**Abstract**

General Chemistry I: Chemical bond and molecular structure, chemical thermodynamics, chemical equilibrium.

In the course "Chemistry I", the competencies of process understanding, system understanding, modeling, concept development and data analysis & interpretation are taught, applied and examined.

**Objective**

Introduction to general and inorganic chemistry. Basics of the composition and the change of the material world. Introduction to the thermodynamically controlled physico-chemical processes. Macroscopic phenomena and their explanation through atomic and molecular properties. Using the theories to solve qualitatively and quantitatively chemical and ecologically relevant problems.

**Content**

1. **Stoichiometry**
   - Amount of substance and mass. Composition of chemical compounds. Reaction equation. Ideal gas law.
2. **Atoms**
3. **Chemical bonding and its representation.**
4. **Basics of chemical thermodinamics**
   - System and surroundings. Description of state and change of state of chemical systems.
5. **First law of thermodinamics**
6. **Second law of thermodinamics**
   - Entropy. Change of entropy in chemical systems and universe. Reaction entropy.
7. **Gibbs energy and chemical potential.**
8. **Combination of laws of thermodinamics.**
9. **Chemical equilibrium**
10. **Acids and bases**
11. **Dissolution and precipitation.**

**Lecture notes**

Online-Skript mit durchgerechneten Beispielen.

| 401-0251-00L | Mathematics I | O | 6 credits | 4V+2U | A. Cannas da Silva |

**Abstract**

This course covers mathematical concepts and techniques necessary to model, solve and discuss scientific problems - notably through ordinary differential equations.

**Objective**

Mathematics is of ever increasing importance to the Natural Sciences and Engineering. The key is the so-called mathematical modelling cycle, i.e. the translation of problems from outside of mathematics into mathematics, the study of the mathematical problems (often with the help of high level mathematical software packages) and the interpretation of the results in the original environment.

The goal of Mathematics I and II is to provide the mathematical foundations relevant for this paradigm. Differential equations are by far the most important tool for modelling and are therefore a main focus of both of these courses.
1. Single-Variable Calculus:  
   review of differentiation, linearisation, Taylor polynomials, maxima and minima, antiderivative, fundamental theorem of calculus, integration methods, improper integrals.

2. Linear Algebra and Complex Numbers:  
   systems of linear equations, Gauss-Jordan elimination, matrices, determinants, eigenvalues and eigenvectors, cartesian and polar forms for complex numbers, complex powers, complex roots, fundamental theorem of algebra.

3. Ordinary Differential Equations:  
   separable ordinary differential equations (ODEs), integration by substitution, 1st and 2nd order linear ODEs, homogeneous systems of linear ODEs with constant coefficients, introduction to 2-dimensional dynamical systems.

Literature  
- Bretscher, O.: Linear Algebra with Applications (Pearson Prentice Hall).

Prerequisites / notice  
Prerequisites: familiarity with the basic notions from Calculus, in particular those of function and derivative.

---

551-0001-00L  
**General Biology I**  
**O** 3 credits  **3V**  
U. Sauer, O. Y. Martin, A. Widmer  

**Abstract**  
Organismic biology to teach the basic principles of classical and molecular genetics, evolutionary biology and phylogeny. First in a series of two lectures given over two semesters for students of agricultural and food sciences, as well as of environmental sciences.

**Objective**  
The understanding of some basic principles of biology (inheritance, evolution and phylogeny) and an overview of the diversity of life.

**Content**  
The first semester focuses on the organismal biology aspects of genetics, evolution and diversity of life in the Campbell chapters 12-34.

- Week 1-7 by Alex Widmer, Chapters 12-25
- Week 8-14 by Oliver Martin, Chapters 26-34

**Literature**  

**Prerequisites / notice**  
The lecture is the first in a series of two lectures given over two semesters for students with biology as a basic subject.

---

701-0243-01L  
**Biology III: Essentials of Ecology**  
**O** 3 credits  **2V**  
J. Alexander  

**Abstract**  
This introductory lecture in ecology covers basic ecological concepts and the most important levels of complexity in ecological research. Ecological concepts are exemplified by using aquatic and terrestrial systems; corresponding methodological approaches are demonstrated. Threats to biodiversity and the appropriate management are discussed.

**Objective**  
The objective of this lecture is to teach basic ecological concepts and the different levels of complexity in ecological research. The students should learn ecological concepts at these different levels in the context of concrete examples from terrestrial and aquatic ecology. Corresponding methods for studying the systems will be presented. A further aim of the lecture is that students achieve an understanding of biodiversity, why it is threatened and how it can be managed.

**Content**  
- Biodiversity: variation, threats and conservation
- Influence of environmental factors on organisms; adaptation to environmental conditions
- Population dynamics: causes, description, prediction and regulation
- Interactions between species (competition, coexistence, predation, parasitism, food webs)
- Ecological communities: structure, stability, succession
- Ecosystems: compartments, material and energy flows

**Literature**  

**Competencies**  
- Subject-specific Competencies  
  - Concepts and Theories
  - Analytical Competencies
  - Decision-making
  - Problem-solving
  - Communication
  - Cooperation and Teamwork
  - Sensitivity to Diversity
  - Adaptability and Flexibility
  - Creative Thinking
  - Critical Thinking
  - Self-awareness and Self-reflection
  - Self-direction and Self-management

---

701-0027-00L  
**Environmental Systems I**  
**O** 2 credits  **2V**  
N. Dubois, A. Hall, R. Knutti  

**Abstract**  
The lecture provides a science-based exploration of environmental aspects from three research fields: earth, climate, and health sciences.
This course introduces basic economic concepts and theories. Beginning with microeconomics, the course starts with the topics of supply and demand, households, firms, and market structures, and moves on to the key macroeconomic concepts of national accounts, the labor market, trade, and monetary policy.

**Objective**
The students are able to explain important properties of the three environmental systems, to discuss critical drivers, trends and conflicts of their use, and to compare potential solutions.

**Content**
The lecture discusses the role of the environmental systems based on selected environmental problems, among these the exploration of raw materials and fossil fuels, climate change and its impacts on man and environment, and the spread and control of infectious diseases in the human population and agricultural systems.

**Lecture notes**
Slides are provided by instructors and are accessible via moodle.

---

**World Food System**

**Abstract**
Die Grundlagen des Welternährungssystem werden anhand von Fallbeispielen aus der Forschung entlang der Wertschöpfungskette vermittelt.

**Objective**
Mit Besuch dieser Lehrveranstaltung soll Verständnis geschaffen werden, was ein Welternährungssystem ist, wo aktuell die grossen Herausforderungen liegen, was Elemente und Einflussfaktoren auf die Ernährungssicherheit sind, welche Wechselwirkungen zwischen diesen Elementen und Einflussfaktoren bestehen, und welche potentiellen Lösungsstrategien sich für spezifische Herausforderungen ableiten lassen.

**Content**

**Lecture notes**
Skripte und zusätzliches Lernmaterial werden auf Moodle verfügbar gemacht.

**Literature**
Information zu Büchern und anderer Literatur wird während der Lehrveranstaltung bekanntgegeben.

**Prerequisites / notice**

Das Fach ist Teil der Basisprüfung nach dem ersten Studienjahr.

---

**Economics**

**Abstract**
This course introduces basic economic concepts and theories. Beginning with microeconomics, the course starts with the topics of supply and demand, households, firms, and market structures, and moves on to the key macroeconomic concepts of national accounts, the labor market, trade, and monetary policy.

**Objective**
After successful completion of the course you will be able to:

- Describe the basic micro- and macroeconomic problems and theories.
- Introduce economic reasoning appropriately to a given topic.
- Evaluate economic measures.

**Content**
Households, firms, supply and demand: How are household preferences and consumption patterns formed? How does a household react to price changes? How are goods prices formed? At what prices are companies willing to offer goods? How do we make economic decisions?

Markets: What is "perfect competition" and how does a competitive market work? Are monopolies always a bad thing? How can the state influence the market?

Market failure: What happens when prices give wrong signals?

Labour market: How do supply and demand work in the labour market? What influences unemployment?

National accounts: How big is the Swiss economy?

Foreign trade: Why do countries trade with each other? What are the consequences for the domestic market?

Money and inflation: What exactly is money? How does money creation work and what happens when there is too much (or too little) money on the market?

Students will be asked to apply these concepts to issues in their own field of study and to current issues in society. This goal will be achieved through participation in exercises, class discussions and reading material from current media. By the end of the course, students should be able to apply economic analysis confidently and independently.

Abstract
Teaching of basic knowledge in microbiology with main focus on Microbial Cell Structure and Function, Molecular Genetics, Microbial Growth, Metabolic Diversity, Phylogeny and Taxonomy, Prokaryotic Diversity, Human-Microbe Interactions, Biotechnology.

Objective
Teaching of basic knowledge in microbiology.

Content

Lecture notes
Wird von den jeweiligen Dozenten ausgegeben.

Literature
Die Behandlung der Themen erfolgt auf der Basis des Lehrbuchs Brock, Biology of Microorganisms

Competencies
Subject-specific Competencies
Concepts and Theories
Techniques and Technologies

Analysis Competencies
Vermittlung von betriebswirtschaftlichen Grundlagenwissen und Analyse- und Planungsinstrumenten mit Anwendung auf Unternehmen der Agrar- und Ernährungswirtschaft.

Content
Definition of the pedosphere, soil functions, rocks as parent materials, minerals and weathering, soil organisms, soil organic matter, soil formation, principles of soil classification, global soil regions, physical soil properties and functions, chemical soil properties and functions, soil fertility, land use and soil degradation.

Lecture notes
Polybook

Literature

Prerequisites / notice
Prerequisites: Basic knowledge in chemistry, biology and geology.

701-1501-00L Introduction to Agricultural Management O 2 credits 2V R. Kretzschmar

Abstract
Introduction to the formation and properties of soils as a function of parent rock, landscape position, climate, and soil organisms. Complex relationships between soil forming processes, physical and chemical soil properties, soil biota, and ecological soil properties are explained and illustrated by numerous examples.

Objective
Understanding of soils as integral parts of ecosystems, development and distribution of soils as a function of environmental factors, and processes leading to soil degradation.

Content
The course "Pedosphäre" teaches and examines the competencies process understanding and systems understanding.

Literature
701-1501-00L Introduction to Agricultural Management O 2 credits 2V R. Kretzschmar

Abstract
Vermittlung von betriebswirtschaftlichen Grundlagenwissen und Analyse- und Planungsinstrumenten mit Anwendung auf Unternehmen der Agrar- und Ernährungswirtschaft.

Objective
Teilnehmer des Kurses sollen am Ende der Vorlesung i) grundlegende Unternehmensentscheide strukturieren und analysieren können, ii) verschiedene Analyse- und Planungsinstrumente auf Fragestellungen der Produktionsplanung, Investition und Finanzierung an Beispielen anwenden zu können, iii) verschiedene Werkzeuge zur unternehmerischen Entscheidungsunterstützung anwenden können und iv) die Spezifika von Unternehmen in der Agrar- und Ernährungswirtschaft kennen.

Content
Die Vorlesung geht auf folgende Inhalte, mit spezifischen Anwendungen im Agrar- und Ernährungssektors ein:

Comprehensives
Concepts and Theories
Techniques and Technologies

Analysis Competencies
Analytical Competencies
Problem-solving

Communication
Sensitivity to Diversity

Adaptability and Flexibility
Critical Thinking
Integrity and Work Ethics
Self-awareness and Self-reflection
Self-direction and Self-management

751-1311-00L Introduction to Nutritional Science O 2 credits 2V R. Finger

Abstract
This course introduces basic concepts of micro- and macronutrient nutrition. Micronutrients studied include fat-soluble and water-soluble vitamins, minerals and trace elements. Macronutrients include proteins, fat and carbohydrates.

Objective
To introduce the students to the both the macro- and the micronutrients.

Content
The course is devided into two parts: Macronutrients and macronutrients. The micronutrient part includes fat-soluble vitamins, water-soluble vitamins, minerals and trace elements. The macronutrient part introduces basic nutritional aspects of proteins, fats, carbohydrates and energy metabolism. The nutrients are described in relation to digestion, absorption and metabolism. Special aspects of homeostasis and homeoeosis are emphasized.

Lecture notes
There is no script. Powerpoint presentations will be made available.

**Abstract**

Important concepts from population, quantitative and molecular genetics are introduced and applied to plant and animal populations.

**Objective**

After the course, the students will be able to:

- work with genetic polymorphisms and explain mechanisms underlying allele frequency changes in natural and experimental populations;
- determine factors affecting the selection intensity
- explain the difference between genotypic and phenotypic values
- quantify the expected genetic gain per time unit
- explain important molecular methods to determine genetic polymorphisms;
- map traits in plant and animal populations using molecular marker information;
- integrate different concepts from population, molecular and quantitative genetics and explain their importance for applications in genetics in agricultural sciences.

**Content**

- Molecular genetics (15%)
  - DNA sequence variation
  - Marker & genotyping technologies (SSRs, AFLPs, SNPs, KASP, GBS, RADseq, AmpSeq, Chip Technologies)
- Population genetics (30%)
  - Allele- and genotype frequencies in populations
  - Hardy-Weinberg equilibrium
  - Genetic drift, differentiation of populations
  - Fitness, selection
  - Inbreeding, relationship, effective population size
- Quantitative genetics (40%)
  - Recombination, crossing over, linkage analysis, genetic mapping
  - QTL mapping
  - Forms of selection and selection differential
  - Heritability
  - Quantification of expected genetic gain
  - Genotypic value, allele substitution effect, breeding value
- Integrative genetics (15%)
  - Genome-wide association mapping
  - Estimation of genomic breeding values

**Lecture notes**

Slides and exercises will be provided in advance of each class via Moodle.

**Abstract**

This course is only for students enrolled in a Bachelor's degree programme.

Students enrolled in a Master's degree programme may attend "Principles of Microeconomics" (LE 363-0503-00L) instead.

**Objective**

Students acquire a deeper understanding of basic microeconomic models.

They acquire the ability to apply these models in the interpretation of real world economic contexts.

Students acquire a reflective and contextual knowledge on how societies use scarce resources to produce goods and services and distribute them among themselves.

751-0903-00L  Microeconomics of the Agriculture and Food Sector  W+ 3 credits  2V  L. Zachmann

Abstract
In dieser Vorlesung werden ökonomische Charakteristika des Agrar- und Lebensmittelsektors herausgearbeitet und anderen Sektoren gegenübergestellt. Fokus ist dabei Lebensmittelindustrie in der Schweiz und in der EU. Es werden mikroökonomische Zusammenhänge, insbesondere zur Preis- und Mengenbildung in verschiedenen Wettbewerbsmodellen, am Fallbeispiel des Agrar- und Ernährungssektors vermittelt.

Objective

Content
- Der Agrar- und Lebensmittelsektor in der EU und der Schweiz
- Preiselastizitäten von Angebot und Nachfrage im Ernährungssektor
- Gewinnmaximierung
- Grundlagen der Spieltheorie
- Monopol / Monopolistischer Wettbewerb
- Oligopol (Stackelberg, Cournot, Bertrand)
- Monopson
- Produktdifferenzierung
- Preisdiskriminierung
- Kartelle
- Pindyck und Rubinfeld, Mikroökonomie, 7. Aufl., Pearson Studium.

Literature

Prerequisites / notice
Empfohlene Vorkenntnisse:
- Grundkenntnisse der Ökonomie/Agrarökonomie
- Vorlesung Einführung in die Mikroökonomie

751-0401-00L  Optimization of Agricultural Production Systems  W+ 3 credits  2G  R. Huber

Abstract
Introduction in to optimization of agricultural production systems with linear and non-linear programming models.

Objective
Students will be able to a) solve linear and non-linear optimization problems in the context of agricultural production; b) properly interpret the results; and c) critically discuss the economic implications.

Content
The course is an application of Operations Research (OR). First, the theory and application of linear programming (LP) is presented. Students will learn the underlying principles (Optimization, Duality, Simpex) and solve exercises in the context of agricultural production. In the second part of the course, the foundation of non-linear programming (NLP) is introduced (Lagrange, Kuhn-Tucker) and illustrated with various examples.

751-0301-00L  Resource and Environmental Economics  W+ 3 credits  2G  A. Miftakhova, A. Minabutdinov

Abstract
Relationship between economy and environment, market failures, external effects and public goods, contingent valuation, internalisation of externalities, economics of non-renewable resources, economics of renewable resources, environmental cost-benefit analysis, sustainability economics, and international resource and environmental problems.
A successful completion of the course will enable a thorough understanding of the basic questions and methods of resource and environmental economics and the ability to solve typical problems using appropriate tools consisting of concise verbal explanations, diagrams or mathematical expressions. Concrete goals are first of all the acquisition of knowledge about the main questions of resource and environmental economics and about the foundation of the theory with different normative concepts in terms of efficiency and fairness. Secondly, students should be able to deal with environmental externalities and internalisation through appropriate policies or private negotiations, including knowledge of the available policy instruments and their relative strengths and weaknesses. Thirdly, the course will allow for in-depth economic analysis of renewable and non-renewable resources, including the role of stock constraints, regeneration functions, market power, property rights and the impact of technology. A fourth objective is to successfully use the well-known tool of cost-benefit analysis for environmental policy problems, which requires knowledge of the benefits of an improved natural environment. The last two objectives of the course are the acquisition of sufficient knowledge about the economics of sustainability and the application of environmental economics theory and policy at international level, e.g. to the problem of climate change.

The course covers all the interactions between the economy and the natural environment. It introduces and explains basic welfare concepts and market failure; external effects, public goods, and environmental policy; the measurement of externalities and contingent valuation; the economics of non-renewable resources, renewable resources, cost-benefit analysis, sustainability concepts; international aspects of resource and environmental problems; selected examples and case studies. After a general introduction to resource and environmental economics, highlighting its importance and the main issues, the course explains the normative basis, utilitarianism, and fairness according to different principles. Pollution externalities are a deep core topic of the lecture. We explain the governmental internalisation of externalities as well as the private internalisation of externalities (Coase theorem). Furthermore, the issues of free rider problems and public goods, efficient levels of pollution, tax vs. permits, and command and control instruments add to a thorough analysis of environmental policy. Turning to resource supply, the lecture first looks at empirical data on non-renewable natural resources and then develops the optimal price development (Hotelling-rule). It deals with the effects of explorations, new technologies, and market power. When treating the renewable resources, we look at biological growth functions, optimal harvesting of renewable resources, and the overuse of open-access resources. A next topic is cost-benefit analysis with the environment, requiring measuring environmental benefits and measuring costs. In the chapter on sustainability, the course covers concepts of sustainability, conflicts with optimality, and indicators of sustainability. In a final chapter, we consider international environmental problems and in particular climate change and climate policy.

**Course Details**

**Objective**

- After attending the class, you should be able to:
  - understand the accounting system, the reporting process, and be able to prepare financial statements
  - feel comfortable reading and using the information presented in companies’ annual reports
  - understand cost concepts and conduct cost analyses
  - become familiar with several classic decisions using managerial accounting information
  - comment on the current events related to these topics

**Content**

- Accounting plays a critical role in the effective functioning of the financial market as well as the long-term success of a company. This course intends to provide an introduction to accounting for those who wish to pursue a career in business, and need the skills and knowledge to understand, analyze, and interpret accounting information to make informed decisions. The course is divided into two parts. In the first part, we focus on financial reporting and start with the basic accounting concepts and the accounting cycle, to learn how the financial system is set up in a company and how financial statements are prepared. We then delve deeper into each major account, and discuss how revenues and expenses are recognized, and how assets, liabilities, and equities are reported. In the second part, we focus on managerial accounting for internal managerial/operational decisions including fundamental topics such as cost behavior, cost estimation, CVP analyses, and relevant costing. We then cover budgeting and standard costing, which are important parts of accounting system in companies.

</table>

**Objective**

- The general theme of this course is the effect of environmental factors (such as light, temperature, relative humidity, CO2 concentrations, etc.) on plant physiology: water uptake and transport, transpiration, CO2 gas exchange of plants (photosynthesis, respiration), growth and C allocation, yield and production, stress physiology. Working with measurement data and Jupyter Notebooks is included.

**Abstract**

- The students will understand the impact of environmental factors on plant physiology and will learn the theoretical basis and terminology of plant ecophysiology that is necessary to analyze yield potentials in agriculture. The students will learn about classical and latest studies in plant ecophysiology. Students will check and implement their knowledge and understanding of ecophysiology using measurement data.
## Plant Nutrition I

<table>

<tr>
<td><strong>Abstract</strong></td>
<td>The aim of these lecture is to present the processes controlling the uptake and transport of nutrients by the plant, the assimilation of nutrients in the plant, the effect of nutrients on crop yield and quality, the role of the soil as a source of nutrients for crops, and the basic principles of fertilization of different crop types using mineral and organic fertilizers.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Objective</strong></td>
<td>At the end of the lecture, students know how mineral nutrients are taken up through roots and circulate in the plants and what their roles in plants are. They understand the importance of nutrients for yield formation and for crop product quality. They are able to propose fertilization plans adapted for field crops growing under Swiss conditions.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Content</strong></td>
<td>A general introduction explains the needs of appropriately managing nutrients in plant production. Afterwards, we will study the physiology of plant nutrition (nutrient uptake by roots; nutrient transports in the plant; physiological roles of nutrients in the plant). Then the role of nutrients for yield formation and their effects on crop quality is dealt with. Finally, the bases of crop fertilization are taught (availability of nutrient in soil; N, P and K fertilization; different types of fertilizers).</td>

751-4504-00L  Plant Pathology I  W+  2 credits  2G  B. McDonald

Abstract

Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems.

Objective

Students will understand: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems as a basis for implementing disease management strategies in agroecosystems.

Content

Course description: Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies.

Lecture Topics and Tentative Schedule

Week 1  The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrotrophs, disease cycles and pathogen life cycles.

Week 2  Nematode attack strategies and types of damage. Viral pathogens, classification, reproduction and transmission, attack strategies and types of damage. Examples TMV, BYDV. Bacterial pathogens and phytoplasmas, classification, reproduction and transmission.

Week 3  Bacterial attack strategies and symptoms. Example bacterial diseases: fire blight, Agrobacterium crown gall, soft rots. Fungal and oomycete pathogens, classification, growth and reproduction, sexual and asexual spores, transmission.

Week 4  Fungal and oomycete life cycles, disease cycles, infection processes, colonization, phytotoxins and mycotoxins. Attack strategies of fungal necrotrophs and biotrophs. Symptoms and signs of fungal infection. Example fungal diseases: potato late blight.

Week 5  Example fungal diseases: wheat stem rust, grape powdery mildew, wheat septoria tritici blotch. Plant defense mechanisms, host range and non-host resistance. Passive structural and chemical defenses, preformed chemical defenses. Active structural defense, histological and cellular (papillae).

Week 6  Active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytoalexins and disease resistance. Pisatin and pisatin demethylase. Local and systemic acquired resistance (LAR, SAR), induced systemic resistance (ISR), signal molecules, defense activators (Bion). Pathogen effects on food quality. Positive and negative transformations.

Week 8  Epidemiology: Disease pyramid, environmental effects on epidemic development, plant effects on development of epidemics, including resistance, physiology, density, uniformity.

Week 9  Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity. Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies, ELISA.

Week 10  Molecular detection and diagnosis of pathogens: PCR, rDNA and loop-mediated isothermal amplification. Strategies for minimizing disease risks: calculating disease thresholds, disease forecasting systems.

Week 12  Physical control methods. Cultural control methods: avoidance, tillage practices, crop sanitation.

Week 13  Cultural control methods: fertilizers, crop rotations.

Week 14  Open lecture.

Lecture notes  Detailed lecture notes (~160 pages) will be available for purchase at the cost of reproduction at the start of the semester.

751-5003-00L  Sustainable Agroecosystems II  W+  2 credits  2V  K. Benabderrazik, J. Six

Data: 02.07.2024 12:39  Autumn Semester 2024  Page 11 of 2667
Abstract
This class conveys current topics and methods of agroecological and food systems research through selected case studies from ongoing research of the Sustainable Agroecosystems group. Students will be encouraged to develop critical thinking competencies, through individual and group work, on major agricultural and food system challenges and paths towards agricultural and food system transformation.

Objective
(1) Systematically analyse and discuss case studies from ongoing agroecological and food system research.
(2) Learn and experiment on methods for field and laboratory investigations in agroecology.
(3) Engage with positive and empowering frameworks that motivate critical reflection and action on the types of transformative responses needed to adapt and thrive within agricultural and food systems.
(4) Reflect critically on agricultural and food system transformation tools and methods from the perspective a food system stakeholder.
(5) Identify and describe institutions in the context of sustainable agricultural development (for Bachelor and Master thesis and internships).

Content
The course will address a wide range of agricultural and food system challenges (e.g. food security, climate crisis, soil degradation, etc.) in both temperate and tropical contexts. In class we will address topics like building food system resilience through innovative measures, improving soil fertility management or understanding the effects of agroforestry systems.

Case studies from the on-going research in the Sustainable Agroecosystems Group (sae.ethz.ch) will be presented, covering different scales (e.g. food value-chains, farm dynamics and soil management).

The class is complemented by practical group work conducted with the CSA Meh Als Gmuens in Zürich on Measuring and monitoring Agroecological performance.

Students will gain an overview on institutions and actors’ roles in the field of sustainable agricultural development. Throughout the group work, students will learn to engage directly with various stakeholders, monitor agroecological transition and communicate their research to a wider audience. Ultimately, this class should provide an overview on methods, tools, innovations and platforms that support a sustainable food transformation.

751-4201-00L Horticulture W+ 2 credits 2V C. Carlen, A. Bühlmann, A. Náf, T. Schönberg, T. Verdenal

Abstract
The importance and specificities of the different horticultural crops are shown in this course in the autumn semester. It deals with fruit growing (8 h), berry production (4 h), vegetables (6 h) and viticulture (6 h).

Objective
You are able to describe the production systems of the horticultural crops: fruits, berries, vegetables and viticulture (yield formation and physiology, cultivation methods, main varieties, quality factors).

You are able to assess the importance of new conditions (climate, politics, trade) for the production of horticultural crops and identify options for action for production.

Content
The importance and specificities of the different horticultural crops are shown in this course in the autumn semester. It deals with fruit growing (8 h), berry production (4 h), vegetable growing (6 h) and viticulture (6 h).

Under the responsibility of Agroscope representatives, basic knowledge of production systems (yield formation and physiology, cultivation methods, main varieties, quality) of these horticultural crops, which are important in Switzerland, is imparted.

Case studies from the ongoing research in the Sustainable Agroecosystems Group (sae.ethz.ch) will be presented, covering different scales (e.g. food value-chains, farm dynamics and soil management).

Lecture notes
Delivered during the lectures by the different teachers, Moodle upload.

Literature
Not needed, maybe specific literature is specified by the different teachers.

Language and script: German or French, maybe selected parts in English.

Abstract
Imparts a basic understanding of physiology an anatomy in man and domestic animals, focusing on the interrelations between morphology and function of the organism, in particular of domestic animals. This is fostered by discussing all subjects from a functional point of view. The lecture consists of two consecutive parts.

Objective
The overall goal of this course is to enable students to understand basic functions of the vertebrate organism and to comprehend pathophysiological correlations.

Lecture notes
Handouts are provided by each lecturer separately.

Literature
The lecturers will recommend additional literature at the beginning of the course.
Prerequisites / notice

This lecture is part of the BSc programme in Agricultural Sciences (3rd semester)

751-7501-00L

Introduction to Housing and Behaviour of Farm Animals

Abstract
The overall goal of this course is to provide general knowledge about the behaviour, housing and welfare of domestic animals.

Objective
- Understand the basis of animal behaviour of farm animals
- Acquire knowledge of housing systems and management of domestic animals

Content
1- Introduction to housing
2- Introduction to animal behaviour
3- Housing and behaviour of pigs
4- Housing and behaviour of cattle
5- Housing and behaviour of small ruminants
6- Housing and behaviour of chickens

751-7101-00L

Applied Animal Nutrition

Abstract
The basics of planning of feeding and formulation of diets incl. the implications on nutrient cycles and balances are taught. In the part dealing with ruminants, forage-based diets and the application of feed formulation programs are central and exercised on-farm. With pigs and poultry, the basics of energy and nutrient requirements are deepened through practical examples.

Objective
- Students are able, based on the knowledge they obtain in this course, to deal with problems in the nutrition of ruminants, pigs and poultry on farm.

Content
- Programmtitel Wiederkäufer: Einführung in die Winterfütterungsplanung für Milchkühe, Betriebsbesuch (Erfassung aller notwendigen Daten inkl. Futterprobenentnahme für eine konkrete Planung auf einem Praxisbetrieb), Besonderheiten der Milchviehfütterung (Laktationsverlauf, Jahreszeit, etc.); Einführung in den LBL-Fütterungsplan, Möglichkeiten der Futterbeurteilung und -bewertung mit praktischer Beurteilung der gesammelten Proben, Berechnungen und Besprechung Fütterungsplan, Aufstellung der Mineralstoffbilanz, Vorführung von PC-Software zur Fütterungsplanung Vorstellen und diskutieren des Fütterungsplanes auf dem Praxisbetrieb durch die Gruppe.
- Programmtitel Nicht-Wiederkäufer: Der Energie- und spezifische Nährstoffbedarf beim Schwein und Geflügel; Besonderheiten der Nährstoffbedarfe von Schwein und Geflügel; Besonderheiten der Fütterung in den verschiedenen Produktionsphasen; Fütterungsempfehlungen und -hinweise. Rationengestaltung und -optimierung für Mischfuttermittel anhand verschiedener Beispiele; Einsatzgrenzen von Futtermittel; technologische Futterbearbeitung.

751-7103-00L

Animal Feed and Feeding of Ruminants

Abstract
The knowledge of the nutrition of ruminants and of the feeds used is deepened. Particular emphasis is put on the variety of home-grown feeds, their production and conservation and their application in the nutrition of dairy cows, cattle and small ruminants. Finally, information on specific problems of animal nutrition is communicated.
Objective
Purchase of basic skills in agricultural livestock nutrition.

Content

Lecture notes
Script is available in German language and will be provided by each lecturer when starting his part the lecture.

Literature
Eine Literaturliste ist im Skript enthalten.

Prerequisites / notice
Fach mit benoteter Prüfung am Ende der Lehrveranstaltung.

751-6121-00L Regulatory Physiology W+ 2 credits 2V S. E. Ulbrich, A. -K. Hankele, M. Saenz de Juano Ribes

Abstract
Zusammen mit nervaler Kontrolle, spielen Hormone und Zytokine als Signalmediatoren eine besondere Rolle bei der Regulation der Homöostase von Körperfunktionen (Flüssigkeits-, Temperatur-, Energie-Homöostase). Insbesondere im Zusammenhang mit pathologischen Konstellationen (Fieber, Stress, metabolische Imbalance, Schmerz) wird diese komplexe Funktion verständlich.

Objective

Content
- Thermoregulation (Fieber)
- Flüssigkeitshomöostase (Durchfall)
- Calciumregulation (Milchfieber)
- Energiehomöostase (Ketose)
- Schmerz (zootechnische Eingriffe)
- Stress (allostatische Last, Epigenetik)

Lecture notes
Unterlagen werden individuell von den Dozierenden abgegeben.

Literature
Spezifische Literatur wird individuell von den Dozierenden angegeben.

Abstract
Students will get an introduction to the scientific work with data covering all steps from data import from Excel via statistical analyses to producing correct scientific graphical output. Exercises with the software R/RStudio will provide hands-on opportunities to get acquainted with data analysis and presentation in adequate graphs.

Objective
This lecture with exercises gives an introduction to the scientific work with data, starting with data acquisition and ending with statistical analyses as they are often required for a bachelor thesis (descriptive statistics, linear regression, simple analyses of variance etc.). Using open-source R/RStudio software will be the primary focus via a hands-on approach. An important aspect will be to learn which graphical representation of data are best suited for the task (how can data be presented clearly and still scientifically correct?)
Content
Tentative Programme:
- Introduction
- Introduction to 'R'
- Data import and graphical presentation
- Correct and problematic graphical data displays
- Statistical distribution and confidence intervals
- Statistical tests - Repetition and hands-on applications
- Correlation analysis
- Linear regressions
- Analysis of Variance

Lecture notes
German and English

Prerequisites / notice
Theoretical background in ensemble statistics from the mandatory course in the 4th semester; students should have cleared the examination of that fundamental course to be able to follow

Competencies

Subject-specific Competencies
Concepts and Theories
Techniques and Technologies

Method-specific Competencies
Analytical Competencies
Decision-making
Media and Digital Technologies
Problem-solving
Project Management

Personal Competencies
Creative Thinking
Critical Thinking
Integrity and Work Ethics

751-1010-00L
Introduction to Scientific Methods Part II: Scientific Writing
O 3 credits 4G

Abstract
Die Studierenden kennen die Grundlagen und die Konventionen des wissenschaftlichen Schreibens in den Naturwissenschaften, können wissenschaftliche Literatur suchen und verwalten sowie wissenschaftliche Publikationen analysieren. Sie setzen das Gelernte beim Schreiben eines eigenen Textes um.

Objective
Die Studierenden kennen die Grundlagen und die Konventionen des wissenschaftlichen Schreibens in den Naturwissenschaften. Sie setzen das Gelernte beim Schreiben eines kritischen Literaturberichtes zu einem agrarwissenschaftlichen Thema ihrer Wahl um. Die Lehrveranstaltung bereitet die Studierenden auf weitere schriftliche Arbeiten im Studium der Agrarwissenschaften vor, beispielsweise auf die Bachelor-Arbeit.

751-0206-00L
Applied Laboratory Techniques in Agricultural Sciences
The course is compulsory for students in 5th semester BSc Agricultural Sciences.
O 3 credits 3P

Abstract
Die Lehrveranstaltung ist zweiteilig aus einem Laborpraktikum und einem angewandten Methodentraining aufgebaut. Im Laborpraktikum werden an 6 Kurstagen die wichtigsten Techniken der Molekularbiologie gelehrt. Das folgende Methodentraining findet an 5 Kurstagen im Block in einer der beteiligten Forschungsgruppen statt, um die wichtigsten Methoden aus dem jeweiligen Fachgebiet praxisnah anzuwenden.

Objective
- Aneignung von guter Laborpraxis (Sicherheit, Effizienz, Qualität und Dokumentation)
- Erlernen der wichtigsten Labor- und Feldmethoden in den Agrarwissenschaften sowie deren korrekte und sichere Anwendung
- Vertieftes Verständnis von molekularen, physiologischen und biochemischen Prozessen in aktuellen agrarwissenschaftlichen Themenbereichen
- Aneignung von Kompetenzen für zukünftige Bachelor-, Master-, und Doktorarbeiten
- Kritische Beurteilung der angewandten Methoden für verantwortungsvolle Forschung
The electives listed are recommended. However, electives can be chosen from the complete course offer of the ETH Zurich and University of Zurich.

<td>2G</td>
<td>A. Miftakhova, A. Minabutdinov</td>
</tr>
<tr>
<td>Abstract</td>
<td>Relationship between economy and environment, market failures, external effects and public goods, contingent valuation, internalisation of externalities, economics of non-renewable resources, economics of renewable resources, environmental cost-benefit analysis, sustainability economics, and international resource and environmental problems. A successful completion of the course will enable a thorough understanding of the basic questions and methods of resource and environmental economics and the ability to solve typical problems using appropriate tools consisting of concise verbal explanations, diagrams or mathematical expressions. Concrete goals are first of all the acquisition of knowledge about the main questions of resource and environmental economics and about the foundation of the theory with different normative concepts in terms of efficiency and fairness. Secondly, students should be able to deal with environmental externalities and internalisation through appropriate policies or private negotiations, including knowledge of the available policy instruments and their relative strengths and weaknesses. Thirdly, the course will allow for in-depth economic analysis of renewable and non-renewable resources, including the role of stock constraints, regeneration functions, market power, property rights and the impact of technology. A fourth objective is to successfully use the well-known tool of cost-benefit analysis for environmental policy problems, which requires knowledge of the benefits of an improved natural environment. The last two objectives of the course are the acquisition of sufficient knowledge about the economics of sustainability and the application of environmental economic theory and policy at international level, e.g. to the problem of climate change.</td>

Content

The course covers all the interactions between the economy and the natural environment. It introduces and explains basic welfare concepts and market failure; external effects, public goods, and environmental policy; the measurement of externalities and contingent valuation; the economics of non-renewable resources, renewable resources, cost-benefit-analysis, sustainability concepts; international aspects of resource and environmental problems; selected examples and case studies. After a general introduction to resource and environmental economics, highlighting its importance and the main issues, the course explains the normative basis, utilitarianism, and fairness according to different principles. Pollution externalities are a deep core topic of the lecture. We explain the governmental internalisation of externalities as well as the private internalisation of externalities (Coase theorem). Furthermore, the issues of free rider problems and public goods, efficient levels of pollution, tax vs. permits, and command and control instruments add to a thorough analysis of environmental policy. Turning to resource supply, the lecture first looks at empirical data on non-renewable natural resources and then develops the optimal price development (Hotelling-rule). It deals with the effects of explorations, new technologies, and market power.

When treating the renewable resources, we look at biological growth functions, optimal harvesting of renewable resources, and the overuse of open-access resources. A next topic is cost-benefit analysis with the environment, requiring measuring environmental benefits and measuring costs. In the chapter on sustainability, the course covers concepts of sustainability, conflicts with optimality, and indicators of sustainability. In a final chapter, we consider international environmental problems and in particular climate change and climate policy.

Abstract

Introduction in consumer research. The following aspects will be emphasized in the course: Consumer decision making, individual determinants of consumer behavior, environmental influences on consumer behavior, influencing consumer behavior.

Objective

Students will be able to:
- explain the decision-making processes underlying the purchasing process
- describe the factors that have an influence on consumer behavior
- develop strategies to influence purchasing behavior

Competencies

Subject-specific Competencies
- Concepts and Theories
- Analytical Competencies

Method-specific Competencies
- Decision-making

Social Competencies
- Cooperation and Teamwork
- Customer Orientation
- Sensitivity to Diversity

Personal Competencies
- Critical Thinking

Abstract

Agriculture needs to become more sustainable via innovative approaches. This course allows students to explore in group work, how this could be realized. There are short impulse talks on ‘Smart Farming’ given by experts on technology, sustainability and entrepreneurship. Most importantly, students elaborate the first steps to create a startup company in this field.

Objective

During the course, the students generate their own ideas. They explore e.g., which technologies provide possibilities for a more sustainable agriculture. They simulate the creation of a startup company in a team.

Prerequisites / notice

All students interested should come to the first lecture (25th September). There, details of this year’s format will be explained. If case students are then still interested to visit the class, they have to write a motivational letter of max. 100 words and send it via email to Achim.Walter@usys.ethz.ch until (27.9.). Participants will be selected according to the following criteria:
1.) Convincing motivational letter
2 a) Agricultural science students of the BSc program, 5. Semester
2 b) Students of other semesters or study programs, who will be selected with a view to forming four interdisciplinary and diverse teams. The definitive acceptance to the course will be communicated to students by (27.9.). The definitive inscription will subsequently been done by the study secretariate.

Number of participants limited to 16.
Course description: Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies.

Lecture Topics and Tentative Schedule

**Week 1**
The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrotrophs, disease cycles and pathogen life cycles.

**Week 2**
Nematode attack strategies and types of damage. Viral pathogens, classification, reproduction and transmission, attack strategies and types of damage. Examples TMV, BYDV. Bacterial pathogens and phytoplasmas, classification, reproduction and transmission.

**Week 3**
Bacterial attack strategies and symptoms. Example bacterial diseases: fire blight, Agrobacterium crown gall, soft rots. Fungal and oomycete pathogens, classification, growth and reproduction, sexual and asexual spores, transmission.

**Week 4**
Fungal and oomycete life cycles, disease cycles, infection processes, colonization, phytopoxins and mycotoxins. Attack strategies of fungal necrotrophs and biotrophs. Symptoms and signs of fungal infection. Example fungal diseases: potato late blight.

**Week 5**
Example fungal diseases: wheat stem rust, grape powdery mildew, wheat septoria tritici blotch. Plant defense mechanisms, host range and non-host resistance. Passive structural and chemical defenses, preformed chemical defenses. Active structural defense, histological and cellular (papillae).

**Week 6**
Active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytoalexins and disease resistance. Pisatin and pisatin demethylase. Local and systemic acquired resistance (LAR, SAR), induced systemic resistance (ISR), signal molecules, defense activators (Bion). Pathogen effects on food quality. Positive and negative transformations.

**Week 7**

**Week 8**
Epidemiology: Disease pyramid, environmental effects on epidemic development, plant effects on development of epidemics, including resistance, physiology, density, uniformity.

**Week 9**
Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity. Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies, ELISA.

**Week 10**
Molecular detection and diagnosis of pathogens: PCR, rDNA and loop-mediated isothermal amplification. Strategies for minimizing disease risks: calculating disease thresholds, disease forecasting systems.

**Week 11**

**Week 12**

**Week 13**
Cultural control methods: fertilizers, crop rotations.

**Week 14**
Open lecture.

Lecture notes

Detailed lecture notes (~160 pages) will be available for purchase at the cost of reproduction at the start of the semester.
Abstract
This class conveys current topics and methods of agroecological and food systems research through selected case studies from ongoing research of the Sustainable Agroecosystems group. Students will be encouraged to develop critical thinking competencies, through individual and group work, on major agricultural and food system challenges and paths towards agricultural and food system transformation.

Objective
(1) Systematically analyse and discuss case studies from ongoing agroecological and food system research.
(2) Learn and experiment on methods for field and laboratory investigations in agroecology.
(3) Engage with positive and empowering frameworks that motivate critical reflection and action on the types of transformative responses needed to adapt and thrive within agricultural and food systems.
(4) Reflect critically on agricultural and food system transformation tools and methods from the perspective a food system stakeholder.
(5) Identify and describe institutions in the context of sustainable agricultural development (for Bachelor and Master thesis and internships).

Content
The course will address a wide range of agricultural and food system challenges (e.g. food security, climate crisis, soil degradation, etc.) in both temperate and tropical contexts. In class we will address topics like building food system resilience through innovative measures, improving soil fertility management or understanding the effects of agroforestry systems. Case studies from the on-going research in the Sustainable Agroecosystems Group (sa.e.ethz.ch) will be presented, covering different scales (e.g. food value-chains, farm dynamics and soil management).

The class is complemented by practical group work conducted with the CSA Meh Alis Grandma in Zürich on Measuring and monitoring Agroecological performance.

Students will gain an overview on institutions and actors' roles in the field of sustainable agricultural development. Throughout the group work, students will learn to engage directly with various stakeholders, monitor agroecological transition and communicate their research to a wider audience. Ultimately, this class should provide an overview on methods, tools, innovations and platforms that support a sustainable food transformation.

Literature

Prerequisites / notice
Prior participation in the lecture Nachhaltige Agrärökosysteme I (Sustainable Agroecosystems I) 751-5000-00G (spring term) recommended.

Abstract
The basics of planning of feeding and formulation of diets incl. the implications on nutrient cycles and balances are taught. In the part dealing with ruminants, forage-based diets and the application of feed formulation programs are central and exercised on-farm. With pigs and poultry, the basics of energy and nutrient requirements are deepened through practical examples.

Objective
The students are able, based on the knowledge they obtain in this course, to deal with problems in the nutrition of ruminants, pigs and poultry on farm.

Content
- Programmteil Wiederkäuer: Einführung in die Winterfütterungsplanung für Milchkühe, Betriebsbesuch (Erfassung aller notwendigen Daten inkl. Futterprobenentnahme für eine konkrete Planung auf einem Praxisbetrieb), Besonderheiten der Milchviehfütterung (Laktationsverlauf, Jahreszeit, etc.); Einführung in den LBL-Fütterungsplan, Möglichkeiten der Futterbeurteilung und -bewertung mit praktischer Beurteilung der gesammelten Proben, Berechnungen und Besprechung des Fütterungsplanes.
- Programmteil Nicht-Wiederkäuer: Der Energie- und spezifische Nährstoffbedarf beim Schwein und Geflügel; Besonderheiten der Fütterung in den verschiedenen Produktionsphasen; Fütterungsempfehlungen und -hinweise. Rationengestaltung und Rezeptoptimierung für Mischfuttermittel anhand verschiedener Beispiele; Einsatzzgrenzen von Futtermittel; technologische Futterbearbeitung.

Lecture notes
Handouts in German language will be provided by each lecturer on the Moodle platform when starting his part of the lecture.

Animal Feed and Feeding of Ruminants W 2 credits 2V M. A. Boessinger, M. Rombach

Abstract
The knowledge of the nutrition of ruminants and of the feeds used is deepened. Particular emphasis is put on the variety of home-grown feeds, their production and conservation and their application in the nutrition of dairy cows, cattle and small ruminants. Finally, information on specific problems of animal nutrition is communicated.

Objective
Purchase of basic skills in agricultural livestock nutrition.

Content

Lecture notes
Script is available in German language and will be provided by each lecturer when starting his part the lecture.

Literature
Eine Literaturliste ist im Skript enthalten.

Prerequisites / notice
Fach mit benoteter Prüfung am Ende der Lehrveranstaltung.
Agroecology is a discipline, an agricultural practice, and a political-social movement. Students will attend public lectures by experts from different fields and will reflect on agroecology and its principles. Moreover, students will expand their knowledge with case studies and discuss about the role of agroecology to support sustainable agriculture and food systems.

Students are part of small groups focusing on selected principles of the HLPE. During the course, students discuss the potential and limitations of agroecology and learn about scientific contributions to agroecology. Students form an opinion on the role of agroecology, reflect and argue on the different facets and develop recommendations for real-world applications of agroecology in supporting a transition towards sustainable food systems.

The course is designed as a combination of public lectures/webinars on “Agroecology and the Transformation to Sustainable Food Systems” delivered by national and international experts and scientists as well as sessions in which students reflect on the topics addressed in the lecture series in a group work format. The public lectures bring different perspectives to the discussion and are intended as inputs for the students’ sessions. In the student sessions, the student groups deepen their knowledge of the 13 principles of agroecology proposed by the High-Level Panel of Experts (HLPE) of the Committee on World Food Security. They identify “unknowns” and link to other closely related principles. The groups also work out the perspective of a chosen stakeholder. Finally, the groups will take part in a scientific discussion representing their stakeholder perspective. All groups will synthesize their discussions in a short report.

Handouts will be available on the webpage of the course.
Literature

Report of HLPE on agroecology:

Prerequisites / notice

This course is based on fundamental knowledge about plant ecophysiology, soil science, biogeochemistry, crop and forage science, and ecology in general. The course will be taught in English. The course is only offered in fall.

European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
In this class, students will learn concepts and skills for coping with psychosocial demands of teaching. The focus will be on the book "Intelligenz: Grosse Unterschiede und ihre Folgen" by Stern and Neubauer. Participation at the first meeting is mandatory.

Abstract
This course looks into scientific theories and also empirical studies on human learning and relates them to the school.

Objective
Anyone wishing to be a successful teacher must first of all understand the learning process. Against this background, theories and findings on the way humans process information and on human behaviour are prepared in such a manner that they can be used for planning and conducting lessons. Students additionally gain an understanding of what is going on in learning and behavioural research so that teachers are put in a position where they can further educate themselves in the field of research into teaching and learning.

Content
Thematic Schwerpunkte:
- Lernen als Verhaltensänderung und als Informationsverarbeitung: Das menschliche Gedächtnis unter besonderer Berücksichtigung der Verarbeitung symbolischer Information; Lernen als Wissenskonstruktion und Kompetenzerwerb unter besonderer Berücksichtigung des Wissenstransfers; Lernen durch Instruktion und Erklärungen; Die Rolle von Emotion und Motivation beim Lernen; Interindividuelle Unterschiede in der Lernfähigkeit und ihre Ursachen; Intelligenztheorien, Geschlechtsunterschiede beim Lernen

Lernformen:
- Get information about recent literature on learning and instruction
- Understanding findings relevant for education
- Getting to know intelligence tests
- Understanding findings relevant for education

Prerequisites / notice
This lecture is only apt for students who intend to enrol in the programs "Lehrdiplom" or "Didaktisches Zertifikat". It is about learning in childhood and adolescence.

Abstract
This seminar focuses on teaching units in chemistry, physics and mathematics that have been developed at the MINT Learning Center of the ETH Zurich. In the first meeting, the mission of the MINT Learning Center will be communicated. Furthermore, in groups of two, the students will intensively work on, refine and optimize a teaching unit following a goal set in advance.

Objective
- Get to know cognitively activating instructions in MINT subjects
- Get information about recent literature on learning and instruction

Prerequisites / notice
Für eine reibungslose Semesterplanung wird um frühe Anmeldung und persönliches Erscheinen zum ersten Lehrveranstaltungstermin ersucht.

Abstract
This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)".

Objective
- Get to know cognitively activating instructions in MINT subjects
- Get information about recent literature on learning and instruction

Prerequisites / notice
This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)".

Abstract
The successful participation in EW1 ("Human Learning") and EW2 ("Designing Learning Environments for School") is recommended, but not a mandatory prerequisite.

Objective
- Understanding of research methods used in the empirical human sciences
- Getting to know intelligence tests
- Understanding findings relevant for education

Prerequisites / notice
This lecture is only apt for students who intend to enrol in the programs "Teaching Diploma*" or "Didaktisches Zertifikat*. It is about learning in childhood and adolescence.

Abstract
This course aims to inform students on the way humans process information and on human behaviour are prepared in such a manner that they can be used for planning and conducting lessons. Students additionally gain an understanding of what is going on in learning and behavioural research so that teachers are put in a position where they can further educate themselves in the field of research into teaching and learning.

Students apply the insights, abilities and skills they have acquired within the context of an educational institution. They observe 10 lessons and teach 20 lessons independently. Two of them are as assessed as Examination Lessons.

Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.

- Students are able to assess the significance of tuition topics for their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They learn the skills of the teaching trade.
- They learn to assess pupils' work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

The teaching internship can just be visited if all other courses of TC are completed.

Repetition of the teaching internship is excluded even if the examination lessons are to be repeated.

In the mentored work on their subject specialisation, students link high-school and university aspects of the subject, thus strengthening their teaching competence with regard to curriculum decisions and the future development of the tuition. They compile texts under supervision that are directly comprehensible to the targeted readers - generally specialist-subject teachers at high-school level.
Objective
The aim is for the students
- to familiarise themselves with a new topic by obtaining material and studying the sources, so that they can selectively extend their specialist competence in this way.
- to independently develop a text on the topic, with special focus on its mathematical comprehensibility in respect of the level of knowledge of the targeted readership.
- To try out different options for specialist further training in their profession.

**Abstract**
The course provides the scientific basis of the central aspects of reproduction and nutrition physiology of ruminants, and of the implications for animal health, product quality, and breeding programs. Means of knowledge transfer include interdisciplinary approaches, disciplinary parts, web-based learning and self-study.

**Objective**
At the end of the course the students are able to apply, by a comprehensive understanding of the underlying mechanisms, their knowledge in various fields of ruminant science. They will be able to develop and recommend best strategies for breeding programs, feed formulation, improving forage quality, and increasing animal health. They will be trained to carry out interdisciplinary and disciplinary research at the highest level.

**Content**
Fields (contact hours)
- Introduction: 2 h
- Special topics: 20 h
  - Rumen Anatomy
  - Hohenheim Gas Test
  - Calf health
  - Reproduction Techniques
  - Fertility in Cows
- Disciplinary topics: 32 h
  - Ruminal Digestion: 8 h
  - Ruminant Nutrition Physiology: 12 h
  - Reproduction in Ruminants: 8 h
- Lectures held by the students: 4 h

In summary
- Contact hours: 58 h
- Self-study within semester: 30 h (especially preparation for the interdisciplinary courses and the own lecture)
- Self-study in semester break: 32 h
Total: 120 h

**751-6001-00L**
Forum: Livestock in the World Food System

**Abstract**
This forum is a platform for the critical reflection of relevant topics of livestock in the frame of the world food system comprising issues from basic knowledge to acceptance in society. The exchange is operated by scientific writing and presentation.

**Objective**
In the Forum "Livestock in the World Food System", a topic of significance for livestock agriculture is selected by the students and subsequently dealt with from various angles (from scientific basis to production systems, environmental aspects and to the acceptance by society).

The students learn to present a scientific subject in writing and orally to an audience and to defend the presentation in a discussion. Furthermore, feedback is intended to improve the presentation style. Furthermore, the review process of a scientific paper will be demonstrated and applied.

**Content**
The Forum "Livestock in the World Food System" will take place in blocks of 2 hours each. Once the general topic has been selected, it comprises two parts:

**Part 1**
Aspect 1 - Oral presentation: The students form small groups and are lecturers.
Aspect 2 - chairperson: There are moderators which are chosen from outside of the presenting groups and they will lead the discussion and the remaining students and the lecturer are the audience and ask questions.
Aspect 3 - feedback: At the beginning, students form teams of 2, which are not in the same group, to give each other feedback on their presentation style.

**Part 2**
Aspect 1 - Scientific writing: Preparation of a critical review of a chosen publication and individual exchange with the lecturer.
Aspect 2 - Defense: There will be a discussion in small groups on several dates to discuss the chosen publication in detail and the observations during the process.

**Lecture notes**
no scriptum

**Prerequisites / notice**
Requirements for allocation of the two credit points:
- oral talk with sufficient handout
- delivery of the scientific writing in sufficient quality
- active participation during all presentations (in case of absence there will be additional tasks)
- feedback on the presentation style of a student

Data: 02.07.2024 12:39 Autumn Semester 2024 Page 25 of 2667
751-2105-00L  
Political Ecology of Food and Agriculture  

Number of participants limited to 25  
A motivational application is required:  
- presenting yourself and your studies  
- stating what topic in the field of Political Ecology that you are interested in  
- suggesting one paper to enrich the literature list for the course  

Questions regarding the application to johanna.jacobi@usys.ethz.ch.

Abstract  
In this seminar, students are introduced to the multi-disciplinary field of political ecology to investigate human-environment relationships in food and agricultural systems.

Objective  
- Being able to provide an overview of the multi-disciplinary field of political ecology for investigating the relationships of humans to our environment  
- Learn to identify how power and interest influence social-ecological systems and to distinguish symptoms from systemic root causes  
- Become enabled to analyse complex and sometimes distant human-ecology relationships choosing from a broad range of methods

Content  
We will review common narratives in agri-food systems informed by a range of different theories and assisted by different analytical tools. For this purpose, we will start from different concepts of nature, power and interests, explore different ontologies and epistemologies through a set of topics such as hunger, obesity, agrobiodiversity and seeds, forests and deforestation, climate change and food production. Students will explain one concept in each course to the groups and practice their argumentative and writing skills in a final essay, applying the acquired tools to a topic of their choice. While specific inputs from external lecturers broaden our perspective, enough time for critical discussion and reflection will be granted.

Livestock Biology

Number  Title  Type  ECTS  Hours  Lecturers
751-6113-00L  Endocrinology and Biology of Reproduction  W+  3 credits  2G  S. E. Ulbrich, S. M. Bernal Ulloa

Abstract  
Endokrinologie und Reproduktionsbiologie der Säugetiere und des Menschen (Anatomie, Morphologie, Physiologie, Regelmechanismen) Die Systematik der Reproduktionshormone und der Hormonrezeptoren wird erläutert, die Wirkungsmechanismen (Bildung; orale Bioverfügbarkeit; Elimination) erklärt. Mit diesen Grundlagen wird das Verständnis der Regulation der Fortpflanzung umfassend erörtert.

Objective  
Die Studierenden erlangen das grundlegende theoretische Verständnis und Fachwissen zur Endokrinologie der Reproduktion und zur weiblichen und männlichen Reproduktionsbiologie. Sie können darüber hinaus pathologische Situationen (Fortpflanzungsstörungen) und deren vielfältige Ursachen in den physiologischen Kontext einordnen.
Learning Objectives: Part 1:

assessed
H. Signer-Hasler
Type
Lecturers
Papers will be assigned and downloaded from a web page announced during the lecture.
The course provides students with the basic knowledge to understand the connection between the structure of nutritive and non-nutritive
bioactive food and feed components and their effects on the nutrient supply and health of humans and livestock as well as on the quality of
animal-derived foods.
Objective
At the end of this course, the students are aware of food and feed as sources of different bioactive compounds. By a comprehensive
understanding of the connection between bioavailability, molecular mechanisms and biological effects, they are able to apply their
knowledge on beneficial and detrimental effects of bioactive food and feed components in the fields of human and animal nutrition.
Content
The course gives an introduction into different classes of bioactive components present in food and feed including fatty acids and
secondary plant compounds such as carotenoids, polyphenols, phytoestrogens, glucosinolates, protease inhibitors and monoterpenes.
Topics include:
- sources of bioactive food and feed components
- bioavailability and modification in the gastrointestinal tract
- beneficial and detrimental effects
- molecular mechanisms of biological effects
- species differences concerning metabolism and biological effects

Lecture notes
The teaching slides and other materials will be provided during the course.

Literature
Information about books and other references will be communicated during the course.

701-0263-01L Seminar in Evolutionary Ecology of Infectious Diseases W+ 3 credits 2G R. R. Regös, S. Bonhoeffer
Abstract
Students of this course will discuss current topics from the field of infectious disease biology. From a list of publications, each student
chooses some themes that he/she is going to explain and discuss with all other participants and under supervision. The actual topics will
change from year to year corresponding to the progress and new results occurring in the field.
Objective
This is an advanced course that will require significant student participation. Students will learn how to evaluate and present scientific
literature and trace the development of ideas related to understanding the ecology and evolutionary biology of infectious diseases.
Content
A core set of ~10 classic publications encompassing unifying themes in infectious disease ecology and evolution, such as virulence,
resistance, metapopulations, networks, and competition will be presented and discussed. Pathogens will include bacteria, viruses and
tungi. Hosts will include animals, plants and humans.
Lecture notes
Publications and class notes can be downloaded from a web page announced during the lecture.

751-6243-00L Breeding and Conservation of Animal Genetic Resources W+ 2 credits 2V H. Signer-Hasler, C. Flury, H. Pausch
Abstract
Animal genetic resources refer to the genetic and species diversity of livestock. Only a few production breeds have been further developed
through breeding, while local breeds have no longer been able to survive in this competition. Without the support of endangered breeds
and the sustainable breeding of productive breeds, many regionally typical breeds are threatened with extinction.
Objective
Learning Objectives: Part 1:
At the end of the course, students are able to assess the importance and problems of small ruminant breeding and husbandry in
Switzerland and neighbouring countries. They know the most important breeding objectives and are able to assess them in terms of
production and sustainable development in small ruminants and cattle.
Learning objectives part 2:
The second part gives an overview of the distribution, endangerment and conservation of breed diversity of farm animals in Switzerland
and internationally. The theory is illustrated with numerous examples and the knowledge is deepened in exercises.
The students:
- have an overview of the national and international distribution of animal genetic resources and are familiar with the database DAD-IS
(Domestic Animal Diversity Information System).
- can name the national and international efforts to conserve agricultural livestock breeds.
- know how to describe genetic diversity.
- know the challenges in the management of small populations.
- can describe different conservation measures, especially in situ and ex situ conservation.
- can describe current national and international conservation programmes for different livestock breeds.
Prerequisites / notice
Examination:
Examination Part 1: Graded written examination (1 hour) on the material covered.
Examination Part 2: Graded semester performance completed during the block course.
Parts 1 and 2 contribute equally to the final grade.

751-6305-00L Livestock Breeding and Genomics W 3 credits 3G P. von Rohr
Abstract
Swiss routine breeding value estimation/genetic evaluation systems of cattle, pig, sheep and goats are presented with methods and
evaluated traits. Examples will be demonstrated using the statistical software R.
Objective
The students know the theoretical and practical application of breeding value estimation in Switzerland for cattle, pig, sheep and goats. The
students are able to interpret estimated breeding values.
The course program uses a learning-by-doing approach ("hands-on minds-on"). The topics are introduced as short lectures, but most of the

</table>

Abstract
Different experimental designs will be discussed and various statistical tools will be applied to research questions in agroecosystem
sciences. Statistical methods range from simple analysis of variance to mixed-models and multivariate statistics. Surveys and manipulative
field and laboratory experiments are addressed and students learn to analyse data using a hands-on approach.

Objective
Students will know various statistical analyses and their application to science problems in their study area as well as a wide range of
experimental design options used in environmental and agricultural sciences. They will practice to use statistical software packages (R),
understand pros and cons of various designs and statistics, and be able to statistically evaluate their own results as well as those of
published studies.

Content
The course program uses a learning-by-doing approach ("hands-on minds-on"). The topics are introduced as short lectures, but most of the
work is done on the computer using different packages of R – a software for statistical calculation and graphics. In addition to contact hours
exercises must be finalized and handed in for grading. The credit points will be given based on successful assessments of selected
exercises.

The tentative schedule contains the following topics:
- Introduction to experimental design and applied statistics in R
- Data handling and data exploration with tidyverse
- Designs of field and growth chamber experiments theory
- Design creation with DiGGer
- Fitting linear mixed-effects models with lme4
- Marginal means estimation and post-hoc tests with emmeans
- Nonlinear regression fits
- Statistical learning techniques
- Principle component analysis, canonical correspondance analysis (CCA), cluster analysis
- Random forest

This course does not provide the mathematical background that students are expected to bring along when signing up to this course.
Alternatively, students can consider some aspects of this course as a first exposure to solutions in experimental design and applied
statistics and then deepen their understanding in follow-up statistical courses.

Lecture notes
Handouts will be available (in English)

Literature
A selection of suggested additional literature, especially for German speaking students will be presented in the introductory lecture.

Prerequisites / notice
This course is based on the course Mathematik IV: Statistik, passed in the 2nd year and the Bachelor's course "Wissenschaftliche
Datenauswertung und Datenpräsentation" (751-0441-00L)

751-6003-00L Training Course in Research Groups (Large)

Abstract
The students will learn the conceptual and methodological background of research in the animal science groups of the Institute of Plant,
Animal and Agroecosystem Sciences. In addition to teaching the theoretical background, the major aim of the course is to integrate the
students into the research groups (on job training) and, hence, to focus on the practical application of the knowledge.

Objective
- Introduction into the conceptual and methodological basis of research
- Integration of the students into the research groups (on job training)
- Application of the gained knowledge

Content
The students will be integrated into the research groups day-to-day work and will thus deal with all aspects of scientific work. This
comprises the planning (conceptually and logistically), execution (data collection, laboratory analyses) and evaluation (statistics, data
presentation) of experiments as well as the basics of scientific writing (aim: later publication, Master thesis). The research topics and the
range of methodologies vary between the animal science research groups in the Institute of Plant, Animal and Agroecosystem Sciences.

Lecture notes
None

Literature
Specific readings after enlisting in a particular research group.
Prerequisites / notice
The number of training slots in the various groups is limited. It is therefore highly recommended to contact the group leaders early enough (first come first serve).
The full integration in a research group often means to work on weekends.
The total time budget is equivalent to about 180 hours. Active participation in group meetings (discussion, presentation) and short written reports about the work conducted are required for the 6 credit points. There are no grades, it is only pass or fail.

751-5201-10L W+ 5 credits 10G J. Six, K. Benabderrazik

Abstract
This course guides students in analyzing and comprehending tropical agroecosystems and food systems. Students gain practical knowledge of field methods, diagnostic tools and survey methods for tropical soils and agroecosystems. An integral part of the course is the two-week field project in the Mount Kenya Region, which is co-organized with the University of Embu (Kenya).

Objective
(1) Overview of the major land use systems in Tropical agroecosystems in several contexts Africa
(2) Interdisciplinary analysis of agricultural production systems
(3) Knowledge on methods to assess agroecological performance of a tropical agroecosystems
(4) Hands-on training on the use of field methods, diagnostic tools and survey methods.
(5) Gain practical knowledge on how to assess to climate resilience and farming systems.
(6) Collaboration in international students and stakeholders

Content
This course guides students in analyzing and comprehending tropical agroecosystems. Students of ETH Zürich will work together with the students from Embu University (Kenya) in an interdisciplinary and intercultural team. Students will focus on the Agroecological performance and climate resilience of diverse farming systems in the Mount Kenya Region.

From October 28th to November 11th, The students will take part in a field course in the Mount Kenya Region. Students will then gain practical knowledge on field, meeting several stakeholders of the agricultural and food systems and conducting various assessments related to climate resilience and farming systems.

Prerequisites / notice
We would require the students enrolled to the class to send a short cover letter (1-page max.) by September 18rd 2023, justifying your motivation to enroll to this class. A selection of 20 students will be done on the basis of the letters.

IMPORTANT: Students who enroll for this course are strongly recommended to verify with lecturers from other courses whether their absence of two weeks may affect their performance in the respective courses.
## Alternative Crops

**Number** 751-4104-00L  
**Title** Alternative Crops  
**Type** W+  
**ECTS** 2 credits  
**Hours** 2V  
**Lecturers** A. Walter, K. Berger Büter

### Abstract
Few crops dominate the crop rotations worldwide. Following the goal of an increased agricultural biodiversity, species such as buckwheat but also medicinal plants might become more important in future. The biology, physiology, stress tolerance and central aspects of the value-added chain of the above-mentioned and of other alternative crops will be depicted.

### Objective
During this course, students learn to assess the potential of different minor or alternative crops compared to the dominant major crops based on their biological and agronomical features. Each student will assess and present a specific alternative crop of his or her choice based on information from scientific articles and Wikipedia. Wikipedia-entries will be generated.

### Competencies

**Subject-specific Competencies**
- Concepts and Theories
- Media and Digital Technologies
- Problem-solving
- Project Management

**Method-specific Competencies**
- Communication
- Cooperation and Teamwork
- Self-presentation and Social Influence
- Sensitivity to Diversity

**Social Competencies**
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

**Personal Competencies**
- Adaptability and Flexibility
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

## Current Challenges in Plant Breeding

**Number** 751-3603-00L  
**Title** Current Challenges in Plant Breeding  
**Type** W+  
**ECTS** 2 credits  
**Hours** 2G  
**Lecturers** B. Studer, A. Hund, R. Kölliker

### Abstract
The seminar 'Current Challenges in Plant Breeding' aims to bring together national and international experts in plant breeding to discuss current activities, latest achievements and future prospective of a selected topic/area in plant breeding.

### Objective
The educational objectives cover thematic, methodic as well as social and personal competencies:
- Deepening of scientific knowledge in plant breeding
- Critical evaluation of current challenges and new concepts in plant breeding
- Promotion of collaboration and Master thesis projects with practical plant breeders

**Social/personal competencies:**
- Independent literature research to get familiar with the selected topic
- Establishment of a scientific presentation in an interdisciplinary team
- Establishing contacts and strengthening the network to national and international plant breeders and scientist

### Content
Interesting topics related to plant breeding will be selected in close collaboration with the working group for plant breeding of the Swiss Society of Agronomy (SSA).

### Lecture notes
None

### Literature
Peer-reviewed research articles, selected according to the topic.

### Prerequisites / notice
Participation in the BSc course ‘Pflanzenzüchtung’ is strongly recommended, a completed course in ‘Molecular Plant Breeding’ is advantageous.

### Competencies

**Subject-specific Competencies**
- Concepts and Theories
- Techniques and Technologies

**Method-specific Competencies**
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management

**Social Competencies**
- Communication
- Cooperation and Teamwork
- Customer Orientation
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation

**Personal Competencies**
- Creativity
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

## Weed Science

**Number** 751-4704-00L  
**Title** Weed Science  
**Type** W+  
**ECTS** 3 credits  
**Hours** 2G  
**Lecturers** B. Streit, U. J. Haas

### Abstract
Modern weed management comprises competent knowledge of weed biology, weed ecology, population dynamics, crop-weed-interactions and different measures to control weeds. Weeds are understood to be rather part of a habitat or a cropping system than just unwanted plants in crops.

### Objective
At the end of the course the students are qualified to develop sustainable solutions for weed problems in agricultural and natural habitats.

### Content
Modern weed management comprises competent knowledge of weed biology, weed ecology, population dynamics, crop-weed-interactions and different measures to control weeds. Weeds are understood to be rather part of a habitat or a cropping system than just unwanted plants in crops. Accordingly, this knowledge will be imparted during the course and will be required to understand the mechanisms of integrated weed control strategies.
### Crop Health

<tr>
<td><strong>Abstract</strong></td>
<td>Students will understand the consequences arising from the unintentional or deliberate introduction of alien organisms into agricultural systems. They will be able to understand the concept of environmental risk assessment and be able to evaluate risk management options.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Objective</strong></td>
<td>Alien organisms in agriculture is a topic that receives an increasing awareness among farmers, agricultural scientists, regulators and the general public. Students of this course will learn about the nature of alien organisms such as invasive species, biocontrol organisms and genetically modified organisms. With a particular focus to understanding plants and their interactions we will look at the potential threats the novel organisms pose, the benefits they provide and how both of these effects can be scientifically assessed. Students will learn how the topic of alien organisms in agriculture is intrinsically tied to policy making and regulation and get to know current examples and future challenges in research. In the last part of the course students will be able to apply the acquired knowledge in a practical exercise (case study).</td>

<td>Biogeochemistry and Sustainable Management</td>
<td>W+</td>
<td>3 credits</td>
<td>2G</td>
<td>I. Feigenwinter, N. Buchmann, K.-M. Kohonen</td>
</tr>
</tbody>
</table>

**Abstract**
This course focuses on the interactions between ecology, biogeochemistry and management of agro- and forest ecosystems, thus, coupled human-environmental systems. Students learn how human impacts on ecosystems via management or global change are mainly driven by effects on biogeochemical cycles and thus ecosystem functioning, but also about feedback mechanisms of terrestrial ecosystems.

**Objective**
Students will analyse and understand the complex and interacting processes of ecology, biogeochemistry and management of agroecosystems. They will use their theoretical knowledge in two flipped classroom exercises, but also set up a small weather station and program a data logger to collect meteorological variables, analyze large meteorological and flux data sets, and evaluate the impacts of weather events and management practices on the ecosystem greenhouse gas exchange. Thus, students will expand their computational competences. Moreover, students will be able to coordinate and work successfully in small (interdisciplinary) teams.

**Content**
Agroecosystems play a major role in all landscapes, either for production purposes, ecological areas or for recreation. The human impact on any management on the environment is mainly driven by effects on biogeochemical cycles. Effects of global change impacts will also act via biogeochemistry at the soil-biosphere-atmosphere-interface. Thus, ecosystem functioning, i.e., the interactions between ecology, biogeochemistry and management of terrestrial systems, is the science topic for this course.

Students will gain profound knowledge about biogeochemical cycles and greenhouse gas fluxes in managed grassland and/or cropland ecosystems as well as expand their computational competences. Responses of agroecosystems to the environment, i.e., to climate and weather events, but also to management will be studied. Two flipped class-room exercises include the assessment of an ecosystem disturbance and the experimental design of an own study. Dataloggers will be programmed, and a small weather station will be set up. Different meteorological and greenhouse gas flux data will be analysed (using R) and assessed in terms of production, greenhouse gas budgets, and carbon sequestration. Thus, students will learn how to collect, analyse and interpret data about the complex interactions of a coupled human-environmental system.

Students will work in groups (3-4 persons per group) with data from a small weather station (dedicated to the course), as well as data from the long-term measurement network Swiss FluxNet and from global databases. Data from the intensively managed grassland site Chamau will be used to investigate the biosphere-atmosphere exchange of CO2, H2O, N2O and CH4. Functional relationships will be identified, greenhouse gas budgets will be calculated for different time periods and in relation to management over the course of a year.

**Lecture notes**
Handouts will be available in moodle.

**Prerequisites / notice**
Prerequisites: Attendance of introductory courses in plant ecophysiology, ecology, and grassland or forest sciences. Knowledge of data analyses in R and statistics. Course will be taught in English.

<td>Chemical Nature of Nutrients and their Availability to Plants: The Case of Phosphorus</td>
<td>W+</td>
<td>4 credits</td>
<td>4G</td>
<td>E. Frossard</td>
</tr>
</tbody>
</table>

**Abstract**
The CNNAP course discusses the mechanistic relationships between nutrient speciation in fertilizer and nutrient uptake by plants using phosphorus as an example. The course involves theoretical aspects of nutrient cycling, laboratory work, data analysis and presentation, and the use of advanced methods in plant nutrition studies.

**Objective**
At the end of the CNNAP course, participants will obtain a mechanistic understanding of why and how the speciation of phosphorus in fertilizer can affect its release to the soil solution and subsequent uptake by plants. Students will be able to use this information for the development of fertilization schemes that maximize the nutrient uptake and fertilizer efficiency of crops or pastures. During the course, participants will become familiar with the use of radioisotopes and nuclear magnetic resonance as approaches to measure nutrient availability and forms, respectively and they will know the limits of these techniques. Students will also have the opportunity to improve their laboratory, presentation, discussion and writing skills.

**Lecture notes**
Documents will be distributed during the lecture.

**Literature**
Documents will be distributed during the lecture.

**Prerequisites / notice**
The CNNAP lecture will take place at the ETH experimental station in Eschikon Lindau every second year. The next course will be organized in autumn 2024. The CNNAP course will take place if and only if 8 or more students are registered one week before the start. See the location of the station at: http://www.plantnutrition.ethz.ch/the-group/how-to-find-us.html

We strongly advise students who are planning to be absent for more than one week during the semester NOT to visit this course. Students should have visited the plant nutrition lectures in the 3rd and 6th semesters and the lecture pedosphere in the 3rd semester of the agricultural study program of the ETH. If students do not have visited these courses they will have to acquire the necessary information by themselves as this knowledge is indispensable for the CNNAP course. As the CNNAP course does not take place in autumn 2023, we recommend students interested in integrated assessment of nutrient cycling in soil plant systems to visit the 8th semester lecture 751-3404-00L (Nutrient Fluxes in Soil-Plant Systems: The Case of Nitrogen) organized in spring 2024 by Oberson et al.
This course provides an overview about the applicability of stable isotopes (carbon 13C, nitrogen 15N, oxygen 18O and hydrogen 2H) to process-oriented ecological research. Topics focus on stable isotopes as indicators for the origin of pools and fluxes, partitioning of composite fluxes as well as to trace and integrate processes. In addition, students carry out a small project during lab sessions. Students will be familiar with basic and advanced applications of stable isotopes in studies on plants, soils, water and trace gases, know the relevant approaches, concepts and recent results in stable isotope ecology, know how to combine classical and modern techniques to solve ecophysiological or ecological problems, learn to design, carry out and interpret a small IsoProject, practice to search and analyze literature as well as to give an oral presentation. This course will provide an introduction to the applicability of stable isotopes to ecological research questions. Topics will focus on carbon (13C), nitrogen (15N), oxygen (18O) and hydrogen (2H) at natural isotope abundance and tracer levels. Lectures will be supplemented by intensive laboratory sessions, short presentations by students and computer exercises. 

Lecture notes
Handouts will be available on the webpage of the course.

Literature
Will be discussed in class.

Prerequisites / notice
This course is based on fundamental knowledge about plant ecophysiology, soil science, and ecology in general. Course will be taught in English.

751-5115-00L Current Aspects of Nutrient Cycle in Agro-Ecosystems W+ 2 credits 1S E. Frossard, A. Oberson Dräyer

Abstract
The seminar concerns current aspects and research related to nutrient cycles in agro-ecosystems. The theme of the next seminar is "Integrated Nutrient Management to maximize nutrient use efficiency in productive agricultural systems: Insights from long-term field experiments". Analyze publications and/or data records on long-term field experiments regarding their content on integrated nutrient management and derive the nutrient use efficiency; link this information, write it up in a report and present the results in an oral presentation; work in a group; ask questions and contribute to the discussion following the oral presentations; link the information to answer overarching questions and recommendations; expand the knowledge on nutrient cycles and nutrient management in the agro-ecosystem; learn about the importance of long-term field experiment to answer questions on the sustainability of agricultural systems. The seminar concerns current aspects and research related to nutrient cycles in agro-ecosystems. The theme of the next seminar is "Integrated Nutrient Management to maximize nutrient use efficiency in productive agricultural systems: Insights from long-term field experiments". The students will analyze and connect the results published (or from data records) for selected field experiments in a group work. They will present their analysis in a report and in an oral presentation. The seminar is composed by presentations of experts and of the students. The presentations will be synthesized during a final discussion.

## 751-4003-01L Current Topics in Grassland Sciences (autumn)  

- W+ 2 credits 2S  
- N. Buchmann

### Abstract

Research results in agro- and forest ecosystem sciences will be presented by experienced researchers as well as by doctoral and graduate students. Citation classics as well as recent research results will be discussed. Topics will range from plant ecophysiology, biodiversity and biogeochemistry to management aspects in agro- and forest ecosystems.

### Objective

- Students will be able to understand and evaluate experimental design and data interpretation of on-going studies, be able to critically analyze published research results, practice to present and discuss results in the public, and gain a broad knowledge of recent research and current topics in agro- and forest ecosystem sciences.

### Content

- Research results in agro- and forest ecosystem sciences will be presented by experienced researchers as well as by doctoral and graduate students.
- Citation classics as well as recent research results will be discussed. Topics will range from plant ecophysiology, biodiversity and biogeochemistry to management aspects in agro- and forest ecosystems.

## 751-2105-00L Political Ecology of Food and Agriculture  

- W+ 3 credits 2G  
- J. Jacobi

### Number of participants limited to 25

A motivational application is required:

- presenting yourself and your studies
- stating what topic in the field of Political Ecology that you are interested in
- suggesting one paper to enrich the literature list for the course

### Questions regarding the application to

- johanna.jacobi@usys.ethz.ch.

### Abstract

In this seminar, students are introduced to the multi-disciplinary field of political ecology to investigate human-environment relationships in food and agricultural systems.

### Objective

- Being able to provide an overview of the multi-disciplinary field of political ecology for investigating the relationships of humans to our environment
- Learn to identify how power and interest influence social-ecological systems and to distinguish symptoms from systemic root causes
- Become enabled to analyse complex and sometimes distant human-ecology relationships choosing from a broad range of methods

### Content

- We will review common narratives in agri-food systems informed by a range of different theories and assisted by different analytical tools.
- For this purpose, we will start from different concepts of nature, power and interests, explore different ontologies and epistemologies through a set of topics such as hunger, obesity, agrobiodiversity and seeds, forests and deforestation, climate change and food production.
- Students will explain one concept in each course to the groups and practice their argumentative and writing skills in a final essay, applying the acquired tools to a topic of their choice.
- While specific inputs from external lecturers broaden our perspective, enough time for critical discussion and reflection will be granted.

### Lecture notes

- 20.9.2024 Introduction to political ecology
- 27.9.2024 Ontologies and epistemologies

**Abstract**

Different experimental designs will be discussed and various statistical tools will be applied to research questions in agroecosystem sciences. Statistical methods range from simple analysis of variance to mixed-models and multivariate statistics. Surveys and manipulative field and laboratory experiments are addressed and students learn to analyse data using a hands-on approach.

**Objective**

Students will know various statistical analyses and their application to science problems in their study area as well as a wide range of experimental design options used in environmental and agricultural sciences. They will practice to use statistical software packages (R), understand pros and cons of various designs and statistics, and be able to statistically evaluate their own results as well as those of published studies.

**Content**

The course program uses a learning-by-doing approach ("hands-on minds-on"). The topics are introduced as short lectures, but most of the work is done on the computer using different packages of R – a software for statistical computing and graphics. In addition to contact hours exercises must be finalized and handed in for grading. The credit points will be given based on successful assessments of selected exercises.

The tentative schedule contains the following topics:

- Introduction to experimental design and applied statistics in R
- Data handling and data exploration with tidyverse
- Designs of field and growth chamber experiments theory
- Design creation with DiGGer
- Fitting linear mixed-effects models with lme4
- Marginal means estimation and post-hoc tests with emmeans
- Nonlinear regression fits
- Statistical learning techniques
- Principle component analysis, canonical correspondence analysis (CCA), cluster analysis
- Random forest

This course does not provide the mathematical background that students are expected to bring along when signing up to this course. Alternatively, students can consider some aspects of this course as a first exposure to solutions in experimental design and applied statistics and then deepen their understanding in follow-up statistical courses.

**Lecture notes**

Handouts will be available (in English)

**Literature**

A selection of suggested additional literature, especially for German speaking students will be presented in the introductory lecture.

This course is based on the course Mathematik IV: Statistik, passed in the 2nd year and the Bachelor's course "Wissenschaftliche Datenauswertung und Datenpräsentation" (751-0441-00L)

**Prerequisites / notice**

Subjective Competencies

- Tropical Cropping Systems, Soils and Livelihoods (with Excursion)

**Objective**

This course guides students in analyzing and comprehending tropical agroecosystems and food systems. Students gain practical knowledge of field methods, diagnostic tools and survey methods for tropical soils and agroecosystems. An integral part of the course is the two-week field project in the Mount Kenya Region, which is co-organized with the University of Embu (Kenya)

**Content**

- Overview of the major land use systems in Tropical agroecosystems in several contexts Africa
- Interdisciplinary analysis of agricultural production systems
- Hands-on training on the use of field methods, diagnostic tools and survey methods.
- Gain practical knowledge on how to assess to climate resilience and farming systems.
- Collaboration in international students and stakeholders

This course guides students in analyzing and comprehending tropical agroecosystems. Students of ETH Zürich will work together with the students from Embu University (Kenya) in an interdisciplinary and intercultural team. Students will focus on the Agroecological performance and climate resilience of diverse farming systems in the Mount Kenya Region.

From October 28th to November 11th. The students will take part in a field course in the Mount Kenya Region. Students will then gain practical knowledge on field, meeting several stakeholders of the agricultural and food systems and conducting various assessments related to climate resilience and farming systems.

**Prerequisites / notice**

We would require the students enrolled to the class to send a short cover letter (1-page max.) by September 18rd 2023, justifying your motivation to enroll to this class. A selection of 20 students will be done on the basis of the letters.

Abstract

In this course, students get an overview of agricultural policy evaluations and their societal and political relevance. They learn to understand and apply the principles of scientific based evaluations of agricultural policies.

Objective

The course has four major learning objectives: 1) Students know the conceptual background of evaluations and can relate concepts in agricultural economics to the evaluation of policies. 2) They know the basics of how to design and implement a policy evaluation study. 3) Students can transfer their methodological knowledge from other agricultural economics courses to the context of agricultural policy evaluations (econometrics, modelling etc.). They make hands-on experiences of methodological challenges. 4) They can critically assess the science-policy interface of policy evaluations.

Content

The course consists of two blocks: First, students will learn the basics of how to design, implement and interpret agricultural policy evaluations. In this block, the conceptual embedding, the design and methodological tools as well as case studies are presented. Secondly, the students make hands-on experience using econometric and modelling tools in the context of agricultural policy evaluations. They apply their theoretical and empirical knowledge to Swiss case studies.

Abstract

The course addresses environmental policies, focusing on new steering approaches, which are generally summarized as environmental governance. The course also provides students with tools to analyze environmental policy processes and assesses the key features of environmental governance by examining various practical environmental policy examples.
Objective
To understand how an environmental problem may (not) become a policy and explain political processes, using basic concepts and techniques from political science.

To analyze the evolution as well as the key elements of environmental governance.

To be able to identify the main challenges and opportunities for environmental governance and to critically discuss them with reference to various practical policy examples.

Content
Improvements in environmental quality and sustainable management of natural resources cannot be achieved through technical solutions alone. The quality of the environment and the achievement of sustainable development strongly depend on human behavior and specifically the human uses of nature. To influence human behavior, we rely on public policies and other societal rules, which aim to steer the way humans use natural resources and their effects on the environment. Such steering can take place through government intervention alone. However, this often also involves governance, which includes the interplay between governmental and non-governmental actors, the use of diverse tools such as emission standards or financial incentives to steer actors' behavior and can occur at the local, regional, national or international level.

In this course, we will address both the practical aspects of as well as the scientific debate on environmental governance. The course gives future environmental experts a strong basis to position themselves in the governance debate, which does not preclude government but rather involves a spectrum from government to governance.

Key questions that this course seeks to answer: What are the core characteristics of environmental challenges from a policy perspective? What are key elements of 'environmental governance' and how legitimate and effective are these approaches in addressing persistent environmental challenges?

Furthermore, we encourage the development of soft skills by engaging students in activities such as moderating discussions in class, presenting own proposals, giving regular peer feedback, as well as critically reflecting on various relevant publications in the environmental governance domain.

Lecture notes
Lecture slides, a script and additional course material will be provided on Moodle.

Prerequisites / notice
A detailed course schedule will be made available at the beginning of the semester.

During the lecture we will work with Moodle. We ask that all students register themselves on this platform before the lecture.

We recommend that students have (a) three-years BSc education of a (technical) university; (b) successfully completed Bachelor introductory course to environmental policy (Entwicklungen nationaler Umweltpolitik (or equivalent)) and (c) familiarity with key issues in environmental policy and some fundamental knowledge of one social science or humanities discipline (political science, economics, sociology, history, psychology, philosophy)

Abstract
The main part of this lecture will examine constellations where hierarchies, markets or cooperation have been observed and described in the agricultural sector. On a more aggregated level, different agricultural systems will be evaluated in terms of main socioeconomic parameters like social capital or perceptions.

Objective
Students should be able to describe the dynamics of hierarchies, markets and cooperation in an agricultural context.

Content
Introduction to Sociology
Introduction to Socioeconomics
Agricultural Administration: Path dependencies and efficiency issues
Power in the Chain
The farming family
Occupational Choices
Market segregation
The issue of meat demand
Common Resource Management in Alpine Farming
Agricultural Cooperatives
Societal perceptions of agriculture
Perceptions of farming from within
Varieties of agricultural systems and policies

Lecture notes

Literature
see script

Prerequisites / notice
Basic economic knowledge is expected.
**International Development Cooperation**

*W+* 2 credits 2V  I. Günther

**Abstract**
The course gives economic and empirical foundations for a sound understanding of the instruments, prospects and limitations of international development aid.

**Objective**
Students have a theoretically and empirically sound understanding of the prospects and limitations of international development aid.

**Content**
This course deals with how and why international problem-solving efforts (cooperation) in environmental politics emerge and evolve, and under what circumstances such efforts are effective. Based on concepts and theories of political economy, political science, and public policy, various examples of international environmental policy-making are examined.

**Literature**
Articles and book abstracts will be uploaded to a course website.

---

**International Environmental Politics**

*W+* 3 credits 2V  T. Bernauer

**Abstract**
This course deals with how and why international problem-solving efforts (cooperation) in environmental politics emerge and evolve, and under what circumstances such efforts are effective. Based on concepts and theories of political economy, political science, and public policy, various examples of international environmental policy-making are examined, for example international efforts to reduce air pollution, manage international water resources, mitigate and adapt to global warming, protect the stratospheric ozone layer, address biodiversity challenges, deal with plastic waste, and prevent pollution of the oceans.

**Lecture notes**
Reading materials and slides will be available via Moodle.

**Literature**
Reading materials and slides will be available via Moodle.

**Prerequisites / notice**
The course is open to all ETH students and visiting students from other universities. Participation does not require previous coursework in the social sciences or environmental policy. This course will take place on campus (ETH Main Building, HG F.3). There will be no live-streaming, and the course is NOT in hybrid (on-campus plus online) format. However, the lecture will be recorded and the recordings will be made available via the Moodle platform for this course a few days after the respective lecture for students who are unable to attend in person. All electronic correspondence will take place via the ETH mystudies system and Moodle, so please make sure you are properly registered there with a functioning email address/account.

**Credits and Exam**
After passing a written test at the end of the course (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test). Visiting students (e.g., from the University of Zurich, exchange students) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory. No separate registration for the exam is required, registration for the course as such covers everything. The exam will take place on campus, either in the F3 lecture hall or in a computer room. That is, you must be present in person at ETH Zurich on the exam date/time.

---

**Political Ecology of Food and Agriculture**

*W+* 3 credits 2G  J. Jacobi

**Abstract**
In this seminar, students are introduced to the multi-disciplinary field of political ecology to investigate human-environment relationships in food and agricultural systems.

**Objective**
- Being able to provide an overview of the multi-disciplinary field of political ecology for investigating the relationships of humans to our environment
- Learn to identify how power and interest influence social-ecological systems and to distinguish symptoms from systemic root causes
- Become enabled to analyse complex and sometimes distant human-ecology relationships choosing from a broad range of methods

**Content**
We will review common narratives in agri-food systems informed by a range of different theories and assisted by different analytical tools. For this purpose, we will stay from different concepts of nature, power and interests, explore different ontologies and epistemologies through a set of topics such as hunger, obesity, agrobiodiversity and seeds, forests and deforestation, climate change and food production. Students will explain one concept in each course to the groups and practice their argumentative and writing skills in a final essay, applying the acquired tools to a topic of their choice. While specific inputs from external lecturers broaden our perspective, enough time for critical discussion and reflection will be granted.
Data has become an important resource in today's business environment, which can be used to make better management decisions. By the end of the course, students should understand the different existing approaches, their applicability, and their advantages and disadvantages. They should be able to read and understand regression output tables. Additionally, students will be able to apply the estimation approaches in practice using STATA.

</table>

Abstract
In this class, students learn how to understand and conduct empirical research. It will enable them to manage a business based on evidence-based decision-making. The class includes assignments related to the lecture content.

Objective
The general objective of the course is to enable students to understand the basic principles of empirical studies. After successfully passing the class, they will be able to formulate research questions, design empirical studies, and analyze data by using basic statistical approaches.

Content
Data has become an important resource in today’s business environment, which can be used to make better management decisions. However, evidence-based decision-making comes along with challenges and requires a basic understanding of statistical approaches. Therefore, this class introduces problems and key concepts of empirical research, which might be qualitative or quantitative in its nature. Concerning qualitative research, students learn how to conduct and evaluate interviews. In the area of quantitative research, they learn how to apply measurement and scaling methods and conduct experiments. In addition, basic statistical analyses like a variance analysis and how to conduct it in a standard statistical software package like SPSS or R are also part of the lecture. The lessons learned from the lecture will empower students to critically assess the quality and outcomes of studies published in the media and scientific journals, which might form a basis of their managerial decision-making. We recommend the lecture also to students without basic statistical skills, who plan to attend more advanced lectures in the field of artificial intelligence such as Marketing Analytics.

The lecture will be taught in presence. There will be individual assignments that students have to solve throughout the lecture. In addition to that, there will be some non-mandatory online exercises as an additional opportunity to prepare for the exam.

Literature
Literature and readings will be announced. For a basic understanding we recommend the Handbook of Good Research by Jürgen Brock and Florian von Wangenheim.

Prerequisites / notice
The course includes out-of-class assignments to give students some hands-on experience in conducting empirical research in management. Projects will focus on one particular aspect of empirical research, like the formulation of a research question or the design of a study. Assignments will be graded and need to be turned-in on time as they will be shown and discussed in class. Class participation is encouraged and can greatly improve students’ learning. In this spirit, students are expected to attend class regularly and come to class prepared.

363-0585-00L Intermediate Econometrics W+ 3 credits 2V S. Stefanova

Abstract
The aim of the course is to discuss different econometric models and their empirical applications. We will cover cross-sectional linear and non-linear regression models, models for estimating treatment effects, and linear panel data models.

Objective
By the end of the course, students should understand the different existing approaches, their applicability, and their advantages and disadvantages. They should be able to read and understand regression output tables. Additionally, students will be able to apply the estimation approaches in practice using STATA.

Literature
Literature list provided on Moodle when the course starts.

https://moodle-app2.let.ethz.ch/course/view.php?id=20544
The lectures will consist of both theoretical and practical components. In the theoretical part, we will discuss each estimation approach in
detail. The lecture will present the assumptions, derivations, as well as the advantages and disadvantages of the estimation approach.

In the empirical part, we will look at simulation results using artificial data. Furthermore, we will investigate a particular research question
using STATA.

The course will tentatively cover the following subjects:
- review of ordinary least squares (OLS) estimation
- instrumental variable estimation and two-stage least squares estimation
- seemingly unrelated regression models
- simultaneous equation models
- maximum likelihood estimation
- binary response models
- count data models
- censored and truncated regression models
- sample selection models
- treatment effect models
- static linear panel data models (random effects and fixed effects estimation)

Lecture notes
For the theoretical portions of the lectures, we will prepare slides for in-class discussion. The format of the course is in-person. Slides will
be distributed electronically before each lecture.

For the applied portion of the lectures, we will provide STATA do files, log files, and data sets.

Problem sets will also be made available after every lecture. These problem sets will not be collected or graded, but students can use them
in order to prepare for the final exam. Solutions will be made available in the following lecture.

While there is no required textbook for the course, we draw from the following texts, which are also recommend for the preparation of the
exam:

Literature
Jeffrey M. Wooldridge: Introductory Econometrics; Jeffrey M. Wooldridge: Econometric Analysis of Cross Section and Panel Data; A. Colin
Cameron and Pravin K. Trivedi. Microeconometrics: Methods and Applications. Joshua A. Angrist and Jörn-Steffen Pischke: Mostly
Harmless Econometrics.

Prerequisites /
notice
Prior basic knowledge of matrix algebra and probability theory is strongly recommended.

Risk Analysis and Risk Management in Agriculture
W+ 3 credits 2G R. Finger

Abstract
Agricultural production is exposed to various risks and risk management is indispensable. This course introduces modern concepts on
farmers’ decision making under risk and risk management. We present innovative insights, empirical example from European agriculture.
You gain hands-on experience using R.

Objective
- to develop a better understanding of decision making under uncertainty and risk;
- to gain hands-on experience in risk analysis and management using R
- to gain experience in different approaches to analyze risky decisions;
- to develop an understanding for different sources of risk in agricultural production;
- to understand the crucial role of subjective perceptions and preferences for risk management decisions;
- to get an overview on risk management in the agricultural sector, with a particular focus on insurance solutions

Content
- Quantification and measurement of risk
- Risk preferences, Expected Utility Theory, Cumulative Prospect Theory
- Production and input use decisions under risk
- Portfolio Theory and Farm Diversification
- Forwards, Futures, Crop Insurance
- Weather Index Insurance and Satellite Imagery
- Empirical Applications using R

Lecture notes
Handouts will be distributed in the lecture and available on the moodle.

Prerequisites /
notice
knowledge of basic concepts of probability theory and microeconomics
What causes economic business cycles? How are limited resources, competition, and cooperation reflected in growth dynamics? To answer such questions, we combine macroeconomic models and methods of nonlinear dynamics. We study the role of bifurcations and control parameters for dynamic stability. Feedback cycles and coupled dynamics are reasons for limited predictability, instability and chaos.

Successful participants of the course are able to:
- formalize and solve one- and two-dimensional nonlinear models
- apply formal concepts to model economic growth and competition
- identify critical conditions for stability and dynamic transitions
- analyze macroeconomic models of business cycles, supply and demand
- apply formal concepts to model economic growth and competition

Weekly self-study tasks are used to apply the concepts introduced in the lectures. We practice how to solve nonlinear models formally and numerically and how to interpret the results.

Prerequisites / notice
Students should be familiar with nonlinear differential equations and should have basic programming skills. All necessary details to solve nonlinear models will be provided in the course. The course will not build on mathematical proofs, optimization, statistics, efficient numerical computation and other specialized skills.

401-0647-00L Introduction to Mathematical Optimization W 5 credits 2V+1U D. Adjiaashvili

Abstract
Introduction to basic techniques and problems in mathematical optimization, and their applications to a variety of problems in engineering. The goal of the course is to obtain a good understanding of some of the most fundamental mathematical optimization techniques used to solve linear programs and basic combinatorial optimization problems. The students will also practice applying the learned models to problems in engineering.

Objective
Topics covered in this course include:
- Linear programming (simplex method, duality theory, shadow prices, ...).
- Basic combinatorial optimization problems (spanning trees, shortest paths, network flows, ...).
- Modelling with mathematical optimization: applications of mathematical programming in engineering.
This course is meant for students who did not already attend the course "Mathematical Optimization", which is a more advance lecture covering similar topics. Compared to "Mathematical Optimization", this course has a stronger focus on modeling and applications.

Abstract
This course examines the behaviour of macroeconomic variables, such as gross domestic product, unemployment and inflation rates. It tries to answer questions like: How can we explain fluctuations of national economic activity? What can economic policy do against unemployment and inflation?

Objective
This lecture will introduce the fundamentals of macroeconomic theory and explain their relevance to everyday economic problems.

Content
This course helps you understand the world in which you live. There are many questions about the macroeconomy that might spark your curiosity. Why are living standards so meagre in many African countries? Why do some countries have high rates of inflation while others have stable prices? Why have some European countries adopted a common currency? These are just a few of the questions that this course will help you answer.

Furthermore, this course will give you a better understanding of the potential and limits of economic policy. As a voter, you help choose the policies that guide the allocation of society's resources. When deciding which policies to support, you may find yourself asking various questions about economics. What are the burdens associated with alternative forms of taxation? What are the effects of free trade with other countries? How does the government budget deficit affect the economy? These and similar questions are always on the minds of policy makers.

Literature

This book can also be used for the course '363-0503-00L Principles of Microeconomics' (Filippini).

Besides this textbook, the slides, lecture notes and problem sets will cover the content of the lecture and the exam questions.

Personal Competencies
- Adaptability and Flexibility fostered
- Creative Thinking fostered
- Critical Thinking assessed
- Integrity and Work Ethics fostered
- Self-awareness and Self-reflection fostered
- Self-direction and Self-management fostered

Abstract
The course covers the economics of risk and insurance, in particular the following topics will be discussed:

2) individual decision making under risk
3) models of insurance demand, risk sharing, insurance supply
4) information issues in insurance markets
5) advanced topics in microeconomics and behavioral economics
5) the macroeconomic role of insurers and insurance regulation

Objective
The course introduces students to basic microeconomic models of risk attitudes and highlight the role insurance can – or cannot – play for individuals facing risks.

Content
Everyday, we take decisions involving risks. These decisions are driven by our perception of and our appetite for risk. Insurance plays a significant role in people's risk-management strategies.

In the first part of this lecture, we discuss a normative decision concept, Expected Utility theory, and compare it with empirically observed behaviour.

Students then learn about the rationale for individuals to purchase insurance, and for companies to offer it. We derive the optimal level of insurance demand and discuss how it depends on our model's underlying assumptions.

We then discuss the consequences of information asymmetries in insurance markets and the consequences for insurance supply.

Finally, we discuss refinements in decision theory that help account for observed behaviours that don't fit with the basic models of microeconomic theory. For example, we'll explore how behavioural economics can be leveraged by the insurance industry.

Literature
Main literature:
- Handbook of the Economics of Risk and Uncertainty, Volume1;

### 363-1137-00L

**Applied Econometrics in Environmental and Energy Economics**

*Does not take place this semester.*

It is highly recommended to take 363-0570-00L Principles of Econometrics first.

#### Abstract

The course introduces the most common empirical methods for the analysis of issues in environmental, energy, and resource economics. The course includes computer laboratory sessions, and covers the following broad topics: demand models, discrete choice models, empirical methods in policy evaluation, field- and quasi-experiments.

#### Objective

At the end of the course, the students will be able to: understand the most common empirical methodologies used in environmental, energy, and resource economics; understand the problems the methodologies learnt in class aim to address; appreciate the importance of causal inference in empirical economics; read and understand the research papers in the literature; apply the empirical methods learnt in class using the software R.

#### Content

The course introduces students to empirical statistical methods that have wide application in environmental, energy, and resource economics and it is divided in four blocks. The first block is a quick review of the basic econometric methodology and concepts (OLS, standard errors, logit/probit models); the second block introduces demand models like the Almost Ideal Demand System, discrete choice models, and their evolutions; the third block explores causal inference in empirical economics and the main reduced-form econometric techniques used in policy evaluation, such as difference-in-differences, regression discontinuity and synthetic control; the fourth block introduces field experiments and instrumental variables, and their characteristics.

At the end of each block there will be a computer laboratory class in which the student will learn to apply the methodologies learnt in class using the statistical open-source software R. Throughout the course, students will have the chance to work on actual data used for analysis in economics papers.

The lectures will make use of current research papers in the literature to illustrate practical examples in which the methodologies learnt in class have been used. Students will be expected to read in advance the paper that will be explained during the lecture. The evaluation policy has the aim to allow students to get practical experience on the econometric methodologies learnt in class. Thus, beyond a final open-book computer exercise exam (60% of the grade), the course includes short takehome computer exercises (40% of the grade).

As the course will be centered on econometric methods, it is recommended that students have taken 363-0570-00L Principles of Econometrics first, or have otherwise a solid knowledge of basic econometric methodologies as detailed in Part 1 of Wooldridge, Jeffrey M. (2018) Introductory Econometrics : A Modern Approach. Seventh ed. ISBN: 978-1-337-55886-0. Knowledge of statistical software R is helpful, but not required and will be taught in the computer laboratory sessions.

#### Prerequisites / notice

It is highly recommended to take 363-0570-00L Principles of Econometrics first.

---

### Project Management and Communication of Science

#### Number | Title | Type | ECTS | Hours | Lecturers
--- | --- | --- | --- | --- | ---
751-5201-10L | Tropical Cropping Systems, Soils and Livelihoods (with Excursion) | W+ | 5 credits | 10G | J. Six, K. Benabderrazik

**IMPORTANT:** Students who enroll for this course are strongly recommended to verify with lecturers from other courses whether their absence of two weeks may affect their performance in the respective courses.

#### Abstract

This course guides students in analyzing and comprehending tropical agroecosystems and food systems. Students gain practical knowledge of field methods, diagnostic tools and survey methods for tropical soils and agroecosystems. An integral part of the course is the two-week field project in the Mount Kenya Region, which is co-organized with the University of Embu (Kenya).

#### Objective

1. Overview of the major land use systems in Tropical agroecosystems in several contexts Africa
2. Interdisciplinary analysis of agricultural production systems
3. Knowledge on methods to assess agroecological performance of a tropical agroecosystems
4. Hands-on training on the use of field methods, diagnostic tools and survey methods.
5. Gain practical knowledge on how to assess to climate resilience and farming systems.
6. Collaboration in international students and stakeholders

#### Content

This course guides students in analyzing and comprehending tropical agroecosystems. Students of ETH Zürich will work together with the students from Embu University (Kenya) in an interdisciplinary and intercultural team. Students will focus on the Agroecological performance and climate resilience of diverse farming systems in the Mount Kenya Region.

From October 28th to November 11th, The students will take part in a field course in the Mount Kenya Region. Students will then gain practical knowledge on field, meeting several stakeholders of the agricultural and food systems and conducting various assessments related to climate resilience and farming systems.

#### Prerequisites / notice

We would require the students enrolled to the class to send a short cover letter (1-page max.) by September 18rd 2023, justifying your motivation to enroll to this class. A selection of 20 students will be done on the basis of the letters.
### Professional Internship

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>751-0210-00L</td>
<td>Professional Internship</td>
<td>O</td>
<td>30 credits</td>
<td></td>
<td>B. Dorn</td>
</tr>
</tbody>
</table>

**Abstract**

Students primarily work on a defined task or internship project in a professional environment within the field of Agricultural Sciences. By doing so, they apply the subject-specific, method-specific, social, and personal competencies acquired during their studies in their daily work and further develop and deepen them. Additionally, they reflect upon and present their internship experiences.

**Objective**

The students will set their own learning and working goals, and reflect on learning and work performance within the framework of their internship provider.

**Content**

- a preparatory phase, which includes an information event, the attendance of Agro Day II as well as seeking a suitable internship position.
- the placement period, preferably in the 3rd semester of the master's programme, but necessarily before the master's thesis, lasting at least 16 weeks. During placement period, additional written assignments will be completed.
- a follow-up phase, which includes presenting a "1-minute presentation" and discussing a poster on Agro-Day II.

**Prerequisites / notice**

Der Praktikumsaufenthalt wird in der Regel im dritten Master-Semester, in jedem Fall vor Beginn der Master-Arbeit absolviert. Er kann erst absolviert werden, wenn

- die Bachelor-Arbeit im Studiensekretariat abgegeben wurde;
- eine Einschreibung ins Master-Studium Agrarwissenschaften erfolgt ist;
- allfällige Zulassungsauflagen erfüllt sind.

Falls in einem Semester nur die Lehrveranstaltung Berufspraktikum belegt wird, kann man sich in ein Urlaub einschreiben. Genaue Informationen finden sich im Moodle Kurs.

### Minors

#### Agricultural Economics and Policy

<table>

<td>Evaluation of Agricultural Policies</td>
<td>W</td>
<td>3 credits</td>
<td>2G</td>
<td>R. Huber, R. Finger, C. Schader</td>
</tr>
</tbody>
</table>

**Abstract**

In this course, students get an overview of agricultural policy evaluations and their societal and political relevance. They learn to understand and apply the principles of scientific based evaluations of agricultural policies.

**Objective**

The course has four major learning objectives: 1) Students know the conceptual background of evaluations and can relate concepts in agricultural economics to the evaluation of policies. 2) They know the basics of how to design and implement a policy evaluation study. 3) Students can transfer their methodological knowledge from other agricultural economics courses to the context of agricultural policy evaluations (econometrics, modelling etc.). They make hands-on experiences of methodological challenges. 4) They can critically assess the science-policy interface of policy evaluations.

**Content**

The course consists of two blocks: First, students will learn the basics of how to design, implement and interpret agricultural policy evaluations. In this block, the conceptual embedding, the design and methodological tools as well as case studies are presented. Secondly, the students make hands-on experience using econometric and modelling tools in the context of agricultural policy evaluations. They apply their theoretical and empirical knowledge to Swiss case studies.
**Management for Enterprises in the Agri-Food-Chain II**

**Abstract**
Advanced Management in the Agri-Food Chain:
Framework and models for management of organizations in the Agri-Food Chain in a complex environment.

**Objective**
- Students learn the basic theory and practice of dynamic simulation.
- Know the characteristics and consequences of complexity in the organizational world.
- Know possible practical applications and examples of the treated contents to organizations in the Agri-Food Chain and are able to deepen the relevant topics in an autonomous way.

**Content**
In the lecture the following contents will be treated:
- State, reasons and effects of complexity in the organizational world.
- A basic framework for shaping and governing intelligent organizations.
- Selected contemporary models for managing in the complex organizational world.
- Transfer and adaption of the models to organizations in the Agri-Food Chain.

**Lecture notes**
Reader with selected contents.

**Prerequisites / notice**
- Vorlesung "Management für Unternehmen der Agrar- & Ernährungswirtschaft I" in D-USYS

**Socioeconomics of Agriculture**

**Abstract**
The main part of this lecture will examine constellations where hierarchies, markets or cooperation have been observed and described in the agricultural sector. On a more aggregated level, different agricultural systems will be evaluated in terms of main socioeconomic parameters like social capital or perceptions.

**Objective**
Students should be able to describe the dynamics of hierarchies, markets and cooperation in an agricultural context.

**Content**
Introduction to Sociology
Introduction to Socioeconomics
Agricultural Administration: Path dependencies and efficiency issues
Power in the Chain
The farming family
Occupational Choices
Market segregation
The issue of meat demand
Common Resource Management in Alpine Farming
Agricultural Cooperatives
Societal perceptions of agriculture
Perceptions of farming from within
Varieties of agricultural systems and policies

**Lecture notes**

**Prerequisites / notice**
Basic economic knowledge is expected.

**Dynamic Simulation in Agricultural and Regional Economics**

**Abstract**
In this class, students learn the basics of system dynamics and its application to agricultural and regional economic questions. In the second half of the class, students develop their own simulation model, with which they evaluate potential interventions for improving the economic as well as the ecological sustainability of food systems.

**Objective**
- Students learn the basic theory and practice of dynamic simulation.
- Students can develop, analyze and extend a dynamic simulation model and interpret its results.
- By applying the developed simulation model, students gain insights into food system issues. They also learn to recognize the benefits and pitfalls of dynamic simulation, both from a theoretical and an applied perspective.

**Lecture notes**
Slides (will be provided during the class); articles and papers (will be provided during the class).

**Risk Analysis and Risk Management in Agriculture**

**Abstract**
Agricultural production is exposed to various risks and risk management is indispensable. This course introduces modern concepts on farmers' decision making under risk and risk management. We present innovative insights, empirical example from European agriculture.

**Objective**
- to develop a better understanding of decision making under uncertainty and risk;
- to gain hands-on experience in risk analysis and management using R;
- to develop an understanding for different sources of risk in agricultural production;
- to understand the crucial role of subjective perceptions and preferences for risk management decisions;
- to get an overview on risk management in the agricultural sector; with a particular focus on insurance solutions.
**Content**
- Quantification and measurement of risk
- Risk preferences, Expected Utility Theory, Cumulative Prospect Theory
- Production and input use decisions under risk
- Portfolio Theory and Farm Diversification
- Forwards, Futures, Crop Insurance
- Weather Index Insurance and Satellite Imagery
- Empirical Applications using R

**Lecture notes**
Handouts will be distributed in the lecture and available on the moodle.

**Prerequisites / notice**
Knowledge of basic concepts of probability theory and microeconomics

**Competencies**

**Literature**
Literature and readings will be announced. For a basic understanding we recommend the Handbook of Good Research by Jürgen Brock and Florian von Wangenheim.

**Prerequisites / notice**
The course includes out-of-class assignments to give students some hands-on experience in conducting empirical research in management. Projects will focus on one particular aspect of empirical research, like the formulation of a research question or the design of a study. Assignments will be graded and need to be turned-in on time as they will be shown and discussed in class. Class participation is encouraged and can greatly improve students' learning. In this spirit, students are expected to attend class regularly and come to class prepared.

**363-0305-00L**
Empirical Methods in Management

**Abstract**
In this class, students learn how to understand and conduct empirical research. It will enable them to manage a business based on evidence-based decision-making. The class includes assignments related to the lecture content.

**Objective**
The general objective of the course is to enable students to understand the basic principles of empirical studies. After successfully passing the class, they will be able to formulate research questions, design empirical studies, and analyze data by using basic statistical approaches.

**Content**
Data has become an important resource in today’s business environment, which can be used to make better management decisions. However, evidence-based decision-making comes along with challenges and requires a basic understanding of statistical approaches. Therefore, this class introduces problems and key concepts of empirical research, which might be qualitative or quantitative in its nature. Concerning qualitative research, students learn how to conduct and evaluate interviews. In the area of quantitative research, they learn how to apply measurement and scaling methods and conduct experiments. In addition, basic statistical analyses like a variance analysis and how to conduct it in a standard statistical software package like SPSS or R are also part of the lecture. The lessons learned from the lecture will empower students to critically assess the quality and outcomes of studies published in the media and scientific journals, which might form a basis of their managerial decision-making. We recommend the lecture also to students without basic statistical skills, who plan to attend more advanced lectures in the field of artificial intelligence such as Marketing Analytics.

The lecture will be taught in presence. There will be individual assignments that students have to solve throughout the lecture. In addition to that, there will be some non-mandatory online exercises as an additional opportunity to prepare for the exam.

**Literature**
Articles and book abstracts will be uploaded to a course website.

**851-0626-01L**
International Development Cooperation

**Abstract**
The course gives economic and empirical foundations for a sound understanding of the instruments, prospects and limitations of international development aid.

**Objective**
Students have a theoretically and empirically sound understanding of the prospects and limitations of international development aid. Students are able to critically discuss the various aid instruments of bi- and multilateral donors and NGOs.

**Content**
Introduction to the Determinants of Underdevelopment; History of Aid; Aid and Development: Theories and Empirics; Political Economy of Aid; Experience and Impact of Aid; New Instruments of Aid: e.g. Micro-Finance, Budget-Support; Fair-Trade.

**Literature**
Books and articles will be uploaded to a course website.

<td>Forum: Livestock in the World Food System</td>
<td>W+</td>
<td>2 credits</td>
<td>2S</td>
<td>S. Meese</td>
</tr>
</tbody>
</table>

**Abstract**
This forum is a platform for the critical reflection of relevant topics of livestock in the frame of the world food system comprising issues from basic knowledge to acceptance in society. The exchange is operated by scientific writing and presentation.

**Objective**
In the Forum "Livestock in the World Food System", a topic of significance for livestock agriculture is selected by the students and subsequently dealt with from various angles (from scientific basis to production systems, environmental aspects and to the acceptance by society).

The students learn to present a scientific subject in writing and orally to an audience and to defend the presentation in a discussion. Further, feedback is intended to improve the presentation style. Furthermore, the review process of a scientific paper will be demonstrated and applied.
The Forum "Livestock in the World Food System" will take place in blocks of 2 hours each. Once the general topic has been selected, it comprises two parts:

**Part 1**
Aspect 1 - Oral presentation: The students form small groups and are lecturers.
Aspect 2 - chairperson: There are moderators which are chosen from outside of the presenting groups and they will lead the discussion and the remaining students and the lecturer are the audience and ask questions.
Aspect 3 - feedback: At the beginning, students form teams of 2, which are not in the same group, to give each other feedback on their presentation style.

**Part 2.**
Aspect 1 - Scientific writing: Preparation of a critical review of a chosen publication and individual exchange with the lecturer.
Aspect 2 - Defense: There will be a discussion in small groups on several dates to discuss the chosen publication in detail and the observations during the process.

Introductions to both presentation forms will be given by the lecturer.

**Lecture notes**
**Prerequisites / notice**
- oral talk with sufficient handout
- delivery of the scientific writing in sufficient quality
- active participation during all presentations (in case of absence there will be additional tasks)
- feedback on the presentation style of a student

**751-6501-00L Ruminant Science**

**W+** 4 credits 4G M. Niu, M. Terranova, U. Witschi

**Abstract**
The course provides the scientific basis of the central aspects of reproduction and nutrition physiology of ruminants, and of the implications for animal health, product quality, and breeding programs. Means of knowledge transfer include interdisciplinary approaches, disciplinary parts, web-based learning and self-study.

**Objective**
At the end of the course the students are able to apply, by a comprehensive understanding of the underlying mechanisms, their knowledge in various fields of ruminant science. They will be able to develop and recommend best strategies for breeding programs, feed formulation, improving forage quality, and increasing animal health. They will be trained to carry out interdisciplinary and disciplinary research at the highest level.

**Content**
- Fields (contact hours)
  - Introduction: 2 h
  - Special topics: 20 h
  - Rumen Anatomy
  - Hohenheim Gas Test
  - Calf health
  - Reproduction Techniques
  - Fertility in Cows
  - Disciplinary topics: 32 h
  - Ruminal Digestion: 8 h
  - Ruminant Nutrition Physiology: 12 h
  - Reproduction in Ruminants: 8 h
  - Lectures held by the students: 4 h

In summary
- Contact hours: 58 h
- Self-study within semester: 30 h (especially preparation for the interdisciplinary courses and the own lecture)
- Self-study in semester break: 32 h
Total: 120 h

**Lecture notes**
**Literature**
**Prerequisites / notice**
The specialty of this course is that for the first time the animal science disciplines are unified. This is realised with a particular emphasis on interdisciplinary special topics and new forms of teaching. At the same time the essential basics in the central fields are communicated.

Conditions for successful participation: Background on animal science from the Bachelor is desired. In order to attend the Minor in Ruminant Science without any animal science background, a realistic self-assessment concerning the need for additional self-study is recommended (e.g. by choosing an appropriate bachelor course which then may be counted as 'optional courses' in the master). These efforts depend on the extent to which animal science courses have already been attended in the bachelor.

The control of performance will consist of:
- an own short lecture
- a final oral examination with focus on comprehension of the fundamental linkages rather than of specific details

**751-6243-00L Breeding and Conservation of Animal Genetic Resources**

**W+** 2 credits 2V H. Signer-Hasler, C. Flury

**Abstract**
Animal genetic resources refer to the genetic and species diversity of livestock. Only a few production breeds have been further developed through breeding, while local breeds have no longer been able to survive in this competition. Without the support of endangered breeds and the sustainable breeding of productive breeds, many regionally typical breeds are threatened with extinction.
**Objective**

Learning Objectives: Part 1:
At the end of the course, students are able to assess the importance and problems of small ruminant breeding and husbandry in Switzerland and neighbouring countries. They know the most important breeding objectives and are able to assess them in terms of production and sustainable development in small ruminants and cattle.

Learning objectives part 2:
The second part gives an overview of the distribution, endangerment and conservation of breed diversity of farm animals in Switzerland and internationally. The theory is illustrated with numerous examples and the knowledge is deepened in exercises.

The students:
- have an overview of the national and international distribution of animal genetic resources and are familiar with the database DAD-IS (Domestic Animal Diversity Information System).
- can name the national and international efforts to conserve agricultural livestock breeds.
- know how to describe genetic diversity.
- can point out what is important in the management of small populations.
- can describe different conservation measures, especially in situ and ex situ conservation.
- can describe current national and international conservation programmes for different livestock breeds.

**Prerequisites / notice**

Examination:
Examination Part 1: Graded written examination (1 hour) on the material covered. Examination Part 2: Graded semester performance completed during the block course. Parts 1 and 2 contribute equally to the final grade.

**Abstract**
Few crops dominate the crop rotations worldwide. Following the goal of an increased agricultural biodiversity, species such as buckwheat but also medicinal plants might become more important in future. The biology, physiology, stress tolerance and central aspects of the value-added chain of the above-mentioned and of other alternative crops will be depicted.

**Objective**
During this course, students learn to assess the potential of different minor or alternative crops compared to the dominant major crops based on their biological and agronomical features. Each student will assess and present a specific alternative crop of his or her choice based on information from scientific articles and Wikipedia. Wikipedia-entries will be generated.

<td>Current Challenges in Plant Breeding</td>
<td>W</td>
<td>2</td>
<td>2G</td>
<td>B. Studer, A. Hund, R. Kölliker</td>
</tr>
</tbody>
</table>

**Abstract**
The seminar 'Current Challenges in Plant Breeding' aims to bring together national and international experts in plant breeding to discuss current activities, latest achievements and future prospective of a selected topic/area in plant breeding.

**Objective**
The educational objectives cover thematic, methodic as well as social and personal competencies:
- Deepening of scientific knowledge in plant breeding
- Critical evaluation of current challenges and new concepts in plant breeding
- Promotion of collaboration and Master thesis projects with practical plant breeders
- Independent literature research to get familiar with the selected topic
- Critical evaluation and consolidation of the acquired knowledge in an interdisciplinary team
- Establishment of a scientific presentation in an interdisciplinary team
- Presentation and discussion of the teamwork outcome
- Establishing contacts and strengthening the network to national and international plant breeders and scientist

**Content**
Interesting topics related to plant breeding will be selected in close collaboration with the working group for plant breeding of the Swiss Society of Agronomy (SSA).

**Lecture notes**
None

**Literature**
Peer-reviewed research articles, selected according to the topic.

**Prerequisites / notice**
Participation in the BSc course ‘Pflanzenzüchtung’ is strongly recommended, a completed course in ‘Molecular Plant Breeding’ is advantageous.
The course focuses on alien organisms in agriculture as well as the scientific assessment and regulatory management of their effects on the environment and agricultural production. Alien organisms in agriculture is a topic that receives an increasing awareness among farmers, agricultural scientists, regulators and the general public. Students of this course will learn about the nature of alien organisms such as invasive species, biocontrol organisms and genetically modified organisms. With a particular focus on arthropods, plants and their interactions we will look at the potential threats the novel organisms pose, the benefits they provide and how both of these effects can be scientifically assessed. Students will learn how the topic of alien organisms in agriculture is intrinsically tied to policy making and regulation and get to know current examples and future challenges in research. In the last part of the course students will be able to apply the acquired knowledge in a practical exercise (case study).

Material will be distributed during the course. A part of the course will take place in flipped classroom mode, i.e. some lectures will be available as podcasts.

This course focuses on the interactions between ecology, biogeochemistry and management of agro- and forest ecosystems, thus, coupled human-environmental systems. Students learn how human impacts on ecosystems via management or global change are mainly driven by effects on biogeochemical cycles and thus ecosystem functioning, but also about feedback mechanisms of terrestrial ecosystems. Students will analyse and understand the complex and interacting processes of ecology, biogeochemistry and management of agroecosystems. They will use their theoretical knowledge in two flipped classroom exercises, but also set up a small weather station and different meteorological and greenhouse gas flux data will be analysed (using R) and assessed in terms of production, greenhouse gas budgets, and carbon sequestration. Thus, students will learn how to collect, analyse and interpret data about the complex interactions of a coupled human-environmental system.

Students will work in groups (3-4 persons per group) with data from a small weather station (dedicated to the course), as well as data from the long-term measurement network Swiss FluxNet and from global databases. Data from the intensively managed grassland site Chamau will be used to investigate the biosphere-atmosphere exchange of CO2, H2O, N2O and CH4. Functional relationships will be identified, greenhouse gas budgets will be calculated for different time periods and in relation to management over the course of a year.

Handouts will be available in moodle.

Prerequisites: Attendance of introductory courses in plant ecophysiology, ecology, and grassland or forest sciences. Knowledge of data analyses in R and statistics. Course will be taught in English.
Current Aspects of Nutrient Cycle in Agro-Ecosystems

Abstract
The seminar concerns current aspects and research related to nutrient cycles in agro-ecosystems. The theme of the next seminar is "Integrated Nutrient Management to maximize nutrient use efficiency in productive agricultural systems: Insights from long-term field experiments".

Objective
Analyze publications and/or data records on long-term field experiments regarding their content on integrated nutrient management and derive the nutrient use efficiency; link this information, write it up in a report and present the results in an oral presentation; work in a group; ask questions and contribute to the discussion following the oral presentations; link the information to answer overarching questions and recommendations; expand the knowledge on nutrient cycles and nutrient management in the agro-ecosystem; learn about the importance of long-term field experiment to answer questions on the sustainability of agricultural systems.

Content
The seminar concerns current aspects and research related to nutrient cycles in agro-ecosystems. The theme of the next seminar is "Integrated Nutrient Management to maximize nutrient use efficiency in productive agricultural systems: Insights from long-term field experiments". The students will analyze and connect the results published (or from data records) for selected field experiments in a group work. They will present their analysis in a report and in an oral presentation. The seminar is composed by presentations of experts and of the students. The presentations will be synthesized during a final discussion.

751-4003-01L Current Topics in Grassland Sciences (autumn)

Abstract
Research results in agro- and forest ecosystem sciences will be presented by experienced researchers as well as by doctoral and graduate students. Citation classics as well as recent research results will be discussed. Topics will range from plant ecophysiology, biodiversity and biogeochemistry to management aspects in agro- and forest ecosystems.

Objective
Students will be able to understand and evaluate experimental design and data interpretation of on-going studies, be able to critically analyze published research results, practice to present and discuss results in the public, and gain a broad knowledge of recent research and current topics in agro- and forest ecosystem sciences.

Content
Research results in agro- and forest ecosystem sciences will be presented by experienced researchers as well as by doctoral and graduate students. Citation classics as well as recent research results will be discussed. Topics will range from plant ecophysiology, biodiversity and biogeochemistry to management aspects in agro- and forest ecosystems.

Lecture notes
none

Prerequisites
Basic knowledge of plant ecophysiology, terrestrial ecology and management of agro- and forest ecosystems. Course will be taught in English.

751-4506-00L Plant Pathology III

Abstract
Identification based on host, symptoms and micro-morphology, completed with life cycles and related control measures of the most important fungal diseases and their causal pathogens of annual and perennial crops with agricultural significance.

Objective
The students will learn and train preparation skills for microscopy, acquire knowledge of selected diseases (identification, biology of pathogen, epidemiology and systematics) and understand the corresponding integrated control measures practiced in Swiss agriculture.

Content
A script will be used on annual and perennial crops and their most important diseases. It will be updated stepwise.

Lecture notes

Prerequisites
The course will be in German (spec. nomenclature)
Environmental Systems Data Science: Data

B. Streit

The course provides the first part of an introduction to the statistical/graphical/data science software R (https://www.r-project.org/) for environmental scientists. R is free software with a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

### Prerequisites

- Mathematical knowledge up to University level
- Basic knowledge of programming
- Basic Excel knowledge

### Content

- R Basics: reading and writing data from/to files, creating vectors & matrices, selecting elements of dataframes, vectors and matrices, arithmetics;
- Types of data: numeric, character, logical and categorical data, missing values;
- Simple (statistical) functions: summary, mean, var, etc., simple statistical tests;
- What is R?
- R Basics: reading and writing data from/to files, creating vectors & matrices, selecting elements of dataframes, vectors and matrices, arithmetics;
- Types of data: numeric, character, logical and categorical data, missing values;
- Simple (statistical) functions: summary, mean, var, etc., simple statistical tests;
- Writing simple functions;
- Introduction to graphics: scatter-, boxplots and other high-level plotting functions, embellishing plots by title, axis labels, etc., adding elements (lines, points) to existing plots.

### Objective

The students are able to

- frame a data science problem and build a hypothesis
- describe the steps of a typical data science project workflow
- conduct selected steps of a workflow on specifically prepared datasets, with a focus on choosing, fitting and evaluating appropriate algorithms and models
- critically think about the limits and implications of a method
- visualise data and results throughout the workflow
- access online resources to keep up with the latest data science methodology and deepen their understanding

### Lectures

- L. Pellissier, C. P. Albouy, M. Volpi
- M. Mächler

### Competencies

- Personal Competencies: Critical Thinking
- Method-specific Competencies: Analytical Competencies, Problem-solving
- Subject-specific Competencies: Concepts and Theories, Techniques and Technologies

### Data Science and Technology for Agricultural Science

#### 751-4704-00L Weed Science

**Abstract**

Modern weed management comprises competent knowledge of weed biology, weed ecology, population dynamics, crop-weed-interactions and different measures to control weeds. Weeds are understood to be rather part of a habitat or a cropping system than just unwanted plants in crops.

**Objective**

At the end of the course the students are qualified to develop sustainable solutions for weed problems in agricultural and natural habitats.

**Content**

Modern weed management comprises competent knowledge of weed biology, weed ecology, population dynamics, crop-weed-interactions and different measures to control weeds. Weeds are understood to be rather part of a habitat or a cropping system than just unwanted plants in crops. Accordingly, this knowledge will be imparted during the course and will be required to understand the mechanisms of integrated weed control strategies.

#### Using R for Data Analysis and Graphics (Part I)

**Number** 701-3001-00L

**Title** Environmental Systems Data Science: Data Processing

**Type** W

**ECTS** 2

**Hours** 2G

**Lecturers** L. Pellissier, C. P. Albouy, M. Volpi

**Abstract**

Students are introduced to a typical data science workflow using various examples from environmental systems. They learn common methods and key aspects for each step through practical application. The course enables students to plan their own data science project in their specialization and to acquire more domain-specific methods independently or in further courses.

**Objective**

The students are able to

- frame a data science problem and build a hypothesis
- describe the steps of a typical data science project workflow
- conduct selected steps of a workflow on specifically prepared datasets, with a focus on choosing, fitting and evaluating appropriate algorithms and models
- critically think about the limits and implications of a method
- visualise data and results throughout the workflow
- access online resources to keep up with the latest data science methodology and deepen their understanding

**Content**

- The data science workflow
- Access and handle (large) datasets
- Prepare and clean data
- Analysis: data exploratory steps
- Analysis: machine learning and computational methods
- Evaluate results and analyse uncertainty
- Visualisation and communication

**Prerequisites / notice**

- 252-0840-02L Anwendungsnahe Programmieren mit Python
- 401-0624-00L Mathematik IV: Statistik
- 401-6215-00L Using R for Data Analysis and Graphics (Part I)
- 401-6217-00L Using R for Data Analysis and Graphics (Part II)
- 701-0105-00L Mathematik VI: Angewandte Statistik für Umwelt- und Naturwissenschaften

#### Using R for Data Analysis and Graphics (Part II)

**Number** 401-6215-00L

**Title** Using R for Data Analysis and Graphics (Part I)

**Type** W

**ECTS** 1.5

**Hours** 1G

**Lecturers** A. Hauser

**Abstract**

The course provides the first part of an introduction to the statistical/graphical/data science software R (https://www.r-project.org/) for scientists. Topics covered are data generation and selection, graphical and basic statistical functions, creating simple functions, basic types of objects.

**Objective**

The students will be able to use the software R for simple data analysis and graphics.

**Content**

The course provides the first part of an introduction to the statistical software R for scientists. R is free software that contains a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

Part I of the course covers the following topics:

- What is R?
- R Basics: reading and writing data from/to files, creating vectors & matrices, selecting elements of dataframes, vectors and matrices, arithmetics;
- Types of data: numeric, character, logical and categorical data, missing values;
- Simple (statistical) functions: summary, mean, var, etc., simple statistical tests;
- Writing simple functions;
- Introduction to graphics: scatter-, boxplots and other high-level plotting functions, embellishing plots by title, axis labels, etc., adding elements (lines, points) to existing plots.

The course focuses on practical work at the computer with R. We will make use of the graphical user interface RStudio: www rstudio.org

**Lecture notes**

An Introduction to R. http://stat.ethz.ch/CRAN/doc/contrib/Lam-IntroductionToR_LHL.pdf

**Prerequisites / notice**

The course resources will be provided via the Moodle web learning platform. Subscribing via Mystudies "automatically" makes you a student participant of the Moodle course of this lecture, which is at

https://moodle-app2.let.ethz.ch/course/view.php?id=20847

**Competencies**

- Personal Competencies: Critical Thinking
- Method-specific Competencies: Analytical Competencies, Problem-solving
- Subject-specific Competencies: Concepts and Theories, Techniques and Technologies

#### 401-6217-00L Using R for Data Analysis and Graphics (Part II)

**Number** 401-6217-00L

**Title** Using R for Data Analysis and Graphics (Part II)

**Type** W

**ECTS** 1.5

**Hours** 1G

**Lecturers** M. Mächler

**Abstract**

The course focuses on practical work at the computer with R. We will make use of the graphical user interface RStudio: www rstudio.org

**Competencies**

- Personal Competencies: Critical Thinking
- Method-specific Competencies: Analytical Competencies, Problem-solving
- Subject-specific Competencies: Concepts and Theories, Techniques and Technologies

Data: 02.07.2024 12:39 Autumn Semester 2024 Page 53 of 2667
The course provides the second part of an introduction to the statistical software R for scientists. Topics are data generation and selection, graphical functions, important statistical functions, types of objects, models, programming and writing functions.

Note: This part builds on "Using R... (Part I)", but can be taken independently if the basics of R are already known.

Abstract

The students will be able to use the software R efficiently for data analysis, graphics and simple programming.

Objective

The course provides the second part of an introduction to the statistical software R (https://www.r-project.org/) for scientists. R is free software that contains a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

Content

Part II of the course builds on part I and covers the following additional topics:
- Elements of the R language: control structures (if, else, loops), lists, overview of R objects, attributes of R objects;
- More on R functions;
- Applying functions to elements of vectors, matrices and lists;
- Object oriented programming with R: classes and methods;
- Tailoring R: options;
- Extending basic R: packages

The course focuses on practical work at the computer. We will make use of the graphical user interface RStudio: www.rstudio.org

Prerequisites / notice

Basic knowledge of R equivalent to "Using R... (part I)" (= 401-6215-00L ) is a prerequisite for this course.

The course resources will be provided via the Moodle web learning platform. As from FS 2019, subscribing via Mystudies should "automatically" make you a student participant of the Moodle course of this lecture, which is at https://moodle-app2.let.ethz.ch/course/view.php?id=20848

751-5510-00L Introduction to Agricultural Robotics W+ 3 credits 2G S. Mintchev

Abstract

Autonomous robots are quickly becoming a key player in the transition to precision agriculture. In this course, students will learn theoretical and practical aspects of robotics. Lectures will introduce how robots operate and analyse their application to precision agriculture. In hands-on laboratories, students will apply concepts learned in class on educational robots to simulate a weeding task.

Objective

After the course, students will be able to critically examine and select appropriate robotic solutions for agricultural applications.

The learning objectives of the course are: (i) illustrate the principle of operation of the main components of a robotic system, (ii) analyse how the different robotic components are integrated and contribute to the functioning of a robotic system, and (iii) solve problems in the field of agriculture using robotic principles.

Content

Robots are becoming a key technology in the transition to smart farming and in supporting the agricultural needs of the 21st century. For example, robots enable site-specific fertilization, automated weeding, or livestock herding.

The course gives an overview of robotic systems, beginning with their fundamental components (e.g., sensors, actuators, locomotion strategies) and gradually scaling up to the system level, illustrating the concepts of perception, robot control, obstacle avoidance and navigation. Exercises performed with an educational robot (Thymio) will complement the theoretical lectures providing a hands-on practical experience of the challenges of using these machines.

During the course, students will gradually apply the theoretical and practical knowledge they are learning. To this end, students will work in teams to develop a robotic solution for an agricultural task of their choice. Students will learn to translate the task into meaningful requirements for a robotic system and critically select the most appropriate components to achieve the required robotic functions. Students will periodically present and discuss the development of this "robot design" exercise during presentations and in a journal report.

Lecture notes

Copies of the slides and exercises will be provided on the course Moodle page.

Literature

Prerequisites / notice

No mandatory prerequisites, but it is preferable that students have a basic knowledge of computer programming.

Class size limitation to 30 students.
701-0951-00L GIST - Introduction into Geoinformation Science and Technology  

Abstract: Theoretical basics and fundamental concepts of Geographic Information Science are imparted and subsequently further elaborated with the software ArcGIS.

Objective: Students are able to:
- elucidate the theoretical and conceptional foundations of geographic information systems (GIS)
- independently perform normal GIS work using commercial software and practical examples

Content:
- What is GIS? What are spatial data?
- The representation of reality by means of spatial data models: vector, raster, TIN
- The four phases of data modelling: Spatial, conceptual, logical and physical model
- Possibilities of data collection
- Transition of reference frame
- Spatial Analysis I: query and manipulation of vector data
- Spatial Analysis II: operators and functions with raster data
- Digital elevation models and derived products
- Process modelling with vector and raster data
- Presentation possibilities of spatial data

One Friday is reserved for a field trip or guest speaker;

Literature:

Prerequisites / notice: Aufgrund der Grösse des verfügbaren EDV-Schulungsraumes ist die Teilnehmerzahl auf 50 Studierende beschränkt! Für die Übungen werden die Studierenden auf zwei, max. drei Zeitfenster aufgeteilt. Pro Zeitfenster können maximal 25 Studierende betreut werden.

651-4031-00L Geographic Information Systems  

Abstract: Introduction to the fundamental concepts and data processing capabilities of Geographic Information Systems (GIS). Practical application of geospatial data management and analysis functions based on a selected geoscience project.

Objective: Students can:
- explain the basic principles of GIS
- solve a complex, real-world GIS problem in the field of Earth Science
- apply the principles of data modelling and geoprocessing with ArcGIS Pro: data design and modelling, data acquisition, data integration of different data types (including LiDAR data), spatial analysis of vector and raster data, special functions for digital terrain modelling and hydrology, map production and 3D visualisation.

Content: Theoretical introduction to the concepts, spatial data types and spatial data handling functions of Geographic Information Systems (GIS). Application of data modeling principles and geoprocessing capabilities using ArcGIS Pro: data design and modeling, data acquisition, data acquisition and integration, spatial analysis of vector and raster data, particular functions for digital terrain modeling and hydrology, map generation and 3D-visualization.

Lecture notes: Lecture Script: Introduction to Geographic Information Systems, Tutorial: Introduction to ArcGIS Pro. All lecture materials are provided digitally.

Literature:
Building on existing data science resources

The CNNAP course discusses the mechanistic relationships between nutrient speciation in fertilizer and nutrient uptake by plants using concepts and theories. Students are introduced to advanced data science where environmental data are analyzed using state of the art machine learning methods. Starting from known statistical approaches, they learn the principle of more advanced machine learning methods with practical application. The course enables students to plan their own data science project in their specialization and to apply machine learning methods.

Environmental Systems Data Science: Machine Learning

The students are able to:
- select an appropriate model related to a research question and dataset
- describe the steps from data preparation to running and evaluating models
- prepare data for running machine learning with dependent and independent variable
- build and validate regressions and neural network models
- understand convolution and deep learning models
- access online resources to keep up with the latest data science methodology and deepen their understanding

The data science workflow:
- Data preparation for running and validating machine learning models
- Get to know machine learning approaches including regression, random forest and neural network
- Model complexity and hyperparameters
- Model parameterization and loss
- Model evaluations and uncertainty
- Deep learning with convolutions

The seminar concerns current aspects and research related to nutrient cycles in agro-ecosystems. The students are able to:
- analyze publications and/or data records on long-term field experiments regarding their content on integrated nutrient management and recommendations; expand the knowledge on nutrient cycles and nutrient management in the agro-ecosystem; learn about the importance of long-term field experiment to answer questions on the sustainability of agricultural systems.
- ask questions and contribute to the discussion following the oral presentations; link the information to answer overarching questions and recommendations; expand the knowledge on nutrient cycles and nutrient management in the agro-ecosystem; learn about the importance of long-term field experiment to answer questions on the sustainability of agricultural systems.
- derive the nutrient use efficiency; link this information, write it up in a report and present the results in an oral presentation; work in a group; ask questions and contribute to the discussion following the oral presentations; link the information to answer overarching questions and recommendations; expand the knowledge on nutrient cycles and nutrient management in the agro-ecosystem; learn about the importance of long-term field experiment to answer questions on the sustainability of agricultural systems.
- work in a group; ask questions and contribute to the discussion following the oral presentations; link the information to answer overarching questions and recommendations; expand the knowledge on nutrient cycles and nutrient management in the agro-ecosystem; learn about the importance of long-term field experiment to answer questions on the sustainability of agricultural systems.

Chemical Nature of Nutrients and their Availability to Plants: The Case of Phosphorus

The CNNAP course discusses the mechanistic relationships between nutrient speciation in fertilizer and nutrient uptake by plants using phosphorus as an example. The course involves theoretical aspects of nutrient cycling, laboratory work, data analysis and presentation, and the use of advanced methods in plant nutrition studies.
At the end of the CNNAP course, participants will obtain a mechanistic understanding of why and how the speciation of phosphorus in fertilizer can affect its release to the soil solution and subsequent uptake by plants. Students will be able to use this information for the development of fertilization schemes that maximize the nutrient uptake and fertilizer efficiency of crops or pastures. During the course, participants will become familiar with the use of radiotopes and nuclear magnetic resonance as approaches to measure nutrient availability and forms, respectively and they will know the limits of these techniques. Students will also have the opportunity to improve their laboratory, presentation, discussion and writing skills.

**Objective**

At the end of the CNNAP course, participants will:

- Obtain a mechanistic understanding of why and how phosphorus in fertilizer can affect its release to the soil solution and subsequent uptake by plants.
- Use information for the development of fertilization schemes that maximize nutrient uptake and fertilizer efficiency of crops or pastures.
- Become familiar with the use of radiotopes and nuclear magnetic resonance as approaches to measure nutrient availability and forms.
- Know the limits of these techniques.
- Improve their laboratory, presentation, discussion, and writing skills.

**Lecture notes**

Documents will be distributed during the lecture.

**Literature**

Documents will be distributed during the lecture.

**Prerequisites / notice**

The CNNAP lecture will take place at the ETH experimental station in Eschikon Lindau every second year. The next course will be organized in autumn 2024.

The CNNAP course will take place if and only if 8 or more students are registered one week before the start.

See the location of the station at: http://www.plantnutrition.ethz.ch/the-group/how-to-find-us.html

We strongly advise students who are planning to be absent for more than one week during the semester NOT to visit this course.

Students should have visited the plant nutrition lectures in the 3rd and 6th semesters and the lecture pedosphere in the 3rd semester of the agricultural study program of the ETH. If students do not have visited these courses they will have to acquire the necessary information by themselves as this knowledge is indispensable for the CNNAP course.

As the CNNAP course does not take place in autumn 2023, we recommend students interested in integrated assessment of nutrient cycling in soil plant systems to visit the 8th semester lecture 751-3404-00L (Nutrient Fluxes in Soil-Plant Systems: The Case of Nitrogen) organized in spring 2024 by Oberson et al.

**Competencies**

**Subject-specific Competencies**

- Concepts and Theories: assessed
- Techniques and Technologies: assessed

**Method-specific Competencies**

- Analytical Competencies: assessed
- Problem-solving: assessed
- Project Management: fostered

**Social Competencies**

- Communication: assessed

**Personal Competencies**

- Adaptability and Flexibility: fostered
- Creative Thinking: fostered
- Critical Thinking: assessed
- Integrity and Work Ethics: fostered
- Self-awareness and Self-reflection: fostered
- Self-direction and Self-management: fostered

**Abstract**

This course provides an overview about the applicability of stable isotopes (carbon 13C, nitrogen 15N, oxygen 18O and hydrogen 2H) to process-oriented ecological research. Topics focus on stable isotopes as indicators for the origin of pools and fluxes, partitioning of composite fluxes as well as to trace and integrate processes. In addition, students carry out a small project during lab sessions.

**Objective**

Students will be familiar with basic and advanced applications of stable isotopes in studies on plants, soils, water and trace gases, know the relevant approaches, concepts and recent results in stable isotope ecology, know how to combine classical and modern techniques to solve ecophysiological or ecological problems, learn to design, carry out and interpret a small IsoProject, practice to search and analyze literature as well as to give an oral presentation.

**Content**

The analyses of stable isotopes often provide insights into ecophysiological and ecological processes that otherwise would not be available with classical methods only. Stable isotopes proved useful to determine origin of pools and fluxes in ecosystems, to partition composite fluxes and to integrate processes spatially and temporally.

This course will provide an introduction to the applicability of stable isotopes to ecological research questions. Topics will focus on carbon (13C), nitrogen (15N), oxygen (18O) and hydrogen (2H) at natural isotope abundance and tracer levels. Lectures will be supplemented by intensive laboratory sessions, short presentations by students and computer exercises.

**Lecture notes**

Handouts will be available on the webpage of the course.

**Literature**

Will be discussed in class.

**Competencies**

**Subject-specific Competencies**

- Concepts and Theories: assessed
- Techniques and Technologies: assessed

**Method-specific Competencies**

- Analytical Competencies: assessed
- Problem-solving: assessed
- Project Management: fostered

**Social Competencies**

- Communication: assessed

**Personal Competencies**

- Creative Thinking: fostered
- Critical Thinking: assessed
- Integrity and Work Ethics: fostered
- Self-awareness and Self-reflection: fostered
- Self-direction and Self-management: fostered

**Abstract**

This course covers chemical and biogeochemical processes in soils and water and their influence on the behavior and cycling of nutrients and pollutants in terrestrial and aquatic systems. Approaches for quantitative modeling of the processes are introduced and applied in selected examples.

**Objective**

1. Understanding of important chemical properties and processes of soils and water and their influence on the behavior (e.g., chemical speciation, bioavailability, mobility) of nutrients and pollutants.
2. Quantitative applications of chemical equilibria to processes in natural systems.

The course "Soil and Water Chemistry" teaches, applies and examines the competences process understanding, systems understanding, and modelling.

**Content**

Chemical equilibria in aqueous solutions, gas equilibria, precipitation and dissolution of mineral phases, silicate weathering, weathering kinetics, formation of secondary minerals (clay minerals, oxides, sulfides), redox processes in natural systems, pH buffering and acidification, salinity and salinization, environmental behavior of selected essential and toxic trace elements.

**Lecture notes**

Environmental Soil Physics/Vadose Zone Hydrology
W 3 credits 2V+1U A. Carminati, P. U. Lehmann Grunder

Abstract
The course provides theoretical and practical foundations for understanding and characterizing physical soil properties and processes and their relevance for terrestrial ecosystems, plant growth, hydrological processes and atmospheric-land gas exchange, across all relevant scales.

Objective
Students are able to:
- Characterize the different soils based on their key textural and structural properties.
- Simulate and predict soil water retention and flow under varying environmental conditions and understand the key driving forces (capillarity, gravity, friction) and related water properties (surface tension and viscosity).
- Predict soil hydraulic properties for varying soil textural classes.
- Predict solute transport in soils for varying environmental conditions.
- Predict energy balance and temperature dynamics in soils.
- Predict conditions for plant water stress
- Estimate the impact of soil properties on the hydrological cycle and on plant growth.

Content

INTRODUCTION
Week 1 (September 18)
Presentation of the role of soil physics in environmental sciences and terrestrial ecosystems: soils in the water cycle; soils and vegetation; soils and solute transport. Survey on students' interests and expectations. Presentation of course structure and learning objectives.

BASIC SOIL PROPERTIES
Week 2 (September 25) and Week 3 (October 02)
soil texture, particle size distribution, soil structure, soil surface area, porosity and bulk density
Pore scale consideration (water in a single pore), pore sizes and shapes; surface tension; Young-Laplace equation; capillary rise; contact angle
Friction and laminar flow; Hagen-Poiseuille's law; Washburn equation; numerical lab (REPORT 1)

SOIL HYDRAULIC PROPERTIES
Week 4 (October 09) and Week 5 (October 16)
Soil water potential and soil water potential - The energy state of soil water; total water potential and its components; volumetric and gravimetric water contents; field capacity and wilting point
Soil water characteristics and pore size distribution
Saturated water flow in soils - Laminar flow in tubes (Poiseuille's Law); Darcy's Law, conditions and states of flow; permeability and hydraulic conductivity, measurement and theoretical concepts; effective conductivity; unsaturated hydraulic conductivity; Buckingham law.
Unsaturated water flow in soils - Unsaturated hydraulic conductivity models and applications

TOOLBOX – MEASUREMENTS AND MODELING
Week 6 (October 23) and Week 7 (October 30)
Measuring soil hydraulic properties, fitting and interpretation; Lab tour - demonstration of soil physical methods; lecture on HYPROP method; report on HYPROP data (REPORT 2)
Modelling unsaturated water flow based on Richards equation - Using Hydrus1D for simulation of unsaturated flow; simulating HYPROP measurements (REPORT 3)

SOIL IN THE WATER CYCLE
Week 8 (November 06) – Week 9 (November 13)
Water infiltration - steady state solutions for infiltration; approximate solutions to infiltration (Green-Ampt, Philip); infiltration rate and ponding; outlook to preferential flow
Water evaporation - Energy balance and land atmosphere interactions - potential and actual evaporation, evaporation stages;

SOIL PLANT INTERACTIONS
Week 10 (November 20) Week 11 (November 27)
Root water uptake and transpiration – Theory and mechanisms controlling root water uptake; hydraulic properties of rhizosphere; plant and stomatal conductance.
Modelling root water uptake and transpiration; analytical approaches and modeling using Hydrus (REPORT 4)

SOLUTE TRANSPORT
Week 12 (December 04) Week 13 (December 11)
Transport mechanisms of solutes in porous media; breakthrough curves; convection-dispersion equation; solutions for pulse and step solute application
Transport of reactive substances, preferential flow, simulations with Hydrus

CLOSURE
Week 14 (December 18)
Summary, course synthesis, connections between the different topics, questions, exam preparation

Literature
Supplemental textbook (not mandatory) - Introduction to Environmental Soil Physics, by: D. Hillel
This course guides students in analyzing and comprehending tropical agroecosystems and food systems. Students gain practical knowledge of field methods, diagnostic tools and survey methods for tropical soils and agroecosystems. An integral part of the course is the two-week field project in the Mount Kenya Region, which is co-organized with the University of Embu (Kenya).

**Abstract**

This course guides students in analyzing and comprehending tropical agroecosystems and food systems. Students gain practical knowledge of field methods, diagnostic tools and survey methods for tropical soils and agroecosystems. An integral part of the course is the two-week field project in the Mount Kenya Region, which is co-organized with the University of Embu (Kenya).

**Objective**

(1) Overview of the major land use systems in Tropical agroecosystems in several contexts Africa
(2) Interdisciplinary analysis of agricultural production systems
(3) Knowledge on methods to assess agroecological performance of a tropical agroecosystems
(4) Hands-on training on the use of field methods, diagnostic tools and survey methods.
(5) Gain practical knowledge on how to assess to climate resilience and farming systems.

**Content**

This course guides students in analyzing and comprehending tropical agroecosystems. Students of ETH Zürich will work together with the students from Embu University (Kenya) in an interdisciplinary and intercultural team. Students will focus on the Agroecological performance and climate resilience of diverse farming systems in the Mount Kenya Region.

From October 28th to November 11th, The students will take part in a field course in the Mount Kenya Region. Students will then gain practical knowledge on field, meeting several stakeholders of the agricultural and food systems and conducting various assessments related to climate resilience and farming systems.
Food and Consumer Behaviour

**Title:** Food and Consumer Behaviour  
**Type:** W  
**ECTS:** 2  
**Hours:** 2V  
**Lecturers:** M. Siegrist, F. Michel

**Abstract:** This course focuses on food consumer behavior, consumer's decision-making processes and consumer's attitudes towards food products. Students will be able to:

- to describe heuristics that influence consumer behavior in the food domain  
- to explain the consumer led food product development  
- to summarise how consumers perceive the environmental impact and the healthiness of foods  
- to assess the cultural, the environmental and the food policy impact on consumer behavior  
- to explain psychological factors influencing eating behavior

**Competencies**

- Subject-specific Competencies: Concepts and Theories, Techniques and Technologies  
- Method-specific Competencies: Analytical Competencies, Decision-making, Problem-solving  
- Social Competencies: Communication  
- Personal Competencies: Adaptability and Flexibility

**Lecture notes:** There is no script. Powerpoint presentations and relevant scientific articles will be available online for students. A selection of 20 students will be done on the basis of the letters.

**Prerequisites / notice:** The course is open to master and MAS students in food science and nutrition or related. Basic knowledge of food chemistry and nutrition is expected, as well as an understanding of food processing.

---

Nutritional Aspects of Food Composition and Processing

**Title:** Nutritional Aspects of Food Composition and Processing  
**Type:** W  
**ECTS:** 3  
**Hours:** 2V  
**Lecturers:** B. E. Baumer, J. M. Sych

**Abstract:** Lecture type course with an interdisciplinary approach for the evaluation of nutritional aspects of changes in food composition due to processing.

- describe and compare the major concepts /criteria used for the evaluation of the nutritional quality of food  
- apply these criteria when assessing the effects of selected processing technologies on nutritional quality.  
- evaluate recent formulation strategies aimed to achieve additional physiological benefits for targeted population groups (i.e. functional foods),

**Content:** The course gives inputs on compositional changes in food due to processing (with focus on thermal/chilling, enzymatic, chemical, separation and emerging technologies) or new formulation strategies. New approaches for evaluating these changes (e.g. nutritional profiles) and how these are communicated to consumers are also discussed.

**Lecture notes:** There is no script. Powerpoint presentations and relevant scientific articles will be available online for students. A selection of recommended readings will be given at the beginning of the course.

**Prerequisites / notice:** The course is open to Master and MAS students in food and science and nutrition or related. Basic knowledge of food chemistry and nutrition is expected, as well as an understanding of food processing.

**Competencies**

- Subject-specific Competencies: Concepts and Theories, Techniques and Technologies  
- Method-specific Competencies: Analytical Competencies, Decision-making  
- Social Competencies: Communication  
- Personal Competencies: Critical Thinking

---

Bioactive Feed Compounds and Enriched Food Products

**Title:** Bioactive Feed Compounds and Enriched Food Products  
**Type:** W  
**ECTS:** 2  
**Hours:** 2V  
**Lecturers:** M. Niu, to be announced

**Abstract:** The course provides students with the basic knowledge to understand the connection between the structure of nutritive and non-nutritive bioactive food and feed components and their effects on the nutrient supply and health of humans and livestock as well as on the quality of animal-derived foods.

**Objective:** At the end of this course, the students are aware of food and feed as sources of different bioactive compounds. By a comprehensive understanding of the connection between bioavailability, molecular mechanisms and biological effects, they are able to apply their knowledge on beneficial and detrimental effects of bioactive food and feed components in the fields of human and animal nutrition.

**Content:** The course gives an introduction into different classes of bioactive components present in food and feed including fatty acids and secondary plant compounds such as carotenoids, polyphenols, phytoestrogens, glucosinolates, protease inhibitors and monoterpenes.

**Topics include:**

- sources of bioactive food and feed components  
- bioavailability and modification in the gastrointestinal tract  
- beneficial and detrimental effects  
- molecular mechanisms of biological effects  
- species differences concerning metabolism and biological effects
Alternative Crops

Abstract
Few crops dominate the crop rotations worldwide. Following the goal of an increased agricultural biodiversity, species such as buckwheat but also medicinal plants might become more important in future. The biology, physiology, stress tolerance and central aspects of the value-added chain of the above-mentioned and of other alternative crops will be depicted.

Objective
During this course, students learn to assess the potential of different minor or alternative crops compared to the dominant major crops based on their biological and agronomical features. Each student will assess and present a specific alternative crop of his or her choice based on information from scientific articles and Wikipedia. Wikipedia-entries will be generated.

Competencies

Subject-specific Competencies
- Concepts and Theories: fostered

Method-specific Competencies
- Media and Digital Technologies: fostered
- Problem-solving: fostered
- Project Management: fostered

Social Competencies
- Communication: assessed
- Cooperation and Teamwork: assessed
- Self-presentation and Social Influence: fostered
- Sensitivity to Diversity: fostered

Personal Competencies
- Creative Thinking: assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: fostered
- Self-awareness and Self-reflection: assessed
- Self-direction and Self-management: fostered

Alternative Crops

W+ 2 credits 2V A. Walter, K. Berger Büter

Abstract
Few crops dominate the crop rotations worldwide. Following the goal of an increased agricultural biodiversity, species such as buckwheat but also medicinal plants might become more important in future. The biology, physiology, stress tolerance and central aspects of the value-added chain of the above-mentioned and of other alternative crops will be depicted.

Objective
During this course, students learn to assess the potential of different minor or alternative crops compared to the dominant major crops based on their biological and agronomical features. Each student will assess and present a specific alternative crop of his or her choice based on information from scientific articles and Wikipedia. Wikipedia-entries will be generated.

Competencies

Subject-specific Competencies
- Concepts and Theories: fostered

Method-specific Competencies
- Media and Digital Technologies: fostered

Political Ecology of Food and Agriculture

Number of participants limited to 25
A motivational application is required:
- presenting yourself and your studies
- stating what topic in the field of Political Ecology that you are interested in
- suggesting one paper to enrich the literature list for the course

Abstract
In this seminar, students are introduced to the multi-disciplinary field of political ecology to investigate human-environment relationships in food and agricultural systems.

Objective
- Being able to provide an overview of the multi-disciplinary field of political ecology for investigating the relationships of humans to our environment
- Learn to identify how power and interest influence social-ecological systems and to distinguish symptoms from systemic root causes
- Become enabled to analyse complex and sometimes distant human-ecology relationships choosing from a broad range of methods

Content
We will review common narratives in agri-food systems informed by a range of different theories and assisted by different analytical tools. For this purpose, we will start from different concepts of nature, power and interests, explore different ontologies and epistemologies through a set of topics such as hunger, obesity, agrobiodiversity and seeds, forests and deforestation, climate change and food production. Students will explain one concept in each course to the groups and practice their argumentative and writing skills in a final essay, applying the acquired tools to a topic of their choice. While specific inputs from external lecturers broaden our perspective, enough time for critical discussion and reflection will be granted.

The course gives economic and empirical foundations for a sound understanding of the instruments, prospects and limitations of international development aid. Students will gain an overview on institutions and actors’ roles in the field of sustainable agricultural development. Throughout the group work, students will learn to engage directly with various stakeholders, monitor agroecological transition and communicate their research to a wider audience. Ultimate, this course should provide an overview on methods, tools, innovations and platforms that support a sustainable food transformation.

**Literature**

**Prerequisites / notice**

Prior participation in the lecture Nachhaltige Agrarökosysteme I (Sustainable Agroecosystems I) 751-5000-00G (spring term) recommended.
The Forum "Livestock in the World Food System" will take place in blocks of 2 hours each. Once the general topic has been selected, it comprises two parts:

**Part 1**

Aspect 1 - Oral presentation: The students form small groups and are lecturers.
Aspect 2 - chairperson: There are moderators which are chosen from outside of the presenting groups and they will lead the discussion and the remaining students and the lecturer are the audience and ask questions.
Aspect 3 - feedback: At the beginning, students form teams of 2, which are not in the same group, to give each other feedback on their presentation style.

**Part 2**

Aspect 1 - Scientific writing: Preparation of a critical review of a chosen publication and individual exchange with the lecturer.
Aspect 2 - Defense: There will be a discussion in small groups on several dates to discuss the chosen publication in detail and the observations during the process.

Introductions to both presentation forms will be given by the lecturer.

**Lecture notes**

no scriptum

**Prerequisites / notice**

Requirements for allocation of the two credit points:

- oral talk with sufficient handout
- delivery of the scientific writing in sufficient quality
- active participation during all presentations (in case of absence there will be additional tasks)
- feedback on the presentation style of a student

**Competencies**

Creative Thinking: fostered
Critical Thinking: fostered
Self-awareness and Self-reflection: fostered
Self-direction and Self-management: fostered

**Content**

This course guides students in analyzing and comprehending tropical agroecosystems and food systems. Students gain practical knowledge of field methods, diagnostic tools and survey methods for tropical soils and agroecosystems. An integral part of the course is the two-week field project in the Mount Kenya Region, which is co-organized with the University of Embu (Kenya).

**Abstract**

This course guides students in analyzing and comprehending tropical agroecosystems and food systems. Students gain practical knowledge of field methods, diagnostic tools and survey methods for tropical soils and agroecosystems. An integral part of the course is the two-week field project in the Mount Kenya Region, which is co-organized with the University of Embu (Kenya).

**Objective**

(1) Overview of the major land use systems in Tropical agroecosystems in several contexts Africa
(2) Interdisciplinary analysis of agricultural production systems
(3) Knowledge on methods to assess agroecological performance of a tropical agroecosystems
(4) Hands-on training on the use of field methods, diagnostic tools and survey methods.
(5) Gain practical knowledge on how to assess to climate resilience and farming systems.
(6) Collaboration in international students and stakeholders

**Content**

This course guides students in analyzing and comprehending tropical agroecosystems. Students of ETH Zürch will work together with the students from Embu University (Kenya) in an interdisciplinary and intercultural team. Students will focus on the Agroecological performance and climate resilience of diverse farming systems in the Mount Kenya Region.

From October 28th to November 11th, The students will take part in a field course in the Mount Kenya Region. Students will then gain practical knowledge on field, meeting several stakeholders of the agricultural and food systems and conducting various assessments related to climate resilience and farming systems.

**Prerequisites / notice**

We would require the students enrolled to the class to send a short cover letter (1-page max.) by September 18rd 2023, justifying your motivation to enroll to this class. A selection of 20 students will be done on the basis of the letters.

**Competencies**

**Subject-specific Competencies**

Concepts and Theories: assessed
Techniques and Technologies: assessed

**Method-specific Competencies**

Analytical Competencies: assessed
Decision-making: fostered
Problem-solving: fostered
Project Management: assessed

**Social Competencies**

Communication: assessed

Synergies, Practices and Policies

Limited to 20 students.

Abstract
In politics, society, and science, it can seem that the values and practices of agricultural production and environmental protection are in conflict. This tension is often described as “protection versus use” of natural resources. We will explore ways to move beyond the apparent conflict. We will apply this learning to field trips and transdisciplinary projects.

Objective
Students are able to:
- Define different kinds and categories of values.
- Relate value concepts to their own studies, life, and experiences through reflective journaling.
- Infer the underlying values in a text or policy about agri-environmental topics.
- Collaboratively develop a transdisciplinary project for an agri-environmental case study from the field trips.

Content
The course consists of interactive seminars alongside fieldtrips to farms that have found innovative solutions to balancing protection and production.

Seminars will cover topics such as the relationship between values and behavior and how people perceive value trade-offs. We will also discuss environmental ethics, environmental valuation and its critiques, the interplay of facts and values in agri-environmental decision-making, cultural ecosystem services, and relational values.

This class requires active participation. Learning is based on in-class activities, group work and fieldtrips.

Literature
Literature will draw from political ecology, value theory and environmental values, as well as case studies and primary texts, such as the following (not all will be required reading; we will read 1 or 2 papers or book chapters each week).

Environmental Values, by O'Neill, Holland and Light, 2008
IPBES Values Assessment 2023

Autonomous robots are quickly becoming a key player in the transition to precision agriculture. In this course, students will learn theoretical and practical aspects of robotics. Lectures will introduce how robots operate and analyse their application to precision agriculture. In hands-on laboratories, students will apply concepts learned in class on educational robots to simulate a weeding task.

The learning objectives of the course are: (i) illustrate the principle of operation of the main components of a robotic system, (ii) analyse how the different robotic components are integrated and contribute to the functioning of a robotic system, and (iii) solve problems in the field of agriculture using robotic principles.

### Content
- The data science workflow
- Access and handle (large) datasets
- Prepare and clean data
- Analysis: data exploratory steps
- Analysis: machine learning and computational methods
- Evaluate results and analyse uncertainty
- Visualisation and communication

### Prerequisites / notice
- 252-0840-02L Anwendungsnahes Programmieren mit Python
- 401-0624-00L Mathematik IV: Statistik
- 401-6215-00L Using R for Data Analysis and Graphics (Part I)
- 401-6217-00L Using R for Data Analysis and Graphics (Part II)
- 701-0105-00L Mathematik VI: Angewandte Statistik für Umwelt Naturwissenschaften

### Literature

Class size limitation to 30 students.
Agroecology is a discipline, an agricultural practice, and a political-social movement. Students will attend public lectures by experts from different fields and will reflect on agroecology and its principles. Moreover, students will expand their knowledge with case studies and discusses about the role of agroecology to support sustainable agriculture and food systems.

Students will be able to transfer their disciplinary and interdisciplinary knowledge about the thirteen principles as guiding principles for policymakers, practitioners, and other stakeholders across the food system in planning, managing, and evaluating agroecological transformation. Students are part of small groups focusing on selected principles of the HLPE. During the course, students discuss the potential and limitations of agroecology and learn about scientific contributions to agroecology. Students form an opinion on the role of agroecology, reflect and argue on the different facets and develop recommendations for real-world applications of agroecology in supporting a transition towards sustainable food systems.

The course is designed as a combination of public lectures/webinars on "Agroecology and the Transformation to Sustainable Food Systems" delivered by national and international experts and scientists as well as sessions in which students reflect on the topics addressed in the lecture series in a group work format. The public lectures bring different perspectives to the discussion and are intended as inputs for the students' sessions. In the student sessions, the student groups deepen their knowledge of the 13 principles of agroecology proposed by the High-Level Panel of Experts (HLPE) of the Committee on World Food Security. They identify "unknowns" and link to other closely related principles. The groups also work out the perspective of a chosen stakeholder. Finally, the groups will take part in a scientific discussion representing their stakeholder perspective. All groups will synthesize their discussions in a short report.

Hands-on involvement with the scientific community (e.g., under the guidance of agricultural science professors) will be an essential component. This will prepare students for successful career advancement in the field of agroecology, reflecting and arguing on the different facets and developing recommendations for real-world applications of agroecology in supporting transitions of sustainable food systems.

Only students who fulfill the following criteria are allowed to begin with their master thesis:

- a. successful completion of the bachelor programme;
- b. fulfilling of any additional requirements necessary to gain admission to the master programme.

The Master thesis is an independent scientific work. Normally the subject is selected among the topics of the core subject. It is written under the guidance of a agricultural science professor.
We study the following chapters of the book Marschner’s Mineral Nutrition of Plants Fourth Edition 2023.

Objective
The course enables students to describe basic knowledge of human and animal anatomy and physiology, to understand basic functions of the organism, to understand connections between morphology and function of organ systems, to describe the development of organ systems and to be able to understand pathophysiological connections.

Literature
A detailed bibliography is included in the lecture notes.

Prerequisites / notice
Calculation exercises are part of the course. A calculator is required for this.

Comprehensiveness
Basics in Animal Nutrition

Content
Turnover and utilisation of nutrients and energy in the animal (definition of terms, turnover in the animal body, balances, utilisation).
Feed evaluation in cattle, pigs and poultry (energetic feed evaluation, evaluation of nitrogenous feed substance)
Nutrition of cattle, pigs and poultry (basics of feeding, physiological characteristics, demand and demand coverage, feeding standards, ration design)
Feed science (individual feedstuffs, farm-produced feed)

Lecture notes
Lecture notes are available and can be obtained by moodle.

Literature
A detailed bibliography is included in the lecture notes.

Prerequisites / notice
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Comprehensiveness
Plant Nutrition I

Content
We study the following chapters of the book Marschner’s Mineral Nutrition of Plants Fourth Edition 2023.

Lecture notes
We study the following chapters of the book Marschner’s Mineral Nutrition of Plants Fourth Edition 2023.

Literature

Comprehensiveness
Anatomy and Physiology of Humans and Animals I+II

Abstract
Imparts a basic understanding of physiology an anatomy in man and domestic animals, focusing on the interrelations between morphology and function of the organism, in particular of domestic animals. This is fostered by discussing all subjects from a functional point of view. The lecture consists of two consecutive parts.

Objective
The course enables students to describe basic knowledge of human and animal anatomy and physiology, to understand basic functions of the organism, to understand connections between morphology and function of organ systems, to describe the development of organ systems and to be able to understand pathophysiological connections.

Literature
A detailed bibliography is included in the lecture notes.

Prerequisites / notice
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Comprehensiveness
Basics in Animal Nutrition

Content

Prerequisites / notice
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.
Introduction to Crop and Forage Production

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Abstract
This course provides an introduction into crop and forage sciences - with a focus on sustainable management methods in Switzerland and Europe.

Objective
The students know the basic processes and management methods of arable and forage production in Switzerland and Central Europe. They know the most relevant arable crops. Students can assess the influence of environmental factors and management not only on individual plants, but also on meadow and pasture plant communities and on their yields. They understand the relevance of crop rotation measures and can make recommendations for the establishment of land management methods. The students are familiar with sustainable, climate-friendly and biodiversity-conserving or biodiversity-enhancing management measures and understand the value of species-rich vegetation for the provision of ecosystem services.

Content
The lecture is divided into two parts, i.e., Arable Crop and Forage Production, supervised by different lecturers.

The part 'Arable Crop Production' deals with the most relevant arable crops and with basic steps of arable field management such as soil tillage, sowing and plant protection. Effects on soil structure, different tillage measures for different crops as well as differences in the intensity of intervention in comparison of conventional and soil-conserving tillage (e.g. no-till) are explained. The most important differences between conventional, integrated and organic production are addressed. Special emphasis is placed on the establishment of crop rotations taking into account the farm context.

In the part 'Forage Production', important plant functional groups and representative plant species as well as different types of grassland systems, i.e., most important mixtures as well as natural plant communities in Central Europe are presented (ward assessment). Based on the ecophysiology of individual plants, the reactions of plant stands to changing environmental conditions are elaborated. Different types of management are presented (e.g. fertilisation, grazing, cutting) and their effects on stand composition and yields are discussed. Feedback mechanisms between environment and grassland systems are addressed. The role of biodiversity is addressed.

Animal Breeding

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Abstract
Introduction to basics of animal breeding. Importance of animal production. Species of livestock and their products, performance recording, functional traits, genetic diversity, breeding goals. Qualitative and quantitative traits. Basic knowledge of breeding methods: genetic and environmental variation, heritability, genetic correlation, estimation of breeding values, selection, mating systems.

Objective
Show the importance of animal production for Swiss and international agriculture. Name the livestock species, their products, systematic classification and breeding and production goals. Describe methods to measure animal performance (performance recording) and functional traits. Define the most important parameters and methods in animal breeding.

Content
Domestication, history of animal breeding.
Definition, models of animal production, species of livestock, numbers, distribution.
Genetic polymorphisms and their applications in animal breeding.
Genetic diversity, breeds, production and breeding goals.
Qualitative (monogenic) and quantitative (polygenic) traits, Mendelian genetics, quantitative genetics.
Genetic and environmental variation, heritability, genetic correlation, selection, selection response.

Lecture notes
Transparencies and single chapters of textbook are made available on homepage.

Literature
Tierzucht (William/Simianer) UTB 3526 (2011)
Additional literature to be announced in the lecture.

**Abstract**
The courses Structural Design I and II explain the fundamentals of how structures function. These courses put great emphasis on studying the relationship between the form of a structure and the internal forces within it by means of graphic statics.

**Objective**
At the end of the courses Structural Design I and II, students will be able to:
1. visualize the internal forces within structural elements.
2. understand the relationship between the form of a structure and the internal forces within it.
3. modify the design of a structure in order to improve it.
4. identify the most important structural typologies.
5. use graphic statics for the form-finding and analysis of structures.
6. carry out basic dimensioning of structural elements.
7. respond to structural problems in a creative manner.

**Content**
Structural Design I:
- Fundamentals of static equilibrium
- Introduction to graphic statics
- Basic dimensioning of structural elements
- Cables and stiffening schemes of cables
- Arches and stiffening schemes of arches
- Arch-cables structures

Structural Design II:
- Trusses
- Beams
- Frames
- Plates
- Buckling of compression elements

**Abstract**
Sociology I investigates the relation between social developments and the production of the built environment from a macro-sociological point of view. It examines central aspects of social change, historical and contemporary forms of urbanization, and typical examples of models of urbanization.

**Objective**
This series of lectures should enable students to comprehend architecture in its social context.

**Content**
Sociology I deals with the macro-sociological point of view, and investigates the relation between social developments and the production of the built environment. In the first part central aspects of social change are examined, in particular the transition from Fordism to Neoliberalism and the interlinked processes of globalization and regionalization. The second part deals with historical and current forms of urbanization. Among other aspects, it focuses on the changed significance of the urban-rural contradiction, the processes of suburbanization, periurbanization, and planetary urbanization; the formation of global cities and metropolitan regions; the development of new urban configurations in centres (gentrification) and in urban peripheries (edge city, exopolis, new urban intensity). In the third part these general processes are illustrated by typical models of urbanization: Manchester, Chicago, Los Angeles, Paris and Zürich.

**Literature**
A detailed collection of original texts will be distributed.

<td>J. Schäfer</td>
</tr>
</tbody>
</table>

**Abstract**
History of building from classical antiquity to modernity: building types, constructions, forms, with particular reference to functional issues such as flexibility of use, statics, durability. This is not a mere history lecture, but an important part of the basic introduction into construction.

**Objective**
Participants know the fundamentals of building history, including landmark monuments of each era, key historic constructions and forms. They are able to "read" a historic building and to relate it to building history. They are aware of the variety of historic building constructions.
### Content

Building history I covers the period from classical Greek antiquity to medieval architecture. The principal topics include construction issues such as Greek megalithic building, Roman mortar-and-rubble construction, and vaulting.

Within the Vitruvian and Albertian triad of firmitas, utilitas and venustas, we focus on the first two topics, whereas the last topic (deciphering the "meaning" of architecture) stands at the heart of the "architectural history" lectures. The present lecture contributes essentially to deepening knowledge about historic constructions, an indispensable precondition for building within existing fabric.

- buildings of Greek antiquity as examples of construction with huge stone blocks
- Roman buildings as examples of building with small materials, strict functional disposition, and evolution of the art of vaulting
- late antique and early Christian buildings: discovering interior space, developing new paradigms for religious architecture, construction wide-span roofs
- early and high medieval construction, continuing antique traditions, revival of dressed stone and vaulting
- small buildings, notably rural housing
- the medieval monastery

### Lecture notes

Please keep a tight record of manuscript notes yourself. pdfs of lecture slides will be on line before each lecture. Lecture notes for exam preparation are provided and should be used in conjunction with the pictures from the lecture slides.

The exam will be held at the end of the first year. It is a computer-based multiple choice test. It calls for precise knowledge of the examples presented in the lecture, including the specifics of the architecture and construction of the buildings. Terminology is in GERMAN.

Will be announced during the lectures.

Due to professor Holzer's sabbatical, this lecture will be given by Dr. Jasmin Schäfer, in Fall Term 2024. However, the contents will be identical to the lecture delivered by professor Holzer in the Fall Term of 2023. This includes the topics, slides, lecture notes. Professor Holzer's lecture of Fall Term 2023 is available as a recording on video.ethz.ch. The lecture of Dr. Schäfer in Fall Term 2024 will NOT be recorded. Please refer to the recording of Fall Term 2023 under video.ethz.ch.

You may either listen to the fall 2023 recordings, to Dr. Schäfer's live lecture, or to both, to be prepared for the spring term of 2025 and the exam.

**Abstract**

Introduction and overview of the history and theory of architecture from the Renaissance to the nineteenth century. The course covers the chronology and key works, protagonists and discourses of early modern European architecture.

Fundamentals for the History and Theory of Architecture II-II offers a practical introduction to the methods and instruments of the history of art and architecture.

**Objective**

1. Acquiring basic knowledge of the history and theory of architecture during the early modern period, of its key protagonists and discourses and of the methods and instruments of architectural research.
2. Identifying the main architectural issues and debates of the period and recognising the places and architectural works covered in the course.
3. Acquiring the tools to develop a historically informed reading of the built environment, recognising debates, styles, ideas and problems which drive and inform architectural production.
4. Developing the tools to draw on historical, theoretical and critical research to the benefit to one's own architectural culture.

**Content**

The course History and Theory of Architecture II-II offers a chronological and thematic overview of the architecture and architectural theory produced in Europe from the 15th to the 19th centuries. Thematic lectures about key questions at play during the period will be combined with in-depth analysis of historical buildings, texts and iconographies.

Themes will cover the emergence and development of Vitruvian design and practice up to the 19th century and related issues such as the emergence of the architect; the development of original design practices and of divergent theories of architectural composition and design; the media of architectural design and practice (drawings, models, building materials); patterns and media of dissemination and influence (books, imagery, micro-architecture); building types (the palazzo and the villa); questions of beauty and ornament; questions of patronage (e.g., the Roman papacy) and the formation of religious and political symbolism through architecture; the relation of buildings to the city (e.g. the development of European capitals); attitudes towards history (origin myths, historicism); the question of the monument.

The exercises Fundamentals of the History and Theory of Architecture II-II aim to explore and develop basic methods and strategies to research the history of art and architecture. They consist of four parts, each developed under one of the four gta Chairs and each dealing with a particular area of study in the field of architecture and art history.

1. The historiography of architecture (M. Delbeke)
2. Architectural media (L. Stalder)
3. Architecture and art (P. Ursprung)
4. Urbanism and the Commons (T. Avermaete)
Literature
Course scripts, PowerPoints and lecture recordings for History and Theory of Architecture I-II will be available to download from the course page. Printed copies of the course scripts will also be available for purchase.

Prerequisites / notice
For the course History and Theory of Architecture I-II students will rely on assisted self-study to acquire basic knowledge of the history of architecture in Europe.

Abstract
Building Materials - Introduction to the most common building materials
- Raw materials + Production
- Properties + Application
- Ecological footprint + Recycling

Objective
The lecture develops an understanding of different building materials and its application for construction under the aspects of material properties and ecological aspects.

Content
The lecture introduces the most common building materials concrete, steel, masonry and timber, but also clay, glass and polymers in a historical context. The fabrication processes are described and the most important properties regarding construction explained. A special focus is on the ecological aspects such as availability of raw materials, effort for production, emission of hazardous substances, disposal and recycling.

Abstract
This course introduces computational design and teaches how design can be modeled and materialized using digital technology. Participants learn to use the computer strategically, thoughtfully, and sensitively within the design process. With the “digital literacy” acquired in this course, they develop an understanding of the potential of a digital building culture.

Objective
To systematically harvest the potential of the computer in their work processes, architects need an insight into the fundamental principles of information technology. In this course, students learn the concepts, methods, and instruments of computational design. By the end of the two semesters, students will have mastered the basics of 3D modeling techniques, parametric design, programming code for Computer-aided-design (CAD), and digital prototyping. The acquired knowledge qualifies students to use the computer as a unique instrument to model their designs. Participants also learn to apply CAD and programming code creatively and productively in planning, design, and construction.

Specifically, the learning goals are:
- Critical understanding of the possibilities of information technology in design
- Acquiring an overview of the mechanisms and types of CAD systems and digital building models
- Gaining knowledge of the basic principles of computational geometry
- Applying visualization techniques and creatively using various digital media
- Learning concepts and application of parametric design, being able to integrate computer-aided analysis and optimization methods in design-process
- Understanding the principles of digital process chains from design to production
- Strategically using visual programming code
- Reading, understanding, and adapting programming code within CAD software.
The course is titled Perspectives on Landscape and Urban Transformation I+II. By bringing forward the term 'landscape' the course represents and collectively shape our environment. This is the first course which is collectively organized by the Institute of Landscape and Urban Studies (LUS), with the NEWROPE chair taking up the coordination. It will span two semesters.

Students will be provided with a reader at the first lecture. The reader for the course Perspectives on Landscape and Urban Transformation I+II is a container which holds together a collection of different hand-outs, brochures, and materials. All in all, it is a 'bag' and a personal organizer which invites students to fill over the course of the year. It allows them to individually structure and curate the content of the course. It is deliberately designed to be open-ended and to be individually extended and adapted. Towards the end of the semester, students will get a glossary where all key terms and concepts, presented in the various lectures, are combined. Each week students will receive a small leaflet that gives an overview of the individual lecture, as well as an additional reading.

Course Structure
The course consists of theoretical lectures, practical tutorials introducing technical concepts, and exercises supported by tutors. Participants can find updated and detailed information on Moodle, which is the learning platform for the course.

**052-0709-00L Perspectives on Landscape and Urban Transformation I
This learning unit replaces the old learning unit 052-0709-00L Urban Design I**

**Abstract**
In this course we will collectively explore the different actions and actors, as well as the roles and professional practices that represent and collectively shape our environment. This is the first course which is collectively organized by the Institute of Landscape and Urban Studies (LUS), with the NEWROPE chair taking up the coordination. It will span two semesters.

**Objective**
Through the different Perspectives on Landscape and Urban Transformation, students will learn to understand the complexity of the (urban) landscape. The various perspectives, readings and key terms will enrich and expand the vocabulary and theoretical knowledge of students. Tools for observation and activation will give students agency to observe and intervene in processes of urban transformation.

At the end of the course students will be able to perceive and identify a multitude of actors and professional roles and recognize how they are overlapping, entangled and ever-shifting. Students will practice to textually and visually illustrate complex processes, including the many different stakeholders involved and the notion of time. Students will learn to reflect about and formulate their possible personal positions in relation to others. The formulated learning goals are aligned with the teaching activities, the exercises, and the final evaluation.

**Content**
The course is titled Perspectives on Landscape and Urban Transformation I-II. By bringing forward the term 'landscape' the course stresses the need to put the natural environment and the landscape at the core of urban thinking. Accordingly, every architect requires a basic knowledge of the landscape and nature. Also, to focus on 'urban transformation', instead of 'urban design' is a conscious choice. It comes out of the recognition that materials, energy and space are finite, which forces us to engage first with what is already there, instead of producing even more new things.

This course presents designers as facilitators of complex urban transformation processes. This position requires both an understanding of a great diversity of perspectives and positions constituting a city, and of the different professional roles one can take up to detect and utilize this diversity of – specific and often conflicting – needs, wishes, ambitions and actions. In each lecture one of these perspectives is presented. The list of different perspectives presented in both semesters is deliberately left incomplete, leaving space for students to think of other perspectives, needs and desires that one could take into account when working on a design or (redevelopment) of a space.

Students will be provided with a reader at the first lecture. The reader for the course Perspectives on Landscape and Urban Transformation I-II is a container which holds together a collection of different hand-outs, brochures, and materials. All in all, it is a 'bag' and a personal organizer which invites students to fill over the course of the year. It allows them to individually structure and curate the content of the course. It is deliberately designed to be open-ended and to be individually extended and adapted. Towards the end of the semester, students will get a glossary where all key terms and concepts, presented in the various lectures, are combined. Each week students will receive a small leaflet that gives an overview of the individual lecture, as well as an additional reading.

All documents can be downloaded via moodle.

**Lecture notes**
Weekly handout of readings. All documents can be downloaded via moodle.

**Literature**
The course takes place at the Fokushalle, E7, ONA Building from 18:15h-20:15h.

The course will be under the formal responsibility of Prof. Freek Persyn and collectively coordinated by a core team consisting of Freek Persyn, Michiel van Iersel, Lukas Fink and Charlotte Schaeben.

Students can contact:
Charlotte (schaeben@arch.ethz.ch) for organisational, technical and personal questions
Lukas (fink@arch.ethz.ch) for questions regarding the reader, weekly exercises and the final exam
Michiel (mvaniersel@arch.ethz.ch) for questions regarding guests and literature

#### Course Description

**Abstract**

Designing and constructing will be understood to be a complementary offer. The content and methodical foundations of design and construction are taught and deepened through lectures and exercises.

**Objective**

Understanding and dominating the methodology of designing and constructing.

**Content**

Lectures and exercises to achieve the methodology and ability of designing and constructing.

**Lecture notes**

**Literature**

- Ed. Andrea Deplazes
- German, English, French, Spanish
- ISBN 978-3-0356-1669-9

Further Literature will be published in the lectures.

**Prerequisites / notice**

100% of interest and engagement!

Participation in the seminar week of the Deplazes chair ("Hybrid Modeling") from DATE is compulsory!
Art in Space and Time I

Project grading at semester end is based on the list of enrolments on x.xx.2024 (valuation date) only. This is the ultimate deadline to unsubscription or enrol for the studio.

8 credits 5G+4U  R. Barba, H. E. Franzen, M. Narula

Abstract
Attendance in the lecture and exercise "Art in Space and Time I" and in the course "Introduction to Free and Perspective Drawing". Submission of artistic exercise works. The semester grade results from participation in the lecture and exercise "Art in Space and Time I" as well as the "Introduction to Free and Perspective Drawing", and the submission of artistic exercise works.

Objective
Students engage in experimental concepts in the arts as well as free and perspective drawing. In addition to acquiring extended artistic thought processes and practices, they each develop their own artistic exercise works.

Content
"Art in Space and Time" encompasses diverse and multi-disciplinary research fields, ranging from urban anthropology to artistic practices: film, sculpture, sound, writing, digital arts, and performance. These fields include and intersect with language, political discourses, and investigations of the human environment. Concrete theoretical as well as speculative, practical procedures are being tested to open up new horizons of perception and to reflect on them.

Examination Blocks

052-0503-00L  Art in Space and Time I  O  8 credits  5G+4U  R. Barba, H. E. Franzen, M. Narula

Examination Blocks

052-0607-00L  Structural Design III  O  2 credits  3G  J. Pauli

Abstract
The course Structural Design III complements the courses Structural Design I and II by introducing building materials and construction techniques.

Objective
After a successful conclusion of the course, students will be able to:

1. Understand the structural behaviour of a building and of its main components
2. Conceive and control design parameters as part of the design process
3. Design structural systems in compliance with diverse performance criteria including architectural, structural, constructive, and environmental aspects altogether.
4. Design structural systems consistent with the material used
5. Dimension structural elements using different building materials
6. Develop construction details in compliance to a specific static scheme
Content

The course presents a holistic approach to the design of structures by integrating static equilibrium, learned in previous semesters, with considerations regarding materials and construction techniques.

The course explores the relationship between architecture and structure by introducing and discussing design parameters and their implications with respect to different performance criteria. In addition to those related to statics, performance criteria also include aspects related to use of material and energy resources, which is directly connected to questions of environmental footprint.

The objective of the course is to show that structural design tasks must consider a number of aspects belonging to different disciplines simultaneously. This results in a level of complexity that very rarely can be reduced to a univocal “right” answer. Critical thinking and technical knowledge must support each other. The course aims at giving the tools for developing these skills.

After a brief review of the key aspects taught in Structural Design I and II, the course Structural Design III will examine different load-bearing elements, how they relate to each other, and their possible relationships with the architectural space.

Starting from 2D spanning structures, a series of 5 lectures will illustrate the functioning of the main load-bearing elements of multistory buildings by means of graphic statics as well as analytical methods.

Implications at the level of structural performance, spatial performance, material use, and environmental footprint will be thoroughly discussed throughout the entire course by analyzing buildings of exemplary quality.

The content of the lectures will be strengthened through 5 exercise sessions during which students will apply the knowledge gained during the lectures and refine their design skills through dedicated design exercises under the supervision of a tutoring team.

Literature

"The art of structures. Introduction to the functioning of structures in architecture"

"Faustformel Tragwerksentwurf"
(Philippe Block, Christoph Gengangel, Stefan Peters, DVA Deutsche Verlags-Anstalt 2013, ISBN: 978-3-421-03904-0)

"Form and Forces: Designing Efficient, Expressive Structures"

Prerequisites / notice

To take part in this course, it is recommended to first complete the courses Structural Design I and II or to have knowledge of graphic statics.

Prerequisites / notice

To take part in this course, it is recommended to first complete the courses Structural Design I and II or to have knowledge of graphic statics.

Abstract

This two-semester course is an introduction to the history of architecture from the Second Industrial Revolution in the 1850s to the Oil Crisis in the 1970s in Europe. Students will be able to identify the “things”—technical objects and ensembles—that transformed architecture, and to relate them to the technical, scientific, and cultural concerns that introduced them as key features of modernity.

Objective

To introduce students to the history and theory of architecture, the course has three objectives. First, students will be able to identify the “things” that transformed architecture in modernity, and the crucial events, buildings, theories, and actors that characterize their history.

Second, students will be able to describe how these “things” operated at different scales, focusing less on the formal level, and naming instead the different forms of expertise that constituted them historically, as well as the processes within which they were embedded.

Third, students will be able to reflect on a series of apparatuses, devices, and building parts that are in fact micro-architectures which have often been neglected, despite their pivotal role in shaping the daily lives of modern societies.

Content

The course proposes a new approach to the study of the history and theory of architecture in Europe during modernity. It focuses less on single architects or their buildings, and more on those “things” that have brought profound transformations in the built environment and daily life over the last 200 years, such as the revolving door, the clock, and the curtain.

The notion of “thing” includes both the concrete building parts and the concerns associated with them, such as material performance, social synchronization, and individual expression. To understand buildings as assemblages of “things,” therefore, does not mean to diminish their significance, but on the contrary to add reality to them, to understand them in terms of the complex, historically situated, and diverse concerns within which they were designed.

Each lecture introduces one “thing” through a genealogy that shaped it, from patents and scientific discoveries and technological advancement, to cinema, the visual arts, and literature. A set of renowned projects as well as lesser-known buildings from all around Europe offers a variety of case studies to describe these “things,” to understand how they operated in relation with one another, and to identify the theories and tactics that architects mobilized to make sense of them.

Integrity and Work Ethics

Self-awareness and Self-reflection

Self-direction and Self-management

Computational Design III

Title of this course before HS22: "Mathematical Thinking and Programming III".

Abstract

This class builds on the digital literacy foundations taught in the previous year and expands the acquired competence in the use of computers in design. At the core stands the question of how to use digital architectural design methods in a creative, purposeful and self-confident manner.

Objective

The course consists of lectures and exercises. The lectures convey an insight into strategies for the implementation of algorithmic techniques in architectural design by presenting and discussing the research and the build work of the professorship. This pragmatic view on the computational design process helps demystifying algorithmic techniques and developing a critical understanding for their potentials in the architectural praxis. Programming is an extension of traditional design tools. While this powerful cultural technique allows us to handle complexity in a previously unknown way, the question of its meaning, relevance and potential needs to be negotiated on a context specific base for every single project. In order to be able to do this, we shall develop a conceptual understanding for the methods as well as familiarity with the practice of programming. While the works discussed in the lectures sharpen the conceptual understanding, the tutored exercises will train the programming practice. In these sessions, we will implement simplified yet powerful versions of the discussed projects by using Rhinoceros 3D as a modeler and Grasshopper as a visual programming interface, both environments that have been introduced in the previous semesters. Up-to-date and detailed information on the lectures and exercises is announced on MOODLE, which will serve as the teaching platform for this course.

The specific learning goals are:

• To develop a critical awareness for the potentials of algorithmic design methods.
• Learn to deploy parametric design strategies.
• Become familiar with the practice of visual programming.
• Understand the concepts and potentials of digital fabrication.

Global History of Urban Design I

This course focuses on the history of the design of cities, as well as on the ideas, processes and actors that engender and lead their development and transformation. The history of urban design will be approached as a cross-cultural field of knowledge that integrates scientific, economic and technical innovation as well as social and cultural advances.

Objective

The lectures deal mainly with the definition of urban design as an independent discipline, which maintains connections with other disciplines (politics, sociology, geography) that are concerned with the transformation of the city. The aim is to make students conversant with the multiple theories, concepts and approaches of urban design as they were articulated throughout time in a variety of cultural contexts, thus offering a theoretical framework for students' future design work.
In the first semester the genesis of the objects of study, the city, urban culture and urban design, are introduced and situated within their intellectual, cultural and political contexts:

01. The History and Theory of the City as Project
02. Of Rituals, Water and Mud: The Urban Revolution in Mesopotamia and the Indus
03. The Idea of the Polis: Rome, Greece and Beyond
04. The Long Middle Ages and their Counterparts: From the Towns of Tuscany to Delhi
05. Between Ideal and Laboratory: Of Middle Eastern Grids and European Renaissance Principles
06. Of Absolutism and Enlightenment: Baroque, Defense and Colonization
07. The City of Labor: Company Towns as Cross-Cultural Phenomenon
08. Garden Cities of Tomorrow: From the Global North to the Global South and Back Again
09. Civilized Wilderness and City Beautiful: The Park Movement of Olmsted and The Urban Plans of Burnham
10: The Extension of the European City: From the Viennese Ringstrasse to Amsterdam Zuid

Prior to each lecture a chapter of the reader (Skript) will be made available through the webpage of the Chair. These chapters will provide an introduction to the lecture, the basic visual references of each lecture, key dates and events, as well as references to the compulsory and additional reading.

These books will be reserved for consultation in the ETH Baubibliothek, and will not be available for individual loans.

A list of further recommended literature will be found within each chapter of the reader (Skript).

Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

Method-specific Competencies
- Analytical Competencies: assessed
- Decision-making: fostered
- Project Management: fostered

Social Competencies
- Communication: fostered
- Cooperation and Teamwork: assessed
- Leadership and Responsibility: fostered
- Self-presentation and Social Influence: assessed
- Sensitivity to Diversity: assessed

Personal Competencies
- Negotiation: fostered
- Creative Thinking: fostered
- Critical Thinking: assessed
- Integrity and Work Ethics: fostered

There are three books that will function as main reference literature throughout the course:

Students are required to familiarize themselves with the conventions of architectural drawing (reading and analyzing plans at various scales).

There are ten research domains in the course: 01. The History and Theory of the City as Project, 02. Of Rituals, Water and Mud: The Urban Revolution in Mesopotamia and the Indus, 03. The Idea of the Polis: Rome, Greece and Beyond, 04. The Long Middle Ages and their Counterparts: From the Towns of Tuscany to Delhi, 05. Between Ideal and Laboratory: Of Middle Eastern Grids and European Renaissance Principles, 06. Of Absolutism and Enlightenment: Baroque, Defense and Colonization, 07. The City of Labor: Company Towns as Cross-Cultural Phenomenon, 08. Garden Cities of Tomorrow: From the Global North to the Global South and Back Again, 09. Civilized Wilderness and City Beautiful: The Park Movement of Olmsted and The Urban Plans of Burnham, 10: The Extension of the European City: From the Viennese Ringstrasse to Amsterdam Zuid.

These books will be reserved for consultation in the ETH Baubibliothek, and will not be available for individual loans.

A list of further recommended literature will be found within each chapter of the reader (Skript).

Students are required to familiarize themselves with the conventions of architectural drawing (reading and analyzing plans at various scales).

Students are required to familiarize themselves with the conventions of architectural drawing (reading and analyzing plans at various scales).

These books will be reserved for consultation in the ETH Baubibliothek, and will not be available for individual loans.

A list of further recommended literature will be found within each chapter of the reader (Skript).
The building process is the main focus of this lecture series. The process is understood as a sequence of criteria in time.

Concepts and Theories

The learning material, available via https://moodle-app2.let.ethz.ch/is comprised of:
- Toolbox 'Reader' with an introduction to the lecture course and tool summaries
- Weekly exercise tasks
- Infographics with basic information of each city
- Quiz question for each tool
- Additional reading material
- Interviews with experts
- Archive of lecture recordings
- Reading material will be provided throughout the semester.

Data: 02.07.2024 12:39
Autumn Semester 2024
Page 80 of 2667
### Objective

The course provides the basics and tools for an in-depth understanding of the discipline of landscape architecture and its far-reaching interconnections with architecture, urban planning, ecology and other spatial and nature-related sciences. The aim is to adopt landscape perspectives in planning and design processes and to critically reflect on one's own projects within a specific context. Students learn about historical developments and their topicality and learn "from history". Design contexts are presented on the basis of examples. Students develop a basis for ways of thinking and action for current landscape architectural challenges.

### Content

The lectures in the fall semester course “History and Theory of Gardens and Landscape Architecture” provide an overview of the cultural history of nature, the landscape and the garden from its origins to the present day. An in-depth understanding of change as well as the design strategies and characteristics of the most important epochs and their current relevance will be discussed.

### Lecture notes

Handouts and a bibliography will be provided

### Prerequisites / notice

General information on the examination:

Bachelor students: The knowledge taught in the lecture and the exam-relevant literature provided by the lecturer serve as the basis for exam preparation. The course is designed as an annual program. As the written session exam tests knowledge from both the Landscape Architecture I and II lecture series, it is strongly recommended that you attend the course over two semesters.

The examination topics will be announced shortly before the end of the semester. The lecturer will provide texts on the examination topics as pdf files for download. These serve to deepen understanding of the lecture.

Mobility students or students from other departments: Students who only attend the lecture for one semester complete the lecture with an end-of-semester oral examination.

Here too, the lecturer provides literature relevant to the examination as a download.

Students registered for the exam will receive further information on the exam procedure by email shortly before the end of the semester.

- Self-awareness and Self-reflection: fostered
- Self-direction and Self-management: fostered

### 052-0609-00L Energy and Climate Design I

**Abstract**

This annual course focuses on physical principles, concepts and methods for the efficient and sustainable heating, cooling and ventilation of buildings. Interactions of energy, GHG emissions and climate with architectural and urban design will be investigated.

**Objective**

At the end of this one-year course, students will be able to estimate the impact of energy, GHG emissions and climate on a building. You will be able to independently apply the steps of an integrated design process to your own project and master selected tools from the A/S knowledge platform ([https://moodle-app2.let.ETHZ.ch/course/view.php?id=11917](https://moodle-app2.let.ETHZ.ch/course/view.php?id=11917)). Future own designs can be supplemented and enriched with potentials from energy and climate analyses.

**Content**

Students work independently in groups on a series of tasks. With the help of digital tools, the steps of an integrated design process are played through in a case study. The obligatory group tasks are supported with short input presentations, lecture notes and feedback sessions. The following topics are covered in the first semester of this annual course:

1. Local potentials
2. Demand
3. Supply

**Lecture notes**

The slides of the lecture on the course moodle serve as lecture notes and are available as download.

**Literature**

A list of relevant literature is available at the chair.

**Prerequisites / notice**

This course can only be taken if Energy and Climate Design II is taken in the following semester, as the group work is connected and extends throughout the year.

**Competencies**

#### Subject-specific Competencies

- Concepts and Theories: assessed
- Techniques and Technologies: assessed

#### Method-specific Competencies

- Analytical Competencies: assessed
- Decision-making: assessed

- Integrity and Work Ethics: assessed
- Self-direction and Self-management: assessed

### 052-0507-00L Architectural Technology V

**Abstract**

Construction is the prerequisite for making an architectural, spatial idea tangible in the first place. In this lecture series, it is understood as a component of a holistic, coherent architecture and is derived from its architectural, spatial context on the basis of a broad selection of buildings.

**Objective**

...
Objective

The lecture series does not provide instructions or recipes on general constructive topics. The description of distinctive, spatial experiences and the constructive measures used to achieve them, is rather intended to sharpen the students' awareness, for their own design work and to show countless possibilities of how an architectural, spatial idea can be understood and further developed through its material, its construction method and its supporting structure.

Content

The buildings, which are described and explained in the lectures, differ fundamentally from each other in their time of origin, their urban context, as well as their geographical location and could hardly be more different in their scale and their use. These buildings are not a typical expression of their time and location, instead they are an expression of an individual creation and likewise use the constructive possibilities of their time and their environment in a distinctive way. Accordingly, each lecture is dedicated to a different architect.

In addition, isolated current examples from professional practice will be shown. These lectures on new buildings, some of them unfinished, are given by an architect directly involved on site, in English, and partly online.

23.09.24 Film
30.09.24 Artigas
14.10.24 Bloc
28.10.24 Modell und Wirklichkeit
11.11.24 Shinohara
25.11.24 Nov Le Corbusier

Lecture notes

The script is a comprehensive collection of material that allows students to form their own ideas about the case studies shown, independent of the lecture. Most of the photographs were taken on study trips and show the buildings under discussion with unpublished material. The extensive collection of photographs is supplemented with drawings, plans, site photographs, and historical photographs from books and archives. The script will be made available in digital form at the end of the year to students enrolled in the lecture series.

Prerequisites / notice

Mobility students or students from other departments who only want to take the exam on the material from the last semester (Construction V or VI) are asked to contact the chair in advance.

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php). Students who do not wish to change the design class don't have to participate in the internal enrolment. Project grading at semester end is based on the list of enrollments on 30.10.2024, 24:00 h (valuation date) only. This is the ultimate deadline to unsubscribe or enroll for the studio.

Abstract

Focusing on the theme of Shelter, the semester begins with a field trip to Rome, where we will visit and study selected historical examples. Through this analysis we will develop a typological understanding of architecture, addressing questions of space, structure and tectonics. The second half of the semester will be dedicated to the design of an ideal shelter located in the Roman countryside.

Objective

Design Studio "Architectural Design III":
Master the analysis of historical case studies through experimental drawings. Foster a multifaceted interpretation of architectural principles and characteristics, while developing an environmentally aware approach to design, and addressing climate issues on a typological level. Cultivate an understanding of the topic in relation to contemporary issues. Learning to address aspects related to form and tectonics within the design of a new building.

Lecture "Construction III":
Introducing students into different design and making approaches to find a path towards their personal approach on designing and making.
Design Studio "Architectural Design III":
In times of climate crisis and strong social transformation we find ourselves dwelling on unsettling questions: am I still safe in my place? Will there be room for everyone in the future? What is the minimum necessary to live? What does it take to foster an idea of community that is gradually disappearing? Within the discipline of architecture, such doubts and fears can be translated into fundamental design questions: how do we protect our living space from increasingly harsh and unpredictable climatic events? How do we design resilient and durable structures? How to make the best use of the limited available resources? All these questions take us back to the roots of architecture, to the complex relationship between nature and civilization, to the human need of finding refuge in and from nature: Shelter.

But what is Shelter? Not just a protection from natural elements, a shelter also identifies the place of collective refuge in our society, a place of community and hospitality. This social value in turn influences the architectural form: be it inn or church, hut or temple, cave or hangar, the Shelter is as much primary dwelling as cultural place. The Shelter is Architecture.

With these questions in mind, we will dedicate the coming studio in the series of Ideal Architecture to the development of a contemporary understating of Shelter, taking into consideration its connotation as both intimate and collective space, and its socio-cultural value: The Ideal Shelter - 7 new Types. Starting from historical examples, we will develop the basic architectural knowledge needed to tackle this challenging task in theory and practice. Primary questions of space, structure and tectonics, as well as the fundamental issues of proportion, form and meaning will be at the center of our design debate.

We will begin the design process for a new contemporary shelter with a field trip to Rome. We will visit, analyze and critically reflect on 7 shelters from different time periods. This will be followed by a visit to 7 sites outside of Rome. Here in the ideal (-ized) landscape of the Roman Campagna, the Ideal Shelter will find its place. As a studio we will collectively develop a culture of representation where multi-layered drawings and models, as well as the handling of historical references, will form the methodological basis for the design, which will primarily focus on typological, tectonic, and formal aspects.

Lecture "Construction III":
The overall topic of the lecture series is "Construction – Elements of Architecture". The lecture series gives the students an insight into different construction and design methods. The lectures are held by four different professorships in a block of 5 lectures in a row and showcasing their individual approach on design and architecture in general.

Abstract

Lecture "Construction III":
The overall topic of the lecture series is "Construction – Elements of Architecture". The lecture series gives the students an insight into different construction and design methods. The lectures are held by four different professorships in a block of 5 lectures in a row and showcasing their individual approach on design and architecture in general.

Objective

In the 2nd Year curriculum, three courses are related in design theory and design practice: "Konstruktion III" is design theory. "Konstruktion BUK III" is construction theory. "Architectural Design III" integrates the theories from the different courses including with them to apply architectural design in real-world problems.

Architectural Design III: House Behaviorology in Switzerland (M.Kaijima)

Typology and Research (4 weeks)
Each individual student
• is able to understand different housing typologies within their historical context. (2)
• is able to understand the principles of housing design, including topics such as Typology, Program, Usage, Privacy, Commonality, Material and Climate. (2)
• is able to independently gather information on a self-chosen topic (3)
• is able to analyze a case study house based on an individually formed question or individual interest. (4)
• is able to represent their analysis in a drawing and a short text. (3)

Structure and Space (4 weeks)
Each individual student
• is able to design a small-scale housing complex according to the above-mentioned principles. (3)
• is able to design spaces for privacy and for community. (3)
• is able to adapt a housing design to the needs of specific inhabitants with partially special needs, such as families and elderly. (3)
• is able to apply the principles of structural design to their housing design. (3)
• is able to critically evaluate a design and improve it. (5+6)
• is able to represent a design through floor plans, sections and elevations as well as with physical models (3)

Improving Design + Details and Construction (5 weeks)
Each individual student
• is able to detail a small-scale housing complex. (3)
• is able to understand the principles of construction. (2)
• is able to gather examples and evaluate them in accordance with their design (5)
• is able to evaluate and chose materials and construction in accordance with their design idea (5).
• is able to draw a section of their design in scale 1:50 with all necessary details. (3)

Cognitive scale
(1) Remember
(2) Understand
(3) Apply
(4) Analyze
(5) Evaluate
(6) Create
https://ethz.ch/content/dam/ethz/main/eth-zurich/education/lehrentwicklung/files_DE/Vorlage_LernzieleFormulierenDe.pdf

Grading Criteria:
The submissions will be graded before each review. Each submission is graded according to the following criteria:
• Completeness and punctuality of submission
• Research method, the ability to find and analyze information
• Implementation of the concept of Architectural Behaviorology within the design
• Choice of Typology, Design and Expression of the project, in connection with the concept of Architectural Behaviorology
• Structural design, construction details and choice of materials in accordance with the design idea and the method of Architectural Behaviorology
• Visualization, the ability to communicate a design effectively with compelling drawings, models and text.

The final grade consists of the following partial grades:
• Mid review 1 submission (individual work): 30%
• Mid Review 2 submission (individual work): 30%
• Final Review submission (individual work): 30%
• "Construction III" submission (individual work): 10%

Lecture "Construction III":
Introducing students into different design and making approaches to find a path towards their personal approach on designing and making. Last day of lecture, students must bring construction drawing by A5 sketchbook given at first lecture by design studio to submit the result of understanding of lectures. The presentation will be a large exhibition participated by all 2nd year students to share as exhibition by all 2nd year students. The result will be integrated in the grading of design studio.
**Content**

Architectural Design III: House Behaviorology in Switzerland (M.Kaijima)

Architectural Behaviorology and Actor Network Theory are our two guiding principles to not only design architecture but also understand our current existing environment.

By understanding a building, a house not as an isolated object but as a node in a vast and far reaching network, or several networks, we grow conscious of the impact, which our design has, not only on the specific plot but on the neighborhood, the city, the environment, society. Vice-versa, analyzing and understanding the relationships, which have shaped existing buildings, helps us to better understand how and why the design of those buildings came to be.

While identifying the relationship between actors within the network, we simultaneously observe the behavior of each actor as a result of their relationship. The behavior can be static or dynamic, actors can be human or inanimate. How does a building behave towards its environment? What behavior do inhabitants engage in within and around a building? How do we have to design to take Behaviors of certain materials into account?

House and Housing is the base of our living environment and a diverse field in architecture. House behaviorology will set the challenge to find sustainable living condition in the city, by understanding historical examples and their geography, density, economic standing, and time period.

At first, to find the character and essence of today's house and housing design in Ticino, we will start analyzing existing single-family houses in and around the city. We will research and map how these basic units of housing relate to the users, to each other and to their surroundings. What kind of purposes they fulfilled and what kind of activities and behaviors do these houses enable?

Second, we will try to improve on the design by changing the single-family house into housing complexes, responding to the need of greater density, but still retaining the qualities of the original houses. Where do we find synergies, when combining houses? What kind of common spaces arise and how can we make use of them to make better neighborhoods?

Simultaneously we will have a close look on designing for inclusivity. How do we design for partially special needs groups, such as the elderly or children? How can we all live together in a house and in the urban ecology?

**The course is structured as follow:**

**Typology and Research (4 weeks)**
- Analyzing an existing single-family house in Ticino according to the principles of Architectural Behaviorology and the historical context of the said house.
- Defining a special interest for an element or relationship between elements of the chosen house and defining a question as a tool to better understand this field of interest.
- Representing the house and the research in a large-scale drawing and a short text.

**Structure and Space (4 weeks)**
- Designing a housing complex with a given program on the basis of the analysis of the case study single-family house.
- Evaluating and adapting the design constantly.
- Applying the principles of structural design to the design project.

**Improving Design + Details and Construction (5 weeks)**
- Constantly improving the design and sharpening the design idea.
- Detailing one section in the scale of 1:50 by applying the learned principles of construction and structural design as well as adding details in accordance with the principles of Architectural Behaviorology.

**Lecture notes**

Architectural Design III: House Behaviorology in Switzerland (M.Kaijima) Lecture Notes

Each student will receive a printed reader, containing the basic information about the course, such as schedule, syllabus and other important information, as well as examples and references for the design task, and readings to support the theoretical framework of the course.

**Architectural Design III: Material and Light**

***R. Boltshauser***

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php). Students who do not wish to change the design class don't have to participate in the internal enrolment.

Project grading at semester end is based on the list of enrolments on 30.10.2024, 24:00 h (valuation date) only. This is also the ultimate deadline to unsubscribe or enroll for the studio.

**Abstract**

In the autumn semester, we will approach the phenomenon of space through fundamental experiences with regenerative materials and «Nordic Light» to design a cultural centre on Louis Kahn's home island of Saaremaa in Estonia.

In the spring semester, we work on the redensification of an industrial wasteland in Brunnen (CH) and focus on the themes of structure and place.

**Objective**

Semester topic "Design III":
- Addressing dense, sustainable, circular, simple building
- Development of a broad theoretical basic
- Holistic design of spatial atmospheres in the interplay of concept, context, construction, climate, sustainability and materiality
- Research and development of architectural themes resulting from energy and climatic considerations
- Practical work with models, plans and visualization programs as part of the design process

Lecture "Construction III":

Introducing students into different design and making approaches to find a path towards their personal approach on designing and making.

**Content**

Semester topic "Architectural Design III":

(...)

Lecture "Construction III":

The overall topic of the lecture series is "Construction – Elements of Architecture". The lecture series gives the students an insight into different construction and design methods. The lectures are held by four different professorships in a block of 5 lectures in a row and showcasing their individual approach on design and architecture in general.

**Lecture notes**

The students will receive a reader at the beginning of the semester.

Abstract

Do we live a house?
Or do we house a life?
How. Do. We. Live.
Do we know HOW we live? Do we know enough about HOW we live? HOW do things around us shape the way we live? HOW do we live the things around us? WHAT are the conditions around us? WHAT makes our habits? HOW do habits change conditions?
Objective
With sets of questions, we will question
HOW TO house a life?
HOW TO cook?
HOW TO bath?
HOW TO rest?
HOW TO move?
HOW TO eat?
HOW TO plant?
HOW TO clean?
Combined with
WHAT IS
WHAT IS wood?
WHAT IS steel?
WHAT IS stone?
WHAT IS ceramic?
WHAT IS glass?
WHAT IS earth?
WHAT IS concrete?
Lined out with
WHERE IS
WHERE IS the window?
WHERE IS the stool?
WHERE IS the tree?
WHERE IS the stove?
WHERE IS the sink?
WHERE IS the lamp?
WHERE IS the door?
And never without
WHAT ABOUT
WHAT ABOUT the norm and the normative?
WHAT ABOUT the size and the scale?
WHAT ABOUT the place and the space?
WHAT ABOUT the individual and the common?
WHAT ABOUT the culture and the society?
WHAT ABOUT the weather and the atmosphere?
WHAT ABOUT the speed and the urge?
These sets of questions will guide us through the semester and form SETTINGS, SCENOGRAPHIES and SEQUENCES.
Is the way we cook defining the space or is our space changing the way we cook? Is taking a bath a matter of physical cleaning or might it also be a matter mental health? Do we sleep to rest or is the bedroom also a place to read, to play, to meet? Can space be more than circulation? What do you store, where do you hide? What is an office at home? What is work at all?

Content
0 + 3 + 13
This studio will be organized in 0 + 3 + 13 movements.
Movement 0, 1, 2 and 3 will last 3 weeks. Movement 13 will last 1 week.
During Movement 0, students will question, travel, draw, and collect from the activities of Universum Carousel Journey.
Movements 1, 2 and 3, students will work in groups of 3. These 3 students become a practice. The practice will be assigned a set of 2x HOW TO and 1x WHILST, that they will freely combine with 1x WHAT IS, 1x WHERE IS and 1x WHAT ABOUT. They will work in the form of settings, scenographies and sequences for 3 weeks.
In the next movement group members and assigned sets of questions change again. Each movement will be another group constellation of students. We study 3 times a combination of questions. All together we will by that collect an endless series of configurations of topics.
The Movement 13, will be an individual movement of questioning, connecting M0, M1, M2 and M3 all together into sets of questions that will be presented in the last week as a ground for a collective discussion.

Abstract

RETHINKING LANDSCAPE STRUCTURES
The semester explores new ways of dealing with infrastructure projects and exemplary climate adaptations of the Swiss cultural landscape.

Objective

DESIGNING LANDSCAPES AND PROCESSES
The primary goal of the studio is to project landscapes. This entails the constant oscillation between territorial relationships and local actions - between landscape space and place.

THINKING IN SYSTEMS
Due to the dynamics of their constituent elements such as soil, water and vegetation, landscapes change their dimensions and character with cycles and time. Designing landscape consequently means thinking in and designing systems and processes.

DEVELOPMENT OF A LANDSCAPE VOCABULARY
'Reading' a landscape, its space-defining elements – like water, topography and vegetation – and the processes and forces that shape them is as much a focus of teaching as designing. Thus, an intensive examination of our understanding of landscape and our relationship to nature goes hand-in-hand with the semester.

METHOD TO DESIGN FROM AND WITH PROCESSES
Because of the complexity of territory and task, the iterative design method is followed, oscillating between designing and analyzing, and between large and small scales. Developing an attitude, crystallizing the specific themes, and choosing the appropriate design tools are as much a part of the work process as designing the transformation processes.

Content

PROTOTYPICAL CASE STUDIES ON THE CLIMATE ADAPTATION OF THE SWISS LANDSCAPE
Based on specific issues such as landslide risks or planned tunnel projects, new innovative ways of dealing with natural events and infrastructure projects are designed - always in search of multi-layered added value for people, flora and fauna.

Parallel to the landscape design, the students get to know landscape architecture as one of the instruments with which today's questions can be answered. Because these increasingly demand different answers - systemic thinking, designing processes, accepting change and a differentiated landscape vocabulary are prerequisites for this.

### Prerequisites / notice

- **Architectural Design V-IX: Topic (M. Conen)**
  - Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).
  - Project grading at semester end is based on the list of enrolments on 30.10.2024 (valuation date) only. This is the ultimate deadline to unsubscribe or enroll for the studio.

- **Architectural Design V-IX: Topic (GD C. Baumann)**
  - Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).
  - Project grading at semester end is based on the list of enrolments on 30.10.2024 (valuation date) only. This is the ultimate deadline to unsubscribe or enroll for the studio.

- **Architectural Design V - A New Museum (A. Caruso)**
  - Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).
  - Project grading at semester end is based on the list of enrolments on 30.10.2024 (valuation date) only. This is the ultimate deadline to unsubscribe or enroll for the studio.
Abstract
To be specified.

Objective
Qualification to control the design process increasingly independent and with sole responsibility and to find to an individual design methodology and attitude.

Content
To be specified.

Prerequisites / notice
To be specified.

  - Creative Thinking: assessed
  - Critical Thinking: assessed
  - Integrity and Work Ethics: assessed
  - Self-awareness and Self-reflection: assessed
  - Self-direction and Self-management: fostered

**052-1145-24L Architectural Design V-IX: Voluptas S2E5 – Pathfinder W (Charbonnet/Heiz)**

*Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).*

Project grading at semester end is based on the list of enrolments on 30.10.2024 (valuation date) only. This is the ultimate deadline to unsubscribe or enroll for the studio.

Abstract
"Italian may be "such children" but their tar-babies are not physical pain or coldness; they want an absence of history, they want to start fresh. When they designed those big palaces in Rome they must have known all along about hope and death, but they were so graceful they made it look easy."

Objective
**METHODOLOGY**
1. Conduct a survey based on the objective observation of Rome; Driven by the choice of an Agent, map out a singular path within the city; Consider the subjectivity of experience and extrapolate multiple storylines.
2. Develop a project addressing a specific problematic: formulate a critical comment onto a contemporary condition; Intensify the experience to reveal further potentials.
3. Elaborate an argumentative discourse, supported by a curated selection of multidisciplinary sources.

**INCENTIVES**
Drafting & Mounting
Conceptual & Critical Thinking
Argumentation & Rhetoric
Narration & Storytelling
Scenography & Atmosphere
Expression & Composition

**SKILLS**
Researching Contemporary Concepts & Curating multidisciplinary Sources; Articulating a discursive Argument; Mastering Visual Literacy & Storytelling, Image Mounting & Composing, Architectural Drafting & Projecting.

Content
**PATHFINDER 3** is dedicated to the timeless city of Rome: its intricate history, morphology, mythology… all canonical spatial parameters as suggested by Lefebvre: political, sociological, anthropological, economical, temporal."

Our interest will focus both on the banal and the sublime, on habits, routines, and calendar rites as well as on individual and social rhythms setting the pace for society. As the ordinary interweaves thousands of beats, repetitive tunes and syncopated breaks, there can be no territoriality without its temporalities, may it be that of urbanisation, of experience, or of dreams.

The critical consideration of these paragons, further endowed with the lure of fiction, shall initiate alternate (hi)stories and cityscapes.

The design studio will be carried out in collaboration with the Faculty of Game Design of the Zurich University of the Arts (ZHdK). Together we will draft, mount, design, discuss, play… confront our perspectives onto contemporaneity and ultimately imagine audacious yet playful architectural and territorial fictions.

A series of lectures by experts from a variety of fields will enrich our investigations.

### Prerequisites / notice

For 052-1105-24L Architectural Design V-IX: Topic (J.De Vylder)
- Individual and group work, including 5 or more weeks of group work.

### Abstract

To follow

### Objective

To follow

### Content

To follow

### Prerequisites / notice

CHF xx.-- per student (estimated costs, without possible seminar week costs)
Each student will receive a printed reader, containing the basic information about the course, such as schedule, syllabus and other important information, as well as examples and references for the design task, and readings to support the theoretical framework of the course.

Lecture notes
Abstract: This studio works on the idea that a substantial understanding of today's technology (internet of things, big data, machine intelligence ...) changes the perspective to architectural theory and will result in different architectural designs and building constructions.

Objective:
1) Identification and understanding of the challenges of today's technologies; 
2) techniques of working within the plenty of the internet; 
3) a methodology to design digital architectures; 
4) understanding of the shift from hard building construction to soft building applications, and 
5) an understanding of the importance of becoming a literate digital persona in order to be an architect today.

Content:
METEORA #09 will use artificial intelligence to write a text to explicate a precise position in today's world, to create a spectrum of images to reflect this world and design an architectural artefact which brings things into adequate proportions.
We are used to designing architecture from a supposedly objective perspective. With immersive technologies, we overcome this distance, expand our perception and immerse ourselves directly in the space to be designed. In doing so, we develop an altered understanding of space by digitally designing architecture and its construction while simultaneously moving within it.

The possibility to present the designs in the Immersive Design Lab using a room-filling projection and to immerse with VR goggles requires new forms of presentation, which we will explore together.

- We learn how to develop and explore our projects with virtual reality
- We learn to computationally design with the parametric tool Grasshopper in Rhino
- We present our projects interactively in the Immersive Design Lab

Prerequisites / notice

The official language in our studio is German. Table critiques can also take place in English. Lectures and project meetings can also be held in English depending on our guests.

We do not presume any prior knowledge of Rhinoceros or Grasshopper. We will introduce the necessary methods and will rehearse them together.

Individual and group work, including 5 or more weeks of group work.

Introduction: Tuesday, Sept. 17th 2024, Immersive Design Lab (HIT F 22)
Concept discussion: Wednesday, Oct. 16th 2024
Intermediate discussion: Wednesday, Nov. 22nd 2024
Presentation discussion: Wednesday, Dec. 4th 2024
Final crits:

CHF 100.-- per student (estimated costs, excluding possible seminar week costs)

Architectural Design V-IX: Topic (A. Puigjaner)

The Architecture and Care design studio will address the spaces where human reproduction takes place. Gendered constructs around reproduction have been and still are central practices to the ways we structure social realities. Architecture and space have historically contributed to promoting and perpetuating sexist social models around reproductive labour and its associated care practices.

RAISING CRITICAL ARCHITECTURAL POSITIONS

Formulating clear and precise questions, using abstract ideas to interpret information, considering diverse points of view, reaching well-reasoned conclusions, and testing alternative outcomes. Performing qualitative and quantitative architectural research and translating it into an architectural language. Gathering, assessing, recording, and comparatively evaluating relevant information and performance in order to support conclusions.

DESIGNING SOCIAL IMPACT

Designing responding to territories of care and their characteristics, including urban context and historical fabric, soil, topography, ecology, climate, economy… Using formal, organisational, social, and environmental principles and informing two- and three-dimensional design. Understanding construction systems and their coherent formalisation. Considering the environmental impact and the reuse of the design.

COMMUNICATING ARCHITECTURAL PROJECTS

Writing, performing, and speaking effectively about an architectural design, using representational media appropriate for both the profession and for a wider audience. Making clear architectural drawings and constructing props at different scales that illustrate and communicate an architectural research and design technically, experimentally, and aesthetically.
Content

In Switzerland, official data shows that nowadays the burdens of child-rearing still predominantly fall upon women, with 70 percent expressing concerns that having a child will impact on their careers. There are a myriad of reasons for the country’s declining birth rates – for instance a stronger focus on women’s careers, challenging socio-economic conditions, and the availability of contraception – and architecture is one of them: urbanisation leading to smaller living spaces and the dispersion of support networks, the scarcity of nearby public care facilities, and the lack of adequate spaces for shared forms of care beyond the domestic sphere of the nuclear family. Public relief, despite being remarkably generous in comparison to other countries, is still insufficient: fertility treatments like IVF are not covered by insurance – while three percent of children born were conceived in vitro – child care costs are only partially subsidised, etc. Unsurprisingly, people who can become pregnant are having less and less children and, if so, much later in their life. In this context, what can the role of architecture be?

In this design course, we will imagine architectures that support alternative reproduction practices at different stages, from fertility treatments to upbringing. Speculating with new programmes and institutions, we will design collective spaces that promote and visualise shared forms of reproductive care. In the present context, the division between productive and reproductive labour, the spaces it takes place in, and the bodies that carry it out, are once again being reshaped. The limits of the domestic are blurring, the home is no longer necessarily a space for care; instead, it is a transient, productive, and networked space. On the other hand, public and collective spaces can shelter former domestic activities and become spaces for care through different bodies (human and non-human), technologies, and strategies at multiple scales.

Addressing architecture from the urban to the body, the course aims to develop a comprehensive understanding of the relationship between design and reproduction in Switzerland. We will understand dependency as a positive kin, and propose programmes and spaces that support sharing reproductive labour in transversal ways. This realignment can contribute to generating new forms of balance, ones in which we stop “caring for” and start “caring with” as a form of interdependence. We will look at the body – its spaces, contexts and rituals – as a starting point for an architectural and aesthetic proposal at multiple scales. The students will be asked to design avoiding former forms of spatial oppression and exploitation and, instead, explore the paths of otherness, wildness, diversity, complexity, and the impractical. The final objective is to propose institutions providing inclusive spaces for reproductive futures based on collective kinship.

Prerequisites / notice

Only group work.

Abstract

Building Construction (BUK) as an integrated discipline is included in this course.

Architectural Design V-IX: Heritage-Led Teaching Project (GD A. Beer / D. Merz)

This semester, the Design Studio (14KP) is offered in conjunction with an integrated design-build seminar week in Davos (2KP) on the Schatzalp and the elective 052-0911-24L Repair: Keep in Place (2KP) as a heritage-led teaching project. To take part in the required 052-0911-24L Repair: Keep in Place you must register separately. You will be automatically enrolled for the seminar week when you join the design studio.

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

Project grading at semester end is based on the list of enrolments on 30.10.2024 (valuation date) only. This is the ultimate deadline to unsubscribe or enroll for the studio.

Architectural Design V-IX: Topic (GD G.Retsin)

Please register (www.mystudies.ethz.ch) only after the
The examination of filmic space situations and performance discloses new perceptions of architecture which will be studied on behalf of film analyses and experimental topics. During the course space-effective creative means such as editing or framing will be introduced and discussed under perceptive aspects. Mediality within spatial perception can thus be integrated into a development of cultural history and leads towards a conception which goes beyond the limits of architecture and stimulates new processes of design.

Does not take place this semester.

The ubiquity of neural nets calls on architects to explore the vectorial world they index. After introducing participants to basic concepts of coding and machine learning, this course invites them to inventively explore hidden connections among vectorized digital objects.

In the second phase, INVENTING, participants are given access to a multi-modal corpus, an inventory containing millions of digital objects pertaining to different media – scans, sounds, samples and sentences – and a series of bespoke functions in Wolfram Mathematica. Aided by machine-learning algorithms, participants will join characteristic collections of digital objects into a story a character might tell. These collections can be based on authors, inviting participants to further engage with theoretical ideas. In the third phase, STAGING, participants will focus on bringing these stories to life through a deliverable in their chosen format, accompanied by weekly tutorials.

The course deals with spatial phenomena at the interface of film and architecture. The alternating influence of these two media will be analyzed, the dispositions of perception and effect will be compared and thus will sharpen the view for a architectural way of looking at space.

The first phase of the course, CODING, offers entry points to coding literacy as well as related theoretical literature without attempting exhaustive coverage: using Wolfram Mathematica, participants will get familiar with functional programming, including importing and exporting data, organizing it into data structures, writing simple functions and encoding and decoding digital objects into and from vectors.

The course offers 2G lecture notes and an extensive list of references. Participation in the curricular activities and project submit will be assessed through weekly tutorials, final crits, intermediate crits and project grading at semester end. Final grades will be based on the list of internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

Project grading at semester end is based on the list of enrolments on 30.10.2024 (valuation date) only. This is the ultimate deadline to unsubscribe or enroll for the studio.

### 052-0507-24L Finding a language for change

**W** 2 credits 2S M. Kupferschmid

**Abstract**
How can we use writing to approach a new architectural form that remains relevant even in times of major social challenges such as the climate crisis? During the semester, all seminar participants will work on their own texts in which they take a critical stance towards a particular building.

**Objective**
- Using text as a way of approaching questions on climate-relevant architecture.
- Development of an individual text, ongoing revision with the help of various exercises and reviews.
- Reflection on one's own role as an architect in the architectural discourse, in relation to the climate crisis and in the changing professional field.

**Content**
How do we find a new architectural form and thus a new language in a time where everything is changing rapidly – and must change? The issues of ecological sustainability in particular are causing fundamental changes in the field of architecture and in our understanding of the profession. How does writing serve us as a means of approaching an architectural language that remains relevant in this environment? In the best sense, writing forces us to take a stance.

Over the course of the semester, all students explore several buildings. Through writing, they try to find out what it contributes to finding new forms for architecture in the climate crisis. We examine what influence sustainability has on the development process and the perception of the buildings, what new architectural language they have in store for us and what processes are taking place in the background. All students write their own short text. Over the course of the semester, they continuously revise their text and reflect on what they have written with feedback from their teachers and fellow students. The focus does not lie on the finished text, but on sharpening and at the same time constantly questioning their own attitude and continuously reflecting on what they have written.

**Lecture notes**
The students will receive a reader at the beginning of the semester.

### 052-0583-24L Archives of the Living

**W** 2 credits 4S A. Caruso, M. Conen

**Abstract**
This course intends to use different techniques of recording and research to capture a special and important time in the history of Zurich between the late 1970s and the early 1980s. The documents that each student produces will be test of how to communicate and archiving specific topics of this time.

**Objective**
- The students will engage with existing archives, but will ask new questions in order to extend the received meanings of the material
- The students will use photographic and video recordings to represent the sites that we are studying
- The students will use social scientific interview techniques

This material will be assembled into small documents that communicate specific topics from the main theme

**Content**
Zurich between the late 1970s and the early 1980s was a city where urban activism, punk and a nascent contemporary art scene came together in an explosive way. Inspired by other scenes, in say London and New York, what was special in Zurich was how intermingled the members of the different scenes were and how influential they would become for the future shape of the city. This must have something to do with the mall scale of the city and how intertwined its society is.

Independent of official policies and large capital investments, it was the ideas and the participants of these times that has given shape, for better and for worse, to contemporary Zurich. This course will begin to engage with the stories, the people, and the artefacts of that time. Drawing on the holdings of existing social archives in the city, but also engaging through photography and writing, we will begin to construct an archive of the living for Zurich.

### 052-0527-24L BUK Re-Detailing

**W** 2 credits 2G S. Girsberger

**Abstract**
Remodeling and reuse is the order of the day. This should be learned (again). In this elective course we construct with what we find. The limited range of materials requires a creative and flexible approach to joining and connecting. In addition to practical examples and lectures, we try to develop theoretical details using reused material.

**Objective**
Questions about both application in construction and expression should be answered. Which reused materials and elements are suitable for what and how are they assembled? What new aesthetics can be created and how can they be conveyed? The aim is to prepare the young generation of architects for the constructive use of reused materials. Using theoretical exercises and practical examples, an attitude towards building with existing things and its challenges and opportunities should be developed.

**Content**
Phase 1: Inputs and lectures give students insight into the topic of circular building. Necessities, opportunities as well as challenges and limitations of the practice are discussed together. We get an overview of processes from the organization of a component platform to non-linear planning within the architectural offices

Phase 2: In experimental exercises (groups of two to three), details on a scale of 1:5/1:10 are constructed from the collected material. The focus is on the choice of materials for the specific location and on joining the individual elements. It is examined how one can react to a given situation with limited resources. Against the background of a new aesthetic, various forms of representation are also being examined.

**Prerequisites / notice**
Attending the first event is mandatory. A list will be given out in which people can sign up. The number of participants is limited to 20 students.

Practice-oriented seminar on the topic of analog & artistic photography

Instructed by Nicolas Rolle, the seminar serves as an introduction to analog experimentation in the creative process of artistic practice. By analyzing the motifs and ways of thinking of photographers, the aim is to develop a basic approach to the medium of photography and to expand practical work in the darkroom through theoretical questions about the medium.

Theoretical and practical introductions form the core of the targeted exploration of the photographic apparatus. Students are encouraged to gather their own experiences in analog experiments and to explore the urban space and their surroundings with the camera. With an artistic work developed over the semester, the expanded concept of photography will be sharpened and brought to an individual expression.

Lecturer approval required for all students. Please send a letter of motivation (max. 300 words) to rolle@arch.ethz.ch by 05.09.2024. The number of participants is limited to 20. The course will be held in German in the Fall Semester 2024.

Participants pay CHF 25.00 for the materials required in the course.

Understanding Light

The seminar explores light from the perspectives of Physics and Art, opening up new dimensions for collaboration across disciplines by tackling questions such as: What is the origin and nature of light? How does it travel through space and time? How can it be made productive in an artistic sense and what, in turn, can artistic methodologies contribute to experimenting and thinking about light?

In this course, we will set a performative frame for experimentation and exploration. Coupled with experiments in the Dep. of Physics, students will be introduced to concepts such as the origin of light and color, and the interpretation of the optical world that surrounds us to understand what actually gives rise to the effects we see everyday—from butterfly wings and autumn colors to the appearance of buildings and cities. In addition, we will perform practical experiments with basic optical components like lenses, mirrors, and prisms, in order to understand how they can be used to capture images. Inputs by guest lecturers (e.g. on light in photography, anthropology or urban landscapes) are planned. Students will be asked to present related topics.

At the end of the semester, the artistic experiments will be presented.

Max. number of participants: 15

Please send a short motivation letter (max. 300 words) to artinspaceandtime@arch.ethz.ch by 05 September 2024.

Unveiling Habitats

How can architects integrate the topic of cohabitation and biodiversity into the design process? As an interdisciplinaries discipline, architecture plays a key role in promoting biodiversity in urban areas. In this seminar, promising leverages and fields of action will be explored and discussed in order to create ecologically rich and networked living spaces of high-quality.

In this context: how can integrative construction projects of the future be designed with a high ecological quality and a high quality of life - both for humans and other living beings? In this seminar, we will look at the notions, issues and actors involved in questions of biodiversity in the urban area of the city of Zurich from an architectural perspective. Theory and practice in the field of architecture and biodiversity will be linked through a variety of guest contributions from experts and on the basis of a case study and several field trips. The individual research and findings are summarized in the form of a visual project documentation and will be presented at a final event.

Analytical Competencies fostered

Presentations of the lecturer and guests will be made available.

Creative Thinking

There is a sense of new beginnings in architecture. Over the past two decades, efforts in sustainable construction have primarily focused with special focus upon the dynamic changes in this context and the related planning and building reactions to them. The objective is that the students engage in a debate of a differentiated functional planning as a basis for complex buildings which are to be successful functionally, operationally and in design. On the basis of a given scope of themes the students carry out research aiming for possible improvements for example in health facility planning. The scope of subjects is announced at the beginning of each semester.

Complex buildings such as health care buildings are subject to constant change. In a new hospital building 60% of the diagnostic and treatment areas are subject to building changes within the first 10 years of operation. Architecture has to develop concepts which accommodate this level of dynamics into the building structure in a better way. In the coming years this need for adaptability is going to be challenges even further by the even more reducing health care resources. The paper should discuss in this context a specific question in detail by analysing problems and developing and discussing potential planning solutions.

Lecture notes

Presentations of the lecturer and guests will be made available.

Re-Imagine: architectures of transformation

The shift from ‘Ersatzneubau’ as the status quo to an intelligent approach to our existing building stock has just begun. This transition demands new roles, new knowledge, and new ways of action. The course examines, through lectures and discussions with guests, the fields of action that open up for architects to actively shape a changing building culture.

The objective is to develop an awareness of the field of action of one’s own profession to help shape a sustainable building culture.

- Develop an awareness of the field of action of one’s own profession to help shape a sustainable building culture
- Understand and analyze complex and multifaceted mechanisms in the construction process, especially in the transformation processes of existing buildings
- Investigate and discuss relevant case studies, practices, and processes
- Question common practices and formulate alternative approaches

Content

There is a sense of new beginnings in architecture. Over the past two decades, efforts in sustainable construction have primarily focused on (replacement) new buildings that consume as little energy as possible in operation. Recently, the issue of embodied energy has gained more attention: in Switzerland, there is an increasing willingness to preserve not only monuments but also “everyday” buildings from demolition and to redesign them for continued use and a new life cycle. Although the practice of replacement construction still constitutes a large part of overall construction activity, a path is slowly opening towards a building culture that seeks the ongoing redesign of existing buildings instead of the tabula rasa and “clean solutions” of past decades.

This shift from a demolition culture to a transformation culture requires a new set of skills from architects. The times of standard solutions and pre-drawn construction detail catalogs are over. Transformation projects require imagination, technical skill, and a profound understanding of our building stock. We will explore the changing role of architects in this new building culture through discussions with local experts and pioneers who have demonstrated exemplary approaches in their practice and made significant contributions to the transformation. Each week, we will examine a specific step in the transformation process of a building, from strategic planning to construction. This will provide a detailed understanding of the tools and competencies that practicing architects need to learn, the contributions we can make as individuals to the transformation, and the opportunities a changing building culture can offer us.

Each session will include an introduction to the topic with practical examples, followed by guest presentations sharing their experiences, expertise, and case studies. The inputs will be discussed in plenary at the end of each lesson.
Fusions of digital-analog relationships have accompanied us since the very beginning of the digitalization era. The rapidly growing impact of digital technologies on our life necessitates constant adaptation. The course introduces the term "Hybrid Reality," which represents the coexistence of physical and digital spaces. Using state-of-the-art VR technologies, the methodology focuses on immersive, real-time, 1:1 scale space creation, exploring corporeal design, and reinventing conventional methods. Students will learn to digitize physical spaces, create hybrid reality environments, and design interactive exhibitions.

The course "360 – Reality to Virtuality" is interconnected with "3D Scanning and Freeform Modeling".

You must register for both courses: "360 – Reality to Virtuality" and "3D-Modeling" (2x 2 ETCS). Classroom teaching as 4h block + self-teaching and research at home.

Max. number of participants 15 students.

A 200 CHF deposit will be charged for the VR Headset. It will be refunded upon the return of the headset on the last day of the course.

If you already have an Oculus Quest 2, you do not need to pay any deposit and can work on your own device.

Please send a short application email (max 150 words) to Adam Kiryk: kiryk@arch.ethz.ch

Enrolment in agreement with the lecturer only

Classroom teaching as 4h block + self-teaching and research at home.

You must register for both courses: "360 – Reality to Virtuality" and "3D-Modeling" (2x 2 ETCS).

The course "360 – Reality to Virtuality" is interconnected with "3D Scanning and Freeform Modeling".

Students formulate a precise research question for the course that they investigate through tests and a model of a built architectural project during the semester.

The individual tests, material samples, and fabrication techniques are continuously questioned to make specific decisions related to the research goals. The students will derive the model type, scale, context, material, and level of detail from their findings - this will inform the further development of the research question.

The model resulting from this process, the accompanying tests, and the project documentation provide insight into possible answers to the research question and allow the students to check the validity of their assumptions to inform their studies.

We expect you to have sound knowledge of building 3d models and creating plans. Our class supports Rhino3D, but you are free to use modeling tools you already know.

In addition to the course taking place in person (3h), an independent processing time of 5-6h/week is needed to complete your project successfully.

The students will design models as tools for understanding complex questions by investigating an existing architectural project.

The students will test materials, techniques, and construction principles for model-building by completing hands-on activities.

The students will test and challenge model-building conventions by building examples.

The students will review their work by creating annotated images and writing texts as part of their course documentation.

The students will design models as tools for understanding complex questions by investigating an existing architectural project.

The number of participants is unlimited. The course takes place on Thursdays from 12:00 p.m. to 2:00 p.m. in the ONA Hall E7. The class will be held in German.

If a credit is sought, the following is required to pass the elective:

- The definitive registration takes place after attending the introductory event.
- The number of participants is unlimited. The course takes place on Thursdays from 12:00 p.m. to 2:00 p.m. in the ONA Hall E7. The class will be held in German.

If a credit is sought, the following is required to pass the elective:

- The drawings must be uploaded to the drawing blog on the respective practice day. Attendance and submission is required for at least 8 practice days. The submissions on the blog must contain the category of your name and that of the respective lecture title. You will receive further information on this at the beginning of the elective course.

**052-0549-24L**  
**Hybrid Modeling: 3D-Printing for the Architectural Design**  
**W** 2 credits  
**J. Benhamu Esayag**

**Abstract**  
The HYTAC Elective Course offers the opportunity to explore alternative ways to approach Point Cloud and 3D Printing in a simple way. The students will learn the basic principles and workflows behind photogrammetry, 3d-modeling and 3D-printing, to produce digital and physical (3d-printed) models.

**Objective**  
By the end of this course, the students will be capable of:

- a) creating and processing point-cloud-generated models in Blender
- b) producing 3D-printed models in architectural scale
- c) using the above digital tools to advance their personal design workflows.

**Content**  
The goal of the course is to introduce digital technologies and facilitate common architectural workflows by skipping the time-consuming processes of 3D modeling.

The course includes:

- Introduction to photogrammetry and 3D printing through lectures and tutorials.
- Generation of a digital twin of the selected site through photogrammetry and production of a physical model (3D printed)
- Use of Blender. Basic skills can be acquired during the course.

In case of questions regarding the course, please visit our website: https://hytac.arch.ethz.ch/courses/elective-2/ or contact us directly via email (hytac@arch.ethz.ch).

**Literature**  
www.3djony.com

**Prerequisites / notice**  
Basic Knowledge of 3D printing technology is not required.

**Competencies**  
- Subject-specific Competencies: Concepts and Theories fostered
- Subject-specific Competencies: Techniques and Technologies fostered
- Method-specific Competencies: Analytical Competencies fostered
- Method-specific Competencies: Decision-making fostered
- Method-specific Competencies: Media and Digital Technologies fostered
- Method-specific Competencies: Problem-solving fostered
- Social Competencies: Communication fostered
- Social Competencies: Cooperation and Teamwork fostered
- Social Competencies: Sensitivity to Diversity fostered
- Personal Competencies: Adaptability and Flexibility fostered
- Personal Competencies: Critical Thinking fostered
- Personal Competencies: Integrity and Work Ethics fostered
- Personal Competencies: Self-awareness and Self-reflection fostered

**052-0533-24L**  
**New constructive places of contemporary timber construction II**  
**W** 2 credits  
**I. von Meiss-Leuthold, D. Mettler, D. Studer**

**Abstract**  
The elective subject "New focal points of construction" investigates on the basis of contemporary architecture the complex interaction of construction elements. The comparative analysis of built constructions serves as a basis for further development of future constructions. This semester will focus on building with new timber construction.

**Objective**  
The target of the course is the understanding of the impacts of material, technology and construction to the architectural education of constructive points. The focus lies on the present state of technology and the current challenge of building. The conjunction to current constructive methods and basic conditions enables a critical evaluation of the constructive Status Quo within the contemporary producing architecture as well as a perspective to new constructive education.

**Content**  
Course:
1. Introduction of current level of technique
2. Colloquium with guests of producing and processing companies.
3. Visit of construction site and factory

Excercise:
- Analysis and presentation in group of two of a building.

The definitive registration takes place after attending the introductory event.

**Competencies**  
- Subject-specific Competencies: Concepts and Theories fostered
- Subject-specific Competencies: Analytical Competencies fostered
- Subject-specific Competencies: Decision-making fostered
- Subject-specific Competencies: Media and Digital Technologies fostered
- Social Competencies: Cooperation and Teamwork fostered
- Personal Competencies: Critical Thinking fostered

**052-0569-24L**  
**Lecture Series Design and Architecture (Ringvorlesung): Practice what we teach?**  
**W** 2 credits  
**A. Fonteyne**

**Abstract**  
Specialists give lectures on current architecture-specific topics.

**Objective**  
Obtaining knowledge from architectural practice after 2020.

**Content**  
Specialists give lectures on current architecture-specific topics.

Lecturers are listed in due time.
### Subject-specific Competencies
- Concepts and Theories
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Communication
- Cooperation and Teamwork
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation
- Adaptable and Flexible
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

### Prerequisites / notice
For more information, please contact: veiga@arch.ethz.ch

### Prerequisites
- 052-0557-24L
- 052-0561-24L
- 063-0561-24L

### Literature
- Required readings and recommended screenings will be made available as a download for registered participants.

### Competencies
- Self-awareness and Self-reflection
-里的

### Objective
Understand the complex relationships between material, detail and built artifact. New artistic methods are designed, analyzed and applied from a deeper understanding of innovative building materials.

### Abstract
This course will invite students to take the stance of a spoilsport in relation to established typological norms and rules. By doing so, the edges of knowledge on typological definition should be expanded in unforeseen ways, allowing new interpretations of existing architectural stapples and the formulation of new design approaches to long-standing norms and rules. Withdraw from the current, play a different game.

### Excerpt of Johann Huizinga’s “Homo Ludens – A Study of The Play Element in Culture”, 1955
Excerpt of Johann Huizinga’s “Homo Ludens – A Study of The Play Element in Culture”, 1955

### Content
- The edges of knowledge on typological definition should be expanded in unforeseen ways, allowing new interpretations of existing architectural stapples and the formulation of new design approaches to long-standing norms and rules. Withdraw from the current, play a different game.
- By doing so, the course will invite students to take the stance of a spoilsport in relation to established typological norms and rules. This is because the spoilsport shatters the play-world itself. By withdrawing from the game he reveals the relativity and fragility of the play-world in which he had temporarily shut himself with others. He robs play of its illusion—a pregnant word which means literally “in-play” (from inlusio, illudere or inludere)\*

---

*Excerpt of Johann Huizinga’s “Homo Ludens – A Study of The Play Element in Culture”, 1955*
The course "360 – Reality to Virtuality" is interconnected with "3D Scanning and Freeform Modeling". You must register for both courses: "360 – Reality to Virtuality" and "3D-Modeling" (2x 2 ETCS). Classroom teaching as 4h block + self-teaching and research at home.

Max. number of participants 15 students.

A 200 CHF deposit will be charged for the VR Headset. It will be refunded upon the return of the headset on the last day of the course.

For students from the 3rd semester

Upon completion of the course, students will have:
1. acquired a general knowledge of the role of architecture and urban planning in the historical context of development aid, the main actors involved, and strategies adopted
2. acquired an in-depth knowledge on the specific housing paradigm of 'sites-and-services'
3. developed a critical attitude in engaging with the history of postcolonial urban design
4. developed a theoretical understanding of the act of inhabitation as central to architecture and its history
5. developed a reflective attitude on the modes of writing architectural history and the role of inhabitation in it
6. strengthened their analytical skills by engaging in text- and project-based discussions, their collaborative skills through team-based project analyses, and their communication skills through presenting the outcomes of their work to their peers.

In our seminar series ‘The City Lived’ we focus on the history of urban design, with a particular emphasis on the lived experiences in the city. This semester’s seminar will focus on ‘sites-and-services’, an important housing paradigm that was mobilized in the context of development aid to provide cost-efficient housing for the global poor.

This housing strategy consisted of providing ‘sites’ – plots of land to construct dwellings on – in combination with a set of ‘services’, ranging from infrastructural features, such as sewerage and waste disposal, to market-based interventions that aimed to make cheap building material more easily accessible, or financial loan schemes that offered inhabitants the means to invest in their homes. It often operated on a large scale, and targeted thousands of households in a single project. For several decades from the 1970s, it was heavily endorsed by major actors such as the World Bank and the United Nations as a cost-efficient way to meet the most basic housing needs of a high number of people, whilst simultaneously offering authorities the means to direct the enormous growth of spontaneous settlements in the urban peripheries as part of their broader urban development plans. As such, these sites-and-services schemes have left a major imprint on many cities in the Global South. Despite this impact, however, their histories are not well documented.

Whereas sites-and-services were promoted as a cost-efficient solution to the housing problem of the global urban poor, the housing paradigm attracted severe criticism from its inception. One line of critique considered such programs as formalizing the state’s disinvestment in its poorest citizens, symptomatic of neoliberal policies that erode structures of state support, while another line of critique considered them as instruments of a globalizing debt economy, incorporating the global poor in an expanding, profit-oriented capitalist market.

Beyond its praise and criticism, in this seminar we study sites-and-services projects in the first place as material artefacts: as man- and woman-made built environments that have shaped the lives of thousands of people, whose history for that very reason deserves to be studied.

In doing so, we will discuss two broader themes. On the one hand, sites-and-services projects allow us to problematize the notion of housing expertise and how it was mobilized in the Global South. Therefore, we will discuss them against the background of housing policy in the Global South more generally. Which housing paradigms were relied upon in the context of the Global South? And what were the logics underlying them? On the other hand, since these were essentially unfinished projects that relied on their future inhabitants to complete their dwellings, in this seminar we will not only intend to dig up the histories of such projects, but also to discuss what we can learn from the histories of such atypical housing projects. Inhabitants have drastically expanded and transformed the initial minimal design to often unrecognizable degrees according to their needs and resources, and many sites are now integrated into wider urban patterns. How do we write the history of ‘unfinished’ projects? How do we acknowledge the act of appropriation and inhabitation as an integral part of such projects?

This course is based on weekly two-hour seminars, in combination with a case study analysis in small groups. After introducing the main context, the seminars are structured around the themes of ‘housing expertise’ and ‘lived architecture’, and gradually shift from tutor-led input sessions to student-led text discussions and project presentations. After the first class, students will be asked to form balanced groups of 3 students to work on one sites-and-services project (from a pre-selected list) over the course of the semester. The semester-long case study analysis will culminate in a final presentation and an exhibition entry that will be included in a collaborative online exhibition. Three main feedback opportunities are provided within the contact hours: short ‘Flash Presentations’ during Seminar 3, ‘Mid-Term Presentations’ during Seminar 6, and a final in-class workshop focused on students’ writing and exhibition entry during Seminar 9.

Students are expected to actively attend and participate in each session. During the input phase, each week students are required to read 1–3 texts (‘Compulsory Reading’) and actively engage with other students and tutors on a pre-assigned digital canvas sheet (via Padlet).

An online exhibition based on earlier student work can be consulted here: https://repository.avermaete.ethz.ch/exhibitions/sites-and-services/

**History, Criticism and Theory in Architecture:**

**Architectural Ecology II: A History**

**Abstract**

In this seminar we will, on the one hand, deal with the central strategies in the context of the climate crisis and get to know them by reading theoretical key texts. On the other hand, we will analyze concrete architectural case studies from Europe and Japan on this basis and thus examine these as well as the theoretical strategies for their potentials.

**Objective**

By combining theoretical foundations and practice-based approaches, the course aims to develop a deeper understanding of theoretically grounded ecological architecture while capturing and questioning the methods of current practice from a variety of perspectives.

**Content**

Climate change confronts architecture with a series of new and complex challenges that are reflected in a specific vocabulary. Terms like sufficiency, circularity or cohabitation are shaping the debates around this crisis or are standing for possible ways out of it. At the same time, the immediate nature of the situation forces us to critically question or revise common standards in the built practice - without having established new reliabilities in advance. Instead, a wide variety of isolated, sometimes contradictory strategies are being pursued simultaneously: Replacing fossil building materials with ecological ones, striving for "less" or a "different" way of building, low-tech and high-tech approaches, simple or multi-layered constructions. Theoretical and practical perspectives seem to be little connected so far.

In this seminar we will, on the one hand, deal with the central concepts and strategies of the current debates and get to know and question them by reading key theoretical texts. On the other hand, we will analyze relevant case studies from Europe and Japan on this basis and thus examine both the theoretical strategies and the concrete projects for their potentials.

By combining theoretical foundations and practice-based approaches, we thus aim to develop a deeper understanding of an academically informed, ecological architecture, while at the same time capturing and questioning the methods of our current practice from a variety of perspectives.

**Prerequisites / notice**

As we want to ensure a constructive discussion during the Seminar, we need to limit the amount of students participating.

To this end, we kindly ask you to send us a short letter of motivation. This does not need be long (3-5 sentences should be enough), but make sure to state concisely why you would like to join us for this course.

Please send your statement to kersting@arch.ethz.ch by Monday the 18th of September (23:59). We will notify the accepted candidates by Wednesday the 20th.

**052-0817-24L**

**Theory of Architecture: Desert Modernism(s)**

**Does not take place this semester.**

**Abstract**

Worl’s major deserts—both hot and cold—have often served to search, extract, and transport the deserts’ various natural resources, such as oil and gas, as well as to design and build new cities, infrastructures, residential architecture, tourist complexes, farming systems, solar power plants, climate and aerospace research centers, chemical weapons testing complexes, nuclear weapon research centers...

**Objective**

Knowledge of architectural photography

**Content**

History, theory and practice of photography in relation to architecture

**Prerequisites / notice**

This course runs on a bi-weekly schedule in two separate groups limited to 15 students each and is taught in English.

Students will be selected on the basis of a motivation letter.

Course dates and place: see room reservation.
Special Questions in History of Art and Architecture:
Architecture in the Expanded Field

**Abstract**
This seminar will explore contemporary architecture through the lens of its ever expanding field, taking as a starting point the view that we “both do and do not know” what architecture is. Together we will discuss texts, visit workspaces and have conversations with practitioners who work at the interfaces of architecture, art and other disciplines.

**Objective**
This course aims to sharpen critical reading and thinking skills. Students should come away clearer about their position on the contemporary contours and potentials of architecture.

**Content**
Adapting our course title from Rosalind Krauss’s prominent essay on sculpture (1979) but not strictly following its argument, we will pay special attention to ways that architecture intersects with art (and other disciplines), whether through direct collaboration, cross-referencing, role-swapping, or the engagement of parallel topics or methods.

A series of conversations with internationally known practitioners who work at the interfaces of architecture, art and other disciplines will form the basis of our discussions.

In addition, we will visit relevant locations and read and discuss texts from the fields of history and theory.

**Literature**
Literature will be provided at the start of the semester. Texts will be in German and English language.

**Prerequisites / Notice**
Due to the guest talks and visits planned, individual sessions might take place at times or locations different from the regular time-table. The adapted schedule will be communicated during the first meeting.

Texts and conversations will be in German and/or English.

---

PhD Teaching: Drawing Things Together: Drawings
Beyond Disegno

**Abstract**
This seminar will study the material, cultural, and social parameters that conditioned drawing practices in Europe from the 15th through 19th centuries. We will examine drawings firsthand, and compile critical perspectives to grasp the varied roles drawings performed in artistic and architectural practices as well as the production of knowledge, and the constitution of power structures.

**Objective**
The course aims to sharpen the historical awareness of the media conditions of architectural design. It does so by highlighting the practice of hand drawing in the face of today’s digital imaging devices and through a critical engagement with the material, cultural, and social conditions and implications of the allegedly neutral blank page. This exploration also involves a methodological reflection of historical research. We will delve into in-depth reading of texts from various scientific fields and disciplinary perspectives. This will require the preparation of one text per session, which will be moderated alternately by one or two assigned students. This reading component will be complemented by visits to drawing collections and study rooms, to familiarize ourselves with the historical materials. Texts and discussions will be held in German and English, requiring a sufficient command of both languages.
How can we think of utopias in the dystopian times we live in? Are all utopian visions devoid of reformist agency, as historians have assessed? What is the role of architectural history in navigating these questions? This course critically interrogates the concept of utopia in its historical and spatial dimensions, through a combination of lectures, readings, and in-class discussion.

This course departs from two influential paradigms and shifts the focus to the material, cultural, and social parameters that conditioned drawing practices in the early modern period. We will consider the act of drawing less an externalization of an individual mind than a cultural technique, just as we will consider drawings less the traces of a creative process than social objects. Drawings can be read as tacit notations of discourses and practices, as tools of collaboration and exchange, as sites of the production of knowledge as much as of institutional centralization and social power.

This entails refraining from any attempt at a systematic or conclusive history or theory of drawings in favor of gathering various theoretical observations and critical perspectives, combining thoughts, approaches, and questions from such diverse fields as art history, history of science, cultural studies, and media theory. The texts we will subject to an in-depth reading in assigned sessions, therefore, range from classical pieces of architectural history to contemporary contributions of critical theory. The reading sessions will be complemented by on-site visits to study rooms and drawing collections to enable firsthand engagement with the historic materials themselves.

Such “utopias of the rear-guard” will be the focus of our course. Bringing together archival material and secondary sources, we will explore the spatial articulation of feminist, decolonial, spiritual, and other collectivist sites of resistance. Although the gravity of this theme is heightened by the exigencies of our present, the emphasis of the class will be on pre- and early modern examples, with particular attention paid to the socio-political structures of the Enlightenment.

Students will learn how to approach primary / archival and secondary sources and will be given a curated selection of readings to support their understanding of key concepts, such as utopia, identity, colonialism, etc. They will be given the opportunity to research their own case studies, curate material, and present on it at the end of the semester in a symposium format. Most importantly, they will learn methodologies to engage with the architectural form and the built environment critically, as well as to approach early modern episodes through contemporary lenses, in a historically responsible way.

Architecture’s historical failure to breathe life into reformist, utopian dreams can feel disempowering, especially in light of current escalating ecological, political, and cultural challenges. If, however, the clean slate worlds envisioned by architectural avant-gardes have traditionally failed to materialize into a more equitable future, there is still a lot to learn from practitioners, theorists, and communities who devoted their efforts to resist disenfranchisement, and to reclaim and restore the equity of their present.

Enrollment limited due to intensive workshop format. Course intended for students from 5th semester onwards. Attendance in all sessions required.

This course departs from two complementary propositions. The first is Manfredo Tafuri’s claim that modern architectural utopias not only lack reformist agency, but are often complicit in promoting and establishing the status quo of the ruling capitalist class. The second, is Anthony Vidler’s theorization of modernity as the defensive attitude of humanity against an increasingly threatening natural, social and political environment.

The course will thus be divided into two parts: the first, devoted to the historicized study of.Validation and interpretation, and the second, devoted to the critical applications of the results. Through the process of interpretation and critique, we will seek to identify and assess the assumptions and implications of the modernist project, and to evaluate its potential for contemporary use.

Students will be expected to engage actively in class discussions and to participate fully in the development of the course’s themes and topics. They will be required to complete a series of assignments that will allow them to develop their own critical perspectives on the material presented in class.

Data: 02.07.2024 12:39 Autumn Semester 2024 Page 112 of 2667
The subject of this seminar is the relationship between architecture and social class. Our inherited class reference determines our social architecture: how we relate to each other in a historically grown, hierarchically structured space, how we perceive the built world, how we intervene in it in a creative way and how we judge sensuality and beauty, all of this is strongly pre-structured and yet leaves nothing to be desired leeway open. We can't help what class we're born into, but we can understand, meditate—and maybe even change—the social reflexes and unconscious beliefs that arise out of this coincidence. This seminar offers a sociological, historical and aesthetic basis for this.

• On the basis of theoretical texts, a number of questions are discussed: How is the racialization of the working class manifested in the history of cultural production? How are economic discrimination and privilege in the field of the arts related to normative gender categories? How do we make the big analytic terms our own when we write about class and architecture to connect with others?

• Exercises on graphical representations of social strata. What is a spatial perspective considering the creativity of class habitus? How can we present the fragments of our perception, determined by class origin, as a whole without leveling or even condemning individual positions? How do we deal with the naturalized power of imagery's common sense when representing class issues in architecture?

• Personal engagement with autobiographical photo material regarding the manifestation of the habitual, inherited lifestyle of a certain milieu or a certain class faction - or regarding the manifestation of the break with this heritage. Approaching the answer to the question: What makes the difference - between a narcissistic and an objectified architectural view of social space?

In autumn 2024, two exhibitions take place in Zurich focusing on Switzerland and its colonial interdependencies. In the seminar, this topic will be addressed using the Graphische Sammlung ETH Zürich as an example. The students will research a selection of works from the collection, read specialized texts and discuss the jointly visited exhibitions.

Students learn about the history of the collection and work on individual works of the Graphische Sammlung ETH Zürich with a possibly critical approach. What makes the difference - between a narcissistic and an objectified architectural view of social space?

The compulsory texts will be available at the beginning of the seminar.

The seminar is limited to 20 people. There will be a waiting list.

Please note:
Several meetings will take place at Graphische Sammlung ETH Zürich in the main building or in museums in Zurich. Time for travel before and after the meetings is therefore necessary.

052-0845-24L Reflection on Exhibition and Art Practice Now. Colonial Influence? Focus on the Graphic Arts Collect

Abstract
In autumn 2024, two exhibitions take place in Zurich focusing on Switzerland and its colonial interdependencies. In the seminar, this topic will be addressed using the Graphische Sammlung ETH Zürich as an example. The students will research a selection of works from the collection, read specialized texts and discuss the jointly visited exhibitions.

Objective
Students learn about the history of the collection and work on individual works of the Graphische Sammlung ETH Zürich with a possibly critical approach. What makes the difference - between a narcissistic and an objectified architectural view of social space?

Content
It has long been known that although Switzerland itself was not a colonial power, it nevertheless has complex colonial ties. This will be the subject of two different exhibitions in Zurich in autumn 2024 and will also be the topic of a seminar focusing on a collection of ETH Zurich: Graphische Sammlung ETH Zürich. In addition to reading specialized texts and visiting the exhibitions at Landesmuseum (ikolonial – Globale Verflechtungen der Schweiz), students will familiarize themselves with various forms of presentation and ways of communicating the topic.

The compulsory texts will be available at the beginning of the seminar.

The seminar is limited to 20 people. There will be a waiting list.

Please note:
Several meetings will take place at Graphische Sammlung ETH Zürich in the main building or in museums in Zurich. Time for travel before and after the meetings is therefore necessary.

052-0851-24L Exploring Internationalism: How to work for UNESCO?

Abstract
This seminar explores the different actors working for UNESCO and the role of bureaucracy and international relations in their work. We will focus on the 1970s project on "Traditional Forms of Architecture", the collaboration with the International Union of Architects on an international information network in architecture, and the 1983 Bangkok workshop on "Training of Barefoot Architects".

Objective
The goal of this seminar is to develop an understanding of how international organisations such as UNESCO work internally and how they try to act in the world. In addition to academic argumentation and writing, the seminar will provide basic skills in working with archival material and analysing printed material from the 1970s and 1980s. The final assignment will be a short academic paper on one of the three case studies.
This is not a seminar on how to get a job at UNESCO. Rather, we will explore who works for UNESCO, what they do in the field of architecture, and the role of bureaucracy and international relations in their work.

The United Nations Educational, Scientific and Cultural Organisation (UNESCO) is an international organisation that coordinates a wide range of activities related to architecture. These include the preservation of historical monuments and the establishment of a universal cultural heritage, initiatives for school construction projects, the commissioning of manuals and the implementation of training programmes.

In this seminar, we will focus on three case studies to disentangle the UNESCO apparatus.

The first section will look at the UNESCO project on “Traditional Forms of Architecture” in the 1970s, led by Wolf Tschettermann, Acting Director of UNESCO’s Human Settlements and Socio-Cultural Environment Division. Through contacts with a variety of architects and academics around the world, he collected and commissioned studies on what he called “architecture without architects”, particularly in countries where development projects threatened to transform the existing built environment. We will look at published articles, audio-visual material and documents from the UNESCO archives to understand how these studies were produced (negotiations, contracts, payment) and used (publications, exhibitions, etc.) by UNESCO.

The second part will focus on the cooperation between UNESCO and the International Union of Architects (UIA), exemplified by the joint project ARKISYST, “an international information network in architecture”. Sponsored by the Spanish government and coordinated by the architect Donald Conway, the possibility of establishing a global exchange of information on architecture and urban planning was intensively studied but never implemented. This case study allows us to question notions of international standardisation, global participation and open access.

The third section of the seminar will examine the UNESCO Workshop on “Training of Barefoot Architects” in Bangkok, 30 May–4 June 1983, which was organised by the UNESCO Regional Office for Education in Asia and the Pacific. The aim of this analysis is to explore the different perspectives of the various actors involved in this workshop, including the architect Yona Friedman. The UNESCO archives provide a valuable source of information on the criticism of the approach and attitude of the “foreign expert” by local architects.

063-0861-24L Integrated Discipline HS24 in the Field of History and Theory of Architecture (GTA)

Enrolling in this course is only possible on agreement with the lecturer and if you attend a design course (V-IX) at the same time.

Abstract

Works in the integrated discipline art and architectural history evolve in close connection with projects in design. Textual and creative works are possible. The length of the text or the extent of the creative project will be decided upon individually.

Interested students are asked to develop a (textual or diagrammatic) concept sketch explaining the content and the form.

Objective

We expect that students pursue their examination of the design process independently and in an original manner or that they develop a related theme from the perspective of the history of art and architecture.

The work should be part of the design process and interact with it formally and in regard to content.

Content

Weks in the integrated discipline art and architectural history evolve in close connection with projects in design. Textual and creative works are possible. The length of the text or the extent of the creative project will be decided upon individually.

Interested students are asked to develop a (textual or diagrammatic) concept sketch explaining the content and the form.

052-0823-24L History of Art and Architecture: The School of (Sub)Curating

Abstract

The School of (Sub)Curating asks, discusses, plays with and ventures into the question of how to visualise art and knowledge in space. It teaches you a history of curating and challenges you to become active in figuring out spatial forms of presentation for artworks, books, magazines, films, sounds and more. With guest artists, curators and researchers.

Objective

The School of (Sub)Curating teaches you about curating both historically and practically. It increases the knowledge of and sensitivity towards space in relation to presentation and exhibition and their underlying histories. It asks students to take on an active role in further expanding, assessing critically and playing experimentally with these histories.

Students will learn to take into account different modes of presentation, to think about the translation of images, texts and other artefacts into space as well as addressing an audience through display, writing, discourse and invention.

Each student, or group of students, will realise a small exhibition/presentation of a project, which will be on view at Kunsthalle Zürich in autumn/winter 2024.

Content

The School of (Sub)Curating asks how to translate art and artefacts into space. How to install documents about an exhibition? Or a book? Or a digital magazine? How to contextualise an early platform for digital arts? How to introduce historic design for therapeutic toys? To stage children’s books? To show a magazine stored on a USB stick? To translate travel books into space? Or films about exhibitions? What about presenting sound? Or a radio station? The collaborative seminar starts with introducing ways of curating, formats and projects.

Then over to you: you take on one project, visualise it, install it and present it during an opening. It will be part of the exhibition AAA stage children’s books? To show a magazine stored on a USB stick? To translate travel books into space? Or films about exhibitions? What about presenting sound? Or a radio station? The collaborative seminar starts with introducing ways of curating, formats and projects.

Then over to you: you take on one project, visualise it, install it and present it during an opening. It will be part of the exhibition AAA

Literature

https://ursprung.arch.ethz.ch/lehrveranstaltungen

"Why look at animals?" is the title of an article from 1980 by British writer and art critic John Berger. In this fundamental text Berger looks at the question of cohabitation of humans and 'non human animals' and "human animals). Examples include structures which have been built with often high architectonic ambitions for certain species of animals, like stables, riding houses, pigeon towers, zoos and different typologies of agricultural buildings from different regions and epochs. (Examples: Riding house of William Cavendish in Bolsover Castle 1660ies, Hameau de la Reine, toy farm for Marie Antoinette, Versailles, 1783-1788; Pigeon towers in Iran; Hugo Häring, Gut Garkau, 1922; next phase for the expansion of Zoo Zürich, Tessiner Houses, etc.)

The second module focusses on the city as a shared space for humans and animals. Until the beginning of the 20th century, masses of animals were kept within the confines of big cities. It came with its own challenges, so called "cultural followers" and "pests", which made a strong impact on building, zoning, and developing the city. Zoonoses were and still are a serious threat today, influencing urban planning. (Examples: Johann Bernhard Fischer von Erlach, Imperial riding school and stables in Vienna; Animals in "Georgian" London; Union Stock Yards, Chicago, ab 1865; Pest and rats, Urban Foxes, Racoons in Berlin et. al.)

The final module focusses on recent discourses of human-animal-relations in philosophy, biology and literary studies, leading to the new interdisciplinary field of "Animal Studies". The focal point is the question, which roles and which spaces were and are given or denied to animals in our built environment. In this seminar, students will read texts from different academic fields contributing to the new research area of the so called "Animal studies" – biology, sociology, history, philosophy, ecology, art history, literary studies – and apply this knowledge on architecture. Thereby buildings and cities are not seen as a mere stage for interactions between humans and animals but as active contributors facilitating or hindering these encounters.

Throughout the course, students will develop a high degree of independent thinking, the ability to read texts critically and apply the results on historic and contemporary examples, be it the built environment, a text or an art project. Via individual presentations students learn to process complex content verbally and visually and answer questions. This schools several important skills like abstraction of content, conveyance of content, visualization, reaction to unforeseen questions et. al. With the joint close reading students will further exercise the analytical skills whereas the final discussion will train the discursive skills and show how to synthesize differing positions.

The program comprises following elements:

- short students presentations 15-20 minutes
- several mini lectures by the lecturer
- impulse lectures by guest
- joint close reading of key texts
- joint analysis of projects
- excursion Hönggerberg
- final discussion
- submission of power point presentation (The lecturer will comment individually on the submission of the power point presentation.)

The seminar is organized in three modules:

I Building for animals

The first module will focus on buildings (or environments) designed to accommodate animals (and often to accommodate the proximity of "non human animals" and "human animals"). Examples include structures which have been built with often high architectonic ambitions for certain species of animals, like stables, riding houses, pigeon towers, zoos and different typologies of agricultural buildings from different regions and epochs. (Examples: Riding house of William Cavendish in Bolsover Castle 1660ies, Hameau de la Reine, toy farm for Marie Antoinette, Versailles, 1783-1788; Pigeon towers in Iran; Hugo Häring, Gut Garkau, 1922; next phase for the expansion of Zoo Zürich, Tessiner Houses, etc.)

II Animal city

The second module focusses on the city as a shared space for humans and animals. Until the beginning of the 20th century, masses of animals were kept within the confines of big cities. It came with its own challenges, so called "cultural followers" and "pests", which made a strong impact on building, zoning, and developing the city. Zoonoses were and still are a serious threat today, influencing urban planning. (Examples: Johann Bernhard Fischer von Erlach, Imperial riding school and stables in Vienna; Animals in "Georgian" London; Union Stock Yards, Chicago, ab 1865; Pest and rats, Urban Foxes, Racoons in Berlin et. al.)

III Architectural and animal theories

The final module focusses on recent discourses of human-animal-relations in philosophy, biology and literary studies, leading to the new field of more or less radical "animal studies" or "human-non human animal studies" emerging within the last two decades. In this part of the course the renewed focus on questions of cohabitation in a global perspective is studied through contemporary texts and art/architectural projects with a strong political message. These objects and projects are taken as a starting point for a discussion on the future role of architecture and urban planning in fostering biodiversity. (Examples: Donna Haraway, When species meet, 2007; study: Animal Aided Design, 2015; Installation: Mapping the post human city, 2021)
For centuries, advice literature has extensively examined the codes of propriety, or decorum, and ordered both the plot and the stage of performance. The seminar draws architectural history's attention to textual sources from advice literature that formulate the normative and gendered standards of interior design, decoration and homemaking. Through a critical examination of advice ranging from Ottoman adab books to Western etiquette manuals, we will examine the various regimes and expressions of gender embedded in the skin of architecture.

How do we comply, condone, distort, or resist gender roles in our manners and social conduct? And how does this performance inform our own position? We are exposed to the notion of social lives of objects. How do we comply, condone, distort, or resist gender roles in our manners and social conduct? And how does this performance inform our own position? We are exposed to the notion of social lives of objects.

The elective introduces to the subject and complexity of the urbanized landscape and teaches the critical engagement with the challenges and potentials of current tendencies in Landscape Architecture. On the basis of a concrete study area, students examine the large-scale design on a territorial scale. On the basis of cartographic analysis and field trips, students will develop concrete strategies for the urban landscape of the Città Metropolitana di Torino.

For further information see: https://www.versobooks.com/books/4089-henri-lefebvre-and-the-theory-of-the-production-of-space

The elective deals with current transformation processes of metropolitan landscapes in Europe and introduces landscape architecture design on a territorial scale. On the basis of cartographic analysis and field trips, students will develop concrete strategies for the urban landscape of the Città Metropolitana di Torino.

For further information see: https://www.versobooks.com/books/4089-henri-lefebvre-and-the-theory-of-the-production-of-space

The book will be published by Verso in November 2022, and offers an encompassing, systematic, and accessible introduction to Lefebvre’s theory of space and the urban. We will provide pre-print copies of the individual chapters to the seminar participants.

The goals of this course include:
- reading, debating and discussing a scholarly text
- acquiring new skills in reading and applying a theoretical text
- strengthening ability to read, present and debate academic texts
- getting familiar with one of the most important theories on space and the urban in social sciences

The number of participants is limited to 40-50.

Participants will be expected to engage actively in:
- reading, debating and discussing a scholarly text
- acquiring new skills in reading and applying a theoretical text
- strengthening ability to read, present and debate academic texts
- getting familiar with one of the most important theories on space and the urban in social sciences

On the occasion of the publication of the forthcoming book 'Henri Lefebvre and the Theory of the Production of Space' by Christian Schmid, we are organising a special seminar in the autumn semester 2022 in which we will read and discuss the book together.

Henri Lefebvre developed an extraordinarily and far-reaching spatio-temporal theory of society that is today widely applied in humanities and social sciences, particularly in urban studies, human geography, sociology, cultural anthropology, political sciences, philosophy, literature, cultural studies and the arts, and also in architecture, urban design and planning.

This book provides the first systematic reconstruction of Lefebvre’s theory of the production of space. While many receptions represent Lefebvre’s work as a collection of inspiring but disparate thoughts and reflections, this book starts from the thesis of coherence, assuming that this work is distinguished by a continuity of concepts and categories that are connected in a consistent way. It reveals the historical development of the core concepts. It illuminates Lefebvre’s understanding of everyday life, the right to the city, the thesis of the complete urbanization of society, and the intrinsic relationship between space and the state. It explains the famous double triad of the production of space: perceived, conceived and lived space – and spatial practice, representation of space and spaces of representation. And it develops a dialectical matrix of a theory of society, which is based on the core categories of spatio-temporal dimensions, levels, and configurations of social reality. It also gives an overview on the different Lefebvre receptions and discusses a wide range of applications of his concepts in various research fields.

The course will compose of lectures, practical crash courses in media use and storytelling, and fieldwork sessions. The course will aim to equip students with the basic tools and core principles to create short but complex experiments reflecting on urban space. This semester, the focus falls on the topic of video games, asking students to think about how filmmaking and digital animation skills may be used to tap into the multi-faceted possibilities presented by contemporary video gaming.

Using widely available recording tools and editing software, students will turn their fieldwork into short video or audio works of about 3-5 minutes.

NOTE: Students of this course will be given preference to the Semester Studio of the Chair of Architecture and Urban Design and Urban Studies (LUS) and if you attend a design course (V-IX) at the same time. Enrolling in this course is only possible on agreement with the lecturer and if you attend a design course (V-IX) at the same time.
students will reflect on the perception of the urban environment and the methods used to map and model the existing context – discussing, how different methodologies shape the way we perceive our environment. Therefore 3D tools such as laser scanning and photogrammetry will be tested in the field. Their application in the urban context and the workflow from scan to drawing will become known to the students.

This is the question that the teaching and research project Schnitt durch Zürich (Section through Zurich) has been investigating by the Chair of Laurent Staedler. As an Addition to the existing work, this course will create a section of the Uetliberg. In the course of methodical refinement 3D laser scanning and point cloud modeling methods, developed at the Chair of Christophe Girot are used to digitally model the topography and vegetation as well as pathways and buildings. Following the data collection the materials will be transferred to common CAD Software and reproduced in a section. Students will use scanners to scan the slopes and forests of the Uetliberg in fieldwork and get introduced to the workflow from scan to CAD drawing. This should give a tool for a better understanding of the existing context in future projects and thus broaden the students’ methodological scope.

Lecture notes:
- Learning Materials and Software Tutorials will be provided during the classes.
- Students will generally work in groups of 2

Literature:
- Literature will be provided during the course.

Prerequisites / notice:
The lectures will be held in English, assistance in English and German.

Objective:

- General introduction: reconstruction approaches after conflicts and natural disasters
- Housing culture and post-tsunami reconstruction in Tamil Nadu, India
- Patterns of adaptation to culturally inadequate post-disaster housing
- Reconstruction challenges in rural and urban settings
- Housing reconstruction in rural and urban Nepal after the 2015 earthquake
- Rebuilding communities and schools in Haiti
- Learnings from postwar reconstruction in Kosovo
- Bottom-up housing initiatives in ongoing conflicts: the case of Ukraine
- Humanitarian planning: tackling emergency shelter needs.
- Housing initiatives in temporary camps

Lecture notes:
A course overview including lecture summaries is made available to inscribed students prior the start of the semester.

Literature:
A bibliography will be made available to inscribed students prior the start of the semester.

052-0751-24L Topology ■

Abstract:
The elective course "Topology" in the Autumn Semester 2023 builds on a long standing specialization in the spatial exploration of the landscape. We will embark the participants on a terrain that we shape through our own thoughts and actions, adopting different perceptual perspectives, supported by examples from art, literature, technology and history.

Objective:
This elective course gives architecture students the opportunity to further develop their perception of space through a site-specific approach in the field of landscape architecture. The students will learn to use 3D point cloud technology and other spatial sensing technologies in order to analyze complex urban landscape and develop new ways of editing and representing these intertwined spaces.

Literature:
A bibliography will be made available to inscribed students prior the start of the semester.

Content

Students will document and analyze a case-study site to reveal its topological potentials and sensory qualities. This understanding will be gained through point cloud modeling and audiovisual composition. In particular, we will develop a new, comprehensive sectional model of a topologically interesting site situation.

Students will become acquainted to working with point cloud models produced with laser-scanning. Through a series of steps, they will learn how a laser-scanning survey is conducted, how the raw data is processed, how point cloud models are assembled, what qualities these models can provide to analyze, explore and represent space as an audiovisual experience.

Collected samples from the field will be assembled and built into an interactive application in the «Landscape Visualization and Modelling Lab». All software required is open source and can also be installed on private laptops, facilitating work from home if necessary.

Lecture notes

Literature will be provided during the course.

Prerequisites / notice

- The course is limited to 20 students (based on available computer stations)
- Students will work in groups of 2
- The lectures will be held in English, assistance in English and German
- The enrolment will be prioritized by the time of inscription and balanced between departments

Competencies

My Garden’s Boundaries are the Horizon: A Case Study of Queer Gardens

W 2 credits 2S C. Baumann

Abstract

This course aims to raise awareness about the necessity to look at architectural history through a non-normative lens. The participants will be invited to explore the topic of queer gardens via the review of exemplary case studies. We will discuss how the shape of those gardens have been influenced by their owner’s personality and argue if such spaces share a common denominator.

Objective

Participants will conduct an analysis of case studies through the means of archival and iconographical research. They will also redraw the gardens in plans and sections in order to understand the specificity of those spaces. They will be invited to sharpen their critical thinking and debate the topic of queer gardens: Can one define the spatial criteria of such a typology? Does such a genre even exist? The outcome of this weekly elective course will be a presentation of the selected garden along with pictures, plans, section, a brief descriptive text and a bibliography list.

Content

“My garden’s boundaries are the horizon” (1) is one of the first sentence used by Derek Jarman, the late English artist, filmmaker and gay rights activist in the book Modern Nature to describe his small garden located in Dungeness, south Kent. The diary depicts Jarman’s artist life, his ordeal dealing with AIDS as well as his love for gardening. The word garden comes from the etymology “to guard” and is by definition an enclosed outdoor space. What a contradiction then to describe a garden, as Jarman’s does, by the absence of its limits! Dungeness has emerged over time as an exemplary reference of queer garden, but does such a typology even exists? And if it does, what are its characteristics?

“Growing up queer means experiencing the destabilising absence of broad and accessible queer history”.(2) Architecture as well as landscape architecture are far from exempt from this reality and there are little stories about queer landscapes to be found in the textbooks. In order to bridge this knowledge gap, we will study the gardens of openly queer personalities of the 20th and 21st century. The case studies will include, but not limited to, the followings:

- Casa Azul, Frida Kahlo, Mexico
- Dungeness, Derek Jarman, United Kingdom
- Majorelle Garden, Yves Saint-Laurent and Pierre Bergé, Morocco
- Sissinghurst, Vita Sackville-West, United Kingdom
- Temple de l’Amitié, Natalie Clifford Barney, Paris
- Villa Gamberaia, Florence Blood and Princess Ghyka, Italy

(1) Modern Nature, The Journals of Derek Jarman, Derek Jarman, Paperback, 2018
(2) Queer spaces, an Atlas of LGBTQ+ Places and Stories, Adam Nathaniel Furman and Joshua Mandell (Eds), Routledge, 2022

Literature

A bibliography specifically focused on queer spaces will be given at the beginning of the semester.

Prerequisites / notice

The assessment will be based on the following criteria: quality of the research, critical thinking, participation in the group discussions, and quality of the final presentation.

The number of participants is limited to 20. A short letter of motivation via mail is expected for application.

Data: 02.07.2024 12:39 Autumn Semester 2024 Page 120 of 2667

151-8015-00L  Moisture Transport in Porous Media  W  3 credits  2G  J. Carmeliet, A. Kubilay, A. Rubin, D. A. Strebel

Objective: - Basic knowledge of moisture transport and related degradation processes in porous materials - Knowledge of experimental determination of moisture transport properties - Application of knowledge to moisture transport in cracked materials, drying of porous materials and microclimate in urban street canyons

Content:
1. Introduction
   - Moisture damage: problem statement, durability
   - Applications: building materials, soil science, geoscience
2. Moisture transport: theory and application
   - Description of moisture transport
   - Determination of moisture transport properties
   - Exercises on moisture transport properties
3. Special topics
   - Liquid transport in cracked materials, Drying of porous materials, Microclimate in urban street canyons

Lecture notes: Handouts, supporting material and exercises are provided online via Moodle.

Literature: All material is provided online via Moodle.

101-0577-00L  An Introduction to Sustainable Development in the Built Environment  W  3 credits  2G  G. Habert, E. Zea Escamilla

Abstract: In 2015, the UN Conference in Paris shaped future world objectives to tackle climate change. This decarbonization strategy is additional to Sustainable Development goals formulated the same year by the UN general assembly.

What does that mean for the built environment?
This course provides an introduction to the notion of sustainable development when applied to our built environment.
Subject-specific Competencies
The main focus of the diploma elective subject is in showing the building process by means of current examples of urban design with architectural relevance. Visits to construction sites and interdisciplinary lectures on the topics of communication, complexity, landscape and investment are the main focus of the workshop. The Chair views itself as the facilitator between those involved in construction and students. Active participation is a prerequisite.

Methods
- Method 1: Life cycle assessment (planning, construction, operation/use, deconstruction)
- Method 2: Life Cycle Costing
- Method 3: Labels and certification
- Method 4: Material Flow Analysis

Main issues:
- Operation energy at building, urban and national scale
- Mobility and density questions
- Embodied energy for developing and developed world
- Synthesis: Transition to sustainable development

Lecture notes
All relevant information will be online available before the lectures. For each lecture slides of the lecture will be provided.

Literature
A list of the basic literature will be offered on a specific online platform, that could be used by all students attending the lectures.

Objective
At the end of the semester, the students have an understanding of the term of sustainable development, its history, the current political and scientific discourses and its relevance for our built environment.

In order to address current challenges of climate change mitigation and resource depletion, students will learn a holistic approach of sustainable development. Ecological, economical and social constraints will be presented and students will learn about methods for argumentation and tools for assessment (i.e. life cycle assessment).

For this purpose an overview of sustainable development is presented with an introduction to the history of sustainability and its today definition as well as the role of cities, urbanisation and material resources (i.e. energy, construction material) in social economic and environmetal aspects.

The course aims to promote an integral view and understanding of sustainability and describing different spheres (social/cultural, ecological, economical, and institutional) that influence our built environment.

Students will acquire critical knowledge and understand the role of involved stakeholders, their motivations and constraints, learn how to evaluate challenges, identify deficits and define strategies to promote a more sustainable construction.

After the course students should be able to define the relevance of specific local, regional or territorial aspects to achieve coherent and applicable solutions toward sustainable development.

The course offers an environmental, socio-economic and socio-technical perspective focussing on buildings, cities and their transition to resilience with sustainable development. Students will learn on theory and application of current scientific pathways towards sustainable development.

Content
The following topics give an overview of the themes that are to be worked on during the lecture.
- Overview on the history and emergence of sustainable development
- Overview on the current understanding and definition of sustainable development and beyond

Methods
- Method 1: Life cycle assessment (planning, construction, operation/use, deconstruction)
- Method 2: Life Cycle Costing
- Method 3: Labels and certification
- Method 4: Material Flow Analysis

Main issues:
- Operation energy at building, urban and national scale
- Mobility and density questions
- Embodied energy for developing and developed world
- Synthesis: Transition to sustainable development

Lecture notes
All relevant information will be online available before the lectures. For each lecture slides of the lecture will be provided.

Literature
A list of the basic literature will be offered on a specific online platform, that could be used by all students attending the lectures.

052-0615-24L Building Process: Realization

Objective
Enrolment is only possible in agreement with the lecturer (eglin@arch.ethz.ch).

Abstract
Visits to construction sites and interdisciplinary lectures on the topics of communication, complexity, landscape and investment are the main focus of the workshop. In addition, the term process is to be depicted by means of visits to manufacturers of construction components.

Content
The main focus of the diploma elective subject is in showing the building process by means of current examples of urban design with architectural relevance. The Chair views itself as the facilitator between those involved in construction and students. Active participation is a prerequisite.

Lecture notes
The recordings of the lectures are available on the MAP under the link https://map.arch.ethz.ch (book symbol at the top right).

All relevant information will be online available before the lectures. For each lecture slides of the lecture will be provided.

Literature
A list of the basic literature will be offered on a specific online platform, that could be used by all students attending the lectures.

Objective
Enrolment is only possible in agreement with the lecturer (eglin@arch.ethz.ch).

Abstract
Visits to construction sites and interdisciplinary lectures on the topics of communication, complexity, landscape and investment are the main focus of the workshop. In addition, the term process is to be depicted by means of visits to manufacturers of construction components.

Content
The main focus of the diploma elective subject is in showing the building process by means of current examples of urban design with architectural relevance. The Chair views itself as the facilitator between those involved in construction and students. Active participation is a prerequisite.

Lecture notes
The recordings of the lectures are available on the MAP under the link https://map.arch.ethz.ch (book symbol at the top right).

Literature
https://map.arch.ethz.ch

Prerequisites / notice
The number of participants is limited and enrolment is only possible in agreement with the chair.

Introductory event: Participation in the introductory event is a prerequisite for this course!

Structure (Lectures, field work, final presentation) will be communicated in time.
1. To gain insight into informal urbanism and the prominent urban phenomenon of favelas, their inherent informality, dynamic nature, and the interplay between stability and change.
2. To develop the ability to decode the intricate fabric of favelas, to read the interrelationships between various elements, resources, and the nuanced rhythms of signals, noises, and uncertainties that define their urban landscapes.
3. To gain familiarity with AI algorithms as tools for exploring and interpreting favelas, employ images and textual analysis to uncover urban themes and issues these informal settlements embody.
4. To develop critical thinking skills, encouraging a deeper exploration of the underlying social, economic, and cultural factors at play.
5. To gain broader insights and generalisations from the study of favelas, to identify overarching principles that can contribute to the discourse on urbanism and informal settlements.
6. To enhance design fluency, effectively communicating complex ideas and interpretations through images and words, refining the ability to conceptualise and share favela ideas.
7. To develop the ethical dimensions of studying and representing informal urban environments.

Students will learn and engage with various modes of engagement with favelas using visual and written forms, becoming familiar with AI techniques and strategies to tackle both. By the end of the semester, students should have broadened their understanding of impoverished urban areas of the South and a clearer perspective on urban trends and opportunities in those areas. Using texts and images will develop competencies to be more effective visual communicators, understanding how to generate and manipulate images and text to express their ideas confidently, clearly, and precisely. Throughout the semester, students will write around 1000 to 2000 words and create self-organising maps using internet-sourced images guided by provided algorithms. Self-organising maps (SOMs) are an artificial neural network that helps visualise and group complex data by finding patterns and similarities, making it easier to understand and analyse large sets of information. Thus, a significant portion is dedicated to the data’s curation, editing, and publishing of the final assignment: a speculative exhibition that includes a poster and catalogue with a curator’s readings of favelas.

052-0639-24L Climate Responsive Architecture with Hive

This Online course provides an introduction to climate-responsive design using the Hive tool and how to apply it in early building design stages. Hive allows architecture and building science students to understand the relation between architectural design, climate, comfort and energy. Hive is a plugin for the 3D modeling environment Rhino and its visual programming interface Grasshopper.

Objective

- Recall general principles of climate responsive design and examples of it.
- Utilize 3D building geometries to conduct simplified energy demand and supply simulations.
- Observe relevant physical principles and interactions between climate, energy and geometry.
- Implement passive and active concepts for Climate Responsive Design.
- Apply Hive for building design analysis and integrate it into own designs or in design courses.
- Identify and harness synergies and trade-offs between climate, energy and architectural design aspects.

Content

The course can be frequented individually, or as a prerequisite for other courses such as the master course Climate and Energy Systems 3 or architectural design studios.

Modules:
1. Course overview.
2. Introduction to climate responsive design.
3. Introduction to Rhino, Grasshopper and Hive.
4. Early solar analyses.
7. Real-world Applications and Examples.

Prerequisites / notice

No previous knowledge is required for joining this course.

This is a blended-learning self-paced ONLINE COURSE that can be started at any time.

A working Rhino 6 or 7 license is necessary.

052-0641-24L Digital Lexicon

The seminar focuses on the etymology and use of terms. It engages students to interrogate words and notions in order to understand the historical and theoretical implications related to the digital. The seminar aims to be a collective and shared work through the edition of a common lexicon.

Objective

Enlarge a background of historical knowledge and architectural culture. Develop a critical reflexion on tools and methods of digital design. Foster writing and synthesis skills and organize a collective publication.

Content

Is digital design a tool, a language, a content, a style, a dogma? In the last four decades the digital turn had a radical impact in the field of architecture from the conception to the fabrication stage, through different ways of representing and simulating space. Despite its recent history and a substantial rapid evolution, digital design is also naturally in continuity with previous techniques of craftsmanship and traditional design. Digital, computer, analog, virtual, artificial intelligence, smart technology, virtual reality, parametric design, rendering, modelization, auralization: to only name some of the most widely employed terms. The proposed seminar focuses on the theoretical definition of a recent although already dense and evolving vocabulary related to digital design. Building on the etymology of chosen terms and borrowing from a selected bibliography, we will edit a collective lexicon tackling the historical roots and theoretical implications of our everyday language employed in relation to the digital.
We expect students to achieve the following objectives at the end of the course:

**Subject-specific Competencies**
- Concepts and Theories: assessed
- Analytical Competencies: assessed
- Decision-making: assessed
- Cooperation and Teamwork: assessed
- Adaptability and Flexibility: assessed
- Creative Thinking: assessed
- Critical Thinking: assessed
- Self-awareness and Self-reflection: assessed

**Future Cities Laboratory Indicia 03: Actions and Evidence for Future Settlements**

<td>Future Cities Laboratory Indicia 03: Actions and Evidence for Future Settlements</td>
<td>2</td>
<td>S. Menz, J. Da Cruz Paulos, E. Suel</td>
</tr>
</tbody>
</table>

**Abstract**
The course is organised based on the Future Cities Laboratory (FCL) publication Indicia 03. Indicia 03 conveys the main research results as actions and guidelines for sustainable city-making. The course offers twelve thematic colloquia. It aims to introduce research outcomes of FCL and provide a platform for interdisciplinary knowledge exchange and critical thinking across domains.

**Objective**
We expect students to achieve the following objectives at the end of the course:
- Students learn about the main research results of FCL regarding sustainable urban development in an interdisciplinary format.
- Conversations with experts from different disciplines enable students to think critically and holistically about urbanisation and sustainability strategies from a global perspective.
- Through knowledge exchange and debates across disciplines, students explore and refine future studies/research in specific urban contexts.

**Content**
Planning and designing cities is complex and needs to address both short- and long-term sustainable development. The realisation of sustainability and resilience requires technology development with improved individual understandings and responsible actions, which brings with it challenges and great opportunities for change and transformation. FCL’s research covers multiple experiences and scales, from the individual citizen to larger communities and from small villages to megacities and offers important insights into the development of future settlements worldwide. This research has resulted in important Actions and Evidence required for the planning and design of future high-density, high-liveability cities published in Indicia 03.

The course consists of 12 colloquiums with specific themes that correspond to the chapters of Indicia 03. Each colloquium is joined by two to four external experts and FCL Global researchers from different disciplines to present their work. Moderated dialogues (debates and discussions) encourage students to explore the interrelationship between actions and guidelines as described in Indicia 03.

These include but are not limited to:
- Dialogue 1: Design Liveable Density
- Dialogue 2: Plan Variable Flows
- Dialogue 3: Partner with Nature
- Dialogue 4: Adopt Open Processes
- Dialogue 5: Harness Cyber-Physical Interactions
- Dialogue 6: Stimulate Diverse Economies
- Dialogue 7: Build Well
- Dialogue 8: Foster Settlement Systems
- Dialogue 9: Waterfront Tanjong Pagar: An Exploration in Transformative Design Research
- Dialogue 10: Cooling Singapore: Towards Urban Climate Design and Management
- Dialogue 11: Bioregion Java
- Dialogue 12: The Pandemic City

At the end of the course, students write an essay of 2,000 to 3,000 words based on one of the dialogues. The essays reflect the specific research content and actions described in Indicia 03 and address students' insights into sustainable urban development.

**Prerequisites / notice**
This elective course is organised with a focus on FCL Global research contents. We provide digital copies of the Indicia 03 for the students attending the course. The format of the course is the physical (at ETH Hönggerberg) and virtual. It will be open to all researchers and students in FCL Global, D-Arch and D-Baug.

<tr>
<td>052-0655-24L</td>
<td>Architectural Acoustics</td>
<td>3</td>
<td>A. Xydis, C. Frick, J. Strauss</td>
</tr>
</tbody>
</table>

**Abstract**
Every space, outdoor or indoor, exhibits different acoustic properties. These properties depend on the space's shape, size, and surface material; therefore, architects' design influences their resulting acoustical signature. This course introduces room acoustics and its applications in architecture and design.

**Objective**
The course lays out the theoretical background on how sound propagates in space, interacts with surfaces, and is ultimately perceived. Furthermore, hands-on exercises provide the tools to measure and analyse the acoustics of existing spaces and how to design and predict the acoustics of modelled spaces. The course provides a comprehensive understanding of acoustics and its practical applications in architecture, enabling students to apply their knowledge of acoustics in real-world scenarios.

**Content**
The course examines room acoustics and its applications in architecture and design. It introduces physiological and psychoacoustics by exploring audible space impressions in daily life and our ability to perceive and localise sounds. It provides the theoretical background on how sound propagates in space and interacts with surfaces by looking closely into reflection, absorption, and diffusion. It demonstrates basic mathematical and physics concepts such as decibels and reverberation time through practical examples and hands-on exercises.

The course examines how headphones and loudspeaker systems made electroacoustics and their application in room acoustics simulation and auralisation, a tool for acoustic design in architecture. It provides the software and hardware tools to measure and analyse the acoustics of existing spaces. It demonstrates acoustic simulation tools for designing and predicting the acoustics of digitally designed spaces.

Lectures by guest speakers round up the content and broaden the focus outside the box. Finally, the course concludes with a short seminar thesis, allowing students to apply their acquired knowledge to a small design project.

**Lecture notes**
The course format is a 1-hour lecture and a 2-hour hands-on exercise session.

**Prerequisites / notice**
The course takes place in the Immersive Design Laboratory (IDL) at HIT F22.

Integrated Discipline HS24 in the Field of Technology in Architecture (ITA)

**Title:** Integrated Discipline HS24 in the Field of Technology in Architecture (ITA)

**Type:** W

**ECTS:** 3 credits

**Hours:** 2A

**Supervisors:**

**Abstract:** This part of the curriculum addresses design work in different areas of architecture and urbanism and integrates the knowledge acquired in previous years. It involves the active participation of specialists from the chairs of the institute ITA.

**Objective:** Understanding of the importance of the ITA disciplines for architectural design and integration of structural thinking into the design process.

**Content:** This part of the curriculum addresses design work in different areas of architecture and urbanism and integrates the knowledge acquired in previous years. It involves the active participation of specialists from the chairs of the institute ITA.

---

**Historic Building Archaeology and Conservation**

**Number:** 063-0961-24L

**Title:** Integrated Discipline HS24 in the Field Historic Building Archaeology and Conservation (IDB)

**Type:** W

**ECTS:** 3 credits

**Hours:** 2A

**Lecturers:**

**Supervisors**

**Abstract:** The formal framework needs to be discussed with the staff members.

**Objective:** A study in building research and preservation of building heritage with a clear topic.

**Content:** In addition to theory, heritage conservation also plays an important practical role in the current building revolution. In order to make the diverse possibilities in architecture visible, this course develops new strategies for communicating the discipline of monument preservation for an exhibition on this topic at S AM in 2025.

**Objective:** The aim of the seminar is to develop concepts for communicating and exhibiting heritage-related content and debates that go beyond specialist discourse and address a broader public. As part of the course, participants will acquire in-depth knowledge of various exhibition strategies in the field of architecture and will have the opportunity to develop exhibits for an exhibition organised by the S AM Swiss Architecture Museum (Basel) in collaboration with the Chair of Construction Heritage and Monument Preservation at ETH Zurich and ICOMOS Suisse in spring 2025.

**Content:** At a time when the maintenance of existing buildings is seen as an essential element of the building revolution, the theory and practice of heritage conservation is taking on an integral role. Nevertheless, heritage conservation still has to contend with image problems: people often misunderstand exactly what its aim is and, unaware of its mission, principles and (still highly topical) theories, the discipline is often assumed to have a purely conservative attitude. 50 years after the European Year of Monument Conservation in 1975, when the whole of Europe was dominated by the question of how to preserve the built heritage, there is no need for a fundamental repositioning, but there is certainly a need for an “update” on issues of monument conservation and its attitude in the face of current challenges. The joint exhibition at the S AM Swiss Architecture Museum in spring 2025 is dedicated to this topic. The course offers the opportunity to deal with architectural exhibition strategies and to participate in the development of various concepts for communicating the theory and practice of heritage conservation. New guiding principles for the future practice of heritage conservation will be jointly derived on the basis of best practice examples. In group work, current examples of successful cooperation between heritage conservation and architecture will be analyzed and documented for presentation in the exhibition in the form of drawings, texts and models. Depending on the number of participants, other parts of the exhibition can also be the subject of the work.

**Prerequisites / notice:** The course addresses primarily students of the MAS ETH in Denkmalpflege und Konstruktionsgeschichte and the CAS ETH in Future Heritage.

052-0911-24L  Repair: Keep in Place  W  2 credits  2S  S. Langenberg

This semester the elective (2KP) is offered in combination with a design studio (14KP) and an integrated design-build seminar week (2KP) in Davos on the Schatzalp. This course can only be taken in conjunction with 052-0923-24 U Architectural Design V-IX: Heritage-Led Teaching Project (GD A. Beer / D. Merz) and an integrated Design-Build seminar week. Please note: Registration for the elective is open until 18.09.2024. Please wait for enrolment and assignment of design studio.

Abstract
Complex constructions that are difficult to maintain and industrial manufacturing processes decrease the lifespan of objects not only in product design but also in architecture. Repairability is becoming less of a concern – replacement seems to be the norm. We need to rethink the way we build, starting already with the planning phase.

Objective
In this course, we combine traditional topics of preservation with concepts of repair and FAB initiatives to raise awareness for sustainable thinking and action. Students will learn both traditional and digital methods as well as the basic building and material criteria for repair. The objective is not only the hands-on repair of a building part but especially to learn about the concepts of heritage preservation.

Content
The elective course will discuss and examine the reparability of constructions and building systems. Students will identify building parts in need of maintenance and subsequently develop a repair concept. In groups, they will carry out the repair under expert guidance or possibly with the aid of digital fabrication processes. The objective is to recognize and analyze mechanisms of deterioration and to propose adequate repair measures.

052-0915-24L  Building Surveying and Building Archaeology  W  2 credits  2G

Does not take place this semester.

Abstract
Surveying and measuring technologies in historical building archaeology. Case studies on building archaeology.

Objective
Basic understanding of different surveying methods and first practical contacts with technical surveys instruments. Understanding of the procedures and aims of building archaeology.

Content
From folding rule to laser scanner: surveying techniques and their possible applications.

The elective subject "Building Surveying and Building Archaeology" covers surveying and measurement methods ranging from simple hand measurements and tachymetry to laser scanning, terrestrial and drone-based photogrammetry (structure from motion) and other non-invasive assessment methods such as thermal imaging. The different methods and technologies will be presented on the basis of current or completed research projects and their practical applications will be discussed. Internal and external guest speakers will report on their latest research projects in the field of building research and construction history. In the course of the elective, students will also have the opportunity to try out the methods themselves and integrate them into a small concluding project of their own.

The course is composed of theoretical and practical parts in and outside the classroom.

Literature
Will be announced in the course for the individual lectures.

Abstract
- The seminar week is obligatory for students of all semesters. There are many and varied study contents.
- The students will be enabled to discuss narrowly formulated factual questions in small groups and in direct contact with the professors.

<td>'Caractère' or character is not only a quality applied to human beings. It is also a category of architectural discourse, developed in the 18th century when architects and theorists were seeking new ways to talk about and judge buildings, pushing architectural discourse beyond Vitruvian categories to which it had been tied for centuries before.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

This reading class will closely examine key texts that discuss the phenomenon of a building's 'character' from the 1700s up until today. The weekly assigned texts (in the original French, English or German) will be read at home and then discussed in class. Independent reading and vivid participation in class are a fundamental prerequisite. In addition, there will be weekly written assignments, which will all be graded. A final written assignment at the end of the semester will be graded as well. To pass the course, students will have to read each assigned text, and hand in all written assignments on time.

</tr>
<tr>
<td></td>
<td>When we talk about meaning in architecture we often begin with the architect, the patron or any number of contingencies which shaped a particular building's construction. But it is perhaps when architecture is violently destroyed that its capacity to embody meaning is most explicit. During acute periods of political dissent certain buildings have such a palpable entanglement with oppression that for certain groups their elimination almost becomes a necessity. In such moments architecture is suddenly transformed from an apparatus of control to an instrument of rebellion. Whether it is the burning of the 3rd precinct headquarters of the Minneapolis police after the murder of George Floyd or the storming of the Bastille, there is no ambiguity here. Stones, concrete and plaster become so loaded that all involved know precisely why they are raising them to the ground. When Black Jamaicans burnt down Morant Bay courthouse in 1865, they were very consciously attacking an object of imperial control. And when suffragette women bombed baroque churches in Britain they were bringing the fight to a religious-political structure which refused to give them the vote. In many of these cases, recourse to violence came only after it was clear that polite pleading was all too inadequate. Each week we will look in detail at the violent destruction of a specific building through political dissent. Where available we will turn to textual sources which record the voices of those who were committed to violent dissent against architecture but we will also recognise certain cases as acts of direct political speech through architecture by those to whom printed representation was not available.</td>

063-0803-24L History and Theory in Architecture IX: Earthworks: Art, Architecture, Ground
W 1 credit 1V P. Ursprung

Abstract
The current trend of architecture towards the ground and its materiality, the fascination for quarries, minerals, geology and the subterranean raises questions. How can one locate the phenomenon within the theoretical and historical discourse?

Objective
Increase knowledge of contemporary and historical discourse on architecture, art and the ground.

Content
Dwelling as a continuation of the Earth’s crust can be theorized from contemporary architecture back to Paleohistorical periods. The lecture will focus on various case studies of contemporary architecture and relate these phenomena to models of historiography and theory, and to earlier works of art and architecture. Which is the relation to the discussion of the Anthropocene? How does it affect perceptions of temporality and space? Which are the connections to earlier movements such as Land Art? How does it resonate with notions of infrastructure, extraction, and forms of power?

Abstract
Is our Age of Algorithms the new Stone Age? The lecture course discusses such parallelization in architectural theory and practice from the nineteenth century to the present day.

Objective
The course conveys tools for the critical assessment of references to history in their theoretical and practical application in architecture.
The "invention" of the term "prehistory" and its corollaries such as "primal history" in the early nineteenth century shaped an image of science that architecture still reflects today. Architectural historicism was confronted with new depths of time, modernism was inspired by new concepts of origin. The "return to origins"; whether as a means of reflecting on historical truth or primal creativity, gave rise to a panoply of architectural manifestations and theoretical approaches. Architectural prehistory is often associated with a "prearchitectonic" world that articulated itself for instance in caves. However, when literary scholar Ann Bergren or philosopher Elizabeth Grosz speak of "prearchitectural" conditions, they are referring to a kind of mythical time in the sense of an eternal truth rather than to a long gone historical period. These positions seem to run parallel to the presence of archaisms in modern and contemporary architecture. Topics of the lecture course include Gottfried Semper's reflections on "antediluvian" societies and "prearchitectonic" cultural techniques; Walter Benjamin's "primal history of the nineteenth century"; nineteenth-century Egyptomania and twentieth-century reappraisals of Mayan architecture; the new Swiss sense of deep time that was awakened by the mid-nineteenth-century discovery of lacustrine dwellings on Switzerland's lakeshores and echoed in Le Corbusier's self-fashioning as a noble savage; Sigfried Giedion's encounters with the eternal present in the caves of Lascaux and Georges Bataille's pondering on today's loss of an environment which resembles the catastrophes that once buried prehistoric life.

From a 'cottage' in Chile, a 'tea equipage' in London, a 'veranda' in Mumbai, to a 'cathedral' in Strasbourg, this course presents global entanglements of built spaces while asking who we listen to when forming our understanding of architectural histories. By combining intersectional history with reception history, we ask: how and by whom were architectures also made? Through a set of lectures which are interspersed with exercises over the semester, students will engage with a diverse set of primary sources – texts, objects, sites – to actively re-think and re-read the past of the built environment. Lectures will present both theories and methods such as the global microhistory or collaborative reading.

This course encourages students to critically reflect on the relevance and critical importance of historical research for the present and the future. By completing this course, students will:
- develop an understanding of history as a living practice that shapes our present and future,
- deepen knowledge about local and global entanglements of buildings and objects,
- learn about concepts such as intersectional feminism, coloniality and decolonization,
- become familiar with historiographic methods such as the global microhistory or collaborative reading,
- improve both analytical and speculative writing skills.

This course introduces students to intersectional history – how accounts of the past are shaped by intersecting privileges and marginalizations – as well as reception history – how the meaning of architecture is and has been shaped also by those who dwell in it and use it. It draws heavily on the research of the ERC-funded group WoWA – Women Writing Architecture. It will focus, as the project, on the 18th and 19th centuries, complicating European histories within colonial contexts, especially linking to Latin America and the Indian subcontinent. However, it will also reach beyond this time frame to bring in a wider context – up to the Renaissance and into the 20th century. Through a set of lectures which are interspersed with exercises over the semester, students will engage with a diverse set of primary sources – texts, objects, sites – to actively re-think and re-read the past of the built environment. Lectures will present both theories and concepts such as intersectional feminism, critical race theory, (de- and post-) colonialism and coloniality, as well as showcase global microhistories of texts, objects, and sites that materialise the approach of intersectional histories. We reflect on what constitutes architecture – or architectures – from the point of view of the user, critic, and dweller. In several structured exercises, students will analyse an object, site, or text on both a micro and global scale, producing their own global microhistories over the semester. They will receive feedback and their work process and outcome will be graded.

This course is intended for students from the 5th semester onwards. Attendance is a key requirement. All readings will be available on Moodle.

For syllabus and readings, see https://www.gta.arch.ethz.ch

063-0863-24L Intersectional Histories: How Architectures Were Also Made

W 2 credits 2G A. Hultzsch

Abstract
From a 'cottage' in Chile, a 'tea equipage' in London, a 'veranda' in Mumbai, to a 'cathedral' in Strasbourg, this course presents global entanglements of built spaces while asking who we listen to when forming our understanding of architectural histories. By combining intersectional history with reception history, we ask: how and by whom were architectures also made?

Objective
This course encourages students to critically reflect on the relevance and critical importance of historical research for the present and the future. By completing this course, students will:
- develop an understanding of history as a living practice that shapes our present and future,
- deepen knowledge about local and global entanglements of buildings and objects,
- learn about concepts such as intersectional feminism, coloniality and decolonization,
- become familiar with historiographic methods such as the global microhistory or collaborative reading,
- improve both analytical and speculative writing skills.

Content
This course introduces students to intersectional history – how accounts of the past are shaped by intersecting privileges and marginalizations – as well as reception history – how the meaning of architecture is and has been shaped also by those who dwell in it and use it. It draws heavily on the research of the ERC-funded group WoWA – Women Writing Architecture. It will focus, as the project, on the 18th and 19th centuries, complicating European histories within colonial contexts, especially linking to Latin America and the Indian subcontinent. Personal Competencies

Case Studies Construction History and Building Preservation

Does not take place this semester. Each enrolment requires an uninterrupted visit throughout the semester. Cancellation (incl. deletion of enrolment) is permitted until x.x.2024.

Acquiring in-depth knowledge of construction history and building archeology by means of detailed study of selected historic monuments. The course will start with a multi-part classroom introduction, followed by field studies in small groups.

The participants will gain in-depth knowledge on the methodology of building archeology by means of the documentation and interpretation of real historic structures in on-site studies.

We study historic constructions in German-speaking Switzerland (individual small groups, objects within 2 hrs public transport reach from ETH Hoenggerberg). Each group will be assigned an individual tutor (PhD student) who will be present on-site, on individual appointment.

We will survey, document and analyze a historic construction, with particular attention to production traces, constructive detail and load-carrying system.

We will start with introductory classroom lectures and on-site teaching during the first third of the semester. This will be followed by individual digital investigations on site. The progress will be pinpointed in three critiques:

1) on site, with individual tutor
2) at institute, with professor and institute members
3) final delivery, at institute, with professor and all institute members

The detailed schedule of the case studies can be found here:

Detailed instructions on on-site investigations, as well as manuscripts on the background, will be provided. It is mandatory to read them in due time!

Each enrolment obliges the student to visit all compulsory dates during the entire semester without interruption.

Literature

Will be announced during the introductory lectures.
This class will NOT take place in fall term 2024, due to prof. Holzer's sabbatical.

The class will start again in spring term 2025, with a new concept and topic (roof trusses instead of bridges).

### Competencies

### Future Monuments

#### 063-0911-24L

**Abstract**
Heritage conservation is dedicated to the preservation and protection of historical buildings. In this lecture, students will learn about the theoretical positions on historic monuments and the basics of preservation in practice.

**Objective**
In addition to active participation in the discussions, students will be asked to engage with a topic or object of their own choice in order to be able to develop and comprehensibly justify their own positions within the context of preservation. Our goal here is to foster students' communication skills and the culture of discussion.

**Content**
The responsible reconstruction and further development of the existing building stock requires knowledge and an understanding of the theoretical positions conservation and the basics of preservation in practice. The core course of spring semester 2024 conveys this knowledge to students with the help of selected writings and discusses them in the context of various guest lectures.

Abstract
This lecture series sets up an agenda for widening the disciplinary field of architecture and urbanism from their focus on the city, or the urban in the narrow sense, to wider territorial scales, which correspond to the increasing scales of contemporary urbanisation. It discusses the concepts of territory and urbanisation, and their implications for the work of architects and urbanists.

Objective
The course will enable students to critically discuss concepts of territory and urbanisation. It will invite students to revisit the history of architects’ work engaging with the problematic of urbanising territories and territorial organisation. The goal is to motivate and equip students to engage with territory in the present day and age, by setting out our contemporary urban agenda.

The lectures are animated by a series of visual and conceptual exercises, usually on A4 sheets of paper. All original student contributions will be collected and bound together, creating a unique book-object.

Content
The lecture series consists of 7 core lectures delivered by professor Milica Topalović, and 4 curated guest lectures highlighting a selected theme.

This fall, within the theme MY WEATHER, we will trace the uneven impacts of the environmental crises on the ground, and reflect on the entanglements of weather, atmosphere, and climate with the constructed environments and ecologies.

063-0701-24L Methods of Urban Research: Extended Urbanisation W 2 credits 2G C. Schmid

Abstract

While architects, planners, and urban designers have engaged with the city, the analysis of urbanising territories ‘beyond the city’ have been a blind spot. This lecture series attempts to close this gap by discussing with researchers who will present methods, experiences and findings from a great variety of territories of extended urbanisation.

Objective

The lecture series ‘Methods of Urban Research: Extended Urbanisation’ presents the methodology of sociological analysis of territories of extended urbanisation. These territories, which have traditionally been beyond the sensorium of architecture and urban design professions provide important terrains for urban practice. The lecture series will bring together researchers that have been part of a long-standing research project on territories of extended urbanisation. They will present a kaleidoscopic overview of the diverse methods and insights into international research on urbanisation processes in large metropolises and in territories characterized by extended urbanisation. Most of the presented case studies are published in the brand new book “Extended Urbanisation: Tracing Planetary Struggles”.

Semester performance will be assessed on the basis of a written group assignment on extended urbanization (approximately 10 pages, in groups of four). For the assignment - describe and analyse an example of extended urbanization in a geography of your choice. The example may be from Switzerland or from any other region of the planet. Based on scientific literature and other data, conduct a critical analysis of the chosen case study, and discuss the consequences of urbanization of this area for its people and the environment. Develop a possible urban strategy for alternative inclusive development. Summarize your findings through a A3-sized poster.

103-0569-00L European Aspects of Spatial Development

W 3 credits 2G A. Peric Momcilovic

Abstract
Following the insight into historical perspective and contemporary models of governance and planning, the course focuses on the international dimension of spatial planning in Europe. This includes a discussion of how European spatial policy is made and by whom, how planners can participate in such process and how they can address transnational challenges of spatial development cooperatively.

Objective
Keeping the general aim of exploring the European dimension of spatial planning in mind, the specific course learning objectives are as follows:
- to interpret the history of spatial planning at the transnational scale
- to understand and explain the content of the European spatial policy agenda
- to describe and analyse the role of territorial cooperation in making European spatial development patterns and planning procedures
- to discuss the changing role of planners and evaluate the ways of their engagement in European spatial policy-making

Content
- European spatial policy agenda: introduction and basic directives
- governance models
- planning models; collaborative planning model (main concepts & critics)
- post-positivist approach to spatial planning
- transnational spatial planning in Europe; questioning the European spatial planning; spatial development trends in Europe
- EU as a political system: EU institutions & non-EU actors
- planning families in Europe; the European spatial planning agenda
- spatial planning strategies and programmes on territorial cooperation
- the notion of planning culture and planning system; planning cultures in Europe
- basic characteristics of planning systems in Europe
- the relevance of European transnational cooperation for spatial planning
- European transnational initiatives

Lecture notes
The documents for the lecture will be provided at the moodle.

The course “Architektur und Tragwerk” represents an opportunity for architecture students to develop a design project in which load-bearing structures and architectural space support and enhance each other as inherent parts of the same design process. The demonstration of economic considerations within the design and construction process of buildings is the main focus of the diploma elective subject. Alongside determining basic principles, case studies play an important role in teaching. The economic factors of building construction are examined and the specific decision process is simulated. The case studies in the lectures as well as the processing of individual topics within the framework of elective work permit and require students active participation.

**063-0601-24L Building Process: Economy**

**063-0417-24L Architecture and Structure**

**W 3 credits 3G J. Pauli**

**Abstract**
The course “Architektur und Tragwerk” represents an opportunity for architecture students to develop a design project in which load-bearing structures and architectural space support and enhance each other as inherent parts of the same design process.

**Objective**
After a successful completion of the course, students will be able to:
1. Critically evaluate structural design concepts with respect to their ability to support and strengthen architectural concepts
2. Identify the most relevant design parameters and performance criteria for a given design task and select adequate tools to effectively integrate them as part of the design process
3. Conduct design explorations in compliance with structural, spatial, and environmental design aspects simultaneously

**Content**
The course “Architektur und Tragwerk” represents an opportunity for architecture students to develop a design project in which load-bearing structures and architectural space support and enhance each other as inherent parts of the same design process. The course fosters the development of a design thinking that emerges from the coexistence of a number of design parameters and performance criteria related to force flow, construction technologies, material use, and spatial qualities. Students will learn about diverse operative tools and strategies to control the complexity of such a multidisciplinary design process in which space-making and load-bearing elements are inherently intertwined. The potential of each design option will be evaluated based on various factors; in addition to structural performance and architectural expression, aspects related to material use, construction processes, and environmental footprint will play a crucial role in the whole process.

**063-0605-24L Computational Graphic Statics**

**W 3 credits 3G L. Enrique Monzo, P. Block**

To participate in this course it is recommended that the student has previously taken the courses
Tragwerkentwurf I-IV.
This course presents the potentials of combining graphic statics with computational tools.

- Use statics for the form finding and analysis of structures.
- Understand the goal and structure of an algorithm.
- Create algorithms based on graphic statics to explore equilibrium systems.
- Explain the potential of studying graphic statics models using computational tools.
- Use Interactive Graphic Statics (IGS2) for the analysis, form finding and design of 2D structures.
- Apply computational graphic statics in design contexts.
- Basic use of Rhinoceros and Grasshopper.
- Demonstrate elementary skills in Python scripting.

In this subject semester, we explore the topic of zero-emission building design, which integrates aspects of energy, materials, technology, human behavior, and comfort into architectural design and seeks synergetic design solutions. The practical potential and relevance of these methods will be demonstrated through various design-oriented tutorials and exercises.

All materials (lectures, tools, examples) are available on the A/S Knowledge Platform: https://moodle-app2.let.ethz.ch/course/view.php?id=11917

A student can only register once for a "Fachsemester" during the Master studies!

The application deadline for this "Fachsemester" is 4.9.2024, 8 p.m. You will receive a message about acceptance or rejection for the subject semester by 5.9.2024, 2 p.m. at the latest. Students who have been rejected have the opportunity to choose a design class (enrollment ends on 5.9.2024, at 6 p.m.).

In this subject semester, we explore the topic of zero-emission building design, which integrates aspects of energy, materials, technology, human behavior, and comfort into architectural design and seeks synergetic design solutions.

Upon successful completion of the subject semester, students will be able to identify concepts and relevant design parameters for zero-emission building design and develop integrated architectural design strategies. They will know how to select and use appropriate simulation and analysis tools to qualify and quantify their design solutions and will be able to visualize their concepts with both technical schematics and architectural drawings and visualizations.

The subject semester kicks off with an introduction to the use and exploitation of building systems for the design of zero-emission buildings. The goal of the semester is to demonstrate the relationships between building systems and architecture and to find ways to manifest building systems in design.

Students begin with a research and mapping phase in which they first investigate various building systems for zero-emission building design. They then map the building systems with architectural parameters for successful interaction between the two and create a catalog of their findings.

After the research and mapping phase, students design a small building in which they explore how to maximize the interactions between the building systems and the architectural parameters. Finally, students attempt to quantify their design solutions using low-threshold modeling, simulation, and optimization tools such as Rhino/Grasshopper or Hive. To assess and discuss their concepts not only numerically but also architecturally and aesthetically, students also find appropriate forms of visualization.

Students document the process and results both numerically and architecturally, which are then discussed with a final jury.

All materials (lectures, tools, examples) are available on the **A/S Knowledge Platform**: https://moodle-app2.let.ethz.ch/course/view.php?id=11917

All materials (lectures, tools, examples) are available on the **A/S Knowledge Platform**: https://moodle-app2.let.ethz.ch/course/view.php?id=11917
The working mode is an individual design research studio with weekly group meetings and reviews. We expect good basic knowledge of sustainable construction and energy and climate systems. Prior experience in parametric design tools (e.g. Rhino) and/or simulation tools is a plus.

Please note that a student can only register once for a subject semester during the master's program!

Apply with a brief letter of motivation by 8 pm on September 7, 2022 to: illias.hischier@arch.ethz.ch. Your participation in the subject semester will be confirmed by September 9, 2022.

The objective is to develop a design project that explores the historical entanglements of Swiss industry with global colonialism. This project will focus on the architecture-specific research methods, investigating how centuries of colonialism have historically influenced the aesthetic, construction and craft cultures of Swiss cities, and explores ways to engage with these contested legacies today.
Lecture notes

Methodology

The overarching hypothesis of this Research Studio is that historical and theoretical research can profit profoundly from the use of the tools and knowledge of architects. On the one hand, the spatial, formal, material, and constructive knowledge gained throughout architectural studies will guide the historical research in the archives, in the library, and/or in the city itself and will allow students to articulate specifically architectural interpretations of the materials they find. On the other hand, the Studio explicitly asks students to employ specific architectural tools such as drawing, writing and model-making to explore the historical and theoretical realities that are being investigated. By actively reflecting on the composition of a varied set of analytical and interpretative drawings, texts, and models, students will probe the capacity of these media to act as tools for historical and theoretical research.

Within the general theme of Swiss Coloniality, students will be guided to identify their own subtheme, which will require exploring their own specific research methodologies. These architecture-specific methodologies will be strategically chosen to discuss specific aspects of society: political, economic, social, cultural, or otherwise. Thus, conjointing these ‘autonomous’ and ‘heteronomous’ dimensions of architecture, a new understanding of the city and our built environment is developed that allows us to answer (some of) the research questions mentioned previously.

Research process

Students will be guided through three phases with different emphases: Definitions, Logics and Reinterpretations of Swiss Coloniality. The first phase, Definitions, is focused on developing an understanding of what the notion of Swiss Coloniality can entail and how it relates specifically to industry and the production of the city. This phase will allow students to become familiar with the historical and current entanglements of Switzerland with global colonialism and, by closely examining its main actors, practices, and materials, will set the stage for students to develop their own, individual research project.

The second phase, Logics, is about understanding and demonstrating the inner workings and mechanisms of Swiss Coloniality. Each of the students will focus on one specific case – a material, a site, an actor, a practice, etc. – and will examine it closely through targeted archival and library research, as well as through drawing, writing, and model-making.

In the third phase, Reinterpretations, students will formulate and investigate a hypothesis regarding the entanglements of Swiss industry with global colonialism. Based on this hypothesis, students will position themselves in relation to Swiss Coloniality, its history and its enduring impact. The position statement can take the form of a written text, architectural drawings and/or models and will be presented in the form of a student-curated studio exhibition and an online adaptation of it.

Course syllabus and reader will be made available during the course's first week.

Further course information on https://avermaete.arch.ethz.ch/researchstudio

The Research Studio is self-dependent work and tutoring takes place on Tuesdays and Wednesdays.

Fachsemester "Peace Out"

Allocation only after consultation with the professor (meetings as required and after consultation with the chair).

A student can only register once for a "Fachsemester" during the Master studies!

The application deadline for this "Fachsemester" is xxx, 8 p.m. You will receive a message about acceptance or rejection for the subject semester by xxx, 2 p.m. at the latest. Students who have been rejected have the opportunity to choose a design class (enrollment ends on xxx, at 6 p.m.)."

Abstract

In slang, “peace out” means “goodbye”. It also relates to the word “peace” which is, today, rarely used and hard to focus on. This double-meaning is the entry point for our Fachsemester. Can peace, in our present time, only be imagined as something that is over or yet to come? Are art or architecture peaceful as such? Does something like violent art or architecture exist?

Objective

Our aim is to increase the knowledge and sensitivity of architecture students toward the history of art and architecture, to make their voices heard and to develop new teaching formats for the history and theory of architecture. Students will learn to take position in a field, they will practice argumentation and increase their skills in writing and presenting.
In slang, “peace out” means “goodbye”. It also relates to the word “peace” which is, today, rarely used and hard to focus on. This double-meaning is the entry point for our Fachsemester. Can peace, in our present time, only be imagined as something that is over or yet to come? Are art or architecture peaceful as such? Does something like violent art or architecture exist? Starting with a visit to the almost forgotten Paxmal, a monument for peace initiated exactly 100 years ago by Karl Bickel high over Walensee, we will dive into the history of pacifism and look backwards, forward and to the present.

The Fachsemester in HS 2024 will deal with issues of ethics and esthetics in the largest sense. The syllabus will contain articles and book chapters on philosophy, performance, political science, poetry and history. Students are invited to develop their own texts in relation to the overall topic.

Our aim is to increase the facility of students for understanding spatial, political and historical interrelations. We support students to develop their skills in writing and reading, to make their voices heard, and to experiment, together with the teaching group, with new educational forms for the history and theory of art and architecture.

The group will meet on Wednesdays 10-13 at Kunsthalle Zürich and Thursdays 10-13 in our office.

Start: Wednesday, 18 September 2024.

Lecture notes
A Syllabus with source material for the lecture session will be provided.

Subject Semester HS24 (Fachsemester) in the Field of History and Theory in Architecture (gta)

A student can only register once for a "Fachsemester" during the Master studies!

The application deadline for this "Fachsemester" is 4.9.2024, 8 p.m. You will receive a message about acceptance or rejection for the subject semester by 5.9.2024, 2 p.m. at the latest. Students who have been rejected have the opportunity to choose a design class (enrollment ends on 5.9.2024, at 6 p.m.).

Content

Meaning in architecture is often a more fraught question than in painting or literature. Architecture’s non-figurative nature may not appear as easy to read as the iconography of a painting or the narrative of a novel, but buildings do mean things and this meaning is inflected through audience and time. At its creation, occupation, or even violent destruction, architecture can embody all sorts of specific identifiable meanings, for definable even antagonistic groups.

We are interested in meaning in architecture in the widest possible sense. This Fachsemester is a place where you can pursue your own research interests. You come to us with a topic and we will help you develop it from initial idea, through focused research, ending with a carefully edited essay which you will deliver as a lecture at the end of the course. Weekly discussions will be focused on your research and how you can most quickly develop your own expertise. Complimentary talks will be given by members of Chair Delbeke where they will explain how they have conducted their own research from initial idea to published paper.
A student can only register once for a "Fachsemester" during the Master studies!

Places for this "Fachsemester" are limited. If you are interested in taking part, please send us an email with a 300-word motivation letter including an initial topic proposal to: professur.delbeke@gta.arch.ethz.ch

If you already have a specific case study in mind, please describe what this is. If not, you can describe a general idea or area of interest and we will help you find a more specific object of study during the course.

Proposals are open but might include: decoding the iconography of a particular building, historically and ideologically placing the ideas of a particular architect, studying a performance and its architectural setting, explaining the significance of a building during a specific political event, or reconstructing how the ideas of a particular group or class shaped a particular building or architectural type.

Our sole stipulation is that most or at least part of your work will focus on the period before 1900.

Deadline for applications is Wednesday September 6, 8 p.m. You will receive a message about acceptance or rejection for the subject semester by Thursday, September 7, 2 p.m. at the latest. Students who have been rejected have the opportunity to choose a design class (enrollment ends on September 7, at 6 p.m.).

Feel free to get in touch with us over summer if you would like to discuss your proposal in advance.

**Abstract**

Analysis of a single monument or a small group of interrelated monuments with the methods of archeological building research. Embedding of the objects studied into a context of construction history by means of archival and literature studies.

**Objective**

In-depth knowledge of the methods of archeological building research and construction history. Case-oriented in-depth knowledge of a selected historic building or construction type in its technical, social and economic setting and its architectural relevance.

**Content**

This study will require the in-depth analysis of a historic structure or a small group of structures. This includes an object documentation (survey drawings, photographic record, textual description). Contextual information to be researched by the methods of construction history (archival, literature).

**Prerequisites / notice**

The subjects can be proposed by the students. In consultation with the professors of architecture, the fixed topics are binding (see Art. 29 Reg. 201 MSc Architecture).

**Field of Design and Architecture**

Definition of topics by professors, in consultation with the students (student's proposal / content of an elective course).

For supervision in the field of "Model and Design" choose the Study Director.

**Abstract**

IEA focus work, of which the content may also refer to an elective subject.

**Objective**

Development of skills and competences in a special area / sub-area of architectural theory or practice.
In-depth work is carried out in the respective subject areas of the institute. The professors determine the topics in consultation with the students. The content of the in-depth work can also relate to the content of an elective course.

The performance assessment comprises either a purely written work with a subsequent oral examination or a creative, technical or graphic work, including a description, with a subsequent oral examination. At least in the case of one in-depth thesis, the performance assessment must take the form of a purely written work with a subsequent oral examination (Regulations Paragraph 2 Letter a). In formal terms, the written work must meet the criteria of an academic paper. In addition to the creative, manual or drawing part, it includes a written description of the question, the methodology and the possible gain in knowledge of the work.

The students take the oral examination with the professor with whom they have discussed the topic of the in-depth thesis.

The written or creative, manual or drawing work and the oral examination are each assessed individually. These two assessments are offset against each other and result in the overall grade for the in-depth work. Paragraph 7 remains reserved.

The oral examination can only be taken if the written work or the creative, technical or graphic work is sufficient.

A thesis is passed if the overall grade is at least 4. It is considered not passed if the overall grade is below 4; if the written or creative, technical or graphic work is unsatisfactory and therefore the oral examination cannot be taken; in such a case, the failure will be noted with the term “dropout”.

An in-depth thesis that has not been passed cannot be repeated. In order to acquire the required CP, a further in-depth work must be carried out and the performance must be assessed with an overall grade of at least 4. The number of attempts is limited (see regulations).

If more than one “in-depth study” course unit is not passed, the course is considered to have been definitively failed, which leads to exclusion from the course.

The creative, craft or drawing in-depth work is publicly exhibited. Purely written in-depth theses are made publicly available.

The topic is determined in consultation with the chosen professor.

### Field of History and Theory of Architecture

**Definition of topics by professors, in consultation with the students (student's proposal / content of an elective course).**

Abstract

Indentation work of the Institute ITA of which the content can also refer to an elective subject.

The topic is determined in consultation with the chosen professor.

Objective

Development of skills and competences in a special area / sub-area of architectural theory or practice.

Content

In-depth work is carried out in the respective subject areas of the institute. The professors determine the topics in consultation with the students. The content of the in-depth work can also relate to the content of an elective course.

The performance assessment comprises either a purely written work with a subsequent oral examination or a creative, technical or graphic work, including a description, with a subsequent oral examination. At least in the case of one in-depth thesis, the performance assessment must take the form of a purely written work with a subsequent oral examination (Regulations Paragraph 2 Letter a). In formal terms, the written work must meet the criteria of an academic paper. In addition to the creative, manual or drawing part, it includes a written description of the question, the methodology and the possible gain in knowledge of the work.

The students take the oral examination with the professor with whom they have discussed the topic of the in-depth thesis.

The written or creative, manual or drawing work and the oral examination are each assessed individually. These two assessments are offset against each other and result in the overall grade for the in-depth work. Paragraph 7 remains reserved.

The oral examination can only be taken if the written work or the creative, technical or graphic work is sufficient.

A thesis is passed if the overall grade is at least 4.

It is considered not passed if the overall grade is below 4; if the written or creative, technical or graphic work is unsatisfactory and therefore the oral examination cannot be taken; in such a case, the failure will be noted with the term “dropout”.

An in-depth thesis that has not been passed cannot be repeated. In order to acquire the required CP, a further in-depth work must be carried out and the performance must be assessed with an overall grade of at least 4. The number of attempts is limited (see regulations).

If more than one “in-depth study” course unit is not passed, the course is considered to have been definitively failed, which leads to exclusion from the course.

The creative, craft or drawing in-depth work is publicly exhibited. Purely written in-depth theses are made publicly available.

The subjects can be proposed by the students.

Note: In consultation with the professors of architecture, the fixed topics are binding (see Art. 29 Reg. 201 MSc Architecture).

Only students who fulfill the following criteria are allowed to begin with their master thesis:

a. successful completion of the bachelor programme;

b. fulfilling of any additional requirements necessary to gain admission to the master programme.

Ultimate deadline to unsubscribe or enroll for the Master Thesis is 23.10.2024.

Deleting a reservation after this date is prohibited.
Abstract
The master's thesis is the completion of the Master's degree.

Objective
It shows the students' ability to work independently and is a proof of the successful completion of their studies.

Prerequisites / notice
The Master's thesis is supervised by a design professor D-ARCH. The students can choose one of the topics presented by the D-ARCH or - after approval by the head of the work - a free, self-chosen topic. Further details are regulated in Articles 31-38.

</tbody>
</table>
| Objective | - Learn about the properties of light: intensities, phases, colors, and interactions with matter  
- Exploring optical effects: reflection, refraction, dispersion  
- Learn to plan and carry out an art project based on research inputs from other sciences  
- Enhancing conceptual and interdisciplinary thinking in unusual set-ups  
- Learn how to cope with unforeseen results and make random events productive for the successful implementation of a project  
- Fostering communication and presentation skills |      |      |       |                      |
| Content | In this course, we will set a performative frame for experimentation and exploration. Coupled with experiments in the Dep. of Physics, students will be introduced to concepts such as the origin of light and color, and the interpretation of the optical world that surrounds us to understand what actually gives rise to the effects we see everyday—from butterfly wings and autumn colors to the appearance of buildings and cities. In addition, we will perform practical experiments with basic optical components like lenses, mirrors, and prisms, in order to understand how they can be used to capture images. Inputs by guest lecturers (e.g. on light in photography, anthropology or urban landscapes) are planned. Students will be asked to present related topics. |      |      |       |                      |
| Prerequisites / notice | Max. number of participants: 15

| 063-0649-24L | Architectural Design with Machine Learning | W    | 2    | 2G    | A. Apolinarska |
| Abstract | This elective course presents machine-learning methods for data-driven design exploration in architectural design, and how to leverage them in combination with the parametric modelling paradigm. |      |      |       |                      |
| Objective | The students learn how to harness parametric models for data exploration and how to augment the design process with project-specific generative deep learning models. They acquire basic understanding of the underlying methods and can implement them in their design tasks in architecture, urban planning, engineering etc. |      |      |       |                      |
The course will cover the following topics: data exploration (analytics and visualisations), forward and inverse design problems (enhancing parametric modelling with machine learning), basics of machine learning (feed-forward networks, backpropagation), and generative models with special focus on autoencoders.

The course consists of lectures providing a theoretical background followed by hands-on practical sessions with coding exercises in Python and Grasshopper. In parallel, the students will work in small groups on a semester project, in which they apply the presented data-exploration and inverse design methods to a design task of their choice. Building upon the provided framework (in Grasshopper and Python), students will generate custom datasets and train project-specific models, and then use them for concept-phase design exploration.

Lecture notes
Slides and other materials will be provided during the course.

Prerequisites / notice
Literature will be provided during the course.
063-0669-00 Coding Architecture I, or 063-0670-00 Coding Architecture II, or equivalent programming fluency in Python and Grasshopper.

101-0531-00L Digital Creativity for Circular Construction

All students who register go on a waiting list until 11.09.2024. To register:
1. Enroll before 05.09.2024
2. Send a short motivation letter (max. 300 words) and a 1-page CV to cea-course@ibi.baug.ethz.ch by 05.09.2024
3. MIBS students: This course is mandatory and there is no need to send your application documents

Please only register for the course if you really intend to participate on all course dates (see course catalog), otherwise, you will deprive someone else of a place.

Abstract
The course is about digital innovation towards a circular economy in the built environment. How can we bring together two worlds that are often too distinct: low-impact construction and digital innovation? Bringing digital tools already used in other sectors into the construction sector, students will learn about circular construction (e.g., reuse of materials) through hands-on learning practices.

Objective
In the fall semester 2024 we will focus on applying artificial intelligence (AI) and extended reality (XR) to the circular design workflow and evaluate possible solutions using digital technologies to enable a circular built environment (more specifically, with reused building materials). To achieve this, they need to be able to do the following:

1. Apply circular principles using recovered building materials.
2. Compare different digital technologies applied in circular construction (e.g., LiDAR scanning, drone imagery, photogrammetry, computational design, AI, computer vision, XR, LCA tools etc.)
3. Understand the potential and limitations of AI for circular construction, e.g. use machine learning to detect and digitize materials (computer vision) or to support creativity in the early design phases of circular construction (generative AI).
4. Communicate the importance and urgency of circular construction.
5. Assess the environmental impact implications of their design and technology decisions through a preliminary Life Cycle Assessment (LCA).

Content
Students will receive an introduction to circular principles by experts from the building industry and visit of (de-)construction sites where circular construction is exemplified. They will explore how to use digital technologies such as LiDAR scanning, photogrammetry, scan-to-BIM, computer vision, computational design, digital fabrication, blockchain technology and learn about the design implications using reclaimed building materials. This course is meant as an overview/introduction of many digital technologies that could be useful for circularity and gives the tools to students to further study the technologies they are most interested in on their own. Creativity in writing, filmmaking, design, construction, etc. is expected from the students. This course will give the tools to students to learn more on LCA if they wish to deepen their knowledge further.

Lecture notes
Language: English
Courses are on Tuesday afternoons in Kunsthalene or a room at ETH, but also require out-of-the-semester work and significant homework and site visits outside of class hours.

Literature
Prerequisites / notice

Interest in Digitalisation and Construction. Flexibility: This is a hands-on course, where students explore digital technologies and opportunities/challenges of reuse. Flexibility (e.g. adapting to unforeseen circumstances), responsibility (e.g. arriving on time for safety briefing), and spontaneity (e.g. finding innovative solutions) is expected from the students to adapt to the contingencies from demolition and construction sites with reused materials. The course is mandatory for MIBS students. If you are a first year MIBS student, please do not apply, you are automatically accepted. All other students from other departments should apply. Please only register for the course if you really intend to participate on all course dates (see course catalog). Please only register for the course if you are willing to send us a letter of motivation and really intend to participate; otherwise, you will deprive someone else of a place. All non-MIBS students who register go onto a waiting list until 11.09.2024 and up to 25 of them will be selected by the lecturer.

To register:
1. Enroll before 05.09.2024.
2. Send a short letter of motivation (max. 300 words) and a 1-page CV to cea-course@ibi.baug.ethz.ch by 05.09.2024.

Abstract

This seminar deals with writings by Walter Benjamin. On the one hand, his most famous and influential essays and fragments on critique, history and experience will be read and discussed, and on the other, a special focus will be placed on his thinking on architectural themes.

Objective

On the one hand, students learn to know Walter Benjamin’s most influential ideas, such as his views on art criticism, history and culture, as well as to reflect on his philosophical methods, such as thinking in constellations and pictures. On the other hand, students learn to apply Benjamin’s methods of interpretation (Deutung) to architectural works and the Benjaminian texts themselves.

Abstract

This course covers the chemical and physical processes controlling the composition of the troposphere and stratosphere and introduces the relevant fundamentals for processes in the gas phase, in aerosols and clouds. These concepts are explored in the context of key environmental issues, such as urban air pollution, stratospheric ozone depletion, and air quality connections to climate change.

Objective

1. describe the structure of the atmosphere and list atmospheric components and their main properties
2. define and describe the chemical and physical processes in the stratosphere and troposphere, follow reaction mechanisms, and apply rate laws
3. describe the physical and chemical principles of air pollution and summarize the most important legislative measures
4. discuss the local, regional, and global aspects of interactions between air quality, ecosystem health, and climate

Content

- Origin and properties of the atmosphere: composition (gases and aerosols), atmospheric structure, UV radiation, transport timescales
- Kinetics of gas phase reactions: rate laws, mechanisms of bimolecular and termolecular reactions.
- Stratospheric chemistry: Chapman cycle, catalytic ozone destruction cycles, polar ozone hole, Montreal protocol
- Tropospheric chemistry: oxidizing capacity of the troposphere and the role of OH, oxidation and global budgets of CO and CH4, role of NOx, and the global tropospheric O3 budget
- Surface ozone chemistry: HOx-NOx cycle, role of VOCs, O3 isopleth, ozone production efficiency
- Aerosols: primary and secondary sources, composition, quantities and measures, connections to climate
- Multiphase chemistry: solubility of gases, Raoult’s Law and hygroscopicity, kinetics of gas to particle transfer, N2O5 chemistry, aqueous phase sulfur chemistry, secondary organic aerosol formation
- Air quality: role of planetary boundary layer, deposition processes, summer- versus winter-smog, environmental problems, legislation, long-term trends
- Global aspects: air quality - climate interactions

Lecture notes

Lecture materials (slides) are provided continuously during the semester, at least 2 days before each lecture. Annotations and corrections are provided at the latest within the same week.

Prerequisites / notice

Attendance of the lecture "Atmosphäre" LV 701-0023-00L or equivalent knowledge is a pre-requisite, and basic courses in physics and chemistry are expected.

On Mondays (or upon agreement) a tutorial is offered. This allows the students to discuss unresolved issues from the lecture or to discuss the problems of the exercise series and their solution. Participation is recommended.

Satellite observations; analysis of vertical soundings; geostrophic and thermal wind; cyclones at mid-latitude; global circulation; north-Atlantic oscillation; atmospheric blocking situations; Eulerian and Lagrangian perspective; Potential Vorticity; Alpine dynamics (storms, orographic wind); planetary boundary layer; water isotopes.

The students are able to:
- explain basic measurement and analysis techniques that are relevant in atmospheric dynamics.
- to explain the basic dynamics of the global circulation and of synoptic- and meso-scale flow features.
- to explain how mountains influence the atmospheric flow on different scales.
- basic understanding of stable water isotopes as tracers for moist adiabatic processes in weather systems.

Satellite observations; analysis of vertical soundings; geostrophic and thermal wind; cyclones at mid-latitude; global circulation; North-Atlantic oscillation; atmospheric blocking situations; Eulerian and Lagrangian perspective; Potential Vorticity; Alpine dynamics (storms, orographic wind); planetary boundary layer; water vapour transport in the atmosphere; water isotopes.

Lecture slides and chapters from the textbook will be made available on moodle: https://moodle-app2.let.ethz.ch/course/view.php?id=22731

An electronic version of this book can be obtained via the ETH library.

The concepts are applied to understand and judge the validity of different proposed artificial weather modification ideas.

The students are able to:
- to explain the mechanisms of convective storm formation using knowledge of thermodynamics and cloud microphysics.
- to interpret precipitation radar images.
- to evaluate the significance of clouds and aerosol particles for artificial weather modification.

In the course "Atmospheric Physics", the competencies of process understanding, system understanding and data analysis & interpretation are taught, applied and examined. Measurement methods are taught as well.

The course starts with introducing selected concepts of thermodynamics for atmospheric processes: The students learn the concept of the thermodynamic equilibrium and derive the Clausius-Clayperon equation from the first law of thermodynamics. This equation is central for the phase transitions in clouds.

Students also learn to use thermodynamic charts (tephigrams) and to identify cloud base, cloud top, available convective energy in radiosonde ascents. Atmospheric mixing processes are introduced as a basis for fog formation. The concept of an air parcel is used to understand convection.

Aerosol particles are introduced in terms of their physical properties and their role in cloud formation based on Köhler theory. Thereafter cloud microphysical processes including ice nucleation are discussed.

With these basics, the different forms of precipitation (convective vs. stratiform) are discussed and how they can be identified in radar images. Students will also learn under which conditions severe convective storms (especially supercells with tornados) can form.

The concepts are applied to understand and judge the validity of different proposed artificial weather modification ideas.

The students are able to:
- to explain orographic wind; planetary boundary layer; water isotopes.
- to explain the Atlantic oscillation; atmospheric blocking situations; Eulerian and Lagrangian perspective; Potential Vorticity; Alpine dynamics (storms, orographic wind).

We offer a lab tour, in which we demonstrate how some of the processes discussed in the lectures are measured with instruments.

pdf-files of the revised book will be provided on moodle on a chapter-by-chapter basis.

There is a additional tutorial right after each lecture to give you the chance to ask further questions and discuss the exercises. The participation is recommended but voluntary.

We offer a lab tour, in which we demonstrate how some of the processes discussed in the lectures are measured with instruments.

**Abstract**

This seminar is designed for PhD students and PostDoc researchers involved in inter- or transdisciplinary research. It addresses and discusses challenges of this kind of research using scientific literature presenting case studies, concepts, theories, methods and by testing practical tools. It concludes with a 10-step approach to make participants' research projects more societally relevant.

**Objective**

Participants know specific challenges of inter- and transdisciplinary research and can address them by applying practical tools. They can tackle questions like: how to integrate knowledge from different disciplines, how to engage with societal actors, or how to secure broader impact of research. They learn to critically reflect their own research project in its societal context and on their role as scientists.

**Content**

The seminar covers the following topics:

1. Theories and concepts of inter- and transdisciplinary research
2. The specific challenges of inter- and transdisciplinary research
3. Collaborating between different disciplines
4. Engaging with stakeholders
5. 10 steps to make participants' research projects more societally relevant

Throughout the whole course, scientific literature will be read and discussed as well as practical tools explored in class to address concrete challenges.

**Literature**

Further, this collection of tools will be used: https://naturalsciences.ch/topics/co-producing_knowledge https://www.shapetoolkit.eu

**Prerequisites / notice**

In this seminar, the process of writing a scientific proposal will be introduced. The essential elements of a proposal, including the peer review process, will be outlined and class exercises will train scientific writing skills. Knowledge exchange between class participants is promoted through the preparation of a master thesis proposal and evaluation of each other's work.

Training scientific writing skills.

Attendance is mandatory.

The master thesis is supervised by a professor of the D-ERDW or of the Institute for Atmosphere and Climate (IAC, D-USYS), a professor who teaches in the module subjects or a senior scientist who is on the list of "competent leaders of master theses" of the D-ERDW or of the D-USYS (associated with the IAC).

The master programme will be completed by a master thesis on a topic selected from the subject range of the chosen major programme. Students are to prove their skills in working autonomously on a scientific project. They document their work in a scientific report.

<tr>
<th>Course Units for Additional Admission Requirements</th>
</tr>
</thead>
</table>

- Laboratory and Field Courses
  The course in the category «lab and field work» are only offered in spring semester.

- Master's Thesis
  The courses below are only available for MSc students with additional admission requirements.
701-0412-AAL Climate Systems
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Introduction of the most important components of the climate systems and their interactions.

Objective
Students have a basic understanding of the global energy balance, radiation budget, boundary layer, atmosphere, ocean, biosphere, land-surface coupling, cryosphere, carbon cycle, climate variability, climate of the past and anthropogenic climate change, and they are able to apply this to solve simple quantitative problems and answer qualitative questions.

Lecture notes
Copies of the slides are provided in electronic form.

Prerequisites / notice
Teaching: Reto Knutti, several keynotes to special topics by other professors
Course taught in german, slides in english

701-0471-AAL Atmospheric Chemistry
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
This is a self-study course targeted at Master students who did not follow the bachelor course "atmospheric chemistry" or equivalent, providing a general introduction into atmospheric chemistry. It introduces the relevant fundamental concepts, which are explored in the context of key environmental issues, such as air pollution, stratospheric ozone depletion, and connections to climate change.

Objective
At the end of this course, students are able to:
1. describe the structure of the atmosphere and list atmospheric components and their main properties
2. define and describe the chemical and physical processes in the stratosphere and troposphere, follow reaction mechanisms, and apply rate laws
3. describe the physical and chemical principles of air pollution and summarize the most important legislative measures
4. discuss the local, regional, and global aspects of interactions between air quality, ecosystem health, and climate

Content
- Origin and properties of the atmosphere: composition (gases and aerosols), atmospheric structure, UV radiation, transport timescales
- Kinetics of gas phase reactions: rate laws, mechanisms of bimolecular and termolecular reactions.
- Stratospheric chemistry: Chapman cycle, catalytic ozone destruction cycles, polar ozone hole, Montreal protocol
- Tropospheric chemistry: oxidizing capacity of the troposphere and the role of OH, oxidation and global budgets of CO and CH4, role of NOx, and the global tropospheric O3 budget
- Surface ozone chemistry: HOx-NOx cycle, role of VOCs, O3 isopleth, ozone production efficiency
- Aerosols: primary and secondary sources, composition, quantities and measures, connections to climate
- Multiphase chemistry: solubility of gases, Raoult's Law and hygroscopicity, kinetics of gas to particle transfer, N2O5 chemistry, aqueous phase sulfur chemistry, secondary organic aerosol formation
- Air quality: role of planetary boundary layer, deposition processes, summer- versus winter-smog, environmental problems, legislation, long-term trends
- Global aspects: air quality - climate interactions

Lecture notes
The slides, notes and exercises of the preceding edition of the bachelor course 701-0471-01L Atmospheric Chemistry will be provided.

Prerequisites / notice
Basic courses in chemistry and physics are expected

Competencies

701-0475-AAL Atmospheric Physics
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
This is a self-study course for MSc students, who like to learn something about Atmospheric Physics but for cannot follow the course Atmosphärenphysik, because that is taught in German. However, the slides and the textbook of the course Atmosphärenphysik, and they form the basis also for this course.

Objective
See entry under LV 701-0475-00L Atmosphärenphysik

Content
See entry under LV 701-0475-00L Atmosphärenphysik

Lecture notes
Powerpoint slides and script from LV 701-0475-00L Atmosphärenphysik will be made available

Literature
pdf-files of the revised book will be provided as well.

Competencies

701-0473-AAL Weather Systems
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students),...
Abstract
The students learn about the dynamical features of the Earth's atmosphere. They interpret satellite imagery and learn about basic concepts in dynamical meteorology. The global circulation is briefly discussed, before introducing the Eulerian and the Lagrangian perspective, which are used to study air streams in extratropical cyclones and to investigate basic aspects in mountain meteorology.

Objective
The students are able to
- explain basic measurement and analysis techniques that are relevant in atmospheric dynamics
- to discuss the mathematical basics of atmospheric dynamics, based on selected atmospheric flow phenomena
- to explain the basic dynamics of the global circulation and of synoptic- and meso-scale flow features
- to explain how mountains influence the atmospheric flow on different scales
- basic understanding of the role of moist adiabatic processes for weather systems and why stable water isotopes are useful in this context

Content
Satellite observations; analysis of vertical soundings; geostrophic and thermal wind; cyclones at mid-latitude; global circulation; north-atlantic oscillation; atmospheric blocking situations; Eulerian and Lagrangian perspective; potential vorticity; Alpine dynamics (storms, orographic wind); planetary boundary layer

701-0106-AAL Mathematics V: Applied Deepening of Mathematics I - III
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Selected mathematical topics are presented for later use in more specialised lectures. Part of the topics were already discussed in the lectures Mathematics I-III. Here, they should be shortly recapitulated and most importantly applied to practical problems. If necessary, new mathematical concepts and methods will be introduced in order to solve challenging and inspiring problems from practice.

Objective
The aim of this lecture is to prepare the students for the more specialised lectures. They should become more familiar with the mathematical background, the mathematical concepts and most of all with their application and interpretation.

Content
Practical examples from the following areas will be discussed: ordinary differential equations; eigenvalue problems from linear algebra; systems of linear and nonlinear differential equations; partial differential equations (diffusion, transport, waves).

701-0071-AAL Mathematics III: Systems Analysis
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
The objective of the systems analysis course is to deepen and illustrate the mathematical concepts on the basis of a series of very concrete examples. Topics covered include: linear box models with one or several variables, non-linear box models; models in space and time.

Objective
Learning and applying of concepts (models) and quantitative methods to address concrete problems of environmental relevance. Understanding and applying the systems-analytic approach, i.e., Recognizing the core of the problem - simplification - quantitative approach - prediction.

Content
Introduction to principles of models; one-dimensional linear box models; multi-dimensional linear box models; nonlinear box models; models in space and time

Lecture notes
Teaching material: book (see literature).

|                 | When are experiments meaningful? How do we have to proceed to test hypotheses with experiments? By which criteria do we estimate the explanatory value of competing theories? To answer these questions the key to understanding scientific research. This seminar focuses on how these foundations can be taught in science lessons. |
Course promotes exchange between student teachers and elementary school teachers in STEM teaching with 3 parts: 1) block seminar, 2) collaboration with elementary school teacher in a class, and 3) final report. Registration implies participation in all 3 parts.

Students learn more about the potential and challenges of pupils. They get to know the early stages of knowledge as well as the development of pre-concepts of students in their subject area. The seminar with a phase of cooperation consists of three phases: In the block seminar, pre-concepts are discussed in their own subject as well as theoretical inputs from developmental and cognitive psychology. During the cooperation phase, a teaching task defined by the primary and secondary school teachers is actively undertaken in a class. Finally, a final report is written, which contains a description of the students' level of knowledge. This seminar is only suitable for students who can adapt flexibly to the needs of pupils from lower class levels.

Subject-specific Competencies
Method-specific Competencies
Social Competencies
Personal Competencies

Disorders of Social Cognition

Enrolment possible with matriculation in
- Master HST
- Teaching Diploma or Teaching Certificate

This course unit can only be enrolled after successful participation in, or during enrolment in the course "Human Learning (EW1)".

Teaching Diploma Sports: allocation of the ECTS only possible in the category "Educational Science" !!!

In this seminar, we consider how the human brain processes social information. The approach focuses on exploring the neural bases of social cognition in healthy individuals, as well as providing case studies from atypical populations, whose pathologies are typified by dysfunction in social information processing, such as autism spectrum disorder and schizophrenia.

- To familiarise students with forms of social cognition in humans, as well as the neural systems that support social cognition.
- To critically evaluate theories and data relating to Social Cognition and Social Neuroscience.
- To relate how knowledge of typical brain function can inform our understanding of individuals who process social information differently, and vice versa.
- To develop effective scientific communication skills in oral and written formats.

This seminar will consider how the human brain understands and organises social behaviour. The approach will focus on exploring the neural bases of social cognition in healthy individuals, as well as providing case studies from atypical populations, whose pathologies are typified by dysfunction in social information processing. Examples of such pathologies include autism spectrum disorder, schizophrenia and attention deficit hyperactivity disorder. By examining healthy and atypical populations, this module will highlight how disorders of social cognition can inform the understanding of healthy brain function, as well as how understanding healthy brain function can inform disorders of social cognition.

Effectiveness Use of Visualisations for Learning

Successful completion of the lecture "871-0240-00L Human Learning (EW1)"

Seminar participants learn how to examine visualizations for their pedagogical impact. They will learn how to assess when it is worth using visualizations, how many visualizations should be offered, and how they can be embedded in teaching materials to avoid misconceptions and promote learning.

Visualizations are an integral part of STEM subjects. Visualizations can make learning content intuitively accessible. However, visualizations can also create misconceptions. For example, ball-and-stick models in chemistry can create the misconception that chemical bonds consist of static connections. In order to avoid such misconceptions, the seminar teaches effective instructional methods with visualizations. The seminar builds on theories from EW1. Practical exercises with various visualization methods (e.g. images, graphs, animations, simulations, interactive diagrams) will help seminar participants to create effective learning materials with visualizations for their own discipline.

**Abstract**

This course looks into scientific theories and also empirical studies on human learning and relates them to the school.

**Objective**

Anyone wishing to be a successful teacher must first of all understand the learning process. Against this background, theories and findings on the way humans process information and on human behaviour are prepared in such a manner that they can be used for planning and conducting lessons. Students additionally gain an understanding of what is going on in learning and behavioural research so that teachers are put in a position where they can further educate themselves in the field of research into teaching and learning.

**Content**

Thematische Schwerpunkte:
- Lernen als Verhaltensänderung und als Informationsverarbeitung
- Das menschliche Gedächtnis unter besonderer Berücksichtigung der Verarbeitung symbolischer Information
- Lernen als Wissenskonstruktion und Kompetenzerwerb
- Lernen durch Instruktion und Erklärungen
- Die Rolle von Emotion und Motivation beim Lernen
- Interindividuelle Unterschiede in der Lernfähigkeit und ihre Ursachen

Lernformen:
- Theorien und wissenschaftliche Konstrukte werden zusammen mit ausgewählten wissenschaftlichen Untersuchungen in Form einer Vorlesung präsentiert.

**Lecture notes**

Folien werden zur Verfügung gestellt.

**Literature**

**Prerequisites / notice**

This lecture is only apt for students who intend to enrol in the programs “Lehrdiplom” or “Didaktisches Zertifikat”. It is about learning in childhood and adolescence.
**Abstract**

Students learn and practice techniques and skills for coping with psychosocial demands of teaching.

**Objective**

Students possess theoretical knowledge and practical competences to be able to cope with the psychosocial demands of teaching.

1. They know the basic rules of negotiation and conflict management (e.g., mediation) and can apply them in the school context (e.g., in conversations with parents).
2. They can apply diverse techniques of classroom management (e.g., prevention of disciplinary problems in the classroom) and know relevant authorities for further information (e.g., legal conditions; crisis intervention).
3. They know stress coping strategies to prevent burnout (e.g., psychosocial support) and are familiar with relevant institutions.

**Content**

**Major themes:**
- Counseling and counseling techniques
- Conflict management and mediation
- Classroom management
- Supporting students in a psychological crisis
- Preventing stress and burnout

**Forms of learning**

Theoretical foundations will be taught in workshops which contain different means of activation and interaction such as group work, panel discussions, and individual work. Subsequently, this knowledge will be transferred and applied in different school-related situations by means of role plays, discussing of cases and video sequences, as well as reflections of practical experiences.

**Literature**

Slides of the lecturer's presentations, supplementary materials, and materials for further reading are made available on Moodle.

**Prerequisites / notice**

The successful completion of ALL modules relevant for the teacher's diploma is required for participation in this course.

**Abstract**

The students have to read the book "Lernwirksam unterrichten" from Felten/Stern and they have to answer questions. In individual or small-group sessions will be discussed how insights from learning research can inform classroom practice.

**Objective**

Students know
- How to plan events and camps
- To assess curricula critically and to use them properly
- How to combine theoretical and practical issues in the 'Ergänzungsfach'

**Content**

1. LV Semestereinführung
2. LV Planung Outdoor-Weekend
3. LV Auswertung Outdoor-Event
4. LV Planung Event
5. LV Event-Präsentationen / Schlussveranstaltung

**Prerequisites / notice**

Enrolment only possible with matriculation in Teaching Diploma without the subject of Sport.

**Abstract**

The focus will be on the book "Intelligenz: Grosse Unterschiede und ihre Folgen" by Stern and Neubauer. Participation at the first meeting is obligatory. It is required that all participants read the complete book. Furthermore, in two meetings of 90 minutes, concept papers developed in small groups (5 - 10 students) will be discussed.

**Objective**

- Understanding of research methods used in the empirical human sciences
- Getting to know intelligence tests
- Understanding findings relevant for education

**Data:** 02.07.2024 12:39  Autumn Semester 2024  Page 159 of 2667
Analytical Competencies

1. Assessing the adequacy of Matura thesis topics and defining the scope of a project.

2. Determining and promoting a successful work process.

3. Devising and applying criteria for assessing process, product and presentation of a Matura thesis.

Subject-specific Competencies

Concepts and Theories

Disorders of Social Cognition

- Teaching Diploma or Teaching Certificate

Enrolment possible with matriculation in Teaching Diploma or Teaching Certificate.

This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1).

Abstract

In this seminar, future teachers will be trained to prepare and conduct excursions to out-of-school learning venues. For this purpose, excursions are offered at the Swiss Federal Institute for Forest, Snow and Landscape Research (WSL) in Birmensdorf.

Objective

Future teachers will learn to prepare and conduct excursions to out-of-school learning venues.

Content

Excursions at the Swiss Federal Institute for Forest, Snow and Landscape Research (WSL) in Birmensdorf:

- Dendrochronology: What annual rings tell
- Photosynthesis/Climate change: The tracks in the forest
- Forest Soil: The soil in the focus of the climate

Prerequisites / notice

Für eine reibungslose Semesterplanung wird um frühe Anmeldung und persönliches Erscheinen zum ersten Lehrveranstaltungstermin ersucht.

Using Outdoor Education

Enrolment only possible with matriculation in Teaching Diploma Biology and Geography.

Abstract

In this seminar, future teachers will be trained to prepare and conduct excursions to out-of-school learning venues. For this purpose, excursions are offered at the Swiss Federal Institute for Forest, Snow and Landscape Research (WSL) in Birmensdorf.

Objective

- Get to know cognitively activating instructions in MINT subjects

Content

Excursions at the Swiss Federal Institute for Forest, Snow and Landscape Research (WSL) in Birmensdorf:

- Dendrochronology: What annual rings tell
- Photosynthesis/Climate change: The tracks in the forest
- Forest Soil: The soil in the focus of the climate

Prerequisites / notice

Assessed

Formation of Knowledge in STEM Fields in Primary and Secondary School

Addresses to students enrolled either in Teaching Diploma (TD) or Teaching Certificate (TC) (excluding Teaching Diploma Sport).

This course unit can only be enrolled after successful participation in the course 871-0240-00L "Human Learning (EW 1)".

Abstract

Course promotes exchange between student teachers and elementary school teachers in STEM teaching with 3 parts: 1) block seminar (ca. 16 h), 2) collaboration with elementary school teacher in a class (ca. 34 h, with approx. 50% spent in the elementary or middle school class and ca. 50% for preparation), and 3) final report (ca. 10 h). Registration implies participation in all 3 parts.

Objective

1. Assessing the adequacy of Matura thesis topics and defining the scope of a project.
2. Determining and promoting a successful work process.
3. Devising and applying criteria for assessing process, product and presentation of a Matura thesis.

Prerequisites / notice

Focus on STEM subjects (biology, chemistry, computer science, mathematics, and physics) with no explicit discussion of geography or physical education.

Disorders of Social Cognition

Enrolment possible with matriculation in

- Master HST

- Teaching Diploma or Teaching Certificate

This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)"

!! Teaching Diploma Sports: allocation of the ECTS only possible in the category "Educational Science"!!!

Abstract

In this seminar, we consider how the human brain processes social Information. The approach focuses on exploring the neural bases of social cognition in healthy individuals, as well as providing case studies of dysfunction in social information processing, such as autism spectrum disorder and schizophrenia.
In this course options for implementing the specifications in the framework curriculum for the vocational baccalaureate are developed and fostered.

**Subject-specific Competencies**
- Concepts and Theories
- Techniques and Technologies

**Method-specific Competencies**
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management

**Social Competencies**
- Communication
- Cooperation and Teamwork
- Self-presentation and Social Influence
- Sensitivity to Diversity

**Personal Competencies**
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.
UZH Module Code: 090LLB2

Simultaneous enrolment in course “Unterrichtsgestaltung und Schulentwicklung an Berufsmaturitätsschulen” (UZH Module Code: 090LLB1) is compulsory.

Mind the enrolment deadlines at UZH: https://www.uzh.ch/cmsssl/en/studies/application/deadline.html (*Registering for studies at more than one university, Teaching Diploma*, Philosophische Fakultät)

Abstract In this course, pedagogical processes are analyzed and learning and socialization processes are discussed using concrete case studies from teaching at vocational schools and vocational baccalaureate schools. The focus is on the supporting and encouraging role of the teacher and the consideration of the individual life and professional situations of the trainees in their heterogeneity.

Objective
- Students are familiar with a variety of approaches in the areas of individual support, internal differentiation, learning and problem-solving skills as well as constructive error and criticism culture. They are able to use them to promote learning.
- Students are aware of age- and development-typical problems of learners in education, can address them appropriately and involve counseling services and legal representation of young people appropriately.
- Students are able to relate their instructions to the students' learning experiences in professional practice and to their various life and work contexts, and to incorporate them as a starting point for school-based and lifelong learning processes.
- Students can describe and explain the experience and behaviour of adolescents at school and the world of work from different perspectives.

**871-0242-06L**

**Cognitively Activating Instructions in MINT Subjects**

Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).

This course unit can only be enrolled after successful participation in, or during enrollment in the course “Human Learning (EW 1)”.

Abstract This seminar focuses on teaching units in chemistry, physics and mathematics that have been developed at the MINT Learning Center of the ETH Zurich. In the first meeting, the mission of the MINT Learning Center will be communicated. Furthermore, in groups of two, the students will intensively work on, refine and optimize a teaching unit following a goal set in advance.

Objective
- Get to know cognitively activating instructions in MINT subjects
- Get information about recent literature on learning and instruction

Prerequisites / notice Für eine reibungslose Semesterplanung wird um frühe Anmeldung und persönliches Erscheinen zum ersten Lehrveranstaltungstermin ersucht.

**871-0229-00L**

**Using Outdoor Education**

Enrolment only possible with matriculation in Teaching Diploma Biology and Geography.

Abstract In this seminar, future teachers will be trained to prepare and conduct excursions to out-of-school learning venues. For this purpose, excursions are offered at the Swiss Federal Institute for Forest, Snow and Landscape Research (WSL) in Birmensdorf.

Objective Future teachers will learn to prepare and conduct excursions to out-of-school learning venues.

Content
- Excursions at the Swiss Federal Institute for Forest, Snow and Landscape Research (WSL) in Birmensdorf:
  - Forest Soil: The soil in the focus of the climate
  - Photosynthesis/Climate change: The tracks in the forest
  - Dendrochronology: What annual rings tell
  - Dendrochronology: What annual rings tell

**871-0242-07L**

**Human Intelligence**

Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).

This course unit can only be enrolled after successful participation in, or during enrollment in the course “Human Learning (EW 1)”.

Abstract The focus will be on the book “Intelligenz: Grosse Unterschiede und ihre Folgen” by Stern and Neubauer. Participation at the first meeting is obligatory. It is required that all participants read the complete book. Furthermore, in two meetings of 90 minutes, concept papers developed in small groups (5 - 10 students) will be discussed.

Objective
- Understanding of research methods used in the empirical human sciences
- Getting to know intelligence tests
- Understanding findings relevant for education

**871-0227-00L**

**Foundations of the Theory of Science for Science Lessons**

Course for students of the Teaching Certificate and the Teaching Diploma without the subject of Sport.

Abstract When are experiments meaningful? How do we have to proceed to test hypotheses with experiments? By which criteria do we estimate the explanatory value of competing theories? The answers to these questions are the key to understanding scientific research. This seminar focuses on how these foundations can be taught in science lessons.

Objective
- an overview of the most important models in the theory of science
- expertise to implement and discuss these models in science lessons

**871-0240-27L**

**Supervising and Assessing Matura Theses**

Prerequisites: successful participation in 871-0240-00L “Human Learning (EW1)”.

Abstract This course prepares prospective teachers to supervising and assessing scientific projects at upper secondary school level, particularly Matura theses in STEM subjects at Gymnasium.

Objective
1. Assessing the adequacy of Matura thesis topics and defining the scope of a project.
2. Determining and promoting a successful work process.
3. Devising and applying criteria for assessing process, product and presentation of a Matura thesis.
871-0226-00L  Effective Use of Visualisations for Learning

<table>
<thead>
<tr>
<th>Content</th>
<th>Objective</th>
<th>Abstract</th>
</tr>
</thead>
<tbody>
<tr>
<td>Visualizations are an integral part of STEM subjects. Visualizations can make learning content intuitively accessible. However, visualizations can also create misconceptions. For example, ball-and-stick models in chemistry can create the misconception that chemical bonds consist of static connections. In order to avoid such misconceptions, the seminar teaches effective instructional methods with visualizations. The seminar builds on theories from EW1. Practical exercises with various visualization methods (e.g. images, graphs, animations, simulations, interactive diagrams) will help seminar participants to create effective learning materials with visualizations for their own discipline.</td>
<td>- To develop effective scientific communication skills in oral and written formats.</td>
<td>In this seminar, we consider how the human brain processes social information. The approach focuses on exploring the neural bases of social cognition in healthy individuals, as well as providing case studies from atypical populations, whose pathologies are typified by dysfunction in social information processing, such as autism spectrum disorder and schizophrenia. The seminar will consider how the human brain understands and organises social behaviour. The approach will focus on exploring the neural bases of social cognition in healthy individuals, as well as providing case studies from atypical populations, whose pathologies are typified by dysfunction in social information processing. Examples of such pathologies include autism spectrum disorder, schizophrenia and attention deficit hyperactivity disorder. By examining healthy and atypical populations, this module will highlight how disorders of social cognition can inform the understanding of healthy brain function, as well as how understanding healthy brain function can inform disorders of social cognition.</td>

Abstract
Professors from national and international universities, technical experts from the industry as well as research associates of the institute of structural engineering (IBK) are invited to present recent research results and specific projects from the practice. This colloquium is addressed to members of universities, practicing engineers and interested persons in general.

Objective
Learn about recent research results in structural engineering.

Content
Learn about recent research results and novel practical applications & methods in structural engineering.

Competencies
Subject-specific Competencies: Concepts and Theories, assessed

Abstract
The Institute for Geotechnical Engineering invites distinguished speakers from research and practice, nationally and internationally. The colloquia are directed towards staff and students from Universities as well as engineers and scientists working in industry. Details can be obtained from www.igt.ethz.ch by following Events & Public Events. Some colloquia are available via webcast.

Objective
Learn about recent research results in geotechnics.

Data: 02.07.2024 12:39  
Autumn Semester 2024  
Page 165 of 2667
The course is structured into six modules. The first five are using Matlab, while the last introduces Python.

1. Getting to know Matlab: Matlab as a calculator; variables and arrays
2. Programming basics I: iterating and branching
3. Programming basics II: input and output, functions, visualization
4. Introduction to scientific programming: implementing simple algorithms from numerics, statistics and discrete math; validation, testing and debugging
5. From structures to objects to GUI: basics of object-oriented programming, introduction to interactive programming and graphical user interfaces (GUI)

6. Introduction to programming with Python

A script will be provided. The students will discover the topics of each module through E.Tutorials that they will follow at their own pace online.

The course Private Law focuses on the Swiss Code of Obligations (contracts, torts) and on Property Law (ownership, mortgage and easements). In addition, the course will provide a short overview of Civil Procedure and Enforcement.

The course Private Construction Law

As future construction practitioners, students are able to recognise legal problems independently and in good time in their daily work and to initiate the right measures.

The class Introduction to Civil Law introduces to practice-relevant basics of construction and real estate law.

Mathematics as a tool to solve engineering problems. Mathematical formulation of technical and scientific problems.

Simple Mathematical models in engineering.

Calculus for functions of one variable with applications.

Basic mathematical knowledge for engineers.

- Con riassunti in italiano. E possibile sostenere l'esame in italiano.
- Examen au 1er propédeutique; convient pour travail de semestre.
- Les examens peuvent se faire en français ou en italien.
- What else to know ...

Abstract
We will model and solve scientific problems with partial differential equations. Differential equations which are important in applications will be classified and solved. Elliptic, parabolic and hyperbolic differential equations will be treated. The following mathematical tools will be introduced: Laplace and Fourier transforms, Fourier series, separation of variables, methods of characteristics.

Objective
Learning to model scientific problems using partial differential equations and developing a good command of the mathematical methods that can be applied to them. Knowing the formulation of important problems in science and engineering with a view toward civil engineering (when possible). Understanding the properties of the different types of partial differential equations arising in science and in engineering.

Content
Classification of partial differential equations
Study of the Heat equation general diffusion/parabolic problems using the following tools through Separation of variables as an introduction to Fourier Series.
Systematic treatment of the complex and real Fourier Series
Study of the wave equation and general hyperbolic problems using Fourier Series, D'Alembert solution and the method of characteristics.
Laplace transform and its uses to differential equations
Study of the Laplace equation and general elliptic problems using similar tools and generalizations of Fourier series.
Application of Laplace transform for beam theory will be discussed.

Lecture notes
Lecture notes will be provided

Literature
large part of the material follow certain chapters of the following first two books quite closely.

The course material is taken from the following sources:
Stanley J. Farlow - Partial Differential Equations for Scientists and Engineers
G. Felder: Partielle Differenzialgleichungen.
https://people.math.ethz.ch/~felder/PDG/

Prerequisites / notice
Analysis I and II, insbesondere, gewöhnliche Differentialgleichungen.

402-0023-01L Physics O 7 credits 5V+2U J. Faist

Abstract
This course gives an overview of important concepts in classical dynamics, thermodynamics, magnetism, atomic physics, and special relativity. Emphasis is placed on demonstrating key phenomena using experiments, and in developing skills for quantitative problem solving.

Objective
The goal of this course is to make students able to explain and apply the basic principles and methodology of physics to problems of interest in modern science and engineering. An important component of this is learning how to solve new, complex problems by breaking them down into parts and applying simplifications. A secondary goal is to provide to students an overview of important subjects in both classical and modern physics.

Content
Electrodynamics, Thermodynamics, Quantum physics, Waves and Oscillations, special relativity

Lecture notes
Lecture notes and exercise sheets will be distributed via Moodle

**Abstract**
The course teaches the basics of hydromechanics, relevant for civil and environmental engineers.

**Objective**
- Understanding properties of water, hydrostatics, stability of floating bodies, continuity, Euler equation of motion, Navier-Stokes equations, similarity, Bernoulli principle, momentum equation for finite volumes, potential flows, ideal fluids vs. real fluids, boundary layer, pipe flow, open channel flow, flow measurements, demonstration experiments in the lecture hall.

**Content**
- Properties of water, hydrostatics, stability of floating bodies, continuity, Euler equation of motion, Navier-Stokes equations, similarity, Bernoulli principle, momentum equation for finite volumes, potential flows, ideal fluids vs. real fluids, boundary layer, pipe flow, open channel flow, flow measurements, demonstration experiments in the lecture hall.

B. Sudret

**Abstract**
Introduction to structural mechanics, statically determinate beams and frame structures, trusses, stresses and deformations, statically indeterminate beams and frame structures (force method)

**Objective**
- Understanding the response of elastic beam and frame structures
- Ability to correctly apply the equilibrium conditions
- Understanding the basics of continuum mechanics
- Computation of stresses and deformations of elastic structures
- Ability to apply the force (flexibility) method for statically indeterminate structures

**Content**
- Equilibrium, reactions, static determinacy
- Internal forces (normal and shear forces, moments)
- Arches and cables
- Elastic trusses
- Influence lines
- Basics of continuum mechanics
- Stresses in elastic beams
- Deformations in Euler-Bernoulli and Timoshenko beams
- Energy theorems
- Statically indeterminate systems (Force method)

D. Kochmann

**Abstract**
Dynamics of particles, rigid bodies, and deformable bodies: Motion of a single particle, motion of systems of particles, 2D and 3D motion of rigid bodies, vibrations, waves.

**Objective**
This course enables students to apply the concepts and laws governing the kinematics and kinetics of particles, rigid bodies, and elastic bodies in order to identify, formulate, and solve dynamical engineering problems. Specifically, students will be able to describe, analyze, and predict the motion of particles and bodies in space over time and to relate their motion to the applied forces for applications in (not only) mechanical and civil engineering.
Content

Students of mechanical and civil engineering learn the fundamental concepts of the dynamics of mechanical systems. By studying the motion of a single particle, systems of particles, of rigid bodies, and of deformable bodies, we introduce essential concepts such as kinematics, kinetics, work and energy, equations of motion, and forces and torques. Further topics include the stability of equilibria and vibrations as well as an introduction to the dynamics of deformable bodies and waves in elastic rods. Throughout the course, application-oriented examples help students acquire a proficient background in engineering dynamics, further to learn and embrace problem-solving techniques for dynamical engineering problems, gain cross-disciplinary expertise (by linking concepts from, among others, mechanics, mathematics, and physics), and prepare students for advanced courses and work on engineering applications. The detailed syllabus includes:

1. Motion of a single particle: kinematics (trajectory, velocity, acceleration), forces and torques, constraints, active and reaction forces, balance of linear and angular momentum, work-energy balance, conservative systems, equations of motion.
2. Motion of systems of particles: internal and external forces, balance of linear and angular momentum, work-energy balance, rigid systems of particles, particle collisions, mass accretion/loss.
3. Motion of rigid bodies in 2D and 3D: kinematics (angular velocity, velocity and acceleration transfer, instantaneous center and axis of rotation), balance of linear and angular momentum, work-energy balance, angular momentum transport, inertial vs. moving reference frames, apparent forces, Euler equations.
5. Introduction to waves and vibrations of elastic bodies: local form of linear momentum balance, waves in slender elastic rods.

Lecture notes

Lecture notes (a complete scriptum) is available on Moodle. Students are encouraged to take their own notes during class.

Literature

Lecture notes (a complete scriptum) is available on Moodle. Further reading materials are suggested but not required for this class.

Prerequisites / notice

For students in the bachelor’s degree programme in mechanical engineering:
Precondition for this course unit are passed first year examination blocks A and B.

Competencies

Abstract

Objective

Die Studierenden erlernen in den Vorlesungen und in auf diese abgestimmten Laborübungen theoretische und praktische Kompetenzen für den werkstoffgerechten Einsatz und bewussten Umgang mit Baustoffen als wertvolle Ressourcen.
Content

Der Jahreskurs gliedert sich in 8 Module, die auf 2 Semester verteilt sind. Module umfassen Vorlesungen und dazugehörige Labore:

HS:

Modul 1: Physikalisches Verhalten von Materialien und ihre Charakterisierung:
L (3-4): Labore zu Bauphysik, zu Finite Elemente Methoden, bewertete Hausübung zu LCA und zur Analyse wissenschaftlicher Daten.

Modul 2: Zementöse Baustoffe:
L (5): Labore zu Betontechnologie, Mineralische Bindemittel, Stein als Baumaterial, Mauerwerk und Mikrostruktur unterschiedlicher Baustoffe.

Modul 3: Amorphe Werkstoffe:

Modul 4: Digitale Fabrikation:
V (2): Methoden der digitalen Fabrikation und additiven Fertigung.
E (1): Exkursion Emersive Design Lab / HIB

FS:

Modul 5: Metalle und Korrosion:
L (3): Labore zu metallischen Werkstoffen, Dauerhaftigkeit von Stahlbetonbauten, detektieren und orten der Korrosion und digitaler Fabrikation.

Modul 6: Holz und Holzwerkstoffe:
L (2): Labore zu Holzeigenschaften auf Makro- und Mikroskopischer Ebene.

Modul 7: Baustoffe im Computer:
V (3): Grundlagen der Materialsimulation, Mikromechanik und Fallstudien zu Materialsimulationen für Baustoffe

Modul 8: Repetitorien:

Exam Block 3

Number Title Type ECTS Hours Lecturers
101-0315-00L Geotechnical Engineering O 5 credits 4G A. Puzrin

Abstract

The course explores the fundamental principles of Geomechanics and Geotechnical Engineering, with the following objectives:
- Recognition of the basic consequences of the ground construction;
- Understanding of the important fundamental concepts of Soil mechanics and Geotechnical Engineering;
- Independent analysis of the basic geotechnical problems.

Objective

The course explores the fundamental principles of Geomechanics and Geotechnical Engineering, with the following objectives:
- Recognition of the basic consequences of the ground construction;
- Understanding of the important fundamental concepts of Soil mechanics and Geotechnical Engineering;
- Independent analysis of the basic geotechnical problems.

Content

Overview of stability problems; Bearing capacity of shallow and deep foundations; Soil-foundation interaction; Analysis and design of shallow and deep foundations; Earth pressure on retaining structures; Analysis and design of retaining walls; Excavations: dewatering, analysis and design; Soil improvement; Safety considerations.

Lecture notes

Examples

Literature

## Public Transport and Railways

### Objective

Teaches the basic principles of public transport network and topology design, to understand the main characteristics and differences of public transport networks, based on buses, railways, or other technologies.

Teaches students to recognize the interactions between the infrastructure design and the production processes, and various performance criteria based on various perspective and stakeholders.

At the end of this course, students can critically analyze existing networks of public transport, their design and use; consider and substantiate different choices of technologies to suitable cases; optimize the use of resources in public transport.

### Content

Infrastructure: Planning processes and decision levels in network development and infrastructure planning, planning of topologies; tracks and roadways, station infrastructures; Fundamentals of the infrastructure design for lines; track geometries; switches and crossings

Vehicles: Classification, design and suitability for different goals

Network design: design dilemmas, conceptual models for passenger transport on long distance, urban regional transport.

Operations: Passenger/Supply requirements for line operations; timetabling, measures of realized operations, capacity

### Literature

- Reference material books are provided in German and English (list disseminated at lecture), plus Skript Bahninfrastruktur; System- und Netzplanung

### Notice

- Slides, in English, are made available some days before each lecture.

### Prerequisites

- The content of steel structures I is a prerequisite

---

## Steel Structures II

### Objective

Fatigue resistance and safe life assessment. Detailing, drafting, fabrication and erection, cost estimation.

Students will expand the knowledge acquired during "Steel Structures I" and learn how to apply these skills to the design of more complex building and bridge steel and composite structures. They will acquire the fundamental background for the phenomena of plate buckling and fatigue and learn how to apply it to practical design tasks. In addition, students will learn to appreciate the importance of questions of detailing, fabrication, erection and cost calculation for the effective design of steel and composite structures.

After completion of the year-long course in Steel Structures I-II, students will have at their disposal a wide and detailed set of skills concerning the modern practice for steel and composite structures design and have a deep understanding of its theoretical & scientific background. The examples of scientific and standardisation work provided in the lectures give the students the opportunity to learn about the most current developments and see how these are used to shape the future practice in the structural engineering field.

### Content

The lecture Steel Structures II complements the knowledge acquired in part 1 by providing students with additional theoretical and practical knowledge, e.g. on the design of steel and composite structures against fatigue, plate buckling, as well as on the structural modelling and analysis of more complex building and bridge structures. These more theoretical topics will be exemplified and illustrated by applications to real problems in the design of bridges and multi-storey building structures. Finally, the course will provide detailed insight into aspects pertaining to structural detailing, fabrication, erection and cost estimation for constructional steelwork.

Content overview:

- Structural forms, analysis techniques and modelling of multi-storey buildings and bridges.
- Structural analysis (deformations, internal forces, stresses and strains) in steel-concrete composite girders considering the effects of creep, shrinkage and shear deformations.
- Elastic and plastic longitudinal shear transfer mechanisms and effects
- Plate buckling of unstiffened and stiffened panels
- Fatigue resistance and safe life assessment: phenomenon and design approaches
- Special topics of steel connection design
- Detailing, drafting, fabrication and erection, cost determination in constructional steelwork

### Literature

- J.-P. Lebet, M. Hirt: Steel Bridges, Conceptual and Structural Design of Steel and Steel-Concrete Composite Bridges, EPFL Press
- Stahlbautenkalender (various editions), Ernst & Sohn, Berlin
- Detailling, drafting, fabrication and erection, cost calculation for the effective design of steel and composite structures.

### Notice

- The content of steel structures I is a prerequisite

**Data: 02.07.2024 12:39**

**Autumn Semester 2024**

**Page 171 of 2667**
The world’s growing population, changing demographics, and changing climate pose formidable challenges to humanity’s ability to live sustainably. Ensuring that humanity can live sustainably requires accommodating Earth’s growing and changing population through the provision and operation of a sustainable and resilient built environment. This requires ensuring excellent decision-making as to how the built environment is constructed and modified.

The objective of this course is to ensure the best possible decision making when engineering sustainable systems, i.e., ones that meet the needs of stakeholders in the short, medium and long term. In this course, you will learn the main principles of Systems Engineering that can help you from the first idea that a system may not meet expectations, to the quantitative and qualitative evaluation of possible system modifications. Additionally, the course includes an introduction to the use of operations research methods in the determination of optimal solutions in complex systems.

More specifically upon completion of the course, you will have gained insight into:
- how to structure the large amount of information that is often associated with attempting to modify complex systems
- how to set goals and define constraints in the engineering of complex systems
- how to generate possible solutions to complex problems in ways that limit exceedingly narrow thinking
- how to compare multiple possible solutions over time with differences in the temporal distribution of costs and benefits and uncertainty as to what might happen in the future
- how to assess values of benefits to stakeholders that are not in monetary units
- how to assess whether it is worth obtaining more information in determining optimal solution
- how to take a step back from the numbers and qualitatively evaluate the possible solutions in light of the bigger picture
- the basics of operations research and how it can be used to determine optimal solutions to complex problems, including linear, integer and network programming, dealing with multiple objectives and conducting sensitivity analyses.

The lectures are structured as follows:

1. Introduction – An introduction to System Engineering, a way of thinking that helps to engineer sustainable systems, i.e. ones that meet the needs of stakeholders in the short, medium and long terms. A high-level overview of the main principles of System Engineering. The expectations of your efforts throughout the semester.
2. Situation analysis – How to structure the large amount of information that is often associated with attempting to modify complex systems.
3. Goals and constraints – How to set goals and constraints to identify the best solutions as clearly as possible.
4. Generation of possible solutions – How to generate possible solutions to problems, considering multiple stakeholders.
5. The principles of net-benefit maximization and a series of methods that range from qualitative and approximate to quantitative and exact, including pairwise comparison, elimination, weighting, and expected value.
6. The idea behind the supply and demand curves and revealed preference methods.
7. The concept of equivalence, including the time value of money, interest, life times and terminal values.
8. The relationship between net-benefit and the benefit-cost ratio. How incremental cost benefit analysis can be used to determine the maximum net benefit. Internal rates of return.
9. How to consider multiple possible futures and use simple rules to help pick optimal solutions and to determine the value of more information.
10. Once quantitative analysis is used it becomes possible to use operations research methods to analyse large numbers of possible solutions. Linear programming and the simplex method.
11. How sensitivity analysis is conducted using linear programming.
12. How to use operations research to solve problems that consist of discrete values, as well as how to exploit the structure of networks to find optimal solutions to network problems.
13. How to set up and solve problems when there are multiple objectives.

The course uses a combination of qualitative and quantitative approaches.

Lecture notes
- The lecture materials consist of a script, the slides, example calculations in Excel, Moodle quizzes, and excercises.
- The lecture materials will be distributed via Moodle before each lecture.

Literature
Appropriate literature in addition to the lecture materials will be handed out when required via Moodle.
Structural Concrete I

Contents: Introduction, historical development of structural concrete, materials and material behaviour (cement, concrete, reinforcing steel, prestressing steel), linear members (axial force, flexure and axial force, compression members and columns, shear, bending and shear, torsion and combined actions), strut-and-tie models and simple stress fields, detailing, basic aspects of membrane elements.

Knowledge of the materials concrete and reinforcing steel and understanding their interaction;
Understanding the response of typical structural members;
Knowledge of elementary models and ability to apply them to practical problems;
Ability to correctly dimension and detail simple structures.

Lecture notes
The lecture notes as well as the lecture presentations and handouts may be downloaded from the website of the Chair of Hydrology and Water Resources Management.

Prerequisites / notice
Knowledge of statistics is a prerequisite. The required theoretical background, which is needed for understanding part of the lectures and performing part of the assignments, may be summarised as follows:
- Elementary data processing; hydrological measurements and data, data visualisation (graphical representation and numerical parameters).
- Frequency analysis: hydrological data as random variables, return period, frequency factor, probability paper, probability distribution fitting, parametric and non-parametric tests, parameter estimation.

Self-direction and Self-management

Hydrology

The course introduces the students to engineering hydrology. It covers first physical hydrology, that is the description and the measurement of hydrological processes (precipitation, interception, evapotranspiration, runoff, erosion, and snow), and it introduces then the basic mathematical models of the single processes and of the rainfall-runoff transformation, thereby including flood analysis.

Evaporation and evapotranspiration: processes, measurement and estimation, potential and actual evapotranspiration, energy balance method, empirical methods.

Infiltration: measurement, Horton’s equation, empirical and conceptual models, phi-index and percentage method, SCS-CN method.

Surface runoff and subsurface flow: Hortonian and Dunnian surface runoff, streamflow measurement, streamflow regimes, annual hydrograph, flood hydrograph analysis – baseflow separation, flow duration curve.

Basin characteristics: morphology, topographic and phreatic divide, hypsometric curve, slope, drainage density.

Rainfall-runoff models (R-R): rationale, linear model of rainfall-runoff transformation, concept of the instantaneous unit hydrograph (IUH), linear reservoir, Nash model.

Flood estimation methods: flood frequency analysis, deterministic methods, probabilistic methods (e.g. statistical regionalisation, indirect R-R methods for flood estimation, rational method).

Erosion and sediment transport: watershed scale erosion, soil erosion by water, estimation of surface erosion, sediment transport.

Snow (and ice) hydrology: snow characteristic variables and measurements, estimation of snowmelt processes by the energy budget equation and conceptual melt models (temperature index method and degree-day method), snowmelt runoff.

Self-presentation and Social Influence

Interception: measurement and estimation.

Knowledge of the hydrological cycle: global water resources, water balance, space and time scales of hydrological processes.

Autumn Semester 2024
Conceptual Design/Project Work

Number Title Type ECTS Hours Lecturers
101-0007-01L Project Work Conceptual Design O 3 credits 5S F. Ortiz Quintana

Abstract
A structure to be designed serves as a mean to practice the holistic approach of conceptual design by working in parallel and iteratively on different levels of detailing. Both, requirements and scope of action, are identified by the students and serve as basis for a solution. The task group organizes itself to solve complex tasks.

Objective
The project work conceptual design conveys a first insight into the holistic approach to cope with typical tasks of civil engineering and introduces professional techniques of civil engineering to students. A further aim is to consolidate the knowledge gained so far in bachelor courses, to link different domains and to fill gaps with respect to work techniques. The students analyse the inventory, formulate design requirements and boundary conditions, elaborate approaches and proposals for solutions, dimension some exemplary structural elements, practise detailing and document their work by different media.

Content
Topics:
- Basics of graphic representation
- Acceptance of service
- Analysis of third-party documents
- Site survey
- Conceptual design
- Service criteria agreement
- Technical specification
- Connections
- Structural analysis
- Quantities and costs
- Models

Methodology:
- Excursion with mission
- Lectures
- Autonomous work
- Role playing
- Presentations
- Deliveries
- Final presentation
- Exhibition

Bachelor’s Thesis

Number Title Type ECTS Hours Lecturers
101-0006-10L Bachelor’s Thesis O 8 credits 17D Supervisors

Abstract
The Bachelor Programme concludes with the Bachelor Thesis. This project is supervised by a professor. Writing up the Bachelor Thesis encourages students to show independence and to produce structured work. The contents base upon the fundamentals of the Bachelor Programme. Students can choose from different subjects and tasks. The thesis consists of both a written report and an oral presentation.

Abstract
This course is designed to lay down the foundation of the different concepts, techniques, and tools for successful project management of construction projects.

Objective
The goal is that at the end of this course students should have a good understanding of the different project management knowledge areas, the phases required for successful project management, and the role of a project manager. To demonstrate this, students will work in groups in different case studies to apply the concepts, tools and techniques presented in the class.

Two 3 to 4 hours sessions towards the end of the lecture series will introduce a practical project to allow the teams to demonstrate the tools and techniques learned during the semester.

The course will have a final quiz that will be graded.

The course will be supported by several external lecturers from the construction industry and demonstrations of real-life case studies.

Content
The main content of the course is summarized in the following topics:

- Introduction, project and organization structures
- Project scheduling
- Resource management
- Risk management
- Project estimating and budgeting
- Project financing and Public-Private Partnerships (PPP)
- Construction Process management and controlling
- Sustainability management
- Reporting and Communication
- Interpersonal skills and leadership in Construction projects
- Advanced Topics in Construction Project management (BIM / 5D planning, Ki)
- Project Evaluation and Closure

Lecture notes
The slides for the class will be available for download from Moodle at least one day before each class. Copies of all necessary documents will be distributed at appropriate times.

Literature
Relevant readings will be recommended throughout the course (and made available to the students via Moodle).

Prerequisites / notice
The students will be randomly assigned to teams. Students will be graded as a team based on the final Project proposal with the in-class oral presentation as well as a final exam (50% exam and 50% project). Homework will not be graded but your final report and presentation will consist mostly of your homework assignments consolidated and put in a report and presentation format.

Abstract
Enrolment after agreement with the lecturer only.
Principles of heat and mass transport, hygro-thermal performance, durability of the building envelope and interaction with indoor and outdoor climates, applications.

Objective
The students will acquire in the following fields:
- Indoor and outdoor climate and driving forces.
- Hygrothermal properties of building materials.
- Building envelope solutions and their construction.
- Hygrothermal performance and durability.

Content
Handouts, supporting material and exercises are provided online via Moodle.
Priority will be given to students in Integrated Building Systems Master (MIBS).
Please send an email to the main lecturer, if you are not a MIBS student.

Design and Building Process MIBS is a brief manual for prospective architects and engineers covering the competences and the responsibilities of all involved parties through the design and building process. Lectures on six compact aspects gaining importance in a increasingly specialised, complex and international surrounding.

**Objective**

Participants will come to understand how they can best navigate the design and building process, especially in relation to understanding their profession, gaining a thorough knowledge of rules and regulations, as well as understanding how involved parties’ minds work. They will also have the opportunity to investigate ways in which they can relate to, understand, and best respond to their clients’ wants and needs. Finally, course participants will come to appreciate the various tools and instruments, which are available to them when implementing their projects. The course will guide the participants, bringing the individual pieces of knowledge into a superordinate relationship.

**Content**

Design and Building Process MIBS is a brief manual for prospective architects and engineers covering the competences and the responsibilities of involved parties through the design and building process. Three compact chapters regarding the established building culture are gaining importance in an increasingly specialised, complex and international surrounding. Lectures on the topics of competence, organisation, agility, monitoring, interest, and the environment will guide the participants, bringing the individual pieces of knowledge into a superordinate relationship. The course introduces the key figures, depicts the criteria of the project and highlights the proved services of the consultants. In addition to discussing the basics, the terminologies and the tendencies, the lecture units will refer to the studios as well as the practice: Teaching-based workshops will compliment and deepen the understanding of the three selected aspects of profession, methodology, and environment. The course is presented as a moderated seminar to allow students the opportunity for individual input: active collaboration between the students and their tutor therefore required.

**Abstract**

This course aims at analyzing, designing, improving public transport systems, as part of the overall transport system. Public transport is a key driver for making our cities more livable, clean and accessible, providing safe, and sustainable travel options for millions of people around the globe. Proper planning of public transport system also ensures that the system is competitive in terms of speed and cost. Public transport is a crucial asset, whose social, economic and environmental benefits extend beyond those who use it regularly; it reduces the amount of cars and road infrastructure in cities; reduces injuries and fatalities associated to car accidents, and gives transport accessibility to very large demographic groups.

Goal of the class is to understand the main characteristics and differences of public transport networks. Their various performance criteria based on various perspective and stakeholders. The most relevant decision making problems in a planning tactical and operational point of view. At the end of this course, students can critically analyze existing networks of public transport, their design and use; consider and substantiate possible improvements to existing networks of public transport and the management of those networks; optimize the use of resources in public transport.

**General structure:**

- general introduction of transport, modes, technologies,
- system design and line planning for different situations,
- mathematical models for design and line planning
- timetabling and tactical planning, and related mathematical approaches
- operations, and quantitative support to operational problems,
- evaluation of public transport systems.

**Content**

Basics for line transport systems and networks

- Passenger/Supply requirements for line operations
- Objectives of system and network planning, from different perspectives and users, design dilemmas
- Conceptual concepts for passenger transport: long-distance, urban transport, regional, local transport

Planning process, from demand evaluation to line planning to timetables to operations
- Matching demand and modes
- Line planning techniques
- Timetabling principles

Allocation of resources
- Management of operations
- Measures of realized operations
- Improvements of existing services

Lecture notes

Lecture slides are provided.
Infrastructure management is the process that ensures infrastructure provides desired service over time. This course provides an overview of the process and insight into some of the most important parts, i.e., defining service, justifying interventions, monitoring the infrastructure system, and ensuring a well-functioning infrastructure management organisation.

The objective of this course is to provide an overview of the infrastructure management process. The high-level process can be used as a starting point to ensure that infrastructure management is done professionally, efficiently and effectively. This process can be used to help improve the specific infrastructure management processes in the organisations.

More specifically upon completion of the course, students had their first experience with:

- defining the service to be provided by infrastructure,
- developing and evaluating asset strategies, and converting them into programs / project portfolios
- establishing a monitoring program for an infrastructure system, and
- establishing basic rules and principles to ensure an infrastructure management organisation is running well.

The weekly lectures are structured as follows:

1. Introduction: An introduction to infrastructure management and the project.
2. Service: Determination of what service you are trying to provide with an infrastructure network is important in justifying the interventions you think are required and ensuring that investment decisions are aligned throughout an infrastructure management organisation. This lecture introduces the concept of serve and connects it to measurable indicators.
3. Help session 1: This session provides time for your group to ask questions as you define the service you want your infrastructure network to provide
4. Presentation 1: 4 groups will present their ideas on how they want their networks to provide service
5. Interventions: Justifying the interventions you want to execute to ensure you continue to provide the defined service requires you to model deterioration, determining economically justifiable strategies and explain which interventions will be postponed if you can't do all you would like. This lecture is focused on explaining the main principles behind each of these concepts.
6. Help session 2: This session provides time for your group to ask questions as you justify the interventions you want to execute on your infrastructure network over time and explain what you will postpone if you cannot do all of them.
7. Presentation 2: 4 groups will present how they have justified interventions and how they have selected the ones they would like to postpone if required
8. Monitoring: To ensure you the infrastructure network is providing what you expect you need to monitor its performance and how projects are being done. This lecture is focused on the principles to ensure a monitoring system is set up that ensure that the infrastructure system is providing the expected service.
9. Help session 3: This session provides time for your group to ask questions on how to establish the monitoring systems for your infrastructure networks.
10. Presentation 3: 4 groups will present how they intended to monitor their systems and projects.
11. Organisation: Managing infrastructure only works well with great teams of people with great processes. This lecture focuses on the principles of ensuring a well-functioning organisation and well-functioning processes.
12. Help session 4: This session provides time for your group to ask questions on how to ensure well-functioning organisations and well-functioning processes.
13. Presentation 4: 4 groups will present how they intended to ensure well-functioning organisations and well-functioning processes.

- The lecture materials consist of handouts and the slides.
- The lecture materials will be distributed via Moodle by the beginning of each lecture.
- The questions to be discussed in the discussion session will be distributed by the end of the day on the Monday before the discussion session.
Appropriate literature will be handed out when required via Moodle.

This course has no prerequisites.

Abstract

In 2015, the UN Conference in Paris shaped future world objectives to tackle climate change. This decarbonization strategy is additional to Sustainable Development goals formulated the same year by the UN general assembly.

Objective

At the end of the semester, the students have an understanding of the term of sustainable development, its history, the current political and scientific discourses and its relevance for our built environment.

In order to address current challenges of climate change mitigation and resource depletion, students will learn a holistic approach of sustainable development. Ecological, economical and social constraints will be presented and students will learn about methods for argumentation and tools for assessment (i.e. life cycle assessment).

For this purpose an overview of sustainable development is presented with an introduction to the history of sustainability and its today definition as well as the role of cities, urbanisation and material resources (i.e. energy, construction material) in social economic and environmetal aspects.

The course aims to promote an integral view and understanding of sustainability and describing different spheres (social/cultural, ecological, economical, and institutional) that influence our built environment.

Students will acquire critical knowledge and understand the role of involved stakeholders, their motivations and constraints, learn how to evaluate challenges, identify deficits and define strategies to promote a more sustainable construction.

After the course students should be able to define the relevance of specific local, regional or territorial aspects to achieve coherent and applicable solutions toward sustainable development.

The course offers an environmental, socio-economic and socio-technical perspective focussing on buildings, cities and their transition to resilience with sustainable development. Students will learn on theory and application of current scientific pathways towards sustainable development.

Content

The following topics give an overview of the themes that are to be worked on during the lecture.

- Overview on the history and emergence of sustainable development
- Overview on the current understanding and definition of sustainable development and beyond

Methods

- Method 1: Life cycle assessment (planning, construction, operation/use, deconstruction)
- Method 2: Life Cycle Costing
- Method 3: Labels and certification
- Method 4: Material Flow Analysis

Main issues:

- Operation energy at building, urban and national scale
- Mobility and density questions
- Embodied energy for developing and developed world
- Synthesis: Transition to sustainable development

Literature

A list of the basic literature will be offered on a specific online platform, that could be used by all students attending the lectures.
## Major in Geotechnical Engineering

### 101-0317-00L Tunnelling I

**Abstract**

Basic aspects of design and analysis of underground structures. Conventional tunnel construction methods. Auxiliary measures (ground improvement and drainage, forepoling, face reinforcement). Numerical analysis methods.

**Objective**

Basic aspects of design and analysis of underground structures. Conventional tunnel construction methods. Auxiliary measures (ground improvement and drainage, forepoling, face reinforcement). Numerical analysis methods.

**Content**

- Numerical analysis methods in tunnelling.
- Conventional excavation methods (full face, top heading and bench, side drift method, ...)
- Auxiliary measures:
  - Injections
  - Jet grouting
  - Ground freezing
  - Drainage
  - Forepoling
  - Face reinforcement

**Lecture notes**

Autographieblätter

**Literature**

Empfehlungen

This course will continue to be offered in German up to and including HS24.

### 101-0357-00L Theoretical and Experimental Soil Mechanics

**Prerequisites:** Mechanics I, II and III.

**Abstract**

Overview of soil behaviour

- Discussion of general gaps between basic theory and soil response
- Stress paths in practice & in laboratory tests
- Triaxial tests: consolidation & shear, drained & undrained response
- Plasticity theory & Critical State Soil Mechanics, Cam Clay

**Objective**

1. Extend knowledge of theoretical approaches that can be used to describe soil behaviour.
2. Offer the opportunity to perform hands on element tests required for constitutive model calibration.
3. Enable students to select an appropriate constitutive model and calibrate it using element test performed in the lab.
4. Enable students to carry out FE analyses for realistic geotechnical applications.

**Content**

- Overview of soil behaviour
- Discussion of general gaps between basic theory and soil response
- Stress paths in practice & in laboratory tests
- Triaxial & direct shear tests: consolidation & shear, drained & undrained response
- Plasticity theory & Critical State Soil Mechanics, Cam Clay

**Lecture notes**

Printed script with web support

**Literature**

https://moodle-app2.let.ethz.ch/

**Prerequisites / notice**

Pre-requisites: Fundamental knowledge of solid and soil mechanics.

The theoretical part of the course will be covered by problem-based lectures. The experimental part will be covered by hands-on element tests performed by the students in the laboratory. These experimental results will be instrumental in the calibration of advanced soil constitutive models.

The connection between the experimental and theoretical parts of the course will be facilitated by means of numerical investigations (i.e., FE analyses), including the selection and calibration of relevant constitutive models. The numerical investigations shall be documented by the students in a final report.

Laboratory equipment will be available for 60 students. Students registered for the Geotechnics Specialty in Masters will be given priority as follows: (1) 2nd year students; (2) 1st year students, (3) doctoral students taking the class for their qualifying exam; Further students will be admitted on a first-come-first-served basis.
Abstract
This lecture deals with the practical application of the knowledge gained in the fundamental lectures from the Bachelor degree. The basics of planning and design of geotechnical structures will be taught for the main topics geotechnical engineers are faced to in practice.

Objective
Transfer of the fundamental knowledge taught in the Bachelor degree to practical application.
Ability to plan and design geotechnical structures based on the state of the art.

Content
- Introduction to Swisscode SIA
- Foundations and settlements
- Pile foundations
- Excavations
- Slopes
- Soil nailing
- Reinforced geosystems
- Ground improvement
- River levees

Lecture notes
Script in the form of chapters and powerpoint overheads with web support (moodle-app2.let.ethz.ch)
Exercises

Literature
Relevant literature will be stated during the lectures

Prerequisites / notice
Pre-condition: Successful examinations (pass) in the geotechnical studies (soil mechanics and ground engineering, each 5 credits) in the Bachelor degree of Civil Engineering (ETH), or equivalent for new students.
The lecture contains at least one presentation from practice.

Competencies
- Subject-specific Competencies
  - Concepts and Theories assessed
  - Techniques and Technologies assessed
- Method-specific Competencies
  - Analytical Competencies assessed
  - Decision-making fostered
- Social Competencies
  - Communication fostered
  - Cooperation and Teamwork fostered
  - Customer Orientation fostered
  - Leadership and Responsibility fostered
  - Self-presentation and Social Influence fostered
  - Sensitivity to Diversity fostered
  - Negotiation fostered
- Personal Competencies
  - Adaptability and Flexibility fostered
  - Creative Thinking assessed
  - Critical Thinking assessed
  - Integrity and Work Ethics fostered
  - Self-awareness and Self-reflection fostered
  - Self-direction and Self-management fostered

101-0369-00L Forensic Geotechnical Engineering
Prerequisites: successful participation in "Geotechnical Engineering" (101-0315-00L) or an equivalent course.

Abstract
In this course selected famous geotechnical failures are investigated with the following purpose: (a) to deepen understanding of the geotechnical risks and possible solutions; (b) to practice design and analysis methods; (c) to learn the techniques for investigation of failures; (d) to learn the techniques for mitigation of the failure damage.

Objective
In this course selected famous geotechnical failures are investigated with the following purpose: (a) to deepen understanding of the geotechnical risks and possible solutions; (b) to practice design and analysis methods; (c) to learn the techniques for investigation of failures; (d) to learn the techniques for mitigation of the failure damage.

Content
- Failure due to the loading history
- Failure due to excessive settlements
- Failure due to the leaning instability
- Bearing capacity failure
- Excavation failure
- Failure in the creeping landslides
- Failure evolution in submarine landslides
- Construction in the landslide influence zone
- Delayed failure in snow avalanches

Lecture notes
Lecture notes
Exercises

Literature

Prerequisites / notice
The course is given in the first MSc semester.
Prerequisite: Basic knowledge in Geotechnical Engineering (Course content of "Grundbau" or similar lecture).
After passing this course students will be able to:

**Concepts and Theories**
- assessed

**Method-specific Competencies**

**Abstract**
This course aims to provide a basic understanding of the mechanics and rheology of granular matter. It includes fundamental concepts as well as recent progress in research with main focus on related engineering and natural hazards applications. Small experiments are performed in class to illustrate important processes and state-of-the-art numerical modeling tools are introduced and used.

**Objective**
Granular materials have the ability to sustain stresses like a solid of flow like a fluid depending on the applied solicitation and boundary conditions. This course targets civil, geotechnical and mechanical engineering students, who are interested in discovering the fascinating and sometimes surprising world of granular media, the second most used material in industry and in learning novel modeling approaches. After this class, the students should know how to describe inter-particle interactions at the grain scale, the statics of granular materials, the transition towards fluid states through classical frictional plastic laws and the rheology of granular flows. Furthermore, the students should know the basics of the Discrete Element Method (DEM), its advantage and limitations and should be able to use a commercial software for different types of application.

**Content**
This course covers grain-scale interactions, statics and rheology of granular materials based on a mix between classical lectures, on-board developments, presentation of small experiments, analytical and numerical exercises. We present the domains of application of granular mechanics through examples taken from the industry or research. In addition, the Discrete Element Method (DEM) together with state-of-the-art contact models will be presented and used to simulate standard tests such as the granular column collapse, shear flows but also more complex industrial or geophysical problems. Calibration of model parameters based on laboratory experiments will be discussed. The course will not cover aspects related to granular gazes and kinetic theory.

**Lecture notes**
Lecture slides and lecture notes will be provided on Moodle.

**Literature**
Books:
1. Granular Media: Between Fluid and Solid by Bruno Andreotti, Olivier Pouliquen, and Yoël Forterre
2. Particulate Discrete Element Modelling: A Geomechanics Perspective by Catherine O’Sullivan

**Prerequisites / notice**
Basic knowledge of physics, mechanics and soil mechanics is required.

**Abstract**
This course focuses on the axial, shear, bending and torsion load-deformation response of continuous elastic prismatic structural elements such as rods, beams, shear walls, frames, arches, cables and rings, and structures that contain such elements. Additional special topics may be addressed time-permitting.

**Objective**
After passing this course students will be able to:
1. Explain the equilibrium of continuous structural elements.
2. Formulate mechanical models of continuous prismatic structural elements.
3. Analyze the axial, shear, bending and torsion load-deformation response of prismatic structural elements and structures assembled using these elements.
4. Determine the state of forces and deformations in rods, beams, frame structures, arches, cables and rings under combined mechanical and thermal loading.
5. Use the theory of continuous structures to design structures and understand the basis for structural design code provisions.

**Content**
This is the third course in the ETH series on theory of structures. Building on the material covered in previous courses, this course focuses on the axial, shear, bending and torsion load-deformation response of continuous elastic prismatic structural elements such as rods, beams, shear walls, frames, arches, cables and rings, and structures assembled using such elements. Additional special topics, such as the behavior of inelastic prismatic structural elements or the behavior of planar structural elements and structures may be addressed if time permits. The course provides the theoretical background and engineering guidelines for practical structural analysis of modern structures.

**Lecture notes**
Electronic copies of the learning material will be managed using Moodle. The learning material includes the lecture presentations, additional reading, and exercise problems and solutions. Lectures are streamed live and recorded on the ETH Video Portal.
Literature

Prerequisites / notice
Working knowledge of theory of structures, as covered in ETH course Theory of Structures I (Baustatik I) and Theory of Structures II (Baustatik II), and ability to solve ordinary differential equations. Basic knowledge of structural design of reinforced concrete, steel or wood structures. Familiarity with structural analysis computer software and computer tools such as Python, Matlab, Mathematica, Mathcad or Excel.

Competencies

101-0127-00L Advanced Structural Concrete

Objectives
Within this course, the students are able to:
- deepen their understanding of structural concrete models and apply them to general design problems, including the assessment of existing structures.
- enhance their knowledge about the load-deformation response of reinforced and prestressed concrete structures.
- identify and assess the limits of applicability of limit analysis methods.
- recognise the assumptions of models suitable for computer-aided structural design and use in a critical way structural concrete design software.
- evaluate the long-term behaviour and the behaviour under fire conditions of concrete structures.
- assess the behaviour of fibre reinforced concrete structures.

Content
Fundamentals (structural analysis, theorems of limit analysis, applicability of limit analysis methods); walls and beams (stress fields and strut-and-tie models, compatibility and deformation capacity, membrane elements with yield conditions and load-deformation behaviour, computer-aided structural design); slabs (equilibrium solutions, yield conditions, shear and punching shear, sustainability); long term effects; steel fibre reinforced concrete (mechanical behaviour, applications); fire behaviour.

Lecture notes
Lecture notes see: http://www.concrete.ethz.ch

Literature

Prerequisites / notice
Students are assumed to be proficient in the material taught in the following courses offered in the BSc in Civil Engineering at ETH Zurich (or have acquired equivalent knowledge elsewhere):
- Theory of structures I-II
- Structural Concrete I-II (incl. prestressed concrete)

Competencies

101-0137-00L Steel Structures III: Advanced Steel and Composite Structures

Abstract
Expand the theoretical background and practical knowledge in the design of steel and composite structures. Special composite construction and detailing: partial connection, serviceability. Fire design. Cold-formed steel design. Crane girders; masts; tanks & silos. Structural glazing and lightweight cable-supported structures.
Objective
In Steel Structures III, students will deepen and expand their theoretical background and practical knowledge of the design and construction of steel and composite structures. The focus of the course lies on design tasks and solutions in modern, multi-storey, steel-framed buildings driven by architectural needs, as well as on certain special fields of application of steel structures. Students will learn how to solve complex structural engineering tasks in larger building projects, e.g. through the use and correct design of large-span slim-floor girders and ultra-slimer composite columns, or the use of glazing and cable structures as principal load-carrying components. They learn how steel structures behave under fire conditions and how they can be protected and designed accordingly. Finally, students learn about the fundamental aspects governing the design of specialty steel structures, such as thin-walled cold-formed sections, crane girders, masts and storage tanks.

The examples of scientific and standardisation work provided in the lectures give the students the opportunity to learn about the most current developments and see how these are used to shape the future practice in the structural engineering field.

Content
Steel Structures III provides in-depth theoretical background and practical knowledge on advanced design topics in steel and composite structures. The focus of the course lies on design tasks and solutions in modern, multi-storey, steel-framed buildings driven by architectural needs, as well as on certain special fields of application of steel structures. The course discusses the use and design of large-span slim-floor girders and ultra-slimer composite columns, as well as the use of glazing and cable structures as principal load-carrying components. The design of steel structures under elevated temperatures (fire conditions) is treated, as well as special topics of design for serviceability. In addition, fundamental concepts of the design of cold-formed steel framed structures are discussed. Finally, the course will give an overview on the design of specialty steel structures, such as crane girders, masts and storage tanks.

Lecture notes
Slides and lecture notes. Worked examples. Handouts and formula collections.

Literature
Stahlbaukalender (various editions), Ernst + Sohn, Berlin

| 101-0157-01L |
| Structural Dynamics and Vibration Problems |
| Objective |
| Fundamentals of structural dynamics are presented. Computing the response of elastic single and multiple DOF structural systems subjected to harmonic, periodic, pulse, and impulse excitation is discussed. Practical solutions to vibration problems in flexible structures under diverse excitations are developed. |
| Content |
| After successful completion of this course the students will be able to: |
| 1. Explain the dynamic equilibrium of structures under dynamic loading. |
| 2. Use second-order differential equations to theoretically and numerically model the dynamic equilibrium of structural systems. |
| 3. Model structural systems using single-degree-of-freedom, or the use of glazing and cable structures as principal load-carrying components. |
| 4. Compute the dynamic response of structural system to harmonic, periodic, pulse, and impulse excitation using time-history and response-spectrum methods. |
| 5. Use dynamics of structures to identify the basis for structural design code provisions related to dynamic loading. |
| Lecture notes |
| The class will be taught mainly on the blackboard. Accompanying electronic material will be uploaded to ILIAS and available through myStudies. |

All the material can be found in Anil Chopra's comprehensive textbook given in the literature below.

Literature

Prerequisites / notice

Knowledge of the fundamentals in structural analysis, and in structural design of reinforced concrete, steel and/or wood structures is mandatory. Working knowledge of matrix algebra and ordinary differential equations is required. Familiarity with Matlab and with structural analysis computer software is desirable.

151-8015-00L Moisture Transport in Porous Media

Abstract

Moisture transport and related degradation processes in porous materials. Theory of moisture transport in porous materials. Experimental determination of moisture transport properties. Exercises on moisture transport properties determination:

- Liquid transport in cracked porous media, Drying of porous media, microclimate in urban street canyons.

Objective

- Basic knowledge of moisture transport and related degradation processes in porous materials.
- Knowledge of experimental determination of moisture transport properties.
- Application of knowledge to moisture transport in cracked materials, drying of porous materials and microclimate in urban street canyons.

Content

1. Introduction
   - Moisture damage: problem statement, durability
   - Applications: building materials, soil science, geoscience

2. Moisture transport: theory and application
   - Description of moisture transport
   - Determination of moisture transport properties
   - Exercises on moisture transport properties

3. Special topics
   - Liquid transport in cracked materials, Drying of porous materials, Microclimate in urban street canyons

Lecture notes

Handouts, supporting material and exercises are provided online via Moodle.

101-0167-01L Fibre Composite Materials in Structural Engineering

Abstract

- 1) Lamina and Lamine Theory
- 2) FRP Manufacturing and Testing Methods
- 3) Design and Application of Externally Bonded Reinforcement to Concrete, Timber, and metallic Structures
- 4) FRP Reinforced Concrete, All FRP Structures
- 5) Measurement Techniques and Structural Health Monitoring

Objective

At the end of the course, you shall be able to:

1) Design advanced FRP composites for your structures,
2) To consult owners and clients with necessray testing and SHM techniques for FRP structures,
3) Continue your education as a phd student in this field.

Content

- fibre Reinforced Polymer (FRP) composites are increasingly being used in civil infrastructure applications, such as reinforcing rods, tendons and FRP profiles as well as wraps for seismic upgrading of columns and repair of deteriorated structures. The objective of this course is on one hand to provide new generation of engineering students with an overall awareness of the application and design of FRP reinforcing materials for internal and external strengthening (repair) of reinforced concrete structures. The FRP strengthening of other structures such as metallic and timber will also be shortly discussed. On the other hand the course will provide guidance to students seeking additional information on the topic. Many practical cases will be presented analysed and discussed. An ongoing structural health monitoring of these new materials is necessary to ensure that the structures are performing as planned, and that the safety and integrity of structures is not compromised. The course outlines some of the primary considerations to keep in mind when designing and utilizing structural health monitoring techniques. During the course, students will have the opportunity to design FRP strengthened concrete beams and columns, apply the FRP by themselves, and finally test their samples up to failure.

This course aims at analyzing, designing, improving public transport systems, as part of the overall transport system.

Objective
Public transport is a key driver for making our cities more livable, clean and accessible, providing safe, and sustainable travel options for millions of people around the globe. Proper planning of public transport system also ensures that the system is competitive in terms of speed and cost. Public transport is a crucial asset, whose social, economic and environmental benefits extend beyond those who use it regularly; it reduces the amount of cars and road infrastructure in cities; reduces injuries and fatalities associated to car accidents, and gives transport accessibility to very large demographic groups.

Goal of the class is to understand the main characteristics and differences of public transport networks. Their various performance criteria based on various perspective and stakeholders.
The most relevant decision making problems in a planning tactical and operational point of view
At the end of this course, students can critically analyze existing networks of public transport, their design and use; consider and substantiate possible improvements to existing networks of public transport and the management of those networks; optimize the use of resources in public transport.

General structure:
general introduction of transport, modes, technologies, system design and line planning for different situations, mathematical models for design and line planning timetabling and tactical planning, and related mathematical approaches operations, and quantitative support to operational problems, evaluation of public transport systems.
Basics for line transport systems and networks
Passenger/Supply requirements for line operations
Objectives of system and network planning, from different perspectives and users, design dilemmas
Conceptual concepts for passenger transport: long-distance, urban transport, regional, local transport
Planning process, from demand evaluation to line planning to timetables to operations
Matching demand and modes
Line planning techniques
Timetabling principles
Allocation of resources
Management of operations
Measures of realized operations
Improvements of existing services

Lecture notes are provided.

Traffic Engineering
O 6 credits 4G A. Kouvelas
Abstract Fundamentals of traffic flow theory and control.
Objective The objective of this course is to fully understand the fundamentals of traffic flow theory in order to effectively manage traffic operations. By the end of this course students should be able to apply basic techniques to model different aspects of urban and inter-urban traffic performance, including congestion.
Content Introduction to fundamentals of traffic flow theory and control. Includes understanding of traffic data collection and processing techniques, as well as data analysis, traffic modeling, and methodologies for traffic control.
Lecture notes The lecture notes and additional handouts will be provided during the lectures.
Prerequisites Verkehr III - Road Transport Systems 6th Sem. BSc (101-0415-00L)

Transport Planning Methods
W 6 credits 4G E. Heinen
Abstract The course provides the necessary knowledge to develop models supporting and also evaluating the solution of given planning problems. The course is composed of a lecture part, providing the theoretical knowledge, and an applied part in which students develop their own models in order to evaluate a transport project/ policy by means of cost-benefit analysis.
Objective - Knowledge and understanding of statistical methods and algorithms commonly used in transport planning
- Comprehend the reasoning and capabilities of transport models
- Ability to independently develop a transport model able to solve / answer planning problem
- Getting familiar with cost-benefit analysis as a decision-making supporting tool
The course provides the necessary knowledge to develop models supporting the solution of given planning problems and also introduces cost-benefit analysis as a decision-making tool. Examples of such planning problems are the estimation of traffic volumes, prediction of estimated utilization of new public transport lines, and evaluation of effects (e.g. change in emissions of a city) triggered by building new infrastructure and changes to operational regulations.

To cope with that, the problem is divided into sub-problems, which are solved using various statistical models (e.g. regression, discrete choice analysis) and algorithms (e.g. iterative proportional fitting, shortest path algorithms, method of successive averages).

The course is composed of a lecture part, providing the theoretical knowledge, and an applied part in which students develop their own models in order to evaluate a transport project/ policy by means of cost-benefit analysis. Interim lab session take place regularly to guide and support students with the applied part of the course.

The exercises provide a framework for practical application of the learned theoretical concepts of spatial planning to real-life situations.

The course focuses on both theoretical concepts and practice-oriented approaches to gain knowledge and be equipped to address current issues in spatial planning and development. This is mirrored in the course’s structure made of both of lectures and exercises.

The lecture series introduces necessary key concepts and covers the following main topics:
- Drivers of spatial development, inward development, core tasks and current challenges for (spatial) planners.
- Interplay of formal and informal planning instruments across scales and actors.
- Differentiation urban typologies, their characteristics and challenges
- Types of spatial analysis and key figures
- Planning approaches and the (political) steering of spatial development.
- Types of processes and participation in spatial development.
- Approaches for planning complex urban situations
- Concepts for sustainable development

The exercises provide a framework for practical application of the learned theoretical concepts of spatial planning to real-life situations.
### Basics of Air Transport (Aviation I)

**Code:** 151-0227-00L  
**Title:** Basics of Air Transport (Aviation I)  
**Credits:** 4  
**Lecturer:** P. Wild

#### Abstract
In general the course explains the main principles of air transport and elaborates on simple interdisciplinary topics. Working on broad 14 different topics like aerodynamics, manufacturers, airport operations, business aviation, business models etc. the students get a good overview in air transportation. The program is taught in English and we provide 11 different experts/lecturers.

#### Objective
The goal is to understand and explain basics, principles and contexts of the broader air transport industry. Further, we provide the tools for starting a career in the air transport industry. The knowledge may also be used for other modes of transport. Ideal foundation for Aviation II - Management of Air Transport.

#### Content
Weekly: 1h independent preparation; 2h lectures and 1 h training with an expert in the respective field

- Concept: This course will be taught as Aviation I. A subsequent course - Aviation II - covers the "Management of Air Transport".

- Content: Transport as part of the overall transportation scheme; Aerodynamics; Aircraft (A/C) Designs & Structures; A/C Operations; Aviation Law; Maintenance & Manufacturers; Airport Operations & Planning; Aviation Security; ATC & Airspace; Air Freight; General Aviation; Business Jet Operations; Business models within Airline Industry; Military Aviation.

- Technical visit: This course includes a guided tour at Zurich Airport and Dubendorf Airfield (baggage sorting system, apron, Tower & Radar Simulator at Skyguide Dubendorf).

#### Literature
- Preparation materials & slides are provided prior to each class
- Literature will be provided by the lecturers, respectively there will be additional Information upon registration (normally available in Moodle)

#### Prerequisites / notice
The lecture is planned as class teaching.

### Railway Systems I

**Code:** 227-0523-00L  
**Title:** Railway Systems I  
**Credits:** 6  
**Lecturer:** M. Meyer

#### Abstract
Basic characteristics of railway vehicles and their interfaces with the railway infrastructure:
- Transportation tasks and vehicle types
- Running dynamics
- Mechanical part of rail vehicles
- Brakes
- Traction chain and auxiliary supply
- Railway power supply
- Signalling systems
- Standards
- Availability and safety
- Traffic control and maintenance

#### Objective
- Overview of the technical characteristics of railway systems
- Know-how about the design and construction principles of rail vehicles
- Interrelationship between different fields of engineering sciences (mechanics, electro and information technology, transport systems)
- Understanding tasks and opportunities of engineers working in an environment which has strong economical and political boundaries
- Insight into the activities of the railway vehicle industry and railway operators in Switzerland
- Motivation of young engineers to start a career in the railway industry or with railway operators
The weekly lectures are structured as follows:

### Infrastructure Management 1: Process

**Assessed**

B. T. Adey

Critical Thinking

The objective of this course is to provide an overview of the infrastructure management process. The high-level process can be used as a framework to assess how well your infrastructure network is performing over time. This course provides an overview of the process and insight into some of the most important parts, i.e., defining service, justifying interventions, monitoring the infrastructure system, and ensuring a well-functioning organisation.

The course is designed to help you improve the specific infrastructure management processes in the organisations. The lectures are structured as follows:

1. **Introduction:** An introduction to infrastructure management and the project.
2. **Service:** Determination of what service you are trying to provide with an infrastructure network. This lecture introduces the concept of service and connects it to measurable indicators.
3. **Help session 1:** This session provides time for your group to ask questions as you define the service you want your infrastructure network to provide.
4. **Presentation 1:** 4 groups will present their ideas on how they want their networks to provide service.
5. **Interventions:** Justifying the interventions you want to execute to ensure you continue to provide the defined service requires you to model deterioration, determining economically justifiable strategies and explain which interventions will be postponed if you can't do all you would like. This lecture is focused on explaining the main principles behind each of these concepts.
6. **Help session 2:** This session provides time for your group to ask questions as you justify the interventions you want to execute on your infrastructure network over time and explain what you will postpone if you cannot do all of them.
7. **Presentation 2:** 4 groups will present how they have justified interventions and how they have selected the ones they would like to postpone if required.
8. **Monitoring:** To ensure you the infrastructure network is providing what you expect you need to monitor its performance and how projects are being done. This lecture is focused on the principles to ensure a monitoring system is set up that ensure that the infrastructure system is providing the expected service.
9. **Help session 3:** This session provides time for your group to ask questions on how to establish the monitoring systems for your infrastructure networks.
10. **Presentation 3:** 4 groups will present how they intended to ensure well-functioning organisations and well-functioning processes.
11. **Organisation:** Managing infrastructure only works well with great teams of people with great processes. This lecture focuses on the principles of ensuring a well-functioning organisation and well-functioning processes.
12. **Help session 4:** This session provides time for your group to ask questions on how to ensure well-functioning organisations and well-functioning processes.
13. **Presentation 4:** 4 groups will present how they intended to ensure well-functioning organisations and well-functioning processes.
Hydraulic structures and their functions within hydraulic systems are treated in this lecture. The basic concepts of their layout and design are fostered in this course.

### Literature

Appropriate literature will be handed out when required via Moodle.

This course has no prerequisites.

### Competencies

#### Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

#### Method-specific Competencies
- Analytical Competencies: fostered
- Decision-making: fostered

- Creative Thinking: fostered
- Critical Thinking: fostered
- Integrity and Work Ethics: fostered
- Self-awareness and Self-reflection: fostered
- Self-direction and Self-management: fostered

---

**Urban Systems and Transportation**

This course is an introduction to urban and regional economics. It focuses on the formation and development of urban systems, and highlight how transport infrastructure investments can affect the location, size and composition of such systems.

#### Objective

The main objective of this course is to provide students with some basic tools to analyze the fundamental economic forces at play in urban systems (i.e., agglomeration and congestion forces), and the role of transport networks in shaping the structure of these systems. Why do urban areas grow or decline? How do transport networks affect the location of individuals and firms? Does the location of a firm determine its productivity? Can transport infrastructure investments reduce economic disparities? These are some of the questions that students should be able to answer after having completed the course.

#### Content

The course is organized in four parts. I start with the key observation that economic activity (both in terms of population density and productivity) is unevenly distributed in space. For instance, the share of the population living in urban centers is increasing globally, from 16% in 1900 and 50% in 2000 to about 68% by the year 2050 (UN, World Economic Prospects, 2014). The goal of the first part is then to understand the economic forces at play behind these trends, looking at the effects within and across urban areas. I will also discuss how natural or man-made geographical characteristics (e.g., rivers, mountains, borders, etc.) affect the development of such urban systems.

In the second part, I discuss the planning and pricing of transport networks, moving from simple local models to more complex transport models at a global scale. The key aspects include: the first and second best road pricing, the public provision of transport networks and the demographic effects of transport networks.

In the third part, I combine the previous two parts and analyze the interaction between urban systems and transportation. Thereby, the main focus is to understand the economic mechanisms that can lead to a general equilibrium of all actors involved. However, as the study of the historical development of urban systems and transport networks provides interesting insights, I will discuss how their interaction in the past shapes today’s economic geography.

Finally, I broaden the scope of the course and explore related topics. There will be a particular emphasis on the relation between urban systems and fiscal federalism as well as environmental policies. Both aspects are important determinants of the contemporary developments of urban systems, and as such deserve our attention.

In general, this class focuses on the latest research developments in urban and regional economics, though it does not require prior knowledge in this field. It pays particular attention to economic approaches, which are based on theoretical frameworks with strong micro-foundations and allow for precise policy recommendations.

### Lecture notes

Course slides will be made available to students prior to each class.

### Literature

Course slides will be made available to students.

### Competencies

River Engineering

Abstract

The lecture addresses the fundamentals of river engineering to quantitatively describe the flow of water, transport of sediment and wood, and morphological changes such as erosion and deposition processes associated with river structures. In addition, design guidelines for river engineering structures are introduced.

Objective

At the end of the course, the students will be able to:
- recall and describe the fundamentals of transport processes in rivers,
- apply different calculation approaches and methods to tackle river engineering problems and tasks such as the discharge capacity of a river, scour estimation, or sediment budget of a river,
- design and dimension river engineering works needed to influence the processes in watercourses, and
- determine the interaction between flow (discharge), sediment transport, wood transport and the resulting channel evolution.

Content

The first part of the lecture introduces the fundamentals of river engineering, such as methods to determine and calculate the river discharge, or sampling methods to characterize the bed material. In addition, the transport processes of sediment (bedload and suspended load) and wood in rivers will be examined, including the principles of incipient motion, and initiation of erosion or deposition processes.

In the second part of the lecture, the methods will be explained to quantify the bed load budget and the morphological changes (erosion, deposition) in river systems. Specifically, natural channel formation processes, different bed forms and plan forms of rivers (straight, meandering, braided) are examined.

The last part of the lecture focuses on the design of river engineering structures, including examples from an ongoing flood and river rehabilitation project at the Alpine Rhine in Austria and Switzerland.

The lecture slides can be downloaded via Moodle.

Prerequisites / notice

Recommended lectures:
- Hydrology (102-0293-AAL), Hydraulics I (101-0203-01L), and Hydraulic Engineering (101-0206-00L).

Short practical exercises (voluntary) will be offered throughout the semester to improve the application of the learned subjects.
The main aim of the course is to provide practical training with watershed models for environmental engineers. The course is built on quantitative assessment of physical processes governing natural and engineered systems relies on numerically solving differential equations, fast and accurate solutions require performant algorithms leveraging parallel hardware. The goal of this course is to offer a practical approach to solve systems of differential equations in parallel on GPUs using the Julia language. Julia combines high-level language conciseness to low-level language performance which enables efficient code development.

The course will be taught in a hands-on fashion, putting emphasis on you writing code and completing exercises; lecturing will be kept at a minimum. In a final project you will solve a solid mechanics or fluid dynamics problem of your interest, such as the shallow water equation, the shallow ice equation, acoustic wave propagation, nonlinear diffusion, viscous flow, elastic deformation, viscous or elastic poromechanics, frictional heating, and more. Your Julia GPU application will be hosted on a git-platform and implement modern software development practices.

### Abstract

Watershed Modelling is a practical course on numerical water balance models for a range of catchment-scale water resource applications. The course covers GIS use in watershed analysis, models types from conceptual to physically-based, parameter calibration and model validation, and analysis of uncertainty. The course combines theory (lectures) with a series of practical tasks (exercises).

The main aim of the course is to provide practical training with watershed models for environmental engineers. The course is built on thematic lectures (2 hrs a week) and practical exercises (2 hrs a week). Theory and concepts in the lectures are underpinned by many examples from scientific studies. A comprehensive exercise block builds on the lectures with a series of 4 practical tasks to be conducted during the semester in group work. Exercise hours during the week focus on explanation of the tasks. The course is evaluated 50% by performance in the graded exercises and 50% by a semester-end oral examination (30 mins) on watershed modelling concepts.

The first part (A) of the course is on watershed properties analysed from DEMs, and on global sources of hydrological data for modelling applications. Here students learn about GIS applications (ArcGIS, Q-GIS) in hydrology - flow direction routines, catchment morphometry, extracting river networks, and defining hydrological response units. In the second part (B) of the course on conceptual watershed models students build their own simple bucket model (Matlab, Python), they learn about performance measures in modelling, how to calibrate the parameters and how to validate models, about methods to simulate stochastic climate to drive models, uncertainty analysis. The third part (C) of the course is focussed on physically-based model components. Here students learn about components for soil water fluxes and evapotranspiration, they practice with a fully-distributed physically-based model Topkapli-ETH, and learn about other similar models at larger scales. They apply Topkapli-ETH to an alpine catchment and study simulated discharge, snow, soil moisture and evapotranspiration spatial patterns.

There is no textbook. Learning materials consist of (a) video-recording of lectures; (b) lecture presentations; and (c) exercise task documents that allow independent work.

### Literature

Literature consist of collections from standard hydrological textbooks and research papers, collected by the instructors on the course moodle page.

### Prerequisites / notice

Basic Hydrology in Bachelor Studies (engineering, environmental sciences, earth sciences). Basic knowledge of Matlab (Python), ArcGIS (Q-GIS).

Abstract
Opportunities and limitations of concrete technology, Commodities and leading edge specialties.

Objective
Advanced education in concrete technology for civil engineers who are designing, specifying and executing concrete structures.

Content
- concrete components
- concrete properties
- concrete mix design
- production, transport, casting
- demoulding, curing and additional protective measures
- durability
- standards
- chemical admixtures
- alternative binders
- - specialty concretes such as: self compacting concrete, fiber reinforced concrete, fast setting concrete
- - the role of sustainability in concrete technology
- - new research in digital fabrication with concrete

Lecture notes

151-8015-00L  Moisture Transport in Porous Media  W  3 credits  2G  J. Carmeliet, A. Kubilay, A. Rubin, D. A. Strebel

Abstract
Moisture transport and related degradation processes in porous materials Theory of moisture transport in porous materials Experimental determination of moisture transport properties Exercises on moisture transport properties determination: Selected topics Liquid transport in cracked porous media, Drying of porous media, microclimate in urban street canyons.

Objective
- Basic knowledge of moisture transport and related degradation processes in porous materials
- Knowledge of experimental determination of moisture transport properties
- Application of knowledge to moisture transport in cracked materials, drying of porous materials and microclimate in urban street canyons

Content
1. Introduction
   - Moisture damage: problem statement, durability
     - Applications: building materials, soil science, geoscience
2. Moisture transport: theory and application
   - Description of moisture transport
   - Determination of moisture transport properties
   - Exercises on moisture transport properties
3. Special topics
   - Liquid transport in cracked materials, Drying of porous materials, Microclimate in urban street canyons

Lecture notes
Handouts, supporting material and exercises are provided online via Moodle.

Literature
All material is provided online via Moodle.
101-0617-01L Advances in Building Materials

Abstract
The course on Advances in Building Materials provides an introductory overview of the needs and future of materials science in the building sector. Focus topics concern sustainability, durability, thermal insulation, coatings, sealants, adhesives, flame retardancy and the future perspective and developments of concrete and wood with regard to smart material development and ecological concerns.

Objective
In this course, the students will gain a broad overview of the use of materials in the building sector, with a particular focus on concrete and wood. Current limitations and in particular sustainability related challenges will be detailed with the objective of laying the grounds to discuss future developments anticipated in this field.

Content
This course for civil engineers lays the grounds in the specialization Materials and Mechanics and complements the second introductory course of the specialization on Numerical Mechanics of Materials. The course also addresses master students in Materials Science and other study programs interested in deepening their understanding of application-relevant properties of engineering materials and sustainability related challenges. The following topics are covered:

1. Material selection
2. Materials and sustainability 1
3. Materials and sustainability 2
4. Recyclability
5. Material science of wood durability
6. Material science of concrete durability
7. Foams in construction and thermal insulation
8. Sealants and adhesives in construction
9. Coatings
10. Flame retardants
11. Future of wood – 1
12. Future of wood – 2
13. Future of concrete – 1
14. Future of concrete – 2

Lecture notes
Handouts will be provided for each lecture.

101-0617-02L Computational Science Investigation for Material Mechanics

Abstract
Introduction to computational sciences with focus on numerical modeling of the mechanics of materials. Simulation of material damage, fracture and failure with various material models.

Objective
Learning from mistakes and failures is as old as the engineering discipline. Understanding why things went wrong is essential for improvement, but often impossible without the help of numerical modelling. Real world problems are often highly nonlinear, dependent on multiple physical fields, involve fundamental material behavior far from equilibrium and reversibility, and can often only be understood by addressing different relevant scales.

In this course, we will use real-life cases to learn how to deal with such problems. Starting from the problem description with governing equations, you will learn how to tackle non-linear and multi-field problems using numerical simulations. A particular focus will be on fracture. We will investigate the conditions and mechanisms that lead to material failure and analyze the contributions of plastic behavior, size effects, randomness in the underlying material micro-structure, and various other non-linear material behavior. You will learn various approaches to model the mechanics of complex heterogeneous materials and to implement your model in Python code to run numerical simulations.

Content
1. Introduction to (numeric) forensic engineering
2. The nature of engineering problems (governing equations)
3. Numerical recipes for dealing with non-linear problems
4. Multi-field problems (HTM)
5. Creep and relaxation
6. On the nature of failure - Physics of damage and fracture
7. Cracks and growth in structures (LEFM and beyond)
8. Damage and fracture in heterogeneous materials
9. Mechanics of fatigue
10. Student -Project presentation

Lecture notes
Will be provided during the lecture via moodle.

Literature
Will be provided during the lecture.

151-0353-00L Mechanics of Composite Materials

W 4 credits 2V+1U G. Pappas
Abstract
The courses treats aspects related to elastic behavior of unidirectional and multidirectional laminates, micromechanics, failure and damage analysis, analysis and design of composite structures. The focus is on laminated fiber-reinforced polymer composites.

Objective
The objective is to introduce the basic concept of composite materials and provide a thorough understanding of the mechanical response of such materials and structures particularly made from fiber reinforced polymer composites, including elastic behavior, failure, fracture and damage analysis as well as structural design aspects. The ultimate goal is to provide the necessary skills to address the design and analysis of modern lightweight composite structures.

Content
The course is addressing following topics:
- Introduction
- Elastic anisotropy
- Micromechanics & Homogenization
- Classical Laminate Theory (CLT)
- Strength, failure and damage analysis
- Thin ply composite shells & effects of material non-linearity
- Analysis and design of composite structures

Lecture notes
Script, handouts, exercises and additional material are available in PDF-format on the moodle page of the lecture.

Literature
The lecture material is covered by a script/lecture notes compiled by CMASLab and further literature is referenced therein.

101-0608-00L 4 credits

Lecture notes
As the course follows a lecture on demand approach, the lecture slides will be provided after each course.

Literature
A list of the basic literature will be offered on a specific online platform, that could be used by all students attending the lectures.

Prerequisites / notice
The students are expected to work out of class as well. The course time will be used by the teachers to answer project-specific questions. The lecture series will be conducted in English and is aimed at students of master's programs, particularly in civil engineering and MIBS. No lecture will be given during Seminar week.

Abstract
Currently, Life Cycle Assessment (LCA) is applied as an ex-post design evaluation of buildings, but rarely used to improve the building during the design process.

Objective
The course will follow two main objectives and a third optional objective, depending on the design projects the students’ choose. At the end of the course, the students will:
1. Know the methodology of LCA
2. Be able to apply LCA in the design process to assess and improve the environmental performance of their projects
3. Be able to use the parametric LCA tool and link it to additional performance assessment tools for a holistic optimisation

Content
The course will be structured into two parts, each making up about half of the semester.

Part I: Exercises with lectures on demand
The first six individual courses will follow the “lectures on demand” approach. Small “hands-on” exercises focusing on one specific aspect will be given out and the necessary background knowledge will be provided in the form of short input lectures when questions arise. The following topics will be discussed during the first part:
1. LCA basic introduction
2. System boundaries, functional unit, end of life
3. Carbon budget and LCA benchmarks
4. BIM-LCA, available calculation tools and databases
5. Integrated analysis of environmental and cost assessment
6. Bio-based carbon storage

Part II: Project-based learning
In the second part, the students will work on their individual project in groups of three. For the design task, the students will bring their own project and work on improving it. The projects can be chosen depending on the students background and range from buildings to infrastructure projects. Intermediate presentations will ensure the continuous work and make sure all groups are on the same level and learn from each other. During this part, the following hands-on tutorials will be given:
1. Introduction to Rhinoceros 6 and 7
2. Introduction to grasshopper
3. Integrated assessment tools (ladybug tools)
4. Introduction to in-house grasshopper plugin for LCA analysis

Autumn Semester 2024
101-0577-00L  An Introduction to Sustainable Development in the Built Environment

Abstract
In 2015, the UN Conference in Paris shaped future world objectives to tackle climate change. This decarbonization strategy is additional to Sustainable Development goals formulated the same year by the UN general assembly. What does that mean for the built environment? This course provides an introduction to the notion of sustainable development when applied to our built environment.

Objective
At the end of the semester, the students have an understanding of the term of sustainable development, its history, the current political and scientific discourses and its relevance for our built environment.

In order to address current challenges of climate change mitigation and resource depletion, students will learn a holistic approach of sustainable development. Ecological, economical and social constraints will be presented and students will learn about methods for argumentation and tools for assessment (i.e. life cycle assessment).

For this purpose an overview of sustainable development is presented with an introduction to the history of sustainability and its today definition as well as the role of cities, urbanisation and material resources (i.e. energy, construction material) in social economic and environmental aspects.

The course aims to promote an integral view and understanding of sustainability and describing different spheres (social/cultural, ecological, economical, and institutional) that influence our built environment.

Students will acquire critical knowledge and understand the role of involved stakeholders, their motivations and constraints, learn how to evaluate challenges, identify deficits and define strategies to promote a more sustainable construction.

After the course students should be able to define the relevance of specific local, regional or territorial aspects to achieve coherent and applicable solutions toward sustainable development.

The course offers an environmental, socio-economic and socio-technical perspective focussing on buildings, cities and their transition to resilience with sustainable development. Students will learn on theory and application of current scientific pathways towards sustainable development.

Content
The following topics give an overview of the themes that are to be worked on during the lecture.

- Overview on the history and emergence of sustainable development
- Overview on the current understanding and definition of sustainable development and beyond

Methods
- Method 1: Life cycle assessment (planning, construction, operation/use, deconstruction)
- Method 2: Life Cycle Costing
- Method 3: Labels and certification
- Method 4: Material Flow Analysis

Main issues:
- Operation energy at building, urban and national scale
- Mobility and density questions
- Embodied energy for developing and developed world

- Synthesis: Transition to sustainable development

Lecture notes
All relevant information will be online available before the lectures. For each lecture slides of the lecture will be provided.

Literature
A list of the basic literature will be offered on a specific online platform, that could be used by all students attending the lectures.

101-0553-00L  Materials and Constructions

Abstract
Building materials with a special focus on regenerative materials: earth, bio-based and reuse. Looking at material sourcing, properties and performance, as well as how they are integrated in the buildings (building envelope and detailing).
Choice of material is done out of sustainability concern.
Comfort, moisture transfer and building physics with hygroscopic materials.
Students will receive an introduction to circular principles by experts from the building industry and visit de- and construction sites where circular construction is exemplified. They will explore how to use digital technologies such as LiDAR scanning, photogrammetry, scanning to-BIM, computer vision, computational design, digital fabrication, blockchain technology and learn about the design implications using reclaimed building materials. This course is meant as an overview/introduction of many digital technologies that could be useful for circular construction and evaluate possible solutions using digital technologies to enable a circular built environment (more specifically, with reused building materials). To achieve this, they need to be able to do the following:

1. Apply circular principles using recovered building materials.
2. Compare different digital technologies applied in circular construction (e.g., LiDAR scanning, drone imagery, photogrammetry, computational design, AI, computer vision, XR, LCA tools etc.)
3. Understand the potential and limitations of AI for circular construction, e.g., use machine learning to detect and digitize materials (computer vision) or to support creativity in the early design phases of circular construction (generative AI).
4. Communicate the importance and urgency of circular construction.
5. Assess the environmental impact implications of their design and technology decisions through a preliminary Life Cycle Assessment (LCA).

The course will be taught at the Kunsthalle Zurich as part of an exhibition. By the end of this course, students will be able to use augmented computational design enabling circular construction, with a view to environmental implications. They will be able to assess the challenges and opportunities of low-carbon, circular construction and evaluate possible solutions using digital technologies to enable a circular built environment (more specifically, with reused building materials). To achieve this, they need to be able to do the following:

1. Apply circular principles using recovered building materials.
2. Compare different digital technologies applied in circular construction (e.g., LiDAR scanning, drone imagery, photogrammetry, computational design, AI, computer vision, XR, LCA tools etc.)
3. Understand the potential and limitations of AI for circular construction, e.g., use machine learning to detect and digitize materials (computer vision) or to support creativity in the early design phases of circular construction (generative AI).
4. Communicate the importance and urgency of circular construction.
5. Assess the environmental impact implications of their design and technology decisions through a preliminary Life Cycle Assessment (LCA).

Students will receive an introduction to circular principles by experts from the building industry and visit de- and construction sites where circular construction is exemplified. They will explore how to use digital technologies such as LiDAR scanning, photogrammetry, scanning to-BIM, computer vision, computational design, digital fabrication, blockchain technology and learn about the design implications using reclaimed building materials. This course is meant as an overview/introduction of many digital technologies that could be useful for circularity and gives the tools to students to further study the technologies they are most interested in on their own. Creativity in writing, filmmaking, design, construction, etc. is expected from the students. This course will give the tools to students to learn more on LCA if they wish to deepen their knowledge further.

Language: English

Courses are on Tuesday afternoons in Kunsthalle or a room at ETH, but also require out-of-the-semester work and significant homework and site visits outside of class hours.
Link

---

**Prerequisites / notice**

Interest in Digitalisation and Construction. Flexibility: This is a hands-on course, where students explore digital technologies and opportunities/challenges of reuse. Flexibility (e.g. adapting to unforeseen circumstances), responsibility (e.g. arriving on time for safety briefing), and spontaneity (e.g. finding innovative solutions) is expected from the students to adapt to the contingencies from demolition and construction sites with reused materials. The course is mandatory for MIBS students. If you are a first year MIBS student, please do not apply, you are automatically accepted. All other students from other departments should apply. Please only register for the course if you really intend to participate on all course dates (see course catalog). Please only register for the course if you are willing to send us a letter of motivation and really intend to participate; otherwise, you will deprive someone else of a place. All non-MIBS students who register go onto a waiting list until 11.09.2024 and up to 25 of them will be selected by the lecturer.

To register:
1. Enroll before 05.09.2024.
2. Send a short letter of motivation (max. 300 words) and a 1-page CV to cea-course@ibi.baug.ethz.ch by 05.09.2024.

Collaborators: Kunsthalle Zürich, ETH AI Center, Design++

101-0339-00L | Environmental Geotechnics – Polluted Sites and Waste Disposal | W | 3 credits | 2G | M. Plötze

**Abstract**

The practice of landfiling, remediation of polluted sites and the disposal of radioactive waste are based on the same concepts of environmental protection. Understanding the contaminants behaviour and how to reduce their release to the environment is the key to remediating polluted sites and designing multi-barrier systems.

**Objective**

On successful completion of this course students will be able to
- Assess the risk to the environment from landfills, contaminated sites and radioactive waste repositories in terms of the fate and transport of contaminants.
- Describe the technologies available to minimise environmental contamination
- Describe the principles of dealing with polluted sites and propose and evaluate appropriate remediation techniques
- Explain the concepts underlying radioactive waste management practices.
This lecture course consists of lectures with exercises and case studies.
- An overview of the principles of environmental protection in waste management and how this is applied in legislation.
- An overview of the chemistry underlying the release and transport of contaminants from the landfilled/contaminated material/radioactive waste repository focusing on processes controlling mobility of heavy metals and organic compounds
- Introduction to contaminant transport in porous adsorbing media
- Design and function of engineered barriers. Clay as a barrier.
- Polluted site remediation: Site investigation, assessment, and remediation technologies
- Concepts and safety in radioactive waste management
- Role of the geological and engineered barriers and radionuclide transport in geological media.

101-0367-00L Geotechnical Engineering in Transportation and Pavement Design

Objective

Students should be able to recognise basic structural and material-related connections in traffic route engineering as well as be able to design pavements. This includes knowledge of the interrelation of local conditions such as soil properties, climate, water, as well as the mechanical behaviour of the selected construction materials and the quality of the design models involved.

Content

The content of the lecture is divided into the parts "geotechnical fundamentals in transportation", "construction technology and materials" and "pavement design". In the first part, soil stabilization, artificial compaction, testing of soils as well as the effects of frost are discussed for traffic route engineering. Thereafter, knowledge of the building materials and construction methods used in transportation is imparted with reference to European and national standards. After conveying some introductory concepts on the structural behaviour of asphalt, different design methods and models for pavements are subsequently examined.

This knowledge is conveyed through lectures, practical demonstrations, moderated exercises and assignments (to be completed independently).

Lecture notes

Slides, exercise and homework sheets, handouts

Literature

According to the bibliography in the submitted documents

Prerequisites / notice

Basic knowledge in "soil mechanics".

101-0119-00L Structural Masonry

Objective

Knowledge of the engineering properties of materials for masonry construction.

Technical understanding of the structural behaviour of load-bearing masonry structures subjected to in-plane forces and combined actions.

Develop a technical competence for design procedures for load-bearing masonry structures by means of exercises.
### 101-0129-00L Non Destructive Evaluation & Rehabilitation of Existing Structures

**Abstract**
Introduction to non destructive evaluation tools and quantitative structural analyses and verifications for condition assessment of existing structures and subsequent decisions on their rehabilitation.

**Objective**
The goal is for students to familiarize themselves with the handling of assessment and rehabilitation of existing structures from the perspective of a consulting engineer, following a systematic approach as described in current codes and to further learn how to use new non-destructive evaluation technologies.

**Content**
This course is organized in two main pillars. The first pillar describes the technologies that are available for non destructive evaluation of existing structures and delves into description of the principle of operation of such methods (e.g. wave propagation, acoustic emission analysis, tomography). The second pillar, overviews the current implementation of condition assessment processes in codes and standards. Complementary to the topic of structural evaluation, the topic of interventions, rehabilitation and retrofitting of existing structures for different construction materials is next addressed.

**101-0159-00L Method of Finite Elements II**

**Abstract**
The Method of Finite Elements II is a continuation of Method of Finite Elements I. Here, we explore the theoretical and numerical implementation concepts for the finite element analysis beyond the linear elastic behavior. This course aims to offer students with the skills to perform nonlinear FEM simulations using coding in Python.

*This course offers no introduction to commercial software.*

**Objective**
This class overviews advanced topics of the Method of Finite Elements, beyond linear elasticity. Such phenomena are particularly linked to excessive loading effects and energy dissipation mechanisms. Their understanding is necessary for reliably computing structural capacity. In this course, instead of blindly using generic structural analysis software, we offer an explicit understanding of what goes on behind the curtains, by explaining the algorithms that are used in such software.

The course specifically covers the treatment of the following phenomena:
- Material Nonlinearity (Plasticity)
- Geometric Nonlinearity (Large Displacement Problems)
- Nonlinear Dynamics
- Fracture Mechanics

The concepts are introduced via theory, numerical examples, demonstrators and computer labs in Python (starting Fall 2021).

Upon completion of the course, the participants will be able to:
- Recognize when linear elastic analysis is insufficient
- Solve nonlinear dynamics problems, which form the core for limit state calculations (e.g. ultimate capacity, failure) of structures
- Numerically simulate fracture; a dominant failure phenomenon for structural systems.

**Literature**
- SIA-Document D 0239 «Existing Structures – Introduction» (in German/French)
- SIA-Document D 0239 «Existing Structures – Consolidation and Practice» (in German/French)

**Lecture notes**
The course slides serve as Script. These are openly available on: http://www.chatzi.ibk.ethz.ch/education/method-of-finite-elements-ii.html

Analytical Competencies

Subject-specific Competencies

Design of Reinforced Concrete Buildings for Seismic Performance: Practical Deterministic and Probabilistic Approaches (1st ed.).

After successfully completing this course, the students will be able to:

Seismic Design of Structures II

B. Stojadinovic

In this course the students will learn how to do performance-based seismic design of building structures. This is a project-based course.

Moodle is used to manage the course learning material. These include the lecture presentations, additional reading, exercise problems and solutions, example models of structures in OpenSees system for earthquake engineering simulation, and example designs.

This course completes the series of courses on dynamic analysis and seismic design of structures at ETHZ. Building on the material covered in Structural Dynamics and Seismic Design of Structures I (101-0188-00 G) and in the primary target group (majoring in Structural Engineering and/or doing project-based coursework for other majors).

101-0189-00L

Seismic Design of Structures II

W 4 credits 2G B. Stojadinovic

Number of participants limited to 18.

All students go on a waiting list. Final registration based on an application letter (information given in the first lecture). Priority will be given to students who completed Seismic Design of Structures I (101-0188-00 G) and are in the primary target group (majoring in Structural Engineering and/or doing project-based coursework for other majors).

Abstract

In this course the students will learn how to do performance-based seismic design of building structures. This is a project-based course. The students will, in parallel, acquire the basis knowledge about the seismic behavior and non-linear response modeling of structures, and apply this knowledge in a project focused on design of a new building.

Objective

After successfully completing this course, the students will be able to:

1. Model and explain the seismic behavior of new structures with moment frame, braced frame and shear wall structural systems.
2. Evaluate the performance of new structures under earthquake loading using modern risk-informed performance assessment methods and analysis tools.
3. Use the knowledge of nonlinear dynamic response of structures to interpret the design code provisions and apply it in seismic design of structural systems.
4. Successfully design such systems to achieve the performance objectives stipulated by the design codes.

Content

This course completes the series of courses on dynamic analysis and seismic design of structures at ETHZ. Building on the material covered in Structural Dynamics and Seismic Design of Structures I, the following advanced topics will be covered in this course: 1) behavior and non-linear response modeling of structural systems under earthquake excitation; 2) displacement-based inelastic design of new building structures; 3) seismic design of moment frame, braced frame and shear wall structures. These topics will be discussed from the standpoint of risk-informed performance-based seismic design.

Lecture notes

Moodle is used to manage the course learning material. These include the lecture presentations, additional reading, exercise problems and solutions, example models of structures in OpenSees system for earthquake engineering simulation, and example designs.

Literature

Design of Reinforced Concrete Buildings for Seismic Performance: Practical Deterministic and Probabilistic Approaches (1st ed.).

Earthquake Engineering: From Engineering Seismology to Performance-Based Engineering, Borzorgnia, Y. and Bertero, V. Eds., CRC Press, 2004

Prerequisites / notice

ETH Seismic Design of Structures I course, or equivalent. Students are expected to understand the seismological nature of earthquakes, to characterize the ground motion excitation, to analyze the response of elastic single- and multiple-degree-of-freedom systems to earthquake excitation, to use the concept of response and design spectrum, to compute the equivalent seismic loads on simple structures, and to perform code-based seismic design of simple structures. Familiarity with structural analysis software, such as SAP2000 or OpenSees, and general-purpose software, such as Python and Matlab, is expected.

Number of participants limited to 10. All students go on a waiting list. Final registration based on an application letter (information given in the first lecture). Priority will be given to students who completed Seismic Design of Structures I (101-0188-00 G) and are in the primary target group (majoring in Structural Engineering and/or doing project-based coursework for other majors).
This course will cover the analysis and design of isolation systems to mitigate earthquakes and other forms of vibrations. The course will cover:

1. Conceptual basis of seismic isolation, seismic isolation types, mechanical characteristics of isolators.
3. Design approaches and code requirements.

After successfully completing this course the students will be able to:

1. Understand the mechanics of and design isolator bearings.
2. Understand the dynamics of and design an isolated structure.

There is no single textbook for this course. However, most of the lectures are based on parts of the following books:

- Dynamics of Structures, Theory and Applications to Earthquake Engineering, 4th edition, Anil Chopra, Prentice Hall, 2017
- Design of seismic isolated structures: from theory to practice, Farzad Naeim and James M. Kelly, John Wiley & Sons, 1999
- Mechanics of rubber bearings for seismic and vibration isolation, James M. Kelly and Dimitrios Konstantinidis, John Wiley & Sons, 2011

The electronic copies of the learning material will be uploaded to ILIAS and available through myStudies. The learning material includes: reading material, and (optional) exercise problems and solutions.

<td>Abstract</td>
<td>The goal of the course is to introduce students to Structural Design. The course fosters the development of a design thinking that emerges from the coexistence of a number of design parameters and performance criteria related to force flow, construction technologies, material use, and spatial qualities. Students will learn about diverse tools that allow for controlling such a complex blend of parameters and criteria at the interface between different disciplines such as structural engineering and architecture. These tools will include physical models, graphical methods, and digital tools. After a series of lectures and workshops, students will work on a design exercise that represents the core of the entire course. The design exercise is an opportunity to deal with an open-ended task that does not admit a univocal answer. In fact, besides structural performance, design options will be discussed and evaluated through a set of criteria including spatial qualities, constructability, and environmental footprint.</td>

Prerequisite / notice

101-0120-00L Structural Glass Design and Facade Engineering W 3 credits 3G V.-A. Silvestru

Abstract

The course gives an introduction to structural glass design and related façade engineering aspects. It will focus on the properties of the material glass and glass products, as well as on the structural design of glass elements and their supporting systems and connections.

Objective

After successful completion of the course, students will be able to:
- Understand and apply the fundamentals of the material glass and glass products, the basic principles for using glass as a load-carrying building material for structural applications and the types of connections used for glass elements;
- Recognize requirements for glass elements depending on their application area and chose the appropriate glass products and assemblies accordingly;
- Structurally design out-of-plane loaded glass elements based on available standards, both by hand calculations and specific software applications;
- Apply selected approaches for the structural design of in-plane loaded glass elements;
- Select suitable supporting systems (post-and-beam façade, curtain wall, etc.) and connections (point fixings, brackets, etc.) for the glass elements and structurally design them.

Content

This course introduces civil engineering students to structural glass design and related façade engineering aspects. It aims to provide the students the knowledge required in engineering offices to design glass elements but at the same time, the necessary fundamentals for later performing research in this field. To achieve this, the course includes lectures, design exercises and a design project.

Lectures:
The lectures will cover the following contents:
- Production methods and properties of the material glass and glass products and their structurally relevant properties (annealed glass, thermally tempered glass, chemically tempered glass, laminated glass, insulating glass, curved glass);
- Connection principles and types for glass elements (mechanical fixing, adhesive bonding);
- Requirements for glass elements depending on the application area (vertical glazing, overhead glazing, walk-on glazing, barrier glazing);
- Structural design of glass elements based on standards and research results (out-of-plane loaded glass elements and in-plane loaded glass elements);
- Typologies and design of structural systems for transparent façades;
- Requirements and functions for transparent façades.

Design exercises:
The principles and methods presented in the lectures are practiced with the students in design exercises. Hand calculation methods and their limitations as well as the software for structural glass design SJ Mepla are used for out-of-plane loaded glass elements. For in-plane loaded glass elements, the specifics of numerical calculation procedures are exemplified with the software Abaqus.

Design project:
The students will consolidate the knowledge gained in the theory-lectures and in the design exercises by working on a small design task (e.g. a glass canopy, a glass façade, a glass pavilion) in the form of a group work (ideally groups of 2-3 students). Within this task, the students will: conceptually design the structure and selected connection details; identify requirements for the glass elements and define their assembly; structurally design selected glass components, their support systems and their connections. The students will work on the design task in the second half of the semester and will get feedback on their progress in weekly review sessions. At the end of the semester, the groups will submit a project report and give an oral presentation of their projects.

Lecture notes

The lectures are based on lecture slides and handouts.

Literature

Recommended and supplementary literature:

Prerequisites / notice

Prior knowledge of structural analysis, especially steel structures is necessary. Prior basic knowledge on the method of finite elements is recommended.

101-0139-00L Scientific Machine and Deep Learning for Design and Construction W 3 credits 4G B. Bickel, A. Müller, M. Piovacci
Abstract
This course will present methods of scientific machine and deep learning (ML / DL) for applications in design and construction. After providing proper background on ML and the scientific ML (SciML) track, several applications of SciML together with their computational implementation during the design and construction process of the built environment are examined.

Objective
This course aims to provide a graduate-level introduction to machine learning, with a particular focus on scientific machine learning for applications in the design and construction phases of projects from architecture and civil engineering.

Upon completion of the course, the students will be able to:
1. Understand main ML background theory and methods.
2. Assess a problem and apply ML and DL in a computational framework accordingly.
3. Incorporate scientific domain knowledge in the SciML process.
4. Define, plan, conduct and present a SciML project.

Content
The course will include theory and algorithms for SciML, programming assignments, as well as a final project assessment.

The topics to be covered are:
2. Incorporation of Domain Knowledge into ML and DL.
4. ML training, validation and testing pipelines for academic and research projects.

A comprehensive series of computer/lab exercises and in-class demonstrations will take place, providing a "hands-on" feel for the course topics.

Lecture notes
The course script is composed by lecture slides, which are available online and will be continuously updated throughout the duration of the course.

101-0138-11L Bridge Design: Project Competition W 4 credits 2S W. Kaufmann

Abstract
This module offers the possibility to apply the fundamentals of the course Bridge Design in a conceptual design project. The scenario is set as a design competition: The students (group of two) will get a basic documentation (service criteria agreement, plans, digital terrain model, geotechnical report, photo documentation, etc.) and will develop a conceptual design suitable for the given site.

Objective
At the end of the course, students will have developed a convincing bridge design that satisfies following criteria:
_ Consideration of governing boundary conditions and constraints.
_ Conception of an efficient structural system with an adequate aesthetic expression considering the environment.
_ Definition of the relevant actions and decisive load cases.
_ Proof of feasibility by dimensioning the main structural elements.
_ Schematic overview of construction processes.
_ Appropriate presentation and visualisation of the proposed bridge design.

Content
The module is built up as follows:
0. Presentation of problem statement / project. (1st week of semester)
1. Introduction to design tools & working methods.
   a. Define requirements and boundary conditions.
   b. Study of references and possible concepts
   c. Choice of best variant
   d. Structural modelling & calculations
   e. Plans & visualisation
2. Working on project (milestones):
3. Presentation of your work in a mid-term and a final critique.
4. Submission

Prerequisites / notice
101-0138-00L Bridge Design or an equivalent attestation of knowledge in bridge design.

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>The objective of this course is to conduct a realistic traffic engineering project from beginning to end. The students will first familiarize themselves with microscopic traffic models. Students will work in groups on a project that includes a base scenario on a real traffic network. Throughout the semester, along with theoretical concepts, the students will build the base scenario (design, calibration and validation) and will develop alternative scenarios regarding modification on the infrastructure, simulation of in-vehicle technologies and vehicle-to-everything (V2X) communication. Simulations will be implemented in Aimsun software. The students will be asked to understand, analyze, interpret and present traffic properties. Evaluation of alternative scenarios over the same network will be performed. Finally, students will be asked to design, implement, analyze and present a novel proposal, which will be compared with the base scenario. Upon completion of the course, the students will have: - Understand the basic models used in microsimulation software (car-following, lane changing, gap acceptance, give ways, on/off-ramps, etc.). - Design a road transport network inside the simulation software. - Understand the basics behind modeling traffic demand and supply, vehicle dynamics, performance indicators for evaluation and network design for a realistic road transport network. - Understand how to design a complete study, implement and validate it for planning purposes, e.g. creating a new road infrastructure. - Make valid and concrete engineering proposals based on the simulation model and alternative scenarios.</td>

Data: 02.07.2024 12:39 Autumn Semester 2024 Page 206 of 2667
Content

In this course, the students will first learn some microscopic modelling and simulation concepts, and then complete a traffic-engineering project with microscopic traffic simulator Aimsun. Microscopic modelling and simulation concepts will include:
1) Car following models
2) Lane change models
3) Calibration and validation methodology
Specific tasks for the project will include:
1) Building a model with the simulator Aimsun in order to replicate and analyze the traffic conditions measured/observed.
2) Calibrating and validating the simulation model.
3) Redesigning/extend the model to improve the traffic performance through Aimsun and with/without programming in Python or C++.

The course will be based on a project that each group of students will build (design, calibrate, analyze and presentation) across the semester. A mid-term and final presentation of the work will be asked from each group of students. It consists of weekly 2-hour lectures. The students work in pairs on a group project that completes in the end of the semester. The modelling software used is Aimsun and lectures (theory and hands on experience) are taking place in a computer room.

The course Road Transport Systems (Verkehr III), or simultaneously taking the course Traffic Engineering is encouraged. Previous experience with Aimsun/Python/C++ is helpful but not mandatory.

Objective

The lecture gives a deeper insight into railway technology, the interaction between track and vehicles as well as in construction and dimensioning of the track. Methods for starting up and the diagnosis of the state of the track and its forecast are shown. State-of-the-art maintenance strategies and technologies are presented.

Abstract

Railway technology; interaction between track and vehicles; stress; track construction including features of railway bridges and tunnels; starting up; track diagnostics and forecast; track maintenance and related methods.

Objective

The lecture gives a deeper insight into railway technology, the interaction between track and vehicles as well as in construction and dimensioning of the track. Methods for starting up and the diagnosis of the state of the track and its forecast are shown. State-of-the-art maintenance strategies and technologies are presented.
Content
1 - Railway technology
Track, power supply / catenaries, information technology, safety / interlockings / dispatching

2 - Interaction
Interaction between track and vehicles, vehicle dynamics

3 - Railway Track
Stress; track construction including special features of railway bridges and tunnels

4 - Starting up
Goals, methods, procedures

5 - Diagnostics, maintenance strategies
Track diagnostics and forecast

6 - Track maintenance
Maintenance strategies, fundamentals of track maintenance and related methods

101-0491-10L Basics of Java and Best Practices for Scientific Computing
W 1 credit 1U M. Balac

Abstract
This course provides an introduction to programming in Java, version control, and cloud computing.

Objective
At the end of the course, the students should
● Have acquired object-oriented programming skills with a focus on Java.
● Have an understanding of version control using git
● Have learned to deploy java applications on servers

Content
This course provides an introduction to object-oriented programming with Java. Four topics are covered:
● Basics of Java (objects, classes, interfaces, abstract classes, static classes, static methods,...)
● Injection (traditional vs. Guice)
● Code versioning
● Java application deployment on servers

Literature
Intro to Java Programming, Comprehensive Version (10th Edition) by Y. Daniel Liang
Abstract
The course transmits fundamental knowledge for treating applied glaciological problems. Topics include climate-glacier interactions, glacier ice flow, glacier hydrology, ice avalanches, and lake ice.

Objective
The objectives of the courses are to:
- learn about fundamental glaciological processes, including glacier mass balance, ice dynamics, and glacier-related hazards;
- apply the above knowledge to some case studies inspired by contract-works performed at ETH's Glaciology section;
- generate the own computer code to solve the above case studies, and interpret the results;
- understand, both in class and in the field, the practical relevance of glaciology, with a focus on the Swiss applications.

Content
The course will develop along the following outline:
- How glaciology became a scientific discipline
- Glaciology and hydropower
- Glacier mechanics and ice flow
- Gravitational glacier instabilities
- Glacier hydrology and glacier lake outbursts
- Lake ice and ice bearing capacity
- Field excursion to Jungfraujoch
- Discussion of the exercises performed during the semester

Lecture notes
Digital lecture handouts will be distributed prior to each class.

Literature
Links to relevant literature will be provided during the classes.

Prerequisites / notice
Completed BSc studies. Basic knowledge in computer scripting in any language (e.g., Python, R, Julia, Matlab, IDL, ...) will be advantageous for solving the exercises. The exercises will be performed in groups. A minimal level of fitness is required for the field excursion.

101-1249-00L Hydraulics of Engineering Structures W 3 credits 2G I. Albayrak, F. Evers
Abstract
Hydraulic fundamentals are applied to hydraulic structures for wastewater, flood protection and hydropower. Typical case studies from engineering practice are further described.

Objective
Understanding and quantification of fundamental hydraulic processes with particular focus on hydraulic structures for wastewater, flood protection and hydropower.

In the course "Hydraulics of Engineering Structures", the competencies of process understanding, system understanding and measurement methods are taught, applied and examined. The competencies modeling, concept development and data analysis & interpretation are taught and data analysis & interpretation is applied in addition.

Content
1. Introduction & Basic equations
2. Losses in flow & Maximum discharge
3. Uniform flow & Critical flow
4. Hydraulic jump & Stillling basin
5. Backwater curves
6. Weirs & End overfall
7. Sidewer & Side channel
8. Bottom opening, Venturi & Culverts, Restrictors, Inverted siphons
9. Fall manholes & Vortex drop
10. Supercritical flow & Special manholes
11. Aerated flows & Low level outlets
12. Hydraulics of sediment bypass tunnels
13. Vegetated flows - Introduction & Application
14. Summary

101-1250-00L Transport Processes in Torrents W 3 credits 2V I. Schalko

Abstract
This course focuses on the various transport processes in torrents. This includes discharge, bedload, debris flow, and large wood. Differences between transport processes in rivers versus torrents will be discussed. Special focus will be put on the (1) analysis of the interaction between the transport processes (cascading processes) and the (2) design of countermeasures.

Objective
At the end of the course, the students will be able to:
(1) Describe the different transport processes in torrents, such as flow discharge or bedload transport,
(2) discuss how cascading processes affect the resulting natural hazard, and
(3) derive solutions for a sustainable hazard management.

Content
The first part of the lecture introduces the different transport processes in torrents such as discharge, bedload, debris flow, and large wood. This will include methods to determine and calculate the discharge, characterize debris flow, and quantify wood load.

In the second part of the lecture, special focus will be put on the cascading effects (what happens if multiple transport processes occur at once) and their implications on the resulting natural hazards.

The last part of the lecture focuses on the design of countermeasures such as check dams and will include examples from selected catchments in Switzerland.

Two field trips are planned to illustrate the transport processes and existing countermeasures.

Major in Materials and Mechanics

Number Title Type ECTS Hours Lecturers
101-0639-01L Science and Engineering of Glass and Natural Stone in Construction W 3 credits 2G

Does not take place this semester.

Abstract
The course offers an overview of relevant practical issues and present technological challenges for glass and natural stones in constructions. Students gain a good knowledge of the basics of glasses and natural stones, their potential as engineering materials and learn to apply them in the design of civil engineering constructions and to evaluate concepts.
Objective

Glass is increasingly used in constructions to ease the construction process, as functional insulation barrier, even for structural applications of impressive size. While everyone has experienced the innovation potential of glass in the last decade, products from natural stone suffer from an unjustified traditional image that often originates from a lack of understanding of the material and its combination with other materials. Culturally important structures often are made from natural stone and their conservation demands an understanding of their deterioration mechanisms, the concepts of which can be applied to other civil engineering materials. Designers and engineers need the knowledge to reconcile materials and system behavior with the entire processing, handling, integration and life time in mind.

In this module students are provided with a broad fundamental as well as practice-oriented education on glass and natural stone in civil engineering applications. Present and future construction and building concepts demand for such materials with optimized properties. Based on the fundamentals from the Bachelor course in materials by the end of this module, you should be able to:

- recognize and choose specific applications from the broad overview you were provided with,
- relate processing technologies to typical products and building applications and recognize (and explain typical damage related to wrong material choice or application,
- explain the nature of glassy and crystalline materials and interpret their physical behavior against this background,
- explain the major deterioration mechanisms in natural stone and how this relates to durability,
- analyze material combinations and appraise their application in future products as well as integration in existing constructions,
- summarize with appropriate guidance publications on a related topic in an oral presentation and short report.

Content

Lecture 1: An introduction to science and engineering of glass and natural stone in construction (FW/TW)

Lecture 2: Glass chemistry including historical development of glass composition, use of raw materials, melts, chemical stability and corrosion. (FW)

Lecture 3: Geology and mineralogy of stones used in construction. Formation processes, chemistry, crystal structure. (TW)

Lecture 4: Microscopic models for glassy materials. Physics of vitrification. From microscopic physical models to thermodynamics, rheology and mechanics of glassy materials. (FW)

Lecture 5: Stone properties and behavior: microstructure, density, porosity, mechanical properties (TW)

Lecture 6: Glass physics: Optical properties (transmission, reflection, emission, refraction, polarization and birefringence, testing methods); Mechanical properties (density, thermal, mechanical, electric properties, glass testing) (FW)

Lecture 7: Stone properties and durability: transport, moisture and thermal cycling (TW)

Lecture 8: Forming and processing of glass: (plate and molded glass, drawing, slumping, profiling etc.; Processing: Cutting, mechanical processing, tempering, gluing, bending, laminating of glass Surface treatments: coating, sputtering, enameling, printing, etching, chemical pre-stressing.) (FW)

Lecture 9: Durability: Salt crystallization, freezing, biodeterioration (TW)

Lecture 10: Glass products for civil engineering applications: (Molded glasses, fiber glass, foam glass, plate glass); construction glass (insulation glass, structural glass, protective glass, intelligent glass, codes); (FW)

Lecture 11: Conservation: Consolidation, cleaning, and other treatments (TW).

Lecture 12: Glass in constructions. (modeling, application and regulation, typical damage in glass) (FW)

Lecture 13: Student presentations; exam questions (FW/TW)

Lab 1: Durability of natural stone (FW/TW)

Lab 2: Fracture of glass (FW/TW)

Will be handed out in the lectures

Literature

Werkstoffe II script (download via the IFB homepage). Rest will be handed out in the lectures

Prerequisites / notice

Werkstoffe II/III of the bachelor studies or equivalent introductory materials lecture.

101-0659-01L Durability and Maintenance of Reinforced Concrete

W 4 credits 2V U. Angst, Z. Zhang

Abstract

We look at the durability of reinforced concrete structures, covering common deterioration processes such as reinforcement corrosion, frost damage, ASR, etc. The course spans the range from fundamental mechanisms to aspects of engineering practice. New methods and materials for preventative measures, condition assessment and repair techniques are treated. Examples from real cases are shown.
The course is based on the book Analytical Competencies, M. Wyrzykowski.

3 credits

Subject-specific Competencies
- Degradation mechanisms for concrete: sulphate attack, ASR, frost attack.
- Inspection and condition assessment: Chloride analyses, carbonation depth, etc. Non-destructive tests, particularly potential mapping to detect corrosion. New developments (for example, monitoring with sensors).

Method-specific Competencies
- Stainless steel as reinforcing steel for concrete: Different types of stainless steels. Coupling with black reinforcing steel. Examples of application. Life-cycle-costs.
- Modern materials and construction technologies: Discussion of expected implications for the durability of structures today and in the future.

Content

Excursion:
- We generally try to organize a site-visit (depending on availability of construction sites). Presumably, we will visit an installation site of cathodic protection on a concrete structure in the Zurich area.

Lecture notes

Prerequisites / notice

We generally try to organize a site-visit (depending on availability of construction sites). Presumably, we will visit an installation site of cathodic protection on a concrete structure in the Zurich area.

Literature

Form of teaching:
The course is a lecture that contains frequent discussion and interaction between students and lecturer. You will see and work on many examples from engineering practice, both during the lectures and in the form of exercises to be solved at home.

Report:
Each student will work on a small case study and deliver a report during the semester. The report will be graded.

Excursion:
We generally try to organize a site-visit (depending on availability of construction sites). Presumably, we will visit an installation site of cathodic protection on a concrete structure in the Zurich area.

Abstract

Concrete is generally viewed as a durable construction material. However, the long-term performance of a concrete structure can be greatly compromised by early-age cracking. This course will explain how shrinkage of concrete leads to cracking and how control of shrinkage allows increasing the expected durability of a concrete structure.
This course will begin with a brief introduction about hydration and microstructure development in cement paste and concrete. The students will learn the main causes of cracking at early ages, namely plastic, drying, thermal and autogenous shrinkage, with special emphasis on the driving mechanisms. The importance of concrete curing, especially in the first few days after casting, will be stressed and explained. Building on the knowledge of the driving forces of shrinkage, the way of action of shrinkage-reducing admixtures will be clarified and different applications illustrated. As an extension of external curing, the students will become familiar with internal water curing by means of saturated lightweight aggregates and superabsorbent polymers. Most concrete members are restrained by adjacent structures. When shrinkage is restrained, cracks may develop. The students will learn how to apply different criteria for assessing concrete cracking and how to retrieve the mechanical properties of the concrete, especially stiffness and creep, which are needed for the calculations of self-induced stresses and risk of cracking.

In addition to macroscopic cracks, microcracking may occur in the cement paste due to inner restraint offered by the aggregates. Both macroscopic cracks and diffuse microcracking within a concrete may facilitate the ingress of harmful substances (e.g. chloride and sulfate ions) into the concrete; these may react with the concrete or with the reinforcement and create further deterioration. The students will acquire an understanding of the mechanisms of transport through cracked concrete, with special focus on experimental evidence and on techniques able to visualize the transport process and follow it in time. As a final outcome of the course, the students will be able to estimate the impact of cracking on the expected durability of concrete structures and to implement different types of measures to reduce the extent of cracking.

Advances in concrete technology over the past decades have led to the practical use of concrete with a low water to binder ratio and with different types of mineral and organic admixtures. Another recent development is self-compacting concrete, which avoids concrete vibration and reduces labor during placing. Unfortunately, these concretes are especially prone to cracking at early ages, unless special precautions are taken. Proper curing becomes in this case the key to achieve better performance in various environmental and load conditions. Specific topics covered by the course:

- Hydration and microstructure development
- Plastic shrinkage
- Development of mechanical properties
- Thermal deformation
- Autogenous deformation
- Drying shrinkage
- Creep and relaxation
- Curing
- Shrinkage-reducing admixtures
- Internal curing: saturated lightweight aggregates and superabsorbent polymers
- Fracture and microcracking
- Transport in cracked concrete
- Impact of cracking on concrete durability
- Self-healing of cracks

For each lecture, lecture notes will be provided. In addition, one or two research papers for each lecture will be indicated as supportive information.

Copies of one to two research papers relevant to the topic of each lecture will be provided to the students as supportive information.

A basic knowledge of concrete technology is preferable.

The course Wood structure and function conveys basic knowledge on the microstructure of softwoods and hardwoods as well as general aspects of sustainability in wood production. In terms of bulk wood products, a specific focus is laid on sawn timber production and drying processes. Concerning wood veneer production, steaming, veneer cutting, and assembly to veneer lumber products are presented.

Further, the common technologies for the production of particle boards and fibre boards will be discussed. Topics related to wood gluing and wood protection as well as potentials and limitations in the application of wood and wood-based products are covered. In a further part, the lecture deals with the most important digital technologies, e.g. Internet of Things, artificial intelligence, and their impact on the wood industry based on illustrative examples.

101-0637-10L

**Objective**

Learning target is a basic understanding of the anatomy of wood and the related impact of endogenous and exogenous factors. The students can learn how to distinguish common central European wood species at the macroscopic and microscopic level. A deeper insight will be given by wood identification exercises for softwood species. Further, the students will gain insight into the relationships between tree growth and wood properties with a specific focus on the wood function in the living tree.

**Content**

In an introduction to wood anatomy, the general structural features of softwoods and hardwoods will be explained and factors of diversity and variability will be discussed. A specific focus is laid on common central European tree species with relevance in the wood sector, which will be studied in macro- and microstructural investigations. In the following, relationships between wood structure, properties and function in the living tree will be in the focus of the lectures. Topics covered are water transport, trends in wood anatomy within trees, environmental impact on wood anatomy, wood defects and their causes, tools to study wood properties over time, secondary changes in wood, and tree biomechanics.

**Competencies**

- Subject-specific Competencies
- Method-specific Competencies

**101-0637-20L**

**Objective**

The learning target is a fundamental understanding of the dominating wood processing chains, which are applied to fabricate common wood products. Students will be introduced to the economic relevance of the renewable resource wood and are trained in its technological properties. The students will learn to identify the relationships between wood species and their properties as well as the suitable wood machining processes to fabricate targeted wood products. Finally, the digital transformation process, which will affect all sectors of the wood industry with an impact on the entire value chain and business models will be covered. It will be illustrated how production processes can become more flexible, efficient and less resource-demanding.

**Content**

The general introduction shows the economic relevance of the resource wood in a global, European, and Swiss context and reflects aspects of sustainability in wood production. In terms of bulk wood products, a specific focus is laid on sawn timber production and drying processes. Concerning wood veneer production, steaming, veneer cutting, and assembly to veneer lumber products are presented. Further, the common technologies for the production of particle boards and fibre boards will be discussed. Topics related to wood gluing and wood protection as well as potentials and limitations in the application of wood and wood-based products are covered. In a further part, the lecture deals with the most important digital technologies, e.g. Internet of Things, artificial intelligence, and their impact on the wood industry based on illustrative examples.

**101-0159-00L**

**Objective**

The Method of Finite Elements II is a continuation of Method of Finite Elements I. Here, we explore the theoretical and numerical implementation concepts for the finite element analysis beyond the linear elastic behavior. This course aims to offer students with the skills to perform nonlinear FEM simulations using coding in Python. *This course offers no introduction to commercial software.*
This class overviews advanced topics of the Method of Finite Elements, beyond linear elasticity. Such phenomena are particularly linked to excessive loading effects and energy dissipation mechanisms. Their understanding is necessary for reliably computing structural capacity. In this course, instead of blindly using generic structural analysis software, we offer an explicit understanding of what goes on behind the curtains, by explaining the algorithms that are used in such software.

The course specifically covers the treatment of the following phenomena:
- Material Nonlinearity (Plasticity)
- Geometric Nonlinearity (Large Displacement Problems)
- Nonlinear Dynamics
- Fracture Mechanics

The concepts are introduced via theory, numerical examples, demonstrators and computer labs in Python (starting Fall 2021).

Upon completion of the course, the participants will be able to:
- Recognize when linear elastic analysis is insufficient
- Solve nonlinear dynamics problems, which form the core for limit state calculations (e.g. ultimate capacity, failure) of structures
- Numerically simulate fracture; a dominant failure phenomenon for structural systems.

See the class webpage for more information:

#### Abstract
Structural reliability aims at quantifying the probability of failure of systems due to uncertainties in their design, manufacturing and environmental conditions. Risk analysis combines this information with the consequences of failure in view of optimal decision making. The course presents the underlying probabilistic modelling and computational methods for reliability and risk assessment.

#### Objective
The goal of this course is to provide the students with a thorough understanding of the key concepts behind structural reliability and risk analysis. After this course the students will have refreshed their knowledge of probability theory and statistics to model uncertainties in view of engineering applications. They will be able to analyze the reliability of a structure and to use risk assessment methods for decision making under uncertain conditions. They will be aware of the state-of-the-art computational methods and software in this field.

#### Content
Engineers are confronted every day to decision making under limited amount of information and uncertain conditions. When designing new structures and systems, the design codes such as SIA or Euro- codes usually provide a framework that guarantees safety and reliability. However the level of safety is not quantified explicitly, which does not allow the analyst to properly choose between design variants and evaluate a total cost in case of failure. In contrast, the framework of risk analysis allows one to incorporate the uncertainty in decision making.

The first part of the course is a reminder on probability theory that is used as a main tool for reliability and risk analysis. Classical concepts such as random variables and vectors, dependence and correlation are recalled. Basic statistical inference methods used for building a probabilistic model from the available data, e.g. the maximum likelihood method, are presented.

The second part is related to structural reliability analysis, i.e. methods that allow one to compute probabilities of failure of a given system with respect to prescribed criteria. The framework of reliability analysis is first set up. Reliability indices are introduced together with the first order-second moment method (FOSM) and the first order reliability method (FORM). Methods based on Monte Carlo simulation are then reviewed and illustrated through various examples. By-products of reliability analysis such as sensitivity measures and partial safety coefficients are derived and their links to structural design codes is shown. The reliability of structural systems is also introduced as well as the methods used to reassess existing structures based on new information.

The third part of the course addresses risk assessment methods. Techniques for the identification of hazard scenarios and their representation by fault trees and event trees are described. Risk is defined with respect to the concept of expected utility in the framework of decision making. Elements of Bayesian decision making, i.e. pre-, post and pre-post risk assessment methods are presented.

The course also includes a tutorial using the UQLab software dedicated to real world structural reliability analysis.

#### Abstract
The course provides the necessary knowledge to develop models supporting and also evaluating the solution of given planning problems. The course is composed of a lecture part, providing the theoretical knowledge, and an applied part in which students develop their own models in order to evaluate a transport project/ policy by means of cost-benefit analysis.

#### Objective
- Knowledge and understanding of statistical methods and algorithms commonly used in transport planning
- Comprehend the reasoning and capabilities of transport models
- Ability to independently develop a transport model able to solve / answer planning problem
- Getting familiar with cost-benefit analysis as a decision-making supporting tool
Agent Based Modeling in Transportation

This course provides an introduction to agent-based modeling in transportation. The lectures and exercises offer an opportunity to learn about agent-based simulation models' current methodology, focusing on MATSim, how agent-based models are set up, and perform a practical case study by working in groups.

At the end of the course, the students should:
- have an understanding of agent-based modeling
- have an understanding of MATSim
- have an understanding of the process needed to set up an agent-based study
- have practical experience of using MATSim to perform transportation studies

This course provides an introduction to agent-based models for transportation policy analysis. Four essential topics are covered:

1) Introduction of agent-based modeling and its comparison to the traditional state of practice modeling
2) Introduction of MATSim, an open-source agent-based model, developed at ETH Zurich and TU Berlin, and its various parts
3) Setting up an agent-based model simulation, where different statistical methods used in the process will be introduced and explained.
4) Conducting a transport policy study. The case study will be performed in groups and will include a paper-like report.

MATSim

Agent-based modeling in general

Additional relevant readings, primarily scientific articles, will be recommended throughout the course.

For those without object-oriented programming experience, a crash course 101-0491-10 Basics of Java and Best Practices for Scientific Computing before the start of HS is recommended.

Competency

Personal Competencies

Critical Thinking

Numerical Hydraulics

The goal of the course is to develop the understanding of the students for numerical simulation of flows to an extent that they can later use commercial software in a responsible and critical way.

The basic equations are derived from first principles. Possible simplifications relevant for practical problems are shown and their applicability is discussed. Using the example of non-steady state pipe flow numerical methods such as the method of characteristics and finite difference methods are introduced. The finite volume method as well as the method of characteristics are used for the solution of the shallow water equations. Special aspects such as wave propagation and turbulence modelling are also treated.

All methods discussed are applied practically in exercises. This is done using programs in MATLAB which partially are programmed by the students themselves. Further, some generally available softwares such as BASEMENT for non-steady shallow water flows are used.

Slides from the lectures and programs used can be downloaded.
The Method of Finite Elements II is a continuation of Method of Finite Elements I. Here, we explore the theoretical and numerical implementation concepts for the finite element analysis beyond the linear elastic behavior. This course aims to offer students with the skills to perform nonlinear FEM simulations using coding in Python. This course offers no introduction to commercial software.

Upon completion of the course, the participants will be able to:
- Recognize when linear elastic analysis is insufficient
- Solve nonlinear dynamics problems, which form the core for limit state calculations (e.g. ultimate capacity, failure) of structures
- Numerically simulate fracture; a dominant failure phenomenon for structural systems.

The concepts are introduced via theory, numerical examples, demonstrators and computer labs in Python (starting Fall 2021).

The course specifically covers the treatment of the following phenomena:
- Material Nonlinearity (Plasticity)
- Geometric Nonlinearity (Large Displacement Problems)
- Nonlinear Dynamics
- Fracture Mechanics

Abstract

Introduction to computational sciences with focus on numerical modeling of the mechanics of materials. Simulation of material damage, fracture and failure with various material models.

Objective

Learning from mistakes and failures is as old as the engineering discipline. Understanding why things went wrong is essential for improvement, but often impossible without the help of numerical modelling. Real world problems are often highly nonlinear, dependent on multiple physical fields, involve fundamental material behavior far from equilibrium and reversibility, and can often only be understood by addressing different relevant scales.

In this course, we will use real-life cases to learn how to deal with such problems. Starting from the problem description with governing equations, you will learn how to tackle non-linear and multi-field problems using numerical simulations. A particular focus will be on fracture. We will investigate the conditions and mechanisms that lead to material failure and analyze the contributions of plastic behavior, size effects, randomness in the underlying material micro-structure, and various other non-linear material behavior. You will learn various approaches to model the mechanics of complex heterogeneous materials and to implement your model in Python code to run numerical simulations.

Content

1 Introduction to (numeric) forensic engineering
2 The nature of engineering problems (governing equations)
3 Numerical recipes for dealing with non-linear problems
4 Multi-field problems (HTM)
5 Creep and relaxation
6 On the nature of failure - Physics of damage and fracture
7 Cracks and growth in structures (LEFM and beyond)
8 Damage and fracture in heterogeneous materials
9 Mechanics of fatigue
10 Student -Project presentation

Lecture notes

Will be provided during the lecture via moodle.

Literature

Will be provided during the lecture.
Part 1 - Discovering a modern parallel computing ecosystem
- Learn the basics of the Julia language;
- Learn how to solve diffusion, wave propagation and advection processes;
- Implement efficient iterative algorithms;
- Get started with software development tools: git, version control.

Part 2 - Developing your own parallel algorithms on GPUs
- Implement wave propagation and porous convection;
- Apply spatial and temporal discretisation (finite-differences, various time-stepper);
- Understand the practical challenges of parallel computing: GPUs, multi-core CPUs;
- Learn about main simulation performance limits;
- Implement software development tooling: unit tests, continuous integration (CI).

Part 3 - Multi-GPU computing projects
- Understand the practical challenges of distributed parallel computing on multi-GPUs;
- Implement shared (on CPU and GPU) and distributed memory parallelisation (multi-GPUs/CPUs);
- Automate the software tooling using remote runners.

Final projects
- Apply your new skills in a final project;
- Implement advanced physical processes (solid and fluid dynamic - elastic and viscous solutions).

Lecture notes
Digital lecture notes, interactive Julia notebooks, online material.

Literature
Links to relevant literature will be provided during classes.

Prerequisites / notice
Completed BSc studies. Interest in and basic knowledge of numerics, applied mathematics, and physics/engineering sciences. Basic programming skills (in e.g. Matlab, Python, Julia); advanced programming skills are a plus.

Competencies
Subject-specific Competencies

101-0139-00L  Scientific Machine and Deep Learning for Design and Construction
W  3 credits  4G  B. Bickel, A. Müller, M. Piovarci

Abstract
This course will present methods of scientific machine and deep learning (ML / DL) for applications in design and construction. After providing proper background on ML and the scientific ML (SciML) track, several applications of SciML together with their computational implementation during the design and construction process of the built environment are examined.

Objective
This course aims to provide a graduate-level introduction to machine learning, with a particular focus on scientific machine learning for applications in the design and construction phases of projects from architecture and civil engineering.

Upon completion of the course, the students will be able to:
1. Understand main ML background theory and methods.
2. Assess a problem and apply ML and DL in a computational framework accordingly.
3. Incorporate scientific domain knowledge in the SciML process.
4. Define, plan, conduct and present a SciML project.
The course will include theory and algorithms for SciML, programming assignments, as well as a final project assessment.

The topics to be covered are:
2. Incorporation of Domain Knowledge into ML and DL.
4. ML training, validation and testing pipelines for academic and research projects.

A comprehensive series of computer/lab exercises and in-class demonstrations will take place, providing a "hands-on" feel for the course topics.

The course script is composed by lecture slides, which are available online and will be continuously updated throughout the duration of the course.

Suggested Reading:
- Marc Peter Deisenroth, A Aldo Faisal, and Cheng Soon Ong Mathematics for Machine Learning

Familiarity with Python is advised.

The course gives an introduction to structural glass design and related façade engineering aspects. It will focus on the properties of the material glass and glass products, as well as on the structural design of glass elements and their supporting systems and connections.

After successful completion of the course, students will be able to:
- Understand and apply the fundamentals of the material glass and glass products, the basic principles for using glass as a load-carrying building material for structural applications and the types of connections used for glass elements;
- Recognize requirements for glass elements depending on their application area and chose the appropriate glass products and assemblies accordingly;
- Structurally design out-of-plane loaded glass elements based on available standards, both by hand calculations and specific software applications;
- Apply selected approaches for the structural design of in-plane loaded glass elements;
- Select suitable supporting systems (post-and-beam façade, curtain wall, etc.) and connections (point fixings, brackets, etc.) for the glass elements and structurally design them.

This course introduces civil engineering students to structural glass design and related façade engineering aspects. It aims to provide the students the knowledge required in engineering offices to design glass elements but at the same time, the necessary fundamentals for later performing research in this field. To achieve this, the course includes lectures, design exercises and a design project.

The lectures will cover the following contents:
- Production methods and properties of the material glass and glass products and their structurally relevant properties (annealed glass, thermally tempered glass, chemically tempered glass, laminated glass, insulating glass, curved glass);
- Connection principles and types for glass elements (mechanical fixing, adhesive bonding);
- Requirements for glass elements depending on the application area (vertical glazing, overhead glazing, walk-on glazing, barrier glazing);
- Structural design of glass elements based on standards and research results (out-of-plane loaded glass elements and in-plane loaded glass elements);
- Typologies and design of structural systems for transparent façades;
- Requirements and functions for transparent façades.

The principles and methods presented in the lectures are practiced with the students in design exercises. Hand calculation methods and their limitations as well as the software for structural glass design SJ Mepla are used for out-of-plane loaded glass elements. For in-plane loaded glass elements, the specifics of numerical calculation procedures are exemplified with the software Abaqus.

The students will consolidate the knowledge gained in the theory-lectures and in the design exercises by working on a small design task (e.g. a glass canopy, a glass façade, a glass pavilion) in the form of a group work (ideally groups of 2-3 students). Within this task, the students will: conceptually design the structure and selected connection details; identify requirements for the glass elements and define their assembly; structurally design selected glass components, their support systems and their connections. The students will work on the design task in the second half of the semester and will get feedback on their progress in weekly review sessions. At the end of the semester, the groups will submit a project report and give an oral presentation of their projects.

The lectures are based on lecture slides and handouts.

Recommended and supplementary literature:

Prior knowledge of structural analysis, especially steel structures is necessary. Prior basic knowledge on the method of finite elements is recommended.
### Microscopic Modelling and Simulation of Traffic Operations

**W 3 credits 2G M. Makridis**

**Abstract**
The course introduces basics of microscopic modelling and simulation of traffic operations, including model design and development, calibration, validation, data analysis, identification of strategies for improving traffic flow performance, and evaluation of such strategies. The aim is to provide the fundamentals for building a realistic traffic engineering project from beginning to end.

**Objective**
The objective of this course is to conduct a realistic traffic engineering project from beginning to end. The students will first familiarize themselves with microscopic traffic models. Students will work in groups on a project that includes a base scenario on a real traffic network. Throughout the semester, along with theoretical concepts, the students will build the base scenario (design, calibration and validation) and will develop alternative scenarios regarding modification on the infrastructure, simulation of in-vehicle technologies and vehicle-to-everything (V2X) communication.

Simulations will be implemented in Aimsun software. The students will be asked to understand, analyze, interpret and present traffic properties, modeling and simulation of alternative scenarios over the same network will be performed. Finally, students will be asked to design, implement, analyze and present a novel proposal, which will be compared with the base scenario.

Upon completion of the course, the students will:
- Understand the basic models used in microsimulation software (car-following, lane changing, gap acceptance, give ways, on/off-ramps, etc.).
- Design a road transport network inside the simulation software.
- Understand the basics behind modeling traffic demand and supply, vehicle dynamics, performance indicators for evaluation and network design for a realistic road transport network.
- Understand how to design a complete study, implement and validate it for planning purposes, e.g. creating a new road infrastructure.
- Make valid and concrete engineering proposals based on the simulation model and alternative scenarios.

**Content**
In this course, the students will first learn some microscopic modelling and simulation concepts, and then complete a traffic-engineering project with microscopic traffic simulator Aimsun.

Microscopic modelling and simulation concepts will include:
1. Car following models
2. Lane change models
3. Calibration and validation methodology

Specific tasks for the project will include:
1. Building a model with the simulator Aimsun in order to replicate and analyze the traffic conditions measured/observed.
2. Calibrating and validating the simulation model.
3. Redesiging/extend the model to improve the traffic performance through Aimsun and with/without programming in Python or C++.

The course will be based on a project that each group of students will build (design, calibrate, analyze and presentation) across the semester. A mid-term used for the presentation of the work will be asked from each group of students.

It consists of weekly 2-hour lectures. The students work in pairs on a group project that completes in the end of the semester. The modelling software used is Aimsun and lectures (theory and hands on experience) are taking place in a computer room.

The course Road Transport Systems (Verkehr III), or simultaneously taking the course Traffic Engineering is encouraged. Previous experience with Aimsun is helpful but not mandatory.

**Literature**
The lecture notes and additional handouts will be provided before the lectures.

**Prerequisites / notice**
Students need to know some basic road transport concepts. The course Road Transport Systems (Verkehr III), or simultaneously taking the course Traffic Engineering is encouraged. Previous experience with Aimsun is helpful but not mandatory.

**102-0468-10L Watershed Modelling**

W 6 credits 4G P. Molnar, A. Costa, S. Sinclair

**Abstract**
Watershed Modelling is a practical course on numerical water balance models for a range of catchment-scale water resource applications. The course covers GIS use in watershed analysis, models types from conceptual to physically-based, parameter calibration and model validation, and analysis of uncertainty. The course combines theory (lectures) with a series of practical tasks (exercises).

**Objective**
The main aim of the course is to provide practical training with watershed models for environmental engineers. The course is built on thematic lectures (2 hrs a week) and practical exercises (2 hrs a week). Theory and concepts in the lectures are underpinned by many examples from scientific studies. A comprehensive exercise block builds on the lectures with a series of 4 practical tasks to be conducted during the semester in group work. Exercise hours during the week focus on explanation of the tasks. The course is evaluated 50% by performance in the graded exercises and 50% by a semester-end oral examination (30 mins) on watershed modelling concepts.

**Content**
The first part (A) of the course is on watershed properties analyzed from DEMs, and on global sources of hydrological data for modelling applications. Here students learn about GIS applications (ArcGIS, Q-GIS) in hydrology - flow direction routines, catchment morphometry, extracting river networks, and defining hydrological response units. In the second part (B) of the course on conceptual watershed models students build their own simple bucket model (Matlab, Python), they learn about performance metrics in modelling, how to calibrate the parameters and how to validate models, about methods to simulate stochastic climate to drive models, uncertainty analysis. The third part (C) of the course is focused on physically-based model components. Here students learn about components for soil water fluxes and evapotranspiration, they practice with a fully-distributed physically-based model Topkapi-ETH, and learn about other similar models at larger scales. They apply Topkapi-ETH to an alpine catchment and study simulated discharge, snow, soil moisture and evapotranspiration spatial patterns.

**Lecture notes**
There is no textbook. Learning materials consist of (a) video-recording of lectures; (b) lecture presentations; and (c) exercise task documents that allow independent work.

**Literature**
Literature consist of collections from standard hydrological textbooks and research papers, collected by the instructors on the course moodle page.

Data: 02.07.2024 12:39 Autumn Semester 2024 Page 220 of 2667
Prerequisites / notice
Basic Hydrology in Bachelor Studies (engineering, environmental sciences, earth sciences). Basic knowledge of Matlab (Python), ArcGIS (Q-GIS).

Competencies

Subject-specific Competencies
- Concepts and Theories
- Analytical Competencies
- Decision-making
- Media and Digital Technologies

101-0491-10L
Basics of Java and Best Practices for Scientific Computing
W 1 credit 1U M. Balac

Abstract
This course provides an introduction to programming in Java, version control, and cloud computing.

Objective
At the end of the course, the students should
- Have acquired object-oriented programming skills with a focus on Java.
- Have an understanding of version control using git
- Have learned to deploy java applications on servers

Content
This course provides an introduction to object-oriented programming with Java. Four topics are covered:
- Basics of Java (objects, classes, interfaces, abstract classes, static classes, static methods,...)
- Injection (traditional vs. Guice)
- Code versioning
- Java application deployment on servers

Literature
Intro to Java Programming, Comprehensive Version (10th Edition) by Y. Daniel Liang

401-0647-00L
Introduction to Mathematical Optimization
W 5 credits 2V+1U D. Adjiashvili

Abstract
Introduction to basic techniques and problems in mathematical optimization, and their applications to a variety of problems in engineering.

Objective
The goal of the course is to obtain a good understanding of some of the most fundamental mathematical optimization techniques used to solve linear programs and basic combinatorial optimization problems. The students will also practice applying the learned models to problems in engineering.

Content
Topics covered in this course include:
- Linear programming (simplex method, duality theory, shadow prices, ...).
- Basic combinatorial optimization problems (spanning trees, shortest paths, network flows, ...).
- Modelling with mathematical optimization: applications of mathematical programming in engineering.

Literature
Information about relevant literature will be given in the lecture.

Prerequisites / notice
This course is meant for students who did not already attend the course "Mathematical Optimization", which is a more advance lecture covering similar topics. Compared to "Mathematical Optimization", this course has a stronger focus on modeling and applications.

101-0307-00L
Design and Construction in Geotechnical Engineering
W 4 credits 3G I. Anastasopoulos, K. Kassas, A. Marin, L. Sakellariadis

Abstract
This lecture deals with the practical application of the knowledge gained in the fundamental lectures from the Bachelor degree. The basics of planning and design of geotechnical structures will be taught for the main topics geotechnical engineers are faced to in practice.

Objective
Transfer of the fundamental knowledge taught in the Bachelor degree to practical application.

Ability to plan and design geotechnical structures based on the state of the art.

Content
- Introduction to Swisscode SIA
- Foundations and settlements
- Pile foundations
- Excavations
- Slopes
- Soil nailing
- Reinforced geosystems
- Ground improvement
- River levees

Lecture notes
Script in the form of chapters and powerpoint overheads with web support (moodle-app2.let.ethz.ch)

Exercises

Literature
Relevant literature will be stated during the lectures

Prerequisites / notice
Pre-condition: Successful examinations (pass) in the geotechnical studies (soil mechanics and ground engineering, each 5 credits) in the Bachelor degree of Civil Engineering (ETH), or equivalent for new students.

The lecture contains at least one presentation from practice.
In this course students will see what the BIM method entails for a civil engineer and learn how to create a parametric model yourself incl. associated steel, precast concrete, in-situ concrete, reinforcement and masonry parts based on a practical example. Students will also learn how to automatically create formwork plans, parts lists and data for digital prefabrication and construction sites. They will thus acquire the necessary basis for their future work as engineers and how their work interacts with draughtsmen, designers and master builders in a digital working environment.

In this course, students will see what the BIM method entails for a civil engineer and learn how to create a parametric model yourself inclusive of associated steel, precast concrete, in-situ concrete, reinforcement and masonry parts based on a practical example. Students will also learn how to automatically create formwork plans, parts lists and data for digital prefabrication and construction sites. They will thus acquire the necessary basis for their future work as engineers and how their work interacts with draughtsmen, designers and master builders in a digital working environment.

This course aims to provide a basic understanding of the mechanics and rheology of granular matter. It includes fundamental concepts as well as recent progress in research with main focus on related engineering and natural hazards applications. Small experiments are performed in class to illustrate important processes and state-of-the-art numerical modeling tools are introduced and used.

Granular materials have the ability to sustain stresses like a solid of flow like a fluid depending on the applied solicitation and boundary conditions. This course targets civil, geotechnical and mechanical engineering students, who are interested in discovering the fascinating and sometimes surprising world of granular media, the second most used material in industry and in learning novel modeling approaches. After this class, the students should know how to describe inter-particle interactions at the grain scale, the statics of granular materials, the transition towards fluid states through classical frictional plastic laws and the rheology of granular flows. Furthermore, the students should know the basics of the Discrete Element Method (DEM), its advantages and limitations and should be able to use a commercial software for different types of application.

This course will not cover aspects related to granular gasses and kinetic theory. This course covers grain-scale interactions, statics and rheology of granular materials based on a mix between classical lectures, on-board developments, presentation of small experiments, analytical and numerical exercises. We present the domains of application of granular mechanics through examples taken from the industry or research. In addition, the Discrete Element Method (DEM) together with state-of-the-art contact models will be presented and used to simulate standard tests such as the granular column collapse, shear flows but also more complex industrial or geophysical problems. Calibration of model parameters based on laboratory experiments will be discussed. The course will not cover aspects related to granular gasses and kinetic theory.

Practice-oriented introduction to BIM working methods for civil engineers. Advantageous applications compared to 2D/3D, especially for digital construction and parametric modelling.

Basic knowledge of physics, mechanics and soil mechanics is required.

- Parametric modelling of steel, precast concrete, in-situ concrete, reinforcements and masonry
- Parametric modelling of connections and joints
- Defining and evaluating concreting stages
- Semi-automatic creation of formwork plans according to sia standards
- Automatic export of all necessary models and data for BIM2Field
- Insight into BIM2Field applications "Stake out from model" and "Lay reinforcement based on model".

Available eLearning content
PowerPoint slides

Lecture notes

Prerequisites / notice
Basic knowledge of construction detailing in steel and concrete, as taught in the BSc courses for steel and concrete structures, is of advantage.

This course will not cover aspects related to granular gasses and kinetic theory.

Basic knowledge of physics, mechanics and soil mechanics is required.
Bridge Design: Project Competition

W. Kaufmann

Abstract
This module offers the possibility to apply the fundamentals of the course Bridge Design in a conceptual design project. The scenario is set as a design competition: The students (group of two) will get a basic documentation (service criteria agreement, plans, digital terrain model, geotechnical report, photo documentation, etc.) and will develop a conceptual design suitable for the given site.

Objective
At the end of the course, students will have developed a convincing bridge design that satisfies following criteria:
1. Consideration of governing boundary conditions and constraints.
2. Conception of an efficient structural system with an adequate aesthetic expression considering the environment.
3. Definition of the relevant actions and decisive load cases.
4. Proof of feasibility by dimensioning the main structural elements.
5. Schematic overview of construction processes.
6. Appropriate presentation and visualisation of the proposed bridge design.

Content
The module is built up as follows:
0. Presentation of problem statement / project. (1st week of semester)
1. Introduction to design tools & working methods.
2. Working on project (milestones):
   a. Define requirements and boundary conditions.
   b. Study of references and possible concepts.
   c. Choice of best variant.
   d. Structural modelling & calculations.
   e. Plans & visualisation.
3. Presentation of your work in a mid-term and a final critique.
4. Submission.

Prerequisites / notice
101-0138-00L Bridge Design or an equivalent attestation of knowledge in bridge design.

Competencies

Subject-specific Competencies
- Concepts and Theories: assessed
- Techniques and Technologies: assessed

Method-specific Competencies
- Analytical Competencies: assessed

Digital Creativity for Circular Construction

C. De Wolf

Abstract
The course is about digital innovation towards a circular economy in the built environment. How can we bring together two worlds that are often too distinct: low-impact construction and digital innovation? Bringing digital tools already used in other sectors into the construction sector, students will learn about circular construction (e.g., reuse of materials) through hands-on learning practices.

Objective
In the fall semester 2024 we will focus on applying artificial intelligence (AI) and extended reality (XR) to the circular design workflow and. The course will be taught at the Kunsthalle Zurich as part of an exhibition.

By the end of this course, students will be able to use augmented computational design enabling circular construction, with a view to environmental implications. They will be able to assess the challenges and opportunities of low-carbon, circular construction and evaluate possible solutions using digital technologies to enable a circular built environment (more specifically, with reused building materials). To achieve this, they need to be able to do the following:
1. Apply circular principles using recovered building materials.
2. Compare different digital technologies applied in circular construction (e.g., LiDAR scanning, drone imagery, photogrammetry, computational design, AI, computer vision, XR, LCA tools etc.)
3. Understand the potential and limitations of AI for circular construction, e.g. use machine learning to detect and digitize materials (computer vision) or to support creativity in the early design phases of circular construction (generative AI).
4. Communicate the importance and urgency of circular construction.
5. Assess the environmental impact implications of their design and technology decisions through a preliminary Life Cycle Assessment (LCA).

Content
Students will receive an introduction to circular principles by experts from the building industry and visit of (de-)construction sites where circular construction is exemplified. They will explore how to use digital technologies such as LiDAR scanning, photogrammetry, scan-to-BIM, computer vision, computational design, digital fabrication, blockchain technology and learn about the design implications using reclaimed building materials. This course is meant as an overview/introduction of many digital technologies that could be useful for circularity and gives the tools to students to further study the technologies they are most interested in on their own. Creativity in writing, filmmaking, design, construction, etc. is expected from the students. This course will give the tools to students to learn more on LCA if they wish to deepen their knowledge further.

Lecture notes
Language: English
Courses are on Tuesday afternoons in Kunsthalle or a room at ETH, but also require out-of-the-semester work and significant homework and site visits outside of class hours.
Hydraulic Engineering III

**Prerequisites / notice**
Interest in Digitalisation and Construction. Flexibility: This is a hands-on course, where students explore digital technologies and opportunities/challenges of reuse. Flexibility (e.g. adapting to unforeseen circumstances), responsibility (e.g. arriving on time for safety briefing), and spontaneity (e.g. finding innovative solutions) is expected from the students to adapt to the contingencies from demolition and construction sites with reused materials. The course is mandatory for MIBS students. If you are a first-year MIBS student, please do not apply, you are automatically accepted. All other students from other departments should apply. Please only register for the course if you really intend to participate on all course dates (see course catalog). Please only register for the course if you are willing to send us a letter of motivation and really intend to participate; otherwise, you will deprive someone else of a place. All non-MIBS students who register go onto a waiting list until 11.09.2024 and up to 25 of them will be selected by the lecturer.

To register:
1. Enroll before 05.09.2024.
2. Send a short letter of motivation (max. 300 words) and a 1-page CV to cea-course@ibi.baug.ethz.ch by 05.09.2024.

**Collaborators:** Kunsthalle Zürich, ETH AI Center, Design++

--- | --- | --- | --- | --- | ---
101-0249-00L | Hydraulic Engineering III | W | 3 credits | 2S | R. Boes

**Abstract**
The lecture focuses on selected topics in hydraulic engineering, water management and aquatic ecology relating to hydropower and flood protection projects.

**Objective**
The overarching goal of the course is to broaden and enhance knowledge on special aspects in hydraulic engineering and its links to aquatic ecology and to understand the procedures and the planning sequence of large-scale projects.

**Content**
Selected topics in hydraulic engineering will be focused on, e.g. dam safety, materials in dam construction, possible problems at reservoirs like hazards from impulse waves and dam breaching, the hydraulics of spillways and intake structures at dams and weirs and the link between hydropower and ecology. Another focus will be put on typical approaches and procedures in the planning process of large-scale hydraulic engineering projects at the national and international level.

**Lecture notes**
Lecture handouts will be available online. Parts of the lectures will also be covered by a manuscript that will be available in electronic form.

**Literature**
will be specified in the lecture and in a written manuscript

**Prerequisites / notice**
External speakers will be involved to present current topics and projects in Switzerland and abroad.

**Competencies**

**Subject-specific Competencies**

101-0608-00L

**Design-Integrated Life Cycle Assessment**

**Abstract**
Currently, Life Cycle Assessment (LCA) is applied as an ex-post design evaluation of buildings, but rarely used to improve the building during the design process. The aim of this course is to apply LCA during the design of buildings by means of a digital, parametric tool. The necessary fundamentals of the LCA method will be taught following a lecture on demands approach.
The course will follow two main objectives and a third optional objective, depending on the design projects the students' choose. At the end of the course, the students will:

1. Know the methodology of LCA
2. Be able to apply LCA in the design process to assess and improve the environmental performance of their projects
3. Be able to use the parametric LCA tool and link it to additional performance assessment tools for a holistic optimisation
4. Assess and improve the environmental performance of their projects
5. Be able to use the parametric LCA tool and link it to additional performance assessment tools for a holistic optimisation

The course will be structured into two parts, each making up about half of the semester.

Part I: Exercises with lectures on demand
The first six individual courses will follow the "lectures on demand" approach. Small "hands-on" exercises focusing on one specific aspect will be given out and the necessary background knowledge will be provided in the form of short input lectures when questions arise. The following topics will be discussed during the first part:

1) LCA basic introduction
2) System boundaries, functional unit, end of life
3) Decision-making
4) Media and Digital Technologies
5) Problem-solving
6) Integrated assessment tools (ladybug tools)
7) Introduction to in-house grasshopper plugin for LCA analysis

Part II: Project-based learning
In the second part, the students will work on their individual project in groups of three. For the design task, the students will bring their own project and work on improving it. The projects can be chosen depending on the students background and range from buildings to infrastructure projects. Intermediate presentations will ensure the continuous work and make sure all groups are on the same level and learn from each other. During this part, the following hands-on tutorials will be given:

1) Introduction to Rhinoceros 6 and 7
2) Introduction to grasshopper
3) Integrated assessment tools (ladybug tools)
4) Introduction to in-house grasshopper plugin for LCA analysis

Lecture notes
As the course follows a lecture on demand approach, the lecture slides will be provided after each course.

Literature
A list of the basic literature will be offered on a specific online platform, that could be used by all students attending the lectures.

Prerequisites / notice
The students are expected to work out of class as well. The course time will be used by the teachers to answer project-specific questions.

The lecture series will be conducted in English and is aimed at students of master's programs, particularly in civil engineering and MIBS. No lecture will be given during Seminar week.

101-0329-00L  Tunnelling III  W  4 credits  2G  G. Anagnostou, E. Pimentel, M. Ramoni

Abstract
Deepen the knowledge on selected topics of underground construction as well as learning working out conceptual solutions of complex problems.

Objective
Lecture: Deepen the knowledge on selected topics of underground construction.
Exercises: Conceptual solutions of complex problems.

Content
Caverns: Geometry, construction methods, support.
Shafts: Construction methods, support.
Urban tunnelling: Boundary conditions, system choice, alignment, design.
Field measurements: Principles, monitoring layout, applications, interpretation.
Cut and cover tunnels: Modelling, design.
Exercising conceptual solution of complex tunnelling problems based upon discussion of current tunnel cases with particularly demanding problems in small groups.

Lecture notes
Autographieblätter

Prerequisites / notice
Prerequisite: BSc course "Tunnelling", MSc courses "Tunnelling I" and "Tunnelling II".

This course will continue to be offered in German up to and including HS24.

Competencies
Subject-specific Competencies
Concepts and Theories assessed
Techniques and Technologies assessed
Method-specific Competencies
Analytical Competencies assessed
Decision-making assessed
Problem-solving assessed

101-0139-00L  Scientific Machine and Deep Learning for Design and Construction  W  3 credits  4G  B. Bickel, A. Müller, M. Piovarci

Abstract
This course will present methods of scientific machine and deep learning (ML / DL) for applications in design and construction. After providing proper background on ML and the scientific ML (SciML) track, several applications of SciML together with their computational implementation during the design and construction process of the built environment are examined.
Objective
This course aims to provide a graduate-level introduction to machine learning, with a particular focus on scientific machine learning for applications in the design and construction phases of projects from architecture and civil engineering.

Upon completion of the course, the students will be able to:
1. Understand main ML background theory and methods.
2. Assess a problem and apply ML and DL in a computational framework accordingly.
3. Incorporate scientific domain knowledge in the SciML process.
4. Define, plan, conduct and present a SciML project.

Content
The course will include theory and algorithms for SciML, programming assignments, as well as a final project assessment.

The topics to be covered are:
2. Incorporation of Domain Knowledge into ML and DL.
4. ML training, validation and testing pipelines for academic and research projects.

A comprehensive series of computer/lab exercises and in-class demonstrations will take place, providing a "hands-on" feel for the course topics.

Lecture notes
The course script is composed by lecture slides, which are available online and will be continuously updated throughout the duration of the course.

101-0357-00L
Theoretical and Experimental Soil Mechanics ■

Prerequisites: Mechanics I, II and III.

The number of participants is limited to 60 due to the existing laboratory equipment! Students with major in Geotechnical Engineering have priority. Registrations will be accepted in the order they are received.

Abstract
Overview of soil behaviour
Explanation of typical applications: reality, modelling, lab tests with transfer of results to practical examples
Consolidation theory and typical applications
Triaxial tests: consolidation & shear, drained & undrained response
Plasticity theory & Critical State Soil Mechanics, Cam Clay
Application of plasticity theory
Introduction to physical modelling

Objective
(1) Extend knowledge of theoretical approaches that can be used to describe soil behaviour.
(2) Offer the opportunity to perform hands on element tests required for constitutive model calibration.
(3) Enable students to select an appropriate constitutive model and calibrate it using element test performed in the lab.
(4) Enable students to carry out FE analyses for realistic geotechnical applications.

Content
Overview of soil behaviour
Discussion of general gaps between basic theory and soil response
Stress paths in practice & in laboratory tests
Explanation of typical applications: reality, modelling, laboratory tests with transfer of results to the practical examples
Consolidation theory for incremental and continuous loading oedometer tests and typical applications in practice
Triaxial & direct shear tests: consolidation & shear, drained & undrained response
Plasticity theory & Critical State Soil Mechanics, Cam Clay
Application of plasticity theory
Introduction to physical modelling with emphasis on centrifuge modelling

Lecture notes
Printed script with web support
Exercises

Literature
https://moodle-app2.let.ethz.ch/

Pre-requisites: Fundamental knowledge of solid and soil mechanics.

The theoretical part of the course will be covered by problem-based lectures.
The experimental part will be covered by hands-on element tests performed by the students in the laboratory. These experimental results will be instrumental in the calibration of advanced soil constitutive models.
The connection between the experimental and theoretical parts of the course will be facilitated by means of numerical investigations (i.e, FE analyses), including the selection and calibration of relevant constitutive models. The numerical investigations shall be documented by the students in a final report.

Laboratory equipment will be available for 60 students. Students registered for the Geotechnics Specialty in Masters will be given priority as follows: (1) 2nd year students; (2) 1st year students, (3) doctoral students taking the class for their qualifying exam; Further students will be admitted on a first-come-first-served basis.
Structural Glass Design and Facade Engineering

Abstract
The course gives an introduction to structural glass design and related façade engineering aspects. It will focus on the properties of the material glass and glass products, as well as on the structural design of glass elements and their supporting systems and connections.

Objective
After successful completion of the course, students will be able to:
- Understand and apply the fundamentals of the material glass and glass products, the basic principles for using glass as a load-carrying building material for structural applications and the types of connections used for glass elements;
- Recognize requirements for glass elements depending on their application area and chose the appropriate glass products and assemblies accordingly;
- Structurally design out-of-plane loaded glass elements based on available standards, both by hand calculations and specific software applications;
- Apply selected approaches for the structural design of in-plane loaded glass elements;
- Select suitable supporting systems (post-and-beam façade, curtain wall, etc.) and connections (point fixings, brackets, etc.) for the glass elements and structurally design them.

Content
This course introduces civil engineering students to structural glass design and related façade engineering aspects. It aims to provide the students the knowledge required in engineering offices to design glass elements but at the same time, the necessary fundamentals for later performing research in this field. To achieve this, the course includes lectures, design exercises and a design project.

Lectures:
The lectures will cover the following contents:
- Production methods and properties of the material glass and glass products and their structurally relevant properties (annealed glass, thermally tempered glass, chemically tempered glass, laminated glass, insulating glass, curved glass);
- Connection principles and types for glass elements (mechanical fixing, adhesive bonding);
- Requirements for glass elements depending on the application area (vertical glazing, overhead glazing, walk-on glazing, barrier glazing);
- Structural design of glass elements based on standards and research results (out-of-plane loaded glass elements and in-plane loaded glass elements);
- Topologies and design of structural systems for transparent façades;
- Requirements and functions for transparent façades.

Design exercises:
The principles and methods presented in the lectures are practiced with the students in design exercises. Hand calculation methods and their limitations as well as the software for structural glass design SJ Mepla are used for out-of-plane loaded glass elements. For in-plane loaded glass elements, the specifics of numerical calculation procedures are exemplified with the software Abaqus.

Design project:
The students will consolidate the knowledge gained in the theory-lectures and in the design exercises by working on a small design task (e.g. a glass canopy, a glass façade, a glass pavilion) in the form of a group work (ideally groups of 2-3 students). Within this task, the students will: conceptually design the structure and selected connection details; identify requirements for the glass elements and define their assembly; structurally design selected glass components, their support systems and their connections. The students will work on the design task in the second half of the semester and will get feedback on their progress in weekly review sessions. At the end of the semester, the groups will submit a project report and give an oral presentation of their projects.

Lecture notes
The lectures are based on lecture slides and handouts.

Literature
Recommended and supplementary literature:

Prerequisites / notice
Prior knowledge of structural analysis, especially steel structures is necessary. Prior basic knowledge on the method of finite elements is recommended.

Solving Partial Differential Equations in Parallel on GPUs

Abstract
This course aims to cover state-of-the-art methods in modern parallel computing on Graphics Processing Unit (GPU), supercomputing and code development with applications to natural sciences and engineering.

Objective
When quantitative assessment of physical processes governing natural and engineered systems relies on numerically solving differential equations, fast and accurate solutions require performant algorithms leveraged on parallel hardware. The goal of this course is to offer a practical approach to solve systems of differential equations in parallel on GPUs using the Julia language. Julia combines high-level language conciseness to low-level language performance which enables efficient code development.

The course will be taught in a hands-on fashion, putting emphasis on you writing code and completing exercises; lecturing will be kept at a minimum. In a final project you will solve a solid mechanics or fluid dynamics problem of your interest, such as the shallow water equation, the shallow ice equation, acoustic wave propagation, nonlinear diffusion, viscous flow, elastic deformation, viscous or elastic poromechanics, frictional heating, and more. Your Julia GPU application will be hosted on a git-platform and implement modern software development practices.
Communication
The course is based on the book
Part 1 - Discovering a modern parallel computing ecosystem
- Learn the basics of the Julia language;
- Learn how to solve diffusion, wave propagation and advection processes;
- Implement efficient iterative algorithms;
- Get started with software development tools: git, version control.

Part 2 - Developing your own parallel algorithms on GPUs
- Implement wave propagation and porous convection;
- Apply spatial and temporal discretisation (finite-differences, various time-stepper);
- Understand the practical challenges of parallel computing: GPUs, multi-core CPUs;
- Learn about main simulation performance limiters;
- Implement software development tooling: unit tests, continuous integration (CI).

Part 3 - Multi-GPU computing projects
- Understand the practical challenges of distributed parallel computing on multi-GPUs;
- Implement shared (on CPU and GPU) and distributed memory parallelisation (multi-GPUs/CPUs);
- Automate the software tooling using remote runners.

Final projects
- Apply your new skills in a final project;
- Implement advanced physical processes (solid and fluid dynamic - elastic and viscous solutions).

Lecture notes
Digital lecture notes, interactive Julia notebooks, online material.

Literature
Links to relevant literature will be provided during classes.

Prerequisites / notice
Completed BSc studies. Interest in and basic knowledge of numerics, applied mathematics, and physics/engineering sciences. Basic programming skills (in e.g. Matlab, Python, Julia); advanced programming skills are a plus.

101-0659-01L
Durability and Maintenance of Reinforced Concrete W 4 credits 2V U. Angst, Z. Zhang

Abstract
We look at the durability of reinforced concrete structures, covering common deterioration processes such as reinforcement corrosion, frost damage, ASR, etc. The course spans the range from fundamental mechanisms to aspects of engineering practice. New methods and materials for preventative measures, condition assessment and repair techniques are treated. Examples from real cases are shown.

Objective
After this course you will have profound understanding about:

- the different mechanisms of deterioration of concrete structures, in particular reinforcement corrosion
- the relevant parameters affecting durability of reinforced concrete (cover depth, concrete quality, moisture, etc.)

Furthermore, you will know:

- current engineering approaches for durability design (accoring to standards) and their limitations
- refined models for enhanced durability design and service life predictions
- preventive measures to improve durability (e.g. stainless steel reinforcement, concrete surface coatings, etc.)
- the particular durability challenges with post-tensioned structures and ways to overcome them (electrically isolated tendons)
- methods for inspection and condition assessment of existing, ageing structures (including non-destructive techniques and monitoring with sensors)
- repair methods for deteriorated concrete structures such as conventional repair and electrochemical methods (in particular cathodic protection)
- possible future problems for durability that may arise with modern materials and construction technologies
- Socio-economic challenges related to ageing infrastructures
- Degradation mechanisms for concrete: sulphate attack, ASR, frost attack.
- Inspection and condition assessment: Chloride analyses, carbonation depth, etc. Non-destructive tests, particularly potential mapping to detect corrosion. New developments (for example, monitoring with sensors).
- Stainless steel as reinforcing steel for concrete: Different types of stainless steels. Coupling with black reinforcing steel. Examples of application. Life-cycle-costs.
- Modern materials and construction technologies: Discussion of expected implications for the durability of structures today and in the future.

Excursion:
- We generally try to organize a site-visit (depending on availability of construction sites). Presumably, we will visit an installation site of cathodic protection on a concrete structure in the Zurich area.

The course is based on the book

Slides of the lectures will be distributed in advance
Special handouts and reprints for particular topics will be distributed
The course is based on the book

Slides of the lectures will be distributed in advance

Special handouts and reprints for particular topics will be distributed

Form of teaching:
The course is a lecture that contains frequent discussion and interaction between students and lecturer. You will see and work on many examples from engineering practice, both during the lectures and in the form of exercises to be solved at home.

Report:
Each student will work on a small case study and deliver a report during the semester. The report will be graded.

Excursion:
We generally try to organize a site-visit (depending on availability of construction sites). Presumably, we will visit an installation site of cathodic protection on a concrete structure in the Zurich area.

101-0677-00L  Concrete Technology  W  2 credits  2G  F. Nägele, G. Martinola, T. Wangler

Abstract
Opportunities and limitations of concrete technology.
Commodities and leading edge specialties.

Objective
Advanced education in concrete technology for civil engineers who are designing, specifying and executing concrete structures.

Content
Based on the lecture 'Werkstoffe' students receive deep concrete technology training. Comprehensive knowledge of the most important properties of conventional concrete and the current areas of research in concrete technology will be presented. The course covers various topics, including:

- concrete components
- concrete properties
- concrete mix design
- production, transport, casting
- demoulding, curing and additional protective measures
- durability
- standards
- chemical admixtures
- alternative binders
- specialty concretes such as: self compacting concrete, fiber reinforced concrete, fast setting concrete
- the role of sustainability in concrete technology
- new research in digital fabrication with concrete

Lecture notes
Slides provided for download.

101-0427-01L  Public Transport Design and Operations  W  6 credits  4G  F. Corman

Abstract
This course aims at analyzing, designing, improving public transport systems, as part of the overall transport system.
Objective

Public transport is a key driver for making our cities more livable, clean and accessible, providing safe, and sustainable travel options for millions of people around the globe. Proper planning of public transport system also ensures that the system is competitive in terms of speed and cost. Public transport is a crucial asset, whose social, economic and environmental benefits extend beyond those who use it regularly; it reduces the amount of cars and road infrastructure in cities; reduces injuries and fatalities associated to car accidents, and gives transport accessibility to very large demographic groups.

Goal of the class is to understand the main characteristics and differences of public transport networks. Their various performance criteria based on various perspective and stakeholders. The most relevant decision making problems in a planning tactical and operational point of view

At the end of this course, students can critically analyze existing networks of public transport, their design and use; consider and substantiate possible improvements to existing networks of public transport and the management of those networks; optimize the use of resources in public transport.

General structure:
general introduction of transport, modes, technologies,
system design and line planning for different situations,
timetabling and tactical planning, and related mathematical approaches
operations, and quantitative support to operational problems,
evaluation of public transport systems.

Content

Basics for line transport systems and networks
Objectives of system and network planning, from different perspectives and users, design dilemmas
Conceptual concepts for passenger transport: long-distance, urban transport, regional, local transport

Planning process, from demand evaluation to line planning to timetables to operations
Matching demand and modes
Line planning techniques
Timetabling principles
Allocation of resources
Management of operations
Measures of realized operations
Improvements of existing services

Lecture notes

Lecture slides are provided.

101-0492-00L Microscopic Modelling and Simulation of Traffic Operations W 3 credits 2G M. Makridis

Abstract

The course introduces basics of microscopic modelling and simulation of traffic operations, including model design and development, calibration, validation, data analysis, identification of strategies for improving traffic flow performance, and evaluation of such strategies. The aim is to provide the fundamentals for building a realistic traffic-engineering project from beginning to end.
Objective

The objective of this course is to conduct a realistic traffic engineering project from beginning to end. The students will first familiarize themselves with microscopic traffic models. Students will work in groups on a project that includes a base scenario on a real traffic network. Throughout the semester, along with theoretical concepts, the students will build the base scenario (design, calibration and validation) and will develop alternative scenarios regarding modification on the infrastructure, simulation of in-vehicle technologies and vehicle-to-everything (V2X) communication.

Simulations will be implemented in Aimsun software. The students will be asked to understand, analyze, interpret and present traffic properties. Evaluation of alternative scenarios over the same network will be performed. Finally, students will be asked to design, implement, analyze and present a novel proposal, which will be compared with the base scenario.

Upon completion of the course, the students will:
- Understand the basic models used in microsimulation software (car-following, lane changing, gap acceptance, give ways, on/off-ramps, etc.).
- Design a road transport network inside the simulation software.
- Understand the basics behind modeling traffic demand and supply, vehicle dynamics, performance indicators for evaluation and network design for a realistic road transport network.
- Understand how to design a complete study, implement and validate it for planning purposes, e.g. creating a new road infrastructure.
- Make valid and concrete engineering proposals based on the simulation model and alternative scenarios.

Content

In this course, the students will first learn some microscopic modelling and simulation concepts, and then complete a traffic-engineering project with microscopic traffic simulator Aimsun.

Microscopic modelling and simulation concepts will include:
1) Car following models
2) Lane change models
3) Calibration and validation methodology
Specific tasks for the project will include:
1) Building a model with the simulator Aimsun in order to replicate and analyze the traffic conditions measured/observed.
2) Calibrating and validating the simulation model.
3) Redesigning/ extending the model to improve the traffic performance through Aimsun and with/ without programming in Python or C++.

The course will be based on a project that each group of students will build (design, calibrate, analyze and present) across the semester. A mid-term and final presentation of the work will be asked from each group of students.

The students work in pairs on a group project that completes in the end of the semester. The modelling software used is Aimsun and lectures (theory and hands on experience) are taking place in a computer room.

The course Road Transport Systems (Verkehr III), or simultaneously taking the course Traffic Engineering is encouraged. Previous experience with Aimsun/Python/C++ is helpful but not mandatory.

Lecture notes

The lecture notes and additional handouts will be provided before the lectures.

Literature

Additional literature recommendations will be provided at the lectures.

Prerequisites / notice

Students need to know some basic road transport concepts. The course Road Transport Systems (Verkehr III), or simultaneously taking the course Traffic Engineering is encouraged. Previous experience with Aimsun is helpful but not mandatory.

101-0527-10L Materials and Constructions W 4 credits 2G G. Habert, M. Posani

Abstract

Building materials with a special focus on regenerative materials: earth, bio-based and reuse.
Looking at material sourcing, properties and performance, as well as how they are integrated in the buildings (building envelope and detailing).
Choice of material is done out of sustainability concern.
Comfort, moisture transfer and building physics with hygroscopic materials.

Objective

Special focus on regenerative materials: earth, bio-based and reuse
The students will acquire knowledge in the following fields:
Fundamentals of material performance
Introduction to durability problems of building facades
Materials for the building envelope:
- Overview of structural materials and systems: concrete, steel, stone, earth, wood and bamboo
- Insulating materials (bio-based vs conventional)

Assessment of materials and components behaviour and performance
Degradation risks connected to insulation and post-insulation
Aspects of sustainability and durability

Special focus on comfort, moisture transfer and building physics with hygroscopic materials will be done.

Content

Introduction
Sustainable cement and concrete
Earth construction
Stone
Steel
Bamboo
Timber construction
Building physic and conventional insulation
Bio-based insulation and degradation risks with insulation
Hygrothermal properties of building materials and dynamic numerical simulations
Efficiency and sustainability of modern window glazing

Course will have general lectures
+ hands on lab @home experiments
+ group project for implementation of regenerative materials.

**Objective:**
After a successful completion of the course, students will be able to:

1. Critically evaluate structural design concepts based on their impact and implications beyond the sole structural performance
2. Identify the most relevant design parameters and performance criteria for a given design task and select adequate tools to effectively integrate them as part of the design process
3. Develop structural systems in compliance with structural, spatial, and environmental design aspects simultaneously

**Abstract:**
The goal of the course is to introduce students to Structural Design. The course fosters the development of a design thinking that emerges from the coexistence of a number of design parameters and performance criteria related to force flow, construction technologies, material use, and spatial qualities.

**Objective:**
In the course Numerical Hydraulics the basics of numerical modelling of flows are presented.

**Abstract:**
The goal of the course is to develop the understanding of the students for numerical simulation of flows to an extent that they can later use commercial software in a responsible and critical way.

**Content:**
The basic equations are derived from first principles. Possible simplifications relevant for practical problems are shown and their applicability is discussed. Using the example of non-steady state pipe flow numerical methods such as the method of characteristics and finite difference methods are introduced. The finite volume method as well as the method of characteristics are used for the solution of the shallow water equations. Special aspects such as wave propagation and turbulence modelling are also treated.

**Lecture notes:**
Slides from the lectures and programs used can be downloaded.

</tbody>
</table>

**Objective:**
Practice-oriented introduction to BIM working methods for civil engineers.

**Abstract:**
Advantageous applications compared to 2D/3D, especially for digital construction and parametric modelling.

**Content:**
- Parametric modelling of steel, precast concrete, in-situ concrete, reinforcements and masonry
- Parametric modelling of connections and joints
- Defining and evaluating concreting stages
- Semi-automatic creation of formwork plans according to sia standards
- Automatic export of all necessary models and data for BIM2Field
- Insight into BIM2Field applications "Stake out from model" and "Lay reinforcement based on model".

**Lecture notes:**
Available eLearning content

---

Data: 02.07.2024 12:39
This course covers grain-scale interactions, statics and rheology of granular materials based on a mix between classical lectures, on-board lectures and laboratory experiments.

**Subject-specific Competencies**
- Concepts and Theories
- Techniques and Technologies
- Media and Digital Technologies
- Cooperation and Teamwork

**Competencies**
- Subject-specific Competencies: assessed
- Method-specific Competencies: fostered
- Social Competencies: fostered

**Prerequisites / notice**
- Basic knowledge of construction detailing in steel and concrete, as taught in the BSc courses for steel and concrete structures, is of advantage.

**Literature**

**Prerequisites / notice**
- Basic knowledge of physics, mechanics and soil mechanics is required.

**Objective**
The goal is for students to familiarize themselves with the handling of assessment and rehabilitation of existing structures from the perspective of a consulting engineer, following a systematic approach as described in current codes and to further learn how to use new non destructive evaluation technologies.

**Content**
This course is organized in two main pillars. The first pillar describes the technologies that are available for non destructive evaluation of structures and delves into description of the principle of operation of such methods (e.g. wave propagation, acoustic emission analysis, tomography). The second pillar, overviews the current implementation of condition assessment processes in codes and standards, Complementary to the topic of structural evaluation, the topic of interventions, rehabilitation and retrofitting of existing structures for different construction materials is next addressed.

**Lecture notes**
Lecture notes

**Books**
1. Granular Media: Between Fluid and Solid by Bruno Andreotti, Olivier Pouliquen, and Yoël Forterre
2. Particulate Discrete Element Modelling: A Geomechanics Perspective by Catherine O'Sullivan

101-0138-11L Bridge Design: Project Competition

W 4 credits 2S W. Kaufmann

Abstract

This module offers the possibility to apply the fundamentals of the course Bridge Design in a conceptual design project. The scenario is set as a design competition: The students (group of two) will get a basic documentation (service criteria agreement, plans, digital terrain model, geotechnical report, photo documentation, etc.) and will develop a conceptual design suitable for the given site.

Objective

At the end of the course, students will have developed a convincing bridge design that satisfies following criteria:

- Consideration of governing boundary conditions and constraints.
- Conception of an efficient structural system with an adequate aesthetic expression considering the environment.
- Definition of the relevant actions and decisive load cases.
- Proof of feasibility by dimensioning the main structural elements.
- Schematic overview of construction processes.
- Appropriate presentation and visualisation of the proposed bridge design.

Content

The module is built up as follows:

0. Presentation of problem statement / project. (1st week of semester)
1. Introduction to design tools & working methods.
2. Working on project (milestones):
   - a. Define requirements and boundary conditions.
   - b. Study of references and possible concepts
   - c. Choice of best variant
   - d. Structural modelling & calculations
   - e. Plans & visualisation
3. Presentation of your work in a mid-term and a final critique.
4. Submission

Prerequisites / notice

101-0138-00L Bridge Design or an equivalent attestation of knowledge in bridge design.

101-0531-00L Digital Creativity for Circular Construction

W 8 credits 7SP C. De Wolf

Abstract

The course is about digital innovation towards a circular economy in the built environment. How can we bring together two worlds that are often too distinct: low-impact construction and digital innovation? Bringing digital tools already used in other sectors into the construction sector, students will learn about circular construction (e.g., reuse of materials) through hands-on learning practices.

Objective

In the fall semester 2024 we will focus on applying artificial intelligence (AI) and extended reality (XR) to the circular design workflow and. The course will be taught at the Kunsthalle Zurich as part of an exhibition.

The course is about digital innovation towards a circular economy in the built environment. How can we bring together two worlds that are often too distinct: low-impact construction and digital innovation? Bringing digital tools already used in other sectors into the construction sector, students will learn about circular construction (e.g., reuse of materials) through hands-on learning practices.

By the end of this course, students will be able to use augmented computational design enabling circular construction, with a view to environmental implications. They will be able to assess the challenges and opportunities of low-carbon, circular construction and evaluate possible solutions using digital technologies to enable a circular built environment (more specifically, with reused building materials). To achieve this, they need to be able to do the following:

1. Apply circular principles using recovered building materials.
2. Compare different digital technologies applied in circular construction (e.g., LiDAR scanning, drone imagery, photogrammetry, computational design, AI, computer vision, XR, LCA tools etc.)
3. Understand the potential and limitations of AI for circular construction, e.g., use machine learning to detect and digitize materials (computer vision) or to support creativity in the early design phases of circular construction (generative AI).
4. Communicate the importance and urgency of circular construction.
5. Assess the environmental impact implications of their design and technology decisions through a preliminary Life Cycle Assessment (LCA).
Students will receive an introduction to circular principles by experts from the building industry and visit of (de-)construction sites where circular construction is exemplified. They will explore how to use digital technologies such as LiDAR scanning, photogrammetry, scan-to-BIM, computer vision, computational design, digital fabrication, blockchain technology and learn about the design implications using reclaimed building materials. This course is meant as an overview/introduction of many digital technologies that could be useful for circularity and gives the tools to students to further study the technologies they are most interested in on their own. Creativity in writing, filmmaking, design, construction, etc. is expected from the students. This course will give the tools to students to learn more on LCA if they wish to deepen their knowledge further.

Courses are on Tuesday afternoons in Kunsthalle or a room at ETH, but also require out-of-the-semester work and significant homework and site visits outside of class hours.

Interest in Digitalisation and Construction. Flexibility: This is a hands-on course, where students explore digital technologies and opportunities/challenges of reuse. Flexibility (e.g. adapting to unforeseen circumstances), responsibility (e.g. arriving on time for safety briefing), and spontaneity (e.g. finding innovative solutions) is expected from the students to adapt to the contingencies from demolition and construction sites with reused materials. The course is mandatory for MIBS students. If you are a first year MIBS student, please do not apply, you are automatically accepted. All other students from other departments should apply. Please only register for the course if you really intend to participate on all course dates (see course catalog). Please only register for the course if you are willing to send us a letter of motivation and really intend to participate; otherwise, you will deprive someone else of a place. All non-MIBS students who register go onto a waiting list until 11.09.2024 and up to 25 of them will be selected by the lecturer.

To register:
1. Enroll before 05.09.2024.
2. Send a short letter of motivation (max. 300 words) and a 1-page CV to cea-course@ibi.baug.ethz.ch by 05.09.2024.

Collaborators: Kunsthalle Zürich, ETH AI Center, Design++

Only students who fulfill the following criteria are allowed to begin with their master thesis:
- a. successful completion of the bachelor programme;
- b. fulfilling of any additional requirements necessary to gain admission to the master programme.

Abstract

The Master Programme concludes with the Master Thesis, which has to be done in one of the chosen specialisations and has to be completed within 18 weeks. The Master Thesis is supervised by a professor and shall attest the students ability to work independently and to produce scientifically structured work.

Objective

To work independently and to produce a scientifically structured work.

Content

The topics of the Master Thesis are published by the professors. The Topic can be set also in consultation between the student and the professor.

Abstract
Students are introduced to a narrative of ‘Urban Stories’ through a series of three tools driven by social, governance, and environmental transformations in today’s urbanization processes. Each lecture explores one city’s spatial and organizational ingenuity born out of a particular place's realities, allowing students to transfer these inventions into a catalog of conceptual tools.

Objective
How can students of architecture become active agents of change? What does it take to go beyond a building's scale, making design-relevant decisions to the city rather than a single client? How can we design in cities with a lack of land, tax base, risk, and resilience, understanding that Zurich is the exception and these other cities are the rule? How can we discover, set rather than follow trends and understand existing urban phenomena activating them in a design process? The lecture series produces a growing catalog of operational urban tools across the globe, considering Governance, Social, and Environmental realities. Instead of limited binary comparing of cities, we are building a catalog of change, analyzing what design solutions cities have been developing informally incrementally over time, why, and how. How do urban areas grow or decline? How do transport networks affect the location of individuals and firms? Does the location of a firm determine its productivity? Can transport infrastructure investments reduce economic disparities? These are some of the questions that students should be able to answer after having completed the course.

Content
The course is organized in four parts. I start with the key observation that economic activity (both in terms of population density and productivity) is unevenly distributed in space. For instance, the share of the population living in urban centers is increasing globally, from 16% in 1900 and 50% in 2000 to about 68% by the year 2050 (UN, World Economic Prospects, 2014). The goal of the first part is then to understand the economic forces at play behind these trends, looking at the effects within and across urban areas. I will also discuss how natural or man-made geographical characteristics (e.g., rivers, mountains, borders, etc.) affect the development of such urban systems.

In the second part, I discuss the planning and pricing of transport networks, moving from simple local models to more complex transport models at a global scale. The key aspects include: the first and second best road pricing, the public provision of transport networks and the demographic effects of transport networks.

In the third part, I combine the previous two parts and analyze the interaction between urban systems and transportation. Thereby, the main focus is to understand the economic mechanisms that can lead to a general equilibrium of all actors involved. However, as the study of the historical development of urban systems and transport networks provides interesting insights, I will discuss how their interaction in the past shapes today’s economic geography.

Finally, I broaden the scope of the course and explore related topics. There will be a particular emphasis on the relation between urban systems and fiscal federalism as well as environmental policies. Both aspects are important determinants of the contemporary developments of urban systems, and as such deserve our attention.

In general, this class focuses on the latest research developments in urban and regional economics, though it does not require prior knowledge in this field. It pays particular attention to economic approaches, which are based on theoretical frameworks with strong micro-foundations and allow for precise policy recommendations.

Literature
Course slides will be made available to students prior to each class.

Personal Competencies
- Critical Thinking: fostered
Urban form cannot be reduced to physical space. Cities result from social construction, under the influence of technologies, ecology, culture, the impact of experts, and accidents. Urban un-concluded processes respond to political interests, economic pressure, cultural inclinations, along with the imagination of architects and urbanists and the informal powers at work in complex adaptive systems. Current urban phenomena are the result of urban evolution. The facts stored in urban environments include contributions from its entire lifecycle, visible in the physical environment, and non-physical aspects. This imaginary city exists along with its potentials and problems and with the conflicts that have evolved. Knowledge and understanding, along with a critical observation of the actions and policies, are necessary to understand the diversity and instability present in the contemporary city and understand how urban form evolved to its current state.

How did cities develop into the cities we live in now? Urban plans, instruments, visions, political decisions, economic reasonings, cultural inputs, and social organization have been used to operate in urban settlements in specific moments of change. We have chosen cities that exemplify how these instruments have been implemented and how they have shaped urban environments. We transcribe these instruments into urban operational tools that we have recognized and collected within existing tested cases in contemporary cities across the globe.

This lecture series will introduce urban knowledge and the way it has introduced urban models and operational modes within different concrete realities, therefore shaping cities. The lecture series translates urban knowledge into operational tools, extracted from cities where they have been tested and become exemplary samples, most relevant for understanding how the urban landscape has taken shape. The tools are clustered in twelve thematic clusters and three tool scales for better comparability and cross-reflection.

The Tool case studies are compiled into a global urbanization toolbox, which we use as typological models to read the city and critically reflect upon it. The presented contents are meant to serve as inspiration for positioning in future professional life and provide instruments for future design decisions.

In an interview with a local designer, we measure our insights against the most pressing design topics in cities today, including inclusion, affordable housing, provision of public spaces, and infrastructure for all.

The elective course "Topology" in the Autumn Semester 2023 builds on a long-standing specialization in the spatial exploration of the landscape. We will embark the participants on a terrain that we shape through our own thoughts and actions, adopting different perceptual perspectives, supported by examples from art, literature, technology and history.

General Chemistry (Inorganic Chemistry) I

Abstract
Introduction to the chemistry of ionic equilibria: Acids and bases, redox reactions, formation of coordination complexes and precipitation reactions

Objective
Understanding and describing ionic equilibria from both a qualitative and a quantitative perspective

Content
Chemical equilibrium and equilibrium constants, mono- and polyprotic acids and bases in aqueous solution, calculation of equilibrium concentrations, acidity functions, Lewis acids, acids in non-aqueous solvents, redox reactions and equilibria, Galvanic cells, electrode potentials, Nerst equation, coordination chemistry, stepwise formation of metal complexes, solubility

Lecture notes
Copies of the course slides as well as other documents will be provided as pdf files via the moodle platform.

Literature

General Chemistry (Organic Chemistry) I

Abstract
Introduction to Organic Chemistry. Classical structure theory, stereochemistry, chemical bonds and bonding, symmetry, nomenclature, organic thermochemistry, conformational analysis, basics of chemical reactions.

Objective
Introduction to the structures of organic compounds as well as the structural and energetic basis of organic chemistry.

Content

Lecture notes
Unterlagen werden als PDF über die ILIAS-Plattform zur Verfügung gestellt

Literature

General Chemistry (Physical Chemistry) I

Abstract
The lecture provides an introduction to some of the physical fundamentals of chemistry, in particular radioactivity, quantum mechanics, the structure of matter and an atom, the periodic table of elements, and chemical bonding.

Objective
After the lecture, students will be able to,
- to calculate physical quantities and their units which are important for chemistry,
- name some properties of chemically relevant particles and propose experimental methods to determine these properties,
- name applications and hazards of radioactivity,
- categorize radioactive decay processes and mathematically represent the time course of simple decay reactions and qualitatively predict and represent them,
- describe wave and particle properties of electromagnetic radiation and matter and propose experimental methods for their detection,
- independently solve the Schrödinger equation for a molecular multi-particle system,
- to calculate quantitative properties of electromagnetic radiation and matter and propose experimental methods for their detection,
- to explain the basics of quantum mechanics (meaning of the wave function, Heisenberg's uncertainty principle, operators, commutators) and to perform simple calculations with them,
- analyze and calculate absorption and emission spectra of single-electron atoms,
- to set up the Schrödinger equation for a molecular multi-particle system,
- to categorize the periodic table of elements with the help of the orbital concept,
- recognize and use similarities in the electronic structure of atoms to predict chemically relevant properties, and
- establish term symbols for atomic ground states.

Content
Atomic structure and structure of matter: atomic theory, elementary particles, atomic nuclei, radioactivity, nuclear reactions. Atomic orbitals and energy levels: ionisation energies, atomic spectroscopy, term values and symbols. Quantum mechanical atom model: wave-particle duality, the uncertainty principle, Schrödinger’s equation, the hydrogen atom, construction of the periodic table of the elements. Chemical bonding: ionic bonding, covalent bonding, molecular orbitals.

Lecture notes

Prerequisites / notice
Voraussetzungen: Maturastoff. Insbesondere Integral- und Differentialrechnung.

Competencies
The students will learn and understand the methodological basics of binding theory in complexes of transition metals. They will be able to foster a collection of slides and a script will be made available via Moodle.

The lecture provides an introduction to the basics of biochemistry and molecular biology as well as evolutionary principles. The focus is on bacteria and archaea under consideration of universal concepts.

The newly conceived lecture is supported by scripts.

The lecture is divided into different sections:
1. Geochemical perspectives on Earth and introduction to evolution
2. Building blocks of life
3. Macromolecules: Proteins
4. Membranes and transport across the plasma membrane
5. Universal mechanisms of inheritance, transcription and translation
6. Reaction Kinetics, binding equilibria and enzymatic catalysis
7. Essentials of Catabolism
8. Essentials of Anabolism
9. Metabolism and biogeochemical cycling of elements

The lecture notes are supported by scripts.

The literature is given in the lecture.

Further reading suggestions will be indicated during the lecture.

The lecture is divided into the following parts, which introduce the students to the chemistry of transition metals as well as lanthanides and actinides: 1) General definitions and terms in coordination chemistry; 2) Coordination numbers and structures; 3) Ligand types; 4) The chemical bond in coordination compounds part A: Crystal field theory and ligand field theory; 5) The chemical bond in coordination compounds part B: Qualitative MO theory; 6) Reactivity and reaction mechanisms of coordination compounds; 7) Group theory and character tables; 8) Vibrational spectroscopy; 9) Electronic excitation.

**Prerequisites / notice**

- Voraussetzungen:
  - Mathematik I und II
  - Allgemeine Chemie I und II
  - Physikalische Chemie I

---

**Objective**

**Introduction to Chemical Reaction Kinetics**

**Content**

- Fundamental concepts: rate laws, elementary reactions and composite reactions, molecularity, reaction order. Experimental methods in reaction kinetics up to new developments in femtosecond kinetics. Simple chemical reaction rate theories: temperature dependence of the rate constant and Arrhenius equation, collision theory, reaction cross-section, transition state theory. Reaction mechanisms and complex kinetic systems, approximation techniques, chain reactions, explosions and detonations. Homogeneous catalysis and enzyme kinetics.

**Course objectives**

- Understand fundamental concepts of chemical reaction kinetics.
- Gain insight into reaction mechanisms and complex kinetic systems.
- Learn about homogeneous catalysis and enzyme kinetics.
- Study advanced topics such as explosion and detonation kinetics.

**Assessment**

- Contractual examination: 80% of the exam mark (in case of repetition of the exam, the exercise marks from a previous semester can be kept).
- Performance component: 12% of the exam mark.

**Information**

For more information about the lecture: www.csms.ethz.ch/education/InfoI

---

**529-0422-00L**  
**Physical Chemistry II: Chemical Reaction Kinetics**

**Credit Distribution**

- 4 credits
- 3V+1U

**Objective**

- Introduction to Chemical Reaction Kinetics

**Content**

- Fundamental concepts: rate laws, elementary reactions and composite reactions, molecularity, reaction order. Experimental methods in reaction kinetics up to new developments in femtosecond kinetics. Simple chemical reaction rate theories: temperature dependence of the rate constant and Arrhenius equation, collision theory, reaction cross-section, transition state theory. **529-0001-00L**  
**Introduction to Computer Science**

**Credit Distribution**

- 4 credits
- 2V+2U

**Objective**

- Introduction to UNIX, introduction to C++ programming, data representation and processing, computational errors, algorithms and scaling, sorting and searching, numerical algorithms, algorithmic strategies, computer simulation, computer architecture, operating systems, programming languages, computer networks, databases, representation of chemical structures, molecular simulation.
- Acquire a starting package concerning the computational aspects of natural sciences; discuss fundamentals of computer architecture, languages, algorithms and programming with an eye to their application in the area of chemistry, biology and material science.

**Content**

- Lecture: Introduction to UNIX, introduction to C++ programming, data representation and processing, computational errors, algorithms and scaling, sorting and searching, numerical algorithms, algorithmic strategies, computer simulation, computer architecture, operating systems, programming languages, computer networks, databases, representation of chemical structures, molecular simulation.
- Exercises: Make students familiar with the UNIX operating system, C++ programming techniques, simple algorithms and computational applications in chemistry by means of exercise series at the computer.

**Prerequisites / notice**

Since the exercises on the computer do convey and test essentially different skills than those being conveyed during the lectures and tested at the written exam, the results of the exercises are taken into account when evaluating the results of the exam (compulsory performance component, 12% of the exam mark; in case of repetition of the exam, the exercise marks from a previous semester can be kept).

For more information about the lecture: www.csms.ethz.ch/education/InfoI

---

**Organic Chemistry I**

**Credit Distribution**

- 3 credits
- 2V+1U

**Objective**

- This course will build upon the basic knowledge of structure and reactivity of organic molecules gained in AC/OCI and AC/OCII. The module aims to provide a wide understanding of the occurrence, synthesis, properties, and reactivity of carbonyl compounds.
- The goal of this course is the acquisition of a basic repertoire of synthetic methods including important reactions of aldehydes, ketones, carboxylic acids, and carbonyl acid derivatives. Particular emphasis is placed on the understanding of reaction mechanisms and the correlation between structure and reactivity. A deeper understanding of the concepts presented during the lecture is reached by solving the problems handed out each time and discussed one week later in the exercise class.

Literature

529-0018-00L Organic Chemistry for Biochemistry and Chemical Biology

Objective
After the completion of this lecture, the students will have an understanding of organic chemistry commonly employed in the field of chemical biology, be able to apply these concepts to the design and synthesis of tools for probing biological pathways, and explain the underlying reaction mechanisms of selective reactions.

Content
The course will discuss past and recent advances in the synthesis of biomolecules, organic chemistry for applications in chemical biology, and the mechanism of relevant reactions. Topics will include chemical ligations, bioorthogonal reactions, photofunctional probes, photopharmacology, activity-based probes, targeted protein degraders, chemical probes for metabolites, fluorescent dyes and imaging, caged biomolecules, conditional activation, site-specific protein modification, and metabolic engineering.

Lecture notes
Lecture notes and other material relevant for the course will be available online under https://bode.ethz.ch/education.html.

Literature
Relevant research articles and review papers will be available in the course and course material.

Prerequisites / notice
This is an advanced organic chemistry course. Prior knowledge of organic synthesis, reactions, and mechanisms is required. Familiarity with biochemistry and biology is recommended.

Laboratory Courses

529-0124-00L BCB I: General Chemistry

Abstract
The general chemistry practical course aims at preparing the students for the work in modern chemistry laboratory. The students are trained to behave safely in the laboratory and use chemicals, chemistry glassware, and related equipment to perform and analyze the equilibrium in basic chemical reactions.

Objective
The students are expected to gain practical experience with as well as establish understanding of the following concepts and phenomena:

- Safe behavior and safety regulations in chemistry laboratory;
- Best practices in common techniques (purification, recrystallization, distillation, etc.);
- Analysis of measured values (measuring error, average value, error analysis);
- Acid-base-equilibria (strengths of acids and bases, pH- and pKa-values, titrations, buffer systems);
- Precipitation equilibria (gravimetry, potentiometry, conductivity measurements);
- Oxidation state and redox reactions (redox-titrations, galvanic elements);
- Metal complexes (syntheses of complexes, ligand exchange reactions, complexometric titration)
- Qualitative analysis (cation and anion separation, determination of cations and anions).

Latest online enrolment is 18.09.2023.
Information about the practical course will be given on the first day.
In the general chemistry practical course students are introduced to the work in chemistry laboratory. During the course they become familiar with common chemistry glassware and related equipment as well as learn basic experimental procedures, such as distillation, recrystallization, purification, digestion etc. Upon the measurements of pH, conductivity, and potential in the course of reactions, students establish the understanding of the chemical equilibrium concept.

Students work with various classes of inorganic compounds and types of chemical reactions, e.g. acid-base, redox, precipitation. They also obtain first experience with the synthesis of metal complexes as well as learn basics of qualitative analysis of an unknown substance.

529-0016-00L BCB III: Organic Chemistry

**Abstract**
Laboratory course in Organic Chemistry for students of "Biochemistry - Chemical Biology"

**Objective**
Introduction into basic techniques used in the organic laboratory. Understanding organic reactions through experiments.

**Content**
Part I: Basic operations such as the isolation, purification, and characterization of organic compounds: distillation, extraction, chromatography, crystallization, IR (UV/1H-NMR)-spectroscopy for the identification of the constitution of organic compounds.

Part II: Organic reactions: preparative chemistry. From simple, one-step to multi-step syntheses. The syntheses include classic Organic Chemistry as well as methods widely used in a Chemical Biology context.

Number of participants limited to 6. The enrolment is done by the D-BIOL study administration.

**Abstract**
The focus of this laboratory course is on current research topics related to metabolic engineering and the general understanding of metabolism, particularly in relation to one carbon metabolism. Projects will be carried out in small teams.

**Objective**
The course aims at introducing technologies to investigate bacterial metabolism and key principles of metabolic engineering. The main focus of this block course is on practical work and will familiarize participants with complementary approaches, in particular genetic, biochemical and analytical techniques including metabolomics. Results will be presented by students in scientific presentations. Another goal is to learn how to write a scientific report.

Data: 02.07.2024 12:39 Autumn Semester 2024 Page 244 of 2667
The course and will include topics such as pathway elucidation & engineering and related ongoing research projects in the lab. Experimental work applied during the course will comprise methods such as cloning work & transformation, growth determination, enzyme activity assays, liquid-chromatography mass-spectrometry and dynamic labeling experiments.

551-1421-00L The Mechanisms of Natural Transformation in Competent Gram-Negative Bacteria

Number of participants limited to 5.
The enrolment is done by the D-BIOL study administration.

Abstract
Students will carry out defined research projects related to the current research topics of the Hospenthal group. The topics will include protein expression of pilins and/or other competence proteins from Gram-negative bacteria, protein purification using affinity chromatography, crystallisation experiments and analysis of assembled pil by electron microscopy.

Objective
The course should enable students to understand concepts of protein expression, purification and the characterisation of biomolecular interactions. In addition, students will learn some basic principles of X-ray crystallography and electron microscopy.

Content
The students will be tutored in their experimental work by an experienced doctoral student. The course will also include a short lecture delivered by M. Hospenthal, providing the theoretical background for the experimental work. Throughout the course, students will receive exercises that further help to explain the theory of the practical work, as well as literature research tasks.

Participation in the following Hospenthal lab projects will be possible:
• Purification, biophysical characterisation and structure determination of pilins
• Purification, biophysical characterisation and structure determination of proteins and protein complexes involved in natural transformation.

Experimental work on this project involves:
• Cloning and mutagenesis
• Recombinant or endogenous protein production in E. coli or Legionella
• Protein purification by affinity chromatography (other chromatographic purification techniques will also be discussed)
• Protein crystallisation and crystal optimisation
• Visualisation of bacterial pil by electron microscopy (negative stain or cryo electron microscopy)
• DNA binding experiments
• Enzymatic activity measurements
• In silico structural analyses using PyMOL and Chimera

Literature
Any required reading of literature will be discussed at the beginning of the course.

Prerequisites / notice
There are no special requirements for this course.

The enrolment is done by the D-BIOL study administration.

Abstract
Research laboratory class in small groups. Research projects on current topics in cellular microbiology and bacterial pathogenesis are assigned to each student.

Objective
Introduction to a current topic in cellular microbiology, molecular genetics of a bacterial pathogen or its interaction with the host's microbiome. Experimental work in the research lab and introduction to the current lab techniques. This includes contributions to the analysis of animal experiment. You will work with the current research literature in bacterial pathogenesis and write a research protocol. Requirement for obtaining the credit points: oral presentation of the research project, a short written exam and evaluation of the research protocol.

Content
Research projects on the model pathogen Salmonella.

Lecture notes
none.

Literature
Literature will be selected with reference to the assigned research project.

**551-0351-00L Membrane Biology**

**Number of participants limited to 12.**

The enrolment is done by the D-BIOL study administration.

**Abstract**
The course will introduce the students to the key concepts in membrane biology and will allow them to be involved in laboratory projects related to that broad field. The course will consist of lectures, literature discussions, and practical laboratory work in small groups. Results of the practical projects will be presented during the poster session at the end of the course.

**Objective**
The aim of the course is to expose the students to a wide range of modern research areas encompassed by the field of membrane biology.

**Content**
Students will be engaged in research projects aimed at understanding the biological membranes at the molecular, organellar and cellular levels. Students will design and perform experiments, evaluate experimental results, analyze the current scientific literature and understand the relevance of their work in the context of the current state of the membrane biology field.

**Lecture notes**
No script

**Literature**
The recommended literature, including reviews and primary research articles, will be provided during the course

**Prerequisites / notice**
The course will be taught in English. All general lectures will be held at ETH Hoenggerberg. Students will be divided into small groups to carry out experiments at ETH or at the Paul Scherrer Institute. Travel to the Paul Scherrer Institute will be by public transportation.

**551-0359-00L Plant Biochemistry**

**Number of participants limited to 11.**

The enrolment is done by the D-BIOL study administration.

**Abstract**
In this block course, students actively participate in ongoing research projects in plant metabolism and plant cell biology, supervised by PhD students and postdoctoral fellows in small groups. The research background is discussed in Journal Clubs. At the end of the course, students present their projects and results in an interactive poster session.

**Objective**
Students are able to independently apply and record current molecular biology methods on plants, critically evaluate and communicate the results, understand the larger context of their research project and develop ideas for further experiments.

**Content**
Projects are newly designed each year and announced a few days before the course starts. Possible projects include the cell biology of starch granule formation (using fluorescence and electron microscopy and protein-protein interaction studies) or RNA metabolism in chloroplasts (using import assays and RNA detection).

**Lecture notes**
No script

**Literature**
Descriptions of the possible projects including individual reading suggestions will be handed out beforehand.

551-1609-00L Single Molecule Biophysics Studies of the Microtubule Cytoskeleton

Number of participants limited to 5.
The enrolment is done by the D-BIOL study administration.

Abstract
This laboratory course has a focus on current research topics in our laboratory related to microtubule nucleation and dynamics and its investigation using in vitro reconstitutions and single molecule biophysics. Projects will be conducted in small groups.

Objective
The course aims to introduce technologies to investigate cytoskeletal processes and regulation using in vitro reconstitutions and single molecule biophysics methods. The main focus of this block course is on practical work and will familiarize participants with complementary approaches, in particular protein purification and biophysical techniques including single molecule fluorescence imaging using Total Internal Reflection Fluorescence Microscopy (TIRFM) and subsequent image analysis methods. Results will be presented by students in scientific presentations. Another goal is to learn how to write a scientific report.

Content
The course will include topics such as microtubule polymerization dynamics and related ongoing research projects in the lab. Experimental work applied during the course will comprise methods such as cloning work & transformation, protein purification, single molecule fluorescence imaging using Total Internal Reflection Fluorescence Microscopy (TIRFM), and single molecule image analysis.

529-0044-00L Genetic Code Expansion for Studying Posttranslational Modifications

Enrolment limited to max 8 students. The enrolment is done by the D-BIOL study administration.

Abstract
In this block course we will prepare proteins bearing site-specifically installed post-translational modifications using genetic code expansion. The impact of the post-translational modifications on enzymatic activity and protein-protein interactions will be studied.

Objective
Students will learn basic techniques for genetic code expansion. They will learn how to synthesize non-canonical amino acids (ncAAs), manipulate plasmids through cloning techniques to introduce an amber codon at a user defined site in a gene of interest, express and purify recombinant proteins bearing site-specific ncAAs using state-of-the-art chromatographic techniques, characterize the target protein using mass spectrometry and analyze the properties of the target protein regarding enzymatic activity and protein-protein interactions using biophysical techniques.

After the course, participants should be able to apply the gained skills in future chemical and molecular biology lab courses and projects. Individual reports describing the experiments and obtained results must be prepared by the end of the course. At the end of the course, each team (consisting of two participants each) will present their results in an oral presentation.
Content
During this block course, the participants will study the impact of different post-translational modifications (PTMs) on protein function using genetic code expansion. The participants will work in teams of two, will first synthesize different ncAAs mimicking PTMs, such as acylated lysine derivatives (e.g., acetyllysine, butyryllysine etc.). These ncAAs will be incorporated into target proteins using orthogonal aminoacyl tRNA synthetase / tRNA pairs, which direct the site-specific incorporation in response to an in frame introduced amber stop codon (amber suppression). Therefore, the participants will introduce the amber stop codon at different positions in the gene of interest using standard molecular cloning techniques. After recombinant expression of the target protein, the participants will isolate the ncAA-bearing target proteins using different chromatography techniques using a FPLC system. After characterization of the PTM-bearing protein using mass spectrometry, the participants will study the impact of the PTM on enzymatic activity and protein-protein interactions using biophysical techniques.

Lecture notes
All the required theoretical and experimental informations can be found in the provided script. Details will be discussed in class. Relevant research papers will be recommended for reading during the seminars.

Prerequisites / notice
This laboratory block course is designed for 3 weeks, 3.5 days. Students should have basic practical knowledge in organic synthesis, molecular cloning, protein expression and purification (participants must have attended the practical course BCB-IV prior to this block course). The maximum number of participants is currently limited to 8. Interested applicants may contact Dr. M. Fottner for further information. Commitment for attendance of entire course is necessary. The course cannot be interrupted by individual absences once started.

Abstract
During the block course, the participants will carry out biological-chemical enzyme evolution experiments using molecular genetic mutation technologies and in vivo selection in recombinant bacterial strains. The class will have its very dense program consists of the practical course itself and an integrated series of seminar/lecture sessions.

Objective
All technologies used for the experiments will be explained to the students in theory and in practice with the goal that they will be able to independently apply them for the course project and in future research endeavors. After the course, an individual report about the results obtained has to be prepared.

Content
The class deals with a specifically designed and genuine research project. We intend to carry out biological-chemical enzyme evolution experiments using molecular genetic mutation technologies and in vivo selection in recombinant bacterial strains. By working in parallel, teams of 2 participants each will generate a variety of different variants of a chorismate mutase. Individual enzyme catalysts will be purified and subsequently characterized using several different spectroscopic methods. The detailed chemical-physical analyses include determination of the enzymes’ kinetic parameters, their molecular mass, and the integrity of the protein structure. The results obtained from the individual evolution experiments will be compared and discussed at the end of the class in a final seminar. We expect that during this lab course we will not only generate novel enzymes, but also gain new mechanistic insights into the investigated catalysts.

Lecture notes
A script will be distributed to the participants on the first day of the course.

Literature

Further literature will be indicated in the distributed script.

Prerequisites / notice
This laboratory block course will involve experiments that require a tight schedule and, particularly in the second half, very long (1) working days. The maximum number of participants for the laboratory class is limited, but surplus applicants may contact P. Kast directly to have their names added to a waiting list. A valid registration is considered a commitment for attendance of the entire course, as involved material orders and experimental preparations are necessary and, once the class has started, the flow of the experiments must not be interrupted by individual absences. In case of an emergency, please immediately notify P. Kast. For more information see http://www.kast.ethz.ch/teaching.html, from where you can also download a flyer.

Bioactive Natural Products from Bacteria
Number of participants limited to 8. The enrolment is done by the D-BIOL study administration.

Abstract
Lab course. In small groups projects of relevance to current research questions in the field of bacterial natural product biosynthesis are addressed.

Objective
Introduction to relevant subjects of the secondary metabolism of bacteria. Training in practical work in a research laboratory. Scientific writing in form of a research report.

Content
Research project on bacteria that produce bioactive natural products (e.g., Streptomycetes, Cyanobacteria, uncultivated bacteria). The techniques used will depend on the project, e.g. PCR, cloning, natural product analysis, precursor feeding studies, enzyme expression and analysis.
### Microbial Community Genomics

**Number of participants limited to 10.**

**Prerequisites:** Participants should bring their own laptop computer. Basic knowledge in [R], Python and/or UNIX is required.

**Abstract**

We provide training in the use of computational methods to address molecular, genetic, ecological and/or evolutionary questions by analyzing DNA sequencing data from microbial communities. The course includes lectures, tutorials, and the development of a research project at the intersection between microbiology and bioinformatics.

**Objective**

Students will learn concepts and methods for analyzing complex 'omics' datasets and applying them in individual projects. To facilitate learning, the course includes lectures on functional genomics, metagenomics and microbiology, along with practical sessions on scientific programming to analyze and visualize biological data. Additionally, students will learn how to plan, execute, report on, and present a scientific project.

**Prerequisites / notice**

Participants should bring their own laptop computer. Basic knowledge in [R], Python and/or UNIX is required.

### Polymer Physics Methods for Unstructured Biomolecules

**Enrollment limited to 12 students. Enrollment is done by the D-BIOL study administration.**

**Abstract**

Establishing a link between known phenomena, concepts and spectroscopic techniques in polymer physics on the one hand and the study of unstructured biological macromolecules on the other. Attention is paid to the relationship between molecular interactions in biopolymers and their tendency to form molecular condensates, such as membraneless organelles.

**Objective**

Expansion of competences for the experimental and analytical treatment and structural characterization of partially and completely unstructured biomacromolecules as well as their interactions and self-organization.

**Content**

Part I: Molecular interactions, concepts of polymer physics, spectroscopic methods; Part II: Polymer types in biology - proteins, DNA/RNA, polysaccharides, lipids; Part III: Molecular modeling and determination of conformational ensembles.

**Lecture notes**

Script for part I of the course in HS2024; slides for all three parts

**Autumn Semester 2024**

**Page 249 of 2667**
Introduction to the diversity of current RNA-research at all levels from structural biology to systems biology using mainly model systems like S. cerevisiae (yeast), mammalian cells.

The students will gain an overview about the diversity of current RNA-research. They will learn to design experiments and use techniques necessary to analyze different aspects of RNA biology. Through lectures and literature seminars, they will learn about the burning questions of RNA research and discuss approaches to address these questions experimentally. In practical lab projects the students will work in one of the participating laboratories. Finally, they will learn how to present and discuss their data in an appropriate manner. Student assessment is a graded semester performance based on individual performance in the laboratory, the written exam and the poster presentation.

Documentation and recommended literature will be provided at the beginning and during the course.

The course will be taught in English.

551-1417-00L In Vivo Cryo-EM Analysis of Dynein Motor Proteins

Abstract

Motor proteins convert chemical energy into mechanical motion. In this block course, we study dynein motor proteins in cilia. Dynein causes conformational change upon ATP hydrolysis and finally generate ciliary bending motion. Participants will analyze cryo-EM data of cilia and visualize in vivo 3D structure of dynein to learn how motor proteins function in the cell.

Objective

The goal of this course is to be familiar with structural biology techniques of cryo-electron tomography and single particle cryo-EM studies on motor proteins. The main focus is 3D image analysis of cryo-EM datasets acquired by highest-end microscopes. Participants will learn structure-function relationship at various scales: how the conformational change of motor proteins causes mechanical force and generates cellular motility.

Content

Motor proteins, such as dynein, myosin and kinesin, hydrolyze ATP to ADP and phosphate to convert chemical energy to mechanical motion. Their function is essential for intracellular transport, muscle contraction and other cellular motility as well as cell division. Motor proteins have been major targets of biophysical studies. There exist questions from atomic to tissue levels – how ATP hydrolysis causes conformational change of motor proteins; how their motion is regulated by calcium, phosphorylation and other factors; how motions of multiple motor proteins are coordinated to generate cellular motility. Structural biology has been playing central roles to answer these questions. X-ray crystallography and single particle cryo-EM address structural analysis at atomic resolution and try to reveal molecular mechanism of conformational change. Cryo-electron tomography analyze localization and 3D structure of motor proteins in the cell to explain how motions of molecular motors happen in the context of cellular environment and are integrated into cellular motion.

In this course, we study dyneins in cilia. Cilia are force-generating organelles, made by nine microtubules and thousands of dyneins. Dynein hydrolyzes ATP and undergoes conformational change, generating linear motion with respect to the microtubule. As a whole system, cilia integrate motions of these dyneins and orchestrate beating motion. To explain ciliary motion at molecular level, we need to know dynein conformational change in the cellular context. Cryo-electron tomography is recently developed technique to study molecular structures in vivo and therefore a suitable method to study dynein in cilia. Recently spatial resolution of these cryo-EM techniques was dramatically improved, driven by development of new types of detectors and electron optics. The participants of this course will learn a program to analyze cryo-electron tomography and single particle cryo-EM data, acquired by highest-end electron microscopes and detectors in ETH and other places, and reconstruct 3D structure (tomogram) of cilia from various organisms (from green algae to human). They will further learn a program to study molecular structures from these tomograms (called subtomogram averaging) and apply it to reconstruct high-resolution 3D structure of dyneins, microtubules and regulatory proteins. This practical course is therefore mainly computational, but we will also provide students a chance to prepare data from green algae, cryo-EM data collection using an electron microscope in PSI and site-visit of highest-end electron microscope facility in ETH.

Abstract

An organic-synthetic sub-project of the current research of a group from the Laboratory of Organic Chemistry is carried out under the guidance of doctoral students.

Objective

Learn to plan and carry out challenging multistep syntheses making use of modern methods; reach a deeper understanding of organic reactions through experimental work; develop an organic-synthetic research project; take accurate notes, write a publication style report, and present the obtained results in a seminar.

Content

An organic-synthetic sub-project of the current research of a group from the Laboratory of Organic Chemistry is carried out under the guidance of doctoral students.

Number of participants limited to 5.

The enrolment is done by the D-BIOL study administration.

The course notes.

No set textbooks. Literature will be indicated or provided by the supervising tutors.

Autumn Semester 2024
Prerequisites / notice
Course prerequisites: Accomplished laboratory course Organic Chemistry I (529-0229-00 or 529-0016-00) and passed session exams Organic Chemistry I (529-0221-00 or 529-1011-00) / Organic Chemistry II (529-0222-00 or 529-1012-00). The number of participants per course is limited to 4.

Abstract
The lectures give an overview of selected drugs and the molecular mechanisms underlying their therapeutic effects in disease. The historical and modern-day methods by which these drugs were discovered and developed are described. Structure-function relationships and the biophysical rules underlying ligand-target interactions will be discussed and illustrated with examples.

Objective
Basic understanding of therapeutic agents with respect to molecular, pharmacological and pharmaceutical properties.

Content
Molecular mechanisms of action of drugs. Structure function and biophysical basis of ligand-target interactions.

Lecture notes
Will be provided in parts before each individual lecture.

#### Abstract
Advanced lecture class providing a broad overview on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

#### Objective
This concept class will be based on common concepts and introduce to the enormous diversity among bacteria and archaea. It will cover the current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

#### Content
Advanced class covering the state of the research in bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

#### Literature
Updated handouts will be provided during the class.

#### Prerequisites / Notice
English

The lecture "Grundlagen der Biologie II: Mikrobiologie" is the basis for this advanced lecture.

#### Abstract
Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

#### Objective
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry. The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

---

*Data: 02.07.2024 12:39  Autumn Semester 2024  Page 252 of 2667*
### Content
Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.
Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

### Lecture notes
Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

### Literature
Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

### Prerequisites / notice
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

### 551-1299-00L Bioinformatics

**Abstract**
Students will study bioinformatic concepts in the areas of metagenomics, genomics, transcriptomics, proteomics, biological networks and biostatistics. Through integrated lectures, practical hands-on exercises and project work, students will also be trained in analytical and programming skills to meet the emerging increase in data-driven knowledge generation in biology in the 21st century.

**Objective**
Students will have an advanced understanding of the underlying concepts behind modern bioinformatic analyses at genome, metagenome and proteome-wide scales. They will be familiar with the most common data types, where to access them, and how to analytically work with them to address contemporary questions in the field of biology.

**Prerequisites / notice**
Course participants have already acquired basic programming skills in UNIX, Python and R.

| 529-0240-00L | Chemical Biology - Peptides | O      | 6    | 3G    | H. Wennemers |
| Abstract     | An advanced course on the synthesis, properties and function of peptides in chemistry and biology. |
| Objective    | Knowledge of the synthesis, properties and function of peptides in chemistry and biology. |
| Content      | Advanced peptide synthesis, conformational properties, combinatorial chemistry, therapeutic peptides, peptide based materials, peptides in nanotechnology, peptides in asymmetric catalysis. |
| Lecture notes| Citations from the original literature relevant to the individual lectures will be assigned weekly. |

| 529-0241-10L | Selectivity in Organic Synthesis | O      | 6    | 3G    | J. W. Bode |
| Abstract     | Fundamentals of selective organic reactions, including current and historical examples of enantioselectivity, regioselectivity, chemoselectivity. Further aspects include recent developments in catalysis, strategies and tools for selective organic synthesis. |
| Objective    | Understanding and explaining the origin of selectivity in organic synthesis and the application of selective organic reactions to the construction of complex organic and biological molecules. |
| Content      | Fundamental concepts and recent advances for the selective synthesis of complex organic molecules, including natural products, pharmaceuticals, and biological molecules. Key concepts include the development of enantioselective and regioselective catalysts, the identification of new reaction mechanisms and pathways, and technological advances for facilitating the synthesis of organic molecules. Analysis of key primarily literature including identification of trends, key precendents, and emerging topics will be emphasized. |
| Lecture notes| will be provided in class and online |
The aim of the course is to learn how to design polymerization reactors and bioreactors to produce polymers and proteins with the specific properties required for their applications. This includes understanding the principles of polymerization processes, kinetic aspects, and the importance of reaction mechanisms. Students will also learn about writing an original research proposal and the regulatory aspects of these processes.

**Literature**

- **Biochemical and Polymer Reaction Engineering**: R.W. Blanch, D.S. Clark, Biochemical Engineering, CRC Press, 1995
- **Surfactants and Colloid Stability**: H.W. Blanch, D. S. Clark, Biochemical Engineering, CRC Press, 1995

**Additional References**

- **Kinetics and control of emulsion polymerization**: H.W. Blanch, D. S. Clark, Biochemical Engineering, CRC Press, 1995
- **Additional handout of slides will be provided during the lectures.**

**Prerequisites**

**Compensatory Courses**

Compensatory courses can be used to compensate for core subjects that have been failed twice. The assignment of the corresponding course units to the regulatory category "core subjects and compensatory courses" in the transcript of records is only made upon application by the student to the study administration office of the degree programme.
Abstract
In this course, various topics related to the development, GMP production and application of therapeutic proteins will be discussed. Furthermore, students will expand their training in pharmaceutical immunology and will be introduced to the basic concepts of pharmaceutical product quality management.

Objective
Students know and understand:
- basic mechanisms and regulation of the immune response
- the pathogenic mechanisms of the most important immune-mediated disorders
- the concepts of vaccination and cancer immunotherapy
- the most frequently used expression systems for the production of therapeutic proteins
- the use of protein engineering tools for modifying different features of therapeutic proteins
- the mechanism of action of selected therapeutic proteins and their application
- basic concepts in the GMP production of therapeutic proteins

Content
The course consists of two parts:

In the first part, students will complete their training in Pharmaceutical Immunology. This part particularly focuses on the pathogenic mechanisms of immune-mediated diseases, vaccination and cancer immunotherapy. Deepened knowledge of immunology will be relevant for understanding the mechanism of action of many therapeutic proteins, as well as for understanding one major concern related to the use of protein-based drugs, namely, immunogenicity.

The second part focuses on topics related to the development and application of therapeutic proteins, such as protein expression, protein engineering, reducing immunogenicity, and GMP production of therapeutic proteins. Furthermore, selected examples of approved therapeutic proteins will be discussed.

Lecture notes
Handouts to the lectures will be available for downloading under http://www.pharma.ethz.ch/scripts/index

Prerequisites / notice
Prerequisites: Either 535-0830-00L Pharmaceutical Immunology I or 551-0317-00L Immunology I

535-0230-00L Medicinal Chemistry I

Objective
Basic understanding of therapeutic agents with respect to molecular, pharmacological and pharmaceutical properties.

Content
Molecular mechanisms of action of drugs. Structure function and biophysical basis of ligand-target interactions

Lecture notes
Will be provided in parts before each individual lecture.

Literature
- J. Piel, M. Pihlofer, A. Vagstad

Prerequisites / notice
Attendance of Medicinal Chemistry II in the spring semester.

551-0313-00L Microbiology (Part I)

Objective
Advanced course on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Content
This concept will be based on common concepts and introduce to the enormous diversity among bacteria and archaea. It will cover the current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Lecture notes
Updated handouts will be provided during the class.

Literature
Current literature references will be provided during the lectures.

Prerequisites / notice
English

529-0041-00L Modern Mass Spectrometry, Hyphenated Methods, and Chemometrics

Objective
Modern mass spectrometry, hyphenated analytical methods, speciation, chemometrics.

Content
Comprehensive knowledge about the analytical methods introduced in this course and their practical applications.

Abstract
Modern mass spectrometry: time-of-flight, orbitrap and ion cyclotron resonance mass spectrometry, ICP-MS. Soft ionization methods, desorption methods, spray methods. Mass spectrometry imaging.

Use of statistical and computer-assisted methods for processing analytical data (chemometrics).

Lecture notes
Lecture notes will be made available online.

Literature
Information about relevant literature will be available in the lectures.

Prerequisites / notice
Exercises are an integral part of the lecture. Prerequisites:
- 529-0051-00 "Analytische Chemie I (3. Semester)"
- 529-0058-00 "Analytische Chemie II (4. Semester)" (or equivalent)
Students will study bioinformatic concepts in the areas of metagenomics, genomics, transcriptomics, proteomics, biological networks and biostatistics. Through integrated lectures, practical hands-on exercises and project work, students will also be trained in analytical and programming skills to meet the emerging increase in data-driven knowledge generation in biology in the 21st century.

### Abstract

Students will have an advanced understanding of the underlying concepts behind modern bioinformatic analyses at genome, metagenome and proteome-wide scales. They will be familiar with the most common data types, where to access them, and how to analytically work with them to address contemporary questions in the field of biology.

### Competencies

**Subject-specific Competencies**

- Concepts and Theories: fostered
- Techniques and Technologies: assessed

**Method-specific Competencies**

- Analytical Competencies: assessed
- Decision-making: fostered
- Media and Digital Technologies: fostered
- Problem-solving: assessed
- Project Management: fostered

**Social Competencies**

- Communication: fostered
- Cooperation and Teamwork: fostered
- Customer Orientation: fostered
- Leadership and Responsibility: fostered
- Self-presentation and Social Influence: fostered
- Sensitivity to Diversity: fostered
- Negotiation: fostered

**Personal Competencies**

- Adaptability and Flexibility: fostered
- Creative Thinking: assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: fostered
- Self-awareness and Self-reflection: fostered
- Self-direction and Self-management: fostered

### Prerequisites / notice

Students bring their own computer with keyboard, internet access (browser) and software to connect to the ETH network via VPN.
Please mind the ETH enrolment deadlines for UZH students: https://www.ethz.ch/en/studies/non-degree-courses/special-students-university-of-zurich.html

**Abstract**

Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

**Objective**

This course focuses on the concepts of classical and modern genetics and genomics.

**Content**

The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

**Lecture notes**

Scripts and additional material will be provided during the semester.

**Competencies**

Subject-specific Competencies

- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies

- Analytical Competencies
- Problem-solving

Social Competencies

- Communication
- Self-presentation and Social Influence

Personal Competencies

**551-0317-00L Immunology I**

**Abstract**

Introduction into structural and functional aspects of the immune system. Basic knowledge of the mechanisms and the regulation of an immune response.

**Objective**

Introduction into structural and functional aspects of the immune system. Basic knowledge of the mechanisms and the regulation of an immune response.

**Content**

- Introduction and historical background
- Innate and adaptive immunity, Cells and organs of the immune system
  - B cells and antibodies
  - Generation of diversity
  - Antigen presentation and Major Histoincompatibility (MHC) antigens
  - Thymus and T cell selection
  - Autoimmunity
  - Cytotoxic T cells and NK cells
  - Th1 and Th2 cells, regulatory T cells
  - Allergies
  - Hypersensitivities
  - Vaccines, immune-therapeutic interventions

**Lecture notes**

Electronic access to the documentation will be provided. The link can be found at "Lernmaterialien"

**Literature**

- Kuby, Immunology, 9th edition, Freeman + Co., New York, 2020

**Prerequisites / notice**

For D-BIOL students Immunology I (WS) and Immunology II (SS) will be examined as one learning entity in a "Sessionsprüfung". All other students write separate exams for Immunology I and Immunology II. All exams (combined exam Immunology I and II, individual exams) are offered in each exam session.

**Competencies**

Subject-specific Competencies

- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies

- Analytical Competencies
- Decision-making
- Problem-solving
- Project Management

Social Competencies

- Communication
- Cooperation and Teamwork

Personal Competencies

- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Self-direction and Self-management

**551-0127-00L Fundamentals of Biology III: Multicellularity**

**Abstract**

The lecture conveys the fundamental concepts underlying multicellularity with an emphasis on the molecular basis of multicellular biological systems and their functional integration into coherent wholes. The structural and functional specialization in multicellular organisms will be discussed by highlighting common and specific functions in fungi, plants, and animals (including humans).

**Objective**

1. Students can describe advantages and challenges associated with being multicellular and outline independent solutions that organisms have developed to cope with the challenges of complex multicellularity.
2. Students can explain how the internal and external structures of fungi, plants and animals function to support survival, growth, behavior, and reproduction.
3. Students can explain the basic pathways and mechanisms of cellular communication regulating cellular behavior (cell adhesion, metabolism, proliferation, reproduction, development).
4. Students can describe how a single cell develops from one cell into many, each with different specialized functions.
Content

The lecture introduces the structural and functional specialization in fungi, plants and animals, including humans. After providing an overview on the diversity of eukaryotic organisms, the lecture will discuss how fungi, plants, animals and humans have evolved structures and strategies to cope with the challenges of multicellularity. The molecular basis underlying communication, coordination and differentiation will be conveyed and complemented by key aspects of reproduction, metabolism development, and regeneration. Topics include form and function of fungi and plants, human anatomy and physiology, metabolism, cell signaling, adhesion, stem cells, regeneration, reproduction, and development.

Literature

Campbell “Biology”, 11th Edition

Prerequisites / notice

Some lecture are held in English.

Self-direction and Self-management fostered

Abstract

The course will introduce students to a selected set of laboratory techniques that are foundational to modern biological research.

Objective

For each of the techniques covered in the course, the students will be able to explain:

a) the physical, chemical and biological principles underlying the technique,

b) the requirements for the sample,

c) the type of raw data collected by the technique,

d) the assumptions and auxiliary information used in the interpretation of the data and

e) how these data can be used to answer a given biological question.

By the end of the course the students will be able to select the appropriate experimental technique to answer a given biological problem and will be able to discuss the advantages and limitations of individual techniques as well as how different techniques can be combined to gain a more complete understanding of a given biological questions.

Content

The course will be based on a combination of lectures, self-study elements and exercises.

The focus will be on the following experimental techniques:

- DNA sequencing
- chromatography
- mass-spectrometry
- UV/Vis and fluorescence spectrometry
- light microscopy
- electron microscopy
- X-ray crystallography
- NMR spectroscopy

Lecture notes

The course is supported by a Moodle page that gives access to all supporting materials necessary for the course.

Competencies

Self-direction and Self-management fostered

Abstract

Molecular models, classical force fields, configuration sampling, molecular dynamics simulation, boundary conditions, electrostatic interactions, analysis of trajectories, free-energy calculations, structure refinement, applications in chemistry and biology. Exercises: hands-on computer exercises for learning progressively how to perform an analyze classical simulations (using the package GROMOS).

Objective

Introduction to classical (atomic) computer simulation of (bio)molecular systems, development of skills to carry out and interpret these simulations.

Content

Molecular models, classical force fields, configuration sampling, molecular dynamics simulation, boundary conditions, electrostatic interactions, analysis of trajectories, free-energy calculations, structure refinement, applications in chemistry and biology. Exercises: hands-on computer exercises for learning progressively how to perform an analyze classical simulations (using the package GROMOS).

Lecture notes

The powerpoint slides of the lectures will be made available weekly on the website in pdf format (on the day preceding each lecture).

Literature

See: www.csms.ethz.ch/education/CSBMS

Prerequisites / notice

Since the exercises on the computer do convey and test essentially different skills than those being conveyed during the lectures and tested at the oral exam, the results of the exercises are taken into account when evaluating the results of the exam (learning component, possible bonus of up to 0.25 points on the exam mark).

For more information about the lecture: www.csms.ethz.ch/education/CSBMS
Subject-specific Competencies

Cell Biophysics

fostered

Media and Digital Technologies

assessed

Objectives

The aim of the course is to learn how to design polymerization reactors and bioreactors to produce polymers and proteins with the specific

analytical models. Experimental results from the literature.

The objective of this course is to show that biological phenomena despite their variety can be analytically described using only two principles

from statistical mechanics: maximization of the entropy and minimization of the Gibbs free energy.

Starting point of the course is the probability theory, which enables to derive step-by-step the two pillars of thermodynamics from

the perspective of statistical mechanics: the maximization of entropy according to the Boltzmann’s law as well as the minimization of the Gibbs

free energy. Then, an assortment of biological phenomena at the molecular and cellular level (e.g. cytoskeletal polymerization, action

potential, photosynthesis, gene regulation, morphogen patterning) will be examined at the light of these two principles with the aim to derive

a quantitative expression describing their behavior. Each analytical model is finally validated by comparing it with the corresponding

experimental results from the literature.

By the end of the course, students will also learn to critically evaluate the concepts of making an assumption and making an approximation.

529-0043-01L

Analytical Strategy

W 6 credits

3G R. Zenobi, S. Giannoukos, D. Günther

Abstract

Problem-oriented development of analytical strategies and solutions.

Objective

Ability to create solutions for particular analytical problems.

Content

Individual development of strategies for the optimal application of chemical, biochemical, and physico-chemical methods in analytical

chemistry solving predefined problems. Experts from industry and administration present particular problems in their field of activity.

Lecture notes / notice

Copies of problem sets and solutions will be distributed free of charge

Prerequisites

529-0051-00 "Analytical Chemistry I (3. Semester)"

529-0058-00 "Analytical Chemistry II (4. Semester)"

(or equivalent)

529-0615-01L

Biochemical and Polymer Reaction Engineering

W 6 credits

3G P. Arosio, P. Fleckenstein

Abstract

Polymerization reactions and processes. Homogeneous and heterogeneous (emulsion) kinetics of free radical polymerization. Post

treatment of polymer colloids. Bioprocesses for the production of molecules and therapeutic proteins. Kinetics and design of aggregation

processes of macromolecules and proteins.

Objective

The aim of the course is to learn how to design polymerization reactors and bioreactors to produce polymers and proteins with the specific

product qualities that are required by different applications in chemical, pharmaceutical and food industry. This activity includes the post-
treatment of polymer latexes, the downstream processing of proteins and the analysis of their colloidal behavior.

Content

We will cover the fundamental processes and the operation units involved in the production of polymeric materials and proteins. In

particular, the following topics are discussed: Overview on the different polymerization processes. Kinetics of free-radical polymerization

and use of population balance models. Production of polymers with controlled characteristics in terms of molecular weight distribution.

Kinetics and control of emulsion polymerization. Surfactants and colloidal stability. Aggregation kinetics and aggregate structure in

conditions of diffusion and reaction limited aggregation. Modeling and design of colloid aggregation processes. Physico-chemical

characterization of proteins and description of enzymatic reactions. Operation units in bioprocessing: upstream, reactor design and

downstream. Industrial production of therapeutic proteins. Characterization and engineering of protein aggregation. Protein aggregation in

biology and in biotechnology as functional materials.

Lecture notes

Additional handout of slides will be provided during the lectures.

Cell Biophysics

W 6 credits

4G T. Zambelli

Abstract

Applying two fundamental principles of thermodynamics (entropy maximization and Gibbs energy minimization), an analytical model is

derived for a variety of biological phenomena at the molecular as well as cellular level, and critically compared with the corresponding

experimental data in the literature.

Objective

Engineering uses the laws of physics to predict the behavior of a system. Biological systems are so diverse and complex prompting the

question whether we can apply unifying concepts of theoretical physics coping with the multiplicity of life’s mechanisms.

Objective of this course is to show that biological phenomena despite their variety can be analytically described using only two principles

from statistical mechanics: maximization of the entropy and minimization of the Gibbs free energy.

Starting point of the course is the probability theory, which enables to derive step-by-step the two pillars of thermodynamics from

the perspective of statistical mechanics: the maximization of entropy according to the Boltzmann’s law as well as the minimization of the Gibbs

free energy. Then, an assortment of biological phenomena at the molecular and cellular level (e.g. cytoskeletal polymerization, action

potential, photosynthesis, gene regulation, morphogen patterning) will be examined at the light of these two principles with the aim to derive

a quantitative expression describing their behavior. Each analytical model is finally validated by comparing it with the corresponding

experimental results from the literature.

By the end of the course, students will also learn to critically evaluate the concepts of making an assumption and making an approximation.
Content
• Basics of theory of probability
• Boltzmann's law
• Entropy maximization and Gibbs free energy minimization
• Ligand-receptor: two-state systems and the MWC model
• Random walks, diffusion, crowding
• Electrostatics for salty solutions
• Elasticity: fibers and membranes
• Molecular motors
• Action potential: Hodgkin-Huxley model
• Photosynthesis and vision
• Gene regulation
• Development: Turing patterns

Theory and corresponding exercises are merged together during the classes.

Lecture notes
No lecture notes because the two proposed textbooks are more than exhaustive!

I am willingly available Mondays 17.00 o'clock - 18.00 in my office GLC F12.2 for whatever discussion about the lessons and the exercises.

I am using OneNote. All lectures will be broadcast via ZOOM, while corresponding videos of the previous years (lectures and exercises) are available in Moodle!!!

Literature

As further deepening:

Prerequisites / notice
Participants need a good command of
• differentiation and integration of a function with one or more variables (basics of Analysis),
• Newton's and Coulomb's laws (basics of Mechanics and Electrostatics).

Competencies

529-0231-00L Organic Chemistry III: Introduction to Asymmetric Synthesis 4 credits 3G E. M. Carreira

Abstract
Methods of Asymmetric Synthesis

Objective
Understanding of the basic principles of diastereoselective synthesis

Content
Conformational analysis: acyclic and cyclic systems; Diastereoselective sigmatropic rearrangements; Diastereoselective Carbonyl addition reactions: Cram- and Felkin-Anh models, carbonyl Lewis acid interactions, chelate controlled reactions; chemistry of enolates, selective formation; asymmetric enolate alkylation; aldol reactions, allyl- and crotyl-metal chemistry; cyclisations, Baldwin rules; Diastereoselective olefin functionalization: hydroboration, dihydroxylation, epoxidation.

Literature
Evans' Problems in Organic Chemistry App
Concepts of the planning of organic synthesis (strategy and tactics), retrosynthetic analysis. Structure-reactivity relation in the context of  

to yield materials with enhanced polymeric characteristics.

1) The students will be able to recognize different polymer types and associate them with their chemical structure and properties (i.e. rubber elasticity, glass transition temperature, etc.)
2) The students will become familiar with various synthetic methods to produce polymers of different architectures and topologies
3) The students will be exposed to different characterization methods (e.g. size exclusion chromatography, mass-spectrometry, nuclear magnetic resonance) that are necessary to confirm the successful synthesis and structure of a polymer
4) The students will understand the mechanism of selected polymerization methodologies
5) The students will be introduced to state-of-the-art polymer synthesis and recent literature examples will be critically discussed

Lecture slides with references to further literature will be available on Moodle

L. Mandelkern, “An Introduction to Macromolecules”
J. M. G. Cowie “Polymers: Chemistry and Physics of Modern Materials”
publications mentioned on the slides

Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

Handout during the course.

551-1407-00L RNA Biology Lecture Series I: Transcription & Processing & Translation

Objective
This course covers aspects of RNA biology related to gene expression at the posttranscriptional level. These include RNA transcription, processing, alternative splicing, editing, export and translation.

Prerequisites / notice
Basic knowledge of cell and molecular biology.

529-0132-00L Inorganic Chemistry III: Organometallic Chemistry and Homogeneous Catalysis

Objective
Towards an understanding of the fundamental coordination-chemical and mechanistic aspects of transition-metal chemistry relevant to homogeneous catalysis.

Prerequisites / notice
Basic knowledge of cell and molecular biology.

551-1409-00L RNA Biology Lecture Series II: Non-Coding RNAs: Biology and Therapeutics

Objective
This course covers aspects of RNA biology related to the functions of non-coding RNAs as well as their use as drugs to treat diseases.

Prerequisites / notice
Basic knowledge of cell and molecular biology.

529-0243-01L Transition Metal Catalysis: From Mechanisms to Applications

Objective
Detailed discussion of selected modern transition metal catalyzed reactions from a synthetic and mechanistic viewpoint.

Prerequisites / notice
Required level: Courses in organic and physical chemistry (kinetics in particular) of the first and second year as well as ACI and III

Competencies
- Subject-specific Competencies
- Method-specific Competencies
- Personal Competencies

Communication
- Assessed

Objective
Detailed discussion of selected modern transition metal catalyzed reactions from a synthetic and mechanistic viewpoint. Synthetic applications of these reactions. Introduction and application of tools for the elucidation of mechanisms. Selected examples of topics include: C-H activation, C-O activation, C-C activation, reductively active ligands, main group redox catalysis, bimetallic catalysis.

| 401-0649-00L | Applied Statistical Regression                                         | Z Dr | 5    | 2V+1U | M. Dettling                                    |
|              | **Abstract**                                                          |      |      |       | This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning "good practice" that can be applied in every student's own projects and daily work life. A special focus will be laid in the use of the statistical software package R for regression analysis. |
|              | **Objective**                                                         |      |      |       | The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling. |
|              | **Content**                                                          |      |      |       | The course starts with the basics of linear modeling, and then proceeds to parameter estimation, tests, confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, multicolinearity problems and model interpretation, as well as general modeling strategies. The last third of the course is dedicated to an introduction to generalized linear models: this includes the generalized additive model, logistic regression for binary response variables, binomial regression for grouped data and poisson regression for count data. |
|              | **Lecture notes**                                                    |      |      |       | A script will be available.                    |

Personal Competencies
- Adaptability and Flexibility: assessed
- Creative Thinking: assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: assessed
- Self-awareness and Self-reflection: fostered
- Self-direction and Self-management: fostered

Prerequisites / notice
The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

Literature
- Faraway (2005): Linear Models with R
- Faraway (2006): Extending the Linear Model with R
- Draper & Smith (1998): Applied Regression Analysis
- Fox (2008): Applied Regression Analysis and GLMs
- Montgomery et al. (2006): Introduction to Linear Regression Analysis

Additional information is given during the lecture.

Prerequisites / notice
The lecture requires an active participation of the students. All students will participate in individual or group work focusing on specific subject of the lecture. Students will have ample time for preparation during lecture time.

401-5640-00L ZüKoSt: Seminar on Applied Statistics Z Dr 0 credits 1K M. Kalisch, F. Balabdaoui, A. Bandeira, Y. Chen, R. Furrer, T. Hothorn, L. Meier,
Presentations will be made available after the seminars. Students gain competences in presenting their work orally, leading discussions about current topics in ecology and evolution, interacting and assessing.

Analytical Competencies

Concepts and Theories

Techniques and Technologies

Decision-making

Problem-solving

Creative Thinking

Critical Thinking

Interaction seminar. Student-led presentations, guests and discussions on current themes in ecology, evolution and population biology.

You will present one paper yourself. Give an introduction to the field of the paper, then show and comment on the main results (all the papers we present are available online, so you can show original figures with a beamer). Finish with a summary of the main points and a discussion of their significance.

Requirements: Knowledge of the basic concepts of statistics is desirable.

Method-specific Competencies

Subject-specific Competencies

Creative Thinking

Critical Thinking

Zürich Ecology and Evolution Interaction Seminar

The course introduces you to recent developments in the fields of cellular and molecular neurobiology. It also supports you to develop your skills in critically reading the scientific literature. You should be able to grasp what the authors wanted to learn i.e. their goals, why the authors chose the experimental approach they used, the strengths and weaknesses of the experiments and the data presented, and how the work fits into the wider literature in the field. You will present one paper yourself, which provides you with practice in public speaking.

You are expected to take part in the discussion and to ask questions. To prepare for this you should read all the papers beforehand (they will be announced a week in advance of the presentation).

Lecture notes

Prerequisites / notice

You must attend at least 80% of the journal clubs, and give a presentation of your own. At the end of the semester there will be a 30 minute oral exam on the material presented during the semester. The grade will be based on the exam (45%), your presentation (45%), and a contribution based on your active participation in discussion of other presentations (10%).

Statistical Consulting

The Statistical Consulting service is open for all members of ETH, including students, and partly also to other persons.

Advice for analyzing data by statistical methods.

Students and researchers can get advice for analyzing scientific data, often for a thesis.

We highly recommend to contact the consulting service when planning a project, not only towards the end of analyzing the resulting data!

This is not a course, but a service. There are no exams nor credits.

Contact: beratung@stat.math.ethz.ch . Tel. 044 632 2223. See also http://stat.ethz.ch/consulting

Requirements: Knowledge of the basic concepts of statistics is desirable.

Abstract

Objective

Content

Prerequisites / notice

Competencies
Presentation and discussion of current research projects carried out by various immunology-oriented research groups in Zurich.

Objective
The aim of this monthly meeting is to provide further education for master and doctoral students as well as Postdocs in diverse topics of immunology and to give an insight in the related research. Furthermore, this platform fosters the establishment of science- and technology-based interactions between the participating research groups.

551-1106-00L Progress Reports in Microbiology and Immunology

Students must sign up via secr.micro.biol.ethz.ch

Abstract
Presentation and discussion of current research results in the field of Microbiology and Infection Immunology

Objective
Precise and transparent presentation of research findings in relation to the current literature, critical discussion of experimental data and their interpretation, development and presentation of future research aims.

551-0209-00L Sustainable Plant Systems (Seminar)

Abstract
Agriculture, food and waste management should use less resources to accept the planetary boundaries. The focus of the seminar is:

(1) Agroecological systems. Can we transform the impact of agricultural in Switzerland and beyond?
(2) Food system transformation. How can local sustainable food systems be built and scaled through policy strategies, food environments and consumer habits.

Objective
Participants will be able to:

(1) Review issues of sustainability in the context of plant science research and literature on sustainable agriculture and the food system.
(2) Analyse and interact on several case studies on agro-ecology and the food system.

Content
Future society has to feed nine billion people, therefore agriculture and food, waste and resource management have to go hand in hand toward the use of less resources and acceptance of the limits of Planetary Boundaries. The focus of the seminar will be:

(1) Research in agroecological systems. How can we transform the impact of agricultural in Switzerland and beyond?
(2) Food system transformation. How can local sustainable food systems be built and scaled through policy strategies, food environments and consumer habits.

The seminar will have (a) two face-to-face sessions, (b) self-organized group work phase with case studies that will be analyzed by student groups and results be presented, (c) participants will publish a report in the ETHZ-PSC Science and Policy Blog on their findings.

551-0120-00L Plant Biology Colloquium (Spring Semester)

Objective
Current topics in Molecular Plant Biology presented by internal and external speakers from academia.

Content

551-0120-01L Plant Biology Colloquium (Autumn Semester)

Abstract
This compulsory course only once. It may be taken in autumn as course 551-0120-00 "Plant Biology Colloquium (Autumn Semester)" or in spring as course 551-0120-01 "Plant Biology Colloquium (Spring Semester)".

Objective
Getting insight into actual areas and challenges of Molecular Plant Biology.

Content

551-1615-00L NMR Methods for Studies of Biological Macromolecules

Prerequisites: Basic knowledge in biological NMR spectroscopy.

Abstract
In this seminar series, topics relevant to solution state NMR with biological macromolecules are treated. Each semester a different aspect of biomolecular NMR is discussed in depth. The course is tailored to advanced students (PhD students and postdocs) who have experience with applications of NMR spectroscopy. Each participant presents a selected topic in form of a seminar.

Objective
The students will actively participate in the course which is held in form of a seminar. Individual students will prepare particular topics of the course based on literature references and present the material in form of a seminar to their fellow students. In short, the students learn to actively participate in discussions and to prepare a presentation of a scientific topic which was mostly unknown to them before.
**Competencies**

### Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies

### Method-specific Competencies
- Analytical Competencies
- Media and Digital Technologies

### Social Competencies
- Communication
- Cooperation and Teamwork
- Customer Orientation
- Sensitivity to Diversity

### Personal Competencies
- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics

### Current Topics in Molecular Health Sciences
- **Z 0 credits 2S**
  - **I. Zanini,** further lecturers

**Abstract**
This course is a seminar series on current research topics within the Institute of Molecular Health Sciences.

**Objective**
The course introduces the participants to recent developments in the fields of molecular health sciences.

### Lecture Series: Space Research and Exploration
- **Z Dr 1 credit 2V**
  - **S. P. Quanz**

**Abstract**
Lecture Series about selected topics of space research and exploration consisting of individual talks given by different leading experts from academia and industry.

**Objective**
- Attending students will
  - experience the interdisciplinarity of space research and exploration spanning physics, engineering, geosciences, biology and more
  - get familiar with the Swiss space research and industry landscape
  - enhance their communication skills by broadening their research horizon
  - have the opportunity for direct learning by posing questions to experts

**Content**
The field of space research and exploration is intrinsically interdisciplinary. Cutting edge space activities are dominated by an interplay between the scientifically desirable and the technologically possible. The Lecture Series: Space Research and Exploration aims to shed light on key questions engaged by leading scientists and engineers today. It consists of weekly lectures, given by different speakers with vast experience in their respective field (e.g., Human Spaceflight, System Engineering of Spacecraft, Space Life Sciences, Space-based astrophysics). Subsequent to the talk, the student will have the opportunity to deepen their understanding by asking questions to the presenter in a moderated Q&A.

Confirmed speakers will be announced by the start of the semester (see lecture from last year for previous speakers).

**Abstract**
The lecture provides an introduction to the basics of biochemistry and molecular biology as well as evolutionary principles. The focus is on bacteria and archaea under consideration of universal concepts.

**Objective**
Introduction to biochemistry, molecular biology and evolutionary principles

**Content**
The lecture introduces biology as an interdisciplinary science. Links to physics and chemistry will manifest as biological processes that operate within the laws of thermodynamics and are rooted in elements, molecules and chemical reactions. The transition from geochemistry to biochemistry is discussed and considered in relation to the origin of life. Evolutionary principles are introduced and resulting processes are used as a guiding principle. Unifying concepts in biology are presented, including the structure and function of cellular macromolecules and the ways in which hereditary information is encoded, decoded and replicated. Central principles of universal energy conversion are looked at, starting from redox processes and focusing on bacteria and archaea. Finally, biological processes are put into an ecosystems perspective.

The lecture is divided into different sections:
1. Geochemical perspectives on Earth and introduction to evolution
2. Building blocks of life
3. Macromolecules: Proteins
4. Membranes and transport across the plasma membrane
5. Universal mechanisms of inheritance, transcription and translation
6. Reaction Kinetics, binding equilibria and enzymatic catalysis
7. Essentials of Catabolism
8. Essentials of Anabolism
9. Metabolism and biogeochemical cycling of elements

**Lecture notes**
The newly conceived lecture is supported by scripts.

**Literature**
The lecture is supported by scripts.

**Abstract**
The lecture deals with a number of basic chemistry concepts. These include (amongst others) chemical reactions, energy transfer during chemical reactions, properties of ionic and covalent bonds, Lewis structures, properties of solutions, kinetics, thermodynamics, acid-base equilibria, electrochemistry and properties of metal complexes.

**Objective**
The course is designed to provide an understanding of the basic principles and concepts of general and inorganic chemistry.

**Abstract**
Fundamentals of Organic Chemistry: molecular structure. Bonding and functional groups; nomenclature; resonance and aromaticity; stereochemistry; conformation; bond strength; organic acids and bases; basic reaction thermodynamics and kinetics; reactive intermediates: carbanions, carbenium ions and radicals.

**Objective**
Understanding the basic concepts and definitions of organic chemistry. Knowledge of the functional groups and classes of compounds that are important in biological systems. Foundations for the understanding of the relationship between structure and reactivity.

**Content**

**Lecture notes**
Lecture notes are available (pdf file). Exercises, answer keys and other handouts can be downloaded from the Moodle course "Organic Chemistry I" of the current semester (https://moodle.app2.let.ethz.ch).
Literature

Prerequisites / notice
The course consists of lectures (36 hours) and problem-solving lessons (20 hours, groups of ca. 25 people). In addition, online exercises are available in the e-learning environment Moodle (Course OC I).

| Abstract    | Mathematics I/II is an introduction to one- and multidimensional calculus and linear algebra emphasizing on applications. |
| Objective   | Students understand mathematics as a language for modeling and as a tool for solving practical problems in natural sciences. Students can analyze models, describe solutions qualitatively or calculate them explicitly if need be. They can solve examples as well as their practical applications manually and using computer algebra systems. |
## Eindimensionale diskrete Entwicklungen ##
- linear, exponentiell, begrenzt, logistisch
- Fixpunkte, diskrete Veränderungsraten
- Folgen und Grenzwerte

## Funktionen in einer Variablen ##
- Reproduktion, Fixpunkte
- Periodizität
- Stetigkeit

## Differentialrechnung (I) ##
- Veränderungsraten-/geschwindigkeit
- Differentialquotient und Ableitungsfunktion
- Anwendungen der Ableitungsfunktion

## Integralrechnung (I) ##
- Stammfunktionen
- Integrationstechniken

## Gewöhnliche Differentialgleichungen (I) ##
- Qualitative Beschreibung an Beispielen:
  - Beschränkt, Logistisch, Gompertz
  - Stationäre Lösungen
  - Lineare DGL 1. Ordnung
  - Trennung der Variablen

## Lineare Algebra ##
- Erste Arithmetische Aspekte
- Matrizenrechnung
- Eigenwerte / -vektoren
- Quadratische LGS und Determinante

Lecture notes
In Ergänzung zu den Vorlesungskapiteln der Lehrveranstaltungen fassen wir wichtige Sachverhalte, Formeln und weitere Ausführungen jeweils in einem Vademecum zusammen.

Dabei gilt:
* Die Skripte ersetzen nicht die Vorlesung und/oder die Übungen!
* Ohne den Besuch der Lehrveranstaltungen verlieren die Ausführungen ihren Mehrwert.
* Details entwickeln wir in den Vorlesungen und den Übungen, um die hier bestehenden Lücken zu schliessen.
* Prüfungsrelevant ist, was wir in der Vorlesung und in den Übungen behandeln.

Laboratory Course General Chemistry (for Biology and Pharmacy) 

Information about the practical course will be given on the first day.

Register in myStudies as early as possible, because the fire protection courses take place separately before the internship starts.

Abstract
Introduction to the practical work in a chemistry laboratory. The most important manipulations and techniques are treated, as well as the most fundamental chemical reaction types.

Objective
- Knowledge of the basic chemical laboratory methods
- Basic knowledge of the scientific approach in experimenting
- Observation and interpretation of chemical processes
- Keeping of a reliable laboratory journal

Content
- Simple chemical working techniques/methods
- Separation techniques
- Physical measurements: mass, volume, pH
- Ionic solids (salts)
- Acid/base chemistry, buffers
- Redox reactions
- Metal complexes
- Titration methods and quantitative spectrometry
- Introduction to qualitative analysis

Lecture notes
Course manual in German (is handed out to the students at the begin of the lessons)

Language: German, English upon request

Literature

is a suitable textbook.

Prerequisites / notice
This practical course causes costs for materials and chemicals. The costs are charged to the students at the end of semester.

By enrolling in this lab course, students confirm that they will thoroughly study and follow all safety information and instructions and that they have an accident insurance valid for Switzerland for the entire duration of the semester.

Advanced Course in Physical Chemistry

Number  Title                                    Type  ECTS  Hours  Lecturers

Abstract
The lecture conveys the fundamental concepts underlying multicellularity with an emphasis on the molecular basis of multicellular biological systems and their functional integration into coherent wholes. The structural and functional specialization in multicellular organisms will be discussed by highlighting common and specific functions in fungi, plants, and animals (including humans).

Objective
1. Students can describe advantages and challenges associated with being multicellular and outline independent solutions that organisms have developed to cope with the challenges of complex multicellularity
2. Students can explain how the internal and external structures of fungi, plants and animals function to support survival, growth, behavior, and reproduction.
3. Students can explain the basic pathways and mechanisms of cellular communication regulating cellular behavior (cell adhesion, metabolism, proliferation, reproduction, development).
4. Students can describe how a single cell develops from one cell into many, each with different specialized functions.

Content
The lecture introduces the structural and functional specialization in fungi, plants and animals, including humans. After providing an overview on the diversity of eukaryotic organisms, the lecture will discuss how fungi, plants, animals and humans have evolved structures and strategies to cope with the challenges of multicellularity. The molecular basis underlying communication, coordination and differentiation will be conveyed and complemented by key aspects of reproduction, metabolism development, and regeneration. Topics include form and function of fungi and plants, human anatomy and physiology, metabolism, cell signaling, adhesion, stem cells, regeneration, reproduction, and development.

Literature
Alberts et al. 'Molecular Biology of the Cell' 6th edition
Campbell 'Biology', 11th Edition

Prerequisites / notice
Some lecture are held in English.

Bioanalytics

Abstract
The course will introduce students to a selected set of laboratory techniques that are foundational to modern biological research.

Objective
For each of the techniques covered in the course, the students will be able to explain:
- the physical, chemical and biological principles underlying the technique,
- the requirements for the sample,
- the type of raw data collected by the technique,
- the assumptions and auxiliary information used in the interpretation of the data and
- how these data can be used to answer a given biological question.

By the end of the course the students will be able to select the appropriate experimental technique to answer a given biological problem and will be able to discuss the advantages and limitations of individual techniques as well as how different techniques can be combined to gain a more complete understanding of a given biological questions.

Content
The course will be based on a combination of lectures, self-study elements and exercises.

The focus will be on the following experimental techniques:
- DNA sequencing
- chromatography
- mass-spectrometry
- UV/Vis and fluorescence spectrometry
- light microscopy
- electron microscopy
- X-ray crystallography
- NMR spectroscopy

Lecture notes
The course is supported by a Moodle page that gives access to all supporting materials necessary for the course.

Foundations of Computer Science

Abstract
This course provides selected computer science concepts for interdisciplinary projects.

Objective
Students learn to:
- encode a problem into a program, test the program, and correct errors.
- understand and improve existing code.
- deal with the complexity of real data.
- store data in a suitable data structure.
- query databases and understand and evaluate the corresponding database model.
- implement models from the natural sciences as a simulation.
- run random experiments and interpret the results.
- explain and apply standard algorithms and evaluate their efficiency.

Content
1. Variables, data types
2. Control structures, logic
3. Sequential data types, search- and sort algorithms, sequence analysis
4. Functions, modules, simulation and animation
5. Manage data with a relational database
6. Matrices, random experiments, cellular automata

Lecture notes
All materials for the lecture are available at www.gdi.ethz.ch

Literature

Prerequisites / notice
This course is based on application-oriented learning. The students spend most of their time working through projects with data from natural science and discussing their results with teaching assistants. To learn the computer science basics there are electronic tutorials available.

J. Dambon
Vertiefung von Statistikmethoden. Nach dem detaillierten Fundament aus Statistik I liegt nun der Fokus auf konzeptueller Breite und konkreter Problemlösungsfähigkeit mit der Statistiksoftware R.

**Objective**

**Content**

- 1. Evaluation of chemical equilibria based on chemical potential
- 2. Interpretation of phase diagrams
- 3. Which interactions between molecules are important in living cells
- 4. Why molecules self-organize into aggregates
- 5. Which physical-chemical basics determine behavior of biomembranes
- 6. What determines the rate of chemical reactions, in particular also of enzymatically catalyzed reactions
- 7. What determines the transport rate of matter and heat

**Lecture notes**

A lecture script is provided

**Literature**

In addition to the lecture script, the following two books can be used to gain deeper understanding

The basic reactions of Organic Chemistry and their mechanisms should be known and the corresponding exam have been passed (cf. course 529-1012-00L Organic Chemistry II for Students of Biology, Pharmaceutical Sciences, and Health Sci. and Tech.).

The prerequisite for passing is the ETH security exam.

By enrolling in this lab course, students confirm that they have thoroughly studied all safety information and will follow all instructions.

Prerequisites / notice

The aim of the course is to provide students with a solid introduction to the fields of population and quantitative genetics (emphasis on basic concepts) and ecological genetics (more emphasis on evolutionary and ecological processes of adaptation and speciation).

Method of instruction

The methods of instruction include lectures, exercises, and exams. Students will be assessed on their understanding of the course material, their ability to apply it to real-world problems, and their ability to work cooperatively in a team environment.

Literature

Handouts

The handouts are available online and will be distributed to students at the beginning of the course. They will be used in class to cover the course material and to supplement the textbook.

Prerequisites

Before enrolling in this course, students must have completed at least one course in mathematics and one course in biology. They must also have a strong interest in the subject matter and be willing to put in the necessary effort to succeed.

Assessment

Assessment will be based on a combination of exams, assignments, and participation in class. The final grade will be calculated based on the following criteria: 30% for the first exam, 30% for the second exam, 30% for the third exam, and 10% for participation and homework assignments.

Handouts

The handouts are available online and will be distributed to students at the beginning of the course. They will be used in class to cover the course material and to supplement the textbook.

**Abstract**

Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

**Objective**

This course focuses on the concepts of classical and modern genetics and genomics.

**Content**

The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

**Lecture notes**

Scripts and additional material will be provided during the semester.

**Abstract**

The advanced course introduces students to plants through a concept-based discussion of developmental processes that integrates physiology and biochemistry with genetics, molecular biology, and cell biology. The course follows the life of the plant, starting with the seed, progressing through germination to the seedling and mature plant, and ending with reproduction and senescence.

**Objective**

The new course "Molecular Life of Plants" reflects the rapid advances that are occurring in the field of experimental plant biology as well as the changing interests of students being trained in this discipline. Contemporary plant biology courses emphasize a traditional approach to experimental plant biology by discussing discrete topics that are removed from the context of the plant life cycle. The course will take an integrative approach that focuses on developmental concepts. Whereas traditional plant physiology courses were based on research carried out on intact plants or plant organs and were often based on phenomenological observations, current research in plant biology emphasizes work at the cellular, subcellular and molecular levels.

The goal of "Molecular Life of Plants" is to train students in integrative approaches to understand the function of plants in a developmental context. While the course focuses on plants, the training integrative approaches will also be useful for other organisms.

**Content**

The course "Molecular Life of Plants" will cover the following topics:

- Seed structure and physiology, their dormancy and germination.
- Seedling establishment and early development.
- Plant reproroduction.
- Structure and Function of Meristems, including stem cells.
- Plant organ development (leaves, roots, flowers etc.).
- Plant-microbe interactions; beneficial friends or pathogenic foes?
- Polyploidy; the benefits, problems and solutions to of multiple genomes.
- Photosynthesis and carbon partitionning.
- Photosynthesis and the evolution of C4 metabolism.
- Starch biosynthesis and degradation.
- Chloroplast development and chlorophyll biosynthesis.
- Senescence mechanisms in plants.
- General principles of RNA silencing.
- MicroRNAs: discovery, general principle and modes of action at the cellular and system levels.
- Chromatin-based RNA silencing.
- Antiviral RNA silencing.
- RNA silencing movement and amplification.

**Abstract**

Advanced lecture class providing a broad overview on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

**Objective**

This concept class will be based on common concepts and introduce to the enormous diversity among bacteria and archaea. It will cover the current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

**Content**

Advanced class covering the state of the research in bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

**Lecture notes**

Updated handouts will be provided during the class.

**Prerequisites / notice**

The lecture "Grundlagen der Biologie II: Mikrobiologie" is the basis for this advanced lecture.
Abstract
Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

Objective
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Content
Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes. Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

Lecture notes
Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

Literature
Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

Prerequisites / notice
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

Abstract
Students will study bioinformatic concepts in the areas of metagenomics, genomics, transcriptomics, proteomics, biological networks and biostatistics. Through integrated lectures, practical hands-on exercises and project work, students will also be trained in analytical and programming skills to meet the emerging increase in data-driven knowledge generation in biology in the 21st century.

Objective
Students will have an advanced understanding of the underlying concepts behind modern bioinformatic analyses at genome, metagenome and proteome-wide scales. They will be familiar with the most common data types, where to access them, and how to analytically work with them to address contemporary questions in the field of biology.

Prerequisites / notice
Course participants have already acquired basic programming skills in UNIX, Python and R. Students bring their own computer with keyboard, internet access (browser) and software to connect to the ETH network via VPN.
Adaptability and Flexibility fostered

ECTS
Mainly based on original literature, a detailed list will be distributed during the lecture and will include topics such as pathway elucidation & engineering and related ongoing research projects in the lab.

Nucleic Acids and Carbohydrates will be provided at the beginning of the course.

Number of participants limited to 6.

The enrolment is done by the D-BIOL study administration.

The focus of this laboratory course is on current research topics related to metabolic engineering and the general understanding of metabolism, particularly in relation to one carbon metabolism. Projects will be carried out in small teams.

The course aims at introducing technologies to investigate bacterial metabolism and key principles of metabolic engineering. The main focus of this block course is on practical work and will familiarize participants with complementary approaches, in particular genetic, biochemical and analytical techniques including metabolomics. Results will be presented by students in scientific presentations. Another goal is to learn how to write a scientific report.

The course will include topics such as pathway elucidation & engineering and related ongoing research projects in the lab. Experimental work applied during the course will comprise methods such as cloning work & transformation, growth determination, enzyme activity assays, liquid-chromatography mass-spectrometry and dynamic labeling experiments.

None

Will be provided at the beginning of the course.

Note for BSc Biology students: Only one of the two concept courses 529-0731-00 Nucleic Acids and Carbohydrates (autumn semester) or 529-0732-00 Proteins and Lipids (spring semester) can be counted for the Bachelor's degree.
Students will carry out defined research projects related to the current research topics of the Hospenthal group. The topics will include protein expression of pilins and/or other competence proteins from Gram-negative bacteria, protein purification using affinity chromatography, crystallisation experiments and analysis of assembled pili by electron microscopy.

The enrolment is done by the D-BIOL study administration.

Students will be tutored in their experimental work by an experienced doctoral student. The course will also include a short lecture delivered by M. Hospenthal, providing the theoretical background for the experimental work. Throughout the course, students will receive exercises that further help to explain the theory of the practical work, as well as literature research tasks.

Participation in the following Hospenthal lab projects will be possible:
- Purification, biophysical characterisation and structure determination of pilins
- Purification, biophysical characterisation and structure determination of proteins and protein complexes involved in natural transformation.

Experimental work on this project involves:
- Cloning and mutagenesis
- Recombinant or endogenous protein production in E. coli or Legionella
- Protein purification by affinity chromatography (other chromatographic purification techniques will also be discussed)
- Protein crystallisation and crystal optimisation
- Visualisation of bacterial pili by electron microscopy (negative stain or cryo electron microscopy)
- DNA binding experiments
- Enzymatic activity measurements
- In silico structural analyses using PyMOL and Chimera

Any required reading of literature will be discussed at the beginning of the course.

551-0337-00L  
Cell Biology of the Nucleus  
W 6 credits  7P  R. Kroschewski, Y. Barral,  
M. Jagannathan, S. Jessberger, K. Weis

Number of participants limited to 14.

The enrolment is done by the D-BIOL study administration.

The aim of our course is to introduce the students to the organizational principles of the nucleus using budding yeast, drosophila and vertebrate cells as model systems. Emphasis is given to:
- Establishment of nuclear identity and nuclear-cytoplasmic communication
- Reorganization of the nucleus in aging
- Animal cells during the generation of cell diversity and neuronal differentiation

By the end of the course, based on lectures, literature reading and practical lab work, the students will be able to formulate open questions concerning the function of the nucleus. Thus, the students will know about the mechanisms and consequences of nuclear-cytoplasmic compartmentalization, DNA clustering in the nucleus and cytoplasm during cell divisions and aging.

During this block-course, the students will
- learn how organelles establish and maintain identity with a focus on the nucleus
- discover the evolutionary and functional plasticity of the nucleus
- design, apply, evaluate and compare experimental strategies

Students - in groups of 2 or max. 3 - will be integrated into a research project connected to the subject of the course, within one of the participating research groups.

Lectures and technical notes will be given and informal discussions held to provide you with the theoretical background.

Optional papers linked to the projects shall support you in that choice. They can also serve as framework orientation for the practical parts of this block course.

Documentation and recommended literature (review articles) will be provided during the course.
### Creative Thinking

**Concepts and Theories**

- Insight into and overview about the genetic and metabolic alterations that underlie different cancer types, the complex cancer cell circuitries governing tumor development, progression, and metastasis. Understanding of modern approaches used in contemporary basic and translational cancer research and sophisticated strategies to control individual cancers and combat drug resistance. The course is closely linked to ongoing research projects in the lab to provide the participants with direct insights into current experimental approaches and strategies. Student assessment is a graded performance based on individual performance in the laboratory, a written report of their data and a presentation of a recent paper published in a top ranking international peer reviewed journal that relates to cancer.

**Method-specific Competencies**

- Perform quantitative proteomic analysis (protein identification with Mascot and/or Sequest Softwares)
- Perform qualitative proteomic analysis (label-free and labeled analyses)

**Social Competencies**

- Communication
- Cooperation and Teamwork

**Personal Competencies**

- Critical Thinking

### Introduction to Mass Spectrometry-Based Proteomics

**Number of participants limited to 12.**

- The enrolment is done by the D-BIOL study administration.

**Abstract**

- Protein Analysis by Mass Spectrometry

**Objective**

- How to prepare a protein sample for MS analysis (trypsin digestion, C18 clean-up)
- Principles of data acquisition LC-MS (QTOF and/or Ion Trap instruments)
- Perform qualitative proteomic analysis (protein identification with Mascot and/or Sequest Softwares)
- Perform quantitative proteomic analysis (label-free and labeled analyses)
- Analyze/interpret the data to find up/down regulated proteins

**Competencies**

- Subject-specific Competencies: Concepts and Theories
- Method-specific Competencies: Analytical Competencies
- Social Competencies: Cooperation and Teamwork
- Personal Competencies: Critical Thinking

### Block Courses in 2nd Quarter of the Semester

**Abstract**

- Research laboratory class in small groups. Research projects on current topics in cellular microbiology and bacterial pathogenesis are assigned to each student.

**Objective**

- Introduction to a current topic in cellular microbiology, molecular genetics of a bacterial pathogen or its interaction with the host's microbiome. Experimental work in the research lab and introduction to the current lab techniques. This includes contributions to the analysis of animal experiment. You will work with the current research literature in bacterial pathogenesis and write a research protocol.

**Requirement for obtaining the credit points:** oral presentation of the research project, a short written exam and evaluation of the research protocol.

**Content**

- Research projects on the model pathogen Salmonella.

**Lecture notes**

- none.

**Literature**

- Literature will be selected with reference to the assigned research project.

**Competencies**

Introduction of the biological and ecological basics of fungi in forests. Focusing on mycorrhizal, saprobic, and pathogenic fungi and their

**Objective**

Knowledge of the fungi of forest and its ecological significance. Knowing of current methodological research approaches. Self-reliant and deepened activities of selected topics of fungi from forests.

**Content**

Introduction of the biological and ecological basics of fungi in forests. Focusing on mycorrhizal, saprobic, and pathogenic fungi and their functional relevance in the forest ecosystems. To get to know current methodological research approaches on the basis of selected examples with practical works in forest and lab as well as excursions and lectures.

**Lecture notes**

Unterlagen zum Kurs werden abgegeben.

**Literature**

**Prerequisites / notice**

Der Blockkurs findet an der Eidg. Forschungsanstalt WSL in Birmensdorf statt. Der Wald vor der Haustüre des Institutes macht diesen Kurs besonders praxisnah.

Erreichbarkeit mit Tram 14 bis Triemli, danach PTT-Bus 220 oder 350 bis Birmensdorf Sternen/WSL, oder mit S9 bis Birmensdorf SBB und mit PTT-Bus eine Station in Richtung Zürich bis Birmensdorf Sternen/WSL.

**Computational Methods in Genome and Sequence Analysis**

This course aims to provide students with a comprehensive overview of computational methods for sequence analysis and assist with developing skills for application of computational approaches by experimental scientists in the life sciences.

**Objective**

Methods for analyzing animal genomes are increasingly becoming important for applications in human health and biotechnology suggesting that the experience will be useful to develop relevant expertise for a broad range of functions. Students will have the opportunity to advance their knowledge in programming by focusing on algorithms for genome and gene sequence analysis. A major goal of the course will be to lead the student to an independent and empowered attitude towards computational problems. For reaching this goal the students will work on an implementation of a solution for a set real-world problem in genome and sequence analysis under guided supervision.
The course will consist of a series of lectures, assignments for implementing elementary tasks in Python, project development and discussion workshops, and 3 and a half week of practical work implementing a Python script as a solution to a real world problem associated with sequence analysis. At the end of the course students will explain their solutions and demonstrate the functionality of their implementations, which will then be discussed and commented on by the group. It is expected that students will be able to apply the knowledge to improve on concrete problems.

Prerequisites / notice
- It is recommended to bring your own computer with a Python installation to the course
- simple computers can be provided
- Programming basics with Python

551-0359-00L  Plant Biochemistry

Number of participants limited to 11.
The enrolment is done by the D-BIOL study administration.

Objective

Students are able to independently apply and record current molecular biology methods on plants, critically evaluate and communicate the results, understand the larger context of their research project and develop ideas for further experiments.

Content

Projects are newly designed each year and announced a few days before the course starts. Possible projects include the cell biology of starch granule formation (using fluorescence and electron microscopy and protein-protein interaction studies) or RNA metabolism in chloroplasts (using import assays and RNA detection).

Lecture notes
No script

551-1609-00L  Single Molecule Biophysics Studies of the Microtubule Cytoskeleton

Number of participants limited to 5.
The enrolment is done by the D-BIOL study administration.

Abstract

This laboratory course has a focus on current research topics in our laboratory related to microtubule nucleation and dynamics and its investigation using in vitro reconstitutions and single molecule biophysics. Projects will be conducted in small groups.

Objective

The course aims to introduce technologies to investigate cytoskeletal processes and regulation using in vitro reconstitutions and single molecule biophysics methods. The main focus of this block course is on practical work and will familiarize participants with complementary approaches, in particular protein purification and biophysical techniques including single molecule fluorescence imaging using Total Internal Reflection Fluorescence Microscopy (TIRFM) and subsequent image analysis methods. Results will be presented by students in scientific presentations. Another goal is to learn how to write a scientific report.
In this block course we will prepare proteins bearing site-specifically installed post-translational modifications using genetic code expansion. The course will include topics such as microtubule polymerization dynamics and related ongoing research projects in the lab. Experimental work applied during the course will comprise methods such as cloning work & transformation, protein purification, single molecule fluorescence imaging using Total Internal Reflection Fluorescence Microscopy (TIRFM), and single molecule image analysis.

Objective
Students will learn basic techniques for genetic code expansion. They will learn how to synthesize non-canonical amino acids (ncAAs), manipulate plasmids through cloning techniques to introduce an amber codon at a user defined site in a gene of interest, express and purify recombinant proteins bearing site-specific ncAAs using state-of-the-art chromatographic techniques, characterize the target protein using mass spectrometry and analyze the properties of the target protein regarding enzymatic activity and protein-protein interactions using biophysical techniques.

Content
During this block course, the participants will study the impact of different post-translational modifications (PTMs) on protein function using genetic code expansion. The participants will work in teams of two, will first synthesize different ncAAs mimicking PTMs, such as acylated lysine derivates (e.g. acetylylsine, butryllysine etc.). These ncAAs will be incorporated into target proteins using orthogonal aminoacyl tRNA synthetase / tRNA pairs, which direct the site-specific incorporation in response to an in frame introduced amber stop codon (amber suppression). Therefore, the participants will introduce the amber stop codon at different positions in the gene of interest using standard molecular cloning techniques. After recombinant expression of the target protein, the participants will isolate the ncAA-bearing target proteins using different chromatography techniques using a FPLC system. After characterization of the PTM-bearing protein using mass spectrometry, the participants will study the impact of the PTM on enzymatic activity and protein-protein interactions using biophysical techniques.

Prerequisites / notice
This laboratory block course is designed for 3 weeks, 3.5 days. Students should have basic practical knowledge in organic synthesis, molecular cloning, protein expression and purification (participants must have attended the practical course BCB-IV prior to this block course). The maximum number of participants is currently limited to 8. Interested applicants may contact Dr. M. Fottner for further information. Commitment for attendance of entire course is necessary. The course cannot be interrupted by individual absences once started.

Lecture notes
All the required theoretical and experimental informations can be found in the provided script. Details will be discussed in class. Relevant research papers will be recommended for reading during the seminars.

Enrolment limited to max 8 students. The enrolment is done by the D-BIOL study administration.

Abstract
In this block course we will prepare proteins bearing site-specifically installed post-translational modifications using genetic code expansion. The impact of the post-translational modifications on enzymatic activity and protein-protein interactions will be studied.

Biological Chemistry B: New Enzymes from Directed Evolution Experiments

W
6 credits
7P
P. A. Kast, M. Levasseur

The enrolment is done by the D-BIOL study administration.

Abstract
During the block course in the fall semester, we will carry out biological-chemical enzyme evolution experiments using molecular genetic mutation technologies and in vivo selection in recombinant bacterial strains. The class deals with a specifically designed and genuine research project. We intend to carry out biological-chemical enzyme evolution experiments using molecular genetic mutation technologies and in vivo selection in recombinant bacterial strains. By working in parallel, teams of 2 participants each will generate a variety of different variants of a chorismate mutase. Individual enzyme catalysts will be purified and subsequently characterized using several different spectroscopic methods. The detailed chemical-physical analyses include the determination of the enzymes' kinetic parameters, their molecular mass, and the integrity of the protein structure. The results obtained from the individual evolution experiments will be compared and discussed at the end of the class in a final seminar. We expect that during this lab course we will not only generate novel enzymes, but also gain new mechanistic insights into the investigated catalysts.

Lecture notes
A script will be distributed to the participants on the first day of the course.
I. Zemp
M. Schuppler

Introduction to the physiological and biochemical action of insulin signaling and its role in the fasted/feeding response and in obesity and diabetes.

Further literature will be indicated in the distributed script.

Prerequisites / notice
This laboratory course will involve experiments that require a tight schedule and, particularly in the second half, very long (!) working days. The maximum number of participants for the laboratory class is limited, but surplus applicants may contact P. Kast directly to have their names added to a waiting list. A valid registration is considered a commitment for attendance of the entire course, as involved material orders and experimental preparations are necessary and, once the class has started, the flow of the experiments must not be interrupted by individual absences. In case of an emergency, please immediately notify P. Kast. For more information see http://www.kast.ethz.ch/teaching.html, from where you can also download a flyer.

Methods in Cellular Biochemistry
551-0336-00L
Methods in Cellular Biochemistry
Number of participants limited to 19.
The enrolment is done by the D-BIOL study administration.

Abstract
Students will learn about biochemical approaches to analyze cellular functions. The course consists of practical projects in small groups, lectures and literature discussions. The course concludes with the presentation of results at a poster session.

Objective
Students will learn to design, carry out and assess experiments using current biochemical and cell biological strategies to analyze cellular functions in model systems. In particular they will learn novel imaging techniques along with biochemical approaches to understand fundamental cellular pathways. Furthermore, they will learn to assess strengths and limitations of the different approaches and be able to discuss their validity for the analysis of cellular functions.

Literature
Documentation and recommended literature (review articles and selected primary literature) will be provided during the course.

Insulin Signaling
551-1515-00L
Insulin Signaling
Number of participants limited to 15.
The enrolment is done by the D-BIOL study administration.

Abstract
Introduction to the physiological and biochemical action of insulin signaling and its role in the fasted/feeding response and in obesity and diabetes.

Objective
The students will obtain an overview about the current topics of research in insulin signaling and how it impacts on growth, metabolism and cell differentiation. They will learn to design experiments and use techniques necessary to analyze different aspects of insulin signaling, including physiological actions in whole animals as well as in tissue culture. Through lectures and literature seminars, they will learn about the open questions of insulin signaling research and discuss approaches to address these questions experimentally.

In practical lab projects the students will perform physiological in vivo studies as well as biochemical experiments. Finally, they will learn how to present and discuss their data. Student assessment is a graded semester performance based on individual performance in the laboratory, a written exam and the lab data presentation.

Experimental Food Microbiology for Biologists
752-4020-00L
Experimental Food Microbiology for Biologists
Number of participants limited to 12.
Minimum number of participants: 6 (below this number the course will be cancelled)
The course can only be booked via the Biology Student secretariat.

Number of participants limited to 20.
The enrolment is done by the D-BIOL study administration.

Abstract
Introduction to food microbiology, covering food spoilage, foodborne pathogens and the psychrophilic microbiome of aquatic systems.

Objective
The students will obtain an overview about the current topics of research in food microbiology and how it impacts on food quality and safety. They will learn to design experiments and use techniques necessary to analyze different aspects of food microbiology, including physiological actions in whole animals as well as in tissue culture. Through lectures and literature seminars, they will learn about the open questions of food microbiology research and discuss approaches to address these questions experimentally.

In practical lab projects the students will perform physiological in vivo studies as well as biochemical experiments. Finally, they will learn how to present and discuss their data. Student assessment is a graded semester performance based on individual performance in the laboratory, a written exam and the lab data presentation.
Teaching of basic experimental knowledge for detection and identification of microorganisms in food. Practical experiments were accompanied by theoretical introductions. Students become acquainted with classical and state-of-the-art molecular techniques for the rapid detection of foodborne pathogens and experiments in dependence on current research topics of the Laboratory of Food Microbiology.

Fachliche Lernziele

Die Studierenden
- setzen im Studium erworbenes und im Rahmen der Lehrveranstaltung neu erarbeitetes Wissen ein, um zu beurteilen, welche Mikroorganismen in welchen Lebensmitteln relevant sind.
- können entscheiden, welche Verfahren zum Nachweis welcher Mikroorganismen geeignet sind.

Überfachliche Lernziele

Die Studierenden
- evaluieren und bewerten ihre Ergebnisse vor dem Hintergrund der verwendeten Methoden.
- dokumentieren ihre Tätigkeiten in einem Laborjournal in übersichtlicher Form und diskutieren die erhaltenen Ergebnisse kritisch.
- präsentieren die erhaltenen in mündlicher Form verständlich und nachvollziehbar.

Teaching of basic experimental knowledge for detection and identification of foodborne pathogens by applying state-of-the-art techniques as well as modern molecular techniques for the rapid identification of relevant foodborne pathogens.

Lecture notes

Handouts were provided at the start of the course

Literature

- Krämer: "Lebensmittel-Mikrobiologie" (Ulmer; UTB)
- Süssmuth et al.: "Mikrobiologisch-Biochemisches Praktikum" (Thieme)

Prerequisites

Important information!

During the course we will work with the food-borne pathogen Listeria monocytogenes. Listeria monocytogenes represents a particular threat to pregnant women. Due to biosafety reasons participation is not allowed in case of pregnancy.

Microbial Community Genomics

W 6 credits 7P S. Sunagawa

Number of participants limited to 10.

Prerequisites: Participants should bring their own laptop computer. Basic knowledge in [R], Python and/or UNIX is required.

The enrolment is done by the D-BIOL study administration.

Abstract
We provide training in the use of computational methods to address molecular, genetic, ecological and/or evolutionary questions by analyzing DNA sequencing data from microbial communities. The course includes lectures, tutorials, and the development of a research project at the intersection between microbiology and bioinformatics.

Objective

Students will learn concepts and methods for analyzing complex 'omics' datasets and applying them in individual projects. To facilitate learning, the course includes lectures on functional genomics, metagenomics and microbiology, along with practical sessions on scientific programming to analyze and visualize biological data. Additionally, students will learn how to plan, execute, report on, and present a scientific project.

Prerequisites

Participants should bring their own laptop computer. Basic knowledge in [R], Python and/or UNIX is required.

Bioactive Natural Products from Bacteria

W 6 credits 7P J. Piel

Number of participants limited to 8.

The enrolment is done by the D-BIOL study administration.

Abstract
Lab course. In small groups projects of relevance to current research questions in the field of bacterial natural product biosynthesis are addressed.

Objective
Introduction to relevant subjects of the secondary metabolism of bacteria. Training in practical work in a research laboratory. Scientific writing in form of a research report.

Content
Research project on bacteria that produce bioactive natural products (e.g., Streptomycetes, Cyanobacteria, uncultivated bacteria). The techniques used will depend on the project, e.g. PCR, cloning, natural product analysis, precursor feeding studies, enzyme expression and analysis.

Lecture notes
none.
Introduction to Ecology

Number of participants limited to 15. The enrolment is done by the D-BIOL study administration.

ATTENTION: Students of the biology teaching diploma, please contact Dr. O. Martin until 01.08.2024.

Abstract

Objective

Studierende vertiefen ihr Wissen zu ökologischen Themen konkret anhand von:

- Vorlesungen zu Grundlagen der Ökologie
- Planen und Durchführen von Experimenten (z.B. Verhaltensökologie mit Insekten)
- Literaturdiskussionen
- Einblicke in aktuelle ökologische Forschungsarbeiten im Raum Zürich (z.B. Gastvorträge, Laborbesuche)
- Besprechung der Möglichkeiten zum Einsatz von Ökologie im theoretischen und praktischen Unterricht

Content

- Einleitung: evolutionäre Hintergrund der Ökologie / Ökologie in Forschung und Praxis
- Umweltbedingungen und Ressourcen: Abiotische Umweltbedingungen & Verfügbarkeit von Ressourcen / Klima & Biome der Erde
- Individuen & Populationen: Geburt, Tod & Wanderungen / Interessenkreis Konkurrenz / Prädation, Weidegang & Parasiten / Molekular & evolutionäre Ökologie
- Lebensgemeinschaften und Ökosysteme: Von Populationen zu Lebensgemeinschaften / Muster des Artenreichtums / Energie- & Stofffluss durch Ökosysteme
- Angewandte Aspekte der Ökologie: Globale biogeochemische Kreisläufe & ihre Veränderung durch den Menschen / Naturschutzbiologie / Ökologie des Menschen: Bevölkerungswachstum, Krankheiten & Nahrungsernährung

Polymers Physics Methods for Unstructured Biomolecules

Enrollment limited to 12 students. Enrollment is done by the D-BIOL study administration.

Abstract

Establishing a link between known phenomena, concepts and spectroscopic techniques in polymer physics on the one hand and the study of unstructured biological macromolecules on the other. Attention is paid to the relationship between molecular interactions in biopolymers and their tendency to form molecular condensates, such as membraneless organelles.

Objective

Expansion of competences for the experimental and analytical treatment and structural characterization of partially and completely unstructured biomacromolecules as well as their interactions and self-organization.

Content

- Part I: Molecular interactions, concepts of polymer physics, spectroscopic methods; Part II: Polymer types in biology - proteins, DNA/RNA, polysaccharides, lipids; Part III: Molecular modeling and determination of conformational ensembles.

Lecture notes

Script for part I of the course in HS2024; slides for all three parts.

Abstract

Bryophytes: basic knowledge on the morphology, ecology, biogeography and endangerment of bryophytes; knowledge of common species; skills in the determination of bryophytes; field trip.

Ferns: basic knowledge on the life cycle, morphology, evolution and ecology of ferns; identification of Swiss ferns; field trips.

Objective

Bryophytes: basic knowledge on the morphology, ecology, biogeography and endangerment of bryophytes; knowledge of common species; skills in the determination of bryophytes.

Ferns: basic knowledge on the life cycle, morphology, evolution and ecology of ferns; identification of Swiss ferns.

Content

Bryophytes: Systematics and morphology of hornworts, liverworts and mosses and additional topics such as ecology, biogeography, diversity and endangerment of bryophytes; one full-day field trip.

Ferns: Life cycle and morphology; evolutionary groups of ferns including horsetails and lycopods; mating systems, phylogeny and evolutionary processes; ecology; full-day and half-day field trips.
This course aims at the understanding of the cellular and molecular mechanisms underlying tissue repair processes in response to different injuries. The focus will be on repair of the skin and the liver. In addition, we will highlight the parallels and differences between tissue repair and cancer.

Objective:
The students will obtain an overview about the diversity of current RNA-research at all levels from structural biology to systems biology using mainly model systems like S. cerevisiae (yeast), mammalian cells. The goal is to acquire the techniques to image bacteria by electron cryotomography, resolving their structure in a native state, in 3D, and to understand the importance of motor proteins in cellular motility.

Method-specific Competencies:
- Analytical Competencies fostered
- Communication fostered
- Cooperation and Teamwork fostered
- Creative Thinking fostered

Personal Competencies:
- Adaptability and Flexibility fostered
- Leadership and Responsibility fostered
- Self-direction and Self-management fostered

Data: 02.07.2024 12:39 Autumn Semester 2024 Page 289 of 2667
Content

Motor proteins, such as dynein, myosin and kinesin, hydrolyze ATP to ADP and phosphate to convert chemical energy to mechanical motion. Their function is essential for intracellular transport, muscle contraction and other cellular motility as well as cell division. Motor proteins have been major targets of biophysical studies. There exist questions from atomic to tissue levels – how ATP hydrolysis causes conformational change of motor proteins; how their motion is regulated by calcium, phosphorylation and other factors; how motions of multiple motor proteins are coordinated to generate cellular motility. Structural biology has been playing central roles to answer these questions. X-ray crystallography and single particle cryo-EM address structural analysis at atomic resolution and try to reveal molecular mechanism of conformational change. Cryo-electron tomography analyze localization and 3D structure of motor proteins in the cell to explain how motions of molecular motors happen in the context of cellular environment and are integrated into cellular motion.

In this course, we study dynesins in cilia. Cilia are force-generating organelles, made by microtubules and thousands of dyneins. Dynein hydrolyzes ATP and undergoes conformational change, generating linear motion with respect to the microtubule. As a whole system, cilia integrate motions of these dyneins and orchestrate beating motion. To explain ciliary motion at molecular level, we need to know dynein conformational change in the cellular context. Cryo-electron tomography is recently developed technique to study molecular structures in vivo and therefore a suitable method to study dynein in cilia. Recently spatial resolution of these cryo-EM techniques was dramatically improved, driven by development of new types of detectors and electron optics. The participants of this course will learn a program to analyze cryo-electron tomography and single particle cryo-EM data, acquired by highest-end electron microscopes and detectors in ETH and other places, and reconstruct 3D structure (tomogram) of cilia from various organisms (from green algae to human). They will further learn a program to study molecular structures from these tomograms (called subtomogram averaging) and apply it to reconstruct high-resolution 3D structure of dyneines, microtubules and regulatory proteins. This practical course is therefore mainly computational, but we will also provide students a chance of cilia preparation from green algae, cryo-EM data collection using an electron microscope in PSI and site-visit of highest-end electron microscope facility in ETH.

Lecture notes

Scripts will be distributed during the course.

Literature

An overview is given in the following review articles. Further literature will be indicated during the course.

Block Courses in the 1st Half of the Semester

From 17.09.2024 to 01.11.2024

Abstract

This course combines Limnology (the study of inland waters in its broad sense) with ecological and evolutionary concepts. It deals with rivers, groundwater and lakes. This course contains a lecture part, an experimental part, two determination courses (aquatic invertebrates and algae) as well as excursions.

Objective

During this course you will get an overview of the world's typical continental aquatic ecosystems. After this course you will be able to understand how aquatic organisms have adapted to their habitat, and how the interactions (e.g. food web) between organisms work. During the experimental part of this course you will learn the principles of doing research to observe interrelations in aquatic ecosystems. You will measure and interpret biological and physical data (e.g. during experiments, field work) and present the collected knowledge scientifically.

After this course you will know the most important aquatic species groups (macroinvertebrates, microinvertebrates and freshwater algae) in Switzerland and the most important identification traits.

Content

The course contains a lecture part, an experimental part, two determination courses (aquatic invertebrates and algae) and field excursions.

Lecture

The lecture part covers ecology and evolution of aquatic organisms in lentic and lotic waters. Topics include: Adaptations, distribution patterns, biotic interactions, and conceptual paradigms in freshwater ecosystems; important aspects regarding ecosystem metabolism and habitat properties of freshwaters; applied case studies and experiments testing ecological and evolutionary processes in freshwaters.

Practical part:

The practical part includes an excursion to Greifensee and a 3-day-excursion to the river Glatt in Niederuzwil, where you independently perform small research projects. Additionally, you will perform in small groups an independent experiment in a research group at Eawag.

The taxonomic part will cover macroinvertebrates (e.g. Crustacean, aquatic insects), microinvertebrates and algae. The goal is to get to know the most common aquatic taxa in Switzerland, to identify them with commonly used identification literature, and to get an idea how these organisms are used in research and practice. (Language: German, translation of the most important things during the course possible)

Lecture notes

Course notes and power point presentations provided during the course.

Prerequisites / notice

The maximal participating number of biology students is 16.

The course includes a field trip to Greifensee (21.09.2023) and a 3-day-excursion to the river Glatt in Niederuzwil from 27.09. to 29.09.2023.

529-0810-01L Laboratory Course Organic Chemistry II

- W 12 credits 14P C. Thilgen

Abstract
An organic-synthetic sub-project of the current research of a group from the Laboratory of Organic Chemistry is carried out under the guidance of doctoral students.

Objective
- Learn to plan and carry out challenging multistep syntheses making use of modern methods;
- Reach a deeper understanding of organic reactions through experimental work;
- Develop an organic-synthetic research project;
- Take accurate notes, write a publication style report, and present the obtained results in a seminar.

Content
An organic-synthetic sub-project of the current research of a group from the Laboratory of Organic Chemistry is carried out under the guidance of doctoral students.

Lecture notes
No course notes.

Literature
No set textbooks. Literature will be indicated or provided by the supervising tutors.

Prerequisites
- Course prerequisites: Accomplished laboratory course Organic Chemistry I (529-0229-00 or 529-0016-00) and passed session exams Organic Chemistry I (529-0221-00 or 529-1011-00) / Organic Chemistry II (529-0222-00 or 529-1012-00).
- The number of participants per course is limited to 4.

Abstract
This course aims to provide students with a comprehensive overview of mammalian developmental biology and stem cell systems both on the theoretical as well as the experimental level. Centering the course on genetic and genomic methods engages the students in contemporary research and prepares for future studies in the course of semester and master projects.

Objective
- Understanding mammalian development
- Introduction to stem cells systems
- Working with cultured cells
- Translational aspects of mammalian cell biology

Content
The course will consist of a series of lectures, assay assignments, project development and discussion workshops, and 2 and a half week of lab work with different mammalian cell systems embedded in real life research projects. At the end of the course students will take an exam consisting of questions on the topic of the lectures and workshops. It is expected that students will be able to apply the knowledge to concrete problems.

- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics in their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They acquire the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils’ work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.
- They plan and conduct laboratory experiments in schools.

Examination Lesson I Biology

In the context of an examination lesson conducted and graded at a high school, the candidates provide evidence of the subject-matter-based and didactic skills they have acquired in the course of their training.

Objective

Content

Lecture notes

Nach Abschluss der übrigen Ausbildung.

Prerequisites / notice

Findet in der Regel am Schluss der Ausbildung, vor Ablegung der Prüfungslektionen statt.

Professional Exercises in Biology

Students conduct a series of "classical" biological school experiments and therefore gain practice and experience in this area.

Objective

- to develop and conduct teaching that is conducive to learning at high school level, substantiating it in terms of the subject-matter and from the didactic angle
- to analyze the tuition they have given with regard to its strengths and weaknesses, and outline improvements.

Abstract

Lecture notes

Nach Abschluss der übrigen Ausbildung.

Prerequisites / notice

Findet in der Regel am Schluss der Ausbildung, vor Ablegung der Prüfungslektionen statt.

Innovative Biology Teaching at High School

An adequate treatment of current topics of biological research in high schools is a central challenge for future teachers. In this module, students either develop learning materials that aim to prepare new content in a way that is suitable for pupils, or they focus on testing activating forms of learning in real lessons.

Number  Title  Type  ECTS  Hours  Lecturers
551-0976-00L  Innovative Biology Teaching at High School  O  4 credits  9A  H. Stocker, Y. Barral, P. Faller
Objective

Students learn to
- engage with current biological research and its relevance to society
- carefully select content for high school
- make meaningful and correct didactic reductions
- compose activating and motivating learning arrangements
- put prepared lessons into practice
- reflect on their role as a teacher.

Content

Students can choose from three options:

Seminar paper:
Writing a textbook chapter on a current topic in biological research (focus on content).

Innovative lesson:
Planning and implementation of biology lessons with special consideration of activating forms of learning (focus on didactics).

The results will be presented and discussed in a seminar.

Prerequisites / notice

The module "Innovative Biology Teaching at High School" is an integral part of the Specialized Biology Course with an Educational Focus. Before taking this module, at least one of the two lectures should have been completed.

The Specialized Biology Course with an Educational Focus can be acknowledged, in agreement with the advisor of the respective elective major, as one of the two obligatory research projects. In such a case, additional 3 CP must be obtained in another course.

551-0973-00L Specialized Biology Course with an Educational Focus: Evolution

Abstract

Specialist aspects of biology with a focus on evolution are covered from the angle of imparting these to pupils, their historical development, and their significance for the subject, the individual and society.

Objective

After successful completion of the module, students should be able
- to retrieve in-depth knowledge of biology with a special focus on evolution and to impart this to others.
- to analyse controversial topics and to give factual explanations for these.
- to prepare teaching units suitably tailored to the recipients, with complex learning matter on a high professional level.

Content

Selected biological topics, with a special focus on evolution, are dealt with under consideration of the special needs of persons involved in teaching.

The module comprises lectures, a book club, and a project assignment.

Lecture notes
Teaching materials are available online on Moodle.

Literature
Literature and references are posted online on Moodle.

Prerequisites / notice

The Specialized Biology Course with an Educational Focus consists of three modules (4 CP each). In the fall semester, the focus of the lecture is on evolution. The lecture of the spring semester deals with biological concepts. The sequence of assignment is free. In addition, the module "Innovative Biology Teaching at High School" has to be completed.

Performance is assessed during the course of the entire module. Active participation in the course is required.

The Specialized Biology Course with an Educational Focus can be acknowledged, in agreement with the advisor of the respective elective major, as one of the two obligatory research projects. In such a case, additional 3 CP must be obtained in another course.

In case of overbooking of the course, students enrolled in the Teaching Diploma in Biology will have priority.

Number Title Type ECTS Hours Lecturers
701-0015-00L Transdisciplinary Research: Challenges of Interdisciplinarity and Stakeholder Engagement W 2 credits 1S B. Vienni Baptista, C. E. Pohl, M. Stauffacher

Abstract

This seminar is designed for PhD students and PostDoc researchers involved in inter- or transdisciplinary research. It addresses and discusses challenges of this kind of research using scientific literature presenting case studies, concepts, theories, methods and by testing practical tools. It concludes with a 10-step approach to make participants' research projects more societally relevant.
Objective

Participants know specific challenges of inter- and transdisciplinary research and can address them by applying practical tools. They can tackle questions like: how to integrate knowledge from different disciplines, how to engage with societal actors, or how to secure broader impact of research. They learn to critically reflect their own research project in its societal context and on their role as scientists.

Content

The seminar covers the following topics:
1. Theories and concepts of inter- and transdisciplinary research
2. The specific challenges of inter- and transdisciplinary research
3. Collaborating between different disciplines
4. Engaging with stakeholders
5. 10 steps to make participants' research projects more societally relevant

Throughout the whole course, scientific literature will be read and discussed as well as practical tools explored in class to address concrete challenges.

Literature

Literature will be made available to the participants.
The following open access article builds a core element of the course:

Further, this collection of tools will be used:

701-1651-00L Environmental Governance W 6 credits 3G E. Lieberherr

Abstract

The course addresses environmental policies, focusing on new steering approaches, which are generally summarized as environmental governance. The course also provides students with tools to analyze environmental policy processes and assesses the key features of environmental governance by examining various practical environmental policy examples.

Objective

To understand how an environmental problem may (not) become a policy and explain political processes, using basic concepts and techniques from political science.

Content

To be able to identify the main challenges and opportunities for environmental governance and to critically discuss them with reference to various practical policy examples.

Improvements in environmental quality and sustainable management of natural resources cannot be achieved through technical solutions alone. The quality of the environment and the achievement of sustainable development strongly depend on human behavior and specifically the human uses of nature. To influence human behavior, we rely on public policies and other societal rules, which aim to steer the way humans use natural resources and their effects on the environment. Such steering can take place through government intervention alone. However, this often also involves governance, which includes the interplay between governmental and non-governmental actors, the use of diverse tools such as emission standards or financial incentives to steer actors' behavior and can occur at the local, regional, national or international level.

In this course, we will address both the practical aspects of as well as the scientific debate on environmental governance. The course gives future environmental experts a strong basis to position themselves in the governance debate, which does not preclude government but rather involves a spectrum from government to governance.

To analyze the evolution as well as the key elements of environmental governance.

Key questions that this course seeks to answer: What are the core characteristics of environmental challenges from a policy perspective? What are key elements of "environmental governance" and how legitimate and effective are these approaches in addressing persistent environmental challenges?

Furthermore, we encourage the development of soft skills by engaging students in activities such as moderating discussions in class, presenting own proposals, giving regular peer feedback, as well as critically reflecting on various relevant publications in the environmental governance domain.

Lecture notes

Lecture slides, a script and additional course material will be provided on Moodle.

A detailed course schedule will be made available at the beginning of the semester.

During the lecture we will work with Moodle. We ask that all students register themselves on this platform before the lecture.

We recommend that students have (a) three-years BSc education of a (technical) university; (b) successfully completed Bachelor introductory course to environmental policy (Entwicklungen nationaler Umweltpolitik (or equivalent)) and (c) familiarity with key issues in environmental policy and some fundamental knowledge of one social science or humanities discipline (political science, economics, sociology, history, psychology, philosophy)
Concepts and Theories

Using Outdoor Education

Enrolment only possible with matriculation in Teaching Diploma Biology and Geography.

Abstract
In this seminar, future teachers will be trained to prepare and conduct excursions to out-of-school learning venues. For this purpose, excursions are offered at the Swiss Federal Institute for Forest, Snow and Landscape Research (WSL) in Birmensdorf.

Objective
Future teachers will learn to prepare and conduct excursions to out-of-school learning venues.

Content
Excursions at the Swiss Federal Institute for Forest, Snow and Landscape Research (WSL) in Birmensdorf:
- Dendrochronology: What annual rings tell
- Photosynthesis/Climate change: The tracks in the forest
- Forest Soil: The soil in the focus of the climate

Human Physiology I

Abstract
Dieser Kurs vermittelt die Grundlagen der Physiologie und Anatomie des menschlichen Körpers.
Der Schwerpunkt dieses Kurses liegt auf dem Verständnis der physiologischen Mechanismen des menschlichen Körpers. Im Mittelpunkt steht dabei der gesunde Mensch, ergänzt um Beispiele für klinisch wichtige Funktionsstörungen/ Krankheiten. Im Sinne einer integrativen Betrachtungsweise wird bezüglich Funktion jeweils der Bogen von den molekularen Mechanismen bis zum komplexen Zusammenspiel der Organe im Gesamtorganismus gespannt. Die Anatomie wird dort speziell besprochen, wo sie für das Verständnis der Funktion notwendig oder hilfreich ist.

Kurs umfasst das Herbst- (Teil I) und das Frühjahrssemester (Teil II). Im Teil I werden Kern-Konzepte der Physiologie vermittelt, also die grundlegenden Mechanismen, die für das Verständnis aller physiologischen Prozesse notwendig sind. Die Studierenden werden dazu befähigt, diese allgemeinen Prinzipien auf die Funktionen aller Organsysteme und deren Zusammenspiel anzuwenden. Im Teil II werden zudem die allgemeinen Aspekte des Nervensystems und des endokrinen Systems eingeführt, da alle Organfunktionen letztlich unter nervaler und endokriner Kontrolle stehen.

**Content**

Humanphysiologie I (HS)

- «Kern-Konzepte» in der Physiologie
  1. Struktur und Funktion
  2. Energietransfer, -speicherung und -nutzung
  3. Informationsfluss, -speicherung und -nutzung
  4. Homöostase
  5. Evolution
- Allgemeine Endokrinologie und endokrines System
- Allgemeine Neurophysiologie und Neuroanatomie
- Die chemischen Sinne, Geschmack und Geruch
- Ernährung und Verdauung
- Leber und Stoffwechsel
- Energiehomöostase
- Flüssigkeitshomöostase und Niere
- Reproduktion, Entwicklung und Altern

Humanphysiologie II (FS)

- Sinnesphysiologie
- Muskelsphysiologie
- Neuronale Kontrolle von Haltung und Bewegung
- Höhere zentralnervöse Hirnfunktionen
- Atmung und Lunge
- Herz und Kreislauf
- Blut
- Immunologie
- Thermoregulation/Fieber
- Stress

**Lecture notes**

Online-Material wird im Laufe des Kurses zur Verfügung gestellt.

- Self-direction and Self-management: fostered

### Introduction to Ecology

**Number of participants limited to 15.**
**The enrolment is done by the D-BIOL study administration.**

**ATTENTION:** Students of the biology teaching diploma, please contact Dr. O. Martin until 01.08.2024.

**Abstract**

**Objective**
Studierende vertiefen ihr Wissen zu ökologischen Themen konkret anhand von:
- Vorlesungen zu Grundlagen der Ökologie
- Planen und Durchführen von Experimenten (z.B. Verhaltensökologie mit Insekten)
- Literaturdiskussionen
- Einblicke in aktuelle ökologische Forschungsarbeiten im Raum Zürich (z.B. Gastvorträge, Laborbesuche)
- Besprechung der Möglichkeiten zum Einsatz von Ökologie im theoretischen und praktischen Unterricht
- Exkursionen & Führungen

**Content**
- Einleitung: evolutionäre Hintergrund der Ökologie / Ökologie in Forschung und Praxis
- Umweltbedingungen & Ressourcen: Abiotische Umweltbedingungen & Verfügbarkeit von Ressourcen / Klima & Biome der Erde
- Individuen & Populationen: Geburt, Tod & Wanderungen / Interspezifische Konkurrenz / Prätation, Weidegang & Parasiten / Molekulare & evolutionäre Ökologie
- Lebensgemeinschaften und Ökosysteme: Von Populationen zu Lebensgemeinschaften / Muster des Artenreichtums / Energie- & Stofffluss durch Ökosysteme
- Angewandte Aspekte der Ökologie: Globale biogeochemische Kreisläufe & ihre Veränderung durch den Menschen / Naturschutzbiologie / Ökologie des Menschen: Bevölkerungswachstum, Krankheiten & Nahrungsversorgung

**Lecture notes**
Kursunterlagen werden via Moodle verfügbar sein.

Abstract
Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

Objective
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry. The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Content
Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

Lecture notes
Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

Literature
Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

Prerequisites / notice
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

Competencies
Subject-specific Competencies
Concepts and Theories assessed
Techniques and Technologies assessed

Abstract
During this Masters level seminar style course, students will explore current research topics in cellular biochemistry focused on the structure, function and regulation of selected cell components, and the consequences of dysregulation for pathologies.

Objective
Students will work with experts toward a critical analysis of cutting-edge research in the domain of cellular biochemistry, with emphasis on normal cellular processes and the consequences of their dysregulation. At the end of the course, students will be able to evaluate, critically discuss and write about scientific articles in the research area of cellular biochemistry, and they will identify open testable research questions.

Content
Guided by an expert in the field, students will engage in classical round-table style discussions of current literature with frontal presentations. Guided by a faculty expert, students develop domain knowledge of the research area associated with a primary paper, and alternate as discussion leaders to present the research topic. By the end of the semester, students will formulate their ideas about open testable research questions that extend from the published work.

Literature
The literature will be provided during the course.

Prerequisites / notice
The course will be taught in English.

Abstract
Biophysics of protein folding, membrane proteins and biophysics of membranes, enzymatic catalysis, catalytic RNA and RNAi, current topics in protein biophysics and structural biology.

Objective
Understanding of structure-function relationships in proteins and in protein folding, detailed understanding of biophysics and physical methods as well as modern methods for protein purification and microanalytic.

Lecture notes
Scripts on the individual topics can be found under http://www.mol.biol.ethz.ch/teaching.
Basics: assessed 5 credits

Study of fundamental concepts, models and computational methods for the analysis of complex biological networks. Topics: Systems biology, computational approaches to address contemporary biological problems related to metabolism. The course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.

Lecturers: University lecturers

Abstract

Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Objective

This course focuses on the concepts of classical and modern genetics and genomics.

Content

The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Lecture notes

Scripts and additional material will be provided during the semester.

Abstract

Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.

Objective

Develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology.

Content

The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics. For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

Lecture notes

Script and original publications will be supplied during the course.

Prerequisites / notice

The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.

636-0007-00L | Computational Systems Biology | W | 6 | 3V+2U | J. Stelling |

Abstract

Study of fundamental concepts, models and computational methods for the analysis of complex biological networks. Topics: Systems approaches in biology, biology and reaction network fundamentals, modeling and simulation approaches (topological, probabilistic, stoichiometric, qualitative, linear / nonlinear ODEs, stochastic), and systems analysis (complexity reduction, stability, identification).

Objective

The aim of this course is to provide an introductory overview of mathematical and computational methods for the modeling, simulation and analysis of biological networks.

Content

Biological systems have witnessed an unprecedented increase in experimental data and, correspondingly, an increased need for computational methods to analyze this data. The explosion of sequenced genomes, and subsequently, of bioinformatics methods for the storage, analysis and comparison of genetic sequences provides a prominent example. Recently, however, an additional area of research, captured by the label "Systems Biology", focuses on how networks, which are more than the mere sum of their parts' properties, establish biological functions. This is essentially a task of reverse engineering. The aim of this course is to provide an introductory overview of corresponding computational methods for the modeling, simulation and analysis of biological networks. We will start with an introduction into the basic units, functions and design principles that are relevant for biology at the level of individual cells. Making extensive use of example systems, the course will then focus on methods and algorithms that allow for the investigation of biological networks with increasing detail. These include (i) graph theoretical approaches for revealing large-scale network organization, (ii) probabilistic (Bayesian) network representations, (iii) structural network analysis based on reaction stoichiometries, (iv) qualitative methods for dynamic modeling and simulation (Boolean and piece-wise linear approaches), (v) mechanistic modeling using ordinary differential equations (ODEs) and finally (vi) stochastic simulation methods.

401-0649-00L | Applied Statistical Regression | W | 5 | 2V+1U | M. Dettling |

Data: 02.07.2024 12:39 Autumn Semester 2024 Page 303 of 2667
Abstract
This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning "good practice" that can be applied in every student's own projects and daily work life. A special focus will be laid in the use of the statistical software package R for regression analysis.

Objective
The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.

Content
The course starts with the basics of linear modeling, and then proceeds to parameter estimation, tests, confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, multicollinearity problems and model interpretation, as well as general modeling strategies.

The last third of the course is dedicated to an introduction to generalized linear models: this includes the generalized additive model, logistic regression for binary response variables, binomial regression for grouped data and poisson regression for count data.

Lecture notes
A script will be available.

Literature
Faraway (2005): Linear Models with R
Faraway (2006): Extending the Linear Model with R
Draper & Smith (1998): Applied Regression Analysis
Fox (2008): Applied Regression Analysis and GLMs
Montgomery et al. (2006): Introduction to Linear Regression Analysis

Prerequisites / notice
The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L "Applied Statistical Regression" and 401-3622-00L “Statistical Modelling” are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

529-0041-00L Modern Mass Spectrometry, Hyphenated Methods, and Chemometrics

Abstract
Modern mass spectrometry, hyphenated analytical methods, speciation, chemometrics.

Objective
Comprehensive knowledge about the analytical methods introduced in this course and their practical applications.

Content
Hyphenation of separation with identification methods such as GC-MS, LC-MS, GC-IR, LC-IR, LC-NMR etc.; importance of speciation. Modern mass spectrometry: time-of-flight, orbitrap and ion cyclotron resonance mass spectrometry, ICP-MS. Soft ionization methods, desorption methods, spray methods. Mass spectrometry imaging. Use of statistical and computer-assisted methods for processing analytical data (chemometrics).

Lecture notes
Lecture notes will be made available online.

Literature
Information about relevant literature will be available in the lecture & in the lecture notes.

Prerequisites / notice
Exercises are an integral part of the lecture.
Prerequisites: 529-0051-00 "Analytische Chemie I (3. Semester)"; 529-0058-00 "Analytische Chemie II (4. Semester)" (or equivalent)

<tr>
<td>Abstract</td>
<td>Applying two fundamental principles of thermodynamics (entropy maximization and Gibbs energy minimization), an analytical model is derived for a variety of biological phenomena at the molecular as well as cellular level, and critically compared with the corresponding experimental data in the literature. Engineering uses the laws of physics to predict the behavior of a system. Biological systems are so diverse and complex prompting the question whether we can apply unifying concepts of theoretical physics coping with the multiplicity of life’s mechanisms. Objective of this course is to show that biological phenomena despite their variety can be analytically described using only two principles from statistical mechanics: maximization of the entropy and minimization of the Gibbs free energy. Starting point of the course is the probability theory, which enables to derive step-by-step the two pillars of thermodynamics from the perspective of statistical mechanics: the maximization of entropy according to the Boltzmann’s law as well as the minimization of the Gibbs free energy. Then, an assortment of biological phenomena at the molecular and cellular level (e.g. cytoskeletal polymerization, action potential, photosynthesis, gene regulation, morphogen patterning) will be examined at the light of these two principles with the aim to derive a quantitative expression describing their behavior. Each analytical model is finally validated by comparing it with the corresponding experimental results from the literature. By the end of the course, students will also learn to critically evaluate the concepts of making an assumption and making an approximation.</td>

- Random walks, diffusion, crowding
- Electrostatics for salty solutions
- Elasticity: fibers and membranes
- Molecular motors
- Action potential: Hodgkin-Huxley model
- Photosynthesis and vision
- Gene regulation
- Development: Turing patterns

Theory and corresponding exercises are merged together during the classes.

Lecture notes

No lecture notes because the two proposed textbooks are more than exhaustive!

I am willingly available Mondays 17.00 o'clock - 18.00 in my office GLC F12.2 for whatever discussion about the lessons and the exercises.

!!! I am using OneNote. All lectures will be broadcast via ZOOM, while corresponding videos of the previous years (lectures and exercises) are available in Moodle !!!

Literature

As further deepening:

Prerequisites / notice

Participants need a good command of
- differentiation and integration of a function with one or more variables (basics of Analysis),
- Newton's and Coulomb's laws (basics of Mechanics and Electrostatics).

Notions of vectors in 2D and 3D are beneficial.

551-0357-00L

Cellular Matters: Properties, Functions and Applications of Biomolecular Condensates

The number of participants is limited to 30 and will only take place with a minimum of 6 participants.

At the beginning of the course, student groups will be formed and assigned to the milestone papers. To facilitate this, students must confirm their registration by the beginning of the 3rd week of semester.

Abstract

This Master level course delves into the emerging field of biomolecular condensates - membrane-less organelles in cells. Using interdisciplinary concepts from biology, chemistry, biophysics, and soft matter, we will explore the biological properties of these condensates, their functions in health and disease, and their potential as new biomimetic materials for various applications.

Cellular Matters: Properties, Functions and Applications of Biomolecular Condensates

The number of participants is limited to 30 and will only take place with a minimum of 6 participants.

At the beginning of the course, student groups will be formed and assigned to the milestone papers. To facilitate this, students must confirm their registration by the beginning of the 3rd week of semester.

Abstract

This Master level course delves into the emerging field of biomolecular condensates - membrane-less organelles in cells. Using interdisciplinary concepts from biology, chemistry, biophysics, and soft matter, we will explore the biological properties of these condensates, their functions in health and disease, and their potential as new biomimetic materials for various applications.
Objective

In the last decade, a novel type of cell compartments called biomolecular condensates have been discovered. This discovery is radically changing our understanding of the cell, its organization, and dynamics. The emerging picture is that the cytoplasm and nucleoplasm are highly complex fluids that can (meta)stably segregate into membrane-less compartments, similar to emulsions.

This interdisciplinary course encompasses milestone works and cutting-edge research questions in the young field of biomolecular condensates, including their properties, functions, and applications. The course begins with a lecture series that introduces the topic of condensates to an interdisciplinary audience and provides a theoretical foundation for understanding current research questions in the field. The lectures provide a base for student presentations of recent publications in the field, and for research seminars given by course lecturers, who are all active researchers with diverse expertise. Through this exciting interdisciplinary understanding of biomolecular condensates, bridging biology, chemistry, biophysics, and soft matter.

Students will not only learn how to critically read and evaluate scientific literature but will also gain valuable experience in giving scientific presentations to an interdisciplinary audience. Each presentation will require an introduction, critical analysis of the results, and a discussion of their significance, allowing student to substantiate their statements with a critical mindset that considers the pros and cons of chosen approaches and methods, as well as any limitations or possible follow-up experiments. This process will enable student to ask relevant queries and actively participate in class discussions, further enhancing their scientific skills.

In preparing the presentations, the students will have the unique opportunity to interact closely with each other and with the lecturers, who are all internationally well-established experts, and receive guidance in select a topic for the final presentation and supporting literature.

Content

The topic of biomolecular condensates goes beyond the boundaries of traditional disciplines and requires a multi-disciplinary approach that leverages and cross-fertilizes biology, physical chemistry, biophysics, and soft matter. This course will explore the properties, functions and potential applications of biomolecular condensates, including their role in neurodegenerative diseases such as Alzheimer's and Parkinson's, as well as their use as smart biomimetic materials.

This course is divided into two parts. The fist part will introduce the basic concepts essential to the study of biomolecular condensates and phase separation. Topics include: fundamental units and scales in soft matter, phase transitions in biology, biopolymers and molecular self-assembly, introduction to active matter. This will establish a foundation for the second part, which will explore milestone works and current research in the field of biomolecular condensates. Each lecture of this second part will consist of:

1) a short literature seminar, where student groups will present and discuss a milestone paper assigned in advance and
2) a research seminar, where one of the course lecturers will present their own state-of-the-art research in the field, building upon the milestone literature.

At the beginning of the course, student groups will be formed and assigned to the milestone literature. To facilitate this, students must confirm their registration by the beginning of the 3rd week of semester.

Lecture notes

Lecture slides and some scripts will be provided.

Literature

No compulsory textbooks. Literature will be provided during the course

529-0733-02L Chemical Biology and Synthetic Biochemistry

W 6 credits 3G K. Lang, M. Fottner

Overview of modern chemical biology and synthetic biochemistry techniques, focussed on protein modification and labeling and on methods to endow proteins with novel functionalities.

After taking this course, students should be capable of the following: A) Recall different possibilities for modifying proteins in vitro and in vivo and their applications in a biological context. B) Understand the chemical and biochemical consequences of modifications and assess the different reaction possibilities in the context of in vivo - in vitro, C) Critically analyze and assess current chemical biology articles D) Question the approaches learned and apply them to new biological problems.

Advanced genetic code expansion methods (amber suppression, orthogonal ribosomes, unnatural base pairs, genome engineering and genome editing)

directed evolution and protein engineering

chemical biology of ubiquitin and targeted protein degradation

A script will not be handed out. Handouts to the lecture will be provided through moodle.

Citations from the original literature relevant to the individual lectures will be assigned during the lectures.

Knowledge provided in the bachelor lectures 'Nucleic Acids and Carbohydrates' and 'Proteins and Lipids' is assumed for this lecture.

Abstract
Biophysics of protein folding, membrane proteins and biophysics of membranes, enzymatic catalysis, catalytic RNA and RNAs, current topics in protein biophysics and structural biology.

Objective
Understanding of structure-function relationships in proteins and in protein folding, detailed understanding of biophysics and physical methods as well as modern methods for protein purification and microanalytics.

Lecture notes
Scripts on the individual topics can be found under http://www.mol.biol.ethz.ch/teaching.

Literature
Basics:
- Creighton, T.E., Proteins, Freeman, (1993)
- Fersht, A., Enzyme, Structure and Mechanism in Protein Science (1999), Freeman.

Current topics: References will be given during the lectures.

Abstract
Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Objective
This course focuses on the concepts of classical and modern genetics and genomics.

Content
The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Lecture notes
Scripts and additional material will be provided during the semester.

Microbiology (Part I)

Abstract
Advanced lecture class providing a broad overview on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Objective
This concept class will be based on common concepts and introduce to the enormous diversity among bacteria and archaea. It will cover the current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Content
Advanced class covering the state of the research in bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Lecture notes
Updated handouts will be provided during the class.
### Immunology I

**W 3 credits 2V**  
M. Kopf, A. Oxenius

**Abstract**  
Introduction into structural and functional aspects of the immune system. Basic knowledge of the mechanisms and the regulation of an immune response.

**Objective**  
Introduction into structural and functional aspects of the immune system. Basic knowledge of the mechanisms and the regulation of an immune response.

**Content**  
- Introduction and historical background  
- Innate and adaptive immunity, Cells and organs of the immune system  
- B cells and antibodies  
- Generation of diversity  
- Antigen presentation and Major Histoincompatibility (MHC) antigens  
- Thymus and T cell selection  
- Autoimmunity  
- Cytotoxic T cells and NK cells  
- Th1 and Th2 cells, regulatory T cells  
- Allergies  
- Hypersensitivities  
- Vaccines, immune-therapeutic interventions

**Lecture notes**  
Electronic access to the documentation will be provided. The link can be found at "Lernmaterialien"

**Literature**  
- Kuby, Immunology, 9th edition, Freeman + Co., New York, 2020

**Prerequisites / notice**  
For D-BIOL students Immunology I (WS) and Immunology II (SS) will be examined as one learning entity in a "Sessionsprüfung". All other students write separate exams for Immunology I and Immunology II. All exams (combined exam Immunology I and II, individual exams) are offered in each exam session.

**Competencies**  
- Subject-specific Competencies  
  - Concepts and Theories  
  - Techniques and Technologies
- Method-specific Competencies  
  - Analytical Competencies  
  - Decision-making
- Social Competencies  
  - Communication
- Personal Competencies  
  - Adaptability and Flexibility  
  - Creative Thinking  
  - Critical Thinking  
  - Self-direction and Self-management

### Nucleic Acids and Carbohydrates

**W 6 credits 3G**  
K. Lang, M. Frei, P. A. Kast, H. Wennemers

**Abstract**  
Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines

**Objective**  
Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines

**Content**  
Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines

**Lecture notes**  
No script; illustrations from the original literature relevant to the individual lectures will be provided weekly (typically as handouts downloadable from the Moodle server).

**Literature**  
Mainly based on original literature, a detailed list will be distributed during the lecture

**Competencies**  
- Subject-specific Competencies

### Recommended Master Courses

**Number**  
**551-0317-00L**  
**551-0317-00L**  
**529-0731-00L**  
**529-0732-00**

**Title**  
- Writing Scientific Reports for MSc Biology
- Nucleic Acids and Carbohydrates
- Proteins and Lipids (spring semester) can be counted for the Bachelor's degree
- Immunology I
- Immunology II

**Type**  
W

**ECTS**  
2

**Hours**  
1G

**Lecturers**  
R. Taylor

**Objective**  
This short course is designed to accompany MSc students in writing their first reports in English, providing input on scientific writing in English as well as feedback on drafts sections of the report.

- Students will learn to:  
  - Plan, draft, structure, and edit scientific reports  
  - Produce reader-friendly sentences  
  - Establish a clear and logical flow between sentences and paragraphs  
  - Select formal vocabulary and use it in a generally accurate and correct manner  
  - Choose and use generally suitable grammatical structures, punctuation, and identify areas in which further development is needed

---

**Autumn Semester 2024**  
Page 309 of 2667
The course covers the process of writing reports in biology, helping students to focus on the language and communicative aspects of these reports. Topics covered include structuring sentences, paragraphs, and longer sections (introductions, methods, etc.); presenting and integrating non-textual elements such as graphs and tables; reviewing common grammar problems for advanced writers in English; and editing drafts and proofs. Sessions will consist of a mix of specialist input, group and pair work, and editing sessions.

Students who attend this course will turn in three sections of a report (approx. 500 words each) for feedback, revising these texts for a final portfolio that is graded.

Prerequisites / notice
Participants should be at a stage in their research where they can already start drafting parts of the report.

**529-0243-01L Transition Metal Catalysis: From Mechanisms to Applications**

**Abstract**
Detailed discussion of selected modern transition metal catalyzed reactions from a synthetic and mechanistic viewpoint.

**Objective**
Understanding and critical evaluation of current research in transition metal catalysis. Design of mechanistic experiments to elucidate reaction mechanisms. Synthetic relevance of transition metal catalysis. Students will also learn about writing an original research proposal during a workshop.

**Content**
Detailed discussion of selected modern transition metal catalyzed reactions from a synthetic and mechanistic viewpoint. Synthetic applications of these reactions. Introduction and application of tools for the elucidation of mechanisms. Selected examples of topics include: C-H activation, C-O activation, C-C activation, redox active ligands, main group redox catalysis, bimetallic catalysis.

**Lecture notes**
Lecture slides will be provided online. A Handout summarizing important concepts in organometallic and physical organic chemistry will also be provided. Useful references and handouts will also be provided during the workshop.

**Literature**
Primary literature and review articles will be cited during the course.

The following textbooks can provide useful support for the course:

**Prerequisites / notice**
Required level: Courses in organic and physical chemistry (kinetics in particular) of the first and second year as well as ACI and III Competencies.

**529-0041-00L Modern Mass Spectrometry, Hyphenated Methods, and Chemometrics**

**Abstract**
Modern mass spectrometry, hyphenated analytical methods, speciation, chemometrics.

**Objective**
Comprehensive knowledge about the analytical methods introduced in this course and their practical applications.

**Content**
Hyphenation of separation with identification methods such as GC-MS, LC-MS, GC-IR, LC-IR, LC-NMR etc.; importance of speciation. Modern mass spectrometry: time-of-flight, orbitrap and ion cyclotron resonance mass spectrometry, ICP-MS. Soft ionization methods, desorption methods, spray methods. Mass spectrometry imaging. Use of statistical and computer-assisted methods for processing analytical data (chemometrics).

**Lecture notes**
Lecture notes will be made available online.

**Literature**
Information about relevant literature will be available in the lecture & in the lecture notes.

**Prerequisites / notice**
Exercises are an integral part of the lecture.

Prerequisites:
529-0051-00 "Analytische Chemie I (3. Semester)"
529-0058-00 "Analytische Chemie II (4. Semester)"
(or equivalent)
Citations from the original literature relevant to the individual lectures will be assigned weekly.

Fundamental concepts and recent advances for the selective synthesis of complex organic molecules, including natural products, will be covered in Selectivity in Organic Synthesis. This course will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

An advanced course on the synthesis, properties and function of peptides in chemistry and biology, will be covered in Biopolymers. The students should obtain an understanding of these processes, which are at work during gene expression.

This course covers aspects of RNA biology related to gene expression at the posttranscriptional level. These include RNA transcription, processing, alternative splicing, editing, export and translation.

This course covers aspects of RNA biology related to the functions of non-coding RNAs as well as their use as drugs to treat diseases.

Fundamentals of selective organic reactions, including current and historical examples of enantioselectivity, regioselectivity, chemoselectivity. Further aspects include recent developments in catalysis, strategies and tools for selective organic synthesis.

Selectivity in Organic Synthesis

Biological Engineering and Biotechnology

RNA Biology Lecture Series I: Transcription & Processing & Translation

RNA Biology Lecture Series II: Non-Coding RNAs: Biology and Therapeutics

Abstract
Applying two fundamental principles of thermodynamics (entropy maximization and Gibbs energy minimization), an analytical model is derived for a variety of biological phenomena at the molecular as well as cellular level, and critically compared with the corresponding experimental data in the literature.

Objective
Engineering uses the laws of physics to predict the behavior of a system. Biological systems are so diverse and complex prompting the question whether we can apply unifying concepts of theoretical physics coping with the multiplicity of life’s mechanisms.

Objective of this course is to show that biological phenomena despite their variety can be analytically described using only two principles from statistical mechanics: maximization of the entropy and minimization of the Gibbs free energy.

Starting point of the course is the probability theory, which enables to derive step-by-step the two pillars of thermodynamics from the perspective of statistical mechanics: the maximization of entropy according to the Boltzmann’s law as well as the minimization of the Gibbs free energy. Then, an assortment of biological phenomena at the molecular and cellular level (e.g. cytoskeletal polymerization, action potential, photosynthesis, gene regulation, morphogen patterning) will be examined at the light of these two principles with the aim to derive a quantitative expression describing their behavior. Each analytical model is finally validated by comparing it with the corresponding experimental results from the literature.

By the end of the course, students will also learn to critically evaluate the concepts of making an assumption and making an approximation.

Content
• Basics of theory of probability
• Boltzmann’s law
• Entropy maximization and Gibbs free energy minimization
• Ligand-receptor: two-state systems and the MWC model
• Random walks, diffusion, crowding
• Electrostatics for salty solutions
• Elasticity: fibers and membranes
• Molecular motors
• Action potential: Hodgkin-Huxley model
• Photosynthesis and vision
• Gene regulation
• Development: Turing patterns

Theory and corresponding exercises are merged together during the classes.

Lecture notes
No lecture notes because the two proposed textbooks are more than exhaustive!

I am willingly available Mondays 17.00 o’clock - 18.00 in my office GLC F12.2 for whatever discussion about the lessons and the exercises.

!!! I am using OneNote. All lectures will be broadcast via ZOOM, while corresponding videos of the previous years (lectures and exercises) are available in Moodle !!!

Literature

As further deepening:

Prerequisites / notice
Participants need a good command of
• differentiation and integration of a function with one or more variables (basics of Analysis),
• Newton's and Coulomb's laws (basics of Mechanics and Electrostatics).

Notions of vectors in 2D and 3D are beneficial.
The topic of biomolecular condensates goes beyond the boundaries of traditional disciplines and requires a multi-disciplinary approach that leverages and cross-fertilizes biology, physical chemistry, biophysics, and soft matter. This course will explore the properties, functions, and applications of biomolecular condensates, including their role in neurodegenerative diseases such as Alzheimer's and Parkinson's, as well as their use as smart biomimetic materials.

This course is divided into two parts. The first part will introduce the basic concepts essential to the study of biomolecular condensates and phase separation. Topics include: fundamental units and scales in soft matter, phase transitions in biology, biopolymers and molecular self-assembly, introduction to active matter. This will establish a foundation for the second part, which will explore milestone works and current research in the field of biomolecular condensates. Each lecture of this second part will consist of:

1) a short literature seminar, where student groups will present and discuss a milestone paper assigned in advance and an active matter seminar, where the course lecturers will present their own state-of-the-art research in the field, building upon the milestone literature.

At the beginning of the course, student groups will be formed and assigned to the milestone papers. To facilitate this, students must confirm their registration by the beginning of the 3rd week of semester.

This interdisciplinary course encompasses milestone works and cutting-edge research questions in the young field of biomolecular condensates, including their properties, functions, and applications. The course begins with a lecture series that introduces the topic of condensates to an interdisciplinary audience and provides a theoretical foundation for understanding current research questions in the field. The lectures provide a base for student presentations of recent publications in the field, and for research seminars given by course lecturers, who are all active researchers with diverse expertise. Through this exciting interdisciplinary understanding of biomolecular condensates, bridging biology, chemistry, biophysics, and soft matter, we will explore the biological properties of these highly complex fluids that can (meta)stably segregate into membrane-less compartments, similar to emulsions.

In preparing the presentations, the students will have the unique opportunity to interact closely with each other and with the lecturers, who are all internationally well-established experts, and receive guidance in select a topic for the final presentation and supporting literature. Students will not only learn how to critically read and evaluate scientific literature but will also gain valuable experience in giving scientific presentations to an interdisciplinary audience. Each presentation will require an introduction, critical analysis of the results, and a discussion of their significance, allowing student to substantiate their statements with a critical mindset that considers the pros and cons of chosen approaches and methods, as well as any limitations or possible follow-up experiments. This process will enable student to ask relevant question and actively participate in class discussions, further enhancing their scientific skills.

In the last decade, a novel type of cell compartments called biomolecular condensates have been discovered. This discovery is radically changing our understanding of the cell, its organization, and dynamics. The emerging picture is that the cytoplasm and nucleoplasm are highly complex fluids that can (meta)stably segregate into membrane-less compartments, similar to emulsions.

### Content

**Cellular Matters: Properties, Functions and Applications of Biomolecular Condensates**

**Objective**

At the beginning of the course, student groups will be formed and assigned to the milestone papers. To facilitate this, students must confirm their registration by the beginning of the 3rd week of semester.

**Abstract**

This Master level course delves into the emerging field of biomolecular condensates - membrane-less organelles in cells. Using interdisciplinary concepts from biology, chemistry, biophysics, and soft matter, we will explore the biological properties of these condensates, their functions in health and disease, and their potential as new biomimetic materials for various applications.

**In the last decade, a novel type of cell compartments called biomolecular condensates have been discovered. This discovery is radically changing our understanding of the cell, its organization, and dynamics. The emerging picture is that the cytoplasm and nucleoplasm are highly complex fluids that can (meta)stably segregate into membrane-less compartments, similar to emulsions.**
**Chemical Biology and Synthetic Biochemistry**

**W** 6 credits 3G  K. Lang, M. Fottner

**Abstract**
Overview of modern chemical biology and synthetic biochemistry techniques, focussed on protein modification and labeling and on methods to endow proteins with novel functionalities.

**Objective**
A) Recall different possibilities for modifying proteins in vitro and in vivo and their applications in a biological context, B) Understand the chemical and biochemical consequences of modifications and assess the different reaction possibilities in the context of in vivo - in vitro, C) Critically analyze and assess current chemical biology articles D) Question the approaches learned and apply them to new biological problems.

**Content**
- principles of protein labeling and protein modification (fluorescent proteins, enzyme-mediated labeling, bioorthogonal chemistries)
- advanced genetic code expansion methods (amber suppression, orthogonal ribosomes, unnatural base pairs, genome engineering and genome editing)
- directed evolution and protein engineering
- chemical biology of ubiquitin and targeted protein degradation

**Lecture notes**
A script will not be handed out. Handouts to the lecture will be provided through moodle.

**Literature**
Citations from the original literature relevant to the individual lectures will be assigned during the lectures.

**Prerequisites / notice**
Knowledge provided in the bachelor lectures ‘Nucleic Acids and Carbohydrates’ and ‘Proteins and Lipids’ is assumed for this lecture.

**Elective Concept Courses**

**Abstract**
Biophysics of protein folding, membrane proteins and biophysics of membranes, enzymatic catalysis, catalytic RNA and RNAi, current topics in protein biophysics and structural biology.

**Objective**
Understanding of structure-function relationships in proteins and in protein folding, detailed understanding of biophysics and physical methods as well as modern methods for protein purification and microanalytics.

**Lecture notes**
Scripts on the individual topics can be found under [http://www.mol.biol.ethz.ch/teaching](http://www.mol.biol.ethz.ch/teaching).
Current topics: References will be given during the lectures.

551-0319-00L  Cellular Biochemistry (Part I)  W  3 credits  2V  U. Kutay, F. Allain, T. Kleele, I. Zemp

Abstract
Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

Objective
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

Content
Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

Lecture notes
Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

Literature
Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

Prerequisites / notice
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

Competencies
- Subject-specific Competencies: Concepts and Theories, Techniques and Technologies
  - Concepts and Theories: assessed
  - Techniques and Technologies: assessed

551-1299-00L  Bioinformatics  W  6 credits  4G  S. Sunagawa, P. Beltrao, V. Boeva, A. Kahles, C. von Mering, N. Zamboni

Abstract
Students will study bioinformatic concepts in the areas of metagenomics, genomics, transcriptomics, proteomics, biological networks and biostatistics. Through integrated lectures, practical hands-on exercises and project work, students will also be trained in analytical and programming skills to meet the emerging increase in data-driven knowledge generation in biology in the 21st century.

Objective
Students will have an advanced understanding of the underlying concepts behind modern bioinformatic analyses at genome, metagenome and proteome-wide scales. They will be familiar with the most common data types, where to access them, and how to analytically work with them to address contemporary questions in the field of biology.

Prerequisites / notice
Course participants have already acquired basic programming skills in UNIX, Python and R.

Competencies
- Subject-specific Competencies: Concepts and Theories, Techniques and Technologies
  - Concepts and Theories: assessed
  - Techniques and Technologies: assessed

Social Competencies

551-0309-00L  Concepts in Modern Genetics  W  6 credits  4V  Y. Barrai, A. Hajnal, O. Voinnet, University lecturers

Information for UZH students:
Enrolment to this course unit only possible at ETH. No enrolment to module BIO348 at UZH.

Please mind the ETH enrolment deadlines for UZH students: https://www.ethz.ch/en/studies/non-degree-courses/special-students-university-of-zurich.html

Abstract
Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Objective
This course focuses on the concepts of classical and modern genetics and genomics.

Content
The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Lecture notes
Scripts and additional material will be provided during the semester.
Advanced class covering the state of the research in bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis. This concept class will be based on common concepts and introduce to the enormous diversity among bacteria and archaea. It will cover assessed

Electronic access to the documentation will be provided. The link can be found at "Lernmaterialien"

2V
Updated handouts will be provided during the class.

Lecturers
W.-D. Hardt, L. Eberl, B. Nguyen,
J. Piel, M. Pilhofer, A. Vagstad

2 credits
W.

Objective
This concept class will be based on common concepts and introduce to the enormous diversity among bacteria and archaea. It will cover the current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Content
Advanced class covering the state of the research in bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Literature
Current literature references will be provided during the lectures.

Prerequisites /
English
The lecture "Grundlagen der Biologie II: Mikrobiologie" is the basis for this advanced lecture.

</tbody>
</table>

Abstract
This short course is designed to accompany MSc students in writing their first reports in English, providing input on scientific writing in English as well as feedback on drafts sections of the report.

Objective
Students will learn to:
- Plan, draft, structure, and edit scientific reports
- Produce reader-friendly sentences
- Establish a clear and logical flow between sentences and paragraphs
- Select formal vocabulary and use it in a generally accurate and correct manner
- Choose and use generally suitable grammatical structures, punctuation, and identify areas in which further development is needed

Content
The course covers the process of writing reports in biology, helping students to focus on the language and communicative aspects of these reports. Topics covered include structuring sentences, paragraphs, and longer sections (introductions, methods, etc.); presenting and integrating non-textual elements such as graphs and tables; reviewing common grammar problems for advanced writers in English; and editing drafts and proofs. Sessions will consist of a mix of specialist input, group and pair work, and editing sessions.

Prerequisites /
Participants should be at a stage in their research where they can already start drafting parts of the report.

This course provides a detailed understanding of U. Suter. Weekly seminar about cutting edge topics in immunology and infection biology. Internationally renowned experts present their current ECTS.

Documents of the lectures are available for download at: 

Hours

The course is a literature seminar or "journal club". Each Friday a student, or a member of the Suter Lab in the Institute of Molecular Health fostered

Lecturers

A. Oxenius, C. Schneider, E. Slack, R. Spörri, further lecturers

You will present one paper yourself. Give an introduction to the field of the paper, then show and comment on the main results (all the papers we present are available online, so you can show original figures with a beamer). Finish with a summary of the main points and a discussion of their significance.

Prerequisites / notice

For D-BIOL students Immunology I (WS) and Immunology II (SS) will be examined as one learning entity in a "Sessionsprüfung". All other students write separate exams for Immunology I and Immunology II. All exams (combined exam Immunology I and II, individual exams) are offered in each exam session.

Abstract

This course provides a detailed understanding of the development of T and B cells, the dynamics of an immune response during acute and chronic infection, immunopathology, modern vaccination strategies. Key experimental results will be shown to help understanding how immunological text book knowledge has evolved.

Objective

Obtain a detailed understanding of the development, activation, and differentiation of different types of T cells and their effector mechanisms during immune responses, recognition of pathogenic microorganisms by the host cells and molecular events thereafter, events and signals for maturation of naive B cells to antibody producing plasma cells and memory B cells. Optimization of B cell responses by intelligent design of new vaccines. Content

- Development and selection of CD4 and CD8 T cells, natural killer T cells (NKT), and regulatory T cells (Treg)
- NK T cells and responses to lipid antigens
- Differentiation, characterization, and function of CD4 T cell subsets such as Th1, Th2, and Th17
- Overview of cytokines and their effector function
- Co-stimulation (signals 1-3)
- Dendritic cells
- Evolution of the "Danger" concept
- Cells expressing Pattern Recognition Receptors and their downstream signals
- T cell function and dysfunction in acute and chronic viral infections
- Development and selection of CD4 and CD8 T cells
- Recognition of pathogenic microorganisms by the host cells and molecular events thereafter
- The dynamics of an immune response during acute and chronic infection
- Immunopathology
- Modern vaccination strategies

Abstract

Does not take place this semester.

Objective

The course is a literature seminar or "journal club". Each Friday a student, or a member of the Suter Lab in the Institute of Molecular Health Sciences, will present a paper from the recent literature.

Content

You will present one paper yourself. Give an introduction to the field of the paper, then show and comment on the main results (all the papers we present are available online, so you can show original figures with a beamer). Finish with a summary of the main points and a discussion of their significance.

Lecture notes

Presentations will be made available after the seminars.

Prerequisites / notice

You must attend at least 80% of the journal clubs, and give a presentation of your own. At the end of the semester there will be a 30 minute oral exam on the material presented during the semester. The grade will be based on the exam (45%), your presentation (45%), and a contribution based on your active participation in discussion of other presentations (10%).

Funding of participants limited to 15. The course will cover the current grand topics in immunology: B cells, innate immunity, antigen presentation, tumor immunity, T cells, myeloid cells and stromal cells. For each topic two or four hours will be allocated. Historical milestone papers will be presented by the tutor/lecturer providing an overview on the development of the theoretical framework and critical technological advances. The students will read the historical milestone papers and contribute to the discussion. In the second part of the lecture, students will present recent high impact research papers that have emerged from the landmark achievements of the previously discussed milestone concepts.

Literaturunterlagen werden vor Beginn des Kurses auf folgender website zugänglich sein: https://moodle-app2.let.ethz.ch/course/view.php?id=15568

Within the framework of this course, we will work out how the various methods work and what their capabilities/limits are. The problem
areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single
cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single
cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.
Guided by an expert in the field, students will engage in classical round-table style discussions of current literature with frontal presentations. Guided by a faculty expert, students develop domain knowledge of the research area associated with a primary paper, and alternate as discussion leaders to present the research topic. By the end of the semester, students will formulate their ideas about open testable research questions that extend from the published work.

The literature will be provided during the course.

The course will be taught in English.

752-4009-00L Molecular Biology of Foodborne Pathogens W 3 credits 2V M. Loessner, A. Harms, M. Schuppler, E. Slack

Abstract
The course offers detailed information on selected foodborne pathogens and toxin producing organisms; the focus lies on relevant molecular biological aspects of pathogenicity and virulence, as well as on the occurrence and survival of these organisms in foods.

Objective
Detailed and current status of research and insights into the molecular basis of foodborne diseases, with focus on interactions of the microorganism or the toxins they produce with the human system. Understanding the relationship between specific types of food and the associated pathogens and microbial risks. Another focus lies on the currently available methods and techniques useful for the various purposes, i.e., detection, differentiation (typing), and antimicrobial agents.

Content
Molecular biology of infectious foodborne pathogens (Listeria, E. coli, Campylobacter, Salmonella, etc) and toxin-producing organisms (Bacillus, Clostridium, Staphylococcus). How and under which conditions will toxins and virulence factors be produced, and how do they work? How is the interaction between the human host and the microbial pathogen? What are the roles of food and the environment? What can be done to interfere with the potential risks? Which methods are best suited for what approach? Last, but not least, the role of bacteriophages in microbial pathogenicity will be highlighted, in addition to various applications of bacteriophages for both diagnostics and antimicrobial intervention.

Lecture notes
Electronic copies of the presentation slides (PDF) and additional material will be made available for download to registered students.

Literature
Recommendations will be given in the first lecture

Prerequisites / notice
Lectures (2 hours) will be held as a single session of approximately 60+ minutes (10:15 until approx. 11:15 h), without a break!

751-4504-00L Plant Pathology I W 2 credits 2G B. McDonald

Abstract
Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems.

Objective
Students will understand: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems as a basis for implementing disease management strategies in agroecosystems.
Course description: Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies.

Lecture Topics and Tentative Schedule

Week 1  The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrotophs, disease cycles and pathogen life cycles.

Week 2  Nematode attack strategies and types of damage. Viral pathogens, classification, reproduction and transmission, attack strategies and types of damage. Examples TMV, BYDV. Bacterial pathogens and phytoplasmas, classification, reproduction and transmission.

Week 3  Bacterial attack strategies and symptoms. Example bacterial diseases: fire blight, Agrobacterium crown gall, soft rots. Fungal and oomycete pathogens, classification, growth and reproduction, sexual and asexual spores, transmission.

Week 4  Fungal and oomycete life cycles, disease cycles, infection processes, colonization, phytotoxins and mycotoxins. Attack strategies of fungal necrotophs and biotrophs. Symptoms and signs of fungal infection. Example fungal diseases: potato late blight.

Week 5  Example fungal diseases: wheat stem rust, grape powdery mildew, wheat septoria tritici blotch. Plant defense mechanisms, host range and non-host resistance. Passive structural and chemical defenses, preformed chemical defenses. Active structural defense, histological and cellular (papillae).

Week 6  Active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytoalexins and disease resistance. Pisatin and pisatin demethylase. Local and systemic acquired resistance (LRAR, SAR), induced systemic resistance (ISR), signal molecules, defense activators (Bion). Pathogen effects on food quality. Positive and negative transformations.

Week 8  Epidemiology: Disease pyramid, environmental effects on epidemic development, plant effects on development of epidemics, including resistance, physiology, density, uniformity.

Week 9  Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity. Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies, ELISA.

Week 10  Molecular detection and diagnosis of pathogens: PCR, rDNA and loop-mediated isothermal amplification. Strategies for minimizing disease risks: calculating disease thresholds, disease forecasting systems.

Week 12  Physical control methods. Cultural control methods: avoidance, tillage practices, crop sanitation.

Week 13  Cultural control methods: fertilizers, crop rotations.

Week 14  Open lecture.

Lecture notes

Detailed lecture notes (~160 pages) will be available for purchase at the cost of reproduction at the start of the semester.

Competencies

Subject-specific Competencies

Concepts and Theories assessed

Techniques and Technologies assessed

636-0017-00L Computational Biology  W  6 credits  3G+2A  T. Vaughan, C. Magnus, T. Stadler

Abstract

The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Computational algorithms extracting biological information from genetic sequence data are discussed, and statistical tools to understand this information in detail are introduced.

Objective

Attendees will learn which information is contained in genetic sequencing data and how to extract information from this data using computational tools. The main concepts introduced are:

* stochastic models in molecular evolution
* phylogenetic & phylodynamic inference
* maximum likelihood and Bayesian statistics

Attendees will apply these concepts to a number of applications yielding biological insight into:

* epidemiology
* pathogen evolution
* macroevolution of species

Content

The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods for direct alignment analysis using approaches such as BLAST and GWAS. Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. Lastly, we introduce the field of phylodynamics, the aim of which is to understand and quantify population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

Lecture notes

Lecture slides will be available on moodle.

Literature

The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:

* Yang, Z. 2006. Computational Molecular Evolution.
* Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.
Prerequisites / notice
Basic knowledge in linear algebra, analysis, and statistics will be helpful. Programming in R will be required for the project work (compulsory continuous performance assessments). In case you do not have any previous experience with R, we strongly recommend to get familiar with R prior to the semester start. For the D-BSSE students, we highly recommend the voluntary course „Introduction to Programming“, which takes place in Basel before the start of the semester.

701-1703-00L Evolutionary Medicine for Infectious Diseases

Abstract
This course explores infectious disease from both the host and pathogen perspective. Through short lectures, reading and active discussion, students will identify areas where evolutionary thinking can improve our understanding of infectious diseases and, ultimately, our ability to treat them effectively.

Objective
Students will learn to (i) identify evolutionary explanations for the origins and characteristics of infectious diseases in a range of organisms and (ii) evaluate ways of integrating evolutionary thinking into improved strategies for treating infections of humans and animals. This will incorporate principles that apply across any host-pathogen interaction, as well as system-specific mechanistic information, with particular emphasis on bacteria and viruses.

Content
We will cover several topics where evolutionary thinking is relevant to understanding or treating infectious diseases. This includes: (i) determinants of pathogen host range and virulence, (ii) dynamics of host-parasite coevolution, (iii) pathogen adaptation to evade or suppress immune responses, (iv) antimicrobial resistance, (v) evolution-proof medicine. For each topic there will be a short (< 20 minutes) introductory lecture, before students independently research the primary literature and develop discussion points and questions, followed by interactive discussion in class.

Literature
The focus is on primary literature, but for some parts the following text books provide good background information:

- Schmid Hempel 2011 Evolutionary Parasitology
- Stearns & Medzhitov 2016 Evolutionary Medicine

Prerequisites / notice
A basic understanding of evolutionary biology, microbiology or parasitology will be advantageous but is not essential.

752-5500-00L Applied Bioinformatics: Microbiomes

Abstract
Learn to apply practical bioinformatics/computational skills for analysis of microbiomes in foods and human health! Students will apply basic programming skills for scientific computing and bioinformatics, and learn and discuss the importance of microbiomes to foods and human health, through recognition and comparison of ecological theory, methodology, and experimental design across systems.

Objective
Learn to apply bioinformatics and computational methods for analysis of microbiome next-generation sequencing data. A secondary goal is to critically examine the relevance of microbiomes to food quality, safety, and human health, through application of theory and appropriate experimental design. Students completing this course will thus be able to both apply appropriate methodology to study microbiomes (or other high-dimensional data) in different systems, as well as evaluate and interpret bioinformatics results.

Content
1. Introduction to microbiomes and microbial bioinformatics toolkit. Python, Pandas, Jupyter, GitHub, visualization libraries for Python.
3. Microbial diversity, function, and ecology. Molecular ecology, diversity metrics, ordination methods.

This course requires extensive engagement in learning outside of the classroom (using online resources and practical exercises), with a focus on active learning in the classroom.

Prerequisites / notice
No specific pre-requisites, but students should have some familiarity with microbiology, molecular biology, programming (Python), bioinformatics, and statistics.

Data: 02.07.2024 12:39  Autumn Semester 2024   Page 322 of 2667
This lecture is the first part of a one-year course. It offers insights into the fundamentals and applications of Food Microbiology. Contents include basic microbiology of the different bacteria, yeasts and molds present in foods, as well as the occurrence and control of foodborne pathogens and spoilage organisms.

Objective

The lecture offers insights into the fundamentals and applications of Food Microbiology. Contents include basic microbiology of the different bacteria, yeasts, molds and protozoa in foods, as well as the occurrence and control of foodborne pathogens and spoilage organisms.

Content

1. History of Food Microbiology
   1.1. Short synopsis of foodborne microorganisms
   1.2. Spoilage of Foods
   1.3. Foodborne Disease
   1.4. Food Preservation
   1.5. VIP's of Food Microbiology
2. Overview of Microorganisms in Foods
   2.1 Origin of foodborne Microorganisms
   2.2. Bacteria
   2.3. Yeasts
   2.4. Molds
3. Microbial Spoilage of Foods
   3.1. Intrinsic and Extrinsic Parameters
   3.2. Meats, Seafoods, Eggs
   3.3. Milk and Milk Products
   3.4. Vegetable and Fruit Products
   3.5. Miscellaneous (baked goods, nuts, spices, ready-to-eat products)
   3.6. Drinks and Canned Foods
4. Foodborne Disease
   4.1. Significance and Transmission of Foodborne pathogens
   4.2. Staphylococcus aureus
   4.3. Gram-positive Sporeformers (Bacillus & Clostridium)
   4.4. Listeria monocytogenes
   4.5. Salmonella, Shigella, Escherichia coli
   4.6. Vibrio, Yersinia, Campylobacter
   4.7. Brucella, Mycobacterium
   4.8. Parasites
   4.9. Viruses and Bacteriophages
   4.10. Mycotoxins
   4.11. Bioactive Amines
   4.12. Miscellaneous (Antibiotic-resistant Bacteria, Biofilms)

Literature

Recommendations will be given in the first lecture.

Competencies

Subject-specific Competencies
   Concepts and Theories assessed
   Techniques and Technologies assessed
Method-specific Competencies
   Analytical Competencies fostered
   Decision-making assessed
   Media and Digital Technologies assessed
   Problem-solving assessed
   Project Management assessed
Social Competencies
   Communication assessed
   Cooperation and Teamwork assessed
   Self-presentation and Social Influence fostered
   Negotiation fostered
Personal Competencies
   Adaptability and Flexibility fostered
   Creative Thinking assessed
   Critical Thinking assessed
   Integrity and Work Ethics fostered
   Self-awareness and Self-reflection fostered
   Self-direction and Self-management fostered

Evolutionary Genetics

Abstract

The concept course 'Evolutionary Genetics' consists of two lectures that jointly provide an introduction to the fields of population and quantitative genetics (emphasis on basic concepts) and ecological genetics (more emphasis on evolutionary and ecological processes of adaptation and speciation).

Objective

The aim of the course is to provide students with a solid introduction to the fields of population genetics, quantitative genetics, and ecological genetics. The concepts and research methods developed in these fields have undergone profound transformations; they are of fundamental importance in our understanding of evolutionary processes, both past and present. Students should gain an appreciation for the concepts, methods and explanatory power of evolutionary genetics.

Content

Population genetics - Types and sources of genetic variation; randomly mating populations and the Hardy-Weinberg equilibrium; effects of inbreeding; natural selection; random genetic drift and effective population size; gene flow and hierarchical population structure; molecular population genetics: neutral theory of molecular evolution and basics of coalescent theory.
Quantitative genetics - Continuous variation; measurement of quant. characters; genes, environments and their interactions; measuring their influence; response to selection; inbreeding and crossingbreeding, effects on fitness; Fisher's fundamental theorem.
Ecological Genetics - Concepts and methods for the study of genetic variation and its role in adaptation, reproductive isolation, hybridization and speciation

Molecular Life of Plants

Abstract

The concept course 'Molecular Life of Plants' consists of two lectures that jointly provide an introduction to the fields of population and quantitative genetics (emphasis on basic concepts) and ecological genetics (more emphasis on evolutionary and ecological processes of adaptation and speciation).

Objective

The aim of the course is to provide students with a solid introduction to the fields of population genetics, quantitative genetics, and ecological genetics. The concepts and research methods developed in these fields have undergone profound transformations; they are of fundamental importance in our understanding of evolutionary processes, both past and present. Students should gain an appreciation for the concepts, methods and explanatory power of evolutionary genetics.

Content

Population genetics - Types and sources of genetic variation; randomly mating populations and the Hardy-Weinberg equilibrium; effects of inbreeding; natural selection; random genetic drift and effective population size; gene flow and hierarchical population structure; molecular population genetics: neutral theory of molecular evolution and basics of coalescent theory.
Quantitative genetics - Continuous variation; measurement of quant. characters; genes, environments and their interactions; measuring their influence; response to selection; inbreeding and crossingbreeding, effects on fitness; Fisher’s fundamental theorem.
Ecological Genetics - Concepts and methods for the study of genetic variation and its role in adaptation, reproductive isolation, hybridization and speciation

Literature

The advanced course introduces students to plants through a concept-based discussion of developmental processes that integrates physiology and biochemistry with genetics, molecular biology, and cell biology. The course follows the life of the plant, starting with the seed, progressing through germination to the seedling and mature plant, and ending with reproduction and senescence.

The new course "Molecular Life of Plants" reflects the rapid advances that are occurring in the field of experimental plant biology as well as the changing interests of students being trained in this discipline. Contemporary plant biology courses emphasize a traditional approach to experimental plant biology by discussing discrete topics that are removed from the context of the plant life cycle. The course will take an integrative approach that focuses on developmental concepts. Whereas traditional plant physiology courses were based on research carried out on intact plants or plant organs and were often based on phenomenological observations, current research in plant biology emphasizes work at the cellular, subcellular and molecular levels.

The goal of "Molecular Life of Plants" is to train students in integrative approaches to understand the function of plants in a developmental context. While the course focuses on plants, the training integrative approaches will also be useful for other organisms.

The course "Molecular Life of Plants" will cover the following topics:

- Seed structure and physiology, their dormancy and germination.
- Seedling establishment and early development.
- Structure and Function of Meristems, including stem cells.
- Plant organ development (leaves, roots, flowers etc.).
- Plant reproduction.
- The plant vasculature for long-distance transport and other specialized tissues.
- Sensing and responding to the abiotic environment
- Plant-microbe interactions; beneficial friends or pathogenic foes?
- Polyploidy; the benefits, problems and solutions to of multiple genomes.
- Photosynthesis and carbon partitioning.
- Photosynthesis and the evolution of C4 metabolism.
- Starch biosynthesis and degradation.
- Chloroplast development and chlorophyll biosynthesis.
- Senescence mechanisms in plants.
- General principles of RNA silencing
- MicroRNAs: discovery, general principle and modes of action at the cellular and system levels.
- Chromatin-based RNA silencing.
- Antiviral RNA silencing.
- RNA silencing & defense against non-viral pathogens.
- RNA silencing movement and amplification.

551-0307-00L Molecular and Structural Biology I: Protein Structure and Function
D-BIOL students are obliged to take part I and part II (next semester) as a two-semester course

Abstract
Biophysics of protein folding, membrane proteins and biophysics of membranes, enzymatic catalysis, catalytic RNA and RNAi, current topics in protein biophysics and structural biology.

Objective
Understanding of structure-function relationships in proteins and in protein folding, detailed understanding of biophysics and physical methods as well as modern methods for protein purification and microanalytics.

Lecture notes
Scripts on the individual topics can be found under http://www.mol.biol.ethz.ch/teaching.

Literature
Basics:
- Creighton, T.E., Proteins, Freeman, (1993)
- Fersht, A., Enzyme, Structure and Mechanism in Protein Science (1999), Freeman.

Current topics: References will be given during the lectures.

551-0309-00L Concepts in Modern Genetics
Information for UZH students: Enrolment to this course unit only possible at ETH. No enrolment to module BIOC348 at UZH.

Please mind the ETH enrolment deadlines for UZH students: https://www.ethz.ch/en/studies/non-degree-courses/special-students/university-of-zurich.html

Abstract
Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Objective
This course focuses on the concepts of classical and modern genetics and genomics.

Content
The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Lecture notes
Scripts and additional material will be provided during the semester.
551-0319-00L **Cellular Biochemistry (Part I)**

**Objective**
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

**Content**
Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes. Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

**Prerequisites / notice**
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

**Competencies**
- **Method-specific Competencies**: Concepts and Theories
- **Social Competencies**: Communication
- **Personal Competencies**: Creative Thinking

**Lecture notes**
Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials (alicia.smith@bc.bioc.ethz.ch)

**Literature**
Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

**551-1299-00L **Bioinformatics**

**Objective**
Students will study bioinformatic concepts in the areas of metagenomics, genomics, transcriptomics, proteomics, biological networks and biostatistics. Through integrated lectures, practical hands-on exercises and project work, students will also be trained in analytical and programming skills to meet the emerging increase in data-driven knowledge generation in biology in the 21st century.

**Prerequisites / notice**
Course participants have already acquired basic programming skills in UNIX, Python and R.

**Competencies**
- **Method-specific Competencies**: Concepts and Theories
- **Social Competencies**: Communication
- **Personal Competencies**: Creativity

**529-0731-00L **Nucleic Acids and Carbohydrates**

**Abstract**
Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNA; polymersases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines.

**Objective**
Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNA; polymersases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines.

**Content**
Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNA; polymersases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines.
No script; illustrations from the original literature relevant to the individual lectures will be provided weekly (typically as handouts downloadable from the Moodle server).

Mainly based on original literature, a detailed list will be distributed during the lecture.

Combines Concepts and Theories with Techniques and Technologies assessed

Analytical Competencies assessed

Problem-solving assessed

Cooperation and Teamwork assessed

Self-awareness and Self-reflection assessed

Self-direction and Self-management assessed

This short course is designed to accompany MSc students in writing their first reports in English, providing input on scientific writing in English as well as feedback on drafts sections of the report.

Students will learn to:
- Plan, draft, structure, and edit scientific reports
- Produce reader-friendly sentences
- Establish a clear and logical flow between sentences and paragraphs
- Select formal vocabulary and use it in a generally accurate and correct manner
- Choose and use generally suitable grammatical structures, punctuation, and identify areas in which further development is needed

The course covers the process of writing reports in biology, helping students to focus on the language and communicative aspects of these reports. Topics covered include structuring sentences, paragraphs, and longer sections (introductions, methods, etc.); presenting and integrating non-textual elements such as graphs and tables; reviewing common grammar problems for advanced writers in English; and editing drafts and proofs. Sessions will consist of a mix of specialist input, group and pair work, and editing sessions.

Students who attend this course will turn in three sections of a report (approx. 500 words each) for feedback, revising these texts for a final portfolio that is graded.

Participants should be at a stage in their research where they can already start drafting parts of the report.

This course is designed to accompany MSc students in writing their first reports in English, providing input on scientific writing in English as well as feedback on drafts sections of the report.

D-BIOL students are obliged to take part I and part II (next semester) as a two-semester course

The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes. Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

<td>Writing Scientific Reports for MSc Biology</td>
<td>W</td>
<td>2 credits</td>
<td>1G</td>
<td>R. Taylor</td>
</tr>
<tr>
<td>Abstract</td>
<td>This short course is designed to accompany MSc students in writing their first reports in English, providing input on scientific writing in English as well as feedback on drafts sections of the report. Students will learn to: - Plan, draft, structure, and edit scientific reports - Produce reader-friendly sentences - Establish a clear and logical flow between sentences and paragraphs - Select formal vocabulary and use it in a generally accurate and correct manner - Choose and use generally suitable grammatical structures, punctuation, and identify areas in which further development is needed</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>The course covers the process of writing reports in biology, helping students to focus on the language and communicative aspects of these reports. Topics covered include structuring sentences, paragraphs, and longer sections (introductions, methods, etc.); presenting and integrating non-textual elements such as graphs and tables; reviewing common grammar problems for advanced writers in English; and editing drafts and proofs. Sessions will consist of a mix of specialist input, group and pair work, and editing sessions. Students who attend this course will turn in three sections of a report (approx. 500 words each) for feedback, revising these texts for a final portfolio that is graded. Participants should be at a stage in their research where they can already start drafting parts of the report.</td>

| 551-1153-00L | Systems Biology of Metabolism                                       | W    | 4    | 2V    | U. Sauer, N. Zamboni       |
|              | Number of participants limited to 15.                              |      |      |       |                            |
|              | Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts. |      |      |       |                            |
|              | Develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology. |      |      |       |                            |
|              | The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics. For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics. |      |      |       |                            |
|              | Script and original publications will be supplied during the course. |      |      |       |                            |
| Lecture notes| The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry. |      |      |       |                            |
| Prerequisites | Solid knowledge in biochemistry strongly recommended                  |      |      |       |                            |

| 529-0004-01L | Classical Simulation of (Bio)Molecular Systems                      | W    | 6    | 4G    | P. H. Hünenberger, J. Dolenc, S. Riniker |
|              | Molecular models, classical force fields, configuration sampling, molecular dynamics simulation, boundary conditions, electrostatic interactions, analysis of trajectories, free-energy calculations, structure refinement, applications in chemistry and biology. Exercises: hands-on computer exercises for learning progressively how to perform an analyze classical simulations (using the package GROMOS). |      |      |       |                            |
| Objective    | Introduction to classical (atomistic) computer simulation of (bio)molecular systems, development of skills to carry out and interpret these simulations. |      |      |       |                            |
| Content      | Molecular models, classical force fields, configuration sampling, molecular dynamics simulation, boundary conditions, electrostatic interactions, analysis of trajectories, free-energy calculations, structure refinement, applications in chemistry and biology. Exercises: hands-on computer exercises for learning progressively how to perform an analyze classical simulations (using the package GROMOS). |      |      |       |                            |
| Lecture notes| The powerpoint slides of the lectures will be made available weekly on the website in pdf format (on the day preceding each lecture). |      |      |       |                            |
| Literature   | See: www.csms.ethz.ch/education/CSBMS                               |      |      |       |                            |
| Prerequisites | Since the exercises on the computer do convey and test essentially different skills than those being conveyed during the lectures and tested at the oral exam, the results of the exercises are taken into account when evaluating the results of the exam (learning component, possible bonus of up to 0.25 points on the exam mark). |      |      |       |                            |

### 401-0649-00L Applied Statistical Regression

**Abstract**
This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning “good practice” that can be applied in every student’s own projects and daily work life. A special focus will be laid in the use of the statistical software package R for regression analysis.

**Objective**
The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.

**Content**
The course starts with the basics of linear modeling, and then proceeds to parameter estimation, tests, confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, multicollinearity problems and model interpretation, as well as general modeling strategies.

The last third of the course is dedicated to an introduction to generalized linear models: this includes the generalized additive model, logistic regression for binary response variables, binomial regression for grouped data and poisson regression for count data.

**Lecture notes**
A script will be available.

**Literature**
- Faraway (2005): Linear Models with R
- Faraway (2006): Extending the Linear Model with R
- Draper & Smith (1998): Applied Regression Analysis
- Fox (2008): Applied Regression Analysis and GLMs
- Montgomery et al. (2006): Introduction to Linear Regression Analysis

**Prerequisites / notice**
The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

### 401-6215-00L Using R for Data Analysis and Graphics (Part I)

**Abstract**
The course provides the first part an introduction to the statistical/graphical/data science software R (https://www.r-project.org/) for scientists. Topics covered are data generation and selection, graphical and basic statistical functions, creating simple functions, basic types of objects.

**Objective**
The students will be able to use the software R for simple data analysis and graphics.

**Content**
The course provides the first part of an introduction to the statistical software R for scientists. R is free software that contains a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

Part I of the course covers the following topics:
- What is R?
- R Basics: reading and writing data from/to files, creating vectors & matrices, selecting elements of dataframes, vectors and matrices, arithmetics;
- Types of data: numeric, character, logical and categorical data, missing values;
- Simple (statistical) functions: summary, mean, var, etc., simple statistical tests;
- Writing simple functions;
- Introduction to graphics: scatter-, boxplots and other high-level plotting functions, embellishing plots by title, axis labels, etc., adding elements (lines, points) to existing plots.

The course focuses on practical work at the computer with R. We will make use of the graphical user interface RStudio: www.rstudio.org

**Lecture notes**
An Introduction to R. http://stat.ethz.ch/CRAN/doc/contrib/Lam-IntroductionToR_LHL.pdf

**Prerequisites / notice**
The course resources will be provided via the Moodle web learning platform.

Subscribing via Mystudies "automatically" makes you a student participant of the Moodle course of this lecture, which is at https://moodle-app2.et.tzh.ch/course/view.php?id=20847

Objective

Engineering uses the laws of physics to predict the behavior of a system. Biological systems are so diverse and complex prompting the question whether we can apply unifying concepts of theoretical physics coping with the multiplicity of life’s mechanisms.

Objective of this course is to show that biological phenomena despite their variety can be analytically described using only two principles from statistical mechanics: maximization of the entropy and minimization of the Gibbs free energy.

Starting point of the course is the probability theory, which enables to derive step-by-step the two pillars of thermodynamics from the perspective of statistical mechanics: the maximization of entropy according to the Boltzmann’s law as well as the minimization of the Gibbs free energy. Then, an assortment of biological phenomena at the molecular and cellular level (e.g. cytoskeletal polymerization, action potential, photosynthesis, gene regulation, morphogen patterning) will be examined at the light of these two principles with the aim to derive a quantitative expression describing their behavior. Each analytical model is finally validated by comparing it with the corresponding experimental results from the literature.

By the end of the course, students will also learn to critically evaluate the concepts of making an assumption and making an approximation.

Content

- Basics of theory of probability
- Boltzmann’s law
- Entropy maximization and Gibbs free energy minimization
- Ligand-receptor: two-state systems and the MWC model
- Random walks, diffusion, crowding
- Electrostatics for salty solutions
- Elasticity: fibers and membranes
- Molecular motors
- Action potential: Hodgkin-Huxley model
- Photosynthesis and vision
- Gene regulation
- Development: Turing patterns

Theory and corresponding exercises are merged together during the classes.

Lecture notes

No lecture notes because the two proposed textbooks are more than exhaustive!

I am willingly available Mondays 17.00 o’clock - 18.00 in my office GLC F12.2 for whatever discussion about the lessons and the exercises.

!!! I am using OneNote. All lectures will be broadcast via ZOOM, while corresponding videos of the previous years (lectures and exercises) are available in Moodle !!!
principles of protein labeling and protein modification (fluorescent proteins, enzyme-mediated labeling, bioorthogonal chemistries)
directed evolution and protein engineering
chemical biology of ubiquitin and targeted protein degradation
advanced genetic code expansion methods (amber suppression, orthogonal ribosomes, unnatural base pairs, genome engineering and genome editing)

Lecture notes
A script will not be handed out. Handouts to the lecture will be provided through moodle.

Literature
Citations from the original literature relevant to the individual lectures will be assigned during the lectures.

Prerequisites / notice
Knowledge provided in the bachelor lectures 'Nucleic Acids and Carbohydrates' and 'Proteins and Lipids' is assumed for this lecture.

Abstract
This short course is designed to accompany MSc students in writing their first reports in English, providing input on scientific writing in English as well as feedback on drafts sections of the report.

Objective
Students will learn to:
- Plan, draft, structure, and edit scientific reports
- Produce reader-friendly sentences
- Establish a clear and logical flow between sentences and paragraphs
- Select formal vocabulary and use it in a generally accurate and correct manner
- Choose and use generally suitable grammatical structures, punctuation, and identify areas in which further development is needed

Content
The course covers the process of writing reports in biology, helping students to focus on the language and communicative aspects of these reports. Topics covered include structuring sentences, paragraphs, and longer sections (introductions, methods, etc.); presenting and integrating non-textual elements such as graphs and tables; reviewing common grammar problems for advanced writers in English; and editing drafts and proofs. Sessions will consist of a mix of specialist input, group and pair work, and editing sessions.

Prerequisites / notice
Participants should be at a stage in their research where they can already start drafting parts of the report.

Abstract
Students will study bioinformatic concepts in the areas of metagenomics, genomics, transcriptomics, proteomics, biological networks and biostatistics. Through integrated lectures, practical hands-on exercises and project work, students will also be trained in analytical and programming skills to meet the emerging increase in data-driven knowledge generation in biology in the 21st century.

Objective
Students will have an advanced understanding of the underlying concepts behind modern bioinformatic analyses at genome, metagenome and proteome-wide scales. They will be familiar with the most common data types, where to access them, and how to analytically work with them to address contemporary questions in the field of biology.

Prerequisites / notice
Course participants have already acquired basic programming skills in UNIX, Python and R.

Students bring their own computer with keyboard, internet access (browser) and software to connect to the ETH network via VPN.

Competencies

551-0319-00L Cellular Biochemistry (Part I)

W 3 credits 2V U. Kutay, F. Allain, T. Kleele, I. Zemp

Abstract
Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

Objective
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry. The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into highly complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Content
Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

Lecture notes
Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

Literature
Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

Prerequisites / notice
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

551-0309-00L Concepts in Modern Genetics

W 6 credits 4V Y. Barral, A. Hajnal, O. Voinnet, University lecturers

Information for UZH students:
Enrolment to this course unit only possible at ETH. No enrolment to module BIO348 at UZH.

Please mind the ETH enrolment deadlines for UZH students: https://www.ethz.ch/en/studies/non-degree-courses/special-students-university-of-zurich.html

Abstract
Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Objective
This course focuses on the concepts of classical and modern genetics and genomics.

Content
The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

| 551-1303-00L    | Current Research Topics in Cellular Biochemistry | W    | 4    | 2S    | T. Kleee, V. Korkhov, G. Neurohr, V. Panse, M. Peter, A. E. Smith, F. van Drogen |
| Abstract        | During this Masters level seminar style course, students will explore current research topics in cellular biochemistry focused on the structure, function and regulation of selected cell components, and the consequences of dysregulation for pathologies. |
| Objective       | Students will work with experts toward a critical analysis of cutting-edge research in the domain of cellular biochemistry, with emphasis on normal cellular processes and the consequences of their dysregulation. At the end of the course, students will be able to evaluate, critically discuss and write about scientific articles in the research area of cellular biochemistry, and they will identify open testable research questions. |
| Content         | Guided by an expert in the field, students will engage in classical round-table style discussions of current literature with frontal presentations. Guided by a faculty expert, students develop domain knowledge of the research area associated with a primary paper, and alternate as discussion leaders to present the research topic. By the end of the semester, students will formulate their ideas about open testable research questions that extend from the published work. |
| Literature      | The literature will be provided during the course. |

| Notice          | No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student. |
The lecture will cover molecular and cellular processes underlying the development of the nervous system (neurogenesis, cell death, cell migration and differentiation, axon guidance and synapse formation). The importance of these processes in the context of developmental diseases is discussed.

On successful completion of the module the student should be able to:
- identify key steps in development underlying neurological syndromes and diseases

The lecture will cover molecular and cellular processes underlying the development of the nervous system. After an introduction to structure and function of the nervous system, we will discuss neurogenesis, cell death, cell migration and differentiation, axon guidance and synapse formation. The importance of these processes in the context of developmental diseases will be discussed.

From DNA to Diversity: the Evolution of Multicellular Organisms (University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: BIO344

Evolutionary Medicine for Infectious Diseases

This course explores infectious disease from both the host and pathogen perspective. Through short lectures, reading and active discussion, students will identify areas where evolutionary thinking can improve our understanding of infectious diseases and, ultimately, our ability to treat them effectively.

Students will learn to (i) identify evolutionary explanations for the origins and characteristics of infectious diseases in a range of organisms and (ii) evaluate ways of integrating evolutionary thinking into improved strategies for treating infections of humans and animals. This will incorporate principles that apply across any host-pathogen interaction, as well as system-specific mechanistic information, with particular emphasis on bacteria and viruses.

We will cover several topics where evolutionary thinking is relevant to understanding or treating infectious diseases. This includes: (i) determinants of pathogen host range and virulence, (ii) dynamics of host-parasite coevolution, (iii) pathogen adaptation to evade or suppress immune responses, (iv) antimicrobial resistance, (v) evolution-proof medicine. For each topic there will be a short (< 20 minutes) introductory lecture, before students independently research the primary literature and develop discussion points and questions, followed by interactive discussion in class.

The focus is on primary literature, but for some parts the following text books provide good background information:

- Schmid Hempel 2011 Evolutionary Parasitology
- Stearns & Medzhitov 2016 Evolutionary Medicine

A basic understanding of evolutionary biology, microbiology or parasitology will be advantageous but is not essential.

Creativity and Critical Thinking

By the end of this module, each student should be able to:
- interpret and critically evaluate original research reports
- apply knowledge and relate experimental approaches from molecular, cellular and developmental biology to the developing nervous system

The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on OLAT.

The lecture notes Must be downloaded from OLAT: https://www.olat.uzh.ch/olat/dmz/ as BIO344

Immunology III

Data: 02.07.2024 12:39 Autumn Semester 2024 Page 335 of 2667
This course provides a detailed understanding of
- development of T and B cells
- the dynamics of an immune response during acute and chronic infection
- mechanisms of immunopathology
- modern vaccination strategies

Key experimental results will be shown to help understanding how immunological textbook knowledge has evolved.

Obtain a detailed understanding of
- the development, activation, and differentiation of different types of T cells and their effector mechanisms during immune responses,
- recognition of pathogenic microorganisms by the host cells and molecular events thereafter,
- events and signals for maturation of naive B cells to antibody producing plasma cells and memory B cells.
- optimization of B cell responses by intelligent design of new vaccines

- Development and selection of CD4 and CD8 T cells, natural killer T cells (NKT), and regulatory T cells (Treg)
- NK T cells and responses to lipid antigens
- differentiation, characterization, and function of CD4 T cell subsets such as Th1, Th2, and Th17
- overview of cytokines and their effector function
- co-stimulation (signals 1-3)
- dendritic cells
- evolution of the "danger" concept
- cells expressing pattern recognition receptors and their downstream signals
- T cell function and dysfunction in acute and chronic viral infections

- milestones and current topics of innate immunity, antigen presentation, B cells, thymus and T cells, cytotoxic T cells, NK cells, stromal cells, CNS immunity and tumor immunology.

- milestones and current topics of innate immunity, antigen presentation, B cells, thymus and T cells, cytotoxic T cells, NK cells, stromal cells, CNS immunity and tumor immunology.

- original and review articles will be distributed by the respective lecturer.

551-1171-00L Immunology: From Milestones to Current Topics

W 4 credits 2S B. Ludewig, N. Pikor, University lecturers

Abstract
Milestones in Immunology: on old concepts and modern experiments

Objective
The course will cover the current grand topics in immunology: B cells, innate immunity, antigen presentation, tumor immunity, T cells, myeloid cells and stromal cells. For each topic two or four hours will be allocated. Historical milestone papers will be presented by the tutor/lecturer providing an overview on the development of the theoretical framework and critical technological advances. The students will read the historical milestone papers and contribute to the discussion. In the second part of the lecture, students will present recent high impact research papers that have emerged from the landmark achievements of the previously discussed milestone concepts.

Content
- milestones and current topics of innate immunity, antigen presentation, B cells, thymus and T cells, cytotoxic T cells, NK cells, stromal cells, CNS immunity and tumor immunology.
- original and review articles will be distributed by the respective lecturer.

Lecture notes
Original and review articles will be distributed by the respective lecturer.

752-4009-00L Molecular Biology of Foodborne Pathogens

W 3 credits 2V M. Loesner, A. Harms, M. Schupppler, E. Slack

Abstract
The course offers detailed information on selected foodborne pathogens and toxin producing organisms; the focus lies on relevant molecular biological aspects of pathogenicity and virulence, as well as on the occurrence and survival of these organisms in foods.

Objective
Detailed and current status of research and insights into the molecular basis of foodborne diseases, with a focus on interactions of the microorganism or the toxins they produce with the human system. Understanding the relationship between specific types of food and the associated pathogens and microbial risks. Another focus lies on the currently available methods and techniques useful for the various purposes, i.e., detection, differentiation (typing), and antimicrobial agents.

Content
- molecular biology of infectious foodborne pathogens (Listeria, E. coli, Campylobacter, Salmonella, etc) and toxin-producing organisms (Bacillus, Clostridium, Staphylococcus). How and under which conditions will toxins and virulence factors be produced, and how do they work? How is the interaction between the human host and the microbial pathogen? What are the roles of food and the environment? What can be done to interfere with the potential risks? Which methods are best suited for what approach? Last, but not least, the role of bacteriophages in microbial pathogenicity will be highlighted, in addition to various applications of bacteriophage for both diagnostics and antimicrobial intervention.

Lecture notes
Electronic copies of the presentation slides (PDF) and additional material will be made available for download to registered students.

Literature
Recommendations will be given in the first lecture

Prerequisites / notice
Lectures (2 hours) will be held as a single session of approximately 60+ minutes (10:15 until approx. 11:15 h), without a break !

376-1305-01L Molecular Neurophysiology: From Molecules to Systems

W 3 credits 2V G. Schratt, R. Fiore, W. von der Behrens, J. Winterer

Abstract
Information for UZH students: Enrolment to this course unit only possible at ETH. Please mind the ETH enrolment deadlines for UZH students: https://ethz.ch/en/studies/non-
The course covers the physiology of nerve cells, from the single cell through the neuronal network to the systemic level. The focus is on molecular and cellular mechanisms – synaptic transmission, signal transduction, gene expression, synaptic plasticity.

Based on an understanding of molecular and cellular mechanisms, the aim is to provide a deepened insight into neurophysiological processes underlying complex brain functions – learning/memory, sleep, sensory.

First, basic molecular and cellular mechanisms in nerve cells (excitability, neurotransmission, signal transduction, gene expression, synaptic plasticity) are introduced. Afterwards, their significance for selected neurophysiological processes (learning/memory, sleep, sensory) will be illuminated.

The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on Moodle.

Literature: The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on Moodle.

551-1407-00L RNA Biology Lecture Series I: Transcription & Processing & Translation

W 4 credits 2V F. Allain, N. Ban, S. Jonas, U. Kutay, further lecturers

Abstract
This course covers aspects of RNA biology related to gene expression at the posttranscriptional level. These include RNA transcription, processing, alternative splicing, editing, export and translation.

Objective
The focus is on developing a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key processes. This course covers aspects of RNA biology related to gene expression at the posttranscriptional level. These include RNA transcription, processing, alternative splicing, editing, export and translation.

Content
- Transcription & 3'end formation: splicing, alternative splicing, RNA editing; the ribosome & translation, translation regulation, RNP biogenesis & nuclear export, mRNA surveillance & mRNA turnover; signal transduction & RNA.

Prerequisites / notice
Basic knowledge of cell and molecular biology.

551-1409-00L RNA Biology Lecture Series II: Non-Coding RNAs:

W 4 credits 2V J. Hall, M. Stoffel, further lecturers

Abstract
This course covers aspects of RNA biology related to the functions of non-coding RNAs as well as their use as drugs to treat diseases.

Objective
The course students should get familiar with the wide array of roles, which non-coding RNAs play in cellular functions.

Content
- Micro RNAs: computational approaches to miRNAs; micro RNA function in metabolism; viruses and viral RNAs; ncRNA-mediated genome regulation; epigenetic programming of genome remodelling in ciliates; telomerase and telomeres; tRNA biology.

Prerequisites / notice
Basic knowledge of cell and molecular biology.

551-1153-00L Systems Biology of Metabolism

Number of participants limited to 15.

W 4 credits 2V U. Sauer, N. Zamboni

Abstract
Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.

Objective
Develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology.

Content
The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics. For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

Lecture notes
Script and original publications will be supplied during the course.

Prerequisites / notice
The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.

376-0300-00L Essentials in Translational Science

W 3 credits 2G J. Goldhahn

Abstract
Translational science is a cross disciplinary scientific research that is motivated by the need for practical applications that help people (e.g. Medicine). The course should help to clarify basics of translational science, illustrate successful applications and enable students to integrate key features into their future projects.

Objective
After completing this course, students will be able to understand: Principles of translational science including medical device development, intellectual property, regulatory environment and project management.

Content
- What is translational science and what is it not including: How to identify need?
- How to choose the appropriate research type and methodology
- How to measure success?
- How are medical devices developed?
- How to handle IP in the development process?
- How does the regulatory environment impact innovation?
- How to manage complex development projects?
- Positive and negative examples will be illustrated by distinguished guest speakers.

Literature
- Principles of Biomedical Sciences and Industry: Translating Ideas into Treatments
  https://doi.org/10.1002/9783527624014

Prerequisites / notice
4x online input lecture followed by case preparation and symposium

<tr>
<td><strong>Objective</strong></td>
<td>The new course &quot;Molecular Life of Plants&quot; reflects the rapid advances that are occurring in the field of experimental plant biology as well as the changing interests of students being trained in this discipline. Contemporary plant biology courses emphasize a traditional approach to experimental plant biology by discussing discrete topics that are removed from the context of the plant life cycle. The course will take an integrative approach that focuses on developmental concepts. Whereas traditional plant physiology courses were based on research carried out on intact plants or plant organs and were often based on phenomenological observations, current research in plant biology emphasizes work at the cellular, subcellular and molecular levels. The goal of &quot;Molecular Life of Plants&quot; is to train students in integrative approaches to understand the function of plants in a developmental context. While the course focuses on plants, the training integrative approaches will also be useful for other organisms.</td>

</tbody>
</table>
| **Content** | The course "Molecular Life of Plants" will cover the following topics:  
- Seed structure and physiology, their dormancy and germination.  
- Seedling establishment and early development.  
- Structure and Function of Meristems, including stem cells.  
- Plant organ development (leaves, roots, flowers etc.).  
- Plant reproduction.  
- The plant vasculature for long-distance transport and other specialized tissues.  
- Sensing and responding to the abiotic environment.  
- Plant-microbe interactions; beneficial friends or pathogenic foes?  
- Polyploidy; the benefits, problems and solutions to of multiple genomes.  
- Photosynthesis and carbon partitioning.  
- Photorespiration and the evolution of C4 metabolism.  
- Starch biosynthesis and degradation.  
- Chloroplast development and chlorophyll biosynthesis.  
- Senescence mechanisms in plants.  
- General principles of RNA silencing.  
- MicroRNAs: discovery, general principle and modes of action at the cellular and system levels.  
- Chromatin-based RNA silencing.  
- Antiviral RNA silencing.  
- RNA silencing & defense against non-viral pathogens.  
- RNA silencing movement and amplification. |

**Abstract**
Biophysics of protein folding, membrane proteins and biophysics of membranes, enzymatic catalysis, catalytic RNA and RNAi, current topics in protein biophysics and structural biology.

**Objective**
Understanding of structure-function relationships in proteins and in protein folding, detailed understanding of biophysics and physical methods as well as modern methods for protein purification and microanalytics.

**Lecture notes**
Scripts on the individual topics can be found under http://www.mol.biol.ethz.ch/teaching.

**Abstract**
Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

**Objective**
This course focuses on the concepts of classical and modern genetics and genomics.

**Content**
The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

**Lecture notes**
Scripts and additional material will be provided during the semester.

551-0313-00L Microbiology (Part I)

W 3 credits 2V

Objective

This concept class will be based on common concepts and introduce to the enormous diversity among bacteria and archaea. It will cover the current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Content

Advanced class covering the state of the research in bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Lecture notes

Updated handouts will be provided during the class.

Literature

Current literature references will be provided during the lectures.

Prerequisites / notice

The lecture "Grundlagen der Biologie II: Mikrobiologie" is the basis for this advanced lecture.

551-0319-00L Cellular Biochemistry (Part I)

W 3 credits 2V

Objective

The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular biology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular concept of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry. The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Content

Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

Lecture notes

Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

Literature

Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

Prerequisites / notice

To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

Competencies

- Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies
- Analytical Competencies
- Critical Thinking

701-2413-00L Evolutionary Genetics

W 6 credits 4V

Objective

The aim of the course is to provide students with a solid introduction to the fields of population and quantitative genetics. The concepts and research methods developed in these fields have undergone profound transformations; they are of fundamental importance in our understanding of evolutionary processes, both past and present. Students should gain an appreciation for the concepts, methods and explanatory power of evolutionary genetics.

Content

Population genetics - Types and sources of genetic variation; randomly mating populations and the Hardy-Weinberg equilibrium; effects of inbreeding; natural selection; random genetic drift and effective population size; gene flow and hierarchical population structure; molecular population genetics: neutral theory of molecular evolution and basics of coalescent theory. Quantitative genetics - Continuous variation; measurement of quant. characters; genes, environments and their interactions; measuring their influence; response to selection; inbreeding and crossbreeding, effects on fitness; Fisher's fundamental theorem. Ecological Genetics - Concepts and methods for the study of genetic variation and its role in adaptation, reproductive isolation, hybridization and speciation.

529-0731-00L Nucleic Acids and Carbohydrates

W 6 credits 3G

Objective

The concept course 'Evolutionary Genetics' consists of two lectures that jointly provide an introduction to the fields of population and quantitative genetics (emphasis on basic concepts) and ecological genetics (more emphasis on evolutionary and ecological processes of adaptation and speciation).

Content

Population genetics - Types and sources of genetic variation; randomly mating populations and the Hardy-Weinberg equilibrium; effects of inbreeding; natural selection; random genetic drift and effective population size; gene flow and hierarchical population structure; molecular population genetics: neutral theory of molecular evolution and basics of coalescent theory. Quantitative genetics - Continuous variation; measurement of quant. characters; genes, environments and their interactions; measuring their influence; response to selection; inbreeding and crossbreeding, effects on fitness; Fisher's fundamental theorem. Ecological Genetics - Concepts and methods for the study of genetic variation and its role in adaptation, reproductive isolation, hybridization and speciation.

Prerequisites / notice

To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

Competencies

- Subject-specific Competencies
- Concepts and Theories
- Techniques and Technologies
- Analytical Competencies
- Critical Thinking

Note for BSc Biology students: Only one of the two concept courses 529-0731-00 Nucleic Acids and Carbohydrates (autumn semester) or 529-0732-00 Proteins and Lipids (spring semester) can be counted for the Bachelor's degree.

Abstract

Structure, function and chemistry of nucleic acids and carbohydrates, DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines
Objective
Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines

Content
Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines

Lecture notes
No script; illustrations from the original literature relevant to the individual lectures will be provided weekly (typically as handouts downloadable from the Moodle server).

Literature
Mainly based on original literature, a detailed list will be distributed during the lecture

551-1299-00L Bioinformatics W 6 credits 4G S. Sunagawa, P. Beltrao, V. Boeva, A. Kahles, C. von Mering, N. Zamboni

Abstract
Students will study bioinformatic concepts in the areas of metagenomics, genomics, transcriptomics, proteomics, biological networks and biostatistics. Through integrated lectures, practical hands-on exercises and project work, students will also be trained in analytical and programming skills to meet the emerging increase in data-driven knowledge generation in biology in the 21st century.

Objective
Students will have an advanced understanding of the underlying concepts behind modern bioinformatic analyses at genome, metagenome and proteome-wide scales. They will be familiar with the most common data types, where to access them, and how to analytically work with them to address contemporary questions in the field of biology.

Prerequisites / notice
Course participants have already acquired basic programming skills in UNIX, Python and R.

| Number of participants limited to 15. |
| Abstract           | Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts. |
| Objective          | Develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology. |
| Content            | The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics. For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics. |
| Lecture notes      | Script and original publications will be supplied during the course. |
| Prerequisites / notice | The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry. |

Data: 02.07.2024 12:39 Autumn Semester 2024 Page 341 of 2667
Abstract
Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems.

Objective
Students will understand: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems as a basis for implementing disease management strategies in agroecosystems.

Content
Course description: Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies.

Lecture Topics and Tentative Schedule

Week 1  The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrotrophs, disease cycles and pathogen life cycles.

Week 2  Nematode attack strategies and types of damage. Viral pathogens, classification, reproduction and transmission, attack strategies and types of damage. Examples TMV, BYDV. Bacterial pathogens and phytoplasmas, classification, reproduction and transmission.

Week 3  Bacterial attack strategies and symptoms. Example bacterial diseases: fire blight, Agrobacterium crown gall, soft rots. Fungal and oomycete pathogens, classification, growth and reproduction, sexual and asexual spores, transmission.

Week 4  Fungal and oomycete life cycles, disease cycles, infection processes, colonization, phytotoxins and mycotoxins. Attack strategies of fungal necrotrophs and biotrophs. Symptoms and signs of fungal infection. Example fungal diseases: potato late blight.

Week 5  Example fungal diseases: wheat stem rust, grape powdery mildew, wheat septoria tritici blotch. Plant defense mechanisms, host range and non-host resistance. Passive structural and chemical defenses, preformed chemical defenses. Active structural defense, histological and cellular (papillae).

Week 6  Active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytalexins and disease resistance. Pisatin and pisatin demethylase. Local and systemic acquired resistance (LAR, SAR), induced systemic resistance (ISR), signal molecules, defense activators (Bion). Pathogen effects on food quality. Positive and negative transformations.

Week 8  Epidemiology: Disease pyramid, environmental effects on epidemic development, plant effects on development of epidemics, including resistance, physiology, density, uniformity.

Week 9  Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity. Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies, ELISA.

Week 10  Molecular detection and diagnosis of pathogens: PCR, rDNA and loop-mediated isothermal amplification. Strategies for minimizing disease risks: calculating disease thresholds, disease forecasting systems.

Week 12  Physical control methods. Cultural control methods: avoidance, tillage practices, crop sanitation.

Week 13  Cultural control methods: fertilizers, crop rotations.

Week 14  Open lecture.

Techniques and Technologies

Lecture notes
Detailed lecture notes (~160 pages) will be available for purchase at the cost of reproduction at the start of the semester.

Competencies

Subject-specific Competencies

Concepts and Theories

Techniques and Technologies

551-1407-00L RNA Biology Lecture Series I: Transcription & Processing & Translation

Abstract
This course covers aspects of RNA biology related to gene expression at the posttranscriptional level. These include RNA transcription, processing, alternative splicing, editing, export and translation.

Objective
The students should obtain an understanding of these processes, which are at work during gene expression.

Content
Transcription & 3'end formation; splicing, alternative splicing, RNA editing; the ribosome & translation, translation regulation, RNP processing, alternative splicing, editing, export and translation.

Prerequisites / notice
Basic knowledge of cell and molecular biology.

551-1409-00L RNA Biology Lecture Series II: Non-Coding RNAs: Biology and Therapeutics

Abstract
This course covers aspects of RNA biology related to the functions of non-coding RNAs as well as their use as drugs to treat diseases.

Objective
The students should get familiar with the wide array of roles, which non-coding RNAs play in cellular functions.

Content
Micro RNAs; computational approaches to miRNAs; micro RNA function in metabolism; viruses and viral RNAs: nucleic acid-based drugs; ncRNA-mediated genome regulation; epigenetic programming of genome remodelling in ciliates; telomerase and telomeres; RNA biology.

Prerequisites / notice
Basic knowledge of cell and molecular biology.

529-0733-02L Chemical Biology and Synthetic Biochemistry

Abstract
Overview of modern chemical biology and synthetic biochemistry techniques, focussed on protein modification and labeling and on methods to endow proteins with novel functionalities.
Objective

After taking this course, students should be capable of the following:

A) Recall different possibilities for modifying proteins in vitro and in vivo and their applications in a biological context.

B) Understand the chemical and biochemical consequences of modifications and assess the different reaction possibilities in the context of in vivo - in vitro.

C) Critically analyze and assess current chemical biology articles.

D) Question the approaches learned and apply them to new biological problems.

Content

- Concepts and Theories
- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving

Advanced genetic code expansion methods (amber suppression, orthogonal ribosomes, unnatural base pairs, genome engineering and genome editing)

directed evolution and protein engineering

chemical biology of ubiquitin and targeted protein degradation

Lecture notes

A script will not be handed out. Handouts to the lecture will be provided through moodle.

Literature

Citations from the original literature relevant to the individual lectures will be assigned during the lectures.

Prerequisites / notice

Knowledge provided in the bachelor lectures 'Nucleic Acids and Carbohydrates' and 'Proteins and Lipids' is assumed for this lecture.

Competencies

Subject-specific Competencies

- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies

- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management

Social Competencies

- Communication
- Cooperation and Teamwork
- Customer Orientation
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity
- Negotiation

Personal Competencies

- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection
- Self-direction and Self-management

Literature

The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:

- Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.

Prerequisites / notice

Basic knowledge in linear algebra, analysis, and statistics will be helpful. Programming in R will be required for the project work (compulsory continuous performance assessments). In case you do not have any previous experience with R, we strongly recommend to get familiar with R prior to the semester start. For the D-BSSE students, we highly recommend the voluntary course "Introduction to Programming", which takes place in Basel before the start of the semester.

Competencies

Subject-specific Competencies

- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies

- Analytical Competencies
- Decision-making
- Problem-solving

Personal Competencies

- Creative Thinking
- Critical Thinking

Content

The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods for direct alignment analysis using approaches such as BLAST and GWAS.

Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. Lastly, we introduce the field of phyldynamics, the aim of which is to understand and quantify population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

Lecture notes

Lecture slides will be available on moodle.

Abstract

The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Computational algorithms extracting biological information from genetic sequence data are discussed, and statistical tools to understand this information in detail are introduced.

Attendees will learn what information is contained in genetic sequencing data and how to extract information from this data using computational tools. The main concepts introduced are:

* stochastic models in molecular evolution
* phylogenetic & phylodynamic inference
* maximum likelihood and Bayesian statistics

Attendees will apply these concepts to a number of applications yielding biological insight into:

* epidemiology
* pathogen evolution
* macroevolution of species
### Using R for Data Analysis and Graphics (Part II)

- **Course Code:** 401-6217-00L
- **Credits:** 1.5 credits
- **Lecturer:** M. Mächler

#### Abstract
The course provides the second part an introduction to the statistical software R for scientists. Topics are data generation and selection, graphical functions, important statistical functions, types of objects, models, programming and writing functions.

#### Objective
The students will be able to use the software R efficiently for data analysis, graphics and simple programming.

#### Content
Part II of the course builds on part I and covers the following additional topics:
- Elements of the R language: control structures (if, else, loops), lists, overview of R objects, attributes of R objects;
- More on R functions;
- Applying functions to elements of vectors, matrices and lists;
- Object oriented programming with R: classes and methods;
- Tayloring R: options;
- Extending basic R: packages

#### Competencies
- **Subject-specific Competencies**
  - Concepts and Theories
  - Techniques and Technologies
- **Method-specific Competencies**
  - Analytical Competencies
  - Media and Digital Technologies
  - Problem-solving
- **Social Competencies**
  - Cooperation and Teamwork
- **Personal Competencies**
  - Creative Thinking

#### Lecture notes
**Prerequisites / notice**
Basic knowledge of R equivalent to "Using R .. (part I)" is a prerequisite for this course.

#### Competencies
- **Subject-specific Competencies**
  - Concepts and Theories
  - Techniques and Technologies
- **Method-specific Competencies**
  - Analytical Competencies
  - Decision-making
  - Media and Digital Technologies
  - Problem-solving
- **Social Competencies**
  - Communication
- **Personal Competencies**
  - Adaptability and Flexibility
  - Critical Thinking
  - Self-direction and Self-management

### Applied Statistical Regression

- **Course Code:** 401-0649-00L
- **Credits:** 5 credits
- **Prerequisites:** 1G
- **Lecturer:** M. Dettling

#### Abstract
This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning "good practice" that can be applied in every student's own projects and daily work life. A special focus will be laid in the use of the statistical software package R for regression analysis.

#### Objective
The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.
The course starts with the basics of linear modeling, and then proceeds to parameter estimation, tests, confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, multicollinearity problems and model interpretation, as well as general modeling strategies.

The last third of the course is dedicated to an introduction to generalized linear models: this includes the generalized additive model, logistic regression for binary response variables, binomial regression for grouped data and poisson regression for count data.

Lectures and exercises will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L “Applied Statistical Regression” and 401-3622-00L “Statistical Modelling” are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

<td>Writing Scientific Reports for MSc Biology</td>
<td>W</td>
<td>2</td>
<td>1G</td>
<td>R. Taylor</td>
</tr>
</tbody>
</table>

**Abstract**

Students will learn to:
- Plan, draft, structure, and edit scientific reports
- Produce reader-friendly sentences
- Establish a clear and logical flow between sentences and paragraphs
- Select formal vocabulary and use it in a generally accurate and correct manner
- Choose and use generally suitable grammatical structures, punctuation, and identify areas in which further development is needed

**Content**

The course covers the process of writing reports in biology, helping students to focus on the language and communicative aspects of these reports. Topics covered include structuring sentences, paragraphs, and longer sections (introductions, methods, etc.); presenting and integrating non-textual elements such as graphs and tables; reviewing common grammar problems for advanced writers in English; and editing drafts and proofs. Sessions will consist of a mix of specialist input, group and pair work, and editing sessions.

Students who attend this course will turn in three sections of a report (approx. 500 words each) for feedback, revising these texts for a final portfolio that is graded.

**Literature**

- Draper & Smith (1998): Applied Regression Analysis
- Fox (2008): Applied Regression Analysis and GLMs
- Montgomery et al. (2006): Introduction to Linear Regression Analysis

**Prerequisites / notice**

The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

Few crops dominate the crop rotations worldwide. Following the goal of an increased agricultural biodiversity, species such as buckwheat but also medicinal plants might become more important in future. The biology, physiology, stress tolerance and central aspects of the value-added chain of the above-mentioned and of other alternative crops will be depicted.

During this course, students learn to assess the potential of different minor or alternative crops compared to the dominant major crops based on their biological and agronomical features. Each student will assess and present a specific alternative crop of his or her choice based on information from scientific articles and Wikipedia. Wikipedia-entries will be generated.

</tr>
</tbody>
</table>

**Abstract**
The concept course 'Evolutionary Genetics' consists of two lectures that jointly provide an introduction to the fields of population and quantitative genetics (emphasis on basic concepts) and ecological genetics (more emphasis on evolutionary and ecological processes of adaptation and speciation).

**Objective**
The aim of the course is to provide students with a solid introduction to the fields of population genetics, quantitative genetics, and ecological genetics. The concepts and research methods developed in these fields have undergone profound transformations; they are of fundamental importance in our understanding of evolutionary processes, both past and present. Students should gain an appreciation for the concepts, methods and explanatory power of evolutionary genetics.

**Content**
Population genetics - Types and sources of genetic variation; randomly mating populations and the Hardy-Weinberg equilibrium; effects of inbreeding; natural selection; random genetic drift and effective population size; gene flow and hierarchical population structure; molecular population genetics: neutral theory of molecular evolution and basics of coalescent theory.

Quantitative genetics - Continuous variation; measurement of quant. characters; genes, environments and their interactions; measuring their influence; response to selection; inbreeding and crossbreeding, effects on fitness; Fisher's fundamental theorem.

Ecological Genetics - Concepts and methods for the study of genetic variation and its role in adaptation, reproductive isolation, hybridization and speciation

**Abstract**
This is an introductory class on insect ecology. During the course you will learn about insect interactions with, and adaptations to, their environment and other organisms, and the importance of insect roles in our ecosystems. This course includes in-person lectures, small group discussions and outside readings.

**Objective**
The aim of the course is for you to be able to describe examples of insect interactions and evaluate their impact on broader ecosystems. Important topics include: insect-plant interactions, chemical ecology, predator-prey interactions, vectors of disease, social insects, mutual and parasitic interactions, and examining insect ecology in an evolutionary context.

**Lecture notes**
Provided to students through Moodle

**Literature**
Selected required readings (peer reviewed literature). Optional recommended readings with additional information.

</table>
This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning "good practice" that can be applied in every student's own projects and daily work life. A special focus will be laid in the use of the statistical software package R for regression analysis.

The course starts with the basics of linear modeling, and then proceeds to parameter estimation, tests, confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, multicollinearity problems and model interpretation, as well as general modeling strategies. The last third of the course is dedicated to an introduction to generalized linear models: this includes the generalized additive model, logistic regression for binary response variables, binomial regression for grouped data and poisson regression for count data.

A script will be available.

The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L "Applied Statistical Regression" and 401-3622-00L "Statistical Modelling" are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

3 credits

This course provides the ecological systems' knowledge needed to question applied sustainability solutions. We will critically assess the complexity of current environmental issues, illustrating basic ecological concepts and principles. Our central aim is to balance participants’ respect for complexity with a sense of possibility by providing examples from the vast solution space offered by ecological systems, such as e.g. green infrastructure to manage water.

At the end of the course... you know how to structure your inquiry and how to proceed the analysis when faced with a complex environmental issue. You can formulate the relevant questions, find answers (supported by discussions, input from the lecturers and the literature), and you are able to present your conclusions clearly and cautiously.

...you understand the complexity of interactions and structures in ecosystems. You know how ecosystem processes, functions and services interact and feed back across multiple spatio-temporal scales (in general, plus in depth case examples).

...you understand that biodiversity and the interaction between organisms are an integral part of ecosystems. You are aware that the link between biodiversity and process/function/service is rarely fully understood. You know how to honestly deal with this lack of understanding and can nevertheless find, critically analyse and communicate solutions.

...you understand the importance of ecosystem services for society.

...you have an overview of the methods of ecosystem research and have a deeper insight into some of them, e.g. ecosystem observation, manipulation and modelling.

...you have reflected on ecology as a young discipline at the heart of significant applied questions.

This course provides the ecological systems' knowledge needed to question applied sustainability solutions. We will critically assess the complexity of current environmental issues, illustrating basic ecological concepts and principles. Our central aim is to balance participants' respect for complexity with a sense of possibility by providing examples from the vast solution space offered by ecological systems, such as e.g. green infrastructure to manage water.

The course is structured around four larger topical areas: (1) Integrated Water Management -- Green infrastructure (land management options) as an alternative to engineered solutions (e.g. large reservoirs) in flood and drought management; (2) Fire dynamics, the water cycle and biodiversity -- The surprising dynamics of species life cycles and populations in arid landscapes; (3) Rewilding, e.g. reintroducing apex predators (e.g. wolves), or large ungulates (e.g. bisons) in protected areas -- A nature conservation trend with counterintuitive effects; (4) Coupling of aquatic and terrestrial systems: carbon, nitrogen and phosphorus transfers of global importance on landscape scale.

Case descriptions, commented glossary and a list of literature and further resources per case.

It is not essential to borrow/buy the following books. We will continuously provide excerpts and other literature during the course.

- Schulze et al. (2005) Plant Ecology; Springer.
The course combines elements of a classic lecture, group discussions and problem based learning. It is helpful, but not essential to be familiar with the "seven stages" method (see e.g. course 701-0352-00L "Analysis and Assessment of Environmental Sustainability" by Christian Pohl et al.).

### 401-6215-00L Using R for Data Analysis and Graphics (Part I)

**W 1.5 credits 1G A. Hauser**

**Abstract**
The course provides the first part an introduction to the statistical/graphical/data science software R (https://www.r-project.org/) for scientists. Topics covered are data generation and selection, graphical and basic statistical functions, creating simple functions, basic types of objects.

**Objective**
The students will be able to use the software R for simple data analysis and graphics.

**Content**
The course provides the first part of an introduction to the statistical software R for scientists. R is free software that contains a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

Part I of the course covers the following topics:
- What is R?
- R Basics: reading and writing data from/to files, creating vectors & matrices, selecting elements of dataframes, vectors and matrices, arithmetics;
- Types of data: numeric, character, logical and categorical data, missing values;
- Simple (statistical) functions: summary, mean, var, etc., simple statistical tests;
- Writing simple functions;
- Introduction to graphics: scatter-, boxplots and other high-level plotting functions, embellishing plots by title, axis labels, etc., adding elements (lines, points) to existing plots.

The course focuses on practical work at the computer. We will make use of the graphical user interface RStudio: www.rstudio.org

Note: Part I of UsingR is complemented and extended by Part II, which is offered during the second part of the semester and which can be taken independently from Part I.

**Lecture notes**
An Introduction to R. http://stat.ethz.ch/CRAN/doc/contrib/Lam-IntroductionToR_LHL.pdf

**Prerequisites / notice**
The course resources will be provided via the Moodle web learning platform. Subscribing via Mystudies "automatically" makes you a student participant of the Moodle course of this lecture, which is at https://moodle-app2.let.ethz.ch/course/view.php?id=20847

### 401-6217-00L Using R for Data Analysis and Graphics (Part II)

**W 1.5 credits 1G M. Mächler**

**Abstract**
The course provides the second part an introduction to the statistical software R for scientists. Topics are data generation and selection, graphical functions, important statistical functions, types of objects, models, programming and writing functions.

Note: This part builds on "Using R... (Part I)", but can be taken independently if the basics of R are already known.

**Objective**
The students will be able to use the software R efficiently for data analysis, graphics and simple programming.

**Content**
The course provides the second part of an introduction to the statistical software R (https://www.r-project.org/) for scientists. R is free software that contains a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

Part II of the course builds on Part I and covers the following additional topics:
- Elements of the R language: control structures (if, else, loops), lists, overview of R objects, attributes of R objects;
- More on R functions;
- Applying functions to elements of vectors, matrices and lists;
- Object oriented programming with R: classes and methods;
- Tayloring R: options;
- Extending basic R: packages.

The course focuses on practical work at the computer. We will make use of the graphical user interface RStudio: www.rstudio.org

**Lecture notes**
An Introduction to R. http://stat.ethz.ch/CRAN/doc/contrib/Lam-IntroductionToR_LHL.pdf

**Prerequisites / notice**
Basic knowledge of R equivalent to "Using R... (Part I)" (= 401-6215-00L) is a prerequisite for this course.

The course resources will be provided via the Moodle web learning platform. As from FS 2019, subscribing via Mystudies should "automatically" make you a student participant of the Moodle course of this lecture, which is at https://moodle-app2.let.ethz.ch/course/view.php?id=20848

Abstract

Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies.

Objective

Students will understand: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems as a basis for implementing disease management strategies in agroecosystems.

Content

Course description: Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies.

Lecture Topics and Tentative Schedule

Week 1  The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrotrophs, disease cycles and pathogen life cycles.
Week 2  Nematode attack strategies and types of damage. Viral pathogens, classification, reproduction and transmission, attack strategies and types of damage. Examples TMV, BYDV. Bacterial pathogens and phytoplasmas, classification, reproduction and transmission.
Week 3  Bacterial attack strategies and symptoms. Example bacterial diseases: fire blight, Agrobacterium crown gall, soft rots. Fungal and oomycete pathogens, classification, growth and reproduction, sexual and asexual spores, transmission.
Week 4  Fungal and oomycete life cycles, disease cycles, infection processes, colonization, phytotoxins and mycotoxins. Attack strategies of fungal necrotrophs and biotrophs. Symptoms and signs of fungal infection. Example fungal diseases: potato late blight.
Week 5  Example fungal diseases: wheat stem rust, grape powdery mildew, wheat septoria triticum blotch. Plant defense mechanisms, host range and non-host resistance. Passive structural and chemical defenses, preformed chemical defenses. Active structural defense, histological and cellular (papillae).
Week 6  Active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytoalexins and disease resistance. Pisatin and pisatin demethylase. Local and systemic acquired resistance (LAR, SAR), induced systemic resistance (ISR), signal molecules, defense activators (Bion). Pathogen effects on food quality. Positive and negative transformations.
Week 8  Epidemiology: Disease pyramid, environmental effects on epidemic development, plant effects on development of epidemics, including resistance, physiology, density, uniformity.
Week 9  Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity. Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies, ELISA.
Week 10 Molecular detection and diagnosis of pathogens: PCR, rDNA and loop-mediated isothermal amplification. Strategies for minimizing disease risks: calculating disease thresholds, disease forecasting systems.
Week 12 Physical control methods. Cultural control methods: avoidance, tillage practices, crop sanitation.
Week 13 Cultural control methods: fertilizers, crop rotations.

Lecture notes

Week 14  Open lecture.

Competencies

Subject-specific Competencies

Computational Biology

W 6 credits 3G+2A

T. Vaughan, C. Magnus, T. Stadler

636-0017-00L

The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Computational algorithms extracting biological information from genetic sequence data are discussed, and statistical tools to understand this information in detail are introduced.

Objective

Attendees will learn which information is contained in genetic sequencing data and how to extract information from this data using computational tools. The main concepts introduced are:

- stochastic models in molecular evolution
- phylogenetic & phylodynamic inference
- maximum likelihood and Bayesian statistics

Attendees will apply these concepts to a number of applications yielding biological insight into:

- epidemiology
- pathogen evolution
- macroevolution of species

Content

The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods for direct alignment analysis using approaches such as BLAST and GWAS. Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. Lastly, we introduce the field of phylodynamics, the aim of which is to understand and quantify population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

Lecture notes

Lecture slides will be available on moodle.
Literature

The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:
* Yang, Z. 2006. Computational Molecular Evolution.
* Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.

Prerequisites / notice

Basic knowledge in linear algebra, analysis, and statistics will be helpful. Programming in R will be required for the project work (compulsory continuous performance assessments). In case you do not have any previous experience with R, we strongly recommend to get familiar with R prior to the semester start. For the D-BSSE students, we highly recommend the voluntary course „Introduction to Programming“, which takes place in Basel before the start of the semester.

701-1471-00L Ecological Parasitology

W 3 credits 1V+1P F. Feijen, J. Jokela, C. Vorburger

Abstract

The course will not take place fall semester 2024.

Course focuses on the ecology and evolution of macroparasites and their hosts. Through lectures and practical work, students learn about diversity and natural history of parasites, adaptations of parasites, ecology of host-parasite interactions, applied parasitology, and human macroparasites in the modern world.

Objectives

1. Identify common macroparasites in invertebrates.
2. Understand ecological and evolutionary processes in host-parasite interactions.
3. Conduct parasitological research

Content

Lectures:

1. Diversity and natural history of parasites (i.e. systematic groups and life-cycles).
2. Adaptations of parasites (e.g. evolution of life-cycles, host manipulation).
3. Ecology of host-parasite interactions (e.g. parasite communities, effects of environmental changes).
4. Ecology and evolution of parasitoids and their applications in biocontrol
5. Human macroparasites (schistosomiasis, malaria).

Practical exercises:

1. Examination of parasites in molluscs (identification and examination of host exploitation strategies).
2. Examination of parasites in amphipods (identification and examination of effects on hosts).
3. Examination of parasitoids of aphids.

The three practicals will take place at the 03.10.2023, the 17.10.2023 and the 07.11.2023 at Eawag Dübendorf from 08:15 - 12:00. Note that each practical takes 2 hours longer than the weekly lecture.

701-1703-00L Evolutionary Medicine for Infectious Diseases

W 3 credits 2G A. Hall

Abstract

This course explores infectious disease from both the host and pathogen perspective. Through short lectures, reading and active discussion, students will identify areas where evolutionary thinking can improve our understanding of infectious diseases and, ultimately, our ability to treat them effectively.

Objective

Students will learn to (i) identify evolutionary explanations for the origins and characteristics of infectious diseases in a range of organisms and (ii) evaluate ways of integrating evolutionary thinking into improved strategies for treating infections of humans and animals. This will incorporate principles that apply across any host-pathogen interaction, as well as system-specific mechanistic information, with particular emphasis on bacteria and viruses.

Content

We will cover several topics where evolutionary thinking is relevant to understanding or treating infectious diseases. This includes: (i) determinants of pathogen host range and virulence, (ii) dynamics of host-parasite coevolution, (iii) pathogen adaptation to evade or suppress immune responses, (iv) antimicrobial resistance, (v) evolution-proof medicine. For each topic there will be a short (~20 minutes) introductory lecture, before students independently research the primary literature and develop discussion points and questions, followed by interactive discussion in class.

Literature

The focus is on primary literature, but for some parts the following text books provide good background information:

Schmid Hempel 2011 Evolutionary Parasitology
Steens & Medzhitov 2016 Evolutionary Medicine

Prerequisites / notice

A basic understanding of evolutionary biology, microbiology or parasitology will be advantageous but is not essential.
Communication fostered

Evolution is the one theory that encompasses all of biology. It provides a single, unifying concept to understand the living systems that we observe today. We will introduce several types of mathematical models of evolution to describe gene frequency changes over time in the context of different biological systems, focusing on sexual populations. Viruses and cancer cells provide the most prominent examples of such systems and they are at the same time of great biomedical interest. The course will cover some classical mathematical population genetics and population dynamics, and also introduce several new approaches. This is reflected in a diverse set of mathematical concepts which make their appearance throughout the course, all of which are introduced from scratch. Topics covered include the quasispecies equation, evolution of HIV, evolutionary game theory, evolutionary stability, evolutionary graph theory, tumor evolution, stochastic tunneling, genetic progression of cancer, diffusion theory, fitness landscapes, branching processes, and evolutionary escape.

Prerequisites / notice

Prerequisites: Basic mathematics (linear algebra, calculus, probability)

Competencies

Critical Thinking fostered

Advanced Ecological Processes

701-0328-00L

Abstract

This course presents a broad overview of the key processes structuring ecological populations and communities, with a particular focus on understanding and managing global change impacts.

Objective

COURSE GOALS

In this course, students will develop an integrated knowledge of how ecological theory can help us understand and manage ecological responses to global change. Specifically, the course goals are to:

- Introduce students to the major ecological processes that together shape the composition and abundance of species within ecological communities.
- Provide insight to students on the ecological impacts of anthropogenic change, and how an understanding of ecological processes can help us predict these ecological impacts and design conservation / restoration actions to mitigate their negative impacts.
- Teach students to critically summarize and analyze primary ecological literature, understanding how ecological studies contribute to our knowledge, how to critically evaluate their strengths and weaknesses, and practice designing follow up studies.

LEARNING OBJECTIVES

The learning objectives follow from the course goals. After attending this course, students should be able to:

- Describe key processes affecting the size of populations and abundance of species within ecological communities.
- Critically evaluate evidence and conclusions presented in primary ecological literature based on your understanding of these ecological processes.
- Apply knowledge of ecological processes to make predictions about the major responses of ecological communities to anthropogenic perturbations.

Content

We will explore how ecological theories can provide insight into the effects of anthropogenic change as well as guide management to undo undesired impacts. Collectively, this requires us to focus on classic problems in ecology (for examples, competitive coexistence, top-down impacts of predators, diversity-ecosystem function relationships, the role of dispersal in spread).

The course is taught in a flipped format. Generally (with the exception of a few weeks), there will be online materials for students to watch or read during the first hour of class (lecture videos, readings), and the class will meet in person for the second half of class. The in person portions of the class will have students participate in activities to learn the content, including paper discussions, groupwork, and presentations. Students are also required to submit a written assignment.

Lecture notes

All course materials (videos, lecture notes, primary literature) will be provided on the course moodle.

Competencies

Subject-specific Competencies

Concepts and Theories assessed

Applied Bioinformatics: Microbiomes

752-5500-00L

Abstract

Learn to apply practical bioinformatics/computational skills for analysis of microbiomes in foods and human health! Students will apply basic programming skills for scientific computing and bioinformatics, and learn and discuss the importance of microbiomes to foods and human health, through recognition and comparison of ecological theory, methodology, and experimental design across systems.

Lecture notes

No.

LEARNING OBJECTIVES

The learning objectives follow from the course goals. After attending this course, students should be able to:

- Describe key processes affecting the size of populations and abundance of species within ecological communities.
- Critically evaluate evidence and conclusions presented in primary ecological literature based on your understanding of these ecological processes.
- Apply knowledge of ecological processes to make predictions about the major responses of ecological communities to anthropogenic perturbations.
Objective
Learn to apply bioinformatics and computational methods for analysis of microbiome next-generation sequencing data. A secondary goal is to critically examine the relevance of microbiomes to food quality, safety, and human health, through application of theory and appropriate experimental design. Students completing this course will thus be able to both apply appropriate methodology to study microbiomes (or other high-dimensional data) in different systems, as well as evaluate and interpret bioinformatics results.

Content
1. Introduction to microbiomes and microbial bioinformatics toolkit. Python, Pandas, Jupyter, GitHub, visualization libraries for Python.
3. Microbial diversity, function, and ecology. Molecular ecology, diversity metrics, ordination methods.

This course requires extensive engagement in learning outside of the classroom (using online resources and practical exercises), with a focus on active learning in the classroom.

Prerequisites / notice
No specific pre-requisites, but students should have some familiarity with microbiology, molecular biology, programming (Python), bioinformatics, and statistics.

Students will bring and work on their own laptop computers.

All software used in the course is free and open-source.

Abstract
Students will study bioinformatic concepts in the areas of metagenomics, genomics, transcriptomics, proteomics, biological networks and biostatistics. Through integrated lectures, practical hands-on exercises and project work, students will also be trained in analytical and programming skills to meet the emerging increase in data-driven knowledge generation in biology in the 21st century.
Objective

Students will have an advanced understanding of the underlying concepts behind modern bioinformatic analyses at genome, metagenome and proteome-wide scales. They will be familiar with the most common data types, where to access them, and how to analytically work with them to address contemporary questions in the field of biology.

Prerequisites

Course participants have already acquired basic programming skills in UNIX, Python and R.

Abstract

This short course is designed to accompany MSc students in writing their first reports in English, providing input on scientific writing in English as well as feedback on drafts sections of the report.

Objective

Students will learn to:
- Plan, draft, structure, and edit scientific reports
- Produce reader-friendly sentences
- Establish a clear and logical flow between sentences and paragraphs
- Select formal vocabulary and use it in a generally accurate and correct manner
- Choose and use generally suitable grammatical structures, punctuation, and identify areas in which further development is needed

Content

The course covers the process of writing reports in biology, helping students to focus on the language and communicative aspects of these reports. Topics covered include structuring sentences, paragraphs, and longer sections (introductions, methods, etc.); presenting and integrating non-textual elements such as graphs and tables; reviewing common grammar problems for advanced writers in English; and editing drafts and proofs. Sessions will consist of a mix of specialist input, group and pair work, and editing sessions.

Students who attend this course will turn in three sections of a report (approx. 500 words each) for feedback, revising these texts for a final portfolio that is graded.

Prerequisites

Participants should be at a stage in their research where they can already start drafting parts of the report.

Abstract

Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

Objective

The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Content

Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

Lecture notes

Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

Literature

Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

Prerequisites / notice

To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

4444 Elective Compulsory Master Courses I: Computation

Number Title Type ECTS Hours Lecturers
636-0007-00L Computational Systems Biology W 6 credits 3V+2U J. Stelling

Abstract
Study of fundamental concepts, models and computational methods for the analysis of complex biological networks. Topics: Systems approaches in biology, biology and reaction network fundamentals, modeling and simulation approaches (topological, probabilistic, stoichiometric, qualitative, linear / nonlinear ODEs, stochastic), and systems analysis (complexity reduction, stability, identification).

Objective
The aim of this course is to provide an introductory overview of mathematical and computational methods for the modeling, simulation and analysis of biological networks.
**Content**

Biology has witnessed an unprecedented increase in experimental data and, correspondingly, an increased need for computational methods to analyze this data. The explosion of sequenced genomes, and subsequently, of bioinformatics methods for the storage, analysis and comparison of genetic sequences provides a prominent example. Recently, however, an additional area of research, captured by the label "Systems Biology", focuses on how networks, which are more than the mere sum of their parts' properties, establish biological functions. This is essentially a task of reverse engineering. The aim of this course is to provide an introductory overview of corresponding computational methods for the modeling, simulation and analysis of biological networks.

We will start with an introduction into the basic units, functions and design principles that are relevant for biology at the level of individual cells. Making extensive use of example systems, the course will then focus on methods and algorithms that allow for the investigation of biological networks with increasing detail. These include (i) graph theoretical approaches for revealing large-scale network organization, (ii) probabilistic (Bayesian) network representations, (iii) structural network analysis based on reaction stoichiometries, (iv) qualitative methods for dynamic modeling and simulation (Boolean and piece-wise linear approaches), (v) mechanistic modeling using ordinary differential equations (ODEs) and finally (vi) stochastic simulation methods.

**Notice**

Number of participants limited to 15.

Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.

Develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology.

The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics. For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

Script and original publications will be supplied during the course.

The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.

---

Mind the enrolment deadlines at UZH: https://www.uzh.ch/cmsssl/en/studies/application/deadline.html

The evolution of the various body-plans is investigated by means of comparison of developmentally essential control genes of molecularly analysed model organisms.
Evolutionary Dynamics

T. Zambelli

Evolution is the one theory that encompasses all of biology. It provides a single, unifying concept to understand the living systems that we observe today. We will introduce several types of mathematical models of evolution to describe gene frequency changes over time in the context of different biological systems, focusing on asexual populations. Viruses and cancer cells provide the most prominent examples of such systems and they are at the same time of great biomedical interest. The course will cover some classical mathematical population genetics and population dynamics, and also introduce several new approaches. This is reflected in a diverse set of mathematical concepts which make their appearance throughout the course, all of which are introduced from scratch. Topics covered include the quasispecies equation, evolution of HIV, evolutionary game theory, evolutionary stability, evolutionary graph theory, tumor evolution, stochastic tunneling, genetic progression of cancer, diffusion theory, fitness landscapes, branching processes, and evolutionary escape.

By the end of this module, each student should be able to:
- recognize the universal principles underlying the development of different animal body plans.
- explain how the genes encoding the molecular toolkit have evolved to create animal diversity.
- relate changes in gene structure or function to evolutionary changes in animal development.

Key skills:
- By the end of this module, each student should be able to:
  - present and discuss a relevant evolutionary topic in an oral presentation
  - select and integrate key concepts in animal evolution from primary literature
  - participate in discussions on topics presented by others

636-0009-00L

Evolutionary Dynamics

W 6 credits 2V+1U+2A N. Beerenwinkel

Abstract

Evolutionary dynamics is concerned with the mathematical principles according to which life has evolved. This course offers an introduction to mathematical modeling of evolution, including deterministic and stochastic models, with an emphasis on tumor evolution. The goal of this course is to understand and to appreciate mathematical models and computational methods that provide insight into the evolutionary process in general and tumor evolution in particular. Students should analyze and evaluate models and their application critically and be able to design new models.

Objective

Theory and corresponding exercises are merged together during the classes.

Lecture notes

I am willingly available Mondays 17:00 o'clock - 18:00 in my office GLC F12.2 for whatever discussion about the lessons and the exercises.

!!! I am using OneNote. All lectures will be broadcast via ZOOM, while corresponding videos of the previous years (lectures and exercises) are available in Moodle !!!
Literature

As further deepening:

Prerequisites / notice

Participants need a good command of
• differentiation and integration of a function with one or more variables (basics of Analysis),
• Newton's and Coulomb's laws (basics of Mechanics and Electrostatics).

Notions of vectors in 2D and 3D are beneficial.

**551-0317-00L Immunology I**

**Abstract**

Introduction into structural and functional aspects of the immune system. Basic knowledge of the mechanisms and the regulation of an immune response.
Objective
Introduction into structural and functional aspects of the immune system.

Basic knowledge of the mechanisms and the regulation of an immune response.

Content
- Introduction and historical background
- Innate and adaptive immunity, Cells and organs of the immune system
- B cells and antibodies
- Generation of diversity
- Antigen presentation and Major Histoincompatibility (MHC) antigens
- Thymus and T cell selection
- Autoimmunity
- Cytotoxic T cells and NK cells
- Th1 and Th2 cells, regulatory T cells
- Allergies
- Hypersensitivities
- Vaccines, immune-therapeutic interventions

Lecture notes
Electronic access to the documentation will be provided. The link can be found at "Lernmaterialien".

Literature
- Kuby, Immunology, 9th edition, Freeman + Co., New York, 2020

Prerequisites / notice
For D-BIOL students Immunology I (WS) and Immunology II (SS) will be examined as one learning entity in a “Sessionsprüfung”. All other students write separate exams for Immunology I and Immunology II. All exams (combined exam Immunology I and II, individual exams) are offered in each exam session.

551-1299-00L Bioinformatics W 6 credits 4G S. Sunagawa, P. Beltrao, V. Boeva, A. Kahles, C. von Mering, N. Zamboni

Abstract
Students will study bioinformatic concepts in the areas of metagenomics, genomics, transcriptomics, proteomics, biological networks and biostatistics. Through integrated lectures, practical hands-on exercises and project work, students will also be trained in analytical and programming skills to meet the emerging increase in data-driven knowledge generation in biology in the 21st century.

Objective
Students will have an advanced understanding of the underlying concepts behind modern bioinformatic analyses at genome, metagenome and proteome-wide scales. They will be familiar with the most common data types, where to access them, and how to analytically work with them to address contemporary questions in the field of biology.

Prerequisites / notice
Course participants have already acquired basic programming skills in UNIX, Python and R.

Competencies
Subject-specific Competencies
Concepts and Theories: assessed
Techniques and Technologies: assessed

Method-specific Competencies
Analytical Competencies: assessed
Decision-making: assessed
Media and Digital Technologies: assessed
Problem-solving: assessed
Project Management: fostered

Social Competencies
Communication: fostered
Cooperation and Teamwork: fostered

Personal Competencies
Adaptability and Flexibility: fostered
Creative Thinking: assessed
Critical Thinking: assessed
Integrity and Work Ethics: fostered
Self-awareness and Self-reflection: fostered
Self-direction and Self-management: fostered

</tbody>
</table>

Does not take place this semester.

Abstract
The course is a literature seminar or "journal club". Each Friday a student, or a member of the Suter Lab in the Institute of Molecular Health Sciences, will present a paper from the recent literature.

Objective
The course introduces you to recent developments in the fields of cellular and molecular neurobiology. It also supports you to develop your skills in critically reading the scientific literature. You should be able to grasp what the authors wanted to learn i.e. their goals, why the authors chose the experimental approach they used, the strengths and weaknesses of the experiments and the data presented, and how the work fits into the wider literature in the field. You will present one paper yourself, which provides you with practice in public speaking.

Content
You are expected to take part in the discussion and to ask questions. To prepare for this you should read all the papers beforehand (all the papers we present are available online, so you can show original figures with a beamer). Finish with a summary of the main points and a discussion of their significance.

Lecture notes
Presentations will be made available after the seminars.
Prerequisites / notice
You must attend at least 80% of the journal clubs, and give a presentation of your own. At the end of the semester there will be a 30 minute oral exam on the material presented during the semester. The grade will be based on the exam (45%), your presentation (45%), and a contribution based on your active participation in discussion of other presentations (10%).

551-0571-00L From DNA to Diversity: the Evolution of Multicellular Organisms (University of Zurich)
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.
UZH Module Code: BIO336
Mind the enrolment deadlines at UZH: https://www.uzh.ch/cmsssl/en/studies/application/deadlines.html

Abstract
The evolution of the various body-plans is investigated by means of comparison of developmentally essential control genes of molecularly analysed model organisms.

Objective
By the end of this module, each student should be able to
- recognize the universal principles underlying the development of different animal body plans.
- explain how the genes encoding the molecular toolkit have evolved to create animal diversity.
- relate changes in gene structure or function to evolutionary changes in animal development.
Key skills:
By the end of this module, each student should be able to
- present and discuss a relevant evolutionary topic in an oral presentation
- select and integrate key concepts in animal evolution from primary literature
- participate in discussions on topics presented by others

551-1117-00L Cutting Edge Topics: Immunology and Infection Biology
Information for UZH students:
Enrolment to this course unit only possible at ETH. No enrolment to module BIO636 at UZH.
Please mind the ETH enrolment deadlines for UZH students: https://www.ethz.ch/en/studies/non-degree-courses/special-students/special-students-university-of-zurich.html

Abstract
Weekly seminar about cutting edge topics in immunology and infection biology. Internationally renowned experts present their current research followed by an open discussion.

Objective
Weekly seminar about cutting edge topics in immunology and infection biology. Internationally renowned experts present their current research followed by an open discussion.
The aim of this course is to confront students with current research topics and with scientific presentation. The course offers the opportunity to gain in depth knowledge about diverse topics which are often only briefly touched in the concept courses and to engage in discussion with experts in the field.

Content
Immunology and infection biology.
The specific topics are variable and depend each semester on the list of invited experts.

Lecture notes
Current research data (often not yet published) are presented in this seminar series. There is no script and we are not allowed to record or distribute the contents of the seminars. Thus, the ability of students to extract the most relevant points of each seminar is promoted, which is an important skill for the future attendance of scientific meetings.

Literature
Often parts of the presented seminars have already been published by the respective speakers and the respective primary research can be retrieved from scientific journals.

Competencies
Subject-specific Competencies

551-1153-00L Systems Biology of Metabolism
Number of participants limited to 15.

Abstract
Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.

Objective
Develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology.
The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics. For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

### 551-1177-00L Immunology: From Milestones to Current Topics

**W 4 credits 2S**

**B. Ludewig, N. Pikor, University lecturers**

**Abstract**

Milestones in Immunology: on old concepts and modern experiments

**Objective**

The course will cover the current grand topics in immunology: B cells, innate immunity, antigen presentation, tumor immunity, T cells, myeloid cells and stromal cells. For each topic two or four hours will be allocated. Historical milestone papers will be presented by the tutor/lecturer providing an overview on the development of the theoretical framework and critical technological advances. The students will read the historical milestone papers and contribute to the discussion. In the second part of the lecture, students will present recent high impact research papers that have emerged from the landmark achievements of the previously discussed milestone concepts.

**Content**

Milestones and current topics of innate immunity, antigen presentation, B cells, thymus and T cells, cytotoxic T cells, NK cells, stromal cells, CNS immunity and tumor immunology.

**Lecture notes**

Script and original publications will be supplied during the course.

**Literature**

Literaturunterlagen werden vor Beginn des Kurses auf folgender website zugänglich sein: https://moodle-app2.let.ethz.ch/course/view.php?id=15568

### 551-1303-00L Current Research Topics in Cellular Biochemistry

**W 4 credits 2S**

**T. Kleele, V. Korkhov, G. Neurohr, V. Panse, M. Peter, A. E. Smith, F. van Drogen**

**Abstract**

During this Masters level seminar style course, students will explore current research topics in cellular biochemistry focused on the structure, function and regulation of selected cell components, and the consequences of dysregulation for pathologies.

**Objective**

Students will work with experts toward a critical analysis of cutting-edge research in the domain of cellular biochemistry, with emphasis on normal cellular processes and the consequences of their dysregulation. At the end of the course, students will be able to evaluate, critically discuss and write about scientific articles in the research area of cellular biochemistry, and they will identify open testable research questions.

**Content**

Guided by an expert in the field, students will engage in classical round-table style discussions of current literature with frontal presentations. Guided by a faculty expert, students develop domain knowledge of the research area associated with a primary paper, and alternate as discussion leaders to present the research topic. By the end of the semester, students will formulate their ideas about open testable research questions that extend from the published work.

**Literature**

The literature will be provided during the course.

**Prerequisites / notice**

The course will be taught in English.

### 551-1407-00L RNA Biology Lecture Series I: Transcription & Processing & Translation

**W 4 credits 2V**

**F. Allain, N. Ban, S. Jonas, U. Kutay, further lecturers**

**Abstract**

This course covers aspects of RNA biology related to gene expression at the posttranscriptional level. These include RNA transcription, processing, alternative splicing, editing, export and translation.

**Objective**

The students should obtain an understanding of these processes, which are at work during gene expression.

**Content**

Transcription & 3'end formation; splicing, alternative splicing, RNA editing; the ribosome & translation, translation regulation, RNP biogenesis & nuclear export, mRNA surveillance & mRNA turnover; signal transduction & RNA.

**Prerequisites / notice**

Basic knowledge of cell and molecular biology.

### 551-1409-00L RNA Biology Lecture Series II: Non-Coding RNAs: Biology and Therapeutics

**W 4 credits 2V**

**J. Hall, M. Stoffel, further lecturers**

**Abstract**

This course covers aspects of RNA biology related to the functions of non-coding RNAs as well as their use as drugs to treat diseases.

**Objective**

The students should get familiar with the wide array of roles, which non-coding RNAs play in cellular functions.

**Content**

Micro RNAs; computational approaches to miRNAs; micro RNA function in metabolism; viruses and viral RNAs; nucleic acid-based drugs; ncRNA-mediated genome regulation; epigenetic programming of genome remodelling in ciliates; telomerase and telomeres; TRNA biology. http://www.nccr-rna-and-disease.ch/tiki-index.php?page=LectureSeries

**Prerequisites / notice**

Basic knowledge of cell and molecular biology.

### 551-2223-00L Immunology III

**W 4 credits 2V**

**M. Kopf, S. B. Freigang, S. R. Leibundgut, F. Mair, A. Ovenius, C. Schneider, E. Slack, R. Spörri, further lecturers**

The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.
Abstract
This course provides a detailed understanding of
- development of T and B cells
- the dynamics of an immune response during acute and chronic infection
- mechanisms of immunopathology
- modern vaccination strategies
Key experimental results will be shown to help understanding how immunological text book knowledge has evolved.

Objective
Obtain a detailed understanding of
- the development, activation, and differentiation of different types of T cells and their effectormechanisms during immune responses,
- Recognition of pathogenic microorganisms by the host cells and molecular events thereafter,
- events and signals for maturation of naive B cells to antibody producing plasma cells and memory B cells.
- Optimization of B cell responses by intelligent design of new vaccines

Content
- Development and selection of CD4 and CD8 T cells, natural killer T cells (NKT), and regulatory T cells (Treg)
- NK T cells and responses to lipid antigens
- Differeentiation, characterization, and function of CD4 T cell subsets such as Th1, Th2, and Th17
- Overview of cytokines and their effector function
- Co-stimulation (signals 1-3)
- Dendritic cells
- Evolution of the "Danger" concept
- Cells expressing Pattern Recognition Receptors and their downstream signals
- T cell function and dysfunction in acute and chronic viral infections

Literature
Documents of the lectures are available for download at:
https://moodle-app2.let.ethz.ch/course/view.php?id=2581&notifyeditingon=1

Prerequisites / notice
Immunology I and II recommended but not compulsory

227-0939-00L Cell Biophysics W 6 credits 4G T. Zambelli

Abstract
Applying two fundamental principles of thermodynamics (entropy maximization and Gibbs energy minimization), an analytical model is derived for a variety of biological phenomena at the molecular as well as cellular level, and critically compared with the corresponding experimental data in the literature.

Objective
Engineering uses the laws of physics to predict the behavior of a system. Biological systems are so diverse and complex prompting the question whether we can apply unifying concepts of theoretical physics coping with the multiplicity of life’s mechanisms.

Objective of this course is to show that biological phenomena despite their variety can be analytically described using only two principles from statistical mechanics: maximization of the entropy and minimization of the Gibbs free energy.

Starting point of the course is the probability theory, which enables to derive step-by-step the two pillars of thermodynamics from the perspective of statistical mechanics: the maximization of entropy according to the Boltzmann’s law as well as the minimization of the Gibbs free energy. Then, an assortment of biological phenomena at the molecular and cellular level (e.g. cytoskeletal polymerization, action potential, photosynthesis, gene regulation, morphogen patterning) will be examined at the light of these two principles with the aim to derive a quantitative expression describing their behavior. Each analytical model is finally validated by comparing it with the corresponding experimental results from the literature.

By the end of the course, students will also learn to critically evaluate the concepts of making an assumption and making an approximation.

Content
• Basics of theory of probability
• Boltzmann's law
• Entropy maximization and Gibbs free energy minimization
• Ligand-receptor: two-state systems and the MWC model
• Random walks, diffusion, crowding
• Electrostatics for salty solutions
• Elasticity: fibers and membranes
• Molecular motors
• Action potential: Hodgkin-Huxley model
• Photosynthesis and vision
• Gene regulation
• Development: Turing patterns

Theory and corresponding exercises are merged together during the classes.

Lecture notes
No lecture notes because the two proposed textbooks are more than exhaustive!

I am willingly available Mondays 17.00 o'clock - 18.00 in my office GLC F12.2 for whatever discussion about the lessons and the exercises.

!!! I am using OneNote. All lectures will be broadcast via ZOOM, while corresponding videos of the previous years (lectures and exercises) are available in Moodle !!!

Literature

As further deepening:

Prerequisites / notice
Participants need a good command of
• differentiation and integration of a function with one or more variables (basics of Analysis),
• Newton's and Coulomb's laws (basics of Mechanics and Electrostatics).

Notions of vectors in 2D and 3D are beneficial.
### Molecular Neurophysiology: From Molecules to Systems
**Module Code:** 376-1305-01L
**Credits:** 3
**Lecturers:** G. Schratt, R. Fiore, W. von der Behrens, J. Winterer

**Abstract**
The course covers the physiology of nerve cells, from the single cell through the neuronal network to the systemic level. The focus is on molecular and cellular mechanisms – synaptic transmission, signal transduction, gene expression, synaptic plasticity.

**Objective**
Based on an understanding of molecular and cellular mechanisms, the aim is to provide a deepened insight into neurophysiological processes underlying complex brain functions – learning/memory, sleep, sensory.

**Content**
First, basic molecular and cellular mechanisms in nerve cells (excitability, neurotransmission, signal transduction, gene expression, synaptic plasticity) are introduced. Afterwards, their significance for selected neurophysiological processes (learning/memory, sleep, sensory) will be illuminated.

**Literature**
The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on Moodle.

### Development of the Nervous System (University of Zurich)
**Module Code:** 376-1305-00L
**Credits:** 3
**Lecturers:** University lecturers

**Abstract**
The lecture will cover molecular and cellular processes underlying the development of the nervous system (neurogenesis, cell death, cell migration and differentiation, axon guidance and synapse formation). The importance of these processes in the context of developmental diseases is discussed.

**Objective**
On successful completion of the module the student should be able to
- relate structure and function of the nervous system to its development - apply principles of molecular, cellular, and developmental biology to the development of the nervous system
- identify key steps in development underlying neurological syndromes and diseases

**Key skills**
On successful completion of the module the student should be able to
- interpret and critically evaluate original research reports
- apply knowledge and relate experimental approaches from molecular, cellular and developmental biology to the developing nervous system.

**Content**
The lecture will cover molecular and cellular processes underlying the development of the nervous system. After an introduction to structure and function of the nervous system, we will discuss neurogenesis, cell death, cell migration and differentiation, axon guidance and synapse formation. The importance of these processes in the context of developmental diseases will be discussed.

**Lecture notes**
Must be downloaded from OLAT: https://www.olat.uzh.ch/olat/dmz/ as BIO344

**Literature**
The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on OLAT.

**Prerequisites / notice**
BIO142 Developmental Biology, BIO143 Neurobiology

### Chemical Biology and Synthetic Biochemistry
**Module Code:** 529-0733-02L
**Credits:** 6
**Lecturers:** K. Lang, M. Fottner

**Abstract**
Overview of modern chemical biology and synthetic biochemistry techniques, focussed on protein modification and labeling and on methods to endow proteins with novel functionalities.
Objective

After taking this course, students should be capable of the following: A) Recall different possibilities for modifying proteins in vitro and in vivo and their applications in a biological context, B) Understand the chemical and biochemical consequences of modifications and assess the different reaction possibilities in the context of in vivo - in vitro, C) Critically analyze and assess current chemical biology articles D) Question the approaches learned and apply them to new biological problems.

Content

principles of protein labeling and protein modification (fluorescent proteins, enzyme-mediated labeling, bioorthogonal chemistries)

advanced genetic code expansion methods (amber suppression, orthogonal ribosomes, unnatural base pairs, genome engineering and genome editing)

directed evolution and protein engineering

chemical biology of ubiquitin and targeted protein degradation

Lecture notes

A script will not be handed out. Handouts to the lecture will be provided through moodle.

Literature

Citations from the original literature relevant to the individual lectures will be assigned during the lectures.

Prerequisites / notice

Knowledge provided in the bachelor lectures 'Nucleic Acids and Carbohydrates' and 'Proteins and Lipids' is assumed for this lecture.

Abstract

This short course is designed to accompany MSc students in writing their first reports in English, providing input on scientific writing in English as well as feedback on drafts sections of the report.

Objective

Students will learn to:
- Plan, draft, structure, and edit scientific reports
- Produce reader-friendly sentences
- Establish a clear and logical flow between sentences and paragraphs
- Select formal vocabulary and use it in a generally accurate and correct manner
- Choose and use generally suitable grammatical structures, punctuation, and identify areas in which further development is needed

Content

The course covers the process of writing reports in biology, helping students to focus on the language and communicative aspects of these reports. Topics covered include structuring sentences, paragraphs, and longer sections (introductions, methods, etc.); presenting and integrating non-textual elements such as graphs and tables; reviewing common grammar problems for advanced writers in English; and editing drafts and proofs. Sessions will consist of a mix of specialist input, group and pair work, and editing sessions.

Students who attend this couc will turn in three sections of a report (approx. 500 words each) for feedback, revising these texts for a final portfolio that is graded.

Prerequisites / notice

Participants should be at a stage in their research where they can already start drafting parts of the report.

Elective Major: Molecular Health Sciences

Abstract

Information for UZH students: Enrolment to this course unit only possible at ETH. No enrolment to module BIC348 at UZH.

Please mind the ETH enrolment deadlines for UZH students: https://www.ethz.ch/en/studies/non-degree-courses/special-students-special-students-university-of-zurich.html

Objective

Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

This course focuses on the concepts of classical and modern genetics and genomics.
The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Lecture notes
Scripts and additional material will be provided during the semester.

551-1299-00L Bioinformatics

Abstract
Students will study bioinformatic concepts in the areas of metagenomics, genomics, transcriptomics, proteomics, biological networks and biostatistics. Through integrated lectures, practical hands-on exercises and project work, students will also be trained in analytical and programming skills to meet the emerging increase in data-driven knowledge generation in biology in the 21st century.

Objective
Students will have an advanced understanding of the underlying concepts behind modern bioinformatic analyses at genome, metagenome and proteome-wide scales. They will be familiar with the most common data types, where to access them, and how to analytically work with them to address contemporary questions in the field of biology.

Prerequisites / notice
Course participants have already acquired basic programming skills in UNIX, Python and R.

551-0317-00L Immunology I

Abstract
Introduction into structural and functional aspects of the immune system.
Basic knowledge of the mechanisms and the regulation of an immune response.

Objective
Basic knowledge of the mechanisms and the regulation of an immune response.

Content
- Introduction and historical background
- Innate and adaptive immunity, Cells and organs of the immune system
- B cells and antibodies
- Generation of diversity
- Antigen presentation and Major Histoincompatibility (MHC) antigens
- Thymus and T cell selection
- Autoimmunity
- Cytotoxic T cells and NK cells
- Th1 and Th2 cells, regulatory T cells
- Allergies
- Hypersensitivities
- Vaccines, immune-therapeutic interventions

Lecture notes
Electronic access to the documentation will be provided. The link can be found at "Lernmaterialien"

Literature
- Kuby, Immunology, 9th edition, Freeman + Co., New York, 2020

Prerequisites / notice
For D-BIOL students Immunology I (WS) and Immunology II (SS) will be examined as one learning entity in a "Sessionsprüfung". All other students write separate exams for Immunology I and Immunology II. All exams (combined exam Immunology I and II, individual exams) are offered in each exam session.

Competencies

| Subject-specific Competencies                                      | assessed   |
| Concepts and Theories                                              |            |
| Techniques and Technologies                                        |            |
| Method-specific Competencies                                       | fostered   |
| Analytical Competencies                                            | fostered   |
| Decision-making                                                   | fostered   |
| Problem-solving                                                   | fostered   |
| Project Management                                                 | fostered   |

Social Competencies

| Communication                                                     | fostered   |
| Cooperation and Teamwork                                          | fostered   |

Personal Competencies

| Adaptable and Flexibility                                         | fostered   |
| Creative Thinking                                                 | fostered   |
| Critical Thinking                                                  | assessed   |
| Self-awareness and Self-reflection                                 | fostered   |
| Self-direction and Self-management                                 | fostered   |
Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry. The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes. Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

Recommended supplementary literature (review articles and selected primary literature) will be provided during the course. Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

By the end of this module, each student should be able to:
- recognize the universal principles underlying the development of different animal body plans.
- explain how the genes encoding the molecular toolkit have evolved to create animal diversity.
- relate changes in gene structure or function to evolutionary changes in animal development.
- present and discuss a relevant evolutionary topic in an oral presentation
- select and integrate key concepts in animal evolution from primary literature
- participate in discussions on topics presented by others

The evolution of the various body-plans is investigated by means of comparison of developmentally essential control genes of molecularly analysed model organisms.

During this Masters level seminar style course, students will explore current research topics in cellular biochemistry focused on the structure, function and regulation of selected cell components, and the consequences of dysregulation for pathologies. Students will work with experts toward a critical analysis of cutting-edge research in the domain of cellular biochemistry, with emphasis on normal cellular processes and the consequences of their dysregulation. At the end of the course, students will be able to evaluate, critically discuss and write about scientific articles in the research area of cellular biochemistry, and they will identify open testable research questions.

Guided by an expert in the field, students will engage in classical round-table style discussions of current literature with frontal presentations. Guided by a faculty expert, students develop domain knowledge of the research area associated with a primary paper, and alternate as discussion leaders to present the research topic. By the end of the semester, students will formulate their ideas about open testable research questions that extend from the published work.

The literature will be provided during the course. The course will be taught in English.

**Abstract**

Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.

**Objective**

Develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology.

**Content**

The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics. For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

**Lecture notes**

Script and original publications will be supplied during the course.

**Prerequisites / notice**

The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.

---

**551-1177-00L** Immunology: From Milestones to Current Topics  
**W 4 credits 2S**  
B. Ludewig, N. Pikor, University lecturers

**Abstract**

Milestones in Immunology: on old concepts and modern experiments

**Objective**

The course will cover the current grand topics in immunology: B cells, innate immunity, antigen presentation, tumor immunity, T cells, myeloid cells and stromal cells. For each topic two or four hours will be allocated. Historical milestone papers will be presented by the tutor/lecturer providing an overview on the development of the theoretical framework and critical technological advances. The students will read the historical milestone papers and contribute to the discussion. In the second part of the lecture, students will present recent high impact research papers that have emerged from the landmark achievements of the previously discussed milestone concepts.

**Content**

Milestones and current topics of innate immunity, antigen presentation, B cells, thymus and T cells, cytotoxic T cells, NK cells, stromal cells, CNS immunity and tumor immunology.

**Lecture notes**

Original and review articles will be distributed by the respective lecturer.

**Literature**

Literaturunterlagen werden vor Beginn des Kurses auf folgender website zugänglich sein: https://moodle-app2.let.ethz.ch/course/view.php?id=15568

**752-4009-00L** Molecular Biology of Foodborne Pathogens  
**W 3 credits 2V**  
M. Loessner, A. Harms, M. Schuppler, E. Slack

**Abstract**

Molecular biology of infectious foodborne pathogens (Listeria, E. coli, Campylobacter, Salmonella, etc) and toxin-producing organisms (Bacillus, Clostridium, Staphylococcus). How and under which conditions will toxins and virulence factors be produced, and how do they work? How is the interaction between the human host and the microbial pathogen? What are the roles of food and the environment? What can be done to interfere with the potential risks? Which methods are best suited for what approach? Last, but not least, the role of bacteriophages in microbial pathogenicity will be highlighted, in addition to various applications of bacteriophage for both diagnostics and antimicrobial intervention.

**Objective**

Detailed and current status of research and insights into the molecular basis of foodborne diseases, with focus on interactions of the microorganism or the toxins they produce with the human system. Understanding the relationship between specific types of food and the associated pathogens and microbial risks. Another focus lies on the currently available methods and techniques useful for the various purposes, i.e., detection, differentiation (typing), and antimicrobial agents.

**Content**

Molecular biology of infectious foodborne pathogens (Listeria, E. coli, Campylobacter, Salmonella, etc) and toxin-producing organisms (Bacillus, Clostridium, Staphylococcus). How and under which conditions will toxins and virulence factors be produced, and how do they work? How is the interaction between the human host and the microbial pathogen? **376-0300-00L** Essentials in Translational Science  
**W 3 credits 2G**  
J. Goldhahn

**Abstract**

Translational science is a cross disciplinary scientific research that is motivated by the need for practical applications that help people (e.g. Medicines). The course should help to clarify basics of translational science, illustrate successful applications and enable students to integrate key features into their future projects.

**Objective**

After completing this course, students will be able to understand:

- Principles of translational science including medical device development, intellectual property, regulatory environment and project management
- Students should be able to apply this knowledge in drug development programs in Pharma, Biotech or their own spin-off.

**Content**

What is translational science and what is it not including:

- How to identify need?
- How to choose the appropriate research type and methodology
- How to measure success?
- How are medical devices developed?
- How to handle IP in the development process?
- How does the regulatory environment impact innovation?
- How to manage complex development projects?

- Positive and negative examples will be illustrated by distinguished guest speakers.

### 701-1703-00L Evolutionary Medicine for Infectious Diseases

| Objective | Students will learn to (i) identify evolutionary explanations for the origins and characteristics of infectious diseases in a range of organisms and (ii) evaluate ways of integrating evolutionary thinking into improved strategies for treating infections of humans and animals. This requires incorporate principles that apply across any host-pathogen interaction, as well as system-specific mechanistic information, with particular emphasis on bacteria and viruses. |
| Content | We will cover several topics where evolutionary thinking is relevant to understanding or treating infectious diseases. This includes: (i) determinants of pathogen host range and virulence, (ii) dynamics of host-parasite coevolution, (iii) pathogen adaptation to evade or suppress immune responses, (iv) antimicrobial resistance, (v) evolution-proof medicine. For each topic there will be a short (<5 minutes) introductory lecture, before students independently research the primary literature and develop discussion points and questions, followed by interactive discussion in class. |
| Literature | The focus is on primary literature, but for some parts the following text books provide good background information:  
Schmid Hempel 2011 Evolutionary Parasitology  
Stearns & Medzhitov 2016 Evolutionary Medicine |

### 636-0108-00L Biological Engineering and Biotechnology

### 551-1407-00L RNA Biology Lecture Series I: Transcription & Processing & Translation

| Objective | The students should obtain an understanding of these processes, which are at work during gene expression. |
| Content | This course covers aspects of RNA biology related to gene expression at the posttranscriptional level. These include RNA transcription, processing, alternative splicing, editing, export and translation. |
| Prerequisites / notice | Basic knowledge of cell and molecular biology. |

### 551-1409-00L RNA Biology Lecture Series II: Non-Coding RNAs: Biology and Therapeutics

| Prerequisites / notice | Does not take place this semester. |
This course covers aspects of RNA biology related to the functions of non-coding RNAs as well as their use as drugs to treat diseases.

Objective

The students should get familiar with the wide array of roles, which non-coding RNAs play in cellular functions.

Content

Micro RNAs; computational approaches to miRNAs; micro RNA function in metabolism; viruses and viral RNAs; nucleic acid-based drugs; ncRNA-mediated genome regulation; epigenetic programming of genome remodelling in ciliates; telomerase and telomeres; tRNA biology.

Prerequisites / notice

Basic knowledge of cell and molecular biology.

376-1305-00L Development of the Nervous System (University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.

UZH Module Code: BIO344

Mind the enrolment deadlines at UZH:

Abstract

The lecture will cover molecular and cellular processes underlying the development of the nervous system (neurogenesis, cell death, cell migration and differentiation, axon guidance and synapse formation). The importance of these processes in the context of developmental diseases is discussed.

Objective

On successful completion of the module the student should be able to
- relate structure and function of the nervous system to its development - apply principles of molecular, cellular, and developmental biology to the development of the nervous system
- identify key steps in development underlying neurological syndromes and diseases

Key skills

On successful completion of the module the student should be able to
- interpret and critically evaluate original research reports
- apply knowledge and relate experimental approaches from molecular, cellular and developmental biology to the developing nervous system

Content

The lecture will cover molecular and cellular processes underlying the development of the nervous system. After an introduction to structure and function of the nervous system, we will discuss neurogenesis, cell death, cell migration and differentiation, axon guidance and synapse formation. The importance of these processes in the context of developmental diseases will be discussed.

Lecture notes

Must be downloaded from OLAT: https://www.olat.uzh.ch/olat/dmz/

as BIO344

Literature

The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on OLAT.

Prerequisites / notice

BIO142 Developmental Biology, BIO143 Neurobiology

376-1305-01L Molecular Neurophysiology: From Molecules to Systems

Information for UZH students:
Enrolment to this course unit only possible at ETH.
Please mind the ETH enrolment deadlines for UZH students: https://ethz.ch/en/studies/non-degree-courses/special-students/special-students-university-of-zurich.html

Abstract

The course covers the physiology of nerve cells, from the single cell through the neuronal network to the systemic level. The focus is on molecular and cellular mechanisms – synaptic transmission, signal transduction, gene expression, synaptic plasticity.

Objective

Based on an understanding of molecular and cellular mechanisms, the aim is to provide a deepened insight into neurophysiological processes underlying complex brain functions – learning/memory, sleep, sensory.

Content

First, basic molecular and cellular mechanisms in nerve cells (excitability, neurotransmission, signal transduction, gene expression, synaptic plasticity) are introduced. Afterwards, their significance for selected neurophysiological processes (learning/memory, sleep, sensory) will be illuminated.

Literature

The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on Moodle.

Competencies

Subject-specific Competencies assessed
Concepts and Theories
Analytical Competencies

Method-specific Competencies

551-0223-00L Immunology III

Abstract

This course provides a detailed understanding of
- development of T and B cells
- the dynamics of a immune response during acute and chronic infection
- mechanisms of immunopathology
- modern vaccination strategies

Key experimental results will be shown to help understanding how immunological text book knowledge has evolved.

Objective

Obtain a detailed understanding of
- the development, activation, and differentiation of different types of T cells and their effector mechanisms during immune responses, - Recognition of pathogenic microorganisms by the host cells and molecular events thereafter, - events and signals for maturation of naive B cells to antibody producing plasma cells and memory B cells.
- Optimization of B cell responses by intelligent design of new vaccines

- 02.07.2024 12:39 Autumn Semester 2024 Page 369 of 2667
Content
- Development and selection of CD4 and CD8 T cells, natural killer T cells (NKT), and regulatory T cells (Treg)
- NK T cells and responses to lipid antigens
- Differentiation, characterization, and function of CD4 T cell subsets such as Th1, Th2, and Th17
- Overview of cytokines and their effector function
- Co-stimulation (signals 1-3)
- Dendritic cells
- Evolution of the "Danger" concept
- Cells expressing Pattern Recognition Receptors and their downstream signals
- T cell function and dysfunction in acute and chronic viral infections

Literature
Documents of the lectures are available for download at: https://moodle-app2.let.ethz.ch/course/view.php?id=2581&notifyeditingon=1

Prerequisites / notice
Immunology I and II recommended but not compulsory

</tbody>
</table>

Abstract
This short course is designed to accompany MSc students in writing their first reports in English, providing input on scientific writing in English as well as feedback on drafts sections of the report.

Objective
Students will learn to:
- Plan, draft, structure, and edit scientific reports
- Produce reader-friendly sentences
- Establish a clear and logical flow between sentences and paragraphs
- Select formal vocabulary and use it in a generally accurate and correct manner
- Choose and use generally suitable grammatical structures, punctuation, and identify areas in which further development is needed

Content
The course covers the process of writing reports in biology, helping students to focus on the language and communicative aspects of these reports. Topics covered include structuring sentences, paragraphs, and longer sections (introductions, methods, etc.); presenting and integrating non-textual elements such as graphs and tables; reviewing common grammar problems for advanced writers in English; and editing drafts and proofs. Sessions will consist of a mix of specialist input, group and pair work, and editing sessions.

Students who attend this course will turn in three sections of a report (approx. 500 words each) for feedback, revising these texts for a final portfolio that is graded.

Prerequisites / notice
Participants should be at a stage in their research where they can already start drafting parts of the report.

Abstract

**Microrobotics**
- Microrobotics is an interdisciplinary field that combines aspects of robotics, micro and nanotechnology, biomedical engineering, and materials science. The aim of this course is to expose students to the fundamentals of this emerging field. Throughout the course, the students apply these concepts in assignments. The course concludes with an end-of-semester examination.

Objective
- The objective of this course is to expose students to the fundamental aspects of the emerging field of microrobotics. This includes a focus on physical laws that predominate at the microscale, technologies for fabricating small devices, bio-inspired design, and applications of the field.

Content
- Main topics of the course include:
  - Scaling laws at micro/nano scales
  - Electrostatics
  - Electromagnetism
  - Low Reynolds number flows
  - Observation tools
  - Materials and fabrication methods
  - Applications of biomedical microrobots

Lecture notes
- The powerpoint slides presented in the lectures will be made available as pdf files. Several readings will also be made available electronically.

Prerequisites / notice
- The lecture will be taught in English.

**Microsystems I: Process Technology and Integration**
- Students are introduced to the fundamentals of semiconductors, the basics of micromachining and silicon process technology and will learn about the fabrication of microsystems and devices by a sequence of defined processing steps (process flow).

Objective
- Students are introduced to the basics of micromachining and silicon process technology and will understand the fabrication of microsystem devices by the combination of unit process steps (process flow).

Content
- Introduction to microsystems technology (MST) and micro electro mechanical systems (MEMS)
- Basic silicon technologies: Thermal oxidation, photolithography and etching, diffusion and ion implantation, thin film deposition
- Specific microsystems technologies: Bulk and surface micromachining, dry and wet etching, isotropic and anisotropic etching, beam and membrane formation, wafer bonding, thin film mechanical properties

Application of selected technologies will be demonstrated on case studies.

Lecture notes
- Lectures (available online)

Literature
- S. M. Sze: Semiconductor Devices, Physics and Technology
- W. Menz, J. Mohr, O. Paul: Microsystem Technology
- Hong Xiao: Introduction to Semiconductor Manufacturing Technology
- T. M. Adams, R. A. Layton: Introductory MEMS, Fabrication and Applications

Prerequisites / notice
- Prerequisites: Physics I and II

**Introduction to Estimation and Machine Learning**
- Students master the basic mathematical concepts and algorithms of estimation and machine learning.

Objective
- Review of probability theory; basics of statistical estimation; least squares and linear learning; Hilbert spaces; singular-value decomposition; kernel methods, neural networks, and more.

Content
- Lecture notes will be handed out as the course progresses.

Lecture notes
- Lecture notes will be handed out as the course progresses.

Prerequisites / notice
- solid basics in linear algebra and probability theory

**Analog Integrated Circuits**
- This course provides a foundation in analog integrated circuit design based on bipolar and CMOS technologies.

Objective
- Integrated circuits are responsible for much of the progress in electronics in the last 50 years, particularly the revolutions in the Information and Communications Technologies we witnessed in recent years. Analog integrated circuits play a crucial part in the highly integrated systems that power the popular electronic devices we use daily. Understanding their design is beneficial to both future designers and users of such systems.

Content
- Review of bipolar and MOS devices and their small-signal equivalent circuit models; Building blocks in analog circuits such as current sources, active load, current mirrors, supply independent biasing etc; Amplifiers: differential amplifiers, cascode amplifier, high gain structures, output stages, gain bandwidth product of op-amps; stability; comparators; second-order effects in analog circuits such as mismatch, noise and offset; data converters; frequency synthesizers; switched capacitors.
- The exercise sessions aim to reinforce the lecture material by well guided step-by-step design tasks. The circuit simulator SPECTRE is used to facilitate the tasks. There is also an experimental session on op-amp measurements.

Lecture notes
- Handouts of presented slides. No script but an accompanying textbook is recommended.

Literature
Objective

Beside electronics nanodevices, D-ITET is pushing its research in the fields of NMR (MRI), electrochemistry, bioelectronics, nano-optics, and quantum information, which are all rationalized in terms of quantum mechanics.

Starting from the axioms of quantum mechanics, we will derive the fascinating theory describing spin and qubits, electron transitions and transfer, photons and LASER: quantum mechanics is different because it mocks our daily Euclidean intuition!

In this way, students will work out a robust quantum mechanics (theoretical!!!) basis which will help them in their advanced studies of the following masters: EEIT (batteries), Biomedical Engineering (NMR, bioelectronics), Quantum Engineering, Micro- and Nanosystems.

IMPORTANT: "qubits" from the point of view of NMR (and NOT from that of quantum computing!).

Content

- Lagrangian and Hamiltonian: Symmetries and Poisson Brackets
- Postulates of QM: Hilbert Spaces and Operators
- Density Operator
- Spin: Qubits, Bloch Equations, and NMR
- Entanglement
- Symmetries and Corresponding Operators
- Schrödinger's Wave Mechanics: Electrons in a Periodic Potential and Energy Bands
- Harmonic Oscillator: Creation and Annihilation Operators
- Identical Particles: Bosons and Fermions
- Quantization of the Electromagnetic Field: Photons, Absorption and Emission, LASER
- Electron Transfer: Marcus Theory via Born-Oppenheimer, Franck-Condon, Landau-Zener

Lecture notes

No lecture notes because the proposed textbooks together with the provided supplementary material are more than exhaustive!

!!! I am using OneNote. All lectures and exercises will be broadcast via ZOOM, while corresponding videos of the previous years are available in Moodle !!!

Literature

Supplementary material will be uploaded in Moodle.

Prerequisites / notice

The course has been intentionally conceived to be self-consistent with respect to QM for those master students not having encountered it in their track yet. Therefore, a presumably large overlapping has to be expected with a (welcome!) QM introduction course like the D-ITET "Physics II".

A solid base of Analysis I & II as well as of Linear Algebra is really helpful.

Competencies

- Self-awareness and Self-reflection
- Self-direction and Self-management

227-0385-10L Biomedical Imaging W 6 credits 5G S. Kozerke, K. P. Prüssmann

Abstract

Introduction to diagnostic medical imaging based on electromagnetic and acoustic fields including X-ray planar and tomographic imaging, radio-tracer based nuclear imaging techniques, magnetic resonance imaging and ultrasound-based procedures.

Objective

Upon completion of the course students are able to:

- Explain the physical and mathematical foundations of diagnostic medical imaging systems
- Characterize system performance based on signal-to-noise ratio, contrast-to-noise ratio and transfer function
- Design a basic diagnostic imaging system chain including data acquisition and data reconstruction
- Identify advantages and limitations of different imaging methods in relation to medical diagnostic applications
Abstract

Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The focus is on learning the basic vocabulary of biomedical engineering and getting familiar with concepts that govern common medical instruments and the most important organs from an engineering point of view.

Objective

Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The course provides an overview of the various topics of the different tracks of the biomedical engineering master course and helps orienting the students in selecting their specialized classes and project locations. It also serves as an introduction to the field for students of the ITET, MAVT, HEST and other bachelor programs.

In addition, the most recent achievements and trends of the field of biomedical engineering are also outlined.

Content

History of BME and the role of biomedical engineers. Ethical issues related to BME.

Biomedical sensors both wearable and also biochemical sensors.

Bioelectronics: Nernst equation, Donnan equilibrium, equivalent circuits of biological membranes and bioelectronic devices.

Bioinformatics: genomic and proteomic tools, databases and basic calculations.

Equations describing basic reactions and enzyme kinetics.

Medical optics: Optical components and systems used in hospitals.

Basic concepts of tissue engineering and organ printing.

Biomaterials and their medical applications.

Function of the heart and the circulatory system.

Transport and exchange of substances in the human body, compartment modeling.

The respiratory system.

Bioimaging.

Orthopedic biomechanics.

Lectures (2h), discussion of practical exercises (1h) and homework exercises.

Lecture notes

Introduction to Biomedical Engineering
by Enderle, Banchard, and Bronzino

AND

Prerequisites / notice

No specific requirements, BUT

ITET, MAVT, PHYS students will have to learn a lot of new words related to biochemistry, biology and medicine, while HEST and BIOL students will have to grasp basic engineering concepts (circuits, equations, etc.).

Self-direction and Self-management fostered

Abstract

The course introduces bioelectricity and the sensing concepts that enable obtaining information about neurons and their networks. The sources of electrical fields and currents in the context of biological systems are discussed. The fundamental concepts and challenges of measuring bioelectronic signals and the basic concepts to record optogenetically modified organisms are introduced.

Objective

During this course the students will:
- learn the basic concepts in bioelectronics including the sources of bioelectronic signals and the methods to measure them
- be able to solve typical problems in bioelectronics
- learn about the remaining challenges in this field

Content

Lecture topics:
1. Introduction
2. Membrane and Transport
3-4. Action potential and Hodgkin-Huxley
5. Detection and Noise
6. Measuring currents in solutions, nanopore sensing and patch clamp pipettes
7. Measuring potentials in solution and core conductance model
8. Measuring electronic signals with wearable electronics, ECG, EEG
9. Measuring mechanical signals with bioelectronics
10. In vivo stimulation and recording
11. In vivo electrophysiology
12. Measuring neurons optically, fundamentals of optical microscopy
13. Fluorescent probes and scanning microscopy, optogenetics, in vivo microscopy
14. Measuring biochemical signals

Lecture notes

A detailed script is provided to each lecture including the exercises and their solutions.

Literature

Plonsey and Barr, Bioelectricity: A Quantitative Approach (Third edition)

Prerequisites / notice

The course requires an open attitude to the interdisciplinary approach of bioelectronics. In addition, it requires undergraduate entry-level familiarity with electric & magnetic fields/forces, resistors, capacitors, electric circuits, differential equations, calculus, probability calculus, Fourier transformation & frequency domain, lenses / light propagation / refractive index, pressure, diffusion AND basic knowledge of biology and chemistry (e.g. understanding the concepts of concentration, valence, reactants-products, etc.).
fostered Understanding of the characteristics of neuromorphic circuit elements.

Deep-Learning (DL) a brain-inspired weak for of AI allows training of large artificial neuronal networks (ANNs) that, like humans, can learn real-world tasks such as recognizing objects in images. However, DL is far from being understood and investigating learning in biological networks might serve again as a compelling inspiration to think differently about state-of-the-art ANN training methods.

The main goal of this lecture is to provide a comprehensive overview into the learning principles neuronal networks as well as to introduce a diverse skill set (e.g., simulating a spiking neuronal network) that is required to understand learning in large, hierarchical neuronal networks. To achieve this the lectures and exercises will merge ideas, concepts and methods from machine learning and neuroscience. These will include training basic ANNs, simulating spiking neuronal networks as well as being able to read and understand the main ideas presented in today's neuroscience papers.

After this course students will be able to:
- read and understand the main ideas and methods that are presented in today's neuroscience papers
- explain the basic ideas and concepts of plasticity in the mammalian brain
- implement alternative ANN learning algorithms to 'error backpropagation' in order to train deep neuronal networks.
- use a diverse set of ANN regularization methods to improve learning
- simulate spiking neuronal networks that learn simple (e.g. digit classification) tasks in a supervised manner.

Deep-learning a brain-inspired weak form of AI allows training of large artificial neuronal networks (ANNs) that, like humans, can learn real-world tasks such as recognizing objects in images. The origins of deep hierarchical learning can be traced back to early neuroscience research by Hubel and Wiesel in the 1960s, who first described the neuronal processing of visual inputs in the mammalian neocortex. Similar to their neocortical counterparts ANNs seem to learn by interpreting and structuring the data provided by the external world. However, while on specific tasks such as playing (video) games deep ANNs outperform humans (Minh et al, 2015, Silver et al., 2018), ANNs are still not performing on par when it comes to recognizing actions in movie data and their ability to act as generalizable problem solvers is still far behind of what the human brain seems to achieve effortlessly. Moreover, biological neuronal networks can learn far more effectively with fewer training examples, they achieve a much higher performance in recognizing complex patterns in time series data (e.g. recognizing actions in movies), they dynamically adapt to new tasks without losing performance and they achieve unmatched performance to detect and integrate out-of-domain data examples (data they have not been trained with). In other words, many of the big challenges and unknowns that have emerged in the field of deep learning over the last years are already mastered exceptionally well by biological neuronal networks in our brain. On the other hand, many facets of typical ANN design and training algorithms seem biologically implausible, such as the non-local weight updates, discrete processing of time, and scalar communication between neurons. Recent evidence suggests that learning in biological systems is the result of the complex interplay of diverse error feedback signaling processes acting at multiple scales, ranging from single synapses to entire networks.

The participation in the course is subject to the following conditions:

1) The number of participants is limited to 120 students (MSc and PhDs).
2) Students must have taken the exam in Deep Learning (263-3210-00L) or have acquired equivalent knowledge.

This advanced level lecture requires some basic background in machine/deep learning. Thus, students are expected to have a basic mathematical foundation, including linear algebra, multivariate calculus, and probability. The course is not to be meant as an extended tutorial of how to train deep networks in PyTorch or Tensorflow, although these tools used.

The participation in the course is subject to the following conditions:

1) The number of participants is limited to 120 students (MSc and PhDs).
2) Students must have taken the exam in Deep Learning (263-3210-00L) or have acquired equivalent knowledge.

This course covers analog circuits with emphasis on neuromorphic engineering: MOS transistors in CMOS technology, static circuits, dynamic circuits, systems (silicon neuron, silicon retina, silicon cochlea) with an introduction to multi-chip systems. The lectures are accompanied by weekly laboratory sessions.

Understanding of the characteristics of neuromorphic circuit elements.
Neuromorphic circuits are inspired by the organizing principles of biological neural circuits. Their computational primitives are based on physics of semiconductor devices. Neuromorphic architectures often rely on collective computation in parallel networks. Adaptation, learning and memory are implemented locally within the individual computational elements. Transistors are often operated in weak inversion (below threshold), where they exhibit exponential I-V characteristics and low currents. These properties lead to the feasibility of high-density, low-power implementations of functions that are computationally intensive in other paradigms. Application domains of neuromorphic circuits include silicon retinas and cochleas for machine vision and audition, real-time emulations of networks of biological neurons, and the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS transistor, phototransducers), static circuits (differential pair, current mirror, transconductance amplifiers, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silicon neuron, silicon retina and cochlea) and an introduction to multi-chip systems that communicate events analogous to spikes. The lectures are accompanied by weekly laboratory sessions on the characterization of neuromorphic circuits, from elementary devices to systems.

Prerequisites: Background in basics of semiconductor physics helpful, but not required.

**227-1037-00L**  
Introduction to Neuroinformatics  
W 6 credits  
V. Mante, B. Grewe, G. Indiveri, M. Payvand

**376-1714-00L**  
Biocompatible Materials  
W 4 credits  
K. Maniura, M. Rottmar, M. Zenobi-Wong

Prerequisites: Particular: The course is highly recommended for those who intend to take the spring semester course 'Neuromorphic Engineering II', that teaches the conception, simulation, and physical layout of such circuits with chip design tools.

Connections to computer science and artificial intelligence are discussed, but the main focus of the course is on establishing the biological basis of computations in neurons.
Objective
The lecture series is motivated by an overview covering the skin of the crystals, roughness analysis, contact angle measurements, protein absorption/activity and monocyte behaviour.

As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting, oxidic and organic surfaces are introduced.

The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure's shapes, which are based on the strain relieving mechanisms and kinetic growth processes.

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. Recently, ellipsometry has been introduced to on-line monitor film thickness, and roughness with sub-nanometer precision. These characterisation techniques are vital for optimising the preparation of medical implants.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.

X rays are more and more often used to characterise the human tissues down to the nanometer level. The combination of highly intense beams only some micrometers in diameter with scanning enables spatially resolved measurements and the determination of tissue's anisotropies of biopsies.

Recommended Elective Courses
These courses are particularly recommended for the Bioelectronics track. Please consult your track advisor if you wish to select other subjects.

<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>Photonics, the science of light, has become ubiquitous in our lives. Control and manipulation of light is what enables us to interact with the screen of our smart devices and exchange large amounts of complex information. Photonics has also taken a preponderant role in cutting-edge science, allowing for instance to image nanospecimens, detect diseases or sense very tiny forces. The purpose of this course is three-fold: (i) We first aim to provide the fundamentals of photonics, establishing a solid basis for more specialised courses. (ii) Beyond theoretical concepts, our intention is to have students develop an intuition on how to manipulate light in practise. (iii) Finally, the course highlights how the taught concepts apply to modern research as well as to everyday life technologies (LCD screens, polarisation sun glasses, anti-reflection coating etc...). Content, including videos of laboratory experiments, has been designed to be approachable by students from a diverse set of science and engineering backgrounds.</td>

Molecular Sensors: From Fundamentals to Health and Environmental Applications

Note: previous course title until HS23 "Molecular Health Sensors and Devices"

Molecular sensors are used in everyday life in health care, environmental monitoring, food safety, space and other fields. Sources of molecular information, its transport and fundamental concepts of molecular sensing will be discussed. In the scope of group projects, the acquired knowledge will be applied and deepened in case studies.

After the course, the students will:

- know the requirements and merits of molecular sensors for health, environmental and other emerging applications (e.g. space)
- understand transport phenomena of molecular information & surface interactions and know how to quantitatively describe these
- understand fundamental sensing concepts for the detection and quantification of molecular analytes
- know concepts of signal processing
- be capable to apply the learnt knowledge to conceive and engineer sensor concepts and systems
- know how to investigate sensor-related literature and present scientific data

This course consists of a theoretical and a project-based learning block. In the first 10 semester weeks, theoretical knowledge will be provided through lectures and deepened in corresponding exercises. In the last 4 weeks, the students will apply the learned concepts through group projects to investigate case studies. The outcome will be present.

Transport of Molecular Information; Surface Interactions; Sensor Fundamentals; Chemoresistive Sensing; Electrochemical Sensing; Mass-sensitive; Capacitive Sensing; Signal Processing; Medical Requirements for Molecular Sensing

Hand-outs will be provided to each lecture including the exercises and their solutions.

Neuromorphic Engineering I

Registration in this class requires the permission of the instructor. Class size will be limited to available lab spots. Preference is given to students that require this class as part of their major.

Information for UZH students:
Enrolment to this course unit only possible at ETH. No enrolment to module INI404 at UZH.
Please mind the ETH enrolment deadlines for UZH students: https://ethz.ch/en/studies/non-degree-courses/special-students-university-of-zurich.html

This course covers analog circuits with emphasis on neuromorphic engineering: MOS transistors in CMOS technology, static circuits, dynamic circuits, systems (silicon neuron, silicon retina, silicon cochlea) with an introduction to multi-chip systems. The lectures are accompanied by weekly laboratory sessions.

Neuromorphic circuits are inspired by the organizing principles of biological neural circuits. Their computational primitives are based on physics of semiconductor devices. Neuromorphic architectures often rely on collective computation in parallel networks. Adaptation, learning and memory are implemented locally within the individual computational elements. Transistors are often operated in weak inversion (below threshold), where they exhibit exponential I-V characteristics and low currents. These properties lead to the feasibility of high-density, low-power implementations of functions that are computationally intensive in other paradigms. Application domains of neuromorphic circuits include silicon retinas and cochleas for machine vision and audition, real-time emulations of networks of biological neurons, and the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS transistor, phototransducers), static circuits (differential pair, current mirror, transconductance amplifiers, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silicon neuron, silicon retina and cochlea) and an introduction to multi-chip systems that communicate events analogous to spikes. The lectures are accompanied by weekly laboratory sessions on the characterization of neuromorphic circuits, from elementary devices to systems.

S.-C. Liu et al.: Analog VLSI Circuits and Principles; various publications.
Prerequisites: Background in basics of semiconductor physics helpful, but not required.

## 227-1051-00L Systems Neuroscience (University of Zurich)

**W** 6 credits 2V+1U  D. Kiper

*No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH as an incoming student.*

**UZH Module Code:** INI415

### Abstract

This course focuses on basic aspects of central nervous system physiology, including perception, motor control and cognitive functions.

### Objective

To understand the basic concepts underlying perceptual, motor and cognitive functions.

### Content

Main emphasis sensory systems, with complements on motor and cognitive functions.

### Literature

None

### Prerequisites / notice

None

---

## 227-0384-00L Ultrasound Fundamentals and Applications in Biology and Medicine

**W** 4 credits 3G  X. L. Dean Ben

*Previously (up to spring 2020) offered as Ultrasound Fundamentals, Imaging, and Medical Applications*

### Abstract

Ultrasound waves are non-ionizing and thus provide a safe means to interrogate and treat biological tissues. Advantages such as real-time operation, low cost, and portability have led to ultrasound systems becoming standard tools in hospitals and research laboratories. In biology and medicine include ultrasound and optoacoustic imaging, thermal therapy, or pulse stimulation.

### Objective

The objective of the course is that students are able to understand how to use ultrasound in biology and medicine and generalize this knowledge to applications in other fields.

### Content

The course will cover the basic physics of ultrasound (acoustic waves at frequencies higher than the audible range) in biological tissues as well as the instrumentation required to generate and detect these waves. Imaging methods will extensively be described in the course. Specifically, standard and ultra-fast ultrasound imaging approaches will be covered along with newer optoacoustic and transmission ultrasound imaging methods. The course will also describe mathematical modeling approaches and numerical methods as well as signal and image processing tools applicable in ultrasound-based imaging. Other topics include ultrasound sensors, laser ultrasound, therapeutic effects, or biomedical applications and contrast agents. The course will conclude with current and future research directions in the field of ultrasound in biomedicine.

### Lecture notes

The lecture slides will be made available to the students.

### Prerequisites / notice

Basic knowledge in physics. Basic programming skills, preferably in Matlab.

---

## 227-0166-00L Analog Integrated Circuits

**W** 6 credits 4G  T. Jang

### Abstract

This course provides a foundation in analog integrated circuit design based on bipolar and CMOS technologies. Integrated circuits are responsible for much of the progress in electronics in the last 50 years, particularly the revolutions in the Information and Communications Technologies we witnessed in recent years. Analog integrated circuits play a crucial part in the highly integrated systems that power the popular electronic devices we use daily. Understanding their design is beneficial to both future designers and users of such systems.

### Objective

The basic elements, design issues and techniques for analog integrated circuits will be taught in this course.

### Content

Review of bipolar and MOS devices and their small-signal equivalent circuit models; Building blocks in analog circuits such as current sources, active load, current mirrors, supply independent biasing etc; Amplifiers: differential amplifiers, cascode amplifier, high gain structures, output stages, gain bandwidth product of op-amps; stability; comparators; second-order effects in analog circuits such as mismatch, noise and offset; data converters; frequency synthesizers; switched capacitors.

The exercise sessions aim to reinforce the lecture material by well guided step-by-step design tasks. The circuit simulator SPECTRE is used to facilitate the tasks. There is also an experimental session on op-amp measurements.

### Lecture notes

Handouts of presented slides. No script but an accompanying textbook is recommended.

### Literature

---

## 227-0447-00L Image Analysis and Computer Vision

**W** 6 credits 3V+1U  E. Konukoglu, E. Erdil, F. Yu

### Abstract

### Objective

Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

### Content

This course aims at offering a self-contained account of computer vision and its underlying concepts, including the recent use of deep learning.

The first part starts with an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First the interaction of light with matter is considered. The most important hardware components such as cameras and illumination sources are also discussed. The course then turns to image discretization, necessary to process images by computer.

The next part describes necessary pre-processing steps, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and 3D shape as two important examples. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed. A major part at the end is devoted to deep learning and AI-based approaches to image analysis. Its main focus is on object recognition, but also other examples of image processing using deep neural nets are given.

### Lecture notes

Course material Script, computer demonstrations, exercises and problem solutions

### Prerequisites / notice

Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Python and Linux.

### Language

The course language is English.

---

## 227-0468-00L Analog Signal Processing and Filtering

**W** 6 credits 2V+2U  H. Schmid

*Suitable for Master Students as well as Doctoral Students.*
This lecture provides a wide overview over analog filters (continuous-time and discrete-time), signal-processing systems, and sigma-delta conversion, and gives examples with sensor interfaces and class-D audio drivers. All systems and circuits are treated using a signal-flow view. The lecture is suitable for both analog and digital designers.

The learning goal is that the students can apply signal-flow graphs and can understand the signal flow in such circuits and systems (including non-ideal effects) well enough to gain an understanding of further circuits and systems by themselves.

At the beginning, signal-flow graphs in general and driving-point signal-flow graphs in particular are introduced. We will use them during the whole term to analyze circuits on a system level (analog continuous-time, analog discrete-time, mixed-signal and digital) and understand how signals propagate through them. The theory and CMOS implementation of active Filters is then discussed in detail using the example of Gm-C filters and active-RC filters. The ideal and nonideal behaviour of opamps, current conveyors, and inductor simulators follows. The link to the practical design of circuits and systems is done with an overview over different quality measures and figures of merit used in scientific literature and datasheets. Finally, an introduction to discrete-time and mixed-domain filters and circuits is given, including sensor read-out amplifiers, correlated double sampling, and chopping, and an introduction to sigma-delta A/D and D/A conversion on a system level.

This lecture does not go down to the details of transistor implementations. The lecture "227-0166-00L Analog Integrated Circuits" complements this lecture very well in that respect.

The base for these lectures are lecture notes and two or three published scientific papers. From these papers we will together develop the technical content.

Details: https://people.ee.ethz.ch/~haschmid/asfwiki/

The graph methods are also supported with teaching videos: https://tube.switch.ch/channels/d206c96c?order=episodes, and a Python-based open-source tool to manipulate graphs is available on https://github.com/hanspi42/signalflowgrapher

Some material is protected by password; students from ETHZ who are interested can write to haschmid@ethz.ch to ask for the password even if they do not attend the lecture.

Prerequisites / notice

Knowledge of the Laplace transform and z transform and their interpretation (transfer functions, poles and zeros, bode diagrams, stability criteria …) and of the main properties of linear systems is necessary.

Subject-specific Competencies

- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies

- Analytical Competencies
- Decision-making
- Media and Digital Technologies
- Problem-solving
- Project Management

Social Competencies

- Communication
- Cooperation and Teamwork
- Customer Orientation
- Leadership and Responsibility
- Self-presentation and Social Influence
- Sensitivity to Diversity

Personal Competencies

- Adaptability and Flexibility
- Creative Thinking
- Critical Thinking
- Integrity and Work Ethics
- Self-awareness and Self-reflection

This course focuses on the current state and prospects of memory technologies, emerging beyond the silicon transistor era. We explore resistive PCM and RRAM, magnetic MRAM and ferroelectric FRAM memories, covering physics, device aspects and the latest research in the field. Through interactive lectures and laboratory sessions, students gain up-to-date knowledge and compare emerging memory techs.

This course is organized as a series of lectures, focusing on selected memory technologies. This class also includes practical laboratory sessions for the PCM research topics. Students will spend 2 hours per week in the class and laboratory and additional 2-3 hours per week to prepare for the exam.

Lecture notes

Lecture notes will be made available on the website.
The main goal of this course is to demonstrate the differences in communication between the fields of medicine and engineering. Since cross-disciplinary collaboration between engineers and medical doctors is indispensable for innovation in health care. This course brings together engineering students from ETH Zurich and medical students from the University of Zurich to experience the rewards and challenges of such interdisciplinary work in a project based learning environment.

**Objective**
The main goal of this course is to demonstrate the differences in communication between the fields of medicine and engineering. Since such differences become most evident during actual collaborative work, the course is based on a project in physiology, medical or clinical research that combines medicine and engineering.

For the engineering students, the specific aims of the course are to:
- Identify and precisely define a clinical need;
- Acquire a working understanding of the investigated system;
- Identify the engineering challenges in the project and communicate them to the medical students;
- Develop and implement, together with the medical students, solution strategies for the identified challenges;
- Present the solution concept to a cross-disciplinary audience; Preliminary need and solution validation;

Content
After a general introduction to interdisciplinary communication, need identification and product development, the engineering students will team up with medical students to 1) identify a clinically relevant need, 2) develop early-stage solution concepts to it. In the process, they will be supervised both by lecturers from ETH Zurich and the University of Zurich, receiving coaching customized to the project. The project is usually defined by the team itself, but can also be guided by the lecturers. The course will end with each team presenting identified need and solution concept to a cross-disciplinary audience.

**Lecture notes**
Lecture handouts and relevant material will be provided.

**Prerequisites / notice**
IMPORTANT: Note that a special permission from the lecturers is required to register for this course. Contact the head lecturer to that end.

**Content**

- Applicating two fundamental principles of thermodynamics (entropy maximization and Gibbs energy minimization), an analytical model is derived for a variety of biological phenomena at the molecular as well as cellular level, and critically compared with the corresponding experimental data in the literature.

**Objective**

**Engineering uses the laws of physics to predict the behavior of a system. Biological systems are so diverse and complex prompting the question whether we can apply unifying concepts of theoretical physics coping with the multiplicity of life’s mechanisms.**

**Objective of this course is to show that biological phenomena despite their variety can be analytically described using only two principles from statistical mechanics: maximization of the entropy and minimization of the Gibbs free energy.**

**Starting point of the course is the probability theory, which enables to derive step-by-step the two pillars of thermodynamics from the perspective of statistical mechanics: the maximization of entropy according to the Boltzmann’s law as well as the minimization of the Gibbs free energy. Then, an assortment of biological phenomena at the molecular and cellular level (e.g. cytoskeletal polymerization, action potential, photosynthesis, gene regulation, morphogen patterning) will be examined at the light of these two principles with the aim to derive a quantitative expression describing their behavior. Each analytical model is finally validated by comparing it with the corresponding experimental results from the literature.**

By the end of the course, students will also learn to critically evaluate the concepts of making an assumption and making an approximation.

**Theory and corresponding exercises are merged together during the classes.**

Data: 02.07.2024 12:39  Autumn Semester 2024  Page 383 of 2667
Lecture notes
No lecture notes because the two proposed textbooks are more than exhaustive!

I am willingly available Mondays 17.00 o'clock - 18.00 in my office GLC F12.2 for whatever discussion about the lessons and the exercises.

!!! I am using OneNote. All lectures will be broadcast via ZOOM, while corresponding videos of the previous years (lectures and exercises) are available in Moodle !!!

Literature

As further deepening:

Prerequisites / notice
Participants need a good command of
• differentiation and integration of a function with one or more variables (basics of Analysis),
• Newton's and Coulomb's laws (basics of Mechanics and Electrostatics).

Notions of vectors in 2D and 3D are beneficial.

227-0976-00L Computational Psychiatry & Computational Psychosomatics
2 credits
4S K. Stephan

Abstract
This seminar deals with the development of clinically relevant computational tools and/or their application to psychiatry and psychosomatics. It is complementary to the annual Computational Psychiatry Course and serves to build bridges between computational scientists and clinicians. It is designed to foster in-depth exchange, with ample time for discussion.

Objective
Understanding strengths and weaknesses of current trends in the development of clinically relevant computational tools and their application to problems in psychiatry and psychosomatics.

Content
This seminar deals with the development of computational tools (e.g. generative models, machine learning) and/or their application to psychiatry and psychosomatics. The seminar includes (i) presentations by computational scientists and clinicians, (ii) group discussion with focus on methodology and clinical utility, (iii) self-study based on literature provided by presenters.

Literature
Literature for additional self-study of the topics presented in this seminar will be provided by the presenters and will be available online at https://www.tnu.ethz.ch/en/teaching

Prerequisites / notice
Participants are expected to be familiar with general principles of statistics (including Bayesian statistics) and have successfully completed the course “Computational Psychiatry” (Course number 227-0971-00L).

227-2037-00L Physical Modelling and Simulation
6 credits
4G J. Smajic

Abstract
This module consists of (a) an introduction to fundamental equations of electromagnetics, mechanics and heat transfer, (b) a detailed overview of numerical methods for field simulations, and (c) practical examples solved in form of small projects.

Objective
Basic knowledge of the fundamental equations and effects of electromagnetics, mechanics, and heat transfer. Knowledge of the main concepts of numerical methods for physical modelling and simulation. Ability (a) to develop own simple field simulation programs, (b) to select an appropriate field solver for a given problem, (c) to perform field simulations, (d) to evaluate the obtained results, and (e) to interactively improve the models until sufficiently accurate results are obtained.
The module begins with an introduction to the fundamental equations and effects of electromagnetics, mechanics, and heat transfer. After the introduction follows a detailed overview of the available numerical methods for solving electromagnetic, thermal and mechanical boundary value problems. This part of the course contains a general introduction into numerical methods, differential and integral forms, linear equation systems, Finite Difference Method (FDM), Boundary Element Method (BEM), Method of Moments (MoM), Multiple Multipole Program (MMP) and Finite Element Method (FEM). The theoretical part of the course finishes with a presentation of multiphysics simulations through several practical examples of HF-engineering such as coupled electromagnetic-mechanical and electromagnetic-thermal analysis of MEMS.

In the second part of the course the students will work in small groups on practical simulation problems. For solving practical problems the students can develop and use own simulation programs or chose an appropriate commercial field solver for their specific problem. This practical simulation work of the students is supervised by the lecturers.

263-3210-00L Deep Learning

Objective
In recent years, deep learning and deep networks have significantly improved the state-of-the-art in many application domains such as computer vision, speech recognition, and natural language processing. This class will cover the mathematical foundations of deep learning and provide insights into model design, training, and validation. The main objective is a profound understanding of why these methods work and how. There will also be a rich set of hands-on tasks and practical projects to familiarize students with this emerging technology.

Prerequisites / notice
This is an advanced level course that requires some basic background in machine learning. More importantly, students are expected to have a very solid mathematical foundation, including linear algebra, multivariate calculus, and probability. The course will make heavy use of mathematics and is not (!) meant to be an extended tutorial of how to train deep networks with tools like Torch or Tensorflow, although that may be a side benefit.

The participation in the course is subject to the following condition:
- Students must have taken the exam in Advanced Machine Learning (252-0535-00) or have acquired equivalent knowledge, see exhaustive list below:
  - Advanced Machine Learning
    https://mi2.in.tum.de/courses/aml/
  - Computational Intelligence Lab
    http://da.inf.ethz.ch/teaching/2019/CIL/
  - Introduction to Machine Learning
    https://las.inf.ethz.ch/teaching/introml-S19
  - Statistical Learning Theory
    http://mi2.in.tum.de/courses/slt/
  - Computational Statistics
    https://stat.ethz.ch/lectures/ss19/comp-stats.php
  - Probabilistic Artificial Intelligence
    https://las.inf.ethz.ch/teaching/pai-118

263-5702-00L Seminar on Digital Humans

Objective
This seminar covers advanced topics in digital humans with a focus on the latest research results. Topics include estimating human pose and motion from images, human motion synthesis, learning-based human avatar creation, learning neural implicit representations for humans, modeling, animations, artificial intelligence for digital characters, and others. A collection of research papers is selected.

Prerequisites / notice
This seminar covers advanced topic in digital humans including both seminal research papers as well as the latest research results. A collection of research papers are selected covering topics such as estimating human pose and motion from images, human motion synthesis, learning-based human avatar creation, learning neural implicit representations for humans, modeling, animations, artificial intelligence for digital characters, and others. Each student presents one paper to the class and leads a discussion about the paper. All students read the papers and participate in the discussion.

Content
The seminar covers advanced topics in digital humans including both seminal research papers as well as the latest research results. A collection of research papers are selected covering topics such as estimating human pose and motion from images, human motion synthesis, learning-based human avatar creation, learning neural implicit representations for humans, modeling, animations, artificial intelligence for digital characters, and others. Each student presents one paper to the class and leads a discussion about the paper. All students read the papers and participate in the discussion.

263-5902-00L Computer Vision

Objective
The goal of this course is to provide students with a good understanding of computer vision and image analysis techniques. The main concepts and techniques will be studied in depth and practical algorithms and approaches will be discussed and explored through the exercises.

Content
Camera models and calibration, invariant features, Multiple-view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition

Prerequisites / notice
It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts before taking this course.

376-1103-00L Frontiers in Nanotechnology

Abstract
Many disciplines are meeting at the nanoscale, from physics, chemistry to engineering, from the life sciences to medicine. The course will prepare students to communicate more effectively across disciplinary boundaries, and will provide them with deep insights into the various frontiers.

Data: 02.07.2024 12:39  Autumn Semester 2024  Page 385 of 2667
Objective

Building upon advanced technologies to create, visualize, analyze and manipulate nano-structures, as well as to probe their nano-chemistry, nano-mechanics and other properties within manmade and living systems, many exciting discoveries are currently made. They change the way we do science and result in so many new technologies.

The goal of the course is to give Master and Graduate students from all interested departments an overview of what nanotechnology is all about, from analytical techniques to nanosystems, from physics to biology. Students will start to appreciate the extent to which scientific communities are meeting at the nanoscale. They will learn about the specific challenges and what is currently sizzling in the respective fields, and learn the vocabulary that is necessary to communicate effectively across departmental boundaries.

Each lecturer will first give an overview of the state-of-the art in his/her field, and then describe the research highlights in his/her own research group. While preparing their Final Projects and discussing them in front of the class, the students will deepen their understanding of how to apply a range of new technologies to solve specific scientific problems and technical challenges. Exposure to the different frontiers will also improve their ability to conduct effective nanoscale research, recognize the broader significance of their work and to start collaborations.

Content

Starting with the fabrication and analysis of nanoparticles and nanostructured materials that enable a variety of scientific and technical applications, we will transition to discussing biological nanosystems, how they work and what bioinspired engineering principles can be derived, to finally discussing biomedical applications and potential health risk issues. Scientific aspects as well as the many of the emerging technologies will be covered that start impacting so many aspects of our lives. This includes new phenomena in physics, advanced materials, novel technologies and new methods to address major medical challenges.

Lecture notes

All the enrolled students will get access to a password protected website where they can find pdf files of the lecture notes, and typically 1-2 journal articles per lecture that cover selected topics.

376-1176-00L  

**Wearable and Mobile Technologies of the Future - Focus on Sports and Health**

**Abstract**

This course focuses on the progress in the field of wearable and unobtrusive technologies for sports and health. Topics as monitoring heart health and blood pressure, biofeedback and improvement of motor skills and performance are covered. The focus lies on learning about the principles and design of the new generation of non-invasive technologies in fitness-, athletic and medical applications.

**Objective**

Objective 1: Acquire knowledge about the latest technological advancements in wearable and unobtrusive technologies for sport and health.

Objective 2: Acquire skills to design novel non-invasive technologies for sport and health.

**Content**

The course consists of two modules.

Module 1: Movement.

This module provides the scientific background needed to understand the principles that current technologies investigating movement rely on. The latest technological advancements to track parameters of gait and running, improve posture as well as to monitor overall body movement and provide feedback on motion during sport, rehabilitation or at work will be investigated. The focus will be on wearable-related (e.g., textile-based) technologies.

Module 2: Cardiac.

This module focuses on the latest technologies for monitoring the cardiac cycle and blood pressure. The module starts by succinctly providing background information on cardiac physiology and then briefly introduces conventional technologies used in daily practice. This module subsequently focuses on the latest technologies and the latest data analysis techniques to monitor the cardiac cycle for assisting individuals in sport activities or monitoring their health conditions.

**Prerequisites / notice**

- Students should be proficient in programming (any language).
- Note: assignments will be in MATLAB. Students are expected to learn MATLAB on their own if not experienced with this programming language.
- Course prerequisites:
  - For Biomedical Engineering Master's: none
  - For ITET Master's: none
  - For D-MAVT Master's: none
  - For D-HEST Master's and PhD students:
    - • If BSc in electrical/mechanical engineering or computer science: none
    - • If any other BSc program: 376-0022-00L (Imaging and Computing in Medicine) or 376-1983-00L (Foundations of Data Science)

376-1219-00L  

**Rehabilitation Engineering II: Rehabilitation of Sensory and Vegetative Functions**

**Abstract**

Rehabilitation Engng is the application of science and technology to ameliorate the handicaps of individuals with disabilities to reintegrate them into society. The goal is to present classical and new rehabilitation engineering principles applied to compensate or enhance motor, sensory, and cognitive deficits. Focus is on the restoration and treatment of the human sensory and vegetative system.

**Objective**

Provide knowledge on the anatomy and physiology of the human sensory system, related dysfunctions and pathologies, and how rehabilitation engineering can provide sensory restoration and substitution.

This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.
Content

Introduction, problem definition, overview
Rehabilitation of visual function
- Anatomy and physiology of the visual sense
- Technical aids (glasses, sensor substitution)
- Retina and cortex implants
Rehabilitation of hearing function
- Anatomy and physiology of the auditory sense
- Hearing aids
- Cochlea Implants
Rehabilitation and use of kinesthetic and tactile function
- Anatomy and physiology of the kinesthetic and tactile sense
- Tactile/haptic displays for motion therapy (incl. electrical stimulation)
- Role of displays in motor learning
Rehabilitation of vestibular function
- Anatomy and physiology of the vestibular sense
- Rehabilitation strategies and devices (e.g. BrainPort)
Rehabilitation of vegetative Functions
- Cardiac Pacemaker
- Phrenic stimulation, artificial breathing aids
- Bladder stimulation, artificial sphincter
Brain stimulation and recording
- Deep brain stimulation for patients with Parkinson, epilepsy, depression
- Brain-Computer Interfaces

Literature

Introductory Books:

Selected Journal Articles and Web Links:

Prerequisites / notice

Target Group:
- Students of higher semesters and PhD students of
- D-MAVT, D-ITET, D-INFK, D-HEST
- Biomedical Engineering, Robotics, Systems and Control
- Medical Faculty, University of Zurich
- Students of other departments, faculties, courses are also welcome
This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.
Mostly formal lectures (2 × 45 min), with few specific guest lectures on topics of particular relevance. For example, an introduction to Microfluidics describes the behaviour, control and manipulation of fluids geometrically constrained within sub-uL environments. Microfluidics is an introduction to techniques in micro/nanotechnology and to microfluidics. It reviews how many familiar devices are built and can be used for research and biomedical applications. The main objective of the course is to introduce micro/nanotechnology and microfluidics to students having any technical background. The course should familiarize the students with the techniques used in micro/nanotechnology, cleanroom microfabrication, and show them how micro/nanotechnology pervades throughout life sciences. Microfluidics will be emphasized due to their increasing importance in research and for medical applications.

The second objective is to have life sciences students less intimidated by micro/nanotechnology and make them able to link instruments and techniques to specific problems that they might have in their projects/studies. This will also help students getting access to the ETHZ/IBM Nanotech Center infrastructure if needed.

In terms of technical content, the lectures will cover:
- an overview of the microelectronic industry, Moore’s law, field-effect transistors, next-generation DNA sequencing
- liquid crystal displays, organic light emitting diodes, electrophoretic displays, micromirrors and beamers, photopatterning of proteins and cells, optogenetics, and flexible displays and electronics
- hard disk drives and the giant magnetoresistance effect, magnetic nanoparticles, photonics, magnetic sensing and optical biosensing
- cleanroom techniques and instruments, from design to microfabrication of simple devices and microfluidics, examples of DNA microarrays
- the principles of microfluidics, microfluidic functions and fabrication, from microfluidics for research to point-of-care diagnostics, and the (infamous) history of Theranos, as well as some discussions on diagnostics for COVID, R0, and (im)precision of diagnostic devices and why it matters
- 2 × 45 min will be covered by Yuksel Temiz, a master of Arduino programming and do-it-yourself electronics, who will present how to make 20$ electronic components that are synergistic to microfluidic devices and that can be controlled using a smartphone

The course should familiarize the students with the techniques used in micro/nanotechnology, cleanroom microfabrication, and show them how micro/nanotechnology pervades throughout life sciences. Microfluidics will be emphasized due to their increasing importance in research and for medical applications.

We will investigate the theoretical concepts behind microfluidic device operation, the methods of microfluidic device manufacture and the application of microfluidic architectures to important problems faced in modern day chemical and biological analysis.

A central component of this course is a research project. This will allow students to develop a practical understanding of the benefits of miniaturization in chemical and biological experimentation. Projects will be performed in groups of between four and six students and will include both experimental and simulation aspects. Each group, under the guidance of a mentor, will plan and execute a novel research project. The results of this activity will be disseminated through an "academic-style" research article and a "conference-style" oral presentation. Course grades will be evaluated through both a written exam and the project grade.
Specific topics covered in the course include, but are not limited to:

1. Theoretical Concepts
   Scaling laws, features of thermal/mass transport, diffusion, basic description of fluid flow in small volumes, microfluidic mixing strategies.

2. Microfluidic Device Manufacture
   Basic principles of conventional lithography of rigid materials, 'soft' lithography, polymer machining (injection molding, hot embossing, and 3D-printing).

3. Electrokinetics
   Principles of electrophoresis, electroosmosis, high performance capillary electrophoresis, electrokinetic scaling laws, chip-based electrophoresis and isoelectric focusing.

4. Mass Transfer Phenomena
   Key features of mass transport in microfluidic systems, diffusive transport, diffusion-convection, Péclet number, Taylor-Aris diffusion, chaotic mixing and Damköhler numbers.

5. Heat Transfer Phenomena
   Key features of thermal transport in microfluidic systems, conduction, convection, heat transfer by convection in internal flows, heat transfer processes in microfluidic devices.

6. Microfluidic Systems for Materials Synthesis
   Microfluidic reactors for the controlled synthesis of colloidal nanomaterials, advanced automation for bespoke materials discovery & characterization.

7. Point-of-Care Diagnostics
   Microscale tools for diagnostics, challenges associated with point-of-care (PoC) diagnostic testing, requirements for PoC devices, common PoC device formats, applications of PoC diagnostics in the developing world.

8. Microscale DNA Amplification
   Amplification and analysis of nucleic acids using batch, continuous flow and droplet-based microfluidic reactors.

9. Small scale Molecular Detection
   Spectroscopic approaches for analyte detection in small volumes with a particular focus on single molecule detection.

10. Droplets and Segmented Flows
    Formation, manipulation and use of liquid/liquid segmented flows in chemical and biological experimentation.

Lecture notes
Applications of microfluidic tools in cellular analysis, flow cytometry, enzymatic assays and single cell analysis.

Literature
There is no set text for the course. All relevant literature will be provided electronically through the course Moodle site.

Literature
Lecture handouts, background literature, problem sheets and notes will be provided electronically through the course Moodle site.

Abstract

Biology Courses

Number Title Type ECTS Hours Lecturers
227-0399-10L Physiology and Anatomy for Biomedical Engineers I W 3 credits 2G M. Wyss
The goal of this laboratory course is to give students practical exposure to basic techniques of cell and molecular biology.

Ultrasound waves are non-ionizing and thus provide a safe means to interrogate and treat biological tissues. Advantages such as real-time assessment make ultrasound well suited for applications including: ultrasound and optoacoustic imaging, thermal therapy, or pulse stimulation.

### Bioimaging

#### Track Core Courses

During the Master programme, a minimum of 12 CP must be obtained from track core courses.

#### Prerequisites / notice
- Basic knowledge in physics. Basic programming skills, preferably in Matlab.
- The lecture slides will be made available to the students.
- The course is offered in the Autumn Semester 2024.

#### Content
- Previous offerings:
  - Medical Imaging: Ultrasound (spatial and temporal resolution, phased arrays)
  - Magnetic Resonance (magnetic moment, spin transitions, excitation, relaxation, detection)
  - Nuclear imaging (detection principles, image reconstruction, kinetic modelling)
  - Biomedical Imaging: Ultrasound (mechanical wave generation, propagation in tissue, reflection, transmission)
  - Magnetic Resonance (plane wave encoding, Fourier reconstruction, pulse sequences)
  - Magnetic Resonance (contrast mechanisms, gradient- and spin-echo, applications)
- Biomedical Imaging: X-rays (resolution, detection, digital subtraction angiography, Radon transform)
- Biomedical Imaging: X-rays (filtered back-projection, spiral computed tomography, image quality, dose)
- Biomedical Imaging: Nuclear imaging (radioactive tracer, collimation, point spread function, SPECT/PET)
- Biomedical Imaging: Nuclear imaging (detection principles, image reconstruction, kinetic modelling)
- Biomedical Imaging: Magnetic Resonance (magnetic moment, spin transitions, excitation, relaxation, detection)
- Biomedical Imaging: Magnetic Resonance (plane wave encoding, Fourier reconstruction, pulse sequences)
- Biomedical Imaging: Magnetic Resonance (contrast mechanisms, gradient- and spin-echo, applications)
- Biomedical Imaging: Ultrasound (mechanical wave generation, propagation in tissue, reflection, transmission)
- Biomedical Imaging: Ultrasound (spatial and temporal resolution, phased arrays)
- Biomedical Imaging: Ultrasound (Doppler shift, implementations, applications)
- Biomedical Imaging: Summary, example exam questions

Abstract

Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The focus is on learning the basic vocabulary of biomedical engineering and getting familiar with concepts that govern common medical instruments and the most important organs from an engineering point of view.

Objective

Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The course provides an overview of the various topics of the different tracks of the biomedical engineering master course and helps orienting the students in selecting their specialized classes and project locations. It also serves as an introduction to the field for students of the ITET, MAVT, HEST and other bachelor programs. In addition, the most recent achievements and trends of the field of biomedical engineering are also outlined.

Content

History of BME and the role of biomedical engineers. Ethical issues related to BME.

Biomedical sensors both wearable and also biochemical sensors.

Bioelectronics: Nernst equation, Donnan equilibrium, equivalent circuits of biological membranes and bioelectronic devices.

Bioinformatics: genomic and proteomic tools, databases and basic calculations.

Equations describing basic reactions and enzyme kinetics.

Medical optics: Optical components and systems used in hospitals.

Basic concepts of tissue engineering and organ printing.

Biomaterials and their medical applications.

Function of the heart and the circulatory system.

Transport and exchange of substances in the human body, compartment modeling.

The respiratory system.

Bioimaging.

Orthopedic biomechanics.

Lectures (2h), discussion of practical exercises (1h) and homework exercises.

Lecture notes

Introduction to Biomedical Engineering by Enderle, Banchard, and Bronzino

AND

Prerequisites / notice

No specific requirements, BUT ITET, MAVT, PHYS students will have to learn a lot of new words related to biochemistry, biology and medicine, while HEST and BIOL students will have to grasp basic engineering concepts (circuits, equations, etc.).

Abstract

Objective

Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.
This course aims at offering a self-contained account of computer vision and its underlying concepts, including the recent use of deep learning. The first part starts with an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First the interaction of light with matter is considered. The most important hardware components such as cameras and illumination sources are also discussed. The course then turns to image discretization, necessary to process images by computer. The next part describes necessary pre-processing steps, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and 3D shape as two important examples. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed. A major part at the end is devoted to deep learning and AI-based approaches to image analysis. Its main focus is on object recognition, but also other examples of image processing using deep neural nets are given.

### Lecture notes
- **Course material Script**, computer demonstrations, exercises and problem solutions
- Prerequisites:
  - Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Python and Linux.
- The course language is English.

#### 227-0965-00L Micro and Nano-Tomography of Biological Tissues

**W** 4 credits 3G M. Stampanoni, F. Marone Welford

**Abstract**
The lecture introduces the physical and technical know-how of X-ray tomographic microscopy. Several X-ray imaging techniques (absorption-, phase- and darkfield contrast) will be discussed and their use in daily research, in particular biology, is presented. The course discusses the aspects of quantitative evaluation of tomographic data sets like segmentation, morphometry and statistics.

**Objective**
Introduction to the basic concepts of X-ray tomographic imaging, image analysis and data quantification at the micro and nano scale with particular emphasis on biological applications.

**Content**
Synchrotron-based X-ray micro- and nano-tomography is today a powerful technique for non-destructive, high-resolution investigations of a broad range of materials. The high-brilliance and high-coherence of third generation synchrotron radiation facilities allow quantitative, three-dimensional imaging at the micro and nanometer scale and extend the traditional absorption imaging technique to edge-enhanced and phase-sensitive measurements, which are particularly suited for investigating biological samples.

The lecture includes a general introduction to the principles of tomographic imaging from image formation to image reconstruction. It provides the physical and engineering basics to understand how imaging beamlines at synchrotron facilities work, looks into the recently developed phase contrast methods, and explores the first applications of X-ray nano-tomographic experiments.

The course finally provides the necessary background to understand the quantitative evaluation of tomographic data, from basic image analysis to complex morphometrical computations and 3D visualization, keeping the focus on biomedical applications.

**Lecture notes**
Available online

**Literature**
Will be indicated during the lecture.

#### Recommended Elective Courses
These courses are particularly recommended for the Bioimaging track. Please consult your track advisor if you wish to select other subjects.

**Abstract**
In-depth analysis of the quantum mechanics origin of nuclear magnetic resonance (qubits, two-level systems), of LASER (quantization of the electromagnetic field, photons), and of electron transfer (from electrochemistry to photosynthesis).

**Objective**
Beside electronics nanodevices, D-ITET is pushing its research in the fields of NMR (MRI), electrochemistry, bioelectronics, nano-optics, and quantum information, which are all rationalized in terms of quantum mechanics.

Starting from the axioms of quantum mechanics, we will derive the fascinating theory describing spin and qubits, electron transitions and transfer, photons and LASER: quantum mechanics is different because it mocks our daily Euclidean intuition!

In this way, students will work out a robust quantum mechanics (theoretical!!) basis which will help them in their advanced studies of the following masters: EEIT (batteries), Biomedical Engineering (NMR, bioelectronics), Quantum Engineering, Micro- and Nanosystems.

**Content**
- Lagrangian and Hamiltonian: Symmetries and Poisson Brackets
- Postulates of QM: Hilbert Spaces and Operators
- Density Operator
- Spin: Qubits, Bloch Equations, and NMR
- Entanglement
- Symmetries and Corresponding Operators
- Schrödinger's Wave Mechanics: Electrons in a Periodic Potential and Energy Bands
- Harmonic Oscillator: Creation and Annihilation Operators
- Identical Particles: Bosons and Fermions
- Quantization of the Electromagnetic Field: Photons, Absorption and Emission, LASER
- Electron Transfer: Marcus Theory via Born-Oppenheimer, Franck-Condon, Landau-Zener

**Lecture notes**
No lecture notes because the proposed textbooks together with the provided supplementary material are more than exhaustive!

**Literature**

Supplementary material will be uploaded in Moodle.

---

+ (as rigorous and profound presentation of the mathematical framework) G. Dell'Antonio, "Lectures on the Mathematics of Quantum Mechanics I", 2015, Springer
+ (as account of those formidable years) G. Gamow, "Thirty Years that Shook Physics", 1985, Dover Publications Inc.
The main goal of this lecture is to provide a comprehensive overview into the learning principles neuronal networks as well as to introduce Deep-learning, a brain-inspired weak form of AI allows training of large artificial neuronal networks (ANNs) that, like humans, can learn real-world tasks such as recognizing objects in images. However, DL is far from being understood and investigating learning in biological networks might serve again as a compelling inspiration to think differently about state-of-the-art ANN training methods.

This seminar teaches problem solving skills for computational neuroimaging, based on analyses of neuroimaging and behavioural data. It fosters subject-specific competencies.

Computational Neuroimaging Clinic fosters subject-specific competencies.

The course has been intentionally conceived to be self-consistent with respect to QM for those master students not having encountered it in their track yet. Therefore, a presumably large overlapping has to be expected with a (welcome!) QM introduction course like the D-ITET "Physics II".

A solid base of Analysis I & II as well as of Linear Algebra is really helpful.

<tr>
<td><strong>Objective</strong></td>
<td>The main goal of this lecture is to provide a comprehensive overview into the learning principles neuronal networks as well as to introduce a diverse skill set (e.g. simulating a spiking neuronal network) that is required to understand learning in large, hierarchical neuronal networks. To achieve this the lectures and exercises will merge ideas, concepts and methods from machine learning and neuroscience.</td>
</tr>
<tr>
<td><strong>Content</strong></td>
<td>Deep-learning a brain-inspired weak form of AI allows training of large artificial neuronal networks (ANNs) that, like humans, can learn real-world tasks such as recognizing objects in images. The origins of deep hierarchical learning can be traced back to early neuroscience research by Hubel and Wiesel in the 1960s, who first described the neuronal processing of visual inputs in the mammalian neocortex. Similar to their neocortical counterparts ANNs seem to learn by interpreting and structuring the data provided by the external world. However, while on specific tasks such as playing (video) games deep ANNs outperform humans (Minh et al, 2015, Silver et al., 2018), ANNs are still not performing on par when it comes to recognizing actions in movie data and their ability to act as generalizable problem solvers is still far behind of what the human brain seems to achieve effortlessly. Moreover, biological neuronal networks can learn far more effectively with fewer training examples, they achieve a much higher performance in recognizing complex patterns in time series data (e.g. recognizing actions in movies), they dynamically adapt to new tasks without losing performance and they achieve unmatched performance to detect and integrate out-of-domain data examples (data they have not been trained with). In other words, many of the big challenges and unknowns that have emerged in the field of deep learning over the last years are already mastered exceptionally well by biological neuronal networks in our brain. On the other hand, many facets of typical ANN design and training algorithms seem biologically implausible, such as the non-local weight updates, discrete processing of time, and scalar communication between neurons. Recent evidence suggests that learning in biological systems is the result of the complex interplay of diverse error feedback signaling processes acting at multiple scales, ranging from single synapses to entire networks.</td>

227-0967-00L Computational Neuroimaging Clinic W 3 credits 2V K. Stephan

| **Prerequisite: Successful completion of course "Methods & Models for fMRI Data Analysis", "Translational Neuroimaging", "Computational Psychology"** Abstract | This seminar teaches problem solving skills for computational neuroimaging, based on analyses of neuroimaging and behavioural data. It deals with a wide variety of real-life problems that are brought to this meeting from the neuroimaging community at Zurich, e.g. mass-univariate and multivariate analyses of fMRI/EEG data, or generative models of fMRI, EEG, or behavioural data. |
| **Objective** | 1. Consolidation of theoretical knowledge (obtained in the following courses: "Methods & models for fMRI data analysis", "Translational Neuroimaging", "Computational Psychology") in the setting of concrete research questions. 2. Acquisition of practical problem solving strategies for computational modeling of neuroimaging data. |
| **Content** | This seminar teaches problem solving skills for computational neuroimaging, based on analyses of neuroimaging and behavioural data. Data: 02.07.2024 12:39 Autumn Semester 2024 Page 393 of 2667
Methods & Models for fMRI Data Analysis

**Abstract**

This course teaches methods and models for fMRI data analysis, covering all aspects of statistical parametric mapping (SPM), including preprocessing, the general linear model, statistical inference, multiple comparison corrections, event-related designs, and Dynamic Causal Modelling (DCM), a Bayesian framework for identification of nonlinear neuronal systems from neurophysiological data.

**Objective**

To obtain in-depth knowledge of the theoretical foundations of SPM and DCM and of their practical application to empirical fMRI data.

**Content**

This course teaches state-of-the-art methods and models for fMRI data analysis in lectures and exercises. It covers all aspects of statistical parametric mapping (SPM), including preprocessing, the general linear model, frequentist and Bayesian inference, multiple comparison corrections, event-related designs, and Dynamic Causal Modelling (DCM), a Bayesian framework for identification of nonlinear neuronal systems from neurophysiological data. A particular emphasis of the course will be on methodological questions arising in the context of clinical studies in psychiatry and neurology. Practical exercises serve to consolidate the skills taught in lectures.

---

Neuromorphic Engineering I

**Abstract**

This course covers analog circuits with emphasis on neuromorphic engineering: MOS transistors in CMOS technology, static circuits, dynamic circuits, systems (silicon neuron, silicon retina, silicon cochlea) with an introduction to multi-chip systems. The lectures are accompanied by weekly laboratory sessions.

**Objective**

Understanding the characteristics of neuromorphic circuit elements.

**Content**

Neuromorphic circuits are inspired by the organizing principles of biological neural circuits. Their computational primitives are based on physics of semiconductor devices. Neuromorphic architectures often rely on collective computation in parallel networks. Adaptation, learning and memory are implemented locally within the individual computational elements. Transistors are often operated in weak inversion (below threshold), where they exhibit exponential I-V characteristics and low currents. These properties lead to the feasibility of high-density, low-power implementations of functions that are computationally intensive in other paradigms. Application domains of neuromorphic circuits include silicon retinas and cochleas for machine vision and audition, real-time emulations of networks of biological neurons, and the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS transistor, phototransducers), static circuits (differential pair, current mirror, transconductance amplifiers, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silicon neuron, silicon retina and cochlea) and an introduction to multi-chip systems that communicate events analogous to spikes. The lectures are accompanied by weekly laboratory sessions on the characterization of neuromorphic circuit elements, from elementary devices to systems.

---

Introduction to Neuroinformatics

**Abstract**

The course provides an introduction to the functional properties of neurons. Particularly the description of membrane electrical properties (action potentials, channels), neuronal anatomy, synaptic structures, and neuronal networks. Simple models of computation, learning, and behavior will be explained. Some artificial systems (robot, chip) are presented.

---

Prerequisites / notice

The participants are expected to have successfully completed at least one of the following courses:

- 'Methods & models for fMRI data analysis',
- 'Translational Neumorodelling',
- 'Computational Psychiatry'

**Competencies**

- Subject-specific Competencies: Concepts and Theories
- Method-specific Competencies: Analytical Competencies
- Social Competencies: Communication
- Personal Competencies: Creative Thinking

Understanding computation by neurons and neuronal circuits is one of the great challenges of science. Many different disciplines can contribute their tools and concepts to solving mysteries of neural computation. The goal of this introductory course is to introduce the monocultures of physics, maths, computer science, engineering, biology, psychology, and even philosophy and history, to discover the enchantments and challenges that we all face in taking on this major 21st century problem and how each discipline can contribute to offering solutions.

Content
This course considers the structure and function of biological neural networks at different levels. The function of neural networks lies fundamentally in their wiring and in the electro-chemical properties of nerve cell membranes. Thus, the biological structure of the nerve cell needs to be understood if biologically-realistic models are to be constructed. These simpler models are used to estimate the electrical current flow through dendritic cables and explore how a more complex geometry of neurons influences this current flow. The active properties of nerves are studied to understand both sensory transduction and the generation and transmission of nerve impulses along axons. The concept of local neuronal circuits arises in the context of the rules governing the formation of nerve connections and topographic projections within the nervous system. Communication between neurons in the network can be thought of as information flow across synapses, which can be modified by experience. We need an understanding of the action of inhibitory and excitatory neurotransmitters and neuromodulators, so that the dynamics and logic of synapses can be interpreted. Finally, simple neural architectures of feedforward and recurrent networks are discussed in the context of co-ordination, control, and integration of sensory and motor information.

Connections to computer science and artificial intelligence are discussed, but the main focus of the course is on establishing the biological basis of computations in neurons.

227-2037-00L Physical Modelling and Simulation

Abstract
This module consists of (a) an introduction to fundamental equations of electromagnetics, mechanics and heat transfer, (b) a detailed overview of numerical methods for field simulations, and (c) practical examples solved in form of small projects.

Objective
Basic knowledge of the fundamental equations and effects of electromagnetics, mechanics, and heat transfer. Knowledge of the main concepts of numerical methods for physical modelling and simulation. Ability (a) to develop own simple field simulation programs, (b) to select an appropriate field solver for a given problem, (c) to perform field simulations, (d) to evaluate the obtained results, and (e) to interactively improve the models until sufficiently accurate results are obtained.

Content
The module begins with an introduction to the fundamental equations and effects of electromagnetics, mechanics, and heat transfer. In the introduction follows a detailed overview of the available numerical methods for solving electromagnetic, thermal and mechanical boundary value problems. This part of the course contains a general introduction into numerical methods, differential and integral forms, linear equation systems, Finite Difference Method (FDM), Boundary Element Method (BEM), Method of Moments (MoM), Multiple Multipole Program (MMP) and Finite Element Method (FEM). The theoretical part of the course finishes with a presentation of multiphysics simulations through several practical examples of HF-engineering such as coupled electromagnetic-mechanical and electromagnetic-thermal analysis of MEMS.

In the second part of the course the students will work in small groups on practical simulation problems. For solving practical problems the students can develop and use own simulation programs or choose an appropriate commercial field solver for their specific problem. This practical simulation work of the students is supervised by the lecturers.

252-0543-01L Computer Graphics

Abstract
This course covers fundamental and advanced concepts of modern computer graphics. Students will learn the fundamentals of digital scene representations, advanced physically-based light transport algorithms for generating photorealistic images from these scene representations, and inverse rendering methods for recovering digital scene representations from captured images.

Objective
At the end of the course, the students will be able to build a rendering system based on path-tracing algorithms. The students will learn the principles of physically-based rendering and computer graphics. In addition, the course is intended to stimulate the student's curiosity to explore the field of computer graphics in subsequent classes or on their own.

Content
We will begin with an introduction to light emission and radiometric quantities, followed by an exploration of geometry representations and texture mapping. Next, we will mathematically formulate the physics of light transport and appearance modeling. Subsequently, we will introduce relevant concepts from Monte Carlo integration and develop path-tracing algorithms to solve these equations by simulating light transport for direct and global illumination due to hard surfaces and participating media, such as fog, smoke, and translucent objects. Moreover, we will present techniques for significantly improving path-tracing efficiency, including importance sampling, multiple importance sampling, stratified sampling, denoising, and acceleration data structures. The course lectures will conclude with an overview of image-based capture and rendering methods. Topics covered will include geometry reconstruction, material acquisition, differentiable rendering, and image-based rendering.

Literature
Books:
- Physically Based Rendering: From Theory to Implementation
- High Dynamic Range Imaging: Acquisition, Display, and Image-Based Lighting
- Multiple view geometry in Computer Vision

Prerequisites / notice
Prerequisites:
Fundamentals of calculus and linear algebra, basic concepts of algorithms and data structures, programming skills in C++, and the Visual Computing course are recommended.
The programming assignments will be in C++. This will not be taught in the class.

Competencies
Subject-specific Competencies
- Concepts and Theories assessed
- Techniques and Technologies assessed

Method-specific Competencies
- Analytical Competencies assessed
- Decision-making fostered
- Media and Digital Technologies fostered
- Problem-solving assessed
- Project Management fostered

Social Competencies
- Communication fostered
- Cooperation and Teamwork assessed
- Leadership and Responsibility fostered

Personal Competencies
- Creative Thinking assessed
- Critical Thinking fostered
- Integrity and Work Ethics fostered
- Self-direction and Self-management fostered

402-0674-00L Physics in Medical Research: From Atoms to Cells

Abstract
Scanning probe and diffraction techniques allow studying activated atomic processes during early stages of epithelial growth. For quantitative description, rate equation analysis, mean-field nucleation and scaling theories are applied on systems ranging from simple metallic to complex organic materials. The knowledge is expanded to optical and electronic properties as well as to proteins and cells.
Objective

The lecture series is motivated by an overview covering the skin of the crystals, roughness analysis, contact angle measurements, protein absorption/activity and monocyte behaviour.

As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting, oxidic and organic surfaces are introduced.

The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical evolution of the surface morphology is characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructures shapes, which are based on the strain relieving mechanisms and kinetic growth processes.

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultraviolet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. Recently, ellipsometry has been introduced to on-line monitor film thickness, and roughness with sub-nanometer precision. These characterisation techniques are vital for optimising the preparation of medical implants.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.

X rays are more and more often used to characterise the human tissues down to the nanometer level. The combination of highly intense beams only some micrometers in diameter with scanning enables spatially resolved measurements and the determination of tissue's anisotropies of biopsies.

| Abstract   | This seminar deals with the development of clinically relevant computational tools and/or their application to psychiatry and psychosomatics. It is complementary to the annual Computational Psychiatry Course and serves to build bridges between computational scientists and clinicians. It is designed to foster in-depth exchange, with ample time for discussion. |
| Objective  | Understanding strengths and weaknesses of current trends in the development of clinically relevant computational tools and their application to problems in psychiatry and psychosomatics. |
| Content    | This seminar deals with the development of computational tools (e.g. generative models, machine learning) and/or their application to psychiatry and psychosomatics. The seminar includes (i) presentations by computational scientists and clinicians, (ii) group discussion with focus on methodology and clinical utility, (iii) self-study based on literature provided by presenters. |
| Literature | Literature for additional self-study of the topics presented in this seminar will be provided by the presenters and will be available online at https://www.tnu.ethz.ch/en/teaching |
| Prerequisites / notice | Participants are expected to be familiar with general principles of statistics (including Bayesian statistics) and have successfully completed the course "Computational Psychiatry" (Course number 227-0971-00L). |

Upon completion of the course students are able to:

- Foster knowledge and understanding of concepts and theories related to cell and molecular biology.
- Apply laboratory skills and safety practices in cell culture and molecular biology experiments.
- Conduct experiments using basic techniques of cell and molecular biology.

The goal of this laboratory course is to give students practical exposure to basic techniques of cell and molecular biology. It covers essential laboratory skills and safety, cell culture, protein analysis, RNA/DNA isolation, and related procedures. Students will gain hands-on experience in these fundamental areas.

### Abstract

Introduction to diagnostic medical imaging based on electromagnetic and acoustic fields including X-ray planar and tomographic imaging, radio-tracer based nuclear imaging techniques, magnetic resonance imaging and ultrasound-based procedures.

### Objective

Upon completion of the course students are able to:

- Explain the physical and mathematical foundations of diagnostic medical imaging systems.
- Characterize system performance based on signal-to-noise ratio, contrast-to-noise ratio and transfer function.
- Design a basic diagnostic imaging system chain including data acquisition and data reconstruction.
- Identify advantages and limitations of different imaging methods in relation to medical diagnostic applications.

### Content

- **Introduction** (intro, overview, history)
- **Signal theory and processing** (foundations, transforms, filtering, signal-to-noise ratio)
- **X-rays** (production, tissue interaction, contrast, modular transfer function)
- **X-rays** (resolution, detection, digital subtraction angiography, Radon transform)
- **X-rays** (filtered back-projection, spiral computed tomography, image quality, dose)
- **Nuclear imaging** (radioactive tracer, collimation, point spread function, SPE/C/PE/ET)
- **Nuclear imaging** (detection principles, image reconstruction, kinetic modelling)
- **Magnetic Resonance** (magnetic moment, spin transitions, excitation, relaxation, detection)
- **Magnetic Resonance** (plane wave encoding, Fourier reconstruction, pulse sequences)
- **Magnetic Resonance** (contrast mechanisms, gradient- and spin-echo, applications)
- **Ultrasound** (mechanical wave generation, propagation in tissue, reflection, transmission)
- **Ultrasound** (spatial and temporal resolution, phased arrays)
- **Ultrasound** (Doppler shift, implementations, applications)
- **Summary, example exam questions**

### Abstract

Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. Focus is on learning the basic vocabulary of biomedical engineering and getting familiar with concepts that govern common medical instruments and the most important organs from an engineering point of view.

### Objective

Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The course provides an overview of the various topics of the different tracks of the biomedical engineering master course and helps orienting the students in selecting their specialized classes and project locations. It also serves as an introduction to the field for students of the ITET, MAVT, HEST and other bachelor programs.

In addition, the most recent achievements and trends of the field of biomedical engineering are also outlined.
Content

History of BME and the role of biomedical engineers. Ethical issues related to BME.
Biomedical sensors both wearable and also biochemical sensors.
Bioelectronics: Nernst equation, Donnan equilibrium, equivalent circuits of biological membranes and bioelectronic devices.
Bioinformatics: genomic and proteomic tools, databases and basic calculations.
Equations describing basic reactions and enzyme kinetics.
Medical optics: Optimal components and systems used in hospitals.
Basic concepts of tissue engineering and organ printing.
Biomaterials and their medical applications.
Function of the heart and the circulatory system.
Transport and exchange of substances in the human body, compartment modeling.
The respiratory system.
Bioimaging.
Orthopedic biomechanics.

Lecture notes

Introduction to Biomedical Engineering
by Enderle, Banchard, and Bronzino

AND

moodle page of the course

Prerequisites / notice

No specific requirements, BUT
ITET, MAVT, PHYS students will have to learn a lot of new words related to biochemistry, biology and medicine, while HEST and BIOL students will have to grasp basic engineering concepts (circuits, equations, etc.).

227-0447-00L  Image Analysis and Computer Vision  W  6 credits  E. Konukoglu, E. Erdil, F. Yu

Abstract

Objective
Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

Content
This course aims at offering a self-contained account of computer vision and its underlying concepts, including the recent use of deep learning.
The first part starts with an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First the interaction of light with matter is considered. The most important hardware components such as cameras and illumination sources are also discussed. The course then turns to image discretization, necessary to process images by computer.
The next part describes necessary pre-processing steps, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and 3D shape as two important examples. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed. A major part at the end is devoted to deep learning and AI-based approaches to image analysis. Its main focus is on object recognition, but also other examples of image processing using deep neural nets are given.

Lecture notes
Course material Script, computer demonstrations, exercises and problem solutions

Prerequisites / notice
Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Python and Linux.

227-0965-00L  Micro and Nano-Tomography of Biological Tissues  W  4 credits  M. Stampanoni, F. Marone Welford

Abstract
The lecture introduces the physical and technical know-how of X-ray tomographic microscopy. Several X-ray imaging techniques (absorption-, phase- and darkfield contrast) will be discussed and their use in daily research, in particular biology, is presented. The course discusses the aspects of quantitative evaluation of tomographic data sets like segmentation, morphometry and statistics.

Objective
Introduction to the basic concepts of X-ray tomographic imaging, image analysis and data quantification at the micro and nano scale with particular emphasis on biological applications.
The seminar provides state-of-the-art insight to the biomechanical function of bone from molecules, to cells, tissue and up to the organ. Multiscale imaging and simulation allows linking different levels of hierarchy, where systems biology helps understanding the mechanobiological response of bone to loading and injury in scenarios relevant for personalized health and translational medicine.

The learning objectives include:
1. advanced knowledge of the state-of-the-are in multiscale bone biomechanics;
2. basic understanding of the biological principles governing bone in health, disease and treatment from molecules, to cells, tissue and up to the organ;
3. good understanding of the prevalent biomechanical testing and imaging techniques on the various levels of bone hierarchy;
4. practical implementation of state-of-the-art multiscale simulation techniques;
5. improved programing skills through the use of python;
6. hands on experience in designing solutions for clinical and industrial problems;
7. encouragement of critical thinking and creating an environment for independent and self-directed studying.

Bone is one of the most investigated biological materials due to its primary function of providing skeletal stability. Bone is susceptible to different local stimuli including mechanical forces and has great capabilities in adapting its mechanical properties to the changes in its environment. Nevertheless, aging or hormonal changes can make bone lose its ability to remodel appropriately, with loss of strength and increased fracture risk as a result, leading to devastating diseases such as osteoporosis. To better understand the biomechanical function of bone, one has to understand the hierarchical organization of this fascinating material down from the molecules, to the cells, tissue and up to the organ. Multiscale imaging and simulation allow to link these different levels of hierarchy. Incorporating systems biology approaches, not only biomechanical strength of the material can be assessed but also the mechanobiological response of the bone triggered by loading and injury in scenarios relevant for personalized health.

For the seminar, concepts of video lectures will be used in a flipped classroom setup, where students can study the basic biology, engineering, and mathematical concepts in video tutorials online (TORQUEs). All videos and animations will be incorporated in Moodle and PolBook allowing studying and interactive course participation online. It is anticipated that the students need to prepare 2x45 minutes for the study of the actual lecture material. The course is structured as a seminar in three parts of 45 minutes with video lectures and a flipped classroom setup. In the first part (TORQUEs: Tiny, Open-with-Restrictions courses focused on QUality and Effectiveness), students study the basic concepts in short, interactive video lectures on the online learning platform Moodle. Students are able to post questions at the end of each video lecture or the Moodle forum that will be addressed in the second part of the lectures using a flipped classroom concept. For the flipped classroom, the lecturers may prepare additional teaching material to answer the posted questions (Q&A). Following the Q&A, the students will have to form small groups to try to solve such problems and to present their solutions for advanced multiscale investigation of bone ranging from basic science to clinical application. Towards the end of the semester, students will have to present self-selected publications associated with the different topics of the lecture identified through PubMed or the Web of Science.

Lecture notes:
Material will be provided on Moodle and eColab.

Prerequisites / notice:
Prior experience with the programming language python is beneficial but not mandatory. ETH offers courses for practical programming with python.

  - Self-direction and Self-management: fostered
Objective
Introduction to the basic principles of trauma biomechanics.

Content
This lecture serves as an introduction to the field of trauma biomechanics. Emphasis is placed on the interdisciplinary nature of impact biomechanics, which uses the combination of fundamental engineering principles and advanced medical technologies to develop injury prevention measures. Topics include: accident statistics and accident reconstruction, biomechanical response of the human to impact loading, injury mechanisms and injury criteria, test methods (including crash tests), computer simulations, aspects of vehicle safety. Real world examples mainly from automobile safety are used to augment lecture material.

Lecture notes
Handouts will be made available.

151-0524-00L    Continuum Mechanics I                    W    4 credits    2V+1U    A. E. Ehret
Abstract
The lecture deals with constitutive models that are relevant for the design and analysis of components and structures. These include anisotropic linear elasticity, linear viscoelasticity, plasticity and viscoplasticity. The basic concepts of homogenization and laminate theory are introduced. Theoretical models are complemented by examples of engineering applications and experiments.

Objective
After successful completion of the course students are able to
- explain basic theories for solving continuum mechanics problems
- proficiently apply these theories by solving application-related academic examples
- relate the theories and examples to real engineering applications and challenges
- distinguish between different mechanical behaviors of materials
- systematically select appropriate constitutive theories suitable to analyze and model these materials

Content
Anisotropic Elasticity, Linear Elastic and Linear Viscous Material Behavior, Viscoelasticity, Micro-Macro Modelling, Laminate Theory, Plasticity, Viscoplasticity, Examples of Engineering Applications, Comparison with Experiments

151-0604-00L    Microrobotics                               W    4 credits    3G    B. Nelson
Abstract
Microrobotics is an interdisciplinary field that combines aspects of robotics, micro and nanotechnology, biomedical engineering, and materials science. The aim of this course is to expose students to the fundamentals of this emerging field. Throughout the course, the students apply these concepts in assignments. The course concludes with an end-of-semester examination.

Objective
The objective of this course is to expose students to the fundamental aspects of the emerging field of microrobotics. This includes a focus on physical laws that predominate at the microscale, technologies for fabricating small devices, bio-inspired design, and applications of the field.

Content
Main topics of the course include:
- Scaling laws at micro/nano scales
- Electrostatics
- Electromagnetism
- Low Reynolds number flows
- Observation tools
- Materials and fabrication methods
- Applications of biomedical microrobots

Lecture notes
The powerpoint slides presented in the lectures will be made available as pdf files. Several readings will also be made available electronically.

Prerequisites / notice
The lecture will be taught in English.

151-0905-00L    Medical Technology Innovation - From Concept to Clinics   W    4 credits    3G    I. Herrmann
Abstract
Project-oriented learning on how to develop technological solutions to address unmet clinical needs.
Objective
After completing the course, you will be able to effectively collaborate with medical doctors in order to identify important unmet clinical needs. You will be able to ideate and develop appropriate engineering solutions and implementation strategies for real-world clinical problems. This lecture aims to prepare you for typical engineering challenges in the real-world where - in addition to the development of an elegant solution - interdisciplinary team work and effective communication play a key role.

Lecture Notes
will be available on the moodle.

Literature
will be available on the moodle.

Prerequisites / Notice
On site presence during (most) of the lectures highly encouraged!

227-0384-00L Ultrasound Fundamentals and Applications in Biology and Medicine W 4 credits 3G X. L. Dean Ben

Abstract
Ultrasound waves are non-ionizing and thus provide a safe means to interrogate and treat biological tissues. Advantages such as real-time operation, low cost, and portability have led to ultrasound systems becoming standard tools in hospitals and research laboratories. Applications in biology and medicine include ultrasound and optoacoustic imaging, thermal therapy, or pulse stimulation.

Objective
The objective of the course is that students are able to understand how to use ultrasound in biology and medicine and generalize this knowledge to applications in other fields.

Content
The course will cover the basic physics of ultrasound (acoustic waves at frequencies higher than the audible range) in biological tissues as well as the instrumentation required to generate and detect these waves. Imaging methods will extensively be described in the course. Specifically, standard and ultra-fast ultrasound imaging approaches will be covered along with new optoacoustic and transmission ultrasound imaging methods. The course will also describe mathematical modelling approaches and numerical methods as well as signal and image processing tools applicable in ultrasound-based imaging. Other topics include ultrasound sensors, laser ultrasound, therapeutic effects, or biomedical applications and contrast agents. The course will conclude with current and future research directions in the field of ultrasound in biomedicine.

Lecture Notes
The lecture slides will be made available to the students.

Prerequisites / Notice
Basic knowledge in physics. Basic programming skills, preferably in Matlab.

263-5702-00L Seminar on Digital Humans W 2 credits 2S M. Gross, B. Solenthaler, O. Sorkine Hornung, S. Tang, R. Wampfler

Abstract
The deadline for deregistering expires at the end of the third week of the semester. Students who are still registered after that date, but do not attend the seminar, will officially fail the seminar.

Objective
The goal is to get an overview of actual research topics in the field of digital humans and to improve presentation and critical analysis skills.

Content
This seminar covers advanced topic in digital humans including both seminal research papers as well as the latest research results. A collection of research papers are selected covering topics such as estimating human pose and motion from images, human motion synthesis, learning-based human avatar creation, learning neural implicit representations for humans, modeling, animations, artificial intelligence for digital characters, and others. A collection of research papers is selected.

Literature
Individual research papers are selected each term. See https://vlg.inf.ethz.ch/, https://igl.ethz.ch/, and http://graphics.ethz.ch/ for example papers.

Graded innovation project will require on-site presence.

376-1103-00L Frontiers in Nanotechnology W 4 credits 4V V. Vogel, further lecturers

Abstract
Many disciplines are meeting at the nanoscale, from physics, chemistry to engineering, from the life sciences to medicine. The course will prepare students to communicate more effectively across disciplinary boundaries, and will provide them with deep insights into the various frontiers.
Objective

Building upon advanced technologies to create, visualize, analyze and manipulate nano-structures, as well as to probe their nano-chemistry, nano-mechanics and other properties within manmade and living systems, many exciting discoveries are currently made. They change the way we do science and result in so many new technologies.

The goal of the course is to give Master and Graduate students from all interested departments an overview of what nanotechnology is all about, from analytical techniques to nanosystems, from physics to biology. Students will start to appreciate the extent to which scientific communities are meeting at the nanoscale. They will learn about the specific challenges and what is currently sizzling in the respective fields, and learn the vocabulary that is necessary to communicate effectively across departmental boundaries.

Each lecturer will first give an overview of the state-of-the art in his/her field, and then describe the research highlights in his/her own research group. While preparing their Final Projects and discussing them in front of the class, the students will deepen their understanding of how to apply a range of new technologies to solve specific scientific problems and technical challenges. Exposure to the different frontiers will also improve their ability to conduct effective nanoscale research, recognize the broader significance of their work and to start collaborations.

Content

Starting with the fabrication and analysis of nanoparticles and nanostructured materials that enable a variety of scientific and technical applications, we will transition to discussing biological nanosystems, how they work and what bioinspired engineering principles can be derived, to finally discussing biomedical applications and potential health risk issues. Scientific aspects as well as the many of the emerging technologies will be covered that start impacting so many aspects of our lives. This includes new phenomena in physics, advanced materials, novel technologies and new methods to address major medical challenges.

Lecture notes

All the enrolled students will get access to a password protected website where they can find pdf files of the lecture notes, and typically 1-2 journal articles per lecture that cover selected topics.

376-1176-00L Wearable and Mobile Technologies of the Future - Focus on Sports and Health

Objective

Objective 1:
Acquire knowledge about the latest technological advancements in wearable and unobtrusive technologies for sport and health.

Objective 2:
Acquire skills to design novel non-invasive technologies for sport and health.

Content

The course consists of two modules.

Module 1: Movement.
This module provides the scientific background needed to understand the principles that current technologies investigating movement rely on. The latest technological advancements to track parameters of gait and running, improve posture as well as to monitor overall body movement and provide feedback on motion during sport, rehabilitation or at work will be investigated. The focus will be on wearable-related (e.g., textile-based) technologies.

Module 2: Cardiac.
This module focuses on the latest technologies for monitoring the cardiac cycle and blood pressure. The module starts by succinctly providing background information on cardiac physiology and then briefly introduces conventional technologies used in daily practice. This module subsequently focuses on the latest technologies and the latest data analysis techniques to monitor the cardiac cycle for assisting individuals in sport activities or monitoring their health conditions.

Prerequisites / notice

- Students should be proficient in programming (any language);
- Note: assignments will be in MATLAB. Students are expected to learn MATLAB on their own if not experienced with this programming language.
- Course prerequisites:
  - For Biomedical Engineering Master’s: none
  - For ITET Master’s: none
  - For D-NAV Master’s: none
  - For D-HEST Master’s and PhD students:
    - If BSc in electrical/mechanical engineering or computer science: none
    - If any other BSc program: 376-0022-00L (Imaging and Computing in Medicine) or 376-1983-00L (Foundations of Data Science)

376-1219-00L Rehabilitation Engineering II: Rehabilitation of Sensory and Vegetative Functions

Objective

Provide knowledge on the anatomy and physiology of the human sensory system, related dysfunctions and pathologies, and how rehabilitation engineering can provide sensory restoration and substitution.

This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.
Content

Introduction, problem definition, overview
Rehabilitation of visual function
- Anatomy and physiology of the visual sense
  - Technical aids (glasses, sensor substitution)
- Retina and cortex implants
Rehabilitation of hearing function
- Anatomy and physiology of the auditory sense
- Hearing aids
- Cochlea Implants
Rehabilitation and use of kinesthetic and tactile function
- Anatomy and physiology of the kinesthetic and tactile sense
  - Tactile/haptic displays for motion therapy (incl. electrical stimulation)
- Role of displays in motor learning
Rehabilitation of vestibular function
- Anatomy and physiology of the vestibular sense
  - Rehabilitation strategies and devices (e.g. BrainPort)
Rehabilitation of vegetative Functions
- Cardiac Pacemaker
- Phrenic stimulation, artificial breathing aids
- Bladder stimulation, artificial sphincter
Brain stimulation and recording
- Deep brain stimulation for patients with Parkinson, epilepsy, depression
- Brain-Computer Interfaces

Literature

Introductory Books:

Selected Journal Articles and Web Links:

Prerequisites / notice

Target Group:
- Students of higher semesters and PhD students of
  - D-MAVT, D-ITET, D-INFK, D-HEST
- Biomedical Engineering, Robotics, Systems and Control
- Medical Faculty, University of Zurich
Students of other departments, faculties, courses are also welcome
This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.
376-1220-00L Rehabilitation and Inclusion

Abstract
This course presents origins and prevention of different physical, sensory, mental impairments, their treatments, and methods of assistance in public and home environments. Rehabilitation is put into a larger context providing insights into healthcare systems, health economy, accessibility, barrier-free architecture, para-sports, legal & regulatory aspects, disability policy, and inclusion.

Objective
With this lecture, we want to not only transfer a broad knowledge about rehabilitation and inclusion, but also raise awareness about the challenges and needs of people with impairments, the economy and the overall society. Students should learn about the complex and multi-faceted interaction of care, treatment, assistance, reimbursement, accessibility, legal regulation, and social inclusion. This knowledge and awareness should be presented in a multi-modal way using interactive tools and organizing group/plenar discussions.

Content
The course will cover the following topics:
- Introduction: definition of terms, historical and legal background, role of the UNO, WHO, ICRC
- Origins: reasons and origins of physical, sensory and mental impairments; surgical and pharmaceutical treatments
- Therapy: physical therapy, occupational therapy, speech therapy, psychotherapy
- Technological support: Robot-aided therapy, Virtual Reality, muscle stimulation, Brain-Computer Interfaces (BCIs)
- Home therapy: personal assistance, mobile health systems, tele-monitoring, tele-therapy
- Assistive technologies: gait assistance, prostheses, orthoses, seeing/hearing aids, etc.
- Social inclusion: definition of normality and belongingness, social behaviours, UN-BRK, etc.
- Accessibility: national and international aspects of accessibility
- Health economy in rehabilitation: public and private cost models, health insurance, SUVA, IV
- Barrier-free building and living: environmental obstacles, norms in architecture, inclusive design
- Parasports: history of Olympics and Paralympics, Special Olympics, Deaflympics, Cybathlon
- Policy: health, social, equal opportunity, disability
- Regulatory affairs: ethics committees, Swissmedic, Bundesamt für Gesundheit (BAG), law and disability
- Prevention: primary and secondary prevention, social prevention

376-1351-00L Micro/Nanotechnology and Microfluidics for Biomedical Applications

Abstract
This course is an introduction to techniques in micro/nanotechnology and to microfluidics. It reviews how many familiar devices are built and can be used for research and biomedical applications. Transistors for DNA sequencing, beamers for patterning proteins, hard-disk technology for biosensing and microfluidics for point-of-care diagnostics are just a few examples of the covered topics.

Objective
The main objective of the course is to introduce micro/nanotechnology and microfluidics to students having any technical background. The course is multi-disciplinary and covers a broad range of techniques. For each lecture, a brief historical perspective is given to illustrate by whom and how the techniques were invented.

The course should familiarize the students with the techniques used in micro/nanotechnology, cleanroom microfabrication, and show them how micro/nanotechnology pervades throughout life sciences. Microfluidics will be emphasized due to their increasing importance in research and for medical applications.

The second objective is to have life sciences students less intimidated by micro/nanotechnology and make them able to link instruments and techniques to specific problems that they might have in their projects/studies. This will also help students getting access to the ETHZ/IBM Nanotech Center infrastructure if needed.
Content

Mostly formal lectures (2 × 45 min), with few specific guest lectures on topics of particular relevance. For example, an introduction to cleanroom and micro/nanotechnology instruments and 3D printing will be provided. Last 3 weeks would be dedicated to the presentation and evaluation of projects by students (2 to 3 students per team). For this, about 12 recent technologies are listed and each team picks a technology and makes a short report and presentation describing how it works, its strengths and weaknesses, and describes what problem it solves.

In terms of technical content, the lectures will cover:
- an overview of the microelectronic industry, Moore’s law, field-effect transistors, next-generation DNA sequencing
- liquid crystal displays, organic light emitting diodes, electrophoretic displays, micromirrors and beamers, photopatterning of proteins and cells, optogenetics, and flexible displays and electronics
- hard disk drives and the giant magnetoresistance effect, magnetic nanoparticles, photons, magnetic sensing and optical biosensing
- cleanroom techniques and instruments, from design to microfabrication of simple devices and microfluidics, examples of DNA microarrays
- the principles of microfluidics, microfluidic functions and fabrication, from microfluidics for research to point-of-care diagnostics, and the (infamous) history of Theranos, as well as some discussions on diagnostics for COVID, R0, and (im)precision of diagnostic devices and why it matters
- 2 × 45 min will be covered by Yuksel Temiz, a master of Arduino programming and do-it-yourself electronics, who will present how to make 25$ electronic components that are synergistic to microfluidic devices and that can be controlled using a smartphone

Abstract

Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.

Objective

The course covers the following topics:
1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
2. The concept of biocompatibility.
3. Introduction into methodology used in biomaterials research and application.
4. Introduction to different material classes in use for medical applications.

Content

Introduction into natural and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering, drug delivery and for medical devices are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated.

Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed.

A link between academic research and industrial entrepreneurship is demonstrated by external guest speakers, who present their current research topics.

Data: 02.07.2024 12:39 Autumn Semester 2024 Page 405 of 2667
Within the scope of this lecture you will learn the basic principles of trauma biomechanics. Based on examples from sports, you will get to know different mechanisms that can possibly result in injury. Investigating the background and cause of injury should allow you to assess the injury risk for sports activities. Furthermore you should be able to develop measures to prevent such injury.

This lectures introduces the basic principles of injury mechanics and rehabilitation focussing on sports injuries. Furthermore possibilities to prevent injuries are discussed. Thereby the lecture focuses on sports injuries.

Handouts will be made available.

Abstract
Current topics in biomechanics presented by speakers from academia and industry.

Objective
Getting insight into actual areas and problems of biomechanics.

Abstract
Biomechanics of Sports Injuries and Rehabilitation

Objective
This lecture introduces the basic principles of injury mechanics and rehabilitation focussing on sports injuries.

Content
This lecture deals with the basic principles of injury mechanics and rehabilitation. Mechanisms that can result in injury are presented.

Lecture notes
Handouts will be made available.

Literature

Prerequisites / notice
A course work is required. The mark of this course work contributes to the final credits for this lecture. Details will be given during the first lecture.

Abstract
Physics in Medical Research: From Atoms to Cells

Objective
The lecture series is motivated by an overview covering the skin of the crystals, roughness analysis, contact angle measurements, protein absorption/activity and monocyte behaviour.

Content
As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting, oxidic and organic surfaces are introduced.

The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. For quantitative description, rate equation analysis, mean-field nucleation and scaling theories are applied on systems ranging from simple metallic to complex organic materials. The knowledge is expanded to optical and electronic properties as well as to proteins and cells.

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. Recently, ellipsometry has been introduced to on-line monitor film thickness, and ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. Recently, ellipsometry has been introduced to on-line monitor film thickness, and

Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. Recently, ellipsometry has been introduced to on-line monitor film thickness, and

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.

X rays are more and more often used to characterise the human tissues down to the nanometer level. The combination of highly intense beams only some micrometers in diameter with scanning enables spatially resolved measurements and the determination of tissue’s anisotropies of biopsies.

Abstract
Biostatistics

Objective
The course deals with simple quantitative and graphical as well as more complex methods of biostatistics. Contents: Descriptive statistics, testing hypotheses, confidence intervals, correlation, simple and multiple linear regression, classification and prediction, diagnostic tests, measurement of agreement, causality versus association.

- know the commonly used methods in biostatistics
- perform simple data analysis with R

227-0949-00L  Biological Methods for Engineers  W  3 credits  5P  C. Frei

Abstract
The course during 8 afternoons (13h to 18h) covers basic laboratory skills and safety, cell culture, protein analysis, RNA/DNA Isolation and RT-PCR. Each topic will be introduced, followed by practical work at the bench. Presence during the course is mandatory.

Objective
The goal of this laboratory course is to give students practical exposure to basic techniques of cell and molecular biology.

Content
The goal of this laboratory course is to give students practical exposure to basic techniques of cell and molecular biology.

Prerequisites / notice
Enrollment is limited and students from the Master's programme in Biomedical Engineering (BME) have priority.

Medical Physics

Track Core Courses
During the Master programme, a minimum of 12 CP must be obtained from track core courses.

Number  Title                      Type  ECTS  Hours  Lecturers
227-0311-00L  Qubits, Electrons, Photons  W  6 credits  3V+2U  T. Zambelli

Abstract
In-depth analysis of the quantum mechanics origin of nuclear magnetic resonance (qubits, two-level systems), of LASER (quantization of the electromagnetic field, photons), and of electron transfer (from electrochemistry to photosynthesis).

Objective
Beside electronics nanodevices, D-ITET is pushing its research in the fields of NMR (MRI), electrochemistry, bioelectronics, nano-optics, and quantum information, which are all rationalized in terms of quantum mechanics.

Content
- Lagrangian and Hamiltonian: Symmetries and Poisson Brackets
- Postulates of QM: Hilbert Spaces and Operators
- Heisenberg’s Matrix Mechanics: Hamiltonian and Time Evolution Operator
- Density Operator
- Spin: Qubits, Bloch Equations, and NMR
- Entanglement
- Symmetries and Corresponding Operators
- Schrödinger's Wave Mechanics: Electrons in a Periodic Potential and Energy Bands
- Harmonic Oscillator: Creation and Annihilation Operators
- Identical Particles: Bosons and Fermions
- Quantization of the Electromagnetic Field: Photons, Absorption and Emission, LASER
- Electron Transfer: Marcus Theory via Born-Oppenheimer, Franck-Condon, Landau-Zener

Lecture notes
No lecture notes because the proposed textbooks together with the provided supplementary material are more than exhaustive!

IMPORTANT: “qubits” from the point of view of NMR (and NOT from that of quantum computing!).

In this way, students will work out a robust quantum mechanics (theoretical!!!!) basis which will help them in their advanced studies of the following masters: EEIT (batteries), Biomedical Engineering (NMR, bioelectronics), Quantum Engineering, Micro- and Nanosystems.

Supplementary material will be uploaded in Moodle.

Autumn Semester 2024
The course has been intentionally conceived to be self-consistent with respect to QM for those master students not having encountered it in their track yet. Therefore, a presumably large overlapping has to be expected with a (welcome!) QM introduction course like the D-ITET “Physics II”.

A solid base of Analysis I & II as well as of Linear Algebra is really helpful.

### Competencies

**Subject-specific Competencies**

- Concepts and Theories: assessed
- Techniques and Technologies: fostered

- Self-presentation and Social Influence: fostered
- Sensitivity to Diversity: assessed
- Negotiation: fostered

**Personal Competencies**

- Adaptability and Flexibility: assessed
- Creative Thinking: assessed
- Critical Thinking: assessed
- Integrity and Work Ethics: assessed
- Self-awareness and Self-reflection: assessed
- Self-direction and Self-management: assessed

### Content

- Introduction (intro, overview, history)
- Signal theory and processing (foundations, transforms, filtering, signal-to-noise ratio)
- X-rays (production, tissue interaction, contrast, modular transfer function)
- X-rays (resolution, detection, digital subtraction angiography, Radon transform)
- X-rays (filtered back-projection, spiral computed tomography, image quality, dose)
- Nuclear imaging (radioactive tracer, collimation, point spread function, SPECT/PECT)
- Nuclear imaging (detection principles, image reconstruction, kinetic modelling)
- Magnetic Resonance (magnetic moment, spin transitions, excitation, relaxation, detection)
- Magnetic Resonance (plane wave encoding, Fourier reconstruction, pulse sequences)
- Magnetic Resonance (contrast mechanisms, gradient- and spin-echo, applications)
- Ultrasound (mechanical wave generation, propagation in tissue, reflection, transmission)
- Ultrasound (spatial and temporal resolution, phased arrays)
- Summary, example exam questions

### Objective

Upon completion of the course students are able to:

- Explain the physical and mathematical foundations of diagnostic medical imaging systems
- Characterize system performance based on signal-to-noise ratio, contrast-to-noise ratio and transfer function
- Design a basic diagnostic imaging system chain including data acquisition and data reconstruction
- Identify advantages and limitations of different imaging methods in relation to medical diagnostic applications

### Literature

**Abstract**

Introduction to diagnostic medical imaging based on electromagnetic and acoustic fields including X-ray planar and tomographic imaging, radio-tracer based nuclear imaging techniques, magnetic resonance imaging and ultrasound-based procedures.

**By the end of this course the participants will be able to:**

a) interpret the 6 Rs of radiation oncology in the context of the hallmarks of cancer
b) understand factors which underpin the differing radiosensitivities of different tumors
c) follow rational strategies for combined treatment modalities of ionizing radiation with targeted and immunological agents
d) understand differences in the radiation response of normal tissue versus tumor tissue
e) understand different treatment responses of the tumor and the normal tissue to differential clinical-related parameters of radiotherapy (dose rate, LET etc.).
**Content**

402-0341-00L | Medical Physics I | W | 6 credits | 2V+1U | P. Manser

**Abstract**

Introduction to the fundamentals of medical radiation physics. Functional chain due to radiation exposure from the primary physical effect to the radiobiologically and medically manifest secondary effects. Dosimetric concepts of radiation protection in medicine. Mode of action of radiation sources used in medicine and illustration by means of Monte Carlo simulations.

**Objective**

Understanding the functional chain from primary physical effects of ionizing radiation to clinical radiation effects. Dealing with dose as a quantitative measure of medical exposure. Getting familiar with methods to generate ionizing radiation in medicine and learn how they are applied for medical purposes. Eventually, the lecture aims to show the students that medical physics is a fascinating and evolving discipline where physics can directly be used for the benefit of patients and society.

**Content**

The lecture is covering the basic principles of ionizing radiation and its physical and biological effects. The physical interactions of photons as well as of charged particles will be reviewed and their consequences for medical applications will be discussed. The concept of Monte Carlo simulation will be introduced in the excercises and will help the student to understand the characteristics of ionizing radiation in simple and complex situations. Fundamentals in dosimetry will be provided in order to understand the physical and biological effects of ionizing radiation. Deterministic as well as stochastic effects will be discussed and fundamental knowledge about radiation protection will be provided. In the second part of the lecture series, we will cover the generation of ionizing radiation. By this means, the x-ray tube, the clinical linear accelerator, and different radioactive sources in radiology, radiotherapy and nuclear medicine will be addressed. Applications in radiology, nuclear medicine and radiotherapy will be described with a special focus on the physics underlying these applications.

**Lecture notes**

A script will be provided.

**Prerequisites / notice**

For students of the MAS in Medical Physics (Specialization A) the performance assessment is offered at the earliest in the second year of the studies.

**Abstract**

Scanning probe and diffraction techniques allow studying activated atomic processes during early stages of epitaxial growth. For quantitative description, rate equation analysis, mean-field nucleation and scaling theories are applied on systems ranging from simple metallic to complex organic materials. The knowledge is expanded to optical and electronic properties as well as to proteins and cells.

**Objective**

The lecture series is motivated by an overview covering the skin of the crystals, roughness analysis, contact angle measurements, protein absorption/activity and monocyte behaviour.

As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting, oxidic and organic surfaces are introduced.

The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure’s shapes, which are based on the strain relieving mechanisms and kinetic growth processes.

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichromism and second harmonic generation measurements. Recently, ellipsometry has been introduced to on-line monitor film thickness, and roughness with sub-nanometer precision. These characterisation techniques are vital for optimizing the preparation of medical implants.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.

R x-rays are more and more often used to characterise the human tissues down to the nanometer level. The combination of highly intense beams only some micrometers in diameter with scanning enables spatially resolved measurements and the determination of tissue’s anisotropies of biopsies.

Abstract
This lecture will provide a detailed introduction to radiotherapy treatment planning. The course considers the physical interactions of radiation in tissue, the mathematical aspects of treatment planning and additional aspects of central importance for radiotherapy planning.

Objective
Students shall develop a thorough understanding of the foundations of radiotherapy from a physics and mathematics perspective, focusing on algorithmic components. After completing the course students should be able to implement the main components of a radiotherapy treatment planning system.

Content
Radiotherapy is one of the main treatment options against cancer. Today, more than 50% of cancer patients receive radiation as part of their treatment. Modern radiotherapy is a highly technology driven field.

Research and development in medical physics has improved the precision of radiotherapy substantially. Using intensity-modulated radiotherapy (IMRT), radiation can be delivered precisely to tumors while minimizing radiation exposure of healthy organs surrounding the tumor. Thereby, medical physics has provided radiation oncologists with new curative treatment approaches where previously only palliative treatments were possible. This lecture will provide a detailed introduction to radiotherapy treatment planning and will consists of three blocks:

1. The first part of the course considers the physical interactions of radiation in tissue. The physical interactions give rise to dose calculation algorithms, which are used to calculate the absorbed radiation dose based on a CT scan of the patient.

2. The second part considers the mathematical aspects of treatment planning. Mathematical optimization techniques are introduced, which are used in intensity-modulated radiotherapy to determine the external radiation fields that optimally irradiate the tumor while minimizing radiation dose to healthy organs.

3. The third part deals with additional aspects of central importance for radiotherapy planning. This includes biomedical imaging techniques for treatment planning and target delineation as well as image registration algorithms.

The lectures are followed by computational exercises where students implement the main components of a radiotherapy treatment planning systems in two dimensions in Matlab.

Lecture notes
Lecture slides and handouts.

Prerequisites / notice
Basic programming skills in Matlab (or willingness to learn) are needed for the exercises. Basic knowledge of calculus is needed, approximately corresponding to the 3rd year of a bachelor degree in physics, mathematics, computer science, engineering or comparable discipline.

Other Elective Courses
These courses may be suitable for the Medical Physics track. Please consult your track advisor.

Abstract

Objective
Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

Content
This course aims at offering a self-contained account of computer vision and its underlying concepts, including the recent use of deep learning.

The first part starts with an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First the interaction of light with matter is considered. The most important hardware components such as cameras and illumination sources are also discussed. The course then turns to image discretization, necessary to process images by computer.

The next part describes necessary pre-processing steps, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and 3D shape as two important examples. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed. A major part at the end is devoted to deep learning and AI-based approaches to image analysis. Its main focus is on object recognition, but also other examples of image processing using deep neural nets are given.

Lecture notes
Course material Script, computer demonstrations, exercises and problem solutions

Prerequisites / notice
Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Python and Linux. The course language is English.

Abstract
The lecture introduces the physical and technical know-how of X-ray tomographic microscopy. Several X-ray imaging techniques (absorption-, phase- and darkfield contrast) will be discussed and their use in daily research, in particular biology, is presented. The course discusses the aspects of quantitative evaluation of tomographic data sets like segmentation, morphometry and statistics.

Objective
Introduction to the basic concepts of X-ray tomographic imaging, image analysis and data quantification at the micro and nano scale with particular emphasis on biological applications.

Content
Synchrotron-based X-ray micro- and nano-tomography is today a powerful technique for non-destructive, high-resolution investigations of a broad range of materials. The high-brilliance and high-coherence of third generation synchrotron radiation facilities allow quantitative, three-dimensional imaging at the micro and nanometer scale and extend the traditional absorption imaging technique to edge-enhanced and phase-sensitive measurements, which are particularly suited for investigating biological samples.

The lecture includes a general introduction to the principles of tomographic imaging from image formation to image reconstruction. It provides the physical and engineering basics to understand how imaging beamlines at synchrotron facilities work, looks into the recently developed phase contrast methods, and explores the first applications of X-ray nano-tomographic experiments.

The course finally provides the necessary background to understand the quantitative evaluation of tomographic data, from basic image analysis to complex morphometrical computations and 3D visualization, keeping the focus on biomedical applications.

Objective

The lecture series is motivated by an overview covering the skin of the crystals, roughness analysis, contact angle measurements, protein absorption/activity and monocyte behaviour.

As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting, oxidic and organic surfaces are introduced.

The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure's shapes, which are based on the strain relieving mechanisms and kinetic growth processes.

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. Recently, ellipsometry has been introduced to on-line monitor film thickness, and roughness with sub-nanometer precision. These characterisation techniques are vital for optimising the preparation of medical implants.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.

X rays are more and more often used to characterise the human tissues down to the nanometer level. The combination of highly intense beams only some micrometers in diameter with scanning enables spatially resolved measurements and the determination of tissue’s anisotropies of biopies.

**Biostatistics**  
4 credits  
2V+1U  
B. Sick

**Abstract**

The course deals with simple quantitative and graphical as well as more complex methods of biostatistics. Contents: Descriptive statistics, testing hypotheses, confidence intervals, correlation, simple and multiple linear regression, classification and prediction, diagnostic tests, measurement of agreement, causality versus association.

- know the commonly used methods in biostatistics  
- perform simple data analysis with R

**Objective**

- Materials and fabrication methods  
- Electromagnetism  
- Electrostatics  
- Scaling laws at micro/nano scales  
- Electrostatics  
- Electromagnetism  
- Low Reynolds number flows  
- Observation tools  
- Materials and fabrication methods  
- Applications of biomedical microrobots

**Lecture notes**

Handout during the course.

### Recommended Elective Courses

These courses are particularly recommended for the Molecular Bioengineering track. Please consult your track advisor if you wish to select other subjects.

Project-oriented learning on how to develop technological solutions to address unmet clinical needs. You will be able to ideate and develop appropriate engineering solutions and implementation strategies for real-world clinical problems. This lecture aims to prepare you for typical engineering challenges in the real-world where - in addition to the development of an elegant solution - interdisciplinary team work and effective communication play a key role.

Lecture notes will be available on the moodle.

Lecture notes will be available on the moodle.

On site presence during (most) of the lectures highly encouraged!

Graded innovation project will require on-site presence.

Literature will be available on the moodle.

Abstract

In-depth analysis of the quantum mechanics origin of nuclear magnetic resonance (qubits, two-level systems), of LASER (quantization of the electromagnetic field, photons), and of electron transfer (from electrochemistry to photosynthesis).

Objective

Beside electronics nanodevices, D-ITET is pushing its research in the fields of NMR (MRI), electrochemistry, bioelectronics, nano-optics, and quantum information, which are all rationalized in terms of quantum mechanics.

Starting from the axioms of quantum mechanics, we will derive the fascinating theory describing spin and qubits, electron transitions and transfer, photons and LASER: quantum mechanics is different because it mocks our daily Euclidean intuition!

In this way, students will work out a robust quantum mechanics (theoretical!!!) basis which will help them in their advanced studies of the following masters: EEIT (batteries), Biomedical Engineering (NMR, bioelectronics), Quantum Engineering, Micro- and Nanosystems.

Important: "qubits" from the point of view of NMR (and NOT from that of quantum computing!).

Content

- Lagrangian and Hamiltonian: Symmetries and Poisson Brackets
- Postulates of QM: Hilbert Spaces and Operators
- Heisenberg’s Matrix Mechanics: Hamiltonian and Time Evolution Operator
- Density Operator
- Spin: Qubits, Bloch Equations, and NMR
- Entanglement
- Symmetries and Corresponding Operators
- Schrödinger's Wave Mechanics: Electrons in a Periodic Potential and Energy Bands
- Harmonic Oscillator: Creation and Annihilation Operators
- Identical Particles: Bosons and Fermions
- Quantization of the Electromagnetic Field: Photons, Absorption and Emission, LASER
- Electron Transfer: Marcus Theory via Born-Oppenheimer, Franck-Condon, Landau-Zener

Lecture notes

No lecture notes because the proposed textbooks together with the provided supplementary material are more than exhaustive!

!!! I am using OneNote. All lectures and exercises will be broadcast via ZOOM, while corresponding videos of the previous years are available in Moodle !!!

Literature

Supplementary material will be uploaded in Moodle.

---

Prerequisites / Notice

A solid base of Analysis I & II as well as of Linear Algebra is really helpful.

227-0385-10L Biomedical Imaging W 6 credits 5G S. Kozerke, K. P. Prüssmann

Abstract
Introduction to diagnostic medical imaging based on electromagnetic and acoustic fields including X-ray planar and tomographic imaging, radio-tracer based nuclear imaging techniques, magnetic resonance imaging and ultrasound-based procedures.

Objective
Upon completion of the course students are able to:

• Explain the physical and mathematical foundations of diagnostic medical imaging systems
• Characterize system performance based on signal-to-noise ratio, contrast-to-noise ratio and transfer function
• Design a basic diagnostic imaging system chain including data acquisition and data reconstruction
• Identify advantages and limitations of different imaging methods in relation to medical diagnostic applications

Content
• Introduction (intro, overview, history)
• Signal theory and processing (foundations, transforms, filtering, signal-to-noise ratio)
• X-rays (production, tissue interaction, contrast, modular transfer function)
• X-rays (resolution, detection, digital subtraction angiography, Radon transform)
• X-rays (filtered back-projection, spiral computed tomography, image quality, dose)
• Nuclear imaging (radioactive tracer, collimation, point spread function, SPECT/PET)
• Nuclear imaging (detection principles, image reconstruction, kinetic modelling)
• Magnetic Resonance (magnetic moment, spin transitions, excitation, relaxation, detection)
• Magnetic Resonance (plane wave encoding, Fourier reconstruction, pulse sequences)
• Magnetic Resonance (contrast mechanisms, gradient- and spin-echo, applications)
• Ultrasound (mechanical wave generation, propagation in tissue, reflection, transmission)
• Ultrasound (spatial and temporal resolution, phased arrays)
• Ultrasound (Doppler shift, implementations, applications)
• Summary, example exam questions

227-0386-00L Biomedical Engineering W 4 credits 3G J. Vörös, S. J. Ferguson, S. Kozerke, M. P. Wolf, M. Zenobi-Wong

Abstract
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The focus is on learning the basic vocabulary of biomedical engineering and getting familiar with concepts that govern common medical instruments and the most important organs from an engineering point of view.

Objective
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The course provides an overview of the various topics of the different tracks of the biomedical engineering master course and helps orienting the students in selecting their specialized classes and project locations. It also serves as an introduction to the field for students of the ITET, MAVT, HEST and other bachelor programs.
In addition, the most recent achievements and trends of the field of biomedical engineering are also outlined.
Content

History of BME and the role of biomedical engineers. Ethical issues related to BME.
Biomedical sensors both wearable and also biochemical sensors.
Bioelectronics: Nernst equation, Donnan equilibrium, equivalent circuits of biological membranes and bioelectronic devices.
Bioinformatics: genomic and proteomic tools, databases and basic calculations.
Equations describing basic reactions and enzyme kinetics.
Medical optics: Optical components and systems used in hospitals.
Basic concepts of tissue engineering and organ printing.
Biomaterials and their medical applications.
Function of the heart and the circulatory system.
Transport and exchange of substances in the human body, compartment modeling.
The respiratory system.
Bioimaging.
Orthopedic biomechanics.

Lecture notes

Introduction to Biomedical Engineering
by Enderle, Banchard, and Bronzino

AND

moodle page of the course

Prerequisites / notice

No specific requirements, BUT
ITET, MAVT, PHYS students will have to learn a lot of new words related to biochemistry, biology and medicine, while
HEST and BIOL students will have to grasp basic engineering concepts (circuits, equations, etc.).

Abstract

The course introduces bioelectricity and the sensing concepts that enable obtaining information about neurons and their networks. The sources of electrical fields and currents in the context of biological systems are discussed. The fundamental concepts and challenges of measuring bioelectronic signals and the basic concepts to record optogenetically modified organisms are introduced.

Objective

During this course the students will:
- learn the basic concepts in bioelectronics including the sources of bioelectronic signals and the methods to measure them
- be able to solve typical problems in bioelectronics
- learn about the remaining challenges in this field

Content

Lecture topics:
1. Introduction
2. Sources of bioelectric signals
3. Membrane and Transport
4. Action potential and Hodgkin-Huxley
5. Measuring bioelectronic signals
6. Detection and Noise
7. Measuring currents in solutions, nanopore sensing and patch clamp pipettes
8. Measuring potentials in solution and core conductance model
9. Measuring mechanical signals with bioelectronics
10. In vivo stimulation and recording
11. Functional electric stimulation
12. Optical recording and control of neurons (optogenetics)
13. Measuring neurons optically, fundamentals of optical microscopy
14. Fluorescent probes and scanning microscopy, optogenetics, in vivo microscopy
15. Measuring biochemical signals

Lecture notes

A detailed script is provided to each lecture including the exercises and their solutions.

Literature

Plonsey and Barr, Bioelectricity: A Quantitative Approach (Third edition)

Prerequisites / notice

The course requires an open attitude to the interdisciplinary approach of bioelectronics. In addition, it requires undergraduate entry-level familiarity with electric & magnetic fields/forces, resistors, capacitors, electric circuits, differential equations, calculus, probability calculus, Fourier transformation & frequency domain, lenses / light propagation / refractive index, pressure, diffusion AND basic knowledge of biology and chemistry (e.g. understanding the concepts of concentration, valence, reactants-products, etc.).
The main goal of this course is to demonstrate the differences in communication between the fields of medicine and engineering. Since lecture handouts and relevant material will be provided.

Cross-disciplinary collaboration between engineers and medical doctors is indispensable for innovation in health care. This course brings together engineering students from ETH Zurich and medical students from the University of Zurich to experience the rewards and challenges of such interdisciplinary work in a project based learning environment.

For the engineering students, the specific aims of the course are to:
- Identify and precisely define a clinical need;
- Acquire a working understanding of the investigated system;
- Identify the engineering challenges in the project and communicate them to the medical students;
- Develop and implement, together with the medical students, solution strategies for the identified challenges;
- Present the solution concept to a cross-disciplinary audience; Preliminary need and solution validation;

Surfaces and Interfaces I: Fundamentals, Analytics and Applications

Extended course starting HS23. Old title: Surfaces, Interfaces and their Applications I. Students who obtained credit points for the old course cannot retake it.

Abstract
This course teaches the basics of surface and interface science and technology, including surface modifications and forces. It covers various analytical techniques to study surface and interface properties, and explores phenomena of applied relevance like friction, lubrication, phoresis, and wetting where surfaces play a crucial role.

Objective
Students are able to
- describe the physical and chemical properties of surfaces and interfaces.
- analyze and compare analytical tools for surfaces.
- choose and combine appropriate surface-analytical approaches for solving problems connected to applications.
- understand and explain the importance of surfaces and interfaces in a broad range of phenomena and applications.

Content
- Introduction to surfaces and interfaces
- Structure of surfaces over different length scales: from macroscopic roughness to atomic structure
- Surface modifications
- Adsorption and adsorption models
- Surface forces
- Basic physical concepts
- Thermodynamics of surfaces and interfaces
- Measurement of intermolecular and surface forces
- Dynamics and history effects
- Surface analytics: X-ray Photocorrelation Spectroscopy (XPS) – principles and modern developments
- Surface analytics: Secondary Ion Mass Spectroscopy (SIMS) and IR Spectroscopy – Principles and examples
- Atomic Force Microscopy (AFM): Principles and modes of operation
- Tribology: Adhesion, Friction and Lubrication
- Contact mechanics
- Micro and macroscale friction
- Boundary lubrication
- Wetting
- Contact angles
- Phoretic phenomena
- Electric double layer and electrophoresis
- Electro-osmosis
- Other types of phoresis
- Case studies

Biomineralization

Abstract
The course addresses undergraduate and graduate students interested in getting introduced into the basic concepts of biomineralization.

Objective
The course aims to introduce the basic concepts of biomineralization and the underlying principles, such as supersaturation, nucleation and growth of minerals, the interaction of biomolecules with mineral surfaces, and cell biology of inorganic materials creation. An important part of this class is the independent study and the presentation of original literature from the field.
Biominalization is a multidisciplinary field. Topics dealing with biology, molecular and cell biology, solid state physics, mineralogy, crystallography, organic and physical chemistry, biochemistry, dentistry, oceanography, geology, etc. are addressed. The course covers definition and general concepts of biominalization (BM), types of biominerals and their function, crystal nucleation and growth, biological induction of BM, control of crystal morphology, habit, shape and orientation by organisms, strategies of compartmentalization, the interface between biomolecules (peptides, polysaccharides) and the mineral phase, biomineral experimental methods for studying BM phenomena, inter-, intra, extra- and epitelular BM, organic templates and matrices for BM, structure of bone, teeth (vertebrates and invertebrates) and mollusk shells, calcification, silification in diatoms, radiolarians and plants, calcium and iron storage, impact of BM on lithosphere and atmosphere, evolution, taxonomy of organisms.

1. Introduction and overview
2. Biomineralization and their functions
3. Chemical control of biominalization
4. Control of morphology, Organic templates and additives
5. Modern methods of investigation of BM
6. BM in matrices: bone and nacre
7. Vertebrate teeth
8. Invertebrate teeth
9. BM within vesicles: calcite of coccoliths
10. Silica
11. Iron storage and mineralization

Lecture notes

Script with more than 600 pages with many illustrations will be distributed free of charge.

Prerequisites / notice

No special requirements are needed for attending. Basic knowledge in chemistry and cell biology is expected.

376-1622-00L  Practical Methods in Tissue Engineering  W  5 credits  4P  M. Zenobi-Wong, S. J. Ferguson, S. Grad, S. Schürle-Finke

Abstract
The goal of this course is to teach MSc students the necessary skills for doing research in the fields of tissue engineering and regenerative medicine.

Objective
Practical exercises on topics including sterile cell culture, light microscopy and histology, and biomaterials are covered. Practical work on manufacturing and evaluating hydrogels and scaffolds for tissue engineering will be performed in small groups. In addition to practical lab work, the course will teach skills in data acquisition/analysis.

Prerequisites / notice
A laptop is needed with the below Systems Requirements:
- Memory: 16 GB
- Processor: 3rd gen i7
- DirectX 11.0 compliant AMD Radeon/NVIDIA® GeForce® card with 2 GB RAM
- Storage: 15 GB

Mac computer can be used by pre-installing Windows through bootcamp (older Macs) or Parallels Desktop (14d trial license, 35 CHF license purchasable in the IT shop of ETH).

402-0341-00L  Medical Physics I  W  6 credits  2V+1U  P. Manser

Abstract
Introduction to the fundamentals of medical radiation physics. Functional chain due to radiation exposure from the primary physical effect to the radiobiological and medically manifest secondary effects. Dosimetric concepts of radiation protection in medicine. Mode of action of radiation sources used in medicine and its illustration by means of Monte Carlo simulations.

Objective
Understanding the functional chain from primary physical effects of ionizing radiation to clinical radiation effects. Dealing with dose as a quantitative measure of medical exposure. Getting familiar with methods to generate ionizing radiation in medicine and learn how they are applied for medical purposes. Eventually, the lecture aims to show the students that medical physics is a fascinating and evolving discipline where physics can directly be used for the benefit of patients and the society.

Content
The lecture is covering the basic principles of ionizing radiation and its physical and biological effects. The physical interactions of photons as well as of charged particles will be reviewed and their consequences for medical applications will be discussed. The concept of Monte Carlo simulation will be introduced in the excercises and will help the student to understand the characteristics of ionization radiation in simple and complex situations. Fundamentals in dosimetry will be provided in order to understand the physical and biological effects of ionizing radiation. Deterministic as well as stochastic effects will be discussed and fundamental knowledge about radiation protection will be provided. In the second part of the lecture series, we will cover the generation of ionizing radiation. By this means, the x-ray tube, the clinical linear accelerator, and different radioactive sources in radiology, radiotherapy and nuclear medicine will be addressed. Applications in radiology, nuclear medicine and radiotherapy will be described with a special focus on the physics underlying these applications.

Lecture notes
A script will be provided.

Prerequisites / notice
For students of the MAS in Medical Physics (Specialization A), the performance assessment is offered at the earliest in the second year of the studies.

529-0041-00L  Modern Mass Spectrometry, Hyphenated Methods, and Chemometrics  W  6 credits  3G  R. Zenobi, B. Hattendorf, P. Sinués Martinez-Lozano

Abstract
Modern mass spectrometry, hyphenated analytical methods, speciation, chemometrics.

Objective
Comprehensive knowledge about the analytical methods introduced in this course and their practical applications.

Content
Hyphenation of separation with identification methods such as GC-MS, LC-MS, GC-IR, LC-IR, LC-NMR etc.; importance of speciation. Modern mass spectrometry: time-of-flight, orbitrap and ion cyclotron resonance mass spectrometry, ICP-MS. Soft ionization methods, desorption methods, spray methods, mass spectrometry imaging. Use of statistical and computer-assisted methods for processing analytical data (chemometrics).

Lecture notes
Lecture notes will be made available online.

Literature
Information about relevant literature will be available in the lecture & in the lecture notes.

Prerequisites / notice
Exercises are an integral part of the lecture.

Prerequisites:
529-0051-00 "Analytische Chemie I (3. Semester)"
529-0058-00 "Analytische Chemie II (4. Semester)" (or equivalent)

529-0240-00L **Chemical Biology - Peptides**  
**W 6 credits 3G**  
H. Wennemers  

**Abstract**  
An advanced course on the synthesis, properties and function of peptides in chemistry and biology.

**Objective**  
Knowledge of the synthesis, properties and function of peptides in chemistry and biology.

**Content**  
Advanced peptide synthesis, conformational properties, combinatorial chemistry, therapeutic peptides, peptide based materials, peptides in nanotechnology, peptides in asymmetric catalysis.

**Lecture notes**  
Citations from the original literature relevant to the individual lectures will be assigned weekly.

**Literature**  

529-0615-01L **Biochemical and Polymer Reaction Engineering**  
**W 6 credits 3G**  
P. Arosio, P. Fleckenstein  

**Abstract**  

**Objective**  
The aim of the course is to learn how to design polymerization reactors and bioreactors to produce polymers and proteins with the specific product qualities that are required by different applications in chemical, pharmaceutical and food industry. This activity includes the post-treatment of polymer latexes, the downstream processing of proteins and the analysis of their colloidal behavior.

**Content**  
We will cover the fundamental processes and the operation units involved in the production of polymeric materials and proteins. In particular, the following topics are discussed: Overview on the different polymerization processes. Kinetics of free-radical polymerization and use of population balance models. Production of polymers with controlled characteristics in terms of molecular weight distribution. Kinetics and control of emulsion polymerization. Surfactants and colloidal stability. Aggregation kinetics and aggregate structure in conditions of diffusion and reaction limited aggregation. Modeling and design of colloid aggregation processes. Physico-chemical characterization of proteins and description of enzymatic reactions. Operation units in bioprocessing: upstream, reactor design and downstream. Industrial production of therapeutic proteins. Characterization and engineering of protein aggregation. Protein aggregation in biology and in biotechnology as functional materials.

**Lecture notes**  
Scripts are available on the web page of the Arosio-group: [http://www.arosiogroup.ethz.ch/education.html](http://www.arosiogroup.ethz.ch/education.html)

535-0423-00L **Drug Delivery and Drug Targeting**  
**W 2 credits 1.5V**  
J.-C. Leroux  

**Abstract**  
The students gain an overview on current principles, methodologies and systems for controlled delivery and targeting of drugs. This enables the students to understand and evaluate the field in terms of scientific criteria.

**Objective**  
The students dispose of an overview on current principles and systems for the controlled delivery and targeting of drugs. The focus of the course lies on developing a capacity to understand the involved technologies and methods, as well as an appreciation of the chances and constraints of their therapeutic usage, with prime attention on anticancer drugs, therapeutic peptides, proteins, nucleic acids and vaccines.

**Content**  
The course covers the following topics: drug targeting and delivery principles, macromolecular drug carriers, liposomes, micelles, micro/nanoparticles, gels and implants, administration of vaccines, targeting at the gastrointestinal level, synthetic carriers for nucleic acid drugs, ophthalmic devices, novel trends in transdermal and nasal drug delivery and 3D printing of drug delivery systems.

**Lecture notes**  
Selected lecture notes, documents and supporting material will be directly provided or may be downloaded from the course website.

**Literature**  

Further references will be provided in the course.
Competencies

Subject-specific Competencies
- Concepts and Theories assessed
- Techniques and Technologies assessed

Method-specific Competencies
- Analytical Competencies assessed
- Decision-making assessed
- Media and Digital Technologies fostered
- Problem-solving assessed
- Project Management fostered

Social Competencies
- Communication assessed
- Cooperation and Teamwork assessed
- Customer Orientation fostered
- Leadership and Responsibility fostered
- Self-presentation and Social Influence fostered
- Sensitivity to Diversity fostered

- Self-direction and Self-management fostered

Immunology III

Abstract
This course provides a detailed understanding of
- development of T and B cells
- the dynamics of an immune response during acute and chronic infection
- mechanisms of immunopathology
- modern vaccination strategies

Key experimental results will be shown to help understanding how immunological textbook knowledge has evolved.

Objective
Obtain a detailed understanding of
- the development, activation, and differentiation of different types of T cells and their effector mechanisms during immune responses,
- Recognition of pathogenic microorganisms by the host cells and molecular events thereafter,
- events and signals for maturation of naive B cells to antibody producing plasma cells and memory B cells.
- Optimization of B cell responses by intelligent design of new vaccines

Content
- Development and selection of CD4 and CD8 T cells, natural killer T cells (NKT), and regulatory T cells (Treg)
- NK T cells and responses to lipid antigens
- Differentiation, characterization, and function of CD4 T cell subsets such as Th1, Th2, and Th17
- Overview of cytokines and their effector function
- Co-stimulation (signals 1-3)
- Dendritic cells
- Evolution of the "Danger" concept
- Cells expressing Pattern Recognition Receptors and their downstream signals
- T cell function and dysfunction in acute and chronic viral infections

Literature
Documents of the lectures are available for download at:
https://moodle-app2.let.ethz.ch/course/view.php?id=2581&notifyeditingon=1

Prerequisites / notice
Immunology I and II recommended but not compulsory

Other Elective Courses
These courses may be suitable for the Molecular Bioengineering track. Please consult your track advisor.

Biology Courses

Abstract
Students will be able to identify and enumerate important anatomical structures to describe basic physiological processes of the human body to use a 3d animation database/software to retrieve anatomical structures to understand basic medical terminology

Objective
To understand basic principles and structure of the human body in consideration of the clinical relevance and the medical terminology used in medical work and research.
Abstract
The course during 8 afternoons (13h to 18h) covers basic laboratory skills and safety, cell culture, protein analysis, RNA/DNA isolation and RT-PCR. Each topic will be introduced, followed by practical work at the bench. Presence during the course is mandatory.

Objective
The goal of this laboratory course is to give students practical exposure to basic techniques of cell and molecular biology.

Content
The goal of this laboratory course is to give students practical exposure to basic techniques of cell and molecular biology.

Prerequisites / notice
Enrollment is limited and students from the Master's programme in Biomedical Engineering (BME) have priority.

How to Write Scientific Texts

Abstract
This four-hour course covers the basics of writing and presenting scientific work. The focus lies on the structure and the main elements of a scientific text. Formatting guidelines, citation rules, good practice of scientific writing and hints to convince the audience are part of the course.

Objective
- You can write scientific texts using the correct structure
- You can convincingly present scientific work
- You can differentiate the scientific style from novels and news
- You can adhere to citation rules and scientific integrity

Content
The block course covers the following topics:
- Structure of Scientific Texts
- Structure of Scientific Presentations
- Formatting of Scientific Elements (figures, equations, tables)
- Citation Rules and Scientific Integrity

Literature
Scientific Integrity, see https://ethz.ch/en/research/ethics-and-animal-welfare/research-integrity.html

Prerequisites / notice
You should be writing either a bachelor/semester/master thesis or a scientific publication in the immediate future.

Semester Project 2

Abstract
The semester project is designed to train the students in solving specific biomedical engineering problems. This project uses the technical and social skills acquired during the master's program. The semester project is advised by a professor.

Objective
see above

Research Project (6 credits)

Abstract
Must be completed before the start of the master's thesis

Objective
see above
The five-weeks (full-time) short research project can be done at a research or non-research institution in Switzerland or abroad, but not in a pure industry setting. The project can be done alone or in groups of students, and it is finished with a report and/or prototype. The project must be finished before the start of the Master project.

**Objective**

**227-1760-00L** Research Project (24 credits)  
*Must be completed before the start of the master's thesis*

**Abstract**
The aim of the long research project is to perform a larger (exploratory) scientific study or a larger development project in a team. The duration of this project is at least four months (full-time) and it is finished with a report and/or prototype.

**Objective**

**see above**

**227-1760-00L** Internship in Industry 
*Only for Biomedical Engineering MSc (Programme Regulations 2020).*

**Abstract**
The main objective of the 12-week internship (full-time) is to expose master's students to the industrial work environment. During this period, students have the opportunity to be involved in on-going projects at the host institution.

**Objective**

**see above**

**Master's Thesis**

| Prerequisites / notice | The students look for a placement themselves. |

### Master’s Thesis

**Students can only start with their master’s thesis if**

a. The BSc programme has been completed successfully  
b. Assigned additional requirements for the admission to the master's degree programme have been passed  
c. At least 64 ECTS have been acquired for the master’s degree programme, including 22 ECTS in the core course category and the 16 ECTS in the research projects and internships category

**Abstract**

In the Master thesis students prove their ability to independent, structured and scientific working. The Master thesis is carried out under the supervision of a professor in a research group of the D-BSSE, usually at the D-BSSE. Students are free to choose the area.

Abstract
The course Methods in Cell Analysis and Laboratory Automation introduces students to high-end cell analysis and sample preparation methods including image analysis. Students will be taught theoretical aspects and skills in Flow Cytometry, Light Microscopy, Image Analysis, and the use of Laboratory Automation.

Objective
- to understand the technical and physical principles of light microscopes and flow cytometers
- to have hands-on experience in the use of these technologies to analyze/image real samples
- to be able to run a basic analysis of the data and images obtained with flow cytometers and microscopes
- to get introduced to liquid handling (pipetting) robotics and learn how to implement a basic workflow

Content
The practical course will have five units at 2 days each (total 10 days):

1. Flow Cytometry:
   a. Introduction to Flow Cytometry
   b. Practical demonstration on flow cytometry analyzers and flow cytometry cell sorters
   c. Flow cytometry sample preparation
   d. Learn how to use flow cytometry equipment to analyze and sort fluorescence-labeled cells

2. Light microscopy:
   a. Learn how to build a microscope and understand the underlying physical principles
   b. Learn how to use a modern automated wide field fluorescence microscope
   c. Use this microscope to automatically acquire images of a cell culture assay to analyze the dose-dependent effect of a drug treatment

3. Image Analysis
   a. Introduction to the fundamentals of image analysis
   b. Learn the basics of the image analysis software Fiji/ImageJ
   c. Use Fiji/ImageJ to analyze the images acquired during the microscopy exercise

4. Laboratory Automation
   a. Introduction to the basics of automated liquid handling/ lab robotics
   b. See examples on using lab automation for plasmid library generation and cell cultivation
   c. Learn how to program and execute a basic pipetting workflow including liquid handling and labware transfers on Tecan and Hamilton robotic systems

5. Presentations
   a. Each student will be assigned to an individual topic of the course and will have to prepare a presentation on it.
   b. Presentations and discussion in form of a Colloquium

Lecture notes
You will find further information on the practical course and the equipment at:
https://www.bsse.ethz.ch/laf
https://www.bsse.ethz.ch/laf/

Literature
- Microscopy: Murphy and Davidson, Fundamentals of Light Microscopy and Electronic Imaging, John Wiley & Sons, 2012
- Flow Cytometry: Shapiro, Practical Flow Cytometry, John Wiley & Sons, 2005

Prerequisites / notice
The following knowledge is required for the course:
- basic laboratory methods
- basic physics of optics (properties of light, refraction, lenses, fluorescence)
- basic biology of cells (cell anatomy and physiology)

<table>
<thead>

Abstract
This practical course is an introduction to microsystems technology and microfluidics for the life sciences. It includes basic concepts of microsystem design, fabrication, and assembly into an experimental setup. Biological applications include a variety of measurements of cellular and tissue signals and subsequent analysis.

Objective
The students are introduced to the basic principles of microsystems technology. They get acquainted with practical scientific work and learn the entire workflow of (a) understanding the theoretical concept, (b) planning the experiment, (c) engineering of the needed device, (d) execution of the experiment and data acquisition, (e) data evaluation and analysis, and (f) reporting and discussion of the results.

Content
The practical course will consist of a set of 4 experiments.

Lecture notes
Notes and guidelines will be provided at the beginning of the course.

Literature

Prerequisites / notice
The practical course will consist of a set of 4 experiments. For each experiment, the student will be required to:
- understand the theoretical concept behind the experiment
- plan the experiment
- engineer the devices
- execute the experiments and acquire data
- evaluate and analyze the data
- report and discuss the results

A good quality of the final report will be expected and be an important criterion.
Lab Course: Microbial Biotechnology

The lab course is open for MSc Biotechnology students only.

**Abstract**
Students will learn the foundations of monocytic working practice and create and screen microbial libraries for identification of strains expressing different fluorescent protein (XFP) levels.

**Objective**
Students will learn the foundations of monocytic working practice and create and screen microbial libraries for identification of strains expressing different fluorescent protein (XFP) levels.

**Content**
- Block A: Handling and preparation of microbial libraries
- D1: Introduction to microbiological cultures and monocytic working techniques.
- D2: Plasmid-based expression systems and variation of XFP synthesis levels via site-directed RBS mutagenesis.
- Block B: Library screening
- D3: In vivo screening for XFP expression levels.
- D4: Analysis of XFP levels via SDS-PAGE analysis. RBS-sequencing.
- Block C: Hit recovery and validation
- D5: In silico analysis of RBS variants.
- D6: Cellular XFP content for selected variants at different culture conditions.
- Block D: Data analysis and presentation
- D7: Protein expression analysis, Q&A for reports and presentations.
- D8: Final presentations and wrap-up.

**Lecture notes**
Material will be provided during the course.

**Literature**

---

**Advanced Courses**

*Students need to acquire a minimum of 22 ECTS in this category (MSc Biotechnology Study Programme Regulations 2021). The list of advanced courses is a closed list, no other course can be added to this category.*

**Abstract**
Students are introduced to the basics of microtechnology, cleanroom, semiconductor and silicon process technologies. They will get to know the fabrication of mostly silicon-based microdevices and -systems and all related microfabrication processes.

**Objective**
Students are introduced to the basics of microtechnology, cleanroom, semiconductor and silicon process technologies. They will get to know the different fabrication methods for various microdevices and systems.

**Content**
- Fundamentals of semiconductors and band model
- Fundamentals of devices: transistor and diode.
- Silicon processing and fabrication steps
- Silicon crystal structure and manufacturing
- Thermal oxidation
- Doping via diffusion and ion implantation
- Photolithography
- Thin film deposition: dielectrics and metals
- Wet etching & bulk micromachining
- Dry etching & surface micromachining
- Microtechnological processing and fabrication sequence
- Optional: Packaging

**Lecture notes**
Handouts in English

**Literature**

**Prerequisites / notice**
Fundamentals in physics and physicochemistry (orbital models etc.) are required, a repetitorium of fundamental physics and quantum theory at the semester beginning can be offered.

636-0104-00L  Biophysical Methods  W  4 credits  3G  D. J. Müller

Abstract  Students will be imparted knowledge in basic and advanced biophysical methods applied to problems in molecular biotechnology. The course is fundamental to applying the methods in their daily and advanced research routines. The students will learn the physical basis of the methods as well as their limitations and possibilities to address existing and future topics in molecular biotechnology.

Objective  Gain of interdisciplinary competence in experimental and theoretical research, which qualifies for academic scientific work (master's or doctoral thesis) as well as for research in a biotechnology or a pharmaceutical company. The module is of general use in courses focused on modern biomolecular technologies, systems biology and systems engineering.

Content  The students will learn basic and advanced knowledge in applying biophysical methods to address problems and overcome challenges in biotechnology, cell biology and life sciences in general. The biological and physical possibilities and limitations of the methods will be discussed and critically evaluated. By the end of the course the students will have assimilated knowledge on a portfolio of biophysical tools widening their research capabilities and aptitude.

The biophysical methods to be taught will include:
- Light microscopy: Resolution limit of light microscopy, fluorescence, GFP, fluorescence microscopy, DIC, phase contrast, difference between wide-field and confocal microscopy
- Super resolution optical microscopy: STED, PALM, STORM, other variations
- Electron microscopy: Scanning electron microscopy, transmission electron microscopy, electron tomography, cryo-electron microscopy, single particle analysis and averaging, tomography, sectioning, negative stain
- X-ray, electron and neutron diffraction
- MRI imaging
- Scanning tunneling microscopy and atomic force microscopy
- Patch clamp technologies: Principles of patch clamp analysis and application. Various patch clamp approaches used in research and industry
- Surface plasmon resonance-based biosensors
- Molecular pore-based sensors and sequencing devices
- Mechanical molecular and cellular assembly devices
- Optical and magnetic tweezers
- CD spectroscopy
- Optogenetics
- Molecular dynamics simulations

Lecture notes  Hand out will be given to students at lecture.

Literature  Methods in Molecular Biophysics (5th edition), Serdyuk et al., Cambridge University Press

Prerequisites / notice  The course is composed of 3 SWS (3 hours/week): 2-hour lecture, 1-hour seminar. For the seminar, students will prepare oral presentations on specific in-depth subjects with/under the guidance of the teacher.

636-0108-00L  Biological Engineering and Biotechnology  W  4 credits  3V  M. Fussenegger

Abstract  Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

Objective  Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

Lecture notes  Handout during the course.

636-0107-00L  Biotechnology of Enzymes  W  4 credits  3G  S. Panke, A. Bunzel

Abstract  This course covers the role of enzymes in biotechnology, from discovery via engineering to applications in a variety of fields from food to the pharmaceutical industry.

Objective  Students will learn to identify opportunities for utilizing enzymes in biotechnology and develop basic and advanced enzyme engineering skills, informed by the latest research and techniques.

Content  This course offers an in-depth exploration of the use and engineering of enzymes in biotechnology, spanning fundamental enzymology, enzyme engineering, and applied biocatalysis. Topics will include (1) thermodynamic, kinetic, and mechanistic principles of enzyme catalysis, (2) the generation and engineering of enzymes through technologies such as protein design and directed evolution, (3) industrially applied biocatalysis, and (4) future challenges for biocatalysis.

Lecture notes  Notes will be provided in the form of handouts.

Literature  The course will use selected parts of textbooks, original scientific publications, and reviews, which will be shared during the lecture.

Competencies  Subject-specific Competencies
- Concepts and Theories  assessed
- Techniques and Technologies  assessed
- Analytical Competencies  assessed
- Communication  assessed
- Cooperation and Teamwork  assessed
- Self-direction and Self-management  assessed

636-0550-00L  Biomolecular Nanotechnology  W  4 credits  2V+1U  M. Nash

Abstract  Biomolecular Nanotechnology is a broad field that focuses on the study and science of biological materials including DNA, RNA and proteins at length scales below 10 nm. This is a broad overview of the topic with a focus on current research themes.

Objective  The objective is to familiarise the students with a broad range of topics related to biotechnology, nanotechnology, and biophysics with a focus on current research and reading of scientific literature.

Content  Introduction to biomacromolecules: Measurement techniques for characterisation of biomacromolecules; Fundamentals of molecular recognition; Recombinant DNA: Protein engineering; Directed evolution; Protein folding; Polymers; Elastin-like polypeptides; Intelligent materials; Spatially localized hydrogels; Mechanical properties of proteins and macromolecules; Single-molecule force spectroscopy.
Stem cells are central in tissue regeneration and repair, and hold great potential for therapy. We will discuss the role of stem cells in health and disease, and possibilities to manipulate their behavior for therapeutic application. Basic molecular and cell biology, engineering and novel technologies relevant for stem cell research and therapy will be discussed. The exercises serve to deepen the understanding of the presented concepts and the mathematical methods, and to train students to numerically solve and simulate mathematical models.

**Content**

- Basic mathematical concepts and tools to explore biochemical reaction dynamics as well as basic concepts from dynamical systems theory.
- Exercises serve to deepen the understanding of the presented concepts and the mathematical methods, and to train students to numerically solve and simulate mathematical models.

**Competencies**

**Subject-specific Competencies**

- Concepts and Theories
- Techniques and Technologies

**Method-specific Competencies**

- Analytical Competencies
- Problem-solving

**Personal Competencies**

- Creative Thinking
- Critical Thinking
Microtechnology

Students are introduced to the basics of microtechnology, cleanroom, semiconductor and silicon process technologies. They will get to know the fabrication of mostly silicon-based microdevices and systems and all related microfabrication processes.

Analytical Competencies

- Critical Thinking
- Integrity and Work Ethics

Concepts and Theories

Introduction to microtechnology, semiconductors, and microelectromechanical systems (MEMS)

- Fundamentals of microtechnology, cleanroom, semiconductor and silicon process technologies
- Students will get to know the different fabrication methods for various microdevices and systems

Content

- Fundamentals of semiconductors and band model
- Fundamentals of devices: transistor and diode
- Silicon processing and fabrication steps
- Silicon crystal structure and manufacturing
- Thermal oxidation
- Doping via diffusion and ion implantation
- Photon lithography
- Thin film deposition: dielectrics and metals
- Wet etching & bulk micromachining
- Dry etching & surface micromachining
- Microtechnological processing and fabrication sequence
- Optional: Packaging

Prerequisites / notice

Fundamentals in physics and physicochemistry (orbital models etc.) are required, a repetitorium of fundamental physics and quantum theory at the semester beginning can be offered.

Competencies

- Subject-specific Competencies
- Method-specific Competencies
- Social Competencies
- Personal Competencies

- Concepts and Theories
- Analytical Competencies
- Communication
- Critical Thinking

Lecture notes

Handouts in English

Biophysical Methods

Students will be imparted knowledge in basic and advanced biophysical methods applied to problems in molecular biotechnology. The course is fundamental to applying the methods in their daily and advanced research routines. The students will learn the physical basis of the methods as well as their limitations and possibilities to address existing and future topics in molecular biotechnology.

Abstract

Gain of interdisciplinary competence in experimental and theoretical research, which qualifies for academic scientific work (master's or doctoral thesis) as well as for research in a biotechnology or pharmaceutical company. The module is of general use in courses focused on modern biomolecular technologies, systems biology and systems engineering.

Objective

The students will learn basic and advanced knowledge in applying biophysical methods to address problems and overcome challenges in biotechnology, cell biology and life sciences in general. The biological and physical possibilities and limitations of the methods will be discussed and critically evaluated. By the end of the course the students will have assimilated knowledge on a portfolio of biophysical tools widening their research capabilities and aptitude.

Content

- Light microscopy: Resolution limit of light microscopy, fluorescence, GFP, fluorescence microscopy, DIC, phase contrast, difference between wide-field and confocal microscopy
- Super resolution optical microscopy: STED, PALM, STORM, other variations
- Electron microscopy: Scanning electron microscopy; transmission electron microscopy, electron tomography, cryo-electron microscopy, single particle analysis and averaging, tomography, sectioning, negative stain
- X-ray, electron and neutron diffraction
- MRI imaging
- Scanning tunnelling microscopy and atomic force microscopy
- Patch clamp technologies: Principles of patch clamp analysis and application. Various patch clamp approaches used in research and industry
- Surface plasmon resonance-based biosensors
- Molecular pore-based sensors and sequencing devices
- Mechanical molecular and cellular assembly devices
- Optical and magnetic tweezers
- CD spectroscopy
- Optogenetics
- Molecular dynamics simulations

Lecture notes

Hand out will be given to students at lecture.
**Literature**
Methods in Molecular Biophysics (5th edition), Serdyuk et al., Cambridge University Press
Cell Biology, Pollard & Earnshaw; ISBN-0:7216-3997-6, Saunders, Pennsylvania

**Prerequisites / notice**
The module is composed of 3 SWS (3 hours/week): 2-hour lecture, 1-hour seminar. For the seminar, students will prepare oral presentations on specific in-depth subjects with/under the guidance of the teacher.

Data: 02.07.2024 12:39  Autumn Semester 2024  Page 430 of 2667
We will use different diseases to discuss how to potentially model, diagnose or heal them by stem cell based therapies. This will be used as a guiding framework to discuss relevant concepts and technologies in cell and molecular biology, engineering, imaging, bioinformatics, tissue engineering, that are required to manipulate stem cells for therapeutic application.

Topics will include:
- Embryonic and adult stem cells and their niches
- Induced stem cells by directed reprogramming
- Relevant basic cell biology and developmental biology
- Relevant molecular biology
- Cell culture systems
- Cell fates and their molecular control by transcription factors and signalling pathways
- Cell reprogramming
- Disease modelling
- Tissue engineering
- Bioimaging, Bioinformatics
- Single cell technologies

While no specific textbook will be followed, much of the material and homework problems will be taken from the following books:

- Concepts and Theories
- Techniques and Technologies
- An Introduction to Probability Theory and Stochastic Processes with Applications to Biology
- Analytical Competencies
- Media and Digital Technologies
- Communication
- Cooperation and Teamwork
- Self-presentation and Social Influence
- Critical Thinking
- Integrity and Work Ethics

The aim of this course is to introduce certain topics in Probability Theory and Stochastic Processes that have been specifically selected, assessed, fostered, and encouraged. Students are expected to have a good grasp of Linear Algebra and Multivariable Calculus. Basic knowledge of set theory will also be needed. Students should be prepared for abstract reasoning.

The course will involve a healthy balance between mathematical rigor (theorem proving) and biological applications. Students are expected to have a good grasp of Linear Algebra and Multivariable Calculus. Basic knowledge of set theory will also be needed. Students should be prepared for abstract reasoning.

The electives list in the ETH course catalogue is an open list, and the courses listed in the ETH course catalogue provide just examples for possible elective courses, e.g., a selection of eligible courses. Students are expected to look for relevant courses in the ETH and University of Basel course catalogue and ask their mentor for approval. Courses from the advanced course category may also be taken as electives.

We particularly recommend browsing the University of Basel course catalogue for elective courses of relevant master's degree programs (using the filter "program structure" on the course catalogue website), such as for example: Biomedical Engineering, Chemistry, Drug Sciences, Epidemiology, Infection Biology, Molecular Biology, Nanosciences.

The first half of the course will cover the basics of Probability Theory while the second half will delve into the theory of Stochastic Processes. Below is the list of topics that will be covered in the course.

1. The mathematical representation of random phenomena: The probability space, properties of the probability measure, independence of events, Conditional probability and Bayes formula, applications to parameter inference.
3. Convergence of Random Variables: Modes of convergence, Laws of large numbers, the central limit theorem, the law of the iterated logarithm, Applications to the analysis of cell population data.

While no specific textbook will be followed, much of the material and homework problems will be taken from the following books:

- Computational Biology

The course will involve a healthy balance between mathematical rigor (theorem proving) and biological applications. Students are expected to have a good grasp of Linear Algebra and Multivariable Calculus. Basic knowledge of set theory will also be needed. Students should be prepared for abstract reasoning.

The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Computational algorithms extracting biological information from genetic sequence data are discussed, and statistical tools to understand this information in detail are introduced.
Objective

Attendees will learn which information is contained in genetic sequencing data and how to extract information from this data using computational tools. The main concepts introduced are:

* stochastic models in molecular evolution
* phylogenetic & phylodynamic inference
* maximum likelihood and Bayesian statistics

Attendees will apply these concepts to a number of applications yielding biological insight into:

* epidemiology
* pathogen evolution
* macroevolution of species

Content

The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods for direct alignment analysis using approaches such as BLAST and GWAS.

Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. Lastly, we introduce the field of phylodynamics, the aim of which is to understand and quantify population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

Lecture notes

Lecture slides will be available on moodle.

Literature

The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:

* Yang, Z. 2006. Computational Molecular Evolution.
* Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.

Prerequisites / notice

Basic knowledge in linear algebra, analysis, and statistics will be helpful. Programming in R will be required for the project work (compulsory continuous performance assessments). In case you do not have any previous experience with R, we strongly recommend to get familiar with R prior to the semester start. For the D-BSSE students, we highly recommend the voluntary course „Introduction to Programming“, which takes place in Basel before the start of the semester.

Competencies

Subject-specific Competencies

- Concepts and Theories
- Techniques and Technologies

Method-specific Competencies

- Analytical Competencies
- Decision-making
- Problem-solving

Content

1. Introduction to Modelling in Biology
2. Bioimage Analysis
3. Morphogen Gradients
4. Precision & Robustness of Patterning
5. Mathematical Description of Growing Biological Systems
6. Travelling Waves & Wave Pinning
7. Turing Patterns
8. Chemotaxis
9. Epithelial Organisation
10. Tissue Simulation Frameworks
11. Tissue Mechanics & Fluid Dynamics
12. Growth Control
13. Image-Based Modelling
14. Summary

Lecture notes

All lecture material will be made available online via Moodle.

Data: 02.07.2024 12:39  Autumn Semester 2024  Page 432 of 2667
The course is structured in four main pillars:

1. **Lecture slides will be available**
2. **The modern tools of chemical biology will be discussed and contextualized with a discussion of practical applications with those tools.**

### Prerequisites

The course is self-contained. The course assumes no background in biology but a good foundation regarding mathematical and computational techniques.

### 636-0119-00L Introduction to Statistics and R

**W** 6 credits 3G+2A J. Kuipers

**Abstract**

This course offers a practical introduction to the fundamentals of data analysis and R

**Objective**

To acquire the statistical understanding to design an appropriate analysis and the practical skills to implement the analysis in R and present the results.

**Content**

Data analysis is fundamental for arriving at scientific conclusions and testing different hypotheses. This course offers a hands-on introduction to statistical analyses including: exploratory data analysis, testing differences in populations, p-values, power calculations, multiple testing, confounding, linear regression, maximum likelihood, model selection, and logistic regression; along with the fundamentals of R programming including markdown and data handling with the tidyverse.

**Lecture notes**

Lecture slides will be available

**Prerequisites / notice**

Access to Rstudio with some markdown and tidyverse packages installed.

### 636-0120-00L Introduction to Programming

**Z** 0 credits 1G A. Gupta, T. Vaughan

**Abstract**

This is a voluntary programming course “before” the start of the semester, open for students of the MSc Biotechnology master's programme only. Lecture dates: 2-13 September 2024. Students are asked to sign up for the course in myStudies as well as via the online form (link sent out via e-mail).

**Objective**

The goal of this course is to give students, who have no prior programming background, a solid introduction to algorithm development and its successive implementation in a programming language. For students with previously acquired programming skills, the course will serve as a reinforcement of key aspects of structured programming in addition to providing a well-rounded introduction to MATLAB, R and Python.

**Content**

The course is structured in four main pillars:

- **Logical thinking:** Translating a problem into a conceptual sequence of computational steps. For example:
  - **[Problem]** What is the GC content of a given DNA string?
  - **[Logical steps]**
    - i) Iterate through all nucleotides in the DNA string, one by one
    - ii) Count the Cs or Gs
    - iii) Divide the count of Cs or Gs by the length of the DNA string
    - iv) Report the result.

- **The basics of programming:** Variables, functions and arrays. Control flow and recursion. Top-down algorithm design. Computational complexity of an algorithm.

- **Writing code:** Full introduction to the MATLAB programming language and covers Bash scripting and other programming languages such as R and Python.

- **Primer of Unix commands:** Command-line examples on how to access servers and computing resources at the D-BSSE. Submission of jobs to the EULER cluster.

**Lecture notes**

Available on course website (Moodle)

**Literature**

Publicly available material (links will be posted on the course website)

### 636-0552-00L Metals in Biology (University of Basel)

**W** 3 credits 3G external organisers

**Abstract**

Mind the enrolment deadlines at Uni Basel: https://www.unibas.ch/en/Studies/Mobility/Mobility-Switzerland/Students-Registering-From-Other-Swiss-Universities.html

**Objective**

- Identify key features of metalloenzymes and enzyme mimics
- Deduce and draw reasonable reaction mechanisms catalyzed by metalloenzymes
- Understand the role of metalloenzymes in solving energy-related grand challenges
- Design functional enzyme mimics
- Critically analyze the structure and function of metalloproteins

### 636-0553-00L Chemical Biology (University of Basel)

**W** 3 credits 3G external organisers

**Abstract**

Mind the enrolment deadlines at Uni Basel: https://www.unibas.ch/en/Studies/Mobility/Mobility-Switzerland/Students-Registering-From-Other-Swiss-Universities.html

**Objective**

- The course must be registered for directly at Uni Basel.
- The course is self-contained. The course assumes no background in biology but a good foundation regarding mathematical and computational techniques.

### 636-0551-00L Supramolecular Chemistry (University of Basel)

**W** 3 credits 2V K. Tiefenbacher

**Abstract**

The modern tools of chemical biology will be discussed and contextualized with a discussion of practical applications with those tools.
The course must be registered for directly at Uni Basel. 

Uni Basel course number: 46486-01

Mind the enrolment deadlines at Uni Basel:
https://www.unibas.ch/en/Studies/Mobility/Mobility-Switzerland/Students-Registering-From-Other-Swiss-Universities.html

Abstract
This course provides an introduction to supramolecular chemistry. Prior knowledge in supramolecular chemistry is not a prerequisite for this course.

Objective
After this course, the student is expected to understand and be able to apply the basics of supramolecular chemistry: host-guest interactions, host design, self-assembly and simple enzyme mimetics.

Content
This course provides an introduction to supramolecular chemistry. Prior knowledge in supramolecular chemistry is not a prerequisite for this course. We will first cover the basic concepts of supramolecular chemistry: non-covalent interactions, host-guest chemistry, binding constant determination and binding strength. Subsequently, we will take a closer look at how to bind different species: cations, anions and neutral organic molecules. Towards the end of the semester, we will cover self-assembly processes and applications of supramolecular structures as simple enzyme mimetics.

Lecture notes
The lecture slides are provided online via ADAM. No additional literature is required. If additional information is desired, the book "Supramolecular Chemistry" by Jonathan W. Steed and Jerry L. Atwood (John Wiley & Sons) is recommended.

636-0554-00L Modelling and Simulation in Drug Development

W 2 credits 3V H.-M. Kaltenbach

Abstract
This course introduces how Modelling and Simulation (=mathematical modelling) is applied today for the development of novel drugs in the pharmaceutical industry. Background lectures are combined with hands-on exercises on real-world examples.

Objective
The goal of this course is to provide students with a general understanding of drug development and pharmacology and how Modelling and Simulation is used to develop new drugs. Together with the application, the course will provide the background in the statistical methodologies used to model multivariate and time-dependent data with several levels of statistical variability.

Content
Understanding the pharmacology, pharmacokinetics and pharmacodynamics (PK/PD) of novel drugs is key for a successful drug development process. Modelling and Simulation of these data at the core to gain this understanding. Focusing on the application using real world examples, this course will introduce the statistical methodologies that have been developed to describe complex biological and pharmacological data with several levels of statistical variability.

The course will cover the basics of drug development and pharmacology with a focus on the principles of drug absorption, distribution, metabolism and excretion (ADME) and drug pharmacokinetics and pharmacodynamics (PK/PD). The different drug formats (small molecules, biologics, cell-based therapies, gene therapies and oligonucleotide formats) and their pharmacological properties will be introduced. The translation from animal to human to inform first-in-human dose selections will be discussed.

The methodology part will cover compartmental PK/PD modelling, the practical aspects of numerical solutions of ordinary differential equations (ODEs) and the theory on non-linear mixed effects (NLME) modelling, which has become the de-facto standard methodology in the pharmaceutical industry. The practical problems of Modelling and Simulations will be discussed including parameter identifiability, model development and model evaluation and the application (or not) of the Occam’s Razor.

The course will focus on hands-on exercises using contemporary real-world examples from the pharmaceutical industry and provide necessary theoretical and methodological background in accompanying lectures.

Prerequisites / notice
Basics of dynamic systems (e.g., BSSE courses by Iber or Kamnash, or CSB course by Stelling)
Basics of statistics and R (e.g., BSSE courses by Kuipers or Kaltenbach)

Science in Perspective
see Science in Perspective: Language Courses ETH/UZH
see Science in Perspective: Type A: Enhancement of Reflection Capability

Biotechnology Master - Key for Type

O Compulsory E- Recommended, not eligible for credits
W+ Eligible for credits and recommended Z Courses outside the curriculum
W Eligible for credits Dr Suitable for doctorate

Key for Hours

V lecture P practical/laboratory course
G lecture with exercise A independent project
U exercise D diploma thesis
S seminar R revision course / private study
K colloquium

ECTS European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
As a final module, new business models are discussed and explored. Examples will be used to explore patterns and interfaces and to discuss the opportunities and risks.

How do the experiences of other industries help us? What can be derived from them? Why is BIM only a small part and why is the future of BIM not BIM?

Module 3 focuses on cultural change, innovation, disruption or evolution? In this last model, we learn to question and discover what the 17 Sustainable Goals mean for our industry.

The module offers the opportunity to prepare for the voluntary buildingSMART Professional Certification.

We learn to consciousness look at the topic of added value and digital transformation from different perspectives. Collision checking and quantity take-offs (QTO) are very useful. But they are only basics when it comes to real value creation.

We will analyse the topic on the basis of two concrete examples, familiarise ourselves with them and observe their further development as a result.
