning and analytical solutions of the equations. The course has a particular focus on solid Earth applications.

The goal of this course is to learn and understand few principal partial differential equations (conservation laws) that are applicable for analysing and modelling of any continuum including the Earth's mantle, core, atmosphere and ocean. By the end of the course, students should be able to write, explain and analyse the equations and apply them for simple analytical cases. Numerical solving of these equations will be discussed in the Numerical Modelling I and II course running in parallel.

A provisional week-by-week schedule (subject to change) is as follows:

**Weeks 1-2:** The continuity equation  
Exercise: Computing the divergence of velocity field.

**Weeks 3-4:** Density and gravity  
Exercises: Computing density, thermal expansion and compressibility from an equation of state. Derivation of gravitational acceleration and its divergence from gravitational potential.

**Weeks 5-6:** Stress and strain  

**Weeks 7-8:** The momentum equation  
Deriving momentum equation. Computing velocity for magma flow in a channel.

**Week 9:** Viscous rheology of rocks  
Theory: Solid-state creep of minerals and rocks as the major mechanism of deformation of the Earth's interior. Dislocation and diffusion creep mechanisms. Rheological equations for minerals and rocks. Effective viscosity and its dependence on temperature, pressure and strain rate. Formulation of the effective viscosity from empirical flow laws.  
Exercise: Deriving viscous rheological equations for computing effective viscosities from empirical flow laws.

**Weeks 10:** The heat conservation equation  

**Week 11,12:** Elasticity and plasticity  
Exercise: Compute viscoelastic stress evolution.

GRADING will be based on homeworks (1/3) and oral exam (2/3).
A provisional week-by-week schedule (subject to change) is as follows:

Week 1: Introduction to the finite difference approximation to differential equations. Introduction to programming in Matlab. Solving of 1D Poisson equation.

Week 3: Solving momentum and continuity equations in case of constant viscosity with streamfunction/vorticity formulation.

Weeks 5: Conservative finite differences for the momentum equation. "Free slip" and "no slip" boundary conditions. Solving momentum and continuity equations in case of variable viscosity using pressure-velocity formulation with staggered grid.

Week 7: Advection in 2-D with Marker-in-cell method. Combining flow calculation and advection for buoyancy driven flow.

Week 9: Solving 2D heat conservation equation in case of constant thermal conductivity with explicit and implicit approaches.

Week 10: Solving 2D heat conservation equation in case of variable thermal conductivity with implicit approach. Temperature advection with markers. Creating thermomechanical code by combining mechanical solution for 2D buoyancy driven flow with heat diffusion and advection based on marker-in-cell approach.

Week 11: Implementation of radioactive, adiabatic and shear heating to the thermomechanical code.

Week 12: Programming of solution of coupled solid-fluid momentum and continuity equations for the case of melt percolation in a rising mantle plume.

Week 14: Final project description for slab breakoff modeling.

GRADING will be based on weekly programming homeworks (50%) and a term project (50%) to develop an application of their choice to a more advanced level.

This course provides an overview on the most widely used seismological methods to image the Earth's interior with a focus on crustal and upper-mantle structures. Topics include controlled source methods such as refraction and wide-angle reflection, as well as passive body-wave and surface-wave based methods. The course will discuss the strengths and weaknesses of each method.

Biology

636-0007-00L Numerical Modelling in Fortran W 3 credits 2V 3V+2U P. Tackley

Abstract
This course gives an introduction to programming in Fortran, and is suitable for students who have only minimal programming experience. Fortran is a modern programming language that is updated every few years (most recently in 2018) and is specifically designed for scientific and engineering applications. This course gives an introduction to programming in this language, and is suitable for students who have only minimal programming experience, for example with MATLAB scripts. The focus will be on Fortran 95-2018, but differences to Fortran 77 will be mentioned for those working with already-existing codes. A hands-on approach will be emphasized rather than abstract concepts.

Geophysics: Subject 8

636-0706-00L Spatio-Temporal Modelling in Biology W 4 credits 3G 4D D. Iber

Abstract
This course focuses on modeling spatio-temporal problems in biology, in particular on the cell and tissue level. The aim of this course is to provide an introductory overview of mathematical and computational methods for the modeling, simulation and analysis of biological networks.

Objective

Competencies

Method-specific Competencies
Media and Digital Technologies
Problem-solving

Lecture notes
See http://www.csb.ethz.ch/education/lectures.html

Literature
The lecture course is not based on any textbook. The following textbooks are related to some of its content. The textbooks may be of interest for further reading, but are not necessary to follow the course:

- Murray, Mathematical Biology, Springer
- Forgacs and Newman, Biological Physics of the Developing Embryo, CUP
- Keener and Sneyd, Mathematical Physiology, Springer
- Fall et al, Computational Cell Biology, Springer
- Szallasi et al, System Modeling in Cellular Biology, MIT Press
- Wolkenhauer, Systems Biology
- Kreyszig, Engineering Mathematics, Wiley

Prerequisites / notice

The course is self-contained. The course assumes no background in biology but a good foundation regarding mathematical and computational techniques.

Abstract

This lecture provides deeper knowledge on the possible applications of virtual reality, its basic technology, and future research fields. The goal is to provide a strong knowledge on Virtual Reality for a possible future use in business processes.

Objective

Virtual Reality can not only be used for the visualization of 3D objects, but also offers a wide application field for small and medium enterprises (SME). This could be for instance an enabling technology for net-based collaboration, the transmission of images and other data, the interaction of the human user with the digital environment, or the use of augmented reality systems. The goal of the lecture is to provide a deeper knowledge of today's VR environments that are used in business processes. The technical background, the algorithms, and the applied methods are explained more in detail. Finally, future tasks of VR will be discussed and an outlook on ongoing international research is given.

Content

Lecture notes

The handout is available in German and English.

Prerequisites / notice

"Visualization, Simulation and Interaction - Virtual Reality II" is recommended, but not mandatory.

Didactical concept:

The course consists of lectures and exercises.

Abstract

Most problems in engineering are of nonlinear nature. The nonlinearities are caused basically due to the nonlinear material behavior, contact conditions and instability of structures. The principles of the nonlinear Finite-Element-Method (FEM) will be introduced for treating such problems. The finite element program ABAQUS is introduced to investigate real engineering problems.
The course provides an introduction to non-linear finite element analysis. The treated sources of non-linearity are related to material properties (hyperelasticity, plasticity), kinematics (large deformations, instability problems) and boundary conditions (contact).

Objective
To be able to address all major sources of non-linearity in theory and numerics, and to apply this knowledge to the solution of relevant problems in solid mechanics.

Content
- Introduction into FEM
- Fundamentals of continuum mechanics to characterize large plastic deformations
- Elasto-plastic material models
- Lagrange and Euler approaches
- FEM implementation of constitutive equations
- Element formulations
- Implicit and explicit FEM methods
- FEM formulations of coupled thermo-mechanical problems
- Modeling of tool contact and the influence of friction
- Solvers and convergence
- Instability problems

227-0116-00L VLSI 1: HDL Based Design for FPGAs W 6 credits 5G F. K. Gürkaynak

Abstract
This first course in a series that extends over three consecutive terms is concerned with tailoring algorithms and with devising high performance hardware architectures for their implementation as ASIC or with FPGAs. The focus is on front end design using HDLs and automatic synthesis for producing industrial-quality circuits.

Objective
Understand Very-Large-Scale Integrated Circuits (VLSI chips), Application-Specific Integrated Circuits (ASIC), and Field-Programmable Gate-Arrays (FPGA). Know their organization and be able to identify suitable application areas. Become fluent in front-end design from architectural conception to gate-level netlists. How to model digital circuits with SystemVerilog. How to ensure they behave as expected with the aid of simulation, testbenches, and assertions. How to take advantage of automatic synthesis tools to produce industrial-quality VLSI and FPGA circuits. Gain practical experience with the hardware description language SystemVerilog and with industrial Electronic Design Automation (EDA) tools.

Content
This course is concerned with system-level issues of VLSI design and FPGA implementations. Topics include:

- Overview on design methodologies and fabrication depths.
- Levels of abstraction for circuit modeling.
- Organization and configuration of commercial field-programmable components.
- FPGA design flows.
- Dedicated and general purpose architectures compared.
- How to obtain an architecture for a given processing algorithm.
- Meeting throughput, area, and power goals by way of architectural transformations.
- Hardware Description Languages (HDL) and the underlying concepts.
- SystemVerilog register transfer level (RTL) synthesis and its limitations.
- Building blocks of digital VLSI circuits.
- Functional verification techniques and their limitations.
- Modular and largely reusable testbenches.
- Assertion-based verification.
- Synchronous versus asynchronous circuits.
- The case for synchronous circuits.
- Periodic events and the Anceau diagram.
- Case studies, ASICs compared to microprocessors, DSPs, and FPGAs.

During the exercises, students learn how to model FPGAs with SystemVerilog. They write testbenches for simulation purposes and synthesize gate-level netlists for FPGAs. Commercial EDA software by leading vendors is being used throughout.

Lecture notes Textbook and all further documents in English.

At the end of this course, you will

- understand the design of the main building blocks of state-of-the-art digital integrated circuits
- be able to design and optimize digital integrated circuits on the schematic, layout, and gate levels
- be able to use standard industry software (Cadence Virtuoso) for drawing, simulating, and characterizing digital circuits
- understand the performance trade-offs between delay, area, and power consumption

### Content

The third VLSI course begins with the basics of metal-oxide-semiconductor (MOS) field-effect transistors (FETs) and moves up the stack towards logic gates and increasingly complex digital circuit structures. The topics of this course include:

- Nanometer MOSFETs
- Static and dynamic behavior of complementary MOS (CMOS) inverters
- CMOS gate design, sizing, and timing
- Full-custom standard-cell design
- Wire models and parasitics
- Latch and flip-flop circuits
- Gate-level timing analysis and optimization
- Static and dynamic power consumption; low-power techniques
- Alternative logic styles (dynamic logic, pass-transistor logic, etc.)
- Arithmetic and logic circuits
- Fixed-point and floating-point arithmetic
- Synchronous and asynchronous design principles
- Memory circuits (ROM, SRAM, and DRAM)
- In- and near-memory processing architectures
- Full-custom accelerator circuits for machine learning

The exercises are concerned with schematic entry, layout, and simulation of digital integrated circuits using a disciplined standard-cell-based approach with Cadence Virtuoso.
